Trouble: If an alert for invalid connection or invalid credential appears, check that you have set up and connected AARI correctly to AARI Extensions.

After developing the extensions for your team, return to AARI to assign these extensions to users.

[Provisioning AARI Extensions to teams](#)

Provisioning AARI Extensions to teams

Organize and assign developed extensions to teams for business roles and functions.

Ensure that you have completed development of the AARI Extensions content. [Develop a widget for AARI Extensions](#)

After developing an extension, make sure to **refresh** AARI to load recently developed content.

1. In AARI Extensions, click **Add Extension**.
2. Select the extension.
Recognize the extension by the **Name** you entered in development.
3. Click **Add and Save**
4. To edit properties, select the newly added extension on the **Extension Setup** page .
5. Click the **Teams** tab.
6. Select **Teams** to assign them the extension.
7. To commit your changes, click **Add and Save**.
The ellipsis on the far right of each team offers an option to send the extension link to users.
Users will now be able to access the widget from their web applications.

Check out what users can do with the extension. [Deploy automations in web application](#)

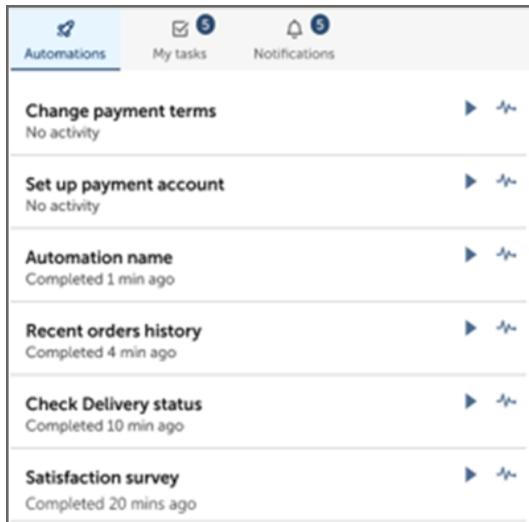

Example of Embedded Automation using AARI Integrations

An Embedded Automation widget is invoked as an Interaction Widget inside Genesys Cloud. The agent uses the widget to correct a pricing error without leaving Genesys.

Embedded Automation

Business users can directly access authorized automation from within their favorite business applications, without having to open a new interface or learn a new app. Embedded Automation delivers automation

everywhere you want, through a widget, either integrated with your web application or delivered through a browser extension. To make the widget accessible, create and configure the widget in your preferred application. Then populate the widget by assigning pre-built automations to teams in AARI. Those teams can access Embedded Automation to complete daily tasks.

Setup

1. Complete the setup process flow [AARI Integrations overview](#)
2. Assign automations [Assign automations to teams](#)
3. Automations assigned should include the following.
 - Attended bot (that can be deployed on the local device) [Attended and unattended automation](#)
 - AARI Process invocation (with two human step forms) [Deploy processes](#)
 - Unattended bot (triggered via AARI process with no human inputs) [Create an AARI process](#)

Tip: Usable sample code

You can download the following sample code to test this example in your own environment. [GitHub: Embedded Use Case 1](#)

Example Summary

In this example, a contact center agent receives a call about an order with an incorrect charge. The agent, operating in Genesys, responds using the embedded widget by launching automated processes and bots, and handles the order correction without leaving Genesys. Deployed automations touch Salesforce and Zoho Sales Order Management to correct the error in respective systems. Assigned automations are detailed in the following image.

The screenshot displays a CRM interface with a top navigation bar containing 'Activity', 'Directory', 'Documents', 'Clients', 'Performance', 'Reports', 'Apps', and 'Admin'. The main area is divided into a left sidebar with navigation icons, a central 'Conversations' panel, and a right 'Interaction Details' panel. The 'Conversations' panel shows a list of interactions, with the selected one for 'Peterson, Mark' (Blue Skies Airlines - Credits and Refunds) highlighted. The 'Interaction Details' panel provides specific information about the call.

Conversations

- Peterson, Mark +
- Blue Skies Airlines - Credits and Refunds

Interaction Details

Interaction Type:	Call
Interaction State:	Connected
Queue Name:	Blue Skies Airlines - Credits and Refunds
Customer's Number:	tel:+1 [redacted]

This example describes steps the agent takes to correct a pricing error while in Genesys, by using the Embedded Automation widget.

1. Deploy the **Salesforce Account Lookup** bot and enter the phone number to pull up the account record.

The screenshot shows a Genesys CRM interface. The top navigation bar includes Activity, Directory, Documents, Clients, Performance, Reports, Apps, and Admin. The main area displays a conversation with Peterson, Mark, identified as a Blue Skies Airlines - Credits and Refunds call. The interaction details show the type as 'Call' and the state as 'Connected'. A 'Results' window is open, displaying the following account information:

Account Number: AC0065321
Name: Mark Peterson
Address: 633 River Oaks Parkway
City: San Jose, State: 633 River Oaks Parkway
Country: USA, Postal Code/ZIP: USA

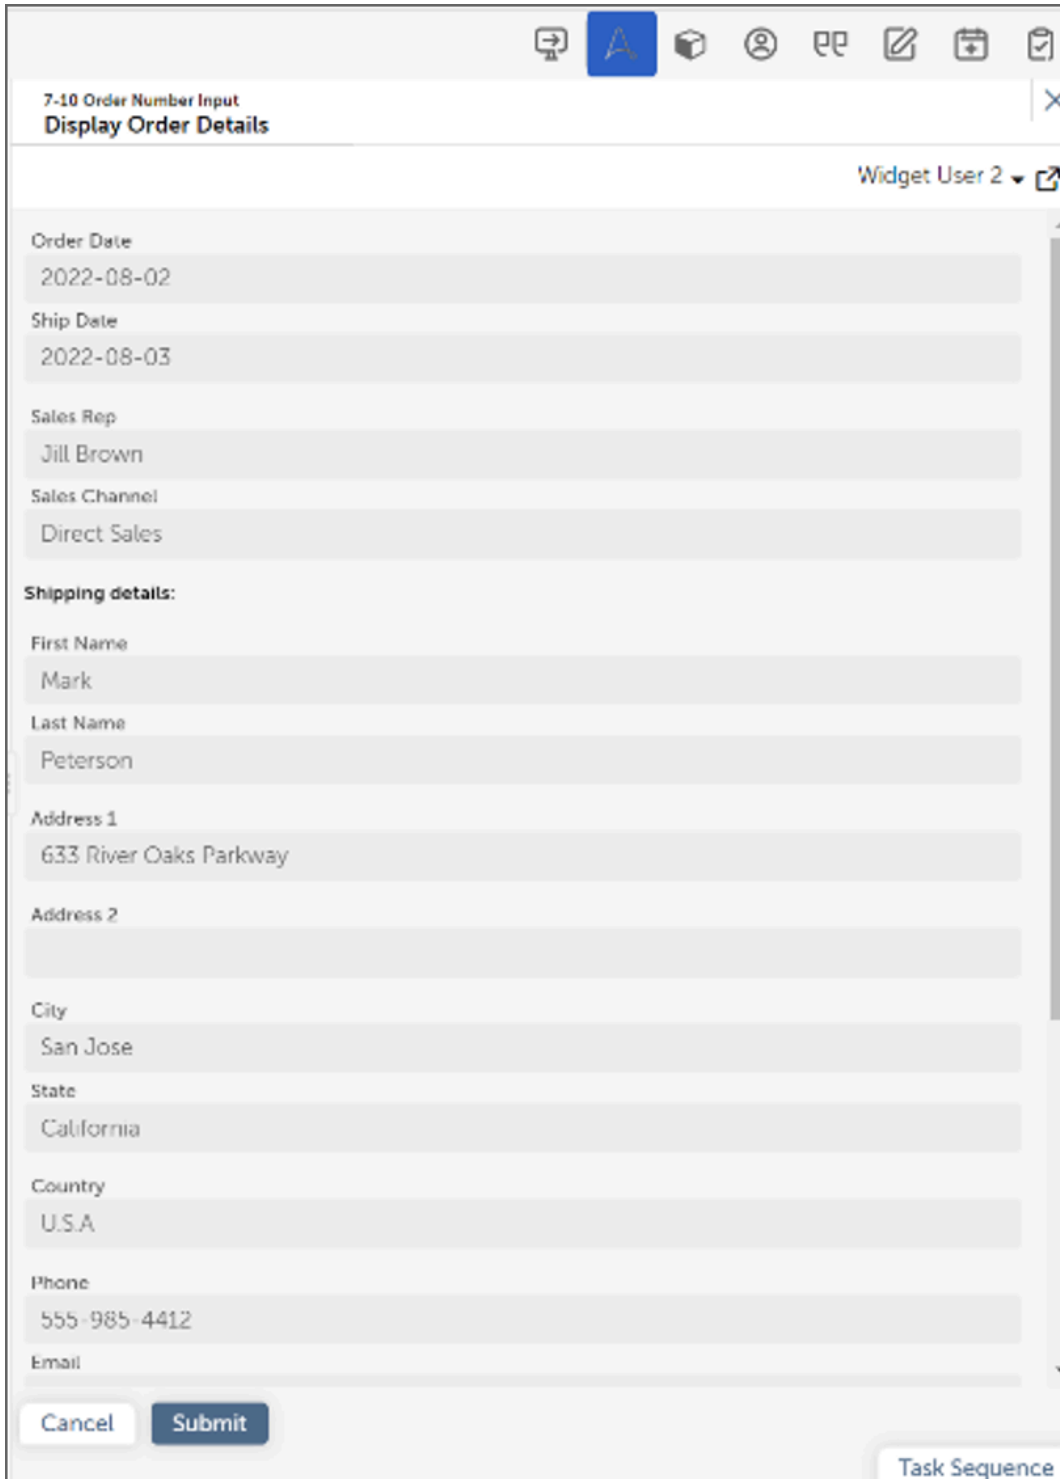

Recent Order History:

Date	SFDC Order Number	ZOHO Reference
2022-08-01	00000100	SO-00001

A 'Close' button is visible at the bottom of the Results window.

Copy the **SFDC Order Number** to enter in the next step.

2. Launch the **Order Items Price Correction** process from within the widget and enter the order number you have retrieved.
A Bot retrieves order details from Zoho and renders the **Display Order Details** in a form, including products and prices paid.

The screenshot displays a widget titled "7-10 Order Number Input Display Order Details". The widget contains a form with the following fields and values:

- Order Date: 2022-08-02
- Ship Date: 2022-08-03
- Sales Rep: Jill Brown
- Sales Channel: Direct Sales
- Shipping details:**
 - First Name: Mark
 - Last Name: Peterson
 - Address 1: 633 River Oaks Parkway
 - Address 2: (empty)
 - City: San Jose
 - State: California
 - Country: U.S.A
 - Phone: 555-985-4412
 - Email: (empty)

At the bottom of the form, there are two buttons: "Cancel" and "Submit". The widget is associated with "Widget User 2" and is part of a "Task Sequence".

3. Correct the price on the item in question.

Enter the **file location**, for the automation to send notes to the appropriate contacts.

Example of Embedded Automation using AARI Extensions

An Embedded Automation widget is invoked as a sidebar that appears for users inside Workday. An HR admin uses the widget to enter an employee address and order business assets to be shipped without leaving Workday.

Embedded Automation

Business users can directly access authorized automation from within their favorite business applications, without having to open a new interface or learn a new app. Embedded Automation delivers automation everywhere you want, through a widget, either integrated with your web application or delivered through a browser extension. To make the widget accessible, create and configure the widget in your preferred application. Then assign pre-built automations in AARI that are necessary for teams to complete daily tasks. The widget populates assigned automations for specific roles.

Setup

Embedded Automation is available through a widget in your desired web application. To activate the widget, you'll want to create and configure the widget through AARI Extensions. Then assign pre-built automations to teams for the widget to populate assigned automations for their assigned roles. Setup of task-specific automations are used in this example and are detailed in the following prerequisites.

1. Complete the following setup process flow.
 - a. *AARI Extensions setup and connection*
 - b. *Setup iFrame widget using AARI Integrations*
 - c. *Develop a widget for AARI Extensions*

Note: For this example, configure the widget to trigger as a Page Load event.

- d. *Provisioning AARI Extensions to teams*
2. In this example, two types of automations are assigned and include the following details.
 - Attended bot (that can be deployed on the local device) *Attended and unattended automation*
 - AARI Process invocation (with two human step forms) *Deploy processes*

Tip: Usable sample code

You can download the following sample code to test this example in your own environment. [GitHub: Embedded Use Case 2](#)

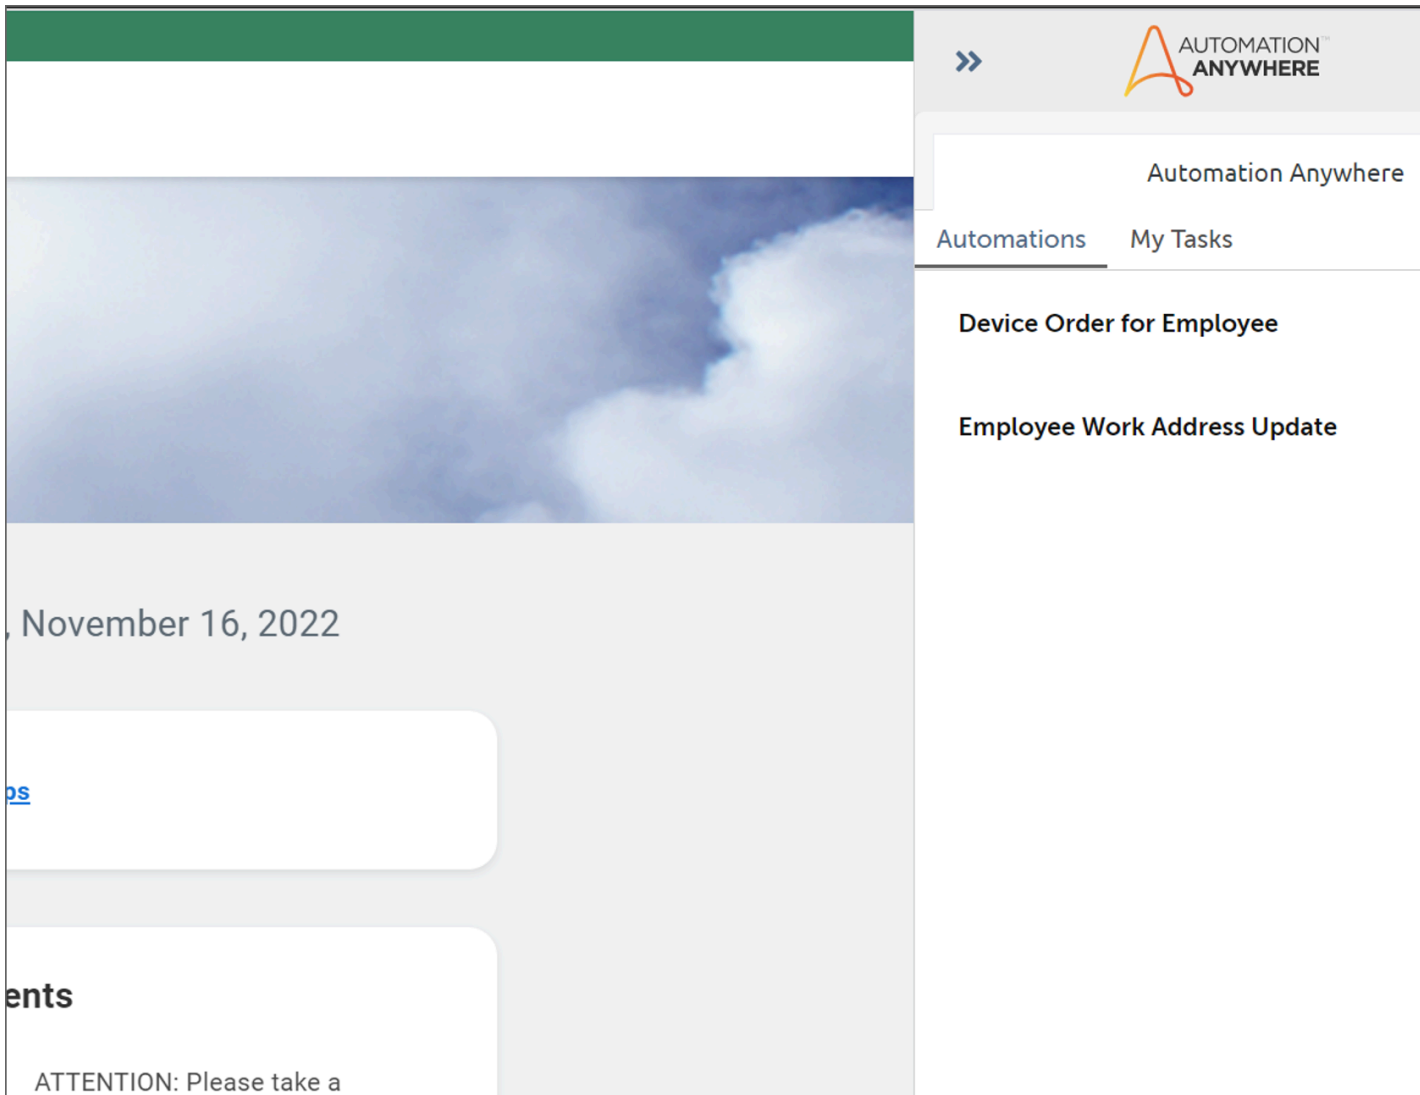

Example Summary

This example begins when a HR Admin logs into Workday and upon landing on the home page, views the new Sidebar that has been deployed by the RPA Center of Excellence (CoE). The Sidebar has been designed to open automatically when the user accesses the Workday application and when the page has completed loading.

The Human Resource Admin begins by opening the Workday application. The Page Load event has been configured to generate the embedded sidebar. The following tasks demonstrate how a HR Admin uses Embedded Automation to access and update an employee address then order hardware assets for delivery.

The following details the automations used in this example. Deployed automations touch Workday and Zoho Sales Order Management to complete the transaction, while the admin remains in the Workday application.

- An attended bot, **Employee Work Address Update**, built for a HR Admin to quickly locate and update home office address details of employees, using interactive forms and local desktop automation.
- An AARI process invocation, **Device Order for Employee**, built for a HR Admin to order hardware assets for employees, like laptops and keyboards, directly from within the HRM application.

1. Start the **Employee Work Address Update** automation that allows you to enter the Employee ID of whom you want to update details.

Powered by Automation Anywhere

The automation updates details of the employee record in Workday.

The next automation simplifies daily tasks of the HR Admin by introducing an automated process for device ordering that is embedded directly in the Workday application using the same Sidebar. Typically, this task would require navigating procurement applications to locate and order devices, and navigating the Workday application to capture shipping address details of the employee.

The next section demonstrates how the task is simplified by bringing the ordering process into the primary application where daily tasks are performed. Like the previous task, when the user logs into Workday the Sidebar appears with the list of available automations their CoE has rolled out to the HR team.

5. Find the **New Device Order for Employee** automation displayed in the Sidebar, and click **Start**.

A new instance is created.

6. Enter the **Employee ID** for a new order.

The screenshot displays the Workday user interface. At the top, there is a search bar with a magnifying glass icon and the text 'Search'. Below this is a large blue and white cloud background. The main content area is divided into several sections:

- Welcome:** Located on the left, it includes a 'Timely Suggestions' section with the text 'Here's where you'll get updates on your active items.' and a 'Recommended for You' section with two cards:
 - Understand Your People Network:** Based on your role, with a 'View Org Chart' link.
 - Showcase Your Best Self with Your Profile:** Based on your most popular actions, with a 'Manage Profile' link.
- Right Sidebar:**
 - View All Apps:** A button with a grid icon and the text 'View All Apps'.
 - Announcements:** Includes the Workday logo, a 'ATTENTION: Please take a moment to review your home' message, and a 'We're Glad You've Joined Team!' announcement with a megaphone icon and the text 'We are a company focused on ideas and innovation and we'.

At the bottom of the page, there is a Workday logo, a copyright notice: '© 2022 Workday, Inc. All rights reserved. Workday Proprietary and Confidential. For authorized use only.', and a system status message: 'System Status: Your Implementation tenant will be unavailable for a maximum of 12 hours during the next Weekly Service Update; starting on Friday, November 18, 2022 at 6:00 PM Pacific Time (Los Angeles) (GMT-8) through Saturday, November 19, 2022 at 6:00 AM Pacific Time (Los Angeles) (GMT-8)'.

After submitting a valid Employee ID, the automation locates the details of the employee within Workday and returns those details into the next step.

7. Confirm the employee details and choose items to order on their behalf.

Example Summary

In this example, a company employee (Jane) submits a request to order replacement hardware. Jane, operating in ServiceNow, uses the embedded widget to launch an automated bot to process the order and submit for approval to a Cost Center Manager (Gerald). Gerald, operating in SAP, uses the embedded widget to launch automations that approve and complete the hardware order for shipping.

The widget is visible in ServiceNow as a custom ServiceNow component that is placed into the Employee Service Portal page. The widget is invoked as a Sidebar, through the web browser, that appears for users inside SAP S/4HANA on a page load trigger.

Setup

1. Complete the setup process flow for ServiceNow [AARI Integrations overview](#)
2. Complete the setup process flow for SAP [AARI Extensions overview](#)
3. Assign automations [Assign automations to teams](#)
4. The embedded widget can contain combinations of three types of automations:
 - AARI Process invocation (with two human step forms) [Deploy processes](#)
 - Attended bot (that can be deployed on the local device) [Attended and unattended automation](#)
 - Unattended bot (triggered via AARI process with no human inputs) [Create an AARI process](#)

Tip: Usable sample code

You can download the following sample code to test this example in your own environment. [GitHub: ServiceNow](#)

Procedure

For this particular example, we focus on just one of the above types of automations:

The **Hardware Replacement Request** AARI process allows an employee access to the business ServiceNow Service Portal for IT requests. An employee can use the embedded widget to automate requests. Jane's request entails ordering replacement hardware such as keyboards, mice or laptops.

When Jane opens ServiceNow they can see the automated process for **Hardware Replacement Request** within the widget.

The screenshot displays the ServiceNow user interface. At the top, the ServiceNow logo is visible on the left, and the heading "How can we help?" is centered. Below the heading is a search bar. The main navigation bar includes "Request Something", "Knowledge Base", and "Get Help". The main content area is divided into sections: "Current Status" (highlighted with an orange box and containing the text "Process Automation deployed on a remote device"), "My Open Incidents" (listing various incidents like "Purchase Request for Hardware: Jane Miller"), and "Automations" (listing "Hardware Replacement Request", "Request New License for Application", "Reset Password to Application", and "Virtual Machine Request").

1. Jane initiates the **Hardware Replacement Request** and is taken to an input page, within the widget, where required information is entered to execute the automation.

2. Here, Jane can select the request for self or another employee and **Submit**.

6. Gerald approves the request and adds any comments without having to leave the SAP environment.

The screenshot displays the Automation Anywhere interface for a request approval. At the top, there is a navigation bar with the Automation Anywhere logo and an 'Options' menu. Below this, the title 'Automation Anywhere' is centered. The main content area is titled '38-29 Request Approval' and 'Approval'. The user 'Gerald Brown' is shown as the approver. The 'Request Details' section includes the following information:

- Date:** 2022-11-17T00:00-08:00[America/Los_Angeles]
- Employee First Name:** Jane
- Employee Last Name:** Miller
- Devices Requested:** Qty 1 of Apple MacBook - Intel Core i9 - 64GB Memory - 8TB SSD @ \$4799
- Total Value:** \$4799
- Requestor Comments:** Require new laptop as old one no longer charges

The 'Approval Decision' section is highlighted with a yellow box and contains two radio buttons:

- Approve
- Deny

Below the decision section is the 'Approver Comments' field, which is currently empty.

7. Jane is able to see the details of each step in the overall process and the status in the workspace widget. She can see that all have been completed successfully and an IT ticket has been created and closed on her behalf to track the request.

Process discovery by using Discovery Bot

You can use Discovery Bot to identify the processes in your business that can be automated. Discovery Bot identifies such processes by recording and analyzing user interactions with various systems for processes, comparing the potential ROI from automating these processes, and creating bots to automate the processes.

What is process discovery

Process discovery is the first step in automation, in which the processes that can be automated in a business are identified. Process discovery is a method used to uncover business processes by recording user interactions with various systems and analyzing the recorded interactions to identify patterns. User interactions with any of the following types of systems can be recorded and analyzed:

- Enterprise solutions, such as ERP, CRM, business process management (BPM), and ECM
- Personal productivity applications, such as Microsoft Excel and Outlook
- Terminal and virtual environments, such as Citrix XenApp and Remote Desktop

Why use Discovery Bot

Many companies begin their automation projects with manual process discovery and documentation. Manual review of process documentation requires interviewing business users and mapping work flows while performing daily operations involving additional resources, which can be time-consuming for businesses. This additional effort prevents or delays businesses from reaching the decision to automate their processes and reaping the benefits of automation. As a result, many of the automation opportunities are left undiscovered. Discovery Bot allows businesses to assess ROI from potential opportunities that can help with deciding and implementing automation for their processes.

Capabilities

Discovery Bot helps in the following ways:

- Enables automatic process documentation and analysis, thereby saving time and resources
- Identifies the correct processes for automation for business users and citizen developers
- Enables business analysts and RPA developers to accelerate automation and maximize RPA ROI
- Converts automation opportunities into bot prototypes for further development and deployment by the automation developer

How Discovery Bot is used

The Discovery Bot administrator creates processes and invites business users through an email invitation to participate in the recording of these processes. Business users record the steps they perform for various business processes. Discovery Bot aggregates the recordings and generates a proposed work flow. The business analyst can adjust the work flow to select and merge steps into branches from different recordings. From the work flow, the analyst identifies and prioritizes potential automation opportunities based on ROI. Opportunities are approved by the analyst, and Discovery Bot converts the opportunities to TaskBots for deployment.

The following image illustrates how Discovery Bot supports your automation journey from process discovery to bot creation.

Workflow map: To view Discovery Bot tasks in an interactive visual format, see [Get started with Discovery Bot](#).

For an overview of how to get started with Discovery Bot, watch the following video:

<https://www.youtube.com/embed/wxp8xi4zn14>

See [Get started with Discovery Bot](#).

Get started with Discovery Bot

Discovery Bot enables organizations to accelerate the automation of business processes from process discovery to bot creation.

- Ensure the system requirements are met.

[Prerequisites for Discovery Bot](#)

- Install and configure Discovery Bot for users in your organization.

[Installing Control Room On-Premises](#)

1. Set up users and assign Discovery Bot roles.

Assign Automation 360 users with the relevant Discovery Bot permissions and associated licenses.

- [Discovery Bot users](#)
- [Supported licenses for Discovery Bot](#)
- [Create users for Discovery Bot](#)
 - [Create multi-role users for Discovery Bot](#)
 - [Create a custom role for Discovery Bot](#)
 - [Assign the Discovery Bot custom role to a user](#)

2. Set up the business process within your organization.

Create a placeholder for collecting all of the recordings associated for a given process. Invite one or more users through email notification to a Discovery Bot process recording session.

Create a Discovery Bot process

3. Record the process.

Business users record their work for the associated processes, annotate their steps, and submit for review a proposed automation work flow.

- *Supported applications and browsers for Discovery Bot*
- *Record a Discovery Bot business process*
- *Record a Discovery Bot process using AARI Assistant*

4. Analyze the process.

The relevant business users (subject matter experts (SMEs), RPM or business analysts (BA)) review the recording data and opportunities associated with the process for specific usage patterns.

Analyzing opportunities for automation

5. Create opportunities. Merge specific recordings or steps as required. Prioritize opportunities and generate bots automatically.

- *Review opportunities, convert to bot, and generate PDD*
- *Using the Filter and Toggle frequency counter options*

Discovery Bot users

Various users are involved in the discovery process, and each user's role and responsibility helps in identifying potential automation opportunities for a business process. The streamlined workflow in Discovery Bot enables various users to collaborate without changing their operations in a major way.

Discovering processes for automation involves the following users:

Control Room administrator

Creates other users, assigns roles to users, and assigns Discovery Bot licenses for users

Discovery Bot administrator

Creates, edits, and deletes processes; also, associates Discovery Bot roles to and disassociates Discovery Bot roles from processes

Users with the Discovery Bot administrator privilege cannot view the recorded data of any process, participate in the recording analysis, or create new opportunities for automation.

Discovery Bot business user

Represents the task force in an organization that will benefit from process automations. The business user performs the following associated tasks for business processes:

- Performs the steps in the assigned process and records the steps

The business user is responsible for recording the steps in the process that are being reviewed and evaluated for potential automation candidates. The business user is invited to

participate in recording session by the Discovery Bot administrator.

- Edits the **Step description** (annotated user text) field for recordings.

For each recording, the business user can review the recorded screen captures and provide annotations to capture the business context for the analyst to review. The business user can update the **Data** (keyboard entered) text field if the information should not be shared with the analyst, for example, user ID and password. If the captured steps are not relevant to the process, the business user can delete the steps before submitting the recording for review.

Note: After a recording has been submitted, it cannot be edited.

- Controls the recording of processes using the media control symbols on the Discovery Bot recorder.

Users can start, pause, resume, and stop the recording on demand by using the Discovery Bot recorder to capture the relevant steps for each process.

Note: After the recorder has been stopped, additional steps cannot be inserted into that recording.

Discovery Bot analyst

This user can also be known by other names in an organization, such as process owner, process analyst, business analyst, or subject matter expert. The Discovery Bot analyst is responsible for reviewing the associated recordings and identifying potential candidates for automation. The analyst can perform the following steps:

- View all approved recordings from assigned users for a given process.

The analyst cannot edit the recordings; however, they can merge the necessary variations from multiple recordings and create an aggregate view of the process.

- Create opportunities from individual recordings and the aggregated view created from multiple recordings, and convert the opportunities into bots.
- Export a potential opportunity to a Word document for reference.

While it is not a prerequisite for the analyst to be knowledgeable about the processes they are reviewing, it is beneficial because this knowledge

helps in easily selecting and analyzing the recordings.

Supported licenses for Discovery Bot

Learn about the supported Discovery Bot licenses to ensure business workers are ready to begin using Discovery Bot.

Process Discovery licenses must be purchased for use for business analysts and business users using Discovery Bot. Discovery Bot supports two licenses:

- Process analyzer license for the Discovery Bot analyst

This license allows a user to view and manage the metadata from all recordings within the process and create, view, and manage opportunities created from the recordings.

- Process recorder license for the Discovery Bot user

The process recorder license allows a user to view, record, and submit a process using the Discovery Bot recorder.

The following table displays detailed information for supported licenses and permissions for Discovery Bot business workers:

Discovery Bot user	System-provided Discovery Bot role	Discovery Bot features	Discovery Bot license required
Discovery Bot admin	AAE_Discovery Bot Admin	<ul style="list-style-type: none"> • Create, view, update, and delete processes. • Assign Discovery Bot analyst and business user to processes. 	None
Discovery Bot analyst	AAE_Discovery Bot Analyst	<p>View assigned processes.</p> <hr/> <p>Note: Assigned processes are only displayed after the processes are created by the Discovery Bot admin.</p> <hr/>	Process analyzer

Discovery Bot user	System-provided Discovery Bot role	Discovery Bot features	Discovery Bot license required
		View only recordings (including annotated steps and metadata) that they have created or been assigned to. An Analyst can also view recordings of other users in the process as long as they are in Approved state. If a user is no longer assigned to a process, the user will lose access to the recordings.	Process analyzer
		View all recordings (own and other users), including metadata and annotated steps, for a given process.	Process analyzer
		<ul style="list-style-type: none"> • Create, view, update, and delete manual generated aggregation • View all manually generated aggregations 	Process analyzer
		Create and view own opportunities for a given process.	Process analyzer
		Convert an opportunity to a bot.	Process analyzer for opportunity creation. Bot Creator license is required to convert an opportunity to a bot.
		Export opportunity to Word.	Process analyzer

Discovery Bot user	System-provided Discovery Bot role	Discovery Bot features	Discovery Bot license required
Discovery Bot user	AAE_Discovery Bot User	<ul style="list-style-type: none"> • Using the Discovery Bot recorder, create or more recordings for an assigned business process. • Update own recording to include annotations for the steps. • Delete one or more steps from own recording before submission. • View only recordings (including annotated steps, keyboard entered text, and application type) that they have created or been assigned to. The user can update the keyboard entered text field if the information should not be shared with the analyst (e.g. user ID and password). <hr/> <p>Note: Assigned processes are only displayed after the processes are created by the Discovery Bot admin.</p> <hr/> <p>If a user is no longer assigned to a process recording, the user will lose access to the recording data.</p>	Process recorder

Prerequisites for Discovery Bot

To use Discovery Bot for your enterprise business processes, you must have an Automation 360 working environment and the associated dependencies installed: Bot Agent, browser extension, and so on.

Supported versions and server requirements

Verify that you have the correct Control Room version installed. The Control Room deployment can be cloud or on-premises.

Ensure your Control Room server requirements are set up before installation. See [Control Room server requirements](#).

System requirements

For Discovery Bot users' recording processes or assigned bot creation privileges, verify that your device meets the following system requirements:

- Windows machine is only supported for recording sessions.
- Oracle database is not supported on Discovery Bot.
- Set your local device credentials for any device that is connected to the Control Room. This is a one-time setup for each device. Ensure each device that you use accepts the credentials in your profile.
- [Set user device credentials](#)
- Register your device and install the latest Bot Agent version on your machine. If you have not already installed the Bot Agent, when you log in initially, you will be prompted to install the Bot Agent from the **Processes** tab. Follow the prompts to install the Bot Agent. This will automatically add your user credentials.

[Install Bot Agent and register device](#)

- To record processes using Google Chrome, the Chrome plug-in must be installed.

[Browser requirements for RPA Workspace](#)

- Ensure your environment is ready to begin recording and analyzing processes using the Discovery Bot recorder. The prerequisites are similar to the Universal Recorder.

[Record a task with the Universal Recorder](#)

- Verify the Discovery Bot recorder requirements are completed.

[Supported applications and browsers for Discovery Bot](#)

Update proxy settings

You must update your proxy settings to add the Automation Anywhere URL domain to the trusted list. The added URL domain is specific to your region of Automation Anywhere cloud. If you are using your proxy to access our cloud, you must avoid a redirect to your proxy. Remove any authentication type settings and policy acceptance.

Installation requirements

The Discovery Bot installer is integrated with the Automation 360 installer. No separate installation is required for Discovery Bot On-Premises users. The IT administrator in your organization performs this task. See [Installing Control Room On-Premises](#).

Note: Ensure your database server requirements are met before using SQL authentication mode to connect to the Control Room: [Installing Control Room using Custom mode](#).

For custom installation, you can now change the default repository path location to a new location on your server after installation. The default path is: `C:\ProgramData\AutomationAnywhere\ServerFiles`. The Process Discovery files now reside in the ServerFiles folder.

Note: For Control Room admin. You must manually copy and paste the existing data into the new location if you change the default path to the new location.

The generated PDD file for an opportunity is now stored locally on your server by Automation 360 On-Premises. The path to the file storage is: `C:\ProgramData\AutomationAnywhere\ServerFiles\ProcessDiscovery\opportunity`. The existing PDD files will automatically be moved to the new location and will not be deleted when a reinstall or upgrade occurs in the Control Room.

Verify installation

After the installation is complete, log in to your Control Room as an administrator. The Discovery Bot tab is available for use from the left panel.

Process Discovery package

The Process Discovery package contains actions that record various object operations such as click (right or left), recording, and window resizing that are used during process recording sessions. View information about the Process Discovery package from the **View package** page (**Bots > Packages > Process Discovery**).

The package is included in the default packages. You can preload the default package when you connect to your device. Preloading the package helps to speed the start time of the recorder the first time you begin recording a process.

The actions in the package are not available for use from the Bot editor.

Related concepts

[Preload packages](#)

You can preload packages on your local device to shorten the bot runtime.

Upgrade Discovery Bot from Enterprise A2019.15 to later versions

Upgrade Discovery Bot from Enterprise A2019.15 (On-Premises) to a later version for the latest features and enhancements.

Enterprise A2019.15 provides a separate installer (executable file) for Discovery Bot On-Premises users to install and use Discovery Bot from the Control Room. Starting from A2019.16, the Discovery Bot installer is integrated with the Enterprise A2019 installer. To upgrade from Enterprise A2019.15 to a later version, you must first uninstall Discovery Bot from your machine and install the Control Room.

1. In your Windows device, go to **Apps & features**.
2. Search for Discovery Bot.
3. Click **Uninstall**.
4. Install the latest version of the Control Room.

[Installing Control Room On-Premises](#)

- From your local machine, log in to your Control Room as an administrator.
The **Discovery Bot** tab is available for use from the left panel.

Create users for Discovery Bot

Create the Discovery Bot admin, analyst, and users to begin using the Discovery Bot functionality for front-office and back-office business processes. The Control Room admin creates these users and assigns the required system roles.

Ensure that you have purchased the necessary Discovery Bot licenses for your business users before you begin creating users: [Prerequisites for Discovery Bot](#).

To use the Discovery Bot features, the user must be assigned the appropriate role and licenses. See [Supported licenses for Discovery Bot](#).

Note: The Discovery Bot Admin role and permissions are distinct from the Control Room Admin role. See [Discovery Bot users](#).

- From your local machine, log in to your Control Room as administrator.
- Go to **Administration > Users**.
- Click **Create user**.
The icon is located at the top-right of the **Users** table.
The **Create user** page is displayed.
- In the **General Details** section, enter the following user details:

Enable User	Select the check box so that the user can log in immediately.
Username	Enter a unique user name.
Description	Optional: Enter a description for the user.
First name	Optional: Enter the first name of the user.
Last name	Optional: Enter the last name of the user.
Email	Enter and confirm the email address for the user. If SMTP is enabled, the user is sent an email to this address to confirm the account. Click the URL in the email to log in to the Control Room and set up your credentials. All important Control Room notifications will be sent to this email address.

- In the **Select Roles** section, select one of the following roles from the **Available roles** column:

Discovery Bot user	Select this role
Admin	AAE_Discovery Bot Admin
Analyst	AAE_Basic and AAE_Discovery Bot Analyst Note: The AAE_Basic role is required to view or add actions to the bots.
Business user	AAE_Basic and AAE_Discovery Bot User Note: The AAE_Basic role is required to view or add actions to the bots created by the analyst.

6. Click the right arrow to move the role to the **Selected** column.
7. In the **Allocate a device license to this user** section, select the following:

Discovery Bot user	Action
Admin	Retain the default None for the user. This user only has access to the Control Room.
Analyst	Assign the Bot Creator - Development license to this user. <hr/> Note: This license is required to convert an opportunity to a bot.
Business user	Retain the default None for the user. This user only has access to the Control Room.

8. Under **Allocate other types of licenses for this user? > Discovery Bot licenses**, select the following:

Discovery Bot user	Action
Admin	No license is required.
Analyst	Select the Process analyzer license.
Business user	Select the Process recorder license.

9. Click **Create user**.
The new user is displayed in the User table. If SMTP is enabled, an email will be sent to the new user inviting them to log in.

Create a Discovery Bot process

You can begin capturing business processes using Discovery Bot. Create a process and assign users to record and capture the process using the Discovery Bot recorder.

Create multi-role users for Discovery Bot

Create multi-role users when you want to combine system-generated Discovery Bot roles and licenses to provide additional functionality for your users. Depending on your business requirements, you can combine up to three Discovery Bot system-generated roles and two process discovery licenses.

Ensure that you have purchased the necessary Discovery Bot licenses for your business users: [Prerequisites for Discovery Bot](#).

To use the Discovery Bot features, the user must be assigned the appropriate role and licenses.

Note: The Discovery Bot Admin role and permissions are distinct from the Control Room Admin role. See [Discovery Bot users](#).

Multi-role users will see a different set of menu actions (vertical ellipsis icon) available on a tile for a process. These actions are different from the standard Discovery Bot user actions that are available on a tile for a process.

The following actions are available for multi-role users (Admin + Business user + Analyst) on a tile for a process:

Admin actions

- View process details
- Edit process details

- Delete process
- View/edit process details

Business user actions

- Start recording

The **Start Recording** icon is displayed on a tile for a process, or you can select start recording from the vertical ellipsis icon.

- Edit my recording

Analyst action

Analyze processes

View process opportunities

1. From your local machine, log in to your Control Room as administrator.
2. Go to **Administration > Users**.
3. Click **Create user**.

The icon is located at the top-right of the **Users** table.

The **Create user** page is displayed.

4. In the **General Details** section, enter the following user details:

Enable User

Select the check box so that the user can log in immediately.

Username

Enter a unique user name.

Description

Optional: Enter a description for the user.

First name

Optional: Enter the first name of the user.

Last name

Optional: Enter the last name of the user.

Password

Optional: Enter your password and confirm the password.

Email

Enter and confirm the email address for the user. If SMTP is enabled, the user is sent an email to this address to confirm the account. Click the URL in the email to log in to the Control Room and set up your credentials. All important Control Room notifications will be sent to this email address.

5. In the **Select Roles** section, select the following roles from the **Available roles** column to create multi-role users:

Discovery Bot user	Select this role
Admin + Business user	AAE_Discovery Bot Admin and AAE_Discovery Bot User
Admin + Analyst	AAE_Basic , AAE_Discovery Bot Admin , and AAE_Discovery Bot Analyst
Business user + Analyst	AAE_Basic , AAE_Discovery Bot User , and AAE_Discovery Bot Analyst
Admin + Business user + Analyst	AAE_Basic , AAE_Discovery Bot Admin , AAE_Discovery Bot User , and AAE_Discovery Bot Analyst

6. Click the right arrow to move the roles to the **Selected** column.

7. In the **Allocate a device license to this user** section, select the following:

Discovery Bot user	Action
Admin + Business user	Retain the default None for the user. This user only has access to the Control Room.
Admin + Analyst	Assign the Bot Creator - Development license to this user. Note: This license is required to convert an opportunity to a bot.
Business user + Analyst	Assign the Bot Creator - Development license to this user. Note: This license is required to convert an opportunity to a bot.
Admin + Business user + Analyst	Assign the Bot Creator - Development license to this user. Note: This license is required to convert an opportunity to a bot.

8. In the **Allocate other types of licenses for this user** section, select the following:

Discovery Bot user	Action
Admin + Business user	Select the Process recorder license.
Admin + Analyst	Select the Process analyzer license.
Business user + Analyst	Select the Process analyzer and Process recorder licenses.
Admin + Business user + Analyst	Select the Process analyzer and Process recorder licenses.

9. Click **Create user**.

The new user is displayed in the User table. If SMTP is enabled, an email will be sent to the new user inviting them to log in.

Create a Discovery Bot process

Log in with your multi-role credentials and create a process. Assign users to record and capture the process using the Discovery Bot recorder. Review and analyze business processes.

Create a custom role for Discovery Bot

Learn how to create a Discovery Bot custom role that allows users to select Discovery Bot feature permissions from standard business user roles (Admin, Business user, or Analyst roles), and a single Control Room admin feature permission for viewing users.

Ensure that you have purchased the necessary Discovery Bot licenses for your business users: [Prerequisites for Discovery Bot](#).

To use the Discovery Bot features, the user must be assigned the appropriate role and licenses.

Note: The Discovery Bot Admin role and permissions are distinct from the Control Room Admin role. See [Discovery Bot users](#).

Use case

The Discovery Bot custom role user is enabled with Control Room Admin feature permissions for viewing users, but does not have edit permissions. The role allows the user to view and manage all Discovery Bot feature permissions for processes, recordings, aggregations, and opportunities. However, the role does not allow the user to view opportunities or the associated metadata created by other analysts in the **Opportunities** tab. The permission to view all opportunities is not enabled for the user.

1. From your local machine, log in to your Control Room as administrator.
2. Go to **Administration > Roles**.
3. Click **Create role**.
The icon is located at the top-right of the **All roles** table.
The **Create role** page is displayed.
4. Enter a **Role** name, and optionally enter a **Role** description.
5. Scroll to the **Administration** section.
6. Select **View users**.
7. Select **View roles**.
8. Scroll to the **Discovery Bot** section.
9. Select **View assigned process** at the parent level.
The child-level permissions are enabled.
10. Select **all** the following feature permissions:
 - a) **Discovery Bot** process feature permissions at the child level
 - b) **Discovery Bot** recording feature permissions at the parent and child levels
 - c) **Discovery Bot** aggregation feature permissions at parent and child levels
 - d) **Discovery Bot** opportunity feature permissions at the parent and child levels

Note: Do **not** select **View all opportunities**.

11. Click **Create role**.
The **Discovery Bot** custom role is created.

Assign the Discovery Bot custom role to a user

Assign the Discovery Bot custom role to a user

Create a new user and assign the **Discovery Bot** custom role you created to the user.

Ensure that you have purchased the necessary Discovery Bot licenses for your business users: [Prerequisites for Discovery Bot](#).

To use the Discovery Bot features, the user must be assigned the appropriate role and licenses.

Note: The Discovery Bot Admin role and permissions are distinct from the Control Room Admin role. See [Discovery Bot users](#).

Custom role users will see a different set of menu actions (vertical ellipsis icon) available on a tile for a process, depending on the permissions given to users. These actions are different from the standard Discovery Bot user actions that are available on a tile for a process.

For this custom role use case, the following actions are available on a tile for a process:

Admin actions

- View process details
- Edit process details
- Delete process

Business user actions

- Start recording

The **Start Recording** icon is displayed on a tile for a process, or you can select start recording from the vertical ellipsis icon.

- Edit my recording

Analyst action

Analyze processes

1. From your local machine, log in to your Control Room as administrator.
2. Go to **Administration > Users**.
3. Click **Create user**.

The icon is located at the top-right of the **Users** table.

The **Create user** page is displayed.

4. In the **General Details** section, enter the following user details:

Enable User

Select the check box so that the user can log in immediately.

Username

Enter a unique user name.

Description

Optional: Enter a description for the user.

First name

Optional: Enter the first name of the user.

Last name

Optional: Enter the last name of the user.

Password

Optional: Enter your password and confirm the password.

Email

Enter and confirm the email address for the user. If SMTP is enabled, the user is sent an email to this address to confirm the account. Click the URL in the email to log in to the Control Room and set up your credentials. All important Control Room notifications will be sent to this email address.

5. In the **Select Roles** section, select the **AAE_Basic** role and the Discovery Bot custom role you created from the **Available roles** column.
6. Click the right arrow to move the roles to the **Selected** column.
7. In the **Allocate a device license to this user** section, select the **Bot Creator - Development license**.
8. In the **Allocate other types of licenses for this user** section, select the **Process analyzer** and **Process recorder** licenses.

9. Click **Create user.**

The new user is displayed in the User table. If SMTP is enabled, an email will be sent to the new user inviting them to log in.

Create a Discovery Bot process

Log in with your custom role credentials and create a process. Assign users to record and capture the process using the Discovery Bot recorder. Review and analyze business processes.

Create a Discovery Bot process

Create a Discovery Bot process and assign users to record and analyze a process for your automation requirements.

- This task is performed by the Discovery Bot admin who manages the creation, deletion, and editing of Discovery Bot processes.

Note: Multi-role and custom role user can also perform this task depending on the roles or the permissions given to users. You will see a different set of menu actions (vertical ellipsis icon) available on a tile for a process.

- Ensure the **Process recorder** license is allocated to Discovery Bot users assigned to recording a process.
- Ensure the **Process analyzer** license is allocated to the Discovery Bot analyst assigned to analyzing a process.
- Create a process and assign users:
 - a) From your local machine, log in to your Control Room as a Discovery Bot administrator.
 - b) Go to **Discovery Bot > Processes**.
 - c) Click **Create Process**.
The **Create process** page is displayed.
 - d) In the **General Details** tab, enter a **Process Name** .
Special characters are not supported. Creating a process with a duplicate name is not supported.
 - e) Optional: Enter a **Process Description**.
 - f) Click **Next** to assign users to a process.
 - g) Optional: In the **Users** tab, select the Discovery Bot business user or analyst from the list of **Available** users.
 - h) Click the right arrow to move the roles to the list in the **Selected** column.
 - i) Click **Next** to view the invitation that is sent to users to begin recording processes.
 - j) Click **Create Process**.
 - k) Click **Close** to exit the page and return to the **Processes** page.

Note: An email invitation is sent to assigned users (new users or users added at a later time) to begin a Discovery Bot process recording session.

The newly created process is displayed in the **Processes** page on a tile.

For users, all of their assigned processes are available for viewing from the **Processes** page. Use the search field to help you locate a specific process by name. The field is not case-sensitive. For users, use the field to search on a process you are assigned to. For admin users, use the field to search on all processes. Use the sort field to help you locate a process tile quickly. Click the drop-

down to sort for a process tile based on the process name in alphabetical order or you can sort in the order of newest process created to oldest process and vice versa. The tile for a process displays the following information for an admin user:

Process tile	Description
Recordings	The number of the recordings captured and stored for a process by users.
Process Cycle	The average time, in minutes and seconds, across all recordings captured for a process.
Vertical ellipsis icon (three dots)	<p>View, edit, or delete information for a process.</p> <hr/> <p>Note: You might see a different set of menu actions available from the tile if you are a Discovery Bot standard user, multi-role user, or custom role user.</p> <hr/> <ul style="list-style-type: none"> Click View process details to view more information about a process, edit and update information, and save changes. Click Edit process details to edit a process. Enter your changes and click Save changes. Click Close to return to the Processes page. <hr/> <p>Note: The name of the process cannot be changed.</p> <hr/> <ul style="list-style-type: none"> Click Delete process to delete a process. A message window appears. Click Yes, delete to delete a process. <p>All recordings and associated data are permanently deleted. This cannot be undone.</p> <p>Click No, cancel to return to the Processes page. <ul style="list-style-type: none"> Click View/edit process details to view more information about a process, edit and update information, and save changes. To edit a process, click Edit. Enter your changes and click Save changes. Click Close to return to the Processes page. <hr/> <p>Note: The name of the process cannot be changed.</p> <hr/> <ul style="list-style-type: none"> Click Edit my recording to edit and review recordings. Click View process opportunities to view auto-generated or custom opportunities created from the Opportunities tab. </p>

- Create a process and add users at a later time:
 - a) From your local machine, log in to your Control Room as a Discovery Bot administrator.
 - b) Go to **Discovery Bot > Processes**.
 - c) Click **Create Process**.
The **Create process** page is displayed.
 - d) In the **General Details** tab, enter a **Process Name**.
Special characters are not supported. Creating a process with a name previously used for another process is not supported.
 - e) Optional: Enter a **Process Description**.
 - f) Click **Create Process** to create a process without assigning users.
 - g) Click **Close** to exit the page and return to the **Processes** page.
- Update an existing process and add users.
 - a) From your local machine, log in to your Control Room as a Discovery Bot administrator.
 - b) Go to **Discovery Bot > Processes**.
 - c) Go to the process you want to edit.
 - d) Click **Edit** from the **Options** icon.
 - e) In the **Edit process** page, click **Next** to assign users to a process.
 - f) In the **Users** tab, select the Discovery Bot business user or analyst from the list of **Available** users.
 - g) Click the right arrow to move the roles to the list in the **Selected** column.
 - h) Click **Save changes**.
 - i) Click **Next** to view the invitation that is sent to users to begin recording processes.
 - j) Click **Close** to exit the page and return to the **Processes** page.

Note: An email invitation is sent to assigned users (new users or users added at a later time) to begin a Discovery Bot process recording session.

The newly created process is displayed in the **Processes** page on a tile.

Record a Discovery Bot business process

Log in to your Control Room as a Discovery Bot user and record a business process assigned to you.

Supported applications and browsers for Discovery Bot

Learn about supported applications and browsers to ensure your environment is ready before you begin using the Discovery Bot recorder.

About the Discovery Bot recorder

The Discovery Bot recorder is similar in function to the Automation 360 Universal Recorder with one significant difference: pre-selection of the application to be used for recording is not required.

The Discovery Bot recorder captures data across many user interface (UI) objects such as Windows applications, native applications, executable file, or browser window on PC devices and machines or virtual

machines running Windows OS. Use the Discovery Bot recorder to capture, read (data extraction), write (data entry), and click (left or right) operations when working across various operations. A single recording per user can capture up to 8 hours of user actions.

The Discovery Bot recorder displays the performed action by using highlighter. Click the object control, for example, a button, form field, or a table. A red outline highlights the control when you move the mouse over it to capture the action.

You can perform actions like double-click, drag-drop, click and hold, and text select while recording. Actions performed using keyboard strokes are displayed in the **Data** field.

Supported applications and browsers

The recorder supports system, web, and virtual applications including the following:

Applications

- Microsoft applications: Edge, PowerPoint, Excel, Word, Outlook, Calculator, Notepad, Notepad++, Teams
- Zoom
- Snagit
- Java applet, web start, and desktop applications that run using Java Runtime Environment (JRE) 6, 7, 8, 9, 10, and 11 (32-bit and 64-bit versions)
- Microsoft Active Accessibility and UI automation based applications
- Oracle EBS and Forms
- SAP 730, 740, 750 and 760 versions.
- Citrix Virtual Apps

Browsers

- Internet Explorer version 11
- Google Chrome

Note: Chrome plug-in must be installed to record processes. If the Chrome plug-in is removed, you must manually add and re-enable the plug-in. [Google Chrome browser extension requirements](#)

Desktop

The desktop refers to the device screen when all application and browser windows are minimized.

Taskbar

The taskbar is the horizontal or vertical bar containing icons of open applications and browsers, as well as the notification area. You can capture application, browser, system, and other icons, for example such as the clock and calendar, volume, and Wi-Fi.

Record a Discovery Bot business process

Record, capture, and annotate steps for a business process using the Discovery Bot recorder. The process recording allows the Discovery Bot analyst to view all recorded steps for a quantitative and comparative

analysis. The steps along with the captured metadata and user actions help the analyst make the decision to create opportunities and bots.

- This task is performed by the Discovery Bot user who records assigned business processes and submits the same for review and analysis.

Note: Multi-role and custom role user can also perform this task depending on the roles or the permissions given to users. You will see a different set of menu actions (vertical ellipsis icon) available on a tile for a process.

- Ensure that you have set your device credentials and installed the latest Bot Agent version on your machine before using the Discovery Bot recorder.
- Ensure that the machine on which you will be performing the recordings is also duly registered.

Prerequisites for Discovery Bot

1. Record a business process:

- a) From your local machine, log in to your Control Room as Discovery Bot business user.
- b) Go to **Discovery Bot > Processes**.
The **Processes** page appears, displaying all processes assigned to the user for recording.
- c) Click the **Start Recording** icon from the tile associated with the process you want to begin recording a process.

Note: You can also select, **Start Recording** from the from the vertical ellipse icon to begin recording a process.

A message window appears notifying you that you are now recording and sharing your screen. The **Discovery Bot Recorder** window is displayed with **Pause** and **Stop** options. Pause and resume the recording as required. Allow for a few minutes for the recorder to start the very first time you begin recording a process.

- d) Perform the actions to record.
For example, open an application and fill in a form or open a browser and search a website. Click the object control, for example, a button, form field, or a table. A red outline highlights the

control when you move the mouse over it to capture the action. The red outline indicates that the recorder is ready for you to take the next action in recording the process.

You can perform actions like double-click, drag-drop, click and hold, and text select while recording. Actions performed using keyboard strokes are displayed in the **Data** field.

- e) Click **Stop** to end the recording.

You can click **Cancel recording** to cancel a recording at any time.

Wait for a few seconds for the recorder to end. The details in the tile for the process is incremented to include the new recording in the **Recordings** section.

Note: Once the recording has been stopped, additional steps cannot be added to the recording.

Note: A maximum of 8 hours worth of user actions can be captured in a single recording.

- f) Enter a name for the recording in the field provided.
The character limit is 50. Special characters are supported.
- g) Click **Save** to save your changes.
- h) Click **Cancel** to discard the recording.

Note: If you discard the recording, you cannot recover it.

2. Review the captured steps, annotate them, and submit a process recording for review to the Discovery Bot analyst:

- a) From **Processes**, select a process by clicking the process name or anywhere within the process tile body. From **Processes**, click the vertical ellipsis icon and select **Edit my recording** to edit and review recordings.

If you click the process tile body or the process name, the **Opportunities** page appears. Only approved recordings from the **Opportunities** tab are displayed for the analyst.

For Discovery Bot multi-role and custom role users, click the vertical ellipsis icon and select **Edit my recording** to edit and review recordings. If you click the process tile body or the process name, the **View process** page appears. Only approved recordings are displayed for the analyst on the **View process** page.

The **Recordings** page appears with the **Recordings** table on the left and single recording details on the right. The table displays the following information:

Recordings	Description
Recordings (#) (# selected)	The number of recordings logged in by users.
Customize columns	Click the table icon to display or hide columns (ID, Status, Process Cycle, and Recorder), or edit the layout of the header rows to display right or left as required.

Recordings	Description
ID	<p>The ID number of the recording in the database. The system collects and sequentially increments the index for each recording captured by the users.</p> <hr/> <p>Note: To search for a specific recording, select ID and enter the ID number in the search bar.</p> <hr/>
Name	The recording name.
Status	<p>The status of the recording:</p> <ul style="list-style-type: none"> • Pending: Initial state. • Approved: All user-required edits have been completed and recording is ready for review by an analyst. • Error: There is an error when storing the recording in the system. • Declined: Currently not being used. <hr/> <p>Note: To search on a process status, select Status and choose a status from the drop-down list.</p> <hr/>
Process Cycle	The recording duration, in minutes and seconds, excluding the time that the recorder was paused.
Recorder	<p>The name of the user that created the recording.</p> <hr/> <p>Note: To search on users assigned to a recording, select Recorder from the drop-down list and enter the user name in the search bar. The search is case-sensitive.</p> <hr/>

- From the **Recordings** table, select a recording to view all captured steps. In the right pane, the header displays the recording ID details, including the total steps captured during the recording session, recording name, process time, and current recording status.

Each recorded step includes: screenshot image with the **Screen** option (icon), application type, data (keyboard entered text), and step description (annotated user text) fields.

- Optional:** To provide a description for the recording, click in the **Description** area. Using the **Description** field that appears, share the context and the purpose of the recording with the analyst. The character limit is 255. The description entered is displayed in the PDD.
- Click **Save** to save the description you entered in the **Description** field.

6. Optional: Click the **Screen** icon to display or hide the screenshot image.

Use the **Screen** option icon when you do not want to share personal image details with the Discovery Bot analyst, multi-role, or custom role users. To remove personal information, for example username and password credentials from the image, edit the **Data** field prior to submission for analyst review.

Note: If you hide an image and Click **Submit**, you cannot display the image again.

7. Click the screenshot to display the image in full size.

The **Screenshot** shows the state of the application at the time of performing the associated action. The red outline highlights where you have performed actions like click and hold and text select. You cannot edit the screenshot. Click the image when you want to display a larger view of the screenshot. Review the step action in more detail from the modal window. Click the pagination located below the image to select a step number or use the right or left arrows to quickly display all captured images. For actions not captured by the recorder such as double-click, drag-drop, and click and hold, you can document the individual steps in the **Step description** field for the analyst.

The duration of the recorded step is displayed in minutes and seconds below the screenshot. Use this information to help prioritize what step or sequence of steps are a better candidate for automation. For example, if a sequence of steps takes longer to perform, you can automate this first for a process to save manual effort.

- Click the **Hide image** icon to hide the image.

The image will not be submitted to the analyst for review. Click **X** to close the frame. Click **Save** to save your selection.

- Click **Show image** to display the image.

The image will be submitted to the analyst for review. Click **X** to close the frame. Click **Save** to save your selection.

8. Optional: Update the application name used in the process recording in the **Application** text field.

The **Application** field represents the name of the application on which the action was performed. If required, the user that made the recording can change this.

9. Optional: Update the keyboard entered text used in the process recording in the **Data** text field.

The **Data** field represents any data entered by the user at that step during the recording.

Note: You must follow the keyboard data entry with a left or right mouse click. For any step in which the data was entered, you can make changes to the data in the **Data** field. You cannot enter any data for steps which do not have any data entered during the actual recording of the process.

10. Optional: Update the context associated with the step in the **Step description** text field.

The **Step description** text field represents any additional description that you would like to provide regarding the operation being performed. The maximum character limit is 2000.

11. Optional: Delete any step that is not required to be included in the process recording.

12. Repeat the above steps for each step as required.

13. Optional: Click **Save** to save your changes.

Use the **Save** option when you want to edit and compare the recording data (including application, keyboard entered text, and annotation text fields) across multiple recordings captured in the **Recordings** table.

14. Optional: Click **Delete** to delete the recording for that process.

Use the **Delete** option when you do not want to submit the recording data to the analyst for review. The recording and associated data is deleted from the **Recordings** page for that process.

15. Click **Submit.**

The recording is submitted to the analyst for review and approval.

Note: After a recording is submitted, it cannot be edited to make additional changes.

16. Click the **Download option to export the opportunity data into a Process Definition Document (PDD) with the same name as the opportunity. Select the type of PDD (Word or PDF) that you want to export. The PDD includes the process recording flow chart and the time on each individual step in hours, minutes, and seconds.**

When an opportunity is created, the PDD begins processing in the background automatically. When the PDD is generated, the field changes from Processing PDD to **Download**. You can now download the document. An email notification to the business user is also sent to the email address on file. If an error occurs when you download the PDD, click **Download** again to generate the PDD again.

Note: If you are a multi-role user, you will receive two email notifications for the exported data, one for the recording data and one for the opportunity data.

Note: You must be the owner of the opportunity to be able to download it; otherwise, the download option is not available.

On your machine, the document is saved in the folder that is configured for downloads in your browser.

Analyzing opportunities for automation

Log in to your Control Room as a Discovery Bot analyst to review and analyze the recordings to create opportunities or bots as required.

Record a Discovery Bot process using AARI Assistant

Use AARI Assistant to record Discovery Bot business processes without signing in to the Control Room.

- Before using the Discovery Bot recorder, ensure that you have set your device credentials and installed the latest version of the Bot Agent on your machine.

Note: The Bot Agent installation will load the AARI icon on your desktop.

- Ensure that the machine on which you will be performing the recordings is also duly registered.

Prerequisites for Discovery Bot

- Ensure that your browser settings allow redirects and pop-ups from your browser to access the Control Room.

1. Double-click the AARI icon to open the AARI Assistant.

2. Use Automation 360 credentials to sign in to the application.

3. Click **Processes**.

The **Recording Processes** page appears, displaying all the processes assigned and available to the user.

4. When you want to start recording a process, click **Start recording**.

A message window appears, notifying you that you are now recording and sharing your screen. The **Discovery Bot Recorder** window is displayed with **Pause** and **Stop** options. Pause and resume the recording as required. The first time you begin recording a process, the recorder might take a few minutes to start recording.

5. Perform the actions to record.

6. To end the recording, click **Stop**.
You will be redirected to the Control Room to review and edit your recording before you submit it.
[Record a Discovery Bot business process](#)
7. To review the steps of previous recordings and submit them, click **Previous recordings**.
You will be redirected to the Control Room to review the recordings.

Analyzing opportunities for automation

Review opportunities and process recording data by using graphs and charts that help you to analyze and understand the benefits and savings from a potential opportunity with or without automation.

Opportunities

The Opportunities header provides a snapshot of the recording and opportunity data captured by all users for assigned processes. The following data is displayed in the **Opportunities** header:

Field	Description
Savings	The potential savings (yearly savings or savings per run) associated with the opportunity
Number of opportunities	The number of opportunities that include the selected recordings
Number of process variants	The number of branches included in the opportunity
Average process cycle	The average duration of the recordings provided for the process
Participants	Number of users who submitted recordings for the process

Opportunities evolution

Use the opportunities evolution map as a guide to decide which opportunities to automate first. Each quadrant displays the following:

- **Proceed now:** These opportunities yield the maximum benefit and ease of implementation.
- **Long term:** These opportunities yield good ROI but will take time to implement. They also require a higher implementation effort to automate.
- **Hold:** The automation benefit is low and the implementation time is high. The recommendation is not to automate.
- **Quick wins:** Always do this first to build momentum.

Application usage

The donut chart displays the number of applications used across selected recordings. The application usage details are displayed in the table to the right of the chart in the following format: Application | minutes seconds | percentage. The percentage represents the percent of the application used over a total of all applications used.

Use case

Use this information to quickly understand user participation and process complexity and variability; the higher the application count, the higher the complexity and variability of the process that is being analyzed. The average process cycle time will provide a quick insight into the duration of the process within the expected processing time. If the actual process cycle is higher across application count, this might be an indicator that the process is a more suitable candidate for automation and assists with improving efficiency.

Process cycle time by process

This graph displays the time associated with the average process cycle (in minutes) for each process and by user.

Use case

Use this information to help you understand which processes take the most time and therefore, will potentially give you more savings if automated. For example, an analyst can learn why a process recording took longer or was completed in a shorter period for one particular participant and compare this information with other participants. This information is instrumental in narrowing down on a smaller subset of the process recordings to study them for inefficiencies that might result in better or more opportunities for automation.

Number of steps by a process

This graph displays the average number of manual steps in each process and by user. Use this information to compare the number of steps across processes. Processes with greater number of manual steps are more likely candidates for automation.

Review opportunities, convert to bot, and generate PDD

Review potential, system-generated opportunities, create custom opportunities from a system-generated opportunity, and convert them to bots. You can also export the opportunity data to a Microsoft Word or PDF document for your reference.

Automation opportunities are of two types, system-generated and manual. System-generated opportunities, also known as auto-generated opportunities, are created when at least one recording is approved by the user for a process. The auto-generated opportunities are available immediately for you to begin analyzing from the **Opportunities** page for the recording. The **Download** option to generate a Microsoft Word or PDF document is not available for auto-generated opportunities. Creating a branch and merging steps into the branch for auto-generated opportunities is not available from the process diagram.

Manual opportunities, also known as custom opportunities, are created from auto-generated opportunities. A custom opportunity allows you the flexibility to review current and newly added recordings from users and decide to accept or reject the new recording changes to the existing process diagram. You can also create a branch as you add steps from another recording to the process diagram. The **Download** option is available for you to use if you want to download a Microsoft Word or PDF document of the custom opportunity data for your reference.

- This task is performed by the Discovery Bot analyst who is in charge of reviewing and analyzing the associated recordings of business processes.

- Ensure the analyst is assigned a Process analyzer license and the **AAE_Discovery Bot Analyst** role before processes are analyzed.

Supported licenses for Discovery Bot

- Ensure the analyst is assigned a Bot Creator license to convert opportunities to bots.

Supported licenses for Discovery Bot

1. Review the data in the **Opportunities** tab:

- a) From your local machine, log in to your Control Room as Discovery Bot analyst.
- b) Go to **Discovery Bot > Opportunities**.

The **Opportunities** page displays all the opportunities you have created. You can configure the menu option to display as you want using the **Customize columns** icon. The table lists the following information:

Field	Description
Opportunity name	The name created for the opportunity. To identify an auto-generated opportunity from a custom opportunity, the auto-generated opportunity begins with the name of the process hyphen OPPORTUNITY.
Process name	The name created for the process.
Type	The type of opportunity created for a process. The type can be Auto or Custom.
Path	The type of path specified based on the Filter option applied to the opportunity. Auto-generated opportunities use filter default value of Most common path.
Date created	When the opportunity was created.
Date modified	The date the opportunity is modified by the analyst. The modified date can occur when a opportunity is updated or when a custom opportunity is created.
Owner	The name of the process owner. The process owner can be system or analyst.
# of recordings	The number of recordings for a process associated with the opportunity.
# of applications	The number of applications used in a recording session associated with the opportunity.
Process cycle	The duration of the recording session associated with the opportunity.
# of users	The number of users who participated in the recording session for that process.

Field	Description
Cost without automation	The formula used to calculate the cost of the opportunity without automation. Use the formula to help you decide which opportunities to prioritize for your business development based on ROI, applications used, number of users, and so on. The formula is calculated by taking the number of users multiplied by the total hourly pay of number of users multiplied by the average process cycle.
Savings	The potential savings associated with the opportunity (this could have been specified as a yearly savings or savings per run).
Priority	The priority level assigned to the opportunity. The priority can be one of the following: <ul style="list-style-type: none"> • Low • Medium • High
Bot created	The bot created for an opportunity. This can be Yes or No. The Convert to bot option is not available for auto-generated opportunities. The Convert to bot option is available for custom opportunities only.

- c) Select the required opportunity by sorting, searching, or both from the table using the **Search** field.
- d) Click the vertical ellipsis icon (three dots) from the table to view an opportunity or download a Word or PDF PDD document.
The PDD download option for Word or PDF is only available for custom opportunities.
- e) Select an opportunity from the table for display.

2. Optional: Create a custom opportunity from the autogenerated opportunity.

- a) Expand the **Recordings** section from the left side of the main canvas.
By default, all selected recordings are displayed in the process diagram.
- b) Select a single recording from the **Recordings** section for review, as needed.
The selected recording is colored in blue from the **Recordings** section and displayed in the new feeder canvas to the left of the main canvas. All recordings are displayed in the process diagram

to the right of the main canvas. Toggle off the selected recording to select another recording for display.

- c) Select either the screenshot icon or the application icon to decide how you want to display the steps.

Use the **Zoom in** or **Zoom out** options as required. Use the **Reset** zoom to bring the view back to the default level and recenter the process in the canvas.

Contiguous steps performed in the same application are combined together. This is displayed as a single group to allow better readability of the process. The number of steps collated together is indicated in the bottom-right corner of the group.

Note: If the screenshot view is the last active view, then the image of the last step in the group is the one that is displayed for the collapsed group. You can drag the process within the canvas by holding down the mouse left button and moving the process to the desired location.

- d) Click a step to expand a group of steps to preview the step in more detail. Alternatively, click the arrow near the top-right corner of the group icon.
Use the group icon to display groups of steps that belong to the primary and secondary level actions (and subgroup level actions) used during the recording session. As required, expand a group of steps to drill down from the primary to subgroup-level actions to help you decide what group of steps to use when creating a potential opportunity for a task that you want to automate. For example, a primary-level action displays Microsoft Outlook, a secondary-level action displays Outlook mail notification, and subgroup-level actions can display compose email, body email, and send email.
- e) Select the **Select all steps** check box from the **Overview** pane to select all the steps in the process diagram.
Based on your requirements, use the Shift key to customize the number of steps within a path from the main canvas. If you select a nested branch or loop, the parent branch or loop displays a partial selection.
- f) Optional: Use the **Filter** option to customize a specific opportunity. [Using the Filter and Toggle frequency counter options.](#)
- g) Optional: Use the **Toggle frequency counter** option to display the frequency of path as compared to other recordings. For more information, see [Using the Filter and Toggle frequency counter options.](#)
- h) Click **Save as** to save the opportunity as a custom opportunity.
- i) Enter a name and description for the opportunity in the fields provided.
- j) Click **Save as** to save your changes.
A message window appears notifying you that the opportunity is created. Click the hyperlink to view the custom opportunity. The PDD is generated and available for download from the **Opportunities** table. Click the vertical ellipsis to download the PDD in Word format or PDF.

Note: The filter option you selected for a custom opportunity will not be reflected in the new custom opportunity process diagram.

3. Optional: Create another custom opportunity from a custom opportunity. Add steps from another recording to the process diagram, create a branch, and merge steps from one or more recordings into the branch.
 - a) Select a single recording from the **Recordings** section.
 - b) Click the branch icon from the right main canvas to add a condition step.
Moving the subsequent step into a branch on the left and adding a new branch to the right in the empty branch are to receive steps from another recording. In the top-right corner of the

yellow box, click the three dots to create a new branch or delete a branch. The branch endpoint is displayed with a small circle.

By default, you can move the branch endpoint lower in the path flow to include more than one step. To move the branch endpoint, press down with the cursor on the endpoint until you see the dotted lines appear around the branches. Drag the endpoint downward in the path flow. Place the endpoint when you see the dotted lines appear between the arrow. The endpoint is shifted downward in the path flow and includes more steps. To select a custom selection of steps, use the Shift key to select a certain number of steps within a path from the main canvas. Cross-path selection is not available.

The loop icon is displayed as an orange circle with an arrow. A loop is a sequence of steps that occurs for a specific number of times for a single recording. The loop icon has a **for** condition displayed under this along with **Count**, which describes the number of times the sequence of

steps in this loop is repeated in the process. You can change the loop condition (**for** and **while**) by saving the process diagram.

- c) Click the **Condition** field at the node level.
- d) In the **Condition** field, enter a name for the condition. Example, `credit score`.
- e) Click the check mark to save the name for the condition.
- f) Open the corresponding branches on the right and left and set a value for the condition. For example, enter less than 200 on the right and greater than 700 on the left.
- g) Drag and drop steps from the recording in the feeder canvas into the receiver step that reads `Drag items here` of the branch in the main canvas.
Use the Shift key to select one or more steps to drag into the receiver step. To clear a condition in the branch, click the three dots. Select **Clear branch**.
- h) Click **Save** to save your changes to the process diagram.
The PDD begins processing in the background automatically. When the PDD is generated, the field changes from Processing PDD to **Download**.
- i) Repeat steps a through h to review additional recordings and create branches and merge steps into the branch.
- j) From the **Overview** pane, click the **Edit** icon to update the potential savings associated with the custom opportunity.
The potential savings and potential cost can be updated at any time as you review the steps from various recordings and make changes within the process diagram.
- k) Enter the estimated cost of the process without automation.
- l) Enter the potential savings associated with the process when automation is used.
This is your best assessment of the expected savings on an annual basis if a bot is used to perform all the steps in the opportunity.
- m) Select the priority from the drop-down list.
- n) Click **Update**.
- o) Click **Save** to save your changes to the process diagram.
- p) Repeat steps j through o to update the potential cost for the custom opportunity from the **Overview** pane.
- q) Click **Save as** to save the opportunity as a custom opportunity.
- r) Enter a name and description for the opportunity in the fields provided.
- s) Click **Save as** to save your changes.
A message window appears notifying you that the opportunity is created. Click the hyperlink to view the custom opportunity.
- t) Optional: Repeat steps 4a through s to create another custom opportunity from this custom opportunity, as needed.
All opportunities (autogenerated and custom) can be viewed from the **Opportunities** page.

4. Optional: For custom opportunities, review new recordings submitted by the Discovery Bot user. Accept or dismiss the new changes for the process diagram.

- a) Click **Review** to accept the updates and review the new recordings.
- b) Select the new recording from the **Recordings** section.
The selected recording is highlighted in blue. The recording opens for display to the left of the canvas. Refer to the dotted lines around the steps. The placement of the steps is displayed in the process diagram to the right of the canvas with a bold border around the steps. The shaded green

refers to the placement of the groups of steps from the new recording as they will appear in the process diagram if you update with these changes.

- c) Click **Update with changes** to accept the updates to the process diagram.
A pop-up message is displayed, indicating that your changes are successfully updated.
- d) Click **Back to edit** to return to the current process diagram without the changes.
- e) Click **Dismiss** to dismiss the changes.
Continue reviewing the current process diagram for the custom opportunity. Add steps from another recording to the process diagram, create a branch, and merge steps from one or more recordings into the branch, as needed.

5. Convert to bot:

- a) Click the **Convert to bot** option.
- b) Enter a bot name.
- c) Optional: Enter a description.
- d) Click **Browse** and accept the default folder location `\Bots\`.
To change the location where your bot is stored, drill down to the folder in which you want to save the bot.
- e) Click **Confirm**.
- f) Click **Convert**.
A message window appears notifying you that the bot has started to convert. You will receive an email when the bot is converted successfully. Click the hyperlink in the email to take you to your folder in which the bot was generated.

Note: In the **My bots** tab, the converted bot displays an error, with 0 byte size while the bot creation is in process. Avoid opening the bot until the bot conversion is complete.

The **Convert to bot** option is only available if you have the Bot Creator license. To review the created bot you must have the **AAE_Basic** role assigned.

- 6. Click the **Download** option to export the opportunity data into a Process Definition Document (PDD) with the same name as the opportunity. Select the type of PDD (Word or PDF) that you want to export. The PDD includes the process recording flow chart with a URL link to the process diagram inside Discovery Bot, and the time on each individual step in hours, minutes, and seconds. The PDD does not display the process diagram if there are more than 100 steps selected.

When an opportunity is created, the PDD begins processing in the background automatically. When the PDD is generated, the field changes from Processing PDD to **Download**. You can now download the document. An email notification to the business user is also sent to the email address on file. If an error occurs when you download the PDD, click **Download** again to generate the PDD again.

Note: If you are a multi-role user, you will receive two email notifications for the exported data, one for the recording data and one for the opportunity data.

Note: You must be the owner of the opportunity to be able to download it; otherwise, the download option is not available.

On your machine, the document is saved in the folder that is configured for downloads in your browser.

Using the Filter and Toggle frequency counter options

Use the Filter and Toggle frequency counter options from the toolbar to help you review, analyze, and compare the various recordings in the process work flow as you look to create a potential opportunity.

Filter option

Use the **Filter** option when you want to use a set of values to compare the different sections of a process across various recordings by selecting a specific path and step filter. The **Filter** window displays the following:

Option	Action
Path: With the most common flow	Select this option when you want to see what paths have the most common variance of a process that is being used. If you choose to automate this type of path, you will have a higher return on your investment.
Path: With the most deviations	Select this option when you want to see certain sections of the process that have a different deviation in the path. The automation priority for such paths are usually low.
Path: With the most repetitive flow	Select this option when you want to display sections of the process that are more repetitive and cost more. The automation priority for such paths are usually high.
Step: Application	Select the Application option when you want to see the application type used during the recording. Use this option to see which applications are more frequently used, and to decide on which applications should be a priority.
Step: Action Type	Select the Action type option to filter the process steps to display only particular actions that will help you get an idea how the steps are used.
Clear	Select Clear to clear all selected options.
Reset	Select Reset to reset to the previous saved state of the filters in a view.
Apply	Select Apply to apply the selected options for display for the system generated or manual opportunity.

Toggle frequency counter

Use the toggle frequency counter option to display the number of recordings that a particular path takes in the flow for a system generated or manual opportunity. Use this option to help you understand the frequency of the path as compared to other recordings. From the **Recordings** table, select two or more recordings and the **Toggle frequency counter** displays two at the start of the process flow to indicate

the number of recordings selected. If each recording takes a different path, the process flow is divided between the total number of recordings selected and displays accordingly. For example, if there are ten recordings in a view and three paths displayed. Two recordings follow one path, two recordings follow the second path, and six recordings follow the third path. Along the path flow, you will see two, two, and six. If a step is merged, the number gets added between the two paths. Use the thick or thinness of the path to help you prioritize processes for automation. The most commonly used path is the thickest path and this can be useful for prioritizing a process when reviewing many recordings. For example, if there are 5 paths for 20 recordings, you will quickly see which is the thickest and consider automating this path. If you have additional bandwidth to automate another path, you can drill down in the flow and look at the numbers to see what path is next as a possible candidate for automation.

Getting started with Privacy Enhanced Gateway

Control the data that the FortressIQ cloud platform receives by using the FortressIQ Privacy Enhanced Gateway (PEG). PEG redacts sensitive data that is included in video frames collected by the FortressIQ desktop sensor. This redaction occurs within your own Virtual Private Cloud (VPC) before the data is forwarded to the FortressIQ cloud for analysis.

Deployment

Before installing PEG in your network, review the deployment platforms supported by PEG, virtual machine (VM) size requirements, and storage requirements.

Obtaining PEG

PEG runs as a VM in your VPC. PEG deployments are supported on Microsoft Azure, AWS, and Google Cloud Platform. Automation Anywhere will provide cloud images for you to deploy.

VM size requirements

The following VM sizes are supported for PEG installation:

- Azure: NC8as T4 v3
- AWS: g4dn.4xlarge
- Google Cloud Platform: N1-highmem-8 with 1 nvidia-tesla-t4 GPU

Note: Each PEG VM can handle 10 sensors per calendar week, with each sensor sending data for approximately eight hours each day for five days a week.

Common storage requirements

Before you install PEG, ensure that your OS or root disk has 2 TB of nearline SSD storage or more. Encrypt the disk using your platform's storage encryption mechanisms.

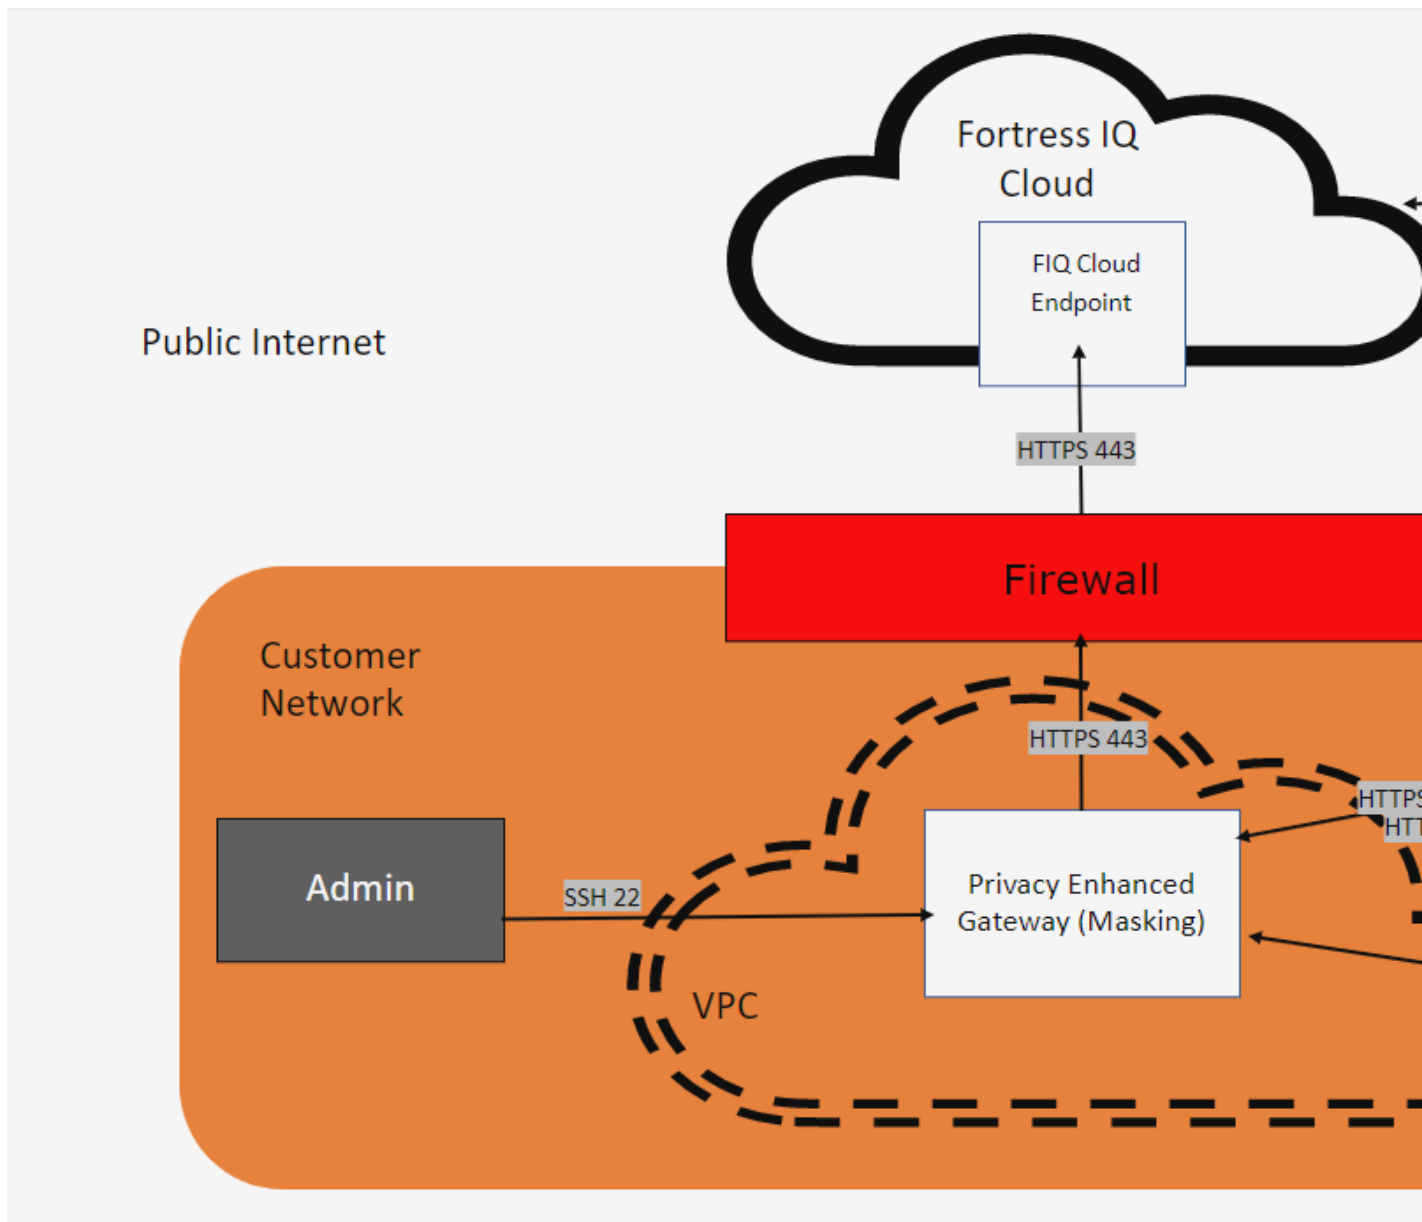

Deployment and networking requirements

Learn about the deployment architecture based on certificates for HTTPS connections and the associated port and DNS requirements.

Deployment

With this deployment model, all connections to PEG remain within networks that you control.

Figure 5: Architecture

Port requirements

The following table lists the port requirements for ingress and egress IP addresses.

Port	Protocol	Purpose	Ingress private IP	Ingress public IP	Egress to public internet
22	TCP	ssh connectivity for Admin	#		
443	TCP	<p>Ingress</p> <p>Desktop sensor and business analyst connectivity over HTTPS (TLS 1.2)</p> <p>Egress</p> <p>PEG sends redacted data to FortressIQ.</p> <p>Also used to pull down PEG installer, updates, and so on from our repositories</p> <p>Sensor connects directly to FortressIQ cloud to get configuration information only. No collected data is sent directly from the sensor to the FortressIQ cloud.</p>	#		#
80	TCP	Used for redirection from http to HTTPS (443)	#		

DNS requirements

You will provide PEG with an apex domain name that you want to use (for example, example.com). Based on that, PEG will inform you about the DNS sub domain records that you must create.

Install PEG

Review the checklist before you begin installing PEG in your environment.

Ensure that PEG VM is deployed and that the network connectivity is set up.

PEG installation checklist

The details for each of these steps follow later.

1. Create certificates.
2. Create DNS entries and deploy PEG VM.
3. Configure PEG to work with a proxy (if you require a proxy).
4. Configure PEG by following the regular set of steps.
5. Validate that PEG is running.

Note: Through the installation process, replace the values within angle brackets with your actual values and remove the angle brackets. For example:

- `<apex domain>` might be replaced by `example.com`.
- `<UID>` might be replaced by `123456ab-789c-12de`.

Create certificates

Create certificates as part of installing PEG.

You can create certificates by using one of two options.

- Option 1: PEG generates keys and CSRs.
- Option 2: Create your own keys and certificates.

In both cases, you will need the following:

- Unique ID (UID) provided by FortressIQ
- The apex domain that you want to use for the PEG DNS names (for example, `example.com`)

Option 1: PEG generates keys and CSRs

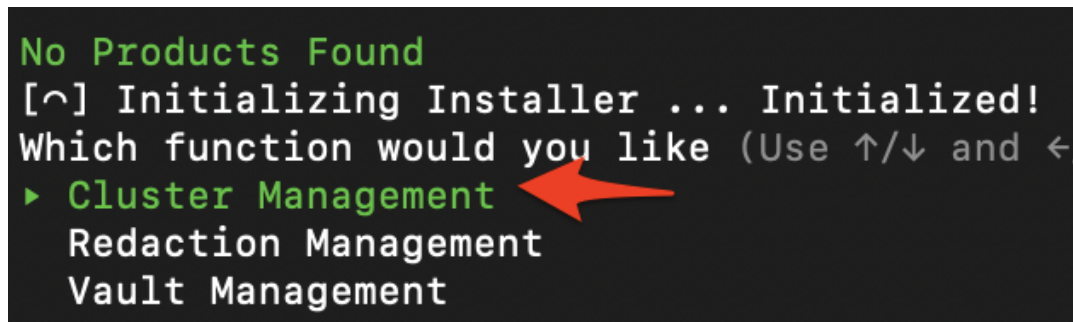

You can use PEG to generate the keys and CSRs for you. To do that, perform the following:

1. Log in to PEG through ssh.

If you do not log in as user named `peguser`, then ensure that you switch to the `peguser` per this command before performing these steps.

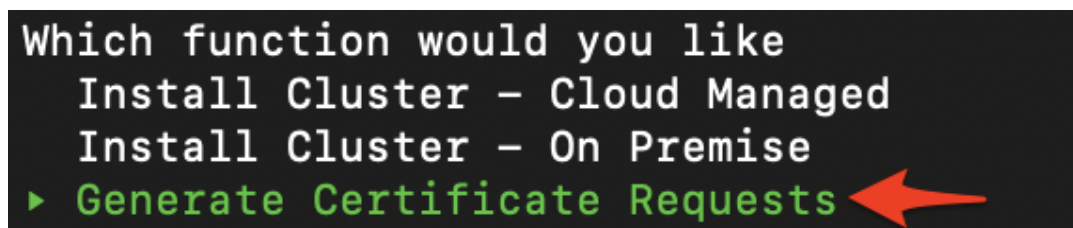

```
sudo su - peguser
```

2. If you already have a unique ID (UID) by FortressIQ, run the following command: `echo "<UID>" > ~/.kudzu/appliance.txt`, where UID is the unique ID that you were provided. If you do not have a UID, the next few steps will generate one for you.
3. Run `cd peg && ./peg_start.sh`.
4. Select **Cluster management**.

```
No Products Found
[~] Initializing Installer ... Initialized!
Which function would you like (Use ↑/↓ and ←/→)
▶ Cluster Management
  Redaction Management
  Vault Management
```

5. Select **Generate Certificate Requests**.

```
Which function would you like
  Install Cluster - Cloud Managed
  Install Cluster - On Premise
▶ Generate Certificate Requests
```

6. Fill out the options that follow.
7. Exit the menu.
8. Please record the UID value that you see in the output of this command: `cat ~/.kudzu/appliance.txt`
The CSRs are located in `~/peg/csr`.
9. Create certificates from those CSRs per [Common Tasks - Creating the certificates](#) below.

Option 2 - Create your own keys and certificates

Learn how to create keys and certificates before you deploy PEG.

Keys and certificates must be in Base64 PEM format (called openssl or PKCS #8 for the key format in some systems). Create certificates according to [Common Tasks - Creating the certificates](#). Keys must not be password protected. Also, ensure that your keys match the file names in the **Key File Name** column of, [Table 3: Mapping of domain names to certificate file names](#).

Common Tasks - Creating the certificates

Learn how to create Base64 PEM certificates.

When you create the certificates, create six server Base64 PEM certificates (called openssl format in some systems), with domain names and file names mapped as follows, where the UID is provided to you by FortressIQ and the apex domain is your apex domain that you will use for PEG. Each certificate you create must just contain the leaf certificate and not the full chain.

Table 3: Mapping of domain names to certificate file names

Domain	Cert file name	Key file name (Required only if you created your own keys)
analytics-fiq-<UID>.<apex domain>	analytics-cert.pem	analytics-key.pem
proxy-fiq-<UID>.<apex domain>	proxy-cert.pem	proxy-key.pem
storage-fiq-<UID>.<apex domain>	storage-cert.pem	storage-key.pem
st-fiq-<UID>.<apex domain>	st-cert.pem	st-key.pem
dlp-fiq-<UID>.<apex domain>	dlp-cert.pem	dlp-key.pem
es-fiq-<UID>.<apex domain>	es-cert.pem	es-key.pem
klite-fiq-<UID>.<apex domain>	klite-cert.pem	klite-key.pem

Note: You can create one certificate with all of the SANs. You can also create just one key if you create keys if you want. However, you will still need to make sure there are seven copies of that certificate and seven copies of that key (if you created keys) named as indicated previously. Do not create a wildcard certificate.

Create DNS entries and deploy PEG VM

Create DNS entries and deploy PEG VM as part of installing PEG.

Create DNS entries where each domain mentioned in [Table 3: Mapping of domain names to certificate file names](#), points to the PEG VM (PEG must have a static IP or a static domain name).

Configure PEG to work with a proxy

Configure PEG to use a proxy for outbound traffic if required.

Deploy PEG VM

Note: When you deploy the PEG VM, ensure that it has a static IP or at least a static domain name. To configure the VM static IP address, use the mechanism provided by your VPC provider.

1. Log in to the PEG VM through ssh.
2. Copy your proxy certificate, if one is required, to the following locations:

Note: The proxy file name must have a .crt extension and must be in the Base64 PEM format (called openssl format in some systems).

- ```
sudo cp <your proxy certificate.crt> /usr/local/share/ca-certificates/
```
- ```
sudo cp <your proxy certificate.crt> /peg_v/certs/
```

3. For the OS to load the certificate, run the following command: `sudo update-ca-certificates`
4. Add the following to the `/etc/environment` file (including the username and password if required) using the `http_proxy` and `https_proxy` values for your environment.

Note: Although this is not a requirement, the `https_proxy` value is often the same as the `http_proxy`, with the protocol being HTTP for both.

Enter the URL in the following format: `<your http/https proxy url>` Enter the username and password if required. [http://username:password@host:port/](#)

```
---
```

```
http_proxy=<your http proxy url> https_proxy=<your https proxy url>
```

```
no_proxy="localhost,::1,127.0.0.0/8,0.0.0.0,10.0.0.0/8,192.168.0.0/16,172.16.0.0/12"
```

5. Log out of your ssh session and then log back in.
This allows the proxy settings to be picked up by the operating system.

6. Edit the following values as follows in `~/peg/text_pipeline/values-gpu.yaml`. (These values are at the bottom of the file).

Enter the URL in the following format: `<your https proxy url>`. Enter the username and password if required. <http://username:password@host:port/>

If you do not use a certificate for the proxy, `fluentd_cert_path` should be left as follows: ""

```
---
```

```
has_fluentd_proxy: "true"
```

```
fluentd_cert_path: "/peg_v/certs/<your proxy.crt>"
```

```
https_proxy: "<your https proxy url>"
```

```
---
```

7. If you performed the steps in [Set up and configure PEG](#) before performing the proxy steps outlined in the previous steps, perform the following steps:

- Run `cd peg && ./peg_start.sh .`
- Select **Cluster Management** and press Enter, and then select **Load Certificates** and press Enter again.

```
No Products Found
[^] Initializing Installer ... Initialized!
Which function would you like (Use ↑/↓ and
▶ Cluster Management
```

```
Which function would you like
  Install Cluster – Cloud Managed
  Install Cluster – On Premise
  Generate Certificate Requests
▶ Load Certificates
```

Set up and configure PEG

Configure PEG for your environment.

If you require a proxy configuration, first perform the steps outlined in [Configure PEG to work with a proxy](#).

Ensure the following:

- Unique ID (UID) provided by FortressIQ
- Platform endpoint provided by FortressIQ

- PEG-managed certificates: the apex domain that you want to use for the PEG DNS names (for example, example.com)

1. Log in to PEG through ssh.

Note: If you do not log in as user named peguser, then ensure that you switch to the peguser before performing these steps: `sudo su - peguser`.

2. Run the following commands:

```
echo "<apex domain>" > ~/.kudzu/apex_domain.txt
```

```
"<UID>" > ~/.kudzu/appliance.txt
```

```
echo "127.0.0.1" > ~/.kudzu/external_ip.txt
```

```
echo "CSRs Generated" > ~/.kudzu/csr_log.txt
```

3. Modify the existing values in `~/peg/text_pipeline/values-gpu.yaml` as seen here. Do not include a slash at the end of the URL.

```
external_fluentd_url: "https://<FortressIQ provided platform endpoint>"
```

```
external_fluentd_port: "443"
```

4. Confirm that the PEG VM can reach the FortressIQ platform by running the following: `curl https://<FortressIQ provided platform endpoint>`

The following message is displayed:

```
400 Bad Request
```

```
'json' or 'msgpack' parameter is required.
```

Although that result is an error response, it is expected as the curl is not sending a well-formed message. The response confirms that the server received the request and responded.

5. Copy the PEG certificates that you created to `/peg_v/certs/` directory.

Ensure that they are named according to the certificate file names in [Table 3: Mapping of domain names to certificate file names](#).

6. If you also created your own keys, copy the PEG keys that you created to the `/peg_v/keys/` directory. Ensure that the keys are not password protected. Also, ensure that they are named according to the certificate file names in Table 1.

If you did not create your own keys, the PEG-generated keys are automatically included by PEG.

7. Run `~/peg/scripts/validatecerts.sh`.

To confirm that the certificates are valid, continue only if the script passes with "All checks passed!"

8. Reboot to ensure that any updated drivers are applied correctly: `sudo reboot now`

9. Run `cd ~/peg && ./peg_start.sh`.

10. Select **Redaction Management** and press Enter, and then select **Install module** and press Enter again.

```
No Products Found
[~] Initializing Installer ... Initialized!
Which function would you like
  Cluster Management
▶ Redaction Management
```

```
Which function would you like
▶ Install Module
  System Monitoring
```

Note: Do NOT install cluster.

11. Select **Vault Management** and press Enter, and then select **System Monitoring** and press Enter again.

```

Which function would you like (Use ↑/↓ and
▶ Cluster Management
```

```
Which function would you like
  Install Cluster – Cloud Managed
  Install Cluster – On Premise
  Generate Certificate Requests
▶ Load Certificates
```

14. Change the analytics page password. Run the following and enter your password. `cd ~/peg/scripts/ && ./change_elastic_password.rb`

Note: The username for logging in to `https://analytics-fiq-<UID>.<apex domain>` is *admin*.

15. Add storage users as needed . You will need at least one user with at least read access to confirm that PEG works. These are the users that can review the redaction of the images. `~/peg/scripts/add-storage-user.rb` .

This script also gives you the option to create users that can edit the pass-and-block (allow/deny) list.

Note: The username that you create corresponds to the **Access Key** in the login page for `https://storage-fiq-<UID>.<apex domain>`. The password corresponds to the **Secret Key**.

Configuration is now complete.

Validate PEG is running

Verify whether your PEG configuration is operating correctly in review mode.

To confirm that PEG is running as expected, perform the following steps:

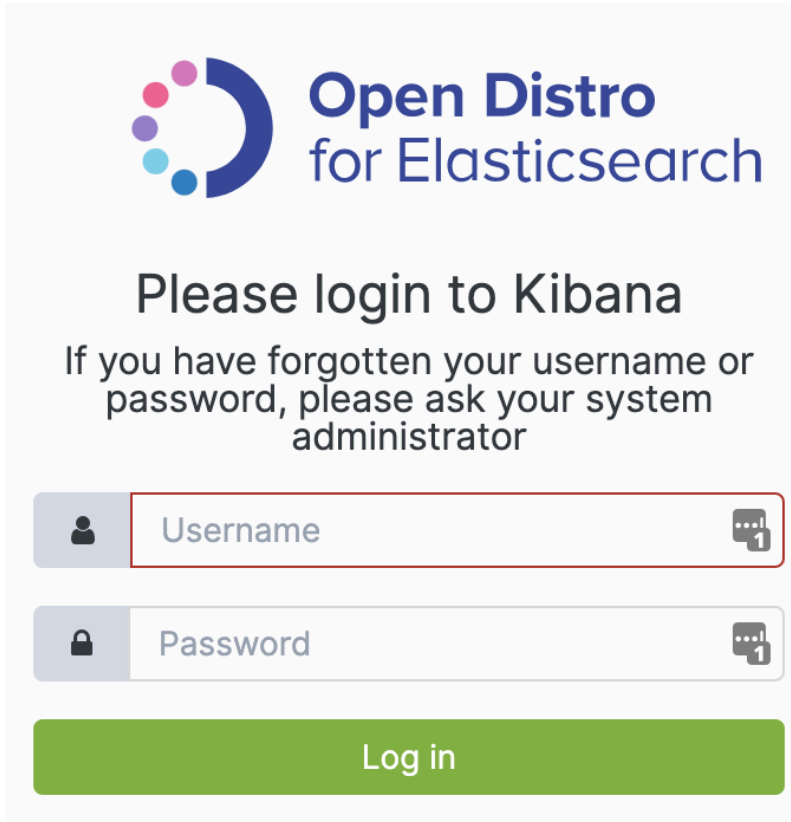

1. In a browser, go to `https://storage-fiq-<UID>.<apex domain>`.
You will see a screen like this: ("Access Key" = "your username" and secret key = "your password")

2. Log in to `https://storage-fiq-<UID>.<apex domain>` using a user you created in the configuration steps previously (by running `~/peg/scripts/add-storage-user.rb` on the VM).
3. After you log in, you will see these folders on the left. If you do not, run the "Storage Management" "initialize storage" steps in the configuration steps. If you still do not see them after that, contact FortressIQ.

4. In a browser, go to the analytics URL: `https://analytics-fiq-<UID>.<apex domain>`
You will see a screen similar to the following:

Open Distro
for Elasticsearch

Please login to Kibana

If you have forgotten your username or password, please ask your system administrator

Username

Password

Log in

If you do, go to the next step.

5. In a browser, go to `https://dlp-fiq-<UID>.<apex domain>`.
You will just see a blank page. If you encounter an error or it times out, then there is something wrong.
6. Install the Neo Sensor on a Windows machine. Open a web page, such as <https://www.fortressiq.com> and then click the page several times.
7. After 10 minutes (which is the approximate duration for review images to be generated), log in to `https://storage-fiq-<UID>.<apex domain>`. Log in with one of the storage users that you created previously in the configuration steps.
Note on the folders on the left side:
- **fiq-screenshots**: Shows the screenshot that PEG received
 - **forwarded**: Shows what the screenshot looks like if it is forwarded. This is populated regardless of whether it was actually forwarded or not.
 - **review**: PEG adds annotation to the images here to show more clearly what will be redacted. PEG includes a blue rectangle around where the redacted word previously existed and includes the text it found above the rectangle.
8. Click the **fiq-screenshots** folder on the left.
9. Download some of the images from this folder and confirm that they look like the results of your test.
10. Click on the **review** folder.

11. Download some of the images from this folder and confirm that they appear to be from your test. If PEG finds words that must be redacted, PEG includes a blue rectangle around where the redacted word existed and it includes the text it found above the rectangle, as follows.

If this looks as expected, you have validated that PEG is working in review mode.

PEG modes overview

Redacted images are processed in one of two modes, the review mode and the forwarding mode.

PEG can run in one of two modes:

- Review mode
- Forwarding mode

Review mode

This is the default mode for PEG when it runs for the first time. In this mode, you can review the redacted images, make changes to the pass-and-block lists, and so on, without PEG forwarding data to the FortressIQ cloud.

Forwarding mode

When you are comfortable with the results of your review of the images, you can enable the forwarding mode. After that, PEG will redact sensitive data from newly incoming images and send the redacted data to the FortressIQ platform. (Existing images from review mode will not be forwarded.)

Switch between modes

Change PEG to the forwarding mode and then back to the review mode.

By default, PEG initially starts in the review mode.

1. To switch to the forwarding mode:

- a) Edit the `~/peg/text_pipeline/values-gpu.yaml` file. At the end of the file, change the `forward_to_fluentd` value to true and save the changes.
`forward_to_fluentd: "true"`
- b) Push the change to PEG by running the following from any folder:

```
source ~/peg/scripts/vars.sh
```

```
kubectl delete cronjob.batch/text-pipeline-masking-masking-cron -n text-pipeline
```

```
kubectl get pods --output=jsonpath={.items..metadata.name} -n text-pipeline -o=name | grep cron | xargs -n1 kubectl delete --grace-period=0 --force -n text-pipeline
```

```
helm upgrade text-pipeline ${text_pipeline_dir} -f ${values_file_t} --namespace text-pipeline --set ocr.name=st-fiq-$new_gen_uuid.$apex_domain --set masking.name=dlp-fiq-$new_gen_uuid.$apex_domain
```

2. To switch back to the review mode:

- a) Edit the `~/peg/text_pipeline/values-gpu.yaml` file. At the end of the file, change the `forward_to_fluentd` value to false and save the changes.
`forward_to_fluentd: "false"`
- b) Push the change to PEG by running the following from any folder:

```
source ~/peg/scripts/vars.sh
```

```
kubectl delete cronjob.batch/text-pipeline-masking-masking-cron -n text-pipeline
```

```
kubectl get pods --output=jsonpath={.items..metadata.name} -n text-pipeline -o=name | grep cron | xargs -n1 kubectl delete --grace-period=0 --force -n text-pipeline
```

```
helm upgrade text-pipeline ${text_pipeline_dir} -f ${values_file_t} --namespace text-pipeline --set ocr.name=st-fiq-$new_gen_uuid.$apex_domain --set masking.name=dlp-fiq-$new_gen_uuid.$apex_domain
```

Determining content for redaction

PEG redacts words for forwarding based on the pass and block lists.

PEG determines the words that must be redacted base on two lists:

- The pass list

- The block list

The pass list

PEG comes with a built-in pass list. This list is based on our experience with customers. It contains all the words that PEG will not redact. Only words in the pass list will be included in images and other data sent to the FortressIQ platform. Words not on the pass list will be redacted.

The block list

The block list is a list of words that PEG will redact. PEG redacts words based on this list first before it processes the pass list. The block list is useful in situations where you know words exist on the pass list that you want redacted, but you do not want to have to modify the pass list. For example, a common use case is that some people's names are also everyday words that appear on the pass list by default. You can create a block list of all of the names of your employees or common names in various countries, which can be obtained from the Internet.

Modify the pass and block lists

Modify the pass list or the block list in the **dictionaries** folder.

To modify the pass list or the block list, perform the following steps:

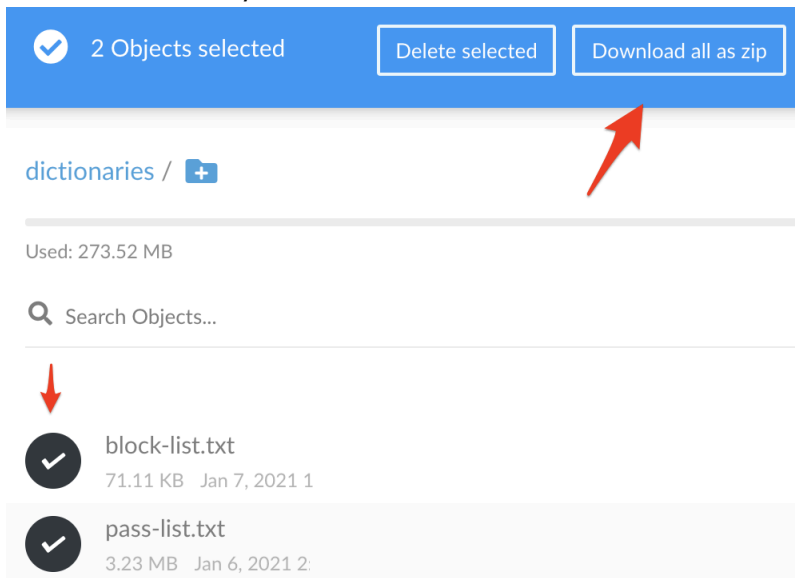

1. Log in to <https://storage-fiq-UID.<apex domain>> as a user who has access to edit the pass and block lists.
2. On the left navigation menu, select the **dictionaries** folder.

- In the dictionaries folder, you will see the **block-list.txt** and **pass-list.txt** files as follows.

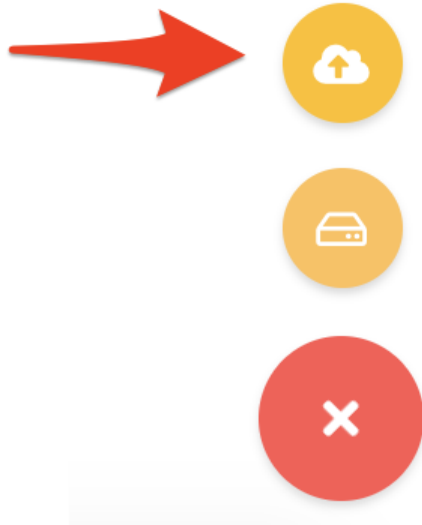

- Select the files that you want to edit and download them.

- Edit the list that you want to edit by using any text editor. Ensure that each word that you add to either list is followed by space and the number 1.
account 1
customer 1
user 1

Note: Use all lowercase letters for all the words.

6. Upload the modified files (named "pass-list.txt" or "block-list.txt" accordingly) to the same dictionaries folder. This will overwrite the existing files and apply your changes. The upload button is at the bottom-right corner of the page. Click plus (+) sign and then the upload icon.

Manage disk space

Manage disk space by managing the duration for which images are kept in the review folder.

When the disk usage is over 90 percent, PEG stops processing new messages. To manage the setting in the review folder, perform the following steps:

1. Add the following block of code to the end of the `~/peg/text_pipeline/values-gpu.yaml` file. (Alternatively, if an entry already exists, modify it.)

```
#Archive Info
review_retention_days: 365
```

The value that you include here will be the number of days for which PEG will keep an image in the review folder. Replace the number **365** with the number of days for which you want to retain review images. This will affect only the review images. The original images and the images in the forwarded folder will not be affected.

2. Push the change to PEG by running the following from any folder:

```
source ~/peg/scripts/vars.sh
```

```
kubectl delete cronjob.batch/text-pipeline-masking-masking-cron -n text-pipeline
```

```
kubectl get pods --output=jsonpath={.items..metadata.name} -n text-pipeline -o=name | grep cron | xargs -n1 kubectl delete --grace-period=0 --force -n text-pipeline
```

```
helm upgrade text-pipeline ${text_pipeline_dir} -f ${values_file_t} --namespace text-pipeline --set ocr.name=st-fiq-$new_gen_uuid.$apex_domain --set masking.name=dlp-fiq-$new_gen_uuid.$apex_domain
```

Renew and replace certificates and keys

In the customer-managed certificates deployment model (unlike in the PEG-managed certificates deployment model), certificates and keys that are about to expire are not renewed and replaced automatically, so you need to perform these tasks manually.

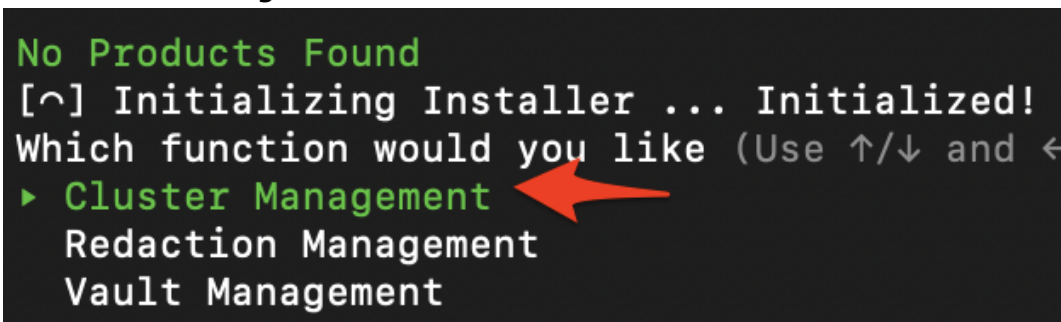

When your certificates are about to expire, you must perform the following tasks:

1. Create a new certificate.
2. Upload the new certificate.

Create a new certificate and key. Ensure that PEG creates the new certificate signing request.

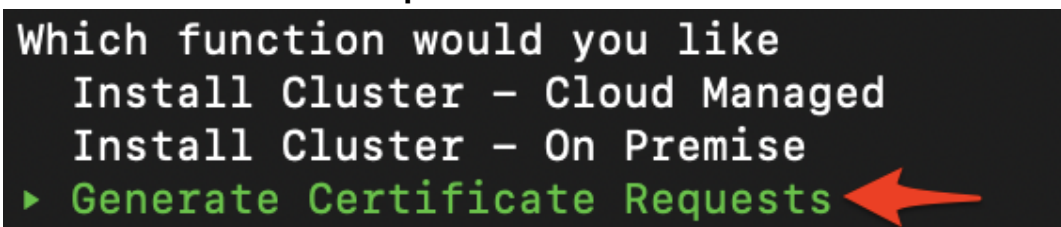

If you want PEG to generate the new certificates and keys, perform the following steps:

1. Run `cd peg && ./peg_start.sh`.
2. Select **Cluster Management**.

```
No Products Found
[~] Initializing Installer ... Initialized!
Which function would you like (Use ↑/↓ and ←)
▶ Cluster Management
  Redaction Management
  Vault Management
```

3. Select **Generate Certificate Requests**.

```
Which function would you like
  Install Cluster - Cloud Managed
  Install Cluster - On Premise
▶ Generate Certificate Requests
```

4. Fill out the options that follow.
5. Exit the menu.

6. The csrs are located in `~/peg/csr`.
7. Create certificates. For more information, see [Create certificates](#).

Upload the new certificates

Upload the new PEG certificates.

1. Copy the PEG certificates that you created to the `/peg_v/certs/` directory. Ensure that they are named according to the certificate file names in [Table 3: Mapping of domain names to certificate file names](#).
2. If you also created your own keys, then copy the PEG keys that you created to the `/peg_v/keys/` directory. Ensure that the keys are not password-protected. Also, ensure that they are named according to the certificate file names in [Table 3: Mapping of domain names to certificate file names](#). If you did not create your own keys, then the PEG-generated keys are included by PEG.
3. Run `~/peg/scripts/validatecerts.sh`. To confirm that the certificates are valid, continue only if the script displays the following: All checks passed!
4. Run the following command on PEG so it loads the latest certificates:

```
kubectl rollout restart deployment.apps/traefik -n kube-system
```

Create image viewer user in analytics portal

Learn how to create an image viewer user and add the user to the analytics portal. Use the image viewer to find, view, and compare images in PEG.

To create a user in image viewer user and add a user to the **klite_read_only** role in the analytics portal, perform the following steps:

Note: The image viewer uses the same logins as those used in the PEG analytics portal.

1. In a browser, go to the analytics portal: `https://analytics-fiq-<UID>.<apex domain>`
2. Enter your admin username and password. Your admin password is the same password as the elastic password you set when you configured PEG.
3. Go to **Security > Internal users**.
4. Click **Create internal users**.
5. In the **Create internal user** form, enter your username and password.
6. Click **Create**.
7. Go to **Security > Roles**.
8. In the search field, enter **klite_read_only**.
9. Click **klite_read_only**.
10. Select the **Mapped Users** tab, and click **Map Users**.
11. Select the users you want to map.
12. Click **Map**.

Users can now log in to the image viewer.

Configuring image viewer

Before you can use the image viewer, you must configure it.

The image viewer requires you to step up the user configuration for first-time users (or if you have to clear cookies you will have to configure it again).

If you are using PEG for the first time, perform the following steps to use the image viewer.

1. To open the image viewer application, enter the following address in a web browser: `https://klite-fiq-<UID>.<apex domain>`
2. In the **Configuration Settings** dialog box, click **Getting started**.
3. Enter your klite username and password.
Enter the username and password that was created for new image viewers users. For more information, see [Create image viewer user in analytics portal](#).
4. For **Index Pattern**, from the drop-down list, select **event_logs**.
5. For **Image Key Field**, from the drop-down list, select **screenshot_key**.
6. Click **Continue**.
You can now use the image viewer.

Using image viewer

Use the image viewer to view the images in buckets that are used frequently.

Before you begin, configure the settings as mentioned in [Configuring image viewer](#). You can use the image viewer to see images in the following buckets:

- **fiq-screenshots**: This includes the screenshot that PEG received.
- **forwarded**: This is what the screenshot looks like when it is forwarded. This is populated regardless of whether it is forwarded or not.
- **review**: This includes annotated images. PEG adds annotation to the images to clearly show what will be redacted. PEG puts a rectangle around where the redacted word previously existed and includes the text it found above the rectangle.

To review the images, perform the following steps:

Note: These steps show you the buckets that are used frequently, but you can change the selection as needed.

1. Log in to the image viewer.
The image viewer application is located at your PEG klite URL: `https://klite-fiq-<UID>.<apex domain>`
2. In Bucket 1, click the pencil icon to select the bucket you want.
For example, select **fiq-screenshots**.
3. In Bucket 2, click the pencil icon to select the bucket you want.
4. Select the timeframe within which you want to review the data.
For example, select **Last 15 days**.

5. Click Refresh.

If images were sent during the selected timeframe, you can see them now. The Bucket 1 version of the screenshot is on the left. The Bucket 2 version of the screenshot is on the right. You can move the bar in the middle to the left and the right to see the difference between the two.

Note: If you just sent in an image, it might not be displayed for 10 minutes.

- 6. Click Filters** to filter the data to only look at a specific set of screenshots.
For example, click **Add filter** to see all notepad screenshots for a specific user.
- 7. Click Configure Field** to select what fields you want to see above the screenshot.
For example, select the **Application**, **Screenshot_key**, and **Title** fields. The image viewer displays these fields above the screenshot.
- 8.** To export images, select the Export image icon located in the top-right corner of the page.
The **Export Images** window appears.
- 9.** Select the image range from 1 to 10 using the modal bar.
- 10.** Select the slot from the drop-down list.
For example, select slot 1.
- 11.** For **Export Option**, choose from the **Selected Range** option or the **Random** option.
- 12.** Click **Download**.

Preprocessing error messages

If you encounter any preprocessing errors, review the cause and perform the required action to resolve the error.

Note:

- From Automation 360 v.23, if an error occurs when you run a bot, a preprocessing or runtime error is shown. Note that preprocessing of child bots does not occur in sequence because these bots are referred in the parent bot and are sometimes in complex nested workflows. Therefore, the errors might be displayed in any sequence for these child bots. The parent bot cannot proceed further until all the errors in the child bots are resolved.
- The following scenarios are applicable only to Automation 360 v.21 or earlier releases. For v.22, Only the **Catch action** scenario is applicable, so review the probable cause.

Cause	Action required
A mismatch occurred and we did not find the expected variable data type.	Use an inline expression or a separate action to convert to the correct variable data type. Variables overview
A "\$" is being read as a variable but no such variable exists.	Use "\$\$" to escape the dollar sign and try again.
The bot is calling another bot, but we did not find the child bot at the specified location.	Check the path and try again.
We found a Catch action that is not contained by a Try action.	Ensure that each Catch action is contained by a Try action.

Cause	Action required
We found a Try action that does not contain a Catch action. Each Try action requires at least one Catch action inside it.	Ensure that each Try action contains a Catch action.

On the [Developer portal](#), find additional how-to tutorials on building advanced bots and packages.

Package SDK

Package SDK enables you in creating and uploading action packages to your Control Room.

The Automation Anywhere Package Development Kit provides detailed instructions for users to independently develop custom actions and upload the packages in their Control Room. The custom action are build in an IDE and are compiled to generate Java Archive (JAR) files. The JAR files are then uploaded to the Control Room which becomes available as actions under the **Action Panel**.

The Package SDK section includes sample codes and supporting files for Java developers to create and validate custom actions.

Review the new, changed, fixed, and deprecated features, and security fixes, known issues, and limitations for the Automation 360 (formerly Enterprise A2019) Package SDK.

Set up the Java project

Set up an integrated development environment (IDE) for Java, including Automation Anywhere custom annotations to develop an action package that you can upload to your Control Room.

A working knowledge of Java and Gradle is required in order to successfully build an action package. You require the following software and file:

- Java Developer Kit (JDK) 11
- Java IDE
 - [Eclipse](#)
 - [Community edition of IntelliJ](#)
- Gradle plug-in v.5.*.* in the IDE
- Automation Anywhere Bot Agent installed and connected to your Control Room **Download and extract a zip file**

Download and extract the zip file for the release you want:

<i>November 2022, Release (A2019.27)</i>	<i>A360-package-sdk-2.6.0.zip</i>
<i>June 2022, Release (A2019.25)</i>	<i>A360-package-sdk-2.5.0.zip</i>
<i>December 2021, Release (A2019.23)</i>	<i>A360-package-sdk-2.4.1.zip</i>
<i>September 2021, Release (A2019.22)</i>	<i>A360-package-sdk-2.3.0.zip</i>
<i>June 2021, Release (A2019.21)</i>	<i>A2019-package-sdk-2.1.0.zip</i>

This section provides reference information about the annotations used to create Automation Anywhere packages.

[Build and test a demo package and bot](#)

This practical how to section demonstrates that creating, changing, and managing packages allow you to customize actions and efficiently manage packages for all Control Room users.

Related tasks[Develop a sample package](#)

Develop your own package and upload it to an Control Room to provide custom actions for bots.

Standard coding practices and guidelines for developing packages

This topic covers standard coding practices and guidelines that help to ensure the development of high quality packages.

Testing

Ensure high quality code. Write sufficient unit tests and integration tests for your package.

Icons

Set proper icon for your package.

Setting the version manually

The SDK package build version gets updated automatically every time a build happens. However, you can set it manually in the command project of a common **build.gradle** file.

- Update the **build.gradle** file before a build.

- Enter up to four digits numbers, separated by a period, as shown below:

```

. . .
ext {
    version '2.0.8'
}
dependencies {...}

```

Dependencies

Embed all the dependencies in your package JAR. Load the dependencies at run time by extracting them to a temporary location. Be sure to clean the temporary location after the dependencies are loaded.

Dependent JAR files

Add dependent JAR files under dependencies in the **build.gradle** file as implementation so that the dependent JAR files are packaged.

```

. . .
dependencies {
    compileOnly name: 'command-
annotations'
    compileOnly name: 'bot-runtime'
    compileOnly name: 'bot-api'
    implementation name: 'i18n-api'
        implementation name:
'mydependentjavafile.jar'
    apt name: 'command-processor'
    compileOnly group:
'org.apache.logging.log4j',
name: 'log4j-core', version:
"$loggerVersion"
testImplementation
"org.testng:testng:$testNgVersion"
testImplementation name: 'bot-
runtime'
    testImplementation name: 'bot-api'
}
. . .

```

Add new actions to the existing package

When adding new actions to an existing package, make sure to do clean before packaging. It is always a good practice to do clean build - gradlew.bat clean build shadowJar.

Error messages

Provide meaningful error messages.

- **Do** throw meaningful error messages. For example, in local language using i18n APIs with `BotCommandException`, throw a new exception

```

BotCommandException(MESSAGES.getString("Run.E

```
- **Do not** throw generic error messages, such as `ex.message`.

Basic validation

Use the validation annotation rules, such as `@NotEmpty` included with this development kit. Do not add basic validations for your code. See [Validation annotations](#).

Loops

Avoid long running loops in your code. Long running loops can cause high CPU usage, leading to errors such as, "Bot is unresponsive."

Add logging

Use the default **log4J** logger provided in the bot run time framework. Do not add your own logger. See the sample code for details.

Logging levels

- **ERROR/FATAL:** Severe error event that the user is affected and there is no workaround.
- **WARN :** Unexpected error occurred but the system has recovered from it.
- **INFO:** Informational messages about state change, for example, an accepted request.
- **DEBUG:** Detailed diagnostic information that will be required to debug when something goes wrong.
- **TRACE:** All information is captured about an application behavior.

If you are not sure of the log level, set it to **TRACE**.

Loading resources

All resources should be loaded using current thread context class loader, as shown in the following example:

```
Thread.currentThread().getContextClassLoader().getResources("resources/");
```

Related concepts[How to examples](#)

This section contains code examples and explanations about how to code some basic bot capabilities.

[Annotations](#)

This section provides reference information about the annotations used to create Automation Anywhere packages.

Related tasks[Set up the Java project](#)

Set up an integrated development environment (IDE) for Java, including Automation Anywhere custom annotations to develop an action package that you can upload to your Control Room.

[Develop a sample package](#)

Develop your own package and upload it to an Control Room to provide custom actions for bots.

Develop a sample package

Develop your own package and upload it to an Control Room to provide custom actions for bots.

Download and extract the contents from the latest Automation 360 Package SDK release. The newest package contains the necessary sample source code to build your package.

You need to have a project created in a Java IDE. For details about setting up a project, read [Set up the Java project](#).

The following high-level tasks provide the basic workflow for creating a package.

1. Create a java class.

This class is the action you plan to publish in your package.

Important: It is required that the class supports the default constructor.

2. Add required business logic to the class.

The following are the supported return types:

- **Void:** Use this return type if your action does not return any value.
- **Value:** Use this return type if your action returns any type of value.

3. Annotate the class with `BotCommand` and `CommandPkg` Annotations to make the class eligible to be converted to an action.

4. Annotate the variable that accepts values with `Idx` and `Pkg`.

5. Annotate the entry method with the `Execute` annotation.

6. From the action prompt, run `gradlew.bat clean build shadowJar`.

The JAR file created from the build is located in `build/lib`.

From the Control Room on the **Bots > Package** page, click the **Add package** icon to upload the JAR file.

Tip: To upload a package to a Control Room, you need **Upload package** permission. Review how to add a package to an Control Room: [Add packages to the Control Room](#).

[Set up the Java project](#)

Set up an integrated development environment (IDE) for Java, including Automation Anywhere custom annotations to develop an action package that you can upload to your Control Room.

Using the package SDK

These example topics provide a basic understanding of how to use the Package SDK with Automation 360. Each SDK package includes a collection of configurable files that you can use to build a custom package, and then use the package to create TaskBots.

Use the following steps to create, configure, and build an IntelliJ project to compile a new package, and then create a bot to test the package you created.

1. Download, extract, and review the Package SDK files:
 - Download the latest Automation Anywhere A2019 Package SDK.
 - [Enterprise Automation360 Package Development Kit Release Notes](#)
 - Go to your `Downloads` folder, right-click your downloaded Package SDK, and select **Extract All**.
 - Review all the files included in the package. You can drop any java file in your IntelliJ project to view or edit the content.
2. Install the latest Automation 360 version:
 - a) After the installation, log in to the Control Room with an admin privilege and create a new user with permissions to upload a package and create bots.
 - [Create a user](#)
 - b) Connect your local device to the Control Room. If required, download and install the latest Bot Agent.
 - [Install Bot Agent and register device](#)
3. Install Java SE Development Kit 11 or IntelliJ IDE Community Edition and Gradle plug-in.
 - Java SE Development Kit 11 (<https://www.oracle.com/java/technologies/javase/jdk11-archive-downloads.html>)
 - Java IDE (<https://www.jetbrains.com/idea/download/#section=windows>)
4. Configure the sample build files in the IntelliJ project.
 - [Configuring build files](#)
5. Create a new directory, package, and class.
 - [Creating new Java class](#)
6. Use the compiled JAR file as a package and upload it to your Control Room in Automation 360.
 - [Upload custom package to your Control Room](#)
7. Create a TaskBot to test the new package.
 - [Create a bot to test the new package](#)
8. Optional: Verify the results, and if required, add additional actions to your bot flow, and configure parameters and values.
9. View additional resources.
 - To learn more, search for the *Package SDK: How to examples*.

[Configuring build files](#)

Configuring build files

Use IntelliJ to configure and compile a JAR file, and then upload it as a package to your Control Room in Automation 360.

A basic understanding of JDK and Java IntelliJ is required in order to build an action package. Ensure you have the following software and files:

- Java SE Development Kit 11 (<https://www.oracle.com/java/technologies/javase/jdk11-archive-downloads.html>)
- Java IDE (<https://www.jetbrains.com/idea/download/#section=windows>)
- Automation Anywhere A2019 SDK. Download and extract the zip file for the release you require:
 - [Enterprise A2019 Package Development Kit Release Notes](#)

1. Unzip the contents of the SDK package to your `IdeaProjects` directory and rename the folder from `<latest package sdk zip file>` to `A2019FileDetails`.

2. In IntelliJ IDEA, go to **File > Open** and open the project located at `C:\Users\<User>\IdeaProjects\A2019FileDetails`.
3. Open the `settings.gradle` file in the project root, and set the `rootProject.name = 'A2019FileDetails'`
4. Update the `package.template` file located at **src > main > resources > package.template**.
5. Change the package name from `A2019DemoPackage` to `A2019FileDetails`.
6. Update the package name in **locales json**: go to **src > main > resources > locales > en_US.json**.
 - a) Open the `en_US.json` file and update the **required** label field. Update the optional description.
 - b) Delete all other remaining lines in the `en_US.json` file.
7. Open the `build.gradle` in the project root. After the dependencies section, remove other dependencies, if they are not required.
8. Save all files.

Creating new Java class

Creating new Java class

Use IntelliJ to create a new java class and a new directory, and configure other build files.

Complete the steps in the following task: [Configuring build files](#).

1. Create a new **Java Class**, right-click the `com.automationanywhere.botcommand` package, and select **New > Java Class**. Enter the name for the new class `GetFileDetails`.
 - a) Copy `@BotCommand` from the `Concatenate.java` and paste it into the new `GetFileDetails.java` file.

```
import static com.automationanywhere.commandsdk.model.DataType.STRING;
//BotCommand makes a class eligible for being considered as an action.

@BotCommand
//CommandPks adds required information to be dispalable on GUI.
@CommandPkg(
    //Unique name inside a package and label to display.
    name = "concatenate", label = "[Concatenate.label]",
    node_label = "[Concatenate.node_label]", description =
    "[Concatenate.description]", icon = "pkg.svg",

    //Return type information. return_type ensures only the right kind
    of variable is provided on the UI.
    return_label = "[Concatenate.return_label]", return_type = STRING,
    return_required = true)
public class Concatenate {

    //Messages read from full qualified property file name and provide
    i18n capability.
    private static final Messages MESSAGES = MessagesFactory
        .getMessages("com.automationanywhere.botcommand.samples.messages");

    //Identify the entry point for the action. Returns a Value<String>
    because the return type is String.
    @Execute
    public Value<String> action(
        //Idx 1 would be displayed first, with a text box for entering the
        value.
        @Idx(index = "1", type = TEXT)
```

```

//UI labels.
@Pkg(label = "[[Concatenate.firstString.label]]")
//Ensure that a validation error is thrown when the value is null.
@NotEmpty
String firstString,

@Idx(index = "2", type = TEXT)
@Pkg(label = "[[Concatenate.secondString.label]]")
@NotEmpty
String secondString) {

//Internal validation, to disallow empty strings. No null check
needed as we have NotEmpty on firstString.
if ("".equals(firstString.trim()))
    throw new
BotCommandException(MESSAGES.getString("emptyInputString",
"firstString"));

if ("".equals(secondString.trim()))
    throw new
BotCommandException(MESSAGES.getString("emptyInputString",
"secondString"));

//Business logic
String result = firstString + secondString;

//Return StringValue.
return new StringValue(result);

```

- b) Update the @CommandPkg parameters such as: name, label, node_label, description, and icon.
 - c) Update the return_label and the return_type.
 - d) Add the NumberValue action, internal validation, business logic, and the return value.
 - e) Delete the Concatenated. java file and samples.commands. basic directory, and the sample.commands directory.
2. Configure the en_US.json file: go to **src > main > resources > locales > en_US.json** and add the following fields after the label and description values, and delete other parameters from the file.

```

{
  "label": "File Details",
  "description": "Returns basic file details",
  "GetFileDetails.label": "File Size",
  "GetFileDetails.description": "Return the size of the selected file in
bytes",
  "GetFileDetails.node_label": "File Size in Bytes",
  "GetFileDetails.return_label": "File Size",
  "GetFileDetails.return_label_description": "Return in bytes",
  "GetFileDetails.filePath.label": "Select a File for analysis"
}

```

3. Delete packages: go to **src > main > java > com.automationanywhere.botcommand**, and delete the `samples.commands` and delete the `samples` packages.
4. Import new icons from Github and update the CommandPkg annotation.
 - a) Download any icons you want to use in your bot flow and save them as `.svg` files.
 - b) Copy your image files into the **src > main > resources > icons** folder.

5. Create a new directory: go to **src**, right- click, and select **New > Directory**.
 - a) In the **Name** field, enter `test\java`. Alternatively, select the `test\java`, and enter the name `TestFileSize`.
 - b) Configure test annotations in the `TestFileSize` java class.
 - c) Create a `@test` public class, create a `GetFileDetails` object, and invoke the action.
 - d) Optional: Run the `TestGetFileDetails` in IntelliJ to test it.
6. Configure the `TestFileSize` file, and open `TestFileSize` and copy and paste the following code:

```

{
    @Test
    public void TestGetFileDetails() {
        String filePath = "src\\main\\resources\\icons\\sample.svg";
        //Create GetFileDetails Object
        GetFileDetails getFileDetails = new GetFileDetails();
        //invoke action
        NumberValue output = getFileDetails.action(filePath);
        Assert.assertEquals(output.getAsDouble(), 5027.0);
    }
}

```

7. Save the project: **File > Save All**.
8. Click **Reload All Gradle Projects**, and then click **Execute Gradle Task**, and verify that the **A2019FileDetails** project is selected.
9. In the **Run Anything** window, enter `gradle clean build shadowJar`.
After it runs, the following message is displayed: `BUILD SUCCESSFUL in 8s <number of seconds>`

Upload custom package to your Control Room

Upload custom package to your Control Room

Use the compiled JAR file and upload it as a package to your Control Room in Automation 360.

- Complete the steps in the following task: [Creating new Java class](#).
 - Ensure you have the following:
 - Access to the Control Room.
 - Credentials with **AAE_Basic** permission or a custom role with the capability to upload packages to the Control Room.
1. From Windows Explorer, go to `C:\Users\<<Username>\IdeaProjects\A2019-FileDetails\build\libs` and locate `A2019FileDetails-2.0.9.jar`.
 2. Log in to your Control Room as a user with permissions to add a new package.
 3. Click **BOTS > Packages**.
 4. In the **All packages** page, move your mouse over the plus sign and click **Add package**.
 5. In the **Add package** page, click **Browse** and locate the `A2019FileDetails-2.0.9.jar` file.
By default, the file is located at: `C:\Users\<<Username>\IdeaProjects\A2019-FileDetails\build\libs`.
 6. Select the `A2019FileDetails-2.0.9.jar` file and click **Open**.
 7. Click **Upload Package**.

Create a bot to test the new package

Create a bot to test the new package

Use the actions in Automation 360 to create a bot and test the new package you have added to your Control Room.

Ensure you have the following to build the bot:

- Access to the Control Room.
- Credentials with **AAE_Basic** permission or a custom role to create bots.
- Your workstation is a registered device in the Control Room.
- Your package `A2019FileDetails-2.0.9.jar` is available in the Control Room.

1. Log in to the Control Room.
2. On the left pane, click **Automation**.
A list of available and forms is displayed.
3. Click the **Create a bot** icon.
4. In the **Name** field, enter `TestingFileSize` or any other name you want.
5. Click **Create & Edit**.
6. In the Actions pane, find **File Details** and drag **File Size** into the bot flow.
 - a) In the **Select a File for analysis** field, select **Desktop file**, click **Browse**, and select any file from your desktop.
 - b) Click **Create variable** to create a new number variable.
 - c) In **Create Variable**, enter `nFileSize` and click **Create & Select**.
 - d) Click **Apply**.
7. In the Actions pane, find the **Number** package and drag the **To String** command.
 - a) In the **Enter a number** field, enter **F2**, and select **nFileSize**.
 - b) In the **Assign the output to variable** field, select **prompt-assignment - String** from the drop-down list.
 - c) Click **Apply**.
8. From the Actions pane, drag **Message box**.
9. In the **Enter the message to display** field, click **F2** and select the **prompt-assignment variable**.
10. Click **Apply** and **Save**.
11. Click **Run**.
The bot displays the `<The value of the file size>`, which is a successful build.

If you were not able to run bot your bot, go back and modify your configuration steps in your Control Room.

How to examples

This section contains code examples and explanations about how to code some basic bot capabilities.

Return a value from an action

Set the following properties on `CommandPkg` to store the action output in a variable.

Expose property attributes of action

The property values of an action can be exposed by setting the following properties on `CommandPkg`.

<i>Organize and group actions when developing packages</i>	Review the provided examples on how to add and group actions during the package SDK development process.
<i>Input types - UI elements</i>	The user interface (UI) elements are the input controls used to receive inputs in an action while building a bot.
<i>Create custom variables using Package SDK</i>	When using Automation 360, you can create custom variables using the SDK package.
<i>Create a condition using Package SDK</i>	When using Automation 360, you can create a condition with the SDK package.
<i>Add a condition in a custom package for If condition</i>	Add conditions in a custom package.
<i>Create an iterator using Package SDK</i>	In Automation 360, you can create an iterator with the SDK package. An iterator is used to loop through multiple objects of similar type and is used with the Loop package. It consists of two methods, <code>next</code> and <code>hasNext</code> , which return the actual object and a boolean value.
<i>Create a trigger using Package SDK</i>	When using Automation 360, you can create a trigger using the SDK package.
<i>Custom triggers - pull and push mechanism</i>	The examples provided in this topic demonstrate how to create time-based and event-based triggers, pull (link TriggerDemo) and push (<code>SimpleMessageListenerContainer</code>) mechanisms using the SDK package.
<i>Add debug logs of custom packages to bot_launcher.log file</i>	You can add logs using <code>log4j</code> . The dependency is already added in the package SDK sample <code>build.gradle</code> file.
<i>Handle sessions in a custom package</i>	You can extract a session using a session name from the <code>SessionsMap</code> . In the same package, you can use sessions to pass information between actions, but not to other packages.
<i>Configure shared session using Package SDK</i>	Package SDK provides configuration for the SDK users to create and use shared sessions. Sessions are seamlessly shared between different bots to share resources between them. This means that if a session has been created, the other TaskBots can read and update the session and vice versa.
<i>Create a bot to test the custom package</i>	A shared session enables you to reuse actions between TaskBots that run concurrently, for example, using the same Excel file to pass values.

Actions

Any action class supports only one method as an entry point. Annotate all parameters of the entry point method with `Idx`. There are three types of actions:

- `Command\Action` (default choice)
- `Iterator`
- `Condition`

CAUTION: If you do not provide a public setter to member variables with `Inject`, compilation errors occur.

Related concepts

Set up an integrated development environment (IDE) for Java, including Automation Anywhere custom annotations to develop an action package that you can upload to your Control Room.

[Develop a sample package](#)

Develop your own package and upload it to an Control Room to provide custom actions for bots.

Return a value from an action

Set the following properties on `CommandPkg` to store the action output in a variable.

Action return values

- **return_type**

Defines the return type of the action. It usually matches the entry method return type.

- **return_required**

When the value is set to `true` the return value is required.

- **return_label**

A description of the UI label for the variable value.

Example: Convert a sourceString to uppercase and assign the result to returnTo

```
//BotCommand makes a class eligible for being considered as an action.
@BotCommand

//CommandPks adds required information to be displayable on the UI.
@CommandPkg(
    //Unique name inside a package and label to display.
    name = "uppercase", label = "[[Uppercase.label]]",
    node_label = "[[Uppercase.node_label]]", description =
    "[[Uppercase.description]]", icon = "pkg.svg",

    //Return type information. return_type ensures only the right kind of
    variable is provided on the UI.
    return_label = "[[Uppercase.return_label]]", return_type =
    STRING, return_required = true)
public class Uppercase {

    //Messages read from a fully qualified property file name and provides i18n
    capability.
    private static final Messages MESSAGES = MessagesFactory
        .getMessages("com.automationanywhere.botcommand.samples.messages");
```

```
//Identify the entry point for the action. Returns a Value <String> because
the return type is String.
@Execute
public Value<String> action(
    //Idx 1 would be displayed first, with a text box for entering the value.
    @Idx(index = "1", type = TEXT)
    //UI labels.
    @Pkg(label = "[[Uppercase.sourceString.label]]")
    //Ensure that a validation error is thrown when the value is null.
    @NotEmpty
    String sourceString,
```

Related concepts

[How to examples](#)

This section contains code examples and explanations about how to code some basic bot capabilities.

Expose property attributes of action

The property values of an action can be exposed by setting the following properties on **CommandPkg**.

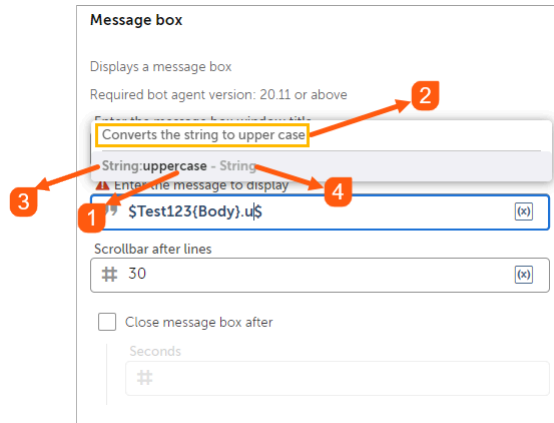

Action property values

	Property Attributes	Description
1	property_name	The name of the property, unique at action level, in auto-complete box this name would appear.
2	property_description	A description of the property.
3	property_type	The data type on which property operates, only if the type matches, the property will be appear in the auto-complete box.
4	property_return_type	The data type for what property returns. If this type does not match with the field type where it is used, there will be validation error.

```
@BotCommand
@CommandPkg(label = "Uppercase", name = "uppercase", description="Converts
the string to upper case",
icon = "uppercase.svg", node_label="Convert {{sourceString}} to upper case|
and assign the result to {{returnTo}}|",
return_type=DataType.STRING, return_required = true, return_label="Assign
the output to variable",
property_name="uppercase", property_description="Converts the string to
upper case", property_type=DataType.STRING,
property_return_type=DataType.STRING) public class UpperCase {

    @Execute
    public Value<String> convert(
        @Idx(index = "1", type=TEXT)
        @Pkg(label="Source string")
        @NotEmpty
        String sourceString){
        return new StringValue(sourceString.toUpperCase());
    }
}
```

For example, the above class in the UI will look like:

Related concepts

[How to examples](#)

This section contains code examples and explanations about how to code some basic bot capabilities.

Organize and group actions when developing packages

Review the provided examples on how to add and group actions during the package SDK development process.

Example: Add actions

```
@BotCommand

//CommandPks adds required information to be dispalable on the UI.
@CommandPkg (
    //Unique name inside a package and a label to display.
    name = "concatenate", label = "[[Concatenate.label]]",
    node_label = "[[Concatenate.node_label]]", description =
    "[[Concatenate.description]]", icon = "pkg.svg",

    //Return type information. return_type ensures only the right kind of
    variable is provided on the UI.
    return_label = "[[Concatenate.return_label]]", return_type = STRING,
    return_required = true)
```

Example: Group actions

Use the `group_label` to `ConcatenateGroup` which it is displayed in the UI also as **ConcatenateGroup**. When the `group_label` is not used, you will get all the actions in the respective package.

```
@BotCommand

//CommandPks adds required information to be dispalable on the UI.
@CommandPkg (
    //Provide a unique name inside a package and a label to display.
    group_label = "ConcatenateGroup", name = "concatenateWithGroup", label =
    "concatenateWithGroup",
    node_label = "[[Concatenate.node_label]]", description =
    "[[Concatenate.description]]", icon = "pkg.svg",

    //Return type information. return_type ensures only the right kind of
    variable is provided on the UI.
    return_label = "[[Concatenate.return_label]]", return_type = STRING,
    return_required = true)
```

```
public class ConcatenateWithGroup {
```

Input types - UI elements

The user interface (UI) elements are the input controls used to receive inputs in an action while building a bot.

The following examples show the supported input types. Use the UI elements to create user interface (UI) designs to build the Control Room interfaces. For instance, if you need an input as text then, use `TEXT`, if you need a radio button, select `RADIO`, and so on. This topic is based on the *SampleUI* sample available within the **Package SDK** in the following location: `<PackageSDK>\src\main\java\com\automationanywhere\botcommand\samples\commands\ui\SampleUI.java`.

1. Make sure you have imported the following packages to ensure all the functionalities works as described in the sample.

```
import com.automationanywhere.commandsdk.annotations.Idx;
import com.automationanywhere.commandsdk.annotations.Pkg;
import com.automationanywhere.commandsdk.annotations.rules.CodeType;
import com.automationanywhere.commandsdk.annotations.rules.VariableType;
```

2. Add the `@BotCommand` annotation to make a class as an Action in the Control Room. For more information on annotations, see [Annotations](#).

```
@BotCommand
```

3. Add the `@CommandPkg` annotation to define all the UI related components - *labels, description, and name*.

```
@CommandPkg(label = "UI Demo", description = "Demonstrates the provided
  UI elements", name = "uiDemo")
```

4. Create a class and define the fields as described below.

- a. Annotate the method with `@Execute` to execute the method during compilation.
- b. In this sample, `@Idx` and `@Pkg` are used as a member of the class, so you should use `set` and `get` methods to define them.
 1. `@Idx` - Defines the index of an action.
 2. `@Pkg` - Defines all the parameters and member variables shown in the interface. Must be accompanied by the `@Idx`, if not this annotation is ignored.
 3. `@Inject` - To receive value from the UI using the member class, `@Inject` is required at field levels.

```
@BotCommand
@CommandPkg(label = "UI Demo", description = "Demonstrates the
  provided UI elements", name = "uiDemo")
public class SampleUI {
    @Idx(index = "1", type = TEXT)
    @Pkg(label = "Text type")
    @Inject
    String text;

    @Execute
    public String getText() {
        return text;
    }
    public void setText(String text) {
        this.text = text;
    }
}
```

```
}
}
```

5. Drag the action into canvas and you will be able to input a string in the text field. You will see an input box similar to this image.

UI element - Number field

Use the *Number* type to create an UI element that will accept a number. Using the below sample you will be able to create a field that will accept only numbers.

```
@BotCommand
@CommandPkg(label = "UI Demo", description = "Demonstrates the provided UI
elements", name = "uiDemo")
public class SampleUI {
    @Idx(index = "2", type = NUMBER)
    @Pkg(label = "Number type")
    @Inject
    String num;

    @Execute
    public String getNum() {
        return num;
    }
    public void setNum(String num) {
        this.num = num;
    }
}
```

Other UI elements

It is possible to create other UI components like: *Boolean*, *Radiobutton*, *Number*, *Variable*, *Code*, *Dictionary*, *List*, *Date/Time*, and so on. To get a complete list of UI elements supported, see `<PackageSDK>\src\main\java\com\automationanywhere\botcommand\samples\commands\ui\SampleUI.java`.

UI validations supported

The following UI validations are also supported:

- *@NotEmpty* means that the UI field needs an input at the bot design time.
- *@LocalFile* refers to a local file from a user machine.
- *@NumberIntegers* refers to a number value that you can provide, such as, a float or a double input kind.

Create custom variables using Package SDK

When using Automation 360, you can create custom variables using the SDK package.

Using custom variables

Use Automation 360 to create a custom variable. This is a system variable and is used as other bot variables, except it is read-only and the value is calculated instead of being assigned.

Required annotations

For creating a variable, the following annotations are required:

Annotation	Usage
BotCommand	Use the BotCommand annotation with the variable as commandType. This ensures that the plain old Java object (POJO) is suitable for creating an Automation 360 variable.
CommandPkg	These values are used when creating a package. Provide a name, label, and description to the annotation.
Idx	Annotate all the parameters and member variables that are required and help with the validation check. Alternatively they might be displayed in the interface for the input. Provide the index (Idx) and the type.
Pkg	Annotate all the parameters and member variables that will be shown in the interface. This annotation will be ignored if it is not accompanied by the Idx.
VariableExecute	The method that has to be called for returning the variable value. This method does not accept any input parameters. Sessions and GlobalSessionContext are available through setter injection.

Use case example

The following use case shows how to return the current time for the system default zone.

1. Create the POJO class with the business logic:

```
public class Now {

    public DateTimeValue now() {
        Instant instant = Instant.now();
        ZonedDateTime now = instant.atZone(ZoneId.systemDefault());
        return new DateTimeValue(now);
    }

}
```

2. Annotate the POJO class to enable it for the Automation 360 variable and to create the package:

```
@BotCommand(commandType = BotCommand.CommandType.Variable)
@CommandPkg(description = "The current datetime at system default zone.",
name = "Now", label = "", variable_return_type = DataType.DATETIME)
public class Now {

    public DateTimeValue now() {
        Instant instant = Instant.now();
        ZonedDateTime now = instant.atZone(ZoneId.systemDefault());
        return new DateTimeValue(now);
    }

}
```

3. Annotate the now method to denote it to be the execute method.

```
@VariableExecute
public DateTimeValue now() {
    Instant instant = Instant.now();
    ZonedDateTime now = instant.atZone(ZoneId.systemDefault());
    return new DateTimeValue(now);
}
```

Every variable must have one test `VariableExecute` method.

[How to examples](#)

This section contains code examples and explanations about how to code some basic bot capabilities.

Using EntryList

EntryList enables you to accept any number of parameters through the bot designer. The parameter structure is defined in the Automation 360 actions.

Example: EntryList

The following example shows how to create a parameter with the name of `village` pair.

```
@BotCommand
@CommandPkg(label = "EntryList example", description = "EntryList example",
icon = "sample.svg", name = "entryListExample")
public class EntryListExample {
    // UI display for ENTRYLIST 1.1, the linking is done based on the ENTRYLIST
    title.
    // This should be added as a child of the ENTRYLIST, however it should not
    be part of options.
    // The EntryList does not need a setter or Inject as the value is provided
    inside the ENTRYLIST.
    @Idx(index = "1.3", type = TEXT, name = "NAME")
    @Pkg(label = "Name", default_value_type = DataType.STRING)
    @NotEmpty
    private String name;
    //Linked to 1.2 through title.
    @Idx(index = "1.4", type = TEXT, name = "VILLAGE")
    @Pkg(label = "village", default_value_type = STRING)
    private String city;
    @Execute
    public void setParameter(
```

```

// Add the entryList, the values are accepted as a list of values.
// Provide the column header for the tabular display of accepted entries.
// In Pkg, provide a unique title.
// Provide Idx for each option separately, this is needed to
// have the correct UI type when the entry form is presented.
// Add only columns to options, you cannot add their definitions.
@Idx(index = "1", type = ENTRYLIST, options = {
    @Idx.Option(index = "1.1", pkg = @Pkg(title = "NAME", label = "Name")),
    @Idx.Option(index = "1.2", pkg = @Pkg(title = "VILLAGE", label =
"village")),
})
//Label that is displayed in the UI
@Pkg(label = "Provide name value entries")
//Header of the entry form
@EntryListLabel(value = "Provide entry")
//Button label which displays the entry form
@EntryListAddButtonLabel(value = "Add entry")
//Unique rule for the column, this value is the column TITLE.
@EntryListEntryUnique(value = "NAME")
//Message to display in the table when no entries are present.
@EntryListEmptyLabel(value = "No parameters added")
List<Value> entryList) {
}

```

Here is another example of the EntryList, define the values of the EntryList usage.

```

//Entry list//
@Idx(index = "1", type = ENTRYLIST, options = {
    @Idx.Option(index = "1.1", pkg = @Pkg(title = HEADER_ENABLED, label =
"[[HEADER1]]")),
    @Idx.Option(index = "1.2", pkg = @Pkg(title = HEADER_NAME, label =
"[[HEADER1]]")),
    @Idx.Option(index = "1.3", pkg = @Pkg(title = HEADER_VALUE, label =
"[[HEARER3]]"))
})
@Pkg(label = "customHeaderslabel")
@EntryListLabel(value = "customHeaderlabel")
@EntryListAddButtonLabel(value = "add.header")
@EntryListEmptyLabel(value = "no.header")
@Inject
List<Value> customHeaders;

```

[How to examples](#)

This section contains code examples and explanations about how to code some basic bot capabilities.

Using regular expression

Use regular expressions (regex) to create string patterns that help match, locate, or manage text in Java. Together, the literals and special characters define a logical pattern. Use the pattern to compare strings of text to check if the strings match the defined pattern.

Note: Regular expression (regex) does not recognize **[\b]** as a Backspace command. Use **\\b** to use Backspace instead.

Example: MatchesRegex

Use `MatchesRegex` to test the string pattern.

In the following example, the input pattern starts from the English alphabet, uppercase and lowercase, (A-Z/a-z) and ends with a numeric value.

```
@Idx(index = "1", type = TEXT)
@Pkg(label = "Field label", description = "Field description")
@MatchesRegex("[A-Za-z]\w*")
@NotEmpty
String cell
```

If the pattern does not match, the following message is displayed: `Must match pattern.`

[How to examples](#)

This section contains code examples and explanations about how to code some basic bot capabilities.

FILE2 (Regex) attribute

A regular expressions (RegEx) are patterns of string defined to search for a file in a specified path. Use the `FILE2` attribute when using regular expressions (regex) to create string patterns.

For instance: If you want to search a folder path for a file (For example `Hello.txt`) which contains a certain string. . You will use `File2` attribute type to enter the following regex pattern: `Hell` or `e11` which will find the file that matches the search criteria. This topic is based on the `File2TypeDemo` sample available within the **Package SDK** in the following location `<PackageSDK>\src\main\java\com\automationanywhere\botcommand\samples\commands\basic\types\File2TypeDemo.java`.

Using the FILE2

1. Make sure you have imported the following packages to ensure all the functionalities works as described in the sample.

```
import com.automationanywhere.commandsdk.annotations.*;
import com.automationanywhere.commandsdk.model.AttributeType;
import org.apache.logging.log4j.LogManager;
import org.apache.logging.log4j.Logger;
```

2. Add the `@BotCommand` annotation to make a class as an Action in the Control Room. For more information on annotations, see [Annotations](#).

```
@BotCommand
```

3. Add the `@CommandPkg` annotation to define all the UI related components - *labels, description, icon, return type, and name*.

```
@CommandPkg(label = "[File2TypeDemo.label]", description =
  "[File2TypeDemo.description]", icon = "sample.svg", name =
  "file2TypeDemo")
```

4. Create a method (For example: *regexFile*) within your class and define the fields as described below.
 - a. Annotate the method with `@Execute` to execute the method during compilation.
 - b. In the below sample, `@Idx`, `@Pkg`, and `@NotEmpty` are defined as a parameters of the method. If they are used as a member of the class, then you should use `set` and `get` methods to define them.
 1. `@Idx` - Defines the index of an action. (`@Idx(index = "1", type = AttributeType.FILE2)`)
 2. `@Pkg` - Defines all the parameters and member variables shown in the interface (`@Pkg(label = "[[File2TypeDemo.localFile.label]]")`). Must be accompanied by the `@Idx`, if not this annotation is ignored.
 3. `@NotEmpty` - Defines that this parameter cannot be empty (`@NotEmpty @LocalFile FileValue fileValue)`).

```

@BotCommand
@CommandPkg(label = "[[File2TypeDemo.label]]",
            description = "[[File2TypeDemo.description]]", icon =
            "sample.svg", name = "file2TypeDemo")
public class File2TypeDemo {
    private static Logger logger =
    LogManager.getLogger(File2TypeDemo.class);

    @Execute
    public void regexFile(
        @Idx(index = "1", type = AttributeType.FILE2)
        @Pkg(label = "[[File2TypeDemo.localFile.label]]")
        @NotEmpty @LocalFile FileValue fileValue)

```

5. Build and upload the custom package to the Control Room. For more information on uploading the package, see [Using the package SDK](#).
6. Create a bot.
7. Drag the action into canvas and you will be able to input the regex to find a file. You will see an input box similar to this image.

DemoPackageSDK: File2 Demo

Sample action showing how to use regex with file name

Required bot agent version: 20.11 or above

Please enter a local file

Specific path

Folder path

File name

ell

Type	Value
Pattern	ell <input type="button" value="Clear"/>

Print the Regex - Folder name and the File location

Use the *Logger* interface obtained from Log4j package to provide information of the objects being manipulated. In the below sample you will be able to log the *folder name* and the *local file location* by using the `debug` method.

```
@BotCommand
```

```

@CommandPkg(label = "[[File2TypeDemo.label]]",
description = "[[File2TypeDemo.description]]", icon = "sample.svg", name =
"file2TypeDemo")
public class File2TypeDemo {
private static Logger logger = LogManager.getLogger(File2TypeDemo.class);

@Execute
public void regexFile(
@Idx(index = "1", type = AttributeType.FILE2) @Pkg(label =
"[[File2TypeDemo.localFile.label]]") @NotEmpty @LocalFile FileValue
fileValue) {
if (fileValue.isRegex()) {

RegexFile regexFile = fileValue.getRegex();
logger.debug("folder name {}", regexFile.getFolder());
logger.debug("local file location {}",
regexFile.getFileNamePattern().toString());
} else {
logger.debug("Regex option is not selected");
}
}
}

```

Create a condition using Package SDK

When using Automation 360, you can create a condition with the SDK package.

Using a condition

If and Loop are branching constructs in Automation 360. They are used to run a sequence of actions when a condition is set to `true`. A condition is used along with the If and Loop packages. A condition takes a set of inputs and returns a Boolean value.

Required annotations

For creating a condition, the following annotations are required:

Annotation	Usage
BotCommand	Use the BotCommand annotation with the condition as <code>commandType</code> . This ensures that the plain old Java object (POJO) is suitable for the creation of an Automation 360 condition.
CommandPkg	These values are used when creating a package. Provide a name, label, and description to the annotation.
Idx	Annotate all the parameters and member variables that are required and help with the validation check, or they might be displayed in the interface for the input. Provide the index (<code>Idx</code>) and the type.
Pkg	Annotate all the parameters and member variables that will be shown in the interface. This annotation will be ignored if it is not accompanied by the <code>Idx</code> .
ConditionTest	The method that has to be called for testing the condition. It must return a Boolean value. If the

Annotation	Usage
	method accepts parameters, then annotate them with <code>Idx</code> .

Use case example

The following use case verifies whether the given number is greater than the other number.

1. Create the POJO class with the business logic:

```
public class IsGreater {

    public Boolean checkGreater(Double first, Double checkAgainst) {
        return first > checkAgainst;
    }

}
```

2. Annotate the POJO class to enable it for the Automation 360 condition and to create the package:

```
@BotCommand(commandType = Condition)
@CommandPkg(label = "Is greater condition", name = "IsGreater",
    description = "Checks if the given number is greater than the other.",
    node_label = "{{first}} > {{checkAgainst}} ")
public class IsGreater {
    public Boolean checkGreater(Double first, Double checkAgainst) {
        return first > checkAgainst;
    }
}
```

3. Annotate the `checkGreater` method to indicate that this method should be used as a comparison method.

```
@ConditionTest
public Boolean checkGreater(Double first, Double checkAgainst) {
    return first > checkAgainst;
}
```

Every condition must have exactly one test condition method.

4. Annotate the parameters of the `checkGreater` method with `Idx` and `Pkg`.

Add `@NotEmpty` to ensure the value is not null.

```
@ConditionTest
public Boolean checkGreater(
    @Idx(index = "1", type = AttributeType.NUMBER) @Pkg(label = "Number to
    check") @NotEmpty Double first,

    @Idx(index = "2", type = AttributeType.NUMBER) @Pkg(label = "Number to
    compare against") @NotEmpty Double checkAgainst) {

    return first > checkAgainst;
}
```

The attribute type number returns a `Double`.

Related concepts[How to examples](#)

This section contains code examples and explanations about how to code some basic bot capabilities.

Add a condition in a custom package for `If` condition

Add conditions in a custom package.

Create condition values in an Action

- To create a condition, set `commandType` property of `BotCommand` annotation with value as `Condition`.
- To define the entry method of the condition, use the annotation `ConditionTest`.

```
@BotCommand(commandType = Condition)
@CommandPkg(label = "File exists", name = "fileExists",
    description = "Checks if the file exists.",
    node_label = "file exists at {{sourceFilePath}}", icon = "")
public class Exist extends AbstractCondition {
    @ConditionTest
    public boolean test(@Idx(index = "1", type = FILE) @LocalFile @Pkg(label =
    "File path") @NotEmpty String sourceFilePath,
        @Idx(index = "2", type = NUMBER) @Pkg(label = "How
    long you would like to wait for this condition
        to be true?(Seconds)",
            default_value = "0", default_value_type =
    DataType.NUMBER)
        @GreaterThanEqualTo("0") @LessThanEqualTo("99999")
    @NotEmpty @NumberInteger Double waitTimeout) {

        // Add the logic to check for the condition
    }
}
```

The following example verifies if the provided boolean value is false.

Set `commandType` to `Condition`.

```
@BotCommand(commandType = Condition)
@CommandPkg(label = "False condition example", name =
    "conditionalTypeExample",
    description = "Checks if the boolean value is false.")
public class ConditionalTypeExample {

    @ConditionTest
    public Boolean validate(
        @Idx(index = "1", type = AttributeType.BOOLEAN)
        @VariableType(BOOLEAN)
        @Pkg(label = "Boolean variable", default_value_type = BOOLEAN)
    @NotEmpty Boolean variable
    ) {
        return variable == null ? false : !variable ;
    }
}
```

Related concepts[How to examples](#)

This section contains code examples and explanations about how to code some basic bot capabilities.

Create an iterator using Package SDK

In Automation 360, you can create an iterator with the SDK package. An iterator is used to loop through multiple objects of similar type and is used with the Loop package. It consists of two methods, `next` and `hasNext`, which return the actual object and a boolean value.

Required annotations

When iterator is used, the `next` method returns the next available value. If no more values are available, an exception is shown. The `hasNext` method checks for other values and returns `false` if no more values are available. In Automation 360, when the loop is executed, `hasNext()` is called first, and `next()` is called only if `hasNext()` returned a `true` value.

For creating an iterator, the following annotations are required.

Annotation	Usage
BotCommand	Use the BotCommand annotation with an iterator as the <code>commandType</code> . This ensures that the plain old Java object (POJO) is eligible for creating an Automation 360 iterator.
CommandPkg	When creating a package, provide a name, label, and description to the annotation.
Idx	Annotate all parameters and member variables that are required and help with the validation check, or they can be displayed in the interface for the input. Provide the <code>Idx</code> and the type.
Pkg	Annotate all parameters and member variables that will be displayed in the interface. This annotation will be ignored if it is not accompanied by the <code>Idx</code> .
HasNext	The method that has to be called for testing if the iteration has more elements (returns <code>true</code> if <code>next()</code> returns an element rather than throwing an exception). It must return a Boolean value. If the method accepts parameters, then they must be annotated with the <code>Idx</code> . The <code>hasNext</code> method verifies it and returns <code>false</code> if no more values are available. In Automation 360, when Loop is executed, <code>hasNext()</code> is called first. <code>next()</code> is called only if <code>hasNext()</code> returns a <code>true</code> value.
Next	The method returns the next available value in the iteration. The return type is a value. If no more value is available, an exception is shown.

Use case example

The example use case loops through number of times, for example, `for (int i=0; I<n; i++)` Java construct. It accepts the value of `n` from the Bot Creator when the bot is created.

1. Make sure you have imported the following packages to ensure all the functionalities works as described in the sample.

```
import com.automationanywhere.botcommand.data.Value;
import com.automationanywhere.botcommand.data.impl.NumberValue;
import com.automationanywhere.commandsdk.annotations.BotCommand;
import com.automationanywhere.commandsdk.annotations.CommandPkg;
import com.automationanywhere.commandsdk.annotations.HasNext;
import com.automationanywhere.commandsdk.annotations.Idx;
import com.automationanywhere.commandsdk.annotations.Inject;
import com.automationanywhere.commandsdk.annotations.Next;
```

```
import com.automationanywhere.commandsdk.annotations.Pkg;
import
    com.automationanywhere.commandsdk.annotations.BotCommand.CommandType;
import
    com.automationanywhere.commandsdk.annotations.rules.GreaterThanOrEqualTo;
import com.automationanywhere.commandsdk.annotations.rules.NotEmpty;
import com.automationanywhere.commandsdk.annotations.rules.NumberInteger;
import com.automationanywhere.commandsdk.model.AttributeType;
import com.automationanywhere.commandsdk.model.DataType;
```

2. Create the POJO class with the business logic.

Ensure that the POJO has a method and returns a boolean value. This will act as the comparison method.

```
@BotCommand(commandType=CommandType.Iterator)
@CommandPkg(return_label = "Return the value in variable", node_label =
    ": {{times}} times",
    label = "Iterator demo", description = "Iterate number of times", name =
    "iteratorTypeDemo", return_type = DataType.NUMBER)
public class IteratorTypeDemo {
    @Idx(index = "1", type = AttributeType.NUMBER)
    @Pkg(label = "times", default_value = "10", default_value_type =
    DataType.NUMBER)
    @GreaterThanOrEqualTo("0")
    @NumberInteger
    @NotEmpty
    @Inject
    private Double times = 10d;

    private Double counter = 0d;

    @HasNext
    public boolean hasNext() {
        return counter < times;
    }

    @Next
    public Value<Double> next() throws Exception{
        if (counter >= times)
            throw new Exception("Counter '"+ counter +"' is exceed the times limit
            '"+times+"'");

        counter++;
        NumberValue result = new NumberValue();
        result.set(counter);
        return result;
    }

    public void setTimes(Double times) {
        this.times = times;
    }
}
```

3. Annotate the POJO class to enable it for the Automation 360 iterator and to create a package.

```
@BotCommand(commandType = CommandType.Iterator)
@CommandPkg(return_label = "Return the value in variable", node_label =
    ": {{times}} times",
    label = "Iterator demo", description = "Iterate number of times", name =
    "iteratorTypeDemo", return_type = DataType.NUMBER)
public class IteratorTypeDemo {
```

```
private Double times = 10 d;
private Double counter = 0 d;

public boolean hasNext() {
    return counter < times;
}
```

4. Annotate the `hasNext()` and `next()` method appropriately.

```
@HasNext
public boolean hasNext() {
    return counter < times;
}

@Next
public Value < Double > next() throws Exception {
    if (counter >= times)
        throw new Exception("Counter '" + counter + "' is exceed the times
limit '" + times + "'");

    counter++;
    NumberValue result = new NumberValue();
    result.set(counter);
    return result;
}
```

The methods are named in easy-to-use way and are in parallel with the Java iterator interface. There is no restriction from the SDK side when naming methods.

In an iterator, do not use parameter methods, but use setter injection.

5. Annotate the variables with `Idx` and `Pkg`.

Add `@NotEmpty` to ensure the value is not null, and add `@GreaterThanEqualTo` to ensure the value is always greater than 0.

```
@Idx(index = "1", type = AttributeType.NUMBER)
@Pkg(label = "times", default_value = "10", default_value_type =
    DataType.NUMBER)
@GreaterThanEqualTo("0")
@NotEmpty
@Inject
private Double times = 10 d;
```

The attribute type number returns a `Double`.

[How to examples](#)

This section contains code examples and explanations about how to code some basic bot capabilities.

Create a trigger using Package SDK

When using Automation 360, you can create a trigger using the SDK package.

Using a trigger

Use Automation 360 to create a trigger. A trigger launches a bot when certain conditions are met and waits until conditions have changed or stopped. When the conditions of the trigger are matched, the run method is called to signal the trigger.

Required annotations

For creating a trigger, the following annotations are required:

Annotation	Usage
BotCommand	Use the <code>BotCommand</code> annotation with the <code>trigger</code> as <code>commandType</code> . This ensures that the plain old Java object (POJO) is suitable for creating the trigger with Automation 360.
CommandPkg	These values are used when creating a package. Provide a name, label, and description to the annotation.
Idx	Annotate all the parameters and member variables that are required and help with the validation check. Alternatively, they might be displayed in the interface for the input. Provide the index (<code>Idx</code>) and the type.
Pkg	Annotate all the parameters and member variables that will be shown in the interface. This annotation will be ignored if it is not accompanied by the <code>Idx</code> .
StartListen	Starts the trigger listener.
TriggerId	A trigger ID, which is required for stopping the trigger.
TriggerRunnable	Provides the runnable. Calling the runnable sends a signal that launches a bot associated with a trigger.

Use case example

The following use case shows how to create a timer trigger that triggers a bot at a regular interval.

1. Create the POJO class with the business logic:

```
public class TriggerDemo {
    private static final Timer TIMER = new Timer(true);

    public void startTrigger(Double interval) {
        TimerTask timerTask = new TimerTask() {

            @Override
            public void run() {
                // Do nothing
            }
        };

        TIMER.schedule(timerTask, interval.longValue());
    }
}
```

Multiple triggers of the same type can exist in a bot. All triggers are identified by a `triggerId`.

2. Add a triggerId to the class:

```
@TriggerId
private String triggerUid;

public String getTriggerUid() {
    return triggerUid;
}

public void setTriggerUid(String triggerUid) {
    this.triggerUid = triggerUid;
}
```

3. Store the TimerTask separately so that when you want to stop a specific trigger, use the triggerId.

```
private static final Map<String, TimerTask> taskMap = new
    ConcurrentHashMap<>();

public void startTrigger(Double interval) {
    TimerTask timerTask = new TimerTask() {

        @Override
        public void run() {
            // Do nothing
        }
    };
    taskMap.put(this.triggerUid, timerTask);
    TIMER.schedule(timerTask, interval.longValue());
}
```

4. Start a trigger when conditions are met. Accept a runnable and call it appropriately.

```
@TriggerRunnable
private Runnable runnable;

public Runnable getRunnable() {
    return runnable;
}

public void setRunnable(Runnable runnable) {
    this.runnable = runnable;
}

public void startTrigger(Double interval) {
    TimerTask timerTask = new TimerTask() {

        @Override
        public void run() {
            runnable.run();
        }
    };
    taskMap.put(this.triggerUid, timerTask);
    TIMER.schedule(timerTask, interval.longValue());
}
```

5. Stop the trigger, either individually (use a triggerId), or stop all triggers at the same time (StopAllTriggers).

```
/*
```

```

    * Cancel all the task and clear the map.
    */
    @StopAllTriggers
    public void stopAllTriggers() {
        taskMap.forEach((k, v) -> {
            if (v.cancel()) {
                taskMap.remove(k);
            }
        });
    }

    /*
    * Cancel the task and remove from map
    *
    * @param triggerUid
    */
    @StopListen
    public void stopListen(String triggerUid) {
        if (taskMap.get(triggerUid).cancel()) {
            taskMap.remove(triggerUid);
        }
    }
}

```

6. Add the remaining annotations.

```

@BotCommand(commandType = BotCommand.CommandType.Trigger)
@CommandPkg(label = "Demo Trigger", description = "Demo Trigger", icon =
    "email.svg", name = "demoTrigger")
public class TriggerDemo {
    //Other code

    @StartListen
    public void startTrigger(@Idx(index = "1", type = AttributeType.NUMBER)
        @Pkg(label = "Please provide the interval to trigger in seconds",
            default_value = "120", default_value_type = DataType.NUMBER)
        @GreaterThan("0")
        @NumberInteger
        @NotEmpty
        Double interval) {
        //Other code
    }
}

```

Custom triggers - pull and push mechanism

The examples provided in this topic demonstrate how to create time-based and event-based triggers, pull ([link TriggerDemo](#)) and push ([SimpleMessageListenerContainer](#)) mechanisms using the SDK package.

Example: Time-based triggers - Pull mechanism

The required conditions of triggering are tested at the regular interval, in seconds.

- A trigger checks the database (DB) at regular intervals and if the SQL (DB) value that a user provides is more than 0, then the timer-based trigger is triggered.
- When the event occurs, it runs the `consumer.accept(<RecordValue Instance>)` method and triggers an associated bot.
- It verifies the conditions at each run.
- Add the valid DB driver in the **build.gradle** file to run this example.

This example is an extension of the timer-based trigger ([TriggerDemo](#)) and demonstrates the trigger pull mechanism.

Note: This is an illustrative example and do not use it in the production environment.

```
@BotCommand(commandType = BotCommand.CommandType.Trigger)
@CommandPkg(label = "JDBC Query Trigger", description = "JDBC Query
Trigger", icon = "jdbc.svg", name = "jdbcQueryTrigger",
return_type = RECORD, return_name = "TriggerData", return_description =
"Available keys: triggerType")
public class DBStatus {

    private static Logger logger = LogManager.getLogger(DBStatus.class);

    // Map storing multiple tasks
    private static final Map<String, TimerTask> taskMap = new
ConcurrentHashMap<>();
    private static final Timer TIMER = new Timer(true);

    @TriggerId
    private String triggerUid;
    @TriggerConsumer
    private Consumer consumer;

    /*
     * Starts the trigger.
     */
    @StartListen
    public void startTrigger(
        @Idx(index="1", type = AttributeType.TEXT)
        @Pkg(label = "Provide the database driver class")
        @NotEmpty
        String driverClassName,

        @Idx(index="2", type = AttributeType.TEXT)
        @Pkg(label = "Provide the Jdbc connection string")
        @NotEmpty
        String jdbcUrl,
```

```

@Idx(index="3", type = AttributeType.TEXT)
@Pkg(label = "Provide the user Name")
@NotEmpty
String userName,

@Idx(index="4", type = AttributeType.CREDENTIAL)
@Pkg(label = "Provide the password")
@NotEmpty
SecureString password,

@Idx(index="5", type = AttributeType.TEXT)
@Pkg(label = "Provide the SQL to check the records")
@NotEmpty
String sqlQuery,

@Idx(index = "6", type = AttributeType.NUMBER)
@Pkg(label = "Provide the interval to query in seconds", default_value =
"300", default_value_type = DataType.NUMBER)
@GreaterThan("0")
@NumberInteger
@NotEmpty
Double interval) {

DataSource dataSource = getDataSource(driverClassName, jdbcUrl, userName,
password);

TimerTask timerTask = new TimerTask() {

@Override
public void run() {
logger.debug("checking DB");
try {
if(checkRecordsExist(dataSource.getConnection(), sqlQuery)){
consumer.accept(getRecordValue());
return;
}
} catch (SQLException e) {
logger.warn(e.getMessage(),e);
logger.warn("Trigger is still running.");
}
logger.debug("no records found");

}
};

taskMap.put(this.triggerUid, timerTask);
TIMER.schedule(timerTask, interval.longValue(), interval.longValue());
}

private RecordValue getRecordValue() {
List<Schema> schemas = new LinkedList<>();
List<Value> values = new LinkedList<>();
schemas.add(new Schema("triggerType"));
values.add(new StringValue("DBStatus"));

RecordValue recordValue = new RecordValue();
recordValue.set(new Record(schemas, values));
return recordValue;
}
/*
* Cancel all the tasks and clear the map.
*/
@stopAllTriggers
public void stopAllTriggers() {

```

```

taskMap.forEach((k, v) -> {
    if (v.cancel()) {
        taskMap.remove(k);
    }
});
}

/*
 * Cancel the task and remove from the map
 *
 * @param triggerUid
 */
@stopListen
public void stopListen(String triggerUid) {
    if (taskMap.get(triggerUid).cancel()) {
        taskMap.remove(triggerUid);
    }
}

    public static DataSource getDataSource(String driverClassName, String
url, String userName, SecureString password) {
        BasicDataSource ds = new BasicDataSource();
        ds.setDriverClassName(driverClassName);
        ds.setUrl(url);
        ds.setUsername(userName);
        ds.setPassword(password.getInsecureString());
        return ds;
    }

    public static boolean checkRecordsExist(Connection con, String query)
throws SQLException {

        Statement stmt = null;
        try {
            stmt = con.createStatement();
            ResultSet rs = stmt.executeQuery(query);
            rs.last();
            if(rs.getRow() > 0)
                return true;
        } catch (SQLException e ) {
            throw new BotCommandException("Problem running statemnt", e);
        } finally {
            if (stmt != null) { stmt.close(); }
        }
        return false;
    }

    public String getTriggerUid() {
        return triggerUid;
    }
    public void setTriggerUid(String triggerUid) {
        this.triggerUid = triggerUid;
    }
    public Consumer getConsumer() {
        return consumer;
    }
    public void setConsumer(Consumer consumer) {
        this.consumer = consumer;
    }
}

```

Example: Event-based triggers - Push mechanism

The trigger waits for an event to occur, for example, a message listener to start listening.

- An event details are stored in the memory and a message listener waits for a message.
- When the event occurs, it runs the `consumer.accept(<RecordValue Instance>)` method and triggers an associated bot..

The following example shows how to create a simple ActiveMQ message listener (SimpleMessageListenerContainer) to demonstrate the trigger push mechanism.

```
@BotCommand(commandType = BotCommand.CommandType.Trigger)
@CommandPkg(label = "JMS Trigger", description = "JMS Trigger", icon =
    "jms.svg", name = "jmsTrigger",
    return_type = RECORD, return_name = "TriggerData", return_description =
    "Available keys: triggerType")
public class JMSQueue implements SessionAwareMessageListener {

    // Map storing multiple MessageListenerContainer
    private static final Map<String, MessageListenerContainer> taskMap = new
    ConcurrentHashMap<>();

    @TriggerId
    private String triggerUid;
    @TriggerConsumer
    private Consumer consumer;

    //This method is called by MessageListenerContainer when a message arrives.
    // At this point, the trigger get enabled
    @Override
    public void onMessage(javax.jms.Message message, Session session) throws
    JMSEException {
        consumer.accept(getRecordValue());
    }

    private RecordValue getRecordValue() {
        List<Schema> schemas = new LinkedList<>();
        List<Value> values = new LinkedList<>();
        schemas.add(new Schema("triggerType"));
        values.add(new StringValue("JMSQueue"));

        RecordValue recordValue = new RecordValue();
        recordValue.set(new Record(schemas, values));
        return recordValue;
    }
    /*
     * Starts the trigger.
     *
     * Use this method to setup the trigger, such as, setup the
     MessageListenerContainer and start it.
     */
    @StartListen
    public void startTrigger(@Idx(index = "1", type = AttributeType.TEXT)
    @Pkg(label = "Provide the broker URL")
    @NotEmpty
    String brokerURL, @Idx(index = "2", type = AttributeType.TEXT)
    @Pkg(label = "Provide the queue name")
    @NotEmpty
    String queueName) {
```

```

    if (taskMap.get(triggerUid) == null) {
        synchronized (this) {
            if (taskMap.get(triggerUid) == null) {
                SimpleMessageListenerContainer messageListenerContainer = new
SimpleMessageListenerContainer();
                messageListenerContainer.setConnectionFactory(new
PooledConnectionFactory(brokerURL));
                messageListenerContainer.setDestinationName(queueName);
                messageListenerContainer.setMessageListener(this);
                messageListenerContainer.start();
                taskMap.put(triggerUid, messageListenerContainer);

            }
        }
    }

}

/*
 * Cancel all the tasks and clear the map.
 */
@stopAllTriggers
public void stopAllTriggers() {
    taskMap.forEach((k, v) -> {
        v.stop();
        taskMap.remove(k);
    });
}

/*
 * Cancel the tasks and remove from the map
 *
 * @param triggerUid
 */
@stopListen
public void stopListen(String triggerUid) {
    taskMap.get(triggerUid).stop();
    taskMap.remove(triggerUid);
}

public String getTriggerUid() {
    return triggerUid;
}

public void setTriggerUid(String triggerUid) {
    this.triggerUid = triggerUid;
}

public Consumer getConsumer() {
    return consumer;
}

public void setConsumer(Consumer consumer) {
    this.consumer = consumer;
}
}

```

This section contains code examples and explanations about how to code some basic bot capabilities.

Add debug logs of custom packages to **bot_launcher.log** file

You can add logs using `log4j`. The dependency is already added in the package SDK sample `build.gradle` file. Review the logging info using `RadioTypeDemo.java` file.

Example 1: Logger info - Get region value using `RadioTypeDemo` class

1. Review the code example where the logger is added in the code, open the `RadioTypeDemo.java` file located at `<your latest package-sdk-2.0.9>\src\main\java\com\automationanywhere\botcommand\samples\commands\basic\types`

```
@BotCommand
@CommandPkg(label = "[[RadioTypeDemo.label]]",
description = "[[RadioTypeDemo.description]]", icon = "sample.svg", name
= "radioTypeDemo")
public class RadioTypeDemo {

    private static Logger logger =
    LogManager.getLogger(RadioTypeDemo.class);

    @Execute
    public void getRegionValue(@Idx(index = "1", type = AttributeType.RADIO,
options = {
        @Idx.Option(index = "1.1", pkg = @Pkg(label =
        "[[RadioTypeDemo.region.1.1.label]]", value = "us_east")),
        @Idx.Option(index = "1.2", pkg = @Pkg(label =
        "[[RadioTypeDemo.region.1.2.label]]", value = "us_west")),
        @Idx.Option(index = "1.3", pkg = @Pkg(label =
        "[[RadioTypeDemo.region.1.3.label]]", value = "us_central"))
    })
    @Pkg(label = "[[RadioTypeDemo.region.label]]")
    @NotEmpty
    String region) {
        logger.info("Selected region is {}", region);
    }
}
```

2. Build a simple bot from the Automation 360 Demo package and select a radio group: **Radio Demo**.
3. Select an appropriate region, such as, US East.
4. Save and run the bot.
5. Access the folder where the logs were generated, the default log location: `C:\ProgramData\AutomationAnywhere\BotRunner\Logs\Bot_Launcher.log`.

If the logs get roll back from the `Bot_Launcher.log` file, then logs will create a folder based on the month when they were created, for example, 2021-May. Inside this folder, the logs will continue to generate.

6. Open the `Bot_Launcher.log` file and review the log info for the **RadioTypeDemo** and **selected region is us_east**.

Example 2: Assigning a value to clipboard

The following example accepts a user input or a variable and assigns it to clipboard.

```
@BotCommand
@CommandPkg(label = "Copy to", icon="assigntoclipboard.svg" , name =
"assignToClipboard", description
= "Accepts user input or a variable and assigns it to Clipboard",
node_label="{value}")
```

```
public class AssignToClipboard {

    private static Logger logger =
        LogManager.getLogger(AssignToClipboard.class);

    @Execute
    public static void assign(@Idx(index = "1", type = TEXT) @Pkg(label =
        "Value") @NotEmpty String
        value) {

        logger.trace("Assigning '{} ' value to clipboard.", value);
    }
}
```

Handle sessions in a custom package

You can extract a session using a session name from the *SessionsMap*. In the same package, you can use sessions to pass information between actions, but not to other packages.

Configure the following attributes

- Apply an annotation to the class field and add a corresponding public setter.
- Retrieve the *SessionsMap* using the *Sessions* attribute.
- Set the variable type as *Map<String, Object>*.
- Set the *attributeType*: TEXT or SESSION. If *type = TEXT*, it is a regular session; if *type = SESSION*, it is a *sharedSession*.

Start a new session

```
@BotCommand
@CommandPkg(label = "Start session", name = "startSession", description =
    "Start new session",
    icon = "pkg.svg", node_label = "start session {{sessionName}}|") public
class Start {

    @Sessions
    private Map<String, Object> sessions;

    @Execute
    public void start(@Idx(index = "1", type = TEXT) @Pkg(label = "Session
name",
        default_value_type = STRING, default_value = "Default") @NotEmpty String
        sessionName) {

        // Check for existing session
        if (sessions.containsKey(sessionName))
            throw new
            BotCommandException(MESSAGES.getString("xml.SessionNameInUse",
            sessionName));

        // Do some operation
```

```

        // Create new session
        sessions.put(sessionName, new Session(operation));
    }
    public void setSessions(Map<String, Object> sessions) {
        this.sessions = sessions;
    }
}

```

End a session

```

@BotCommand
@CommandPkg(label = "End session", name = "endSession", description = "End
    session", icon =
    "pkg.svg", node_label = "End session {{sessionName}}|")
public class EndSession {
    @Sessions
    private Map<String, Object> sessions;
    @Execute
    public void end(
        @Idx(index = "1", type = TEXT) @Pkg(label = "Session name",
        default_value_type = STRING,
        default_value = "Default") @NotEmpty String sessionName) {

        sessions.remove(sessionName);
    }
    public void setSessions(Map<String, Object> sessions) {
        this.sessions = sessions;
    }
}

```

Add a session

In the below example, string objects are used (although in real actions, you can use complex objects).

```

@BotCommand
@CommandPkg(label = "[[SessionDemo.label]]", description =
    "[[SessionDemo.description]]", icon = "sample.svg", name = "sessionDemo")
public class SessionDemo {

    // Sessions are provided as a Map. Actions can add or remove entries in
    this
    // Map.
    // The choice to reuse/overwrite/delete/add any Object in this Map belongs
    to
    // the actions, and the framework makes no assumption regarding it.
    @Sessions
    private Map<String, Object> sessionMap;

    @Execute
    public void execute(@Idx(index = "1", type = TEXT)
        @Pkg(label = "[[SessionDemo.name.label]]")
        @NotEmpty
        String name) {

```

```

    if (!sessionMap.containsKey(name))
        sessionMap.put(name, "Some Value");
    }

    // Ensure that a public setter exists.
    public void setSessionMap(Map<String, Object> sessionMap) {
        this.sessionMap = sessionMap;
    }
}

```

Set a session variable

The below example shows how to develop an action (for example, Set session variable). In the action, the session details are retrieved and stored as a session variable so that the information can be used within a specific package.

```

@BotCommand
@CommandPkg(label = "[[SessionDemo2.label]]", description =
    "[[SessionDemo2.description]]", icon = "sample.svg", name = "SessionDemo2",
return_type = DataType.STRING)
public class SessionDemo2 {

    // Sessions are provided as a Map. Actions can add or remove entries in
    this
    // Map.
    // The choice to reuse/overwrite/delete/add any Object in this Map belongs
    to
    // the actions, and the framework makes no assumption regarding it.
    @Sessions
    private Map<String, Object> sessionMap;

    @Execute
    public Value<?> execute(@Idx(index = "1", type = TEXT)
@Pkg(label = "[[SessionDemo2.name.label]]")
@NotEmpty
String name) {
        if (sessionMap.containsKey(name)) {
            return new StringValue(sessionMap.get(name));
        }
        return new StringValue("session does not exist");
    }
    // Ensure that a public setter exists.
    public void setSessionMap(Map<String, Object> sessionMap) {
        this.sessionMap = sessionMap;
    }
}

```

[How to examples](#)

This section contains code examples and explanations about how to code some basic bot capabilities.

Configure shared session using Package SDK

Package SDK provides configuration for the SDK users to create and use shared sessions. Sessions are seamlessly shared between different bots to share resources between them. This means that if a session has been created, the other TaskBots can read and update the session and vice versa.

Share session between parent and child

The following section describes creating a shared session. The parent *GlobalSessionDemoUpperCaseParent* returns a *Session value* to the global session and is used by the child bot *GlobalSessionDemoUpperCaseChild*.

Note: Place the three classes below in the following location: <PackageSDK>\src\main\java\com\automationanywhere\botcommand\samples\commands\basic

1. Create the following POJO class `DemoForSession` that implements *CloseableSessionObject*.

```
package
com.automationanywhere.botcommand.samples.commands.basic.GlobalSessionSampleProject

import
com.automationanywhere.toolchain.runtime.session.CloseableSessionObject;

import java.io.IOException;

public class DemoForSession implements CloseableSessionObject
{
    public void setClose(boolean close) {
        this.close = close;
    }

    boolean close=false;
    public String getDemo() {
        return demo;
    }

    public void setDemo(String demo) {
        this.demo = demo;
    }
    public DemoForSession(String demo){
        this.demo=demo;
    }
    String demo;

    @Override
    public boolean isClosed() {
        return close;
    }

    @Override
    public void close() throws IOException {

    }
}
```

2. Add the `@BotCommand` annotation to make a class as an Action in the Control Room. For more information on annotations, see [Annotations](#).

```
@BotCommand
```

3. Add the `@CommandPkg` annotation to define all the UI related components - *labels, description, icon, return_type, and name*. The elements *return_label, return_settings, return_type, and return_required* belonging to the `@CommandPkg` ensures that the SESSION is returned by the parent bot.

```
@CommandPkg (
    //Unique name inside a package and label to display.
    name = "GlobalSession", label = "Global session uppercase parent",
```

```

node_label = "Shared session parent node label", description = "Shared
session parent description", icon = "pkg.svg",

//Return type information. return_type ensures only the right kind of
variable is provided on the UI.
return_label = "Return the parent session",
return_settings = {ReturnSettingsType.SESSION_TARGET},
return_type = SESSION,
return_required = true)

```

4. Create the *GlobalSessionDemoUpperCaseParent* object. The *GlobalSessionDemoUpperCaseParent* gets a lower case string input from the action's input, converts it to an upper case string and store the result in the *SessionValue*.

- Annotate the method with `@Execute` to execute the method during compilation.

```

package
com.automationanywhere.botcommand.samples.commands.basic.GlobalSessionSampleProje

import com.automationanywhere.botcommand.data.impl.SessionValue;
import com.automationanywhere.commandsdk.annotations.*;
import com.automationanywhere.commandsdk.annotations.rules.NotEmpty;
import com.automationanywhere.commandsdk.model.ReturnSettingsType;
import org.apache.logging.log4j.LogManager;
import org.apache.logging.log4j.Logger;

import java.util.Map;

import static
com.automationanywhere.commandsdk.model.AttributeType.TEXT;
import static com.automationanywhere.commandsdk.model.DataType.SESSION;

//BotCommand makes a class eligible for being considered as an action.
@BotCommand

//CommandPks adds required information to be disalable on GUI.
@CommandPkg(
//Unique name inside a package and label to display.
name = "GlobalSession", label = "Global session uppercase parent",
node_label = "Shared session parent node label", description =
"Shared session parent description", icon = "pkg.svg",

//Return type information. return_type ensures only the right kind of
variable is provided on the UI.
return_label = "Return the parent session",
return_settings = {ReturnSettingsType.SESSION_TARGET},
return_type = SESSION,
return_required = true)
public class GlobalSessionDemoForStringUpperCaseParent {
private static Logger logger =
LogManager.getLogger(GlobalSessionDemoForStringUpperCaseParent.class);

//Identify the entry point for the action. Returns a SessionValue
because the return_type is SESSION.
@Execute
public SessionValue action(
//Idx 1 would be displayed first, with a text box for entering the
value.
@Idx(index = "1", type = TEXT)
//UI labels.
@Pkg(label = "Enter string in lower case")
//Ensure that a validation error is thrown when the value is null.

```

```

    @NotEmpty
    String firstString) {
    String result = firstString.toUpperCase();
    DemoForSession demoForSession= new DemoForSession(result);
    return SessionValue
        .builder()
        .withSessionObject(demoForSession)
        .build();
    }
}

```

5. Create the *GlobalSessionDemoUpperCaseChild* object. The *GlobalSessionDemoUpperCaseChild* gets a lower case string input from the action's input, converts it to upper case and concatenates it with the *SessionValue* received from the parent bot.

```

package
com.automationanywhere.botcommand.samples.commands.basic.GlobalSessionSampleProject

import com.automationanywhere.botcommand.data.Value;
import com.automationanywhere.botcommand.data.impl.StringValue;

import static com.automationanywhere.commandsdk.model.DataType.STRING;

//BotCommand makes a class eligible for being considered as an action.
@BotCommand

//CommandPkgs adds required information to be disalable on GUI.
@CommandPkg(
    //Unique name inside a package and label to display.
    name = "GlobalSessionChild", label = "Global session upper case child",
    node_label = "Global session child node label",
    description = "Global session child description", icon = "pkg.svg",

    //Return type information. return_type ensures only the right kind of
    variable is provided on the UI.
    return_label = "Return the concatenated string to", return_type =
    STRING, return_required = true)
public class GlobalSessionDemoUpperCaseChild {
    private static Logger logger = LogManager.getLogger(Uppercase.class);

    @Execute
    public Value<String> action(
        //Idx 1 would be displayed first, with a text box for entering the
        value.
        @Idx(index = "1", type = TEXT)
        //UI labels.
        @Pkg(label = "Enter a sting in lower case to concatenate")
        //Ensure that a validation error is thrown when the value is null.
        @NotEmpty
        String sourceString,
        @Idx(index = "2", type = AttributeType.SESSION)

```

```

@Pkg(label = "sharedSession", description = "sharedSession",
    default_value = "Default", default_value_type = DataType.SESSION)
//Using the sessionObject annotation here as its a consumer class
@SessionObject
DemoForSession session) {

//Business logic
String result = sourceString.toUpperCase();
logger.info("session: {}", session);
return new StringValue(result+session.getDemo().toUpperCase());
}
}

```

6. Build and upload the custom package to the Control Room. For more information on uploading the package, see [Using the package SDK](#).
7. Create a bot by using the **Global session uppercase parent** action.
 - a. Enter a lower case string (For example: *parentbot string*)
 - b. Enter a name for the session. The parent bot returns the value to the Global session (For example: Global)
8. Create a TaskBots by using the **Global session upper case child** action. You will be able to input a lower case string and also get the string from the shared parent session. Concatenate the parent and child strings.
9. Use a **Message box** to show the output.

The screenshot displays the Automation Anywhere interface for configuring a bot workflow. The top window, titled "SharedSession", shows the "Actions" pane with "Global session uppercase parent" selected. The main workspace shows a flowchart with two steps: 1. "DemoPackageSDK: Global session uppercase parent Shared session parent node" and 2. "Task Bot: Run 'Bots\SharedSessionChild' and assign output to variable".

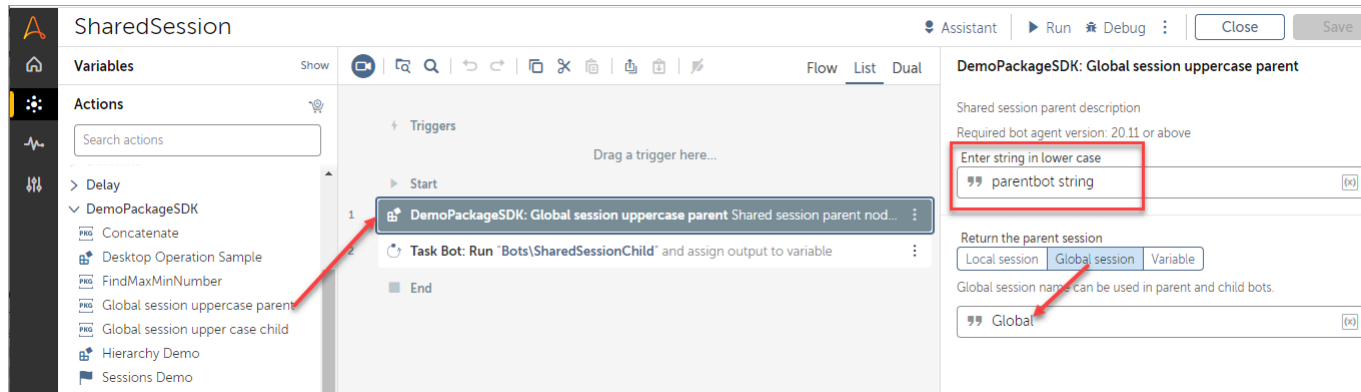

The bottom window, titled "SharedSessionChild", shows the configuration for the child bot. The "Actions" pane lists various actions, and the main workspace shows a flowchart with two steps: 1. "DemoPackageSDK: Global session upper case child Global session child node label" and 2. "Message box \$\$SampleString\$".

Red arrows indicate the flow of configuration: one arrow points from the "Task Bot" action in the parent bot to the "Global session upper case child" action in the child bot, and another arrow points from the "Message box" action in the child bot to the "Message box" configuration field in the child bot's configuration pane.

The configuration pane for "DemoPackageSDK: Global session upper case child" includes the following fields:

- Global session child description
- Required bot agent version: 20.11 or above
- Enter a sting in lower case to concatenate: childbot string
- sharedSession (optional): Global
- Return the concatenated string to: SampleString

10. Now call the **Global session upper case child** into the parent.

11. Run the parent bot and you will see the message box showing the value from the Child bot which it derived using the Shared global session.

Build bots to share session details using Package SDK

A shared session enables you to reuse actions between TaskBots that run concurrently, for example, using the same Excel file to pass values.

Ensure you have the following to build a TaskBot:

- Access to the Control Room
- Credentials with **AAE_Basic** permissions
- A development license, which enables you to create and run TaskBots
- Your workstation is a registered device in the Control Room
- An Excel file that you want to use in the shared session actions

1. Log in to the Control Room.
2. Create three TaskBots that will share the shared session actions.
3. Create a new *childSession2* variable of **Type > Session** and **Session type > MS Excel session**, select **Use as input**, and then click **Apply**.
4. On the left pane, click **Automation**.
A list of available and forms is displayed.
5. Click the **Create a bot** icon.
6. Create a new bot called *childBot2*.
 - a) In the **Name** field, enter *childBot2*.
 - b) In the Actions pane, find **Excel Advanced**, and drag **Get current worksheet name** to the Bot editor.
 - c) In **Session name > Shared session**, enter **F2 > childSession2**, and in **Assign the output to variable**, select **prompt-assignment**.
7. Create a new *parentSession* variable of **Type > Session** and **Session type > MS Excel session**, and then click **Apply**.
8. Create a new bot called *parentSession*, and click **Create & Edit**.

9. In the Actions pane, find **Excel Advanced**, and drag **Open** to the Bot editor.
 - a) In **File path**, select **Desktop file**, click **Browse**, and navigate to the Excel file that you want to use.
 - b) In **Session name**, retain **Default**.
 - c) Click **Save**.
10. Create a new *childSession1* variable of **Type** > **Session** and **Session type** > **MS Excel session**, select **Use as input**, and then click **Apply**.
11. Create a new bot called *childBot1*.
 - a) In the **Name** field, enter *childBot1*.
 - b) In the Actions pane, find **Excel Advanced**, and drag **Get single cell** to the Bot editor.
 - c) Select **Active cell** in **Session name**, and select **Local name**, enter **F2**, and then in **Store cell content to**, select **prompt-assignment**.
12. In the Actions pane, find **Excel Advanced**, and drag **Set session variable** to the Bot editor.
 - a) In **Session name**, retain **Default**.
 - b) In **Save session to a variable**, select **parentSession**.
13. From the Actions pane, find **Task Bot**, and drag **Run** to the Bot editor.
 - a) In **Task Bot to run**, select **Control Room file**, click **Choose**, and then **Browse**, and select **childBot1**.
 - b) In **Input values**, select **Set childSession1**, enter **F2**, and select **parentSession**.
14. In the Actions pane, find **Excel Advanced**, and drag **Close**, select **Session name** as **Local name**, and retain **Default**.
15. In the Actions pane, find **Message box**. In **Enter the message to display**, enter **F2**, and then select **prompt-assignment**.
16. From the Actions pane, select **Task Bot**, and drag **Run** to the Bot editor.
 - a) In **Task Bot to run**, select **Control Room file**, click **Choose**, and then **Browse**, and then select **childBot2**.
 - b) In **Input values**, select **Set childSession2**, enter **F2**, and select **childSession1**.
17. In the Actions pane, find **Message box**. In **Enter the message to display**, enter **F2**, and select **prompt-assignment**.
18. Save all three bots and run the **parentSession** TaskBot.

The following three messages are displayed:

```
Single cell value from parent bot:1
```

```
Current worksheet name of excel opened in parent bot: Sheet1 <name of the sheet>
```

```
Your bot has run successfully!
```

[Develop a sample package](#)

Develop your own package and upload it to an Control Room to provide custom actions for bots.

Creation and function annotations

List of the available creation and function annotations.

Annotation: BotCommand

Makes the type eligible to be treated as an `action`. You can define three types of actions `commandType` property.

- `Command\Action`
- `Condition`
- `Iterator`

Examples:

- `@BotCommand(commandType = BotCommand.CommandType.Iterator)`
- `@BotCommand(commandType = Condition)`
- `@BotCommand(commandType = Varialbe)`
- `@BotCommand(commandType = Trigger)`

Annotation: CommandPkg

Makes the type eligible for creation of action `package.json`. This annotation must be used with `BotCommand` to take effect. `Pkg` participates in the activity only when this annotation is present.

Example:

```
@CommandPkg(label = "Create", name = "createFile",
description = "Creates a file", node_label = "{{filePath}}",
icon = "file.svg")
```

Annotation: ConditionTest

Participates in the `Condition` execution. This annotation can only be used when the `BotCommand` has `commandType` set as `Condition`. Only one method needs to be annotated when `BotCommand` annotation is present on the type. Failure to do so will result in the compilation error.

Annotation: Execute

Participates in the execution of `BotCommand`. Exactly one method needs to be annotated when `BotCommand` annotation is present on the type. Failure to do so will result in the compilation error.

Example:

```
@Execute public void create( @Idx(index = "1", type = FILE) @LocalFile
@Pkg(label =
"File", description = "e.g. C:\\MyDoc\\MyFile.doc") @NotEmpty String
filePath,
@Idx(index = "2", type = CHECKBOX) @Pkg(label = "Overwrite an existing
file")
@NotEmpty Boolean isOverwrite) { createFile(filePath, isOverwrite); }
```

Annotation: GlobalSessionContext

Can only be applied to member variables and fetches the `GlobalSessionContext` through a setter.

Example:

```
@com.automationanywhere.commandsdk.annotations.GlobalSessionContext
private GlobalSessionContext globalSessionContext;

public void setSessionMap(Map < String, Object > sessionMap) {
    this.sessionMap = sessionMap;
}
public void
setGlobalSessionContext(com.automationanywhere.bot.service.GlobalSessionContext
globalSessionContext) {
    this.globalSessionContext = globalSessionContext;
}
```

Annotation: HasNext

Participates in the execution of `Iterator`. This annotation can only be used when the `BotCommand` has `commandType` set as `Iterator`. Requires the `Next` annotation to be present. One method needs to be annotated when `BotCommand` annotation is present on the type. Failure to do so will result in the compilation error.

Annotation: Index

Makes the annotated element part of hierarchy utilized for the code and resource generation. Without this annotation no `BotCommand` related element annotations would be processed.

Annotation: Idx.Option

An option represents the elements that would play in the hierarchy, but lend the values to the parents.

Examples:

- RADIO

```
@Idx(index = "1", type = RADIO, options = {
    @Idx.Option(index = "1.1", pkg = @Pkg(node_label
        = "[[Delay.delayType.1.1.node_label]]", label =
        "[[Delay.delayType.1.1.label]]", value = REGULAR)),
    @Idx.Option(index = "1.2", pkg = @Pkg(node_label
        = "[[Delay.delayType.1.2.node_label]]", label =
        "[[Delay.delayType.1.2.label]]", value = RANDOM))
})
@Pkg(label = "[[Delay.delayType.label]]", default_value = "REGULAR",
    default_value_type = DataType.STRING)
@Inject
private String delayType;
```

- SELECT

```
@Idx(index = "2", type = SELECT, options = {
    @Idx.Option(index = "2.1", pkg = @Pkg(label =
        "[[LaunchWebsite.browser.2.1.label]]", value = "DEFAULT")),
    @Idx.Option(index = "2.2", pkg = @Pkg(label =
        "[[LaunchWebsite.browser.2.2.label]]", value = "INTERNET_EXPLORER")),
    @Idx.Option(index = "2.3", pkg = @Pkg(label =
        "[[LaunchWebsite.browser.2.3.label]]", value = "FIREFOX")),
    @Idx.Option(index = "2.4", pkg = @Pkg(label =
        "[[LaunchWebsite.browser.2.4.label]]", value = "CHROME"))
}) @Pkg(label = "[[LaunchWebsite.browser.label]]", default_value =
    "DEFAULT", default_value_type = DataType.STRING) @NotEmptyStringbrowser)
```

Annotation: Inject

Makes an element eligible for injection into the annotated type object. The injection is setter-based so a corresponding setter in the type is **mandatory**. The injected values would form the `BotCommand` parameter map using the name provided in `Idx`.

Annotation: Next

Participates in the `Iterator` execution. This annotation can only be used when the `BotCommand` has `commandType` set as `Iterator`. Requires the `HasNext` annotation to be present. One method needs to be annotated when `BotCommand` annotation is present on the type. Failure to do so will result in compilation error.

Annotation: Pkg

Makes an element to participate in the `package.json` creation. This annotation is ignored when `Idx` is not present.

Related concepts

[Annotations](#)

This section provides reference information about the annotations used to create Automation Anywhere packages.

Validation annotations

Validates annotated strings and values used in the Java code.

Annotation	Description
<code>CodeType</code>	The MIME-type of the code to format.
<code>CredentialOnly</code>	Can only accept a credential value, no string allowed.
<code>Equals</code>	Validates that the given string is equal to the annotated string variable.
<code>FileExtension</code>	Validates the annotated string value that ends with the supported extension type.
<code>GreaterThan</code>	Validates that the annotated number variable value is always greater than the given numeric value.
<code>GreaterThanEqualTo</code>	Validates that the annotated number variable value is always greater than or equal to the given numeric value.
<code>LessThan</code>	Validates that the annotated number variable value is always less than the given numeric value.
<code>LessThanEqualTo</code>	Validates that the annotated number variable value is always less than or equal to the given numeric value.
<code>LocalFile</code>	Can only accept local paths and no file expression.
<code>MatchesRegex</code>	Validates that the annotated string value matches the given regular expression.

Annotation	Description
NotEmpty	Validates and throws an exception when the annotated variable value is null. <pre>@Execute public Value<Double>length (@Idx (index="1", type=TEXT) @Pkg (label="Source string") @NotEmpty String sourceString) {}</pre>
NotEquals	Validates that the given string is not be equal to the annotated string variable.
NotMatchesRegex	Validates that the annotated string value does not match the given regular expression.
NumberInteger	Ensures the UI accepts only integers and not double for the annotated variable value.
RepositoryFile	Can only accept repository paths and no file expression.
VariableNotPackage	Cannot choose a variable from this package.
VariablePackage	Can only choose a variable from this package.
VariableSubType	The variable subtype must match.
VariableType	The variable type must match.
VariableUserDefined	Can only choose a user-defined variable.

Related concepts

[Annotations](#)

This section provides reference information about the annotations used to create Automation Anywhere packages.

Configure and use credential allow password annotation

Use the provided **CredentialTypeDemo.java** package SDK file and configure the **CredentialAllowPassword** annotation for the password field in Automation 360 locker actions.

Example: Review the CredentialTypeDemo.java

Use the following `CredentialTypeDemo.java` file located at: <latest package-sdk>2.0.9\src\main\java\com\automationanywhere\botcommand\samples\commands\basic\types as an example on how to configure the credential attribute.

```
@BotCommand
@CommandPkg (label = "[[CredentialTypeDemo.label]]",
description = "[[CredentialTypeDemo.description]]", icon = "sample.svg",
name = "credentialTypeDemo")
public class CredentialTypeDemo {

private static Logger logger =
LoggerManager.getLogger (CredentialTypeDemo.class);

/**
* To accept credentials the {@link AttributeType} in index should be
* {@link AttributeType.CREDENTIAL CREDENTIAL}. A {@link SecureString} is
```

```

* provided for any credentials type.
*/
@Execute
public void printCredentials(@Idx(index = "1", type =
AttributeType.CREDENTIAL)
@Pkg(label = "[[CredentialTypeDemo.credentials.label]]")
SecureString credentials) {
    // SecureString provides multiple way to access the data inside.
    // Let's try to get the user name and print it in logs.

    // To get the username as String
    String userName = credentials.getInsecureString();
    logger.trace("User name from getInsecureString : {}", userName);
}

```

Example: Configure the credential attributes @Execute

Configure the index, type, label, optional description, and the credentialAllowPasswordAttribute. When creating a new or updating an existing package, use the **CredentialAllowPassword** annotation to allow the credential picker to pick a credential attribute marked as a password field.

```

@Execute
public void printCredentials(@Idx(index = "2", type =
AttributeType.CREDENTIAL)
@Pkg(label =
"[[CredentialTypeDemo.credentialsAllowPasswordAttribute.label]]")
@CredentialAllowPassword SecureString credentialAllowPasswordAttribute) {
}

```

Configure the attributes in the Control Room

In the **Attribute name** field, enter `password` and an optional **description**, in **Input** field, select **Standard**, and enter the `Value`. In the **Security** field, select **Use attribute only on Password or Masked fields**.

Use the credential attribute in Control Room

- In the **Pick a credential** field, select **credential**. In the **Attribute** field, select **username**. In the **Provide the credential for the user (optional)** field, select **Credential**, and then **Pick**.
- In the **Attribute** field, select **password**. In the **Provide the credential for the password (optional)** field, select **Credential**, and then **Pick**.

Build and test a demo package and bot

This practical how to section demonstrates that creating, changing, and managing packages allow you to customize actions and efficiently manage packages for all Control Room users.

Here is a list of all the necessary tasks to create a package, add the package to your Control Room, and verify your work in a bot. Complete the listed tasks in order.

Tip: Click the title of each step to go the detailed task.

Step 1 *Update related workflow and build files*

Follow the detailed steps for updating workflow and build files for this project using your integrated development environment (IDE).

Step 2 Choose your favorite IDE

You can compile a package from the IDE of your choice. Here are two possible ways you can compile a package:

Compile a demo JAR file from the Eclipse UI

Use Eclipse to compile a demo JAR file that you can add as a package to your Control Room.

Compile a demo JAR file from the command line

Compile the demo Java code provided with this software development kit.

Step 3 *Add your demo package to the Control Room*

Users with **Upload package** permission can add packages to the Control Room for use by all Bot Creators.

Step 4 *Create a demo bot with the demo package*

Create a bot using the demo package to verify the actions that were created.

Step 5 *Change the Java file used to create the package JAR file*

Modify and compile the Java code used to create a package to fix issues and create new functionality.

Step 6 *Upload new demo package*

Package management allows you to upload package updates. The new package has the same name, but a different version number.

Step 7 *Update the demo bot with the updated package*

Update bots to use specific package versions.

Update related workflow and build files

Follow the detailed steps for updating workflow and build files for this project using your integrated development environment (IDE).

Complete all the steps for project setup detailed in [Set up the Java project](#).

This task shows you how to update the appropriate build and workflow files.

1. Open the project "A2019DemoPackage" that you created in [Set up the Java project](#).
You can find the project file in the directory where you extract the zip files to, for example `c:\A2019DemoPackage`.
2. From inside the project, Open the **settings.gradle** file.
3. Replace the project name with `A2019DemoPackageFirstnameLastname`.
If your name is John Developer it would look like this, `A2019DemoPackageJohnDeveloper`.
4. Open **src > main > resources > package.template**.

5. Update the **name**, **label**, and **description** values.

Original package.template	Updated package.template
<pre>{ "name": "A2019DemoPackage", "label": "A2019DemoPackage", "description": "Provides actions for A2019DemoPackage operations.", "group": "", "artifactName": "", "packageVersion": "", "codeVersion": "", "commands": [] }</pre>	<pre>{ "name": "A2019DemoPackageFirstnameLastname", "label": "A2019DemoPackageFirstnameLastname", "description": "A2019DemoPackageFirstnameLastname", "group": "", "artifactName": "", "packageVersion": "", "codeVersion": "", "commands": [] }</pre>

6. Save the changes.

After you have setup the build files, you need to compile the demo Java code, [Compile a demo JAR file from the command line](#).

Compile a demo JAR file from the Eclipse UI

Use Eclipse to compile a demo JAR file that you can add as a package to your Control Room.

Before starting this task complete the steps in [Update related workflow and build files](#).

Build a package file using a Gradle project in the Eclipse IDE.

1. Import the A2019DemoPackage as a Gradle project, **File > Import > Gradle > Existing Gradle Project** and click **Finish**.
2. From the **Gradle Tasks** tab, go to **<your project> > build** and run the following tasks in order.
 - a) **<your project> > build > clean**
 - b) **<your project> > build > build**
3. From the **Gradle Tasks** tab, go to **<your project.> shadow** and run the **shadowJar** task.

Your compiled package file is located in **file:\ \A2019DemoPackage\build\libs**. The package file has named after your project name (**<your project>-1.0.0.jar**).

To add your custom package to your Control Room follow the instructions in [Add packages to the Control Room](#).

Related concepts

[Build and test a demo package and bot](#)

This practical how to section demonstrates that creating, changing, and managing packages allow you to customize actions and efficiently manage packages for all Control Room users.

Compile a demo JAR file from the command line

Compile the demo Java code provided with this software development kit.

Before starting this task complete the steps in [Update related workflow and build files](#).

1. Open a terminal window and go to where the **gradlew.bat** file is located.

```
... \A2019DemoPackage > gradlew.bat
```

2. In the terminal window, type `gradlew.bat clean build shadowJar`, and press **Enter**. Here is an example of what you see:

```
> . . .\A2019DemoPackage>gradlew.bat clean build shadowJar

> Task :compileJava
Note: Starting hierarchy discovery for
'com.automationanywhere.botcommand.demo.Concatenate'
Note: Starting non-hierarchical element discovery for
'com.automationanywhere.botcommand.demo.Concatenate'
Note: Starting hierarchy discovery for
'com.automationanywhere.botcommand.demo.Uppercase'
Note: Starting non-hierarchical element discovery for
'com.automationanywhere.botcommand.demo.Uppercase'
Note: Starting Command Java generator...
Note: Starting Json generator...
Note: Generating command json for Concatenate
Note: Generating command json for Uppercase

> Task :commandCodeGen
mergeJsonFiles: updatePackage: group com.automationanywhere ,
artifactName A2019DemoPackageFirstnameLastname ,
packageVersion 1.0.0-20190816-101906
```

The compiled file is located in **file:\ \A2019DemoPackage\build\libs**.

To add your custom package to your Control Room follow the instructions in [Add packages to the Control Room](#).

Related concepts

[Build and test a demo package and bot](#)

This practical how to section demonstrates that creating, changing, and managing packages allow you to customize actions and efficiently manage packages for all Control Room users.

Add your demo package to the Control Room

Users with **Upload package** permission can add packages to the Control Room for use by all Bot Creators.

Before you can upload a package, you need valid user login credentials with **Upload package** permission for the Control Room you are adding the package to.

To add a package from a source other than Bot Store, follow these steps:

1. Navigate to **Manage > Packages**.
2. Click **Add package**.
3. Click **Browse**.
4. Locate and select the package to add to the Control Room.
Packages are Java Archive (JAR) files that contain actions used to create bots.
5. Click **Upload package**.
6. On the **Bots > Packages > Confirm package** page, choose any of the following options:
 - **Accept, enable and set as default:** Uploads and enables the selected package, and sets it to the default package for the Control Room.
 - **Accept and enable:** Uploads and enables the package, but the package is not set as the default package. Bot Creators have to specifically select non-default packages to use them for creating bots.

Choosing **Reject** stops the upload process.

To add a package from Bot Store, see the following video:

7. After installation, click **Administration** > **Packages** to verify that the package is added.

After successfully uploading your demo package, create a bot to test the actions you just created. For detailed step about how to create a bot, read [Create a demo bot with the demo package](#)

Create a demo bot with the demo package

Create a bot using the demo package to verify the actions that were created.

Here are the minimum prerequisites for building this demo bot:

- Access to a Control Room
- User credentials with **AAE_Basic** permission
- Your local host (workstation) is a registered device in the Control Room
- Ensure that the demo package **A2019DemoPackageFirstnameLastname** is available in the Control Room

This task uses the following actions and components:

- Uppercase (demo package)
- [Message box](#)
- [Variables overview](#)

1. On the left pane, click **Automation**.
A list of available and forms is displayed.
2. Click the **My Task Bot** icon.
3. Type `MyDemoBot1` in the **Name** field.
4. Click **Create & Edit**.
5. Expand **A2019DemoPackageFirstnameLastname** and double **Uppercase**.
6. Type `hello world, go be great!` in all lower case letters.
7. Create the variable `vMyDemoVar1`.
8. Click **Apply**.
9. Add a **Message box** and insert the variable **vMyDemoVar1** in the **Enter the message to display** field.
10. Click **Apply** and **Save**.
11. Click the **Run** icon.
A message box with "HELLO WORLD, GO BE GREAT!" in all upper case letters is displayed. The custom action **Uppercase** converted all the letters from lower case letters to upper case letters.

The task, [Change the Java file used to create the package JAR file](#), gives instruction on how to modify the **Uppercase** action to convert all upper case letters to lower case letters.

Change the Java file used to create the package JAR file

Modify and compile the Java code used to create a package to fix issues and create new functionality.

1. Open the project "A2019DemoPakcage."
2. From inside the project, open **src/main/java/com.automationanywhere.botcommand.samples.commands/basic/Uppercase** .

3. Change the function from upper case to lower case.

Original function	Updated function
<pre>String result = "ALL".equals(caseType) ? sourceString.toUpperCase() : (sourceString .substring(0, 1).toUpperCase() + sourceString .substring(1));</pre>	<pre>String result = "ALL".equals(caseType) ? sourceString.toLowerCase() : (sourceString .substring(0, 1).toUpperCase() + sourceString .substring(1));</pre>

4. Save the changes and re-compile the package.

You can now upload the changed package to the Control Room. [Upload new demo package](#)

Related tasks

[Upload new demo package](#)

Package management allows you to upload package updates. The new package has the same name, but a different version number.

Upload new demo package

Package management allows you to upload package updates. The new package has the same name, but a different version number.

You need **AAE_Basic** permissions to create and edit bots.

1. From the **Bots > Packages** page, click the **Add package** icon.
2. **Browse** to the location of the package to add.
Packages are Java Archive (JAR) files that contain actions used to create bots.
3. Select the package to add, and click **Upload package**.
4. On the **Bots > Packages > Confirm package** page, click **Accept, enable and set as default**.

You can select specific packages to be used from within a bot. Read detailed steps about managing packages for specific bots in [Update the demo bot with the updated package](#) task.

Update the demo bot with the updated package

Update bots to use specific package versions.

- Access to the bot created in the task [Create a demo bot with the demo package](#).
- **AAE_Basic** permission.

1. On the left pane, click **Automation**.
A list of available and forms is displayed.
2. Double-click **MyDemoBot1**, the demo bot you created in an earlier task.
3. Click the **vertical eclipses** in the upper right corner and click **Packages**.
4. Expand the row for the package **A2019DemoPackageFirstnameLastname**.
5. From the drop-down list of package versions, select the **Default** version.
Because you added the updated package as the default version, you are selecting the new version of the package you created.
6. Click **Change Version** and **Save**.

7. On the left pane, click **Automation**.
A list of available and forms is displayed.
8. Double-click **MyDemoBot1**.
9. Click **A2019DemoPackageFirstnameLastname** and type HELLO WORLD, GO BE GREAT! in the **Source string** field.
10. Click **Apply** and **Save**.
11. Click the **Run** icon.
The message box displayed by the bot displays "hello world, go be great!" This verifies that the action from the updated package is being used.

Build and test a custom package

Use IntelliJ to build a custom package and use Automation 360 actions to test the package.

Complete the following tasks to create a custom package, upload the package to your Control Room, and build a bot to test it. After you update the IntelliJ files, create directories, and create and update java classes, you can build the custom package.

1. *Build a custom package in IntelliJ*

Use IntelliJ to import the Automation Anywhere SDK, create a new package, and compile a JAR file that you can upload to your Control Room.

2. *Add custom package to your Control Room*

Use the compiled JAR file and upload it to the Control Room.

3. *Create a bot to test the custom package*

Use Automation 360 actions to create a bot to test the custom package.

Note: The customer support team does not provide guidance for the code written by customers.

See also: [Create custom packages](#)

Build a custom package in IntelliJ

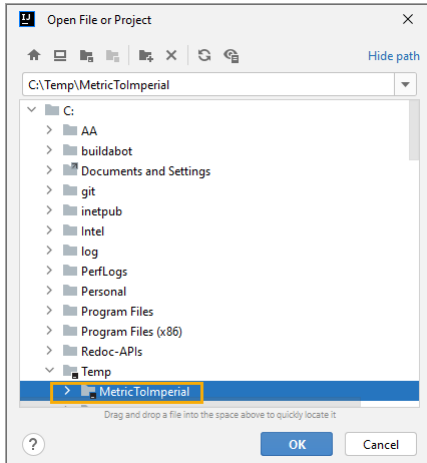

Use Java IntelliJ to create and compile a JAR file that you can upload as a package to your Control Room in Automation 360.

A basic understanding of JDK and Java IntelliJ is required in order to build an action package. Ensure you have installed the following software and files:

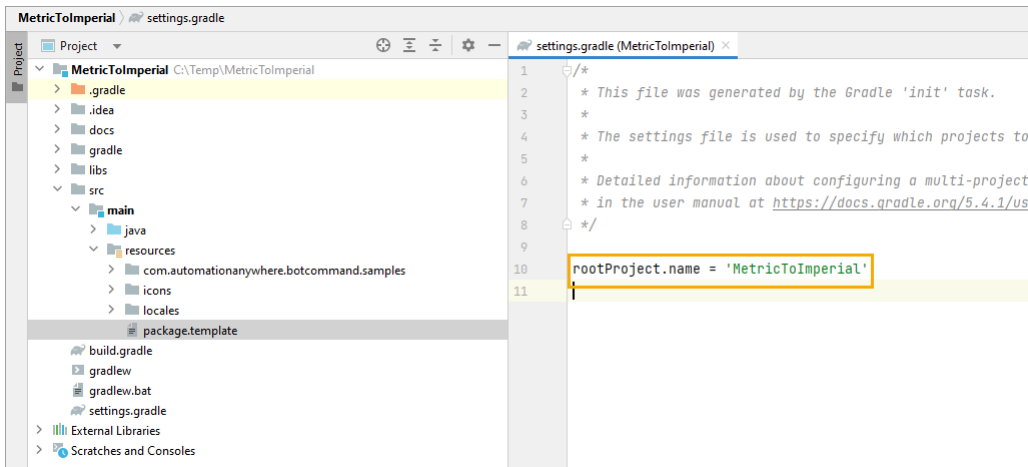

- [Java SE Development Kit 11 Downloads](#)
- Java IDE [Community edition of IntelliJ](#)

1. Download the latest release of the Automation Anywhere **Package SDK**. For the latest release of the Package SDK, see - [Automation 360 Package SDK Release Notes](#).
2. Unzip the contents of the SDK package to any of your local directory.
3. Rename the folder from A360-package-sdk-<version number> to MetricToImperial.

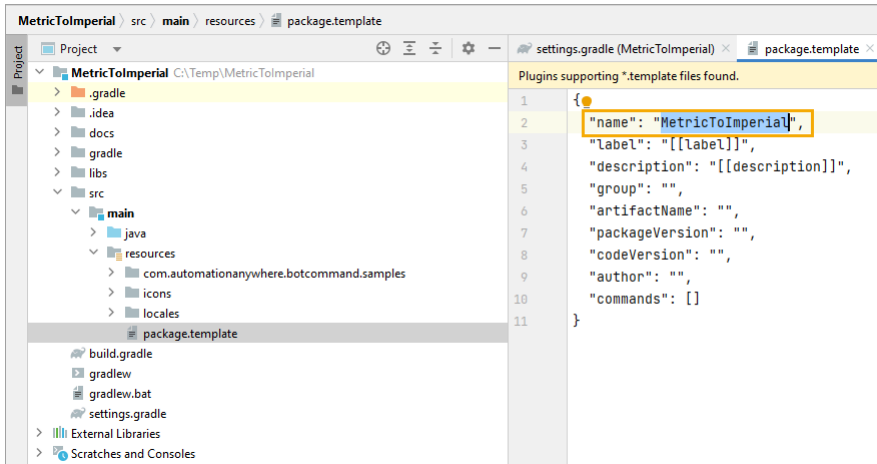

4. In IntelliJ IDEA, go to **File > Open** and open the project at `C:\<SavedLocation>\MetricToImperial`.

5. Open the `settings.gradle` file in the project root. Set the `rootProject.name = 'MetricToImperial'`

6. Open the `package.template` file located at `src > main > resources > package.template`.
7. Change the package name from `A360DemoPackage` to `MetricToImperial`.

Click the **Sync** button in IntelliJ to update the project.

8. Update the package name in **locales json**: go to **src > main > resources > locales > en_US.json**.
 - a) Open the **en_US.json** file and update the **required** label field from A360DemoPackage to MetricToImperial. Update the optional description.
 - b) Delete all other remaining lines in the **en_US.json** file.
9. Delete the sample packages, go to **src > main > java > com.automationanywhere.botcommand**, and delete the `samples.commands` and delete the `samples` packages.
10. Create a new package, right-click on java folder and select **New > Package**. Enter the new package name as `metrictoimperial.commands`.
11. Create a new **Java Class**, right-click on the `metrictoimperial.commands` package, and select **New > Java Class**. Enter the name for the new class `CMtoINCH`:
 - a) Open the **CMtoINCH** class. Copy and paste the following code above the class definition statement:

```
import static com.automationanywhere.commandsdk.model.DataType.NUMBER;
//BotCommand makes a class eligible for being considered as an action.
@BotCommand
//CommandPks adds required information to be disalable on GUI.
@CommandPkg(
    //Unique name inside a package and label to display.
    name = "CMtoInch", label = "[[CMtoINCH.label]]",
    node_label = "[[CMtoINCH.node_label]]", description =
    "[[CMtoINCH.description]]", icon = "ruler_icon.svg",
    //Return type information. return_type ensures only the right
    kind of variable is provided on the UI.
    return_label = "[[CMtoINCH.return_label]]", return_type =
    NUMBER, return_required = true)
```

- b) Inside the **CMtoINCH** class, copy and paste the following code:

```
//Identify the entry point for the action. Returns a Value<String>
because the return type is String.
@Execute
public NumberValue action(
    //Idx 1 would be displayed first, with a text box for entering
    the value.
    @Idx(index = "1", type = AttributeType.NUMBER)
    //UI labels.
    @Pkg(label = "[[CMtoINCH.CMInput.label]]")
    //Ensure that a validation error is thrown when the value is
    null.
    @NotEmpty
    Double CMInput) {
    //Internal validation, to disallow empty inputs. No null check needed
    as we have NotEmpty on CMInput.
    if ("".equals(CMInput.toString().trim()))
        throw new BotCommandException("Input of CM is required");
    Number result;
    try {
        //Conversion logic
        result = CMInput * 0.393701;
    } catch (Exception e) {
        //Throw custom error message
        throw new BotCommandException("Unable to convert " +
        CMInput.toString() + "cm to inches");
    }
}
```

```
//Return NumberValue.
return new NumberValue(result);
}
```

To import the namespaces, click the highlighted red notations and press ALT+ENTER key and select **Import** which automatically imports namespaces based on the annotations and datatypes.

The screenshot shows an IDE window for the project 'MetricToImperial'. The file 'CMtoINCH.java' is open, showing the following code:

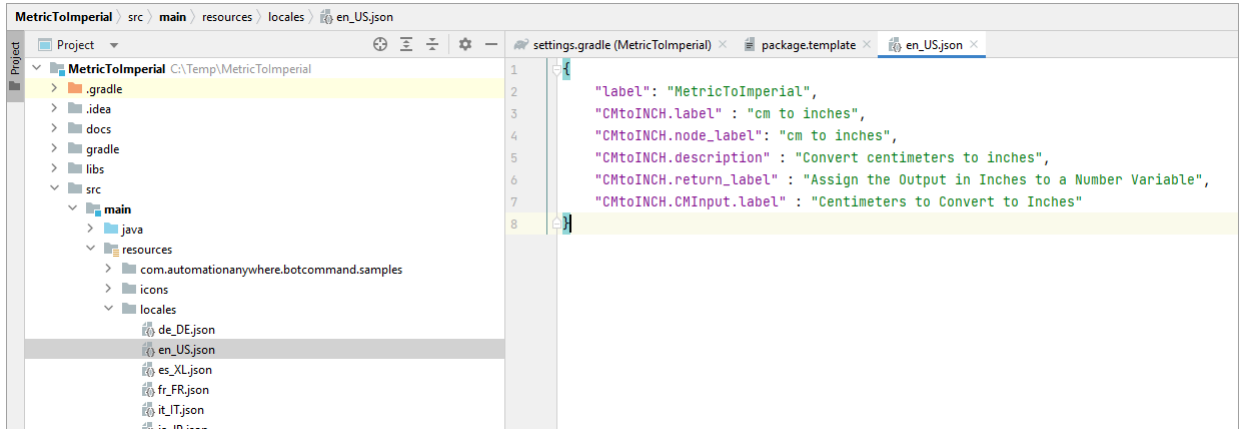

```
4 import com.automationanywhere.commandsdk.annotations.*;
5 import com.automationanywhere.commandsdk.annotations.rules.NotEmpty;
6 import com.automationanywhere.commandsdk.model.AttributeType;
7
8 import static com.automationanywhere.commandsdk.model.DataType.NUMBER;
9 //BotCommand makes a class eligible for being considered as an action.
10 @BotCommand
11 //CommandPks adds required information to be displayable on GUI.
12 @CommandPkg(
13     //Unique name inside a package and label to display.
14     name = "CMtoInch", label = "[[CMtoINCH.label]]",
15     node_label = "[[CMtoINCH.node_label]]", description = "[[CMtoINCH.description]]", icon = "[[CMtoINCH.icon]]",
16     //Return type information. return_type ensures only the right kind of variable is provided
17     return_label = "[[CMtoINCH.return_label]]", return_type = NUMBER, return_required = true)
18 public class CMtoINCH {
19     //Identify the entry point for the action. Returns a Value<String> because the return type is String
20     @Execute
21     @ public NumberValue action(
22         //Idx 1 would be displayed first, with a text box for entering the value.
23         @Idx(index = "1", type = AttributeType.NUMBER)
24         //UI Labels.
25         @Pkg(label = "[[CMtoINCH.CMInput.label]]")
26         //Ensure that a validation error is thrown when the value is null.
27         @NotEmpty
28         Double CMInput) {
29         //Internal validation, to disallow empty inputs. No null check needed as we have NotEmpty on CMInput
30         if (!"".equals(CMInput.toString().trim()))
31             throw new BotCommandException("Input of CM is required");
32         Number result;
33         try {
34             //Conversion logic
35             result = CMInput * 0.393701;
36         } catch (Exception e) {
37             //Throw custom error message
38             throw new BotCommandException("Unable to convert " + CMInput.toString() + "cm to inches");
39         }
40         //Return NumberValue.
41         return new NumberValue(result);
42     }
43 }
```

Red circles 'a' and 'b' highlight the `@BotCommand` and `@Execute` annotations respectively.

12. Configure **en_US.json** file, go to **src > main > resources > locales > en_US.json** and add the following fields after the label and description values:

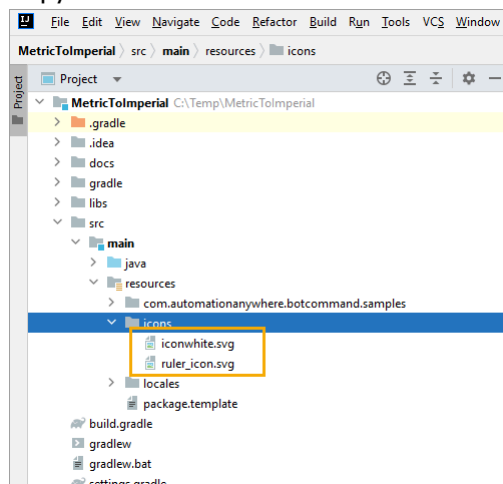

```
"CMtoINCH.label" : "cm to inches",
"CMtoINCH.node_label": "cm to inches",
"CMtoINCH.description" : "Convert centimeters to inches",
"CMtoINCH.return_label" : "Assign the Output in Inches to a Number Variable",
```

```
"CMtoINCH.CMInput.label" : "Centimeters to Convert to Inches"
```

13. Update the CommandPkg annotation. Download icons from Github.

- Download ruler_icon.svg from [github](#) and right-click the image and save the image as ruler_icon.svg.
- Download iconwhite.svg from [github](#), right-click the image and save the image iconwhite.svg.
- Copy both files into the **src > main > resources > icons** folder.

14. Open the build.gradle in the project root. After the dependencies section, but before the last closing tag, copy and paste the following code:

```
test {
    testLogging {
        exceptionFormat = 'full'
    }
    useTestNG() {}

    afterSuite { desc, result ->
        if (!desc.parent)
            println("${result.resultType} " +
                "(${result.testCount} tests, " +
                "${result.successfulTestCount} successes, " +
                "${result.failedTestCount} failures, " +
                "${result.skippedTestCount} skipped)")
    }
    maxHeapSize "3g"
```

```
}

```

15. Update the version number and remove dependencies that is not required for your project from build.gradle.

<https://aa2019packagesdkfordocumentation.s3.us-west-2.amazonaws.com/videos/cm-to-inch-build-gradle.mp4>

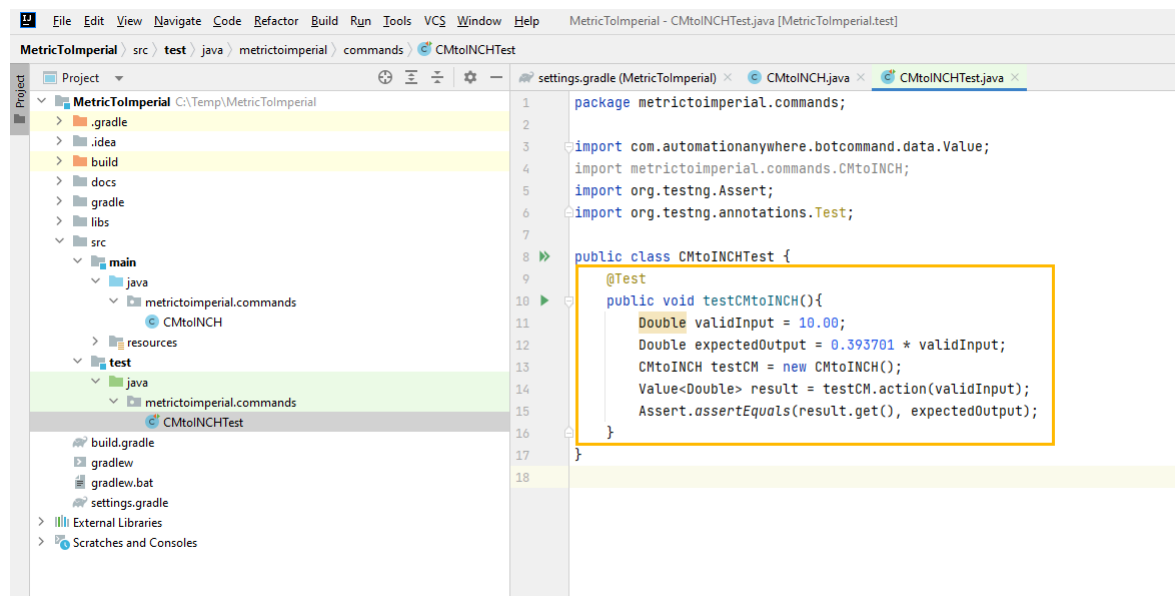

16. Create a new directory, right-click **src** and select **New > Directory**.

- In the **Name** field, enter `test\java`, or select the **test\java** suggestion from the **Gradle Source Sets**.
- Create a new package, right-click the `java` directory and select **New > Package**.
- Enter the name for the newly created package: `metrictoimperial.commands`.

17. Create new Java class, right-click and select **New > Java Class**. Enter the name for the new class `CMtoINCHTest`.

Inside the `CMtoINCHTest` class, copy and paste the following code:

```
@Test
public void testCMtoINCH(){
    Double validInput = 10.00;
    Double expectedOutput = 0.393701 * validInput;
    CMtoINCH testCM = new CMtoINCH();
    Value<Double> result = testCM.action(validInput);
    Assert.assertEquals(result.get(), expectedOutput);
}
```

18. Save the project **File > Save All**.

19. Build the package.

You can use the IntelliJ UI or the command line. If you are using the command line:

- a) Open a terminal window and navigate to the `MetricToImperial` directory.
- b) To build the project, enter the following command: `gradlew.bat clean build shadowJar`

A `BUILD SUCCESSFUL` message appears.

Sometimes a build might fail because existing files could not be automatically deleted and a system message appears indicating the execution failed for the task: `clean`. If this occurs, close the explorer windows and run the build again.

Add custom package to your Control Room

Add custom package to your Control Room

Use the compiled JAR file and upload it as a package to your Control Room in Automation 360.

- Complete the steps in [Build a custom package in IntelliJ](#).
- Ensure you have the following:
 - Access to the Control Room.
 - Credentials with **AAE_Basic** permission or a custom role with permissions to add packages to the Control Room.

1. From Windows Explorer, go to `C:\Users\\IdeaProjects\MetricToImperial\build\libs` and locate `MetricToImperial-1.0.0.jar`.
2. Log in to your Control Room as a user with permissions to add a new package.
3. Click **BOTS > Packages**.
4. In the **All packages** page, move your mouse over the plus sign and click **Add package**.
5. In the **Add package** page, click **Browse** and locate the `MetricToImperial-1.0.0.jar` file. By default, the file is located at: `C:\Users\\IdeaProjects\MetricToImperial\build\libs`.
6. Select the `MetricToImperial-1.0.0.jar` file and click **Open**.
7. Click **Upload Package**.

Create a bot to test the custom package

Use the actions in Automation 360 to create a bot and test the custom package.

Ensure you have the following to build the bot:

- Access to the Control Room.
- Credentials with **AAE_Basic** permission or with a custom role to build a bot.
- Your workstation is a registered device in the Control Room.

- Your package **MetricToImperial-1.0.0.jar** is available in the Control Room.
1. Log in to the Control Room.
 2. On the left pane, click **Automation**.
A list of available and forms is displayed.
 3. Click the **Create a bot** icon.
 4. In the **Name** field, enter `MetricToImperialTest`.
 5. Click **Create & Edit**.
 6. In the Actions pane, find **Metric to Imperial** and drag **Convert centimeters to inches** into the bot flow.
 - a) In the **CM to Convert** field, enter 1.
 - b) Click **Create variable** (next to the **Output** field) to create a new number variable.
 - c) In **Create Variable**, enter `nInchesOutput` and click **Create & Select**.
 - d) Click **Apply**.
 7. In the Actions pane, find the **Number** package and drag the **To String** command below **Convert centimeters to inches**.
 - a) In the **Enter a number** field, enter **F2** and select **nInchesOutput**.
 - b) In the **Enter number of digits after decimal** field, enter 5.
 - c) In the **Assign the output to variable** field, select **prompt-assignment - String** from the drop-down list.
 - d) Click **Apply**.
 8. From the Actions pane, drag **Message box**, click **F2** and insert the **prompt-assignment variable**.
 9. In the **Enter the message to display** field, click **F2** and select the **prompt-assignment variable**.
 10. Click **Apply** and **Save**.
 11. Click **Run**.
The bot displays the `0.39370` message, which is a successful build.

Using Python to parse JSON response

Use the Automation 360 Python script to execute Python functions to build a bot. Use the Python functions to parse the JSON response from a REST Web Services GET request.

Ensure you have the following to build the bot:

- Basic understanding of Python programming language.
- Basic experience with creating Automation Anywhere bots.

- Download and install Python 3.

download Python

Do one of the following:

- While installing the Python, make sure to select **Add Python x.xx to PATH** during the Python installation.

- Add a path to the Environment variable.

1. Log in to the Control Room.
2. On the left pane, click **Automation**.
A list of available and forms is displayed.
3. Click **Create a bot** icon.

4. In the **Name** field, enter `PythonTutorial`.
5. Click **Create & Edit**.
6. In the Actions pane, click **Variables** to create the following new variables:
 - a) Name `dResponse`, **Type** > **Dictionary** and **Subtype** > **String**.
 - b) Name `dRetrieveValue`, **Type** > **Dictionary** and **Subtype** > **Any**.
 - c) Name `dResponseBody`, **Type** > **String**.
 - d) Name `sFullName`, **Type** > **String**.
 - e) Name `sLocation`, **Type** > **String**.
 - f) Name `sTotalUserCount`, **Type** > **String**.
 - g) Name `nTotalUserCount`, **Type** > **Number**.
 - h) Name `nCurrentUser`, **Type** > **Number**.
 - i) Name `sCurrentUser`, **Type** > **String**.
 - j) Name `prompt-assignment`, **Type** > **String**.

7. From the Actions pane, select **REST Web Services > Get method** and place it under the **Start** of the bot flow.
 - a) In the **URI** field, enter `https://randomuser.me/api/?results=5&inc=name,email,location&nat=us`. This is a sample API that returns random user details to the calling application.
 - b) In the **Authentication Mode** drop-down list, select **No Authentication**.

Flow List Dual REST Web Services: Get method

The GET method gets (reads) the information (in the form of an entity) that is identified by the Request URI.

Required bot agent version: 20.11 or above

URI

Enter the URI

`https://randomuser.me/api/?results=5&inc=name,email,location&nat=us`

Select credential as URI

Authentication Mode

No Authentication

Header

Custom headers (optional)

Enabled	Name	Value
No headers		

Add header

Advanced options

Capture failure response

Allow insecure connection when using https

Warning: Transferred data may be visible to attackers

Wait for action to complete (in milliseconds)

`# 60000`

Increase this value if GET action times out

Assign the output to a variable

Multiple variables Dictionary

`dResponse`

Use response header name as key to fetch header value and 'Body' as key to fetch body of response

- c) In the **Assign the output to a variable** drop-down list, select **dResponse -Dictionary of Strings**.
8. From the Actions pane, click **String > Assign** action and drag it into the canvas below the **REST Web Services** action.
 - a) In the **Select the source string variable value** field, enter `$dResponse{Body}$`.

Flow List Dual String: Assign

Assigns or concatenates the given strings

Required bot agent version: 20.11 or above

Select the source string variable(s)/ value (optional)

`$dResponse{Body}$`

Select the destination string variable

`dResponseBody`

- b) In the **Select the destination string variable** drop-down list, select **dResponseBody -String**.

9. From the Actions pane, click **Python script** > **Open** and drag it into the canvas below the **String** > **Assignment**.

a) In the **Python** field, select **Manual input**.

The screenshot shows the Automation Anywhere interface. On the left is a workflow canvas with several actions: 'request for URI', 'String: Assign', 'Python script: Open' (highlighted with a red box and labeled 'a'), 'Python script: Execute function', 'Dictionary: Put', 'String: To number', and a 'Loop' action. On the right is the configuration panel for the 'Python script: Open' action. It includes a 'New Python session' dropdown set to 'Default', a 'Python' section with 'Manual input' selected, and a text area for 'Enter script here' containing Python code. The 'Python runtime version' is set to '3'.

b) In the **Enter script here** field, copy and paste the following code.

```
import json

def get_node_count(response):
    #parse response as json
    response_dict=json.loads(response)
    # Create list from JSON body
    response_body = response_dict['results']
    #return the count of entries in JSON body as string
    lengthasstring = str(len(response_body))
    return lengthasstring

def get_full_name(dictRequest):
    itemCount = int(dictRequest['count'])
    #parse response as json
    response_dict=json.loads(dictRequest['response'])
    # Create list from JSON body
    response_body = response_dict['results']
    #Extract values to return
    return response_body[itemCount]['name']['first'] + " " +
    response_body[itemCount]['name']['last']

def get_location(dictRequest):
    itemCount = int(dictRequest['count'])
    #parse response as json
    response_dict=json.loads(dictRequest['response'])
    # Create list from JSON body
    response_body = response_dict['results']
    #Extract values to return
```

```
return response_body[itemCount]['location']['city'] + ", " +
response_body[itemCount]['location']['state']
```

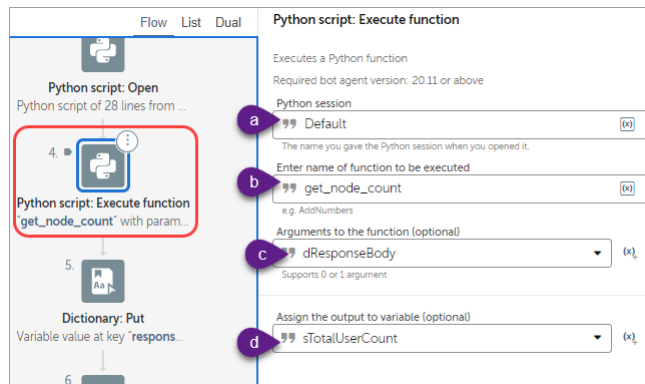

c) In the **Python runtime version** field, retain the default value as **3**.

10. From the Actions pane, click **Python script > Execute function** and drag it into the canvas below the **Python script > Open** action.

a) In the **Python session** field, retain **Default**.

b) In the **Enter the name of function to be executed** field, enter `get_node_count`.

c) In the **Arguments to the function** drop-down list, select **dResponseBody - String**.

d) In the **Assign the output to a variable** drop-down list, select **sTotalUserCount - String**.

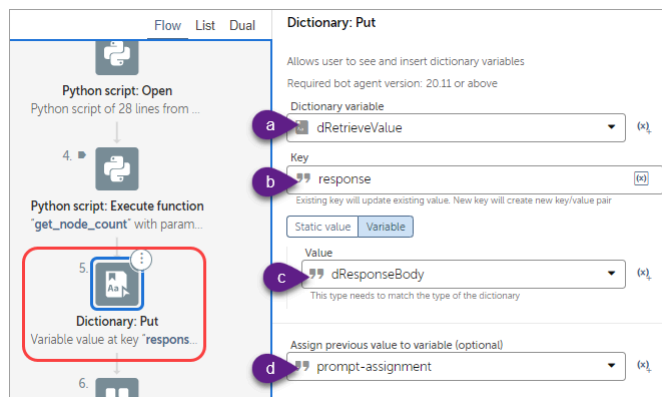

11. From the Actions pane, click **Dictionary > Put** and drag it into the canvas below the **Python script > Open** action.

a) In the **Dictionary variable** field, select **dRetrieveValue -Dictionary**.

b) In the **Associate to this key** field, enter `response`.

c) In the **New value** drop-down list, select **dResponseBody - String**.

d) In the **Assign previous value to a variable** drop-down list, select **prompt-assignment - String**.

12. From the Actions pane, click **String** > **To number** and drag it into the canvas below the **Dictionary** > **Put** action.

- In the **Enter the string** field, enter `$$TotalUserCount$`.
- In the **Assign the output to a variable** drop-down list, select **nTotalUserCount** -

Number.

13. From the Actions pane, click **Loop** > **Loop**.

- In the **Loop Type** > **Iterator**, select **For n times** from the drop-down list.
- In the **times** field, enter `$$nTotalUserCount$`.
- In the **Assign the current value to a variable** drop-down list, select **nCurrentUser** -

Number.

14. From the Actions pane, click **Number**, select **Decrement** and place it inside the **Loop** action.

- In the **Enter number** field, enter `$$nCurrentUser$`.
- In the **Enter decrement value** field, enter 1.
- In the **Assign output to a variable** drop-down list, select **nCurrentUser** -

Number.

15. From the Actions pane, click **Number**, select **To string** and place it inside of the **Loop** action, below **Number** > **Decrement**.

- In the **Enter a number** field, enter `$nCurrentUser$`.
- In the **Enter number of digits after decimal** field, enter 0.
- In the **Assign output to a variable** drop-down list, select **sCurrentUser** -

String.

The screenshot shows the 'Number: To string' configuration panel. The 'Enter a number' field contains the variable `$nCurrentUser$`. The 'Enter number of digits after decimal' field contains the value `0`. The 'Assign the output to variable' dropdown is set to `sCurrentUser`. The action is placed inside a loop, and the configuration is highlighted with a red box and labeled 'String.'

16. From the Action pane, click **Dictionary** > **Put** and place it inside of the **Loop** action.

- In the **Dictionary variable** field, select **dRetrieveValue -Dictionary**.
- In the **Associate to this key** field, enter `count`.
- In the **New value** drop-down list, select **sCurrentUser - String**.
- In the **Assign previous value to a variable** drop-down list, select **prompt-assignment** -

String.

The screenshot shows the 'Dictionary: Put' configuration panel. The 'Dictionary variable' dropdown is set to `dRetrieveValue`. The 'Key' field contains the value `count`. The 'Value' dropdown is set to `sCurrentUser`. The 'Assign previous value to variable' dropdown is set to `prompt-assignment`. The action is placed inside a loop, and the configuration is highlighted with a red box and labeled 'String.'

17. From the Actions pane, click **Python script** > **Execute function** and place it inside of the **Loop** action.

- In the **Python session** field, retain **Default**.
- In the **Enter the name of function to be executed** field, enter `get_full_name`.
- In the **Arguments to the function** drop-down list, select **dRetrieveValue - Dictionary**.
- In the **Assign the output to a variable** drop-down list, select **sFullName** -

String.

18. From the Actions pane, click **Python script** > **Execute function** and place it inside of the **Loop** action.

- In the **Python session** field, retain **Default**.
- In the **Enter the name of function to be executed** field, enter `get_location`.
- In the **Arguments to the function** drop-down list, select **dRetrieveValue - Dictionary**.
- In the **Assign the output to a variable** drop-down list, select **sLocation** -

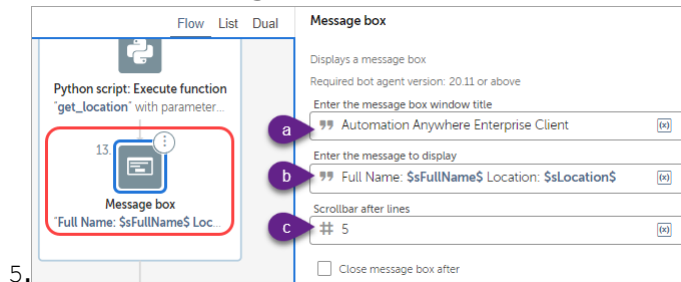

String.

19. From the Actions pane, click **Message box** and place it inside of the **Loop** action.

a) In the **Enter the message to display** field, enter the following:

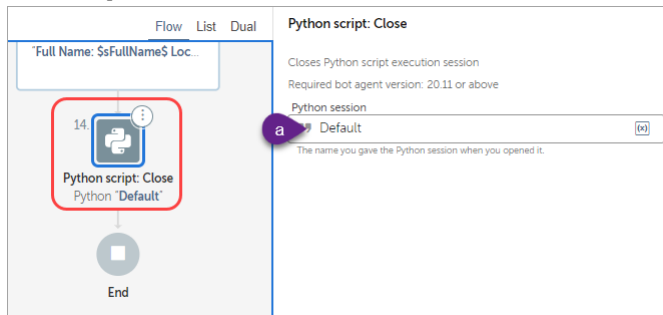

```
Full Name: $sFullName$ Location: $sLocation$
```

b) Select **Close message box after > Seconds**, enter

20. From the Actions pane, click **Python script > Close** and place it outside of the **Loop** action.

a) In the **Python session** field, retain **Default**.

21. Click **Save** to save your bot, and then click **Run**.

The bot runs, displaying five full user names with locations for approximately 5 seconds each before completing its successful execution.

Use JavaScript to build a bot to take user input

Use the JavaScript actions Automation 360 to execute JavaScript functions to build a bot. Use the actions to create a bot that takes user input and provides the appropriate output.

Ensure you have the following to build the bot:

- Basic understanding of JavaScript programming language.
- Basic experience with creating Automation Anywhere bots.

1. Log in to the Control Room.
2. On the left pane, click **Automation**.
A list of available and forms is displayed.
3. Click **Create a bot** icon.
4. In the **Name** field, enter `Hello User`.
5. Click **Create & Edit**.

6. In the Actions pane, click **Variables** to create the following new variables:
 - a) Name `lInputList`, **Type** > **List** and **Subtype** > **String**.
 - b) Name `sInputName`, **Type** > **String**.
 - c) Name `sOutput`, **Type** > **String**.
7. From the Actions pane, click **Prompt** > **For value**:
 - a) In the **Prompt window capture** field, enter `Enter your name here`.
 - b) In the **Prompt message** field, enter `Please enter your name here`.
 - c) In the **Assign the output to a variable** drop-down list, select **sInputName - String**.
8. From the Actions pane, click **List** > **Add item**:
 - a) In the **List variable** drop-down list, select **lInputList - List**.
 - b) In the **Item to be added** drop-down list, select **sInputName - String**.
 - c) In the **Add item** field, select **To end of list**.
9. Create a new JavaScript file.
 - a) Open a notepad, and copy and paste the following code:

```
function response(str){
return "Hello "+ str
}
```
 - b) Save the file in your desktop as `Salutation.js`, and select **Save as type**: as **All Files**.
10. From the Actions pane, click **JavaScript** > **Open**:
 - a) In the **JavaScript session** field, leave as **Default**.
 - b) In **JavaScript** > **Import existing file**, for the **JavaScript file** field, select **Desktop file**.
 - c) Click **Browse** and select the `Salutation.js` file from your desktop or where you saved the file.
 - d) In the **Assign the output to a variable** drop-down list, select **sOutput - String**.
11. From the Actions pane, click **JavaScript** > **Run JavaScript**:
 - a) In the **Enter name of the function to be executed** field, enter `response`.
 - b) In the **Parameters** drop-down list, select **lInputList - List**.
12. From the Actions pane, click **Message box**:
 - a) In the **Enter the message to display** field, enter `$$sOutput$`.
13. Click **Save** to save your bot, and then click **Run**.
14. When the bot prompts to enter a name, enter the name and click **OK**.
A message from the bot appears: `Hello <User>`.

Bot developer recommendations

Automation Anywhere provides a flexible platform for bot and package development. The information in this topic provide guidelines and recommendations on how to structure and develop robust and reusable bots and packages.

Bot Store submissions checklist

Use the checklist to ensure that your Automation 360 Bot Store submission is correctly created, processed, and accepted. If you do not follow requirements listed in the checklist, your submission will be rejected and will not be published on the Bot Store page.

Use this checklist from the developer portal: [Automation 360 bot submission checklist](#).

Building reusable bots

Review the guidelines to gain a better understanding of how to develop bots or subtasks for reusability, from designing and creating through reusing.

Define prerequisites, input, output, and variables

When you build bots for reusability, define the following:

- Document all necessary prerequisites on how to use your bot either on its own or as a subtask.
- When creating your bots, define values as input, output, or local. Input and output variables are used when your bot is designed to be used as a subtask, allowing it to receive and pass back values to or from another calling bot.
- Provide meaningful variable descriptions when defining input and output variables so that other developers know how to interact with your subtask.
- Adhere to an established standard for variable naming guidelines. Review the Automation Anywhere user-defined variables for variable naming guidelines. [Your variables \(user-defined\)](#)

Follow single-responsibility principle

Bots developed for reusability should follow the single - responsibility principle which states that each subtask or component should have responsibility over a single part of the functionality of the overall bot and that responsibility should be entirely encapsulated by that subtask or component.

Other examples of single-responsibility:

- A subtask that processes a single transaction, but can be called multiple times for each transaction on a list.

- A subtask that collects screen display data on a single page of a website, but can be called multiple times as a bot goes through pagination.

Bot design considerations

Consider the following patterns based on which templates must be developed for use:

1. Master, Main, and Sub bots

- Master bot: This bot is called directly to begin the process, through mechanisms including scheduling through the Control Room or API call. Include the following major process steps in the **TRY** section:
 - a. Initial setup for the process.
 - b. Validation that the setup was successful. For example, check whether all required files and folders exist or initial variable values are populated as required.
 - c. Run the desktop **PRE-PROCESS CLEANUP**.
 - d. Call the main bot to run the business logic of the process.

In the **FINALLY** section, run the desktop **POST-PROCESS CLEANUP**.

- Main bot: This bot calls the sub bots as required to run the business logic of the process. Include the following major process steps in the **TRY** section:
 - a. Validation of any input. For example, input variable values from the master bot.
 - b. Execution of sub bots.
 - c. Validation of any output.
 - d. Ensure population of any output variable values based on the execution of main bot, to return to the master bot.

In the **CATCH** section, log the error, and ensure population of any output variable values, for example, **oStrResult** to pass back to the master bot.

- Sub bots
 - A sub bot is called by the master bot or main bot to run the actual business logic required for the automation. They are also referred to as helper tasks or utility

tasks because their only purpose is to assist the calling task.

- Use output variables to return a result indicator to the calling bot either main, or another sub bot. For example, **outStrResult**. The value contains an error message if the processing was not successful due to an error or exception that had occurred.

2. Main and Sub bots: This pattern includes the master and the main bot in a single main bot. The design pattern of the Sub bot is similar to the design pattern explained above.

Opening and closing applications

Any applications, files, or windows that a bot or subtask opens must be closed by the same bot or subtask.

- For example, when a bot opens Microsoft Excel to perform a spreadsheet operation, verify that the spreadsheet and Excel are closed when the bot finishes processing.
- Close applications when the bot execution is successful or unsuccessful.
- Use the **Finally** block of the **Try/Catch/Finally** operation to ensure applications are closed regardless of success of the task processing.
- In the case that applications do not respond during testing, consider using the command prompt to forcefully close (kill) the applications. For example, to forcefully close power point, the command-line operation would be:

```
Taskkill /IM powerpnt.exe /F
```

Error handling

After completing the task, verify that the bot successfully handles any failure or exceptions.

- Each task or subtask must handle its own errors.
- An unhandled exception in a subtask can cause issues in a parent task.
- Use **Try/Catch/Finally** blocks at the root level of every bot.
- Use **Try/Catch** blocks inside of a loop if you want to try an operation multiple times before reporting a failure.

Event or exception handling

Other than action errors that are captured by **Try/Catch**, you must perform code checks for other processes such as events or exceptions. If a certain process condition occurs, notify or log these conditions for additional analysis.

- Develop a configurable event handler TaskBot that minimizes the requirement for code changes if the actions change. For example, maintain an XML file that contains a definition of all the possible events or exceptions and any notification requirements when those events or exceptions occur.
- In the code, when such events or exceptions occur, write the information to an event log. You can also add memory usages and capture a screenshot.
- Run the event handler TaskBot to process the event or exception. For example, issue a notification using parameters such as email recipient, CC recipient, or subject from the XML file.
- If the notification requirements vary for each environment, or change over time, the configuration file can be updated without having to change the code.

Running bots on other computers

When designing a bot, enable it so it runs on computers other than the computer on which a bot was created.

- Use variables for local file paths, network shares, or window titles so that your bot can successfully run from other machines.
- Consider using global values for environment markers or network shares that multiple bots need access to.
- Use wildcard characters for window titles where appropriate to enable bots to run regardless of specific environment or version of the target application. For example, instead of using

```
Salesforce - Professional Edition
- Internet Explorer
```

use the following:

```
Salesforce - * - Internet Explorer
```

Using prompts, message boxes, and infinite loops

Prompts and message box actions stop the bots from running when waiting for a user input. Unless a user input is required, design the bots without using prompt statements.

- When using loops, ensure all loops have a definite end by clearly defining their number of iterations or specifying where break loop actions need to exist.
- If your bot is intended to run as an unattended bot, remove or disable any prompts or message box actions.

- If you are building bots for an attended automation scenario, message boxes and prompts are often reasonable or required for bots to run as expected. Use message boxes to display different variables, such as, responses, outputs, or values.

Storing sensitive data in the Credential Vault

The Control Room includes the Credential Vault that can be used to store sensitive information, such as user names, passwords, API keys, and tokens.

- When building a bot, create a locker in the Control Room using the Credential Vault to store credentials and retrieve them as required by referencing the credential and the attribute. This allows users to create bots that consume APIs or perform logins without the need for bot builders to directly hard-code the required credentials within a bot.
- Do not hard-code sensitive credentials into a bot, or a subtask, because hard-coded storage in a bot introduces a security risk.
- When Credential Vault values are required to be used in a bot, verify that all locker names and credentials are clearly defined in the bot documentation. If required, include details on how to obtain credentials, for example, an API key or a token.

Testing independent tasks

When creating bots for reusability, design them in a way that they can be tested independently of other subtasks.

- Practice the test-driven development (TDD) approach: When adding a new bot, or a new feature in an application, write a test case for it.
- In a test case, define the specific function that validates that feature or functionality.
- For single-responsibility principle and reusability, create many smaller tasks that can be tested independently.

Using comments and steps

Comments enable developers to provide descriptions within their bots so that bot other bot developers can better understand what each section, block of code, or subtask is designed for. Include clear comments to allow developers to understand the purpose of the function of a given code block.

- When bots are submitted to the Bot Store, commenting demonstrates how to customize the bot.
- Using comments makes code maintenance easier because section descriptions help identify where changes might be required to enable

developers to work towards quicker issue resolution

- Comments on bots that are a *work in progress* can be helpful when creating placeholders for future work. Consider using a *TODO* command as a reminder to add logic to the bot, but update the comments when the work is completed.
- Automation 360 includes the Step action, which provides the capability to organize the code into logical groupings to improve readability and the flow.
- Create an outline of the major objectives of your bot by using empty, labeled step actions. When that is completed, go back to each step and complete the logic for the step.

Creating logging files

Identifying problems without logs can be difficult when bots are running unattended on any number of Bot Runners. Software developers, support teams, and bot owners rely on logs to understand where their automations have issues and how to diagnose problems. Bots must log errors to get error details.

- Use error handling and screen captures to better understand when a bot or subtask encounters an error.
- Use the A2019 Bot Store template that contains basic error handling, logging, and snapshot capabilities with the customizable root logging location for maintaining older log files.

Bot Store bot template

- If required, create additional logging files and include a full audit history of everything a bot or subtask has done. The additional log files can include audit, debug, and performance information about the bot, as well as the following:
 - Main bot start and end time.
 - Subtask start and end time.
 - The completion time of specific milestones defined within the bot.
 - Number of transactions received in an input file.
 - Number of successfully processed or failed transactions.

See also: [Best practices: Building reusable and secure Automation 360 bots and packages](#)

Related tasks

[Using Loop action](#)

Use the Loop action to repeatedly run a sequence of actions for a specific number of times or until a condition is met.

Related reference

[Your variables \(user-defined\)](#)

Users and some actions create user-defined variables to temporarily hold values. Use this kind of variable to input values into an action (window title, login credential, or file path) or to accept the output of an action (values read from a file or a Boolean return).

[Application package](#)

Use the **Open Program/File** action in the **Application** package to launch an application or a file. This action supports .exe, .bat, script files, or shortcut paths.

[Error handler package](#)

If a bot encounters an error due to an abnormal condition or exceptions during execution, the normal execution of the bot is hindered, and the bot fails to complete the task. The Error handler package contains actions that enable you to easily handle exceptions a bot encounters and transfers control to the other actions within that bot.

[Step package](#)

The **Step** package groups various actions together and runs them in a specific order. You can provide a relevant name for a step to identify the operation performed by the actions included in that step.

[Prompt package](#)

Use the **Prompt** package to accept an input value, a yes/no response, or to open a file or folder.

[Message box package](#)

Use the **Message box** action from the **Message box** package to insert a message box that shows a message when the task runs. For example, you can insert a **Message Box** action to follow a web form so that the action displays the message: `Web Form Filled and Complete`.

Building reusable packages

Review the guidelines to understand how to build packages for reusability.

Know your incoming data

When setting fields that your action package requires from the user, provide specifics in setting the attribute type to limit the kinds of data that your package receives.

- Limit the input to reduce the burden of checks that have to be done when the package is received.
- Javadoc includes 34 defined attribute types, so review those when you build your package to select the appropriate field types.
- Set your package so that it takes a stored value. For example, on behalf of the bot, your package is making API calls, verify that the *AttributeType* of the action input field for the API key or a token is set to *credential*. This way users are encouraged to use a value stored in the Credential Vault for sensitive input data that the package requires.

Use labels appropriately

In the *CommandPkg* annotation, use different labels, *node_labels*, and descriptions appropriately.

- Use these labels as short descriptions of your action and use only a few words to describe an action.
- Replicate the same naming style as it is presented in the default Action packages.
- Each action is a child element of a package, and the action label is displayed along with the package icon in the Actions pane. Use short names to describe each action.
- Document an expected input format for certain fields. Use the parameter description for the @Pkg annotation. This allows package developers to review the format, requirement, or data that must be used for a specific input field. For example:

```
@Pkg(label = "Start Date",
     description="Date Format as MM/
     DD/YYYY")
```

Unit test your components

During the package development, create unit tests to validate that each component and the action of the package is working as expected.

- Validate the behavior of the individual test unit, a single class, or a single action, to ensure that it is functioning as expected.
- Review and document any feature or functionality defects at early stages of the development process.

Handling errors

Include the error handling in the bot logic to ensure that all errors are handled gracefully. If an error is not handled, it could prevent a bot runner from executing other tasks.

- Create meaningful error messages that can help bot consumers with error resolutions.
- As a package developer, keep in mind these recommendations:
 - Use **Try/Catch** block to accommodate for an error.
 - Use a multi-catch block to find specific errors, and use the **BotCommandException** to return customized error messages. For example:

```
//create array of 3 items
int[] myIntArray = new int[]{1,
0, 7};
try {
    //print 4th item in array

    System.out.println(myIntArray[3]);
```

```

//Perform operation on
first and second items in
array
    int result =
myIntArray[0] / myIntArray[1];
} catch
(ArrayIndexOutOfBoundsException
e) {
    //Throw custom message for
IndexOutOfBounds
    throw new
BotCommandException("The
array does have the number of
expected items.");
} catch (ArithmeticException e)
{
    //Throw custom message on
Atithmetic Exception
    throw new
BotCommandException("Math
Operation Error with " +
Integer.toString(myIntArray[0])
+ " and " +
Integer.toString(myIntArray[1]));
}

```

Follow single-responsibility principle

A package is a collection of actions. Each action within a package must have a single responsibility and that responsibility must be encapsulated by that action.

- Following the single-responsibility principle helps your package consumers to implement it easily, simplifies testing, and avoids unnecessary modifications.
- The actions that you offer allow package consumers to customize the way they use your package within their bots, and can help their bots be as efficient as possible.

Provide examples

When submitting packages to the Bot Store include a demo bot that demonstrates the use of the package.

- Use the Automation 360 actions and allow package consumers to use these actions to expend their bot capabilities.
- Always provide sample bots with descriptions to help your package consumers with the knowledge they require to understand its proper use.

[Building reusable bots](#)

Review the guidelines to gain a better understanding of how to develop bots or subtasks for reusability, from designing and creating through reusing.

Troubleshooting and debugging

Troubleshooting and debugging information.

Troubleshoot bot run issue

Issue: I'm unable to deploy a bot because I get the following – Unexpected error setting up a new user session.

Cause:

Most often, this error is caused by invalid device credentials.

Solution:

Confirm the device is registered and connected.

1. Select **Devices > My devices** from the Automation Anywhere web interface.
2. Confirm that the Status column shows **Connected** for the relevant device.

Confirm that the device username and password are correct.

1. Select the profile icon on the Automation Anywhere web interface and select **Edit profile**.
2. Verify the device username.

Depending on how the device is configured within the network, you might need to prepend it with the domain name. For example, domainname\firstname.lastname.

3. Verify the device password.

Debugger features

The Automation Anywhere Debugger provides tools to help identify and fix issues during bot development.

To run a bot in **Debugger** mode, select the bot to run the debug function against and select **Edit TaskBot**. From the **Edit** TaskBot page, do the following:

1. Click the **Debugger** icon.
2. Click the **Start** icon.

Important: Use the **List** view to debug bots. The list view provides access to all of the **Debugger** features and visual indications of which action is running.

Debugger features:

- To debug your task one action at a time, insert a breakpoint next to each action. This makes the task pause at the breakpoint.
 - To insert a breakpoint, click the vertical ellipses and select **Enable breakpoint**.
 - To remove a breakpoint, click the vertical ellipses and select **Disable breakpoint**.

Tip: You can enable and disable breakpoints in the **Debugger** mode, or in the regular edit mode.

- Select the **Step over** icon to move one action at a time.
- To clear all breakpoints, click the **Clear all breakpoints** icon.
- To stop the current debugging session, click the **Stop** icon.
- To exit debugging, click the **Exit debugger** menu.

Note: You cannot edit actions in **Debugger** mode.

Bot Agent log files

Various types of information about the Bot Agent are captured in different log files. You can analyze these log files when the Bot Agent or a bot encounters an error and identify the root cause for that error.

Overview

The Bot Agent log files enable you to perform these actions:

- Determine whether a bot ran successfully
- Identify issues that resulted in a bot failure
- Determine if the device is properly connected with the Control Room

Log file locations

The Bot Agent log files are available at `C:\ProgramData\AutomationAnywhere\BotRunner\Logs` on your device. The following files are available at this location:

Bot_Launcher

Captures information about the execution of a bot such as the operations performed, events triggered, and errors encountered by the bot.

The filename now includes the name of the user running the bot on the Bot Runner. For a multi-user session machine, there will be a bot launcher log per user.

Node_Manager

Captures information about when a bot is run from the Control Room and communication details between a Bot Runner and the Control Room.

Log file configuration

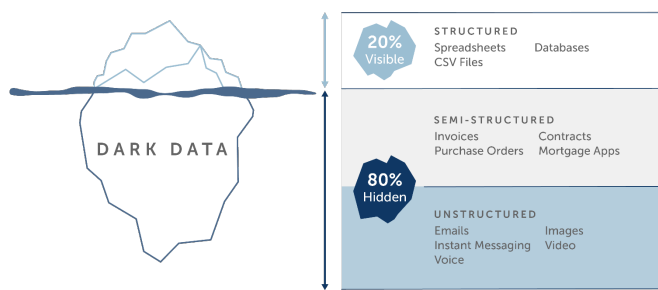

To configure the different types of log files that can be collected from the devices connected to the Control Room, see [Configure log collection](#) and [Customize device settings](#).

Digitize

Automation Anywhere offers several web-based intelligent document processing solutions that extract semi-structured data from documents and convert it into structured data, which can be used by Robotic Process Automation (RPA) bots for automation of business processes.

Overview

Typically, RPA bots can automate only those tasks that involve processing structured data. As a result, about 80% of a business's data remains inaccessible to RPA bots as "dark data." This dark data is made accessible to RPA bots by cognitive automation, which combines the technologies of intelligent document processing and RPA. With cognitive automation, semi-structured data is extracted from documents such as invoices, and converted into structured data, so RPA bots can subsequently use this structured data for automating business processes.

Learn more about the Automation Anywhere intelligent document processing solutions:

Document Automation

Document Automation is the new Cloud-native intelligent document processing solution that business users can set up to automatically read and process documents quickly using pretrained models and validation feedback.

Document Automation

Automation 360 IQ Bot

In Automation 360 IQ Bot, users configure templates and train bots to extract data from a variety of documents. Automation 360 IQ Bot is available for on-premises and cloud installations, and offers users a wide range of tools to customize and optimize document processing, including the following:

- Packages to create models for classifying documents by category and to enhance the quality of documents or images for better extraction
- Standard form models for extracting data from documents that have minimal or no variation in their layout
- Support for Optical Character Recognition (OCR) engines to improve the accuracy of the extracted data

IQ Bot 11.3.x*Automation 360 IQ Bot*

This early version of IQ Bot supports Enterprise 11 customers. It is available for on-premise installations only.

*IQ Bot 11.3.x***Community Edition**

The Community Edition version offers users limited features from the document processing solutions Document Automation and Automation 360 IQ Bot. This version is available to users for free.

Community Edition

Community Edition

The Community Edition version offers users limited features from the document processing solutions Document Automation and Automation 360 IQ Bot. This version is available to users for free.

Users are not required to purchase a license and there are no time limitations. However, there are some functionality constraints as follows:

- You can create a maximum of five learning instances per user.
- You cannot delete a learning instance.
- In the learning instance list, you can view and access only the learning instances and data that you created.

Get started with Community Edition

To begin using Community Edition:

1. Register and log in to Community Edition:

Complete steps one and two of [Get started with Community Edition](#).

2. Install the Bot Agent and set user device credentials.

- a.** Navigate to **Manage > Devices** and click **Connect local device**. Follow the steps in the wizard to connect the Control Room to your device.
- b.** Click **Refresh** to verify that your device is connected.
- c.** Click your username. Navigate to **My settings > Devices > Credentials**. Click **Edit** to provide your device username and password.

3. Navigate to **Manage > Learning instances** and select a version of IQ Bot to begin creating learning instances:

- **Option 1:** Click the **Create learning Instance** option.

Create learning instances to extract data from invoices in Document Automation: [Create a learning instance in Community Edition](#)

- **Option 2:** Click the **Train other documents** option.

Create learning instances to extract data from other document types using Automation 360 IQ Bot: [IQ Bot Community Edition quick start guide](#)

Create a learning instance in Community Edition

Create a learning instance to begin processing documents. In Community Edition, you can extract data from invoices in English using the ABBYY OCR provider.

1. From the Control Room home page, navigate to **Manage > Learning Instances > Create Learning Instance**.
2. Enter a name and description for the learning instance.
Document Automation does not allow duplicate learning instance names, so the name you provide must be unique.
3. Click **Next**.

We recommend that you open a sample document side by side with the Control Room window as you configure the form and table fields.

Note:

- A form field is a type of field that occurs only once in a document.
- A table field is a type of field that reoccurs throughout a document, typically in the form of a table.

-
4. Configure the form and table fields for extraction.

Document Automation offers a standard set of form and table fields, many of which are not initially visible. You can search for a field by field name, field label, or data type.

To see the full list of fields, click **Show unused fields**. See the following video for a demonstration: <https://aa2019packagesdkfordocumentation.s3-us-west-2.amazonaws.com/videos/view-all-li-fields-iqbot.mp4>

Click a field to open the fields editor. You can edit most attributes of a field. You cannot edit the name and default aliases. Document Automation assigns default aliases, which are hardcoded keywords, to standard fields to help with extraction. You cannot modify or delete default aliases, but you can add aliases in the **Custom aliases** field. See the following video for a demonstration of creating a custom alias: <https://aa2019packagesdkfordocumentation.s3-us-west-2.amazonaws.com/videos/custom-alias-iqbot.mp4>

Mouse over the menu icon to the right of a field to access the up/down arrows. Use the arrows to rearrange the order of the fields for a more efficient manual validation. The order of the fields does not impact extraction.

To learn more about the other field attributes, review the table in the next step.

5. To add a field, click **Add a field** and complete the following fields:

Option	Description
Field name	Enter a field name that begins with an alphabetical character (A-Z or a-z). In standard fields, the field name is hardcoded and cannot be changed.
Field label	Enter a user-friendly name to help validators. For example, you can rename <code>Organization tax number</code> to a localized name, such as <code>VAT number</code> . The field label does not affect extraction.

Option	Description
Confidence	<p>Set a threshold to reduce potential false positives.</p> <p>At the time of processing, the Document Automation engine assigns a score to each field in a document to indicate the certainty that the data was correctly extracted. If the document contains fields with a score that is lower than the confidence threshold, the document is sent to the validation queue.</p> <p>If you enter a high confidence threshold, more documents will be sent to the validation queue. If you enter a low confidence threshold, fewer documents will be sent to the validation queue.</p> <p>Supports values from zero to 100.</p>
Data type	<p>Choose from Address*, Text, Number, and Date.</p> <p>If the data in the field does not match the data type, the document is sent to the validation queue.</p> <p>Document Automation supports variations of the date format.</p> <p>* If you are configuring a learning instance with a user-defined document type, the form fields include the address data type, which extracts the entire structure of an address.</p>
Required	<p>Select one of the following:</p> <ul style="list-style-type: none"> • Required: Field cannot be empty. • Optional: Field can be empty or not exist in the document.
Default aliases	<p>No action is necessary for this field. Document Automation assigns default aliases, which are hardcoded keywords, to standard fields to help with extraction.</p>
Custom aliases	<p>Additional keywords to help Document Automation locate the field. For example, add country or region-specific names for fields such as <code>VAT number</code> as an alias to an <code>Organization tax number</code> custom field.</p> <hr/> <p>Note: Custom aliases must be unique. They cannot duplicate the default alias of another field. Exception: Form fields can have duplicate custom aliases as the table fields and vice versa.</p> <hr/>
Validation rules	<p>Depending on data type, create rules using patterns, formulas, lists, and statements such as starts or ends with.</p> <p>Starts With and Ends With Pattern Lists Formulas</p>

6. Click Create.

Upload documents to the learning instance, fix validation errors, and verify the extracted data: [Process documents in Community Edition](#)

Process documents in Community Edition

Upload sample invoices to train the learning instance, verify the extracted data, and fix validation errors.

- If you have not done so already, [Create a learning instance in Community Edition](#)
- Ensure that each file is 2 MB or less.

- Ensure that the sample invoices are in the following supported document types:
 - PDF
 - JPG
 - JPEG
 - PNG
 - TIF
 - TIFF

Upload sample invoices to a learning instance to test the learning instance's data extraction capabilities. If a document requires manual validation, the system sends it to the Validator, where you must manually enter the correct data.

1. Upload documents to the learning instance:

Note: Community Edition can process a maximum of five documents at a time. You must wait for a document to successfully complete processing (and validation if necessary) to upload another document.

- a) Click **Process documents**.
- b) In the **Process Documents** window, click **Browse** to select the files to upload.
- c) In the **Download data to** field, enter the file path where the extracted data is output to a CSV file.
- d) Click **Process documents**.
The Bot Runner window appears. The window disappears when the documents are done processing. Refresh the **Learning instances** table to see the updated metrics.

If there is a value next to the **Validate documents** link, you must manually validate the fields with errors. Otherwise, proceed to step 2b to review the extracted data.

2. Fix the validation errors

a) Click **Validate documents**.

The AARI Task Manager opens in a new tab, with the first failed document in queue. For an introduction to the Validator user interface, see [Using the AARI Task Manager Validator for Document Automation](#).

b) Review each field to verify the data type and extracted value.

Document Automation supports the following data types: text, number, time, and check box

Alternatively, from the drop-down list on the right panel, you can select **Show fields that need validation**.

Note: When documents are awaiting validation, if you edit the learning instance, click **Reprocess** to reattempt extraction.

Reprocessing documents does not affect the uploaded documents metric.

c) Update the fields with errors.

Click the field or draw a box around the values that you want to extract.

<https://aa2019packagesdkfordocumentation.s3-us-west-2.amazonaws.com/videos/validation-iqbot.mp4>

- To skip a document without correcting errors, click **Skip** to proceed to the next document in the validation queue.
- To remove a document that cannot be processed, click **Mark as Invalid**.

d) After you make the necessary corrections, click **Submit** so that the document can finish processing.

The next document in queue appears. When all the documents are corrected, the system displays a message stating that no more tasks are available.

e) Close the tab to return to the **Learning Instances** page.

3. Verify the output results:

a) Open the file in the `SUCCESS` folder that contains the extracted data and review the results to ensure that it matches your use case.

b) Optional: Review the **Learning Instance** dashboard.

The dashboard displays the total number of uploaded documents and the number of documents pending validation.

Congrats! You have now successfully processed your first documents in the Community Edition version of Document Automation.

Automation 360 IQ Bot

Automate document-centric business processes, end to end, by using IQ Bot, a web-based, Cloud-native intelligent document processing solution that can read and process complex documents and email. This solution combines RPA with AI techniques to extract and classify semi-structured and unstructured data.

Automation 360 IQ Bot is a hybrid solution for On-Premises and Cloud deployments.

Note: From Build 4695 (A2019.13), Automation 360 IQ Bot has feature parity with IQ Bot Version 11.3.4.2 and some features from Version 11.3.5. For feature parity information between Automation 360 IQ Bot and the corresponding IQ Bot 11.x versions, see [Automation 360 IQ Bot feature comparison matrix](#).

Overview

The technologies of IQ Bot and RPA together constitute cognitive automation. With cognitive automation, IQ Bot extracts semi-structured and unstructured data and converts it into structured data, and RPA bots subsequently use this structured data for automating business processes.

IQ Bot works by using **learning instances**. A learning instance is a structure that holds information such as document type, language, and fields to be extracted from tables and forms. A learning instance also includes bots that are trained to extract data from documents.

IQ Bot is also supported by RPA bots that are built for functions such as training the Classifier, sharpening document resolution, and downloading the extracted data.

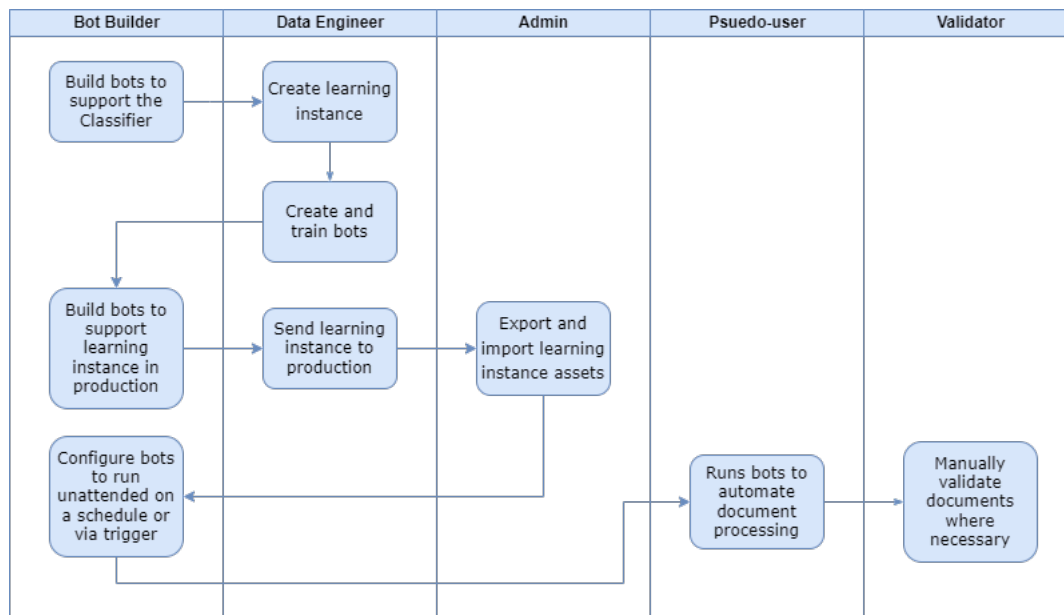

After the bots in a learning instance are trained and the necessary RPA bots are built, a learning instance is set to production mode. After that, IQ Bot can start processing documents automatically, through the following steps:

1. Retrieves documents from a source, such as attachments in incoming email
2. Improves document quality
3. Classifies documents into groups
4. Extracts data
5. Either downloads the extracted data or first sends the document for manual validation and then downloads the data

Types of IQ Bot users

In many organizations, different types of users perform specific tasks within their product area to create, configure, and publish a learning instance and the supporting assets. To learn more about the user types, required licenses, roles, and permissions, and the assigned product areas, see [IQ Bot user personas](#).

The following diagram demonstrates the sequence of how a learning instance and supporting assets are built, as well as which user performs which task.

Get started with learning instances

Perform the following these steps to create a learning instance, train bots, and set the bots to production:

- [Using Automation 360 IQ Bot On-Premises](#)
- [Using Automation 360 IQ Bot Cloud](#)

Build RPA bots for IQ Bot

The following links guide you in configuring RPA bots to support IQ Bot functions.

- Use the IQ Bot Classifier package to improve classification and prevent invalid documents from being uploaded to a learning instance.
[Train the classifier](#) | [Classify documents](#)
- Use the IQ Bot Pre-processor package to prepare documents and extract data before processing.
[Using EnhanceImage action](#) | [Using ConvertImageToPDF action](#)
- After sending a learning instance to production, configure a bot with the **Process documents** action from the IQ Bot Extraction package: [IQ Bot Extraction package](#)
- [Download extracted data](#)

[Install and update Automation 360 IQ Bot](#)

This collection of topics guide you through the process of installing or setting up Automation 360 IQ Bot On-Premises and Cloud.

[Languages supported in Automation 360 IQ Bot](#)

Up to 31 languages are supported in IQ Bot. You can also access up to 190 languages in IQ Bot by using an OCR engine.

IQ Bot architecture diagram

This diagram shows the different components of IQ Bot architecture.

Use the IQ Bot, components, Designer and Validator for designing and validating bots, respectively. In a typical scenario, IQ Bot portal and IQ Bot platform communicate through a network firewall and a load balancer.

Various protocols are used to communicate between the different components. A database server, a file storage server, and servers for IQ Bot are used. An organization has the flexibility of using a separate server for the database or using the Control Room clusterdatabase. A firewall is between the external

components, web browser and Bot Runner, and the data center load balancer. Chrome is the supported browser.

Using Automation 360 IQ Bot On-Premises

Create a learning instance, train the bots to extract data from documents, and push the learning instance to the production environment.

Complete the steps to [install IQ Bot](#).

You must be assigned either the IQ Bot Admin or IQ Bot services roles.

As you configure a learning instance, a Bot builder creates RPA bots to support the learning instance functions. For more information, see [IQ Bot process overview](#).

1. In Automation 360 IQ Bot, click the **LEARNING INSTANCES** tab to create a new learning instance, upload sample documents to train, and select the OCR engine for document processing.

[Create a learning instance](#)

[Select an OCR engine](#)

2. Train the uploaded sample documents in the IQ Bot Designer.

[Train a learning instance](#)

3. As you finish training each bot, set it to Production mode. When all the bots are in Production mode, set the learning instance to Production mode so it can start processing real documents.

[Tasks performed from Bot page](#)

[Set learning instance to Production](#)

Using Automation 360 IQ Bot Cloud

Create a learning instance, train the bots to extract data from documents, and push the learning instance to the production environment.

Complete the steps to [install IQ Bot](#).

You must be assigned either the IQ Bot Admin or IQ Bot services roles.

As you configure a learning instance, a Bot builder creates RPA bots to support the learning instance functions. For more information, see [IQ Bot process overview](#).

1. In Automation 360 IQ Bot, click the **Learning Instance** tab to create a new learning instance and upload sample documents to train.

[Create a learning instance](#)

Note: As Tegaki API OCR requires a separate On-Premises set up that is not supported in Automation 360 IQ Bot Cloud, all other OCR engines except the Tegaki API OCR are available.

- You will always have the latest version of the OCR engines supported by Automation 360 IQ Bot Cloud, but cannot select a specific OCR version.
- You cannot configure OCR settings from the Control Room. Starting with Automation 360 IQ Bot.19 version, we have provided an internal API that can be used to configure OCR settings in the database.

-
2. Train the uploaded sample documents in the IQ Bot Designer.

[Train a learning instance](#)

3. As you finish training each bot, set it to Production mode. When all the bots are in Production mode, set the learning instance to Production mode so it can start processing real documents.

Tasks performed from Bot page

Set learning instance to Production

IQ Bot user personas and roles

Learn about the users that contribute to IQ Bot and the associated roles and licenses. IQ Bot users and roles are defined in the Control Room.

IQ Bot user personas

A persona refers to the type of tasks that a user performs and the product areas with which a user interacts. To learn more about how each user contributes to IQ Bot, see [IQ Bot process overview](#).

User type	Description	Roles, permissions, and licenses	Access to product areas	Related links
Bot builder	Builds RPA bots to support IQ Bot functions such as training the Classifier and pre-processing documents	Bot developer role + Bot creator license	Automation 360	Build RPA bots for IQ Bot
Data engineer	Creates learning instances, trains bots, and sends bots to production	IQ Bot Admin or IQ Bot services roles	Following tabs in Automation 360 IQ Bot <ul style="list-style-type: none"> Dashboard Learning Instances Bots Domains Administration (IQ Bot Admin only) 	Using Automation 360 IQ Bot On-Premises Using Automation 360 IQ Bot Cloud
Admin	Uploads custom domains and migrates learning instances between IQ Bot environments	IQ Bot Admin role or a custom role with the migration utility permission	Following tabs in Automation 360 IQ Bot <ul style="list-style-type: none"> Dashboard Learning Instances Bots Domains Administration 	Custom domains in IQ Bot Migrate learning instances

User type	Description	Roles, permissions, and licenses	Access to product areas	Related links
Pseudo-user	Runs the RPA bots to upload, pre-process, classify, and extract data from documents in IQ Bot	Unattended Bot Runner license + view learning instance permission	Automation 360 and IQ Bot	
Validator	Manually corrects fields in documents that IQ Bot could not process	Validator role	Only the learning instances to which permission is granted	Use the IQ Bot Validator

IQ Bot roles

A role determines the areas in IQ Bot to which you have access. Roles are assigned in the Control Room and are of two types, predefined system roles and custom roles. If your user type is Admin, you can create custom roles.

- System roles: These roles are built in and have a predefined set of permissions that cannot be customized.
- Custom roles: These roles can be customized and modified to grant granular permissions to an IQ Bot user. An admin can configure the scope of a role with organization-wide permissions to manage all organizational resources or more narrowly to be limited to department-level resources. For more information, see [Defining a custom role for IQ Bot](#).

The following table describes the permissions and access areas applicable to each system role:

System role	IQ Bot permissions	Access to tabs
AAE_IQ Bot Admin	Access to all IQ Bot features and can migrate learning instances between environments	<ul style="list-style-type: none"> • Dashboard • Learning Instances • Bots • Domains • Administration Migration utility
AAE_IQ Bot Services	All permissions related to learning instances	<ul style="list-style-type: none"> • Dashboard • Learning instances • Bots
AAE_IQ Bot Validator	Can launch the Validator for granted learning instances	Learning instances

Related concepts

[Defining a custom role for IQ Bot](#)

For various roles within IQ Bot, you can use role-based access control (RBAC) to enable or restrict user access to learning instances, related features, and functionality by defining granular permissions. You can also use RBAC to define custom roles in IQ Bot.

Related tasks

[Creating a user with an IQ Bot specific role](#)

Create users in the Control Room to access IQ Bot.

Related reference

[Automation 360 licenses](#)

The **All Licenses** page displays detailed information about current product and device licenses.

Defining a custom role for IQ Bot

For various roles within IQ Bot, you can use role-based access control (RBAC) to enable or restrict user access to learning instances, related features, and functionality by defining granular permissions. You can also use RBAC to define custom roles in IQ Bot.

IQ Bot supports two types of role definitions:

- System roles in Control Room: These roles are built-in and have a pre-defined set of permissions that cannot be customized. To learn more, see [IQ Bot roles](#).
- Custom roles in Control Room: These roles can be customized and modified to grant granular permissions to an IQ Bot user. If you are an admin, by creating a custom role, you can grant users access to specific learning instances.

If you are a user with the **View and Manage Roles** permission, you can use the Control Room to create and assign custom roles.

Permission	Description
View my learning instances	Allows a user to access their own learning instances.
View learning instances from the same role	Allows a user to view only learning instances created by the same role. Note: If multiple users are assigned the same role, then all these users will have access to the same learning instances.
View all learning instances	Allows users to view all learning instances created by any user across all roles.
Edit learning instance	Allows users to edit learning instances.
Delete learning instance	Allows users to delete learning instances.
Send learning instance to production	Allows users to move learning instances from staging to production.
Import domain	Allows users to import domains into IQ Bot.

Things to remember:

- Ensure that users with **View learning instance from the same role** do not have non-IQ Bot roles. Example: When you create a learning instance, all the roles that you have under your name gets assigned to the learning instance. So, if you have AA_Basic role in combination with **View learning**

instance from the same role, then all the users with AA_Basic role have access to IQ Bot. Therefore, users who create learning instances must not be assigned non-IQ Bot roles.

- It is required that creators of learning instances for a specific department must be assigned a minimum of two roles:
 - A role that allows them to create learning instances
 - A department-specific role with the **View learning instance from the same role** permission
- When new learning instances are migrated, existing roles will not be migrated. After the roles are assigned in the target system, they cannot be changed. IQ Bot A360 does not support changing role assignments of learning instances.

Related tasks

[Create a role](#)

As an administrator, you can configure roles with permissions to access features and perform operations such as create, edit, or delete a bot in the Control Room, and assign the role to a user.

[Creating a user with an IQ Bot specific role](#)

Create users in the Control Room to access IQ Bot.

Creating a user with an IQ Bot specific role

Create users in the Control Room to access IQ Bot.

Create administrator, services, and Validator IQ Bot users with Microsoft Windows credentials using the following roles in the Control Room:

- **AAE_IQ Bot Admin**
- **AAE_IQ Bot Services**
- **AAE_IQ Bot Validator**

Tip: The Active Directory users are authenticated with their Active Directory credentials, and the non-Active Directory users are authenticated with the credentials stored in the Control Room database.

Users in Control Room are created depending on the type of user configured during installation. IQ Bot supports a maximum of five concurrent users.

1. Log in to Control Room as a user with the **AAE_Admin** role.
2. Go to **Administrator > Users**.
3. Click the **Create User** icon.
The **Create User** page appears.
4. Enter the required information on the **Create User** page.

Note:

- The **First name**, **Last name**, and **Description** fields are optional. For a first name and last name, use numbers, spaces (), period (.), hyphen (-), and underscore (_).
- For a Non-Active Directory user, provide information in each field.

-
5. To create a user with the administrator role, select **AAE_IQBotAdmin**. To create a user with the services role, select **AAE_IQBotServices**, To create a Validator role, select the **AAE_IQBotValidator** role.

6. Select a license to be allocated to the user from the **Allocate a device license to user** section.
If no license slots are available for a role, an alert message appears.
7. Click **Save** to create the user.

To switch a user type from Development to Run-time or vice versa, depending on the automation requirements of your organization, update the license type from the License Management section in Control Room.

After a Validator or a services user is created, an email is sent to the user. The user is asked to do the following:

- Verify the email ID and set the Control Room access password, if the Control Room is configured for the Non-Active Directory users.
- Verify the email ID, if the Control Room is configured for the Active Directory users.

Related concepts

[Defining a custom role for IQ Bot](#)

For various roles within IQ Bot, you can use role-based access control (RBAC) to enable or restrict user access to learning instances, related features, and functionality by defining granular permissions. You can also use RBAC to define custom roles in IQ Bot.

Languages supported in Automation 360 IQ Bot

Up to 31 languages are supported in IQ Bot. You can also access up to 190 languages in IQ Bot by using an OCR engine.

When you review the list of languages in IQ Bot, you will observe the following:

- Some languages are listed multiple times as variants, for example, Norwegian, Norwegian (Bokmal), Norwegian (Nynorsk).
- Among languages that are written from right to left, only Arabic is currently supported on IQ Bot.
- For languages not in the IQ Bot UI by default:
 - These rely on ABBYY FineReader Engine 12.2 for text segmentation and OCR, then IQ Bot for classification, extraction, and auto-correction.
 - Contact your **Cognitive Services** or **Sales Engineering** representative to create IQ Bot custom domains to access these languages.
 - In the SQL database and `.json` file, IQ Bot requires language codes for 160 of the additional languages to appear in the UI, and culture codes to allow numeric and date validation.

Note:

- For ABBYY FineReader Engine and Microsoft Azure Computer Vision OCR engine, IQ Bot uses its text segmentation + OCR.
- For Microsoft Azure Computer Vision OCR engine, user can select any language from IQ Bot's drop-down, but the API aims to auto-detect the language during processing, and override user selection.

The following table provides a list of supported languages in IQ Bot for various document types:

Language	Document types such as invoice, contracts, health insurance, purchase order, and so on	Document type -
English	X	X

Language	Document types such as invoice, contracts, health insurance, purchase order, and so on	Document type -
German	X	X
French	X	X
Spanish	X	X
Italian	X	X
Afrikaans		X
Arabic		X
Bulgarian		X
Catalan		X
Chinese (Simplified)		X
Chinese (Traditional)		X
Czech		X
Danish		X
Dutch		X
Flemish		X
Greek		X
Hungarian		X
Indonesian		X
Japanese		X
Korean		X
Latin		X
Malay		X
Norwegian		X
Polish		X
Portuguese		X
Romanian		X
Russian		X
Serbian (Latin)		X
Slovak		X
Swedish		X
Turkish		X

The following table lists the languages that are supported in IQ Bot through a custom domain:

Abkhaz	Galician	Mari	Sioux (Dakota)
Adyghe	Ganda	Maya	Slovenian

Agul	German	Miao	Somali
Albanian	German (new spelling)	Minangkabau	Sorbian
Armenian (Eastern)	German (Luxembourg)	Russian and English	Sotho
Armenian (Grabar)	Guarani	Mohawk	Sunda
Armenian (Western)	Hani	Mongol	Swahili
Avar	Hausa	Mordvin	Swazi
Aymara	Hawaiian	Nahuatl	Tabassaran
Bashkir	Icelandic	Nenets	Tagalog
Basque	Ido	Nivkh	Tahitian
Belarussian	Interlingua	Nogay	Tajik
Bemba	Irish	NorwegianNynorsk and NorwegianBokmal	Tatar
Blackfoot	Kabardian	Norwegian (Bokmal)	Thai
Breton	Kalmyk	Norwegian (Nynorsk)	Jingpo
Bugotu	Karachay-Balkar	Nyanja	Tongan
Burmese	Karakalpak	Occidental	Tswana
Buryat	Kasub	Ojibway	Tun
Chamorro	Kawa	Old English	Turkmen
Chechen	Kazakh	Old French	Turkmen (Latin)
Chukcha	Khakas	Old German	Tuvan
Chuvash	Khanty	Old Italian	Udmurt
Corsican	Kikuyu	Old Slavonic	Uighur (Cyrillic)
Crimean Tatar	Kirghiz	Old Spanish	Uighur (Latin)
Croatian	Kongo	Ossetian	Ukrainian
Crow	Korean (Hangul)	Papiamento	Uzbek (Cyrillic)
Dargwa	Koryak	Tok Pisin	Uzbek (Latin)
Dungan	Kpelle	Portuguese (Brazil)	Vietnamese
Dutch (Netherlands)	Kumyk	Portuguese (Portugal)	Cebuano
Eskimo (Cyrillic)	Lak	Provençal	Welsh
Eskimo (Latin)	Sami (Lappish)	Quechua	Wolof
Esperanto	Latvian	Rhaeto-Romanic	Xhosa
Estonian	Latvian (language written in Gothic script)	Romanian (Moldavia)	Yakut
Even	Lezgin	Romany	Yiddish
Evenki	Lithuanian	Ruanda	Zapotec
Faeroese	Luba	Rundi	Zulu

Fijian	Macedonian	Russian (old spelling)
Finnish	Malagasy	Russian (with accents marking stress position)
Frisian	Malinke	Samoa
Friulian	Maltese	Selkup
Scottish Gaelic	Mansi	Serbian (Cyrillic)
Gagauz	Maori	Shona

The following table provides you with links to supported languages for all IQ Bot supported OCR engines:

IQ Bot supported OCR engines	List of supported languages
ABBYY FineReader Engine	ABBYY FineReader Engine OCR supported languages
Microsoft Azure Computer Vision OCR engine	https://docs.microsoft.com/en-us/azure/cognitive-services/computer-vision/language-support
Google Vision API	https://cloud.google.com/vision/docs/languages
Tesseract4 OCR 4.0.0	https://tesseract-ocr.github.io/tessdoc/Data-Files-in-different-versions.html
Tegaki API	<ul style="list-style-type: none"> • Japanese • Korean • Japanese - English • Korean - English

Note: The supported languages in IQ Bot must be considered in concurrence with the OCR supported languages.

Tip: If you are unable to see all languages in the IQ Bot UI or if IQ Bot is unable to extract data from multiple languages in a document, troubleshoot the issue:

[Unable to extract data from Multiple languages in a document \(A-People login required\)](#)

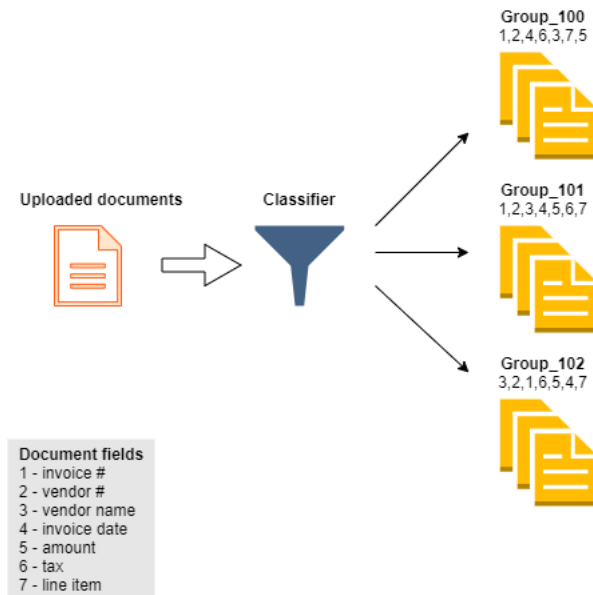

Note: If you are adding custom language to a custom domain, then you must retain the language ID across all installations from where IQ Bot learning instances will be exported and imported.

About the Classifier

Learn about how documents are classified and the factors that affect classification.

When documents are uploaded to a learning instance, the Classifier sorts the documents into document groups based on the layout, which is the order in which the fields appear on the page. If a document is uploaded to a learning instance in production and the document does not match the layout of any of the document groups, the Classifier creates a new group for that document.

The following graphic illustrates how uploaded invoices that contain specific fields are sorted into one of three groups, depending on the order in which the fields appear in the invoice.

Alternatively, you can manually define a document group to process all the documents with an identical layout. In this case, IQ Bot bypasses the Classifier and sends the document to the group you created that has the same layout as the uploaded document. This option is useful when the OCR fails to detect one or more fields in a document, causing the Classifier to unnecessarily create a new document group or send the document to the wrong group. See [Create a new document group](#).

Note: User-created document groups cannot be deleted.

The Classifier is supported by RPA bots and the IQ Bot Classifier package. It contains actions that automate identifying and sorting the different document types. See [IQ Bot Classifier package](#).

Resources

Watch the following videos to learn more about how the Classifier works and how to use it:

<https://www.youtube.com/embed/MXwtff5kL84>

<https://www.youtube.com/embed/EdUNEHtu8i0>

Learning instances created with out-of-box or custom domains

IQ Bot checks for a minimum number of fields that you selected to successfully classify the document. In all other cases, the document will be marked as unclassified.

For example:

- If you create a new learning instance with one to four fields selected, IQ Bot checks for at least four fields from the total number of fields presented for that specific learning instance. Similarly, if you create a learning instance with five fields selected, IQ Bot checks for at least five fields.
- If you create a learning instance with six or more fields selected in the learning instance, IQ Bot checks for at least six fields. For example, if you selected eight fields in an invoice domain, IQ Bot checks for at least six fields out of the total fields available.

Learning instances created with other domains

If you create a learning instance with multiple fields, IQ Bot checks for at least one field and classifies the document. If IQ Bot does not find any field, the document will be marked as unclassified.

Factors that impact classification

Factor	Notes
Page layout	If the page layout is different from the original document with respect to document content position, IQ Bot sends the document to a different group.
Label orientation	All the labels in a document must be oriented in the same direction. If some of the labels are vertical and some horizontal, the document is sent to a different group.
Label position	Labels can be positioned anywhere on the page. However, the label sequence from left to right and top to bottom must be the same as in the training documents.
Match percentage	IQ Bot uses a 70% match for labels.
Fields added after the learning instance is created	Fields added after a learning instance is created are excluded from the classification process.

Related tasks

[Limit the creation of document groups](#)

Limit the number of new document groups that the Classifier can create when a learning instance is in production.

Create a new document group

Manually define a user-created document group to process documents with an identical layout. For example, invoices from a specific supplier.

- If you have not done so already, [Create a learning instance](#). After you create a learning instance, you are redirected to the document groups page, where you create a new document group.
 - Identify the group label. This is the name of the folder in the `documents\classify\train` directory where documents with an identical layout are sent. You will provide the group label in the steps below.
 - Identify sample documents (maximum 150) that have an identical layout. You can upload more documents to train the group after the group is created.
1. Navigate to the learning instance details page and click **Create group**.
 2. In the **Group label** field, provide the folder name that contains the sorted documents in the `documents\classify\train` directory.
 3. Click **Browse** to upload sample documents to define the layout.
 4. Click **Save**.

1. Configure the mechanism to sort incoming documents to the correct group:
 - To use the Classifier, run the bot with the **Train Classifier** action to create the classification model and sub-folders to hold the sorted documents in the `documents\classify\train` directory. See [Using Train Classifier action](#).
 - Alternatively, create RPA bots identify and sort incoming documents using conditional statements, such as string-matching the file name or sender. See the String condition in the [Loop package](#) or [If package](#).
2. Update the following actions:
 - **Optional:** Update the **Classify Document** action to use **Express mode**. See step 6 in [Using the Classify document action](#).
 - Update the **Upload document** action to provide the group label. See step 4 in [Upload document action](#).
3. Upload more documents to train the group. When you are done with training, set the group to production.
4. **After you set the group to production:** If you have a bot with the **Process Documents** action, you must update the action with the group label. See step 7 in [Using IQ Bot Process documents action](#).

Create a learning instance

Create a learning instance and upload sample documents for training. In this step, you define the data elements for a single document type, such as an invoice or a purchase order, and the fields which you want to extract.

Ensure the sample documents meet the following requirements:

- Each document is a separate file. For example, if you have downloaded an email and its attachments into a single PDF, you must separate the email body from the attachments. See [Using the Split document action](#).
- The documents are in one of the following supported file types:
 - PDF
 - JPG
 - JPEG
 - PNG
 - TIFF
- Use documents with a resolution value of at least 300 dots per inch (dpi).
- In staging, you can upload a maximum of 150 documents of 10 MB file size per learning instance.
- In production, you can upload a maximum of 50 MB file size per document. However, the maximum number of documents allowed per learning instance depends on the license.
- There are no limitations on the number of pages per document in a pdfbox OCR.
- You can upload 60 pages per document in an image-based OCR.
- You can upload up to a file size of 12 MB. You can upload additional documents after creating the learning instance.
- The file names of the documents that you upload should not start with special characters, such as the hyphen (-).

Note:

- With the Tesseract4 OCR, currently there is a known limitation which restricts the number of pages per document to less than 60 pages.

- Azure confidential computing enables organizations to upload encrypted data to secured storage, such as private folders on a virtual machine. If you upload documents from such secured folders to IQ Bot, these are moved to **Unclassified** status as data extraction is not supported for such documents.

When you start with a collection of documents to insert into a digital process, you will probably have a mix of documents types, formats, and orientations. An invoice, for example, has a consistent set of data elements, whereas a purchase order contains a different set of data elements. You must create a different learning instance for each of these document types, using the following steps:

1. Navigate to **LEARNING INSTANCES** and click the **New instance** option.
2. In the **Create new learning instance** screen, enter the following information:

- a) **Instance name:** Enter a unique name.

IQ Bot version **A360.21 and below** does not allow duplicate learning instance names. Even if you delete a learning instance, the name cannot be reused. From **IQ Bot version A360.22**, it is possible to create duplicate learning instance names, as well as reuse the name of a deleted learning instance.

- b) Optional: **Description:** Enter a description.

- c) **Document type:** Select the document type from the drop-down list.

Do not choose standard forms as **Document type** while creating learning instance. Based on the option you select, a predefined set of form and table fields for the domain type appears. For example, when you select **Invoices**, the common forms and tables of an invoice appear.

Note: If you want to create a domain to use specifically for this learning instance, select **Document type > Other** and enter a domain name. In the upcoming steps, you will customize the domain.

For more information on creating a custom domain, watch the following video:<https://www.youtube.com/embed/mxn26uQDPoI>

If you want to create a domain to use in more than one learning instance and you have the required access permissions, you can work with Automation Anywhere support to create a custom domain. See [Custom domains in IQ Bot](#) for more information.

- d) **Primary language of documents:** Use the drop-down menu to select a language for the learning instance.

[Languages supported in Automation 360 IQ Bot](#)

To create custom domains in other languages and access up to 190 languages that IQ Bot supports, contact Automation Anywhere support.

Trouble: If you are unable to see all languages in the IQ Bot interface, troubleshoot the issue: [Unable to extract data from Multiple languages in a document \(A-People login required\)](#)

- e) **Upload your documents:** Click the **Browse** option to upload sample documents.

3. Select or de-select fields in the **Common form fields** and **Common table/repeated sections fields** sections.

Form fields appear one time in a document, such as the invoice date or number. Table fields are fields that reoccur throughout the document, such as the item total or quantity.

To see all the possible fields, click **Additional form fields** or **Additional table/repeated section fields**.

4. Optional: Add additional fields by entering the field name in the **Additional form fields** or **Additional table/repeated section fields** section.
Follow the naming conventions when you enter a name in the **Add fields (Optional)** field:
 - Field names can only begin with alphabetical characters (A-Z and a-z).
 - Field names can only include alphanumeric characters and spaces.
 - Field name cannot end with a space.
5. **Optical Character Recognition:** Select the required OCR engine.
Select an OCR engine
6. Optional: De-select the **My PDF documents do not have images** check box. To learn more, see *Disable PDFBox option*
When this check box is selected, IQ Bot uses PDFBox OCR to process PDF documents; non-PDF documents are processed by the OCR you selected in the previous step.
7. **Checkbox auto-detection:** Select the **Detect checkboxes** check box to enable this feature.
Selecting this option allows IQ Bot to automatically detect check boxes in a document. However, it might increase the processing time of documents.
8. Click the **Create instance and analyze** option to create the learning instance.
The system analyzes and sorts the training documents into logical groups based on field identification and shows the details in the **Learning Instance > Summary** tab.

When a new learning instance is created, the sample documents you uploaded are analyzed and sorted into groups based on the document characteristics. To learn more, see *About the Classifier*.

After the Classifier finishes sorting the documents, you are redirected to the Designer, where you will train bots to extract data from each sample document. *Train a learning instance*.

Related tasks

[Select an OCR engine](#)

You can select an OCR engines that suits your requirement for data extraction based on your document types. Restarting IQ Bot services is not necessary for implementing an engine change.

Related reference

[Create a learning instance for standard forms](#)

Learning instance is used in IQ Bot to extract, train, validate content from standard forms. Use the following instructions to create a learning instance for processing standard forms in IQ Bot

Select an OCR engine

You can select an OCR engines that suits your requirement for data extraction based on your document types. Restarting IQ Bot services is not necessary for implementing an engine change.

During IQ Bot installation, the system sets the latest version of Tesseract Optical Character Reader as the default OCR engine. This is also the default setting for the product. However, you can manually set the OCR engine in the `Settings.txt` file, which becomes the default engine. Similar to the prior releases of IQ Bot, you can continue to manually update the `Settings.txt` file with the OCR engine name you want to set as default.

When creating a learning instance, you can select an OCR engine from the **Optical Character Recognition** drop-down menu. See *Create a learning instance*

Note: Selecting an OCR engine in the interface overrides the settings in the `Settings.txt` file.

The following table lists the various OCR engines supported in IQ Bot and the corresponding options:

Table 4: List of OCR engines and their specifications

Qualifiers	OCR Version	Supported installation	Handwritten	Languages Supported	Document Quality	Document Type
Tesseract OCR	4	Cloud and On-Premises	N/A	English German Spanish Italian French	No noise No dark background No stamps/watermarks 200+ dpi	Invoices, POs, etc. Semi-structured formats
ABBYY FineReader Engine	12.3, or 12.4	Cloud and On-Premises	N/A	English All Latin+ Chinese Japanese Korean	Less noise Dark background with white fonts Has stamps/watermarks 96+ dpi	Invoices, POs, etc. Semi-structured formats Mortgage Forms, Tax Forms Unstructured Formats
Microsoft Azure Computer Vision OCR engine	2.0 or 3.2	Cloud and On-Premises	English only	English All Latin+ Chinese Japanese Korean	Less noise Dark background Has stamps/watermarks 96+ dpi	Invoices, POs, etc. Semi-structured formats Passports, Driving license, etc. KYC documents
Google Vision API	Version is updated automatically to match current release	Cloud and On-Premises	N/A	English All Latin+ Asian	Less noise Dark background Has stamps/watermarks 96+ dpi	Invoices, POs, etc. Semi-structured formats Mortgage Forms, Tax Forms Unstructured Formats

Qualifiers	OCR Version	Supported installation	Handwritten	Languages Supported	Document Quality	Document Type
Tegaki API	Check with your Cogent Labs sales representative	On-Premises only	Japanese and Korean	Japanese and Korean	No noise No dark background No stamps/watermarks 200+ dpi	Invoices, POs, etc. Semi-structured formats

1. On the **Create a new learning instance** page, select the domain and language of the documents. In the **My learning instance** list page, a new **OCR Engine** column is available that shows the OCR engine used for creating each learning instance. This information is useful to the user when deciding on document processing.
2. The **Fields to extract** and **Advanced Settings** sections are displayed when you select the domain. Each domain is available with a predefined list of primary supported languages. Language selection is enabled and available from the **Primary language of documents** drop-down list based on supported languages for a specific domain.

Note: If you select a language from the **Primary language of documents** drop-down list and then select an engine that does not support that language, the system displays an error message in the **Optical character recognition** drop-down list.

3. Click **Advanced Settings > Optical character recognition** to display the OCR engine options drop-down list.

If the OCR engine selection is invalid, the **Create instance and analyze** option is not enabled.

Note: IQ Bot automatically installs all OCR engines during the installation process, except for ABBYY FineReader Engine.

Important: You can only configure the selected OCR engine in Automation 360 IQ Bot On-Premises. OCR settings in Automation 360 IQ Bot Cloud cannot be edited as they are not accessible except for ABBYY FineReader Engine. You can edit the configuration settings for ABBYY FineReader Engine using the `appConfigurations` REST API.

You can select from the following:

Option	Description
Tesseract OCR 4	This is the default engine, unless changed in the <code>Settings.txt</code> file.
ABBYY FineReader Engine	<p>To verify if ABBYY FineReader Engine is installed and available for use on your machine, check the <code>Settings.txt</code> file, the OCR Plug-ins folder for the SDK files, and the Optical character recognition drop-down list.</p> <hr/> <p>Note: Also supported in IQ Bot [Local Device] package and IQ Bot Extraction package.</p> <hr/> <p><i>Use ABBYY FineReader Engine OCR engine in IQ Bot</i></p>

Option	Description
Microsoft Azure Computer Vision OCR engine	IQ Bot supports all languages supported by this OCR engine. <i>Use Microsoft Azure Computer Vision OCR engine</i>
Google Vision API	IQ Bot supports Google Vision API as an OCR engine and supports all languages supported by this engine. <i>Use Google Vision API OCR engine</i>
Tegaki API	IQ Bot supports his OCR engine to extract data specific to Japanese and Korean language documents. You need to download and use your private license to use Tegaki API. <hr/> Note: Tegaki API OCR engine is not supported in Automation 360 IQ Bot Cloud. <hr/> <i>Use Tegaki API OCR engine</i>
My PDF documents do not have images	All the PDF documents that you upload are processed using the PDFBox OCR by default, regardless of the OCR engine you have specified or selected. If you are uploading non-PDF documents or PDF documents that contain images, clear the My PDF documents do not have images check box to ensure that the OCR engine that you have specified or selected is used to process the documents. The My PDF documents do not have images check box is enabled by default. To disable this feature, see Disable PDFBox option .

Tip: If IQ Bot is unable to extract data from low quality or handwritten documents, troubleshoot the issue:

[IQ Bot unable to extract data from low quality and Handwritten documents \(A-People login required\)](#)

Note: Use the following files to change the OCR settings:

- `AbbyyImagePreProcessingSettings.json`
- `LanguageCodeToAbbyyLanguageCode.json`
- `TegakiOCREngineSettings.json`
- `Azure3OCREngineSettings.json`
- `GoogleOCREngineSettings.json`
- `AzureOCREngineSettings.json`

[How to change OCR Settings in IQ Bot \(A-People login required\)](#)

Edit a learning instance

Edit a learning instance to change its name, description, add additional training documents, or include additional fields for extraction.

You can only edit a learning instance on Staging. So ensure you move any learning instance in Production environment to Staging to edit it.

1. On the **Learning Instances** page, click a learning instance.
2. Click the **Edit** icon to edit the learning instance.
3. Optional: Update the description field.
4. Optional: Change or update the learning instance name.

When you change the name of a learning instance, the following changes occur:

- A separate folder with the new learning instance name is created in the configured output directory to store the .csv files of processed documents.

The previous folder containing the .csv files before the learning instance name was changed remains as is in the output folder.

- When you migrate a learning instance with an updated name using overwrite or remove options, it is updated in the source environment after the .iqba file is imported.
- An entry in the audit logs is created for this activity.

5. Optional: Click **Browse** to select additional training documents.

The file names of the documents that you upload should not start with special characters, such as the hyphen (-).

6. Optional: Select additional fields and table columns to add to the learning instance for data extraction.
7. Use the **New groups creation setting** field to restrict creation of new groups or set the threshold for the number of groups.

Note: The **New groups creation setting** field only applies to the documents in Production. However, this field option is not applicable for IQ Bot [Local Device] and IQ Bot Extractionpackages.

For more information, see [Limit the creation of document groups](#).

8. Optional: Use the **Default validations group** option to select a default group for document validations.

All new documents use the custom logic and validations defined in the default group. Validation rules from this default group are applied when a document does not belong to any of the existing group. If you delete the selected default group, the validation rules are not applied to any of the new documents that were supposed to use this group.

Note: If you select a default group, you can only change it to another group. However, you cannot select **Select default validation**, which is the default setting.

9. Click **Save** to view a confirmation message.
10. Click **Yes, proceed with field addition** to upload, analyze, and classify the selected training documents (if any) that were added to the learning instance.

The classification of documents remain unaffected by the newly added fields.

All additional fields become available in all the bots and appear as optional fields in the selected learning instance. The bots must be retrained for these fields.

See [Errors generated while editing learning instances](#).

Limit the creation of document groups

Limit the number of new document groups that the Classifier can create when a learning instance is in production.

You can only edit a learning instance that is in staging. If the learning instance is in production, you must revert it to staging.

When documents are uploaded to a learning instance, the Classifier sorts the documents into document groups based on the layout, which is the order in which the fields appear on the page. If a document is uploaded to a learning instance in production and the document does not match the layout of any of the document groups, the Classifier creates a new group for that document.

Use the following steps to either configure a limit for the number of total document groups in the learning instance, or opt to disallow the Classifier from creating new document groups.

1. Navigate to **LEARNING INSTANCES**, select a learning instance, and click **Edit**.
2. Select from the following options:

Option	Description
Select the Never create new groups check box	<p>No new groups are created, irrespective of the number of document uploads. The uploaded documents are sent directly to the Validator.</p> <ul style="list-style-type: none"> • This check box is deselected by default. • When this option is selected, the Threshold to create new groups field is disabled. • You can create new groups manually by uploading them to the learning instance in staging.
Set a value for the Threshold to create new groups field	<p>When you set a threshold value, IQ Bot does not create a group for the uploaded documents till it reaches the defined value. Till the set threshold value is reached, all documents are sent to the Validator.</p> <ul style="list-style-type: none"> • By default, the value is set to 10 for all new learning instances. • You can set a value of up to 10 digits. • IQ Bot does not allow you to enter non-numerical characters, zero, or floating points.

3. Save your updates, which are then reflected in the **Summary** tab.

The **Summary** tab displays all the staging and production details. The information is updated based on any applied setting in the **New groups creation setting** section.

For new learning instances, unless you set the minimum threshold in the **New groups creation setting** section, IQ Bot applies the default set value of 10 and does not create groups for the first 9 uploaded documents.

4. For existing learning instances, you can set the minimum threshold in the **Learning Instance > Edit** page. The new threshold is applied to all documents from then onward.

All existing learning instances, even after upgrade, will continue with a threshold as 1.

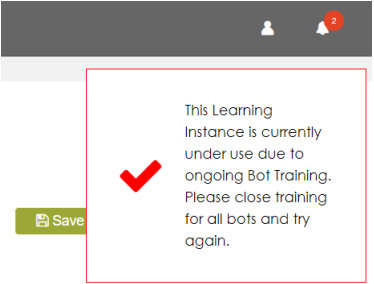

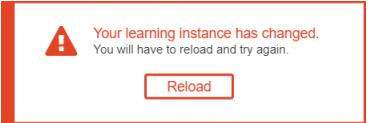

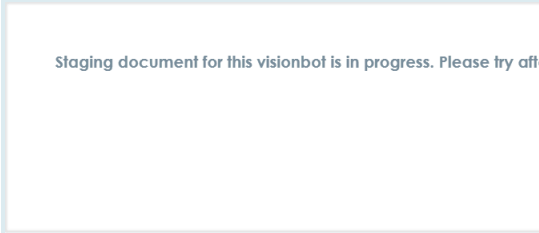

All changes take effect only on the documents uploaded in production after the setting is edited.

If you change the setting to a new threshold or never create new groups with an existing learning instance, this check will be performed only on the next document uploaded in production.

In the production environment, all classified documents that do not belong to any group and do not meet the minimum threshold requirement are sent to the Validator. You can update the values and make necessary corrections. However, all fields are optional and are text data type. The user can **Save current document** without making any corrections, or choose the **Mark as Invalid** option.

Errors generated while editing learning instances

Use case scenarios and error messages generated while editing a learning instance are explained in this topic.

Case	Details	Message
Bot in training	<p>Learning instance is in use because of ongoing bot training and you edit the same instance</p> <p>A) User 2 is editing the same learning instance</p>	
Case 1: Simultaneous editing of same learning instance	<p>Example for case 1:</p> <p>User 1 uploads a document to the same learning instance.</p> <p>User 2 adds a field when editing the same learning instance.</p>	
Run and edit the same bot	<p>Run the bot and then edit the same bot using the same user login or two different user logins.</p>	

Delete a learning Instance

Use the **Learning Instances** page to delete a learning instance from the **View Details** page.

You cannot delete a learning instance that is in the production environment. To edit a learning instance, do the following:

1. On the **Learning Instances** page, click the learning instance or **View Instance Details** icon to show the **Summary** tab.
2. On the details page, : click the **Edit** icon. The learning instance becomes available for editing.

3. To delete the learning instance, click the **Delete Instance** button. A confirmation message appears.
4. Enter the learning instance name in the field and delete the learning instance.

Important:

Unless you have already exported the learning instance as a backup, the following occurs after you delete a learning instance:

- It is permanently deleted and cannot be restored.
 - All the associated bots are deleted and cannot be reused.
 - You cannot reuse a deleted name for a learning instance to create a new one.
-

Disable PDFBox option

The PDFBox option is enabled by default. Disable the option when you are training hybrid PDF documents containing images and text.

The PDFBox option works best with completely digital documents only. When using hybrid documents containing images and text, our recommendation is to disable the PDFBox option for better document classification.

Note: The PDFBox option is enabled in the system by default. Ensure that the PDFBox is kept enabled only if you plan to process digital documents, otherwise processing will fail.

If PDFBox is enabled, you can process the following PDF types:

- **Vector and Hybrid** PDF can be processed using PDFBox
- **Raster** PDF can be first processed using PDFBox, and if no segment is found then the PDF is processed again using Document Image OCR

There are two ways in which you can disable/enable the PDFBox option in IQ Bot:

- Directly in the UI during the creation of a learning instance. In the **Create new learning instance** page go to **Advanced Settings > Optical character recognition** and disable/enable the **My PDF documents do not have images** check-box.
- In the `Setting.txt` file described as follows:

1. Navigate to `C:\Program Files (x86)\Automation Anywhere IQ Bot\Configurations`.
2. Open the `Setting.txt` file, and change `PDFBoxOCREnabled=true` to `PDFBoxOCREnabled=false`

This turns off the processing of uploaded documents by PDFBox for new learning instances (after applying this change), and does not apply to the existing learning instances. IQ Bot will use your selected OCR engine for PDF documents as well.

Note: When PDFBox is disabled, ensure that your PDF document is less than 60 pages.

3. After updating the `Setting.txt` file, execution of `stoppedanduninstalled` and `installedandstartedstart` of IQ Bot services is not required.

Train a learning instance

Use the staging environment to train a learning instance and extract data from sample documents. Review each field to verify whether the correct value is extracted and where necessary, map the correct field.

When you upload sample documents while creating a learning instance, the Classifier analyzes and categorizes these documents into logical groups. The system creates a bot for each document group, which you must train to extract data from specific fields in the sample documents.

The following steps provide an overview of the training process:

Step 1: Open the Designer

From the **My Learning Instances** page, open a learning instance and click **Edit bot** or **Create bot** to start training the learning instance.

For an introduction to the components, see [Introduction to the Designer](#).

Step 2: Map the document fields

In the **Fields** section, click each form field to verify whether the correct value is extracted. If the value is incorrect or if the field was not found (indicated by a grayed-out check icon next to the field), you must remap the field.

- [Map a field](#)
- [Delete mapping in the Designer](#)

Step 3: Map the check boxes (if applicable)

If you configured the learning instance and uploaded sample documents containing check boxes or option buttons, see [Extract data from check boxes or check box groups](#)

Note: Check boxes and check box groups can be extracted as either a form or table field depending on whether the check box appears one time or on a recurring basis in the document.

Step 4: Map the table fields

Review each table field to ensure that the correct column name is identified in the **Column Value** field. If IQ Bot did not find the correct Column Name, remap the column name by using the same approach as you did for the form fields. Then, configure the table settings. [Map a table](#)

If the document contains more than one table, define the additional tables:

1. Add all the table fields to the **Additional table/repeated fields** section of a learning instance. [Edit a learning instance](#).
2. Map the additional table fields. [Add multiple tables in Designer](#).

To establish a relationship between the fields of the different tables, see [Define one or more linked fields in a child table](#).

Step 5: Review the training results

Click **See extraction results** to check the extracted data from the document group. [Preview extracted data](#)

If not all of the fields are extracted, try resizing the mapping areas for those fields.

Alternatively, train the bot by using a different document. [Change the training document for a group](#)

Step 6: Save the bot

Click **Save and go to next group** to train the bot for the next document group.

A menu appears, with the option to **Cancel**, **Save**, or **Save and send to Production**.

Note: We recommend that you test the bot (see next step) before sending it to production.

You can view the status of all the bots in all your learning instances from the **BOTS** tab. [Manage IQ bots](#)

Step 7: Test bot extraction capabilities

Navigate to the **BOTS** tab and click **Test bot**.

The bot processes the remaining documents in the document group based on the trained document. To see the bot performance, review the values in the **Learning instance summary** page, particularly the straight-through processing (STP) metric. [Review the learning instance details](#)

If the STP number is low, you can either retrain the bot, such as by resizing the mapping areas or train the bot on a different document. [Change the training document for a group](#)

Step 8: Send the bot to production

When you are satisfied with the extraction accuracy of the bot, switch it to production mode. Then, switch the learning instance to production mode. Once a learning instance is in production mode, IQ Bot is ready to begin processing documents in real time: classifying the uploaded documents to the document groups with bots in production and either extracting data or sending the document for manual validation.

From the **Learning Instance Details** page, click the switch at the top right to move the learning instance into production mode. [Set learning instance to Production](#)

Note: If you want to retrain a bot, both the learning instance and the bot must be in staging mode.

Related concepts

[About the Classifier](#)

Learn about how documents are classified and the factors that affect classification.

Introduction to the Designer

The Designer is the user interface where you train bots to extract data from uploaded sample documents. The Designer contains auto-mapped fields and table columns, where you can edit the existing mapping or add new fields and tables.

Highlighted areas are:

1. **Fields panel:** List of fields selected for extraction during Learning Instance creation. Fields successfully found are indicated with a green check mark.
2. **Field Details panel:** Details for the highlighted field in the Fields Panel, including data type and extracted value.
3. **Document Image panel:** Rendered image of the document with image view controls
4. **Form fields:** A field that has a single value in the document, such as the invoice number or invoice date.
5. **Table fields:** A field with values that appear more than one time in a document, such as the item description or quantity.
6. The blue boxes indicate System Identified Regions (SIRs) where IQ Bot found extractable data.
7. The training document can be changed by clicking **View each Group (#) document**.
8. The extraction can be tested using **See extraction results**.
9. **Save and close:** Saves the changes and returns to the Learning Instance details page.
10. **Save and go to the next group:** Saves changes, allows the Group to be set to Production mode, and moves to the next available Group.

Note: If you have multiple files in a group and one of the document is deleted, then you will see an error message **Unable to load document** and you will not be able to change the document for training in the Designer. When the entire multi-page document is deleted or corrupted, you will not be able to navigate between the pages. If you click the next page button, then the **Loading document** screen is displayed.

Change the training document for a group

During document training, look at unique document layouts available in a group, and choose a different document than the default one chosen by IQ Bot Designer, that is more representative of documents across that group. That helps maximize straight-through processing (STP).

Follow the steps to choose a different document from a document group.

1. User can see the **View each Group 'x' document** button in the Designer training page next to the document name.
The **View each Group 'x' document** button is disabled if there is a single document in the group.
2. Click the **View each Group 'x' document** button to display the previous and next arrows that will let you move to another document. You can also cancel out of the task.
Choosing a different document as the group's training document will clear all mapping from the previous document. IQ Bot displays a warning message stating the same.
3. Select a new document and click the **Change the training document** button to see a message confirmation stating: *If you change the training document for this group, any mapping from the previously trained document will be lost. Do you want to change the training document for <group name> to <document name>?*
4. Choosing **No, cancel** takes you back to the Designer, whereas confirming the message **Yes, change** loads and launches the new document with auto-mapped fields.
5. Click **See extraction results** to view extracted data from the new document.

Tasks performed from Bot page

This page lists all the available bots for a learning instance, and enables you to perform tasks such as run, change the status, or launch the IQ Bot Designer.

Create a bot to extract text from a document. Define the field labels and values in a document so that the system can learn from it and automatically process other documents in the document group..

Monitor the progress and status of all bots created for a learning instance and set the status from Staging to the Production environment.

Testing a bot verifies that the bot can reach the required accuracy based on the training. It also runs it against all the sample documents associated with that category or group and benchmarks document and field accuracy. Test a bot only in the Staging environment.

Note:

- To view the updated document and field accuracy, refresh the **Bots** page and click the bot name. The updated document and field accuracy appear in the details area.
 - You cannot edit a bot that another user is already editing.
-

Various bot states

The status of a bot is dependent on the state of the learning instance as well as the bot. The table below shows the relationship between learning instance state, bot state, and bot status.

Learning Instance State	Bot State	Bot Status
Staging	Staging	Training

Learning Instance State	Bot State	Bot Status
Staging	Production	Ready
Production	Staging	Training
Production	Production	Active
Created	Not created	No listing

Delete a bot

The following are some key points:

- Clicking the **Delete bot** button displays a message asking if you want to delete the Bot. Selecting yes displays a success message in the Learning Instance details page. The **Summary** tab shows the updated information in the **Staging** and **Production** results sections for the **Groups found** and **Bots created** fields.
- You can delete a Bot in Staging only. Once deleted, the Bot does not display in the Learning Instance details page or the Bot listing page.
 - All associated staging documents are removed from the system.
 - All associated unprocessed production documents get moved to the Validator for processing.

Note: A new Bot is created when the same documents are uploaded again to Staging or Production.

- On re-uploading the deleted documents from the learning instance, the system classifies the documents and displays the groups again with the **Create Bot** option for each group. Clicking the **Create Bot** option creates the Bot and you can see it in the **Create Bot** details page.
- In case of backend exceptions, such as disruption of Services, the system does not let you delete the **Bot**. Instead, it displays an error message saying that an unexpected error has occurred.

Related tasks

[Create your first bot](#)

Perform the following steps to create your first bot that prints the message, `Go be great!`, the Automation Anywhere version of `Hello World!`

Improve output quality using OCR confidence

Improve the output quality of the IQ Bot platform using the system-identified region (SIR) and optical character recognition (OCR) confidence by comparing it to a predefined threshold.

Confidence-based validation is useful for a text type field and for Date or Number fields because it helps route a document, with contentious values, for a human to view despite the fields satisfying the set validation criteria.

Enable OCR confidence-based validation

Note: This option is applicable only if you selected Tesseract OCR when creating the learning instance.

This feature is disabled by default. To enable this feature, open the `Settings.txt` configuration file available in `<IQ Bot Installation Folder>\Configurations\`, and set the desired threshold value in the `ConfidenceThreshold` property. For this example, set the character-level confidence

threshold value to 99, that is `ConfidenceThreshold=99`. When this feature is disabled, the default value is set to 0, signifying that the feature is disabled.

Note: The confidence threshold value is uniformly applicable across all the learning instances.

How OCR confidence-based validation works

In a document if a field's SIR character level confidence is lower than that of the set confidence threshold, the validation for that field fails, resulting in the failure of that document.

Note: If a field value fails due to a validation rule (for example, Invalid Number Format) other than an OCR confidence validation failure, you see that tooltip, and not the tooltip for *Low confidence*.

While training a document, a confidence-based validation failure against a field appears in an orange box during preview if no other validation errors exist for that field. Other validation errors take precedence over OCR character-level confidence validation.

Troubleshoot: If the OCR engine is not able to identify SIRs for Chinese language PDF documents, troubleshoot the issue:

- [Data objects \(SIRs\) are not identified by OCR for Chinese PDF documents \(A-People login required\)](#)
 - [How to convert PDF files to TIFF files \(A-People login required\)](#)
-

Map a field

When you are training a learning instance, if a field value was extracted incorrectly or if the field was not found, you must remap the field.

If you have not done so already, first create a learning instance with sample documents. [Create a learning instance](#)

For an introduction to the components, see [Introduction to the Designer](#).

The Designer image display panel contains blue boxes that surround text, date, or number type data. Each of these blue boxes is a system identified region (SIR) that indicates that IQ Bot has identified that region as containing extractable data. Perform the following steps to map a field to teach IQ Bot to extract data from that field (for example, the invoice number) from a specific region (for example, the top-right side of SIR).

Note: These steps apply only to text, number, and date data types. IQ Bot also supports check boxes. For more information, see [Extract data from check boxes or check box groups](#).

1. Select a field and specify the data type from the **Data type** list.

Note: If a field value contains a mix of letters and numbers, such as invoice number, select the **Text** option.

2. In the image display panel, click the field from where you want to extract data.
IQ Bot tries to identify and autopopulate the corresponding field value in the field details panel.

Tip: Use the pipe symbol (|) to add field aliases, which represents alternative text that might be present in an SIR. For example, if the recipient's information is in a field labeled `Sold to` in some of the documents and in `Ship to` in other documents, enter `Sold to | Ship to` as the field label.

3. Optional: Drag the corners of the green-bounded box to resize the mapping area.
Alternatively, draw a new mapping area by holding and dragging the cursor.
When you resize any value region or create your own value region using select, its position is fixed relative to the field label. The value for that field is always searched in that relative region.
Reset a fixed field region defined by the user in the autodetected mode by clicking the close button at the top-right corner of the field.
For additional information, see [What are the different ways to map form fields in IQ Bot \(A-People login required\)](#).
4. Optional: If the column value is not consistently available in the training documents, expand the **Field options** section and select **Optional**.
5. Optional: Add validation patterns or custom logic.
[Designer validation patterns](#)|[Adding custom logic to improve automatic extraction in production](#)

Review each field to verify whether the correct value is extracted. Then, proceed to mapping table fields. See [Map a table](#) .

Use list validation to improve accuracy of a text field

Setting validations while defining any field or table column while mapping the document class helps validate a field or table column against predefined parameters so that you can be warned if any mismatch is found during the data digitization process.

Enter each text value in a separate line.

- The bot validates extracted value of field/table column against this predefined list and checks for any mismatch found during the **See Extraction Results** phase.
- Besides validating, the process also helps auto correct the extracted values.
- Errors in validation are marked with a red border and can be seen in the **See Extraction Results** phase. Move your cursor over the error to know the error type.

If list validation value is **Adam**, and the extracted value is **Adem**; the extracted value will be auto corrected to **Adam**. In this example, there is a 75% match of characters; and threshold for match is at least 66%.

Use validation patterns/lists to flag discrepancy in extracted data

Use validation patterns/lists to flag discrepancies in extracted data and prevent incorrect data from going through.

When a date/number format pattern is explicitly specified, the date/number is auto corrected.

See the following examples:

Table 5: Example of date format pattern

Incorrect OCR Data	Pattern	Auto-Correction
15 10-2015	dd-mm-yyyy	15-10-2015

Table 6: Example of number format pattern

Incorrect OCR Data	Pattern	Auto-Correction
123 4567	9999999	1234567

Map a table

IQ Bot uses column names as reference points when extracting values from tables. As part of training a learning instance in the Designer, you must map the column names and configure the table settings.

Create a learning instance and map all the form fields in the Designer. [Map a field](#)

1. Skipping the **Table settings** section, click the first table column in the **Table fields** section.
2. Click the name of the column from where you want to extract data in the image display panel.

There are two ways to map the column values:

- **Option 1:** For a basic table that is contained within one page, map the column name to the **Column value** field.
- **Option 2:** If the table spans multiple pages, we recommend mapping the **Column value** field to an entry in that column that has the greatest height and width among the entries in that column.

Depending on which mapping option you choose, IQ Bot autopopulates the **Column value** field in the field details panel with either the name of the selected column or the value of the selected table entry. In addition, the selected SIR in the document is highlighted with yellow color for easy identification.

3. Optional: Drag the corners of the green-bounded box to resize the mapping area.

Alternatively, draw a new mapping area by holding and dragging the cursor.

When you resize any value region or create your own value region using select, its position is fixed relative to the field label. The value for that field is always searched in that relative region.

Reset a fixed-field region defined by the user in the autodetected mode by clicking the close button at the top-right corner of the field.

Tip: For additional information, see [How to map tables in IQ Bot \(A-People login required\)](#)

4. Expand the **Field options** section and select **Required** or **Optional**. Use the optional value if the column value is not consistently available in the training documents.
5. Optional: Provide validation patterns.

[Designer validation patterns](#)

Configure the **Table settings** section. Ensure that you map all the other fields in the document before populating this section.

6. Review the selected option in the **Best field for table/repeated section** field. IQ Bot autodetects the table field that best defines the height of the rows in the table. You can select a different column from the list.

Other columns are extracted in reference to this column. For example, if the **Best field for table/repeated section** has five rows, then a maximum of five rows will be extracted from the other columns.

Note: Ensure that this field does not contain multiple lines or is empty.

7. Optional: Map a field label for the **End of table indicator** field to specify where to stop extracting data from that table.

For example, an invoice might contain the subtotal, sales tax, and total in the table, but because each of these fields has only one value per document, they should not be extracted as part of the table.

Provide the name of the first field that appears where the table ends, for example, `Total` or `Grand Total`.

Provide the value for the **End of table/section indicator** field in any of the following ways:

- In the Image display panel, select an SIR to populate that text value as the **End of table/section indicator**.
- Alternatively, type a value directly into the **End of table indicator/section** field, in the middle panel.

Tip: Use the pipe symbol (|) to add field aliases, which represent alternative text that might be in an SIR. For example, `Subtotal | Subtotal Amounts` refers to Subtotal OR Subtotal Amounts.

For an example of how to map one table for extraction in a document that contains multiple tables, see [Mapping a table in a page with many tables](#).

8. **If you mapped a table value for the Column value field (option 2 in step 2):** Expand the **Advanced table options** section and select **Stop extraction at "end of table indicator"**.
9. Optional: Enter custom logic.

[Adding custom logic to improve automatic extraction in production](#)

Click **See extraction results** to check the training results for table data and remap the fields if required. [Preview extracted data](#)

Mapping a table in a page with many tables

This example guides you in using the **Extract Table Summary Rows** and **End of table indicator** fields to extract one table in a page that contains many tables.

If you have not already done so, create a learning instance and map all the form fields in the Designer.

[Map a field](#)

In this example, a page in a document contains more than one table, but the objective is to extract only one of the tables. User is in the Designer training a bot, with at least one table having duplicate or similar regions matching those of another table. **Extract Table Summary Rows** functionality does not impact data extraction irrespective of whether user specifies the **End of table indicator** value.

1. Create two tables with similar or duplicate areas. For example, one table with *claims total* and other with *record details* related to *line number*.
2. Map all table columns related to *line number*.
3. Map all value columns without table label, but related to *claims total*.
Claim totals table has duplicate or similar areas like another table related to *line number*. So the *billed amount* column is a duplicate area for both tables.
4. Map one column of *claims total* table with the *claims total* label, as at least one column label is required for data extraction for a table.
5. Click on **See extraction results** to see duplicate rows that have duplicate or similar areas on *claims total* table. For example, When single page has multiple claim totals records.
6. Click **Back to training** to return to the training page.
7. Navigate to **Claim totals table > table settings**, and check the box for **Extract Table Summary Rows** label under **Advance Table Options**.
8. Enter value for **End of table indicator** and click on **See extraction results**.
9. User can see rows in *claims total* table related to *claims total* only.

10. Click on **Export to CSV** to open the file.
11. User can see table related to *claims total* extraction, as seen in preview.
12. Next, set the learning instance, and bot to production and upload some files related to the bot.
 - If the bot does not have any validation errors, the user can see *claims total* table as per mapping in production CSV file.
 - If the bot has some validation errors, the user can see *claims total* table as per mapping in the Validator.

Add multiple tables in Designer

If the sample documents contain more than one table, you must map the columns and configure the table settings for each table.

Create a learning instance and map all the fields in the Designer. [Map a field](#)

Map the columns for the first table. [Map a table](#)

Add multiple tables in the Designer to extract their value and validate them. Move one or more table fields from one table to another to train extraction. To add tables do the following:

1. In the **Table fields** panel, click **Add Table**.
2. Select the columns to add from the **Available columns** list and click the arrow to add to the new table column list.
3. Map the column names and values as you did for the first table, then configure the **Table settings** section.

Resources

<https://fast.wistia.net/embed/iframe/czqkzc8nwn>

Click **See extraction results** to check the training results for table data and re-map the fields if needed. [Preview extracted data](#)

Define one or more linked fields in a child table

In the Designer, define one or more linked fields/sections in a child table, to link parent and child tables in a flexible way.

Use the *linked fields in a child table* feature in Designer to create table links, and a hierarchy of table links among parent and child tables. This helps efficient data extraction of the linked fields besides easy linking among tables. Foreign key data extraction allows the following relationships only:

- Link single parent row to a single child row (one-to-one linking).
- Link single parent row to multiple child rows (one-to-many linking).

Note: IQ Bot does not support linking of check boxes.

Use the feature for documents with a list of names or IDs with specific information on each. For example, documents from an electric company with a list of customers and their billing/usage information. Or a document with a list of student names displaying their test scores. Create multiple tables and link the common fields thus allowing efficient and accurate data extraction. IQ Bot supports linking of up to 50

columns and unlimited rows. However, data extraction from rows spanning across multiple pages is not supported.

- **Single parent-child table field/section linking:**

In the **Table/Repeated Section** of the Designer, choose one or more fields/sections from a parent table to link to a child table.

1. Click **Table Settings** in the child table and click on **Link Table Fields** and select the parent table from the drop-down list of table names. This displays the available column options in the parent table you can choose to link to.
2. Select the columns you want linked and click the downward arrow to link the columns to the child table.
3. The linked columns display under **child table > Table Settings > Linked to (table name)**.
4. When previewing the extracted data (click **See extraction results**), the linked fields from the parent table show up in the extreme left columns of the child table.

- **Multiple hierarchical table field/section linking:**

When linking table 1, 2, and 3 in a hierarchy, link in a way so that table 1 is the parent of table 2, and table 2 is parent of table 3. All three tables would be linked. Child table 3 would display linked fields from table 2 and 1. IQ Bot supports hierarchy linking up to six tables at a time.

Note: For table 3, you can only choose fields from table 2 that are not from table 1.

When previewing the extracted data for child table 3 (click **See extraction results**), the extreme left columns show linked fields from table 1. The next columns show linked fields from table 2.

Attention: For successful linking, the child table must be at the same or lower level than the parent.

Extract data from check boxes or check box groups

Train a bot to extract data from a single check box or a group of check boxes.

A check box is a user interface object that allows you to make a binary choice - select or leave unselected. IQ Bot supports extracting data from check boxes or radio buttons marked with a tick, cross, or dot. In addition to square check boxes and round radio buttons, IQ Bot supports triangle and rhombus outlines.

When IQ Bot processes documents with a check box, it extracts either a **Yes** (check box selected) or **No** (check box not selected) value.

You can also combine multiple check boxes into a single group, for example a payment methods group that contains check boxes for cash, credit card, and check. When IQ Bot processes documents with a check box group, it includes the group name in the extraction results.

Recurring check boxes or groups

By default, IQ Bot extracts check box values as a form field. However, if a check box or group appears on a recurring basis in the uploaded documents, you manually select the **Column** option so that IQ Bot extracts the values as table fields. This enables IQ Bot to extract values from the subsequent occurrences. Otherwise, IQ Bot will only extract the check box value the first time it appears.

1. Click the field you want to map from the left panel.

2. In the center panel, in the **Data type** drop-down field, select value as **check box** or **checkbox group**.
 - **To extract data from single check box or check box groups**, click the **Field label** field and then click the corresponding value in the document in the right pane.
 - **Extract data from recurring check box or check box groups**, click the **Column name** field and then click the corresponding value in the document in the right pane.
3. To extract the check box value, draw an outline around the check box excluding the value.
 - **For a single check box**, use the **Draw** tool to draw over the check box or select the auto-mapped check box segment.
 - **For a check box group**, use the **Draw** tool to draw over the region covering all the check boxes in that group.
4. **For single check boxes or check box groups:** Verify the extracted data either in the **Field value** field in the Designer or click **See Extraction Results** to see the extracted data.
For recurring check boxes or check box groups: You can only view the extracted data by clicking **See Extraction Results**; the extracted data is not shown in the Designer.
5. Optional: To add an individual check box to a check box group, select the desired value from the **Checkbox group** drop-down menu.
6. When you are done configuring the check boxes, click **Save and close** or **Save and go to next group**.

<https://fast.wistia.net/embed/iframe/5twla2e5jm>

Preview extracted data

Click **See Extraction Results** to review the extraction accuracy of the bot. This is the only way to see extraction results for table data, since the Designer does not show extracted table data during training. Alternatively, click **Export to CSV** to review the data in a CSV file.

The extraction result window displays the following information:

- Successfully mapped fields and the extracted values.
- Table headers and the values for each row.
- Extraction errors, which are highlighted within a red box. Hover on the error to learn more, such as if there was a validation error or lack of OCR confidence.

Note: The time required to display the extraction results can vary based on the complexity of the Python logic that you have created.

Important: A training document can pass in spite of an error flagged by the validation pattern. Sometimes we want a validation pattern to flag an error, so it would not pass specific documents at a later stage in production; instead enter them in the manual validation queue.

Close the window to return to the Designer.

Attention: If you upload 30 documents and all documents are classified into one group, you can see only one document for each unique layout.

Export data to a CSV file

You can export the extracted data to a CSV file for ease of review. When you click **Export to CSV**, the current document is downloaded to your device. To download other documents you must navigate to them using the < and > buttons.

The data in the downloaded CSV file is displayed exactly how it will appear when IQ Bot downloads data from a successfully processed document from a learning instance in production mode.

Review the learning instance details

Review various details of a learning instance such as associated groups, environment status, staging and productions results, total number of tested documents, modified date and so on.

On the **My learning instances** page, select a learning instance and use the following tabs to review the details:

- **Document Groups**- Contains a list of the document classification groups for the learning instance.
When you create a learning instance and upload documents to train, documents are automatically categorized in the same document group based on their content and classified accordingly. These are termed as classification groups. A bot is more likely to succeed extracting text across documents in a group with similar content.
- **Summary**- Contains various details about the learning instance such as Staging and Production results, current environment that the selected learning instance is in, total number of associated groups and bots, and so on.

Note: The system does not automatically refresh (auto-refresh) the **My learning instances** unless the user loads a screen or clicks the **Refresh** button, thereby manually refreshing data on a page. This feature helps reduce the response time for loading new data or performing any action in IQ Bot.

Related concepts

[Review the dashboard](#)

The dashboard summarizes the performance report and provides document processing information in a graphic format.

Delete mapping in the Designer

Delete mapping of field labels and field values, selecting the **X** delete symbol next to the mapped label or value.

The following use cases explain the delete field labels and value mapping options in the Designer.

Delete a field label and its mapped value:

Select a field label in the middle panel and click the **X** delete symbol of the bound box in the document view to delete both, label and value mapping . The label and the value from the middle panel gets deleted as well. The mapping check mark in the left and middle panels turns from green to gray indicating incomplete mapping.

Delete field value:

Select the field value and click the **X** delete symbol of the mapped box in the document view, to delete the mapped value. The value from the middle panel gets deleted as well. The check mark in the left and

Delete auto mapped value fields:

middle panels turns from green to gray indicating incomplete mapping.

The **X** delete symbol of the mapped box in document view is not visible till user resizes or manually maps it.

For a form field, when a user deletes a resized or manually mapped box around a the field value, IQ Bot repopulates the original auto mapped value.

For a table/section field, that same behavior does not apply, as a user has the option to map a table/section field name but not a field value, and vice versa.

Delete a field label/value with or without auto mapped value:

Select a field label/value with or without auto mapped value. The field label bound box displays in the document with an **X** delete symbol allowing users to delete the label.

Delete field label mapping with validation pattern:

In spite of deleting a field label, the validation pattern that was assigned to the field remains in place.

Delete option ('X') when bounded box reaches space limit:

If the label/field value bounded box in the document view covers a bigger area, extending to the edge of or beyond the document view, the 'X' delete symbol appears in the nearest corner of the box.

Note: The field value box in the middle panel is disabled and users cannot enter text manually.

Designer validation patterns

IQ Bot Designer allows you to validate a field and table column against a set of predefined parameters so that you can be warned if any mismatch is found during data digitization process.

Validate a field or table

Validate a field or table column against the following predefined parameters of validation options:

- Start With / End With
- Pattern
- Lists
- Formulas

IQ Bot classifies documents into groups based on similar content, structure, and layout, which is easily identifiable. The sample documents for training are chosen based on these criteria as well. When you launch the Designer to train your learning instance, IQ Bot loads and displays a sample document from each classified group in the document pane.

Tip: In the Designer set the validation parameters by defining any field and or table column during document training.

<https://fast.wistia.net/embed/iframe/2kp2mo8dpq>

Starts With and Ends With

While all validations can be set at the time of Design definition, you can set **Starts with/Ends with** and **Pattern** validations during training.

To validate whether data in a field starts or ends with a certain value, use the **Starts With** and **Ends With** validation option fields. While defining the design of a field or table column, you can specify whether the data is part of the selected field.

- Start with a certain value using a Starts With field
- End with a certain value using an Ends with field

If the Start With value is "IN" and extracted value is "1N7646464", then validation fails. While if End With value is 2017 and the extracted date value is 10-Aug-2017, the validation passes.

Pattern

A pattern helps define an acceptable format for data.

Validate data in the field or table column against a specific pattern. While defining the field or column in the Design view, specify a pattern of the data in the selected field.

Specify a pattern for date, number, or text fields based on the different available patterns. Reference the tables below for common examples:

Text

Field	Pattern	Notes	Description
Email	<code>^([a-z0-9_\.-]+)@([\da-z_\.-]+\.[a-z\.-]{2,6})\$</code>	This regular expression validates emails like john@ado.com.	The Email field supports regular expressions.
Phone Number	<code>^(\\(\\+?[0-9]*\\)?[0-9_\\-\\(\\)]*\$</code>	This regular expression validates phone numbers like (+64) 38 3235393.	The Phone Number field supports regular expressions.
Website	<code>^([a-zA-Z0-9]+(\\.[a-zA-Z0-9]+).*)\$</code>	This regular expression validates websites like www.domain.com.	The Website field supports regular expressions.
Number string	<code>^[0-9]{1,45}\$</code>	This regular expression validates a string with numbers 0 - 9 and limit length to 45.	The Number string field supports regular expressions.
Alpha-numeric	<code>^[A-Za-z0-9_@./#&+;+-]*\$</code>	This regular expression validates a string containing alphanumeric values like INV-001.	The Alpha-numeric field supports regular expressions.

Number

Field	Pattern	Notes	Description
Number string	<code>^[0-9]{1,45}\$</code>	This regular expression validates a string with numbers 0 - 9 and limit length to 45.	The Number string field supports regular expressions.

Auto Correction for date and number fields

This is one of the built-in features of IQ Bot for date and number format types. It performs automatic validation and correction based on the defined pattern, even when the date/number in the scanned document is incorrect.

Note: Auto correction is only supported for special patterns.

The following table illustrates the auto-correction of an incorrect date and numbers by IQ Bot.

	Incorrect OCR value	Pattern	Auto-Correction	Description
DATE	12 <i>F3B</i> 2 0 1 5	dd mmm yyyy	12 <i>FEB</i> 2015	In the first example, IQ Bot auto corrects incorrect OCR " F3B " to " FEB ".
	15 10-2015	dd-mm-yyyy	15-10-2015	In the second example, IQ Bot auto corrects "15 10-2015" to "15-10-2015".
NUMBER	123 4567	9999999	1234567	In the first example, the extra space between "3" and "4" is deleted after validation against the pattern.
	12.34,S67.12	99,99,999.00	1234567.12	In the second example, the alphabet "S" is corrected as "5".

Note: English language numeric value with at least one digit to the left and two consecutive digits to the right (for example, 1.23) gets auto corrected if there is a space found between the decimal and the digits. For example, values 1 . 23 or 1. 23 or 1 .23 get auto corrected to 1.23.

To use this feature, add Pattern (in validation options) to the selected date and number format fields.

Special number patterns

A special pattern consists of a Prefix, a Number Pattern, and a Suffix. Use for each is explained as follows:

- **Prefix:** Any symbol or a text string that is appended before the Number Pattern.
- **Suffix:** Any symbol or a text string that is appended after the Number Pattern.
- **Number Pattern:** Number pattern has two parts:

- **Integer-part:**

They are represented by nines (9s).

The 9s in the integer part represents integer pattern and separators such as commas, spaces, and so on.

- **Fractional part**

They are represented by zeros.

If you need two fractional number, then it will be represented by two zeros.

Specifying fractional part is optional.

Format of numbers defined for validating numeric data.

IQ Bot supports prefixes and suffixes to make processing and validation of data easier. Specifying a suffix and prefix in the pattern and in the numeric fields is optional. Even if you do not specify the suffix or prefix, IQ Bot auto corrects and includes the required currency symbols and units of measure for the numeric fields as prefix or suffix. If you specify the currency symbols and units of measurements in the pattern and in the numeric data, IQ Bot deletes the currency symbol and unit of measure from the data.

Note: IQ Bot automatically recognizes these currency symbols: \$, ¥, £, ₹, €, Rs, USD, EUR, CAD, AUD, GBP, and INR. We recommend specifying valid currency symbols in the data.

IQ Bot supports prefixes and suffixes to make processing and validation of data easier. Specifying a suffix and prefix in the pattern and in the numeric fields is optional. Even if you do not specify the suffix or prefix, IQ Bot auto corrects and includes the required currency symbols and units of measure for the numeric fields as prefix or suffix. If you specify the currency symbols and units of measurements in the pattern and in the numeric data, IQ Bot deletes the currency symbol and unit of measure from the data.

Note: IQ Bot automatically recognizes these currency symbols: \$, ¥, £, ₹, €, Rs, USD, EUR, CAD, AUD, GBP, and INR. We recommend specifying valid currency symbols in the data.

Examples of special number patterns

Pattern	Example
Supported patterns	Supported format for numeric patterns: <ul style="list-style-type: none"> • Decimal (India) • Decimal (US, UK, Australia and others) • Number (India) • Number (US, UK, Australia and others) • Normal Decimal • Normal Number

Pattern	Example
9,999,999.00	2,597.23
9.999.999,00	7.562.597,23
9 999 999.00	2 597.23
9 999 999,00	7 562 597,23
9999999,00	2597,23
9999999.00	7562597.23
99,99,999.00	75,26,569.56
\$ 9.999.999,00	\$ 7.562.597,23
\$9 999 999.00	\$7 562 597.23
9 999 999,00 \$	2 597,23 \$
€ 9999999,00	€ 7562597,23
€9999999.00	€7562597.23
99,99,999.00 €	75,62,597.23€
EUR 9,999,999.00	EUR 7,562,597.23
EUR9 999 999.00	EUR7 562 597.23
9999999,00 EUR	62597,23 EUR
9.999.999.00	62.986.51
9, 999, 999. 00	232, 510. 68

Special date patterns

Supported date separators include /(forward slash), -(dash), space, .(dot), and ,(comma).

- **d** - Numeric day of the month, from 1 through 31 (eg. 5, 15 etc.)
- **dd** - Numeric day of the month, from 01 through 31 (eg. 05, 15 etc.)
- **m** - Numeric month (eg. 1 for January)
- **mm** - Numeric month (eg. 01 for January)
- **mmm** - First 3 letters of the month (eg. NOV for November)
- **mmmm** - Full name of the month (eg. June)

Examples of special date patterns

Pattern	Example
mm-dd-yy	01-31-18
mmm-dd-yyyy	Jan-31-2018
mmmm dd, yyyy	January 31, 2018
Mmmm d, yyyy	January 9, 2018

Pattern	Example
D M YY	9 5 15
D MM YY	9 11 15
D MMM YY	7 MAR 15
D MMMM YY	7 MARCH 15
M DD YYYY	5 05 2018
D/MM/YY	5/05/18
M/D/YY	9/5/15
DD / M / YYYY	05 / 9 / 2018
MMM / DD / YY	MAR / 05 / 18
D-MMMM-YY	09-APRIL-18
M-D-YY	5-5-18
MM-D-YY	11-5-18
MMM-DD-YYYY	NOV-13-2018
DD - M - YYYY	13 - 5 - 2019
MMMM - DD - YY	OCTOBER - 05 - 18
D.MMMM.YYYY	05.APRIL.2018
MMMM.DD.YYYY	APRIL.05.2018
D . M . YY	5 . 5 . 18
D . MM . YY	5 . 05 . 18
DD . MMM . YY	05 . JUL . 18
M . DD . YYYY	5 . 11 . 2018
MMMM . DD . YY	MAY . 13 . 13
YYYY-MM-DD	2018-01-27
YYYY/MM/DD	2017/07/27

Lists

While defining a field or table column in the Design view, you can specify a list as part of validation option for a selected field or table column. The extracted value of the field is validated against this predefined list during Preview and Test Run.

You can only specify list validation when format of field or table column is "Text". If the lookup returns multiple values for a word, the value is not auto corrected and the validation fails.

To specify list validation, do the following:

1. Select the validation type as **List** from the **Validate** drop-down menu.

2. Type a predefined list and click **Define** to save.
Each value in the list should be in a separate line.

If the extracted value does not match any value in the predefined list, the field is considered to have failed validation.

Formulas

Specify a formula as part of validation options for a selected field or table column. Use basic arithmetic, comparative, logical, and functional operations.

Tip: We recommended using functional operators instead of mathematical operators when validating fields and tables for better accuracy.

When formulating an expression remember the following:

- All function names must be in capital letters.
- All formulas must result in either a true or false validation.
- Field and column names are case sensitive when used within formulas. If field is defined as *Qty* in design, using *qty* or *QTY* in formula results in an invalid formula.
- For variable declaration or manipulation, ensure not to use certain keywords that are reserved for formulating an expression, including SUM, SUB, DIV, MUL, COLSUM, IF.

Mathematical Operators

Operations	Description	Syntax
+	Addition	Field/Column_Name1 + Field/Column_Name2
-	Subtraction	Field/Column_Name1 - Field/Column_Name2
*	Multiplication	Field/Column_Name1 * Field/Column_Name2
/	Division	Field/Column_Name1 / Field/Column_Name2

Comparative Operators

Operations	Description	Syntax
==	Equal To	[Current Field/Column Name] == [expression comprised of one or more field/column name or fixed numeric values] For example, AMOUNT == MUL(QUANTITY, UNIT_PRICE)

Operations	Description	Syntax
>=	Greater than or Equal To	[Current Field/Column Name] >= [expression comprised of one or more field/column name or fixed numeric values] For example, TOTAL_BILL_AMOUNT >= AMOUNT_PAID
<=	Less than or Equal To	[Current Field/Column Name] <= [expression comprised of one or more field/column name or fixed numeric values] For example, AMOUNT_PAID <= TOTAL_BILL_AMOUNT
>	Greater Than	[Current Field/Column Name] > [expression comprised of one or more field/column name or fixed numeric values] For example, BILL_AMOUNT > 0
<	Less Than	[Current Field/Column Name] > [expression comprised of one or more field/column name or fixed numeric values] For example, DISCOUNT_PERCENTAGE < 100
!=	Not Equal To	[Current Field/Column Name] ! = [expression comprised of one or more field/column name or fixed numeric values] For example, DEBIT_AMOUNT != 0

Logical Operators

Operations	Description	Syntax
&&	And: Field/Column is valid if all conditions are true	<p><Current Field/Column Name> <operator 1> <expression 1> && <Current Field/Column Name> <operator 2> <expression 2></p> <p>For example, DISCOUNT_PERCENTAGE >= 0 && DISCOUNT_PERCENTAGE <=100</p>
	Or: Field/Column is valid if any one of the given conditions is true	<p><Current Field/Column Name> <operator 1> <expression 1> <Current Field/Column Name> <operator 2> <expression 2></p> <p>For example, DISCOUNT_PERCENTAGE >= 0 DISCOUNT_PERCENTAGE == 'Net'</p>
!	Not: Converts a true expression to false and also the other way round	<p>!<expression></p> <p>For example, !(AGE < 18) ==> valid when AGE is not less than 18</p>

Functional Operators

Operations	Description	Syntax
SUM	Summation: gives result of addition of one or more field/column/fixed-number values	<p>SUM(n1,n2,...,nN)</p> <p>For example, SUM(SUB_TOTAL, SERVICE_TAX, EDUCATION_CESS) ==> equivalent to SUB_TOTAL plus SERVICE_TAX plus EDUCATION_CESS</p>
SUB	Subtraction: gives result of subtraction of one or more field/column/fixed-number values from the first specified value	<p>SUB(n1,n2,...,nN)</p> <p>For example, SUB(SUB_TOTAL, TOTAL_DISCOUNT, ADJUSTMENTS) ==> equivalent to SUB_TOTAL minus TOTAL_DISCOUNT minus ADJUSTMENTS</p>

Operations	Description	Syntax
MUL	Multiplication: gives result of multiplication of one or more field/column/fixed-number values	MUL(n1,n2,...,nN) For example, MUL(QTY_IN_BOX, UNIT_PRICE, SHIPPED_BOXES) ==> equivalent to QTY_IN_BOX multiply-with UNIT_PRICE multiply-with SHIPPED_BOXES
DIV	Division: gives result of division of one or more field/column/fixed-number values from the first specified value	DIV(n1,n2,...,nN) For example, DIV(AMOUNT, SHIPPED_BOXES, UNIT_PRICE) ==> equivalent to AMOUNT divide-by SHIPPED_BOXES divide-by UNIT_PRICE
COLSUM	Sum of a given Column in a table: gives result after evaluating given expression for each row of specified table and adding them all together	COLSUM("<table-name>", "<expression to evaluate for each row of specified table- name>") For example, FINAL_TOTAL == COLSUM("LINE_ITEMS", "MUL(QTY, UNIT_PRICE)") Say there are 3 rows for table LINE_ITEMS, then FINAL_TOTAL should be equal to MUL(QTY1, UNIT_PRICE1) + MUL(QTY2, UNIT_PRICE2) + MUL(QTY3, UNIT_PRICE3) where, QTY1 is QTY value in row 1, similarly UNIT_PRICE1 is UNIT_PRICE value in row 2, and so on for other rows as well.

Adding custom logic to improve automatic extraction in production

Enter the logic in the IQ Bot Designer to improve text extraction and validation, and to reduce the number of documents entering the Validator that requires RPA post processing.

Overview

For Automation 360 IQ Bot Cloud, there is an identified list of Python libraries and packages that are safe to use for the Custom Logic feature. Use only these packages to ensure security for your cloud infrastructure, file systems, databases, and network resources: [List of Pandas Libraries which are supported and not supported on Automation 360 IQ Bot \(A-People login required\)](#)

Keep in mind the following:

- Custom logic executes in a sequential order across all tables and fields.
- Applying custom logic might increase the extraction time per document.
- Automation 360 IQ Bot validation rules apply over the extracted values processed by the custom script.
- Custom script only works on the extracted data and does not influence the OCR extraction quality.
- Always test your Python script before processing documents in a learning instance in production

The custom logic feature helps clean up extracted values ahead of the validation step but does not replace all the post-processing currently done using the TaskBot. In addition to adding inline scripts, users can use the Python scripts in a central location, import those as modules, and call functions to reduce the amount of Python code at the field or table level.

Restriction: If the number of characters in the Python code along with other information exceeds 32000, and when this code is sent to the back-end as a Windows runtime argument for the process, the execution fails, and does not display any error message.

Resources

<https://fast.wistia.net/embed/iframe/czgI6jtvvw> <https://fast.wistia.net/embed/iframe/r3r3pm1j86>

To learn more, search for *Using Custom Logic in IQ Bot* course in *Automation Anywhere University: RPA Training and Certification (A-People login required)*.

Next step

Using scripts, in the IQ Bot Designer add the **Form fields** and **Table fields**.

Form fields

Add scripts in Designer for form fields.

The *List validation via external file* can be implemented as a part of the field custom logic using python scripts directly in the Designer.

1. In the IQ Bot Designer, left-hand panel, highlight a form field whose extraction/validation you aim to improve further.
2. In the middle panel, scroll down to **Field options** > **Logic**.
3. In that **Logic** section, toggle between **fullscreen** and **smallscreen** for ease of use.
4. Add code to modify IQ Bot's extracted text value. See example below:

```
# variable that stores the value: field_value

# import the Python regular expression library, re
import re

# call the regular expression library's method, findall, to extract the
date value only
field_value = re.findall(r'\d{2}-\d{2}-\d{4}', field_value)[0]
```

5. Select **Test Run** to test your script and see the results before vs. after.

```
value_before: 2018/11/09 B210
value_after: 2018/11/09
```

Table fields

Add scripts in Designer for table fields.

1. In IQ Bot Designer, left-hand panel, highlight **Table/section settings** for the table whose extraction/validation you aim to improve further.
2. In the middle panel, scroll down to **Logic**.
3. In the **Logic** section, toggle between **fullscreen** and **smallscreen** for ease of use.
4. Add code to modify the extracted table values, which are stored as a Python dictionary in a user variable called *table_values*. See example below.

Each row has a Guid (Global unique identifier), which allows IQ Bot to auto track rows that are added and deleted. If you add a row, you need not enter a Guid. IQ Bot will handle this automatically.

```
# variable that stores the value: table_values

# convert from dictionary to dataframe
df = pd.DataFrame.from_dict(table_values)

# print dataframe before update
print(df)

# Item_Description: drop rows with a missing value
df = df[(df["Item_Description"] != "")]

# Quantity: extract first part of the string, the numeric part only
df['Quantity'] = df['Quantity'].str.split(' ', 1).str[0].str.strip()

# print dataframe after update
print(df)

# convert back from dataframe to dict to override what IQ Bot stores
table_values = df.to_dict()
```

5. Select **Test Run** to test your script and see the results before vs. after.

	Item_Description	Quantity	Item_Total	Guid
0	product_id wafer, NO172	4.00	5,840.00	43ea78f4-7b9b-413a-83ce-89d671478d6c
	COMS5A-18090220			
1	Visual Inspection +	1.00 EA	65.00	cc774f5f-2507-4a15-8e45-7b2abf84fabe
2	Total -	4.00PCS GR:	5,905.00	6bddfd1-2359-4305-a0ac-a1769c113bfb
				5% VAT :
3	Total -	KGD:	0.00	2dc642a7-8e6e-4bc6-9672-85afff8c21db

	Item_Description	Quantity	Item_Total	Guid
0	product_id wafer, NO172	4.00	5,840.00	43ea78f4-7b9b-413a-83ce-89d671478d6c
	COMS5A-18090220			
1	Visual Inspection +	1.00	65.00	cc774f5f-2507-4a15-8e45-7b2abf84fabe

6. If you select **See extraction results** or save the bot, your script is saved.

Use cases and examples

These are some use cases the Designer script feature supports.

For examples of user scripts and use cases, see: [IQ Bot custom logic use cases and examples](#)

Following are some use cases:

- Query an extracted value vs. a database in an ERP system to validate values.
- Extract "0123456" from "PO 0123456".
- Remove table rows that contain "Page x of y".
- Extract the currency from one table field (for example: Item Total) and save in an empty table field.
- Extract the product number from a table field (for example: Item Description).
- Extract the zip code from an address.
- Query a REST service (for example: add NLP, retrieve data from an outside system, and so on).
- Return a Boolean yes/no value on whether handwriting exists for a field.

Pre-installed Python packages

To facilitate ease of use and consistent behavior across servers, IQ Bot auto installs Python v3.10.5 and some popular Python packages mentioned as follows. For example: at `C:\Python354-x86-IQBot`.

Table 7: Pre-installed Python packages

Main package	Version	URL
difflib	In-built Python with installer	https://docs.python.org/3/library/text.html
io	In-built Python with installer	https://docs.python.org/3/library/io.html
re	In-built Python with installer	https://docs.python.org/3/library/text.html
sqlite3	In-built Python with installer	https://docs.python.org/2/library/sqlite3.html
string	In-built Python with installer	https://docs.python.org/3/library/text.html
stringprep	In-built Python with installer	https://docs.python.org/3/library/text.html
sys	In-built Python with installer	https://docs.python.org/3/library/sys.html
textwrap	In-built Python with installer	https://docs.python.org/3/library/text.html
unicodedata	In-built Python with installer	https://docs.python.org/3/library/text.html
DateTime	4.3	https://pypi.org/project/DateTime/
pandas	0.24.2	https://pypi.org/project/pandas/
inflection	0.3.1	https://github.com/jpvanhal/inflection
dateutils	0.6.6	https://pypi.org/project/dateutils/

Main package	Version	URL
tabulate	0.8.3	https://pypi.org/project/tabulate/
numby	1.16.4	https://pypi.org/project/numpy/
json	2.0.9	https://docs.python.org/3/library/json.html
requests	2.22.0	https://github.com/kennethreitz/requests
psycopg2	2.8.3	https://pypi.org/project/psycopg2/
pymongo	3.8.0	https://pypi.org/project/pymongo/
pyodbc	4.0.26	https://github.com/mkleehammer/pyodbc
opencv-python	4.1.0.25	https://pypi.org/project/opencv-python/
Pillow	6.0.0	https://github.com/python-pillow/Pillow
cx_Oracle	7.1.3	https://github.com/oracle/python-cx_Oracle
Python Arabic Reshaper	2.0.15	https://github.com/mpcabd/python-arabic-reshaper

Additional Python packages

To allow further empowerment, you can add more Python libraries for use in IQ Bot.

1. Open the `Command Prompt`.
2. In the `Command Prompt`, change directory to IQ Bot's Python dictionary. For example: `C:\Python354-x86-IQBot`.
3. Install your Python package there. For example: `pip install PyArabic`.
4. In **IQ Bot Designer** > **Logic**, you can import and use that Python package.
5. If step 4 does not work, then stop/uninstall and then install/start services.

Extract data using magnetic ink character recognition

Use the magnetic ink character recognition (MICR) OCR feature with ABBYY FineReader Engine version 12.2 support to extract MICR data from financial checks.

Note: Documents in Non-Latin based languages cannot be processed if MICR is enabled on ABBYY FineReader Engine OCR version 12.3 and 12.4.

- Ensure that ABBYY FineReader Engine is installed in the plug-ins folder: `\OCR Plugins\ABBYY SDK\12\ . . .`
- From the `C:\Program Files (x86)\Automation Anywhere IQ Bot (version)\Configurations` folder, open the `Settings.txt` file, change `OCREngine=Tesseract4` to `OCREngine=Abbyy`, and save the file.

Note: A system restart is not required.

The MICR feature is supported with ABBYY FineReader Engine versions 12.2 .

1. Set ABBYY FineReader Engine in your `settings.txt` file as the primary OCR engine.
2. Navigate to the `IQ Bot\Configurations\AbbyyImagePreProcessingSettings.json` file.
3. Update these parameters:
 - `TextTypes = 129`
 - `DetectTextTypesIndependently =true`

The MICR feature is activated in the system.

- Create a learning instance and add form fields to extract MICR data from financial checks such as **MICR** and **Pay to** fields.
- Scan and upload a check to IQ Bot for training. In production, upload the financial checks for accurate MICR data extraction.
- In the Designer, map the MICR data in the financial check for extraction.
- In production, upload the financial checks for accurate MICR data extraction.

Set learning instance to Production

After you have trained a learning instance on Staging to extract data from documents with high accuracy, you can move the learning instance to Production. This enables you to deploy the learning instance on production documents for real time data extraction.

Use the **Set instance to production** button to move a learning instance to Production. When you move a learning instance to the Production environment, a confirmation message appears. To confirm, click **Yes, send to production**. Learning instances in the Production environment are identified by the **Production** label next to their name.

Tip: You can also use the **My Learning Instances** page to move a learning instance to Production.

Manage learning instances

A learning instance is an IQ Bot structure that describes the data in a single document type, for example an invoice. It contains information such as the language used in the document and the fields to extract.

A learning instance can be either in **staging** or **production** mode. These modes determine whether the learning instance is a draft or live version.

Staging

In the staging mode, you can create and edit learning instances, upload sample documents, and train bots to extract data from the sample documents you uploaded. You can test and improve the accuracy of a learning instance and its bots before deploying it to production mode.

Note: Because the data generated by learning instances in the staging mode is based on sample documents, it is kept separate from data pertaining to learning instances in production mode. For example, sample documents are not counted

against your organization's purchased pages. For more information, see [Review the dashboard](#).

Production

In the production mode, a learning instance can automatically process real business documents, extract data, and send documents requiring manual validation to the validation queue.

To find out which mode a learning instance is in, navigate to the **LEARNING INSTANCES** tab, where the **My learning instances** page displays the learning instances in the environment. Each learning instance has a toggle in the **Actions** column, which indicates whether it is in staging (toggle to the left and is colored gray) or production (toggle to the right and colored orange).

Instance name	I:	Provider	# of IQ Bots	# of Files	Training %	Actions
IQBotDemo		Tesseract4 OCR	1	1	0%	
IQBotDemoDLCA		MicrosoftAzureAPI OCR	1	2	100%	

Based on the mode that a learning instance is in, different user types contribute to IQ Bot. For example, in the staging mode, the Data engineer creates learning instances and the Bot builder builds supporting RPA bots, and in the production mode, the Validator manually corrects the fields in the documents that IQ Bot could not process. To learn more about how each user contributes to IQ Bot, see [IQ Bot process overview](#).

Note: The following are the file size restrictions in each stage:

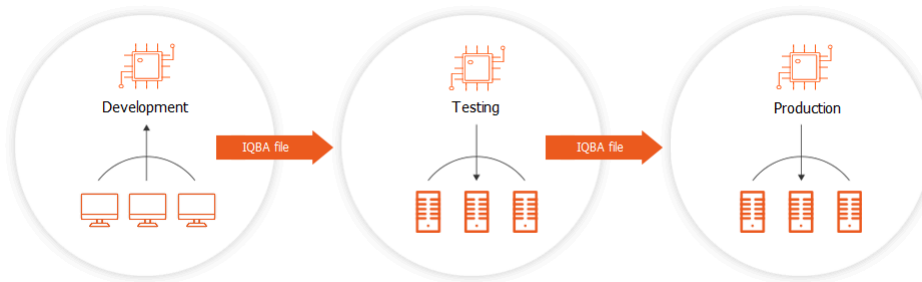

- In staging, you can upload a maximum of 150 documents of 10 MB file size per learning instance.
- In production, you can upload a maximum of 50 MB file size per document. However, the maximum number of documents allowed per learning instance depends on the license.
- There are no limitations on the number of pages per document in a pdfbox OCR.
- You can upload 60 pages per document in an image-based OCR.
- With the Tesseract4 OCR, there is a known limitation that restricts the number of pages per document to fewer than 60 pages.

The learning instance lifecycle

The staging and production modes are independent from the IQ Bot environment when it comes to the traditional DevOps workflow of separate development, testing, and production environments. A learning instance can be in either mode in any of the environments in the development life cycle.

Note: When you transfer a learning instance, it remains in the mode in which it was exported. For example, if you export a learning instance in staging mode from the development environment and import it to the testing environment, the learning instance will still be in staging mode and it will not perform document processing automatically.

The following image shows the typical lifecycle of a learning instance:

You can transfer learning instances across environments by using the Migration Utility. This helps you to avoid having to recreate similar learning instances and better manage the lifecycle of the associated bots. To learn more, see [Migrate learning instances](#).

Rotate the external key

The Control Room supports using CyberArk to store keys for encrypting and decrypting IQ Bot data. A user with the **AAE_IQ Bot Admin** role can change the object name in IQ Bot to start the key rotation process.

- The IQ Bot must have been connected with CyberArk during installation. See [Installing IQ Bot in Custom mode](#).
- Update the password in the CyberArk vault to generate the new key. Note the new key name because you will provide it in IQ Bot.

1. Navigate to **Administration > Key rotation**.

Most of the fields in the **Key rotation** page are auto-filled with the connection details you provided during installation.

2. In the **Object name** field, provide the new key name from CyberArk.

3. Click **Rotate key**.

The IQ Bot retrieves the new key from the CyberArk vault and encrypts data with this new key. When the encryption process completes, a success message appears.

If the encryption process is not successful, use the key rotation synchronizer to recover from the error.

Use the IQ Bot Validator

Use the Validator to manually validate documents from which IQ Bot could not extract data.

When IQ Bot processes documents in a learning instance that is in production mode and encounters one of the following scenarios, IQ Bot sends that document to the Validation queue.

- Data is not readable, such as blurry text or dark background.
- Data is missing from a required field.
- Document failed an automated processing rule.
- Fields did not meet the set optical character recognition (OCR) confidence threshold.

Note: To learn more about how field-level OCR confidence can be used to improve the quality of STP output, see [Improve output quality using OCR confidence](#).

A user with the **AAE_IQ Bot Validator** role opens the Validator window, where they correct the flagged fields.

Once all the fields in the document are corrected, IQ Bot finishes processing the document and exports the data to a .CSV file in the Learning Instance success folder.

Note: If a document required manual validation, it is excluded from the straight-through processing (STP) metric. For more information on the dashboard metrics, see [Review the dashboard](#).

As you work on a document in the Validator queue, if you leave the Validator queue or log out of IQ Bot, the lock on the document is released, allowing other users to access or validate the document.

Validator interface overview

The Validator interface opens with the first document from the validation queue. The data requiring validation distinguished with red text or outlined in red boxes.

Note: An empty page with a notification message appears in the following scenarios:

- If no files are available in the validation queue.
 - If a file does not exist in the validation queue.
 - If another user is working on the remaining file in the validation queue.
-

Validator

Search by filename

Group 13 - Invoice8.tiff - 2 document(s) remaining

Fields	<input type="checkbox"/> Hide successful fields
 Invoice Date	05/07/12
 Invoice Number	359
 Invoice Total	275.52

Table-repeated-section-1

Item_Description	Item_Total	Quantity
Coleman Montana 8 Tent	<div style="border: 1px solid #ccc; width: 100%; height: 20px; display: flex; align-items: center; justify-content: center;"> 1 </div>	<div style="border: 1px solid #ccc; width: 100%; height: 20px;"></div>

1. Provide the values for fields IQ Bot could not extract

Click the empty text field, then select the blue-bordered box in the document that contains the data to extract. After you select a box, the data is

2. Fields awaiting validation are outlined in red

highlighted in yellow and a green outline appears, which you can resize or reposition to include all the data that you want to extract.

3. Add or delete a row

In the example above, the table fields **Item total** and **Quantity** require manual entry.

To insert or delete a row, hover over the ellipses to show the icons for adding or deleting table rows.

4. Mark document as invalid

Removes the document from the validation queue and saves a copy of the document to the Invalid folder. Click [here](#) to mark a document as invalid, then select from the following reasons:

- Fields missing
- Tables missing
- Wrong values

5. Save current document

After you have validated all the fields, click [here](#) so IQ Bot can finish processing this document.

6. Skip to next file

Skip a file without correcting the errors in the current document.

Linked tables in the Validator

Some pages in a document might contain more than one table. When there is a relationship between the tables, such as in the example page below, where a parent table contains patient information and child tables contain additional information related to that patient, these are called **linked tables**.

In the example page below, the red box outlines the parent table and each of the blue boxes outline a child table.

Patient Name: Irrfan Khan		Patient Account No: AASPL_3100	
Member ID: IQ_Bot0001		Claim ID: Cognitive_123XXX	
Date of Birth: 07 Jan 1967		Claim Status: PAID	
Provider Name: Cognitive			
Gender: <input checked="" type="radio"/> Male <input type="radio"/> Female <input type="radio"/> Other		Type of payment: <input type="checkbox"/> Cash <input type="checkbox"/> Cheque <input checked="" type="checkbox"/> Bank Account	

Line	Date of service	Rev Code	Units	Billed Amount	Allowed Amount	Discount /Penalty	Net A
1	02/02/18	0211	1	100.00	100.00	0.00	100.0
2	03/02/18	0221	5	500.00	500.00	0.00	500.0
3	03/02/18	0200	3	300.00	300.00	0.00	300.0
Claim Totals			9	900.00	900.00	0.00	900.00

Payment Mode (If Bank Account):
 Net Banking
 Debit Card
 Credit Card

Type of Card (Only for Debit or Credit card) Payment:
 Master Card
 Visa Card

◆ Paid

To successfully validate a page with linked tables, add the fields from the child tables to same **table-repeated** section as the parent table.

If shared fields between the linked tables do not match values, the Validator does not let you complete validation and save your changes. This functionality helps avoid manual validation errors that can occur when there is a mismatch of field values between the parent and child tables. The Validator shows an error message and prevents the save.

Note: In Validator, if you mark an already corrupted document as invalid then that document is lost in the IQ Bot system. Instead, you will see a placeholder image and you must refresh the page to go to the next document. This applies to single page as well as multi-page documents. When the entire multi-page document is deleted or corrupted, you will not be able to navigate between the pages. If you click the next page button, then the **Loading document** screen is displayed.

Using the Validator

Open the Validator user interface from the **LEARNING INSTANCES** tab. If a learning instance contains documents that require validation, there will be a document icon with a red exclamation mark in the Actions column. Click the document icon to launch the Validator.

Note: Only users with an assigned Validator role can view the Validation page. For more information, see [IQ Bot user personas and roles](#).

<https://fast.wistia.net/embed/iframe/htsfxuq4t2>

Review the dashboard

The dashboard summarizes the performance report and provides document processing information in a graphic format.

The report appears when you log in to the IQ Bot. The information shown consists of: document classification, straight-through processing (STP), accuracy, and human validation for information on actions for a specific learning instance so you can focus on areas that require attention.

The IQ Bot dashboard is divided into two primary areas:

- **My Totals**
- **My Learning Instances**

My Totals area

My totals is a display area of the Dashboard that provides a quick overall view of the status of all learning instances in the Production environment.

View the following information in the **My Totals** area:

- **Documents Processed:** The total number of files processed in the production environment.

Note: If a file is corrupt and cannot be opened, it is not included in this count.

- **Pages purchased:** The number of pages purchased in the current license period.

For example, if 4000 pages were purchased before Dec 31, 2020 and another 20,000 pages were purchased between January 1, 2021 and February 28, 2021, the pages purchased metric shows a count of 20,000 pages, not 24,000. This is because 4000 of the pages were purchased before the license validity period.

Note: This metric is visible only to users with the **AAE_IQ Bot Admin** role or a custom role with the **View administration** permission.

- **Pages uploaded:** The number of pages uploaded to a learning instance in the production environment in the current license period. When the license is renewed, the value reverts to zero.

This metric is different from the documents processed metric because one document can contain multiple pages. Additionally, the metric count includes pages that were uploaded but have not completed processing.

Note: In releases prior to Automation 360 v.23, this metric reflected the number of pages uploaded to learning instances in the production environment from the time of IQ Bot installation.

- **Straight-through processing (STP):** The percentage of total number of uploaded files that were successfully processed without manual intervention.
- **Accuracy:** The field accuracy, which is a percentage value of fields that have been accurately identified. This includes fields whose Optical Character Recognition (OCR) confidence levels exceed the confidence threshold that were set.

My Learning Instances area

View details of learning instances you have created that are in the Staging and Production environments.

View information for learning instances in the staging environment:

- Name of the learning instance
- The domain or type of documents. For example, invoices and receipts.
- Number of documents in the learning instance
- A graphical representation of trained documents showing the details in percentages

View information for learning instances in the production environment:

- Number of files processed
- Straight-Through Processing (STP) percentage of files that were successfully processed without manual intervention
- Field accuracy in percentages

Important: Sometimes, the number of documents in the Dashboard and in the Learning Instance summary page do not match the number of documents submitted for processing. This can occur when documents are classified into groups that are not in production. Documents in this category are not processed (by design), leading to a mismatch between the number of processed documents and the number of total documents. In such a case, if these groups are moved to production, the total numbers of documents will match.

Performance report page

The performance report page displays the details of a learning instance in the production environment.

Navigate to **My learning instances > Production** button to view the **Performance report** page showing details of all learning instances in the production environment.

Note: The **Performance report** page is not available for learning instances that are in the staging environment.

The top right corner of the performance report page displays the percentage of bots trained for the learning instance. The following is an example of how to interpret the percentage information.

Cathy has uploaded 10 documents and has created three bots for the learning instance:

- Bot1
- Bot2
- Bot3

Of these, three documents are a part of Bot1, four documents of Bot2, and three documents of Bot 3. When Cathy sets Bot1 into the production environment, the label displays 33% as the percentage of bots trained for the learning instance, which means that 3 out the 10 (33%) uploaded documents (for Bot1) have been trained.

Performance report details

In the **My learning instances** area, click any displayed information to bring up the **Performance report** page. The following sections describe the information for each displayed section of the performance report.

Instance totals and Processing results

The instance totals and processing results area shows the following information for a learning instance:

- Number of files uploaded for the learning instance – total number of files uploaded that need to be processed.
- Number of files processed for the learning instance - number of files that was processed by a bot.
- Number of files successfully processed for the learning instance – includes files that were successfully processed by a bot without human intervention.
- Number of files sent to validation for the learning instance – files flagged with one or more errors that need human intervention for review.
- Number of files validated for the learning instance – number of files that were reviewed by an individual and the results were saved.
- Number of files marked as invalid for the learning instance – number of files that were reviewed by an individual and marked as invalid.

Classification results

The **Classification** area provides a statistical display of the field representation graphically.

Accuracy results

The **Accuracy** area provides a graphical representation of the field types.

Validation

The **Validation** area provides the following information:

- A statistical representation of the corrections made to individual fields during the process of validating a document.
- A statistical representation of the average time spent to validate a group.

Custom domains in IQ Bot

A domain contains information about the language of the documents and the data fields that the system extracts from the documents. The IQ Bot environment includes seven domains; users with the **AAE_IQ Bot Admin** role can also create and import custom domains to the **Domains** tab.

If your documents contain specialized fields, you can create a custom domain with these fields to make learning instance creation quicker. Otherwise, the learning instance creator must manually define each specialized field, every time they create a new learning instance.

For example, for documents from the pharmaceutical industry, you might add fields like prescription name, dose, or delivery format to the custom domain. Likewise for financial industry documents, you might add fields for margin, call price, or limit order.

The **Domains** tab displays all available domains for use in the system and their associated languages. Besides out-of-box domains offered by IQ Bot, you can also create a custom domain and import it into IQ Bot.

[Create a custom domain \(A-people login required\)](#)

When creating a learning instance using a custom domain:

- The languages assigned to the domain when creating the domain is displayed and is available for selection from the **Primary language of documents** drop-down list.

- The fields that were selected when creating the custom domain are displayed in the **Fields to extract** section of the create **New instance** page.

You can import or export a domain using the **Import** or **Export** option in the **Domains** tab.

Note: Domains are created and saved with the `.dom` extension in the system.

Tip: Troubleshoot classification issue with Chinese language documents:

[Classification issue with Chinese Invoices \(A-People login required\)](#)

Import a domain

You import a domain for the following scenarios:

- Import a new domain.
- Import an existing domain from another system to your current system.

When you are ready to import a domain into your system:

1. Go to the system where you want the domain to be imported.
2. Click **Import new domain** in the **Domains** tab and select the `.dom domain` file in your local machine that you want to import.

The domain import success message is displayed in the **Domains** tab.

The imported domain appears for the selection in the **Document type** drop-down list of the create **New instance** page and is displayed in the domains list in the **Domains** page.

Export a domain

When you click the **Export** option next to a domain, it is exported to an output folder on your local drive. The exported domain is encrypted and is created with a `.dom filename` extension.

You export an existing domain from one IQ Bot system to import to another.

To export a domain from your IQ Bot system, do this: In the **Domains** list page, click the **Export** option next to the domain you want to export.

The system displays a success message for the exported domain.

The file is exported to a local output folder on your machine with a `.dom filename` extension.

Note: The domain files are encrypted for security.

Current limitations to the domain import and export actions

Important: Import or export of domains is independent of the migration action in the Migration Utility feature.

When you migrate learning instances that were created using a custom domain from one system to another, the field names and IDs must be the same in the target machine as well. Otherwise, even though the learning instances are imported, the custom domain will not be imported and the associated field

names and IDs for the custom domain will not work in the imported learning instance. If you run the imported learning instance on documents, the documents will not be classified.

Even if you import the custom domain to your new system, the field names and IDs will still not match as these are automatically generated by the system. Hence classification will fail. This is the current limitation of the Migration Utility feature using a custom domain.

Workaround: First import the .dom file to the target machine, then migrate the learning instances. Move all learning instances to the staging environment, and test them before moving the learning instance to the production environment.

Custom domain enhancements

Import custom domains in any order

When you migrate learning instances (created using a custom domain) from the staging server to the production server, migration fails unless you import the different versions of the custom domain in the same order as they were created.

As the capability to edit a custom domain to add additional fields and aliases was not available, the user had to create a new domain and add the additional fields and aliases to it. Then the user had to assign that new domain to the learning instance. So when the user wanted to use the new domain, they had to re-import the original and the new domain to the production server in the order they were created in.

Importing custom domain to IQ Bot production (A-People login required)

From release Automation 360 Build 5322, this restriction does not exist.

- You can edit and update an existing custom domain multiple times, and import them to the production server multiple times as well.
- You can import the custom domains in any order. The system successfully migrates the updated fields (form or table), and field aliases (variations of field values found in the training documents, associated with a field) to the production server.

Important: Perform all edits or updates to a custom domain in the staging server before importing it to the production server to avoid errors.

IQ Bot performs document classification based on the defined fields and aliases of the version of custom domain used when the learning instance was created.

Editing the same custom domain (with additional fields) changes the version of the custom domain. For new learning instances created using the new version of the custom domain, classification occurs on the updated fields as well. The edited fields (whether form or table fields) are displayed in the learning instance with a double asterisk next to them to help identify them.

Using IQ Bot for standard forms

Standard forms are fixed format type documents that usually contain a large number of fields with very little or no variation in the overall layout, which can include both hand-written and digital content. IQ Bot enables you to extract data from standard forms.

<https://fast.wistia.net/embed/iframe/c05s2zf3l4>

Some examples of standard forms are W-4 (Employee Withholding Certificate), income tax form, sale deed and partnership agreement. You can extract data from standard forms by customizing and building a model before setting it up in IQ Bot. A machine learning model is a file that can be trained to recognize certain types of patterns from documents. You can use a sample document with a set of data to train a model to recognize patterns.

Based on the associated role or permission defined by the Control Room administrator, you can then create a learning instance using a model for extracting data from standard forms.

Note: Users must have the Standard forms pages product license to upload documents for processing. For more information, see [Automation 360 licenses](#).

The following workflow describes the various stages and procedures for setting up data extraction from standard forms:

1. Evaluate your use case for standard forms.
[Evaluate your use case](#)
2. Review the type of standard forms extraction service that fits your requirement.
[Review extraction service](#)
3. Review the service implementation prerequisites.
[Review implementation prerequisites](#)
4. Set up and configure an extraction service.
[Set up extraction service](#)
5. Configure IQ Bot for the selected extraction service.
[Configure IQ Bot for extraction service](#)
6. Build a data extraction model.
[Build extraction model](#)
7. Log in to IQ Bot and create a learning instance.
[Create a learning instance for standard forms](#)
8. Add validation rules for standard forms learning instance.
[Define validation rules for standard forms learning instance](#)
9. Transfer the third-party extraction models
[Transfer third-party extraction service models](#)
10. Move standard forms learning instance across different IQ Bot environments.
[Transfer standard forms learning instance](#)
11. Upload documents in IQ Bot.
[Upload documents for standard forms learning instance](#)
12. Validate the processed documents for standard forms learning instance.
[Use the IQ Bot Validator](#)
13. Download the content extracted from standard forms.
[Download extracted content](#)
14. Review the performance report and document processing information.
[Review the dashboard](#)

Evaluate your use case

Content extraction models can be integrated into IQ Bot for extracting data from specific type of documents.

Before you proceed further with standard forms, evaluate your use case to determine if the content extraction from standard forms suits your requirement. Use the following questions as a guide to determine whether your use case needs Standard forms processing

What are standard forms?

Fixed format type documents that have a defined template, with very little or no variation in the overall layout. Standard forms are also known as structured documents, are generally characterised by high density of information, and are typically official or legal forms. The following table illustrates some examples of standard forms:

Tax form	Medical form	Legal form																																																								
<p>1040 Department of the Treasury U.S. Individual Income Tax Return</p> <p>Filing status: <input type="checkbox"/> Single <input type="checkbox"/> Married</p> <p>Your first name and initial</p> <p>Your standard deduction: <input type="checkbox"/> Standard <input type="checkbox"/> Itemized</p> <p>Spouse standard deduction: <input type="checkbox"/> Spouse <input type="checkbox"/> Spouse is blind <input type="checkbox"/> Spouse</p> <p>Home address (number and street), if different from the above</p> <p>City, town or post office, state, and ZIP code</p> <p>Dependents (see instructions): (1) First name</p> <p>Sign Here Under penalties of perjury, I declare that I prepared this return and I am the preparer of this return. Your signature</p> <p>Paid Preparer Use Only Preparer's name, firm's name, and address</p> <p>Form 1040 (2018)</p> <table border="1"> <tr><td>1</td><td>Wages, salaries, tips, etc.</td></tr> <tr><td>2a</td><td>Tax-exempt interest</td></tr> <tr><td>2b</td><td>Qualified dividends</td></tr> <tr><td>3a</td><td>IRA, pension or annuity</td></tr> <tr><td>3b</td><td>Social Security benefits</td></tr> <tr><td>4</td><td>Total income</td></tr> <tr><td>5</td><td>Adjusted gross income</td></tr> <tr><td>6</td><td>Standard deduction or itemized deductions</td></tr> <tr><td>7</td><td>Qualified plan, IRA, or 529 plan</td></tr> <tr><td>8</td><td>Capital gain or loss</td></tr> <tr><td>9</td><td>Other income</td></tr> <tr><td>10</td><td>Total income</td></tr> <tr><td>11</td><td>Tax before credits</td></tr> <tr><td>12</td><td>Tax credits</td></tr> <tr><td>13</td><td>Subtract line 12 from line 11</td></tr> <tr><td>14</td><td>Other taxes</td></tr> <tr><td>15</td><td>Total tax</td></tr> <tr><td>16</td><td>Refundable credits</td></tr> <tr><td>17</td><td>Refundable amount</td></tr> <tr><td>18</td><td>Additional taxes</td></tr> <tr><td>19</td><td>Refund</td></tr> <tr><td>20</td><td>Amount of refund</td></tr> <tr><td>21</td><td>Account number</td></tr> <tr><td>22</td><td>Amount due</td></tr> <tr><td>23</td><td>Estimated tax</td></tr> </table>	1	Wages, salaries, tips, etc.	2a	Tax-exempt interest	2b	Qualified dividends	3a	IRA, pension or annuity	3b	Social Security benefits	4	Total income	5	Adjusted gross income	6	Standard deduction or itemized deductions	7	Qualified plan, IRA, or 529 plan	8	Capital gain or loss	9	Other income	10	Total income	11	Tax before credits	12	Tax credits	13	Subtract line 12 from line 11	14	Other taxes	15	Total tax	16	Refundable credits	17	Refundable amount	18	Additional taxes	19	Refund	20	Amount of refund	21	Account number	22	Amount due	23	Estimated tax	<p>NHS</p> <p>Care Home</p> <p>COVID-19</p> <p>The COVID-19 vaccination will protect you from SARS-CoV-2, the virus that causes COVID-19. Does the layout of your documents vary across vendor?

Are the positions of the various data elements (checkboxes, tables, and so on) fixed in your documents?

Is the document a dynamic form? For example, you have documents where the values depend on other data elements.

Is the document in a supported language?

If yes, then this use case for content extraction using standard forms is not the best option.

If no, then these are not standard forms and this type of content extraction is not suitable.

If yes, then content from such documents cannot be processed using standard forms content extraction.

See [Azure Form Recognizer Supported Languages](#). If no, then the document cannot be processed as a standard form.

Does the documents have repetitive sections?	If yes, then this is not a standard forms use case. However, if there are a fixed number of such repetitive sections that do not vary between documents, then it can be processed as a standard forms.
Does your documents contain tables that have a different number rows and columns?	If yes, then these documents cannot be considered as standard form. The number of rows and columns have to be fixed for standard forms.
Can document layouts that vary per year be considered as standard forms? For example, a W-4 document in 2020 and W-4 document in 2021?	If the document layout does not vary within the same year or vary across organizations, then it can be considered as standard forms. If there are layout variations across years, then different standard form models must be used to process these documents.

Review extraction service

After you have confirmed that the documents you want to extract content from are standard forms, you can then plan the type of standard forms extraction service that fits your requirement.

The following technologies are available for processing standard forms:

IQ Bot extraction service

This is a template based extraction service that uses OCR and heuristics to extract content from standard forms. You have to train one template per standard form.

Guidelines for using IQ Bot extraction service

- Documents are of good quality (300 dpi)
- Document content is not very dense
- Input documents do not have any handwritten copies (limited support)
- Signatures are currently not supported
- Contains simple table layout (span within a page) with clear header, table boundaries, and so on
- Does not contain any tables or content that have checkboxes (limited support)
- Does not have any repeated sections (limited support)

Benefits of IQ Bot extraction service

- An integrated and simple out-of-the-box setup
- Various OCR engines to increase accuracy of extraction
- Complex layouts (repeated sections, continuous tables etc) can be extracted for specific cases (needs testing)
- Only requires IQ Bot license

Microsoft Azure Form Recognizer service

Third party technology, that provides custom built Artificial Intelligence (AI) models to extract content from standard forms. You can create custom models where documents can be labelled and trained.

Guidelines for using Microsoft Azure Forms Recognizer service

- Input documents:
 - can be dense (contain lot of details and information) and have a reasonable quality (>200 dpi)
 - can contain checkboxes and radio buttons
 - can have handwritten content
 - can contain signatures
 - can contain tables

The input documents can also contain tables that span over a single page. However, if the standard forms contain table that span across multiple pages, the content extraction can fail.

- None of the sections in the input documents are not repeated
- Documents that contain transpose tables

Benefits of Microsoft Azure Forms Recognizer service

- Diverse standard form type documents can be processed
- Auto detection feature can identify different types of tables such as header-less table, inverted tables, and so on
- Good support for handwritten forms

Review implementation prerequisites

After you have finalized the type of extraction service that suits your requirement, ensure that you review the prerequisites before proceeding with the implementation of the service.

IQ Bot extraction service

Review the operating system and database compatibility, database information, and various hardware and software requirements as part of prerequisites for using IQ Bot extraction service.

See [IQ Bot system requirements](#).

Microsoft Azure Form Recognizer service

Review the prerequisites of Microsoft Azure Form Recognizer service installation for standard forms.

- Cloud setup and installation

No additional configurations are required. However, based on the page processing volumes, the Transactions Per Second (TPS) must be increased for the Microsoft region where your service is running. Contact your Customer Success Manager (CSM) or Partner Enablement Manager (PEM) with the expected page volume and Microsoft region where the service is running to update the TPS.
- On-Premises setup and installation

[Pre-requisite for Azure Container on-prem installation for Standard Forms \(A-People login required\)](#)

Considerations for optimum performance

Review the considerations to capture the performance metrics of IQ Bot standard forms with a new Model containing more number of forms or table fields.

Test summary

- Performance test was run for 10000 COVID Form documents (two pages per document = 20000 pages) on a single node IQ Bot server using a single Bot Agent (using IQ Bot Extraction package). This test was conducted to benchmark the performance metrics such as processing time, Straight Through Processing (STP), validation, and documents processed (#successful processed pages/documents and #failed pages/documents).
- New Model (WalgreenComplete 3260b299-68b5-4118-87df-b313bd5c30f6) with 26 Form Fields & 8 Tables fields are trained and used for extraction.
- With new Model (WalgreenComplete 3260b299-68b5-4118-87df-b313bd5c30f6), all the documents were moving to validation during extraction. To get STP we marked below 5 fields as optional for this test: A2PatientSign, B2Date, B2Sign, Phone, InsuranceCard(Table)->Card Details.
- Total time take to process 20000 pages using single Bot Agent was 25 hours, 21 minutes, & 42 seconds. This was based on IQ Bot On-Premises Build 12350.
- Average time take to process single page using IQ Bot Extraction package on single Bot Agent is approximate 4.56 seconds.
- Achieved STP: 100% and Accuracy: 100%.
- During our test execution, the requests were served by Microsoft standard forms services hosted in us-west2 region.
- As confirmed, Microsoft team TPS (Transactions Per Second) supported by us-west2 region was 100 TPS

Note: KPI (Key Performance Indicators) like processing time, STP, accuracy might vary based on the regions where Microsoft standard forms service is hosted and its transactions per second (TPS) rate.

Infrastructure configurations

The following table lists the infrastructure configurations:

Server	Parameters	Values
Server 1 [Web Server]	Control Room	Windows Server 2019 → 8vCPU, 16 GB RAM, 512 GB Disk [Rackspace Platform]-uee
Server 2 [Database]	Database	Windows Server 2019 → 8vCPU, 16 GB RAM, 512 GB Disk [Rackspace Platform]
Server 3 [Application Server]	IQ Bot	Windows Server 2019 → 8vCPU, 16 GB RAM, 512 GB Disk [Rackspace Platform]
Server 4 [Client]	Bot Agent	Windows Server 2019 → 4vCPU, 8 GB RAM, 256 GB Disk [Rackspace Platform]

Product configurations

The following table lists the product configurations:

Parameters	Values
Automation Anywhere Enterprise	Automation 360 Build 12313
Bot Agent	21.80.10273
IQ Bot	A360.24.28441-20220311
IQ Bot Extraction package	1.0.0-20220307-024320
Database	Microsoft SQL Server Developer (64-bit)
Protocol	HTTPS
Network services	Non-Active Directory

Data configurations

The following table lists the data configurations:

Parameters	Values
Domain	Standard forms
Provider	Forms Extractor Type 1
Model	WalgreenComplete 3260b299-68b5-4118-87df-b313bd5c30f6
Document Type	Multi page PDF document
Pages	Two pages per document
Form Fields	26 [A2Date, A2PatientSign, Address, Age, B2Date, B2Sign, City, DOB, Email, FirstName, LTCFName, LastName, Phone, PrintName, Race-American, Race-Asian, Race-Black, Race-Native, Race-Other, Race-UnableToReport, Race-Unknown, Race-White, RefusedInformation, State, VaccinationType, Zipcode]
Table Fields	8 tables, 23 table fields Table1: DriversLicense[Issuance, LicenseNo]Table2: Ethnicity[Hispanic, NotHispanic, UnableToReport, Unknown]Table3: Gender[Female, Male]Table4: InsuranceCard[Card Details, Medical Card, Pharmacy Card]Table5: MedicareDetails[Medicare, Medicare PartB]Table6: PatientCardHolder[DontKnow, No, Question, Yes]Table7: PatientType[Resident, StaffMember]Table8: ScreeningQuestions[DontKnow, No, Question, Yes]
Configuration	COVID forms
# of Documents	10000
# of Pages	20000

Parameters	Values
Language	English

Test results

The following table lists the test results:

Parameters	Values
Total Documents Uploaded	10000
Total Pages Uploaded	20000
Total Processed documents	10000
Total Processed pages	20000
Success	10000 documents
Pending Review (Validation)	0
STP	100%
Accuracy	100%
Processing Time	<i>25 hours, 21 minutes, and 42 seconds</i>

Resource consumption data

The following table provides the resource consumption data:

Parameters	CPU Utilization in %	Memory Utilization in %
IQ Bot	Average: 3.4 Maximum: 26.8	Average: 70.9 Maximum: 78.9
Control Room	Average: 1.4 Maximum: 14.5	Average: 83.3 Maximum: 84.8
Database	Average: 3.3 Maximum: 20.6	Average: 91.5 Maximum: 94.1
Bot Agent (Extraction)	Average: 4.8 Maximum: 48.9	Average: 52.4 Maximum: 58.7

Set up extraction service

To extract content from standard forms, you must setup and configure an extraction service. Review this topic to understand how to setup each of the extraction service.

IQ Bot extraction service

No specific setup is required for content extraction through IQ Bot service. Ensure that you have access to an active IQ Bot environment so that you can create a learning instance.

See [Create a learning instance](#).

Microsoft Azure Form Recognizer service

1. Subscribe to Microsoft Azure service

Microsoft provides the Azure Form Recognizer service. This service enables you to build automated data processing software that can identify and extract specific content from documents. You must have Microsoft Azure subscription in order to access Azure resources (OCR, Form Recognizer), Automation Anywhere provides access to these resources through its subscription. Contact your Customer Success Manager (CSM) or Partner Enablement Manager (PEM) who will help you setup the services.

[Request access for Microsoft Azure resources \(OCR and Form Recognizer\) \(A-People login required\)](#)

2. Setup Microsoft Azure Form Recognizer service

a. For Cloud deployment

- If you have Automation Anywhere subscription, no additional configurations or changes are required.
- If you have Microsoft Azure subscription, review the following article to setup and configure your Microsoft Azure Form Recognizer for extracting content from standard forms.

[Setup Azure Form Recognizer and Storage \(Cloud\) \(A-People login required\)](#)

b. For On-Premises deployment

[Setup Azure Form Recognizer and Storage \(On-Premises\) \(A-People login required\)](#)

Configure IQ Bot for extraction service

IQ Bot must be connected to the extraction service for processing standard forms. The following section provides details on how to configure IQ Bot for the selected extraction service. However, your IT Service team can help you setup and configure the extraction service in IQ Bot.

IQ Bot extraction service

If you choose IQ Bot extraction service, no additional configurations are required.

Microsoft Azure Form Recognizer service

If you choose the Microsoft Azure Form Recognizer service, you must add Microsoft Form API and the corresponding configurations in IQ Bot.

[How to Setup and configure standard forms in IQ Bot \(A-People login required\)](#)

Create the model in Document Automation

In Automation 360 v.26, you can configure the extraction model in the Control Room:

[Create standard form in Document Automation](#)

Build extraction model

Data extraction model typically leverages Artificial Intelligence (AI) and Machine Learning (ML) technologies to accurately extract text, key-value pairs, and tables from documents.

IQ Bot extraction service

Requires no separate AI model as this will be done as part of creating and training a learning instance in IQ Bot.

See *[Create a learning instance](#)*.

Microsoft Azure Form Recognizer service

During your use case evaluation, Microsoft Azure Form Recognizer models can be created by Sales Engineering. But for any production deployment, contact Professional Services, or Partner Enablement Manager (PEM) at Automation Anywhere.

[How to Create and train Azure Form Recognizer model \(A-People login required\)](#)

The benchmarks for the time taken for labeling fields in the Microsoft Azure Form Recognizer service are as follows:

- Up to 30 fields: 1 hour
- 30 to 100 fields: 2 hours
- 100 to 400 fields: 4 hours

Note: While creating a model, ensure there are no duplicate model names. And while creating a table, ensure that the table name does not contain a space. For example, `Sales chart.xls`.

Transfer third-party extraction service models

Third party extraction models can be transferred from one subscription to another. Contact your Automation Anywhere Customer Success Manager (CSM) for assistance.

IQ Bot extraction service

If you are using IQ Bot extraction service, no changes required.

Microsoft Azure Form Recognizer service

- Transfer models from one On-Premises to another On-Premises environment.
Transfer models from one environment to another (On-Prem) (A-People login required)
- Transfer models from one Cloud to another Cloud environment.
Transfer models from one environment to another (Cloud) (A-People login required)

Note: You can transfer standard forms learning instance along with an associated model between your IQ Bot instances using API configurations. For more information, see *Transfer standard forms learning instance and associated model (A-People login required)*

Create a learning instance for standard forms

Learning instance is used in IQ Bot to extract, train, validate content from standard forms. Use the following instructions to create a learning instance for processing standard forms in IQ Bot

<https://fast.wistia.net/embed/iframe/2t9dimrlre>

Using IQ Bot extraction service

Ensure that you have access to an active IQ Bot environment so that you can create a learning instance.

See *Create a learning instance*.

Using Microsoft Azure Form Recognizer service

1. From the **Document type** drop-down menu select **Standard Forms**.
2. In the **Standard form settings** tab, from the **Provider name** drop-down menu, select a provider for processing the form.
3. From the **Configuration type** drop-down menu, select the supported configuration.
This enables you to connect to one of the provider services configured during installation.
4. From the **Select Model** drop-down menu, select a pre-trained model for the selected configuration.

5. Click **Browse** to upload a reference document.

For example, if you have selected the configuration type and model as invoice, you can upload an invoice file that must be analyzed.

Note: The reference document is only a representation of the document type you want to extract data from.

6. From the **Fields to extract** tab, select the fields from where the values must be extracted.

The fields are displayed based on the selected Form set in the pre-trained model, and no additional fields can be added.

7. Click **Create instance and analyze**.

The system analyzes and sorts the document into logical group.

Note: Only one default group is created. The system-identified region (SIR) are not visible and all the training related fields are greyed out. As the standard forms learning instance contains pre-trained model, no additional training of the group is available. You can only add validation patterns and custom logic.

After you have created a learning instance, you must add a group specific to standard forms.

8. On the **Learning Instance details** page, click **Add group**.

9. Create group label as *<Standard Forms layout name>*.

For example, if you have W-4 documents for the year 2021, enter *W4_2021*.

10. Click **Save**.

11. Open the system generated group

12. Click **Delete Bot**.

System generated group is removed from the **Learning instance details** page

Edit a standard forms learning instance

As the learning instances created by using standard forms have pre-set configurations, you can edit only the name and the description. Also, you cannot edit instances in the production environment without moving them to staging.

Note: If you want to change the model associated with a learning instance, you must create a new model and follow these instructions:

1. Create another learning instance similar to the previous one.
2. Associate the new model with this learning instance.
3. Select all the fields you had selected in the previous learning instance.
4. Update the validation rules.
5. Move the learning instance to production and associate a bot with this learning instance.

-
1. On the **My learning instances** page, select the learning instance you want to edit.

You can also use the **Search** bar to locate the learning instance.

2. Click **Edit**.

3. Edit the name of the learning instance in the **Instance name** field.

The document classification options are not available as the standard forms use a pre-trained model and configurations.

4. Optional: Use the **Document Groups** tab to review the groups associated with the learning instance.

Note: The **Add group** button is not available as adding groups is not supported for a standard forms learning instance.

5. Optional: Click the **Summary** tab to review the learning instance.

Standard Forms details such as **Provider**, **Configuration**, and **Model** are available under this tab.

6. Click **Save**.

Changes made to the learning instance are updated on staging.

Define validation rules for standard forms learning instance

To prevent wrong or invalid data extraction, you can edit the bot associated with any standard forms learning instance and customize the validation rules.

You can only edit a bot on staging. So ensure that you move any bot that you want to edit to staging if it is in production.

Using IQ Bot extraction service

Use IQ Bot Designer to train a learning instance and extract content from sample documents. Review each field to ensure the correct value is extracted and where necessary, map the correct field.

For more information, see [Train a learning instance](#).

Using Microsoft Azure Form Recognizer service

1. On the **Bot** page, select the bot you want to edit.

You can also use the **Search** bar to locate the bot.

2. Click the **Edit Bot** icon.

3. In the **Field** column, click **Field options**.

4. Enter any custom validation rules in the fields under the **Validate Pattern** tab.

Documents that are not processed are moved to the **Validator**, and fields with errors are flagged. You can review the flagged fields in the Validator.

Use the IQ Bot Validator

5. Enter post processing logic under the **Logic** tab, and click **Save**.

6. Click **Save**.

The updated bot is saved on staging and you can move it to production.

Upload documents for standard forms learning instance

Upload your documents to IQ Bot for an existing standard forms learning instance for content extraction.

For extracting content from a single document, use the **Upload Document** action from IQ Bot package in RPA Workspace.

See. [Upload document action](#)

For content extraction from multiple or large number of documents, you can use the **Process documents** action from IQ Bot Extraction package in Control Room. Use the following instructions to upload multiple or large number of documents:

1. Drag the **Process documents** action into the workflow.
2. Click the **Learning instance name** drop-down menu and select a standard forms learning instance.
3. In the **Desktop folder** tab, enter the file path for the input folder or click **Browse** to select it.
4. Select the output folder from the **Output folder path** field.
5. Select the **Send documents to IQ Bot Validator for validation** check box.

Although the documents are processed using Bot Runners on your local machine, you must use this option if you want to validate the documents in the Validator

6. Click **Save**.

Download extracted content

After you have trained learning instance, use the **Download all documents** action from the IQ Bot package to download extracted content from standard forms.

1. Drag the **Download all documents** action from the **IQ Bot** package.
2. Click the **Learning instance name** drop-down menu and select a standard forms learning instance.
3. In the **Local output folder** field, provide a path to your local folder where you want to extract the content.
4. In the **IQ Bot Document status**, select the appropriate status for the documents:
5. Select **Delete files from the server after downloading** check box if you want to remove the files from IQ Bot server.
6. In the **Save the response to a variable** field, add a variable.

A variable value in this field provides information if the download was successful or the reason for a failure.

7. Click **Save**, and run the bot.

8. Navigate to the local output folder to review the downloaded files.

The output folder can have up to three subfolders:

- **Retrain:** Contains documents that were sent for validation.

These documents are stored in their original input format and you can train them by uploading them to your existing learning instance.

- **Success:** Standard form documents that have been processed successfully.

The output is a `.json` file. Tables in the input documents are auto extracted and saved as separate `.xls` file with the table name.

- **Validate:** Contains documents that require validation.

These documents will be available in the IQ Bot Validator and you can download the output separately.

Note: Depending on the content in the uploaded documents, you can also get the following additional subfolders:

- **Failed:** Documents that failed the validation process.
 - **Unprocessed:** Documents that could not be classified.
-

Transfer standard forms learning instance

A standard forms learning instance is similar to the regular IQ Bot learning instance that describes the data in a single document type, for example an invoice. It contains information such as the language used in the documents and the fields to extract.

- Ensure that the source and destination systems are running the same IQ Bot version. Learning instances from different IQ Bot versions cannot be imported because their database schema will not match.
- Back up your database before importing learning instances.
- Export the `.iqba` file from the source IQ Bot environment.
- Import the `.iqba` file into the destination IQ Bot environment

<https://fast.wistia.net/embed/iframe/eoegnd0xzn>

Related concepts

[Manage learning instances](#)

A learning instance is an IQ Bot structure that describes the data in a single document type, for example an invoice. It contains information such as the language used in the document and the fields to extract.

Export a standard forms learning instance

Standard forms learning instance can be used across similar IQ Bot environments. Export an existing learning instance to avoid creating another one with the same configurations.

IQ Bot administrator can use the following instructions to edit a standard forms learning instance:

1. Click **Administration > Migration**.
2. Click **Create Backup**.

Backing up your existing learning instance enables you to save and restore the configuration if required.

3. Select the learning instances that you want to back up and then click **Backup**.

4. Enter a name for the IQ Bot archive (IQBA) file.

The name of the archive file is appended with a time stamp to make it unique. You can download this file and export it to the target environment.

5. Click **Backup** to begin the export process.

The exported data file with the `.iqba` extension is available in the `BackupData` folder in your IQ Bot output directory.

Import a standard forms learning instance

Import an existing learning instance from a similar environment to avoid creating learning instances and associated bots multiple times. Use the Automation 360 IQ Bot Migration Utility feature to import any standard forms learning instances.

Ensure that you have migrated the associated configuration to the target server before importing a learning instance.

When you export an `.iqba` file, only a single document associated with every available bot (Group) training is exported.

1. Log in to IQ Bot as an administrator.

2. Click **Administration > Migration**.

A list of backed-up learning instances is displayed.

3. Click the **Import** icon under the **Actions** tab for the selected learning instance.

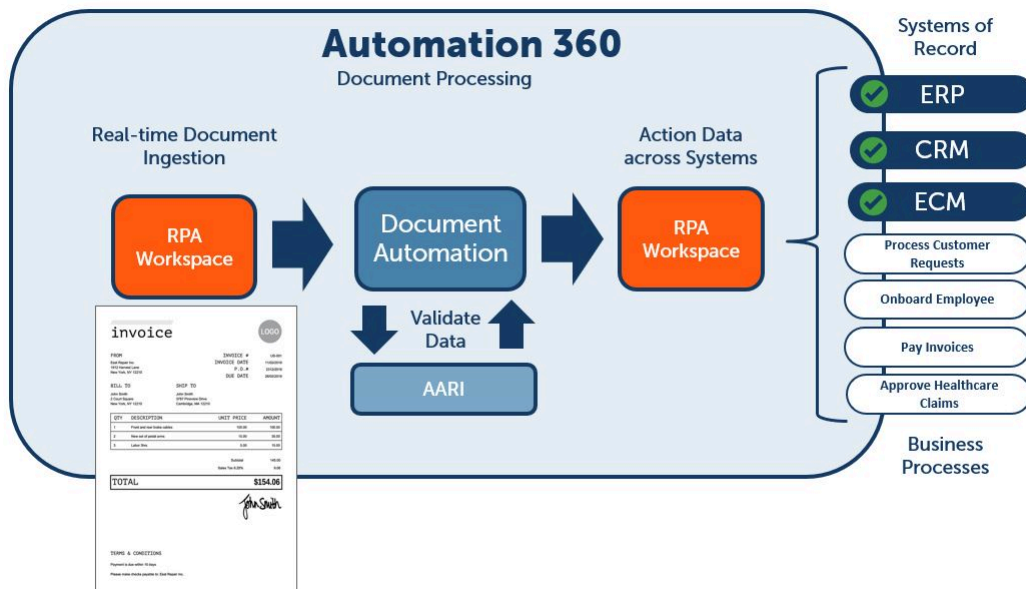

4. Select the import method, and click **Accept**.

The selected standard forms learning instance is imported and is displayed under in **My learning instances** page.

Document Automation

Document Automation is the new Cloud-native intelligent document processing solution that business users can set up to automatically read and process documents quickly using pretrained models and validation feedback.

Document Automation is fully integrated into Automation 360: Document Automation is installed as part of the Control Room, RPA bots are used to extract semi-structured data to automate document-centric business processes, and Automation Anywhere Robotic Interface manages the end-to-end extraction process and validation tasks.

The Document Automation workflow enables users to scale their document processing operation. Users create learning instances that use Automation Anywhere or Google Document AI pre-trained models to process invoices, utility bills, and receipts. Once a learning instance is running in production, it automatically improves extraction accuracy based on feedback from manual validation.

To compare Document Automation features side by side with Automation 360 IQ Bot, see [Intelligent Document Processing solutions feature comparison matrix](#).

Set up the Document Automation environment

Document Automation is installed simultaneously with the Control Room and shares the Control Room database. There are no additional installation tasks for Control Room Cloud customers.

To get started using Document Automation, you must first configure users, roles, and devices, and connect the Control Room with Automation Anywhere Robotic Interface:

[Set up your Document Automation environment](#)

Note: To install Document Automation in an On-Premises server, note the following:

- The Control Room stores Document Automation output data.
- You must install the Control Room in a configuration that points to the location where Document Automation data is stored. Ensure there is sufficient storage space.
- The minimum necessary storage space depends on the processing volume, document size, and use case. As a guide: an environment that processes 100,000 pages per month, with a 30-day data lifespan, requires 500 GB of storage space.

Using Document Automation

Workflow map: Click the following schematic image to view the workflow in an interactive visual

format:

1.

The following is an overview of the end-to-end process to create, configure, and publish a learning instance in Document Automation:

Step 1: *Create a learning instance*

Log in to the Control Room as the learning instance creator user, and create a learning instance to extract values from documents.

Step 2: *Process documents*

Upload documents to the learning instance to test the model, fix validation errors, and verify the extracted data.

Step 3: *Build a bot to upload documents to Document Automation*

Build a bot that uploads documents from a source folder to Document Automation.

Step 4: *Publish the learning instance*

Check-in the learning instance assets (process, form, and bots) to the public repository. Then, deploy the process and bots to unattended Bot Runner devices to begin processing documents in real time.

After the process is deployed, incoming documents are processed, and Document Automation either extracts data from the documents or sends the documents for validation.

Step 5: *Validate the uploaded documents*

Log in as the Validator user, open the validation queue, and use the Validator to fix errors.

Document Automation FAQ

Answers to frequently asked questions (FAQs) on the latest Automation Anywhere intelligent document processing solution, Document Automation.

Product FAQ

What pre-trained models are included?

Automation Anywhere offers invoices and Google Document AI offers invoices, utility bills, and receipts.

Does Document Automation have feature parity with Automation 360 IQ Bot?

Document Automation supports the following features from Automation 360 IQ Bot:

- Data extraction from text, number, date time, and check box fields
- Validation rules based on patterns, formulas, lists, and statements

Which browsers are supported?

Document Automation is supported on the same browsers as the Automation Anywhere Control Room: Google Chrome, Microsoft Internet Explorer, and Microsoft Edge.

Note: If you use Document Automation in Firefox, the user interface might not behave as expected.

What languages are supported?

Document Automation supports English, Dutch, French, German, Italian, Portuguese (Brazilian), and Spanish.

Note: Extraction for French, German, and Spanish language documents is currently in preview. Extraction results will improve in future releases.

You can process documents in other languages by creating and training a training a learning instance in Automation 360 IQ Bot and connecting it with Document Automation to process documents using Document Automation technology and workflow. For more information, see [Connect learning instance](#).

What file formats are supported?

Document Automation can process documents in the following file types:

- PDF
- JPG
- JPEG
- PNG
- TIF
- TIFF

Which licenses are necessary?

The IQ Bot Pages product licenses is necessary for processing documents. The Automation

Anywhere Robotic Interface license is necessary for processing documents in learning instances in production.

To send documents to Google Document AI for extraction, you must also have the `Doc AI Document` product license.

Note: To configure the Control Room with your Google Document AI license key, you must do these steps: [Configure key for Google Document AI](#). These steps are not necessary if you purchased `Doc AI Document` licenses through Automation Anywhere.

We provide a recommendation on configuring users with the minimum necessary roles and device licenses to perform specific tasks in [Document Automation users](#).

Users can connect their learning instances from Automation 360 IQ Bot to their Document Automation environment, which allows them to process documents using the Document Automation technology without having to rebuild the learning instances. For more information, see [Connect learning instance](#).

If you have connected a learning instance from Automation 360 IQ Bot to Document Automation, do not delete the learning instance from Automation 360 IQ Bot since it stores the training data.

We recommend you maintain Automation 360 IQ Bot in a version compatible with the associated Control Room.

Document Automation offers over 35 of the most common invoice fields, with the option to configure custom fields. To see all the possible fields when you are creating a learning instance, click **Show unused fields**.

Can learning instances be migrated from Automation 360 IQ Bot to Document Automation?

Are customers required to maintain their Automation 360 IQ Bot environments?

What learning instance fields are supported out of the box?

Processing and extraction FAQ

Which OCRs are supported?

The Automation Anywhere pre-trained model uses the ABBYY FineReader Engine.

I uploaded documents for processing, but nothing is happening.

The first time you process documents, the Document Extraction package downloads to the local device. This might cause a delay in document processing.

What should I do if a folder contains documents in multiple languages?

Use the IQ Bot Classifier package to sort the documents by language, then create a learning instance for each language.

How do I process documents using Google Document AI?

Document Extraction enables users to send their documents to Google Document AI for processing. To use this feature, users must have Document AI licenses that they either purchased from Automation Anywhere or provided their Google Document AI account credentials to the Control Room.

The process of creating, testing, and publishing is the same for learning instances using a Google Document AI model as for learning instances using a pre-trained model from Automation Anywhere.

Are multi-page tables supported?

Yes, Document Extraction supports extracting tables that span across multiple pages.

Is it possible to extract multiple tables from a document?

At this time, Document Automation can extract one table per document.

Where can I see the reason why data was not extracted from an uploaded document?

The AARI **Requests** tab holds the history for each uploaded document. Here, you can see the step at which extraction failed or if a Validator user marked the document as invalid.

Is currency extraction supported?

Yes, except for the rupee (₹).

Intelligent Document Processing solutions feature comparison matrix

Review the differences between Automation 360 IQ Bot and Document Automation by comparing the features in them.

	Automation 360 IQ Bot	Document Automation
Administration and setup		
Installation	Separate installer	Installed as part of the Control Room
Database administration	Separate database; requires additional effort for backups and maintenance	Uses the Control Room database; no additional backup or maintenance needed
Server configuration	Requires additional SSL configuration, RabbitMQ administration, HA and DR	Works out of the box
Learning instance configuration		
Alias management (keywords)	No way to add or remove field aliases for domains, only for document groups	Users can view, add, or remove field aliases for the learning instance
Confidence threshold	Does not work out of the box; server-level configuration	Helps to catch false positive outcomes; field-level configuration
Field order and field name customization	Not supported	Helps to improve validation efficiency

	Automation 360 IQ Bot	Document Automation
Field configuration	Must be done for every group	Needs to be done only one time for a learning instance
Ability to add and remove fields from the learning instance	No	Yes
Extraction capabilities		
Pre-trained models	Domains required training	Can process invoices, receipts, and utility bills
Handling document variations	Classifier relies on document layout and training. Documents uploaded with a new layout are sent to a new document group, which requires training. Some docs could not be classified.	Layouts are identified using an object detection model to find key-value pairs. It is not necessary to configure all the fields in a learning instance before uploading documents.
Training process	Each group needs to be manually trained before it can process documents	Learning instance extraction improves based on changes users make in the Validator
Output format	CSV only	CSV or JSON
Human review and validation		
Validation queue management	No	Use filters and search to find specific learning instances or documents
End-to-end automation		
Task bots	Must be manually created	Control Room automatically creates task bots for a learning instance
See status and history of uploaded documents	No	Yes
Customizable document processing workflow	No	Yes
Security		
Retention policy	No	Supported by AARI storage See Cloud storage retention policy
Secret management	No	Can use credential vault to store Google Document AI credentials

Set up your Document Automation environment

Document Automation is installed simultaneously with the Control Room. Configure the users, roles, and devices, and connect the Control Room with Automation Anywhere Robotic Interface.

1. Log in to Document Automation through the Control Room.
You will receive an email from Automation Anywhere with your URL and credentials. Open the Control Room URL in your browser, enter your credentials in the login screen, and click **Log in**.
2. Upload the Document Extraction package to the Control Room: *Upload the IQ Bot packages to the Control Room*
3. Create a custom role that allows users to check in and check out bots, manage packages, and validate documents.: *Create a custom role for Document Automation*
4. Create the users necessary to complete the end-to-end process of creating and publishing a learning instance: *Document Automation users*

Note: When creating the `Unattended Bot Runner` user, provide the device credentials. You will connect the `Unattended Bot Runner` to the device in the next step.

5. Configure the unattended Bot Runner user device and device pool to allow the learning instance to function in public mode:
 - a) Using Remote Desktop Protocol (RDP), open the virtual machine where the unattended Bot Runner will run.
 - b) Log in to the Control Room as the `Admin` user you created previously.
 - c) Navigate to **Manage > Devices** and click **Connect local device**. Follow the steps in the wizard to connect the Control Room to your device.
 - d) Click **Refresh** to verify that your device is connected.
 - e) Click **Create device pool** and perform the following steps:
 1. Enter a name for the device pool.
 2. Click **Devices** and then the arrow to move the device to the **Selected** column.
 3. Click **Consumers** and then the arrow to move `aari-document-processor` to the **Selected** column.
 4. Click **Create device pool**.

You can perform the following steps in the virtual machine or you can return to your device. If you perform the following steps on your device, ensure that you log in to the Control Room as the `Admin` user.

6. Open Automation Anywhere Robotic Interface to connect it with the Control Room.
 - a) Navigate to the AARI interface by adding `/aari` after your assigned Control Room URL.
 - b) Navigate to **Manage > Process > Global scheduler** and click **Edit**.
 - c) Select the `Scheduler` user that you created previously and click **Save**.
The following message is displayed: `Secure connection between AARI Web and Enterprise Control Room established successfully`

7. Create a team in AARI to grant the `Validator` user access to the documents awaiting validation.
 - a) Navigate to **Manage > Team > Create new team**.
 - b) Enter a team name.
 - c) Select the **Shared** request visibility.
 - d) In the **Users** field, add the `Validator` user that you created previously and click **Save**.

If users will create learning instances that use the Google Document AI model **and you did not purchase Google Document AI licenses through Automation Anywhere**, follow the steps to [Configure key for Google Document AI](#).

Log in to the Control Room as the `Learning instance creator` user and begin creating learning instances: [Using Document Automation](#)

Create a custom role for Document Automation

With a custom role, Document Automation users can check in and check out bots, manage packages, and validate documents.

1. Navigate to **Administration > Roles > Create role**.
2. Provide a name for the role, such as `aari-document-processor`.
3. In the Feature permissions page, select the following:
 - View my bots
 - Run my bots
 - Export bots
 - Import bots
 - Create folders
 - Rename folders
 - Cancel checkout

Packages

- View packages
- Manage packages

Automation Anywhere Robotic Interface

- Cross Team Read
- AARI Scheduler

4. In the Bots permissions page, select all the check boxes in the **Bots** row.
5. Click **Save** to create the role.

Create users and assign this custom role to them. For more information about the required users, refer to [Document Automation users](#).

Document Automation users

With the required roles, permissions, and licenses, Document Automation users can perform various tasks. Users and roles are defined in the **Administration** tab.

The following table contains information about each type of user that interacts with Document Automation. It includes a description of the tasks that each user performs, the required roles, permissions, and licenses, and links to the pages most relevant to that user. Use this page to guide you in creating the users in the table below: [Create a user](#)

Note: Some users require a custom role in Document Automation. This role grants users permissions to check in and check out bots, manage packages, and validate documents. For instructions on how to create a custom role, see [Create a custom role for Document Automation](#).

User	Description	Roles	License	Related links
Learning instance creator	Can create, edit, and delete learning instances, upload documents for processing, and check in or check out learning instances.	AAE_IQ Bot Services, AAE_Basic, and <code>aari-document-processor</code> custom role	Bot Creator	Create a learning instance in Document Automation Process documents in Document Automation Publish the learning instance
Admin	Deploys the AARI process and RPA bots to the unattended Bot Runner, manages AARI teams, and assigns validation tasks to a team	AAE_IQ Bot Admin, AAE_Pool Admin, AAE_Locker Admin, and AAE_Robotic Interface Manager	--	Set up your Document Automation environment Create an AARI team and assign team roles to members Publish the learning instance
Scheduler	Enables the Control Room and AARI to connect learning instances in public mode to AARI processes. Note: This user is not associated with a real person.	AAE_IQ Bot Services, AAE_Basic, and <code>aari-document-processor</code> custom role	--	--

The **All Licenses** page displays detailed information about current product and device licenses.

Configure key for Google Document AI

If the learning instance uses a Google Document AI model **and you did not purchase Google Document AI licenses through Automation Anywhere**, follow these configuration steps.

- If you have not done so already, complete the steps to [Set up your Document Automation environment](#).
- Log in as the `Admin` user type. For more information about the user types, refer to [Document Automation users](#).

You will assign this role to a Credential Vault locker, which will allow the Learning instance creator user to securely provide the Google Document AI key to the **Extraction bot**, allowing the learning instance to send documents to Google Document AI for extraction.

Create a custom role to access the Credential Vault locker that holds the Google Document AI key:

1. Navigate to **Administration > Roles > Create role**.
2. Provide a name for the role, such as `doc-ai-credential-role`.
The `Manage my credentials and lockers` permission is automatically selected.
3. Click **Create role**.

Assign the role to the `Learning instance creator` and `Unattended Bot Runner` user types.

4. Navigate to **Administration > Users** and locate the users.
5. For each user, click **Edit user** and add the `doc-ai-credential-role`.

Create a credential to store the Google Document AI key:

6. Navigate to **Manage > Credentials > Create credential**.
7. Provide a name for the credential, such as `doc-ai-credential`.
8. Provide a name for the attribute, such as `ServiceAccount`.
9. Select the **Standard** input option and enter the Google Document AI API key in the **Value** field.
10. Click **Create credential**.

Create a locker to store the key and provide access to other users.

11. Navigate to the **Lockers** tab and click **Create locker**.
12. Provide a name for the locker, such as `doc-ai-locker`.
13. Select the `doc-ai-credential` and click the right arrow to move the credential to the **Selected column**.
14. In the **Consumers** tab and select the `doc-ai-credential-role` and click the right arrow to move the credential to the **Selected column**.
15. Click **Create locker**.

Log in as the `Learning instance creator` user type to do the following:

- Create a learning instance: [Create a learning instance in Document Automation](#)
- Provide the credential to the **Extraction bot**: [Configure Extract action to process documents in Google Document AI](#)

Related tasks

[Installing additional licenses](#)

Upload new licenses to the Automation Anywhere Control Room to be distributed to users as required.

Related reference

[System default licenses](#)

Create a learning instance in Document Automation

Begin processing documents by creating a learning instance to extract data from invoices, utility bills, or receipts. A learning instance is a structure that holds information such as document type, language, and the fields to be extracted.

- To create a learning instance, you must be a `Learning instance creator` user. See [Document Automation users](#).
- To create a learning instance that uses a Google Document AI model, you must create a credential and locker to hold your security token. See [Create credential](#) and [Create locker](#).

Note: When configuring the locker, you must add the `aari-document-processor` custom role as a locker consumer.

Watch this video for the complete end-to-end process of creating a learning instance:

<https://fast.wistia.net/embed/iframe/saff87ggz4>

1. From the Control Room home page, navigate to **Manage > Learning Instances > Create Learning Instance**.
2. Enter a name and description for the learning instance.
Document Automation does not allow duplicate learning instance names, so the name you provide must be unique.
3. Select the document type: **Invoice , User-defined, Utility Bill, or Receipt**
Use the user-defined document type to process documents that are visually similar to invoices, such as purchase orders and sales orders, which contain key-value pairs and a table structure. In this document type, you create and configure all of the form and table fields.
4. Select the language.
Document Automation supports English, Dutch, French, German, Italian, Portuguese (Brazilian), and Spanish.

Note: Extraction for French, German, and Spanish language documents is currently in preview. Extraction results will improve in future releases.

5. **If you selected Invoice:** Select the provider.
If you selected the English language in step 4, **Automation Anywhere (Pre-trained)** is auto-selected.
6. For learning instances with the **Automation Anywhere (Pre-trained)** provider, you can opt in to send feedback to the system to improve extraction results. For more information, see [Data extraction in Document Automation](#)
7. Click **Next**.

We recommend that you open a sample document side by side with the Control Room window as you configure the form and table fields.

Note:

- A form field is a type of field that occurs only once in a document.
 - A table field is a type of field that reoccurs throughout a document, typically in the form of a table.
-

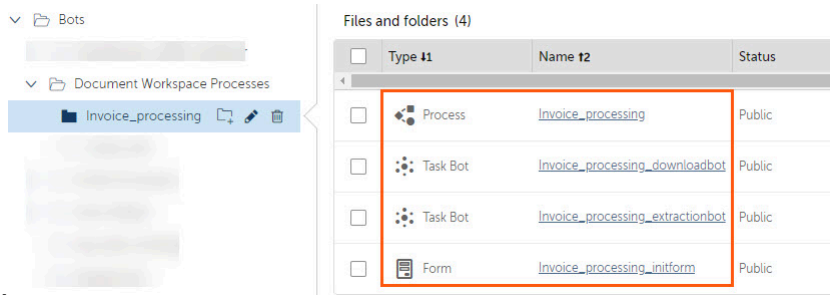

8. Configure the form and table fields for extraction.
Document Automation offers a standard set of form and table fields, many of which are not initially visible. You can search for a field by field name, field label, or data type.
To see the full list of fields, click **Show unused fields**. See the following video for a demonstration: <https://aa2019packagesdkfordocumentation.s3-us-west-2.amazonaws.com/videos/view-all-li-fields-iqbot.mp4>
Click a field to open the fields editor. You can edit most attributes of a field. You cannot edit the name and default aliases. Document Automation assigns default aliases, which are hardcoded keywords, to standard fields to help with extraction. You cannot modify or delete default aliases, but you can add aliases in the **Custom aliases** field. See the following video for a demonstration of creating a custom alias: <https://aa2019packagesdkfordocumentation.s3-us-west-2.amazonaws.com/videos/custom-alias-iqbot.mp4>
Mouse over the menu icon to the right of a field to access the up/down arrows. Use the arrows to rearrange the order of the fields for a more efficient manual validation. The order of the fields does not impact extraction.
To learn more about the other field attributes, review the table in the next step.

9. To add a field, click **Add a field** and complete the following fields:

Option	Description
Field name	Enter a field name that begins with an alphabetical character (A-Z or a-z). In standard fields, the field name is hardcoded and cannot be changed.
Field label	Enter a user-friendly name to help validators. For example, you can rename <code>Organization tax number</code> to a localized name, such as <code>VAT number</code> . The field label does not affect extraction.
Confidence	Set a threshold to reduce potential false positives. At the time of processing, the Document Automation engine assigns a score to each field in a document to indicate the certainty that the data was correctly extracted. If the document contains fields with a score that is lower than the confidence threshold, the document is sent to the validation queue. If you enter a high confidence threshold, more documents will be sent to the validation queue. If you enter a low confidence threshold, fewer documents will be sent to the validation queue. Supports values from zero to 100.
Data type	Choose from Address* , Text , Number , and Date . If the data in the field does not match the data type, the document is sent to the validation queue. Document Automation supports variations of the date format. * If you are configuring a learning instance with a user-defined document type, the form fields include the address data type, which extracts the entire structure of an address.
Required	Select one of the following: <ul style="list-style-type: none"> • Required: Field cannot be empty. • Optional: Field can be empty or not exist in the document.
Default aliases	No action is necessary for this field. Document Automation assigns default aliases, which are hardcoded keywords, to standard fields to help with extraction.
Custom aliases	Additional keywords to help Document Automation locate the field. For example, add country or region-specific names for fields such as <code>VAT number</code> as an alias to an <code>Organization tax number</code> custom field. <hr/> Note: Custom aliases must be unique. They cannot duplicate the default alias of another field. Exception: Form fields can have duplicate custom aliases as the table fields and vice versa. <hr/>
Validation rules	Depending on data type, create rules using patterns, formulas, lists, and statements such as starts or ends with. Starts With and Ends With Pattern Lists Formulas

10. Click **Create**.

When a new learning instance is created, the Control Room creates a folder with the same name as the learning instance in the **Automation > Document Workspace** folder. The folder contains two bots (extraction and download), a process, and a

form.

- **Process:** Manages the process using if/else scenarios through which Document Automation extracts data from uploaded documents, assigns documents to users for validation, and downloads the extracted data. To learn more, see [About the AARI process in Document Automation](#)
- **Extraction bot:** Extracts data from defined fields in the uploaded documents.
- **Download bot:** Downloads the extracted data to a specific folder on the device or shared network.
- **Form:** Defines the input parameters that are sent to the process. Input parameters include the learning instance name, uploaded file, and output file path.

Upload documents to the learning instance, fix validation errors, and verify the extracted data: [Process documents in Document Automation](#)

Data extraction in Document Automation

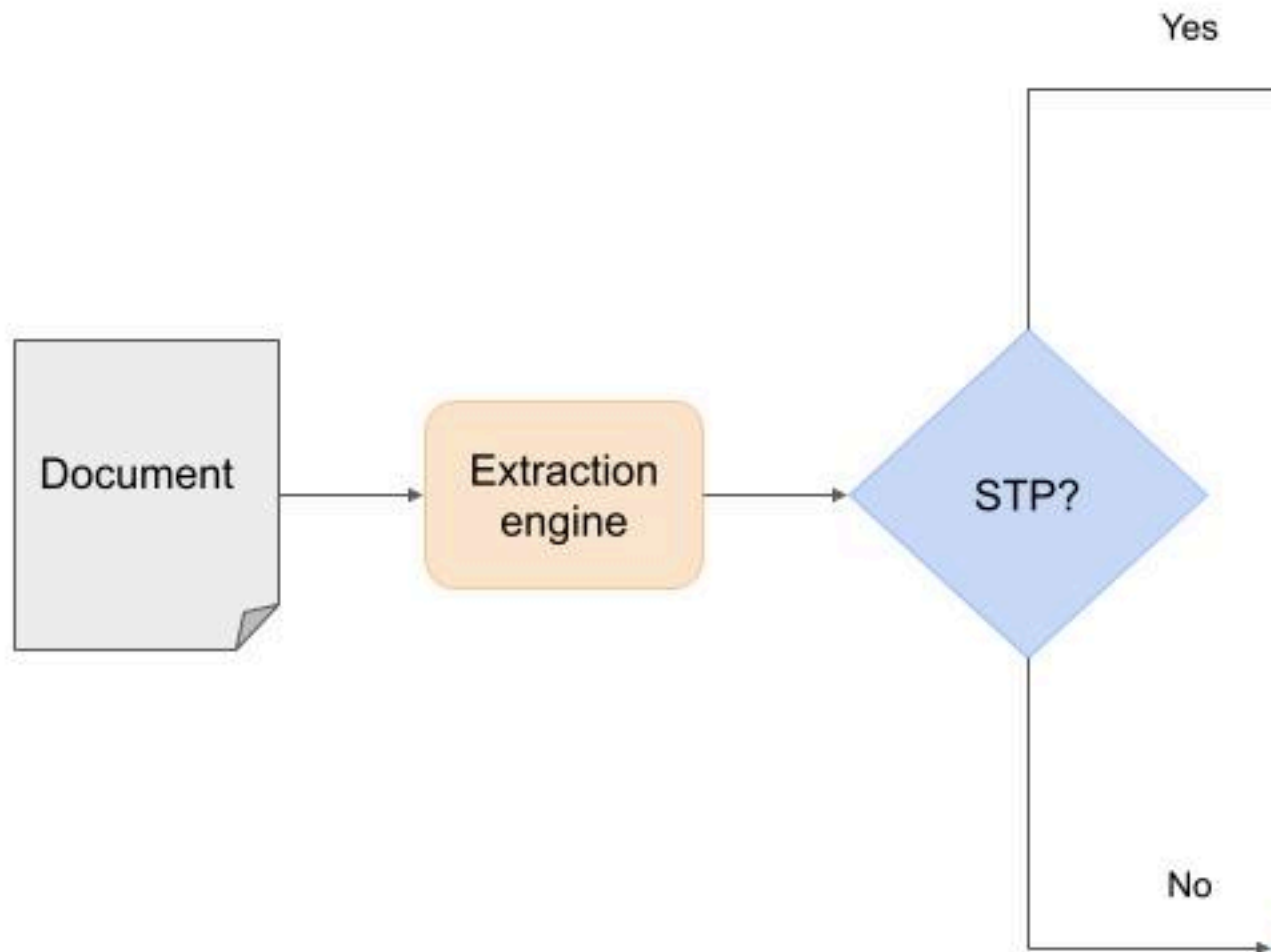

Understand how the system improves extraction accuracy through user-provided changes in the Validator.

Improving extraction accuracy through validation

When a learning instance is created, the user has the option to enable this feature to send feedback to the learning instance based on user-provided changes in the Validator. In Document Automation, learning instances running in production mode can continuously "learn" whenever a user resizes or relocates the extraction region in the Validator.

Note: This feature is available only for Automation Anywhere pre-trained models.

The following graphic provides a visual overview of the process by which learning instances continuously receive feedback from validation:

1. An uploaded document passes through the extraction engine.
2. If the learning instance successfully extracts the data, the document is added to the straight-through processing (STP) count and the extracted values are downloaded to a file in the `Success` folder.
If the learning instance can not extract the data, the system evaluates whether the document contains an unfamiliar layout.
3. If the learning instance does not recognize the document layout (new layout), the document is sent for manual validation where the user "teaches" the learning instance how to extract the data by setting the extraction region.

- The extracted values are downloaded to a file in the `Success` folder and the changes are collected in a feedback file, which is sent to the feedback database.

Note:

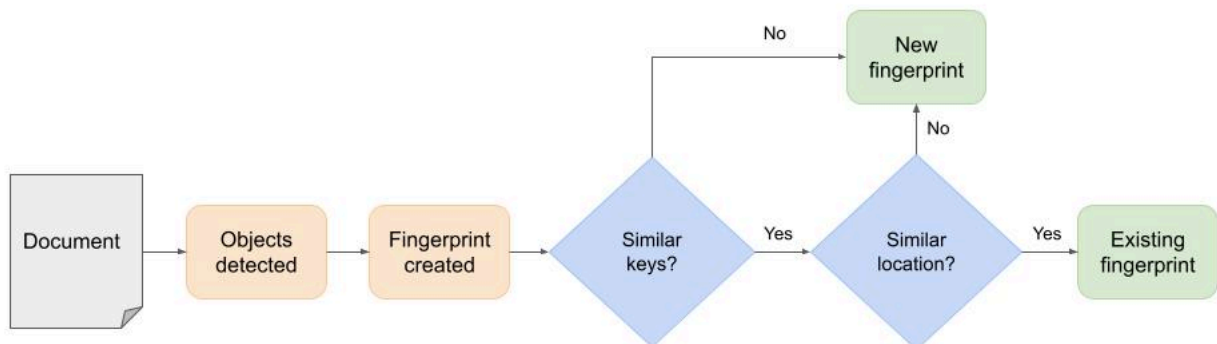

- Feedback is only collected when the user changes the extraction region. If the user manually inputs text, the system does not collect feedback.
- The feedback file only contains data on the field location to improve extraction accuracy for subsequent documents.

If the learning instance recognizes the cluster, it retrieves previous feedback from the feedback database and uses it to extract data.

How Document Automation identifies new layouts

Document Automation extraction is based on object detection. During document processing, the extraction engine identifies objects, or key-value pairs of the field and associated value. The engine creates a "fingerprint" of the document, which stores the sequence of the objects and each object's location in the document.

When a document is processed, if the engine recognizes the keys and their locations, the document is classified and extracted based on that existing fingerprint. Otherwise, the engine saves a new fingerprint of the keys and their locations.

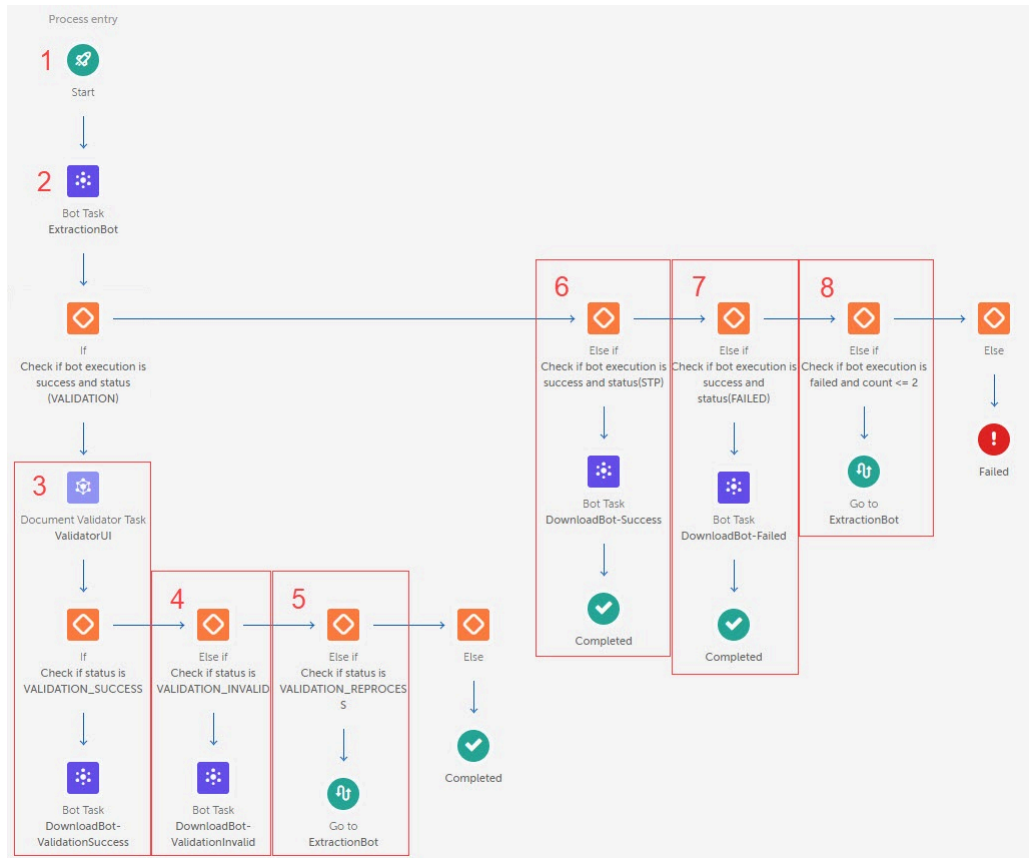

About the AARI process in Document Automation

Document Automation uses Automation Anywhere Robotic Interface technology to manage the end-to-end document extraction process. When you create a learning instance in Document Automation, the system also creates an AARI process. Review the following guide to understand the logic.

When a learning instance is in production, each incoming document creates a new request, which triggers the extraction process. If a document requires manual validation, AARI creates a validation task and assigns it to a validation team.

After the documents are processed, the **Download bot** downloads the extracted data to a file in the `Success` folder.

- 1. Start:** The AARI form that defines the inputs, such as the learning instance name, uploaded documents, and output folder.
- 2. Bot Task ExtractionBot:** Executes the RPA bot that processes input documents to extract data from them.
- 3. Document Validator Task:** Opens the Validation user interface where the user can manually validate the fields in the document.
- 4. Documents require validation:** The ExtractionBot tried to process the documents then sent the documents for validation, the documents were successfully validated, and the DownloadBot downloaded the extracted data to the `Success` subfolder.

Request status = `VALIDATION_SUCCESS`

- 5. Invalid documents:** The previous process was interrupted at validation, where a user marked certain documents as **invalid**. These documents were downloaded to the `Invalid` subfolder.

Request status = `VALIDATION_INVALID`

6. **Reprocessed documents:** The previous process was interrupted at validation because the user clicked **Reprocess**. Documents were sent back to the ExtractionBot for reprocessing.

Request status = `VALIDATION_REPROCESSING`

7. **Documents are successfully processed:** The ExtractionBot successfully processed the documents, no documents required validation, and the DownloadBot downloaded the exacted data.

Request status = `success` and `STP`

8. **Processing failed:** The ExtractionBot failed to process the documents (for example: invalid format or could not read the file) and the file is saved to the `Failed` subfolder

Request status = `FAILED`

9. **Deployment failed:** The Control Room failed to deploy the ExtractionBot (for example: lost server connection). The Control Room makes three attempts.

Warning: We do not recommend deleting the process. If you unintentionally delete a process associated with a learning instance, do the following steps to recover the process:

1. Navigate to **Manage > Learning Instances** and mouse over the actions menu to the right of the learning instance.
2. Click **Export**.
3. Mouse over the actions menu to the right of the learning instance and click **Delete**.
4. Click **Import** at the top of the page.
5. Click **Browse** and select the `.dw` file you exported.
6. When prompted, click **Overwrite** to generate a new process for the learning instance.

Process documents in Document Automation

Upload sample invoices to test the learning instance, verify the extracted data, and fix validation errors.

- If you have not done so already, [Create a learning instance in Document Automation](#).
- Verify that your device is connected to the Control Room: [Install Bot Agent and register device](#)
- If the learning instance uses a Google Document AI model **and you did not purchase Google Document AI licenses through Automation Anywhere**, you must provide your Google Document AI credentials to the **Extraction bot**. See [Configure key for Google Document AI](#)
- If the learning instance uses an Automation Anywhere model, ensure that each file is 50 MB or less.

If the learning instance uses a Google Document AI model, ensure that each file is 20 MB or less, with a maximum of 5 pages.

- Ensure that the sample documents are in one of the following supported document types:
 - PDF
 - JPG
 - JPEG
 - PNG
 - TIF
 - TIFF
- The default output format for the extracted data is CSV file. To change the output to JSON, see [Change output format from CSV to JSON](#).

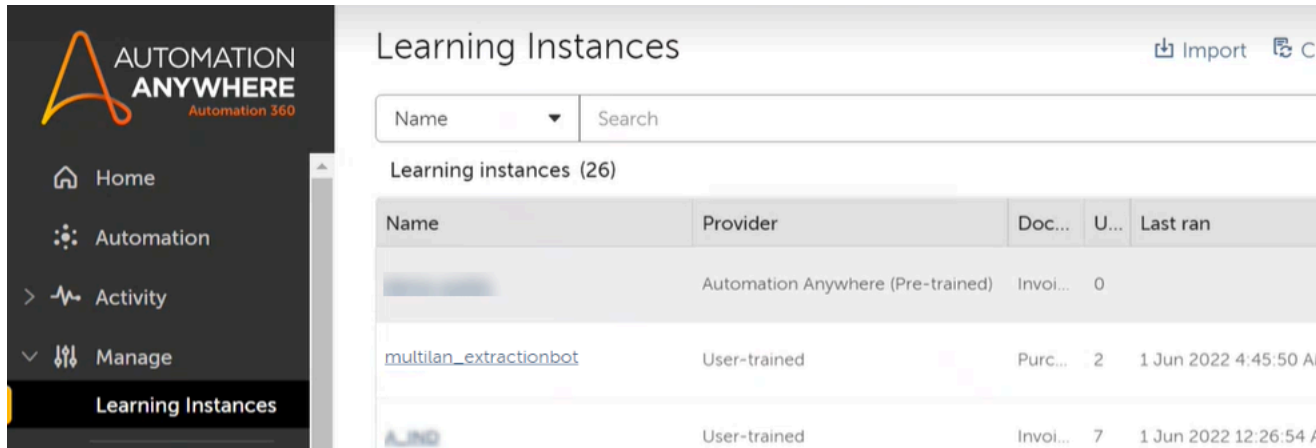

Perform the following steps to upload sample invoices to the learning instance to test the data extraction capabilities of the learning instance.

1. Upload documents to test the learning instance:

See these steps in a video:

<https://fast.wistia.net/embed/iframe/Iyr07vc2ua>

a) Click **Process documents**.

The screenshot shows the Automation Anywhere interface. On the left is a navigation menu with options: Home, Automation, Activity, Manage, and Learning Instances (selected). The main area displays the 'Learning Instances' table with 26 instances. The table has columns: Name, Provider, Doc..., U..., and Last ran. The instance 'multilan_extractionbot' is highlighted, showing it is 'User-trained' with 2 documents and a last run time of 1 Jun 2022 4:45:50 A.

Name	Provider	Doc...	U...	Last ran
[blurred]	Automation Anywhere (Pre-trained)	Invoi...	0	
multilan_extractionbot	User-trained	Purc...	2	1 Jun 2022 4:45:50 A
[blurred]	User-trained	Invoi...	7	1 Jun 2022 12:26:54 A

b) In the **Process Documents** window, click **Browse** to select the files to upload.

c) In the **Download data to** field, enter the file path that will hold extracted data.

When the process runs, it creates the following three folders in the provided file path:

- **Success:** Contains the extracted data in the specified format (CSV or JSON).
- **Invalid:** Holds documents marked invalid.
- **Failed:** Holds documents that could not be processed.

You can provide an output folder path based on one of the following options:

- **Option 1:** The local device path if you have set up document processing and validation on the same device.
This option is typically used when you are testing the learning instance.
- **Option 2:** The shared folder path if you have set up distributed validation on separate devices.
This option is typically used for published learning instances. For example, `\10.239.192.60\Sharepath\Output`.

d) Click **Process documents**.

The Bot Runner window appears. The window disappears when the documents are done processing. Refresh the **Learning instances** table to see the updated metrics.

If there is a value next to the **Validate documents** link, you must manually validate the document fields. Otherwise, proceed to step 3.

2. Fix the validation errorsa) Click **Validate documents**.

The AARI Task Manager opens in a new tab, with the first failed document in queue. For an introduction to the Validator user interface, see [Using the AARI Task Manager Validator for Document Automation](#).

b) Review each field to verify the data type and extracted value.

Document Automation supports the following data types: text, number, time, and check box

Alternatively, from the drop-down list on the right panel, you can select **Show fields that need validation**.

Note: When documents are awaiting validation, if you edit the learning instance, click **Reprocess** to reattempt extraction.

Reprocessing documents does not affect the uploaded documents metric.

c) Update the fields with errors.

Click the field or draw a box around the values that you want to extract.

<https://aa2019packagesdkfordocumentation.s3-us-west-2.amazonaws.com/videos/validation-iqbot.mp4>

- To skip a document without correcting errors, click **Skip** to proceed to the next document in the validation queue.
- To remove a document that cannot be processed, click **Mark as Invalid**.

d) After you make the necessary corrections, click **Submit** so that the document can finish processing.

The next document in queue appears. When all the documents are corrected, the system displays a message stating that no more tasks are available.

e) Close the tab to return to the **Learning Instances** page.**3.** Verify the output results:a) Open the file in the `Success` folder that contains the extracted data and review the results to ensure that it matches your use case.b) Optional: Review the **Learning Instance** dashboard.

The dashboard displays the total number of uploaded documents and the number of documents pending validation.

If the learning instance repeatedly cannot find a field or if characters are not correctly recognized (such as the letter "l" extracted as the number "1"), you can try changing the OCR to Google Vision OCR.

Build a bot that uploads documents from a source folder to the learning instance. Then, publish the learning instance assets (process, form, and bots) to the public repository so that the learning instance can be used in public mode to extract data from real documents, and validators can manually validate documents: [Publish the learning instance](#)

Related concepts[Extracting data from check boxes](#)

Document Automation supports check box extraction for connected learning instances. The output varies depending on the selected data format.

Change output format from CSV to JSON

Data from successfully processed documents is available as a CSV file, by default. Change the output format by editing the download data action **before you begin uploading documents**.

If you have not done so already, [Create a learning instance in Document Automation](#).

To change the output format to JSON, perform the following steps:

1. Navigate to **Automation > Private tab > Document Workspace** and click the folder with the same name as the learning instance to configure the assets.
2. Open the process.

You must update the output format for `DownloadBot-ValidationSuccess` and `DownloadBot-Success`:

3. Click `DownloadBot-ValidationSuccess` and locate the **DocumentType** field.
4. Change `OUTPUT_CSV` to `OUTPUT_JSON`.
5. Repeat steps 3 and 4 to change the output format for `DownloadBot-Success`.
6. Click **Save**.

Upload documents to the learning instance: [Process documents in Document Automation](#)

Connect learning instance

Connect to a learning instance in Automation 360 IQ Bot to process documents in that learning instance using the Document Automation workflow.

To perform this task, you must have one of the following roles:

- **AAE_IQ Bot Admin**
- **AAE_IQ Bot Services**
- A custom role with the **Connect learning instance** permission

Open the Document Automation and Automation 360 IQ Bot environments on the same device.

When you connect a learning instance that was created in Automation 360 IQ Bot, the system creates learning instance assets (RPA bots, AARI process, and form) to enable the learning instance to start processing documents in Document Automation.

Note:

- This feature is available only for Document Automation customers. It is not available in Community Edition.
- The Automation 360 IQ Bot environment must be associated with the Control Room where Document Automation is installed. In addition, Automation 360 IQ Bot must be in a version that is compatible with the Control Room.
- You can connect one learning instance at a time.

A connected learning instance can extract data from check boxes if your device is configured with the Microsoft Visual C++ 2019 Redistributable package: [Extracting data from check boxes](#)

1. Login to the Control Room as the `Admin` user. Navigate to **Manage > Learning Instances**. Click **Connect learning instance**.
This takes you to **Connect Learning Instances from IQ Bot classic page** which contains a list of Automation 360 IQ Bot learning instances.

- Select the learning instance from version Automation 360 IQ Bot to connect with. Move it from left to right. Click **Connect**.

Connect Learning Instances from IQ Bot classic

You can edit the Learning Instance only in IQ Bot

Selected (0)

Name

Select learning instance

Click here to move learning instance left to right

The newly-connected learning instance appears in the Learning instances table in private mode.

Note: The value in the Provider column indicates whether a learning instance was connected from Automation 360 IQ Bot or created in Document Automation.

- For a connected learning instance, the Provider column value is **User-trained**.
- For a learning instance created in Document Automation, the Provider column value is **Automation Anywhere (Pre-trained)**.

Note: You must maintain the Automation 360 IQ Bot server because it stores the configuration and training data for the connected learning instance.

- A connected learning instance can only be edited in Automation 360 IQ Bot. To edit the learning instance after connecting it, click the name in the Learning instances table and you will be redirected to open the learning instance in Automation 360 IQ Bot in a new window.

- To upload documents for processing, click **Process Documents**. [Process documents in Document Automation](#)

Extracting data from check boxes

Document Automation supports check box extraction for connected learning instances. The output varies depending on the selected data format.

A check box is a user interface object that allows you to make a binary choice - select or leave unselected. Document Automation supports extracting data from check boxes or radio buttons marked with a tick, cross, or dot. In addition to square check boxes and round radio buttons, Document Automation supports triangle and rhombus outlines.

Document Automation supports the extraction of group check boxes from connected learning instances. For more information on group check boxes, see [Extract data from check box groups in Automation 360 IQ Bot](#).

Note: To enable check box detection, you must install the Microsoft Visual C++ 2019 Redistributable package on the Bot Runner device where the documents are processed. [Download Microsoft Visual C++ Redistributable](#)

How the data is output

The possible output values are Yes, No, or No Checkbox Found. The output format depends on the format you selected [Change output format from CSV to JSON](#).

Note: Regardless of the document language, the output values are always in English.

Publish the learning instance

Check-in the process associated with the learning instance. Then, build a bot that uploads documents from a source folder to the learning instance and check it in to the public repository. Finally, deploy the process and bots to unattended Bot Runner devices to begin processing documents in real time.

1. Publish the process.
 - a) Navigate to **Automation > Private tab > Bots > Document Workspace processes** and select the folder with the same name as the learning instance.
 - b) Mouse over the vertical ellipses to the right of the process to open the actions menu and click **Check in process**.
The **Check in Process** window opens with the bots and form auto-selected to also be checked in.
 - c) In the **Check in Process** window, add your comment and click **Check in**.
The process appears in the same folder structure in the public workspace.

See these steps in a video:

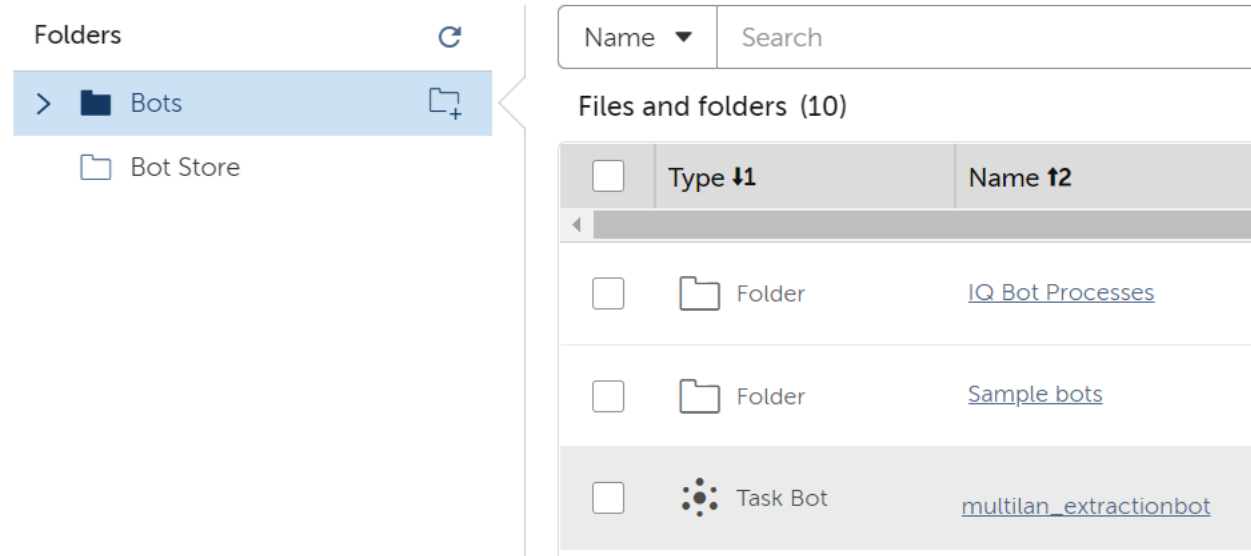

<https://fast.wistia.net/embed/iframe/Iyouw132o4>

2. Build the `Extraction-Scheduler` bot to automate uploading documents to the learning instance:
[Build a bot to upload documents to Document Automation](#)

3. Publish the `Extraction-Scheduler` bot.

- Locate the `Extraction-Scheduler` bot in the private tab.
- Mouse over the triple ellipses to the right of the bot to open the menu and click **Check in Task**

Private bots and files cannot be viewed by other people. If a bot or file has been checked out from the Public tab, other people, but cannot be edited.

bot.

The **Check in Task bot** page opens with the bot auto-selected.

- Add a comment and click **Check in**.

4. Login as the `Admin` user to deploy the process and bots to unattended Bot Runner devices: [Deploy the learning instance assets](#)

Once the process and `Extraction-Scheduler` bot are deployed, documents in the specified folder are uploaded to Document Automation, and Document Automation either extracts data from the documents or sends the documents for validation.

Navigate to **Activity > In progress** to see the status of the running bots.

Build a bot to upload documents to Document Automation

Build a bot to upload documents to a specific learning instance for processing and extraction.

- Ensure you have the name of the destination learning instance.
- If you have an adequate amount of Bot Runners connected. For instructions on connecting a Bot Runner, see step 5 of [Set up your Document Automation environment](#).

Note: You need a dedicated Bot Runner for this bot and additional Bot Runners for the `extraction` and `download` bots, depending on the average number of pages in the documents. Review the explanation below for more guidance on how many Bot Runners are needed.

- Decide on the scheduling interval for deploying this bot with a maximum interval of every thirty minutes.
- Determine the average number of pages in the documents awaiting upload.

This bot is necessary for end-to-end automation of the document extraction process. When deployed, the bot checks if there are enough Bot Runners to handle the documents, by comparing the number of

files already uploaded against a calculated value. The calculation considers the number of Bot Runners, scheduling interval, and average number of pages in the documents.

Note: This step is important as it controls the number of documents being uploaded to ensure smooth processing and avoid overloading the Bot Runners, which might cause a time-out error.

To determine the number of Bot Runners needed, consider the following:

- One Bot Runner can process a single-page document in one minute.
- One Bot Runner can process a two-page documents in two minutes.
- One Bot Runner can process 1440 single-page documents in one day.
- Two Bot Runners can process two single-page documents in one minute.

Use this equation to determine how many Bot Runners are needed:

$$\text{Number of Documents to Process per day} * \text{Average Number of Pages per document} / 1440 = \text{Number of Bot Runners}$$

Note: If the equation result is not an integer, you must round up to the next whole number to obtain an adequate number of Bot Runners. For example, if the equation result is 4.2, you will need 5 Bot Runners.

As an example, if you want to process 10,000 documents each day with an average of one page per document, you need seven Bot Runners:

$$10,000 \text{ documents} * 1 \text{ page per document} / 1440 = 7 \text{ Bot Runners}$$

To build the bot, follow these steps:

1. Navigate to **Automation > Private tab** and click **Create a bot**.
Ensure you do not place the bot in the **Document Workspace** folder.
2. Provide a name for the bot, such as `Extraction-Scheduler`.
3. Create the following variables: [Create a variable](#)

Variable name	Description	Data type	Value
File_Count	Increments with each loop iteration to count the number of files uploaded for processing.	Number	0
Extraction_Device	Number of Bot Runner devices connected to the Control Room	Number	Enter the number of connected Bot Runner devices
Scheduler_Interval	Scheduling interval in minutes	Number	Enter the interval for which you will schedule this bot to run when you deploy it (minimum 2 min,maximum 30 min)
Average_Pages	Average number of pages per document		Enter the approximate average number of pages in the documents

Variable name	Description	Data type	Value
FilesInFolder	Holds file name and extension	Dictionary	--
SourcePath	File path to the folder containing documents awaiting upload to Document Automation	String	Enter the file path
OutputPath	File path to the folder containing the extracted data and invalid or failed documents	String	Enter the file path where you want the extraction output

4. Insert a **Loop** action to iterate through all the documents in a specific file path.
 - a) Double-click or drag the **Loop** action.
 - b) Select the **For each file in folder** iterator.
 - c) Insert the `SourcePath` variable into the **Folder path** field.
 - d) Insert the `FilesInFolder` variable into the **Assign file name and extension to this variable** field.

5. Insert an **If** action to compare the number of documents uploaded for processing to the number of Bot Runner devices multiplied by a scheduling interval and divided by the average number of pages.

Note: You must include this equation to limit the number of files uploaded for processing at one time to ensure that the Bot Runners are able to process the documents.

- a) Drag the **If** action into the **Loop** container.
 - b) Select the **Number** condition.
 - c) Insert the `File_Count` variable into the **Source value** field.
 - d) Select the **Less than** operator.
 - e) Enter the following into the **Target value** field: $\$Extraction_DeviceCount\$ * \$Scheduler_Interval\$ / \$Average_Pages\$$
6. Insert **If: Else** and **Loop: Break** actions to end the loop if the condition is not met:
 - a) Drag the **If: Else** action beside the **If** action in the **Loop** container.
 - b) Drag the **Loop: Break** action into the **If: Else** container.

 7. Insert an error handling mechanism to log any possible errors:
 - a) Drag the **Error handler: Try** action into the **If** container.
 - b) Drag the **Error handler: Catch** action beside the **Error handler: Try** action.
 - c) Drag a **Delay** action below the **Error handler: Catch** action.
 - d) Set a delay of 10 seconds.

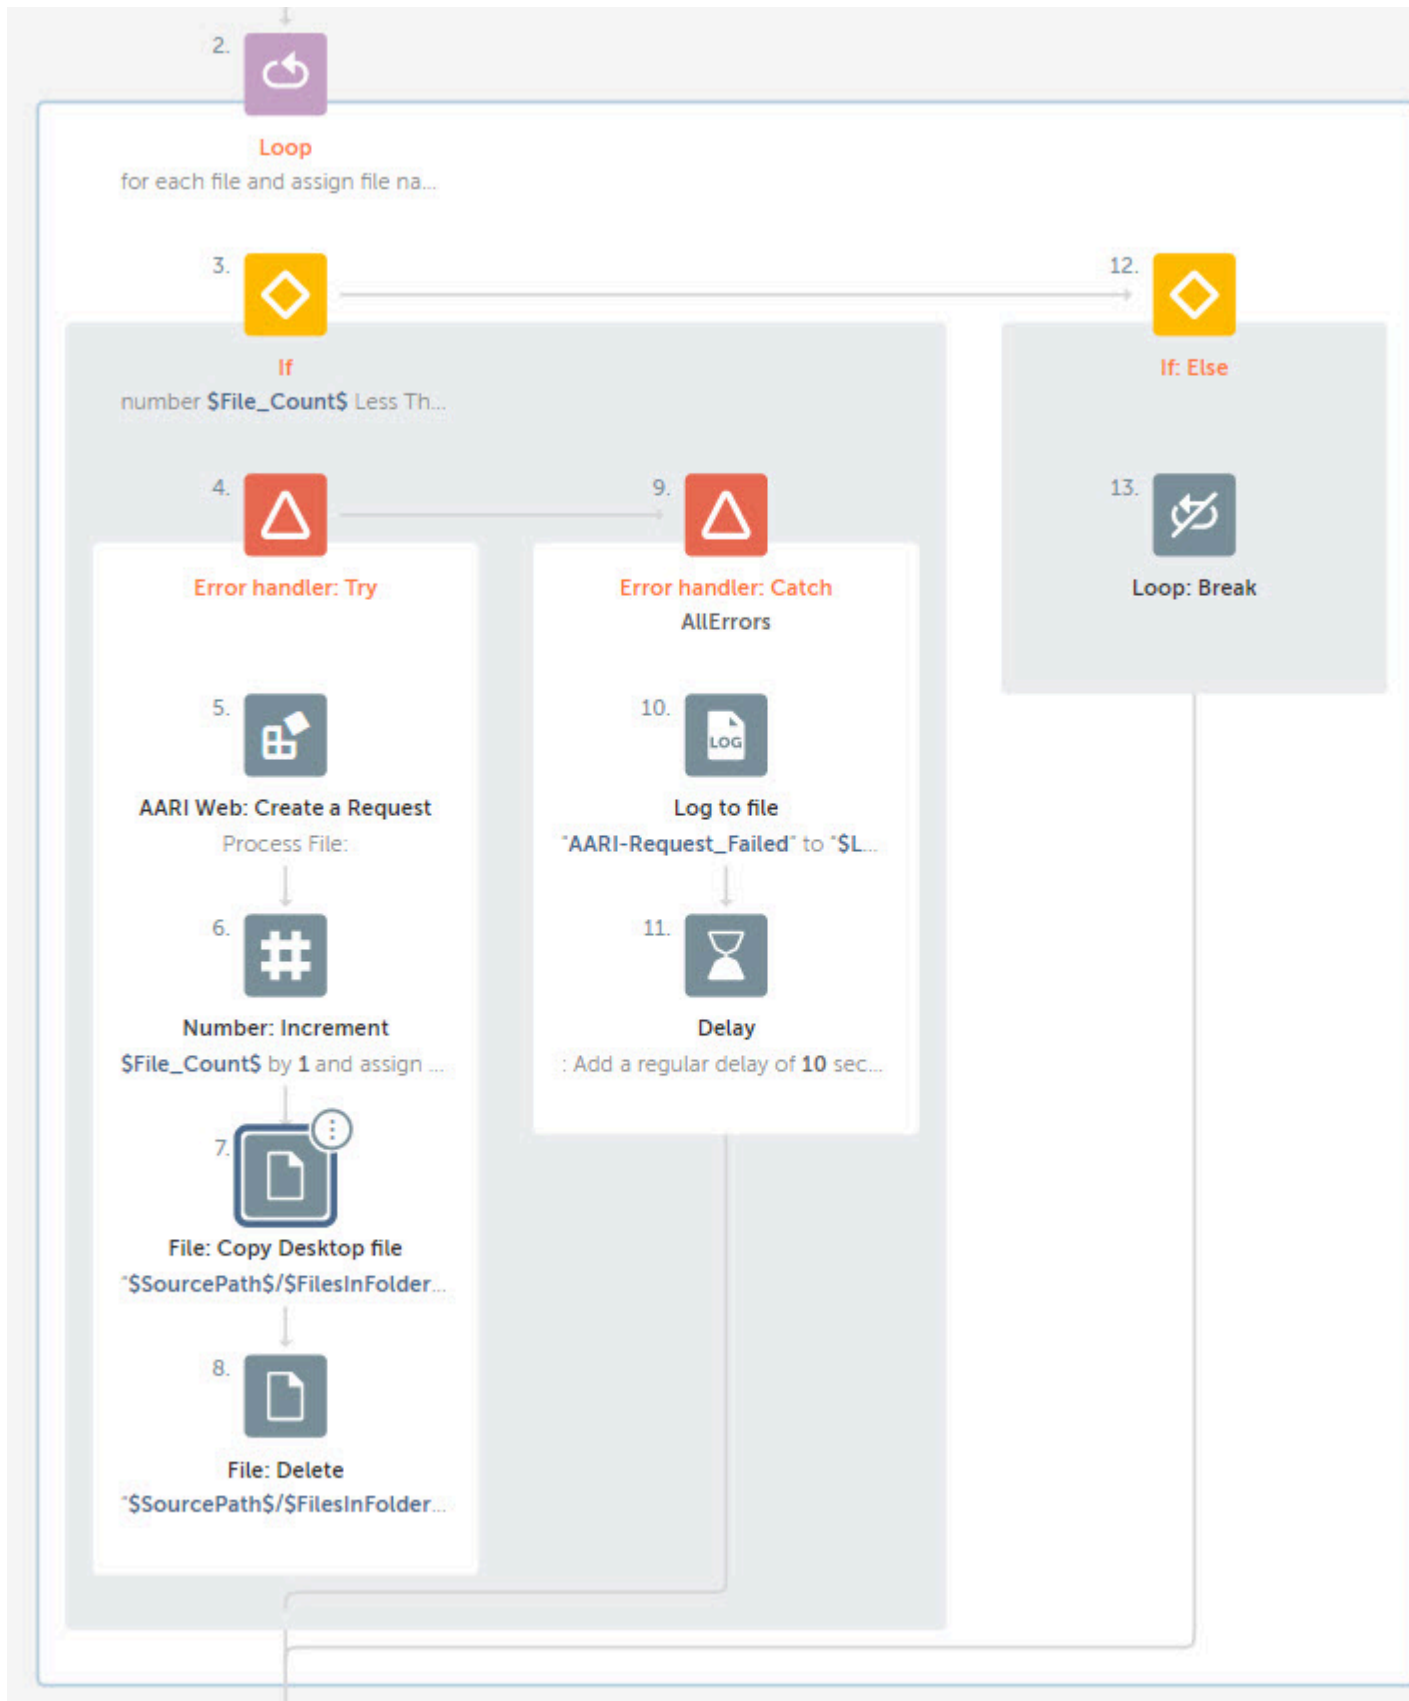

8. Configure actions to upload documents to the process associated with a specific learning instance.
 - a) Drag the **AARI Web: Create a request** action below the **Error handler: Try** action.
 - b) Mark the **Set LearningInstanceName** option and provide the name of the learning instance where to send the documents.
 - c) Mark the **Set InputFile** option and enter `${SourcePath}/${FilesInFolder{name}}$.
${FilesInFolder{extension}}$`.
 - d) Mark the **Set InputFileName** option and enter `${FilesInFolder{name}}$.
${FilesInFolder{extension}}$`.
 - e) Mark the **Set OutputFolder** option and enter `${OutputPath}$`.
 - f) Drag the **Number: Increment** action below the **AARI Web: Create a request** action.
 - g) Insert the `File_Count` variable into the **Number** and **Assign output to variable** fields.
The **Number** action increases the value of `File_Count` by one each time a file is uploaded to the learning instance. As long as the value in `File_Count` is less than the total in the equation you entered in step 5, the bot can run another loop iteration to upload another document to the learning instance.

9. Make a copy of the uploaded file to a different location on your desktop to keep track of which documents were successfully uploaded:
 - a) Drag the **File: Copy Desktop file** action below the **Number: Increment** action.
 - b) Enter `${SourcePath}/${FilesInFolder{name}}$.
${FilesInFolder{extension}}$` in the **Source file** field.
 - c) Provide the folder path where to copy the files.

10. Remove documents after they are uploaded to Document Automation so they do not get re-uploaded in the next iteration:
 - a) Drag the **File: Delete** action.
 - b) Enter `${SourcePath}/${FilesInFolder{name}}$.
${FilesInFolder{extension}}$` in the **File** field.

11. Click **Save**.

The completed bot should resemble the one in the image below:

Publish the process and bot. See step 3 of [Publish the learning instance](#)

Deploy the learning instance assets

Deploy the process and RPA bots to the unattended Bot Runner devices, and assign the learning instance to a validation team. Here, you configure the learning instance assets to process documents in real time.

- The user who created the learning instance assets must check-in the process, form, and bots to the public repository. If you have not done so already, complete steps 1 and 2 of [Publish the learning instance](#).
- To deploy the learning instance assets, you must be an Admin user. See [Document Automation users](#).

1. Assign the a team of Validators to the process:.

- Open AARI by appending `/aari` to the Control Room URL.
- Navigate to **Manage > Process** and locate the process with the same name as the learning instance.
- Click the process to assign it to a team.
- Navigate to the **Request Creation** section and select the **by Bot** option.
- Navigate to the **Teams** tab and click the **Add** icon on the left side.
- Select the team and click **Add and save**.

2. Deploy the `Extraction-Scheduler` bot

See these steps in a video: <https://fast.wistia.net/embed/iframe/v93wkzjrbs>

- Return to the Control Room by removing `/aari` from the Control Room URL.
- Navigate to **Automation > Public tab** and locate the `Extraction-Scheduler` bot.
- Follow the steps to [Schedule a bot](#).

- At the scheduling details section, select **Run repeatedly**.
- Select the **Repeat every** option to schedule the bot on a recurring basis.

When you provide the desired interval and frequency, ensure that the interval matches the value in the `Scheduler_Interval` variable in the `Extraction-Scheduler` bot.

Note: If you are scheduling the bot to run starting today, you must repeat the steps two times to schedule the bot as follows:

- Schedule the bot with the desired start time for today, with an end time of 11:59pm on the same day.
- Schedule the bot to start tomorrow at 12:00am, with an end time of 11:59 on a future date.

Warning: If you do not follow this guidance, the bot will start running each day at the time you provided in the **Start time** field, instead of being scheduled to run for 24 hours of each day.

- When selecting a Bot Runner, deploy the `Extraction-Scheduler` bot to a different Bot Runner than the one running the process.

Note: A Bot Runner can run only one bot at a time. Ensure that you use separate Bot Runners for the process and the `Extraction-Scheduler` bot, so that the `Extraction-Scheduler` bot does not interfere with the `Extraction` and `Download` bots.

Once the process and `Extraction-Scheduler` bot are deployed, documents in the specified folder are uploaded to Document Automation, and Document Automation either extracts data from the documents or sends the documents for validation.

Navigate to **Activity** > **In progress** to see the status of the running bots.

Using the AARI Task Manager Validator for Document Automation

Document Automation uses Automation Anywhere Robotic Interface technology to manage the end-to-end document extraction process. Each incoming document creates a new request, which triggers the extraction process. If a document requires manual validation, AARI creates a validation task and assigns it to a validation team.

When you click the **Validate documents** link in the Learning instances page, the AARI Task Manager opens in a new tab, with the first failed document in queue.

Note: An empty page with a notification message appears in the following scenarios:

- If you are not assigned to any validation teams, and thus do not have access to learning instances.
 - If there are no files that require validation in the learning instances to which you have access.
 - If another user is working on the remaining file in the validation queue.
-

Item Number	Description
24-301	Install (1) 4" Low Voltage Recessed Accent light to new control circuit
25-403	Install (2) 6" White Baffle Recessed Lights to new control circuit
26-101	Install Ceiling Fan Support Box to new control circuit

1. You can toggle between the Table and Detail views

Detail view: We recommend that you perform validation tasks in the **Detail** view because this view shows all the documents in the validation

queue side by side with the document that you are currently validating. Additionally, when you finish validating a document, the next document in the queue automatically opens.

Note: You can search for specific documents (tasks) in **Detail** view only.

Table view: Use the **Table** view see learning instance history. When you open a document from this view, the history for the learning instance that is processing this document appears in a pane on the left. Click the empty text field, then select the blue-bounded box in the document that contains the data to extract. After you select a box, the data is highlighted in yellow and a green outline appears, which you can resize or reposition to include all the data that you want to extract.

The Validator opens with certain filters enabled by default to show only the documents from a specific learning instance that need validation.

The documents that match the parameters you specified in the filters pane appear here.

You can switch between documents in the queue without completing validation for the current document.

Use the icons in the taskbar to hide the blue-bounded system identified regions, stack the document pane above the fields pane, or change the zoom levels.

Use the drop-down list to select between **Show all fields** to see all the document fields or **Show fields that need validation** to only show the fields that need your manual validation.

In the example above, the table fields **Item total** and **Quantity** require manual entry.

To insert or delete a row, hover over the ellipses to show the icons for adding or deleting table rows.

Skip a file without correcting the errors in the current document.

If the learning instance is edited while documents are awaiting validation, you must Reprocess the documents.

Removes the document from the validation queue and saves a copy of the document to the Invalid folder. Click here to mark a document as invalid, then select from the following reasons:

- Fields missing
- Tables missing

2. Filter the documents in your queue

3. Your documents queue

4. Customize your view

5. Toggle between the fields views

6. Fields awaiting validation are outlined in red

7. Add or delete a row

8. Skip to next file

9. Reprocess

10. Mark document as invalid

- Wrong values

For documents processed in a connected learning instance:

The Validator shows the group number for the document. If you are unsatisfied with the extraction results, you can retrain the learning instance in Automation 360 IQ Bot.

Validate documents in Document Automation

If a learning instance cannot extract data from a document (for example, blurry text, data does not match data type, or data is missing for a required field), it sends that document to the validation queue, where the `Validator` user manually provides the data.

The learning instance assets must be checked-in to the public repository.

The Validator is comprised of two panels with the document on the left side and the fields with extracted data on the right side.

In a window that is 1280 pixels or more, the panels are positioned side-by-side. Otherwise, the panel containing the fields and extracted data shifts below the panel containing the document, as demonstrated in this video:

<https://aa2019packagesdkfordocumentation.s3-us-west-2.amazonaws.com/videos/validator-scroll-iqbot.mp4>

Note: If a document contains tables with large number of rows or data fields (>1000), there might be a delay in the initial validation and the corresponding response time.

1. Log in as the `Validator` user.
2. From the Control Room home page, navigate to **Manage > Learning Instances**. The Learning instances table displays details for each instance. The value in the **Validate documents** link indicates the number of documents awaiting manual validation.
3. Click **Validate documents**. The AARI Task Manager opens in a new tab, with the first failed document in queue. For an introduction to the Validator user interface, see [Using the AARI Task Manager Validator for Document Automation](#).
4. Provide correct values to the fields that need validation. See these steps in a video:

<https://fast.wistia.net/embed/iframe/m2au9ht6bf>

- a) Select **Show fields that need validation** from the drop-down list in the right panel.
 - b) Click the field to extract.
 - c) In the document image, click the blue-bounded box containing the correct data or draw a box around the data you want to extract.
 - To skip a document without correcting its errors, click **Skip** to proceed to the next document in the validation queue.
 - To remove a document that cannot be processed, click **Mark as Invalid**.
5. After you make the necessary corrections, click **Submit** so the document can be processed and the extracted data downloaded. The extracted values are saved to a file in the Success folder. The Validator shows the next document in queue. When all documents are corrected, the system displays a message stating that there are no more tasks available.

Export/Import learning instances

A user with the `IQ Bot Admin` role or with the `View and manage migration` permission can use the **Export** and **Import** buttons to move learning instances between Document Automation environments.

Export a learning instance

When you export a learning instance, a `.dw` file is downloaded to your desktop with the learning instance configurations, including the language, provider, and fields.

To export a learning instance, navigate to **Manage > Learning Instances** and mouse over the vertical ellipses to the right of the learning instance you want to export. Then, click **Export**.

Note: The process and bots associated with the learning instance are exported separately: [Export an AARI process](#) | [Export bots](#)

Import a learning instance

First, import the process and bots associated with the learning instance: [Import an AARI process](#). If you do not import the process, Document Automation will create a new process when you import the learning instance.

Note: Verify that the destination environment has the necessary licenses. See [Automation 360 licenses](#).

To import a learning instance:

1. Navigate to **Manage > Learning Instances** and click **Import** at the top of the page.
2. Click **Browse** to select the learning instance.

Note: If there is already a learning instance in this environment with the same ID number, the imported learning instance overwrites the existing one.

3. Select whether to pair the learning instance with an existing process or to create a new process.

<https://fast.wistia.net/embed/iframe/5gehd1sm0j>

Create standard form in Document Automation

Create a standard forms extraction model in the Control Room.

- Ensure your Control Room has the standard forms product license
- You must have the **AAE_IQ Bot Admin** or **AAE_IQ Bot Services** roles to complete this task
- If you have not done so already, follow the steps to [Set up extraction service](#)
- Identify between five and fifteen training documents

As of Automation 360 v.26, you can create an extraction model in Document Automation, however, you must open Automation 360 IQ Bot to create and train the learning instance. After you publish the learning instance, you can either run it in Automation 360 IQ Bot or connect it to Document Automation.

1. In the Control Room, navigate to **Manage > Learning Instances** and click **Standard forms**. The **Projects** window opens in a new tab.
2. Click **Create project**.

3. Enter a name for the project, click **Browse** to upload documents to train the extraction model, and click **Create**.
4. Define the field tags:
 - a) Click **Add new tag**.

- b) Enter a name for the tag. For example, `Invoice no.` or `Invoice Date`.

5. Define the table tags:

- a) Click **Configure table tag**.

- b) Enter a name for the table.
- c) For each column in the table, enter the name of the column under the **Column fields** section.

Column fields

Name	Type	Format
<input type="radio"/> Quantity	string	not-sp...
<input checked="" type="radio"/> Description	string	not-sp...

+ Add column

- d) When you are done entering the columns names, click **Save**.

6. Define the location of the data for each field:

- a) For the form fields, highlight the location of the data to extract, then click the respective field in the right panel.

<https://aa2019packagesdkfordocumentation.s3.us-west-2.amazonaws.com/videos/sf-define-field-location.mp4>

- b) For each row in the table, highlight the location of the data to extract, then click the respective table field on the right.

<https://aa2019packagesdkfordocumentation.s3.us-west-2.amazonaws.com/videos/sf-define-table-field-location.mp4>

- c) Click **Done**, then open the next document and repeat the steps to define the locations of the form and table fields.

7. Click the **Train model** icon, enter a name for the model, and click **Train**.

8. Click the **Analyze** icon, click **Browse for file**, and select a document to test the extraction model.

Login to Automation 360 IQ Bot and follow the steps to [Create a learning instance for standard forms](#).

Note: You cannot edit an extraction model after associating it with a learning instance.

After you send the learning instance to production, you can follow the steps to [Connect learning instance](#) to use the learning instance to process documents in Document Automation.

Manage

This collection of topics will guide you in configuring the devices and users that access Automation Anywhere.

Related tasks

[Schedule a bot](#)

Schedule a bot to run at a specific time.

[Set up locker and assign credentials](#)

Create a role, credentials, and locker to share related sensitive values with a group of users, so they can use those values to build or run bots.

[Create a role](#)

As an administrator, you can configure roles with permissions to access features and perform operations such as create, edit, or delete a bot in the Control Room, and assign the role to a user.

[Create a user](#)

Create a user and assign their specific license based role.

[Set user device credentials](#)

To enable a device for running bots, set the local device credentials.

[Edit profile](#)

Manage user profiles.

[Installing additional licenses](#)

Upload new licenses to the Automation Anywhere Control Room to be distributed to users as required.

Activities

Monitor all ongoing automations and pause, stop, and resume them as required. Also, view the Bot Runner (attended or unattended) trigger deployments in queue.

In-progress activity

Depending on the permissions granted by administrators, as a user, you can view and manage bots and bot folders. With specific permissions, you can perform the following:

View everyone's activity from my folders

With run or schedule permissions on folders, you can view all bot activity started by other users from those folders. This will be a super set in the **View my activity** output.

Manage everyone's activity from my folders

With run or schedule permissions on folders, you can perform management activities, such as **Pause**, **Resume**, and **Stop** on all bot activity started by various users from those folders.

Based on the administrative permissions, you can apply various search parameters to monitor and find the required in-progress activities.

The following table describes various search parameters, their description, and possible values or examples to search the in-progress activities:

Parameter	Description	Possible values and examples
Status	Search for an activity based on its status.	<ul style="list-style-type: none"> • <i>Started</i> • <i>Active</i> • <i>Paused</i> • <i>Unknown</i> • <i>Paused for input</i> • <i>Pending execution</i> • <i>Queued</i>
Automation priority	Search for an activity based on the priority assigned to the automation.	<ul style="list-style-type: none"> • <i>Low</i> • <i>Medium</i> • <i>High</i>
Current action	Search for an activity based on the current action.	User-specified action name
Current bot	Search for an activity based on the name of a bot that is currently running.	User-specified bot name
Bot	Search for an activity based on the name of a bot.	User-specified bot name
Activity type	Search for an activity based on the activity type selected to run a bot.	<ul style="list-style-type: none"> • <i>Run Bot</i> • <i>Import queue files</i> • <i>Run bot with queue</i> • <i>Export bots</i>
Device	Search for an activity based on the device name on which it is running.	User-specified device name

Actions

You can pause, resume, stop, move, export, and refresh the activities or items by using the actions in the **Historical** page. Hover over the actions icon (vertical ellipsis) to enable and use the following actions:

Pause checked items

To pause the selected items

Resume checked items

To resume the selected paused items

Stop checked items

To stop the selected items

Move checked items to history

To stop the selected items

Move checked items to history

To move the selected activity from **In progress** to the **Historical** page.

Note: For Workload automation, you cannot **Stop, Pause/Resume, or Move checked items to history** if the TaskBot status is **Active** or **Unknown**.

Export checked items to CSV

To export selected items to a CSV file based on the following parameters:

- Filters
- Selection

Refresh table

To refresh the table with updated activity details

Customize columns

To show or hide specific columns

Attention: Multiple workload automation entries equaling the number of devices are shown on the **In-progress activity** page if the work items added to a queue are fewer than the number of devices available in a device pool. For details about a workload automation, see the **View queue details** page on the user device on which the workload automation is deployed.

Historical activity

You can search, view, and run previously created bots in the **Activity** > **Historical** page.

Search parameters

Based on the administrative permissions, you can apply various search parameters to monitor and find the required historical activities. The following table describes various search parameters, their description, and possible values or examples to search the historical activities:

Parameter	Description	Possible values and examples
Status	Search for an activity based on its status.	<ul style="list-style-type: none"> • <i>Completed</i> • <i>Failed</i> • <i>Stopped</i> • <i>Timed out</i> • <i>Unknown</i> • <i>Deploy failed</i> • <i>Run failed</i> • <i>Pending execution</i>
Item name	Search for an activity based on triggered item.	<p>A generic name in specif system format with combination of your bot name, date and time when you run the bot, and username by which you run the bot.</p> <p>For example, <i>recorder_Recorder_2.7.3-20220527-004608.2022</i></p>
Automation priority	Search for an activity based on the priority assigned to the automation.	<ul style="list-style-type: none"> • <i>Low</i> • <i>Medium</i> • <i>High</i>
Device name	Search for an activity based on the name of the device on which the activity is running.	User-specified device name

Parameter	Description	Possible values and examples
Bot name	Search for an activity based on the name of a bot.	User-specified bot name
User	Search for an activity based on the name of the user who created the activity.	User specified name

Actions

You can export, refresh, and customize the activity details in the **Activity** > **Historical** page.

Export checked items to CSV

To export selected items to a CSV file based on the following parameters:

- Filters
- Selection

Refresh table

To refresh the table with updated activity details

Customize columns

To show or hide specific columns

Attention: Multiple workload automation entries equal to the number of devices are shown on the **Historical activity** page, if the work items added to a queue are less than the number of devices available in a device pool. For workload automation details, refer to the **View queue details** page on the actual user device on which the workload automation was deployed.

View completed activity

You can view a list of all completed activities and corresponding information in the **Activity** > **Historical** page.

Completed activities

You can use the **Status** search parameter and view all the completed activities in the **Historical** page. You can export data in the table in CSV format, customize columns, and refresh the list in the table for the completed activities.

The retention period of bot execution information in the **Historical** page varies based on the deployment. The retention period for various deployments is listed in the following table:

Deployment	Retention period (Days)
Community Edition	30
Cloud	90
On-Premises	Unlimited (No automatic deletion)

Note:

- For On-Premises deployment, the bot execution information beyond the specified retention period is available in the audit log and these logs are not deleted.

- For Cloud deployment, see [Automation 360 Cloud Data Retention Policy](#).

Note:

- Specify search parameters for the same column using **OR** operator.
 - Specify search parameters for different columns, the system searches using **AND** operator.
-

You can perform the following actions for a table of completed activities:

- Sort the column items in ascending or descending order.
- Drag-and-drop columns to move or change the column sequence.
- Resize the column width.

Activity details

The following table describes various details for completed activities:

Parameter	Description	Possible values and examples
Status	Search for an activity based on its status.	<i>Completed</i>
Item name	Search for an activity based on triggered item.	A generic name in specif system format with combination of your bot name, date and time when you run the bot, and username by which you run the bot. For example, <i>recorder_Recorder_2.7.3-20220527-004608.2022</i>
Automation priority	Search for an activity based on the priority assigned to the automation.	<ul style="list-style-type: none"> • <i>Low</i> • <i>Medium</i> • <i>High</i>
Device name	Search for an activity based on the name of the device on which the activity is running.	User-specified device name
Bot name	Search for an activity based on the name of a bot.	User-specified bot name
User	Search for an activity based on the name of the user who created the activity.	User specified name
Started on	The date and time when the activity was started.	For example, <i>19:01:24IST 2022-06-06</i>
Ended on	The date and time when the activity was ended.	For example, <i>19:01:40IST 2022-06-06</i>
Last modified	The time when activity was last modified.	For example, <i>57 minutes ago</i> or <i>3 weeks ago</i>

Parameter	Description	Possible values and examples
Modified by	The name of the user who changes the activity.	User-specified name

Actions

You can view any individual item using the following action:

View

View details of the completed activity.

Scheduled activities

Schedule bots to run on unattended Bot Runners from the **Scheduled** tab in the Control Room.

Overview

Edit, view, activate, deactivate, delete a schedule, export selected activity details to a CSV file, and search by activity name.

Perform the following actions on a column:

- Click a column to sort it in ascending or descending order.
- Use a drag-and-drop operation to move the column left or right.
- Move the mouse cursor to the end of the column and drag to re-size.

Schedule Actions

Perform the following tasks on an individual Schedule by moving your mouse over the **Actions** icon.

Schedule a bot

Schedule a bot to run at a specific time.

Ensure you are logged in to the Control Room as the administrator or a user with the following permissions:

- Schedule my bots to run
- Schedule permission at folder level for specific bots and their dependencies
- Access to run-as users (Bot Runners) that you can add to the schedule

Note: Automation will fail in the following cases:

- If any of the bot dependencies are missing.
- If you do not have folder privileges on the dependencies.
- If you do not have the scheduling permissions.

-
1. Navigate to **Manage > Scheduled**.
 2. Click **Run bot**.

3. Click **Schedule bot**.
4. Add the scheduling details for the bot.

Note: The value of the **Start date** is always later than or equal to the current date. If the start date is the current date, the scheduled time cannot be less than the current time.

Option	Definition
Run once	<p>To run the bot at a specified time, enter the:</p> <p>Start date Default value is the current day.</p> <p>Start time Default value is roundup to the next half-hour.</p> <p>Time zone User's system time zone</p>
Run repeatedly	<p>To schedule a bot to run at specific time on a given day, enter the:</p> <p>Start date Default value is the current day.</p> <p>End date The default value field is blank.</p> <p>Start time Default value is roundup to the next half-hour.</p> <p>Time zone User's system time zone</p> <hr/> <p>Note:</p> <p>When the daylight saving is enabled and if the Start date is set for a schedule, the Start date is shown in the time zone to which it belongs to and not as per the user's current time zone. However, Next occurrence is shown in the time zone (user's system time zone) as per daylight saving time.</p> <p>For example, for a schedule created on 15th March in GMT time zone, the Start date is shown as Mar-15th which belongs to GMT time zone. Later, when daylight saving is ON and if you edit or view this schedule in the month of August in BST time zone, next occurrence is shown as current August month date which belongs to BST time zone.</p> <hr/>

- In the **Missed schedule setting** section, select **Redeploy the schedule again** to redeploy a schedule that was missed because of Control Room shut down.

When the **Redeploy the schedule again** option is selected, schedules missed because of Control Room shut down are automatically redeployed after the Control Room is restarted. An audit log entry is also added showing the **Event type** as `Schedule misfired`.

- Select the bot to schedule.
 - Latest version: Click **Latest version** tab to select the latest version of the bot.
 - Labeled version: Click **Production version** tab to select the labeled version of the bot.

Available bots are displayed along with any **Input values** and dependencies. If the production label option is selected for the parent bot, the corresponding dependent bots with the production label are also automatically selected. If any of the dependent bots do not have the production label applied, the latest version of the bot is selected.

- Select the Bot Runner user from the **Available bot runners** list.

Note: If a run-as user (Bot Runner) does not appear in the list, ensure the user scheduling the bots is assigned a role that provides access to the appropriate run-as users.

- Click the right arrow (→) to add your selection.
- Optional: Select **Device Pools**.
Select the pool from the list of available device pools. If any of the selected run-as users does not have the bot running device, a device pool is required. You can select up to 25 device pools per schedule.
- Optional: Click the up or down arrow to set the selected device pools in preferred order.
When a is deployed, the selects the first available device based on the order in which you organized the device pools. If none of the devices are available at the time of deployment, the is queued.
- Enter the **Name**.
- Optional: Enter a description.
- Select the **Automation priority** from the **General** tab.
Set the priority to high, medium, or low based on your requirements for resource optimization. The default permission is set to medium.
- Click **Schedule bot**.

The **Schedule bot** option remains disabled until all the required items, such as bots, schedule details, and devices are selected.

The number of times a bot is deployed depends on the run-as users (Bot Runners) selected for the schedule. Consider the following scenarios:

- The number of run-as users selected is two, and both the users have the bot running device: The bot is deployed twice on the two run-as users and their bot running devices.
- The number of run-as users selected is three, and only one of the users has the bot running device. In this case, you must select the device pool. If the device pool has only two devices, the bot is deployed three times on both the devices in the device pool and also on the bot running device of the third user.

- The number of run-as users selected is three, and none of the three users has the bot running device: In this case, you must select the device pool. If the device pool has only two devices, the bot is deployed twice on both the devices in the device pool, and the third request for bot deployment is queued. The bot is deployed only when a device becomes available in the device pool.
- The number of run-as users selected is two, and none of the two users have the bot running device: In this case, you must select the device pool. If the device pool has four devices, the bot is deployed twice on any available two devices in the device pool.

Edit a scheduled activity

Make changes to a schedule so that the automation is not skipped.

Ensure that you are logged in to the as the administrator.

Edit the scheduled activity in order to:

- Change the schedule type, date, or time.
- Add or remove Bot Runners from the schedule.
- Change the retry settings.

Note: The system redeploys the bots and dependencies only if there are updates to the bots or its dependent files.

1. Hover over the **Actions** icon for the scheduled in the Activity table.
2. Click the **Edit** icon. (✎)
3. Make changes to the schedule details, bots, and devices, as required.

Option	Definition						
Run once	To run the bot at a specified time, enter the: <table> <tr> <td>Start date</td> <td>Default value is the current day.</td> </tr> <tr> <td>Start time</td> <td>Default value is roundup to the next half-hour.</td> </tr> <tr> <td>Time zone</td> <td>User's system time zone</td> </tr> </table>	Start date	Default value is the current day.	Start time	Default value is roundup to the next half-hour.	Time zone	User's system time zone
Start date	Default value is the current day.						
Start time	Default value is roundup to the next half-hour.						
Time zone	User's system time zone						

Option	Definition
<p>Run repeatedly</p>	<p>To schedule a bot to run at specific time on a given day, enter the:</p> <p>Start date Default value is the current day.</p> <p>End date The default value field is blank.</p> <p>Start time Default value is roundup to the next half-hour.</p> <p>Time zone User's system time zone</p> <hr/> <p>Note:</p> <p>When the daylight saving is enabled and if the Start date is set for a schedule, the Start date is shown in the time zone to which it belongs to and not as per the user's current time zone. However, Next occurrence is shown in the time zone (user's system time zone) as per daylight saving time.</p> <p>For example, for a schedule created on 15th March in GMT time zone, the Start date is shown as Mar-15th which belongs to GMT time zone. Later, when daylight saving is ON and if you edit or view this schedule in the month of August in BST time zone, next occurrence is shown as current August month date which belongs to BST time zone.</p>

4. Select **Device pools**.
Select the pool from the list of available device pools.
5. Optional: Click the up or down arrow to set the selected device pools in preferred order.
6. Optional: Change the **Automation priority** from the **General** tab.
7. Click **Schedule bot**.

The **Schedule bot** option remains disabled until all the required items, such as bots, schedule details, and devices are selected.

The number of times a bot is deployed depends on the run-as users (Bot Runners) selected for the schedule. Consider the following scenarios:

- The number of run-as users selected is two, and both the users have the bot running device: The bot is deployed twice on the two run-as users and their bot running devices.
- The number of run-as users selected is three, and only one of the users has the bot running device. In this case, you must select the device pool. If the device pool has only two devices, the bot is deployed three times on both the devices in the device pool and also on the bot running device of the third user.
- The number of run-as users selected is three, and none of the three users has the bot running device: In this case, you must select the device pool. If the device pool has only two devices, the bot is

deployed twice on both the devices in the device pool, and the third request for bot deployment is queued. The bot is deployed only when a device becomes available in the device pool.

- The number of run-as users selected is two, and none of the two users have the bot running device: In this case, you must select the device pool. If the device pool has four devices, the bot is deployed twice on any available two devices in the device pool.

Confirm or cancel.
3. Click **Yes, delete**.

Related tasks

[Schedule a bot](#)

Schedule a bot to run at a specific time.

[Edit a scheduled activity](#)

Make changes to a schedule so that the automation is not skipped.

Event triggers

An event trigger is a predefined action that runs an associated bot. All the bots with event triggers are listed under the **Event triggers** tab.

Available role permissions for event triggers

A Control Room administrator must provide the required permissions to ensure the associated users can access event triggers. The following table lists the available permissions:

Permission	Description
View event triggers	Select this permission if the users can only view the event triggers but not run or delete them.

Permission	Description
Manage event triggers	<p>The Manage event triggers permission is available only if View event triggers is enabled. Select this permission if the users can:</p> <ul style="list-style-type: none"> Add an event trigger <hr/> <p>Note: Users associated with the Bot Creator license cannot add event triggers in the private workspace.</p> <hr/> <ul style="list-style-type: none"> Run a bot with event trigger Delete event trigger Associate an event trigger with a Bot Runner (attended or unattended) user or a role that is associated with one or more Bot Runner (attended or unattended) users.

Supported actions

In Automation 360, click **Manage > Event triggers** to view the table that lists all the available bots with event triggers. The following actions are available for this table.

- Enter a keyword from the `BOT_PATH` in the **Search** field to find an event trigger.

For example, if the bot path of an event trigger is `Bots\file--created--event--Salesinfo`, enter `Sales` in the **Search** field to find this event trigger.

- Use the **Run with event triggers** option to add event triggers.

Adding event triggers

- User can also delete any associated (active or inactive) event triggers.

- View the trigger status, bot path, user name, role, and modification details.

Optional: On the specific device, to view trigger details:

1. Open the **Task Manager > Details** tab.
2. Right-click on the column in the list of app entries.
3. Click **Select columns**.
4. Click **Command Line** item to enable the column.

Verify that the following Java processes are running to confirm that the triggers are active:

- Bot agent or node manager

Note: The name for this is **java.exe**

- Trigger listener

Note: The name for this is **javaw.exe**

Optional: To confirm that **java.exe** or **javaw.exe** are associated with a node manager or trigger listener, respectively:

1. Copy the details of this task
Press **CTRL+C** after you clicked the task name.
2. Paste the details to a notepad.
3. Verify the jar files.

Note: Node manager is **node-manager.jar** and the trigger listener is **triggerlistener.jar**

Consider a scenario where triggers are associated with a Bot Runner user who logs off or signs out of a device. This Bot Runner user must log in to the Control Room on that device in order to activate the associated triggers.

Related concepts

[Adding a trigger to run a bot](#)

Add triggers that can automatically run the selected bot whenever a specific event occurs. For example, clicking a specific button or using a combination of keystrokes.

Adding event triggers

Any bot with triggers can be associated with users or role to enable event trigger. Control Room user (or role) with **Manage event triggers** permission can add event triggers.

All the bots a user creates are displayed in the **Private** tab. When the user checks in a bot to a public folder, it is displayed in the **Public** tab.

A private event trigger is created when a user with the **Manage event triggers** permission adds a trigger to a bot but does not check in this bot to a public folder. Private event triggers are listed under the **Manage > Event triggers** page. However, if the user checks in the associated bot to a public folder, it is no longer displayed under the **Event triggers** page.

1. On the left pane, click **Automation**.
2. Click **Run bot**.
3. Click **Run with event triggers**.

4. Select the bot.
 - Latest version: Click **Latest version** tab to select the latest version of the bot.
 - Labeled version: Click **Production version** tab to select the labeled version of the bot.

If the production label option is selected for the parent bot, the corresponding dependent bots with the production label are also automatically selected. If any of the dependent bots do not have the production label applied, the latest version of the bot is selected.

5. Click the right arrow (→) to add your selection.
6. Click **Next**.
7. Select one of the following to link the bot:

Option	Description
Roles	Select the custom role you have created.
Users	Select the Bot Runner (attended or unattended) user who is associated with this custom role.

8. Click the right arrow (→) to add your selection.
9. Click **Next**.
10. Click **Run with event triggers**.

The selected bot is added to the **Event triggers** page under **Activity**.

Related concepts

[Working with bots](#)

Depending on the license and permission assigned to you, you can perform various bot operations and access the private and public workspaces in the Control Room.

Linking event triggers to a Bot Runner

An Control Room administrator or users with **Manage event triggers** permission can add event triggers by associating users or roles with a bot. This enables Bot Runner users to trigger the bot when they perform a specified event.

When a user with a Bot Creator license creates a bot and checks it in a repository, the bot is available in the **Public** workspace. An Control Room administrator or user with **Manage event triggers** permission and access to that **Public** workspace can then link an event trigger.

A Bot Runner (attended or unattended) user must log into the Control Room to start the event trigger, and can choose to log out after that event trigger is activated.

Optionally, administrator can also enable the auto-login feature in the Control Room for unattended Bot Runner users.

See [Configure auto-login settings](#).

Note: Among all the triggers, you can associate any trigger only with a user who has a Bot Runner license. Also, for a user with unattended Bot Runner license, if you associate triggers such as **Hot key**, **Interface**, or **Window**, the following conditions apply:

- The default device must not be in the logged-off or locked state.
- The user must be logged in to the device to perform the predefined task that can trigger the bot.

-
1. On the left pane, click **Automation**.
 2. Click **Run bot**.
 3. Click **Run with event triggers**.

4. Select the bot.

- Latest version: Click **Latest version** tab to select the latest version of the bot.
- Labeled version: Click **Production version** tab to select the labeled version of the bot.

If the production label option is selected for the parent bot, the corresponding dependent bots with the production label are also automatically selected. If any of the dependent bots do not have the production label applied, the latest version of the bot is selected.

5. Click the right arrow (→) to add your selection.**6.** Click **Next**.**7.** Select one of the following to link the bot:

Option	Description
Roles	Select the custom role you have created.
Users	Select the Bot Runner (attended or unattended) user who is associated with this custom role.

8. Click **Add event triggers**.

When the Bot Runner user logs in to Control Room and performs the trigger event, the bot is deployed. The event trigger will continue to work until one of the following changes occur:

- Associated bot is deleted from the public workspace.
- The linked Bot Runner user account is deleted.
- The default device is logged off.

Devices

The device is a machine through which a user connects to the Control Room to create or run bots. Manage devices that are registered to the Control Room through the **Devices** page located in the **Manage** tab.

Tasks performed from the Devices page

As a Control Room user with Bot Runner, Bot Creator, and Device pools privileges, use the **Devices** page to perform the following actions:

- View a list of devices registered and connected to the current instance of the Control Room.
- Create and view a list of device pools available from the current instance of the Control Room.
- Run bots immediately on selected Bot Runners.

If the device is already registered by another user other than the Bot Creator and the Bot Creator does not have the `Register device` permission or the associated device assigned to it, when you run a bot from the bot editor window, the deployment fails with an `insufficient permission error` message.

- Schedule bots to run on selected Bot Runners.
- Run bots on selected device pools.

Notes:

- Only an admin user has access to view all the devices in the Control Room. A non-admin user does not have access to view Bot Creators.

- Only one Bot Creator can be logged in to a device to run bots at any one time. For a new user as a Bot Creator on the same device, the first Bot Creator has to be removed.

Devices

The **Devices** page lists all configured devices and the current state for each device listed. Devices are identified by IP and hostname. A device can be in one of the following states:

Connected

Device is logged in to the Control Room.

Note: Wait for 35 seconds for a device to show as connected in the devices list after you remove and re-register the device.

Disconnected

Device is not logged in to the Control Room.

Offline

Device has been unregistered or disabled by the Control Room administrator.

The following actions are enabled:

Connect local device

The Bot Agent is a lightweight application that enables you to run bots on your device by connecting the device to the Control Room. To run bots on a local machine, install the Bot Agent and add the local device to the list of enabled host devices.

Run bot now with checked items

Runs the bot on selected device.

Export checked items to CSV

Exports the data to a CSV file based on:

- Filters
- Selection

Refresh table

Refreshes the table contents to view the updated status.

Customize columns

Show or hide specific columns.

View and edit device

With the **View and manage ALL device(s)** permission, you can view and edit the following device settings:

- Name
- Status
- Bot Agent version
- Device pool name
- Nickname (optional)
- Description
- Device type (single user or multiple users)

In case of a multi-user device, you can edit the **Concurrent sessions supported** field.

- Add or edit device permissions

- Screen resolution

You can set the screen resolution by either selecting a value from the predefined resolution drop-down list or by selecting custom and entering the values.

- You can edit only the nickname, description, device type, and screen resolution fields.
- Ensure that you have selected the **Allow devices to override resolution settings** option in the Control Room settings for the device level resolution to take effect.

Note: The screen resolution settings are applicable only when you use RDP-based deployments. For regular deployments, a Windows session is created using the existing resolution settings of the device. In this case, the screen resolution set in the Control Room is ignored.

- Lifespan

Device lifespan can be **Persistent** or **Temporary**. Temporary devices are created to support non-persistent virtual desktop infrastructure (VDI) and are automatically deleted after a specified time when the device is disconnected from the Control Room. You can specify the time to automatically delete temporary devices in the Control Room devices settings.

Persistent devices are created to support persistent virtual desktop infrastructure (VDI) and are not deleted after the device is disconnected from the Control Room.

- Auto-login settings

You can customize the auto-login settings for each device. Choose between the settings configured in the Control Room or at the selected device level to either create new user sessions or use existing user sessions after a bot finishes running.

- Installation type

This setting is based on whether the Bot Agent is installed at user level or system level on the user device.

- Deployment type

This setting is based on the user type and installation type. For single users installed at the system level, the default deployment type is regular. For multi-users installed at system level, the default deployment is RDP.

Preload packages

Use preloaded packages to download the most commonly used or customized packages on your local device. As the packages are saved offline on your device, when you run a bot, the system skips the package download process and starts executing the bot, thereby reducing the bot execution time. You can download specific versions of the package to the user device folder `C:\ProgramData\AutomationAnywhere\AAPreloadedPackages`.

Device pools

Device pools provide a logical grouping of similar Bot Runners to run bots with the work items from a queue. For example, group devices of a particular department or unit and create a device pool for it.

Related tasks

[Install Bot Agent and register device](#)

The Bot Agent is a lightweight application that enables you to run bots on your device by connecting the device to the Control Room. To run bots on a local machine, install the Bot Agent and add the local device to the list of enabled host devices.

[Set user device credentials](#)

To enable a device for running bots, set the local device credentials.

[Configure auto-login settings](#)

Configure auto-login settings in the Control Room to either create user sessions or reuse existing user sessions to reduce the bot startup time.

About multi-user devices

A multi-user device is any Windows terminal server device (Windows 2019, Windows 2016, Windows 2012, Windows 10 Enterprise on Azure) which enables multiple users to concurrently log in to a single device.

The multi-user device server enables multiple users to access the same operating system and share the hardware, performing the tasks for each user concurrently. In multi-user devices, bots are deployed using RDP.

Benefits of a multi-user device

A multi-user device ensure that each machine in an organization is fully used, reducing the hardware and software cost by enabling different users to access the same device. Bot Creator users and Bot Runner (attended or unattended) users can be configured on a multi-user device. The multi-user device also provides security and authentication for every user. Each user is assigned unique login credentials for the device and can access only the assigned applications and device settings.

Note: In a multi-user device, if two user sessions with the same device credentials try to deploy a bot, the deployment will fail for one of the user sessions. An appropriate failure message is recorded in the audit log.

Multi-user device in a device pool

A multi-user device can be part of a device pool and the device can be set as the default device for Bot Creator users and Bot Runner (attended and unattended) users.

Set as default device

As a licensed user, when you log in to a non-default device, you can set that device as your default device. You must have the **View and manage ALL device(s)** permission if you want to set another device that is not registered by you as your default device: To set it as the default device, follow these steps:

1. Click the device icon on the top-right of your screen.
2. Select the **Make default device** option from the menu.

If you do not have the necessary permission, a message prompt appears, stating that you will lose access to your current default device.

Configure RDP-based deployment for multi-user devices

RDP-based deployment is used for multi-user devices. When a bot is deployed for an unattended Bot Runner from the Control Room, the Control Room handles the unattended Bot Runner session through RDP and executes the bot.

Ensure that you are logged in to the Control Room as the administrator.

Ensure the following requirements are completed:

- Active Directory Domain Services are set up (**Optional**).
- Remote Desktop Services (RDS) are set up on the machine ready to host multiple (RDS) bot runner sessions (**Mandatory**).
- Active Directory/Local users are created (**Mandatory**).
- Users are provided access to RDS (**Mandatory**).

When registering your device, you can register it as a multi-user device.

1. Change device type to multiple users.
 - a) Navigate to **Manage > Devices**.
 - b) Hover over the actions menu (three vertical ellipses) located to the right of the device name and click the **Edit device** icon.
 - c) Under **Deployment** tab, change the **Device type** to **Multiple users**.
 - d) Enter a value for the **Concurrent sessions supported** field.

The maximum number of allowed concurrent sessions depends on your device license type and the hardware configuration. For example, consider that concurrent sessions is set to 10 and each bot requires 4 GB RAM for execution. If your system RAM is lower than this value, the bot execution might fail.

Also, if the maximum number of sessions allowed in your device is 10 and the multi-user device is set as the default device for 3 Bot Creator users and 2 attended Bot Runner users, then the value for the concurrent sessions supported will be 5. Therefore, at a time, only 5 bots can be deployed concurrently by the unattended Bot Runner users. So ensure that your hardware and device license type support the number of sessions you set.

- e) Click **Save changes**.
2. Set the RDP screen resolution.

This ensures your automation runs seamlessly during RDP-based deployment, even if the resolution of the screen varies between the Bot Runner and Control Room.

You can set it in the following ways:

- At the Control Room level: [Change screen resolution for Bot Runner session](#).
- At the device level: [Devices](#).

Note that you can update the screen resolution at device level only if the option to override screen resolution is enabled in **Administration > Settings > Devices**.

3. Configure the RDP settings.

- Select **Devices** option from **Administration > Settings**.
- Edit the **RDP settings for multiple user devices** field.
- Enter the **Port**.

Recommendation: Use the default port 3389 for RDP-based bot deployments.

- Enter the **RDP session timeout** value.
The default session timeout value is 60.
- Click **Save changes**.

4. By default clipboard data is shared across RDP sessions. Follow the below steps to prevent sharing of clipboard data across multi-user RDP sessions:

- Select **Devices** option from **Administration > Settings**.
- Edit the **Advanced options** field.
- In the **RDP command options** field, enter `-clipboard`.
- Click **Save changes**.

For more information about troubleshooting black screen and lock screen images, see

- [Black screenshot while running the bot in unattended mode \(A-People login required\)](#)
- [Black screen and lock screen images being captured \(A-People login required\)](#)

1. Create users in the Control Room.

These users can be unattended Bot Runners, Attended Bot Runners, or Bot Creators. You can select the multi-user option when you register the device for the first time. See [Create a user](#).

2. Associate the correct device and session login credentials based on the Active Directory users that you create before configuring the multi-user device settings.

You can register an Active Directory user one time as an admin user and the sessions are created when you deploy bots. You do not have to create an RDP session on the Bot Runners server and register the device under an Active Directory user name and user credentials.

3. Deploy the bots on parallel sessions.

Note: If the multi-user device per sessions count provided is less than the actual bot deployment, then the additional bot deployments are queued until the current deployments are in progress.

Convert an existing device to a multi-user device

If you have a server OS, multi-user OS, or hosted VMs such as AWS, Microsoft Azure, or VMware as the Bot Runner machine, you can convert your existing device to a multi-user device.

Ensure that you are logged in to the as the administrator.

Converting a device enables you to share the same device between Bot Runner and Bot Creator users because they can coexist in different sessions simultaneously. Also, multiple parallel executions of a bot can be performed on the same machine.

If you encounter Auto Login issues because multiple users are sharing the device or because it is a remote device, convert your device to a multi-user device.

If you have a single-user device and want to use RDP-based deployment, then set the **device type** as **Multiple users** and **Concurrent sessions supported** to **1**.

1. Navigate to **Manage > Devices**.
2. Hover over the actions menu (three vertical ellipses) located to the right of the device name and click the **Edit device** icon.
3. Under **Deployment** tab, change the **Device type** to **Multiple users**.
4. Enter a value for the **Concurrent sessions supported** field.

The maximum number of allowed concurrent sessions depends on your device license type and the hardware configuration. For example, consider that concurrent sessions is set to 10 and each bot requires 4 GB RAM for execution. If your system RAM is lower than this value, the bot execution might fail.

Also, if the maximum number of sessions allowed in your device is 10 and the multi-user device is set as the default device for 3 Bot Creator users and 2 attended Bot Runner users, then the value for the concurrent sessions supported will be 5. Therefore, at a time, only 5 bots can be deployed concurrently by the unattended Bot Runner users. So ensure that your hardware and device license type support the number of sessions you set.

5. Click **Save changes**.

About device pools

Device pools are a logical grouping of devices or similar unattended Bot Runner machines on which you can run your workload management automations or scheduled unattended automations. For example, you can group the devices (system-wide type) of a specific department or unit and create a device pool.

Overview

You can use a device pool to restrict bot deployments to a specific set of devices that are available from your Control Room instance and take advantage of any device available in a device pool because any device in the device pool can run the bot.

You can also use a device pool to process work items from workload management queues. Workload management distributes work items across various devices in a device pool. This distribution of work items ensures efficient bot processing through optimal usage of devices and Automation 360 licenses. Device pools can contain different types of devices, such as single-user devices or multi-user devices.

You can share the device pool between multiple automations such as workload management, **Run bot**, and **Schedule bot**, thus improving the device utilization.

How a device pool works

When you deploy an unattended bot to a device pool at run time, system identifies the available devices from the pool. System starts with first device from the pool, if the first device is busy, it checks for next device and then the bot is automatically sent to the available device from the list of system-wide devices. As the other bots are deployed, they can run concurrently on the other devices in the device pool. By dynamically allocating devices when bots are deployed, bot deployments are executed quickly and efficiently.

High availability (HA) in device pools

Device pools provide built-in *High Availability* (HA) for the Bot Runner machines if your unattended license is free to use. You are not tied to a single Bot Runner machine, so if your Bot Runner machine is unavailable for any reason and your unattended license is free for deployment, your automation is not affected. The scheduled automation will automatically run on the next available Bot Runner machine, thereby providing high availability.

Note: Consider the following points when working with user credentials:

- Only one user credential can be attached to a licensed user.
- If all devices in a device pool are domain integrated and Active Directory users have access to all devices, licensed users can login to any device by using attached user credentials.
- For more information about running bots in device pool, see [Considerations for running a bot](#).

Managing device pools

As a device pool administrator, you can create, edit, and view all device pools that can be used for scheduling automations and workload management.

As a device pool owner or consumer, you can view only those device pools of which you are the owner or consumer. Only users with the **AAE_Queue Admin** and **AAE_Pool Admin** role can perform device management tasks.

Note: You have to create device pools to view those in the list.

To easily access your device pool, you can search by a device pool name.

- Click a column to sort it in ascending and descending order. You can sort up to three columns by holding the Shift key when you click two more columns. This enables you to sort two additional columns. The sorting is done on the entire table and not just the data that is currently visible to you. The last sorting is stored in memory applied by a user per session.
- Use a drag-and-drop operation to move the column left or right.
- Move your mouse cursor at the end of the column and drag to resize.

Create device pools

Create a device pool with a unique name and add Unattended Bot Runners to the device pool.

- Ensure that you have one of the following roles to view the **Device Pools** tab:
 - **Device pool owner**
 - **Device pool admin**

- Ensure that you have a role with **Create device pools** permission to create a device pool.

Note: A Control Room administrator without device pool admin rights cannot view or create a device pool.

- To add a device in the device pool, you must install it as a system-wide device (Bot Agent).
- After you add the device, you cannot add the same device to another device pool.
- You can add only those Unattended Bot Runners that are not part of any other pool.

Restriction: Unattended Bot Runners that are a part of other device pools are disabled for selection.

- You can use the **Scheduled automations** and **Run with Queue automations** options to run bots on that device.
- You can add Control Room user roles as consumers. Only users with these roles can use the pool for any automation.
- You can select only those devices with the Bot Runner installed at the system wide.
- If the devices in a device pool are more than the number of work items added to a queue, multiple entries equal to the number of devices are shown in the Control Room **In-progress activity** and **Historical** pages. For details, refer to the **View queue details** page on the actual user device on which the workload automation is deployed.

To create a device pool, perform the following steps:

1. Navigate to **Manage > Device pools**.
2. Click **Create device pool**.
3. Enter the **Name**.
4. Optional: Enter a description.
5. Select the **Devices** from the list of .
6. Click the right arrow (→) to add your selection.
7. Click **Next**.
8. Select the Device Pool **Owners**.
9. Select user(s) from the **Available users** list.

Tip: Search the list of users based on their **Username**, **First name**, or **Last name**.

10. Click the right arrow (→) to add your selection.
11. Click **Next**.
12. Optional: Select the **Device Pool Consumers**.
Complete this step to enable device pool consumers to view the device pool when they run the automation for the bot with a queue by following the next set of steps.
13. Optional: Select a Role from the list of **Available roles**.
14. Click the right arrow (→) to add your selection.
15. Click **Create device pool**.

The device pools for which you have consumer privileges are listed in the **My Device Pools** page.

[View device pool details](#)

Related tasks

[Run bot with queue](#)

Collectively process all work items of a queue across all the Bot Runners present in one or more device pools.

View device pool details

As a Control Room user with device pool management privileges or as a device pool owner, you can view device pool details to ensure the information provided is correct and if required customize as per your automation requirement.

Ensure that you are logged in to the [Control Room](#) as the administrator.

Use the **Device pool details** page to view automations that are scheduled to run with or without workload. The following information is displayed as part of device pool data:

Automations

Shows the automations that are using the device pool and the order that is chosen to run those. This is shown as the default view. To find an automation quickly, use the search option using Status, Automation name, Queue, or Activity type.

You can perform the following actions on a table column:

- Click a column to sort it in ascending and descending order. You can sort up to three columns by holding the Shift key when you click two more columns. This enables you to sort two additional columns. The sorting is done on the entire table and not just the data that is currently visible to you. The last sorting is stored in memory applied by a user per session.
- Use a drag-and-drop operation to move the column left or right.
- Move your mouse cursor at the end of the column and drag to resize.

Devices

Shows list of unattended Bot Runner devices that are part of the device pool.

Owners

Shows list of device pool owners that are granted permission to view, edit, and delete the device pool.

[Create device pools](#)

Consumers

Shows the list of device pool consumers who are granted permission to view the device pool as an option to running automations.

[Create device pools](#)

General Details

Shows the last modified date and time, name of the user who modified device pool details, and the Object Type which is the component on which modification was done.

The **Scheduled Automations** tab is selected by default. Automations that are created using **Run bot now** or **Schedule bot** (upcoming schedules) on that device pool are listed.

The second tab, **Run with Queue Automations** lists the automations that are scheduled to run for **Workload** using the option **Run bot with queue**.

To view device pool details:

1. Navigate to **Manage > Device pools**.
2. Hover over the **Actions** icon for the device pool and select **View**.
Select each tab to view the related details.

[Edit device pools](#), or [Run bot with queue](#).

Related tasks

[Create device pools](#)

Create a device pool with a unique name and add Unattended Bot Runners to the device pool.

[Delete device pools](#)

Delete a device pool comprising of unattended Bot Runners after your entity's automation goals are achieved and the device pools are no longer required.

Edit device pools

As a Control Room user with device pool management privileges or as a device pool owner, you can edit device pool details to customize your automation requirements.

- You must have **Device pool owner** or **Device pool admin** roles to edit a device pool.
- Users without **AAE_Admin** role must have the following permissions to edit a device pool:
 - **View and manage ALL device(s)** to add or delete the devices
 - **View Users and Roles basic information** to add or delete the owners and consumers
- To add a device in the device pool, you must install it as a system-wide device (Bot Agent).
- After you add the device, you cannot add the same device to another device pool.

When you open the device pool in edit mode, you can update the queue details such as Bot Runner, Owners, Participants, and Consumers.

1. Go to **Manage > Device Pools**.

The **Device Pools** tab is visible only if you have **Device pool admin** role or you are an owner of any device pool.

2. Locate the device pool you want to edit, hover over the actions menu (vertical ellipsis), and click **Edit**.
You can also edit the device pool details in view mode. For more information, see [View device pool](#)
The **Device pool details** page is displayed with the default **Scheduled Automations** tab.
3. Set the Queue Execution mode to edit workload automations.

Go to the **Run with queue automations** tab, then choose one of the following options to define the order in which your automations run in the queues:

- **Round robin**: Runs your automations at equal time intervals in the **Time slice** field. For more information, see [Round robin](#).
 - **Priority as shown in table**: Runs your automations based on a priority defined in the priority table. For more information, see [Priority as shown in table](#).
4. Update the list of unattended Bot Runner devices that are included in the device pool.
 5. Update the list of device pool owners who are granted permission to view, edit, and delete the device pool.
 6. Update the list of device pool consumers who are granted permission to view the device pool.
 7. Click **Save changes**.

Related tasks

[Create device pools](#)

Create a device pool with a unique name and add Unattended Bot Runners to the device pool.

Delete device pools

Delete a device pool comprising of unattended Bot Runners after your entity's automation goals are achieved and the device pools are no longer required.

View device pool details

As a Control Room user with device pool management privileges or as a device pool owner, you can view device pool details to ensure the information provided is correct and if required customize as per your automation requirement.

Order of the automation queue

You can define the order in which your automations run in the queues.

This topic describes options of orders in which you can run the automation queues.

Round robin

This option runs your automations at equal time intervals specified in the **Time slice** field. You can set a **Time slice** in seconds, minutes, or hours and you can calculate or estimate the time for each automation, and then provide this number.

- The default time slice is **5 minutes**.
- The time slice cannot be set to zero.

Automations are executed for only 5 minutes first, then the system checks for other automations in queue for execution. If there are other automations in the queue, that automation is paused and the next automation is executed. This method continues until all automations in the queue are executed.

Priority as shown in table

With this option, automations run based on a priority defined in the priority table. You can run automations in the order of priority and set the individual priorities for each of the queues. Priority 1 is the highest priority and that queue is processed first and completely by the device pool. Then the device pool moves onto the processing queue with Priority 2. When the queue with Priority 2 is processed completely, the device pool proceeds to processing queue with Priority 3, and so on. Automations are processed until all automations are consumed from the specified automation queue.

Note: This option is available only on the **Run with queue automations** tab.

Delete device pools

Delete a device pool comprising of unattended Bot Runners after your entity's automation goals are achieved and the device pools are no longer required.

Ensure that you are logged in to the as the administrator.

You can choose to delete your device pools in either of two ways:

- Delete one device pool
- Delete multiple or all device pools

If the device pool is being used for workload automation, you will not be allowed to delete it.

1. Navigate to **Manage > Device pools**.

2. Select the device pool(s) to delete.

Select the device pools to delete or select all device pools by selecting the **Select All** check box in the header.

3. Hover over the **Actions** icon for the device pool.
4. Click **Delete**.
Confirm or cancel.

Related tasks

[View device pool details](#)

As a Control Room user with device pool management privileges or as a device pool owner, you can view device pool details to ensure the information provided is correct and if required customize as per your automation requirement.

[Create device pools](#)

Create a device pool with a unique name and add Unattended Bot Runners to the device pool.

Customize device settings

Customize the settings for user devices at the device level such as device lifespan, auto-login, screen resolution, deployment, and other advanced options.

These configurations are available for editing only if the settings are enabled by the Control Room administrator.

1. Navigate to **My Devices > Edit devices**.

2. Select the setting tab for configuration at the device level:

- a) Update the **Nickname** and **Description** parameters, and select either **Persistent** or **Temporary** in the **General Settings**.

Device lifespan can be **Persistent** or **Temporary**. Temporary devices are created to support non-persistent virtual desktop infrastructure (VDI) and are automatically deleted after a specified time when the device is disconnected from the Control Room. You can specify the time to automatically delete temporary devices in the Control Room devices settings.

Persistent devices are created to support persistent virtual desktop infrastructure (VDI) and are not deleted after the device is disconnected from the Control Room.

- b) To update the settings for **Auto Login** to run bots on user sessions at the device level, select **Use custom settings**.

Either create new user sessions or use existing user sessions after a bot finishes running.

You can customize the auto login settings at the device level only if the allow a user to change these settings individually for each device in devices page option is enabled by the Control Room administrator.

- c) Update the **Screen resolution settings** for existing device sessions.

The screen resolution settings are used to begin user sessions at the resolution specified in this setting. You can customize the screen resolution settings at the device level only if the allows users to override the resolution option is enabled by the Control Room administrator.

Note that the screen resolution settings are applicable only when you use RDP-based deployments. For regular deployments, a Windows session is created using the existing resolution settings of the device. In this case, the screen resolution set in the Control Room is ignored.

Recommendation: When resolution-dependent packages are used to build bots, any difference in screen resolution between the Bot Creator and Bot Runner devices will affect the bots at

runtime. Therefore, ensure that the resolution settings on devices match when you create and run bots. See [Screen resolution dependent packages](#).

- d) Update the **Deployment settings** for single or multiple user devices and use the **Use custom settings** option to set the threshold settings for CPU and memory utilization at the device level. For single users installed at the system level, the default deployment type is regular; you can change this to RDP. For multiple users installed at system level, the default deployment is RDP. For single users installed at the user level and multiple users at the system level, you cannot updated the deployment type.

Note: If the Windows setting **Restrict Remote Desktop Services users to a single Remote Desktop Services session** is enabled for RDP in the local group policy, a user is connected to an existing session instead of creating a new session when the user uses RDP to verify bot deployments.

For multiple user devices, additionally configure the **Concurrent sessions supported**. The minimum concurrent session value is **2**.

You can customize the threshold settings only if the enable threshold settings option is enabled by the Control Room administrator.

- e) Update **Log collection configuration** to configure log collection level, log file size, number of archived logs, and synchronize log collection settings.

Collect logs for three levels: information to collect messages that highlight the progress of the application, debugging information that is useful to debug an application, and tracing logs to capture application behavior in detail.

Define the maximum log file size for a single log file. A new log file is created after the file is archived.

Define the number of archived logs files that can be generated. The archived log file is retained for a day. For example, `Node_Manager-2022-Mar-30-1.log.zip`.

Set values and synchronize log collection configuration across devices from the Control Room to capture logs with more information or debug any observed behavior.

- f) Update the **Advanced Options** at the device level such as auto-login timeout, bot launcher JVM options, console readiness wait time, bot response wait time, RDP command options and log collection by selecting the **Use custom settings** option.

Note that you can customize these advanced options only if the allow changes in the edit device page option is enabled by the Control Room administrator.

- Auto-login timeout enables you to set a wait time for a bot to deploy. After this wait time, an error is shown.
- Bot launcher JVM options enable you to send dynamic properties supported for Java. For example, you can use this option to increase the memory of the bot launcher.
- Maximum simultaneous downloads enable you to set the number of simultaneous downloads. For example, 5 downloads including dependent files.
- Console readiness wait time enables you to set a wait time for the console to be displayed when you run a bot. After this wait time, an error is shown.
- Bot response wait time enables you to set a wait time for an active bot session. After this wait time, an error is shown.
- RDP command options enable you to provide different RDP-based commands, for example, ports-related commands.
- When the log collector option is selected by the Control Room admin, the device can send logs to the Control Room.

3. Click **Save changes.**

If the user device is offline, these changes take effect when the device reconnects to the Control Room.

Related concepts[Configure default device settings](#)

Configure the device settings to automatically set a user's current device as the default device after the user logs in to the Control Room.

Related tasks[Change screen resolution for Bot Runner session](#)

For user devices, you can set the screen resolution of the Bot Runners for every bot deployment through the RDP in the Control Room.

[Configure auto-delete temporary device settings](#)

Configure your device settings to automatically delete a temporary device when the device is disconnected from the Control Room after a certain time interval.

[Configure threshold settings for user devices](#)

Configure the CPU utilization and device memory threshold values to control the concurrent bot deployment on user devices based on resource utilization.

[Configure auto-login settings](#)

Configure auto-login settings in the Control Room to either create user sessions or reuse existing user sessions to reduce the bot startup time.

Packages

Users with the **Manage package** permission can upload and manage packages. Automation Anywhere provides you with the flexibility to decide which packages you want to make available to the Bot Creators for creating bots.

Users must have the appropriate administrative permission to view or manage action packages.

View packages

A user with **View packages** permission can view the packages that are available to Bot Creators. Go to the **Bots > Packages** page to view **All packages**.

The **All packages** page lists all the packages in the Control Room that are available for Bot Creators. Packages can have multiple versions.

Manage packages

A user with the **Manage packages** permission can add new packages to the Control Room and manage which packages versions are available in the Control Room.

Add packages from the **Bots > Packages > Add package**.

Manage packages from the **Bots > Packages > All packages > View package** page.

Set as default

Select a package and set it as the default. As soon as a package is set to default, it is the package that all Bot

Disable

Creators in the Control Room use.

Disable a package so that users cannot use it to create new bots. Bots that were created using a disabled package continue to work.

Delete

Deleting a package removes the actions contained in the package from the Control Room for all users.

Important: A package cannot be deleted if it is being used by a bot.

Note: It is recommended that Bot Creators update bots to use the latest version of a package.

Updates to packages by Automation Anywhere are available in each release of Automation 360. The latest updated package can be set to the default package by users and administrators with **Manage package** permission.

Note: When you upgrade to Automation 360 v.24, the Apache log4j2 library is no longer bundled in the command packages. However, older command packages, from Automation 360 v.23 and earlier, might continue to have the log4j2 library bundled within. If you want to use command packages without the log4j2 bundled within, we recommend that you use the newer Automation 360 v.24 packages in your tasks.

RBAC on packages

Based on the business requirements and expertise of developers, administrators can restrict package access for a simplified developer experience, along with the capability to enforce access policies for custom groups.

Overview

The RBAC feature helps you to set access at the package level to restrict usage and execution of packages to improve security. This feature can be applied to all package types, including custom packages where you can control assigning and managing the packages to your users.

RBAC access to packages applies only to the task of creating bots. If a user role does not have access to a particular package, these users cannot view the package on the **Actions** palette and therefore cannot use it when creating bots. However, these users can run bots (created by a different user who has access to the package) that uses the package.

- Each developer sees only the approved list of packages in their workspace.
- Some packages might be available for all users, while some are available only for certain groups.

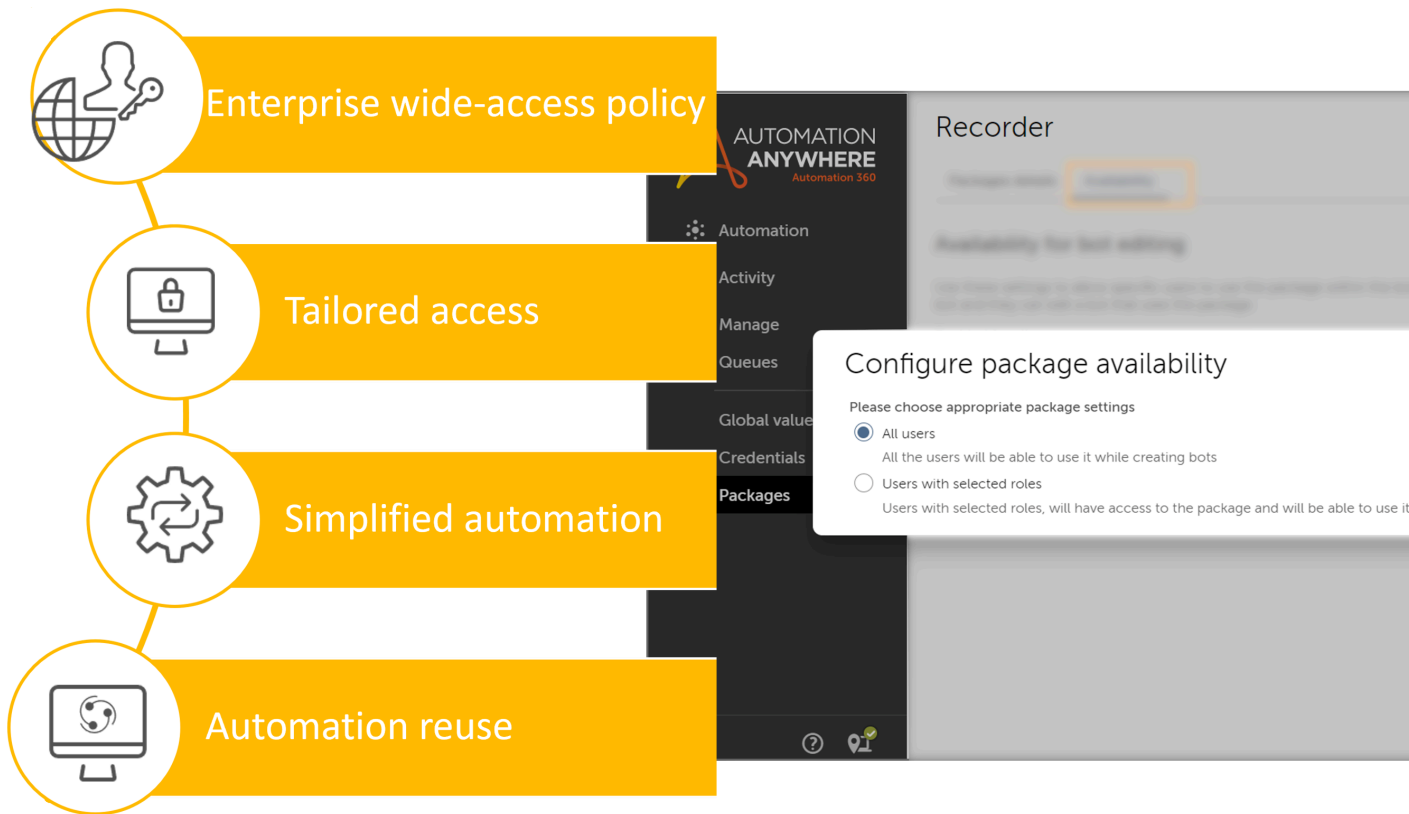

The following image shows how RBAC can be set for user roles and groups:

Benefits of packages RBAC

- **Centralized policy enforcement for secure, user-friendly developer access:** Role-based access to automation provides enhanced security, confidence, and ease of use for developers.
- **Enterprise-wide access policy:** Establish group-based package access with clear policies restricting package access to all the users or users with specific roles.
- **Access based on business needs:** Create required access groups, expose group-appropriate library of packages, and manage the phased rollout of package access.
- **Simplified automation for citizen developers:** Hide complex packages from the action palettes for citizen developers so that they can focus on easy-to-complete automation.
- **Automation reuse with compliance:** Enable users to create utility bots from complex packages to use as cloned bots in the a private workspace or inside public bots.

The following image lists the benefits of packages RBAC:

User types

Administrator

- Customizes packages so that they are accessible to developers based on the developers' expertise, skill, business group, and more.
- Creates custom groups and assign access per group.
- Rolls out packages in a phased manner to different types of developers.
- Provides better control over how packages are made available to developers. For example:
 - New developers can avoid causing security risks as they do not have access to complex packages.
 - Advanced developers can get broader access to packages.

An organization can enforce centralized control over package access and best practices through this feature.

Roles and permission required: Administrators with the **View Users and Roles basic information** and **Manage packages** permission.

Bot developer

- Gets a customized view of packages in their workspace.
- Simplified (easy-to-use) packages are enabled for Citizen Developers so that they can build a basic functional task bot using actions and packages available in their actions palette.
- Advanced developers can get access based on the entitlements or privileges provided by the administrator.

Roles and permission required: Users with the **View Users and Roles basic information** and **Manage packages** permission.

See the following video for an overview of how RBAC is configured:

<https://aa2019packagesdkfordocumentation.s3-us-west-2.amazonaws.com/videos/rbac-package-process.mp4>

Configure RBAC for packages

Restrict packages usage based on your business needs and roles for a secure and simplified developer experience. An administrator can customize access to packages based on developers' expertise, experience, and so on, while bot developers get a customized view of packages in their workspace based on their expertise and needs.

You must be an administrator or a user with the **View Users and Roles basic information** and **Manage packages** permission.

1. Log in to the Control Room.
2. Navigate to **Manage > Packages**.
3. From the list of packages, search for the package for which you want to give access to the users.
4. Click the selected package.

Packages

Download free bots and packages from [Bot Store](#)

Name

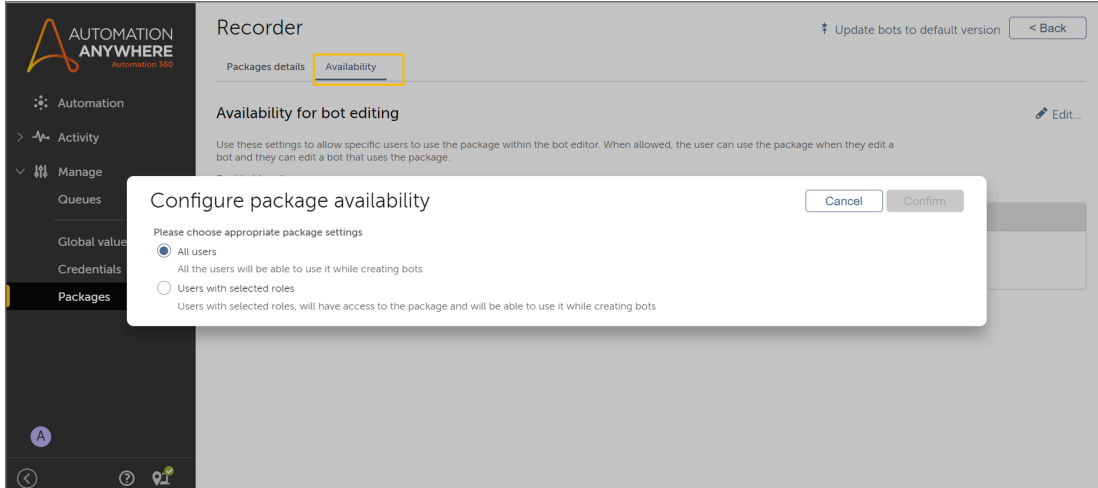

Packages (90)

Status	Name ↑	Vendor	Version	Bot agent (recommen...	Control Room (reco...	# of a
Enabled	AARI Web	Automation Anywhere	7.0.1-20220727-162102	21.134 or above	12316 or above	7
Enabled	Active Directory	Automation Anywhere	3.5.0-20220416-233339	20.11 or above	8750 or above	3
Enabled	Analyze	Automation Anywhere	2.4.4-20220615-020937	20.11 or above	8750 or above	2
Enabled	App integration	Automation Anywhere	4.8.0-20220616-123118	21.88 or above	10195 or above	3
Enabled	Application	Automation Anywhere	3.5.0-20220416-233350	20.11 or above	8750 or above	1
Enabled	Boolean	Automation Anywhere	2.5.0-20220118-153154	20.11 or above	8750 or above	6
Enabled	Bot Migration	Automation Anywhere	9.1.3-20220805-200018	21.220 or above	15224 or above	2

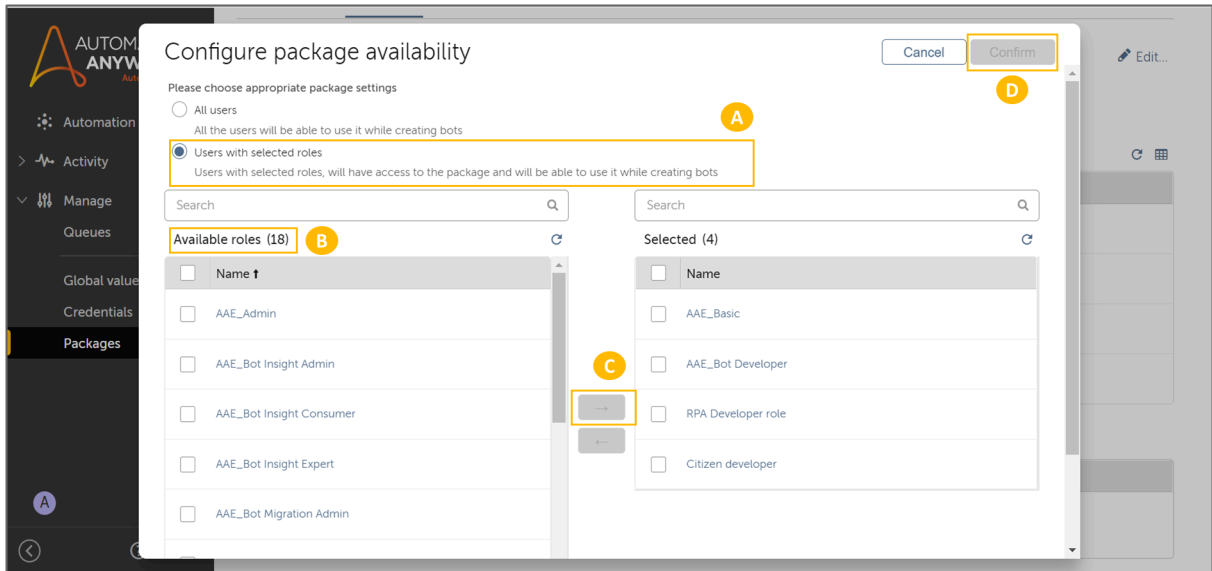

For example, when you click the **Recorder** package, the selected package window opens.

5. To allow specific users to use the package from the Bot editor, go to the **Availability** tab and click **Edit**.

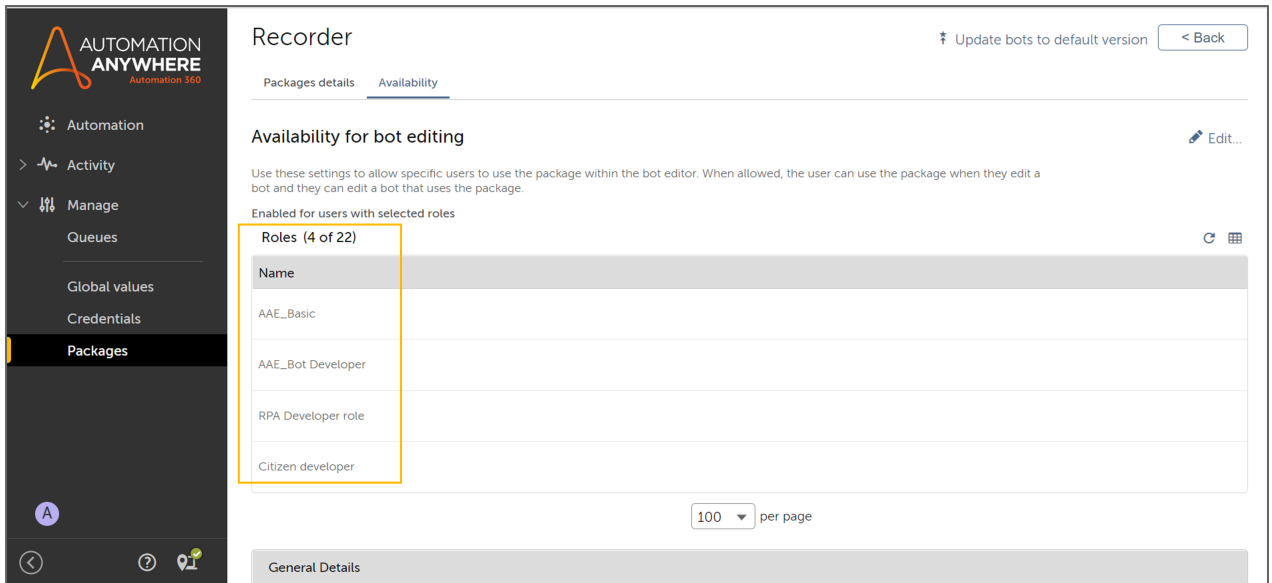

6. On the **Configure package availability** page, choose one of the following options:
- **All user:** Select this option to allow the user to use the package while creating bots. By default, this option is selected for all the packages.
 - **User with selected roles:** Select this option if you want users with selected roles to access the package and use it while creating bots.

7. To configure access for specific users, perform these steps:
 - a) Select the **User with selected roles** option.
 - b) From the available roles, select the roles you want to assign.
 - c) Move the selected roles to the right panel.
This step enables you to define users who will have access to the package in the Bot editor.
 - d) Click **Confirm**.

The availability tab shows the selected roles for whom the specific package is now enabled.

Packages RBAC for bot developer

As a Bot Creator (RPA developer) or Citizen Developer, you can create bots based on the packages that are available to you.

You can use only those package-defined actions, triggers, variables, and customized packages for which you have access. Your access to these packages are set by the administrator based on user roles. If you do not have access to a package, you cannot view that package on the **Actions** palette.

RBAC on packages applies when you create or edit bots in your private workspace. You cannot run bots with restricted packages directly. However, you can use a cloned bot as a sub bot in another main bot and run this bot in a public or private workspace.

When a bot contains packages (or packages that you cannot access), keep in mind these considerations:

- You cannot perform these bot actions:
 - Run a bot: Either a new bot or a checked-out bot with changes
 - Check in a bot

If you try to perform these actions, an error message is displayed that the bot contains packages that are restricted.

- While editing variables, you cannot use variable property options related to restricted packages.

An error message is displayed that the variable is related to a package that is restricted.

- You cannot run a bot with triggers:
 - From the Bot editor, when you run a bot with a trigger that contains a restricted package, see an error message is displayed that the bot with triggers contains a restricted package.
 - When a trigger event is configured for a user and a device, and the trigger event occurs on the device, access to the bot package is verified. If the bot contains a restricted package, the bot fails, and an audit log entry is recorded.

Add packages to the Control Room

Administrators can add packages to the Control Room for use by Bot Creators.

Ensure that you are logged in to the as the administrator.

You can add a package from either Bot Store or another source.

To add a package from a source other than Bot Store, follow these steps:

1. Navigate to **Manage > Packages**.
2. Click **Add package**.
3. Click **Browse**.
4. Locate and select the package to add to the Control Room.
Packages are Java Archive (JAR) files that contain actions used to create bots.
5. Click **Upload package**.
6. On the **Bots > Packages > Confirm package** page, choose any of the following options:
 - **Accept, enable and set as default:** Uploads and enables the selected package, and sets it to the default package for the Control Room.
 - **Accept and enable:** Uploads and enables the package, but the package is not set as the default package. Bot Creators have to specifically select non-default packages to use them for creating bots.

Choosing **Reject** stops the upload process.

To add a package from Bot Store, see the following video:

7. After installation, click **Administration > Packages** to verify that the package is added.

Related concepts

[Build and test a demo package and bot](#)

This practical how to section demonstrates that creating, changing, and managing packages allow you to customize actions and efficiently manage packages for all Control Room users.

Related tasks

[Manage Control Room packages](#)

Manage packages in the Control Room by setting a package as default, disabling it, or deleting it.

Manage Control Room packages

Manage packages in the Control Room by setting a package as default, disabling it, or deleting it.

Ensure that you are logged in to the as the administrator.

To manage packages in the Control Room, users must have **Manage package** permission.

Package management actions apply to all users; however, the user can select specific package versions within a bot.

1. Navigate to **Manage > Packages**.
2. Hover over the **Actions** icon for the package.
3. Click **View**.
4. Choose any of the following options:

Option	Description
Set as default	Select a package and set it as the default. As soon as a package is set to default, it is the package that all Bot Creators in the Control Room use. <hr/> Note: By default, new versions of packages become the default version and will only be used the first time that package is used in editing a bot. If a bot already uses the package, it continues to use an earlier version. <hr/>
Disable	Disable a package so that users cannot use it to create new bots. Bots that were created using a disabled package continue to work.
Delete	Deleting a package removes the actions contained in the package from the Control Room for all users.

Important: A package cannot be deleted if it is being used by a bot.

Related concepts

[Packages](#)

Users with the **Manage package** permission can upload and manage packages. Automation Anywhere provides you with the flexibility to decide which packages you want to make available to the Bot Creators for creating bots.

Related tasks

[Add packages to the Control Room](#)

Administrators can add packages to the Control Room for use by Bot Creators.

Update bots to default package version

You can perform a bulk update to existing bots in the Control Room repository to set the default version for any package. This feature enables a quick update to a secure, stable package version across bots.

- To update bots to the default package version, ensure you have the **View packages permission** and the **permission to edit bots**.

When you begin the bulk update process, this action will update bots for which you have check-out permission and bots using the non-default version of the specific package.

- Verify the bots are compatible with the current default version of the package.
- When you updating bots to the default package version, ensure the bots are not checked out until the process is complete.
- Do not disable the package when the bulk update process is running.

Note:

- Updating bots in bulk to use the default package version might affect the performance of the Control Room repository or other Control Room features.
- When you perform bulk updates to existing bots to set the default versions for packages, ensure that you wait until the bulk update process for one package is completed and only then start updating another package.

1. Navigate to **Manage > Packages**.

2. Search for the package that you want to update across bots.

3. To set the default package version in all the bots in the public workspace, click **Update bots to default package version**.

4. In the **Update bots to default package version** window, enter the following information:

- Activity name:** Name of the initiated process for bulk updating package version across all the bots.

On the **Audit** log page, when you select **Update default package to bot requested** or **Update default package to bot completed** to view the details of the item name, the activity name is displayed as a request name with its value.

- Description:** Optionally provide a description for this activity.
- Check-in comments:** This field is already populated with the version details of the package you are updating.

You can enter a meaningful comment that helps with any future reference. This check-in comment can be viewed on the **View history** page. For example, navigate to **Automation > Public > Folder > Task Bot**. Click the vertical ellipsis and select **View history Task Bot** to view the bulk check-in message for new versions of the bots created through the bulk update.

Note: Running the bulk update process will **not** impact any existing schedules or bot runs. For schedules, the bots with Production label applied will continue to deploy the production version and not the latest version.

5. Click **Update Bots**.

6. Click **Yes, continue**.

The system starts updating all the bots in the Control Room repository that uses the package. If any of the bots are not using the default version of the packages, these bots will be updated.

7. Navigate to **Administration > Audit log**.
8. On the **Audit log** page, search by the event type **Update default package**.
View information such as start of the requested process, individual bots that are being updated with the default package version, and the completion of the requested process. You can also view the following item names in the **Audit log** for this information:
 - **Update default package to bot requested**
 - List of bots that are being updated, for example, `Payrollprocess2022` bot
 - **Update default package to bot completed**
9. To view details about all the bots that were updated to use the default package version, copy the **Request ID** from the **Update default package to bot requested** page. On the **Audit log** page, search by **Request ID** filter and enter the value.
For example, use `d6adb0724340666e`. The **Audit log** page displays all the bots that are successfully updated through the **Update bots to default version** process. The list also includes bots that failed the update process.
10. To view the details of each item name on the **Audit log** page, perform the following steps:
 - a) Click **Update default package to bot requested** and view the following details:
 - **Event details:** Displays information such as details of the user who submitted the request, the user's device details, the request ID number, date and time of the initiated request, and the package version details that will be updated across all the bots.
 - **Update default package details:** Displays information such as the name of the request, change in package version, name of the package being updated, and the version of the package you are currently on.

Depending on the package, all bots using the selected package will be updated one by one.

- b) Click any bot to view the following information:
 - **Request name:** Displays the name of the initiated request.
 - **Bot path:** Displays the file or folder path where the bot is located.
 - **Package name:** Displays the name of the package.
 - **Old package version:** Displays the version the package was on previously.
 - **Target package version:** Displays the version to which the package is being updated.
 - **Old bot version:** Displays the older version of the bot.
 - **New bot version:** Displays the current version of the bot that is being updated.

During the bulk update process, some bots might fail to update the default package version. The failed bot displays an unsuccessful status on the **Audit log** page. For example, if the bots are checked out during the update package process, the package version update is not performed for these bots and they fail.
- c) Click **Update default package to bot completed** to view the information after the bulk update process is completed:
 - Number of bots that are successfully updated.
 - Number of bots that failed to update due to compile-time errors or bots that were checked-out during the update package process.
 - Number of skipped bots.

If the bots are using the same package version, they will display as skipped during the update process.

 - The old package package number and the target (default) package version number.

For an example of this procedure, see [Example of updating default package version across bots](#).

Administrator settings

Control Room administrators manage settings related to the database, Credential Vault, users, roles, action packages, licensing, and more.

Related tasks

[Create a role](#)

As an administrator, you can configure roles with permissions to access features and perform operations such as create, edit, or delete a bot in the Control Room, and assign the role to a user.

[Create a user](#)

Create a user and assign their specific license based role.

[Installing additional licenses](#)

Upload new licenses to the Automation Anywhere Control Room to be distributed to users as required.

[Create credential](#)

Create a credential and add the required attributes.

Audit log

View logs and details to record user activities.

Audit Log displays a read-only table of records of actions performed by users. These log records are searchable and exportable. Audit logs include both **Successful** and **Unsuccessful** actions attempted.

Actions

The following Audit log actions are enabled:

Note: Use your cursor to roll over the action button icons to identify specific functions.

Time filter

Users select from preset time filters or configure a custom time filter for log entries to view. The default time filter setting is **Last 24 hours**.

Search

Search the records. Select additional search filter criteria from the drop-down menu.

Tip: To search the exact phrase, enclose the search phrase within double quotes (for example, "Taylor-Finance-564").

Export checked items to CSV

Export the data to a CSV file based on filters and or selections.

Refresh

Refresh and view the updated status.

Customize columns

Show or hide specific columns.

View

To view details of a table entry, mouse over the entry to expand and click **Audit details**.

Audit log table

View the following audit details in the table.

Table item	Description
Status	Shows action status.
Time	Shows the date and time of the action performed.
Event Type	Shows the type of action performed.
Item Name	Shows the entity on which action was performed.
Event Started By	Shows the user that performed the action.
Source Device	Shows the device or machine name or IP address that was used to perform the action.
Source	Shows the component: Control Room, Enterprise Client or API, from where the action originated or was performed.
Request ID	Shows the unique identity number assigned to a specific set of user actions.

Bot life cycle audit logs

The entry shows the status of each stage of the bot life cycle.

Audit log entry	Success	Failure
Create automation	Bot was sent to the control room and was successfully compiled.	Check if the Control Room is up and running.

Audit log entry	Success	Failure
Bot Sent To Device	Control Room deployed the bot successfully on the specified device.	<p>Possible reasons for failure entry include:</p> <ul style="list-style-type: none"> • Check if you have configured the Node manager on the corresponding device correctly. • Check for the app Automation Anywhere Bot Manager in Add Remove Programs or in Control Panel > Uninstall a program. Try to reinstall by uninstalling and downloading the app again. • Try to reinstall by uninstalling and downloading the app again from Device Manager. • Ensure the device auto log in details are set correctly.
Run bot Deployed	The bot has started on the specified device.	<p>Possible reasons for failure entry include:</p> <ul style="list-style-type: none"> • Check if you have configured the Node manager on the corresponding device correctly. • Check for app Automation Anywhere Bot Manager in Add Remove Programs or in Control Panel > Uninstall a program. • Try to reinstall by uninstalling and downloading the app again from Device Manager. • Ensure device auto log in details are set correctly.

Audit log entry	Success	Failure
Run bot finished	Bot execution completed successfully.	Possible reasons for failure entry include: <ul style="list-style-type: none"> • Check for the bot execution progression in Activity In progress. • Check the code at the line where activity log has been paused for errors. • If it has paused at a message box, minimize all windows and check if the message box is in the background.
Bot Runner Session Continued	Control Room deploys the TaskBots in a sequence for the same RDP session.	
Bot Runner Session Released	When a task successfully completes the execution.	
Download file	Downloading to the Control Room.	
Upload file	Uploading a file to the Control Room.	
Bot Runner Session	Control Room gets the RDP session of Bot Runner machine.	

Automation Anywhere Robotic Interface (AARI) Audit logs

The entry shows the status of events relating to requests, teams, scheduler, process setups, bot setups, human tasks, and bot tasks that you have created, deleted, updated, submitted, or recovered.

Audit log entry	Success
AARI Team	<ul style="list-style-type: none"> • When a team is created by a user • When a team is edited by a user • When a team is deleted by a user
AARI Request	<ul style="list-style-type: none"> • When a request is deleted by a user • When a request is recycled by a user • When a request is recovered by a user

Audit log entry	Success
AARI Human Task	<ul style="list-style-type: none"> When a task is edited by a user When a task is submitted by a user When a task is canceled by a user When a task is assigned by a user to another user When a task is canceled (using a cancel type of action by a user or by a bot (AARI Web package))
AARI Bot Task	When the process launched a bot task
AARI Process	<ul style="list-style-type: none"> When a process is created When a process is edited by a user
AARI Bot Setup	<ul style="list-style-type: none"> When a new bot is added to the bot setup management When the bot setup management is modified When a bot is deleted by a user
Process Scheduler	When the scheduler configuration is modified

Audit events list

Review the list of audit events to identify the type of audit entries that are logged in the Control Room for Automation 360.

General audit entries

The following table shows a list of general audit entries and their descriptions (listed alphabetically):

Audit entries	Description
Accept end user license agreement	This action is logged when the user accepts the license agreement.
Activate automation	This action is logged when the user activates the schedule.
Add credential	This action is logged when the user creates credentials.
Add locker	This action is logged when the user creates the locker.
Add manual dependency	This action is logged when the user adds manual dependency to a bot.
Add MFA token	This action is logged when the user adds the MFA (multi-factor authentication) token.

Audit entries	Description
Allocate license	This action is logged when the user creates a user with a particular license (such as Bot Creator or Bot Runner) and when the user changes the license from Bot. This action is logged when the user creates a user with a particular license (such as Bot Creator or Bot Runner) and when the user changes the license from Bot Creator to Bot Runner and vice versa.
Audit error	This action is logged when an audit error occurs.
Audit migration finished	This action is logged when migration is completed.
Audit migration started	This action is logged when migration is started.
Audit unset activity type	This action is logged when there is an unset activity type.
Automation complete	This action is logged when a schedule completes.
Auto-login credentials not set	This action is logged when auto-login credentials have not been set for the user.
Bot runner session	This action is logged when a Bot runner session occurs.
Bot sent to device	This action is logged when a bot is sent to a device.
Bot sent to device failed due to configuration update	This action is logged when a bot fails to be sent to a device because a device configuration upgrade is in progress.
Bot validation setting	This action is logged when a user sets the bot validation setting.
Callback request	This action is logged when a callback is requested.
Callback URL validation failed	This action is logged when the callback URL is invalid and does not appear on the white list.
Certificate authentication configuration create	This action is logged when a user creates certificate authentication settings.
Certificate authentication configuration update	This action is logged when a user modifies the certificate authentication configuration.
Certificate authentication TLS host configuration create	This action is logged when a user creates a certificate authentication TLS host server configuration.
Certificate authentication TLS host configuration reinstall	This action is logged when a user reinstalls a certificate authentication TLS host server configuration.
Certificate authentication TLS host configuration update	This action is logged when a user modifies a certificate authentication TLS host server configuration.

Audit entries	Description
Change settings	This action is logged when the user changes any setting such as On to Off, or Off to On.
Check in	This action is logged when a check in occurs.
Check in request	This action is logged when a check in is requested.
Check out	This action is logged when a checkout occurs.
Check out request	This action is logged when a check out is requested.
Client log in	This action is logged when a client logs in.
Clone	This action is logged when a user clones an object.
Cloud burst mode	This action is logged when a cloud burst occurs.
Cloud-enabled provisioning success	This action is logged when a cloud is successfully provisioned.
Cloud-enabled provisioning failure	This action is logged when cloud provisioning fails.
Configure credential vault	This action is logged when a user configures a credential vault.
Connect credential vault	This action is logged when a user connects a credential vault.
Control Room configurations	This action is logged when a user edits general configuration settings to the Control Room.
Control Room upgrade available	This action is logged when an upgrade to the Control Room is available.
Control Room upgrade email notification	This action is logged when an email has been sent to indicate a successful upgrade to the Control Room.
Control Room upgrade failure	This action is logged when an upgrade to the Control Room has failed.
Control Room upgrade success	This action is logged when an upgrade to the Control Room has completed successfully.
Create automation	This action is logged when the user creates a new schedule or runs a bot with a queue in workload management.
Create domain	This action is logged when the user creates a new domain.
Create draft of queue	This action is logged when the user saves the work item as draft in workload management.
Create folder	This action is logged when the user creates a new folder.
Create learning instance	This action is logged when the user creates a new learning instance.

Audit entries	Description
Create package	This action is logged when the user creates a new package.
Create proxy credentials	This action is logged when the user creates new proxy credentials.
Create queue	This action is logged when the user creates a new queue in workload management.
Create queue failed	This action is logged when a queue creation fails.
Create role	This action is logged when the user creates a new role.
Create user	This action is logged when a new user is created.
Create work item	This action is logged when new work items are added to a queue.
Create work item failed	This action is logged when new work items failed to add to a queue.
Credential vault settings	This action is logged when a user defines credential vault settings.
Deactivate automation	This action is logged when the scheduled automation is deactivated.
Delete automation	This action is logged when the user deletes the schedule.
Delete bot	This action is logged when the user deletes a bot.
Delete credential	This action is logged when the user deletes credentials.
Delete device	This action is logged when the user deletes a device.
Delete file	This action is logged when the user deletes a file.
Delete folder	This action is logged when the user deletes a folder.
Delete Git settings	This action is logged when the user deletes Git repository settings in the Control Room.
Delete Global value	This action is logged when the user deletes the global value.
Delete learning instance	This action is logged when the user deletes an existing learning instance.
Delete locker	This action is logged when the user deletes a locker.
Delete MFA token	This action is logged when the user deletes the MFA (multi-factor authentication) token.
Delete proxy credentials	This action is logged when the user deletes proxy credentials.

Audit entries	Description
Delete queue	This action is logged when the user deletes the queue in workload management.
Delete queue failed	This action is logged when the user fails to delete a queue.
Delete role	This action is logged when the user deletes roles from the system.
Delete tenant BLM clean up	This action is logged when the Bot Lifecycle Management (BLM) performs clean up for a deleted tenant.
Delete user	This action is logged when the user delete users from the system.
Delete work item	This action is logged when the user deletes the work item from the queue.
Delete work item failed	This action is logged when the user fails to delete work items in a queue.
Deployment automation	This action is logged when a bot is deployed to run.
Deployment queued	This action is logged when a deployment has been queued to run.
Device acquired by user	This action is logged when the device has been acquired by the user.
Device configuration update initiated	This action is logged when the user initiates the device configuration update.
Device details updated	This action is logged when the device details have been successfully updated.
Device not available to acquire	This action is logged when the device is unavailable to be acquired by the user.
Device registered	This action is logged when the user registers a device.
Device type update settings	This action is logged when the settings of a device type are updated.
Disable package	This action is logged when the user disables a package.
Disable user	This action is logged when the user disables another user in the system.
Domain credential reset	This action is logged when the user resets or reconnects to the Active Directory domain from the settings page.
Download bot	This action is logged when a user downloads a bot.
Download bot finished	This action is logged when the Bot Store completes downloading a bot.

Audit entries	Description
Download file	This action is logged when a user downloads a file.
Edit bot	This action is logged when the user modifies a bot.
Edit domain	This action is logged when the user modifies a domain.
Edit learning instance	<p>This action is logged when the user edits any of the following settings of an existing learning instance:</p> <ul style="list-style-type: none"> • Edits the name • Edits or adds a description • Uploads staging documents • Adds new fields • Edits new group setting • Edits default validations groups setting
Edit role	This action is logged when the user modifies a role.
Edit settings	This action is logged when the user modifies settings.
Edit user	This action is logged when the user modifies another user.
Elasticsearch backup	This action is logged when the user provides a backup IP address in the Elasticsearch disaster recovery backup cluster.
Elasticsearch delete index	This action is logged when the user deletes an index from the Elasticsearch.
Email notification	This action is logged when email notification connection or authentication fails.
Email notification settings	This action is logged when the user modifies email notification settings.
Empty pools	This action is logged when there are empty pool IDs.
Enable package	This action is logged when the user enables a package.
Enable user	This action is logged when the user enables another user in the system.
Execute automation	This action is logged when the user executes a bot.
Export bot	This action is logged when the user exports a bot.
Export domain	This action is logged when the user exports any of the domains from the IQ Bot application.

Audit entries	Description
Export learning instance	This action is logged when the user exports a learning instance (<i>.iqba file</i>) through the migration utility.
Export queue	This action is logged when the user exports a queue from workload management.
Export request	This action is logged when the user generates an export request.
Export to csv	This action is logged when the user exports data to a csv.
Failed to acquire user or device	This action is logged when the device or user is unavailable to be acquired.
Failsafe status updated	This action is logged when a failsafe status has been updated.
First Administrator settings	This action is logged when a user configures the first Administrator user in the Control Room.
Force unlock bot	This action is logged when a user unlocks a bot.
GDPR report	This action is logged when a user enables GDPR (General Data Protection Regulation) reporting.
Generate API-Key	This action is logged when an Admin user generates an API key from the My Settings page, which can be used to obtain an authentication token. This audit entry shows the generate API key status as either Successful or Unsuccessful.
Git push	This action is logged when the user synchronizes information between the built-in Git repository and the remote Git host.
Git restore	This action is logged when the user restores all of their bots and associated dependent files from the Git repository to a new database.
Git restore abort	This action is logged when the user aborts to restore all of their bots and associated dependent files from the Git repository to a new database.
Git restore reset	This action is logged when the user resets to restore all of their bots and associated dependent files from the Git repository to a new database.
Import bot	This action is logged when the user imports a bot.
Import domain	This action is logged when the user imports any new domains to IQ Bot.
Import learning instance	This action is logged when the user imports a learning instance (<i>.iqba file</i>) through the migration utility.

Audit entries	Description
Import queue	This action is logged when the user imports a queue into workload management.
Import request	This action is logged when the user generates an import request.
Install license	This action is logged when the user installs or changes the license from the license page.
IP address access	This action is logged when the IP address has been accessed.
License migration	This action is logged when a license is migrated to another user.
License mode change	This action is logged when the user changes the license mode.
Load work items from file	This action is logged when the user selects a CSV or Excel file and uploads the work item in a queue.
Log in banner settings	This action is logged when an Admin configures banner text to display on the login page of the Control Room.
Migration finished	This action is logged when a migration completes.
Migration started	This action is logged when a migration begins.
Move automation to history	This action is logged when the user moves the selected activity to the Historical page.
No access to pool	This action is logged when a user has no access to a device pool.
Password settings	This action is logged when an Admin configures password settings for the Control Room.
Read credential	This action is logged when the logged-in user accesses the credentials of another user for which they do have permission for because the user is not a consumer for the credential or a credential owner.
Read locker	This action is logged when the logged-in user accesses the locker of another user for which they do not have permission because they are not part of a locker as a member (owner, manager, participant, or consumer).
Register app	This action is logged when the user configures IQ Bot.
Release license	This action is logged when the user changes the license from Bot Runner to Bot Creator or Admin.
Release user license	This action is logged when the user changes the user license.

Audit entries	Description
Remove manual dependency	This action is logged when the manual dependency is removed from a bot.
Rename folder	This action is logged when the user renames the folder.
Resend email verification	This action is logged when the email is resent for verification.
Reset password	This action is logged when the user resets the password.
Revert checkout	This action is logged when the user reverts a previous check out action.
Rollback	This action is logged when the user rolls back to a previous version.
Run as user in use	This action is logged when the user runs a bot as the user using the bot.
Run as user invalid	This action is logged when a user who tries to run a bot and use the bot is invalid.
Run automation	This action is logged when the user runs an automation.
Save allowed IP addresses	This action is logged when the allowed IP addresses have been saved.
Schedule misfired	This action is logged when the Control Room services starts or the server is available after more than 15 minutes of scheduled deployment time.
Security Settings - External key Vault - Configuration	For cloud deployments, this action is logged when a user makes a change to the external key vault configuration. Automation Anywhere supports these external key vaults: AWS Secrets Manager, Azure Key Vault, and CyberArk. This audit entry shows the status as either Successful or Unsuccessful.
Send bot to production	This action is logged when the user moves the bot from staging to production.
Send bot to staging	This action is logged when the user moves the bot from production to staging.
Send email	This action is logged when an email is sent.
Send learning instance to production	This action is logged when the user moves the learning instance from staging to production.
Send learning instance to staging	This action is logged when the user moves the learning instance from production to staging.
Session timeout settings	This action is logged when the settings of a session timeout is reached.

Audit entries	Description
Set default device	This action is logged when the user sets the default device.
Set device credentials	This action is logged when the user sets the device credentials.
Set Git settings	This action is logged when the user sets remote Git repository settings in the Control Room.
Sync license	This action is logged when a license is synced.
SysLog Configuration	For on-premises deployments, this action is logged when a user adds, edits, or deletes system configuration. This audit entry shows the Control Room server saving status as either Successful or Unsuccessful.
Temporary devices cleanup job	This action is logged when the temporary device runs its cleanup job.
Test proxy connectivity	This action is logged when proxy connectivity is tested.
Time out	This action is logged when an operation times out.
Train bot	This action is logged when the user creates a training bot.
Transfer credential ownership	This action is logged when the locker admin transfers the ownership of the credentials.
Trigger bot run	This action is logged when a bot runs due to a trigger.
Trigger bot run fail	This action is logged when a bot fails to run due to a trigger.
Trigger delete	This action is logged when a trigger is deleted.
Trigger delete failed	This action is logged when the deletion of a trigger fails.
Trusted CA key store update	This action is logged when a user modifies the trusted CA key store for certificate authentication.
Unable to send bot device	This action is logged when a bot fails to be sent to a device.
Undo checkout	This action is logged when the user reverses a check out.
Unlock credential vault	This action is logged when the user unlocks the credential vault.
Unset default device	This action is logged when the user changes the default device.
Update app registration	This action is logged when the IQ Bot URL is updated in the settings page.

Audit entries	Description
Update automation	This action is logged when the user edits the schedule automation.
Update callback URL failed	This action is logged when the callback URL list has failed to update.
Update callback URL successful	This action is logged when the callback URL list has been updated successfully.
Update credential	This action is logged when the user modifies the credentials.
Update device auto download packages	This action is logged when the device updates its auto download packages settings.
Update device credentials	This action is logged when the device updates its credentials.
Update device general settings	This action is logged when the device updates its general settings.
Update device log settings	This action is logged when the device updates its log settings.
Update device RDP settings	This action is logged when the device updates its RDP (Remote Desktop Protocol) settings.
Update device resolution settings	This action is logged when the device updates its resolution settings.
Update Git settings	This action is logged when the user updates remote Git repository settings in the Control Room.
Update locker	This action is logged when the user modifies the lockers.
Update MFA role	This action is logged when the user modifies the MFA (multi-factor authentication) role.
Update MFA settings	This action is logged when the user modifies the MFA (multi-factor authentication) settings.
Update MFA token	This action is logged when the user modifies the MFA (multi-factor authentication) token.
Update MFA user	This action is logged when the user modifies the two-factor authentication for a user.
Update package	This action is logged when the user updates an existing package.
Update package settings	This action is logged when the user updates any package settings.
Update proxy credentials	This action is logged when the user updates existing proxy credentials.
Update queue	This action is logged when the user updates the existing queue (for example, adding new work items to the same queue).

Audit entries	Description
Update queue failed	This action is logged when the user fails to update the existing queue (for example, adding new work items to the same queue).
Update settings	This action is logged when the user updates any setting in Control Room.
Update temporary devices auto delete settings	This action is logged when the temporary device updates its auto delete settings.
Update work item	This action is logged when the user edits a work item.
Update work item failed	This action is logged when work items fail to update.
Upload	This action is logged when a user imports a file.
Upload bot	This action is logged when a user uploads a bot.
Upload document	This action is logged when a user uploads a document.
Upload file	This action is logged when a user uploads a file.
Upload package	This action is logged when the user uploads a package.
Upload work items file	This action is logged when the user updates a queue and adds work items.
User multiple log in	This action is logged when the user logs in to the Control Room from different browsers with the same username.
User log in	This action is logged when the user logs in to the Control Room.
User log out	This action is logged when the user logs out of the Control Room.
Validate learning instance	This action is logged when the user validates (either corrects the document and saves it or invalidates the document) a document in the validator of a learning instance.
Version control settings	This action is logged when the user updates any version control settings.
Websocket proxy connection failure	This action is logged when the websocket proxy connection fails.

AD audit entries

The following table shows the list of AD audit entries and their descriptions (listed alphabetically):

Audit entries	Description
AD group mapping created	This action is logged when the user creates an AD role mapping.
AD group mapping deleted	This action is logged when the user deletes an AD role mapping.
AD group mapping updated	This action is logged when the user updates an Active Directory role mapping.
AD sync role empty	This action is logged when an Active Directory role assigned with sync operations is empty.
AD sync role conflict	This action is logged when an Active Directory role assigned with sync operations is in conflict with another role.
AD sync role system assigned	This action is logged when new Active Directory roles are assigned with sync operations.
AD sync role system deleted	This action is logged when Active Directory roles are deleted with sync operations.
AD sync role system updated	This action is logged when Active Directory roles are updated with sync operations.
AD sync user count	This action is logged when the Active Directory user counts are synced.
AD sync user deleted	This action is logged when the Active Directory synced users are deleted.
AD sync user out of license	This action is logged when the Active Directory synced users run out of available licenses.

Bot Insight audit entries

The following table shows the list of Bot Insight audit entries and their descriptions (listed alphabetically):

Audit entries	Description
Bot Insight add user dashboard	This action is logged when a new user dashboard is added to Bot Insight.
Bot Insight BLM dashboard export	This action is logged when a user exports a BLM (Bot Lifecycle Management) dashboard from Bot Insight.
Bot Insight BLM dashboard import	This action is logged when a user imports a BLM (Bot Lifecycle Management) dashboard into Bot Insight.
Bot Insight create dashboard	This action is logged when a user creates a dashboard in Bot Insight.
Bot Insight copy dashboard	This action is logged when a user copies a dashboard in Bot Insight.
Bot Insight delete dashboard	This action is logged when a user deletes a dashboard from Bot Insight.

Audit entries	Description
Bot Insight delete user dashboard	This action is logged when a user dashboard is deleted from Bot Insight.
Bot Insight end task	This action is logged when a task ends in Bot Insight.
Bot Insight get task data	This action is logged when task data is retrieved in Bot Insight.
Bot Insight get user dashboards	This action is logged when user dashboards are retrieved in Bot Insight.
Bot Insight load dashboard	This action is logged when a user loads a dashboard in Bot Insight.
Bot Insight operations	This action is logged when operations occur in Bot Insight.
Bot Insight publish dashboard	This action is logged when a user publishes a dashboard in Bot Insight.
Bot Insight registers dashboard	This action is logged when a user registers a dashboard in Bot Insight.
Bot Insight run data	This action is logged when data runs in Bot Insight.
Bot Insight save dashboard	This action is logged when a user saves a dashboard in Bot Insight.
Bot Insight search dashboard	This action is logged when a user searches a dashboard in Bot Insight.
Bot Insight start task	This action is logged when a task starts in Bot Insight.
Bot Insight update dashboard	This action is logged when a user updates a dashboard in Bot Insight.
Bot Insight profile update	This action is logged when a user updates a data profile in Bot Insight.

Bot Store audit entries

The following table shows the list of Bot Store audit entries and their descriptions (listed alphabetically):

Audit entries	Description
Bot Store add to My bots	This action is logged when a user adds a bot to their My bots.
Bot Store clean up	This action is logged when clean up is performed for a deleted tenant.
Bot Store download	This action is logged when a user starts to download a bot from the Bot Store.
Bot Store log in	This action is logged when a user logs in to the Bot Store.

Audit entries	Description
Bot Store submit bots	This action is logged when a user submits bots to the Bot Store.

Device pool audit entries

The following table shows the list of device pool audit entries and their descriptions (listed alphabetically):

Audit entries	Description
Device pool created	This action is logged when the user successfully creates a new device pool.
Device pool creation failed	This action is logged when the user fails to create a device pool.
Device pool deleted	This action is logged when the user successfully deletes a device pool.
Device pool deletion failed	This action is logged when the user fails to delete a device pool.
Device pool update failed	This action is logged when the user fails to update an existing device pool.
Device pool updated	This action is logged when the user edits an existing device pool (for example, add a new device or add a new customer role).

Device update audit entries

The following table shows the list of device update audit entries and their descriptions (listed alphabetically):

Audit entries	Description
Device update acknowledged	This action is logged when the device update has been acknowledged.
Device update already in progress	This action is logged when the device update is already in progress.
Device update completed	This action is logged when the device update has completed.
Device update disconnected	This action is logged when the device update has been disconnected.
Device update downloaded	This action is logged when the device update has been downloaded.
Device update failed and max retry reached	This action is logged when the device update has failed after the maximum number of retries has been reached.

Audit entries	Description
Device update failed and max retry reset reached	This action is logged when the device update has failed but device will continue to retry the update.
Device update initiated	This action is logged when the user initiates the device update.
Device update settings	This action is logged when the settings of a device are updated.
Device update started	This action is logged when the device update has started.
Device update unavailable	This action is logged when the device update has already occurred and been updated.
Device update unsuccessful	This action is logged when the device update has been unsuccessful.
Device update waiting for deployments to complete	This action is logged when the device update is waiting for deployments to complete.

Discovery bot audit entries

The following table shows the list of Discovery bot audit entries and their descriptions (listed alphabetically):

Audit entries	Description
Discovery bot cancel recording	This action is logged when the discovery bot successfully cancels a recording.
Discovery bot convert to bot	This action is logged when the discovery bot successfully converts to a bot.
Discovery bot create aggregated recording	This action is logged when the discovery bot successfully creates a new aggregated recording.
Discovery bot create opportunity	This action is logged when the discovery bot successfully creates a new opportunity.
Discovery bot create process	This action is logged when the discovery bot successfully creates a new process.
Discovery bot create process assignment	This action is logged when the discovery bot successfully creates a new process assignment.
Discovery bot create project	This action is logged when the discovery bot successfully creates a new project.
Discovery bot create recording	This action is logged when the discovery bot successfully creates a new recording.
Discovery bot create recording step	This action is logged when the discovery bot successfully creates a new recording step.
Discovery bot create recording step metadata	This action is logged when the discovery bot successfully creates metadata for a new recording step.

Audit entries	Description
Discovery bot delete aggregated recording	This action is logged when the discovery bot successfully deletes an aggregated recording.
Discovery bot delete opportunity	This action is logged when the discovery bot successfully deletes an opportunity.
Discovery bot delete process	This action is logged when the discovery bot successfully deletes a process.
Discovery bot delete process assignment	This action is logged when the discovery bot successfully deletes a process assignment.
Discovery bot delete project	This action is logged when the discovery bot successfully deletes a project.
Discovery bot delete recording	This action is logged when the discovery bot successfully deletes a recording.
Discovery bot delete recording step	This action is logged when the discovery bot successfully deletes a recording step.
Discovery bot delete recording step metadata	This action is logged when the discovery bot successfully deletes metadata for a recording step.
Discovery bot export opportunity	This action is logged when the discovery bot exports an opportunity.
Discovery bot migrate opportunity	This action is logged when the discovery bot migrates an opportunity.
Discovery bot update aggregated recording	This action is logged when the discovery bot edits an existing aggregated recording.
Discovery bot update aggregated recording json	This action is logged when the discovery bot edits an existing aggregated recording using json.
Discovery bot update opportunity	This action is logged when the discovery bot edits an existing opportunity.
Discovery bot update process	This action is logged when the discovery bot edits an existing process.
Discovery bot update process assignment	This action is logged when the discovery bot edits an existing process assignment.
Discovery bot update project	This action is logged when the discovery bot edits an existing project.
Discovery bot update recording	This action is logged when the discovery bot edits an existing recording.
Discovery bot update recording step	This action is logged when the discovery bot edits an existing recording step.
Discovery bot update recording step metadata	This action is logged when the discovery bot edits metadata for an existing recording step.

Run bot audit entries

The following table shows the list of run bot audit entries and their descriptions (listed alphabetically):

Audit entries	Description
Run bot disconnected	This action is logged when a user disconnects a running bot.
Run bot finished	This action is logged when a running bot finishes.
Run bot paused	This action is logged when a user pauses a running bot.
Run bot pre process failed	This action is logged when the pre-process to run the bot fails.
Run bot reconnected	This action is logged when a user re-connects a running bot.
Run bot resumed	This action is logged when a previously paused bot resumes to run.
Run bot stopped	This action is logged when a user stops a running bot.

Run bot local audit entries

The following table shows the list of run bot local audit entries and their descriptions (listed alphabetically):

Audit entries	Description
Run bot local hotkey finished	This action is logged when a running bot for a local hotkey finishes.
Run bot local hotkey paused	This action is logged when a running bot for a local hotkey pauses.
Run bot local hotkey resumed	This action is logged when a running bot for a local hotkey resumes.
Run bot local hotkey started	This action is logged when a running bot for a local hotkey starts.
Run bot local hotkey stopped	This action is logged when a running bot for a local hotkey stops.
Run bot local hotkey suspended	This action is logged when a running bot for a local hotkey is suspended.
Run bot local schedule finished	This action is logged when a running bot for a local schedule finishes.
Run bot local schedule paused	This action is logged when a running bot for a local schedule pauses.
Run bot local schedule resumed	This action is logged when a running bot for a local schedule resumes.

Audit entries	Description
Run bot local schedule started	This action is logged when a running bot for a local schedule starts.
Run bot local schedule stopped	This action is logged when a running bot for a local schedule stops.
Run bot local schedule suspended	This action is logged when a running bot for a local schedule is suspended.
Run bot local trigger finished	This action is logged when a running bot for a local trigger finishes.
Run bot local trigger paused	This action is logged when a running bot for a local trigger pauses.
Run bot local trigger resumed	This action is logged when a running bot for a local trigger resumes.
Run bot local trigger started	This action is logged when a running bot for a local trigger starts.
Run bot local trigger stopped	This action is logged when a running bot for a local trigger stops.
Run bot local trigger suspended	This action is logged when a running bot for a local trigger is suspended.

Run logic local audit entries

The following table shows the list of run logic local audit entries and their descriptions (listed alphabetically):

Audit entries	Description
Run logic local client finished	This action is logged when running logic for a local client finishes.
Run logic local client paused	This action is logged when running logic for a local client pauses.
Run logic local client resumed	This action is logged when running logic for a local client resumes.
Run logic local client started	This action is logged when running logic for a local client starts.
Run logic local client stopped	This action is logged when running logic for a local client stops.
Run logic local client suspended	This action is logged when running logic for a local client is suspended.

Run workflow local audit entries

The following table shows the list of run workflow local audit entries and their descriptions (listed alphabetically):

Audit entries	Description
Run workflow local client finished	This action is logged when running a workflow for a local client finishes.
Run workflow local client started	This action is logged when running a workflow for a local client starts.
Run workflow local client stopped	This action is logged when running a workflow for a local client stops.
Run workflow local schedule finished	This action is logged when running a workflow for a local schedule finishes.
Run workflow local schedule started	This action is logged when running a workflow for a local schedule starts.
Run workflow local schedule stopped	This action is logged when running a workflow for a local schedule stops.
Run workflow local trigger finished	This action is logged when running a workflow for a local trigger finishes.
Run workflow local trigger started	This action is logged when running a workflow for a local trigger starts.
Run workflow local trigger stopped	This action is logged when running a workflow for a local trigger stops.

Schedule bot audit entries

The following table shows the list of schedule bot audit entries and their descriptions (listed alphabetically):

Audit entries	Description
Schedule bot disconnected	This action is logged when a scheduled bot is disconnected.
Schedule bot ended	This action is logged when a scheduled bot ends.
Schedule bot paused	This action is logged when a scheduled bot pauses.
Schedule bot reconnected	This action is logged when a scheduled bot is reconnected.
Schedule bot resumed	This action is logged when a scheduled bot resumes.
Schedule bot stopped	This action is logged when a scheduled bot stops.

Export audit data to CSV

Export Control Room log related data to a CSV file.

- You must have the *View_user* permission to export the basic information about other users to the CSV file.
- The source and the target Control Room instances must be running the same version.

- The source and the target Control Room instances must be of the same setup type: SSO with SSO, AD with AD, and non-AD with non-AD.

You can export selected, filtered, or all audit log data to a CSV file by using the following options:

- Export checked items**
- Export filtered items**
- Export all items**

1. Navigate to **Administration > Audit log**.

A list of all the logs is displayed.

2.

Click the **Export items to CSV** drop-down menu.

3. Click one of the following required sub-menus:

- Export checked items:** Exports only the selected records.

Note: You must select items to use this option.

- Export filtered items:** Exports only records that are available after applying filters like *Status*, *Item name*, *Event type*, and so on.
- Export all items:** Exports all the available records.

Note: You can export a maximum of 100,000 records at a time.

The CSV file is exported and downloaded to your local system based on the selected option.

Note:

- If there is large number of audit logs to export, a message is displayed, informing that the export function is started and exported CSV file is available in the **Activity > Historical** page. For more information, see [Download exported CSV file](#).
- The time required to export data to a CSV file might vary based on the number of records being exported. A message appears on the screen if the time required to export the data is more than 2 seconds. The CSV file is available for download after it is generated.

Also refer to [Syslog server integration](#).

Download exported CSV file

When there is large number of audit log data to export, the export function starts and exported CSV file is available in the **Activity > Historical** page.

To download the exported CSV file,

1. Navigate to the **Activity > Historical** page and search for exported audit log by using the *Audit-*

Export keyword.

A list of all the exported audit log files is displayed.

- Click the required item name hyperlink to view the audit log details.

Status	Item name	Automation priority	Device name	Bot name	User
Run failed	Audit-Export: cr-audit-20220818-103015-botcreator	Medium	Picked at run time	-	tamur
Completed	Audit-Export: cr-audit-20220818-103015-botcreator	Medium	Picked at run time	-	tamur

- Click **Download exported zip file**.

Device	Name + Description
Device Picked at run time	Name Audit-Export: cr-audit-20220818-103015-botcreator
User botcreator	Description ...

The CSV file is downloaded to your local system as a zip file.

Users

As an administrator, you can create, view, edit, delete, and enable or disable a user. Creating users steps vary depending on whether the user is a non-Active Directory, Active Directory, or single sign-on (SSO) user from an IdP server.

Column actions

- Click a column header to sort by ascending or descending order.
- Drag and drop a column header to move the column left or right.
- Drag the end of a column corner to re-size.

Individual user actions

Perform the following tasks on an individual user:

View

Opens the **View user** page in read-only mode. It shows user details, assigned roles, and general details such as **Last Modified**, **Modified by**, **Object type**, and **User type**.

You can edit a user detail and enable or disable a user.

Edit

Opens the **Edit user** page in write mode. You can update user details, device login credentials, assigned roles, and device licenses.

When you edit a user, an email is sent notifying the user if SMTP is enabled.

Only user devices with the Bot Agent installed at the system level are available for selection as the default device.

Enable | Disable

Activates or deactivates the user. When you enable or disable a user, an email is sent notifying the user if SMTP is enabled.

Delete

Deletes the user. This is useful when users leave an organization or move to another role. This frees

both the device to which the user was attached and the allocated license.

When you delete a user, an email is sent notifying the user if SMTP is enabled.

Note: Before removing a user from the active RPA, administrators should make certain all unfinished development of bots are checked-in.

Table-level actions

Perform the following tasks by hovering the mouse over the icons at the top-right of the **User** table. These actions can be performed only at a table-level and not on individual items.

Create role with checked items	Adds a role and assigns the selected users. <i>Create a user</i>
Delete checked items	Deletes the selected users. You cannot delete a user who is currently logged in.
Export to CSV	Exports the selected users in the table in CSV format.
Refresh	Refreshes the table and reflects the latest data.
Customize columns	Select the columns to show or hide in the table.

Create a user

Create a user and assign their specific license based role.

Ensure that you are logged in to the as the administrator.

1. Navigate to **Administration > Users**.
2. Click **Create user**.
3. Enter the required general details as follows:

Field	Value
Enable User	Select for the user to be activated and log in immediately. <hr/> Note: If this option is not selected, user will be in the inactive state and cannot log in. <hr/>
Username	Enter a unique user name.
Description	Enter a description for the user.
First name	Enter the first name for the user. <hr/> Note: The number of characters allowed in the First name field is 50. <hr/>

Field	Value
Last name	Enter the last name for the user. <hr/> Note: The number of characters allowed in the Last name field is 50. <hr/>
Password	Enter and confirm a password for the user. Ensure that the password follows all the necessary password policies.
Email	Enter and confirm the email address for the user. If SMTP is enabled, an email is sent to this address to confirm the account. All important Control Room notifications are sent to this email address.

4. Select the required role from the list of **Available roles**.

5. Click the right arrow (→) to add your selection.

6. Select **Allow** to allow multiple sessions.

You must be Control Room administrator to set a user as a multi-login service user. It is possible to set a user as a multi-login user either in the UI or API, however a user may only access multiple sessions through the API.

7. Assign a device license to the user.

Note: When you logged in as administrator, you cannot allocate any device license to the user and **None** option is selected by default.

License	Privilege
None	The user can access the Control Room only.
Bot Creator- Development license	Enables user to create and run bots. Auto login is enabled by default.
Unattended Bot Runner - Run-time license	Users with this license can perform all automation tasks that attended users can perform. Additionally, this license can also be used for Control Room deployment, centralized scheduling, and API-based deployment.
Attended Bot Runner - Run-time license	Users with this license can run bots on their devices and use any event trigger associated with their user account or role. However, these users cannot schedule bots.
Citizen Developer - Development license	Users with this license can create and run bots (including bots with triggers) on their devices.

The **Bypass legal disclaimer** option is automatically enabled to allow the user to run bots on a device without having to manually acknowledge a disclaimer.

After you select a device license, the **Device login credentials** are enabled. If you have the **Attest device credentials** permission, you can choose to attest the device credentials for this user to

bypass credential validation when you deploy bots. The Bot Runner user should have an unlocked and active user session.

Note: This works only if the auto login setting **Reuse an existing session** is selected in the Control Room by the administrator.

8. Click **Create user**.

Watch the following video on how to create a user in Automation 360:

Create an Active Directory user

Add the Active Directory user by selecting the AD domain, providing AD environment details, and assigning a role and device license.

Ensure that you are logged in to the as the administrator.

Note: Before removing a user, administrators should make certain all unfinished development of bots are checked-in.

1. Navigate to **Administration > Users**.

2. In the **General Details** section, enter the following information:

- a) **Enable User:** Select this option so that the user can log in immediately.
- b) **Active Directory domain:** Select the active directory name for the user.
The list displays all the domains that are available in the Active Directory domain controller.

Note: Control Room Active Directory supports single forest multi-domain environment.

c) **Username:** Click **CHECK NAME IN ACTIVE DIRECTORY**.

- If the user name is present in the Active Directory database, the **First name**, **Last name**, **Email**, and **Confirm email** fields are automatically populated.

If the data is not automatically populated, enter the details in the fields.

Note: You can use reserved characters, such as the comma (,), in the username.

- If the username is not present in the Active Directory database, an error message is displayed. Contact the network administrator to resolve the issue.

If SMTP is enabled, the user is sent an email to this address to confirm the account. All important Control Room notifications will be sent to this email address. You can use the "@" character to accommodate email user names.

Note: To support SSO over SAML, the User Principal Name (such as in Azure Active Directory) must match the corresponding username in the control room.

3. Select the required role from the list of **Available roles**.

4. Assign a device license to the user.

Note: When you logged in as administrator, you cannot allocate any device license to the user and **None** option is selected by default.

License	Privilege
None	The user can access the Control Room only.
Bot Creator- Development license	Enables user to create and run bots. Auto login is enabled by default.
Unattended Bot Runner - Run-time license	Users with this license can perform all automation tasks that attended users can perform. Additionally, this license can also be used for Control Room deployment, centralized scheduling, and API-based deployment.
Attended Bot Runner - Run-time license	Users with this license can run bots on their devices and use any event trigger associated with their user account or role. However, these users cannot schedule bots.
Citizen Developer - Development license	Users with this license can create and run bots (including bots with triggers) on their devices.

The **Bypass legal disclaimer** option is automatically enabled to allow the user to run bots on a device without having to manually acknowledge a disclaimer.

After you select a device license, the **Device login credentials** are enabled. If you have the **Attest device credentials** permission, you can choose to attest the device credentials for this user to bypass credential validation when you deploy bots. The Bot Runner user should have an unlocked and active user session.

Note: This works only if the auto login setting **Reuse an existing session** is selected in the Control Room by the administrator.

5. Click **Create user**.

Citizen Developer user

A Citizen Developer is a business user who can create and run bots, and share these automated tasks with peers. Citizen Developer is typically not a technical expert but a specialist such as a marketing analyst, HR manager, and accounts manager.

Overview

Users with bot creation capability can create, edit, run, or schedule bots on their device. While users with bot execution capability can access a public folder to run or schedule published bots. Citizen Developer users combine these capabilities to create bots, access the public folder, and clone published bots and run them on their devices.

Capabilities

In an organization, an administrator typically creates the Citizen Developer role with the necessary bot permissions and specifies the database or folder access. The administrator assigns this role to existing or new users and allocates the Citizen Developer license to them.

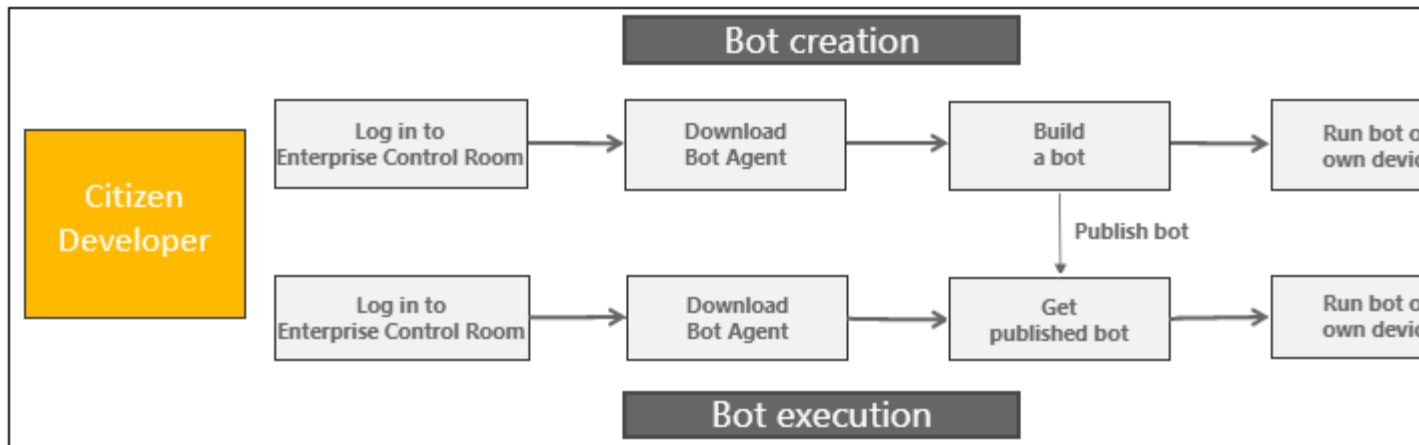

A Citizen Developer user can then perform the following tasks:

- Create bots and run them on their devices.
- Add and delete event triggers for bots on their devices.

Citizen developer user can create a private event trigger. However, the associated bot must be checked in to a public folder for other citizen developer or Bot Runner users to access that event trigger.

- Publish their bots to the public folder where other Citizen Developer users can access them.
- Access the public folder and clone published bots (including bots with triggers).
- Customize cloned bots and run them on their devices.
- Check in bots from their devices to the public folder.
- Check out bots from the public folder.

The following image illustrates the capabilities of a Citizen Developer user:

Example

Consider a scenario where an organization has Marketing and Finance teams. The administrator creates the following two Citizen Developer roles:

- CD (Marketing): provides access to all Marketing team folders
- CD (Finance): provides access to all Finance team folders

The administrator then assigns the Citizen Developer license to users within each team. Citizen Developer users with the CD (Marketing) role can create and run bots on their devices. When a user with the CD (Marketing) role publishes a bot to a public folder, other Citizen Developer users within the Marketing team can clone and run this bot on their devices.

Similarly, Citizen Developer users with the CD (Finance) role will have the same capabilities within the Finance team folders. However, users from one team cannot access any folders and published bots from the other team.

Related tasks

[Create a Citizen Developer user](#)

A Citizen Developer is a business user who can build and run bots on their devices, which then function as their digital assistants.

[Create a Citizen Developer role](#)

A Citizen Developer role enables the associated users to create and run bots on their registered devices.

[Adding event triggers](#)

Any bot with triggers can be associated with users or role to enable event trigger. Control Room user (or role) with **Manage event triggers** permission can add event triggers.

The **All Licenses** page displays detailed information about current product and device licenses.

Create a Citizen Developer user

A Citizen Developer is a business user who can build and run bots on their devices, which then function as their digital assistants.

Ensure that you are logged in to the as the administrator.

1. Navigate to **Administration > Users**.
2. Click **Create user**.
3. Enter the following user details:
 - a) Select the **Enable User** option if you want the user to be able to log in immediately.
 - b) Enter a unique user name.
 - c) Optional: Enter a description for the user.
 - d) Optional: Enter the first name and last name.

Note: The number of characters allowed for the first and last name is 50.

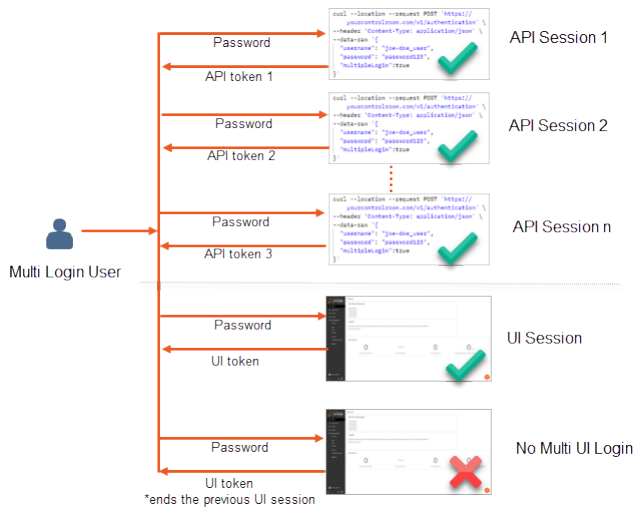

- e) Enter and confirm a password for the user.
Ensure the password follows any necessary password policy.
- f) Enter and confirm the email address for the user.
If SMTP is enabled, the user is sent an email to this address to confirm the account. All Control Room notifications will be sent to this email address.
4. Select a Citizen Developer role from the list of **Available roles**.
If there is no Citizen Developer role available, create one in Control Room.

[Create a Citizen Developer role](#)

5. Click the right arrow (→) to add your selection.
6. Assign the Citizen Developer license to the user.
The license enables users access to the Control Room only and enables them to create and run bots.
The **Bypass legal disclaimer** option is automatically enabled to allow the user to run bots on a device without having to manually acknowledge a disclaimer.
7. Click **Create user**.

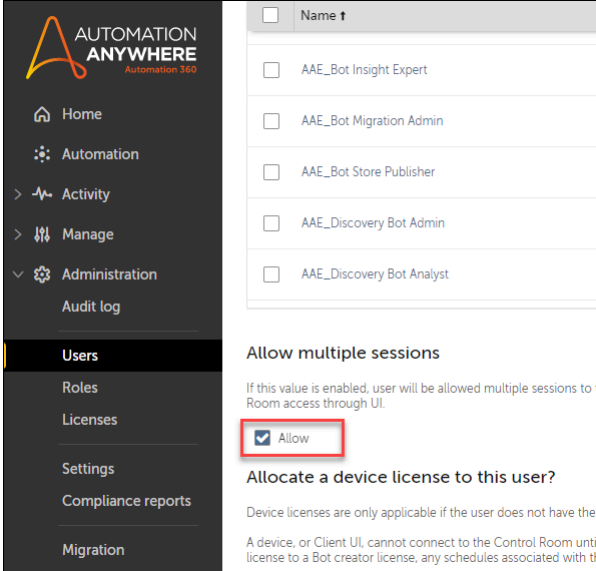

Multi-login user

A multi-login user can log in to multiple sessions of a Control Room through the API at the same time.

Note: Multiple sessions are not allowed for Control Room access through the UI.

A multi-login token is required if you want to configure a Control Room user to use different processes at the same time using multi tokens generate using the API. You need a Control Room administrator role to set a user as a multi-login service user. It is possible to set a user as a multi-login user either in the UI or API.

Authorize using UI	Authorize using API
<p>In the Control Room, go to Administration > Users and select Allow under Allow multiple sessions to enable multi-login.</p> 	<p>Using the <i>Authenticate (username and password)</i>: Request</p> <pre>POST http://{{ControlRoomURL}}/v1/authentication</pre> <p>Request body to generate multi-login token:</p> <pre>{ "username": "jdoe", "password": "mypassword@123", "multipleLogin": true }</pre>

Reset user password

The Control Room administrator generates an email process for the user to reset their password.

Ensure that you are logged in to the as the administrator.

The change password email process.

1. Navigate to **Administration > Users**.
2. Select user from the list.
3. Click the **Edit** icon. (✎)
4. Select **Send reset password email**.

Note: If there is no email server configured, follow these steps to reset the password for a user:

- a. Open the URL for the Control Room in your browser.
- b. Enter the user name, click **Forgot Password**, and follow the prompts to reset or change the password.
- c. Enter the user name, click the **Forgot Password** button, and follow the prompts to reset or change the password.

The selected user receives an email with the necessary instructions to reset the password.

Related tasks

[Log in to Automation Anywhere Control Room](#)

To log in to Automation 360, open the Control Room URL in your browser, enter your credentials in the login screen, and click **Log in**.

Roles

The Control Room enforces role-based access control. There are two types of roles: system and user-created.

Role-based access control (RBAC) gives users access to specific features, based on the assigned roles and the accessibility provided to the user. The benefits of creating roles include:

- Increased security through controlling users access according to their specified roles.
- Decreased need of customer support.
- Easy and accurate monitoring of the use and access of data by higher management, leading to better research management.

System roles

These roles are preconfigured with the permissions necessary to perform the tasks within the scope of that role. They cannot be modified or deleted.

System roles

User-created roles

Users create these roles and the roles can be customized. If a user-created role is created with all Control Room permissions, it is not considered a Control Room Admin role. Only the system-created **AAE_Admin** role has this privilege.

Create a role

Before removing a user role from the active RPA, administrators should make certain all unfinished development of bots are checked-in.

Create a role

As an administrator, you can configure roles with permissions to access features and perform operations such as create, edit, or delete a bot in the Control Room, and assign the role to a user.

Ensure that you are logged in to the as the administrator.

Assign specific permissions to each user. You cannot select users, if these users are deactivated by the Control Room administrator.

1. Navigate to **Administration > Roles**.

2. Click **Create role**.

3. Enter the **Name**.

4. Optional: Enter a description.

5. Select the feature permissions.

For more information about the available feature permissions by product, see [Feature permissions for a role](#).

6. Click **Next**.

7. Based on the option you select, perform the required action:

Option	Action
View my bots permission	Select the bots permissions. Bot permissions for a role
Run my bots permission	Select the Bot Runner devices.
View everyone's activity from my folders	View bot activity started by other users, from the folders where this user has run and or schedule permissions.
Manage everyone's activity from my folders	Manage bot activity, such as Pause , Resume , and Stop , started by different users from the folders where you have run and or schedule permissions.

8. Click **Next**.

9. Select user from the list.

10. Click **Create role**.

Related concepts

[Bot permissions for a role](#)

Assign bot permissions when creating a role with the **View my bots** feature permission.

Related reference

[System roles](#)

System roles are preconfigured with the permissions necessary to perform the tasks within the scope of that role. They cannot be modified or deleted. Administrators assign the roles to users to enable them to access features and perform operations in the Control Room.

Feature permissions for a role

A user with the **AAE_Admin** role or a custom role with the **Manage roles** permission can create and assign roles to users to provide them with access to features and operations.

We recommend that you create individual roles with specific permissions. You can then assign the limited roles to users with that specific permission requirement.

Automation Anywhere Robotic Interface (AARI)

Permission	Description
Cross Team Read	View all teams and see the team members
Cross Process Read	View all processes and see team members and managers
Team Management	Create and view teams, edit team names, descriptions, and process tags. Add new teams, team members, and assigned processes
Task Management	Submit and view tasks from processes that are assigned to the team
Case Management	Create and view requests from processes that are assigned to the team
Global Case Management	View process requests and tasks. Note: This permission does not grant the capability to create a request or submit a task
Global Process Management	View checked-in public processes and assigned managers and teams, edit process tags, and assign managers and teams Note: This permission does not grant the capability to create a process.
Global Team Management	View teams and assigned users, edit team names and descriptions. Add new processes, managers, and users to a team Note: This permission does not grant the capability to create a team.

API

Permission	Description
Bot Insight Data API	Allows access to Bot Insight RESTful APIs to the data logged by the Control Room and by a task during production runs.
Generate API-Key	Users can generate an apiKey that can be used in the Authentication API. <i>Authenticate (username and password)</i> Note: Users without the <code>generateapikey</code> permission can use APIs by authenticating using their username and password. <i>Authenticate (username and apiKey)</i>

Activity

Permission	Description
View my In progress activity	Allows users to view their own activity. Note: All roles have this permission by default.
Manage my In progress activity	Allows users to pause, resume, or cancel their own activity and move their finished activities to history.
View everyone's In progress activity	Allows users to monitor ongoing automations where the user has either run or schedule access on the respective bot.
Manage everyone's In progress activity	Allows users to pause, resume, or cancel their own activity and move their finished activities to history.
View my scheduled bots	Allows users to view their own schedules only.
Schedule my bots to run	Allows users to schedule their bots to run. In addition, users require permission to view and manage Bot Runners.
Edit my scheduled activity	Allows users to edit their own schedules only.
Delete my scheduled activity	Allows users to delete their own schedules only.
View and manage ALL scheduled activity from my Folders	Allows users to view, edit, and delete all the schedules on the bot folders to which they have access. It includes their own schedules and schedules created by other users too.
View and manage ALL scheduled activity	Allows users to view, edit, and delete all the schedules in the system. This includes the schedules that the user created or schedules created by other users.
Set automation priority to high	Allows users to set the automation priority to high to run and schedule bots. Automations with high priority are given preference over the medium and low priority automations so that you can run and schedule the high priority automations.

Audit log

Permission	Description
View everyone's audit log actions	Allows users to view all audit log activity for the Control Room.

Bots

Permission	Description
View my bots	<p>Allows users to view the bots they created and bots that were assigned to them.</p> <hr/> <p>Note: You must assign this permission before assigning any other bots permissions.</p>
Run my bots	Allows users to run the bots they created and bots that were assigned to them.
Export bots	Allows users to export bots and related bot dependencies for which they have download permission.
Import bots	Allows users to import bots and bot dependencies for which they have upload permission.
Label bots	Allows users to create labels for a particular version of a bot. These labels allow the users to schedule, run, queue, export, and trigger bot development workflows with the version of their choice.
Create folders	Allows users to create folders within the folders that they have access to.
Rename folders	<p>Allows users to rename the folders to which they have access.</p> <hr/> <p>Note: Only empty folders can be renamed.</p>
Cancel checkout	Allows users to cancel bot checkout and unlock the file from the public repository.

Bot Store

Permission	Description
View Bot Store	Allows users to view Bot Store.
Add bots from Bot Store to My Bots	Allow users to add bot packages from Bot Store to their Control Room private workspace.
Submit bots to Bot Store	Allow users to submit bot packages to Bot Store.

Credentials and lockers

Permission	Description
Manage my lockers	Allows users to create and manage their own lockers.
Create standard attributes for a credential	Allows users to create a standard attribute for a credential that is shared across all users of that credential.
View and edit ALL credentials attributes value	<p>Allows users to view and edit their own masked attributes.</p> <hr/> <p>Note: You will not be allowed to edit other users credential attributes.</p> <hr/>
Bot Auto-Login Credentials API	Allow users to automate the login process to run bots remotely.

Note: A user with the `AAE_Locker Admin` role can view all credentials and lockers in the Control Room. See [System roles](#).

Dashboards

Permission	Description
View dashboards	<p>Allows users to view the dashboard.</p> <hr/> <p>Note: All roles have this permission by default.</p> <hr/>

Devices

Permission	Description
Register device	Allows users to register a local host device. Devices
View and manage ALL devices	Allows users to view and manage all devices in the Control Room.

Permission	Description
Attest device credentials	<p>Allows users to attest device credentials for Bot Runner users. You can deploy bots on user devices with unlocked and active user session without a system password to bypass credential validation.</p> <hr/> <p>Note: This permission works only if the auto-login setting Reuse an existing session is selected in the Control Room by the administrator.</p> <hr/>
Delete devices	Allows users to edit the devices that they have permission to see.
Edit the devices	Allows users to edit the devices that they have permission to see.
View and manage myBot Creators, Bot Runners and device pools	<p>Allows users to view and manage Bot Creators, Bot Runners, and device pools.</p> <hr/> <p>Note: All roles have this permission by default.</p> <hr/>
Create device pools	Allows users to create and manage their own device pools.

Note: A user with the `AAE_Pool Admin` role can manage all device pools in the Control Room. See [System roles](#).

Discovery Bot process

Permission	Description
View assigned process	<p>Allows users to view assigned processes.</p> <hr/> <p>Note: This is the standard permission. You must assign this permission before assigning any process discovery permissions.</p> <hr/>
View all processes	Allows users to view all the defined processes.
Edit process	Allows users to create and edit processes.

Discovery Bot recording

Permission	Description
View all recordings	Allows users to view all recordings.

Permission	Description
View own recording	Allows users to view their own recording. <hr/> Note: You must assign this permission before assigning any of the following permissions. <hr/>
Run recorder and create recording	Allows users to run the recorder and create recording.
Edit own recording	Allows users to edit their own recording.
Delete own recording	Allows users to delete their own recording.

Discovery Bot aggregation

Permission	Description
View all aggregation	Allows users to view all aggregations.
View own aggregation	Allows users to view their own aggregations. <hr/> Note: You must assign this permission before assigning any of the permissions below. <hr/>
Create or delete own aggregation	Allows users to create and delete aggregations.
Edit aggregation	Allows users to update aggregations.
View system generated aggregation	Allows users to view system aggregations.

Discovery Bot opportunity

Permission	Description
View all opportunities	Allows users to view all opportunities.
View opportunity	Allows users to view opportunities within assigned process. <hr/> Note: You must assign this permission before assigning any of the permissions below. <hr/>
Create or delete opportunity	Allows users to create and delete opportunities within the assigned process.
Convert to bot	Allows users to convert an opportunity to a bot.
Export opportunity	Allows users to export an opportunity.

Event triggers

Permission	Description
View event triggers	Allows users to view event triggers.
Manage event triggers	Allows users to view and manage event triggers. Note: You must assign the <code>view</code> permission before assigning this permission.

IQ Bot

Permission	Description
View IQ Bot	Allows users to view the default dashboards in the IQ Bot portal. Note: You must assign this permission before assigning any of the other IQ Bot permissions.

IQ Bot administration permissions

Permission ID	Description
View Administration	Allows users to access the Administration tab in the IQ Bot portal. Note: You must assign this permission before assigning any other administration permissions.
View and manage settings	Allows users to manage the IQ Bot portal advanced configuration settings.
View and manage migration	Allows users to access the migration utility to import and export learning instances in the IQ Bot portal.

IQ Bot domains permissions

Permission	Description
View domains	Allows users to view all domains in the IQ Bot portal. Note: You must assign this permission before assigning any other domain permissions.
Create domains	Allows users to create domains in the IQ Bot portal.

Permission	Description
Import domains	Allows users to import domains in the IQ Bot portal.
Export domains	Allows users to export domains in the IQ Bot portal.

IQ Bot learning instance permissions

Permission	Description
View learning instances	<p>Allows users to view their learning instances in the IQ Bot portal.</p> <hr/> <p>Note: You must assign this permission before assigning any other learning instance permission.</p> <hr/>
View learning instances from the same role	Allows users to view learning instances created by other users with the same role in the IQ Bot portal.
View ALL learning instances	Allows users to view all learning instances in the IQ Bot portal.
Launch validator	Allows users to access the IQ Bot Validator to review and update documents with exceptions.
Create learning instances	Allows users to create learning instances in the IQ Bot portal.
Edit learning instances	Allows users to edit learning instances in the IQ Bot portal.
Delete learning instances	Allows users to delete their learning instances in the IQ Bot portal.
Send learning instances to production	Allows users to send their learning instances to production in the IQ Bot portal.
Train learning instance groups	Allows users to train their learning instance groups in the IQ Bot portal.

Package manager

Permission	Description
View packages	Allows users to view packages.
Manage packages	Allows users to view and manage packages.

Licenses

Permission	Description
View licenses	Allows users to view the license details for the Control Room.
Manage user's device licenses	Allows users to assign device licenses to other users.
Install licenses	Allows users to install Automation 360 licenses for the Control Room.

Policies

Permission	Description
View policies	Allows users to view the policies which define how automations can be built.
Manage policies	Allows users to view and manage the policies which define how automations can be built.

Migration

Permission	Description
View migration	Allows users to view new migrations, but not run them. Note: You must assign this permission before assigning the <code>manage</code> migration permission.
Manage migration	Allows users to view and run new migrations.
Allow a Bot Runner user to run migrations	Allows Bot Runner user to update the bot conversion status in the Control Room.

Settings

Note: Only a user with the `AAE_Admin` role has the capability to view and manage settings in the Control Room. See [System roles](#).

Users and roles

Permission	Description
View users	Allows users to only view all other users in the system. They cannot create, edit, or delete users. Note: You must assign this permission before assigning the <code>Create user</code> , <code>Update user</code> , or <code>Delete user</code> permission.
Delete users	Allows users to delete other users the Control Room.
Create users	Allows users to create new users in the Control Room.
Edit users	Allows users to edit all users in the system.
View roles	Users with this permission are able to view the roles in the Control Room. Note: You must assign this permission before assigning the <code>Manage roles</code> permission.
Manage roles	Allows users to view and manage all roles in the Control Room.
View users and roles basic information	Allows users to view basic information on users and roles in the Control Room.

Workload

Permission	Description
View and manage my queues	Allows users to view and manage their own schedules.
Create queues	Allows users to create and manage their own queues.
SLA Calculator	Allows users to calculate workload service-level agreements (SLA).

Note: A user with the `AAE_Queue Admin` role has all the workload permissions. In addition, the `AAE_Queue Admin` can manage all the queues in the Control Room. See [System roles](#).

Update Bot wizard permissions

You can assign feature permissions to access and convert a bot from Internet Explorer to Microsoft Edge with IE by using the **Update Bot wizard**. These permissions can be assigned from the **Administration > Roles > Create or edit roles** page.

Permission	Description
View bot update	Allows a user to view the status and summary of each bot update instance when the bots are converted on the Administration > Update Bot wizard page. However, the user cannot run the updates. To do that, a user needs the Manage bot update permission.
Manage bot update	Allows a user to run new bot updates by using the Update Bot wizard.
Allow a Bot Runner user to update bots	Allows Bot Runner users to send bot update status back to the Control Room so that it is visible in the Update Bot wizard report. This permission is assigned by default to the user with the AAE_Admin role.

Bot permissions for a role

Assign bot permissions when creating a role with the **View my bots** feature permission.

Permission	Description
Select all	Enables users to check in, check out, view, delete, run, and schedule bots.
Run/Schedule/Run and Schedule	<p>Enables users to run and schedule bots when the role has the Run my bots and Schedule my bots to run feature permissions.</p> <hr/> <p>Note:</p> <ul style="list-style-type: none"> This permission is limited to running bots when the role has only the Run my bots feature permission. This permission is limited to scheduling bots when the user has only the Schedule my bots to run feature permission. <hr/>
Check in	Enables users to check in bot files or folders to the public workspace from their private workspace. When this permission is selected, the Clone and View content permissions are automatically enabled. These permissions can only be disabled by a user with the AAE_Admin role .
Check out	<p>Enables users to check out bot files or folders from the public workspace. It creates an editable copy of the bot in the private workspace. A bot can be checked out by one user at a time. When this permission is selected, the Clone and View content permissions are automatically enabled. These permissions cannot be disabled.</p> <hr/> <p>Note: To check out dependent folders and files, you must have the Check out permission on the dependency folders.</p> <hr/>
View content	Enables users to view the contents of a bot. This permission applies to both the public and private workspaces. To create a copy of the cloned bot or file in the private workspace, you must have the View content permission on the same folder in the public workspace.

Permission	Description
	<p>Note: You must have the View content permission enabled to export a bot and its dependencies.</p>
Clone	<p>Enables users to create a read-only copy of the bot from the public workspace to their private workspace. A bot can be cloned by multiple users. The Clone permission must be assigned at the folder level for the bot in the public workspace. To clone a dependency folder, you must have the Clone permission on the dependency folder.</p> <p>Note:</p> <ul style="list-style-type: none"> If you have cloned a bot and the corresponding public folder is deleted, then there will be no classifications on the cloned bot in your private workspace. Copy, view, or delete permissions will be available at the bot level. You cannot move or rename a cloned bot in your private workspace. You must have the View content permission on the same folder in the public workspace to view the contents of your cloned bot in the private workspace.
Delete	Enables users to remove files and their dependencies from the public workspace.

Related tasks

[Create a role](#)

As an administrator, you can configure roles with permissions to access features and perform operations such as create, edit, or delete a bot in the Control Room, and assign the role to a user.

Create a Citizen Developer role

A Citizen Developer role enables the associated users to create and run bots on their registered devices.

Ensure that you are logged in to the as the administrator.

Although you can create a Citizen Developer role and assign additional custom bot permissions, ensure the role has all the feature permissions mentioned in this procedure.

1. Navigate to **Administration > Roles**.
2. Click **Create role**.
3. Enter the **Name**.
4. Optional: Enter a description.
5. Select the following feature permissions:

- Event triggers

Select the **View and manage my event triggers** option to allow the user to view, run trigger-based automation, or delete event triggers.

Note: The **View and Manage my event triggers** option is specific to the Citizen Developer license and can fail if it is assigned to users with Bot Creator or other licenses. Adding trigger events from the private repository is not supported.

- Bots

Select the **View my bots** option and the following permissions:

- **Run my bots**
- **Import bots**

- **Cancel checkout**
- Devices
 - Select the following permissions:
 - **Register device**
 - **View and manage ALL device(s)**
 - **Edit the device(s)**

6. Click **Next**.

7. Click **Create role**.

A Citizen Developer role is created in the Control Room. You can create a Citizen Developer user and assign this role to that user.

Create a Citizen Developer user

Assign a role

Roles grant specific permissions to users, such as Bot Creators and Bot Runners.

Ensure that you are logged in to the as the administrator.

Assign specific permissions to each user. You cannot select users, if these users are deactivated by the Control Room administrator.

1. Navigate to **Administration > Roles**.
2. Click **Create role**.
3. Enter the **Name**.
4. Optional: Enter a description.
5. Set the required permissions for the role associated with this repository.
6. Click **Bots**.
7. Select the desired repository folder and grant associating permissions.

Option	Action
Select all	Grant all associated permissions for the repository.
Run	Permission to run bots from the repository.
Check in	Permission to import bots to the repository.
Check out	Permission to export the bot from of the repository.
Delete from Public	Permission to permanently remove bots from the Public repository.

8. Optional: Click **RUN AS**.

This is where administrators select the specific device this role will have access to.

9. Click **Create role**.

Assign this role to the appropriate Bot Creator users.

System roles

System roles are preconfigured with the permissions necessary to perform the tasks within the scope of that role. They cannot be modified or deleted. Administrators assign the roles to users to enable them to access features and perform operations in the Control Room.

Automation 360 roles

Role	Permissions	
<p>AAE_Admin</p> <p>This role allows access to all features, enables users to create other Admin users, and access to all folders and files in the public workspace, including permissions to Create/Edit/Delete Global Values. This is the only role that can access Control Room settings.</p>	<p>Dashboard</p> <p>Activity</p> <p>Event Triggers</p> <p>Bots</p> <p>Package Manager</p> <p>Devices</p> <p>Workload</p>	<p>View dashboards</p> <ul style="list-style-type: none"> • View and manage my in-progress activity • View and manage everyone's in-progress activity • View my scheduled bots • Schedule my bots to run • Edit my scheduled activity • Delete my scheduled activity • View and manage all scheduled activity from my folders • View and manage all scheduled activity <p>View and manage event triggers</p> <ul style="list-style-type: none"> • View and run my bots • Import and export my bots • Create and rename folders • Manage my credentials and lockers • Create standard attributes for a credential • Bot Auto-Login credential API <p>View and manage packages</p> <ul style="list-style-type: none"> • Register device • View and manage all devices • View and manage my Bot Runners, Bot Creators, and device pools <ul style="list-style-type: none"> • View and manage my queues • Administer all queues • SLA calculator

Manage Active Directory role mapping

An administrator or a user with permission to view and manage roles can view the details of the available Active Directory role mappings.

Ensure that you are logged in to the `as` as the administrator.

By default, the Control Room will retrieve all security groups from the Users directory.

To create role mappings with filters for the `Users` directory along with other organizational units (OU), you must update the `um.properties` file. In the Control Room, the `Users` directory is considered similar to the OUs. Therefore, you must define the filter in the `um.properties` file.

For example, set the filter in the file as follows:

```
um.ldap.groupmapping.domain.filter='mydomain.com:OU1&groupFilter|
OU2&groupFilter|Users&groupFilter'
```

Note: Group filters such as `groupFilter` are optional.

In this example, by applying this change to the `um.properties` directs the Control Room to perform the following tasks:

1. Go to domain `mydomain.com`
2. Retrieve all security groups from Organization Unit OU1 that have the group name starts with `groupFilter`.
3. Retrieve all security groups from Organization Unit OU2 that have the group name starts with `groupFilter`.
4. Retrieve all security groups from Users directory that have the group name starts with `groupFilter`.

This setting ensures that the users from the organization units `OU1` and `OU2` will be retrieved in addition to the `Users` directory.

Recommendation: Use filters to narrow down the group display as displaying larger number of groups impacts the performance and makes troubleshooting difficult.

The filters defined in the `um.properties` file are stored in the database. When you update to a newer version of the Control Room, the Control Room references the filters stored in the database because the default `um.properties` file that comes with the installation will not contain these filters. If you define new filters in the default `um.properties` file, the Control Room references the filters defined in the `um.properties` file and overwrites the ones stored in the database.

Multiple Domain Mapping

Mapping supports multiple domains separated by a coma.

```
um.ldap.groupmapping.domain.filter='mydomain.com:OU1&groupFilter|
OU2&groupFilter|Users&groupFilter,mydomain2.com:OU3|OU4'
```

In the example above, the Control Room will perform the additional processes:

1. Go to domain `mydomain2.com`
2. Retrieve all security groups from Organization Unit OU3.
3. Retrieve all security groups from Organization Unit OU4.

Retrieving security groups from nested OUs

Example for retrieving security groups from nested OUs.

In the following *example* organization, consider "Marketing" as the parent OU with additional nested OUs and security groups located in each of these nested OUs.

- Marketing
 - Group 1
 - Group 2
 - US_OU
 - Group 3
 - California_OU
 - Group 4
 - NoCal_OU
 - Group 5
 - SoCal_OU
 - Group 6

By adding the following entry, Control Room will retrieve all groups, group1, group2, group3, group4, group5 and group6 from Marketing and the nested OUs.

```
um.ldap.groupmapping.domain.filter='mydomain.com:Marketing'
```

Note: Providing nested OU in the entry is not supported.

Active Directory role mapping

Navigate to **Administration** > > **Roles** > **Active Directory Role Mapping** and the page displays any role mappings that have been created in the Control Room. You can view or edit the role mappings. You can also create new role mappings or restart the role synchronization process between the Control Room and AD.

When enabled, this synchronization process is triggered once a day (1440 minutes) by default. You can trigger synchronizations in any interval by changing the number of minutes. We recommend that you set the interval settings larger than the default.

Recommendations:

- **Do not** use both **Import** and **Do not import** mappings in the same system because it may complicate use cases and make troubleshooting more difficult to correct any resulting issues.

- If both **Import** and **Do not import** mappings are defined and a user is part of both mappings, then the **Import** mappings take precedence over the **Do not import** mappings.

Consider these examples:

- AD Mapping A = Role A – Group A – Import users from this group into Automation 360
- AD Mapping B = Role B – Group B – Do not import users from this group

Where user D is part of both Groups A and B within Active Directory (AD).

User D will be created in Automation 360 and will be assigned Role A.

- AD Mapping A = Role A – Group A – Import users from this group into Automation 360
- AD Mapping B = Role B – Group B – Do not import users from this group
- AD Mapping C = Role C – Group C – Import users from this group into Automation 360

Where user D is part of all Groups A, B, and C within Active Directory (AD).

User D will be created in Automation 360 and will be assigned to either Role A or Role C based on which mapping the user was mapped to because only single mapping is supported at this time.

One or more available role mappings that match your search criteria appear in the **Role Mapping** table.

Note: The role mappings page displays only the list of mappings and does not validate the mappings by default. Because the changes in security groups and roles are infrequent and take more time in case of slow network or higher number of mappings, the page displays only the list of mappings. To configure default validation on the role mappings page, in the `um.properties` file, add the following entry: `um.ldap.groupmapping.sync.on.get.mappings=true`. Validation of role mappings occurs when you sync the role mappings between the Active Directory and the Control Room.

You can run automations either on the device which is set as your bot running device or from a device pool for which you have consumer privileges ([Create a user](#)). When using Active Directory role mapping, if you want any mapped Active Directory user to be able to use more than one device, you must configure a device pool ([Create device pools](#)).

Sync Active Directory role mapping

Manually or automatically synchronize (sync) role mappings between the Active Directory and Control Room.

Automatically synchronize Active Directory role mapping

By default, synchronizing between Active Directory and Control Room occurs by default at the time interval of 1440 minutes (one day). The time interval for synchronization can be changed in the Active Directory role mappings main page.

Recommendation: As this can be a time-consuming and an expensive operation, set the role synchronization time period to the default value of 1440 minutes (1 day).

Manually run or restart synchronizing Active Directory role mapping

To run or restart automatic synchronizing between the Active Directory and Control Room, do this: From the Control Room go to the **Active Directory role mappings** page and click the **Sync roles from Active Directory** option.

This starts the synchronizing process immediately and continues to run it automatically based on the time interval set.

Cancel automatic synchronizing Active Directory role mapping

To cancel automatic synchronizing between Active Directory and Control Room, do this: From the Control Room go to the **Active Directory role mappings** page and click the **Cancel Sync** option to turn off the periodic automatic sync.

Events that require Active Directory role mapping sync

Sync the role mappings whenever these events occur:

- Changes to AD groups

If any group that is mapped is deleted from the AD, the mappings must be validated before they are deleted because the group is no longer available.

- Update to the license file

Updating the license file can change the available roles. Mappings must be synchronized before updating the roles.

Note: After a sync, the user must wait a few seconds for the updated changes to appear.

Create Active Directory role mapping

When users are created, they automatically inherit the roles assigned to their Active Directory security groups. Create the mapping before synchronizing the user and roles during the user login or background process.

To complete the task, you must have **AAE_Admin** role assigned to you. Ensure you are logged in to the Control Room as the administrator.

In order to create a role mapping, as the administrator will have to provide the following information:

- Unique mapping name.
- The targeted domain where the security groups will pulling the credentials from (see um.properties for details).

Note:

In order to avoid to import a long list of users, a specific security group should be created on the AD side that has only the users who will access Control Room is recommended.

Map a single AD security group to one or more Control Room roles. Create any roles you want to use with the Active Directory security groups. You can also use the default roles available in the Control Room. .

Note: It is not recommended that the AAE_Admin role not be used.

1. Log in to the Control Room.
2. Navigate to **Administration > Roles**.
3. Click **Active Directory Role Mapping**.
4. Click **Create Role Mapping**.
5. Enter the **Name**.

6. Click the **Active Directory domain** drop-down and select an available domain.
7. Use the **Active Directory security group** field to search for a group.
For example, if you have a group named `Certified Publishers`, search for `Certified`. All the groups that contain `Certified` in their name are listed in **GROUPS**.
8. Choose whether **Import users** or **Do not import users**.

Option	Outcome
Import users	<p>All the users who are assigned for the selected security group will be created and assign the mapped roles and licenses in Control Room. If users already exist in Control Room, they will be updated with the latest roles and licenses from the mapping.</p> <p>If synchronization process is enabled and triggered, the existing Control Room users will have the updated roles and licenses from the mapping.</p> <p>If there are new users added to the security group on the Active Directory side, these users will be created in the Control Room.</p> <p>If there are users removed from the security group, these users will be deleted from Control Room.</p>
Do not import users	<p>After the role mapping is created; no user will be created in Control Room. How this mapping is being used in this deployment:</p> <ul style="list-style-type: none"> • On the Create user configuration page, when you create a new user, the role(s) will automatically be assigned to the new user if any of the user security group maps to the existing role mapping. • If synchronization process is enabled and triggered, any existing Control Room users whose security group maps to any role mappings will get the role assignment updated.

9. Click the right arrow (→) to add your selection.
10. Select the required role from the list of **Available roles**.
11. Click the right arrow (→) to add your selection.
12. Select the device licenses to assign to the security group.

License mapping is only supported when the **Import users** options is selected.

Note: The **Do not import users** option does not support license assignment. Administrators will be required to map the licenses manually for users.

You can run automations either on the device which is set as your bot running device or from a device pool for which you have consumer privileges ([Create a user](#)). When using Active Directory role mapping, if you want any mapped Active Directory user to be able to use more than one device, you must configure a device pool ([Create device pools](#)).

13. Click **Create Mappings**.

When the synchronization runs, all users with the assigned roles are updated.

Edit Active Directory role mapping

As an Automation Anywhere Control Room administrator, edit the Active Directory security group mappings assigned to roles in the Control Room.

Ensure that you are logged in to the as the administrator.

Ensure that the mapping name is unique and cannot be duplicated. If you rename a map with an existing mapping name, an error message appears stating that the same name already exists. Changes to mapping name or roles are updated in the audit log.

1. Navigate to **Administration > Roles**.
2. Click **Active Directory Role Mapping**.
3. Hover over the **Actions** icon for the role and select **Edit role mapping**.
4. Supply any required changes for Role Mapping.

Edit the roles by either adding or removing roles from the **Available roles** list, except Bot Insight roles. If you assign Bot Insight roles, an error message appears stating that the role mapping cannot be updated as it contains unsupported roles.

Note: The rest of the fields cannot be edited.

5. Click **Save changes**.

When the LDAP sync runs, all users with the assigned roles are updated.

Delete Active Directory role mapping

An administrator or a user with permission to view and manage role can delete role mappings listed in the Role Mapping table.

Ensure that you are logged in to the as the administrator.

1. Navigate to **Administration > Roles**.
2. Click **Active Directory Role Mapping**.
3. Hover over the **Actions** icon for the role and select **Delete role mapping**.
4. Click **Yes, delete**.

Settings

Use the **Settings** tab to configure the connection to the Credential Vault, enable email notifications, integrate the Control Room with a Git repository, enable secure recording mode, and configure user authentication.

Bots

- Secure recording mode ensures that sensitive data is not stored in the bots. When secure recording mode is enabled, the bots do not capture values of certain properties or store application images. You can enable this setting for some or all users of the Control Room.

Note: Secure recording mode only applies to bots that are created or edited after the mode is enabled.

- Click **Edit** in the **Bots** tab to enable or disable secure recording mode. See [Secure recording](#).
- Bot validation performs an additional compile time validation on migrated bots at the preprocessing stage to save your time and effort. By default, the Bot validation feature is set to **Off**.

Note: You must be a Control Room administrator to view and edit the validation option.

Navigate to **Administration** > **Settings** > **Bots** and set the bot validation option to **On** to detect compilation errors with bots.

Validation happens at the time of running the bot, for new bots. For migrated bots, this check is performed immediately after bot migration, per configuration.

For example, if a parent bot calls a child bot and the child bot has compilation errors, these errors are displayed when you try to run the parent bot. This ensures that an error does not occur in the middle of an automation or make it an incomplete automation.

In the Bot migration results page, select a bot that needs review. Click the three dots under **Reason** tab to see the details. With the Bot validation feature set to **On**, the bots that have compile time errors are displayed as a separate line entry in the migration report.

Migrated bots with compilation errors are shown in **Successful with Review** section of the migration report and ensures that you can get a list of bots that require your attention.

Devices

When there is a new version of the Bot Agent, it is automatically updated.

IQ Bot

View the website address where IQ Bot is currently installed, if applicable. Click **Edit** to update the IQ Bot URL.

Email

All users have to confirm email accounts by clicking the confirmation link that they receive, set the password, and security questions before user can log in to the Automation Anywhere Control Room. By default, email notifications are disabled. Mouse over the **Edit** icon to make changes.

[Edit email notifications](#)

Git integration

Remote Git repository must support Git LFS (Large File Support). Bots are synced using standard Git push over HTTPS.

Login settings

For security, privacy, or any other pertinent announcement, you can provide an additional statement, such as consent text, in the **Login settings** section. The statement is visible to users every time they log in to the Control Room.

This statement on the login page is disabled by default. If you enable it, you can also provide an option (using a check box) for users to read and accept the statement before logging in to the Control Room.

Security settings

Passwords

Customize the password requirements for all Control Room users. The password must include the following:

- A number
- An alphanumeric letter
- A symbol
- A capital letter

For On-Premises users: The check-boxes are enabled, and the user can select or deselect the options.

For Cloud users: The check-boxes are disabled, and the user cannot select or deselect the options.

API-Key duration

The generated API-Key is used to authenticate users. You can customize how long the generated API-Key is valid to authenticate users until either:

- A selected duration is reached (in minutes or days), or
- A new API-Key is generated

Note: You determine the validity duration based on your organization's requirements. Maximum supported API-Key duration is 1 to 14,398,560 minutes, or 1 to 9,999 days.

Time-out session settings

You can enable settings to automatically time out users from the Control Room browser session after the specified minutes of inactivity. You can configure the inactivity time in the range of 10-60 minutes in the **Time-out session setting** field. You can configure the session using increments of

10 minutes. The default value is 20 minutes, which means you will be logged out of the session after 20 minutes of inactivity.

File upload settings

As an Administrator, you can restrict the upload of executable files (dll files, media type application/x-msdownload) to prevent a security breach. To use this feature, enable the **File upload settings** in **Administration > Settings > Security settings**.

User authentication

Configure the *Control Room* to authenticate users through the database option or switch to a SAML Identity Provider (IdP).

[Set up SAML authentication](#)

External key vault

External key vaults provide a way to securely store and retrieve credentials using a third-party key manager such as CyberArk, Azure, and AWS Secrets Manager.

Related tasks

[Set up SAML authentication](#)

Switch an authenticated environment Control Room database to a SAML identity provider (IdP).

[Edit email notifications](#)

Edit details about the email server to use for dispatching email notifications.

Automatic package updates for On-Premises Control Room

Configure the On-Premises Control Room settings to get package updates from the Cloud automatically or only when the Control Room is upgraded manually.

Seamless package update capability is part of our effort to make innovations and enhancements readily available to you. This capability in the Automation 360 platform provides you predictable, qualitative, and non-disruptive access to the latest innovations and enhancements.

When this seamless update capability is enabled, the Control Room can download new packages and new versions of existing packages from Automation Anywhere Cloud when they are released on a regular and predictable release cadence. Newly downloaded package versions are automatically set as default packages so that customers can start using these package versions on an ongoing basis as the packages become available.

Note: To automatically download newly released package versions, the Control Room uses the following URL and port number:

- URL: `https://aai-artifacts.my.automationanywhere.digital/packages/<package-jar-file-name>`
- Port number: TCP 443 (HTTPS)

Note that this capability has no impact on existing bots. Existing bots continue to run unchanged. These new package versions are also backward-compatible with the existing platform version.

Configure packages for On-Premises

Ensure that you are logged in to the On-Premises Control Room as administrator.

1. Navigate to **Administration > Settings > Packages**.

2. Edit the **Packages** option.

The page opens in edit mode.

3. Select **On** to automatically download and install new packages from Automation Anywhere Cloud to the Control Room.

By default, **Automatically update packages from the cloud** is set to **Off**.

When you enable this setting, the system checks for new packages every 12 hours and automatically installs them if new packages are available.

Note: The new package version is downloaded and installed only if it is compatible with your Control Room version.

4. Enable the settings to configure the default version of the package.

This is applicable for new packages downloaded from the Cloud and the Control Room upgrade. By default, this setting is set to **On**.

- Select **On** to automatically set the new version of a package as the default version.
- Select **Off** to manually set the default version after the package update.

5. Save the settings.

Configure default device settings

Configure the device settings to automatically set a user's current device as the default device after the user logs in to the Control Room.

Edit general settings

Ensure that you are logged in to the as the administrator.

Configure the default device setting for temporary or non-persistent devices so that users of such devices users do not have to log in to the Control Room to mark their device as a temporary device.

1. Navigate to **Administration > Settings > Devices**.

2. Edit the **General** settings.

3. To automatically set a logged-in user's device as the default device, verify that the **Enabled** option is selected.

The option is selected by default. You can change it to **Disabled** if you do not want to set a logged-in user's device as the default device.

4. Save the settings.

Change the global cache location

If you do not want to use the default location of global cache, change it according to your requirements:

1. Navigate to **Administration > Settings > Devices**.
2. Edit the **Advanced options** settings.
3. Enter the new location for global cache. This option is available in the Control Room for all devices but can be used only by devices that have the **All Users/System Level (Recommended)** option, selected when installing the Bot Agent.

Note: If the specified path is not valid on the device, then the default path is used.

4. Save the settings.

Configure log collection

The log collection configuration enables you to collect log entries from the devices connected to the Control Room.

You can view the system log information on your device at the following locations:

- Bot Agent installed as admin user: `C:\ProgramData\AutomationAnywhere\BotRunner\Logs`
- Bot Agent installed as local user or non-admin user: `%userprofile%\AppData\Local\AutomationAnywhere\BotRunner\Logs`

.

The following logs are collected:

- Node manager logs
- Bot launcher logs
- Browser extension logs

You can choose to collect one of the following log-level information:

Note: In the production (**PROD**) environment, we recommend that you set the log file configuration level to **INFO** for optimal performance.

- **Info (default):** Informational messages that highlight the progress of the application
- **Debug:** Fine-grained information that is useful for debugging an application
- **Trace:** Captures every behavior of the application in detail

To configure individual device log collection configuration, see [Customize device settings](#).

1. Navigate to **Administration > Settings > Devices**.
2. Edit the **Log collection configuration** settings.
3. To configure the level of log collection, select **Info**, **Debug**, or **Trace**.
4. Set the maximum log file size between 1 MB and 100 MB.
5. Set the maximum number of log files between 1 and 500.
6. Save the settings.

Customize browser extension settings

You can customize the browser extension settings for user devices at the device level. Customizing the setting helps you to continue to use browser-based automations seamlessly even when there is an update to the browser extension.

- You must be a Control Room administrator to configure this setting.
- You must have installed Bot Agent version 21.222 or later.
- You must have installed the Bot Agent with installation type as system-wide.

By default, the Google Chrome and Microsoft Edge browser extensions are enabled on all Bot Agent devices. When this option is enabled, the browser extensions are automatically updated on all the connected devices through a single click.

1. In the Control Room, navigate to **Administration > Settings > Devices**.
2. In the **Browser extensions** settings, select **Edit** and then select one of the following options:
 - **Enabled:** Select this option to enable the Google Chrome or Microsoft Edge extensions on all the connected devices.
 - **Disabled:** Select this option to disable the automatic update of browser extensions. This option is applicable only when a Bot Agent is upgraded or a new Bot Agent is installed.
 - **Force disable Chrome and Edge extensions from all bot running devices:** Select this option when you want to manually upgrade the browser extension.

This option disables browser extensions on all the Bot Agent devices.

Note: Selecting this option might disrupt the functioning of your browser-based automation.

Consider the following when configuring the browser extensions option:

- If the **Browser extensions** option is selected and you disable this option when the **Force disable extension on all bot running devices** option is unselected, then the `ExtensionInstallForceList` group policy is not applied on the devices that are newly registered or upgraded. You will have to enable the extension manually on the newly registered or upgraded devices.
- If the **Browser extensions** option is selected and you deselect it, with the **Force disable extension on all bot running devices** option selected, the `ExtensionInstallForceList` group policy is deleted from all the Bot Agent devices and you must manually update the browser extension.
- If the **Browser extensions** option is unselected and you select it, the group policy changes are pushed to all the Bot Agent devices.

Note: Automation Anywhere does not interfere with the `ExtensionInstallForceList` group policy if it is already present on the system, However, if a key by name **1** is already present in the `ExtensionInstallForceList` folder, create a key name with the subsequent number, in this case, **2**. See [ExtensionInstallForcelist](#) for Google Chrome or [ExtensionInstallForcelist](#) for Microsoft Edge.

Switch device registration between Control Room instances

Configure the device settings in the Control Room to enable single-user devices to easily switch between different instances of the Control Room to run bots in multiple environments. This option enables you to register the Bot Agent on multiple Control Room instances without uninstalling the Bot Agent.

Ensure that you are logged in to the `as` as the administrator.

- You must have the View and Manage ALL device permission to enable the switching option.
- You must enable the switching option on both Control Room instances.
- You can switch between Control Room instances only if the instances are on the same build.

For example, if one Control Room instance is on Build 9664 and another instance is on Build 8815, you cannot switch user device between the two Control Room instances. Both instances should be either on Build 9664 or Build 8815.

1. Navigate to **Administration > Settings > Devices**.
2. **Edit** the **General** settings.
3. Select **Enabled** to enable the local device as the default bot running device after a user logs into the Control Room.
4. Select **Enabled** to enable a single-user device to be switched to another Control Room without reinstalling the Bot Agent.

Additionally, the **Allow fast switching** option allows you to switch the Bot Agent with a single click.

Note: Fast switching is recommended only if there is no change in the network configuration when connecting to a new Control Room. The first time you switch the Bot Agent to a new Control Room, the device lifespan information (that is, whether the device is **Persistent** or **Temporary**) is copied over to the new Control Room. No other configuration information is copied over.

If this setting is not enabled, you must uninstall Bot Agent first and then reinstall it to switch device registration to different Control Room instances.

5. Save the settings.
6. Log in as a Bot Creator user to a Control Room configured in a different environment to verify that users can switch between instances.
The **Connect device** option is available when you click the device icon in the Control Room panel.

Related tasks

[Switch Bot Agent to a different Control Room](#)

Switch the Bot Agent on a registered device to work with a different Control Room manually when you work on automations using different environments.

Automatic package updates for Cloud Control Room

Configure the Cloud Control Room settings to get package updates from the Cloud automatically.

Ensure that you are logged in to the `as` as the administrator.

When a new package or a new package version is released in the Cloud, the package version will automatically get installed on Control Room. This automatic installation of a new package version cannot be turned off by cloud users and can only control the status of the new package version after it is installed.

1. Navigate to **Administration > Settings > Packages**.
2. Edit the **Packages** option. The page opens in edit mode.

3. Enable the settings to set the new package as the default version.
 - **Off:** If you select this option, the new package version will be in enabled status.
 - **On:** If you select this option, the new package version will be in default status; that is, it will set the default version of the package.
4. Save the settings.

Related concepts

[Preload packages](#)

You can preload packages on your local device to shorten the bot runtime.

Change screen resolution for Bot Runner session

For user devices, you can set the screen resolution of the Bot Runners for every bot deployment through the RDP in the Control Room.

This task is performed by the user who wants to build and deploy . You must have the necessary rights and permissions to complete this task, and authorization to log in to the as the licensed user.

The RDP session is created using the set screen resolution during bot deployment.

1. Navigate to **Administration > Settings > Devices**.
2. Edit the **Resolution settings for a device session** field.
3. Set the resolution by either selecting a predefined value from the **Screen resolution** drop-down list or by selecting **Custom** and entering the values you want.

Note that the screen resolution settings are applicable only when you use RDP-based deployments. For regular deployments, a Windows session is created using the existing resolution settings of the device. In this case, the screen resolution set in the Control Room is ignored.

Recommendation: When resolution dependent packages are used to build bots, any screen resolution difference between the Bot Creator and Bot Runner device will impact the bots during runtime. Therefore, ensure the resolution settings on devices match when you create and run bots. See [Screen resolution dependent packages](#).

4. Select the **Do not allow devices to override resolution settings** option.
When you select this option, the resolution settings cannot be changed at the device level.
5. Click **Save**.

Screen resolution dependent packages

The screen resolution between the Bot Runner and Bot Creator device should be consistent as when resolution-dependent packages are used to build bots, any screen resolution difference between the Bot Creator and Bot Runner device will impact the bots during runtime.

Ensure the resolution settings on Bot Creator and Bot Runner devices match when you create and run bots. Review the table given below for information on the resolution-dependent packages and their attributes.

Package	Effects of display parameter changes	Resolution-dependent attributes
Image Recognition	<p>If we use the Image Recognition package in a computer that has a different resolution, scaling, or zooming than the resolution that was configured in the system, it can affect the output as it works on image pixel values and the features.</p> <p>For RDP machines, when you configure Image Recognition package in a different machine and run it on an RDP machine with same resolution and scaling, and if RDP is using a different display driver, the capture might not be accurate. It can render image with slightly different pixel values that can cause a reduction of matching percent.</p>	X, Y, width, and height
Mouse	<p>The Mouse > Click action requires X and Y co-ordinates to capture the UI element. If there is a change in screen resolution, scaling, or zooming, the coordinates might move, and it might click different coordinates. Due to this, the Click action will fail to capture the specific UI element. If you are using the RDP machine with the same resolution, scaling, or zooming then it will not create any issue as the Mouse package does not depend on the pixel value.</p>	X, Y
App Integration	<p>The App Integration > Capture area action requires X and Y co-ordinates to capture the text from a window. Any change in screen resolution, scaling, or zooming might cause change in the coordinates, and the correct text is not captured. In the RDP machine, use same resolution, scaling, and zooming so that you do not encounter any issues.</p>	X, Y, width, and height
Screen	<p>The Screen > Capture area action requires X and Y co-ordinates to capture the screenshot of the application window area. Use the same resolution and scaling in the RDP machine so that the output is not affected.</p>	X, Y, width, and height
OCR	<p>The OCR > Capture area action uses the X and Y co-ordinates to extract text from a specified area in the selected window. Ensure you have the same resolution, scaling, and zooming in the RDP machine so that extraction of the text is not affected.</p>	X, Y, width, and height

Configure auto-delete temporary device settings

Configure your device settings to automatically delete a temporary device when the device is disconnected from the Control Room after a certain time interval.

Ensure that you are logged in to the as the administrator.

1. Navigate to **Administration** > **Settings** > **Devices**.
2. Edit the **Temporary devices - auto delete settings**.

3. Use plus (+) or minus (-) to select the number of **Days, Hours, or Minutes** to wait before the temporary device should be deleted automatically.
The default time is 24 hours.
You can also manually delete the temporary device from the **My devices** page in the Control Room.
4. Save the settings.

Configure threshold settings for user devices

Configure the CPU utilization and device memory threshold values to control the concurrent bot deployment on user devices based on resource utilization.

Ensure that you are logged in to the as the administrator.

Based on the CPU utilization and device memory threshold values, you can determine whether to deploy bots on user devices. If the threshold value is the same or more than the value provided, bots are not deployed on user devices.

The default values for CPU utilization and device memory are based on the following parameters:

- When the frequency of data collection is 10 seconds, the system collects 6 data points in 1 minute.
- When time interval to upload data is 120 seconds, the system uploads 6 data points to the Control Room every 2 minutes.
- When the moving average time window is 2 minutes, the system uses the last 12 data points to calculate the average resource utilization.

1. Navigate to **Administration > Settings > Devices**.
2. Edit **Threshold settings for multi-user devices**.
3. Optimize the behavior for concurrent sessions by choosing one of the following options:
 - Do not enable threshold settings
Use this option to deploy bots on single-user devices.
 - Enable threshold settings to set the maximum values:
 - a. Enter the CPU and memory utilization frequency of data collection.
 - b. Enter the time interval to upload data.
 - c. Enter the moving average time window.
 - d. Enter the CPU threshold limit for new bot deployments on a device.
 - e. Enter the memory threshold limit for new bot deployments on a device.

Use this option to deploy on multi-user devices.

You can either enter the values or click the plus (+) or minus (-) signs to increase or decrease the limit.

4. Save the settings.

Configure auto-login settings

Configure auto-login settings in the Control Room to either create user sessions or reuse existing user sessions to reduce the bot startup time.

Ensure that you are logged in to the as the administrator.

Auto-login enables you to deploy a bot for unattended Bot Runners after automatically logging on to a machine and restoring the machine to its original locked/unlocked state after completing the deployment.

Configure auto-login settings to either create new user sessions or reuse existing sessions in the following scenarios:

- Before deploying a bot, some applications are kept running to accommodate a delay in the application launch.
- When Windows updates or Active Directory policy updates are pushed after a user logs in, changes in the automation environment might affect bot execution.
- Logging off from temporary or non-persistent devices stops bot execution.
- You can reuse existing user sessions when your company's IT policy prevents you from providing device user password for auto-login credentials.
- To bypass legal disclaimers on RDP-based deployments.

1. Navigate to **Administration > Settings > Devices**.

2. Edit the **Auto login settings**.

3. Optional: [External key vault setting](#).

4. Choose how to run bots on user sessions by selecting one of the following options:

- **Always create a new session**

Select this option for desktop deployments where it is possible to create user sessions on devices.

- **Reuse an existing session**

Recommendation: Select this option for auto-login settings in the Control Room to use event triggers on unattended Bot Runners and to run bots when a device is locked or is in a disconnected state (such as RDP).

Available options to lock or unlock the session are:

- An existing locked session
- An existing unlocked session
- A disconnected session
- Allow users to change these settings for each device

Use this option for deployments on devices where it is not possible to create user sessions.

Note: When you use the **Reuse an existing session** option, ensure user sessions are available. If there is no existing user session, triggers and bot deployments will fail.

- **Reuse an existing session, if available**

Use this option if you must create a new session or reuse an existing session. If a session does not exist, create a new session and leave it unlocked for next user session after bots complete their run from the following:

- A new session
- An existing locked session
- An existing unlocked session
- A disconnected session

5. To allow a user to change the auto-login settings at the device level, go to **Administration > My Devices** and select **Allow changes**.

The **Do not allow changes** option disables the user-level auto-login settings for user sessions.

6. Save the settings.

Related reference[Devices](#)

The device is a machine through which a user connects to the Control Room to create or run bots. Manage devices that are registered to the Control Room through the **Devices** page located in the **Manage** tab.

Add access IP addresses

Use this setting to limit user login access to the Control Room URL based on IP addresses or subnets that you specify in a list. You add IP address ranges using the Classless Inter-Domain Routing (CIDR) format, and you can add multiple CIDR ranges.

Note:

If a user attempts to log in to the Cloud Control Room using an IP address that is not included in the access list, an error message displays indicating invalid user or user credentials.

Ensure that you are logged in to the [as the administrator](#).

You must have access to **Administration > Settings** page with view, add, or edit permissions.

Specify a list of IP addresses or IP subnets to permit access to the Cloud Control Room URL and API. If your network egress uses dynamic IP addresses, then the ranges you enter must include the entire range of dynamic IP addresses that can be assigned outbound traffic. For example, to specify a single IP address use, 10.10.10.12/32; or to specify an IP address range, use 192.168.20.0/24.

Note: When using SAML for authentication, use the network access capabilities of the Identify provider to restrict access to specific allowed IP addresses. Ensure all allowed IP addresses configured are removed before switching to SAML for authentication. For more information, please consult [Unable to Set up SAML authentication for Control Room \(A-People login required\)](#).

Perform the following steps to add an IP address or subnet to the list of permitted network access addresses:

1. Log in to the [as the administrator](#).
2. Navigate to **Administration > Settings > Network settings**.
3. Click **Edit** to add to or edit the listed IP addresses.

Note: There is a limit of 25 independent entries in the access permitted table. An entry can be a single IP address or an IP subnet.

4. Enter the IP address information:

Option	Description
Single IP address	Enter the necessary IP address in x.x.x.x format.
Range of IP addresses	Enter the address in x.x.x.x format and specify the subnet mask.

5. Enter the **Name**.
6. Optional: Enter a description.
7. Click **Save changes**.

Related reference[Add IQ Bot cloud server IP addresses to allowed list](#)

To ensure seamless connectivity of your IQ Bot cloud servers with the Cloud Control Room, specify a list or range of IP addresses that are allowed to access the Cloud Control Room URL.

[Add Automation 360 Cloud DNS to trusted list](#)

To ensure secure access to Automation 360 cloud services, add specific Automation Anywhere Domain Name System (DNS) to the safe recipients or trusted list.

Set callback URLs

You can specify valid callback URLs, enabling the Control Room to post the results of the task execution only to defined and secure URLs for more granular security over the network.

Ensure that you are logged in to the as the administrator.

As a Control Room administrator, you can configure and audit specific, permitted URLs for more granular control of the network access points. Only the Callback URLs can be used in bot deployment APIs.

1. Navigate to **Administration > Settings > Network settings > Deployment settings > Callback URL**.
2. Click the **Edit** icon. (✎)
3. Add the required URLs.
Use the **Add** option for more URL fields.
4. Click **Save**.

Set up SAML authentication

Switch an authenticated environment Control Room database to a SAML identity provider (IdP).

Note: SAML integration is irreversible. After it has been established, you cannot modify the configuration.

Ensure that you are logged in to the as the administrator.

Before you set up authentication for the Control Room, setup tasks (such as introducing credentials on a new system and importing users) might be required. If you import users, then you must also include matching user IDs, email addresses, first and last names, in both the Automation Anywhere credentials and matching records to log in after the SAML integration. For example, if using Okta as a SSO, then users must have matching IDs, email addresses, first name and last names in both Automation Anywhere and Okta to log in after the SAML integration.

You should have the required user information and certificate ready. Typical user information consists of user ID, first and last name, and an email address.

Note: You must validate the SAML IdP setup before you configure the Control Room. See [Configure the Control Room as a service provider](#).

After switching to SAML authentication environments, any users with non-SAML IdP formatted IDs will not be able to log in. You need to verify that any bots located in their private folders are exported so they can be imported back against their new user accounts.

Much of this configuration relies on third-party applications to create the necessary metadata. If you require more specific configuration information based on a specific provider, see [Configure SSO authentication with Okta](#).

To switch the Control Room to a SAML-authenticated environment, follow these steps.

1. Navigate to **Administration > Settings > User authentication**.
2. Select the **Use SAML** option.

Note: The **Use Control Room database** option is selected by default.

3. In the **Unique Entity ID for Control Room (Service Provider)** field, enter the entity ID.

4. In the **Encrypt SAML Assertions** field, select one of the following options:

Option	Description
Do not encrypt	SAML assertions are not encrypted.
Encrypt	SAML assertions are encrypted.

5. Optional: Enter the **Public key** and **Private key** values.

Note: Enter keys only if you require encrypted SAML assertions.

6. Click **Validate SAML Settings**.

The Control Room will log in through the SAML provider and redirect back to the **Control Room User Authentication** page.

When you click this option, you will be redirected to a SAML 2.0 service provider web page where you will be prompted to enter credentials and other data.

7. Log in to your provider when prompted.
8. Click **Save changes**.

Related tasks

[Configure the Control Room as a service provider](#)

A valid SAML IDP setup must be configured before the Control Room can be switched to a SAML-authentication environment.

Two-factor authentication

Two-factor authentication (2FA) provides an additional layer of defense against unauthorized users from accessing the Control Room. As an administrator, you can set up 2FA so that the users can validate their identity when logging in to the Control Room using both their user credentials and a second authentication factor.

How 2FA works

2FA is an additional authentication mechanism added to your login process. 2FA is disabled by default. The Control Room administrator configures the 2FA for either all users or users with specific roles. Once 2FA is enabled, it is applicable to all Control Room users that it is intended for.

When you are assigned a role that requires 2FA, you must set up an authenticator application on your mobile or other device and establish a connection between the authenticator application and the Control Room. On subsequent logins, you will be prompted to enter, along with the username and password, a time-based one-time password (TOTP) from the authenticator application to complete the Control Room login.

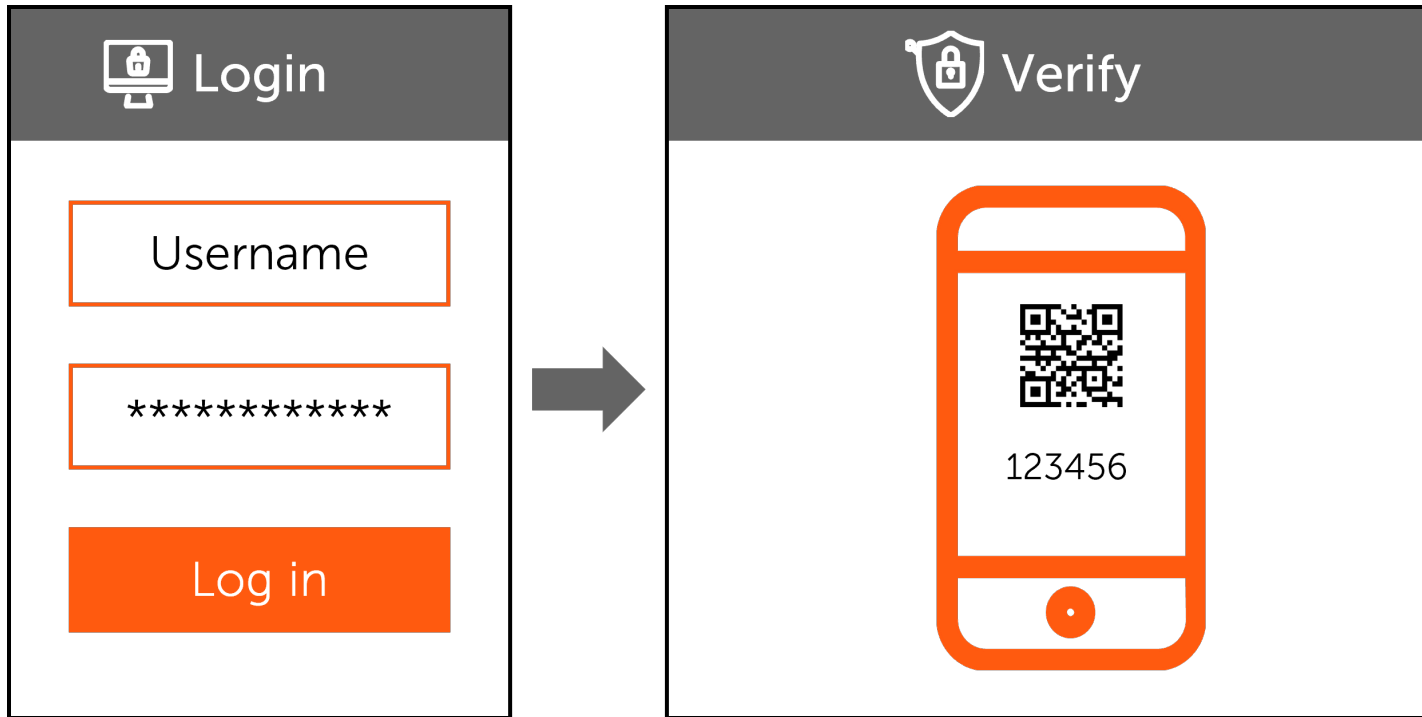

Note: 2FA is not supported for Control Room setup using Active Directory (AD) or SSO. 2FA is supported only when the Control Room is the authentication provider.

Components

Three main components are used in 2FA.

- **Authenticator application:** Installed on your mobile device, this application generates TOTP for verifying your identity. Any authenticator application that supports the TOTP protocol, such as DUO or Google Authenticator is supported.

- **Registered device:** This is the mobile or other device that you register with the Control Room during first login after 2FA is set up. The TOTP is generated through this registered device, which is required any time you log in to the Control Room. If your registered device is lost or unavailable, you must request the Control Room administrator to delete the device, and you can add another device later. Therefore, we recommend you to set up more than one device and register them with the Control Room.
- **Time-based one-time password:** This is a temporary password generated by an algorithm that uses the current time of the day as an authentication factor.

Set up 2FA

1. Enable 2FA in the Control Room.
 - a. Log in to the Control Room as an administrator.
 - b. Navigate to **Administration > Settings > Security settings > Two factor authentication.**
 - c. Click **Edit** to configure the settings.
 - d. Select **Enable**. This is not enabled by default.
 - e. Choose the settings based on your requirements:

Option	Action
All users	Select this option to enable 2FA for all users who have access to the Control Room.

Option	Action
Selected roles	<p>To enable 2FA for users with specific roles:</p> <ol style="list-style-type: none"> 1. From the Available roles column, search and select roles for which you want to enable 2FA. 2. Move these roles to the selected column.

- f. Save your changes.
- 2. Optional:** If a user's registered (mobile) device is unavailable or changed, delete the device and register a new one.
- a.** Log in to the Control Room as an administrator.
 - b.** Navigate to **Administration > Users**.
 - c.** Select the user that you want to edit. Hover over the action menu (vertical ellipsis) located to the right of the username and click **View user**.
 - d.** In the **Authenticators** section, select the device that you want to delete, click the delete icon, and confirm deletion.
- 3.** Set up an authenticator application and establish a connection between the authenticator application and the Control Room.
- a.** Log in to the Control Room as a Citizen Developer or a Bot Creator (RPA Developer).
Ensure that you have an authenticator application set up on your mobile device. During your first login, a QR code is displayed.
 - b.** Either scan the QR code using your authenticator application or manually enter the code displayed in the authenticator application.
 - c.** Enter the name of your authenticator and the new code generated in your authenticator application.
This is a temporary code that is refreshed every few of minutes based on your authenticator application.
 - d.** Click **Confirm**.
Follow the next steps in the login flow, change your password and set the security questions. You will be successfully logged in to the Control Room. On subsequent logins, you must enter the code generated in your authenticator application and confirm.

4. **Optional:** You can manage (add or delete) your authenticator device.
 - a. Log in to the Control Room as a Citizen Developer or a Bot Creator (RPA Developer).
 - b. On the **Home** page, click your username.
 - c. Navigate to **My settings** > **Two factor authentication**.
 - d. Click the plus (+) icon.
 - e. Perform steps [3.b](#) through [3.d](#).
 - f. **Optional:** Select the device that you want to delete, click the delete icon, and confirm deletion.

Configure Credential Vault Connection mode

Credential Vault is a centralized location for securely storing credential information used by bots.

Configure the **Connection mode** to connect to the Credential Vault using a **Master key**.

Note: Provide this key every time you start or restart the Control Room.

To configure settings for Credential Vault, select **Express** or **Manual** mode.

Express mode

Auto connect to the Credential Vault with the master key that is stored in the system during Control Room configuration.

Manual mode

Use this to manually connect to the Credential Vault using the master key that was available during Control Room configuration.

When switching modes, provide the **Master Key** in the field and click **Save** for the changes to take effect.

Tip: Restart the server machine (on which the Control Room is installed) or services to allow changes to take effect.

All updates to the Credential Vault **Connection mode** are captured in the **Audit Log**.

- If you are facing Credential Vault connection issues while accessing the Control Room URL, see [CR fails to load with the Error Code 'cv.validation.secure.cv.locked' \(A-People login required\)](#).
- If the Credential Vault is configured to connect to the Control Room in **Manual** mode, and the **Master Key** is not added within a certain time period (for example, within 2 minutes), the devices might disconnect from the Control Room.

For more information, see [Bot agent device status remains disconnected post restart of Control Room server after windows maintenance \(A-People login required\)](#).

Related tasks

[Set up locker and assign credentials](#)

Create a role, credentials, and locker to share related sensitive values with a group of users, so they can use those values to build or run bots.

Editing SQL user information

Edit MS-SQL configuration related settings, including username, password, database server name, database server IP and port numbers.

To perform this task, you must be a administrator and have the required rights and permissions.

Download the latest Control Room utility and make certain this utility installed on every sever where Automation 360 is running.

Note:

Users are required to make changes to the running configuration via the command line interface.

Note: Please stop all Automation 360 services on all nodes where a Control Room is installed before performing this task.

1. Open the command line prompt and navigate to the Automation 360 application.
For example, `C:\Program Files\Automation Anywhere\jdk11\bin.`
 2. Follow the prompts from the utility to select the SQL database and enter the required credentials.
-

Note: The password will not be displayed on the console

3. Restart the Automation 360 services on the nodes.
The SQL user information has been successfully updated.

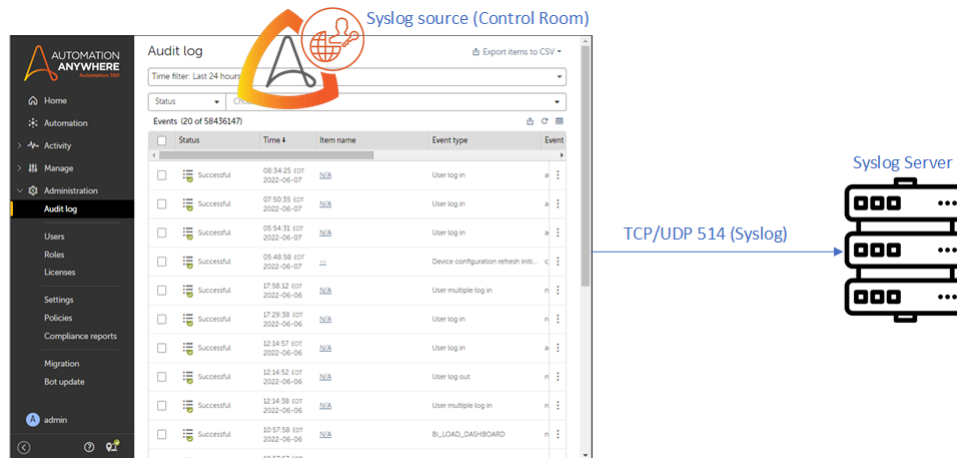

Syslog server integration

The Automation Anywhere Control Room supports ingesting tenants' audit log entries in Syslog format to any Syslog server.

Important: The options to specify or modify the Syslog configurations are available only for the On-Premises deployment.

By pushing syslog data to a Syslog server, you can integrate and leverage the advanced searching and reporting features of Syslog server solutions. When configured, the Control Room audit logs are forwarded to both the Transmission Control Protocol (TCP) and User Datagram Protocol (UDP) network protocols. You can use any syslog server. The following syslog servers are tested and certified by Automation Anywhere:

- Kiwi Syslog Server
- Splunk

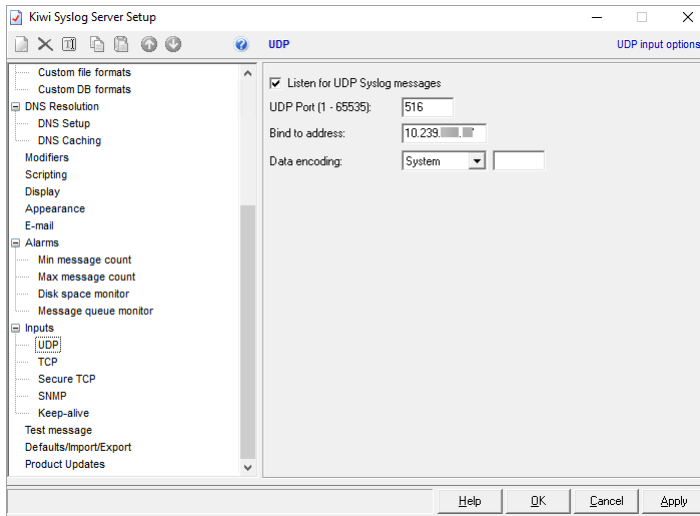

You can configure a Kiwi Syslog Server or a Splunk server that accepts data from a Control Room instance's syslog through a TCP or UDP port. The following example illustrates sending the Syslog data to Kiwi Syslog server through TCP or UDP ports.

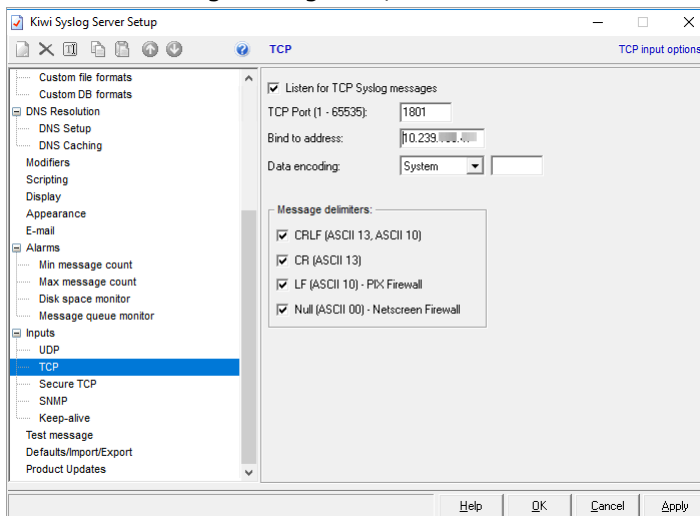

Configure Kiwi Syslog Server

Solarwinds Kiwi Syslog Server is a widely used commercial Syslog server. Kiwi Syslog Server Free Edition can monitor Syslog for up to five devices. Download Kiwi Syslog Server Free Edition from the following link: [Kiwi Syslog Server Free Edition](#). After installation, perform the following steps to configure the Kiwi Syslog Server:

1. Navigate to **File > Setup > Inputs**.
2. To forward the logs through UDP, click **UDP**.

3. Enter the UDP port and the IP to which you want to forward the logs.
4. To forward the logs through TCP, click **TCP**.

5. Enter the TCP port and the IP to which you want to forward the logs.

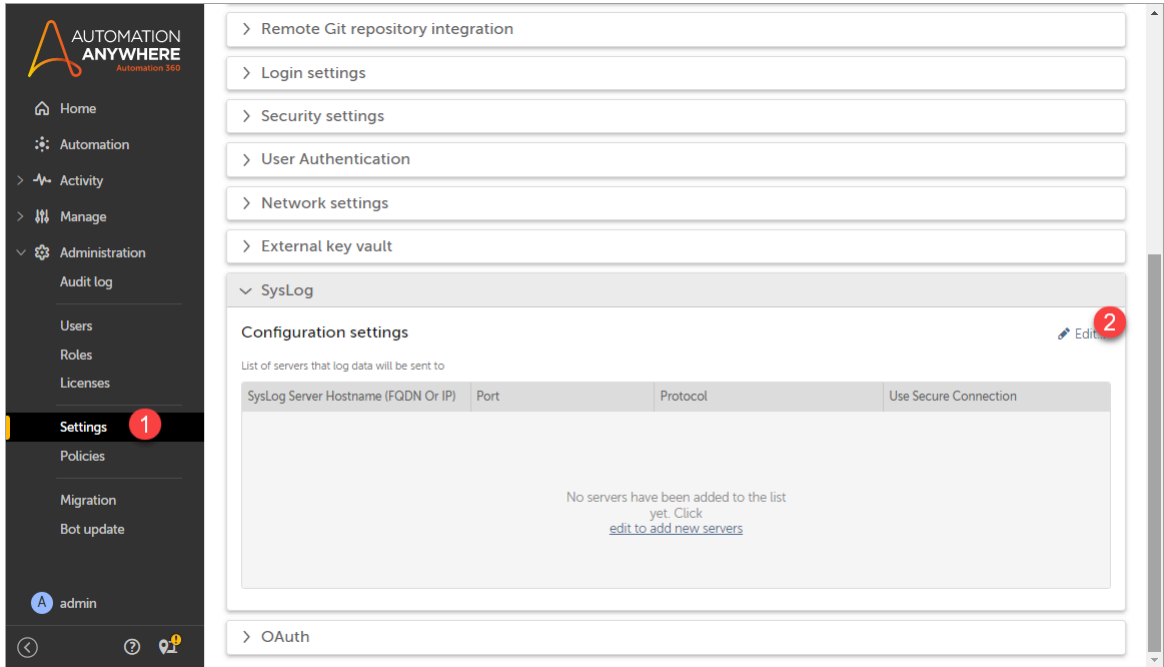

Configure Control Room to send Syslog on UDP or TCP

To configure the Control Room to send Syslog on UDP or TCP, perform the following steps:

Note:

To perform this task, you must be an administrator and have the required rights and permissions.

1. Navigate to Administration > Settings > Network settings.

2. To add more Syslog servers, click the plus (+) sign.

3. Enter the Syslog server information.

Option	Action
Syslog server hostname	Fully qualified domain name (FQDN) or the IP address of the Syslog server to deliver the log reports.
Port	Port that the remote Syslog server uses to receive incoming Syslog records (for example, port 514).
Protocol	TCP or UDP.

Option	Action
Use Secure Connection	Use a TLS encrypted channel to send Syslog records to the remote server. This option is available for TCP only.

- a. To forward the logs to a UDP port, enter the UDP settings (IP, port, and select UDP from **Protocol** drop-down).

Note: For information about specific settings, see the Kiwi Syslog Server documentation.

The screenshot displays the 'SysLog' configuration settings in the Automation Anywhere interface. The left sidebar contains the navigation menu with 'Settings' highlighted. The main content area shows the 'SysLog' configuration section with the following details:

- Configuration settings:** List of servers that log data will be sent to.
- Row 1:** SysLog Server Hostname (FQDN Or IP) is 10.239. Port is 516. Protocol is UDP. A red circle '4' is placed over the hostname field.
- Row 2:** SysLog Server Hostname (FQDN Or IP) is 10.239. Port is 1801. Protocol is TCP. A red circle '3' is placed over the Protocol dropdown menu.
- Row 3:** SysLog Server Hostname (FQDN Or IP) is empty. Port is empty. Protocol is empty. A red circle '3' is placed over the Protocol dropdown menu.

- b. To forward the logs to an TCP port, enter the TCP settings (IP, port, and select TCP from **Protocol** drop-down) .

4. Click **Save changes**.

Verifying data in the Syslog Server

Reception of logs is verified in the Syslog Server. Perform the following steps to verify the data in Syslog Server:

1. Generate a Syslog event by logging in or logging out of the Control Room.

2. Verify the logs in the Kiwi Syslog Server.

Edit email notifications

Edit details about the email server to use for dispatching email notifications.

Ensure that you are logged in to the as the administrator.

Specify details about the email server you want to use and the events when the email notification must be sent. To configure **Email** settings, perform these steps:

1. Navigate to **Administration > Settings > Email**.
2. Click the **Edit** icon. (✎)
3. Select **Send email notifications**.

By default, the email notifications are disabled. You may choose not to send a verification ("Welcome") to the created/edited users.

4. Specify the details of the server that you want to use to send email notifications.

Option	Description
From this email address	Enter the email address that you want to use to send email notifications.
Email server host	Specify the email server that you want to use to send email notifications.
Email server port	Specify the email port that you want to use to send email notifications.
My server uses a secure connection (SSL/TLS)	Select the option if the server uses a secured connection.
My server requires authentication	Select the option if the server requires credentials for access, such as for an external credential vault.
Specify the Username and Password you want to use to access the server.	Specify the credentials.

Important: The options to specify or modify the email server details are available only for the On-Premises deployment.

5. Select any or all of the following options to specify the events when an email notification must be sent:

- **User initiates Forgot Password process from Login screen**
- **User information changes, to the user**
- **A user is activated, deactivated or deleted, to the user**
- **A Task Bot stops running because it is unsuccessful, to the user who started or scheduled it**
- **A BLM package is exported or imported, to the user who performed BLM export or import**
- **A checkin process fails**

Important: If the **Require verification** option is not selected, an email notification without verification link is sent to the specified email ID. You can log in to the Control Room without verifying the email ID and setting the login credentials.

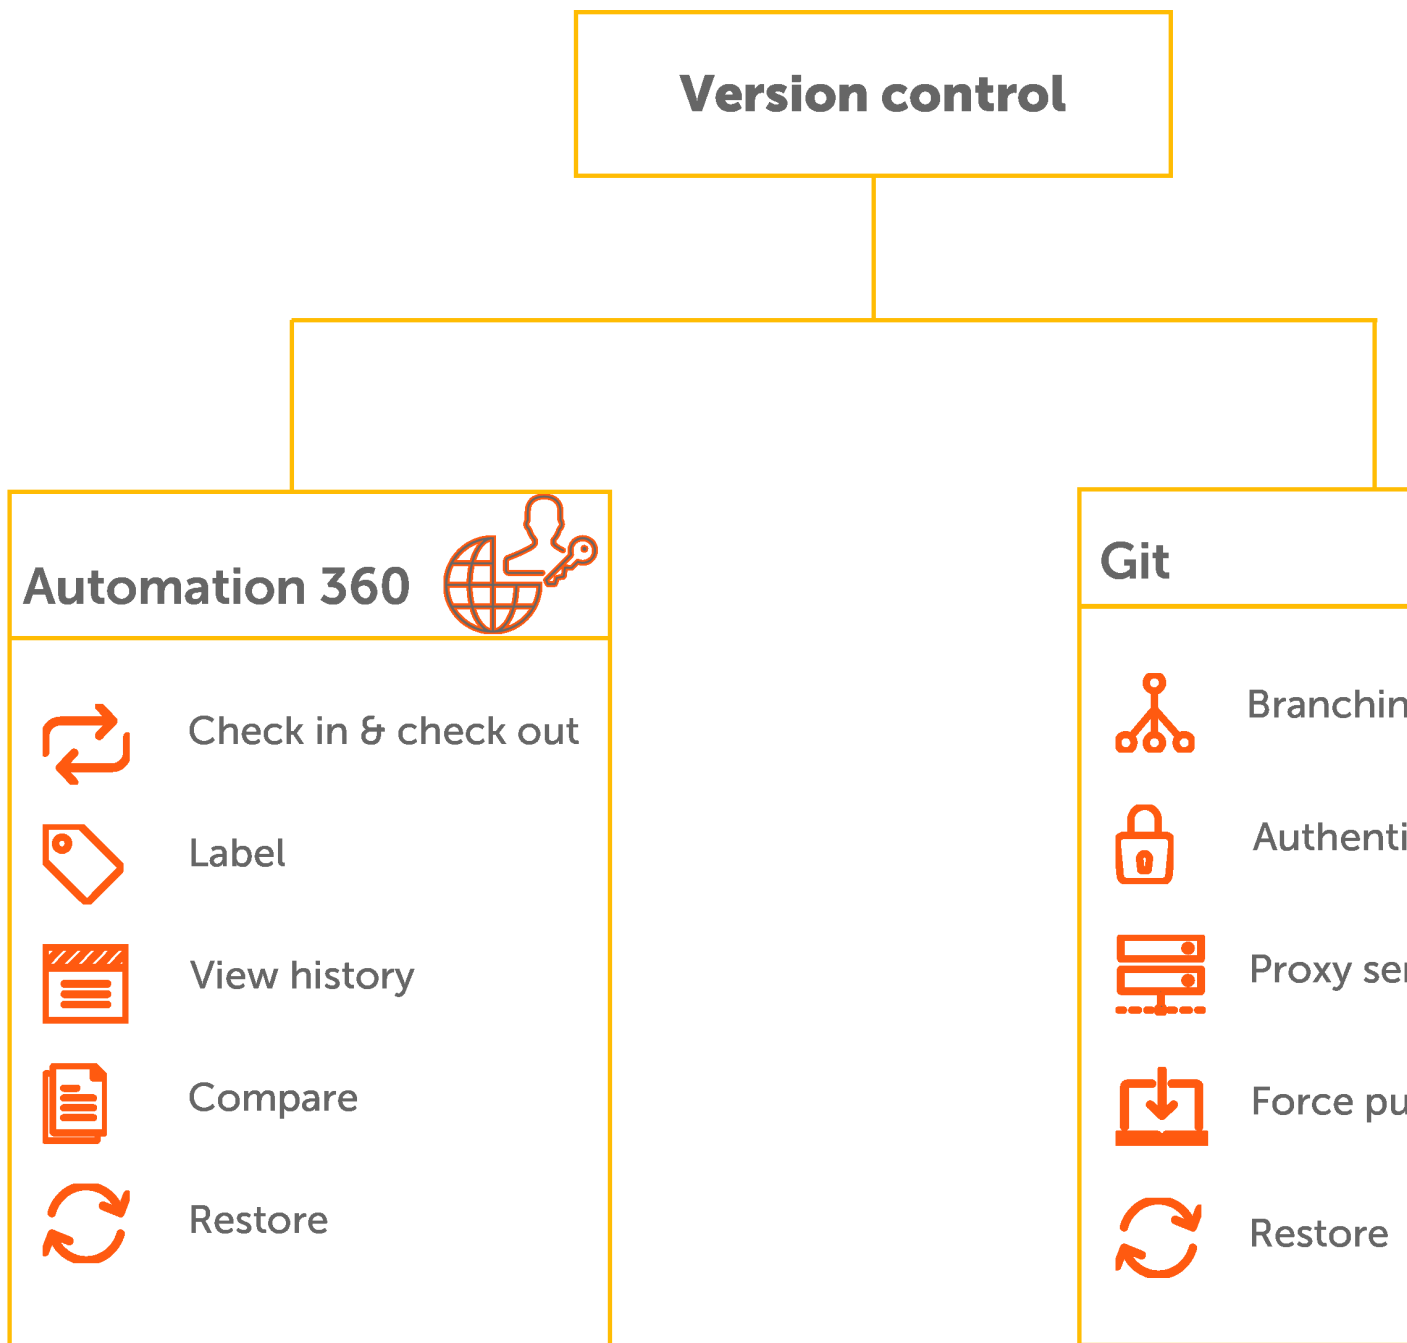

6. Click **Save changes**.

Version control in Automation 360

Version control helps you to manage the changes that you make to files that include TaskBots, documents, reports, scripts, executable files, and workflows. With version control, you can track and monitor changes to your bot logic.

With version control, you can identify the version of a bot that you want to modify and compare your recent changes against the changes made to the bot previously. As a Control Room admin, you can configure version control in the Control Room settings.

Automation 360 includes version control capabilities, and you can use these capabilities irrespective of whether you have integrated your Control Room with Git. Review the capabilities available in Automation 360 and Git.

Version control in Automation 360

- **Check out and check in TaskBots:** You can check out one version of a bot (version 1) from public to your private workspace, make changes to it, and then check in the bot to the public workspace. This creates a new version (version 2) of the bot, which is the latest version. Every time you check out, make changes to, and check in a bot, a new version of the bot is created as the latest version.

Note: You can run either the latest version of a bot or the version that has the production label.

You can roll back to a particular version of a bot by selecting **Advanced options** in the check out action to select a specific version of the bot to check out. Also, you can select the dependencies to check out. By doing this, you can make changes to a specific version of a bot and its dependencies.

When you check in this bot, it becomes the latest version. For example, if the latest version of a bot is version 8 and you want to roll back to version 3, you must first check out version 3 of the bot and then check it back in, which creates version 9. This latest version, which is identical to version 3, is now available in the public workspace for bot operations.

[Check in a bot](#) | [Check out a bot](#)

- **Label TaskBot:** You can also roll back to a specific version of a bot by assigning a label to that version of the bot. You can use this label to choose the version with which you want to perform certain bot operations. With the version of your choice, you can schedule, run, queue, export, and trigger bot development workflows.

[Assign label to a bot](#)

- **View TaskBot history:** You can view the version history of your TaskBots in the public workspace. With **View history**, you can view the history of changes that have occurred in your TaskBots and identify the actions performed by a user. The list of all the versions of a bot is shown in reverse chronological order. The information displayed includes version number, check-in message, date and time of check-in, and the name of the user who checked in the version.

[View TaskBot version history](#)

- **Compare versions:** You can compare any two versions of your TaskBots to view the differences between those two versions.

[Compare bot versions](#)

- **Restore bots from Git:** Even if your Control Room is not integrated with Git, you can restore bots from Git to your public workspace. For example, if you have 50 bots in your public workspace and 75 bots in Git, you can restore the remaining 25 bots from Git to your public workspace.

Note: This restore option is available only for On-Premises deployments and not supported on Cloud deployments.

Version control with Git

If your Control Room is integrated with Git, all the versions of the bots and files in Automation 360 are synced with Git, and you can use the following additional capabilities:

- Integrate with a Git branch.
- Integrate with Git through SSH authentication.
- Integrate with Git through a proxy server.
- Restore bots or files to an empty public repository from an existing Git configuration.
- Configure force push when connecting to Git.

[Integrating Control Room with Git repositories](#)

Integrating Control Room with Git repositories

Git integration with the Control Room ensures one-to-one mapping of the bots checked in to the public workspace of the Control Room and the remote Git file structure. Git commits enable you to enforce security, compliance, and code standards, and ensures that an organization's established best practices can be applied to their bot development processes.

The Control Room has Git Client that is connected to the Git repository that stores the file history of your public workspace. Each time a bot developer performs a bot check-in:

- The bot and the dependent files are checked in to the public workspace.

- The Control Room creates a commit that contains all the contents of the particular check-in within the Git repository.
- The comment entered in the check-in process is used as the Git commit message and the user details are recorded as the author of the Git commit.
- The Bot definitions are stored as JSON files in the Git repository.

Note: The Git repository must be configured to have write access only to the Control Room and not to any other Git client.

Supported Git repositories

You can configure the Control Room to replicate the built-in Git repository with the remote Git host, and synchronize information using Git push. The following sources are certified for Git integration with the Control Room.

- GitHub
- BitBucket
- Azure DevOps

Configure HTTPS (username and password authentication) between the Control Room and the remote Git host. The Control Room and remote Git host use standard Git push protocol over HTTPS to send or receive data.

Exposing the files to your remote Git host enables you to review the bot code and files using third-party comparisons and static code analysis tools to help enforce compliance and maintain security standards.

Configure a remote Git repository in Control Room

Configure a remote Git repository in the Control Room so that you can version all the bots and their dependencies and store them in the Git repository. In addition to the local Automation 360 repository in the Control Room, the remote Git provides a backup for the bots and their dependencies.

- In order to configure a remote Git repository in the Control Room, ensure that you have the `AAE_Admin` role.
- Based on your region, configure your network firewall to add outbound NAT gateway IP addresses to the allowed list.

[Automation 360 IP addresses for external integrations](#)

Note:

- The Git repository must be configured to have write access only to the Control Room and not to any other Git client.
- You cannot upload files greater than 100 MB to the Git repository.

-
1. In the Control Room, navigate to **Administration > Settings > Remote Git repository integration**.
 2. Click **Edit**.

3. Choose one of the following authentication methods and perform the corresponding steps to set up your Git configuration:

Authentication method	Steps
HTTPS Authentication	<p>a. Enter the HTTPS repository path, including the username in the following format:</p> <pre>https://<username>@bitbucket.org/ companyname/product.git</pre> <hr/> <p>Note: Use the Git host that you want to obtain the Git repository address.</p> <hr/> <p>b. Enter the branch name. The changes are pushed to the branch selected. By default, the master branch is selected.</p> <p>c. Enter your Git repository password or a generated Git token.</p> <p>d. Re-enter the password or Git token to confirm.</p>
SSH Authentication	<p>a. Enter the SSH repository path in the following format:</p> <pre>https://git@bitbucket.org:companyname/ product.git</pre> <hr/> <p>Note: Use the Git host that you want to obtain the Git repository address.</p> <hr/> <p>b. Enter the branch name. The changes are pushed to the branch selected. By default, the master branch is selected.</p> <p>c. Enter your SSH authentication private key. You must create the private and public key pair by using the RSA algorithm.</p> <hr/> <p>Note: Ensure that the private key entered in the Control Room contains the following string: -----BEGIN RSA PRIVATE KEY----- AND -----END RSA PRIVATE KEY-----</p> <p>You must generate the public key and enter it in your Git server.</p> <p>See the following topics for steps on how to generate the public key depending on your server:</p> <ul style="list-style-type: none"> • Adding a new SSH key to your GitHub account • Set up an SSH key to your BitBucket account <hr/> <p>d. Optional: Enter the passphrase.</p>

4. Optional: Select the **Connect to Git via proxy** check box.
 - a) Enter the proxy host name or IP address.
 - b) Enter the port number.
 - c) Optional: Select the authentication check box and enter the user name and password.
5. Click **Connect and Save**.
The Control Room connects to the remote Git repository, and the following message is displayed: `Git integration settings successfully saved`. You can also check the audit log where the status for **Set git settings** is displayed as successful.

You can connect to the same Git repository with a different username in the Control Room. For more information, see [How to change the remote Git repository username in the control room \(A-People login required\)](#).

See the following video for an overview of Git:

Connect to Azure DevOps Git from Control Room

You can connect to Azure DevOps Git through the Control Room to check in and manage a bot and its dependent files to the remote Azure DevOps Git repository. It creates a back-up for all your checked-in bot and its dependent files on Azure DevOps.

- To connect to Azure DevOps Git from Control Room, ensure that you have the `AAE_Admin` role.
 - Make sure that you have an Azure DevOps account.
1. Log in to the Azure DevOps account.
 2. Create an Azure DevOps project. Provide a project name and description, select project visibility (public or private), and then click **Create**.
 3. Click **Repos**.
 4. Click **Generate Git Credentials**. Enter the username and the password or token. When you obtain a token to connect to Git, ensure that you have **Read** and **Write** permissions.
 5. Copy the Git repository path without any changes to **Administration > Settings > Git integration > Configuration > Setup Git integration > Edit > Git repository path (including username)** in the Control Room and enter the password/token.
 6. Click **Connect and Save**.
 7. To confirm whether your connection is successful, check in a file from the private repository to a public repository and verify that your changes are pushed to Azure DevOps Git repository.

Remove Git integration configuration

If there is no longer a need to synchronize the bot information stored in your Control Room with the remote Git host, you can remove or disable it.

Ensure that you have the `AAE_Admin` role assigned to you.

1. Navigate to **Administrators > Settings > Git Integration**.
2. In the **Git Integration** window, click **Edit**.
3. Select **Do not set up Git integration**.
4. Click **Connect and Save**.
This setting removes the remote Git configuration, and the Control Room will no longer push the Git history to the remote Git host.

Automation 360 IP addresses for external integrations

To ensure seamless connectivity of your Git instance, on premises key vault, or SIEM with the Cloud Control Room, configure your network firewall to include Automation Anywhere outbound Automation 360 IP addresses to the allowed list.

Based on your region, add the following outbound Automation 360 IP addresses to the allowed list:

Region	IP addresses
- Africa	<ul style="list-style-type: none"> • 13.244.57.44 • 13.244.197.159 • 13.244.185.72 • 54.228.5.1 • 54.228.48.30 • 54.217.103.248

Restore bots from Git repository

If your database is deleted or corrupted, you can restore all your bots and the associated dependent files from the Git repository to your new database. This restore option is available only for On-Premises deployments and not supported on Cloud deployments.

Ensure the following before you restore your bots from Git:

- You must have a backup of the bots on Git.
- You must have the **AAE_Admin** role assigned.
- The Git restore process requires some downtime. When the restore process is running, the following public workspace operations are disabled:
 - Check-out
 - Clone
 - Run and schedule bots
 - Run bots with queue
 - Import and export bots

- When the restore process is running, the check-in operation is not allowed from the private workspace. However, you can use the private workspace for the rest of the operations.
- You can restore your bots to your empty or non-empty repository.
- You cannot abort an ongoing restore process.

1. Log in to the Control Room as an admin user.
2. On the left pane, click **Automation**.
A list of available and forms is displayed.
3. Click the **Restore from Git** option in the **Public** workspace.
The **Restore from Git** dialog box appears, displaying a warning that all the public repository operations will be disabled during the Git restore process.
4. If you have duplicate files in the Git repository, select to either **Overwrite existing files** or **Skip existing files** in the Git repository.
5. Based on whether the repository is empty or non-empty, choose one of the following options:
 - To restore files to a repository that is not fully empty, enter your Git credentials for the associated repository.

Note: You cannot use the existing Git configuration for a partially filled repository.

- To restore files to a fully empty repository, you can choose the Git repository from which you want to restore your files.

Option	Action
Use existing git configuration settings	Select this option to restore your data from the Git repository configured with the Control Room. Note: Ensure you connect your Control Room to the remote Git repository from Administration > Settings > Remote Git repository integration .

Option	Action
Use manual settings	<p>Select this option to restore data from any other repository.</p> <ol style="list-style-type: none"> Enter the HTTPS repository path including the username in the following format: <code>https://<username>@bitbucket.org/companyname/product.git</code> Enter the branch name. Enter your Git repository password or a generated Git token. Re-enter the password or Git token to confirm. <hr/> <p>Note: If you are using the same settings as the existing Git configuration, you will encounter an error. To use the same configuration, first remove the remote Git repository integration setting in Administration > Settings > Remote Git repository integration before providing the same in this manual settings option.</p>

6. Optional: Select the **Connect to Git via proxy** check box.
 - Enter the proxy host name or IP address.
 - Enter the port number.
 - Optional: Select the authentication check box and enter the user name and password.

7. Click **Continue** to proceed with the restore process.

The system starts restoring the bots and the dependent files from Git. This process takes some time. After the restore process is completed successfully, you are automatically returned to the **Automation** page. The bots and the dependent files are restored in your new database, maintaining the original structure of the dependent files.

If the Git restore process fails after restoring some bots, you are redirected to the public workspace with the following options. Choose the required option to complete the restore process:

Option	Action
Revert restoration bots	<p>This option clears all the bots that were restored.</p> <hr/> <p>Note: This option will delete the public bots that were restored from the Git repository.</p>
Restart restoration	The Git restore process restarts from where it ended.
Keep only the restored files	This option retains whatever files were restored and will exit the restore process.

Usage statistics

Automation Anywhere collects usage statistics from Automation 360 for product improvements.

Usage statistics provides information on where users might be facing issues with the product, the most used or least used features, and so on. This information helps in product improvement which in turn helps in improving the customer experience.

By default, the **Usage statistics** option is enabled in the Control Room and usage data is collected. The data collected is stored in Automation 360 and the service provider cloud. The collected data is typically generic information such as anonymized user details, customer name, and user navigation workflows such as menus the users access and clicks.

An administrator can disable the **Usage statistics** option by changing the settings in the Control Room.

Note: The option can be disabled only for On-Premises deployments.

Disable usage statistics

An administrator can disable the **Usage statistics** option by changing the settings in the Control Room.

Ensure that you are logged in to the as the administrator.

1. Navigate to **Administration > Settings > General > Advanced settings**.
2. Click the **Edit** icon. (✎)
3. Select the **Disabled** option.
4. Click **Save changes**.

Set up instances for Cloud-enabled deployments

Manage trust relationship between the cloud-deployed Automation 360 Cloud-enabled instance and the On-Premises applications.

Ensure that you are logged in to the as the administrator.

For Cloud-enabled deployment, the initial welcome email that you received from Automation Anywhere contains:

- URL to the Automation Anywhere Cloud-enabled instance
- Provisioning token needed to establish trust connectivity with the Automation Anywhere Cloud Control Room

Automation Anywhere deploys and configures an Automation Anywhere Automation 360 Cloud instance for this Cloud-enabled deployment option. The customer then installs the On-Premises application within their infrastructure for storing and processing customer data. After this is complete, you install the On-Premises application within your infrastructure for storing and processing customer data.

1. Log in to the On-Premises Control Room as the administrator.
2. Navigate to **Administration > Settings > Cloud-enabled**.
3. Provide the provisioning token to connect to the Control Room.
4. Click **Save changes**.
5. Optional: Test the Cloud-enabled functionality.
Open a browser and enter the URL for the Cloud Control Room service instance. Click **Enter** to be redirected to the On-Premises Control Room.

Generate registration key to install Bot Agent in bulk

The Control Room administrator can generate a registration key to install the Bot Agent on multiple devices at a time in bulk.

Ensure you have set up the Microsoft Active Directory group policy to remotely install the Bot Agent on multiple devices.

Use Microsoft Active Directory Group Policy to remotely install software

Generate and copy the key for use in an installation script or as part of the Active Directory group policy to install the Bot Agent on multiple devices at a time.

Also, download the latest Bot Agent MSI installer file to your default downloads path to install the Bot Agent in bulk.

1. Navigate to **Administration > Settings**.
2. Select the **Bot agent bulk install** option.
3. Generate a new registration key for installation.

Note: Before you generate a new key, keep in mind that the new key invalidates the previous key and any entries or references to the previous key must be replaced with the new key value. Therefore, we recommend that you generate a new key only if the previous key is compromised.

- a) To launch the setting in edit mode, click the **Edit** option.
When you open this setting for the first time, the option **Generate a new key** is shown by default and the phrase `Key not set` appears.
 - b) To create a new registration key, select the **Generate a new key** option.
 - c) To install the Bot Agent using an installation script or through a Active Directory group policy, click **Copy to clipboard**.
 - d) Save the settings.
4. Replace the registration key:
 - a) To launch the setting in edit mode, click the **Edit** option.
The **Keep current key** option is displayed by default.
 - b) To generate a new registration key, select the **Generate a new key** option.
 - c) Select **Continue** on the **Current registration key replacement** message box.
 - d) To use the key, click **Copy to clipboard**.
 - e) Save the updates.
 5. To download the latest Bot Agent MSI installer file, click **Download installer**.
The Bot Agent installer MSI file is downloaded to your default `Downloads` folder.

Edit the Bot Agent MSI file to remotely install the Bot Agent on multiple devices.

Related tasks

[Perform bulk installation of Bot Agent on devices](#)

Edit the Bot Agent MSI file to bulk install (or silently install) the Bot Agent on permanent and temporary devices such as on-premises machines, virtual machines (VM), and non-persistent virtual desktop infrastructure (VDI), for example Citrix, in the Control Room.

Edit the Bot Agent installer file

Edit the Bot Agent MSI installer file to add the registration key and Control Room URL to remotely install the Bot Agent on multiple devices.

To perform this task, you must be a administrator and have the required rights and permissions.

Ensure the Windows 10 Software Development Kit including Orca and Control Room are installed on your device. You can install Orca from `C:\Program Files (x86)\Windows Kits\10\bin\10.0.18362.0\x86\Orca-x86_en-us.msi`.

Set up the Microsoft Active Directory group policy to remotely install the Bot Agent on multiple devices.

Use Microsoft Active Directory Group Policy to remotely install software

Edit the Bot Agent .msi file to enable the Control Room administrator to implement the auto-update Bot Agent policy.

1. Use the latest `AutomationAnywhereBotAgent.msi` file from the following locations:

- Download the file from the Control Room (**Administrator > Settings > Bot agent bulk install**).

The download option is available for On-Premises and Cloud deployments.

- Select the file from the `<application filepath>\crui\asset` folder. For example `C:\Program Files\Automation Anywhere\crui\asset`

This option is available only for On-Premises deployments.

2. Edit the `AutomationAnywhereBotAgent.msi` file using Orca tool.

3. Click the **Property** option.

4. Change the value for `AA_CRTOKEN` and `AA_CRURL`.

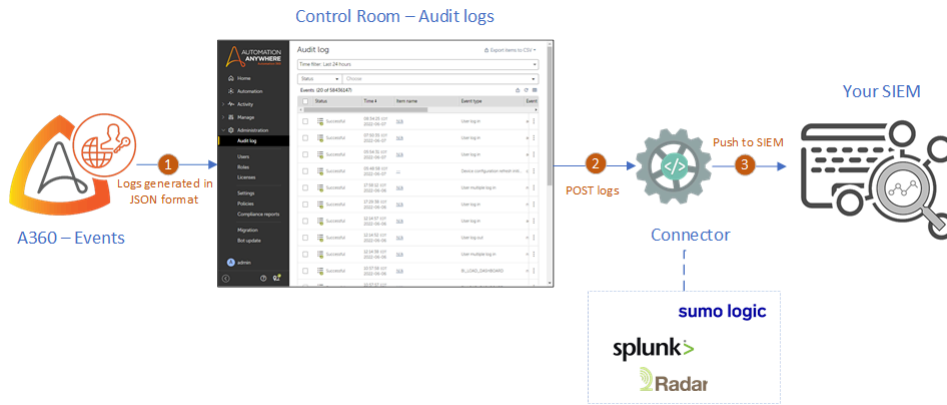

The `AA_CRTOKEN` uses the registration key and the `AA_CRURL` uses the Control Room URL for which the registration key is generated.

5. Save your changes.

Configure integration with SIEM

The Automation Anywhere Control Room supports security information and event management (SIEM) tools ingesting logs from your tenant's Audit logs.

With SIEM integration, audit logs can be sent to analytic tools, such as *Splunk*, *QRadar*, *Sumologic*, and *Arcsight*. By pushing audit log entries to SIEM tools, you can integrate and leverage the advanced searching and reporting features of SIEM solutions. When configured, the Control Room audit logs are forwarded to the configured SIEM server.

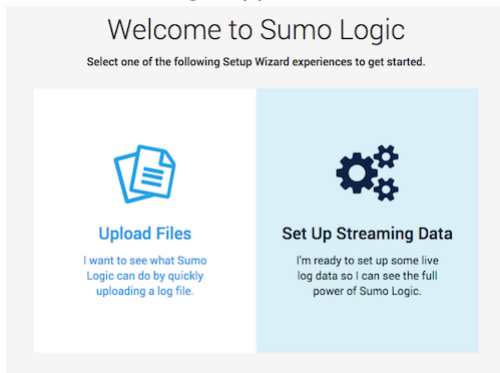

Configure an SIEM server step by step so that Automation 360 sends the audit messages to the SIEM server. In the following example, Sumo Logic is used as the SIEM provider. Use the same procedure to configure any other SIEM server.

Setting up Sumo Logic

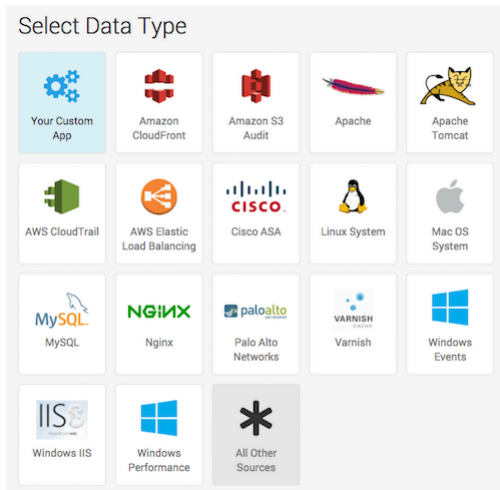

To use Sumo Logic as a logging endpoint, you will need to create a Sumo Logic account, add a new source, and save the HTTP source URL. To add a new source in the Sumo Logic website, perform the following steps:

1. After you create your Sumo Logic account, the Sumo Logic Setup Wizard appears. If you already have an account, you can access the wizard by selecting **Setup Wizard** from the **Manage** menu at the top of the Sumo Logic application. In the **Setup Wizard**, click **Set Up Streaming Data**.

The **Select Data Type** window appears.

2. Click **All Other Sources**.

The **Set Up Collection** window appears.

3. Click **HTTP Source**.

The **Configure Source: HTTP Source** window appears.

4. Enter a name in the **Source Category** (for example, Http Input), and select a timezone for your log files.

The 'Configure Source: HTTP Source' window has two steps. Step 1: 'Enter a Source Category that will help you search your logs later.' The 'Source Category' field contains 'custom_http_logs'. Step 2: 'Select a time zone for your log file.' The 'Use time zone from log file. If none present use:' option is selected, and the dropdown menu shows '(UTC) Etc/UTC'. A 'Continue' button is highlighted in blue.

5. Click **Continue** to see a magic url such as the following:

```
https://endpoint1.collection.us2.sumologic.com/receiver/v1/http/ZaVnA4dhaV0nFJAEMuwFDGEEZUnDedm7hYhkdUJSAE44bmKKp1mp4LsYDCr2MzTA0C21czkqjz9UVjC1mk41
```

Save this URL in an editor. You will need it when you add Sumo Logic as an SIEM logging endpoint.
[Adding Sumo Logic as an SIEM logging endpoint](#)

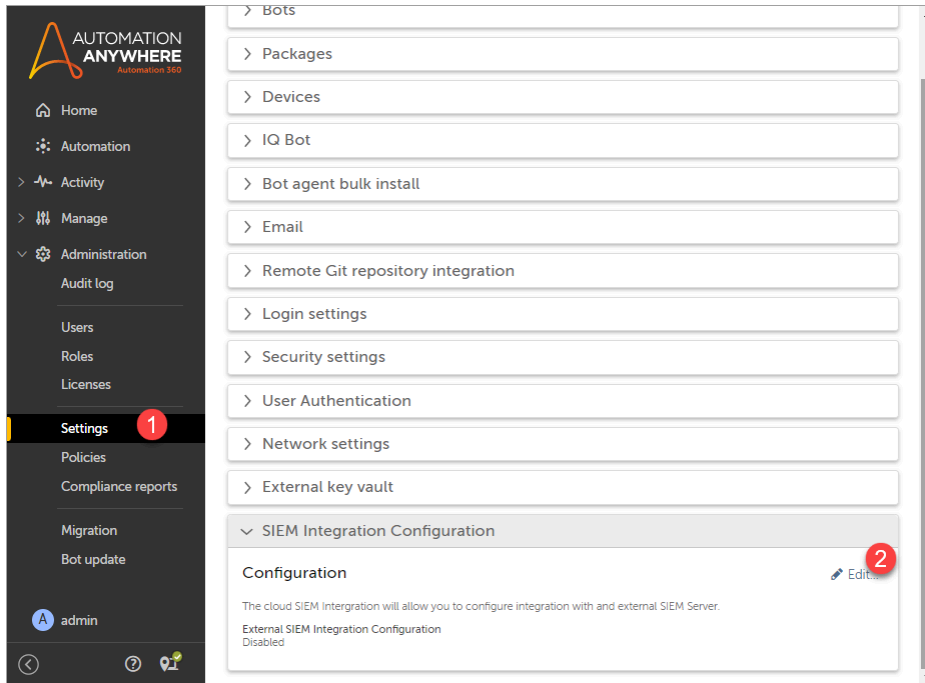

Adding Sumo Logic as an SIEM logging endpoint

To configure the server where audit logs will be sent, perform the following steps:

Note:

To perform this task, you must be an administrator and have the required rights and permissions.

1. Navigate to Administration > Settings > SIEM Integration Configuration.

- Select **Enabled** and paste the **SIEM server endpoint** that you copied previously, from [Setting up Sumo Logic](#).

Note: Ensure that you refer to your SIEM provider's documentation to get the information regarding the HTTP headers and requirements around JSON attributes (request body).

- Select **POST** HTTP method, because Sumo Logic accepts the inputs as a POST method.

Note: The SIEM tool certificate is optional and depends on the SIEM provider. Some SIEM providers require you to enter a valid SIEM tool certificate.

- Enter a name for **Event attribute**(for example, audit). All the log messages will be logged under this category and will act as key to locate all the event logs.

Note: The timestamp attribute is an optional field and depends on the SIEM provider's mapping for this field. For example, Splunk requires the value to be *time* and mapped to one of its timestamp fields. The maximum length allowed is 256 characters. All special characters are allowed except the backslash (\) and double quotation marks ("). These characters have to be escaped.

- Click on plus (+) sign to enter a few **key-value pairs for body** (static attributes) that are sent out along with the logs. The key-value pairs also take special characters as inputs. You will be able to configure a maximum of 50 attributes.

- Click on plus (+) sign to enter a few **key value pairs for header** to be sent with every event data log. The header data is specific to the SIEM provider. For example, with Sumo Logic, it supports

header names starting with the letter X (for example, X-Sumo-Fields). You will be able to configure a maximum of 50 headers.

For more information about header data, see the corresponding SIEM provider's documentation.

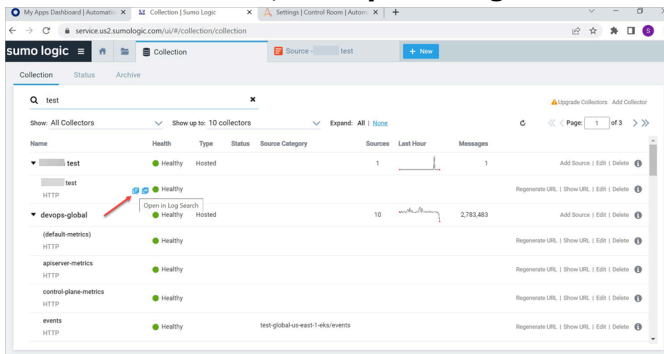

Verifying data in Sumo Logic

Reception of audit logs are verified using the Sumo Logic web interface. One way to do this is to search for events using the name of the collector and source. Perform the following steps to verify the data in Sumo Logic:

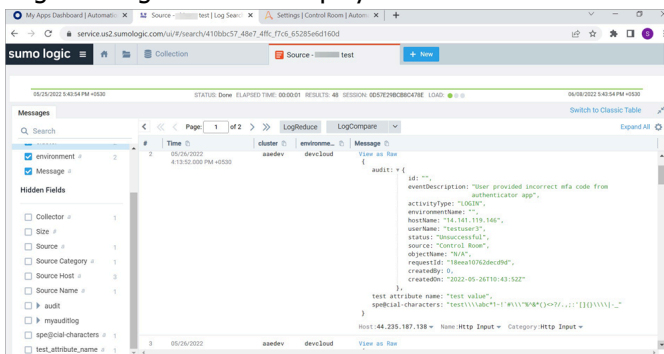

1. Generate an audit log by generating an event. For example, create a user (*Create a user*).
2. Go to *Audit log* to see the entry in the logs.

In Sumo Logic, you will notice the event logged in the source that you configured when setting up Sumo Logic. *Setting up Sumo Logic*

3. Navigate to **Manage Data > Collections**.
4. On the **Collection** tab, click **Open in Log Search** icon next to the respective log source.

It displays events filtered by collector and source. A user creation event in JSON format sent to Sumo Logic through HTTPS is displayed.

Use AuthConfig App to enable OAuth2 services

As an Organization Administrator with access to CALM (Automation Anywhere app hosted on Salesforce), you use the AuthConfig App to manage the relationship between a set of Automation 360 Control Room instances and our OAuth2 (Open Authorization) services.

Note: The availability of this feature is based on your region.

You use OpenID tokens (issued by Salesforce) to authenticate to the AuthConfig App.

Token overview

Automation Anywhere and the AuthConfig App support the following token types:

- **Control Room registration token:** The AuthConfig App generates this token which you enter in the **OAuth Settings** panel of the Automation 360 Control Room. The Control Room registration token establishes the identity of your Control Room to the AuthConfig App. After you register and enable the token, the Control Room can consume access tokens to call APIs.
- **Access token:** A JSON web token generated from an authorization provider after authenticating with an Identity Provider (IdP). Access tokens contain claims that provide information to a resource server. API calls use access tokens to enable an authorized client to gain access to data on the resource server.
- **Refresh token:** Refresh tokens provide a method to get new access tokens without having to collect and authenticate credentials every time an access token expires.

The AuthConfig App generates Control Room registration tokens to enable OAuth2 services. The following diagram shows how a registration token flows between the AuthConfig App and the Automation 360 Control Room:

1. The Administrator uses the AuthConfig App to generate a registration token.
2. The registration token is stored in the database.
3. The Administrator enters the generated registration token into the **OAuth Settings** in the Automation 360 Control Room.
4. The registration token is stored in the database.
5. The registration token is then sent to the AuthConfig App where if the token matches the token stored in the database, the Control Room is registered.

Benefits

You use the AuthConfig App to:

- Enable or disable OAuth2 services for an Automation 360 Control Room (On-Premises or Cloud).
- Configure an Identity Provider (IdP) configuration using a SAML authentication connection for your organization to use with OAuth2 services.
- Generate registration tokens for each Control Room to securely enable OAuth2 services.

For details about accessing automations in a web scenario with AARI Extensions and using a custom widget through Google Chrome extensions, click [here](#).

Prerequisites

Before you use the AuthConfig App:

- Create your Automation Anywhere community (Apeople) credential: [A-People home page \(login required\)](#).
- From the Automation 360 Control Room:
 - To enable an IdP authenticated user to use an access token to call a Control Room API, you must also add the IdP authenticated user as a Control Room user.
 - To use access tokens, you must register and enable Control Room instances with OAuth2 services.

After you complete the prerequisites, you can [access the AuthConfig App](#).

Access the AuthConfig App

The AuthConfig App generates Control Room registration tokens to enable OAuth2 services.

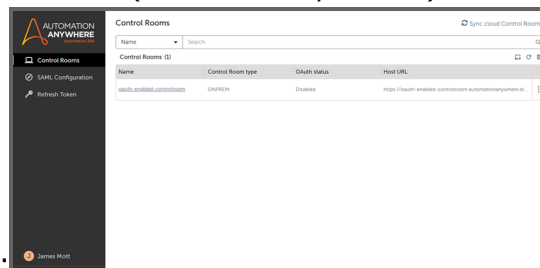

To access the AuthConfig App:

1. Log in to the Automation 360 Control Room as the Administrator.
2. To obtain the AuthConfig App login URL, you can either:
 - From the Control Room, navigate to: **Administration** > **Settings** > **OAuth**, and then click the link provided in the Registration text area, or
 - Copy and paste this URL (default URL) into a browser window: `https://oauthconfigapp.automationanywhere.digital`
3. The **AuthConfig App Log in** dialog box displays:

Click **Log in** to log in with your existing Apeople credentials. You are re-directed to the [A-People home page \(login required\)](#) page.

4. From the A-People home page, enter your credentials (username and password) and click **Log in**. You

are re-directed to the AuthConfig App page:

From AuthConfig App page, you can:

- [Review existing On-Premises and Cloud Control Room instances to enable OAuth2 services](#)
- [Configure SAML](#)

- [Manage refresh tokens](#)

To log out of the AuthConfig App:

1. Click your username profile at the bottom of the page to open the **Log Out** dialog box:

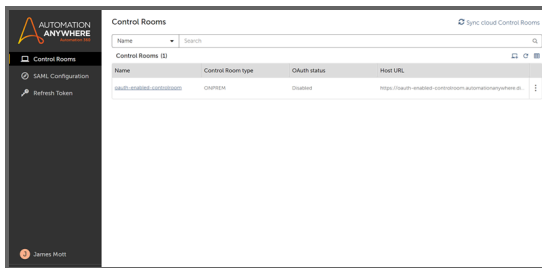

2. Click **Log Out**.

Review Control Rooms

If not already displayed on the AuthConfig App page, select **Control Rooms** on the left side of the page to display a list of all your On-Premises and Cloud Control Rooms.

If new Control Room instances were added through CALM (Automation Anywhere App hosted on Salesforce), click **Sync cloud Control Rooms** at the top of the page to update and display them in the list.

Note: If you delete a Cloud Control Room from the AuthConfig App (which still has a valid license in Salesforce), then the Cloud Control Room will re-appear in the Control Room list after syncing.

From the **Review Control Room** page, you can:

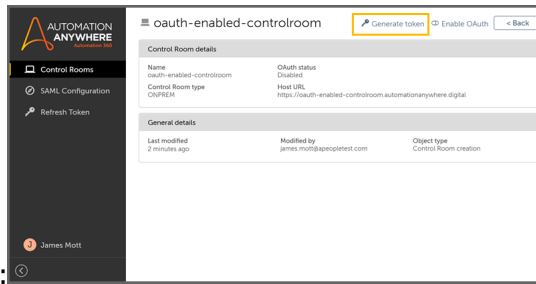

- [Generate a registration token for a Control Room](#)
- [Enable or disable OAuth2 services for a Control Room](#)
- [Add or delete an On-Premises Control Room](#)

Generate a registration token for a Control Room

To generate a registration token for a Control Room:

1. Click the Control Room name or hover over the actions menu (three vertical ellipses) located to the right of the Control Room name and click the **Binoculars** icon. The Control Room details page displays.

- To generate a registration token for the Control Room to enable OAuth2 services, click **Generate**

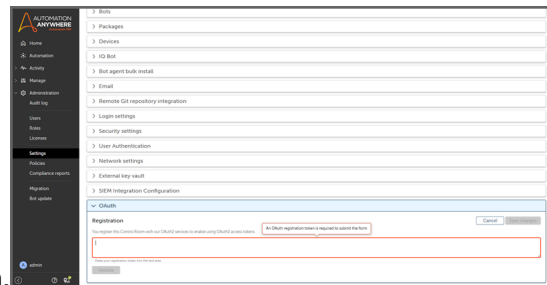

token at the top right of the page:

- A confirmation message displays asking if you want to generate the token. The generated token is required to register your Control Room tenant with OAuth2. Click **Generate**.
- A dialog box displays the newly generated registration token. Click **Copy token**.

Note: You should store this token in a safe place for future use. You cannot retrieve this token after you close the window.

-

Navigate to: **Administration > Settings > OAuth2**. In the text area, paste the token you copied to register the Control Room with our OAuth2 services to enable using OAuth2 access token.

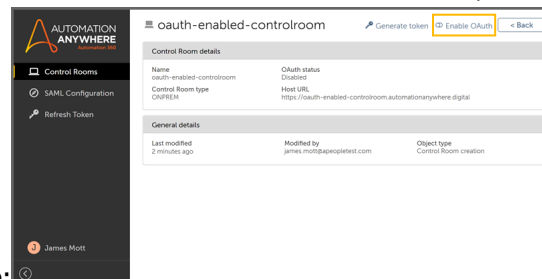

- Click **Validate** and review the data to ensure that it matches the Name and Host URL you were expecting.
- Click **Save changes**.

This registers the AuthConfig App with the selected Control Room.

Enable or disable OAuth2 services for a Control Room

To enable or disable OAuth2 services for a Control Room:

- Click the Control Room name or hover over the actions menu (three vertical ellipses) located to the right of the Control Room name and click the **Binoculars** icon. The Control Room details page displays.
- By default, the OAuth2 services for a Control Room are disabled. To enable OAuth2 service, click the

Enable OAuth2 toggle at the top right of the page:

The OAuth status changes to **Enabled**.

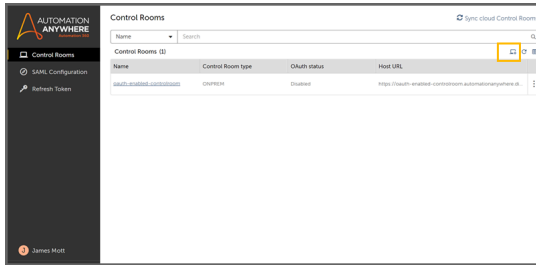

3. Click **< Back** to return to the Control Room list.

Add or delete an On-Premises Control Room

Note: You cannot add a Cloud Control Room because it is consumed automatically by the AuthConfig App.

To add an On-Premises Control Room:

1. Click the **Add Control Room** icon at the top right of the page:

2. The **Add an On-Premises Control Room** dialog box displays:

Add an On-premises Control Room Cancel Submit

Name

Host URL

eg: https://

- a. Enter a unique **Name** and **Host URL** (for example: `https://digital.automationanywhere.com/nextbank`) for the new On-Premises Control Room. The host URL you enter must match the URL you provided to your external OAuth client (for example: Pixiebrix).
- b. Click **Submit** when finished.

To delete an On-Premises Control Room:

1. Hover over the actions menu (three vertical ellipses) located to the right of the Control Room name and click the **Delete** icon:

2. A confirmation message displays asking if you want to permanently delete the Control Room. Click **Yes, delete** to remove the registered Control Room from the AuthConfig App.

Configure SAML connection details

You configure SAML to authenticate to your Identity Provider (IdP) to obtain OAuth access tokens.

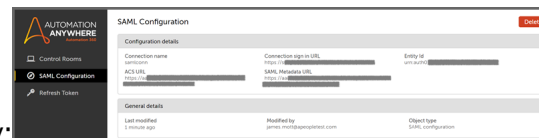

To configure SAML connection details:

1. From **AuthConfig App** page, select **SAML Configuration** on the left side of the page.
2. Click **New SAML configuration** at the top of the page.
3. The **New SAML configuration** dialog box displays:

The dialog box titled "New SAML configuration" has a "Cancel" button and a "Create" button. It contains three input fields: "Connection name", "Connection sign in URL", and "Provider public key". There is a "Browse" button next to the "Provider public key" field.

- a. Enter the connection name and sign-in URL from your external Auth Provider.
- b. Enter your Identity Provider's (IdP) public key or click **Browse** to search for it. The public key validates the IdP's signed response.
- c. Click **Create**.

The "SAML Configuration" page shows configuration details for a SAML connection. It includes fields for "Connection name", "Connection sign in URL", "Entity ID", "ACS URL", "SAML Response URL", and "Entity ID". A "Delete" button is visible in the top right corner.

The connection name configuration details display:

The ACS (Assertion Creation Service) URL directs your IdP where to send its SAML response after authenticating a user, and the Entity ID is the unique identifier of the IdP.

To delete the SAML configuration, click **Delete** at the top right of the page. A confirmation message displays asking if you want to delete the SAML configuration.

Note: If you delete the SAML configuration, Control Room users will not be able to obtain new access tokens using our OAuth2 service.

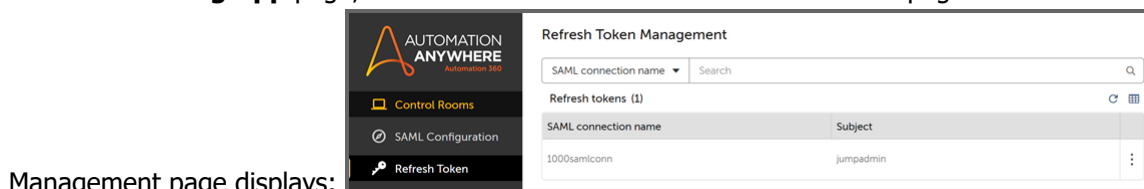

Click **Delete** to continue.

Manage refresh tokens

One SAML connection can have multiple tokens.

To manage the refresh tokens:

1. From **AuthConfig App** page, select **Refresh Token** on the left side of the page. The Refresh Token

The "Refresh Token Management" page shows a search box for "SAML connection name" and a table of refresh tokens. The table has columns for "SAML connection name" and "Subject".

SAML connection name	Subject
1000samiconn	jumpadmin

Management page displays:

2. You can enter SAML connection name or subject search parameters in the **Search** box.
3. To revoke a refresh token, hover over the actions menu (three vertical ellipses) located to the right of the token name and click the **X (Revoke)** icon.
4. A confirmation message displays asking if you want to revoke the token.

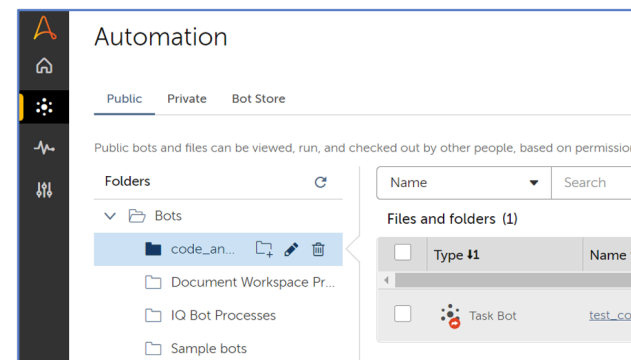

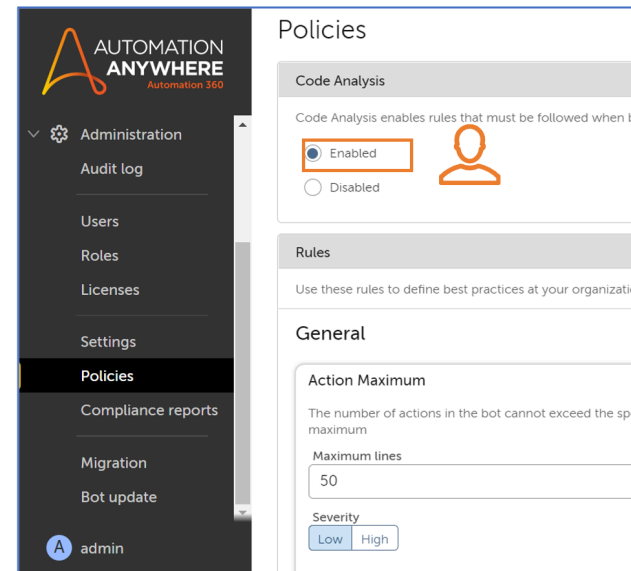

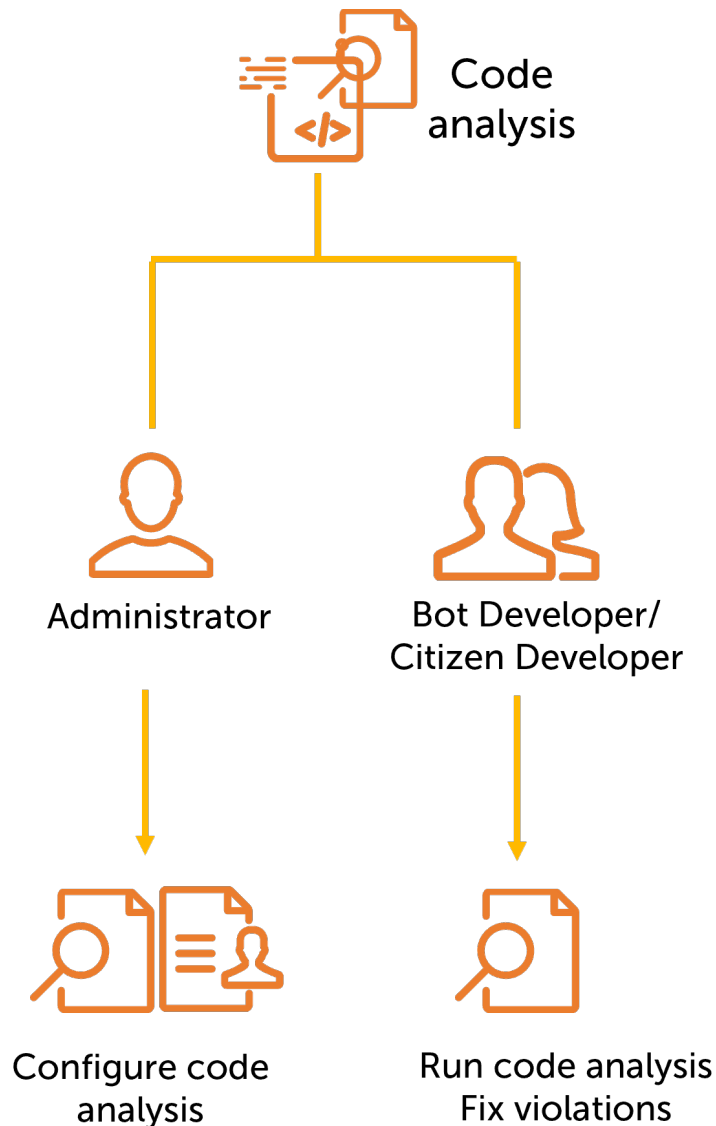

Note: By revoking the refresh token, the associated application will not be able to obtain a new access token using the refresh token.

Click **Revoke**.

Code analysis

Code analysis enables you to evaluate a program without running the code. In Automation 360, the code analysis feature analyzes the code and displays a list of violations based on a set rules. You can review and fix any coding or stylistic errors for your automation.

Code analysis enables you to form certain code structures with which you can implement coding best practices and make the code maintainable, reliable, efficient, and secure.

Benefits

Code analysis provides you the following benefits:

- Implement coding best practices by enforcing certain coding conventions.
- Authorize Citizen Developer to introduce new automations.
- Enable complex automations to be more accessible.
- Improve code readability and quality.
- Control the structure of your automation code.

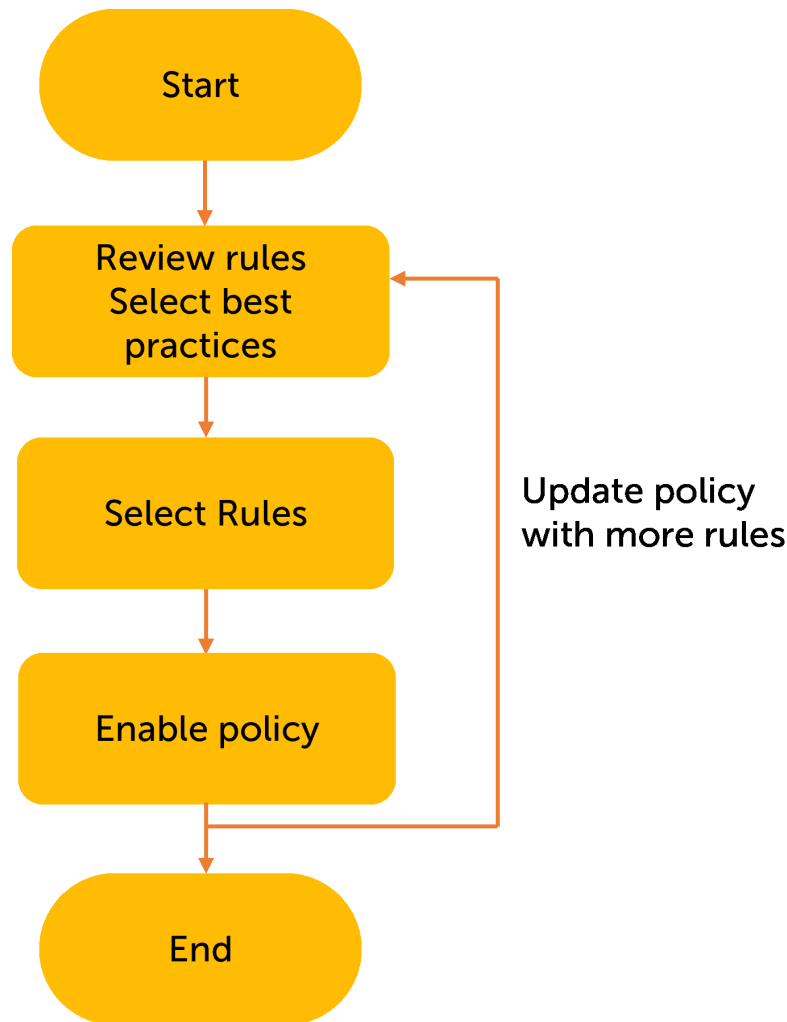

- Improve productivity of the developer and the platform as good coding practise improves the automation quality over time.

Code analysis for user roles

Lead RPA Developer (Administrator)

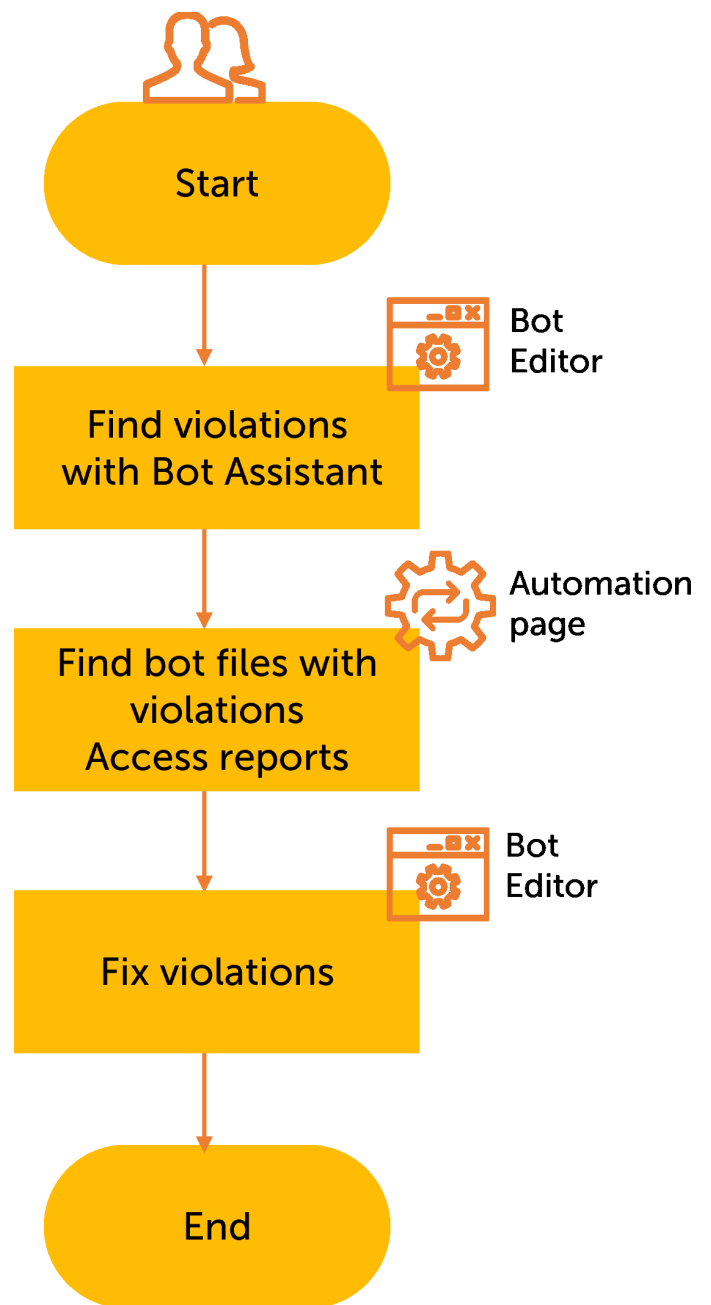

Configure code analysis policies that define coding best practices in the organization. Monitor and report the status of code quality based on adherence to these policies. Code analysis enables certain coding practices and principles to be enforced which in turn helps with the following:

- Facilitate the development of automation by a larger pool of business personnel, for example, a Citizen Developer who might not have strong software development skills.
- Improve maintenance of automations by reducing code complexity and improving readability.
- Improve reliability of automations by reducing errors.
- Improve security and compliance of automations by enforcing secure coding practices.
- Reduce production time and costs of automation.

**Citizen Developer or RPA Developer**

Code analysis provides guidance to develop automations that meet organizational requirements for the following:

- Error reduction
- Code readability and maintenance
- Code security

See the following video for an overview of how code analysis is configured:

<https://aa2019packagesdkfordocumentation.s3-us-west-2.amazonaws.com/videos/code-analysis.mp4>

Permissions

You require the following permissions to set up a code analysis policy.

- **View policies:** Allows you to view the code analysis policy that defines how you can build your automations.
- **Manage policies:** Allows you to view and edit the code analysis policy that defines how you can build your automations.

Components

- **Policy editor:** Contains a global policy for all Control Room users.
- **Rules:** As the foundation of code analysis, rules help to evaluate bot code. Rules can be simple or complex depending on the evaluation that is performed. Rules include coding practices that can be verified. They apply to packages and actions in the automation code. A rule consists of a unique RULE_CODE and a description to indicate the nature of evaluation to be performed on the code.

Code analysis rules

Rules are the foundation of code analysis. They are used to evaluate the bot logic. Rules can be simple or complex depending on the evaluation performed. Rules include coding practices that can be verified. They apply to packages and actions in the automation code.

A rule consists of a unique RULE_CODE and a description which indicates the nature of the evaluation to be done on the code. You can use the severity levels (low or high) to emphasize the criticality of the rule.

The following table lists the rules and their description that can be used with code analysis:

Rule code	Group	Title	Rule description
ACT-GEN-001	Actions, general	Action Maximum	The number of actions in the bot cannot exceed the specified maximum
VAR-NMG-001	Variables, naming	Variable Name Pattern	Variable names must match the specified naming pattern
VAR-NMG-002	Variables, naming	Variable Name Length	Variable names must be within the specified minimum and maximum character length
VAR-USG-001	Variables, usage	No Unused Variables	All the variables must be used within the bot
ACT-COM-001	Actions, comments	Mandatory Header Comment	The first action in the bot must be a Comment action
ACT-COM-002	Actions, comments	Comment Coverage	The number of Comment actions must be equal to or greater than the specified percentage of total command actions
VAL-HCV-002	Values, hard coded values	No Hard Coded Delay	The delay time in the Delay action must be set using a variable
VAL-HCV-003	Values, hard coded values	No Hard Coded File Path	The file or folder path must be set using a variable
VAL-HCV-004	Values, hard coded values	No Hard Coded Email Address	The command action field must not contain a hard-coded email address
ACT-ERR-001	Actions, error handling	No Empty Catch	The catch block cannot be empty
ACT-ERR-002	Actions, error handling	Mandatory Catch Logging	The catch block must contain a Log to File action

Rule code	Group	Title	Rule description
ACT-ERR-003	Actions, error handling	Mandatory Catch Screen Capture	The catch block must contain a Screen capture action

Reviewing code analysis results

As a Bot Creator (RPA developer) or Citizen Developer, you can use code analysis to check and fix any coding errors in your bots. You can develop automation based on configured code analysis policies and predefined rules.

With code analysis, you can improve the reliability of your bots by implementing coding best practices such as variable naming conventions, comment coverage, and error handling. Building bots conforming to the predefined guidelines or rules helps you to identify possible errors during bot development. This reduces bot failures in the production environment. You can run code analysis in both your private and public workspaces and view the results.

With code analysis (available from the Bot editor), you get the following benefits:

- Run code analysis as required.
- Get tooltip guidance for compliance with rules
- Integration with Bot Assistant for accounting and guidance.

Code analysis results

To view the results of code analysis, go to the **Automation** page, and check the **Code Analysis results**. This column shows a summary status of the code analysis results for each automation file. The following details of each status are available:

- **N/A:** Code analysis does not apply to the object because the object is a folder or is not a bot file.
- **Not Scanned:** Code analysis has not been run on the bot.
- **High severity:** The bot has at least one high severity violation.
- **Low severity:** The bot has at least one low severity violation, but no high severity violations.
- **No violations:** There are no code analysis violations in the bot.

The following image shows an example result from code analysis:

and files cannot be viewed by other people. If a bot or file has been checked out from the Public tab, it can be viewed and run by you, but cannot be edited.

Name		Search							
Files and folders (5)									
<input type="checkbox"/>	Type	Name	Status	Source version	Code Analysis results	Size	Last modified	Modified	
<input type="checkbox"/>	Folder	bulk_checkin	N/A	N/A	N/A	N/A	3 minutes ago		S
<input type="checkbox"/>	Task Bot	Excel find text which is no...	New	N/A	Not scanned	16.39 KB	23 minutes ago		S
<input type="checkbox"/>	Task Bot	test_code_analysis	Checked out	3	High severity	2.75 KB	21 hours ago		S
<input type="checkbox"/>	Task Bot	test_migration	New	N/A	Low severity	1.27 KB	24 minutes ago		S
<input type="checkbox"/>	Task Bot	test1	New	N/A	Not scanned	2.32 KB	24 minutes ago		S

100 per page

Note: The status of the bots in the code analysis results column is set to not scanned for the following scenarios:

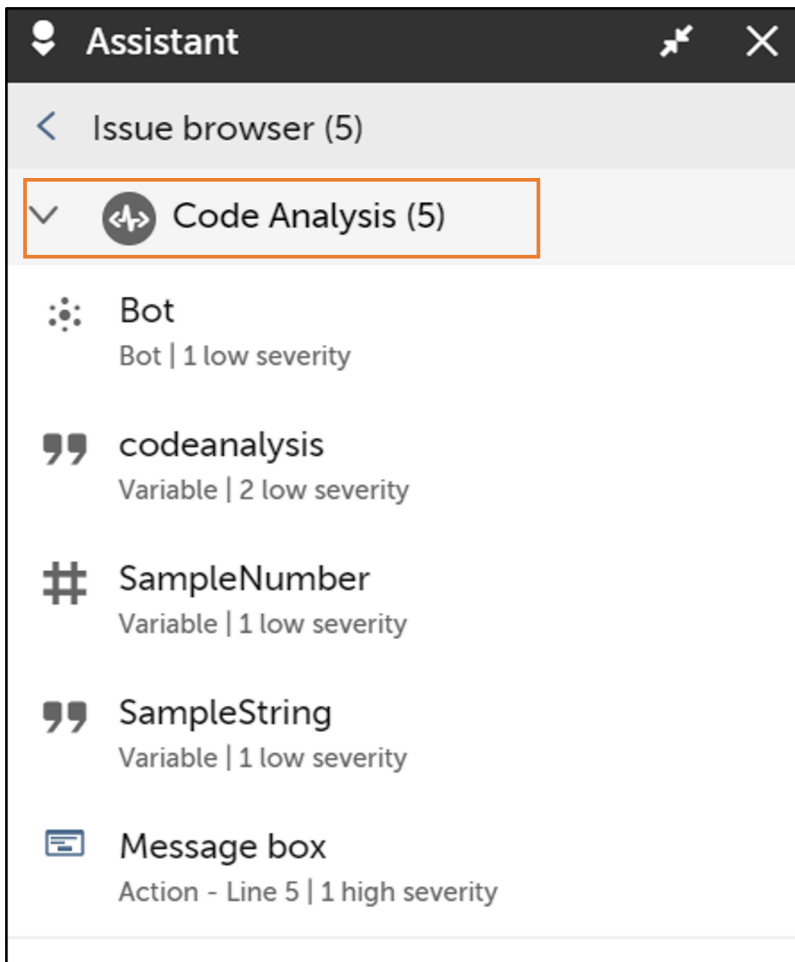

- The bot is edited in the private workspace.
- Code analysis is disabled by the administrator or there is a change in any of the rule configuration.

Reviewing results in Bot editor

When you create a bot or modify an existing bot and then save the bot in the Bot editor, code analysis is initiated in the background, and the results are displayed in the Bot Assistant. The code analysis header shows the total count of violations in the bot. You can expand the code analysis option, select a specific object and view the following attributes:

- Applicable object: Displays the bot, variable, action, and action attribute.
- Rule code: Unique RULE_CODE ID.
- Severity: High or low.
- Rule text: Description to indicate the nature of evaluation to be performed on the code.

The following image shows an example of code analysis displayed in the Bot Assistant:

The code analysis results are displayed in the following order:

Attribute	Rules violated
Bot	<ul style="list-style-type: none"> • Mandatory header comment • Comment coverage • Action maximum
Variable	<ul style="list-style-type: none"> • Variable name pattern • Variable name length • No unused variables
Action	<ul style="list-style-type: none"> • No hard-coded delay • No hard-coded file path • No hard-coded email address • No empty catch • Mandatory catch logging • Mandatory catch screen capture

The code analysis header displays the count of objects with a violation error within the bot. Each object can have either low or high severity. The violation is displayed with the attribute followed by the line

number and the severity. All the high severity errors are displayed first. Navigate to the corresponding line in the bot that has the violation, rectify the violation, and save the bot.

You must save the bot to see the latest code analysis results in the Bot Assistant.

System-created variables

Variables created by the system such as input or output variables, package-suggested variables, or auto-generated variables (window variables) use the default variable naming case convention from code analysis or Pascal case if no format is defined in code analysis rule.

Audit log

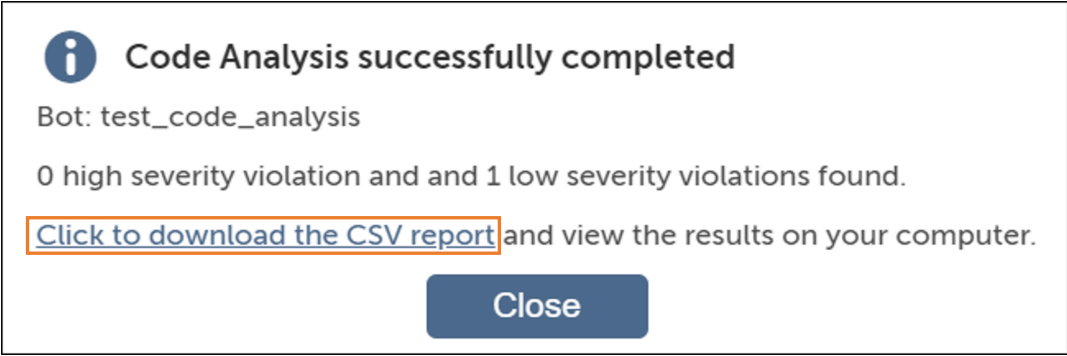

When code analysis is initiated either by saving a bot or running code analysis in the Bot editor, the information is captured in the audit log. The following details are captured:

- Bot name
- User information
- The method through which code analysis is initiated (save option or run code analysis option)
- Time taken for the code analysis to run including details such as the number of code lines if captured by code analysis process
- Total number of violations
- Details of the violations

Code analysis reports

You can access the code analysis report from the **Automation** page after running code analysis. The report is in the form of a downloadable CSV file.

You must have **View content** permission to download the code analysis results in CSV format.

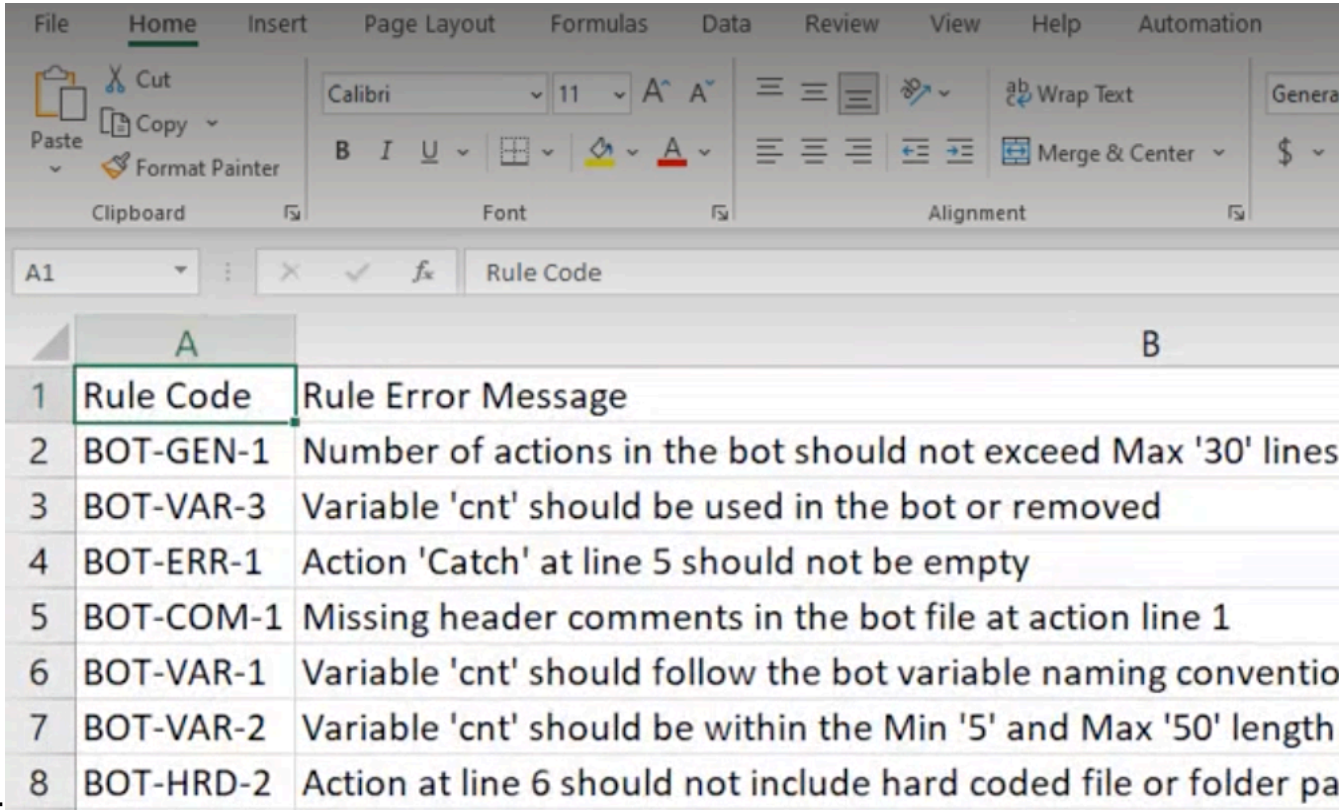

The image shows a notification box with a blue header bar containing an information icon and the text "Code Analysis successfully completed". Below the header, it says "Bot: test_code_analysis" and "0 high severity violation and and 1 low severity violations found." A blue link "Click to download the CSV report" is highlighted with a red box, followed by the text "and view the results on your computer." At the bottom of the box is a blue "Close" button.

The report contains the results of the code analysis policy. It details the violation, the location of the violation, and the bot file location. The code analysis report consists of the following:

- Rule code
- Rule error message description (with location of bot file as appropriate)
- Location of the bot

The following image shows an example code analysis

	A	B
1	Rule Code	Rule Error Message
2	BOT-GEN-1	Number of actions in the bot should not exceed Max '30' lines
3	BOT-VAR-3	Variable 'cnt' should be used in the bot or removed
4	BOT-ERR-1	Action 'Catch' at line 5 should not be empty
5	BOT-COM-1	Missing header comments in the bot file at action line 1
6	BOT-VAR-1	Variable 'cnt' should follow the bot variable naming convention
7	BOT-VAR-2	Variable 'cnt' should be within the Min '5' and Max '50' length
8	BOT-HRD-2	Action at line 6 should not include hard coded file or folder path

report:

Configure code analysis policy

As an administrator or a user with view and manage policy permissions, you can configure code analysis policies to define coding best practices to improve reliability of automations by reducing errors.

Ensure that you have the following permissions:

- View policies
- Manage policies

1. Log in to the Control Room as an administrator.
2. Navigate to **Administration > Policies**.
3. Click **Enabled** in the **Status** section.
By default, this feature is not enabled.
4. Set up one or more rules in the **Rules** section.

Note: You must set at least one rule to enable the code analysis feature.

5. Select the **Severity** as either **Low** or **High** to highlight the criticality of the rule.
After the policy is enabled, it is applied to all the users globally.

Whenever the policy is updated, a prompt is displayed indicating that the policy is updated, and the code analysis results page contains details about the bots that have violations.

The following video displays how to configure the code analysis policy: <https://aa2019packagesdkfordocumentation.s3-us-west-2.amazonaws.com/videos/configure-code-analysis.mp4>

Run code analysis

As a Bot Creator (RPA developer) or Citizen Developer, you can run code analysis to evaluate your bots for any coding errors. You can develop automations based on the code analysis policies and predefined rules.

You must have **View content** permission to download the code analysis results in CSV format.

You can run code analysis only on bots that are error-free. If your bots contain errors, the **Run Code Analysis** option is not enabled. Resolve the errors in your bot to see the **Run Code Analysis** option.

- **Run code analysis in the private workspace:**

- On the **Automation** page, select the bot, click the actions menu (vertical ellipsis), and click **Run Code Analysis**.
A message is displayed indicating that code analysis is successfully completed, along with a file link with the result of the code analysis.
- Click the file link to analyze the result of code analysis.
A CSV file with the result of code analysis is displayed.
- Click **Close**.

- **Run code analysis in the public workspace:** Run code analysis by choosing one of the following options:

Option	Steps
Run Code Analysis	<ol style="list-style-type: none"> On the Automation page, select the bot, click the actions menu (vertical ellipsis), and click Run Code Analysis. Select the version of the bot for which to run code analysis: <ol style="list-style-type: none"> Latest version Product label Click Continue. A message is displayed indicating that code analysis is successfully completed, along with a file link with the result of code analysis. Click the file link to analyze the result of code analysis. A CSV file with the result of code analysis is displayed. Click Close.

Option	Steps
View history Task Bot	<ol style="list-style-type: none"> 1. On the Automation page, select the bot, click the actions menu (vertical ellipsis), and click View history Task Bot. All the versions of the selected bot are displayed on top showing the latest version. 2. Select a version of the bot, click the actions menu (vertical ellipsis), and click Run Code Analysis. A message is displayed indicating that code analysis is successfully displayed, along with a file link with the result of code analysis. 3. Click the file link to analyze the result of code analysis. A CSV file with the result of code analysis is displayed. 4. Click Close.

The following video shows the two ways of running code analysis in the public workspace: <https://aa2019packagesdkfordocumentation.s3-us-west-2.amazonaws.com/videos/run-ca-public-workspace.mp4>

Manage licenses

The Automation Anywhere Control Room provides an automated mechanism for tracking the use of licensed software across multiple Control Room instances and share these permissions in real-time.

All licenses

Automation Anywhere Control Room administrators view, share, and manage user license entitlements across multiple Control Room instances from a single Control Room. Navigate to **Administration > License** to view a summary of product licenses followed by License Summary table.

Note:

To perform this task, you must be a administrator and have the required rights and permissions.

License Cloud services

To edit and or update the license settings, via the License Cloud service, **Click Edit license settings** and supply the necessary information on the **Edit** page.

For more information on this subject, please see these resources:

- [Licenses and cloud services](#)
- [Managing Cloud and file licenses](#)
- [View and edit Cloud Control Room instances](#)

License summaries

The License Summary table details the status of all licenses deployed, or available to be deployed, across any active Control Room. The details displayed are from the point-of-view of the current Control Room to which you are logged into. This real-time access to license information from multiple deployments across the network enable a seamless integration for allocation of needed RPA resources as the need arises.

Updating licenses from a server

To add licenses for users, select the desired method of accessing the license by clicking **Install license from server** or **Install license from file**.

Installing additional licenses

Upload new licenses to the Automation Anywhere Control Room to be distributed to users as required.

Ensure that you are logged in to the as the administrator.

Designate the source of the license (server or filepath) to load into the Control Room. You may also take advantage of the License Cloud services from this page if enabled. Please see [Licenses and cloud services](#) for more information.

1. Navigate to **Administration > Licenses**.
2. Select **Install license from server** or **Install license from file** or **Edit license settings**.

Choose installation source.

Option	Action
Install license from server	<ol style="list-style-type: none"> a. Supply the unique Control Room GUID. b. Click Install license from server.
Install license from file	<ol style="list-style-type: none"> a. Browse to and select the license. b. Click Install license from file.
Edit license settings	<ol style="list-style-type: none"> a. Enter you unique GUID in the filed provided.

3. Click **Save changes**.

Related reference

[Users](#)

As an administrator, you can create, view, edit, delete, and enable or disable a user. Creating users steps vary depending on whether the user is a non-Active Directory, Active Directory, or single sign-on (SSO) user from an IdP server.

[System roles](#)

System roles are preconfigured with the permissions necessary to perform the tasks within the scope of that role. They cannot be modified or deleted. Administrators assign the roles to users to enable them to access features and perform operations in the Control Room.

[Settings](#)

Use the **Settings** tab to configure the connection to the Credential Vault, enable email notifications, integrate the Control Room with a Git repository, enable secure recording mode, and configure user authentication.

Stop and start Control Room services on Linux

Review the instructions and service names to stop and restart Automation Anywhere Control Room services on Linux.

Log in to your Automation Anywhere Control Room server.

1. If you just finished installing A2019, use the following command to display the status of all Control Room services:

```
sudo systemctl status control*
```

Browse through the output. If any of the services are not actively running, you can manually start the service with the following command (see the next step for specific service names):

```
sudo systemctl start <servicename>
```

Note: If more than one service is not running, you can use the script in the next step to start all the services.

For other Linux installation issues, contact Automation Anywhere support: [Open a support case \(A-People login required\)](#).

2. Optional: Create a script from the following code, such as `startallaae.sh`, to start all the Control Room services.

This sample script lists the Control Room services that need to be restarted. You can restart the services in any sequence.

The `sleep` commands allow each service to complete startup before the next service is started.

Note: `controlroomdiscoverybot.service` is only installed by default starting in Automation 360 version 16.

```
echo Starting elasticsearch
sudo systemctl start controlroomelasticsearch.service
sleep 30
echo Starting botcompiler
sudo systemctl start controlroombotcompiler.service
sleep 30
echo Starting control room caching
sudo systemctl start controlroomcaching.service
sleep 30
echo Starting backend service
sudo systemctl start controlroombackend.service
sleep 30
echo Starting reverse proxy
sudo systemctl start controlroomreverseproxy.service
sleep 30
echo Starting messaging
sudo systemctl start controlroommessaging.service
sleep 30
echo Starting iq bot
sudo systemctl start controlroomiqbot.service
sleep 30
echo Starting discovery bot
sudo systemctl start controlroomdiscoverybot.service
sleep 30
```

```

echo Starting aari
sudo systemctl start controlroomaari.service
sleep 30
echo Starting storage
sudo systemctl start controlroomstorage.service
sleep 30
echo Starting ml services
sudo systemctl start controlroomdiscoverybotml.service
sleep 30

```

Assign execute permission to the script and run it: `sudo ./startallaae.sh`

3. To stop a single service, use the following command: `sudo systemctl stop <servicename>`.

Optional: To stop all services for maintenance or other requirements, create a script, such as `stopallaae.sh`, to stop the Control Room services.

```

sudo systemctl stop controlroommessaging.service
sudo systemctl stop controlroomreverseproxy.service
sudo systemctl stop controlroombackend.service
sudo systemctl stop controlroomcaching.service
sudo systemctl stop controlroombotcompiler.service
sudo systemctl stop controlroomelasticsearch.service
sudo systemctl stop controlroomiqbot.service
sudo systemctl stop controlroomdiscoverybot.service

sudo systemctl stop controlroomaari.service
sudo systemctl stop controlroomstorage.service
sudo systemctl stop controlroomdiscoverybotml.service

```

Assign execute permissions to the script and run it: `sudo ./stopallaae.sh`

Control Room log files

Various types of information about the Control Room are captured in different log files. You can analyze these log files when the Control Room or a bot encounters an error and identify the root cause for that error.

Overview

The log files capture information about the errors encountered by various components of the Control Room such as the Bot Store, devices, and license. You can use the information in the log files to identify the root cause of an error and resolve that error.

Log file locations

The Control Room log files are available at `C:\ProgramData\AutomationAnywhere\Logs` on the machine on which you have installed the Control Room. The log files are named `WebCR_<COMPONENT-NAME>`, for example, `WebCR_BotStore`, `WebCR_Devices`, and `WebCR_License`.

You can refer the following log files for the Control Room.

WebCR.log

Contains log entries related to the initialization of the Control Room and messages, if any.

WebCR_UserManagement.log

Contains log entries related to the user management module.

WebCR_Ignite.log	Contains log entries related to the Apache Ignite or caching system.
WebCR_ServerRepository.log	Contains log entries of the server repository related functions.
WebCR_CredentialVault.log	Contains log entries of Credential Vault related function calls.
WebCR_Hibernate.log	Contains log entries related to the Hibernate system, ORM mapping and Query system, ActiveMQ messaging subsystem, and so on.

On the Bot Runner machine (on which the Bot Agent is installed), the log files are available at C:\ProgramData\AutomationAnywhere\BotRunner\Log. You can refer the following log files for the Bot Runner machine.

NodeManager.log	Contains log entry details of the interaction with the Bot Agent and the log entry of every message sent to the Bot Agent.
BotLauncher.log	Contains log entry details of the bots that are deployed on this machine.
TriggerListener.log	Contains log entry details of any triggering activities that occur in bots with triggers.

The corresponding configuration XML files are available at C:\Program Files\Automation Anywhere\Bot Agent\config.

Workload management

The workload management module enables users to upload Microsoft Excel and CSV files to the Control Room so that it feeds the records from the files into the bot deployments.

These records contain highly sensitive information, for example, PII, PCI, PHI, and more. This data is carefully protected by the data encryption key and is at rest in the file share and database.

Divide your automations into small, logical Work Items from the **Workload** page. Process the Work Items simultaneously to ensure that your automation goals are achieved with optimum resource utilization.

Prerequisites

To manage your workload automation, ensure that you are allocated a combination of any or all of the following roles and permissions:

Feature type	Privileges
User roles	<ul style="list-style-type: none"> AAE_Queue_Admin AAE_Pool_Admin
Activity permissions	<ul style="list-style-type: none"> View my in progress activity View my scheduled bots Schedule my bots to run View and manage all scheduled activity from my folders

Feature type	Privileges
Device permissions	<ul style="list-style-type: none"> View and manage my Bot Creator, Bot Runner, and device pools Create device pools Administer all device pools
Bots permissions	<ul style="list-style-type: none"> View my bots Run my bots
Workload permissions	<ul style="list-style-type: none"> View and manage my queues Create queues Administer all queues

Database

Workload automations are supported on the following databases:

- SQL
- PostgreSQL
- Oracle

Other resources

Workflow map: Click the following schematic image to view this workload management workflow in an

interactive visual format:

1. [Workload management process](#)

Attach a work item template to a TaskBot to use the TaskBot in workload automation.

[Use Work Item variables](#)

You can use the Work Item variables to pass the Work Item attributes or values to the TaskBot from the Control Room when you run the bot with the option **Run bot with queue**.

Related reference

[Workload package](#)

The Workload package enables you to insert work items in a queue for workload automation. It also enables data chaining between multiple queues. You can orchestrate multiple bots, and enable optimal device utilization through the queuing mechanism of workload management.

Create workload queues

A queue is one of the main building blocks of Workload Management. A queue holds data known as Work Items for further processing. The system distributes these Work Items to individual unattended Bot Runners in a device pool for processing.

For workload automation create and attach a work item template to a bot, create device pools, add Bot Runners to the pool, create queues, add queue owners, participants, or consumers, define the work item structure, insert work items, and finally run the automation with the queue.

Note: In a multi-user environment, if there are two queues A and B, and multiple work items are in queue A, the device will process work items in queue A first, and then move to queue B. To process both the queues in parallel in a multi-user environment, you must perform one of the following actions:

- Add another device to the existing device pool.
- Create another device pool on the same device.

See the following table for details of the tasks you can perform as a queue owner, participant, or consumer.

Owners	Participants	Consumers
Can perform <ul style="list-style-type: none"> • View the queue • Edit the queue • Add other owners, participants, or consumers to the queue • Add work items to the queue 	Can perform <ul style="list-style-type: none"> • View the queue • Add work items to the queue 	Can perform <ul style="list-style-type: none"> • View the queue • Run bot with queue
Cannot perform: Run bot with queue	Cannot perform: Run bot with queue	Cannot perform: Add work items to the queue

Queue owners and participants: Note that queue owners can edit a queue (change the queue name, description, add or remove owners, participants, or consumers), but participants cannot edit the queue.

You can create a workload queue in one of the following modes:

- [Express mode](#)
- [Standard mode](#)

Express mode

To create queues in express mode with default parameters for workload automation in the Control Room. For more information, see [Create express queues using default workload parameters](#).

Standard mode

The following diagram describes the flow in which you can create a workload queue in standard mode.

To create a workload queue in standard mode,

1. *Create queues*

Create queues that hold specific sets of data your bot is expecting for automation. To create queues, an Control Room administrator assigns the **AAE_Queue Admin** role with **View and manage my queues**, **Create queues**, **Administer all queues**, and **View my in progress activity** permissions.

2. *Add queue owners*

Add queue owners who can create, edit, and view queues.

3. *Add participants to queue*

Add queue participants from different roles defined in the Control Room. This is an optional step.

4. *Add consumers of queues*

Add queue consumers from different roles defined in the Control Room. This is an optional step.

5. *Define Work Item structure*

Define the Work Item structure for processing in a queue. This enables you to manually upload the Work Items from the system in the absence of ready data in a file.

6. *Insert Work Items*

Add Work Items from an Excel or CSV file to the queue after you define the structure.

Related tasks

[Run bot with queue](#)

Collectively process all work items of a queue across all the Bot Runners present in one or more device pools.

[Attach work item template to TaskBot](#)

Attach a work item template to a TaskBot to use the TaskBot in workload automation.

Create express queues

Create queues with default parameters for workload automation using the express queue option in the Control Room.

Ensure that you are logged in to the as the administrator.

You must have the **Create queues** permission to create queues using the express mode.

When you create a queue with default parameters, note the following:

- All .CSV file columns will be available in a workload bot.
- The first 10 columns of the .CSV file will be displayed in the queue.
- All data type will be text.

- Queue sorting will not be available.
1. Navigate to **Manage > Queues**.
 2. To create queues with default workload parameters, click **Create express queue**.
 3. Enter the queue name.
The queue name is the same as the workitem template name by default.
 4. Optional: Enter the queue description.
 5. To select a data file in `.csv` format, click **Browse**.
 6. Click **Create**.
The queue is saved and available for workload automation in the **Queues** list.
You can now view queue details, edit a queue, and run a bot with queue.

Related tasks

[View queue details](#)

Use the **View queues details** page to view the details of a particular queue.

[Edit queues](#)

Edit a queue using two methods - from the **Queues** list, or from the **View queue** page.

[Run bot with queue](#)

Collectively process all work items of a queue across all the Bot Runners present in one or more device pools.

Create queues

Create queues that hold specific sets of data your bot is expecting for automation. To create queues, an Control Room administrator assigns the **AAE_Queue Admin** role with **View and manage my queues**, **Create queues**, **Administer all queues**, and **View my in progress activity** permissions.

Ensure that you are logged in to the as the administrator.

A queue is processed until all work items are completed. When new work items are added to the queue, the Reactivation Threshold value specifies the minimum number of new work items required to resume queue processing. Work items are those items with a **Ready to Run** status.

Create a queue by providing details such as the queue name, queue owners, participants, consumers, work item structure.

Note: You can choose to **Create draft of queue** and add the remaining information later.

1. Navigate to **Manage > Queues**.
2. Click **Create queue**.
3. Enter the **Name**.
4. Optional: Enter a description.
5. Set the **Reactivation Threshold** to resume queue processing.
Default threshold is **1** (one).
6. Optional: Select the average **Time required for a person to complete one work item:**
 - **seconds**
 - **minutes**
 - **hours**
 - **days**

7. Click **Next**.

Add queue owners

Related tasks

[Edit queues](#)

Edit a queue using two methods - from the **Queues** list, or from the **View queue** page.

[Delete queues](#)

Delete a selected queue, multiple selected queues, or all queues of work items.

Add queue owners

Add queue owners who can create, edit, and view queues.

Ensure that you are logged in to the as the administrator.

Queue owners are allowed to edit the queue and add new work items to the queue.

The queue creator is the default queue owner and is able to add other Control Room users as queue owners, if required.

1. Select user(s) from the **Available Users** list from the **Owners** tab.
2. Click the right arrow (→) to add your selection.
3. Click **Next**.

Add queue participants

Add participants to queue

Add queue participants from different roles defined in the Control Room. This is an optional step.

Ensure that you are logged in to the as the administrator.

Participant roles can add new work items and view the queue. However, they are not allowed to edit other queue properties.

1. Select role(s) from the **Available Roles** list from the **Participants** tab.
2. Click the right arrow (→) to add your selection.
3. Click **Next**.

Add consumers of queues

Add consumers of queues

Add queue consumers from different roles defined in the Control Room. This is an optional step.

Ensure that you are logged in to the as the administrator.

There are certain mandatory checks that are to be done for unattended bots to be deployed from Control Room to a device:

- The device where the bot is to be deployed should be set as a default device to only the specific bot runner account.
- Ensure that all necessary privileges have been granted to the Bot Runner.
- Ensure that nobody is signed into the device at the time of bot deployment with the Run As permission from a different device.
- Ensure that the console is currently inactive on default device.

Queue consumers can view the queue and all the work items in the queue. In addition, they can use this queue for running bots on Unattended Bot Runners.

1. Select role(s) from the **Available Roles** list from the **Consumers** tab.
2. Click the right arrow (→) to add your selection.
3. Click **Next**.

Define Work Item structure

Define Work Item structure

Define the Work Item structure for processing in a queue. This enables you to manually upload the Work Items from the system in the absence of ready data in a file.

Define a Work Item structure using any one of the following methods:

1. Using an Excel/CSV file.
2. Using an existing work item template.
3. Manually

Remember: The work flow to process Work Items differs for a queue based on the method that you choose in the **Define Work Item Structure** tab.

1. Select a method to add header columns for Work Item processing:
 - **Use an Excel/CSV file:** Add the header columns from an existing Excel or CSV file. *You can point to the Excel spreadsheet or CSV file you are using in one or more TaskBots you will run in this queue.*
 - a. Enter a unique name for the Work Item structure in the **Work item template** field.
For example, if the queue contains employee information, you can specify the **Work item template** as Employee Data.
 - b. Select a column for inclusion in the Work Item structure from the list of column names. The columns are defined based on the header rows of the selected Excel or CSV file. A maximum of ten (10) columns are allowed for selection and viewing in the Control Room.
For example, you can select column headers Employee Name, Employee ID, and Designation. You can then select the **Data Type - Text, Number, or Date** for that column. You can also choose to view these columns being processed in the **Activity** page.

Note:

- The system allows you to filter/sort Work Items on the columns for viewing the Work Item data in the Control Room.

Actions allowed on view queue page

- When you upload work items from an xls or xlsx file with data type as text, the Excel file column populated with a date in any format (for example, 8/6/2019) is converted to its corresponding workload management date format (for example, Sat Jun 08 00:00:00) in the Control Room Work Item. However, the same is not applicable to a csv file.

-
- c. Select up to three columns for sorting in an ascending or descending order.

When the system processes the Work Items from the queue, it uses the sort criteria specified to retrieve the work items in that order. For example, to process payslips with first Employee

ID followed by Employee Name from 1 to n and A to Z, specify Employee ID and Employee Name in an ascending order.

Note: Work items are processed on sorting order internally. For example, if you add 3 work items **a, c, b** to be sorted by name, then on the user interface they will be shown as **a, c, b**. However, the work items will be processed as per the sorting order **a, b, c**.

- **Use work item template:** Add header columns by searching for an **Existing work item template** or from the **Available work item templates**.

This allows you to pass the values or attributes from the template to a TaskBot with the help of Work Item variables when you use the option **Run bot with queue**.

Tip: Search for an existing Work Item template when there are a large number of templates available for selection.

Use Work Item variables

- **Manually:** Define the Work Item structure manually. You do not have to select from an existing structure.
 - a. Type a name for the Work Item structure in the **Work item template** field.
For example, if the queue contains employee information, add the **Work item template** as Employee Data.
 - b. Add column header names for the Work Item and select the data type for each column: **Text**, **Number**, or **Date**
 - c. Select the display and sorting for the columns in the Control Room.
When the system processes the Work Items from the queue, it uses the sort criteria specified to retrieve the work items in that order. For example, to process payslips with first Employee ID followed by Employee Name from 1 to n and A to Z, specify Employee ID and Employee Name in an ascending order.

2. Click **Next** to add the Work Items.

Insert Work Items

Related reference

[Work item status and actions](#)

Based on the Work Item status, you can do only certain actions on a Work Item.

Insert Work Items

Add Work Items from an Excel or CSV file to the queue after you define the structure.

Ensure that you are logged in to the as the administrator.

Add Work Items from an Excel or CSV file to the queue.

Note: When you upload work items from an xls or xlsx file with data type as text, the Excel file column populated with a date in any format (for example, 8/6/2019) is converted to its corresponding workload management date format (for example, Sat Jun 08 00:00:00) in the Control Room Work Item. However, the same is not applicable to a CSV file.

You can also add Work Items later by editing the queue, see [Edit queues](#).

1. Click **Browse**.

2. Select the Excel or CSV file.
3. Click **Create queue**.

- Now that you have created a queue, it is now ready for deployment from a bot.

Run bot with queue

- Manage Work Items of a queue to fix the discrepancies before queue processing and reduce your automation-related errors.

Manage Work Items

Run bot with queue

Collectively process all work items of a queue across all the Bot Runners present in one or more device pools.

To run a bot with queue, ensure that you are allocated a combination of any or all of the following roles and permissions:

Feature type	Privileges
User roles	<ul style="list-style-type: none"> • AAE_Queue_Admin • AAE_Pool_Admin
Activity permissions	<ul style="list-style-type: none"> • View my in progress activity • View my scheduled bots • Schedule my bots to run • View and manage all scheduled activity from my folders
Device permissions	<ul style="list-style-type: none"> • View and manage my Bot Creator, Bot Runner, and device pools • Create device pools • Administer all device pools
Bots permissions	<ul style="list-style-type: none"> • View my bots • Run my bots
Workload permissions	<ul style="list-style-type: none"> • View and manage my queues • Create queues • Administer all queues

To **Run bot with queue**, note the following:

- You can run bots only on unattended Bot Runners. You cannot run bots on attended Bot Runners from the Control Room.
- The bots have to be checked in to the public folder in order for the bots to qualify to be run with queue.
- Work item sorting is done on the batch added to the queue. For example, if you add 2 batches of work items **a, c, b** and **a, c, b** to be sorted by name, the work items will be processed for queuing as **a, b, c** and **a, b, c**.

- If you use the same device pool for inserting and processing work items for the same queue, you will see duplicate entries in the **In-progress activity** and **Historical** page. To resolve this issue, use one device pool to insert work items and a different device pool to process work items in a queue.

Use the **Run a bot with queue** option from any of the following pages:

- a. **Activity > In progress**
- b. **Manage > Scheduled**
- c. **Manage > Devices**
- d. **Manage > Device pools**
- e. **Manage > Queues**

The procedure for running a bot with a queue is the same in all these pages.

1. Select the bot to run with queue.
 - Latest version: Click **Latest version** tab to select the latest version of the bot.
 - Labeled version: Click **Production version** tab to select the labeled version of the bot.

Available bots are displayed along with any **Input values** and dependencies. If the production label option is selected for the parent bot, the corresponding dependent bots with the production label are also automatically selected. If any of the dependent bots do not have the production label applied, the latest version of the bot is selected.

2. Optional: Select **Run with administrative privileges** if the bot has actions that require administrative privileges to run.
3. Select a queue with which to run the bot.

Note: Ensure the following to see the list of available queues:

- You do not have the AAE_Admin role
- Your role is added to **Queue > Consumers**
- The bot and queue work item templates are identical

-
4. Select the Bot Runner user from the **Available bot runners** list.

To enable a device, it must be connected to the Control Room.

Note: If a device does not appear in the list, ensure the user running the bots is assigned a role that provides access to the appropriate Run-As Users.

-
5. Optional: Select the option to run on bot running devices.

If you want to select Bot Runners that are mapped one-on-one with their default (single-user) devices, select the **Run on bot running devices** option. This option enables the Work Items to be deployed only to the user's default device, whereby the security policy does not allow a user to log in to any other device or when applications for automation are installed on the default device.

If you select this option, ensure that all the default devices are part of the same device pool when you select from the **Device Pool** tab.

Tip: Do not select this option if the run as users (Bot Runners) are configured to use multiple devices. In that configuration, if any device in the pool is processing an automation, the run as user

can log in to another device, and the work items will be processed on that device. This enables optimal utilization of licenses (run as user) and devices.

For information on scenarios for choosing bot running devices for run as users, see [Considerations for running a bot](#).

6. Select Device pools.

Select the pool from the list of available device pools.

7. Optional: Click the up or down arrow to set the selected device pools in preferred order.

When a is deployed, the selects the first available device based on the order in which you organized the device pools. If none of the devices are available at the time of deployment, the is queued.

8. Select the Automation priority from the General tab.

Set the priority to high, medium, or low based on your requirements for resource optimization. The default permission is set to medium.

9. Click Run bot with queue.

Note: If a user who created the WLM automation using the **Run bot with queue** option is deleted, the automation is also affected and queues cannot be processed.

Related tasks

[View automation of a queue](#)

Use the **View activity in progress** page to view the automation details of the selected queue, **Pause**, **Resume**, or **Stop** the in-progress automation.

Related reference

[Concurrent bot deployments and executions](#)

Review the information on the maximum number of concurrent bot deployments and executions for On-Premises deployment.

Add TaskBots and dependent files

Add a TaskBot, and review the input values and dependent files for the automation.

- 1.** Navigate to **Activity > Scheduled, Bots > My Bots**, or **Workload > Queues** page.
- 2.** Click **Run bot with queue**
The **Activity > Run bot with queues Create** page is displayed.
- 3.** Enter a name for the automation.
- 4.** Optional: Enter a description.
For example, you can describe the purpose of running the TaskBot with a queue.
- 5.** Go to the folder that contains the required TaskBot.
- 6.** Select a TaskBot to process in the queue from the list.
 - Latest version: Click **Latest version** tab to select the latest version of the bot.
 - Labeled version: Click **Production version** tab to select the labeled version of the bot.

By default, the Bots folder is selected.

Tip: Use the search field to find a TaskBot quickly.

The **Input values** and **Dependencies** options are displayed at the bottom of the page.

If the production label option is selected for the parent bot, the corresponding dependent bots with the production label are also automatically selected. If any of the dependent bots do not have the production label applied, the latest version of the bot is selected.

7. Optional: Select the **Input values** check box to add the values of variables to the bot during runtime. This is enabled only if the selected TaskBot has **Input values**.

Note: In workload automation, input to the bot is provided by the workload queue, the input type variable is not supported in workload automation.

8. Optional: Review the list of dependent files, if available. This list is enabled only if the selected TaskBot has dependencies. The TaskBot dependencies that are uploaded in the Control Room are available only for review.
9. Click **Next** to add a queue, Bot Runner and device pool.
Add queue, Bot Runner, and device pool

If the selected TaskBot does not contain a work item template, an error message appears at the top of the page. The TaskBot also shows an icon to indicate a missing work item template.

Define Work Item structure

Related reference

[Bot dependencies](#)

Bots dependencies are files and other bots that are required to run that bot successfully.

Add queue, Bot Runner, and device pool

Add a queue, Bot Runner, and device pool to the automation from the **Run bot with queue** page.

Ensure that you are logged in to the as the administrator.

Automation processes are queued until the specified **Run as user** and devices become available. Queuing permits other automation processes for that specific **Run as user** until the specified device becomes available. Any **In use** queues are shown as disabled in the **Available queues** list.

You can deploy the automation on the number of users that you choose with the **Run as** option and not on the total number of devices available in a device pool. Select only those queues that are not in use.

Note: You cannot use multiple queues to add Bot Runners.

1. Select a **Queue** from the **Queues** list.
The queues for which you have consumer access and same work item template as the selected bot are listed.
2. Click **Next**.
3. In the **Run as** tab, from the **Available bot runners** list, select a **Bot Runner**.
 - a) Optional: Select the **Run on bot running devices** option.
If you want to select Bot Runners that are mapped one-on-one to their default (single-user) devices, select the **Run on bot running devices** option. This option enables the Work Items to be deployed only to the user's default device, whereby the security policy does not allow a user to log in to any other device or when applications for automation are installed on the default device.
If you select this option, ensure that all the default devices are part of the same device pool when you select from the **Device Pool** tab in Step 5.

Tip: Do not select this option if the run as users (Bot Runners) are configured to use multiple devices. In that configuration, if any device in the pool is processing an automation, the run

as user can log in to another device, and the work items will be processed on that device. This enables optimal utilization of licenses (run as user) and devices.

For information on scenarios for choosing bot running devices for run as users, see [Considerations for running a bot](#).

4. Click **Next**.
5. In the **Device pool** tab, select a **Device Pool** from the **Available device pools** list.
6. Click **Add**.
The queue and device pool are added to the run bot with the queue list.
7. Optional: Click **Remove** to replace the queue or the device.
8. Click **Run bot with queue**.
The queue status changes to `In use` on the **Queues** page.

[Considerations for running a bot](#)

There are certain considerations you have to keep in mind when running a bot.

Manage workload queues

For workload maintenance tasks such as view the details of queues to pause, stop, or resume its automation, edit the queues, manage the work items in the queue, and delete the queues.

Note: In a multi-user environment, if there are two queues A and B, and multiple work items are in queue A, the device will process work items in queue A first, and then move to queue B. To process both the queues in parallel in a multi-user environment, you must perform one of the following actions:

- Add another device to the existing device pool.
- Create another device pool on the same device.

Workload maintenance tasks

For workload automation maintenance, do the following (in any order):

[View queue details](#)

Use the **View queues details** page to view the details of a particular queue.

[Edit queues](#)

Edit a queue using two methods - from the **Queues** list, or from the **View queue** page.

[Delete queues](#)

Delete a selected queue, multiple selected queues, or all queues of work items.

[Manage Work Items](#)

Manage Work Items of a queue to fix the discrepancies before queue processing and reduce your automation-related errors.

Related reference

[Actions allowed on view queue page](#)

Use different actions such as sorting, searching, or filtering on the table view of the queues.

View queue details

Use the **View queues details** page to view the details of a particular queue.

Ensure that you are logged in to the as the administrator.

Permissions required:

1. **Queue Owner** or **Queue Participant** or **Consumer** rights
2. **View and manage my Queues** feature permission
3. A user with **AAE_Admin** role can view all the queues and manage (pause, resume, and stop) all the WLM automations.

Note: If you are not an owner, participant, or consumer of that queue, you can view only queue names and not the queue details.

The **View queues** page shows the following queue details:

- **New** when the work item is added to the queue recently.
- **On hold** when the work item is deferred from processing by a Queue owner, participant, or consumer.
- **Failed** when the work item processing failed on an unattended bot.
- **Completed** when the work item is successfully processed by a Bot Runner or marked Completed by a queue owner, participant or consumer.
- **Data error** when there is an error in loading data from the file.
- **Active** when the work item is currently being processed or staged for processing.
- **Ready to run** when the work item is successfully processed for execution does not have any data errors and can be staged for processing.

Queue contents in different tabs such as:

1. **Work Items:** This is the default view. This allows you to view all work items in a tabulated form. You can use the filter to view specific work items. For example, all work items with status as **Completed**. You can **View**, **Edit**, or **Delete** the individual work items in each row. You can also change the status of the work items in bulk. For example, change the status of all the work items in **Data error** to **On hold**.
2. **General:** View the **Reactivation Threshold** and **Time** required to complete one work item.
3. **Owners:** View the user names of queue owners who can edit the queue and add new work items.
4. **Participants:** View the user names of queue participants who can add new work items and view the queue.
5. **Consumers:** View the user names of consumers who can view the queue and all the work items in the queue. In addition, they can use this queue when running bots.
6. **Work Item Structure:** View the work item structure that you defined when creating the queue.

Tip: Edit any of these details by either clicking the **edit this queue** link or the **Edit** button. Also, delete the queue by clicking the **Delete** button.

1. Navigate to **Manage > Queues**.
2. Hover over the **Actions** icon for the queue.
3. Click **View**.

Edit queues

Edit a queue using two methods - from the **Queues** list, or from the **View queue** page.

Ensure that you are logged in to the as the administrator.

Permissions required:

1. **AAE_Queue Admin** role.
2. **Queue Owner** rights to edit queues that you created.
3. **Queue Participant** rights to edit queues that are created by other queue owners.

You are allowed to edit a work item only if it is in **New**, **Data error**, **On hold**, **Ready to run**, or **Failed** state.

Edit a queue from the **View queue** page or from the **Queues** list.

1. Navigate to **Manage > Queues**.
2. Hover over the **Actions** icon for the queue.
3. Click the **Edit** icon. (✎)
4. Click one of the following options to launch the **Edit Queue** page.
 - **edit this queue** link.
 - **Edit** button.
5. Edit the queue details, such as queue name (applicable only if in draft), description, work items, threshold and time values, owners, participants, and consumers.

Note: The Work Item structure cannot be edited after it is defined.

Note: The queue name must be unique and not be shared by another queue.

6. Upload a file for the work item that will be used for processing in this queue.
The **Work Items** tab is shown by default.

Tip: You can search for a work item quickly based either on **Status** or **Status details** using the search option.

7. Click **Browse**.
8. Select the file to upload.

Note: You can upload only an Excel or CSV file.

9. Click **Save changes**.
10. Edit the name and save the changes made to the queue.
An edit successful message appears.

Searching and filtering

For ease of access, apply search parameters to **ID**, **Start Time**, **Work item result**, **Status**, and **Queue Name** columns.

- Specify the search parameters in the search bar for **Queue Name**. When you specify search parameters for the same column, the system searches using **OR** operator. When you specify search parameters for different columns, the system searches using **AND** operator.
- Choose the search parameters from a list in the search bar for Work Item **Status**.

- Apply filters to **Work Item Result** to quickly track the final status of the work item. For example if the work item was completed or skipped.
- Use the **Work Item ID** to search for specific work items and combine with the **Start Time** to monitor the progress of the work items that you search based on the **ID**. The **Start Time** filters the list of all work items that start between two given **Start Date** and **Start Time**. For example, all work items started between 01/08/2021 13:00 hrs. and 31/08/2021 15:00 hrs.

Note: Use a hyphen (-) as separator between IDs as any other symbol gives an error. For example, 100-250.

Table items

The following describes the list of items that can be viewed in the table:

Table Item	Description
ID	Shows the system generated id for a work item. When a work item is added to a queue, system generates an id for that work item.
Status	Shows Work item status: Use the View queues details page to view the details of a particular queue.
Start Time and End Time	Shows the work item's processing start/end time and date.
Modified by	Shows the name of the last user who had modified the work item.
Last Modified	Shows the time and date when the work item was modified last.

Note: Apart from the above system generated columns, the fields that you define in your work item are also displayed as columns.

Actions on table column

Use the following actions on a table column:

- Click a column to sort it in ascending and descending order. You can sort up to three columns by holding the Shift key when you click two more columns. This gives you the option of sorting two additional columns. This way the sorting is done on the entire table and not just the data that is currently visible to you. The last sorting is stored in memory applied by a user per session.
- Drag a column to the left or right
- Move your mouse cursor at the end of the column and drag to re-size

Actions on work items

Use the following tasks on specific work items:

Table Item	Description
Refresh	Allows you to refresh the table contents so that you can view the latest work item status
Delete	Allows you to delete one or multiple work items.
Mark complete	Allows you to mark one or more work items as Complete whose status is On hold, Data Error, or Ready to run.
New	Allows you to mark one or more work items as New whose status is On hold, or Data Error
On hold	Allows you to mark one or more work items as On hold whose status is New
Customize columns	Allows you to show or hide specific columns. By default, all columns are displayed including the ones defined in the work item.

Alternately, select work items and use the following actions. Note that these actions can be performed only at a table level and not on individual work items.

Table Item	Description
View	Allows you to view details of selected work item.
Edit	Allows you to edit details of selected work item. You can see this icon only if you are the Queue Owner or Participant or Consumer and the status of the work item is Unsuccessful, On hold, or Data error
Delete	Allows you to delete the selected work item. Note that if a work item is in Active state, you are not allowed to delete it.

Related tasks

[Define Work Item structure](#)

Define the Work Item structure for processing in a queue. This enables you to manually upload the Work Items from the system in the absence of ready data in a file.

View automation of a queue

Use the **View activity in progress** page to view the automation details of the selected queue, **Pause**, **Resume**, or **Stop** the in-progress automation.

You must have the following rights and permissions to complete the task. Ensure you are logged in to the Control Room as the administrator. To complete the task, you must have the following permissions assigned to you:

- **AAE_Queue Admin** role
- **Queue Consumer** or **Queue Participant** rights
- **Manage everyone's In progress activity** feature permission
- **View and manage all scheduled activity from my folders** activity permission (if you have access to the folder which has the WLM bot)

- **View and manage all scheduled activity** permission (if you do not have access to the folder which has the WLM bot)

Note:

- Though the **View automation** page is accessible from the **Workload** module, the page is launched from the **Activity** module.
 - You cannot **Pause/Resume** or **Stop** actions directly from the **Activity > In progress** page. For these actions, the **Manage > Queues > View automation** action is used.
-

1. Log in to the Control Room.
2. Go to **Manage** → **Queues**.
3. Hover over a queue with status **In use**.
4. Click the Actions menu (vertical ellipsis) and select **View automation**. This launches the **Activity > Run bot with queue > View** page.
5. Choose one of the following options to view automation of a queue:

Options	Description
Automation details of the queue	<ul style="list-style-type: none"> • The Bot name, path, dependencies, and if it requires administrative privileges to run in the Task Bot tab. • The Queue used to run the automation in the Queue tab. • Bot Runner details such as username, device, and user status in the Run as tab. • Details of the device pool in use to run the automation in the Device pool tab. • Details such as number of work items that were active, failed, pending, or completed processing in the Run history tab.
Pause	<p>The system pauses the distribution of work items from this queue to available bot runners in the device pool.</p> <hr/> <p>Note: Until you resume this automation, any work items with Ready to Run status from this queue are not sent for processing.</p> <hr/>
Resume	The system starts distributing the work items from this queue.
Stop	<ul style="list-style-type: none"> • The system stops distributing the work items from the queue associated with this automation. • Select No, cancel to return to the details page or Yes, stop to stop the work item processing and return to the Queues page.

Related tasks

[View queue details](#)

Use the **View queues details** page to view the details of a particular queue.

[Delete queues](#)

Delete a selected queue, multiple selected queues, or all queues of work items.

Export queues

Export queues for flexible usage that ensures efficient processing of WLM automations. With export queues feature, you can reuse queues across environments such as Dev, QA, and production.

- You must have the **AAE_Queue_Admin** role to export queues.
- Ensure that the target Control Room user has create users, create roles, and install license permissions.
- The source and target Control Room instances must be running the same version.
- The source and target Control Room instances must be of same setup type: SSO with SSO, AD with AD, and non-AD with non-AD.
- To receive an email notification on successful export of a queue, ensure that the following notification is selected in **Administration > Settings > Email: A BLM package is exported or imported, to the user who performed BLM export or import**.

For more information see [Edit email notifications](#).

When exporting a queue, consider the following factors:

- You can export only the queues that are in the *Not in use* state. The queues in the *New* or *Draft* state cannot be exported.
- Before you export a queue, you must pause all the running WLM automations or queues.
- All the queue entities associated with the queue, for example, general settings, owners, participants, consumers, Work Item structure, and optionally Work Items are exported to your Control Room.

To export a queue, perform the following steps:

1. Navigate to **Manage > Queues**.
2. Select the required queue and click **Export queues**.
3. In the **Export queues** page, select a queue that you want to export, click the right arrow (→), and then click **Next**.

You can select the **Include work items** option to export work items along with the queues. By default, the **Include work items** option is not selected.

Note: When you export a queue along with a large number of work items, the export or import process might take time up to 30 minutes.

4. In the **General** section on the left pane, perform the following steps:
 - a) Required: Specify an **Export name** for the queue that you want to export.
 - b) Optional: Specify a password for the exported queue.
If you specify a password, confirm the password in the **Confirm password** field.

5. Click **Export queues**.

The selected queue is exported and available in the **Activity > Historical** page. The exported queue is in the following file format: *Queue Export:Export.Queues.20220715_162251.<<username>>*

Note: If Automation 360 is email-enabled and the **A BLM package is exported or imported, to the user who performed BLM export or import.** notification in **Settings > Email** is selected, an email notification is sent to your registered email ID. The email body contains a link to the **Activity > Historical** page to download the exported queue.

6. Select the queue and click **Download exported zip file**.

The exported queue zip file is downloaded to your local system, with details such as *Queue general settings, Queue work item template, and Work items* (if included during export).

Note: Data such as queue *owners, consumers, and participants* is not exported.

Import queues

Import queues for flexible usage that ensures efficient processing of WLM automations. You can also import queues along with work items.

- You must have the **AAE_Queue_Admin** role to import queues.
- Users and roles associated with the queues are imported, and the license assigned to the users is also imported.
- Ensure that the target Control Room user has create users, create roles, and install license permissions.
- Ensure that queue names are unique for importing. Queues with the same name are skipped and not imported in the target Control Room.
- The source and target Control Room instances must be running the same version.
- The source and target Control Room instances must be of same setup type: SSO with SSO, AD with AD, and non-AD with non-AD.

When importing a queue, consider the following factors:

- Before you import a queue, you must pause all the running WLM automations or queues.
- Users and roles associated with the queues are imported. Licenses (for example, Bot Creator and Bot Runner) that are assigned to the users associated with the queues are also imported.
- All the queue entities associated with the queue, for example, general settings, owners, participants, consumers, Work Item structure, and optionally Work Items are imported to your Control Room.
- When you import Work Items with the queues, the state of the Work Items (Completed, Failed, Data error, and so on) are maintained in your target Control Room.

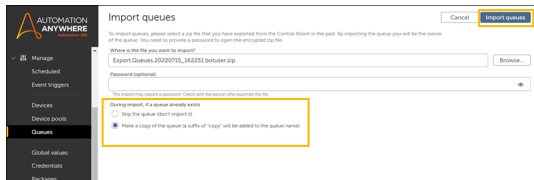

To import a queue, perform the following steps:

1. Navigate to **Manage > Queues**.

2. Select the required queue and click **Import queues**.
3. In the **Import queues** page, click **Browse** to select the required queue from your local system.
4. Optional: Enter a password for the queue that you want to import.

If a queue already exists in your environment, you can select one of the following options:

- **Skip the queue (don't import it):** The selected queue is skipped and is not imported.
- **Make a copy of the queue (a suffix of "copy" will be added to the queue name):** A copy of selected queue is created and imported to your environment, with *copy* suffixed to the name of the queue.

5. Click **Import queues**.
The selected queue is imported and available in the **Manage > Queues**

Manage Work Items

Manage Work Items of a queue to fix the discrepancies before queue processing and reduce your automation-related errors.

Permissions required

You need any of the following permissions to manage the work items:

1. **AAE_Queue Admin** role
2. **View and manage my Queues** feature permission
3. **Queue Owner, Queue Consumer, and/or Queue Participant** permissions

Work item status and actions

Based on the Work Item status, you can do only certain actions on a Work Item.

Work item - status and actions

The following table provides a description of each Work Item status and the action you can do on a Work Item having that status:

Work Item Status	Description	Actions
New	New Work Item is added	View, Edit, and Delete

Work Item Status	Description	Actions
Ready to run	Work Item is successfully processed for execution	View, Edit, and Delete
Active	Work Item is currently being processed	View
Completed	Work Item successfully processed by a Bot Runner	View and Delete
Failed	Work Item processing has failed to execute on unattended Bot Runners	View and Edit
Data Error	Data type mismatch when adding Work Items to the queue	View, Edit, and Delete
On hold	Work Item is deferred for use by the Queue admin	View, Edit, and Delete

Related tasks

[Edit work items](#)

Use the **Queues** page or the **Work item** page to edit the work items of a queue.

[Define Work Item structure](#)

Define the Work Item structure for processing in a queue. This enables you to manually upload the Work Items from the system in the absence of ready data in a file.

View work items

View work items with a status of Completed, Unsuccessful, On hold, Active, or Data Error in the **View work item** page.

Ensure that you are logged in to the as the administrator.

From the **Workload > Queues** page, you can perform the following actions on either one queue or multiple queues, including:

- **Delete:** This will delete the work item permanently.
- **Mark complete:** This will mark the work item as complete.
- **Re-process:** This will mark the work item in **New** state.
- **On hold:** This will mark the work item as **On hold**.

Note: The **Start time** and **End time** are shown when the work item is being processed.

Select a queue to **View**, **Edit**, or **Delete** a queue.

1. Navigate to **Manage > Queues**.
2. Hover over the **Actions** icon for the queue.
3. Click **View**.

[Edit work items](#)

[Delete work items](#)

Related reference

[Work item status and actions](#)

Based on the Work Item status, you can do only certain actions on a Work Item.

Edit work items

Use the **Queues** page or the **Work item** page to edit the work items of a queue.

Ensure that you are logged in to the as the administrator.

You can edit a work item only if it is in a **New**, **On hold**, **Data error**, or **Failed** state.

1. Navigate to **Manage > Queues**.
2. Hover over the **Actions** icon for the queue.
3. Click the **Edit** icon. (✎)
4. Select one of the following options to filter the work items.
 - **Status**
 - **Id**
 - **Name**
 - **Work item result**
5. Change the work item status to **Mark complete**, **Defer**, or **Re-process** in the **Work item attributes and automation details** section.

You can reprocess the failed Work Items by editing and modifying from **Failed** to **Re-process**.

The system will set the status to **Data Error** during the data load if there is any issue with the data. For example, if a user enters a text value for a number field, or an invalid date string for an attribute of date type, the status will be displayed as **Data Error**.

[Work item status and actions](#)

6. Click **Save changes**.

[Delete work items](#)

Delete work items

Delete work items one at a time or **in bulk** in the **View work item** page.

Ensure that you are logged in to the as the administrator.

You can delete a work item only if it is in a **Data error**, **On hold**, **Ready to run**, **Complete**, or **Failed** state. For work items in the **Ready to run** state, the work item should not be in a queued state. To delete such work items, **Pause** the automation.

Note: You can also delete a work item one at a time or **in bulk** using the **Delete** option provided above the Work items table.

1. Navigate to **Manage > Queues**.
2. Select the queue.
3. Hover over the **Actions** icon for the queue.
4. Click **Delete**.
Confirm or cancel.

[Work item status and actions](#)

Based on the Work Item status, you can do only certain actions on a Work Item.

Export work items to CSV file

Export work items to a CSV file for offline audits and records. The CSV file with the exported work items is available for download in the **Activity > Historical** page.

- You must have the **AAE_Queue_Admin** role to export or import work items.
- The source and the target Control Room instances must be running the same version.
- The source and the target Control Room instances must be of the same setup type: SSO with SSO, AD with AD, and non-AD with non-AD.

You can export selected, filtered, or all work items to a CSV file by using the following options:

- **Export checked items**
- **Export filtered items**
- **Export all items**

1. Navigate to **Manage > Queues**.
2. Click the required queue and go to the **Work items**.
A list of available work items is displayed.

3.

Click the **Export items to CSV** icon. (📄)

4. Click one of the following required options:
 - **Export checked items:** Exports only the selected work items

Note: You must select items to use this option.

- **Export filtered items:** Exports only the filtered work items
- **Export all items:** Exports all the available work items

A message is displayed, informing that the exported CSV file is available in the **Activity > Historical** page.

5. Navigate to the **Activity > Historical** page and search for exported work items activity.

Note: You can search for a work item activity by the username. The work item activity name is in the following format: *Work items Export:cr-work-items-20220713-104704.csv*. You can change the work item activity name by using **File > Save**.

6. Select the work item activity and click **Download exported CSV file**.
The CSV file is downloaded to your local system as a zip file.

Workload guidelines

To optimally use your work items and queues in Automation 360, review the guidelines.

Do's

- Ensure that the queue has at least 2 owners so that there is no deadlock if an owner is deleted or disabled.
- If work items are added frequently to a queue, set the reactivation threshold to 1 so that when a work item is added, the work item is added quickly.
- Up to 10 work item columns can be displayed in the Control Room. Use this feature to get maximum visibility in to your work item data.
- Optimally use work item values that can accept up to 1000 characters, especially for work item result values.
- To prioritize certain work items, ensure that you sort the work item data when you create queues.
- To insert work items in a loop, use the `v3/wlm/workitems` API because this API accepts a list of work items in JSON format.
- Ensure that the time (clocks) in all the machines in a cluster are synchronized. This is important for the Apache Ignite cache server to function properly.
- Persistent and continual database connectivity is critical for the functioning of workload automation. Therefore, ensure that you perform a periodic network scan or use tools that can detect or avoid network issues.
- Apply the pagination filter to retrieve more than 200 work items when you retrieve them using the work item API.

```
"page": {
  "offset":0,
  "length":1000
}
```

Don'ts

- To ensure the system works efficiently, do not use the `v3/WLM/workitems` API in a loop to insert work items in bulk.
- If the Bot Runner is part of a device pool, do not create local schedules on that Bot Runner so that the Bot Runner runs only the work items.
- If a user has a queue in use, do not remove the **Run bot** permission from that user (role).
- If a work item is in progress, do not shut down a Bot Runner.

To take a Bot Runner offline for maintenance, ensure that you pause the queue and verify no work item is in progress on the Bot Runner.

- If a work item queue is being processed, do not stop or restart the Automation Anywhere Control Room Service. Instead, pause the queue automation, and then restart the service.

Working with repositories, credentials and roles

Control room administrators configure repositories for Bot Creators to develop RPA bots. Administrators create roles, assign users, and grants permission to action packages used in creating bots.

This topic is intended for experienced Automation Anywhere Automation 360 users.

Administrator tasks

Control room administrators setup repositories for Bot Creators to develop bots. For this process, administrators create users and assign these users specific roles, such as Bot Creators or Bot Runners. Bot Creators are granted access to specific RPA action packages to create, test, and run bots. Completed bots are transferred to the public repository for other users to deploy. The following is a breakdown of control room administrator related tasks to complete this process.

Set up your bot repository

Administrators create repositories for Bot Creators to develop , test, and debug bots. After configuring the repository, the administrator creates the role for the Bot Creator.

Assign a role

Roles grant specific permissions to users, such as Bot Creators and Bot Runners.

Create your users and assign their licensed roles

Create or otherwise edit the user information to assign the licensed role for accessing repositories, packages, and bot building tools and functionality.

Add packages to the Control Room

Administrators can add packages to the Control Room for use by Bot Creators.

Set up lockers and credentials in Credential Vault

The credentials assigned are typically those where the administrator is granting some internal, business-related access to a Bot Creator or Bot Runner for RPA development, for example to a Salesforce account.

Bot Creator task

Bot Creators often require access to protected data to automate a process. Each Bot Creator is given credentials governing the data they are permitted to access. The administrator creates the credential and assigns it to individual users by configuring specific roles for the Bot Creator to access those credentials. Bot Creators must add their own specific attributes to the credentials after they have been assigned by the administrator.

Manage user credentials

Bot Creators and Bot Runners rely on credentials to access necessary data relevant to the bot building process.

This task is performed by the user who wants to build and deploy . You must have the necessary rights and permissions to complete this task, and authorization to log in to the as the licensed user.

Bot Creators often require access to protected data to automate a process. Each Bot Creator is given credentials governing the data they are permitted to access.

Note: Administrators are required to have created the necessary roles and entitlements assigned to the user in order to update and use any granted permissions.

1. Navigate to **Bots > Credentials > My Credentials**.

Select the credential to view and or manage.

2. Click **Edit**.

The configurable fields for the credential are displayed, based on the user granted permissions.

For example, a bot is built that requires the authentication username and password to log in to a specific URL. The user will create a custom credential for this operation by amending the credential governed by the administrator, adding the additional security details. This way, the Bot Creator can authorize only that protected data deemed necessary for the automation.

3. Click **Save changes**.

Set up your bot repository

Administrators create repositories for Bot Creators to develop and build bots.

Ensure that you are logged in to the as the administrator.

Administrators create repositories for Bot Creators to develop , test, and debug bots. After configuring the repository, the administrator creates the role for the Bot Creator.

1. Log in to the as the administrator.

2. On the left pane, click **Automation**.

3. Click **Create subfolder**.

4. Provide the repository folder name and navigation path.

This repository folder is where the bots created by Bot Creators will be stored.

Important: Based on limits requirement in the Windows operating system (primarily Windows Server 2019 and 2016), ensure your folder, file names, and the nested folder structure is not long; otherwise, your bot execution or repository backup can be impacted.

5. Click **Create folder**.

Create roles for users. Roles grant specific permissions to users, such as Bot Creators and Bot Runners.

Create your users and assign their licensed roles

Create a user and assign their specific license based role.

Ensure that you are logged in to the as the administrator.

Create or otherwise edit the user information to assign the licensed role for accessing repositories, packages, and bot building tools and functionality.

1. Navigate to **Administration > Users**.

2. Click **Create user**.

3. Enter the required general details as follows:

Field	Value
Enable User	Select for the user to be activated and log in immediately. Note: If this option is not selected, user will be in the inactive state and cannot log in.
Username	Enter a unique user name.
Description	Enter a description for the user.
First name	Enter the first name for the user. Note: The number of characters allowed in the First name field is 50.
Last name	Enter the last name for the user. Note: The number of characters allowed in the Last name field is 50.
Password	Enter and confirm a password for the user. Ensure that the password follows all the necessary password policies.
Email	Enter and confirm the email address for the user. If SMTP is enabled, an email is sent to this address to confirm the account. All important Control Room notifications are sent to this email address.

4. Select the required role from the list of **Available roles**.

5. Click the right arrow (→) to add your selection.

6. Select **Allow** to allow multiple sessions.

You must be Control Room administrator to set a user as a multi-login service user. It is possible to set a user as a multi-login user either in the UI or API, however a user may only access multiple sessions through the API.

7. Assign the device Bot Creator license to the user.

The Bot Creator license enables user to create and run bots. Auto login is enabled by default.

Note: When you logged in as administrator, you cannot allocate any device license to the user and **None** option is selected by default.

License	Privilege
None	The user can access the Control Room only.
Bot Creator- Development license	Enables user to create and run bots. Auto login is enabled by default.

License	Privilege
Unattended Bot Runner - Run-time license	Users with this license can perform all automation tasks that attended users can perform. Additionally, this license can also be used for Control Room deployment, centralized scheduling, and API-based deployment.
Attended Bot Runner - Run-time license	Users with this license can run bots on their devices and use any event trigger associated with their user account or role. However, these users cannot schedule bots.
Citizen Developer - Development license	Users with this license can create and run bots (including bots with triggers) on their devices.

The **Bypass legal disclaimer** option is automatically enabled to allow the user to run bots on a device without having to manually acknowledge a disclaimer.

After you select a device license, the **Device login credentials** are enabled. If you have the **Attest device credentials** permission, you can choose to attest the device credentials for this user to bypass credential validation when you deploy bots. The Bot Runner user should have an unlocked and active user session.

Note: This works only if the auto login setting **Reuse an existing session** is selected in the Control Room by the administrator.

8. Click **Create user**.

Update the Bot Creator packages and grant permissions to this user to build, test, and run bots. For more information, see

- [Automatic package updates for On-Premises Control Room](#)
- [Automatic package updates for Cloud Control Room](#)
- [Feature permissions for a role](#)
- [Bot permissions for a role](#)

Bot Lifecycle Management

The Bot Lifecycle Management feature enables you to move a bot from one environment to another. For example, you can move a bot from the development or testing environment to the production environment.

Overview

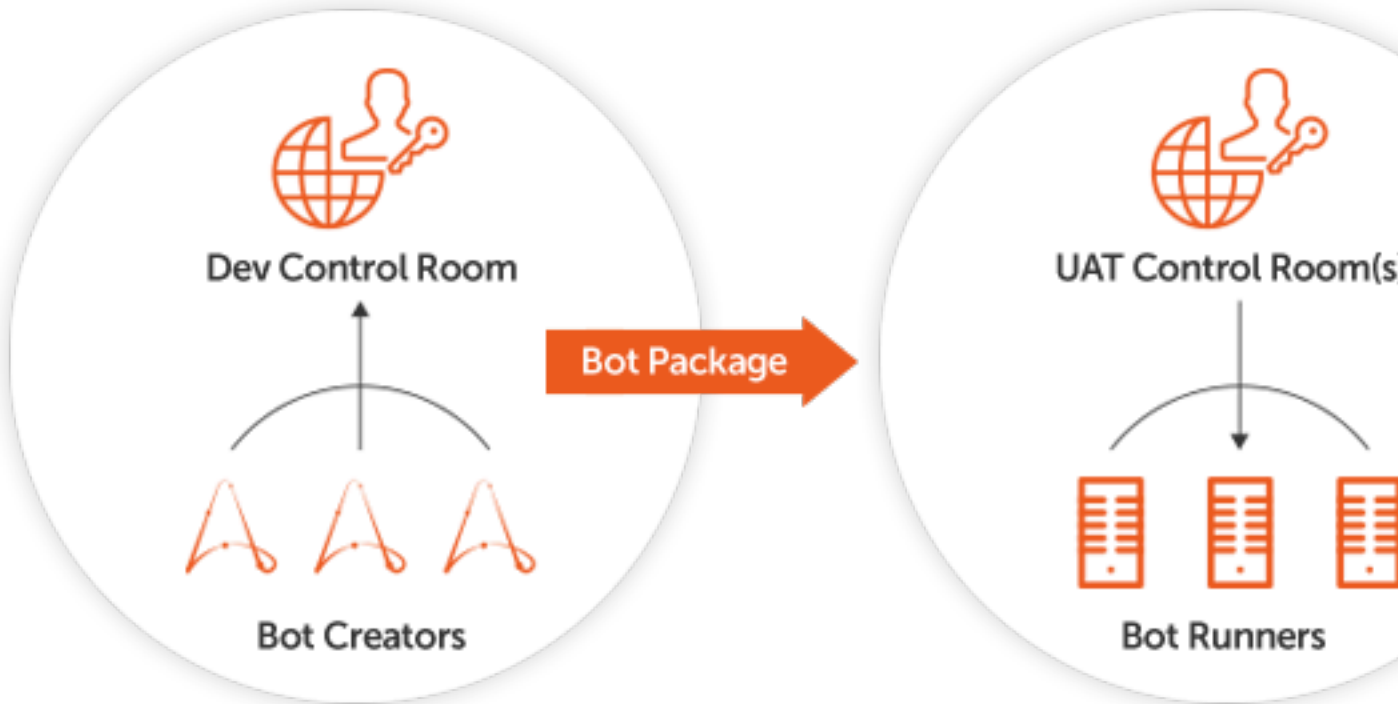

Bot Lifecycle Management easily integrates with the DevOps workflow, which supports separate development, testing, acceptance, and production environments and enables you to move bots along with their dashboards from one environment to another.

Bot Lifecycle Management provides a framework for continuous testing and deployment of bots and their dependencies in separate software development life cycle (SDLC) environments, allowing bots to seamlessly transition between lifecycle stages defined by an organization before they are released to production.

You can use the feature to move bots within different environments and help you prevent failure or disruption of data. You have to export a bot from one environment and then import it to another

environment to move it between environments. You can also bundle all the dependencies of a bot when transitioning it through the different environments.

The following image shows a typical Bot Lifecycle Management workflow:

What is exported across environments

The following entities are included when you perform an export operation from one Control Room to another:

- Bot files
- Dependent files
- Action packages and dependencies
- Bot Insight dashboards

The following entities are **not included** when you perform an export from one Control Room to another:

- Credentials and credential lockers
- Workload management queues
- Bot Runner accounts and permissions

Permissions required to export and import bots

To export bots from the Control Room, you must have the following permissions:

- **Export bot** and **View packages** feature permissions
- **Check in** or **Check out** folder permissions

To import bots to the Control Room, you must have the following permissions:

- **Import bot** and **Manage package** feature permissions
- **Check in** folder permission

Importing Enterprise 11 bots when migrating to Automation 360

You can import your Enterprise 11 bots from the Enterprise 11 Control Room instance to Automation 360. This method enables you to consolidate the Enterprise 11 bots from multiple Control Room repositories to a single Automation 360 repository. After importing the bots to Automation 360, use the Bot Migration Wizard to convert the bots to the Automation 360 supported format (.bot).

Modes to import and export bots

You can use one of the following two modes to import and export bots across different Control Room instances. Choose a method that best suits your environment and requirements.

Manual mode

Involves exporting and importing bots using the user interface.

[Export bots](#) | [Import bots](#)

Automated mode

Involves exporting and importing bots programmatically using Control Room APIs.

[Export files using API](#) | [Import files using API](#)

Moving a bot

To move a bot from one environment to another, follow these steps:

1. Export the bot from the Control Room in the source environment.
2. Import the bot into the Control Room in the destination environment.

Related concepts

[Bot Lifecycle Management API](#)

Use the Bot Lifecycle Management API to export and import bots with dependent files and command packages for comprehensive automation lifecycle management. Users can export bots from public workspace and import to a private workspace in another Control Room and check into a public workspace.

Guidelines for exporting and importing bots

Review the guidelines before you export or import bots.

Guidelines for exporting bots

- Export the action packages along with the bot because the packages in the target Control Room to which you are importing the bot might be different.
- Export the bots folder-wise by moving all the bots from one folder first before moving to the next folder. So do not select the bots from the different folders

- Ensure your SMTP (email) server is integrated with the Control Room so that you can receive a link to the exported package through email.

Email server settings

- Ensure that the source and target Control Rooms have the same set of global values.
- Ensure that the source and target Control Rooms have the same set of lockers and credentials that are referred in the bots.

Guidelines for importing bots

- **Recommended:** When importing bot from the **Automation** page, use the **Skip the bot or file (don't import it)** option because you might want to check the bot first before overwriting it with the imported bot.
- **Recommended:** First import the bots to your private repository (if you are a bot developer), verify the bot, and then check it in to the public workspace.
- The bot directory path is case-sensitive, so ensure that the export and import paths use the same letter case in the Control Room.
- Before importing a bot file of size 200 MB or more, check your load balancer configuration. In few environments, the bot import might fail with an error.

Export bots

You can export a bot from one Control Room to another.

- Only bots in the public workspace can be exported. To export bots, first check these bots into the public workspace before exporting them to the private workspace.
- Ensure that you have the `View package` permissions.
- Ensure that you have the `View content` rights at the folder level from which you want to export the bots.
- Ensure that the version of Control Room and packages in the source and target Control Room are same for export as well as import.

Review the guidelines before you export bots.

Guidelines for exporting and importing bots

Recommendation: To efficiently use the Control Room disk size, as a Control Room administrator, delete the old export packages from `C:\ProgramData\AutomationAnywhere\Server Files\BLM` on the Control Room machine.

1. On the left pane, click **Automation**.
A list of available and forms is displayed.
2. Click **Export bots** icon in the public workspace.
3. Select the bot you want to export.
 - Latest version: Click **Latest version** tab to select the latest version of the bot.
 - Labeled version: Click **Production version** tab to select the labeled version of the bot.
4. Click **Next**.

The bot and its dependencies are ready for export and displayed in the **Review Dependencies** window. If the production label option is selected for the parent bot, the corresponding dependent bots with the production label are also automatically selected. If any of the dependent bots do not have the production label applied, the latest version of the bot is selected.

5. Click **Next**.
All related packages are displayed.
6. Select the necessary packages associated with the bot to export.
Select **Exclude bot packages** to remove all packages from the export.
7. Optional: Enter a password in the **Create password** field.
Password enhances the security for your bot or file when exporting from one Control Room to another.
8. Re-enter the password in the **Confirm password** field.
9. Click **Export bots and files**.
All the selected bots are exported into a `zip` file.

Note: If you have analytics bots in your Control Room, all the Bot Insight dashboards (default, custom, and published) associated with the bots are also exported into the `zip` file.

If you have configured SMTP, an email is sent that contains a link to the zip file of the exported package.

If you have not configured SMTP, perform the following steps to access the link to the zip file of the exported package:

- a) Navigate to **ACTIVITY > Historical**.
- b) Search and view the historical activity of the exported package.
- c) Click **Download exported zip file**.
A link to download the zip file is displayed.

10. Use the link to download the zip file and save it to a location for importing it to another Control Room.

Import the bots into an Control Room.

Related tasks

[Import bots](#)

You can import bots with their dependencies from one Control Room to another. The source environment can be Automation 360 Control Room, Enterprise 11, or Enterprise 10 Control Room instance.

[Export files using API](#)

You can export bots with their dependent files using the Export API.

Related reference

[System roles](#)

System roles are preconfigured with the permissions necessary to perform the tasks within the scope of that role. They cannot be modified or deleted. Administrators assign the roles to users to enable them to access features and perform operations in the Control Room.

Import bots

You can import bots with their dependencies from one Control Room to another. The source environment can be Automation 360 Control Room, Enterprise 11, or Enterprise 10 Control Room instance.

- Ensure that the following rights are enabled to import bots:
 - Import bots permission
 - Create folder permission, if it is required
 - Check-in to public workspace permission if you are importing to the public workspace
- Ensure that the version of Control Room and packages in the source and target Control Room are same for export as well as import.

- You must have a Bot Creator license to import bots either into the private workspace or public workspace.

You can import bots into the public workspace if you have the required permissions, regardless of your license.

- To import the Enterprise 11 bots into your Automation 360 Control Room, consider the following additional requirements:
 - You must have the required `aapkg` package that you created using the Bot Lifecycle Management export feature in the Enterprise 11 Control Room instance.
 - The `aapkg` package must be present in the same Automation 360 machine where you want to import the Enterprise 11 bots.
 - You can import the password protected `aapkg` packages using the Bot Lifecycle Management Import API only.

Import files using API

- Review the guidelines before you import bots.

Guidelines for exporting and importing bots

- To import bots from one Control Room to another, use the exported `zip` file (or `aapkg` file, in case of Enterprise 11 or Enterprise 10 bots). If the SMTP is configured, you will receive a link to download the `zip` or `aapkg` file on your configured email address. If SMTP is not configured, you can access the download link by navigating to **Activity > Historical** page.

Note: You can import the Enterprise 11 bots (`.aapkg` file) with or without the dependent MetaBots only into the public workspace. If you are importing the file into the private workspace, ensure that the dependent MetaBots dependencies are included.

- On the left pane, click **Automation**.
A list of available and forms is displayed.
- Click **Import bots**.
- Browse and select the required `zip` file or `aapkg` file based on your source environment:

Source environment	Action
Automation 360 bots	Select the required <code>zip</code> file.
Enterprise 11 or Enterprise 10 bots	Select the required <code>aapkg</code> file.

4. Select the private workspace or public workspace based on your following source environment:

Source environment	Action
Automation 360 bots	<p>You can select either the private or public workspace as required.</p> <p>If you have analytics bots in your source Automation 360 environment, then all the associated Bot Insight dashboards are also imported based on the following selection:</p> <ul style="list-style-type: none"> If you select the private workspace, you can view only default and custom dashboards. <p>To view published dashboards, you must check in the bots to the public workspace.</p> <ul style="list-style-type: none"> If you select the public workspace, you can view only published dashboards. <p>To view default and custom dashboards, you must check out the bots to the private workspace.</p>
Enterprise 11 or Enterprise 10 bots	<p>Select the public workspace.</p> <p>This selection enables you to migrate Enterprise 11 or Enterprise 10 bots to the Automation 360 environment later during migration.</p>

5. Optional: Enter the password in the **Password** field.

If your exported bot or file is password protected, you will be prompted to enter a password. Obtain the password from the user who has exported this bot or file.

6. If some of the files that are being imported from the package are already available in your Control Room, choose one of the following options:

- **Skip the bot or file (don't import it)**
- **Overwrite the bot or file with the imported one**

7. Click the **Import bots** option.

8. After the import is complete, based on your source environment, navigate to the corresponding repository to find and use the imported bot:

Source environment	Action
Automation 360 bots	Navigate to the corresponding workspace (private or public, based on your selection in Step 4).
Enterprise 11 or Enterprise 10 bots	<p>Navigate to the public workspace in the Bots > My Tasks folder or Bots > My Metabots folder.</p> <hr/> <p>Note: Enterprise 11 and Enterprise 10 bots are imported in <code>.atmx</code> and <code>.mbot</code> format. Use the migration wizard to convert the Enterprise 11 and Enterprise 10 bots files to the <code>.bot</code> format, which is supported in Automation 360.</p> <p>Migrate Enterprise bots</p> <hr/>

System roles are preconfigured with the permissions necessary to perform the tasks within the scope of that role. They cannot be modified or deleted. Administrators assign the roles to users to enable them to access features and perform operations in the Control Room.

Credentials and lockers in the Credential Vault

The Credential Vault securely stores sensitive information such as passwords, account numbers, and social security numbers in credentials and lockers for use in automation tasks. It facilitates role-based access for users of a Control Room and ensures that sensitive values are not stored in bots or on devices.

The Credential Vault consists of two main features: credentials and lockers.

Best Practices:

- Each credential should contain a single password used for authentication to a specific system.
- The credential may have additional attributes such as user name or hostname depending upon what is required in the authentication process that the credential is used for.
- Credentials for applications that process data which requires the highest confidentiality have the least number of consumers where credentials for applications that require lower confidentiality can have a higher number of consumers. Segregate credentials based on applications and data confidentiality.
- Lockers are created to hold credentials that are related to a specific business purpose or class of application based on confidentiality.

Credentials

A credential holds the sensitive information in attributes. An attribute can have a value that is standard for all users or it can accept a user-input value. For example, an `Email` credential can hold three attributes: `host name` (standard value), `username` (user input), and `password` (user input).

By default, all users can create, manage, and use their own credentials. A user is granted access to another user's credentials by receiving access to a locker that holds the credential. If the credential requires a user-input value, it appears in the **CREDENTIAL REQUESTS** tab.

A credential must be assigned to a locker to be used for building and running a bot.

Lockers

A locker specifies which users can view, modify, or access the credentials. For example, a human resources (HR) locker can hold `Email`, `Database`, and `Training website` credentials and allow only specific employees of the HR department to use the credentials in their bots.

A user with either the `AAE_Locker Admin` role or a user-created role with the **Manage my**

credentials and lockers permission configures lockers, adds credentials, and grants access to other users.

Benefits of using the Credential Vault

Apart from providing a secure and centralized location for storing credentials, using the Credential Vault also:

- Minimizes credential fraud.
- Provides an environment to enable improved security.
- Enables businesses to adhere to the processes and credential management compliance standards.
- Offers increased automation opportunities with secure data applications.

Related concepts

[RBAC for Credential Vault credentials management](#)

Credentials created in the Control Room are used across Bot Creators and Bot Runners.

[Configure Credential Vault Connection mode](#)

Credential Vault is a centralized location for securely storing credential information used by bots.

Set up lockers and credentials in Credential Vault

Assign credentials to lockers for Bot Creators to access during the bot building process.

Ensure that you are logged in to the as the administrator.

The credentials assigned are typically those where the administrator is granting some internal, business-related access to a Bot Creator or Bot Runner for RPA development, for example to a Salesforce account.

Note: Credential and attribute names are not case-sensitive and are stored as "lower-case".

1. Navigate to **Manage > Credentials**.
2. Click **Create credential**.
3. Enter the **Credential name** and a **Description** for the configured credential or select **External key vault**.

If integrating with an external key vault, then proceed to [Select External key vault](#).

4. Enter the **Attribute name** and supply the **Description** for the attribute.
5. Select one of the following **Input** options:

Input	Value
Standard	Enter the value. All users see the same credential value set by the credential owner.
User-provided	The value field is not available because the values are not preset during creation. Only users of the locker containing this credential can provide the value.

6. Set **Security** for the attribute.

Note: When the **Masked** option is selected, the attribute value is marked as a password-only attribute and shown as asterisk (*) characters for security purpose.

7. Click **Create credential**.

8. Click the **MY LOCKERS** tab.
9. Click **Create locker**.
10. Enter the **Name**.
11. Optional: Enter a description.
12. Click **Create locker**.

Set up locker and assign credentials

Create a role, credentials, and locker to share related sensitive values with a group of users, so they can use those values to build or run bots.

Do the following to set up the locker and assign credentials:

1. *Create a role*

Define a role and assign permissions to access various features for building bots.

Note: You must have the **AAE_Admin** role or the **Manage roles** permission to create a role and assign it to users.

2. *Create credential*

Create a credential and add the required attributes.

Note: You must have the **Manage my credentials and lockers** and **Create standard attributes for a credential** permission to create a credential and attributes.

3. *Create locker*

Create a locker to group similar credentials and share with other users.

Note: You must have the **AAE_Locker Admin** role or the **Manage my credentials and lockers** permission to create a locker and assign users and roles to it.

Related concepts

[RBAC for Credential Vault credentials management](#)

Credentials created in the Control Room are used across Bot Creators and Bot Runners.

Related tasks

[Edit a credential](#)

Modify credential details and add or remove attributes.

[Edit a locker](#)

Add or remove credentials, owners, managers, participants, or consumer roles.

Create credential

Create a credential and add the required attributes.

This task is performed by the Automation Anywhere Control Room administrator. You must have the necessary rights and permissions to complete this task. Ensure you are logged in to the Control Room as the administrator, or a user with either the `AAE_Locker Admin` role, or a user-created role with the **Manage my credentials and lockers** permission to configure lockers, add credentials, and grants access to other users.

Assign the credential when adding the credential details. If no locker was created, create a locker and then assign the credential. Add up to 50 attributes to a credential.

1. Log in to the Control Room as the administrator.
2. Navigate to **Manage > Credentials** and click **Create credential**.
3. Enter the **Credential name** and a **Description** for the configured credential or select **External key vault**.

If integrating with an external key vault, then proceed to [Select External key vault](#).

4. Enter the **Attribute name** and supply the **Description** for the attribute.
5. Select **External key vault**.

If integrating with an external key vault, such as AWS, Microsoft Azure, or CyberArk, enter the required credentials for the specified external vault as follows:

AWS	Enter the secret name.
CyberArk	Enter the object name.
Microsoft Azure	Enter the secret name.

6. Select one of the following **Input** options:

Input	Value
Standard	Enter the value. All users see the same credential value set by the credential owner.
User-provided	The value field is not available because the values are not preset during creation. Only users of the locker containing this credential can provide the value.

7. Set **Security** for the attribute.

Note: When the **Masked** option is selected, the attribute value is marked as a password-only attribute and shown as asterisk (*) characters for security purpose.

8. Optional: Select **Use attribute ONLY on Password or Masked fields**.

This option ensures that bots input the attribute value only into fields that are identified as password fields.

Note: When this option is selected, an attribute is available only for the commands in Automation Anywhere Enterprise client that support credential variables and where the fields are of **Password** type.

9. Click **Create credential**.

Assign this credential to a locker.

Edit a credential

Modify credential details and add or remove attributes.

A credential can be edited by the owner when the credential is not assigned to a locker. If a credential input type is user-provided, then locker consumers can edit the credential to input a value.

[Role-based access and locker permissions](#)

Note: A user with the **AAE_Locker Admin** role can assign a credential to a new owner. For more information, see [Transfer credential ownership](#).

1. Navigate to **Manage > Credentials**.
2. Hover over the **Actions** icon for the credential.
3. Click the **Edit** icon. (✎)
4. Edit the credential.

If the email notification setting is enabled and credentials are added to a locker, then all the locker consumers receive an email.

The maximum limit of credential attributes that is allowed is 50. If you have upgraded to the current version and have migrated credentials that have more than 50 attributes, when editing that particular credential, the following message displays: `Credentials can only have a maximum of 50 attributes`. To continue, remove the additional attributes that cannot be saved and add those to a new credential.

5. Click **Save changes**.

Related reference

[Credential Vault email notifications](#)

When the email notification setting is enabled, it ensures that users are notified of any changes to credentials and lockers.

Transfer credential ownership

A user with the **AAE_Locker Admin** role can transfer a credential to a different owner.

A credential can only be reassigned to a different owner if it is in a locker. The new owner can be either the locker owner, manager, or participant.

1. Navigate to **Manage > Credentials**.
2. Use the search bar to find the credential.
3. Hover over the vertical ellipses to the right of the credential.
The actions menu opens.
4. Click **Transfer credential ownership**.
A list of users with access to the locker appears,
5. Select the new credential owner.
6. Click **Yes, submit**.

Create locker

Create a locker to group similar credentials to share with other users.

You must either have the `AAE_Locker Admin` role or **Manage my credentials and lockers** permission and the necessary permission to View Users and Roles.

Note: You must have the View Users and Roles basic information permission to view information about other users to add them as locker owners/Managers/participants. Without this permission, an "Access denied" error will occur.

See [RBAC for Credential Vault credentials management](#)

There is **no limit** on the number of credentials that can be stored in a locker. A credential can only belong to one locker. See [Create credential](#). Credentials are further divided in logical groups called lockers.

To create a locker, follow these steps:

1. Navigate to **Manage > Credentials**, and then click the **Lockers** tab.
2. Click **Create locker**.
3. Enter the **Name**.
4. Optional: Enter a description.
5. Select the **Credentials** to add to the locker or select **External key vault**.
6. Enter **External key vault** credentials.

If integrating with an external key vault, such as AWS, Azure, or CyberArk, enter the required credentials for the specified external locker:

AWS	Enter the prefix of secrets stored in the locker.
CyberArk	Enter the safe name where the credential lockers are stored.
Azure	Enter the prefix stored in the locker.

7. Click **Next**.
8. Add the **Owners**.
9. Click **Next**.
10. Optional: Add the **Managers** and click **Next**.

A locker must have at least one owner. The locker owner can edit, view, and delete a locker and also add or remove other owners.

The locker manager can view, edit and delete the locker, and add participants but cannot add owners or managers to the locker.

11. Optional: Add the **Participants** and click **Next**.

A locker participant has access to view a locker and add their own credentials to a locker.

Note: A **locker participant** does not have access to or visibility of credentials created by other users.

12. Add the **Consumers**.

Select one or more roles. Users with these roles have access to the locker. System-created roles are not shown in the **Consumers** list.

Type	Permission
Standard	Locker consumers can view the locker and all the credentials inside the locker. All consumers see the same credential value set by the credential owner.
User-provided	Locker consumers can input their information in user-provided credentials with user-provided attributes.

13. Click **Create locker**.

If the email notification setting is enabled, users receive an email confirming the locker name and their permissions to that locker.

Edit a locker

Add or remove credentials, owners, managers, participants, or consumer roles.

Only a locker owner, locker manager, or locker admin can edit a locker. To edit a locker, follow the steps mentioned below:

Note: Credential, owner, managers, participants, and consumers are separate entities associated with the locker to grant permission. These are not locker entity attributes and modifying these does not change locker objects. Therefore when you edit these fields inside a locker, the locker object is not modified and thereby locker's last modified field is also not updated.

1. Navigate to **Manage > Credentials**, and then click the **Lockers** tab.
2. Hover over the **Actions** icon for the locker.
3. Click the **Edit** icon. (✎)
4. You can make changes to the following:

Option	Description
Credentials	Add or remove credentials that are assigned to a locker.
Owners	Add or remove locker owners. Note: A locker must have at least one owner.
Managers	Add or remove locker managers.
Participants	Add or remove locker participants.
Consumers	Add or remove locker consumers.

If email notification setting is enabled and credentials are added to a locker, then all the locker consumers will receive an email.

5. Click **Save changes**.

Credential Vault email notifications

When the email notification setting is enabled, it ensures that users are notified of any changes to credentials and lockers.

Overview

Email notifications are sent for the following scenarios:

Credential is added to a locker

When credential is added to a locker, a notification is sent to all consumers of the locker to their email address registered in the Control Room. The email consists of a link to the credential that is added to the locker. The consumers are redirected to edit the credential page wherein they input the credential value.

Member is added or removed from a locker	An email notification is sent when a new member (co-owner or participant) is added to a locker or removed from the locker as a member of participant.
Change in permission for locker members	When a locker owner/admin grants or removes locker membership permissions from a locker, an email notification is sent to the locker members at their email address. This ensures that members are notified of their membership changes within the locker.
Locker consumer gets added or removed from a role assigned to a locker, or consumer role gets added or removed from a locker	When a role assigned to a locker is modified by addition or removal of users, an email notification is sent to the new or existing user at their email address so that the consumers are notified that credentials are pending for their input in the locker. Also when a new role added to a locker or an existing role is revoked from the locker, an email notification is sent to the new or existing consumers at their email address so that the consumers are made aware of the changes.

External key vaults for Automation 360

External key vaults provide a secure, encrypted storage space for sensitive data used by RPA. Customers' sensitive data can be accessed and used by their RPA platform by storing the data in a corporate-approved key vault, such as CyberArk Password Vault, AWS Secrets Manager, or Azure Key Vault.

Automation Anywhere provides a secure key vault called Credential Vault. Requirements for external key vault usage are generally related to certain compliance standards and corporate security policies implemented by your IT and IT security groups. As part of their data security policies, these groups select and maintain corporate key vault services, and define the standards for the protection of sensitive data. The Automation 360 Control Room leverages external key vaults to store credentials for security and compliance.

Note: External key vault integration is not supported on Oracle Database.

Users and roles

The following users typically configure and work with external key vaults:

RPA Administrators	RPA Administrators who have AAE_Admin and AAE_Locker_Admin roles with permissions to administer Automation 360 Control Room and Credential Vault instances. The RPA Admin works with the customer External Key Vault Admin.
Customer External Key Vault Administrators	Customer External Key Vault Administrators who are responsible for the administration and management of the external key vault tasks (for example, setting up, managing, and creating access policies).

Benefits

The Automation Anywhere Credential Vault is secure and provides deep integration with the RPA platform. However, because corporate IT must provide secure data services as part of their IT security policies, the RPA platform might be required to use external key vault technology to comply with corporate standards.

External key vaults enable the RPA platform to fully comply with corporate requirements and can provide these additional benefits:

- Deep integration with the Identity Provider (IdP) and corporate authentication platforms such as single sign-on (SSO) and Directory Services (such as Microsoft Active Directory).
- Support of password rotation and synchronization with the systems used with the RPA platform.
- Administration of the key vault and security best practices are performed by the IT group who manages the external key vault instead of the RPA administrators. As a result, the RPA platform becomes a consumer of the credential service.

Guidelines

External key vault integration guidelines support the operation of the RPA platform relating to the coordination, configuration, and consumption of credentials and sensitive data from the external key vault technology.

- **Coordination:** Establish designated contacts for the key vault and RPA platform technologies and identify the individuals responsible for communicating operational guidelines, security policy, and compliance requirements for credential management.
- **Configuration:** Designated contacts collaborate on the use case implementation and configuration requirements of the RPA platform and the external key vault.
- **Consumption:** Based on which use cases are implemented, designated contacts monitor the integration of the RPA platform and the external key vault and coordinate credential rotation and naming requirements.

Integrating external key vault with Control Room

Automation Anywhere Control Room supports these external key vaults: CyberArk Password Vault, AWS Secrets Manager, and Azure Key Vault.

Use cases

The following use cases are supported:

Control Room bootstrap

Retrieval of credentials used by the Control Room to authenticate to supporting services such as database and Control Room software service account.

Control Room system

Retrieval of credentials used by the Control Room for Active Directory (AD) and email (SMTP) integration.

Agent auto-login

Retrieval of credentials used by the RPA platform to launch automations on designated Automation 360 Bot Agent devices.

Agent automation

Retrieval of credentials that the automation (bot) uses during runtime to perform authentications to the applications that are being automated.

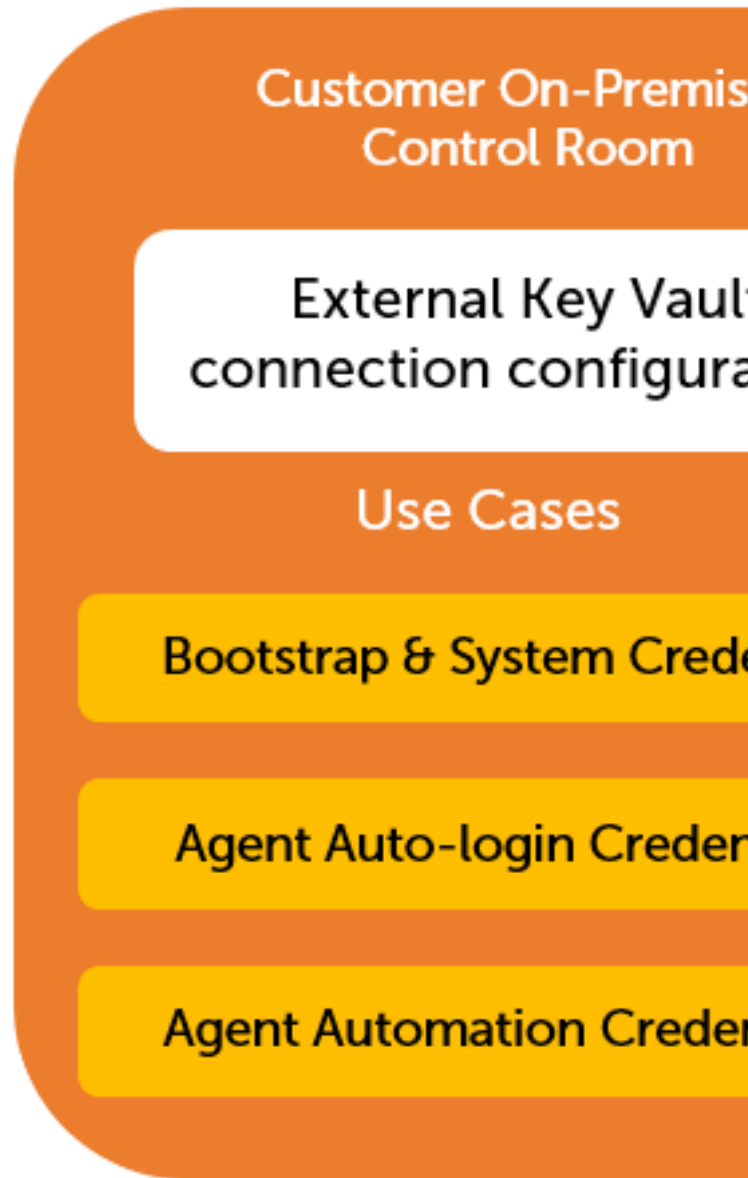

**Plan your integration**

Before you integrate your external key vault with the Automation 360 Control Room, you need to develop an overall external key vault strategy.

The answers to these questions will help determine the integration requirements for the external key vault.

What type of Automation 360 Control Room deployment do you have: On-Premises or Cloud?

- **On-Premises:** The Control Room and external key vault are hosted at the customer's site and environment.

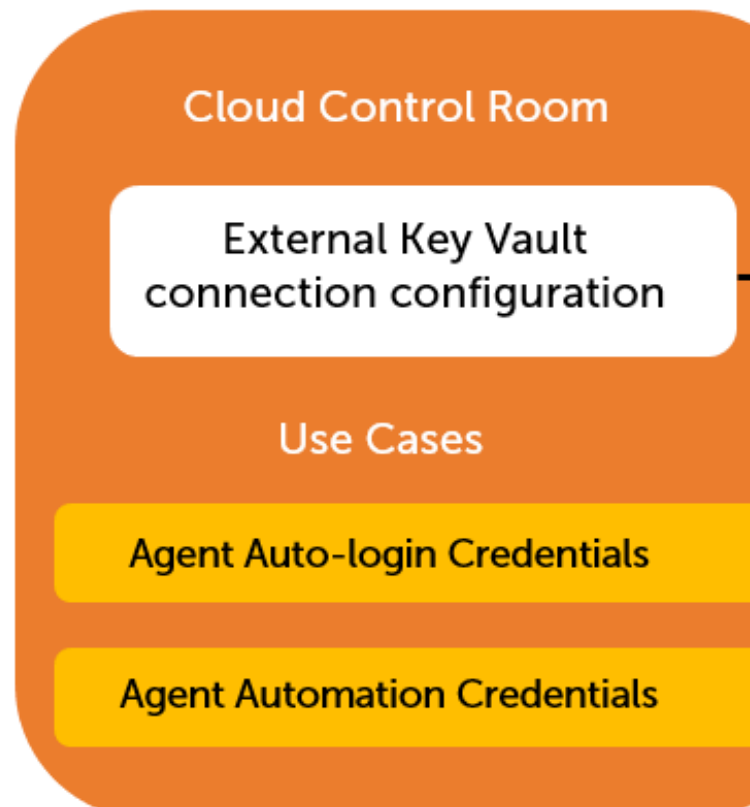

The external key vaults might contain these external key vaults hosted within the customer

site (customer-controlled datacenter or environment):

- CyberArk Password Vault – Customer On-Premises environment
- AWS Secrets Manager – Customer AWS environment
- Azure Key Vault – Customer Azure environment

You can configure the external key vault connection during initial installation or post-installation using the key vault utility.

- **Cloud:** The Control Room is hosted on the Automation 360 Cloud environment and the external key vault is hosted within the customer site (where the customer-controlled datacenter is either On-Premises or in a Cloud environment such as AWS):

The key vault in the customer network requires connection to the Automation 360 Cloud Control Room. You configure the connection to the external key vault from the Automation 360 user interface. Customer network perimeter configuration is required.

What type of third-party external key vault do you have?

CyberArk Password Vault, AWS Secret Manager, or Azure Key Vault.

Each external key vault has their own specific requirements. Review all configuration requirements with RPA and external key vault administrators before starting the integration.

What type of credentials do you need to retrieve from the external key vault based on the supported use cases?

By integrating the Automation 360 Control Room with your external key vault, you can retrieve credentials that support these use cases:

Use case	Credentials	Supported deployment	Credential caching	Credential rotation
Control Room bootstrap	Used to authenticate the database and (optionally) start the Control Room services (Service account)	On-Premises only	Caches the retrieved values	You should rotate the database credential during scheduled downtimes
Control Room system	Used to authenticate to Active Directory (AD), Service account, and SMTP	On-Premises only	Caches the retrieved values	You should rotate the AD, Service account, and SMTP credentials during scheduled downtimes
Agent auto-login	Used by Bot Agent to perform auto-login on a Bot Agent device before launching an automation	On-Premises and Cloud	Does not cache values from external key vault	Always retrieves the latest available credential rotated in the external key vault

Use case	Credential deployment	Supported	Credential caching	Credential rotation
Agent automation	Used by the automation to authenticate to the applications being automated	On-Premises and Cloud	Does not cache values from the external key vault	Always retrieves the latest available credential rotated in the external key vault

Coordinate with external key vault admin team

To ensure a productive, efficient, and rapid integration with the external key vault, you must coordinate with the external key vault administration team and exchange the technical requirements of the RPA platform. By carefully planning and coordinating with the external key vault administration team, you can quickly integrate the Automation Anywhere Control Room with the external key vault and avoid time-consuming troubleshooting issues.

We suggest you follow these guidelines to structure your integration process:

- Review the supported credential use cases to determine which credentials the RPA platform requires to retrieve from the external key vault.
- Schedule a kick-off meeting with the external key vault administration team to exchange information for these details:
 - Which key vault to use?
 - Which use cases to configure?
 - What are the credential naming conventions required by the RPA platform?
 - How are the credentials configured and updated on the external key vault?
 - Does the external key vault have multiple instances (multiple instances of the external key vault can be used for different Automation Anywhere Control Room instances)?
 - Who are the designated contacts for the RPA platform and key vault administration?

- Review the configuration requirements for the Control Room:
 - Are you installing a new Control Room with key vault integration?
If so, then review the installation procedure for the external key vault integration.
 - Are you configuring an existing Control Room to use external key vault integration for the first time?
If so, then review the key vault utility usage procedure to configure key vault integration post-installation.
 - Is the Control Room an Automation 360 Cloud Control Room that will connect to an on-premises key vault?
If so, then you must coordinate with your IT networking team to configure connectivity between the Cloud Control Room and your internal network.
 - Review the external key vault configuration procedure and note all integration settings requirements:
 - Key vault configuration requirements to configure on the external key vault before integration
 - Control Room operating system configuration
 - Authentication method that the Control Room will use to connect to the external key vault
- Schedule integration meetings to coordinate these configuration and set up tasks for the Control Room and external key vault administrators:
 - Configuration of the key vault connection
 - Configuration of each use case
 - Testing of each use case

Note: These integration meetings should be ongoing until you have configured and tested all use cases.

- Add the external key vault integration to regular IT cadence meetings to monitor the operation of the Control Room and the external key vault, specifically credential rotation coordination.

External key vault naming conventions

Specific authentication credentials and external key vaults have restrictions on the use of certain characters in usernames, phrases, and other text. Also, there are different naming conventions to follow based on the external key vault and the credential use cases: Agent auto-login or Agent automation.

Agent auto-login naming conventions

- **CyberArk:** All Agent auto-login credentials are retrieved from the specified safe name and assumed to exist within the Auto-login Credential Safe.
- **AWS Secrets Manager and Azure Key Vault:** All Agent auto-login credentials must adhere to the required naming conventions detailed on this page.

If the Control Room performs an auto-login credential retrieval but no credential exists in the Auto-login Credential Safe that matches that user name, then the auto-login will fail. For any unattended automations, all robotic or digital worker user IDs must have an auto-login credential configured for each Control Room user within the external key vault.

The Control Room retrieves auto-login credentials based on the object naming convention within the external key vault. The Control Room searches for an object where the object name (the credential name in the external key vault) matches the Control Room username for which it is performing auto-login.

The prefix `autologin_` is required as part of the naming convention for auto-login credentials for all external key vaults: CyberArk, AWS, and Azure. The name of the auto-login credential in the external key vault must contain `autologin_` followed by the Control Room username. In some cases, certain key vaults have restrictions on the characters that can be used in credential object names. Additionally, to support how different use cases encode credentials, Automation 360 requires that certain characters be reserved or encoded.

The following table lists examples of the object naming conventions expected in the Control Room:

Control Room username	Expected object name format
ABCD\user123	autologin_ABCD--user123
user123@rpa.abcd.com	autologin_user123-40-rpa-2e-abcd-2e-com

Note: For On-Premises customers using AD authentication, you must format auto-login usernames using the UPN format or `domain\username` postfix.

For auto-login credentials, keep these in mind:

- The object name in the external key vault must contain `autologin_` as a prefix.
- The auto-login credential names must map to the Control Room username (login ID) for the credential being retrieved.

Some external key vaults have usage restrictions of certain characters, such as backslash (\) and ampersand (@) in the secret name (object name), and restrictions on how special characters are interpreted within API calls. If the user ID contains special characters, then you must encode the secret name (object name) in the external key vault using ASCII code character substitutions, as listed in the following table.

This character	Changes to this ASCII code character substitution
\ (backslash)	--
- (dash)	-2d-
_ (underscore)	-5f-
@ (ampersand)	-40-
. (period)	-2e-

Note: Except for the backslash being mapped to double dashes, the dash, period, underscore, and ampersand are mapped using their ASCII code bracketed in dashes.

Agent automation naming conventions

Agent automation credentials are credentials retrieved by the automation during runtime and used by the automation bot to authenticate with applications. Automation credentials retrieved from external key vaults are mapped in the Automation Anywhere Credential Vault using the **External Key Vault** option when configuring lockers and credentials.

The Automation Anywhere locker is mapped to either of the following:

- Safe Name (CyberArk)

- Secret Name Prefix (AWS and Azure)

A credential is mapped to either of the following:

- An Object Name (CyberArk)
- A Secret Name body (AWS and Azure)

Note: You can map any Automation Anywhere locker to any CyberArk Safe Name. The Safe Names used to map Automation Credentials should be distinct from the Safe Name used for auto-login.

To support the Automation Anywhere user-defined credentials functionality, you can create credentials using a Control Room_username postfix because these credentials are retrieved based on the user context of the running bot. If you do not create user-defined credentials, then the automation bot credential retrieval process retrieves the system credential.

Note: For On-Premises customers using AD authentication, you must format Agent automation usernames using the UPN format or `domain\username postfix`.

External key vaults prohibit different special characters in secret names. As a result, you must encode some characters in the credential (secret) name in the external key vault based the type of external key vault (CyberArk, AWS, or Azure) you are using and its specific requirements.

CyberArk Password Vault automation example

The following table shows CyberArk external key vault examples using naming conventions for automation.

Note: The Safe Name maps to the locker for the Control Room, and the Object Name maps to the credential for the Control Room.

Automation credential example	Safe Name	Object in locker	Control Room username
System credential in locker mapped to Safe Name	finance	glaccess	None - system credential
User-defined credential in locker mapped to Safe Name	finance	glaccess_ABCD--RPA--user123	ABCD\RPA\user123
User-defined credential in locker mapped to Safe Name where username is encoded with ASCII mapping	finance	glaccess_ABCD--RPA-2e-user123	ABCD\RPA.user123

AWS Secrets Manager automation example

The following table shows AWS Secrets Manager external key vault examples using naming conventions for automation.

Note: The AWS Secret Name Prefix maps to the locker for the Control Room, and the AWS Secret Body maps to the credential for the Control Room.

Automation credential example	AWS Prefix	AWS Secret Body	Secret in AWS	Control Room username
accounting_pdf System credential in locker mapped to AWS Secret Name prefix <code>accounting</code>	accounting	pdf	accounting_pdf (system)	None - system credential
accounting_pdf_ABCD--user123 User-defined credential in locker mapped to AWS Secret Name prefix <code>accounting</code>	accounting	pdf	accounting_pdf_ABCD--ABCD\user123	ABCD\user123

Azure Key Vault automation example

The following table shows Azure Key Vault external key vault examples using naming conventions for automation.

Note: The Azure Prefix maps to the locker for the Control Room, and the Azure Secret Body maps to the credential for the Control Room.

Automation credential example	Azure Prefix	Azure Secret Body	Secret in Azure	Control Room username
accounting_cv1 System credential in locker mapped to Azure Secret name prefix <code>accounting</code>	accounting	cv1	pdf-5f-cv1 (system)	None - system credential
accounting_cv1_ABCD\user123 User-defined credential in locker mapped to Azure prefix	accounting	cv1	pdf-5f-cv1-5f-ABCD--user123	ABCD\user123

When deploying Azure credentials, the Azure Key Vault character underscore (`_`) is a reserved character and cannot be used in credential names. You must substitute any underscore (`_`) usage with the ASCII code value `5f` bracketed by dashes:

This character	Changes to this ASCII code character substitution
\ (slash)	--

This character	Changes to this ASCII code character substitution
- (dash)	-2d-
_ (underscore)	-5f-
@ (ampersand)	-40-
. (period)	-2e-

Integrating CyberArk Password Vault with Automation 360

You can integrate Automation 360 to retrieve credentials from the CyberArk Password Vault. The credentials become resident within the CyberArk Password Vault where they are managed, rotated, and synchronized.

You integrate the Automation 360 Control Room by connecting it to the CyberArk Password Vault through the CyberArk Central Credential Provider (CCP) APIs. No additional licensing is required to integrate with the CyberArk Password Vault or use the CCP APIs.

Recommendation: We recommend that you control access to the CyberArk Password Vault through an IP address.

You can integrate Automation 360 with the CyberArk Password Vault using either of these deployments:

- Cloud
- On-Premises

The following diagram shows an Automation 360 Cloud deployment where the Control Room is hosted on AAI Cloud:

**On-premises only*

For On-Premises deployments, you deploy the following:

- Control Room as software within your customer environment.
- Bot Agent within your customer environment where automations run and access customer applications.

Important: You can edit the external key vault connection settings through the user interface in Cloud deployments only. External key vault settings in On-Premises deployments are only configurable during installation or with the key vault utility post-installation.

CyberArk Password Vault integration requirements

- [Install CyberArk Central Credential Provider](#)
- [Implement X.509 client certificate authentication method](#)
- [CyberArk Central Credential Provider API configuration requirements](#)
- [Review CyberArk Credential terminology and identifiers](#)
- [Define CyberArk application ID](#)
- [Provision accounts in CyberArk Password Vault](#)
- [Set up access to the application and password providers](#)

Install CyberArk Central Credential Provider

You must install and configure the CyberArk Central Credential Provider on the CyberArk server. See [CyberArk Central Credential Provider installation](#).

Implement X.509 client certificate authentication method

An X.509 client certificate is a type of digital certificate used by client systems to make authenticated requests to a remote server and uses the widely accepted international X.509 public key infrastructure (PKI) standard to verify that a public key belongs to the user, computer, or service identity contained within the certificate.

The Automation 360 Control Room uses a client certificate as the authentication method when connecting to the CyberArk CCP APIs.

This authentication method is highly secure and leverages the system's truststore to store the client certificate, server certificate, and private key. The truststore is a certificate storage location provided by the operating system's software and it contains the issuing Certificate Authority's (CA) certificate. You can import individual server certificates into the truststore. However it is more efficient to import the issuing Certificate Authority (CA) certificate.

The following image provides an overview of certificate-based authentication:

1. The client (Automation 360 Control Room) sends a request to the CyberArk AIM server (protected resource).
2. The server then responds by sending a certificate back to the client.
3. The Automation 360 Control Room verifies the certificate sent by the CyberArk AIM server by validating it against the trusted server certification information stored in the public part of the Control Room truststore.
4. After validating the information in the truststore, the Automation 360 Control Room resends the certificate back to the CyberArk AIM server.
5. The CyberArk AIM server then validates the certificate sent by Automation 360 Control Room against the trusted client certification information stored in the public part of the AIM server truststore

Because client certificates (those with their private key) are generally distributed in password protected format, the certificate file (using .p12 format, such as: `c:\PATH\aaeCyberArkCertificate.p12`) requires a passphrase.

6. Both parties (client and server) gain access to the protected resources if the certificates pass validation based on the following:
- The Control Room certificate must be trusted by the CyberArk AIM server
 - The Control Room must trust the certificate on the CyberArk AIM server
 - The Subject field in the certificate matches the calling system's Fully Qualified Domain Name (DNS Name)
 - The certificate has not expired

Important: As part of the integration planning phase, coordinate certificates and requests for certificates. You will have to request that certificates be issued by the Public Key Infrastructure (PKI) team before you can begin integration configuration. The certificate files are stored in the PKI folder and accessed with the Control Room passphrase when required. The Control Room passphrase is stored encrypted in the `keyvault.properties` file.

CyberArk Central Credential Provider API configuration requirements

You must have network connectivity between the Automation 360 Control Room and the CyberArk AIM server. The Automation 360 Control Room is connected to the CyberArk Password Vault through the CyberArk Central Credential Provider (CCP) APIs for both On-Premises or Cloud deployments.

Note: No additional licensing is required to use the CCP APIs.

To use the CCP API, you must set these required parameters:

- Automation 360 v.20 (supports bootstrap credentials with On-Premises deployment only)
- Automation 360 v.21 or later (supports all bootstrap and system use cases for On-Premises deployments, auto-login, and automation credentials for both On-Premises and Cloud deployments)
- The Control Room Key Vault contains these connection details:
 - CCP API vault connection URL – For example: `https://<host:port>/AIMWebService/api/Accounts?`
 - CCP API AppID – You must configure the CyberArk AIM server with an Application ID (AppID). For example: `AACompanyControlRoom1`.

See [Define CyberArk application ID](#).

- X.509 client certificate with private key issued to the Automation 360 Control Room

(The Control Room Fully Qualified Domain Name is in the Subject: field of the certificate) and configured with the CyberArk AIM server for authentication. For example: `c:\PATH\aaeCyberArkCertificate.p12`

Note: The `.p12` format is required.

Review CyberArk Credential terminology and identifiers

CyberArk and Automation Anywhere use different terminology to describe and identify credentials:

Description	CyberArk	Automation Anywhere
Where credentials are stored	object	credentials
Primary partitioning of the key vault	safe (contains objects)	locker (contains credentials)

- Credentials in CyberArk are stored in objects, and each object is contained in a safe. A single CyberArk instance can have multiple safes, where each safe has access controls for users.
- Credentials in Automation Anywhere are stored in lockers, where each locker has access controls for Control Room users.

CyberArk identifies credentials by safe name AND object name. The CCP API uses a CyberArk safe name and CyberArk object name to access credentials within the CyberArk Password Vault (the credential must exist in CyberArk).

The following is a code sample CCP API call and corresponding response:

```
https://<host:port>/AIMWebService/api/Accounts?
AppID=BillingApp&Query=Safe=Billing;Object=MonthlyBilling
```

Response

```
{
  "Content": "",
  "PolicyID": "CyberArk",
  "CreationMethod": "PVWA",
  "Folder": "Root",
  "Address": "address tbd",
  "Name": "Application-CyberArk-address tbd-vb",
  "Safe": "aa_vb_safe",
  "DeviceType": "Application",
  "UserName": "vb",
  "PasswordChangeInProgress": "False"
}
```

The credential value or secret (for example, the password) is stored in the `Content` attribute and the User ID (the Control Room user name, for example `vb`) is stored in the `UserName` attribute.

Define CyberArk application ID

Automation 360 integrates with CyberArk Password Vault through the CyberArk Central Credential Provider (CCP) API. The application ID (AppID) is a required configuration parameter.

As a CyberArk Administrator, use the CyberArk Password Vault Web Access (PVWA) interface to define the application ID by following the specified procedure to prepare the CyberArk AIM server for integration with the Control Room. See [CyberArk Password Vault Web Access](#).

1. You must log in as a user allowed to manage applications on the CyberArk platform (requires Manage Users authorization).
2. From the **Applications** tab, click **Add Application**.

3. From the **Add Application** panel, enter the following information:

Option	Action
Name	Specify the unique name (ID) of the application. We recommend using a name based on the Control Room name or function, for example: AACompanyControlRoom1.
Description	Enter a short application description used to help identify it.
Business owner	Enter contact information about the application's business owner.
Location	Select the application location in the Vault hierarchy. If a location is not selected, the application will be added in the same location as the user who is creating this application.

4. Click **Add** to add the new application and display it on the **Applications Details** page.
5. From the **Applications Details** page, select the **Allow extended authentication restrictions** check box to specify an unlimited number of machines and Windows domain OS users for a single application.
6. From the **Authentication** tab, click **Add** to add details to the new application.
A list of available authentication characteristics are displayed, which the Credential Provider uses to verify before retrieving the application password.

7. **Optional:** Select **OS user** and enter the name of the user who will run the application, and then click **Add** to add the OS user to the list of users in the **Authentication** tab.
8. Select **Certificate Serial Number** and enter the certificate serial number for the Control Room client certificate, and then click **Add**.
9. (Automation 360 recommended): From the **Allowed Machines** tab, click **Add**, and specify the IP/host name/DNS address where the application is allowed to run and request passwords.
CyberArk AIM uses this address to ensure that only applications which run from specified machines can access their passwords.
10. Click **Add** to add the IP address to the list of allowed machines.

Provision accounts in CyberArk Password Vault

Before an application can function, you must give the application access to existing user accounts or to new user accounts to provision in the CyberArk Password Vault.

Use the Password Safe to provision the privileged user accounts required by the application. You can provision accounts using one of these methods:

- **Manually** add accounts one at a time, and then specify all the account details.
- **Automatically** add multiple accounts using the Password Upload feature. To add account automatically, you must have authorization to the **Add accounts** feature in the Password Safe.

For details about adding and managing privileged accounts, see [Privileged Access Manager - Self-Hosted](#).

Set up access to the application and password providers

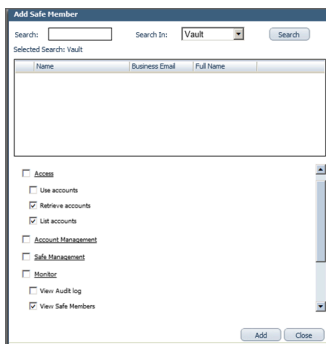

After the user accounts have been provisioned by CyberArk, you must set up access to both the application and to CyberArk Application Password providers who are serving the application.

From where the Central Credential Provider is installed, add the provider user and application users as members of the Password Safes (where the application passwords are stored). You can add the users using one of these methods:

- Manually from the **Safes** tab
- By specifying the Safe names in the CSV file when adding multiple applications

To add users as safe members, from the **Add Safe Member** dialog box, add the provider as a safe member with these access authorizations selected, and then click **Add**:

- Retrieve accounts (Access)
- List accounts (Access)
- View Safe Members (Monitor)

Note: When installing multiple providers for the CyberArk Password Vault integration, we recommend that you first create a group for them, and then add that group to the safe with the same selected access authorizations.

To add application (AppID) as a safe member, perform these steps:

1. From the **Add Safe Member** dialog box, add the (AppID) as a safe member with Retrieve accounts (Access) selected as the access authorization.
2. Click **Add**.

If the safe is configured for object level access, ensure that both the provider user and the application have access to the passwords to retrieve. For details about adding and managing privileged accounts, see [Privileged Access Manager - Self-Hosted](#).

On-Premises integration using CyberArk Password Vault

As an Automation 360 administrator, you can configure the CyberArk On-Premises integration using one of these methods: initial installation or post-installation using a command-line interactive key vault utility.

Within the On-Premises installation wizard, bootstrap credential retrieval from external key vault configuration options are only available if you first configure the key vault connection. The configuration options vary based on the external key vault you select.

Note: If you are using CyberArk in an Automation 360 Cloud deployment, then the CyberArk external key vault must be reachable from the Cloud Control Room through the network perimeter firewall rules. For external firewall rules configuration details, see [Automation 360 IP addresses for external integrations](#).

Choose your integration method:

- [Initial installation](#)
- [Post-installation using key vault utility](#)

On-Premises initial installation using CyberArk Password Vault

Using the initial installation method, you can connect and configure the external key vault connector, service account credential (Active Directory master password), and bootstrap (database) credential identifier.

Note: You must select Microsoft SQL Server Authentication as the database; other database authentication methods are not supported for this use case.

The initial installation supports a `password-less` installation regarding the Control Room bootstrap credentials. The password-less installation identifies the bootstrap credentials by the Safe name and Object name within CyberArk.

You can configure the SMTP and AD credential identifier to retrieve from the external key vault using the Automation 360 user interface.

1. After you start the Automation 360 installation wizard, select **On-premises** as the **Deployment Option** and click **Next**.
2. Accept the license agreement and click **Next**.
3. Select **Custom** as the **Installation Type Preference** and click **Next**.
4. Accept the default locations for the destination folders and click **Next**.

5. To connect and configure the external key vault integration, select **CyberArk**.

- a) In the **Vault URL** field, enter the CyberArk AIM server CCP API URL (for example: `https://<hostname>:<port_num>/`).

Note: To access the CCP APIs, the Control Room will automatically append `/AIMWebService/api/Accounts?` to the vault URL you enter. As a result, you must configure the Web Service on the CyberArk AIM server as `AIMWebService`.

- b) In the **Application ID** field, enter the CCP API AppID (for example: `AAEControlRoom`).
- c) Enter the path to the CyberArk AIM server certificate (in `.pem` format using `.p12`) issued to the Control Room server (The certificate Subject: field contains the Control Room fully qualified domain name (FQDN)).

This certificate must be trusted by and configured within CyberArk.

- d) Click **Upload Certificate** to store on the Automation 360 Control Room server.
- e) Enter the certificate file passphrase used to access the Control Room certificate file.
- f) Optional: If the issuing Certificate Authority (CA) of the CyberArk server certificate *is not* trusted by the Control Room, then enter an optional server certificate.

This is the server certificate for the CyberArk server without a private key (the certificate Subject: field contains the CyberArk AIM Server FQDN). The installer will add the optional CyberArk Server certificate to the truststore used by the Control Room.

- g) Click **Next**.

6. Accept the default settings from the **TLS Configuration** dialog box and click **Next**.

7. From the **Service Credentials** dialog box, select an option to specify the **Safe name** and **Object name** from CyberArk instead of manually entering the user name and password for the **Service Account** used by the Control Room.

8. Click **Service Account (retrieve credential from external key vault)**, and then enter the **Safe name** and **Object name** values.

The installer will query CyberArk for the credential to validate that the object exists in the specified safe.

Note: If the **Service Account** option to specify **Safe name** and **Object name** is not available, then this indicates that the CyberArk Password Vault was not previously configured and connected properly as the external key vault. Contact your AAI Support team or review.

See also: [Troubleshooting external key vaults](#).

9. Click **Next**.

10. From the **Database Server** dialog box, select your **Database Server** and enter the name of your Control Room database, and then click **Next**.

11. From the **Database Authentication** dialog box, select an option to specify the **Safe name** and **Object name** from CyberArk instead of manually entering the user name and password the Control Room uses to authenticate to the database.
- Click **SQL Server authentication (retrieve credential from external key vault)**, and then enter the **Safe name** and **Object name** values.

Note: Enter the same **Safe name** you previously entered for the **Service Account** safe name.

- Click **Next** to continue and complete the initial installation.

After you successfully complete the initial installation, the Automation 360 Control Room can access and retrieve credentials within the CyberArk Password Vault.

On-Premises post-installation using CyberArk Password Vault

You use the command-line interactive key vault utility during a **scheduled system downtime and you must stop all running Control Room services**. You should coordinate any key vault configuration changes that might impact connectivity parameters (such as App ID, vault URL, port numbers, and certificate) during downtimes with the CyberArk administrative team.

Note: If you use the key vault utility to disable CyberArk Password Vault integration, you must first unmap any mapped credentials that are in use.

Using the post-installation method, you can perform these actions:

- Modify or configure the external key vault connection parameters.
- (If not configured during initial installation) Modify or configure the service account credential (Active Directory master password).
- (If not configured during initial installation) Modify or configure the database (bootstrap) credential identifier (retrieved when authenticating the database).

Note: Retrieving bootstrap credentials from an external key vault might cause the Control Room to fail if the external key vault is not accessible during boot-up, or if the external key vault is not accessible when the Control Room refreshes database connections and authenticates users with Active Directory.

- Recover the Control Room for these reasons:
 - By modifying the external key vault connection parameters, the service account, and database credential safe and object identifiers.
 - If CyberArk Password Vault connection parameters changes caused the Control Room to experience connectivity issues.
 - When credential identifiers for bootstrap passwords change.

You can address any initial configuration settings that were not set correctly and recover the system.

You can configure and edit SMTP and AD credential identifiers to retrieve information from the external key vault from the Automation 360 Control Room by navigating to **Administration > Settings > Active Directory**.

1. Run the key vault utility for the CyberArk Password Vault

Note: You must import the CyberArk server certificate (the certificate issued to the CyberArk server) to the Java truststore before invoking the dB utility commands. The certificate can be in `.cer` (PEM) format and does not contain a private key.

To run the key vault utility and update key vault connection settings:

- As the Control Room administrator, access the Automation Anywhere Control Room installation directory that was created during the initial Automation 360 installation.
For example: `C:\Program Files\Automation Anywhere\Enterprise`
- Download the latest version of the key vault utility. To download the jar file used to update the directory, open a browser and access the A-People site: [A-People Downloads page \(Login required\)](#).

Note: If DB authentication is configured to use external key vault, the utility returns the following exception: Database currently configured to retrieve credentials from key vault. Update database authentication to WINDOWS/SQL to proceed further and exit.

The utility requests the user to confirm the action: Disable/update of key vault might impact functionalities using key vault (for example, Active Directory configuration, Email Settings configuration). Make sure to update these settings (if any). Are you sure you want to continue?

- Enter `y` to continue.
- Enter the following:

```
> jdk11\bin\java -jar certmgr.jar -appDir . -importTrustCert <Full path of the certificate>
```
- Add these `jvm` arguments to the command to run the key vault utility:
 - `-Djavax.net.ssl.trustStore="C:\Program Files\Automation Anywhere\Enterprise\pki\trust\store.ks"`
 - `-Djavax.net.ssl.trustStorePassword=changeit --module-path lib -jar crutils.jar -configPath "C:\Program Files\Automation Anywhere`

```
\Enterprise\config" -action [UPDATE_KEY_VAULT_CONFIGURATION or
UPDATE_DB_AUTHENTICATION_CONFIGURATION]
```

You can update either of these configuration actions:

- Enter `UPDATE_KEY_VAULT_CONFIGURATION` to edit the CyberArk key vault configuration.
- Enter `UPDATE_DB_AUTHENTICATION_CONFIGURATION` to change to database authentication using external key vault.

2. Based on which configuration action you used, choose the appropriate action:

- **Update key vault configuration for CyberArk:** If you entered `UPDATE_KEY_VAULT_CONFIGURATION` as the configuration action:
 - After the utility loads the current key vault configuration and properties, and this prompt is displayed: Enter key vault [AWS/CYBERARK/AZURE/NONE] :, enter `CYBERARK`
 - At the Please enter Vault URL: prompt, enter (for example): `https://services.uscentral.skytap.com:19516`
 - At the Please enter Application ID: prompt, enter (for example): `AAEControlRoom`
 - At the Please enter Certificate path: prompt, enter (for example): `C:\Users\Admin\Downloads\client_combined_cert_key_Adminat1234.p12`

Note: The client certificate issued to the Control Room for authenticating to CyberArk must be in `.p12` (pkcs#12) format with the private key.

 - At the Passphrase will not be displayed on the console Passphrase: prompt, enter your passphrase.

The key vault utility runs. If the configuration was successful (the utility was able to connect to the external key vault using the configured parameters), these messages are displayed on the console:

```
Connection configurations valid
Key Vault configurations successfully updated
```

- **Update database authentication for CyberArk:** If you entered `UPDATE_DB_AUTHENTICATION_CONFIGURATION` as the configuration action:
 - After the utility loads the current database configuration information, this prompt is displayed:

```
Database authentication configurations loaded
Currently configured database authentication [SQL]

Change database authentication. Available options:
WINDOWS: Connect to database using windows authentication
SQL: Connect to database using SQL server authentication, manually
enter username and password
KEY_VAULT: Connect to database using SQL server authentication,
retrieve username and password from external key Vault
```

```
Enter database authentication [WINDOWS/SQL/KEY_VAULT]:
```

```
Enter KEY_VAULT
```

- b. At the Please enter Safe name: prompt, enter (for example): aa_vb_safe
- c. At the Please enter Object name: prompt, enter (for example): Database-MSSql-administrator-admin

The key vault utility runs. If the database configuration was successful (the utility was able to connect to CyberArk, retrieve the designated credential and then use the credential to connect to the database), these messages are displayed on the console:

```
Database Credentials are valid
Database authentication configurations successfully updated
```

Cloud integration using CyberArk Password Vault

You connect and integrate the external CyberArk Password Vault to the Automation 360 Control Room.

The following image shows CyberArk Cloud integration with the Control Room:

You must configure the customer network perimeter firewall to allow access to the `CyberArk_CCP_hostname:port` from the Automation 360 Cloud AWS NAT Gateway IP addresses.

The following table provides an example of how to configure the customer perimeter firewall:

From	To	Protocol used
Control Room in Automation 360 Cloud: Three AWS NAT Gateway IP addresses	CyberArk_CCP API_hostname:port For example: cyberarkpww.dev.abcd.com:4043	TLS Encrypted CCP API (TLS mutually authenticated)

For more details, see [Automation 360 IP addresses for external integrations](#).

For Cloud integrations, you can configure the Control Room and external key vault integration using the Automation 360 Control Room user interface.

The Agent auto-login and Agent automation use cases are only supported on Automation 360 Cloud Control Room instances. Neither of these use cases affect the Control Room boot sequence or Control Room functionality.

Note: Bootstrap and service account credential retrieval use cases are not supported on Cloud Control Room instances because the database and services are managed internally by Automation Anywhere.

There is no compliance use case (requirement) for these credentials to be stored in the customer external key vault.

1. Gather the specific CyberArk information required to configure the external key vault connector using the Automation 360 Control Room.

Item	Description
Vault URL	<p>The CyberArk AIM server CCP API URL (for example: <code>https://<hostname:port_num>/</code>)</p> <hr/> <p>Note: To access the CCP APIs, the Control Room will automatically append <code>/AIMWebService/api/Accounts?</code> to the vault URL you enter. As a result, you must configure the Web Service on the CyberArk AIM server as <code>AIMWebService</code></p>
Application ID	<p>The CCP API AppID (for example: <code>AAEControlRoom</code>).</p> <p>For details, see Define CyberArk application ID.</p>
Certificate file	<p>Enter the path to the client certificate issued to the Control Room server. This certificate must be trusted by and configured within CyberArk.</p> <p>The certificate will be issued to the Cloud Control Room (Subject: field of the certificate will contain fully qualified domain name (FQDN) of the Control Room) by the customer internal certificate authority.</p>
Certificate file password	A password used to open the certificate file.
Server certificate - PEM format	(Required for Cloud integration): The server certificate without the private key of the CyberArk AIM server (Subject: field of the certificate will contain the FQDN of the CyberArk AIM server).

2. Log in to the Automation 360 Control Room as the Administrator.
3. From the Control Room, navigate to **Administration > Settings > External key vault** .
4. Click the **Edit** icon to open the **Configuration settings** pane.
5. Click **CyberArk** and then enter the specific CyberArk information described in the preceding table.
6. Click **Save changes** to connect the external key vault.

CyberArk credential retrieval use cases

You can retrieve CyberArk credentials for these use cases: bootstrap, system, auto-login, and automations.

Retrieve Control Room bootstrap credentials with CyberArk

The Automation 360 Control Room uses bootstrap credentials to access supporting services such as database, service account, and Active Directory (AD). You configure these credentials during the initial On-Premises installation or post-installation (using the key vault utility) by specifying the safe name and object name.

The following images shows the process of retrieving the Control Room bootstrap credentials with CyberArk:

When required during the bootup sequence or normal operations (such as refreshing a service authentication), the Control Room uses the key vault connection to retrieve the credential and perform the required authentication.

Note: You must select the Microsoft SQL Server Authentication for this use case; other database authentication methods are not supported for bootstrap.

Retrieve Control Room system credentials with CyberArk

Note: You can configure the service account only during the initial installation.

If you configured an external key vault during the initial installation, you can then use the Automation 360 user interface (post-installation) to configure SMTP and Active Directory (AD) credentials.

1. Log in to the Automation 360 Control Room as the Administrator.
2. From the Control Room, navigate to: **Administration** > **Settings** > **Email Settings**.
3. You can map the AD Master Account credential from the external key vault, configure external credentials, or set to manual (switch modes of AD Master Account credential retrieval).

Retrieve auto-login credentials with CyberArk

Auto-login credentials are used to authenticate to an Automation 360 Bot Agent device and start an active Windows session. Robotic Process Automation (RPA) requires an active Windows session to function. Auto-login occurs prior to the automation running when automations are launched from a remote Bot Agent device.

The following image shows the process of retrieving the auto-login credentials with CyberArk:

A Control Room administrator can manually launch or schedule a job to launch an automation on a Bot Agent device by specifying these details:

- Automation (bot) name
- Device name
- User context

The system performs auto-login to the specified device with the user name and password associated with the user context, and then runs the automation on the device.

To configure retrieval of auto-login credentials from the external key vault, perform these steps:

1. Log in to the Automation 360 Control Room as the Administrator.
2. From the Control Room, navigate to **Administration** > **Settings** > **Devices**.
3. Scroll down to the auto-login settings section and click **Edit**.
4. If you previously configured CyberArk as the external key vault connection, click **Enabled** to retrieve the auto-login credentials from that external key vault.

If this option is disabled, then the external key vault connection was not configured.

Note: If you disable auto-login from the external key vault, then credentials are retrieved using the AAI Credential Vault and its stored credentials instead.

5. Enter the Safe name (for example: AA_Auto-login_Safe).

The safe name you enter is also known as the *Auto-login Credential Safe*.

Note: You can only define a single safe to retrieve auto-login credentials, so all auto-login credentials must be in the designated safe.

6. Click **Save changes**.

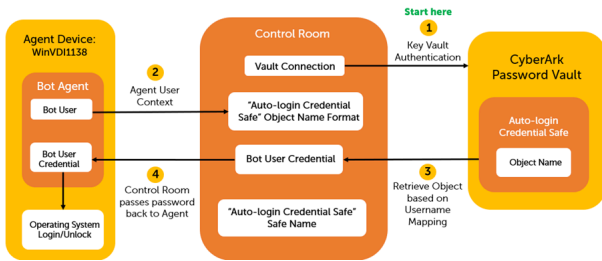

If successful, then the auto-login settings successfully saved message is displayed.

CyberArk auto-login credential example

For this auto-login credential retrieval example, consider a Control Room user who wants to deploy a bot on a device as a specific user. This example uses the following details:

- Automation (bot) name run on a device = ProcureToPayGeoEast
- Agent device name = WinVDI1138
- Agent user context = roboticworker2112@automation.abcd.com

The following image shows this an example of retrieving auto-login credentials with CyberArk:

Before starting the automation, ensure the following:

1. The Control Room connection details have been successfully configured, and the Control Room uses these connection details to connect to CyberArk and performs authentication.
2. The Control Room queries the Bot Agent device running on device `WinVDI1138` to check if there is an active Windows (operating system) session currently on device `WinVDI1138`, and if that session belongs to Agent user `roboticworker2112`.
If there is an existing session on the device for user `roboticworker2112`, then there is no need to perform auto-login and the bot continues with the deployment.
3. However, if there is an no active session or if there is an active session that does not belong to `roboticworker2112`, then the Control Room retrieves the auto-login credential from the CyberArk Password Vault.
4. The Control Room passes the credential (password) to the Bot Agent. The Bot Agent performs a Windows login on device `WinVDI1138` as `roboticworker2112` (first, logging off any other user login session) using the auto-login credential for `roboticworker2112`. The automation (Bot) `ProcureToPayGeoEast` then starts to run on device `WinVDI1138` as `roboticworker2112`.

Retrieve automation credentials with CyberArk

Automation credentials are variables used by bot developers within automation (bot) actions that define and retrieve data from encrypted storage. The automation uses the credentials to authenticate to applications (for example: finance application). Automation credentials are retrieved by the Automation 360 Bot Agent during runtime. Within CyberArk, a safe is a locker, and an object is a credential.

The following image shows the process of retrieving automation credentials with CyberArk:

Automation credentials retrieved from the CyberArk Password Vault are mapped in the Automation Anywhere Credential Vault. The Credential Vault supports these two types of automation credentials:

System credentials

Credentials where the value returned by the credential variable is the same for any automation that uses that variable.

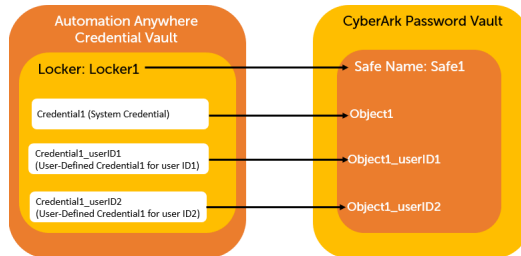

User-defined credentials

Credentials where the value returned by the credential variable is distinct based on the user context in which the automation is running.

For both system credentials and user-defined credentials, the bot developer specifies the same credential variable within the bot code. Then, the system determines which credential to retrieve during bot runtime.

User-defined credentials simplify automation development by enabling bot developers to write code using a single credential variable where the RPA platform substitutes the value returned during runtime with a unique user-specific value. Developers can avoid writing duplicate code with different user-specific credential variables.

The following image shows the relationship between the Automation Anywhere Credential Vault objects and the CyberArk credentials for system and user-defined credentials:

- The Control Room locker (`Locker1`) is mapped to the CyberArk safe name (`Safe1`).
- The Control Room system credential (`Credential1`) is mapped to the CyberArk object (`Object1`).

As an administrator, you create and configure a locker and credentials using the external key vault feature in the Automation 360 Control Room. Within the Control Room, an administrator maps the Automation Anywhere locker (`Locker1`) to a safe name (`Safe1`) and maps the credential (`Credential1`) to an object name (`Object1`). The credentials available to Control Room users are determined by what is configured in the external key vault (CyberArk Password Vault).

If you want to use user-defined credentials with the CyberArk integration, then the CyberArk administrator must create objects for each user-defined credential by naming those objects with the `ControlRoom_username` postfix. During runtime, the RPA platform retrieves the object name that is named with a postfix that matches the user context (user-defined credential) in which the automation is running. If there is no user-defined credential, then the RPA platform retrieves the object name without a username postfix (and uses the system credential).

Note: You can map any Automation Anywhere locker to any CyberArk Safe Name. However, any safe names you use to map automation credentials should be distinct from the safe names you use for auto-login.

As an administrator, you can use the access controls in the Automation 360 Control Room to separate access to credentials by providing users access to a locker. You control access to credentials by assigning different Control Room users to different roles and then associating different lockers with those roles. By mapping different CyberArk safes to different lockers, access to credentials in the CyberArk safes is mapped to and enforced by the access controls in the Control Room.

Note: The same permissions and privileges (assigned through roles) in the Control Room apply to credentials mapped to the external key vault.

CyberArk automations credentials retrieval example

To configure automation credentials retrieval and integrate with the CyberArk Password Vault, you first create a locker and then create credentials.

To create a locker to integrate with the CyberArk Password Vault, perform these steps:

1. From the Automation 360 Control Room, navigate to **Manage > Credential**.

A user with **Manage my credentials and lockers** permissions is authorized to create credentials.

2. From the **Credentials** tab, select **Create Locker**.

3. Enter a name for the locker.

This name is local to the Control Room and does not have any dependency on the CyberArk safe name.

4. Click **External Key Vault** and enter the CyberArk safe name in the **Safe name** field (for example: `Finance_Safe`).**5.** Click **Next**.**6.** Configure Owners, Managers, Participants, and Consumers for the locker.**7.** Click **Create locker**.

See [Create locker](#).

The Control Room is now ready to retrieve credentials and enforce access controls on the mapped CyberArk safe. To continue, you now create the credentials.

To create a credential to integrate with the CyberArk Password Vault, perform these steps:

1. From the Automation 360 Control Room, navigate to **Manage > Credentials**.

A user with **Manage my credentials and lockers** permissions is authorized to create credentials.

2. From the **Credentials** tab, select **Create Credential**.**3.** Enter the credential name in the **Credential name** field.

This name is local to the Control Room and does not have any dependency on the CyberArk safe name.

4. Click **External key vault** below the name field.**5.** From the list of available lockers, select the appropriate locker that was previously mapped to the safe name for the credential you are now mapping to the object (credential).**6.** Enter the CyberArk object name in the **Object name** field.**7.** Click **Validate and retrieve attributes**.

The system validates the mapping by attempting to retrieve from the CyberArk Password Vault the combination of safe name (locker) and object name (credential). Within the safe name mapped to the locker, Automation 360 expects objects to use the correct naming conventions. . See [External key vault naming conventions](#).

If validation fails, then no object exists in the CyberArk Password Vault with the name that matches the combination of safe name (locker) and object name (credential).

When the system successfully retrieves the object details, it will display the CyberArk Password Vault object attributes (the fields within the secret).

8. From the list of attributes, select attributes to map to the credential.**9.** Click **Create credential**.

If successful, then the credential successfully created message is displayed.

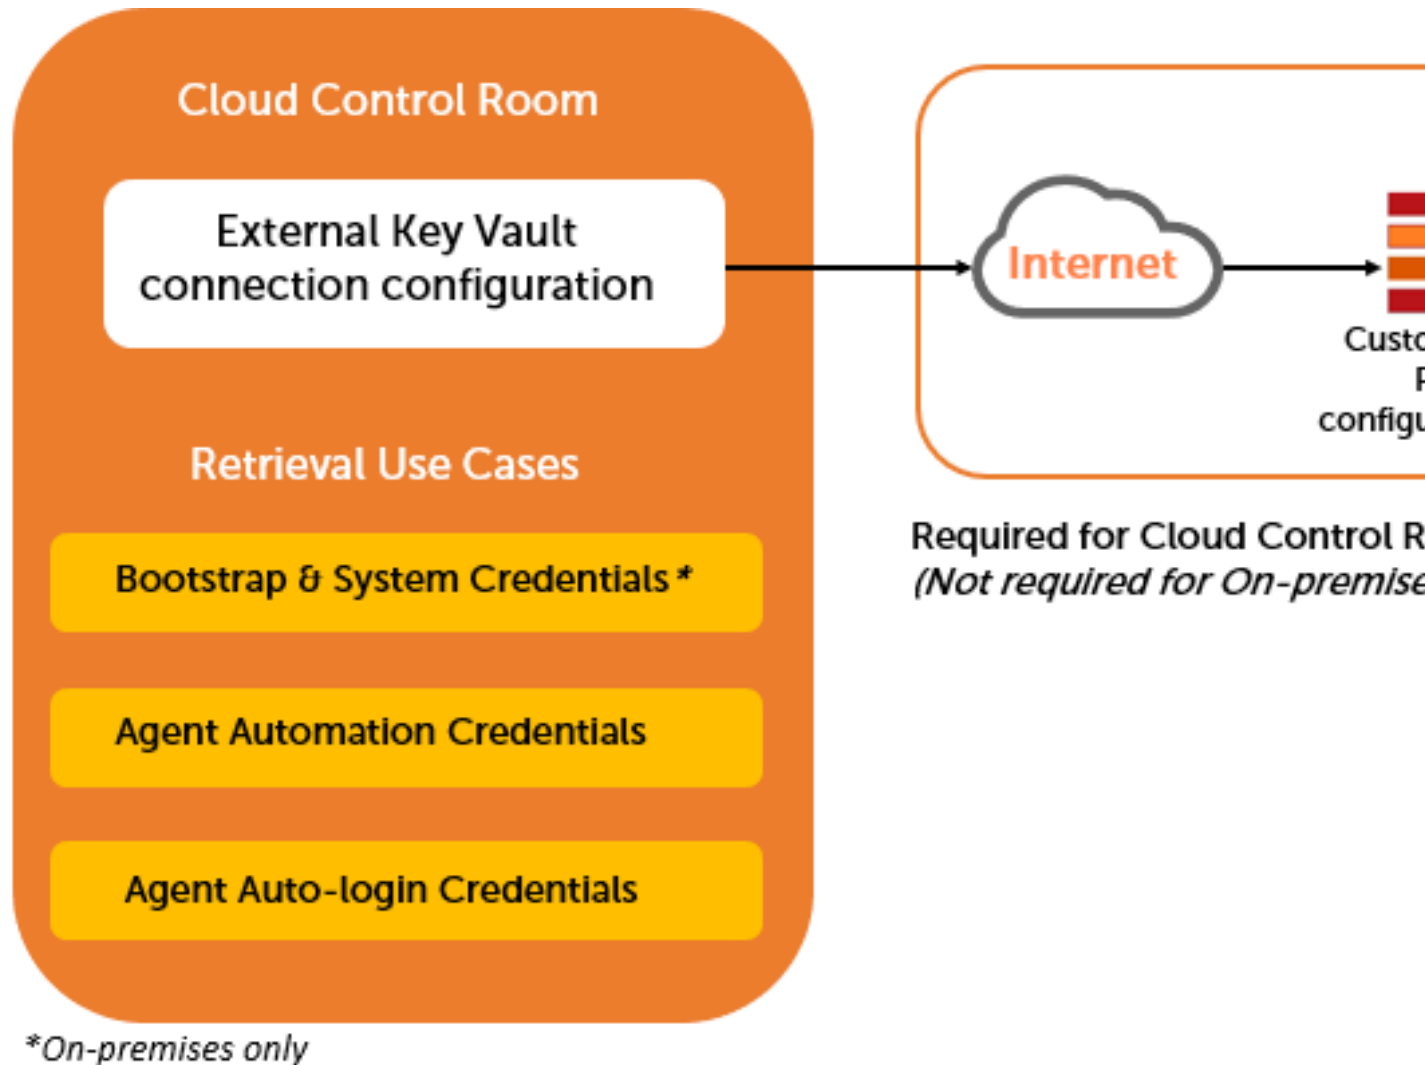

Integrating Azure Key Vault with Automation 360

You integrate the Automation 360 Control Room to retrieve credentials from the Azure Key Vault. The credentials become resident within the Azure Key Vault where they are managed, rotated, and synchronized.

You can integrate Automation 360 with the Azure Key Vault using either of these deployments:

- Cloud
- On-Premises

The following diagram shows an Automation 360 Cloud deployment where with Azure Key Vault:

For On-Premises deployments, you deploy the following:

- Control Room as software within your customer environment.
- Bot Agent within your customer environment where automations run and access customer applications.

Important: You can edit the external key vault connection settings through the user interface in Cloud deployments only. External key vault settings in On-Premises deployments are only configurable during

installation or with the key vault utility post-installation. Customers will need to ensure connectivity to the external key vaults from their On-Premises deployed Control Room instances.

On-Premises integration using Azure Key Vault

As an Automation 360 administrator, you can configure the Azure On-Premises integration using one of these methods: initial installation or post-installation using a command-line interactive key vault utility.

Within the On-Premises installation wizard, bootstrap credential retrieval from external key vault configuration options are only available if you first configure the key vault connection. The configuration options vary based on the external key vault you select.

Choose your integration method:

- [Initial installation](#)
- [Post-installation using key vault utility](#)

On-Premises initial installation using Azure Key Vault

Using the initial installation method, you can connect and configure the external key vault connector, service account credential (Active Directory master password), and bootstrap (database) credential identifier.

Note: You must select Microsoft SQL Server Authentication as the database; other database authentication methods are not supported for this use case.

You can configure the SMTP and AD credential identifier to retrieve from the external key vault using the Automation 360 user interface.

1. [Configure the Azure Key Vault requirements from the Microsoft Azure portal.](#)
2. [Integrate the Azure Key Vault and Automation 360 Control Room.](#)
3. [Set up the authentication type for Automation 360 Control Room users and Azure Key Vault.](#)

After you successfully complete the initial installation, the Automation 360 Control Room can access and retrieve credentials within the Azure Key Vault.

Configure Azure Key Vault requirements for initial installation

Before you can integrate the Automation 360 Control Room with the Azure Key Vault, you must configure Azure Key Vault requirements using the Microsoft Azure portal.

1. Sign in to the Microsoft Azure portal: [Azure portal](#)
2. Create a key vault in Azure.
See [Quickstart: Create a key vault using the Azure portal](#).
3. From the Azure Home page, navigate to **Home** > **selected key vault**. Generate or import secrets for the use cases you will be using with the Azure Key Vault.
For example, if you will be using the bootstrap use case, you should generate a secret that contains the correct database credential that the Control Room will use to authenticate to the database.
4. Collect the following required Azure environment variables that must be set in the environment of the Control Room Server Microsoft operating system:
 - **AZURE_CLIENT_ID:** The client (application) ID of an App Registration in the tenant.
 - **AZURE_CLIENT_SECRET:** A client secret that was generated for the App Registration.
 - **AZURE_TENANT_ID:** The Azure Active Directory tenant (directory) ID.
5. After you set the environment variables in Azure, you must then add them to the Server Environment on the Automation 360 Control Room:

The Azure Key Vault has a flat name space with no organizational containers. There is no safe or locker within the Azure Key Vault and all credentials are stored together in the same container. Credentials are stored in objects which only have a secret name.

For RBAC policies and best practices, see [What is Azure RBAC?](#)

Integrate Azure Key Vault and Control Room

After you configured the Azure Key Vault requirements using the Microsoft Azure portal, you can integrate the Azure Key Vault and the Automation 360 Control Room.

1. After you start the Automation 360 installation wizard, select **On-premises** as the **Deployment Option** and click **Next**.
2. Accept the license agreement and click **Next**.
3. Select **Custom** as the **Installation Type Preference** and click **Next**.
4. Click **Change...** to change the destination folder of where to install Automation 360. Browse to select the folder destination you want and click **Next**.
5. To connect and configure the external key vault integration, select **Azure**.

6. In the **Vault URL** field, enter the Azure Key Vault URL (for example: `https://user-db-vault.vault.azure.net/`).
7. Accept the default settings from the **TLS Configuration** dialog box and click **Next**.
8. From the **Service Credentials** dialog box, select an option to specify the **Azure Secret name** used by the Control Room and click **Next**.

- From the **Database Authentication** dialog box, select an option to specify the **Secret name** from Azure instead of manually entering the secret name the Control Room uses to authenticate to the database.

- Click **SQL Server authentication (retrieve credential from external key vault)**, and then enter the Azure **Secret Name** value.
- Click **Next** to continue and complete the initial installation.

After you successfully complete the initial installation, the Automation 360 Control Room can access and retrieve credentials within the Azure Key Vault.

Set up authentication type for Azure Key Vault

After you complete the initial installation and configure Azure Key Vault as the external key vault, you can set up the authentication type for Automation 360 Control Room users in the Initial Setup (this occurs directly after the initial installation completes).

- From the **Authentication type for Control Room users** dialog box, click **Active Directory**.

- Optional: Configure the Active Directory integration credential (this is the credential that the Control Room uses to authenticate users with Active Directory) to be retrieved from Azure Key Vault. Click **External Key vault** and enter the Azure secret to retrieve credentials in the field (for example: userAD).
- Click **Discover connections**. The available domains and sites display.
- Click **Next** and continue to create the Control Room first admin. Save the Admin user information. The Control Room will attempt to retrieve the credential from the Azure Key Vault and then authenticate to the Domain Controller. If this fails, cause might be one of the following:
 - There is no secret with that name in the Azure Key Vault
 - There is a secret with that name, but it does not contain a username and password that is authorized for authentication with Active Directory

You can now log in to the Control Room as admin and add users and roles.

Note: The passwords within the Azure Key Vault are masked so ensure that you copy and save them after you create them.

On-Premises post-installation using Azure Key Vault

You use the command-line interactive key vault utility during a **scheduled system downtime and you must stop all running Control Room services**. You should coordinate any key vault configuration changes that might impact connectivity parameters (such as `AZURE_CLIENT_ID`,

AZURE_CLIENT_SECRET, and AZURE_TENANT_ID) during downtimes with the Azure administrative team.

Note: If you use the key vault utility to disable Azure Key Vault integration, you must first unmap any mapped credentials that are in use.

Using the post-installation method, you can perform these actions:

- Modify or configure the external key vault connection parameters.
- (If not configured during initial installation) Modify or configure the service account credential (Active Directory master password).
- (If not configured during initial installation) Modify or configure the database (bootstrap) credential identifier (retrieved when authenticating the database).

Note: Retrieving bootstrap credentials from an external key vault might cause the Control Room to fail if the external key vault is not accessible during boot-up, or if the external key vault is not accessible when the Control Room refreshes database connections and authenticates users with Active Directory.

- Recover the Control Room for these reasons:
 - By modifying the external key vault connection parameters, the service account, and database credential safe and object identifiers.
 - If Azure Key Vault connection parameters changes caused the Control Room to experience connectivity issues.
 - When credential identifiers for bootstrap passwords change.

You can address any initial configuration settings that were not set correctly and recover the system.

You can configure and edit SMTP and AD credential identifiers to retrieve information from the external key vault from the Automation 360 Control Room by navigating to **Administration > Settings > Active Directory**.

1. **Run the key vault utility for the Azure Key Vault:** To run the key vault utility and update key vault connection settings:
 - a) As the Control Room administrator, access the Automation Anywhere Control Room installation directory that was created during the initial Automation 360 installation.
For example: C:\Program Files\Automation Anywhere\Enterprise
 - b) Download the latest version of the key vault utility. To download the jar file used to update the directory, open a browser and access the A-People site: [A-People Downloads page \(Login required\)](#).

Note: If DB authentication is configured to use external key vault, the utility returns the following exception: Database currently configured to retrieve credentials from key vault. Update database authentication to WINDOWS/SQL to proceed further and exit.

The utility requests the user to confirm the action: Disable/update of key vault might impact functionalities using key vault (for example, Active Directory

configuration, Email Settings configuration). Make sure to update these settings (if any). Are you sure you want to continue?

c) Enter `Y` to continue.

d) Enter the following:

```
> jdk11\bin\java -jar certmgr.jar -appDir . -importTrustCert <Full path of the certificate>
```

e) Add these `jvm` arguments to the command to run the key vault utility:

1. `-Djavax.net.ssl.trustStore="C:\Program Files\Automation Anywhere\Enterprise\pki\trust\store.ks"`
2. `-Djavax.net.ssl.trustStorePassword=changeit --module-path lib -jar crutils.jar -configPath "C:\Program Files\Automation Anywhere\Enterprise\config" -action [UPDATE_KEY_VAULT_CONFIGURATION or UPDATE_DB_AUTHENTICATION_CONFIGURATION]`

You can update either of these configuration actions:

- Enter `UPDATE_KEY_VAULT_CONFIGURATION` to edit the Azure Key Vault configuration.
- Enter `UPDATE_DB_AUTHENTICATION_CONFIGURATION` to change to database authentication using external key vault.

2. Based on which configuration action you used, choose the appropriate action:

- **Update key vault configuration for Azure:** If you entered `UPDATE_KEY_VAULT_CONFIGURATION` as the configuration action:
 - a. After the utility loads the current key vault configuration and properties, and this prompt is displayed: `Enter key vault [AWS/CYBERARK/AZURE/NONE] :,` enter `AZURE`
 - b. At the `Please enter Vault URL:` prompt, enter (for example): `https://user-db-vault.vault.azure.net/`

The key vault utility runs. If the configuration was successful (the utility was able to connect to the external key vault using the configured parameters), these messages are displayed on the console:

```
Connection configurations valid
Key Vault configurations successfully updated
```

- **Update database authentication for Azure:** If you entered `UPDATE_DB_AUTHENTICATION_CONFIGURATION` as the configuration action:
 - a. After the utility loads the current database configuration information, this prompt is displayed:

```
Database authentication configurations loaded
Currently configured database authentication [SQL]

Change database authentication. Available options:
WINDOWS: Connect to database using windows authentication
SQL: Connect to database using SQL server authentication, manually
enter username and password
KEY VAULT: Connect to database using SQL server authentication,
retrieve username and password from external key Vault
```

```
Enter database authentication [WINDOWS/SQL/KEY_VAULT]:
```

```
Enter KEY_VAULT
```

- b. At the Please enter Secret name: prompt, enter (for example): testDB

The key vault utility runs. If the database configuration was successful (the utility was able to connect to Azure, retrieve the designated credential and then use the credential to connect to the database), these messages are displayed on the console:

```
Database Credentials are valid
Database authentication configurations successfully updated
```

Cloud integration using Azure Key Vault

For Cloud integrations, you can configure the Control Room and external key vault integration using the Automation 360 Control Room user interface.

The Agent auto-login and Agent automation use cases are only supported on Automation 360 Cloud Control Room instances. Neither of these use cases affect the Control Room boot sequence or Control Room functionality.

Note: Bootstrap and service account credential retrieval use cases are not supported on Cloud Control Room instances because the database and services are managed internally by Automation Anywhere. There is no compliance use case (requirement) for these credentials to be stored in the customer external key vault.

1. Gather the specific Azure information required to configure the external key vault connector using the Automation 360 Control Room.

Item	Description
AZURE_CLIENT_ID	The client (application) ID of an App Registration in the tenant.
AZURE_CLIENT_SECRET	A client secret that was generated for the App Registration.
AZURE_TENANT_ID	The Azure Active Directory tenant (directory) ID.
AZURE_CLIENT_CERTIFICATE_PATH	The path to a PEM certificate used during the authentication instead fo the client secret.

2. Log in to the Automation 360 Control Room as the Administrator.
3. From the Control Room, navigate to **Administration > Settings > External key vault** .
4. Click the **Edit** icon to open the **Configuration settings** pane.
5. Click **Azure** and then enter the specific Azure information described in the preceding table.
6. Click **Save changes** to connect the external key vault.

Azure credential retrieval use cases

You can retrieve Azure credentials for these use cases: bootstrap, system, auto-login, and automations.

Retrieve Control Room bootstrap credentials

Note: This use case applies to On-Premises deployments only.

The Automation 360 Control Room uses bootstrap credentials to access supporting services such as database, service account, and Active Directory (AD). You configure these credentials during the initial On-Premises installation or post-installation (using the key vault utility) by specifying the object name.

The following image shows the process of retrieving the Control Room bootstrap credentials with Azure:

When required during the bootup sequence or normal operations (such as refreshing a service authentication), the Control Room uses the key vault connection to retrieve the credential and perform the required authentication.

Note: You must select the Microsoft SQL Server Authentication for this use case; other database authentication methods are not supported for bootstrap.

Retrieve Control Room system credentials

Note: This use case applies to On-Premises deployments only, and you can configure the service account only during the initial installation.

If you configured an external key vault during the initial installation, you can then use the Automation 360 user interface (post-installation) to configure SMTP and Active Directory (AD) credentials.

1. Log in to the Automation 360 Control Room as the Administrator.
2. From the Control Room, navigate to: **Administration** > **Settings** > **Email Settings**.
3. You can map the AD Master Account credential from the external key vault, configure external credentials, or set to manual (switch modes of AD Master Account credential retrieval).

Retrieve auto-login credentials

Note: This use case applies to both On-Premises and Cloud deployments.

Auto-login credentials are used to authenticate to an Automation 360 Bot Agent device and start an active Windows session. Robotic Process Automation (RPA) requires an active Windows session to function. Auto-login occurs prior to the automation running when automations are launched from a remote Bot Agent device.

The following image shows the process of retrieving the auto-login credentials with Azure:

A Control Room administrator can manually launch or schedule a job to launch an automation on a Bot Agent device by specifying these details:

- Automation (bot) name
- Device name
- User context

The system performs auto-login to the specified device with the user name and password associated with the user context, and then runs the automation on the device.

You must have a secret for each Control Room user for whom the auto-login credentials will be retrieved from the external key vault, and the secret name in the Azure Key Vault **must match** the Control Room username.

To configure retrieval of auto-login credentials from the external key vault, perform these steps:

1. Log in to the Automation 360 Control Room as the Administrator.
2. From the Control Room, navigate to **Administration > Settings > Devices**.
3. Scroll down to the auto-login settings section and click **Edit**.
4. If you previously configured Azure Key Vault as the external key vault connection, click **Enabled** to retrieve the auto-login credentials from that external key vault.

If this option is disabled, then the external key vault connection was not configured.

Note: If you disable auto-login from the external key vault, then credentials are retrieved using the AAI Credential Vault and its stored credentials instead.

5. The Azure Key Vault has a flat name space without any organizational containers, so you do not need to enter a Safe name. Click **Save changes**.

If successful, then the auto-login settings successfully saved message displays.

Auto-login naming conventions

The Control Room retrieves auto-login credentials based on the object naming convention within the external key vault. The Control Room searches for an object where the object name (the credential name in the external key vault) matches the Control Room username for which it is performing auto-login.

The prefix `autologin_` is required as part of the naming convention for auto-login credentials for all external key vaults: CyberArk, AWS, and Azure. The name of the auto-login credential in the external key vault must contain `autologin_` followed by the Control Room username. In some cases, certain key vaults have restrictions on the characters that can be used in credential object names. Additionally, to support how different use cases encode credentials, Automation 360 requires that certain characters be reserved or encoded.

The following table lists examples of the object naming conventions expected in the Control Room:

Control Room username	Expected object name format
ABCD\user123	autologin_ABCD--user123

Control Room username	Expected object name format
user123@rpa.abcd.com	autologin_user123-40-rpa-2e-abcd-2e-com

Note: For On-Premises customers using AD authentication, you must format auto-login usernames using the UPN format or `domain\username` postfix.

For auto-login credentials, keep these in mind:

- The object name in the external key vault must contain `autologin_` as a prefix.
- The auto-login credential names must map to the Control Room username (login ID) for the credential being retrieved.

Some external key vaults have usage restrictions of certain characters, such as backslash (\) and ampersand (@) in the secret name (object name), and restrictions on how special characters are interpreted within API calls. If the user ID contains special characters, then you must encode the secret name (object name) in the external key vault using ASCII code character substitutions, as listed in the following table.

This character	Changes to this ASCII code character substitution
\ (backslash)	--
- (dash)	-2d-
_ (underscore)	-5f-
@ (ampersand)	-40-
. (period)	-2e-

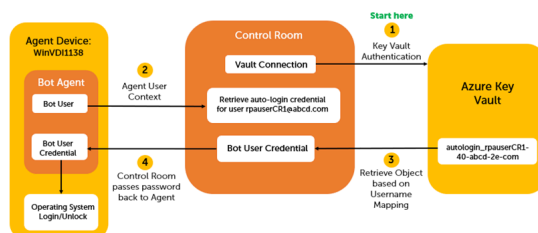

Note: Except for the backslash being mapped to double dashes, the dash, period, underscore, and ampersand are mapped using their ASCII code bracketed in dashes.

Azure auto-login credential example

For this auto-login credential retrieval example, consider a Control Room user who wants to deploy a bot on a device as a specific user. This example uses the following details:

- Automation (bot) name run on a device = `ProcureToPayGeoEast`
- Agent device name = `WinVDI1138`
- Agent user context = `rpauserCR1@abcd.com`

The following image shows this an example of retrieving auto-login credentials with Azure:

Before starting the automation, ensure the following:

1. The Control Room connection details have been successfully configured, and the Control Room uses these connection details to connect to Azure and performs authentication.
2. The Control Room queries the Bot Agent device running on device `WinVDI1138` to check if there is an active Windows (operating system) session currently on device `WinVDI1138`, and if that session belongs to Agent user `rpauserCR1`.

If there is an existing session on the device for user `rpauserCR1`, then there is no need to perform auto-login and the bot continues with the deployment.

3. However, if there is an no active session or if there is an active session that does not belong to `rpauserCR1`, then the Control Room retrieves the auto-login credential from the Azure Key Vault.
4. The Control Room passes the credential (password) to the Bot Agent. The Bot Agent performs a Windows login on device `WinVDI1138` as `rpauserCR1` (first, logging off any other user login session) using the auto-login credential for `rpauserCR1`. The automation (Bot) `ProcureToPayGeoEast` then starts to run on device `WinVDI1138` as `rpauserCR1`.

Retrieve automation credentials

Note: This use case applies to both On-Premises and Cloud deployments.

Automation credentials are variables used by bot developers within automation (bot) actions that define and retrieve data from encrypted storage. The automation uses the credentials to authenticate to applications (for example: finance application). Automation credentials are retrieved by the Automation 360 Bot Agent during runtime.

The following image shows the process of retrieving automation credentials with Azure:

Automation credentials retrieved from the Azure Key Vault are mapped in the Automation Anywhere Credential Vault. The Credential Vault supports these two types of automation credentials:

System credentials

Credentials where the value returned by the credential variable is the same for any automation that uses that variable.

User-defined credentials

Credentials where the value returned by the credential variable is distinct based on the user context in which the automation is running.

For both system credentials and user-defined credentials, the bot developer specifies the same credential variable within the bot code. Then, the system determines which credential to retrieve during bot runtime.

User-defined credentials simplify automation development by enabling bot developers to write code using a single credential variable where the RPA platform substitutes the value returned during runtime with a unique user-specific value. Developers can avoid writing duplicate code with different user-specific credential variables.

The following image shows the expected naming convention for Azure credentials:

The diagram shows six secrets in the Azure Key Vault which can be mapped to two credentials within the Control Room Credential Vault

- Object3
- Object4

For example, you can map a locker in the Control Room to either `prefixID3` or `prefixID4`. Then, you map the secret to a credential. For each credential, the secrets will be consumed (retrieved by the Control Room) as a system-defined credential (without username postfix) and two user-defined credentials (one each for the Control Room users whose usernames are `User1ID1` and `User1ID2`).

Note: Within the Control Room Credential Vault, the name of the locker and the name of the credential are arbitrary and local to the Control Room. You map these names to specific secrets in the external key vault.

Within Azure Key Vault, each automation credential is stored with a name that contains specific identifiers including: a prefix, object identifier, and an optional postfix which identifies a username. This is a required naming convention that assures retrieval of the correct credential. The name of the secret (the credential) in Azure Key Vault encodes information about the mapping within the Automation Anywhere Credential Vault.

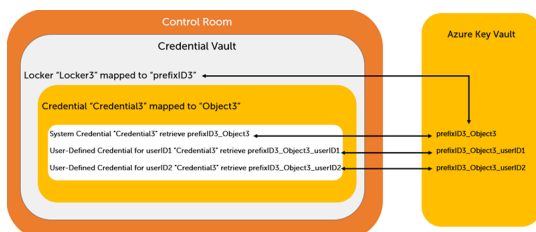

As an administrator, to map a Control Room to Azure Key Vault, you create and configure a locker and a credential using the external key vault option within the **Create Locker** and **Create Credential** features in the Automation 360 Control Room:

- You configure a locker in the Credential Vault to map to an Azure secret name prefix.
- You configure credentials in the Credential Vault that map to an Azure secret object identifier (optional postfix for user-defined credential).

During runtime, the RPA platform retrieves the secret that is named with a postfix that matches the user context (user-defined credential) in which the automation is running. If there is no user-defined credential, then the RPA platform retrieves the secret without a username postfix (system credential).

The Control Room implements access controls to the external credentials through permissions within roles. You control access to credentials by assigning different Control Room users to different roles and then associating different lockers with those roles.

The following image shows the Control Room Credential Vault locker and credential mapped to an Azure secret:

Important: When creating an externally mapped credential, you must place the credential in the appropriate externally mapped locker (the locker is mapped to the prefix in the secret name). The Azure

secret name will have a naming convention: `Prefix + Secret_Name_Body + Postfix` (optional for user-defined credentials).

Note: The same permissions and privileges (assigned through roles) in the Control Room apply to credentials mapped to the external key vault.

Automation naming conventions

The following table shows Azure Key Vault external key vault examples using naming conventions for automation.

Note: The Azure Prefix maps to the locker for the Control Room, and the Azure Secret Body maps to the credential for the Control Room.

Automation credential example	Azure Prefix	Azure Secret Body	Secret in Azure	Control Room username
accounting_cv1 System credential in locker mapped to Azure Secret name prefix accounting	accounting	cv1	pdf-5f-cv1 (system)	None - system credential
accounting_cv1_ABCD\user123 User-defined credential in locker mapped to Azure prefix	accounting	cv1	pdf-5f-cv1-5f-ABCD--user123	ABCD\user123

When deploying Azure credentials, the Azure Key Vault character underscore (`_`) is a reserved character and cannot be used in credential names. You must substitute any underscore (`_`) usage with the ASCII code value `5f` bracketed by dashes:

This character	Changes to this ASCII code character substitution
\ (slash)	--
- (dash)	-2d-
_ (underscore)	-5f-
@ (ampersand)	-40-
. (period)	-2e-

Azure automations credentials retrieval example

To configure automation credentials retrieval and integrate with the Azure Key Vault, you first create a locker and then create credentials.

To create a locker to integrate with the Azure Key Vault, perform these steps:

1. From the Automation 360 Control Room, navigate to **Manage > Credential**.

A user with **Manage my credentials and lockers** permissions is authorized to create credentials.

2. From the **Credentials** tab, select **Create Locker**.

3. Enter a name for the locker (for example, `Locker3`).

This name is local to the Control Room and does not have any dependency on the Azure secret name.

4. Click **External Key Vault** and enter the Azure secret name prefix (for example: `prefixID3`). You must name secrets within the Azure Key Vault using the name prefix for the configuration of the mapping to complete successfully.

5. Click **Next**.

6. Configure Owners, Managers, Participants, and Consumers for the locker.

7. Click **Create locker**.

See [Create locker](#).

The Control Room is now ready to retrieve credentials and enforce access controls on all Azure secrets with the prefix `prefixID3`. To continue, you now create the credentials.

To create a credential to integrate with the Azure Key Vault, perform these steps:

1. From the Automation 360 Control Room, navigate to **Manage > Credentials**.

A user with **Manage my credentials and lockers** permissions is authorized to create credentials.

2. From the **Credentials** tab, select **Create Credential**.

3. Enter the credential name in the **Credential name** field.

This name is local to the Control Room and does not have any dependency on the Azure secret name.

4. Click **External key vault** below the name field.

5. From the list of available lockers, select the appropriate locker that was previously mapped to the secret name prefix for the secrets you are now mapping to the credential.

6. Enter the Azure `Secret_Name_Body` in the **Secret name** field (for example: `Object3`).

7. Click **Validate and retrieve attributes**.

The system validates the mapping by attempting to retrieve from the Azure Key Vault a secret with the name `Prefix_Secret_Name_Body` (for example: `prefixID3_Object3`).

If validation fails, then no secret exists in the Azure Key Vault with the name that matches the combination of locker (prefix) and credential (`Secret_Name_Body`). In this example, there is no secret in the Azure Key Vault named `prefixID3_Object3`.

When the system successfully retrieves the secret, it will display the Azure Key Vault secret attributes (the fields within the secret).

8. From the list of attributes, select attributes to map to the credential.

9. Click **Create credential**.

If successful, then the credential successfully created message displays.

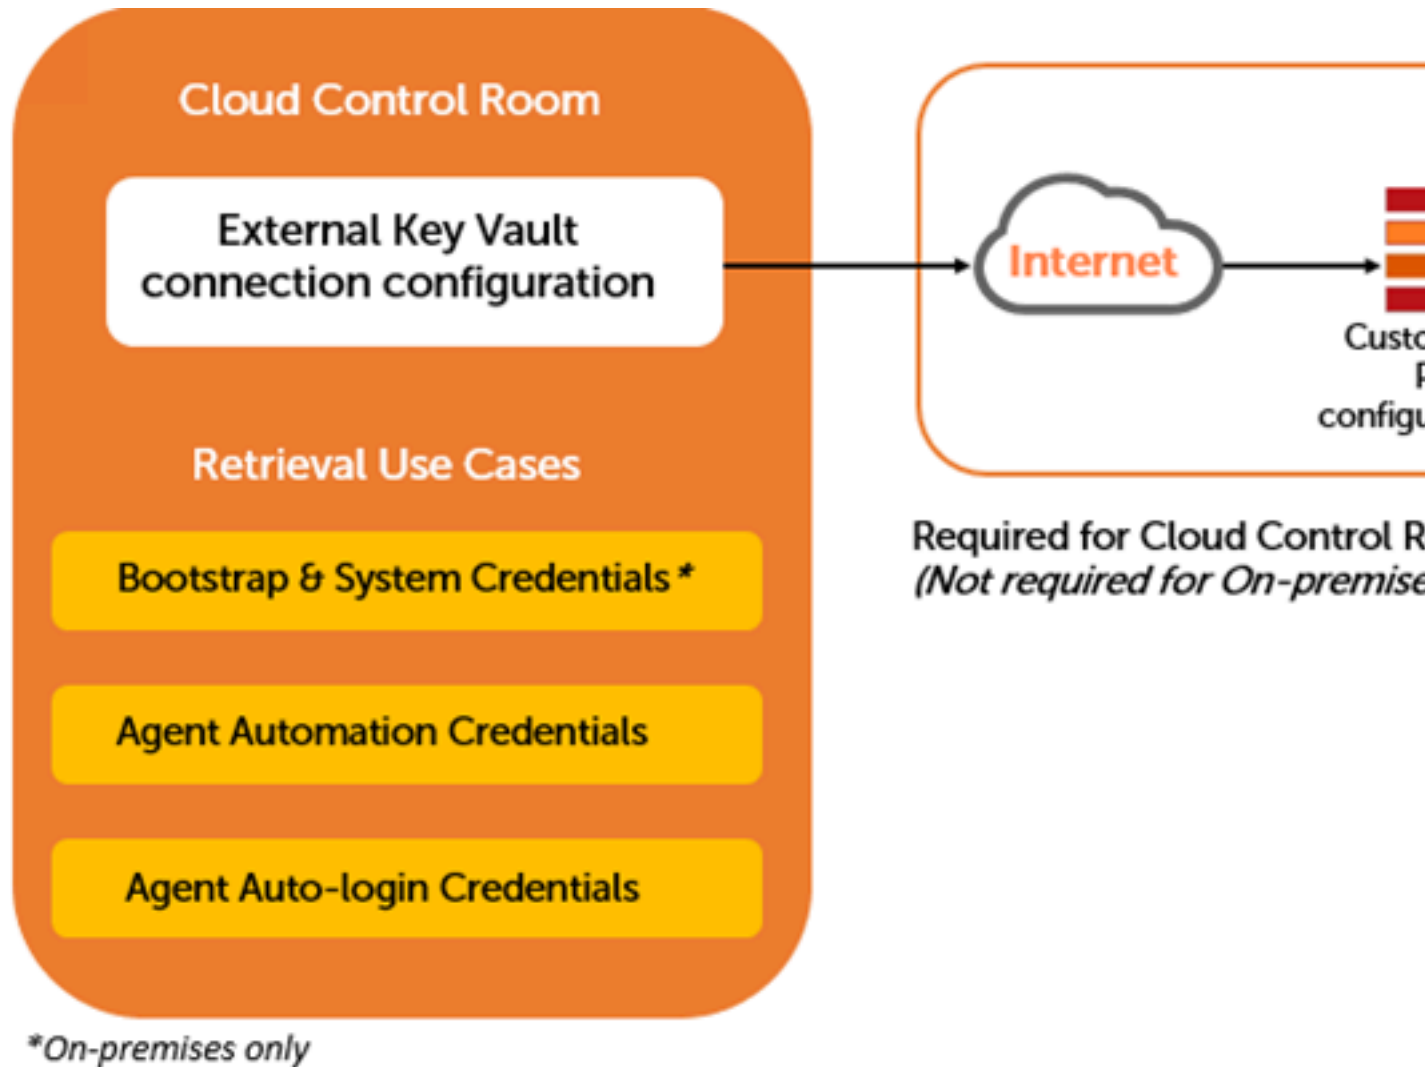

Integrating AWS Secrets Manager with Automation 360

You integrate the Automation 360 Control Room to retrieve credentials from the AWS Secrets Manager. The credentials become resident within the AWS Secrets Manager where they are managed, rotated, and synchronized.

You can integrate Automation 360 with the [AWS Secrets Manager](#) using either of these deployments:

- Cloud
- On-Premises

The following diagram shows an Automation 360 Cloud deployment where with AWS Secrets Manager:

For On-Premises deployments, you deploy the following:

- Control Room as software within your customer environment.
- Bot Agent within your customer environment where automations run and access customer applications.

Important: You can edit the external key vault connection settings through the user interface in Cloud deployments only. External key vault settings in On-Premises deployments are only configurable during

installation or with the key vault utility post-installation. Customers will need to ensure connectivity to the external key vaults from their On-Premises deployed Control Room instances.

On-Premises integration using AWS Secrets Manager

As an Automation 360 administrator, you can configure the AWS On-Premises integration using one of these methods: initial installation or post-installation using a command-line interactive key vault utility.

Within the On-Premises installation wizard, bootstrap credential retrieval from external key vault configuration options are only available if you first configure the key vault connection. The configuration options vary based on the external key vault you select.

Choose your integration method:

- [Initial installation](#)
- [Post-installation using key vault utility](#)

On-Premises initial installation using AWS Secrets Manager

Using the initial installation method, you can connect and configure the external key vault connector, service account credential (Active Directory master password), and bootstrap (database) credential identifier.

Note: You must select Microsoft SQL Server Authentication as the database; other database authentication methods are not supported for this use case.

You can configure the SMTP and AD credential identifier to retrieve from the external key vault using the Automation 360 user interface.

1. [Configure the AWS Secrets Manager requirements](#) from the AWS Administrative Console.
2. [Integrate the AWS Secrets Manager and Automation 360 Control Room.](#)
3. [Set up the authentication type for Automation 360 Control Room](#) users and the AWS Secrets Manager.

After you successfully complete the initial installation, the Automation 360 Control Room can access and retrieve credentials within the AWS Secrets Manager.

Configure AWS Secrets Manager requirements for initial installation

Before you can integrate the Automation 360 Control Room with the AWS Secrets Manager, you must configure AWS Secrets Manager requirements using the AWS Administrative Console.

1. Use the AWS Administrative Console to collect these AWS environment variables which you must set in the environment of the Control Room Server Microsoft Operating System:
 - **AWS_ACCESS_KEY_ID**
 - **AWS_SECRET_ACCESS_KEY**
 - **AWS_SESSION_TOKEN**

- After you set the environment variables in AWS, you must then add them to the Server Environment

on the Automation 360 Control Room:

The AWS Secrets Manager has a flat name space with no organizational containers. There is no safe or locker within the AWS Secrets Manager and all credentials are stored together in the same container. Credentials are stored in objects which only have a secret name.

Integrate AWS Secrets Manager and Control Room

After you configured the AWS Secrets Manager requirements using the AWS Administrative Console, you can integrate the AWS Secrets Manager and the Automation 360 Control Room.

- After you start the Automation 360 installation wizard, select **On-premises** as the **Deployment Option** and click **Next**.
- Accept the license agreement and click **Next**.
- Select **Custom** as the **Installation Type Preference** and click **Next**.
- Accept the default locations for the destination folders and click **Next**.
- To connect and configure the external key vault integration, select **AWS Secret**

Manager.

- In the **Region** field, enter the AWS region code (for example: `us-east1` and click **Next**.
- Accept the default settings from the **TLS Configuration** dialog box and click **Next**.
- Accept the default settings from the **Service Credentials** dialog box, and click **Next**.
- From the **Database Authentication** dialog box, select an option to specify the **Secret name** from AWS instead of manually entering the secret name the Control Room uses to authenticate to the

database.

- Click **SQL Server authentication (retrieve credential from external key vault)**, and then enter the **Secret Name** value.
- Click **Next** to continue and complete the initial installation. The installer will query AWS Secrets Manager for the credential to validate that the secret exists.

After you successfully complete the initial installation, the Automation 360 Control Room can access and retrieve credentials within the AWS Secrets Manager.

Set up authentication type for AWS Secrets Manager

After you complete the initial installation and configure AWS Secrets Manager as the external key vault, you can set up the authentication type for Automation 360 Control Room users in the Initial Setup (this occurs directly after the initial installation completes).

1. From the **Authentication type for Control Room users** dialog box, click **Active**

Directory.

2. You can optionally configure the Active Directory integration credential (this is the credential that the Control Room uses to authenticate users with Active Directory) to be retrieved from AWS Secrets Manager. Click **External Key vault** and enter the AWS secret to retrieve credentials in the field (for example: `userAD`). The Control Room will attempt to retrieve the credential from the AWS Secrets Manager and then authenticate to the Domain Controller. If this fails either:
 - There is no secret with that name in AWS Secrets Manager, or
 - There is a secret with that name, but it does not contain a username and password that is authorized for authentication with Active Directory.
3. Click **Discover connections**. The available domains and sites display.
4. Click **Next** and continue to create the Control Room first admin. Save the Admin user information.

You can now log in to the Control Room as admin and add users and roles.

On-Premises post-installation using AWS Secrets Manager

You use the command-line interactive key vault utility during a **scheduled system downtime and you must stop all running Control Room services**. You should coordinate any key vault configuration changes that might impact connectivity parameters (such as `AWS_ACCESS_KEY_ID`, `AWS_SECRET_ACCESS_KEY`, and `AWS_SESSION_TOKEN`) during downtimes with the AWS administrative team.

Note: If you use the key vault utility to disable AWS Secrets Manager integration, you must first unmap any mapped credentials that are in use.

Using the post-installation method, you can perform these actions:

- Modify or configure the external key vault connection parameters.
- (If not configured during initial installation) Modify or configure the service account credential (Active Directory master password).
- (If not configured during initial installation) Modify or configure the database (bootstrap) credential identifier (retrieved when authenticating the database).

Note: Retrieving bootstrap credentials from an external key vault might cause the Control Room to fail if the external key vault is not accessible during boot-up, or if the external key vault is not accessible when the Control Room refreshes database connections and authenticates users with Active Directory.

- Recover the Control Room for these reasons:
 - By modifying the external key vault connection parameters, the service account, and database credential safe and object identifiers.
 - If AWS Secrets Manager connection parameters changes caused the Control Room to experience connectivity issues.

- When credential identifiers for bootstrap passwords change.

You can address any initial configuration settings that were not set correctly and recover the system.

You can configure and edit SMTP and AD credential identifiers to retrieve information from the external key vault from the Automation 360 Control Room by navigating to **Administration > Settings > Active Directory**.

1. Run the key vault utility for the AWS Secrets Manager: To run the key vault utility and update key vault connection settings:

- As the Control Room administrator, access the Automation Anywhere Control Room installation directory that was created during the initial Automation 360 installation.
For example: `C:\Program Files\Automation Anywhere\Enterprise`
- Download the latest version of the key vault utility. To download the jar file used to update the directory, open a browser and access the A-People site: [A-People Downloads page \(Login required\)](#).

Note: If DB authentication is configured to use external key vault, the utility returns the following exception: Database currently configured to retrieve credentials from key vault. Update database authentication to WINDOWS/SQL to proceed further and exit.

The utility requests the user to confirm the action: Disable/update of key vault might impact functionalities using key vault (for example, Active Directory configuration, Email Settings configuration). Make sure to update these settings (if any). Are you sure you want to continue?

- Enter `y` to continue.
- Enter the following:

```
> jdk11\bin\java -jar certmgr.jar -appDir . -importTrustCert <Full path of the certificate>
```
- Add these `jvm` arguments to the command to run the key vault utility:
 - `-Djavax.net.ssl.trustStore="C:\Program Files\Automation Anywhere\Enterprise\pki\trust\store.ks"`
 - `-Djavax.net.ssl.trustStorePassword=changeit --module-path lib -jar crutils.jar -configPath "C:\Program Files\Automation Anywhere\Enterprise\config" -action [UPDATE_KEY_VAULT_CONFIGURATION or UPDATE_DB_AUTHENTICATION_CONFIGURATION]`

You can update either of these configuration actions:

- Enter `UPDATE_KEY_VAULT_CONFIGURATION` to edit the AWS Secrets Manager configuration.
- Enter `UPDATE_DB_AUTHENTICATION_CONFIGURATION` to change to database authentication using external key vault.

2. Based on which configuration action you used, choose the appropriate action:

- **Update key vault configuration for AWS:** If you entered `UPDATE_KEY_VAULT_CONFIGURATION` as the configuration action:
 - a. After the utility loads the current key vault configuration and properties, and this prompt is displayed: `Enter key vault [AWS/CYBERARK/AZURE/NONE] :,` enter `AWS`
 - b. At the `Please enter Vault URL:` prompt, enter (for example): `https://services.uscentral.skytap.com:19516`

The key vault utility runs. If the configuration was successful (the utility was able to connect to the external key vault using the configured parameters), these messages are displayed on the console:

```
Connection configurations valid
Key Vault configurations successfully updated
```

- **Update database authentication for AWS:** If you entered `UPDATE_DB_AUTHENTICATION_CONFIGURATION` as the configuration action:
 - a. After the utility loads the current database configuration information, this prompt is displayed:

```
Database authentication configurations loaded
Currently configured database authentication [SQL]

Change database authentication. Available options:
WINDOWS: Connect to database using windows authentication
SQL: Connect to database using SQL server authentication, manually
enter username and password
KEY_VAULT: Connect to database using SQL server authentication,
retrieve username and password from external key Vault

Enter database authentication [WINDOWS/SQL/KEY_VAULT]:
```

Enter `KEY_VAULT`

- b. At the `Please enter Secret name:` prompt, enter (for example): `testDB`

The key vault utility runs. If the database configuration was successful (the utility was able to connect to AWS, retrieve the designated credential and then use the credential to connect to the database), these messages display on the console:

```
Database Credentials are valid
Database authentication configurations successfully updated
```

Cloud integration using AWS Secrets Manager

For Cloud integrations, you can configure the Control Room and external key vault integration using the Automation 360 Control Room user interface.

The Agent auto-login and Agent automation use cases are only supported on Automation 360 Cloud Control Room instances. Neither of these use cases affect the Control Room boot sequence or Control Room functionality.

Note: Bootstrap and service account credential retrieval use cases are not supported on Cloud Control Room instances because the database and services are managed internally by Automation Anywhere.

There is no compliance use case (requirement) for these credentials to be stored in the customer external key vault.

1. Gather the specific AWS information required to configure the external key vault connector using the Automation 360 Control Room.

Item	Description
AWS_ACCESS_KEY_ID	The AWS environment variable that specifies an AWS access key associated with an IAM user or role.
AWS_SECRET_ACCESS_KEY	The AWS environment variable that specifies the secret key associated with the access key.
AWS_SESSION_TOKEN	The AWS environment variable that specifies the session token value that is required if you use temporary security credentials retrieved directly from AWS operations.
Region	A separate geographic area that AWS uses to house its infrastructure.

2. Log in to the Automation 360 Control Room as the Administrator.
3. From the Control Room, navigate to **Administration > Settings > External key vault**.
4. Click the **Edit** icon to open the **Configuration settings** pane.
5. Click **AWS** and then enter the specific AWS information described in the preceding table.
6. Click **Save changes** to connect the external key vault.

AWS credential retrieval use cases

You can retrieve AWS credentials for these use cases: bootstrap, system, auto-login, and automations.

Retrieve Control Room bootstrap credentials

Note: This use case applies to On-Premises deployments only.

The Automation 360 Control Room uses bootstrap credentials to access supporting services such as database, service account, and Active Directory (AD). You configure these credentials during the initial On-Premises installation or post-installation (using the key vault utility) by specifying the object name.

The following image shows the process of retrieving the Control Room bootstrap credentials with AWS:

When required during the bootup sequence or normal operations (such as refreshing a service authentication), the Control Room uses the key vault connection to retrieve the credential and perform the required authentication.

Note: You must select the Microsoft SQL Server Authentication for this use case; other database authentication methods are not supported for bootstrap.

Retrieve Control Room system credentials

Note: This use case applies to On-Premises deployments only, and you can configure the service account only during the initial installation.

If you configured an external key vault during the initial installation, you can then use the Automation 360 user interface (post-installation) to configure SMTP and Active Directory (AD) credentials.

1. Log in to the Automation 360 Control Room as the Administrator.
2. From the Control Room, navigate to: **Administration** > **Settings** > **Email Settings**.
3. You can map the AD Master Account credential from the external key vault, configure external credentials, or set to manual (switch modes of AD Master Account credential retrieval).

Retrieve auto-login credentials

Note: This use case applies to both On-Premises and Cloud deployments.

Auto-login credentials are used to authenticate to an Automation 360 Bot Agent device and start an active Windows session. Robotic Process Automation (RPA) requires an active Windows session to function. Auto-login occurs prior to the automation running when automations are launched from a remote Bot Agent device.

The following image shows the process of retrieving the auto-login credentials with AWS:

A Control Room administrator can manually launch or schedule a job to launch an automation on a Bot Agent device by specifying these details:

- Automation (bot) name
- Device name
- User context

The system performs auto-login to the specified device with the user name and password associated with the user context, and then runs the automation on the device.

You must have a secret for each Control Room user for whom the auto-login credentials will be retrieved from the external key vault, and the secret name in the AWS Secrets Manager **must match** the Control Room username.

To configure retrieval of auto-login credentials from the external key vault, perform these steps:

1. Log in to the Automation 360 Control Room as the Administrator.
2. From the Control Room, navigate to **Administration** > **Settings** > **Devices**.
3. Scroll down to the auto-login settings section and click **Edit**.

- If you previously configured AWS Secrets Manager as the external key vault connection, click **Enabled** to retrieve the auto-login credentials from that external key vault.

If this option is disabled, then the external key vault connection was not configured.

Note: If you disable auto-login from the external key vault, then credentials are retrieved using the AAI Credential Vault and its stored credentials instead.

- The AWS Secrets Manager has a flat name space without any organizational containers, so you do not need to enter a Safe name. Click **Save changes**.

If successful, then the auto-login settings successfully saved message displays.

Auto-login naming conventions

The Control Room retrieves auto-login credentials based on the object naming convention within the external key vault. The Control Room searches for an object where the object name (the credential name in the external key vault) matches the Control Room username for which it is performing auto-login.

The prefix `autologin_` is required as part of the naming convention for auto-login credentials for all external key vaults: CyberArk, AWS, and Azure. The name of the auto-login credential in the external key vault must contain `autologin_` followed by the Control Room username. In some cases, certain key vaults have restrictions on the characters that can be used in credential object names. Additionally, to support how different use cases encode credentials, Automation 360 requires that certain characters be reserved or encoded.

The following table lists examples of the object naming conventions expected in the Control Room:

Control Room username	Expected object name format
ABCD\user123	autologin_ABCD--user123
user123@rpa.abcd.com	autologin_user123-40-rpa-2e-abcd-2e-com

Note: For On-Premises customers using AD authentication, you must format auto-login usernames using the UPN format or `domain\username` postfix.

For auto-login credentials, keep these in mind:

- The object name in the external key vault must contain `autologin_` as a prefix.
- The auto-login credential names must map to the Control Room username (login ID) for the credential being retrieved.

Some external key vaults have usage restrictions of certain characters, such as backslash (\) and ampersand (@) in the secret name (object name), and restrictions on how special characters are interpreted within API calls. If the user ID contains special characters, then you must encode the secret name (object name) in the external key vault using ASCII code character substitutions, as listed in the following table.

This character	Changes to this ASCII code character substitution
\ (backslash)	--
- (dash)	-2d-
_ (underscore)	-5f-

This character	Changes to this ASCII code character substitution
@ (ampersand)	-40-
. (period)	-2e-

Note: Except for the backslash being mapped to double dashes, the dash, period, underscore, and ampersand are mapped using their ASCII code bracketed in dashes.

AWS auto-login credential example

For this auto-login credential retrieval example, consider a Control Room user who wants to deploy a bot on a device as a specific user. This example uses the following details:

- Automation (bot) name run on a device = `ProcureToPayGeoEast`
- Agent device name = `WinVDI1138`
- Agent user context = `rpouserCR1@abcd.com`

The following image shows this an example of retrieving auto-login credentials with AWS:

Before starting the automation, ensure the following:

1. The Control Room connection details have been successfully configured, and the Control Room uses these connection details to connect to AWS and performs authentication.
2. The Control Room queries the Bot Agent device running on device `WinVDI1138` to check if there is an active Windows (operating system) session currently on device `WinVDI1138`, and if that session belongs to Agent user `rpouserCR1`.

If there is an existing session on the device for user `rpouserCR1`, then there is no need to perform auto-login and the bot continues with the deployment.

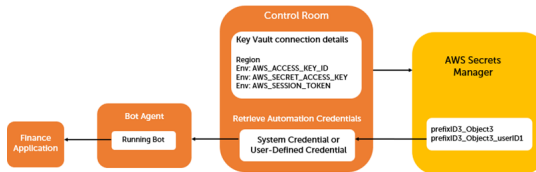

3. However, if there is an no active session or if there is an active session that does not belong to `rpouserCR1`, then the Control Room retrieves the auto-login credential from the AWS Secrets Manager.
4. The Control Room passes the credential (password) to the Bot Agent. The Bot Agent performs a Windows login on device `WinVDI1138` as `rpouserCR1` (first, logging off any other user login session) using the auto-login credential for `rpouserCR1`. The automation (Bot) `ProcureToPayGeoEast` then starts to run on device `WinVDI1138` as `rpouserCR1`.

Retrieve automation credentials

Note: This use case applies to both On-Premises and Cloud deployments.

Automation credentials are variables used by bot developers within automation (bot) actions that define and retrieve data from encrypted storage. The automation uses the credentials to authenticate to applications (for example: finance application). Automation credentials are retrieved by the Automation 360 Bot Agent during runtime.

The following image shows the process of retrieving automation credentials with AWS:

Automation credentials retrieved from the AWS Secrets Manager are mapped in the Automation Anywhere Credential Vault. The Credential Vault supports these two types of automation credentials:

System credentials

Credentials where the value returned by the credential variable is the same for any automation that uses that variable.

User-defined credentials

Credentials where the value returned by the credential variable is distinct based on the user context in which the automation is running.

For both system credentials and user-defined credentials, the bot developer specifies the same credential variable within the bot code. Then, the system determines which credential to retrieve during bot runtime.

User-defined credentials simplify automation development by enabling bot developers to write code using a single credential variable where the RPA platform substitutes the value returned during runtime with a unique user-specific value. Developers can avoid writing duplicate code with different user-specific credential variables.

The following image shows the expected naming convention for AWS credentials:

The diagram shows six secrets in the AWS Secrets Manager which can be mapped to two credentials within the Control Room Credential Vault

- Object3
- Object4

For example, you can map a locker in the Control Room to either `prefixID3` or `prefixID4`. Then, you map the secret to a credential. For each credential, the secrets will be consumed (retrieved by the Control Room) as a system-defined credential (without username postfix) and two User-defined credentials (one each for the Control Room users whose usernames are `User1ID1` and `User1ID2`).

Note: Within the Control Room Credential Vault, the name of the locker and the name of the credential are arbitrary and local to the Control Room. You map these names to specific secrets in the external key vault.

Within AWS Secrets Manager, each automation credential is stored with a name that contains specific identifiers including: a prefix, object identifier, and an optional postfix which identifies a username. This is a required naming convention that assures retrieval of the correct credential. The name of the secret

(the credential) in AWS Secrets Manager encodes information about the mapping within the Automation Anywhere Credential Vault.

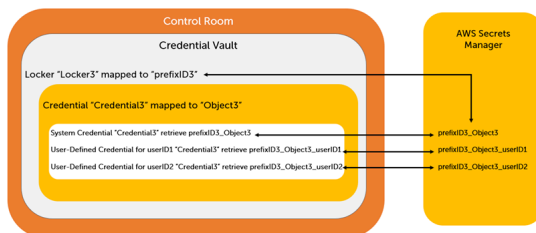

As an administrator, to map a Control Room to AWS Secrets Manager, you create and configure a locker and a credential using the external key vault option within the **Create Locker** and **Create Credential** features in the Automation 360 Control Room:

- You configure lockers in the Credential Vault that map to an AWS secret name prefix.
- You configure credentials in the Credential Vault that map to an AWS secret object identifier (optional postfix for user-defined credential).

During runtime, the RPA platform retrieves the secret that is named with a postfix that matches the user context (user-defined credential) in which the automation is running. If there is no user-defined credential, then the RPA platform retrieves the secret without a username postfix (system credential).

The Control Room implements access controls to the external credentials through permissions within roles. You control access to credentials by assigning different Control Room users to different roles and then associating different lockers with those roles.

The following image shows the Control Room Credential Vault locker and credential mapped to an AWS secret:

Important: When creating an externally mapped credential, you must place the credential in the appropriate externally mapped locker (the locker is mapped to the prefix in the secret name). The AWS secret name will have a naming convention: `Prefix + Secret_Name_Body + Postfix` (optional for user-defined credentials).

Note: The same permissions and privileges (assigned through roles) in the Control Room apply to credentials mapped to the external key vault.

Automation naming conventions

The following table shows AWS Secrets Manager external key vault examples using naming conventions for automation.

Note: The AWS Prefix maps to the locker for the Control Room, and the AWS Secret Body maps to the credential for the Control Room.

Automation credential example	AWS Prefix	AWS Secret Body	Secret in AWS	Control Room username
accounting_pdf System credential in locker mapped to AWS Secret name prefix accounting	accounting	pdf	accounting_pdf (system)	None - system credential
accounting_pdf_ABCD\user123 User-defined credential in locker mapped to AWS Secret Name prefix accounting	accounting	pdf	accounting_pdf_ABCD\user123	ABCD\user123

AWS automations credentials retrieval example

To configure automation credentials retrieval and integrate with the AWS Secrets Manager, you first create a locker and then create credentials.

To create a locker to integrate with the AWS Secrets Manager, perform these steps:

1. From the Automation 360 Control Room, navigate to **Manage > Credential**.
A user with **Manage my credentials and lockers** permissions is authorized to create credentials.
2. From the **Credentials** tab, select **Create Locker**.
3. Enter a name for the locker (for example, `Locker3`).
This name is local to the Control Room and does not have any dependency on the AWS secret name.
4. Click **External Key Vault** and enter the AWS secret name prefix (for example: `prefixID3`). You must name secrets within the AWS Secrets Manager using the name prefix for the configuration of the mapping to complete successfully.
5. Click **Next**.
6. Configure Owners, Managers, Participants, and Consumers for the locker.
7. Click **Create locker**.

See [Create locker](#).

The Control Room is now ready to retrieve credentials and enforce access controls on all Azure secrets with the prefix `prefixID3`. To continue, you now create the credentials.

To create a credential to integrate with the AWS Secrets Manager, perform these steps:

1. From the Automation 360 Control Room, navigate to **Manage > Credentials**.
A user with **Manage my credentials and lockers** permissions is authorized to create credentials.
2. From the **Credentials** tab, select **Create Credential**.

3. Enter the credential name in the **Credential name** field.

This name is local to the Control Room and does not have any dependency on the AWS secret name.

4. Click **External key vault** below the name field.
5. From the list of available lockers, select the appropriate locker that was previously mapped to the secret name prefix for the secrets you are now mapping to the credential.

6. Enter the AWS `Secret_Name_Body` in the **Secret name** field (for example: `Object3`).

7. Click **Validate and retrieve attributes**.

The system validates the mapping by attempting to retrieve from the AWS Secrets Manager a secret with the name `Prefix_Secret_Name_Body` (for example: `prefixID3_Object3`).

If validation fails, then no secret exists in the AWS Secrets Manager with the name that matches the combination of locker (prefix) and credential (`Secret_Name_Body`). In this example, there is no secret in the AWS Secrets Manager named `prefixID3_Object3`.

When the system successfully retrieves the secret, it will display the AWS Secrets Manager secret attributes (the fields within the secret).

8. From the list of attributes, select attributes to map to the credential.
9. Click **Create credential**.

If successful, then the credential successfully created message displays.

Changing external key vault to another

If you did not integrate the external key vault during the initial installation and you want to configure it without re-installing, you must use the key vault utility. Also, to change the external key vault connection details or to change the bootstrap credentials, you must use the key vault utility.

You use the key vault utility for each of these scenarios:

- To initially configure the external key vault connection if it was not configured during initial installation and you do not want to re-install the external key vault.
- To change external key vault connection details:
 - Example 1: CyberArk Password Vault is migrating to a server with a different name
 - Example 2: CyberArk Password Vault authentication certificate is changing
 - Example 3: You want to change from one AWS Secrets Manager instance to another
 - Example 4: You want to change from one Azure Key Vault instance to another
- The Automation 360 Control Room is malfunctioning because the external key vault connection has changed, and the Control Room is no longer able to retrieve credentials from the external key vault.
- The Control Room is malfunctioning because the credentials defined for bootstrap or Active Directory integration have changed names.

- To change the KEY_VAULT from one external key vault to another, or to NONE, you must first manually set the database and service account credentials that are currently being retrieved from the external key vault.

For example, to change from an AWS Secrets Manager key vault to a CyberArk Password Vault, you must perform these actions:

1. Set the external KEY_VAULT attribute to NONE.
2. Set the external key vault to the new key vault type.

This following table provides guidelines on acceptable state changes for the KEY_VAULT attribute:

New key vault	Original key vault			
	AWS	CyberArk	Azure	None
AWS	Yes	No	No	Yes
CyberArk	No	Yes	No	Yes
Azure	No	No	No	Yes
None	Yes	Yes	Yes	Yes

- To change from an AWS Secrets Manager key vault to a CyberArk Password Vault (or vice-versa), you must first change the KEY_VAULT attribute to NONE.
- To change an AWS Secrets Manager key vault or a CyberArk Password Vault to NONE, ensure that the database is not connected with the KEY_VAULT attribute.

Verify external key vault configuration

Use the Automation 360 Control Room to verify external key vault configuration and database authentication changes you made using the key vault utility.

1. Log in to the Automation 360 Control Room as the administrator.
2. Go to **Administration > Settings > General > Configuration settings**.
3. Go to the **Control Room Database & Software** tab and scroll down to the Control Room database information to verify its details.
4. Navigate back to **Settings > External key vault** and review its configuration settings for external vault, vault URL, and Application ID.
5. Navigate back to **Settings > Email**, and click the **Edit** icon to open the **Notifications** pane.
6. Scroll down to verify that the external key vault settings reflect the SMTP credential identifier in the external key vault
7. Click **Close**.

Troubleshooting external key vaults

You can use the `keyvault.properties` file and application log files to review configuration and integration information for external key vaults.

Use the `keyvault.properties` file

You can use the `keyvault.properties` file to review configuration attributes for these external key vaults:

- CyberArk Password Vault
- AWS Secrets Manager
- Azure Key Vault

The following `keyvault.properties` file shows an example with the CyberArk Password Vault:

```
keyvault.type=CYBERARK_PASSWORD_VAULT
keyvault.cyberark.ccp.url=https://services-uscentral.skvtap.com:19516/
keyvault.cyberark.ccp.appid=vb_test_app
keyvault.cyberark.ccp.client.certificate.path=D:\\CyberArk\\client_combined_cert_key_Adminat123.p12
keyvault.cyberark.ccp.client.certificate.passphrase=Password
```

To review the AWS Secrets Manager `keyvault.properties` file, enter these AWS attributes (for example):

- `keyvault.type=AWS_SECRETS_MANAGER`
- `keyvault.aws.region=us-west-2`

Note:

- The certificate passphrase attribute contains the encrypted Control Room certificate file passphrase. **Do not** modify the certificate passphrase attribute directly; instead, you should use the key vault utility.
- You can modify the `keyvault.properties` file. However, any modifications will require a service restart. So we recommend that you always use the key vault utility to make modifications.

Use the application log files

You can use these application log files to review external key vault integration information:

- `WebCR_CredentialVaultlog`
- `WebCR_RestException`

You can use these log messages to troubleshoot external key vault integration or configuration issues:

Log message description	Cause or reason
Unable to send an email	Retrieved SMTP credential is incorrect.
Unable to connect to SMTP server because either your SMTP username or password is incorrect	
Logs indicate failure connecting to LDAP	Failure to authenticate through Active Directory.

Log message description	Cause or reason
WebCR.log file shows database connectivity error, and the Control Room fails to boot up correctly	Retrieved database password is incorrect.
Either your username or your password is incorrect	Retrieved auto-login credential is incorrect for the user (correlates to the bot deployment log for user ID).
Logs indicate connection failure to CyberArk	A possible certificate expiry issue exists if failure occurs after a period of proper functioning for (3, 6, or 12) months.
Unable to retrieve secret, and detail exception will have cause	A non-existent credential identifier (safe name, object name, or secret name) is in use. Might also indicate the credential identifier was removed from the external key vault (if it was previously working properly).
	Might also indicate that the key vault connection is down or unreachable. Or, connection details (API URL, AppID, certificate, region name, AWS keys) are incorrect, have been changed on the key vault, or expired.

Edit My settings

The **My settings** page provides user profile specific information.

My profile

Each RPA user is required to have an active profile in the Control Room to build, run and schedule the deployment of bots as well as for security authorization. Profile information includes user names, email addresses, passwords, and so on.

To access this information, click the **My Settings** navigation tab.

The **My Settings** page displays an expandable **My profile** tab that shows specific and configurable user details. Click the **Edit** icon to update this profile information.

CoE Manager

Automation Anywhere CoE Manager helps you achieve visibility into your end-to-end automation lifecycle while accelerating the pipeline generation. It helps scale the automation programs more quickly and efficiently, while maximizing the value realization from the investment in your automation program.

CoE Manager is available out of the box and requires minimal configurations for first-time use. In addition to program management capabilities, it provides a consistent and repeatable way of assessing automation opportunities in order to minimize variations and maximize return on investment (ROI). ROI can be measured in terms of time and cost saved as well as user-defined KPIs such as operational agility, cash flow, sustainability, and so on.

CoE Manager is powered by Shibumi platform, a leading provider of enterprise program management solutions.

<https://aa2019packagesdkfordocumentation.s3-us-west-2.amazonaws.com/videos/aa-coe-manager.mp4>

Benefits

CoE Manager helps you in the following ways:

- Scale automation programs more quickly and efficiently.
- Forecast business results, identify metrics for success, and track them through the entire automation lifecycle.
- Create single view of portfolio status, risks, and interdependencies.
- Informed decision making with timely and accurate data.
- Assess all automation ideas across expected savings, strategy alignment and automation complexity to enable prioritization.
- Reduce manual effort on multi-level tracking, computing, and reporting.
- Maximize the value (ROI) from your automation investment.
- Boost the value of the pipeline of automation opportunities to build the business case for additional investment.

Capabilities

CoE Manager is a cloud-based platform which helps manage the automation pipeline and delivery.

Key capabilities of CoE Manager are:

- Accelerate the automation lifecycle journey with a purpose-built automation CoE management solution where everyone can share automation ideas.
- Enable the leadership team to make focused decisions by providing dashboards that help maximize the ROI from the automation program.
- Enable tracking and managing the pipeline by tracking automation program data, set targets, and tracking the progress. It helps manage the pipeline from idea to delivery to value realization.

- Track automation ROI via native integration with Automation Anywhere.
- Seamless reporting via dashboards and automated report creation.
- Efficient governance with role-based access control with in-built approval workflows and user notifications.

Components

The CoE Manager includes the following components:

- **Dashboard:** Provides graphical insight to help you view the adoption and progress of the automation program. It displays information on idea velocity, opportunities by stage, forecasted savings versus program target, value by stage, as well as benefits at various stages.
- **Opportunities:** Displays all opportunities across idea, pipeline, in-progress, and deployed stages.
- **Ideas:** Displays new opportunities submitted into CoE Manager.
- **Pipeline:** Displays approved opportunities.
- **In Progress:** Displays opportunities currently in design/build stage.
- **Deployed:** Displays opportunities that are live.
- **Risks:** Track program risks and their resolutions.
- **Reporting:** View and export the status of entire automation program or drill-down into each business unit.
- **Admin:** Configure program details and targets, questionnaire and weightages, cost estimates, benefit types, and so on.

Getting started with CoE Manager

CoE Manager provides clear visibility into the backlog of automation ideas, their position in the lifecycle, and how much value they will deliver back to the business. The following is a high-level overview of how to get started with CoE Manager:

Add the following email domains to your email client's safe-senders list to ensure users receive the notifications generated by CoE Manager.

- APP environment (North America) - notifications come from @mail.app.shibumi.com
- EU environment (Europe and India) - notifications come from @mail.eu.shibumi.com
- AP environment (Asia-Pacific) - notifications come from @mail.ap.shibumi.com

Administrator

- Configure your CoE Manager for first-time use: CoE Manager provides program-level administration tabs to tailor the solution for your use.

[Configuration instructions for admin](#)

- Add users: Add participants to specific roles within your CoE Manager.

[Roles and user management](#)

- Register and access CoE Manager: You must be invited to use CoE Manager. When you respond to your first invitation, you will set up a login account. You will use this account for all future use.

[Creating and managing your account](#)

- Link Control Room: Link up to three Control Room in your CoE Manager.

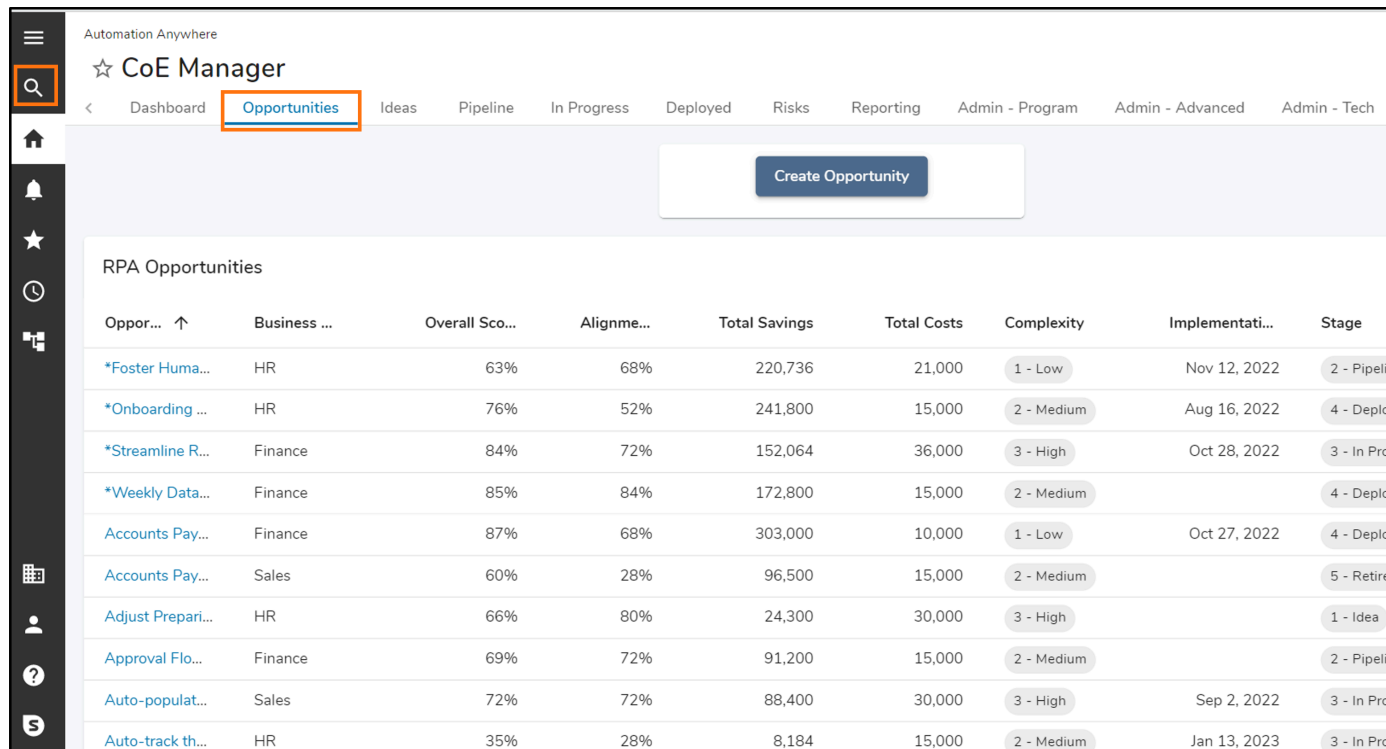

[Integrate CoE Manager with Control Room](#)

- Customize your CoE Manager: The CoE Manager provides several program-level administration tabs to tailor it as per your requirement.

[Customize the CoE Manager](#)

- Register a digital worker within the CoE Manager: You can review digital worker information from the **Deployed** tab and add automations directly on an opportunity. To register a digital worker with an

opportunity, you can either use the **Opportunities** tab to search for the opportunity you would like to update or use the search option (magnifying glass icon) on the Navigation Sidebar.

Integrate CoE Manager with Control Room

You can integrate the CoE Manager with the Control Room to monitor your automations and calculate the savings achieved. You can link up to three Control Room instances with one instance of CoE Manager.

To link a Cloud Control Room to the CoE Manager, follow the steps mentioned below.

1. Create a custom role with the following permissions:
 - View everyone's activity
 - Generate API-Key
2. Create a user and assign the custom role created above.
3. Generate API Key for the user.
4. Log in to the CoE Manager by providing your **Email Address** and **Password**.
5. Navigate to **Admin-Tech** tab.
6. Click the placeholder URL in the **Automation Anywhere URL** column.
7. Click **Edit** in the **Automation Anywhere URL** field and enter the Control Room URL.

8. Enter the username in the **Automation Anywhere Username** field.
9. Enter the API key in the **Automation Anywhere API Key**.
10. Click **Save**.
The **Enabled** column automatically changes to **Yes** when you save the URL, username, and API key.

Customize the CoE Manager

The CoE Manager provides several program-level administration tabs to customize it as per your requirements. You must have an admin role to customize the CoE Manager.

Admin - Program

In the **Admin – Program** tab, you can configure general settings for the overall program.

Program Details

Program Details

Program Start Date 01/01/2022	Program End Date 12/31/2025
Currency Symbol \$	Primary Benefit Currency
Number Format Thousands ▼	Number Suffix K
Formatted Decimal Places 2 ▼	Assign Intake S No
Track Program Risks? Yes ▼	Show Oppty Ac Gantt Chart

Indicate which target value(s) should be used in calculating overall score for opportunities

Opp Target - Overall Score Calculation Use Both	
Opp Target - Amount Saved 40000	Opp Target - H 160

Option	Details
Program Start and End Dates	Displays the start and end dates for the program.
Currency Symbol	Displays the currency symbol alongside savings values. This setting applies to all opportunities.
Primary Benefit Measure	Displays the primary quantitative measure for the CoE Manager as either hours or currency. For example, if you select currency, the program dashboard tab displays forecasted savings on the top-left corner of the page. If you select hours, the program dashboard tab displays the forecasted hours saved.
Number Format	Controls how large numbers are abbreviated. The options are full number, thousands, and millions.
Number Suffix	Automatically assigned based on the number format selected, has a value of K for thousands and M for millions.
Formatted Decimal Places	Specifies how many decimal places to display in numbers formatted with M or K based on the number format selection described above.
Assign Intake Submitter as Opp Owner	Determines whether the system should create an account for the user submitting the opportunity. This is applicable for users who currently do not have an account with the CoE Manager. If set to Yes , the email address in the opportunity submission form is used to create the user account. Ensure the email domain is whitelisted within the CoE Manager.
Track Program Risks	Specifies whether or not to show the risks tab at the program level.

Option	Details
Show Opp Activities As	Specifies how opportunities activities are displayed on the activities tab. You can choose between a List and a Gantt-Chart.
Opp Target – Overall Score Calculation	Choose whether you want to use amount or hours to calculate opportunity targets.
Opp Target – Amount and Hours Saved	Specifies the target amount and hours saved for individual opportunities. For calculating the Overall Score for an opportunity, the percentage achievement toward these targets as well as the business alignment percentage is used.

Weighted Benefit per Stage

Weighted Benefit per Stage

Stage 1 Weight

0%

Stage 2 Weight

25%

Stage 3 Weight

50%

Stage 4 Weight

100%

Determines the weightings to calculate the weighted benefits for opportunities at each stage in CoE Manager. The weighted benefit is calculated by multiplying the estimated value for each opportunity with the corresponding factor to reflect the confidence of the benefit being achieved. Typically, opportunities in the idea stage are weighted lightly and gain in weighted value as they progress toward

Colors	deployment. The weighted value is used to estimate total program savings. Specifies the hexadecimal color codes to use for highlights in the system. The alert color is applied when highlighting severe issues, the warning color is applied when highlighting developing issues, and the normal color is applied for normal operations. The neutral color is applied as a default color in non-alert situations.
Advanced Views	Sets the visibility of the admin tabs. For more information, see: <ul style="list-style-type: none">• Admin - Advanced• Admin - Users• Admin - Tech Integrate CoE Manager with Control Room
Complexity Cost Estimates	Specifies the default implementation cost estimate to be assigned for an opportunity when either a low, medium, or high complexity assessment is specified for that opportunity. You can override the default cost estimate by typing a new value in the implementation cost field on the details tab for the opportunity.
Business Unit List and Opportunity Sources	Lists the business units and opportunity sources for the automation program. Use the Create Business Unit and Create Opportunity Source buttons at the top of the section tabs respectively to create the business unit and opportunity sources.
Monthly Targets	Lists the program and business unit targets. You can enter the targets for the program as a whole and individual business units in this list.

Admin - Users

In the **Admin - Users** tab, you can manage role assignments on individual opportunities.

Opportunity Role Assignments

Opportunity	Role
*Foster Human Resources Metrics	Owner
*Onboarding of temporary/part-time workers	Collaborator
	Collaborator
	Owner
*Streamline Reviewing and Reconciling Transactions	Owner
*Weekly Data Reconciliation	Admin
	Owner
Accounts Payable Automation	Collaborator
	Collaborator
	Owner

Displays the list of opportunities and their participants along with the role of the participant (owner, admin, or collaborator) in that opportunity.

Admin - Tech

In the **Admin - Tech** tab, you can manage the integration of automation platforms for the program.

Configure non-firewalled Control Rooms

Enabled integrations run every four hours starting at 2AM UTC. If any settings are missing (URL, Username, API Key) the integration will be automatically disabled.

Control Room Integrations

Automation Anywhere U... ↑	Automation Anywhere Us
Control Room URL 3	
https://aa-saleseng-us-4sbx.clou...	coemgr_systemuser
https://product.aaedev.supremo...	coemanager_cr_user

You can integrate up to three Cloud Control Room instances with the CoE Manager.

Admin - Advanced

In the **Admin - Advanced** tab, you can define the detailed prompts for additional benefits, complexity and strategic alignment questions for automation opportunities. You can also specify the display icons across the CoE Manager.

Label Settings

You can change the labels for workstream, complexity and strategic alignment attributes in the details section of an opportunity.

Opportunity - Addl Benefit Types

Defines up to five categories of benefits in the additional benefits section on the details tab for opportunities. You can track benefit amounts and comments for each benefit category for the opportunities.

Opportunity - Complexity

Defines up to five complexity questions, weighting for each question and the scoring scale. You can rate each opportunity on a scale from none to very high to drive a complexity score (based on the weightings) for the opportunity.

Opportunity - Strategic Alignment

Defines up to five strategic alignment questions and the weighting for each question. You can rate each opportunity on a scale from none to very high to drive an alignment score (based on the weightings) for the opportunity.

Icon Preview

CoE Manager comes preconfigured with the preferred icons and color schemes. You can

Icon Assignment

customize these using Font Awesome icons to highlight key measures for individual opportunities as well as aggregated information. The **Browse Icons** button allows you to browse Font Awesome icons on their website. The **Icon Preview** entry loads the specified Font Awesome icon (based on an icon ID from the Font Awesome website) in the panel to the right.

Defines the icons to be displayed throughout CoE Manager by using Font Awesome icon IDs from the Font Awesome website.

Export and Import

You can bulk import opportunities into a program. Click the **Export** button to download the opportunity template. This is a pre-filled template with existing opportunities in the CoE Manager. To add new opportunities, follow the below steps:

1. Open the downloaded template and delete the existing data.
2. For each row of new opportunity to be created, enter the data as outlined below:
 - Column A: Default to `Opportunity_t`
 - Column B: Do not fill
 - Column C: Enter the **Business Unit** for the opportunity being created
 - Column D to AE: Fill the details as required
3. Save the excel file.
4. Click the **Import** button.
5. Browse and select the file and click **Import**.

Configure CoE Manager for Single Sign-On (SSO)

Use the SSO option to enable the CoE Manager authentication through an identity provider (IdP) using Security Assertion Markup Language (SAML) 2.0 protocol.

SAML SSO login setup

Before configuring the CoE Manager, ensure you have completed the following requirements:

1. Download the Service Provider (SP) metadata for your respective CoE Manager region using the links provided below:
 - US environment: [Test](#) | [Prod](#)
 - EU environment: [Test](#) | [Prod](#)
 - AP environment: [Test](#) | [Prod](#)

2. Configure your Identity Provider (IdP) with the metadata obtained from the previous step and in SAML assertion, provide the following:
 - Email, First Name, Last Name, and NameID
 - Redirect URL for IdP-initiated login as a relay-state parameter
3. Provide the IdP metadata and the attribute names received from IdP (Email, Last Name, and First Name) to the Automation Anywhere support team.

Login workflow

SAML SSO login can be configured using one of the following methods:

- **Service provider-initiated login:** The SP-initiated login starts with the CoE Manager and is triggered when a user attempts to access the application through a URL. SP-initiated login requires a redirect to the appropriate IdP to ensure proper authentication before access is granted to the service or to any specific object. Depending on whether SSO is configured as mandatory or optional, your login workflow will vary. See below for more information.
- **Mandatory SSO:** After SSO is enabled, enter your email address in the CoE Manager login page and click **Next**.

As the CoE Manager is a multi-tenant application, you must use an email address to determine the IdP to be redirected to. This email address can be from any domain associated with your organization. CoE Manager will redirect to the IdP based on the entered email domain. For example, if your organization is Acme Corp, you might have acme.com and acmeent.com as associated domains. In this event, any address with @acme.com and @acmeent.com will redirect to the IdP when you click **Next**. You will be redirected back to the CoE Manager page after IdP authentication.
- **Optional SSO:** On the login page, enter the email address and click **Next**. Instead of being automatically redirected to the IdP, you will be prompted to either enter a password or select the option to log in with SSO, which will be sent to your IdP for authentication.

Note:

- CoE Manager supports deep linking with SSO. After clicking the link, you should enter your email address in the CoE Manager login page. You are then redirected to the IdP for authentication. After authentication, you are redirected to the URL initially requested.
 - CoE Manager creates a cookie after successfully logging in to the application using SSO. This ensures the subsequent logins to CoE Manager will bypass the username and password screen and redirects to the appropriate SSO login page automatically. You can also override the cookie by navigating directly to the CoE Manager login page, that is `https://<region>.shibumi.com/shibumi/login`.
 - A user account is automatically created after successfully logging in to the CoE Manager using SSO for the first time.
-
- **IdP-initiated login:** With IdP-initiated login, you can access the CoE Manager directly through the IdP (without a login page being displayed). When CoE Manager is launched using this method, you are taken directly to your organization's CoE Manager home page or to a URL provided by the IdP as a relay state parameter.

Account provisioning

CoE Manager provisions user accounts as needed for organizations with enabled SSO. Accounts are generated when:

- A user is assigned a role on an object in CoE Manager
- A user is invited to a CoE Manager work item
- A user first attempts to access CoE Manager

The typical account provisioning sequence would be for a user to be invited into a work item in CoE Manager by an existing user. This triggers the auto-provisioning of their account. If this is not done, when the user attempts to access CoE Manager the first time the account is provisioned, the user will not have access to any work items. This can be a confusing experience. Therefore, it is a recommended best practice to ensure that the users are invited to participate in a work item prior to the first access.

Note: User accounts are not imported in bulk from the IdP. Users are not automatically added or removed from the CoE Manager instance when a person joins or leaves the organization.

When a user is authenticated via an IdP, their first and last name are updated in CoE Manager to reflect the attribute values supplied in the SAML payload (the mapping of first name and last name to attributes is part of the SAML configuration in CoE Manager and in IdP).

Using CoE Manager

CoE manager provides a structured and consistent way of assessing all submitted opportunities, thereby increasing confidence in the quality of automation pipeline.

Work item basics

CoE Manager is composed of Opportunities, Business Units (referred to as workstreams by Shibumi), and a Program. In CoE Manager, these are all called work items. They are places to review and add information. Each of these work items are made up of tabs and sections.

[Work item basics](#)

Roles and user management

Users are assigned to specific roles, and the role determines how the user interacts with CoE Manager. In CoE Manager, all users have inherited permissions, which means that the permissions extend below where they have access.

[Roles and user management](#)

Workspace

CoE Manager workspace is divided into Navigation Sidebar, Header, and Work Area.

[Workspace overview](#)

Personas and available actions

CoE Manager personas represent the people within your organization who participate in your automation program. The titles given to these personas might not match the job titles used within your organization. Use the goal descriptions to help you map your organization titles to the CoE Manager personas. Once you have mapped your positions to the CoE Manager personas, the topics

to cover column (in Persona overview link below) highlights the solution activities most applicable to the persona. Persona-specific support site articles are available through the persona column hyperlinks.

CoE Manager FAQ

For details and questions on the CoE Manager powered by Shibumi platform, review this FAQ.

Overview

What is CoE Manager?

CoE Manager (powered by Shibumi) is a cloud-based solution to manage the automation pipeline, delivery, and benefits of the automation program.

Why do I need CoE Manager?

CoE Manager helps you take control of your end-to-end automation lifecycle while accelerating pipeline generation. It helps CoEs to scale automation programs more quickly and efficiently driving core Automation Anywhere deployments and maximize the value (ROI) from your automation investment. CoE Manager elevates the value of the pipeline of automation opportunities to build the business case for additional investment.

I already have an existing app for managing my automation pipeline. Do I still need CoE Manager?

CoE Manager is a purpose-built automation CoE management solution that provides advanced capabilities to drive automation success and comes with a native integration with Automation Anywhere. It eliminates the manual overhead required in a homegrown tool and allows CoEs to focus on accelerating the automation pipeline instead.

Is CoE Manager a SaaS solution?

Yes, CoE Manager is hosted in Shibumi's cloud infrastructure. Shibumi uses AWS as their cloud provider. Currently, CoE Manager/Shibumi RPA accelerator is hosted in the AWS zones in North America, Germany, and Australia.

Which compliance standards does CoE Manager support?

Automation Anywhere and Shibumi are committed to maintaining compliance with key global information security and regulatory standards, including:

- Service Organization Control (SOC) 2, Type 2 certification
- CSA Cloud Controls Matrix standards compliance

What data retention policies, if any, are in place?

- EU Model clauses supported

Shibumi retains customer information for as long as the account is active, or for as long as it is needed to provide a customer or sponsoring organization with specific requested services.

Do I need Automation Anywhere to use CoE Manager?

No. CoE Manager can work independent of Automation Anywhere. However, Actual ROI information cannot be recorded in COE Manager unless it is linked with an Automation Anywhere Control Room.

What is the Opportunity Lifecycle enforced by CoE Manager? Can it be modified?

All opportunities in CoE Manager follow a tollgate process comprised of 4 stages given below:

- Stage 1: Idea
- Stage 2: Pipeline
- Stage 3: In progress
- Stage 4: Deployed

These four stages are not configurable by an administrator or end user. However, they can be customized by Automation Anywhere for your implementation of CoE Manager if desired. Contact your Automation Anywhere representative to explore this.

Can I use CoE Manager to manage my automation pipeline outside of Automation Anywhere?

Yes.

Does CoE Manager support single sign-on?

Yes, the CoE Manager supports full SAML or SAMLv2 integration into any IDP or SSO solution such as Okta.

Get started**How do I activate CoE Manager?**

Contact your Automation Anywhere representative if your organization has not yet purchased CoE Manager. Each SKU will represent a unit of one CoE Manager instance for an unlimited number of users per year.

How do I access CoE Manager?

Depending on the region from where CoE Manager was purchased, you can access CoE Manager through one of below links.

- [North America](#)
- [Europe](#)
- [APJ](#)

Note: Your account should already be setup in CoE Manager before you logging in. For the account

setup process, refer to [Getting started with CoE Manager](#).

Is there an integration between CoE Manager and Automation 360?

Yes, you can link up to three Automation 360 Cloud Control Room to a CoE Manager enterprise instance. This allows CoE Manager to collect bot activity data to monitor automation executions and calculate achieved savings. For an On-Premises environment, a bot will be provided to push data from an On-Premises Control Room to the COE Manager cloud.

Which version of Automation Anywhere is CoE Manager compatible with?

CoE Manager integrates with Automation 360 Cloud Control Room out of the box and integrates with On-Premises environments through a digital worker. For further details, refer to [CoE Manager](#).

Does CoE Manager require any third-party software applications?

No.

What are the hardware requirements for CoE Manager?

CoE Manager is a cloud-based solution accessible via a browser and does not need any hardware setup.

Which browsers does the CoE Manager support?

Google Chrome, Mozilla Firefox, Microsoft Edge, and Safari.

Can CoE Manager integrate with third-party reporting tools?

Yes. Contact your Automation Anywhere representative to explore this.

Can CoE Manager integrate with third-party process/task mining tools?

Yes. Contact your Automation Anywhere representative to explore this.

Does CoE Manager support APIs?

Yes. CoE Manager/Shibumi exposes create, read, update, and delete capabilities through its GraphQL API.

Can I customize dashboards?

Yes. This feature will be enabled in a future product release.

Can I export the dashboard and reports?

Yes. You can export to Excel or CSV wherever applicable. Export to PDF will be enabled in a future release.

Can I add new business units to manage my automation opportunities?

Yes. You can create as many business units as you need. Ability to add sub-business units will be provided in a future release.

How do I assign opportunity to a user?

You can assign the opportunity to a user as given below:

1. Open the opportunity.
2. Click the **Avatar** icon on the top right.
3. Enter the email address of the user you want to add.
4. Select the role and click **Add**.

I am unable to login into CoE Manager. What do I do?

Contact your CoE Manager administrator to start a password reset.

My organization already uses Shibumi. Can I use CoE Manager with Shibumi license?	No. A new license needs to be purchased from Automation Anywhere to use the CoE manager.
Can I do a bulk upload of automation opportunities?	Yes.
Where do I report a problem with CoE Manager?	For reporting any unexpected or deficient functionality, submit a support ticket to Automation Anywhere.
Can the email branding be changed to customer's requirements?	This feature is not currently available.
Can I rename, copy, move, or delete an opportunity?	Yes, you can access these options from the three vertical dots icon on the top right.

Bot Store

You can access Bot Store from the Control Room. From Bot Store, you can download bots or packages to your Control Room repository.

There are two ways for you to get bots and packages from Bot Store into your Control Room:

- You can load items directly from Bot Store to your Control Room, without needing to download the items locally. For details, see [Directly import bots and packages from Bot Store to Control Room](#).
- You can download items from Bot Store locally, then import them to your Control Room, even if your Control Room is not connected to the internet. For details, see [Download locally and import bots and packages from Bot Store to Control Room](#).

Resources: To learn more, see [Automation Anywhere Bot Store Learning Trail \(A-People login required\)](#).

Related concepts

[Bot permissions for a role](#)

Assign bot permissions when creating a role with the **View my bots** feature permission.

Access Bot Store from the Control Room

As a Bot Store registered user, you can log in to Bot Store from the Control Room.

You must have valid Bot Store credentials to access Bot Store from the Control Room. If you do not have valid Bot Store credentials, you must register with Bot Store.

1. Log in to the Control Room.
2. Click the **Bot Store** tab.
Bot Store opens in a separate window (<https://botstore.automationanywhere.com>).

3. Log in using your Bot Store credentials.

In the Control Room, you can see **My downloads** under the **Bot Store** tab.

Watch the following video on how to find bots on Bot Store.

Submit bots or packages to Bot Store

You can submit bots or packages from the Control Room to Bot Store. If your bot includes dependencies, submit all dependencies. Submit a demo bot that demonstrates the use of the package.

You must have a system-created **AAE_Bot Store Publisher** role in order to submit bots or packages to Bot Store. See [System roles](#).

1. Download the A2019 Bot Store Bot template from GitHub: [A2019 Bot Store Bot Template](#).
2. Log in to the Control Room.
3. Log in to Bot Store using the Bot Store credentials.
4. On the left pane, click **Automation**.
A list of available and forms is displayed.
5. Click **Public** workspace and select the **Bot Store** folder.
6. In the **Automation** page, move your mouse over the **Action** toolbar and click **Submit to Bot Store**.
 - a) In the **Submit to Bot Store** page, review the dependencies that will be bundled with your bot (including a parent bot) and make changes as required. In addition, ensure that the bot and all dependent bots and files are in the same folder to submit to Bot Store.
 - b) Click **Next** to review the **Bundled packages** to ensure all packages are included with your submission.
 - c) If the bot you want to submit and the bundled package look complete, click **Submit**.
When choosing a name for your bot or package, ensure it is unique and descriptive so it is easily searchable on Bot Store.
Alternatively, click **Back** to go back.
When you submit your files, the system displays the following message: `<bot/package name> submission is in progress. Go to Bot Store > My Submissions` to complete your submission form. You will receive a confirmation email when the submission is completed.
 - d) Click **Take me to Bot Store** to complete your submission form in Bot Store.

When you resubmit files to Bot Store, it overwrites the previously submitted files, which are in a **Draft** status.

- It can takes three to five business days for review and approval of your bot or package.
- For any questions on bot and package submissions, contact [Contact Bot Store Support](#) or select the **Have questions about submitting a bot** option on Bot Store pages.

Directly import bots and packages from Bot Store to Control Room

You can load items directly from Bot Store to your Control Room without the need to download the items locally.

You must have a system-created **AAE_Bot Developer** role in order to download bots or packages to your Control Room repository. See [System roles](#).

1. Navigate to Bot Store site.
2. Log in with your A-People credentials to download from Bot Store.
3. Select a bot or package.
Once you have selected your bot, you are redirected to a detailed bot page.
4. Click the **Get Bot** button.
A confirmation window prompts you to confirm the request.
5. Click **Ok, Get Bot** to confirm the request.
You can choose from the **Add to Control Room** or **Download as a zip file** options.
 - The **Add to Control Room** option requires you to specify your Control Room URL.
 - The **Download as a zip file** option requires you to save the bot locally on your device and confirm the location path for your download to begin.
6. Select the **Add to Control Room** option to load the bot directly to your Control Room.
7. Enter your Control Room URL.
8. Log in to the Control Room.
9. Navigate to the **Automation** page.
10. Open your **Bot Store** tab.
11. Click **Add to RPA Workspace** in the **Action** toolbar.
The following message appears: `If you have any files already installed in private workspace, they will be overwritten.`
12. Select **Yes, continue** to overwrite an existing file and continue with the installation, or select **No, cancel** to cancel your download.
The installation status of the selected file changes to `Installed`.
13. Verify the downloaded bots in your Bot Store folder of the private workspace.
The custom packages downloaded from Bot Store are available in the **Packages** repository. You can navigate **Bot Editor > Action Palette**.
14. Verify that the downloaded packages have been enabled in the **Packages** repository. If the packages are not enabled, then go to individual packages and enable them.

Watch the following video on how to download a Bot Store bot to your Control Room.

You can choose from the **Add to Control Room** or **Download as a zip file** options.
 - The **Add to Control Room** option requires you to specify your Control Room URL.
 - The **Download as a zip file** option requires you to save the bot locally on your device and confirm the location path for your download to begin.
6. Select the **Download as a zip file** option
You can save the bot locally on your device and when you confirmed the location path, your download begins.
7. Log in to the Control Room.
8. Navigate to the **Automation** page.
9. Click **Import bots**.
10. Click **Browse**.
11. Select your downloaded zip file at the location path you saved.
12. Specify the option to have your bot in the **Public** or **Private** tab.
13. Click **Import** to import the downloaded bot.
14. Navigate to the **Public** or **Private** tab that you specified.
15. Open your **Bot Store** folder.

16. Access the bot.

You can now use the bot from Bot Store to start your automation experience.

To use a Bot Store package, open the bot you want to edit and access package from the **Actions** panel.

Note: For users who want proxy access to Bot Store, you can reference this knowledge base [article](#) for a workaround.

Getting started with Private Bot Store

Use Private Bot Store to view and submit bots and bot use cases within your company. Use admin tools to review and publish bots and manage users.

The following is a high-level overview of how to get started with Private Bot Store:

1. The Private Bot Store support team creates admin users for your company.
2. Optionally, the support team helps you set up SAML-based SSO or Active Directory Federation Services (ADFS) integration.
3. Admin users grant other users Private Bot Store access and permissions. (It is automated if you use SAML-based SSO or ADFS).
4. Users create bot listings and submit them for approval.
5. Admin users can approve or reject the submitted bots.
 - If approved, the bot listing is published and is available on Private Bot Store for other users within the organization to view.
 - If rejected, the bot author receives feedback on what has to be updated. The bot author updates the bot and resubmits it.
6. Other employees within the company access the published bot listings and use them in their automation tasks.

Related concepts

[Private Bot Store](#)

Private Bot Store is a secure internal bot marketplace for a company to post and share details and documentation for all internally developed bots. Employees can easily discover internal bots and commands to reuse in addition to all of the bots from the Automation Anywhere Bot Store vendors.

Set up A-People user access to Private Bot Store

A-People user access and management is included out-of-the-box with Private Bot Store. Within Private Bot Store, your company admin can manage users. Other users with granted permissions can access Private Bot Store with the same credentials they use for public Bot Store and other Automation Anywhere sites.

- **Set up A-People user access**

After your first admin users get access to Private Bot Store, they can add additional users. Any Private Bot Store user with admin access can manage users from the **Private Bot Store - User Access Settings** page.

- **Add new users individually or in bulk**
 - a) Navigate to **User Access Settings**.
 - b) Click **Add Users**.
 - c) Enter the email addresses for the users you want to add.
Invited users will receive an invitation email with instructions to set up their account.
- **Change user permission level**

Only admin users can modify permission levels by selecting the correct level in the **Access** panel.
- **Delete users**

Select **Delete** in the **Actions** panel.

Related tasks

[Submit and approve bots using Private Bot Store](#)

Use Private Bot Store to submit, review, and approve detailed bot listings for all of the bots your team has built.

Set up SAML user access to Private Bot Store

Use SAML-based single sign-on (SSO) or Active Directory access to ensure that your Private Bot Store user access is updated automatically when users join or leave your company. Users can log in to Private Bot Store using the same credentials they use for other applications.

- **Set up SSO or Active Directory Federation Services (ADFS) user access**

The Private Bot Store support team will help you set up **SSO** or **Active Directory** user access.

 - Provide details about Private Bot Store in your identity provider (IdP) settings.
 - Provide the Private Bot Store support team some information about your system.

The Private Bot Store support team will verify the information and complete the integration.

After the integration is completed, your Private Bot Store user access will be managed automatically by your SSO or ADFS user access.
- **Change user permission level**

Admin users can change a user's permission level by navigating to the Private Bot Store **Settings** page and updating user permissions.

Admins can only modify a user permission level if a user is an active Private Bot Store user.

Related tasks

[Submit and approve bots using Private Bot Store](#)

Use Private Bot Store to submit, review, and approve detailed bot listings for all of the bots your team has built.

Submit and approve bots using Private Bot Store

Use Private Bot Store to submit, review, and approve detailed bot listings for all of the bots your team has built.

- **Submit internal bots:**

To submit a new bot:

- a) From Private Bot Store, click **My Submissions**.
- b) Click **Add New Bot**.
- c) Enter all the required fields, such as bot description, benefits, and requirements.
- d) Review the documentation examples for each field and follow the suggested guidelines.
- e) Click **Submit** or click **Save** to save the bot before submitting it.
After you submit your bot, your Private Bot Store admin team receives an email to review the bot.
Your bot will be published or it might be send back for an update and resubmission.

- **Review internal bot submissions**

Private Bot Store admin users approve or reject bot submissions before they can be published.

- a) As an admin user, navigate to Private Bot Store and click **All Submissions**.
- b) Click **Review Bot** to review each submitted bot.
- c) Approve or reject the submitted bot:
 - **Approve and publish a bot:** On the **Review Bot** page, click **Approve** to publish the bot.
 - **Reject the bot and request updates:** On the **Review Bot** page, click **Reject** to reject the bot and send feedback to the bot submitter with instructions for updates.

Submit and manage bot ideas using Private Bot Store

Use Private Bot Store to submit, manage, and prioritize bot ideas for your development requirements.

- **Submit bot ideas**

- a) From Private Bot Store, click **Suggest Bot Idea**.
- b) Fill in all the fields about your bot idea, with as much detail as possible.
- c) Click **Submit**.
After you submit the bot idea, your admin team will review and prioritize it. The admin team might contact you for more information about your bot idea.

- **Manage bot ideas**

Private Bot Store admin users can manage and prioritize bot ideas.

- As an admin user, navigate to Private Bot Store and click **Manage Bot Ideas**.
- Click **Review** to review each submitted bot idea.
- Edit any of the fields as required.
- Select a **Bot Priority** level for the bot idea.
- Click **Save**.
- Click the **Mail** icon to contact the bot idea submitter to request additional details.

Watch the following video on how to submit a bot idea to Bot Store.

Custom filter management in Private Bot Store

Create your own filters and tags to organize your automations in Private Bot Store using the custom filter management page.

Custom filter management enables you to perform the following activities:

- Rename any of the default filters such as **Applications** and **Departments**, and tags (specific categories) such as **Excel** and **Finance**.
- Add up to six of your own custom filters.
- Add your own custom tags, with up to three nested layers of tags, for example, 2021 > Q1 > January.
- Select which filters you want to appear first in your Private Bot Store navigation.
- Select up to five top tags to appear first under their filter.

The custom filters are displayed throughout Private Bot Store, including:

- In the top navigation, filters on the left, and search results.
- On the listing submission form, where bot builders can select custom tags for their bots.
- On bot detail pages, where users can see how each bots is categorized.

Edit filters

1. You must have an admin user permission to access the **Manage Filters** page in Private Bot Store.
2. Navigate to **Private Bot Store > Manage Filters > Admin Tools > Manage Filters**.
3. Edit the default filters to match your company terminology.

Whenever possible, use default filter names, such as **Departments**, rather than creating your own filters. As a result, all the existing bots are already tagged and you do not have to tag them again.

4. Under **Actions**, click the **Rename Filter** action (pencil icon) to rename the filter.
5. Click **Add Filter** to add a new filter. Enter the name for the new filter.
You can add up to six custom filters.
6. Select a filter and click **Reorder entry** on the left and place the filter into your desired order.

The filter order is reflected in the Private Bot Store navigation and the filter panel.

7. Click the delete (X) action in the right column to delete any custom filter.
You cannot delete default filters.

Edit tags

1. Navigate **Admin Tools > Manage Filters > Actions** select a filter and click the tree icon **Add and Edit Tags** action.
2. Select a tag and click the tree icon to **Add Child Tag** within a tag. Enter a new child tag name.
You can add up to three layers of nested tags.
3. Click the **Rename Tag** action to rename any tag.
For the default tags, the original **Tag Name** continues to appear in the **Default Name** column for your reference.
4. Select up to five **Top Tag** in the left column to display those tags at the top of the list within each filter.
Use this for your company most-used applications or other important bot categories. Other than the selected **Top Tag**, tags are displayed in alphabetical order.
5. Click the delete (X) action to delete any custom tag.
You cannot delete the default tags.

Optimize

Bot Insight is an analytics platform that provides real-time, interactive, and smart insights about business processes and operational intelligence. Bot Insight is available with out-of-the-box dashboards that you can start using instantly. These dashboards provide analyzes to measure the performance of your digital workforce and predict and solve preventable business problems.

Business analytics through Bot Insight

Automation Anywhere Bot Insight processes real-time and interactive insights about business processes, and provides operational intelligence. Access the bots, and manage and instrument them to gather business analytics and insights, and publish dashboards.

1. *Create and edit bots*

The cloud-based bot editor provides tools, packages, and actions to create bots to automate processes.

2. *Instrument the bot for analytics*

Business analytics provides information about the transactional analytics for the data that is logged by the variables that are tagged in a task. The information provided can be about the total sales in a month, invoicing and payment trends, insight about new customers, and quote-to-order ratio.

3. *Access Bot Insight*

Access Bot Insight to perform the business analytics.

4. *Customize dashboards and widgets*

Dashboards represent the RPA infrastructure in the form of meaningful visuals and charts, so that you can analyze, interpret, and take action on the updates that are important to you. The dashboards display dynamically updated information of active users, registered clients, failed tasks, apps, bots, bot schedules, workflows, queues, and the overall status of devices.

5. *Publish a business analytics dashboard*

Publish a dashboard to display the production data generated by the task. The analytics consumers who primarily analyze and interpret data can access the published dashboard.

To learn more, search for the *Managing RPA Reports Using Automation 360* course in [Automation Anywhere University: RPA Training and Certification \(A-People login required\)](#).

Related concepts

[Bot Insight dashboards](#)

The Bot Insight dashboards provide dedicated graphical insight to help you view your bot information.

Related tasks

[Run your first bot](#)

Run a bot from the same device that you used to create the bot.

Related reference

[Analyze package](#)

Use the actions in the **Analyze** package to specify the actions and variables to use in the Bot Insight dashboard and widgets. The **Analyze** package enables you to perform transactional analytics for the data that is logged by the variables when the bot runs.

Accessing Bot Insight

This section provides information about how to access Bot Insight.

To use Bot Insight, the Control Room must have the Bot Insight license applied, and you must be logged in as a user with one of the following roles:

1. `AAE_Bot Insight Expert`
2. `AAE_Bot Insight Consumer`
3. `AAE_Bot Insight Admin`

Access Bot Insight from the Control Room

Access Bot Insight to interactively analyze bot data and enhance bot widgets.

Access Bot Insight from the Control Room in one of the following ways:

- From the Control Room, select **Dashboard**.
 - a) Locate the **Insights** tab.
 - b) In the **Insights** tab, click **Explore Bot Insight**.
The Bot Insight window appears.
- On the left panel, click **Automation**. A list of available bots and forms is displayed.
 - a) In the **Automation** page, click **PUBLIC** to view the public bots that can be viewed, run, and checked out by other people, based on the permissions set by the administrator.
 - b) Click **PRIVATE** to view your bots and files.

Note: Private bots and files cannot be viewed by other users. If a bot or file is checked out from the **PUBLIC** tab, it can be viewed and run by other users. However, the bots and files cannot be edited by other users.

- c) Select your bot from the **Files and Folders** menu.
Alternatively, enter the search parameters in the **Search Name** field and search for your bot.
- d) Open the bot and click **Analyze**.
The Bot Insight window appears.

Roles to access Bot Insight

The Control Room restricts Bot Insight access to users with certain roles.

Access to the dashboard depends on the user roles assigned to a user and the access permission granted to those user roles. See [Role-Based Access Control](#).

System-generated access is provided to all user types for Bot Insight. Admins can customize the Bot Insight experience by assigning a user-generated role to users. Each role includes a permission set, designed to specialize Bot Insight features to make analytics more simple or comprehensive. Admins

should evaluate user tasks and functions to assign the role most appropriate to fulfill user responsibilities, based on the following details.

Note: Various types of dashboards can be accessed for quick insights. Common types are listed below. For more details on dashboards, see [Dashboards overview](#)

- The **system-generated** dashboard is also known as a **Default** type.
- The **user-generated** dashboard is also known as a **Custom** type.
- The **Published** dashboard is also known as the **Production** type.
- When a published dashboard is saved by a user, the dashboard copy is known as a **custom production** type.

Apart from Bot Creators, users with the following roles have access to business analytics dashboards:

Bot Insight Admin

Use this role to perform the following operations in Bot Insight:

- Access Bot Insight API
- Analyze the Data Profile of the task data for which the dashboard report is generated.
- Analyze and save the system-generated dashboards.
- Analyze, save, publish, and delete the user-generated dashboards and publish dashboards.
- Bookmark, compare, and share the dashboards.

Bot Insight Expert

Use this role to perform the following operations in Bot Insight:

- Analyze the data in the dashboards that are deployed in the production environment.
- Save the system-generated dashboards.
- Analyze, save, publish, and delete the user-generated dashboards and publish dashboards.
- Bookmark, compare, and share the dashboards.

Bot Insight Consumer

Use this role to perform the following operations in Bot Insight:

- Analyze the data in the dashboards that are deployed in the production environment.
- Bookmark, compare, and share the publish dashboards.

Role-based access control in Bot Insight

Role-based access control (RBAC) enables a Control Room administrator to restrict access to the various components of Bot Insight.

The Control Room administrator can grant access to various user roles based on your requirements. When adding a user, you assign appropriate roles to that user. A user will have access to the components and folders based on the roles assigned to them.

Requirements

Before you publish the dashboard, ensure that the following requirements are met:

- The bot resides in the Public workspace for which you want to publish the dashboard.
- You have the **View my bots** and **Check in** permissions to the folder that contains the corresponding tasks. You need these permissions to move your bots from Private workspace to Public workspace.

RBAC for business analytics

Dashboards for business analytics are available for the tasks that are enabled for analytics. The Control Room administrator and users who have access to a task can view the dashboards for those tasks. You can access the dashboard for a task from the **Insight** tab in the **DASHBOARD** section of the Control Room and from the **ANALYZE** tab in the Workbench.

To view the Bot Insight dashboards, you must be granted access to the folder containing the corresponding tasks.

For example, you have created various tasks related to sales and accounting and stored them in the Sales and Accounts folder. If you want to grant access to the sales-related tasks to members of your sales department, you need to provide them access to the Sales folder. The same applies to grant access to the accounts-related tasks in the Accounts folder.

The following table illustrates the access the various members of the Sales and Accounts team will have:

	Sales_Dep			Accounts_Team	
	John	Mark	Dave	Smith	Micheal
Access to the Sales folder	Yes	Yes	Yes	No	No
Sales1	Yes	Yes	Yes	No	No
Sales2	Yes	Yes	Yes	No	No
Access to the Accounts folder	No	No	No	Yes	Yes
Accounts1	No	No	No	Yes	Yes
Accounts2	No	No	No	Yes	Yes
Accounts3	No	No	No	Yes	Yes

Bot Insight dashboards

The Bot Insight dashboards provide dedicated graphical insight to help you view your bot information.

Dashboards display meaningful visuals and charts so that you can analyze, interpret, and take action on the updates that are important to you. You can use dynamically updated information about active users, failed tasks, apps, bots, bot schedules, workflows, queues, and the overall status of devices to create custom dashboards and widgets.

Note: You must use the Analyze package version 2.3.0-20210922-121532 or later to generate the dashboard when running analysis. This package version is available from Automation 360 v.23.

Perform the following steps to apply the package.

1. From the Control Room, select **Manage > Packages > Analyze**.

Analyze

This page shows the package details of the selected version. You can also select a different package v

2. Change the Analyze package version to 2.3.0-20210922-121532 or later.
3. Save your changes.
4. Run the bot and ensure the change to dashboard generation.

Note: For changes to be applied to the public workspace, **checkIn** your bot before running analysis.

When you create and run a bot, Bot Insight automatically creates a default dashboard in the collection: My dashboards. If you have a parent bot and a child bot, Bot Insight creates a separate dashboard for each of the bots.

When you deploy and run a bot on the Bot Runner machine, Bot Insight aggregates all the information related to that bot. The published dashboard for that bot displays the aggregated bot information.

Note: Some data might not populate in a widget if bots were created in Automation 360 v.12 or earlier versions. See the following article for troubleshooting: [Bot Insight dashboard not populating data in specific widgets \(A-People login required\)](#).

My dashboards displays the following dashboards:

- [Operations dashboard](#)
 - [Business dashboard](#)
-

Note: You must have either the `AAE_Bot Insight Admin` or the `AAE_Bot Insight Consumer` role assigned to you to view the published dashboard.

Viewing Bot Insight dashboards

The Bot Insight dashboards provide customizable widgets for you to gain insights in specific scenarios. You can view information about your bots on the Bot Insight dashboards from the Control Room.

When you tag variables for analytics in a task and then run the task, Bot Insight generates the analytics dashboard. By default, the system-generated dashboard has the same name as that of the task. You can customize this dashboard to your requirements.

Business analytics provide information on the transactional analytics for data that is logged by the variable tagged in a task. The information provided can be about total sales in a month, invoice, payment trends, new customer insights, or quote-to-order ratio. You can select your dashboard from the **Select a Dashboard** drop-down menu to view the analytics.

Bot Insight provides the following dashboards:

- **Configure**

The system-generated dashboards are available in the **Configure** tab in the Bot Insight window.

- **Analyze**

The customized dashboards can be published and are available in the **Analyze** tab in the Bot Insight window.

- **Operation**

The **Operation** dashboard provides information about bots that are created, deployed, or scheduled to run across different Bot Runner machines. You can use the information to enhance productivity and take measures based on real-time information for RPA deployments.

1. Log in to the Control Room with one of the following roles:

- `AAE_Bot Insight Admin`
- `AAE_Bot Insight Expert`
- `AAE_Bot Insight Consumer`

2. Click **Explore Bot Insight** from the **Insights** tab.

The Bot Insight dashboard appears in a new window.

Viewing Insights

You can view information about business data in Bot Insight.

Click **Insights** from the **Analyze** tab to view information about interesting facts on business data.

The Insight dashboard provides information about business data that is logged through Bot Insight without the need to analyze the dashboards. It provides a snapshot of data that you can use to enhance your bot productivity. This feature highlights important facts that are inferred from within the business process data logged by the bots.

A bot created to process orders displays the following information:

- Total processing cost
- Process time
- Monthly payment
- Total payment

The dashboard provides information about the difference between the calculated metric values for a specific time interval:

- Yesterday
- Last 7 days
- Last 30 days

The Insight dashboard enables you to configure the variance thresholds for indicating metric-level health.

Perform the following steps to configure the variance thresholds:

1. Click **Settings**.
2. In the **Variance Threshold** window, move the slider to the left or the right to adjust the variance threshold.
 - Move the slider to the left for a **Poor** metric health level.
The poor metric level health is represented in red.
 - Move the slider to the right for a **Good** metric health level.
The good metric level health is represented in green.
3. Enter the values in the **Fair** field to set the **Fair** metric health level.
4. Select the **Switch poor and good** check box to switch between the **Poor** and **Good** metric health levels.
5. Click **Save**.

Operations dashboard

The Bot Insight Operations dashboard provides information about bots that are deployed on different Bot Runner machines and bot statistics based on performance. You can use this information to enhance productivity and take measures based on real-time information for RPA deployments.

The Operations dashboard provides visual insight into various operational aspects of bots and displays hyperlinks to the following dashboards:

- Bots Dashboard
- Audit Dashboard
- Device dashboard

These dashboards appear as the Default dashboards and are automatically created by Bot Insight based on the variables that are used in the bot. You can use the **Save As** function to save the Default dashboard as a Custom dashboard. You can also add widgets from the Visualizations menu to your custom dashboards.

Using widgets

Bots Dashboard

You can view information about the bots that are created, deployed, scheduled, and running across various Bot Runner machines.

The dashboard displays the following bot information:

- **Total Bot Runs:** Displays the total number of times the checked-in bots executed from the Bot Runner machines. (The number displays the total number of bots that have run successfully and failed to run).
- **Total Completed (Success):** Displays the number of bots that have ran successfully.
- **Total In Progress:** Displays the number of in-progress bots.
- **Total Failed:** Displays the number of bots that had failed to deploy or run.
- **Weekly Bot Status:** Displays the weekly status of bots that are scheduled to run.

Tip: You can hover over the widget to view the number of bots that have run successfully, failed to deploy, and failed to run. It also displays the weekly bots statistics percentage.

- **Failure Reasons:** Displays reasoning information on bots that had failed.
-

Note: The **Error Message** field displays a snapshot of the original error message and extensive details on why the bot failed. You can export the error messages and logs to a CSV file, which you can later use to troubleshoot.

Audit Dashboard

This dashboard displays various widgets that provide information about Control Room events. Users with the `View everyone's audit log actions` permission have access to view the audit information captured in the Control Room.

System roles.

The dashboard displays the following information:

- **Event Distribution by Activity Type**
- **Event Distribution by User Name**
- **Event Distribution by Source**
- **Event Distribution by Control Room Source**
- **Event Distribution by Workbench Source**

You can perform the following actions in the Operations dashboard:

- Enter the name of the dashboard in the **Search** text box to access a dashboard.
- Click the **Favorite** tab to bookmark your dashboard.
- Double-click the **Favorite** menu to remove bookmarks.

You can view information in the following tabs:

- **Total Views:** Displays the number of users who viewed a particular dashboard.
- **Last Refreshed:** Displays the time and date of when a particular dashboard was last refreshed.

You can click the arrow next to the Operations dashboard tabs to organize the dashboards to your requirements.

You can customize the widgets in the Operations dashboard. You can perform the following functions:

- *Working with Bot Insight dashboards*

- [Comparing dashboards](#)
- [Sharing a dashboard](#)
- [Taking a screenshot of a dashboard](#)
- [Downloading a PDF file from a dashboard](#)

Device Dashboard

The Device dashboard displays various widgets that provide information about resource utilization of the machines on which bots are executed.

The dashboard provides key metrics to analyze the status and utilization of devices. It also displays the activity history of the bots that are deployed on the machines.

The dashboard displays the following information:

- **Online Devices:** Displays the number of Bot Runner machines that are active or online at a point in time.
- **Offline Devices:** Displays the number of Bot Runner machines that are inactive or offline at a point in time. Devices can be online even though no bots are deployed on them.
- **Bot Schedules on Devices:** Displays the number of bots that are scheduled to run on all the Bot Runner machines.
- **Device Utilization%:** Provides the overall time used by bots that are executed across all the Bot Runner machines. You can view and analyze the utilization information by date using the following criteria:
 - Bot duration
 - Unit: %
 - Group 1: Start date time of a bot (interval: day)
 - Group 2: device name

There is no limit on the number of devices that can be displayed on the dashboard.

- **Device Activity History:** Provides information about the execution history of bots deployed on each Bot Runner machine. The Device Activity History table provides the following information:
 - Device name
 - Bot name
 - Bot duration (milliseconds)
 - Start date time of a bot
 - End date time of a bot
 - Status

When the Group1 and Group 2 fields have date type variables and you select **Bot Duration** as a metric, the **Percentage (%)** option appears as an additional option for **Bot Duration Unit**. Based on the selected group interval, the percentage is calculated for the bot duration.

Example: When you select the parameters in the following fields as:

- Group By or Sub By: Date
- Interval: Year
- Metric: Bot Duration
- Bot Duration Unit: Percentage (%)
- The percentage calculated for bot duration is:

$$(10000/1000ms * 60s * 60m * 24h * 365days) * 100 = \%$$

Note: The percentage calculation of the bot duration is available in all the widgets, except datatable and maps.

- **Top Error Messages:** Provides information about the error messages for any bot failure and the frequency of occurrence.

Business dashboard

The Bot Insight Business dashboard provides information about the Bot Insight data and statistics based on bot performance. You can use this information to enhance your productivity and take measures based on real-time information for RPA deployments.

The Business dashboard provides visual insight into the various business aspects of the bots. From this dashboard, you can access both the Default and Custom dashboards.

Bot Insight automatically creates the Default dashboard based on the variables that are used in the bot. You can use the **Save As** function to save the Default dashboard as a Custom dashboard. You can also add widgets from the **Visualizations** menu to your custom dashboards.

Using widgets

In the Custom dashboard, Bot Insight enables you to export data from a dashboard widget to CSV files.

Exporting data from a dashboard widget

You can perform the following actions in the Business dashboard:

- Enter the name of the dashboard in the **Search** text box to access a dashboard.
- Click the **Favorite** tab to bookmark your dashboard.
- Double-click the **Favorite** menu to remove bookmarks.

The dashboard displays the following bot information:

- **Bot Name:** Displays the name of bots that are associated with the business dashboards.
- **Total Views:** Displays the number of users who viewed a dashboard.

- **Last Refreshed:** Displays the time and date on which a particular dashboard was last refreshed.
- **Modified By:** Displays the name of the user who had last modified the dashboard.

You can click the arrow next to the Business dashboard tabs to organize the dashboards to your requirements.

In the **Dashboard Name** tab, select the dashboard that you want to access to view the dashboard. You can also enter the name of the dashboard in the **Search** text box to access the dashboard directly.

Click **Rank** in the **Distinct Count** row to view the rank of each variable. You can view the string data type values that are logged by a variable for the maximum or minimum number of times. This further enhances your ability to verify that the data is logged correctly in the bot.

Viewing ranks of string datatype values

The Business dashboard widgets displays the following information:

- The total number of variables
- The comparison between number variables and transaction status
- The comparison between number variable distribution and transaction status
- A bar chart representing the distribution between the number variables and string variables
- A pie chart representing the relationship between variables in numbers and strings

The Profile dashboard displays bot variables and the transaction data. The Task Name table displays the variable name, display name, data type, inclusion details, maximum, minimum, average, sum, distinct count for the date, string, and number variables.

The Transaction Data table displays the variable name, display name, data type, inclusion details, minimum, maximum, average, sum, and distinct count metrics for the following parameters:

- **Machine Name**
- **Transaction Name**
- **Transaction Start Time**
- **Transaction End Time**
- **Total Transaction Duration** (Start Time - End Time)
- **Transaction Status** (In Progress or Completed)
- **User Name** (User who runs the bot)

You can use the **Preview Data** option to view the total number of records maintained for each variable. When you create and run a bot with multiple **Transaction Blocks** with **Analyze**, **Open**, or **Close** commands, all the tagged business variables are displayed in the **Transaction Names** menu.

You can customize the widgets in the Business dashboard. You can perform the following functions:

- *Working with Bot Insight dashboards*
- *Comparing dashboards*
- *Sharing a dashboard*
- *Taking a screenshot of a dashboard*
- *Downloading a PDF file from a dashboard*

Document Workspace dashboard

The Document Workspace dashboards provide visualizations of learning instance performance and quality metrics as well as validation operations metrics.

Users with access to Document Automation can view and customize the Document Workspace dashboard without additional permissions.

The Document Workspace dashboard contains eight widgets, which contain visualizations of learning instance data. The widgets are customizable:

- You can reposition a widget by dragging and dropping it into a new location.
- You can apply filters, such as by specific learning instance or time frame. [Adding a dashboard filter](#)
- You can click a data point in a widget to "drill down" or filter the metrics in that widget. See the following video: <https://aa2019packagesdkfordocumentation.s3.us-west-2.amazonaws.com/drill-down-feature.mp4>

Document Workspace widgets

Widget	Description
Accuracy % statistics for document fields	A horizontal stacked bar chart that shows the straight-through processing percentage for each field in the learning instances
Extraction time per documents	A horizontal stacked bar chart that shows the average extraction time per learning instance in milliseconds
Number of uploaded documents	A line chart that tracks the total number of files uploaded each day
Number of uploaded pages	A line chart that tracks the total number of pages uploaded each day
STP% over learning instance name	A horizontal bar chart that shows the straight-through processing percentage for each learning instance
STP% over timeline	A line chart that tracks the straight-through processing percentage for all the learning instances by day
Validator performance by # of documents validated	A horizontal stacked bar chart that shows the number of documents each Validator user validated per day

Dashboard filters

Use the following dashboard filters to customize the metrics included in the dashboard:

- Learning Instance Name

Note: By default, both public and private learning instances are included in the dashboard

- Document Type
 - Page Count
 - Created On
-

Note: When you set a filter, it is applied to the entire dashboard. To apply a filter to a specific widget, open the **Widgets** menu and select which widgets to apply the filter:

You can download the data available in the dashboard as a PDF file.

[Taking a screenshot of a dashboard](#)

You can take a screenshot of the data available in the dashboard.

AARI dashboard

Use the AARI dashboard in Bot Insight to view various widgets that provide information about requests created from published processes in Automation Anywhere Robotic Interface (AARI).

Overview

The dashboard provides statistics and shows information about created requests for each process, which can vary from a simple summary to a complex cross-departmental view. You can use this real-time information to make process-related operational decisions. For example, consider a scenario where a manager can get a high-level activity overview of completed and pending tasks in the payroll process, which can then help the manager take necessary actions about the process.

From the AARI dashboard, you can access both the Default and Custom dashboards. Bot Insight automatically creates the Default dashboard from the variables used in the process. You can use save the Default dashboard as a Custom dashboard if required. You can also add widgets from the visualizations menu to your custom dashboards.

Based on RBAC, the following users have access to view the data on the dashboard:

- **AAE_Robotic_Interface_Admin** can view all data inside AARI on the web interface across all teams.
- **AAE_Robotic_Interface_Manager** can view all data inside AARI on the web interface for their own teams.

What you can view in AARI dashboard

The dashboard helps you to visualize and track the number of requests that are open, completed, canceled, or failed.

The dashboard also provides the following capabilities:

- **Heat map chart:** Visualize data about the percentage of request created for each process for a day. You can specify the dates by function (day) to get specific information using the following criteria:
 - Group1: created date (interval: day)
 - Group 2: process name
 - Metric: request created in percentage (%) for each process
- **Request activity history:** This table provides the execution history of the processes deployed on each Bot Runner machine. It includes information such as the following:
 - Process name
 - Username
 - Request details such as the status, ID, end time and start time, duration
 - Total human and bot duration
 - Total human and bot tasks
- **Stacked bar chart:** Analyze the average duration taken by each process for human and bot tasks. For example, consider that there are two processes named API Test-Form 1 and API Test-Form 2 in the bot

task type. For each process, the chart shows the average time (in seconds) taken for its execution. You can view and analyze this information using the following criteria:

- Group 1: task type (human and bot)
- Group 2: process name
- Metric: duration (average)

Editing a data profile

You can modify the data profile of both the Default and Custom Business dashboards without modifying the bots.

You can edit the data profile and regenerate the dashboard based on the new data profile. You can edit the display name of a variable, change its data type, and exclude it from the dashboard.

Bot Insight provides smart data profiling for information about countries, states, and zip or postal codes. Bot Insight analyzes the information provided in the variables and automatically identifies the information as:

- Country (country code or country name)
- State (state code or state name)
- Zip code (five-digit zip code)

You can edit the data profile to convert the above parameters from numeric format to string format (country and state) based on your requirements. You can convert the zip code to either string or numeric format, and use the information to create widgets (world and US map widgets) in the Bot Insight dashboard.

1. Open the Bot Insight dashboard.
2. Click **Profile**.
The **Profile** window appears, displaying all the variables that you have tagged during the bot creation.
3. Click **EDIT**.
4. Specify a new name for a variable in the **Display Name** field.
5. Select an option from the **Datatype** drop-down list to specify a new data type for a variable.
You can change the datatype of a numeric variable to string, string to country, state, and zip code.

Note: Changes to the **Data Type** parameter cannot be reverted.

6. Clear the **Inclusion** check box to exclude the variable from the dashboard. Select **Inclusion** to include a variable from the dashboard and configure how the initial SMART dashboard is generated.
You can view the minimum, maximum, average, sum, and last value for the numeric values, but not for the string and timestamp variable types.
7. Click **Save and Generate Dashboard** to save the changes and generate the dashboard with the updated value.

Bot Insight dashboard filter

The Bot Insight dashboard filter enables you to apply filters across your dashboards to display the filtered data. You can save and publish the custom dashboards with preset filters.

Filters in the Bot Insight dashboard enables you to choose different views of the data. You can apply and save filters in a dashboard to preserve the filtered view. The filtered view displays the same view the next time you view the dashboard.

Dashboard filters enables different combinations of data in a single dashboard. The filter eliminates the need for separate dashboards for different users. A single-filtered dashboard allows you to serve data requirements for a wide range of users.

You can access the dashboard filter from both the Operations and Business dashboards. You can click each item in the filter list to view the parameters. You can search for a specific parameter in the **Search Automation Name** field in the **All** tab. You can select parameters based on whether to include or exclude them in the filter. The selected parameters appear in the **Selected** tab.

When you apply a specific filter, the visual indicator in the dashboard displays the name of the applied active filter. You can delete a dashboard filter by clicking the delete icon. When you publish a custom dashboard with the applied the dashboard-level filters, the published dashboard contains the same filters. You can click **Widgets** in the widget window to apply dashboard widgets.

The Bot Insight dashboard provides the following filters:

- **Attributes:** This filter enables you to include or exclude specific parameters of a given attribute. This can be the bot name, device name, or user name.

For example, you can use the parameters:

- **Model Version** to differentiate the payload and to determine if an upgrade is required in the dashboard. You can also use it as a filter so that the dashboard works correctly even with different job execution pay loads.
- **Job type** to identify the type of task such as TASK(Bot Run), WORKFLOW, WORKORDER, WLM_TASK
- **Automation Name** to provide a name when running or scheduling the bot
- **Object Name** to identify the name of the entity for which the audit action is recorded. For example, to identify the username when the user is edited or created or the bot name when the bot is edited or created.
- **Numeric:** This filter enables you to select a specific duration for which you can get the numerical statistics of the bot. For example, this can be the **totalLines** that is processed by the bot, or the duration during which the bot was active.
- **Time:** This filter enables you to select a single date, or a range of dates to analyze the variables that are categorized under time and date. This can be the bot start time or end time.

Related concepts

[Operations dashboard](#)

The Bot Insight Operations dashboard provides information about bots that are deployed on different Bot Runner machines and bot statistics based on performance. You can use this information to enhance productivity and take measures based on real-time information for RPA deployments.

Adding a dashboard filter

To create a dashboard filter, select a field containing the information type you want to filter and define the return of the data. The filtered view is preserved so that the same view is displayed the next time you view the dashboard.

1. Open the dashboard to which you want to add a filter.
2. Select the parameter based on your requirements in the **Attributes** tab, .
The parameter window appears.
 - a) Enter the name of the variable in the **Search** field.
The variable appears in the **All** tab. Select the variable that you want to add in the filter. The selected variable appears in the **Selected** tab.
 - b) Choose one of the following options:
 - Click **Include** to include the variable in the dashboard filter.

- Click **Exclude** to exclude the variable in the dashboard filter.

c) Click **Apply**.

The **Attributes** filter is added to the dashboard.

3. Select the parameter in the **Numeric** tab.
4. Perform these steps in the selected parameter window:
 - a) Select the condition that you want to specify in the filter.
 - b) Enter the minimum and the maximum values.
 - c) Click **Apply**.

The **Numeric** filter is added to the dashboard.

5. Select the parameter based on your requirement in the **Time** tab.
6. Perform these steps in the selected parameter window:
 - a) Select a specific date, or a range of dates.
 - b) Click **Apply**.

The **Time** filter is added to the dashboard.

Related reference

[Customizing a dashboard](#)

Log in to Bot Insight with the `AAE_Bot_Insight_Expert` role to customize the information displayed in the system-generated dashboard to make it more relevant for an analytics consumer.

Working with Bot Insight dashboards

You can save or delete a Bot Insight dashboard when required. You can also delete a user-created dashboard.

When you delete a dashboard, it does not impact the data associated with that dashboard. You can delete dashboards that are available in the **Analyze** and **Configure** tabs of the Bot Insight window. The dashboards available in the **Analyze** tab are the published dashboards. Therefore, if you delete a dashboard from the **Analyze** tab, it will no longer be available for other users.

- Save a dashboard:
 - a) Open the dashboard that you want to save.
 - b) From the **Actions** menu, select **Save as**.
The **Save Dashboard** window appears.
 - c) In the **Dashboard Name** field, enter the name for the dashboard.
 - d) In the **Dashboard Description** field, enter the description of the dashboard.
 - e) Click **Save**.
Click **Save As** to save a default dashboard as a customized dashboard.
- Open the dashboard you want to delete.
 - a) Click **Delete** on the toolbar.
 - b) Click **Okay**.

Comparing dashboards

You can compare dashboards that belong to two separate processes, or the same process with different filters. The dashboards selected for comparison appears as a side-by-side view to enable you to obtain better insights.

- Compare dashboards:
 - a) Open the dashboard that you want to compare.
 - b) Navigate to **Actions > Compare** in the **Bots Dashboard**.
Your dashboard is now in compare mode. The dashboard you have opened appears in both the **Left View** and **Right View**. You can apply widget filters to your dashboard at any time.
- Apply widgets to your dashboards:
 - a) Click the **Filter** option from your dashboards, represented by the three dots in the corner.
The **Filter** window now appears and shows the available widgets.

Note: The **Filter** option next to the **Close** option accesses the same **Filter** window. You can also expand or minimize the **Filter** window.

- b) Select the **Left View** or **Right View**.
- c) Select the **Attributes**, **Numeric**, or **Time** widgets that you want to apply.
- d) Optional: Click **Clear All** to reset all your widget selections.
- e) Click **Apply** to confirm.
You can now compare your dashboard with widgets.

Customizing a dashboard

Log in to Bot Insight with the `AAE_Bot Insight Expert` role to customize the information displayed in the system-generated dashboard to make it more relevant for an analytics consumer.

To make changes in a Bot Insight dashboard, create a copy of the dashboard, and then update the copy.

After you create customized dashboards for a bot, you can make changes to the tagged variables. You can delete and add variables based on your requirements. By default, the standard dashboard always displays the latest data profile. We recommend you use the system-generated standard dashboard, and then create customized dashboards from it. Data profile updates are highlighted with a red dot in the following scenarios:

- When there are data profile updates.
 - The variables that are newly added display the message `NEW`.
 - The variables that are deleted display the message `DELETED`.
- When the customized dashboard data profile does not match that of the standard dashboard.

Related tasks

[Editing a data profile](#)

You can modify the data profile of both the Default and Custom Business dashboards without modifying the bots.

Viewing ranks of string datatype values

Among string datatype values, you can view the ranking based on the maximum and minimum number of times each string datatype value has been used, as logged by a variable. With this information, you can better verify whether the data logged in the bot is correct.

1. Open the dashboard for which you want to edit the data profile.
2. Click the **Profile** tab.
3. Click **Rank** within the **Distinct Count** column.

The **Distinct Count** column displays the number of unique values logged by a variable.

Note: The **Rank** option is only available for the variables that log values of string datatype. A message appears displaying the top five values that are logged for the maximum number of times in the variable.

4. Select **Bottom** from the list to display the five values that are logged the least number of times in the variable.
5. Select an option from the list to display five or ten values in the message box.

Previewing data

You can view all the variable data associated with a task using the **Preview Data** option.

1. Open the dashboard for which you want to preview the data.
2. Click the **Data Profile** tab.
3. Click the **Preview data** option.

A new window appears displaying all the variable data associated with that task.

Verifying data populated in a custom dashboard

After you create a custom dashboard that contains new widgets or customized widgets from the system-generated dashboards, you can verify the data that is populated in the dashboard.

1. Open the task for which you want to verify the data in Bot Insight.
2. Click **Run** on the toolbar.
3. Click the **ANALYZE** tab.
The system-generated dashboard for the task appears.
4. Click the **Analyze** tab in the Bot Insight window and search for the customized dashboard for which you want to verify the data.
5. Select the dashboard from the search results.
The dashboard appears.
6. Click the **Data Profile** tab and verify the data for the dashboard.

Publishing a business analytics dashboard

Bot Insight enables you to publish a business analytics dashboard that is generated for a task. You can publish both the Custom and Default Business dashboards.

Before you publish a dashboard, ensure that the particular bot resides in the Public folder in the Control Room.

1. Open the dashboard that you want to publish.

2. Customize the dashboard based on your requirements and verify the content and presentation formats.
3. Click **Publish** on the toolbar.
4. Specify a name for the dashboard, and then click **Okay**.
The dashboard is now published and available to display the production data generated by the task. The dashboard updates the data each time a task runs in the production environment from the Control Room on a regular basis.
In the Control Room, ensure that you deploy the bot in the Bot Runner device so that the published dashboards are populated with data.

Related tasks

Import bots

You can import bots with their dependencies from one Control Room to another. The source environment can be Automation 360 Control Room, Enterprise 11, or Enterprise 10 Control Room instance.

Save a published dashboard

You can publish a Bot Insight business analytics dashboard that is generated for a task. You can also save a copy of the published dashboard when required.

Ensure you have the **AAE_Bot Insight Admin** or **AAE_Bot Insight Expert** roles assigned to you.

1. Open the Bot Insight Window.
2. Click the **Business** tab and search for the dashboard for which you want to save a copy of custom production dashboard.
3. Select the dashboard from the search results.
The selected dashboard appears
4. Select the **SaveAs** from the **Action** menu to save the default **Production** dashboard as a **Custom Production** dashboard.
5. In the **Save Dashboard** window, specify a name for the dashboard and click **Okay**.
You can add widgets from the **Visualizations** menu to your custom production dashboard.
You can add, delete, change visualization, apply filters, and so on to customize the dashboard.

Delete a published dashboard

You can publish a Bot Insight business analytics dashboard that is generated for a task. You can also delete a published dashboard when it is not longer required.

Ensure you have the **AAE_Bot Insight Admin** or **AAE_Bot Insight Expert** roles assigned to you.

You cannot delete a default **Production** dashboard if child (custom production dashboards) are associated with it. You must first delete the custom production dashboard and then delete the default **Production** dashboard. However, you can delete a **Custom Production** dashboard.

1. Open the Bot Insight Window
2. Click the **Business** tab and search for the dashboard you want to delete.
3. Click **Delete** from the **Action** menu.
4. Click **Okay** to confirm the deletion.

Reviewing data in a published dashboard

You can review the data available in a published dashboard.

1. Open the Bot Insight window.
2. Search for the dashboard for which you want to view the data.
3. Select the dashboard from the search results.

The selected dashboard appears.

4. Review the data available in the dashboard.

The dashboard reflects the data processed by the task in the production environment.

5. Export the entire dashboard in PDF or PNG format for offline consumption and review.

Sharing a dashboard

You can share the link to view a dashboard through email using the **Share via email** option.

1. Open the dashboard that you want to share.

2. Click **Share via email** on the toolbar.

The email client configured on your system appears. The email client contains a link to access the dashboard.

3. Specify the email address of the recipients and send the email.

Downloading a PDF file from a dashboard

You can download the data available in the dashboard as a PDF file.

1. Open the Bot Insight window.

2. Search for the specific dashboard.

3. Select the dashboard from the search results.

The selected dashboard appears.

4. Review the data available in the dashboard.

5. In the **Actions** menu, click **Download PDF**.

6. In the **Download PDF** window, navigate to the location on your local disk drive.

7. Click **Save**.

Note: Due to a limitation within the third-party recharts library, you might observe labels overlapping issue with data in downloaded PDF.

Taking a screenshot of a dashboard

You can take a screenshot of the data available in the dashboard.

1. Open the Bot Insight window.

2. Search for the dashboard for which you want to view the data.

3. Select the dashboard from the search results.

The selected dashboard appears.

4. Review the data available in the dashboard.

5. In the **Actions** menu, click **Screenshot**.

6. In the **Download PDF** window, navigate to your local disk drive location.

7. Click **Save**.

Using Bot Insight

Use Automation Anywhere Bot Insight to track bot data for analytics.

Automation Anywhere bots are built, run, and monitored in the Control Room. Bot Insight accesses real-time business insights and digital workforce performance data to leverage content-level productivity data

from the bots that are deployed. Data is logged for business analytics who has Attended and Unattended Bot Runner license .

Log in to Automation Anywhere Control Room as an `AAE_Bot Insight Expert` or `AAE_Bot Insight Consumer` to interactively analyze bot data and enhance bot widgets.

In the Control Room, select the Bot Insight tab, to do the following tasks:

- **Interactively analyze the bot data** in the dashboards.
- **Refine and enhance widgets** in the Bot Insight dashboards *before they are published* for wider consumption and deployed to production.

Business analytics

Business analytics provide information about the transactional analytics for the data that is logged by the variable tagged in a task. The information provided can be about the total sales in a month, invoicing and payment trends, insight about new customers, or quote to order ratio.

When you tag variables for analytics in a task, and run the task, Bot Insight generates the analytics dashboard . By default, the generated dashboard has the same name as that of the task. You can customize the system generated dashboards based on your requirement.

Configuring a task for business analytics

To configure a business analytics automation task, enable analytics (using the **Analyze: Open** and **Analyze: Close** actions) and tag the variables that are of interest for data analysis.

To configure a task for business analytics in an existing bot:

1. Log in to the Control Room.

Note: Ensure that you have the Bot Creator license assigned to you.

2. In the **Automation** pane, select the folder that contains the task for which you want to enable analytics.

The **Actions** palette appears in the left-hand side. See [Actions palette for bot creation](#).

3. Build a bot.

For more information about building and editing a bot, see [Get started building bots](#).

4. Insert the **Analyze: Open** action at the beginning of the transaction.
5. Insert the **Analyze: Close** action at the end of the transaction.

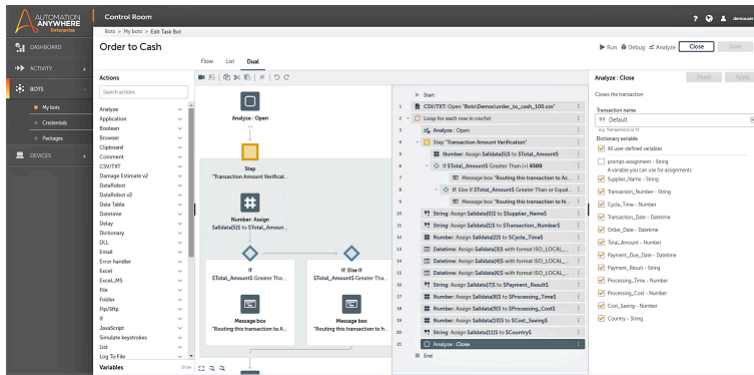

The **Analyze: Close** menu lists all the variables in the transaction. Select the variables that are tagged in the transaction to process business analytics.

Note: This feature enables you to deselect variables that might raise potential privacy concerns, such as social security numbers or bank account details.

6. Click **Apply**.
Click **Reset** to reset the variable selection.
7. Click **Save**.

8. Click **Run**.

The **Bot Run Successfully** message appears.

9. Click **Analyze**.

The Bot Insight window appears.

10. Select a bot from the **Select a Dashboard** drop-down list.

Click the arrow to view the list of bots.

Using widgets

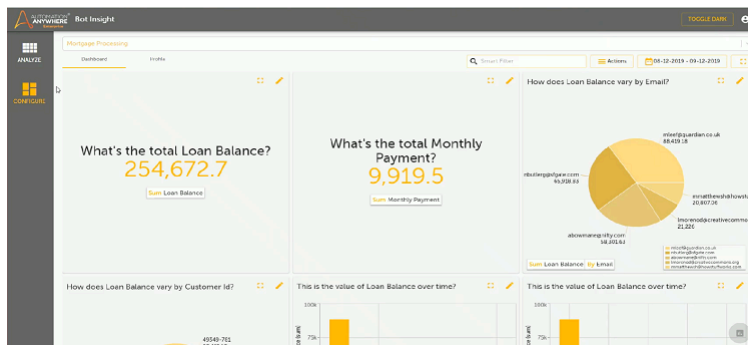

The Bot Insight dashboard provides a host of highly customizable widgets that you can use to gain insights for specific scenarios.

When you select a particular bot, the default widgets automatically appear in the **Dashboard** window. You can select the widgets and reposition them in the dashboard. To search for specific information, use the **Smart Filter** function. You can enter the search parameters in the **Smart Filter** field.

You can also use multiple filters to search for data the widgets should display. Enter the filters, search parameters, separated by a comma in the **Smart Filter** field. You can create, move, rename, and edit the widget properties in a dashboard, based on your requirements.

The available options are:

- Chart filters
- Chart style
- Metric-based filters
- Comparison metrics

You can group information by dates and use the **Date Interval** to view when a particular bot was active.

The following **Date** type options are available:

- **Hour**

- **Day**
- **Week**
- **Month**

Adding a dashboard widget

You can add custom widgets to the Bot Insight dashboard based on your requirements.

1. Open the dashboard.
2. Click the  icon.
The **Add Visualization** window appears.
3. Select a widget that you want to add in the dashboard. See [Bot Insight visualizations](#) .
The **Selected Chart** window appears.
4. **Optional:** Click the **Switch Widget** button to change widgets.
5. Click **Next**.
The **Construct Your Query** window appears.
6. Enter the query information to construct your dashboard. For reference to create a widget query, see [Configuring a Line Bar Chart query](#).
7. Click **Next**.
The **Ready to build** window appears.
8. Click **Confirm**.
The widget appears in the dashboard.

Bot Insight visualizations

The Bot Insight dashboards provide customizable widgets that you can use to gain insights for specific scenarios.

Bot Insight offers the following visualization widgets:

- **Gauge Chart**
- **KPI**
- **Vertical Bar Chart**
- **Line Bar Chart**
- **Clustered Line Bar Chart**
- **Horizontal Bar Chart**
- **Vertical Stacked Bar Chart**
- **Horizontal Stacked Bar Chart**
- **Vertical Clustered Bar Chart**
- **Horizontal Clustered Bar Chart**
- **Heat Map**
- **Pie Chart**
- **Donut Chart**
- **Line Chart**
- **Scatter Chart**
- **Bubble Chart**
- **Datatable Chart**
- **World Map**

- **US Map**

The **Pie Chart** widget enables you to visualize data in a circular statistical graphics that is divided into slices.

Note: Due to a limitation within the third-party recharts library, the data labels in a pie chart are overlapping if it contains many slices. As a result, the labels in a pie chart are not clear and are shown only when you hover over the slices.

The **Heat Map** widget enables you to visualize data as a heat map chart. You can specify the dates by function (day, week, month, or year) to drill down to specific information. This map displays all the possible available combinations of variable values in the X and Y axes. Blank heat map blocks appear if there the value attached to the variable is 0. The color of the heat map block depends on the value of the information displayed. A new window with all the relevant information appears when you hover your mouse over a particular heat map block.

The **Datatable Chart** widget enables you to view and analyze information about all the logged data in a tabular chart. You can select the attributes and metrics based on your requirement. All the available attributes and metrics are selected by default.

The **World Map** widget provides information about the data variables and enables you to drill down to specific information:

1. Country
2. State
3. Zip Code
4. Latitude
5. Longitude

The **US Map** widget provides the following information about the data variables and enables you to drill down to specific information:

1. Country
2. State
3. City
4. Zip Code

The **Line Bar Chart** and the **Clustered Line Bar Chart** widgets enable you to view and analyze information about your metrics and attributes. You can input two metrics and one attribute in **Line Bar Chart** widget, while in the **Clustered Line Bar Chart** widget, a **Sub group** option enables you to add one more attributes if necessary.

The widget displays a line bar graph aggregated by group values when only one attribute is selected or a clustered line bar graph aggregated by subgroup values when two attributes are selected. It displays group sectioning which forms multi-axes labels . You can use **Date** types as interval options, grouped by **Day**, **Week**, **Month**, **Quarter**, and **Year**, with the **Day** set as default.

[Configuring a Line Bar Chart query](#)

Related tasks

[Adding a dashboard widget](#)

You can add custom widgets to the Bot Insight dashboard based on your requirements.

Configuring a Line Bar Chart query

You can construct a custom query based on specific parameters to apply to your widget for line bar and clustered line bar charts.

After you are in the **Construct Your Query** window, follow these steps to select parameters to apply to your widget:

- Construct your query settings.

The query settings vary from widget to widget, but the selection process remains the same.

a) Enter the title of your widget in the **Chart Title** field.

b) Select a metric option in the **Metric** or **Select Metrics** field.

For **Line Bar Chart** and **Clustered Line Bar Chart**, the **Metric** field is renamed to **Y1 Axis** and **Y2 Axis**.

c) Select an aggregated value in the **Aggregated By** field.

For **Line Bar Chart** and **Clustered Line Bar Chart**, the **Aggregated By** field is renamed to **Y1 Aggregated By** and **Y2 Aggregated By** with the same options.

d) Select a value from the **Group By** or **Group 1** field.

e) Select a secondary value from the **Sub Group By** or **Group 2** field.

Note: The **Sub Group By** or **Group 2** field is not available in the **Line Bar Chart**. For the **Metric**, **Group By** and **Sub Group By** fields, the first value is shown as the default value.

f) Select a date value in the **Date Interval** field.

Note: This field appears when you select the Date Type variable in the **Group By** and **Sub Group By** fields.

- Construct your advanced query settings.

You can enable more options to any widgets that support advanced settings.

a) Click **Advanced Settings**.

The settings display the default values. You can change the value of the fields if required.

b) Select a limit value in the **Limit** or **Group Limit** field.

c) Select a sort value in the **Sort By** or **Group Sort By** field.

d) Select a sort order value in the **Sort Order** or **Group Sort Order** field.

e) Select a secondary limit value in the **Sub Group Limit** or **Group 2 Limit** field.

f) Select a secondary sort value in the **Sub Group Sort By** or **Group 2 Sort By** field.

g) Select a secondary sort order value in the **Sub Group Sort Order** or **Group 2 Sort Order** field.

Note: The **Sub Group Limit**, **Sub Group Sort By** and **Sub Group Sort Order** fields are not available in the Line Bar Chart.

Editing a dashboard widget

You can edit the dashboard widget properties based on your requirements.

You can resize and save the widgets in the Bot Insight dashboard based on your requirements. When you resize a dashboard widget, other widgets in the dashboard are automatically adjusted to fill in the available layout.

Note: Bot Insight allows you to resize widgets in the standard and the customized dashboards. However, it does not allow you to save the widgets after resizing in the standard dashboard.

1. Open the dashboard widget.
2. Click the **Edit** button.
The **Edit** window appears.
The **Edit** menu offers the following options:

Chart Title	Renames the chart
Metric	Changes the units
Aggregate By	Changes the aggregation method
Group By	Changes the parameters based on which the widgets are grouped together

3. Click the bottom of a widget to change the attribute of the chart displayed within the widget.
4. Click **Save As** to save the widget.

Drilling down information in dashboard widget

You can drill down information from a dashboard widget based on your requirement. Select the options available in the drop-down list to view specific information in the dashboard widgets.

To use the drill down function feature in the Bot Insight dashboard widget, do the following:

1. Open the dashboard and select the widget.
2. Right-click to view the **Drill Down** menu.
Drill Down menu sample for a mortgage analytics processing bot :

- **Gender**
- **Mortgage Type**
- **Customer ID**
- **Company Name**
- **Email**
- **Loan Due Date**
- **Loan Origin Date**

Note: Bot Insight dynamically generates the **Drill Down** menu options based on the variables you tag when creating the bot.

Renaming a dashboard widget

You can rename a dashboard widget based on your requirement. The default name of a dashboard widget is based on the type of information that the widget displays.

To rename a widget in the Bot Insight dashboard, do the following:

1. Open the dashboard for the widget to edit.
2. Rollover and click the **Edit** button.
The **Edit Chart** window appears.
3. In the **Chart Title** field, enter the name of the widget.
4. Click **Next**.
The **Ready to build! Click Finish** window appears.
5. Click **Finish**.
The **Widget Updated** message appears.

Exporting data from a dashboard widget

You can export data from the Bot Insight **Custom Business** dashboard widgets to CSV files based on the requirement.

1. Open the dashboard.
2. Identify the widget.
3. Click the **Actions** icon.
4. Click **Export**.
The CSV file is automatically saved in your local drive as `Chart name_summary_dd_mm_yyyy`.

Data connector for Power BI

The data connector for Power BI enables you to establish a secure connection to Power BI, and generate and visualize data analytics. You can connect to the Bot Insight APIs in Power BI and apply specific parameters for each of the APIs.

The connector transforms the Bot Insight API responses to data visualizations in Power BI. The data connector for Power BI enables you to perform the following functions in Power BI:

- Authenticate and connect to the Control Room.
- Connect to APIs.
- Generate API responses.
- Transform the API responses to create a data model.
- Create visuals, charts or graphs, to represent the data.
- Create reports.
- Share reports with other users on Power BI.

You can access the following APIs from Power BI:

- `getaudittrialdata`
- `getbotrundata`
- `gettaskvariableprofile`
- `gettasklogdata`

Note: Automation Anywhere Power BI connector is certified and available as part of the Microsoft Power BI Desktop August release. The connector is available in the **Other** section of the **Get Data** dialog box in Power BI.

To update your Power BI to the latest certified release version and use the connector plug-in, manually deploy the data connector in Power BI. This enables you to retrieve information from the Bot Insight API for data analytics.

Trouble: When you attempt to refresh the data in a Microsoft Excel worksheet, an authentication error can occur from multiple simultaneous attempts through open windows and tabs. To avoid this error, perform the following steps:

1. In the Power BI desktop application, navigate to **File > Options and settings > Options**.
 2. From the Current File section, select **Data Load**.
-

Note: Do not select **Data Load** from the Global section.

3. Disable the check box for **Enable parallel loading of tables**.
-

Related reference

[Bot Insight API](#)

Users with the `AAE_Bot_Insight_Admin` or `AAE_Admin` role and the `Bot_Insight` license can access the Bot Insight API to retrieve business and operations data.

Related information

[Microsoft Power BI](#)

Deploy Power BI connector

Deploy the data connector in Power BI to retrieve information from the Bot Insight API to enable data analytics.

The connector can now be accessed directly from the Power BI desktop application. Ensure you meet the following prerequisites.

- You should be using Power BI desktop version 2.92.943.0 or above.
- You know your Automation Anywhere Control Room version.
- You have your Control Room credentials.
- You have your Control Room URL.

The following steps describe how to deploy the connector.

1. From your Power BI desktop application, select **Get data**.
2. In the search field, type and select `Automation Anywhere`.
3. Click **Connect**.
4. From the Login dialog box, enter your Control Room version and URL.
5. Enter your Control Room credentials.
6. Click **Connect**.

[Configure Power BI connector](#)

Configure Power BI connector

Configure the data connector in Power BI to retrieve information from the Bot Insight API to enable data analytics.

Ensure that you have the `Bot Insight Admin`, or `AAE_Admin` role assigned to you in the Control Room.

Notice: A `Bot Creator` license is required to generate a default dashboard with **tasklogdata** for Power BI.

Note: The Power BI Connector is supported with Database Authenticated Control Room and Active Directory authentication.

1. Log in to the Power BI.
2. Click **Get Data**.
The list of all the Power BI certified connectors appears.

For information about how to access non-certified custom connectors, see [Connector extensibility in Power BI](#).
3. Select Automation Anywhere and click **Connect**.
4. In the **Automation Anywhere - Login** window, enter the following information:
 - a) In the **Control Room Version** drop-down menu, select the version of the Control Room.
 - b) In the **Control Room Host** field, enter the IP address or the host name of the Control Room server.
 - c) In the **Bot Insight Host** field, enter the IP address or host name of the Bot Insight server.
5. Click **OK**.
6. In the **Automation Anywhere Login** window, enter your Bot Insight user name and password.

To provide the credentials for Active Directory authentication, you must enter the domain name delimited by a double backslash (\\) along with the user name in the **User name** field. For example:
`domain name\\user name`.
7. Click **Connect**.
The Bot Insight APIs are authenticated and the authorization tokens are generated. The Bot Insight APIs are loaded dynamically from Swagger, along with the applicable request parameters.
8. Select the required Bot Insight API from the **Navigator** menu and enter the information in the respective fields.
9. Click **Load**.
The API retrieves specific information from the server.

To learn how to retrieve information from Bot Insight APIs in Power BI, see [Bot Insight API](#).
10. Click **Transform Data** to convert the structured JSON response to a visual data model.

Related information

[Collaborate, share, and integrate across products with Power BI](#)

Example: Retrieve information in Power BI using business information API

The Power BI connector enables you to access the Bot Insight API from Power BI. This example task shows you how to retrieve information from the Bot Insight API and build data visualizations in Power BI.

1. Open Power BI.
2. Open the **Navigator** window, and log in to the Control Room by entering the credentials.
3. In the **Display Options** menu, select **fx Business Information**.
The **API** window appears.
4. In the **botName** field, enter the name of the bot, or the task for which you want to visualize the analytical data.
To enter multiple bot names, separate each name with a comma.
For example, *SalesAPAC,SalesEMEA,SalesUS*.
5. In the **pageNo** field, enter the offset value for the rows or records that you want to retrieve.
 - If page = 0, and limit =1000, then rows 0 -1000 will be retrieved.
 - If page = 1, and limit =1000, then rows 1001 -2000 will be retrieved.
6. Optional: In the **fromDate** field, enter the date from when you want to retrieve the information.
Format: *yyyy-mm-dd*, or *yyyy-mm-ddTh:m:s.msZ* (2020-02-20T12:45:23.000z)

- Note:** If you do not enter a date, the API will return all available data.

7. Optional: In the **toDate** field, enter the date till when you want to retrieve the information.
Format: *yyyy-mm-dd*, or *yyyy-mm-ddTh:m:s.msZ* (2020-03-21T15:45:32.000z)

- Note:** If you do not enter a date, the API defaults to the current date.

8. In the **limit** field, enter the number of rows or records you want to retrieve.
9. Click **Apply**.
Power BI displays the data visualization.

Configure Tableau web data connector in Bot Insight

The web data connector in Tableau enables you to establish a secure connection with Automation 360 and to extract, visualize, and analyze data from Bot Insight.

- Ensure that your user name is registered in the Control Room and that you have **Bot Insight Admin** or the **AAE_Admin** role assigned to you.
- Ensure you have access to the desktop or public version of Tableau software.

The Web data connector in Tableau enables you to perform the following functions in Tableau:

- Authenticate and connect to the Control Room.
- Connect to Bot Insight APIs for business and operational information.
- Use business and operational information to create a data model.
- Create charts or graphs to represent the data.
- Create reports and share them with other users on Tableau.

1. Open Tableau.

2. Select **Web Data connector** from the **Connect** option in **Data** tab.
3. In the **Web Data Connector** window, enter your Automation Anywhere URL in web data connector field: <control room url>/tableau/Login.html
4. In the **Automation Anywhere - Login** window, enter the following information:
 - a) In the **Control Room Version** drop-down menu, select the version of the Control Room.
 - b) In the **Control Room URL** field, enter the URL or the host name of the Control Room.
 - c) In **User Name** and **Password** field, enter your Bot Insight user name and password.
5. Click **Submit** to connect to Bot Insight APIs.
6. Select either **Business Information** or **Operational Information** in the Bot Insight window. If you are an **AAE_Admin**, you can choose between Audit APIs and Operations APIs.
7. Click **Get Data**.
Bot Insight API retrieves information from the server.
8. Click **Update Now** to gather all the data from Bot Insight in Tableau.
You can use the retrieved data from Bot Insight for data visualizations and analysis in Tableau.

Control Room APIs

The Automation Anywhere Control Room provides APIs that allow you to customize the way that you (and your bots) interact with Automation Anywhere. Control Room APIs allows you to perform tasks such as manage bot deployments, create and manage credentials in the Credential Vault, create and manage user accounts and roles, and create and manage queues.

Getting started with Control Room APIs

The Control Room APIs are built on HTTP and uses REST APIs with methods GET, POST, PUT, and DELETE. All requests must include an X-Authorization header with the JSON authentication token.

Note: You can view the in the , but API functionality is limited. You need a licensed Edition to access the full functionality of the APIs.

Watch the following video to learn how to test Control Room APIs in Swagger and Postman:

Control Room support for several API clients, allowing you to explore the Control Room APIs. Download and install *Postman*, then click the <https://www.postman.com/collections/bb5cd3541d29e192cd43> to download the Control Room APIs collection. . For more detailed documentation of each APIs, visit the links below.

Bot Agent API: Auto registration

Automatically register and connect your device to a Control Room by using the `Auto registration` API.

This API uses the generic registration token from the `auto-registration.properties` file to register the device in the specified Control Room URL. You cannot autoregister the device if the Control Room URL is not available in the `auto-registration.properties` file. The `auto-registration.properties` file must be available on your local system, and you must not delete the file after the registration is complete.

Note: To register the device from the command line or API, you must set the `AA_DELAY_REGISTRATION_UNTIL_LOGIN` MSI parameter.

Request

```
POST http://127.0.0.1:22113/v1/registration/auto
```

Request body:

```
{
  "url": "https://{controlroom url}",
  "userName": "dpcreator"
}
```

Request parameters

Parameter	Type	Required	Description
url	String	Yes	Specify the Control Room URL to autoregister the device.
userName	String	No	Specify the Control Room user to associate the device as the default device.

Response

```
{
  "result": "REGISTERED",
  "deviceId": "11",
  "crUrl": "control_room_url",
  "userName": "dpcreator",
  "installationType": "SYSTEM_WIDE",
  "crSwitchAllowed": "false",
}
```

Response parameters

Parameter	Type	Description
result	String	Status of the device registration.
deviceId	Number	Unique ID of the device the Bot Agent is installed on.
crUrl	String	The Control Room URL where the device is autoregistered.
userName	String	The username for which the device is associated as default device.
installationType	String	The type of installation that is performed.
crSwitchAllowed	String	Indicates whether the device can be registered on a different Control Room.

The REST API responds to each request with an HTTP response code. For response codes, see [API response codes](#).

Configure the Control Room

Before you start creating workflows for bot deployment and workload management using Control Room APIs, ensure you complete specific prerequisites and steps in the Control Room.

Ensure you have following licenses and permissions:

- One or more Bot Creator and unattended Bot Runner licenses.
- Control Room admin credentials to view, create, and configure users, roles, and device pools.

- The **Create device pools** feature permission or the **AAE_Pool Admin** role must be assigned to you.

Follow these steps to configure your Control Room with users, roles, and bots.

1. Log in to the Control Room as an admin.
2. Create a Control Room user.
Ensure that the user is assigned the **AAE_BASIC** role.
Create a user
3. Create a custom role to map the users you created to Bot Runners and `Bot` folders.
 - a) In the **Features** tab, ensure you select these permissions: **View my Scheduled Bots**, **Schedule my bots to run**, **Run my Bots**, **View my Bots**, and **Generate my API Key**.
 - b) In the **Automation** tab, expand the **Bots** folder and select the root folder or subfolders you want to provide access for use. Ensure you select these permissions: **Run and schedule** and **View content**.
 - c) In the **Run as** tab, select one or more Bot Runners from the list of **Available bot runners**.
 - d) In the **Users** tab, select the new user created in Step 1 to assign the custom role to this new user.
4. Create a new device pool.
In the **Consumers** tab, ensure you select the custom role you created in Step 3.
Create device pools
5. Log in to the Control Room as a Bot Creator and create bots to automate routine business tasks.
Build a Go be Great bot
Ensure you check in the bots in the `Bot` folder or folders selected when creating the custom role (Step 3). *Check in a bot*

Authentication API

Use the Authentication API to generate, refresh, and manage the JSON Web Tokens (JWTs) that are required for authentication and authorization in order to use the Control Room APIs.

Note: You can view the in the , but API functionality is limited. You need a licensed Edition to access the full functionality of the APIs.

Set up authentication or authorization for your application

1. Generate a token with one of the following endpoints:

Note: `apiKey` or `password` is used to generate a valid token. Both (`apiKey` and `password`) cannot be used together in a request body.

- *Authenticate (username and password)*

If you are trying out the Control Room APIs in Swagger or another REST client, use this authentication method.

- *Authenticate (username and apiKey)*

Use this authentication method to generate the token without the need for the user's password, such as for organizations that use single sign-on (SSO).

Note: Tokens have a default timeout of 20 minutes. Do not use an expired token for your API requests. Using an expired token will invalidate the current valid token.

- **Simple and Protected Negotiation GSSAPI Mechanism (SPNEGO)**

You can use SPNEGO if your Control Room is configured with the Active Directory (AD) mode of authentication and it is Kerberos-enabled.

In a Control Room configured with SPNEGO, you can use the following URL to generate a token:
`https://<your_control_room_url>/v1/authentication/SPNEGO`

2. *Validate token*

3. *Refresh token*

4. *Expire token*

Authenticate (username and password)

Use this API to authenticate access to your Control Room with a valid `username` and `password`. A successfully completed response generates a JSON Web Token. By default, a token is valid for 20 minutes.

Request

```
POST http://{{ControlRoomURL}}/v1/authentication
```

Request body:

```
{
  "username": "jdoe",
  "password": "mypassword@123"
}
```

Request body to generate Multi-login token:

```
{
  "username": "jdoe",
  "password": "mypassword@123",
  "multipleLogin": true
}
```

```
}

```

Note: `apiKey` or `password` is used to generate a valid token. Both (`apiKey` and `password`) cannot be used together in a request body.

Request Parameters

Parameter	Type	Description
<code>username</code>	String	Enter your user name.
<code>password</code>	String	Enter your password.
<code>multipleLogin</code>	Boolean	<p>Allow or disallow multiple login. For more information on multi-login, see Multi-login user.</p> <ul style="list-style-type: none"> <code>true</code> - Allows multiple login <code>false</code> - Disallows multiple login <p>Note: If this value is set to <code>true</code>, you will be allowed multiple API sessions.</p>

Response

```
{
  "token": "eyJhbGciOiJSUzUxMiJ9.eyJzdWIiOiIxIiwiaWF0Ij0iY2xpZW50VHlwZSI6IldFQmI6ImxpY2Vuc2VzIjpbY2t1lCBg_cDgBwj5FvaBt9u5xKu5W5j3Nur6x3PF62NeB3ZIdxiUPaFBU0Br84mPJMD4_EpwBfbsVOMH6ngiLtJYI0V-U1Iw0JHiX2-Ug",

```

Response Parameters

Parameter	Type	Description
token	String	Generated access token that acts as a session ID that your application will use for making requests. This token is equivalent to the user credentials and must be protected. Note: If <i>multipleLogin</i> is set to <i>true</i> , you will be able to use this token for multiple API sessions.

Parameter	Type	Description
user	Object	<p>The user object returned with all the details of the user.</p> <ul style="list-style-type: none"> • id - Id of the user. • email - Email id of the user. • username - User name of the user. • domain - Domain logged in to. • firstname - First name of the user. • lastname - Last name of the user. • roles - Roles assigned to the user. • sysAssignedRoles - System assigned roles. • permissions - Permissions assigned to the user. • licenseFeatures - License assigned to the user.

Insert the token in the request header of subsequent API requests.

Note: For an Control Room that is deployed on Cloud and has SAML authentication enabled, generate the web token with your `username` and `apiKey`.

Authenticate (username and apiKey)

Note: You can view the in the , but API functionality is limited. You need a licensed Edition to access the full functionality of the APIs.

The REST API responds to each request with an HTTP response code. For response codes, see [API response codes](#).

Related concepts

[Authentication API](#)

Use the Authentication API to generate, refresh, and manage the JSON Web Tokens (JWTs) that are required for authentication and authorization in order to use the Control Room APIs.

Authenticate (username and apiKey)

Use this API to authenticate access to a Control Room with the `username` and `apiKey`. A successful response generates a JSON Web Token. A generated token is valid for 20 minutes. You can generate the token without the need for the user's password, such as for organizations that use single sign-on (SSO).

To generate the token, you require the following:

- A custom role with the Generate API-Key permission

- Valid username and API-key to the Control Room. The API-Key is a 40-character string generated in the Control Room.

Create and assign API key generation role

Request

```
POST http://{{ControlRoomURL}}/v1/authentication
```

Request body:

```
{
  "username": "jdoe",
  "apiKey": "Vie;Z:IvtAhY0\\1RAD[SWl{NU7baRLYEeIYUJSKO"
}
```

Note: With `apiKey` you will be generating a multi session token. `multipleLogin` parameter is not applicable while you use `apiKey` to login.

Note: `apiKey` or `password` is used to generate a valid token. Both (`apiKey` and `password`) cannot be used together in a request body.

Request Parameters

Parameter	Type	Description
username	String	Enter your user name.
apikey	String	Enter your apikey. Note: With .24 or previous versions, you must replace any escape character <code>'\'</code> with <code>'\\'</code> in the API key. With .25 or later versions, the API key will no longer have any escape characters(<code>'\'</code>).

Response

```

Response Parameters

Parameter	Type	Description
token	String	Generated access token that acts as a session ID that your application will use for making requests. This token is equivalent to the user credentials and must be protected.
user	Object	The user object returned with all the details of the user. <ul style="list-style-type: none"> • id - Id of the user. • email - Email id of the user. • username - User name of the user. • domain - Domain logged in to. • firstname - First name of the user. • lastname - Last name of the user. • roles - Roles assigned to the user. • sysAssignedRoles - System assigned roles. • permissions - Permissions assigned to the user. • licenseFeatures - License assigned to the user.

Insert the token in the request header of subsequent API requests.

Related concepts

[Authentication API](#)

Use the Authentication API to generate, refresh, and manage the JSON Web Tokens (JWTs) that are required for authentication and authorization in order to use the Control Room APIs.

Related reference

[Authenticate \(username and password\)](#)

Use this API to authenticate access to your Control Room with a valid `username` and `password`. A successfully completed response generates a JSON Web Token. By default, a token is valid for 20 minutes.

Create and assign API key generation role

As an Administrator, you can create a custom role to generate an API key and assign that custom role to users. By default, the `Generate API-Key` parameter is not enabled for any of the System-created roles.

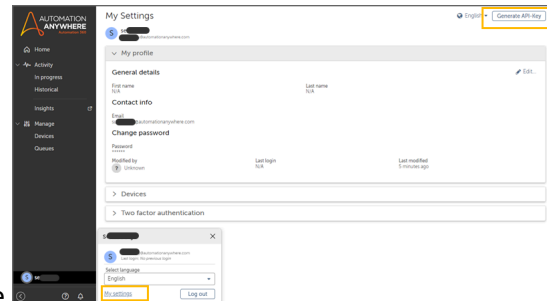

To create and assign a custom role to generate an API key:

1. Log in as an Administrator to the Automation 360 Control Room.

2. Navigate to: **Administration > Roles.**
3. Click **Create role.** For more information, see [Create a role.](#)
4. Scroll down to the **API** section.
5. Select **Generate API-Key.**

6. Enter a unique name in the **Role name** field.
7. Click **Create role.**
8. Navigate to: **Administration > Users**, and assign the custom role you just created to a non-Administration user.
9. Log in as the user you assigned the **Generate API-Key** role to.
10. Navigate to the username profile at the bottom left of the page and select **username > My settings.**
- 11.

Click **Generate API-Key** at the top right of the page.

12. Copy the generated **API-Key** to your clipboard.

Use the **API-Key** to log in to a Control Room using SSO, or use the **API-Key** to log in as a user without a password.

Related reference

[Authenticate \(username and apiKey\)](#)

Use this API to authenticate access to a Control Room with the `username` and `apiKey`. A successful response generates a JSON Web Token. A generated token is valid for 20 minutes. You can generate the token without the need for the user's password, such as for organizations that use single sign-on (SSO).

Validate token

Verify if a JSON Web Token is valid.

Request

```
GET https://{{ControlRoomURL}}/v1/authentication/token?token=<token>
```

```
Header: X-Authorization <<authentication token>>
```

All API calls must contain an authentication token in the request header. Use the [Authentication API](#) to generate a JSON web token. See [Authentication API](#).

If the token is not valid, you must generate a token using one of the authentication methods:

[Authentication API](#)

Request Parameters

Parameter	Type	Required	Description
token	String	Yes	Enter the token you want to validate. To generate a token, see Authenticate (username and password and apiKey) .

Response

```
200 OK
```

```
{
  "valid": true
}
```

Response Parameters

Parameter	Type	Description
valid	Boolean	Returns <ol style="list-style-type: none"> <code>true</code>, if the token is valid. <code>false</code>, if the token is invalid.

Note: You can view the in the , but API functionality is limited. You need a licensed Edition to access the full functionality of the APIs.

The REST API responds to each request with an HTTP response code. For response codes, see [API response codes](#).

Related concepts

[Authentication API](#)

Use the Authentication API to generate, refresh, and manage the JSON Web Tokens (JWTs) that are required for authentication and authorization in order to use the Control Room APIs.

Refresh token

Generate a JSON Web Token using a valid existing token. This endpoint provides you with a new token without the need to collect and authenticate credentials every time a token expires. By default, a token is valid for 20 minutes.

Request

```
POST https://{{ControlRoomURL}}/v1/authentication/token
```

```
Header: X-Authorization <<authentication token>>
```

All API calls must contain an authentication token in the request header. Use the [Authentication API](#) to generate a JSON web token. See [Authentication API](#).

Request body:

```
{
  "token":
  "eyJhbGciOiJSUzUxMiJ9.eyJzdWIiOiIxIiwiaWF0Ij0iY2xpZW50VHlwZSI6IldFQiIsImxpY2Vuc2VzIjpbXSwiYW5hbnQIj0iLC0vs--8b_pLG9XSUR0186uvXFopB75eVAAG-1l_AZhR78UE6Voi7_UggzHkLRrEpQ-szR7cmFDpLxZ28xLnFJYhaIuMNdW9dWDVquBWTQSpYGNJd56D-tFFHBodwVdNamqWHxaQebqlzMyUyQV6Q-gKdgubpT5gwuXnp-BwScjHOYM3Fpj_nt0nEbJC5uWpJNtLQBpVzhsRwwlRKNOHQVbo6X7zkvKBoij8ewa5FWQwX7T-760BeqfssR6mmX5PcyCkrVJju2XqItQ9XMGNP7h_MaUDotU_CJyguPZA"
}
```

Request Parameters

Parameter	Type	Required	Description
token	String	Yes	Enter the token you want to refresh. If the token is not valid, you must generate a token using the following methods: Authenticate (username and password) or Authenticate (password) .

Response

```
200 OK
```

```
{

Response Parameters

Parameter	Type	Description
token	String	Generated access token that acts as a session ID that your application will use for making requests. This token is equivalent to the user credentials and must be protected. Note: If <i>multipleLogin</i> is set to <i>true</i> , you will be able to use this token for multiple API sessions.

Parameter	Type	Description
user	Object	<p>The user object returned with all the details of the user.</p> <ul style="list-style-type: none"> • id - Id of the user. • email - Email id of the user. • username - User name of the user. • domain - Domain logged in to. • firstname - First name of the user. • lastname - Last name of the user. • roles - Roles assigned to the user. • sysAssignedRoles - System assigned roles. • permissions - Permissions assigned to the user. • licenseFeatures - License assigned to the user.

Note: You can view the in the , but API functionality is limited. You need a licensed Edition to access the full functionality of the APIs.

The REST API responds to each request with an HTTP response code. For response codes, see [API response codes](#).

Related concepts

[Authentication API](#)

Use the Authentication API to generate, refresh, and manage the JSON Web Tokens (JWTs) that are required for authentication and authorization in order to use the Control Room APIs.

Expire token

Immediately log out the user and invalidate their JSON Web Token so that it cannot be used for authentication.

Request

```
POST https://{{ControlRoomURL}}/v1/authentication/logout
```

```
Header: X-Authorization <<authentication token>>
```

All API calls must contain an authentication token in the request header. Use the [Authentication API](#) to generate a JSON web token. See [Authentication API](#).

Request body:

```
{
  "token":
  "eyJhbGciOiJSUzUxMiJ9.eyJzdWIiOiIxIiwiaWF0Ij0iY2xpZW50VHlwZSI6IldFQIIsImxpY2Vuc2VzIjpbXSwiYW5hbnQI6IiCO-vs--8b_pLG9XSUR0186uvXFopB75eVAaG-1l_AZhR78UE6Voi7_UggzHkLRrEpQ-szR7cmFDpLxZ28xLnFJYhaIuMNdW9dWDVquBWTQSpYGNJd56D-tFFHBodwVdNamqWHxaQebq1zMyUyQV6Q-gKdgubpT5gwuXnp-BwScjHOYM3Fpj_nt0nEbJC5uWpJNtLQBpVzhsRwwlRKNOHQVbo6X7zkvKBoij8ewa5FWQwX7T-760BeqfssR6mmX5PcyCkrVJju2XqItQ9XMGNP7h_MaUDotU_CJyguPZA"
}
```

Request Parameters

Parameter	Type	Required	Description
token	String	Yes	Enter the session's token that you want to logout. To generate a token, see Authenticate (username and password and apiKey) .

Response

```
204 No Response
```

Note: You can view the in the , but API functionality is limited. You need a licensed Edition to access the full functionality of the APIs.

The REST API responds to each request with an HTTP response code. For response codes, see [API response codes](#).

Related reference[Authenticate \(username and apiKey\)](#)

Use this API to authenticate access to a Control Room with the `username` and `apikey`. A successful response generates a JSON Web Token. A generated token is valid for 20 minutes. You can generate the token without the need for the user's password, such as for organizations that use single sign-on (SSO).

User management APIs

Use `User Management` APIs to create, search, update, or delete roles and users in your Control Room.

Note: You can view the in the , but API functionality is limited. You need a licensed Edition to access the full functionality of the APIs.

User Management Roles

Users need the following permissions in order to create and manage users and roles.

- **View users**

You need an administrator permission to create and manage users and roles. It is recommended that non-administrator users be given limited permissions for creating and managing users. Learn how to [create a role with limited permissions](#) that can be assigned to users.

- **Create users**

Create new users in the Control Room.

- **Edit users**

Edit all users in the Control Room, including users created by other administrators.

- **Delete users**

Delete any user in the Control Room.

- **View roles**

Users with this permission can view roles to which they have access.

- **Manage roles**

Users can create, edit and delete roles to which they have access.

- **View licenses**

Users with these permissions are able to view and manage device licenses. Device licenses are required to enable users to perform specific tasks. For example, Bot Creators require a **DEVELOPMENT** device license in order to create bots.

- **Manage users device license**

Users with this permission can assign device licenses to other users.

Role APIs

Use `Role` APIs to List Roles, create a role, retrieve a specific role using an object ID, update a role, or delete a role.

List roles

Retrieves current roles based on search criteria, such as filtering, sorting, and pagination.

```
POST http://<your_control_room_url>/v1/usermanagement/roles/list
```

Create role

Creates a new role with a new role name.

```
POST http://<your_control_room_url>/v1/usermanagement/roles
```

Retrieve role

Retrieves a specific role based on a unique role ID.

```
GET http://<your_control_room_url>/v1/usermanagement/roles/{id}
```

Update role

Modifies an existing role name based on a unique role ID.

```
PUT http://<your_control_room_url>/v1/usermanagement/roles/{id}
```

Delete role

Deletes an existing role based on a unique role ID.

```
DELETE http://
<your_control_room_url>/v1/
usermanagement/roles/{id}
```

User APIs

Use `User` APIs to create a user, search for users, retrieve a user details based on a user ID, update a specific user details, or delete a user.

Create user

Creates a user with a new user name.

```
POST http://<your_control_room_url>/
v1/usermanagement/users
```

Search for users API

Retrieves current users based on search criteria, such as filtering, sorting, and pagination.

```
POST http://<your_control_room_url>/
v1/usermanagement/users/list
```

Retrieve a specific user details API

Retrieves user details based on a unique user ID.

```
GET http://<your_control_room_url>/
v1/usermanagement/users/{uid}
```

Update an existing user details API

Modifies an existing user name based on a unique user ID.

```
PUT http://<your_control_room_url>/
v1/usermanagement/users/{uid}
```

Delete an existing user API

Deletes an existing user based on a unique user ID.

```
DELETE http://
<your_control_room_url>/v1/
usermanagement/users/{uid}
```

Related concepts

[Authentication API](#)

Use the Authentication API to generate, refresh, and manage the JSON Web Tokens (JWTs) that are required for authentication and authorization in order to use the Control Room APIs.

Related reference

[Roles and permissions](#)

Assign roles from the Automation 360 Administration user interface or through the User Management API to enable users to access features. You can assign a system-created role or create a custom role with specific permissions.

Create role

Use `Create role` API to create a new role with permissions in the Control Room.

Request

```
POST https://{{ControlRoomURL}}/v1/usermanagement/roles
```

```
Header: X-Authorization <<authentication token>>
```

All API calls must contain an authentication token in the request header. Use the `Authentication` API to generate a JSON web token. See [Authentication API](#).

Request Parameters

Parameter	Type	Required	Description
name	String	Yes	Name of the role.
description	String	No	Description of the role.
permissions	Array	No	An array of permissions that will be granted for the role. mandatory parameters. For more details on the parameters, see below.
principals	Array	No	An array/collection of principals (users) who will be granted the role. For more information on the parameters, see below.

permission array parameters

Parameter	Type	Required	Description
id	Integer	No	The numeric value that uniquely identifies the permission.
action	String	No	The action the permission enables.
resourceId	String	No	The resource id to which the action belongs.
resourceType	Array	No	The resource group to which the action belongs. Typically a user is given the role permission in conjunction with a resource. Roles and permissions

principals array parameters

Parameter	Type	Required	Description
id	Integer	No	Id of the user.
username	String	No	User name of the user.
subjectId	String	No	Subject Id of the user.
domain	String	No	Active directory domain, if the user is an AD User.
autoLoginEnabled	Boolean	No	Flag to indicate if auto login is enabled or not.
deleted	Boolean	No	Flag to indicate if user is deleted or not.

Parameter	Type	Required	Description
emailVerified	Boolean	No	Flag to indicate if email is verified or not.
pwdExpired	Boolean	No	Flag to indicate if password is expired or not.

Response Parameters

Parameter	Type	Description
id	Integer	Unique identifier representing the new role created.
name	String	Name of the role created.
description	String	Description of the role created.
version	Integer	Version of the role instance.
createdBy	Integer	Id of the user who created the role.
createdOn	String	The creation timestamp of the role.
updatedBy	Integer	Id of the user who made a latest update to the role.
updatedOn	String	The latest update timestamp of the role.
permissions	Array	An array of unique permissions that have been assigned to the role.
principals	Array	An array of unique users that have been assigned to the role.

Note: You can view the in the , but API functionality is limited. You need a licensed Edition to access the full functionality of the APIs.

The REST API responds to each request with an HTTP response code. For response codes, see [API response codes](#).

List roles

Use the `List Roles` API to retrieve a list of roles in the Control Room. The endpoint supports pagination, sorting, and filtering.

Request

```
POST http://{{ControlRoomURL}}/v1/usermanagement/roles/list
```

```
Header: X-Authorization <<authentication token>>
```

All API calls must contain an authentication token in the request header. Use the `Authentication` API to generate a JSON web token. See [Authentication API](#).

Request body without filters:

```
{
  "sort": [
    {
      "field": "name",
      "direction": "asc"
    }
  ],
  "filter": {
  },
  "page": {
    "offset": 0,
    "total": 100,
    "totalFilter": 100,
    "length": 200
  }
}
```

Request body with filters:

```
{
  "sort": [
    {
      "field": "name",
      "direction": "asc"
    }
  ],
  "filter": {
    "operator": "and",
    "operands": [
      {
        "operator": "substring",
        "field": "name",
        "value": "Device"
      },
      {
        "operator": "gt",
        "field": "createdOn",
        "value": "2022-02-01T00:00:00.989Z"
      },
      {
        "operator": "lt",
```

```

        "field": "createdOn",
        "value": "2022-03-20T23:00:00.123Z"
    }
  ]
},
"page": {
  "offset": 0,
  "total": 100,
  "totalFilter": 100,
  "length": 200
}
}

```

Request Parameters

Parameter	Type	Required	Description
sort	Array	No	By default, search results are sorted in descending order with respect to their ids. An alternative sorting is specified using the sort query parameter. Enter the field by which you want to sort along with the direction <code>asc</code> (ascending) or <code>desc</code> (descending).
filter	Object	No	Filters the result.
page	Object	No	The page object allows you to get the desired pages.

For more information on Filtering, Pagination, and Sorting, see [Filtering, pagination, and sorting](#).

Response

```

{
  "page": {
    "offset": 0,
    "total": 21,
    "totalFilter": 1
  },
  "list": [
    {
      "id": 24,
      "name": "Device_admin",
      "description": "This is a device admin role",
      "countPrincipals": 1,
      "version": 1,
      "createdBy": 1,
      "createdOn": "2022-03-17T19:32:20.620Z",
      "updatedBy": 1,
      "updatedOn": "2022-03-24T02:20:13.787Z",
      "systemRole": false
    }
  ]
}

```

Response Parameters

Parameter	Type	Description
offset	Integer	The starting list offset, used for pagination.
total	Integer	Total number of records.
totalFilter	Integer	Number of records after applying the filter.
List	Array	The array of List roles object.
List roles object		
id	Integer	The unique Id of a specific role.
name	String	Name of role.
description	String	Description of role.
countPrincipals	Integer	Count of Principals (users) who are granted with this role.
version	Integer	Version of the role instance.
createdBy	Integer	Id of the user who created the role.
createdOn	String	The creation timestamp of the role.
updatedBy	Integer	Id of the user who made a latest update to the role.
updatedOn	String	The latest update timestamp of the role.
systemRole	Boolean	Flag to indicate if this role is system role or not.

Note: You can view the in the , but API functionality is limited. You need a licensed Edition to access the full functionality of the APIs.

The REST API responds to each request with an HTTP response code. For response codes, see [API response codes](#).

Retrieve role

Use the `Get role by ID` API to retrieve a specific role in the Control Room.

Request

```
GET https://{{ControlRoomURL}}/v1/usermanagement/roles/<role ID>
```

```
Header: X-Authorization <<authentication token>>
```

All API calls must contain an authentication token in the request header. Use the `Authentication` API to generate a JSON web token. See [Authentication API](#).

Request Parameters

Parameter	Type	Required	Description
role ID	Integer	Yes	Enter the Id of the role.

Response

200 OK

Response Parameters

Parameter	Type	Description
id	Integer	Unique identifier representing the new role created.
name	String	Name of the role created.
description	String	Description of the role created.

Parameter	Type	Description
version	Integer	Version of the role instance.
createdBy	Integer	Id of the user who created the role.
createdOn	String	The creation timestamp of the role.
updatedBy	Integer	Id of the user who made a latest update to the role.
updatedOn	String	The latest update timestamp of the role.
permissions	Array	An array of unique permissions that have been assigned to the role.
principals	Array	An array of unique users that have been assigned to the role.

Note: You can view the in the , but API functionality is limited. You need a licensed Edition to access the full functionality of the APIs.

The REST API responds to each request with an HTTP response code. For response codes, see [API response codes](#).

Update role

Use the `Update role` API to update an existing role in the Control Room.

Request

```
PUT https://{ControlRoomURL}/v1/usermanagement/roles/<role ID>
```

```
Header: X-Authorization <<authentication token>>
```

All API calls must contain an authentication token in the request header. Use the `Authentication` API to generate a JSON web token. See [Authentication API](#).

Request body:

```
{
  "id":25,
  "name":"Trigger Manager",
  "principals":[
    {
      "id":3
    },
    {
      "id":4
    }
  ],
  "description":"View and Manage the triggers",
```

```

```

Request Parameters

Parameter	Type	Required	Description
name	String	Yes	Enter the name of the role.
description	String	No	Description of the role.
permissions	Array	No	An array of permissions that will be granted for the role. mandatory parameters. For more details on the parameter

Parameter	Type	Required	Description
principals	Array	No	An array/collection of principals (users) who will be granted the permission. For more information on the parameters, see below.

permission array parameters

Parameter	Type	Required	Description
id	Integer	No	The numeric value that uniquely identifies the permission.
action	String	No	The action the permission enables.
resourceId	String	No	The resource id to which the action belongs.
resourceType	Array	No	The resource group to which the action belongs. Typically a user is given the role permission in conjunction with the resource permission. Roles and permissions

principals array parameters

Parameter	Type	Required	Description
id	Integer	No	Id of the user.
username	String	No	User name of the user.
subjectId	String	No	Subject Id of the user.
domain	String	No	Active directory domain, if the user is an AD User.
autoLoginEnabled	Boolean	No	Flag to indicate if auto login is enabled or not.
deleted	Boolean	No	Flag to indicate if user is deleted or not.
emailVerified	Boolean	No	Flag to indicate if email is verified or not.
pwdExpired	Boolean	No	Flag to indicate if password is expired or not.

Response

200 OK

Response Parameters

Parameter	Type	Description
id	Integer	Unique identifier representing the new role created.
name	String	Name of the role created.
description	String	Description of the role created.
version	Integer	Version of the role instance.
createdBy	Integer	Id of the user who created the role.
createdOn	String	The creation timestamp of the role.
updatedBy	Integer	Id of the user who made a latest update to the role.
updatedOn	String	The latest update timestamp of the role.
permissions	Array	An array of unique permissions that have been assigned to the role.
principals	Array	An array of unique users that have been assigned to the role.

Note: You can view the in the , but API functionality is limited. You need a licensed Edition to access the full functionality of the APIs.

The REST API responds to each request with an HTTP response code. For response codes, see [API response codes](#).

Delete role

Use the `Delete role` API to delete an existing role in the Control Room.

Request

```
DELETE https://{ControlRoomURL}/v1/usermanagement/roles/<role ID>
```

```
Header: X-Authorization <<authentication token>>
```

All API calls must contain an authentication token in the request header. Use the `Authentication` API to generate a JSON web token. See [Authentication API](#).

Request Parameters

Parameter	Type	Required	Description
role ID	Integer	Yes	Enter the Id of the role.

Response

```
200 OK
```

Note: You can view the in the , but API functionality is limited. You need a licensed Edition to access the full functionality of the APIs.

The REST API responds to each request with an HTTP response code. For response codes, see [API response codes](#).

Create user

Use the `Create user` API to create a new user in the Control Room.

Request

```
POST https://{ControlRoomURL}/v1/usermanagement/users
```

```
Header: X-Authorization <<authentication token>>
```

All API calls must contain an authentication token in the request header. Use the `Authentication` API to generate a JSON web token. See [Authentication API](#).

Request body:

```
{
  "roles": [
    {
```

```

        "id": 185
      }
    ],
    "email": "aaa@a.com",
    "enableAutoLogin": true,
    "username": "test1",
    "description": "",
    "firstName": "joe",
    "lastName": "doe",

      "DEVELOPMENT"
    ],
    "sysAssignedRoles": [],
    "deviceCredentialAttested": false
  }
}

```

Request Parameters

Parameter	Type	Required	Description
roles	Integer	Yes	Id of the role. To find an ID of a role, see List roles .
domain	string	No	ActiveDirectory domain
email	String	No	Email of the user
enableAutoLogin	Boolean	No	Flag to enable or disable Auto login.
username	String	Yes	Username of the user.
password	String	Yes	Password of the user.
firstName	String	No	First name of the user
lastName	String	No	Last name of the user
disabled	boolean	No	Enable or disable the user
description	String	Yes	Provide a description.
licenseFeatures	String	No	License allocated to the user. You will be able to retrieve the available licenses using List Control Room licenses . Note: licenseFeatures is case sensitive and must be entered in ALL CAPS. Valid licenseFeatures inputs include: DEVELOPMENT, RUNTIME, ANALYTICSCLIENT, ATTENDED, DISCOVERYBOTANALYZER, DISCOVERYBOTRECORDER, AARIUSER, CITIZENDEVELOPER, and CLOUDBOTRUNNER
sysAssignedRoles	Integer	No	System assigned roles
deviceCredentialAttested	String	No	Device Credential attested.

Response

201 Created

Response Parameters

Parameter	Type	Description
id	Integer	Unique identifier representing the new user created.
Roles		
name	String	Name of the role.
id	Integer	Id of the role
version	Integer	Version of the role instance.
Permissions		
permissions	Array	An array of unique permissions that have been assigned to the user.
id	Integer	Id of the permission.
action	String	Action associated with the permission.
resourceId	Integer	Resource Id
resourceType	String	Type of resource

Parameter	Type	Description
createdBy	Integer	Id of the user who created the user.
createdOn	String	The creation timestamp of the user.
updatedBy	Integer	Id of the user who made a latest update to the user.
updatedOn	String	The latest update timestamp of the user.

Note: You can view the in the , but API functionality is limited. You need a licensed Edition to access the full functionality of the APIs.

The REST API responds to each request with an HTTP response code. For response codes, see [API response codes](#).

Search for users API

Use the `Search for users` API to search for all users in the Control Room.

Request

```
POST http://{{ControlRoomURL}}/v1/usermanagement/users/list
```

```
Header: X-Authorization <<authentication token>>
```

All API calls must contain an authentication token in the request header. Use the `Authentication` API to generate a JSON web token. See [Authentication API](#).

To search for users, you must have one of the following:

- **Admin** role
- Custom role with **View Users** permission

Request body:

```
{
  "filter": {
    "operator": "and",
    "operands": [
      "substring"
    ],
    "field": "name",
    "value": "device"
  },
  "sort": [
    {
      "field": "name",
      "direction": "asc"
    }
  ],
  "page": {
    "offset": 0,
    "total": 100,
    "totalFilter": 100
  }
}
```

```
}

```

Request Parameters

Parameter	Type	Required	Description
sort	Array	No	By default, search results are sorted in descending order of the IDs. To specify an alternate sorting, use the sort query parameter. Enter the field by which you want to sort along with the direction <code>asc</code> (ascending) or <code>desc</code> (descending).
filter	Object	No	Filters the result.
page	Object	No	The page object allows you to get the desired number of pages.

For more information on Filtering, Pagination, and Sorting, see [Filtering, pagination, and sorting](#).

Response

```
{
  {
    "page": {
      "offset": 0,
      "total": 100,
      "totalFilter": 100
    },
    "list": [
      {
        "id": 110,
        "roles": [
          {
            "id": 0,
            "name": "string"
          }
        ],
        "permissions": [
          {
            "id": 59,
            "action": "managecredentials",
            "resourceId": null,
            "resourceType": "credentials"
          }
        ],
        "licenseFeatures": [
          "DEVELOPMENT"
        ],

    "updatedOn": "2022-03-24T02:20:13.787Z"
  }
]
}

```

Response Parameters

Parameter	Type	Description
offset	Integer	The starting list offset, used for pagination.
total	Integer	Total number of records.
totalFilter	Integer	Number of records after applying the filter.
List	Array	The array of List roles object.
List roles object		
id	Integer	The unique Id of a specific role.
name	String	Name of role.
permissions	Array	Collection of unique permissions that have been assigned to the role.
licenseFeatures	String	License features that include - DEVELOPMENT - RUNTIME - IQBOTRUNTIME - ANALYTICSCLIENT - ANALYTICSAPI
description	String	Description of the role.
principalId	Number	Unique ID of the principal user.
email	Integer	Email ID of the user.
emailVerified	Boolean	Indicates if the email ID has been verified.
passwordSet	Boolean	Indicates if the user had set his password.
enableAutoLogin	Boolean	Indicates if auto login is enabled for the user.
username	String	User log in name.
firstName	String	First name specified for the user.
lastName	String	Last name specified for the user.
createdBy	Integer	ID of the user who created the role.
createdOn	String	Timestamp when the role was created.
updatedBy	Integer	ID of the user who last updated the role.
updatedOn	String	Timestamp when the role was last updated.
systemRole	Boolean	Indicates if this role is a system role or not.

Note: You can view the in the , but API functionality is limited. You need a licensed Edition to access the full functionality of the APIs.

The REST API responds to each request with an HTTP response code. For response codes, see [API response codes](#).

Retrieve a specific user details API

Use the `Get user details` API to retrieve a specific user details in the Control Room.

Request

```
GET http://{{ControlRoomURL}}/v1/usermanagement/users/{uid}
```

```
Header: X-Authorization <<authentication token>>
```

All API calls must contain an authentication token in the request header. Use the `Authentication` API to generate a JSON web token. See [Authentication API](#).

Ensure you have an admin role or a custom role with **View Users** permission.

Request Parameters

Parameter	Type	Required	Description
uid	Integer	Yes	Enter the unique ID of the user.

Response

```
{
  "id": 110,
  "roles": [
    {
      "id": 0,
      "name": "string"
    }
  ],
  "permissions": [
    {
      "id": 59,
      "action": "managecredentials",
      "resourceId": null,
      "resourceType": "credentials"
    }
  ],
  "licenseFeatures": [
    "DEVELOPMENT"
  ],
  "principalId": 110,
  "domain": null,
  "email": "xyz@automationanywhere.com",
  "emailVerified": true,
}
```

```

"passwordSet": true,
"questionsSet": true,
"enableAutoLogin": true,
"username": "bot_creator",
"firstName": "Mike",
"lastName": "Bots",
"description": "User to manage bots",
"disabled": true,
"clientRegistered": true,
"createdBy": 27,
"createdOn": "2022-03-17T19-32-20",
"updatedBy": 29,
"updatedOn": "2022-03-24T02-20-13"
}

```

Response Parameters

Parameter	Type	Description
id	Integer	Unique identifier representing a specific permission
roles		
id	Integer	Unique identifier representing a specific role
name	String	Name of role.
permissions	Array	Collection of unique permissions that have been assigned to the role.
licenseFeatures	String	License features that include - DEVELOPMENT - RUNTIME - IQBOTRU ANALYTICSCLIENT - ANALYTICSAPI
description	String	Description of the role.
domain	String	ActiveDirectory(LDAP) domain
principalId	Number	Unique ID of the principal user.
email	Integer	Email ID of the user.
emailVerified	Boolean	Indicates if the email ID has been verified.
passwordSet	Boolean	Indicates if the user had set his password.
questionsSet	Boolean	Indicates if the user has set questions and answer.
enableAutoLogin	Boolean	Indicates if auto login is enabled for the user.
firstName	String	First name specified for the user.
lastName	String	Last name specified for the user.
disabled	Boolean	User enable/disable flag.
clientRegistered	Boolean	Flag to indicate if client/device is registered.
createdBy	Integer	ID of the user who created the role.
createdOn	String	Timestamp when the role was created.
updatedBy	Integer	ID of the user who last updated the role.
updatedOn	String	Timestamp when the role was last updated.

Note: You can view the in the , but API functionality is limited. You need a licensed Edition to access the full functionality of the APIs.

The REST API responds to each request with an HTTP response code. For response codes, see [API response codes](#).

Update an existing user details API

Use the `Update user details` API to update an existing user information in the Control Room.

Ensure you have an admin role or a custom role with **Edit Users** permission.

1. Add the authentication token to the request header.
2. Use the PUT method and endpoint URL: `<your_control_room_url>/v1/usermanagement/users/744`
3. In the request header, add an existing user ID you want to update. To find a user ID you want to update, execute the `Search for users` API.

If you want to add a new role ID to your request, perform the following steps:

- a) Execute the `Search for users` API. Use the POST method and endpoint URL: `<your_control_room_url>/v1/usermanagement/users/list`
- b) When you get all role IDs, add a new role to the existing role IDs. You will not able to add one role by itself, you must add it to the collection of role IDs.

The following request body is for an existing user ID: 744 and the existing role IDs: 169, 2, and 26. Modify other parameters as needed.

Request body

```
{
  "roles": [
    {
      "id": 169
    },
    {
      "id": 2
    },
    {
      "id": 26
    }
  ],
  "email": "Joe.Smith@automationanywhere.com",
  "enableAutoLogin": false,
  "firstName": "FN",
  "lastName": "LN",
  "description": "test",
  "disabled": false,
  "licenseFeatures": [
    "RUNTIME"
  ]
}
```

4. Send the request.

The response body returns the updated details for the user ID: 744.

Response body:

```
{
```

```

    "id": 744,
    "username": "cs_runner",
    "domain": null,
    "firstName": "FN",
    "lastName": "LN",
    "version": 60,
    "principalId": 744,
    "deleted": false,
    "roles": [
      {
        "name": "AAE_Basic",
        "id": 2,
        "version": 0
      },
      {
        "name": "cs_role2",
        "id": 169,
        "version": 3
      },
      {
        "name": "all",
        "id": 26,
        "version": 54
      }
    ],
    "sysAssignedRoles": [],
    "groupNames": [],
    "permissions": [
      {
        "id": 2912,
        "action": "upload",
        "resourceId": "34241",
        "resourceType": "repositorymanager"
      },
      {
        "id": 4101,
        "action": "download",
        "resourceId": "34439",
        "resourceType": "repositorymanager"
      }
    ],
    "licenseFeatures": [
      "RUNTIME"
    ],
    "emailVerified": true,
    "passwordSet": true,
    "questionsSet": true,
    "enableAutoLogin": false,
    "disabled": false,
    "clientRegistered": false,
    "description": "test",
    "createdBy": 451,
    "createdOn": "2020-08-25T07:27:58Z",
    "updatedBy": 451,
    "updatedOn": "2021-03-16T17:15:19Z",
    "publicKey": null,
    "appType": null,
    "routingName": null,
    "appUrl": null,
    "email": "Joe.Smith@automationanywhere.com",
    "lastLoginTime": "2021-02-25T18:01:40Z",
    "deviceCredentialAttested": false
  }

```

```
}
```

The REST API responds to each request with an HTTP response code. For details about the response codes, see [API response codes](#).

Delete an existing user API

Use the `Delete user` API to delete an existing user in the Control Room.

Request

```
DELETE https://{ControlRoomURL}/v1/usermanagement/users/<user ID>
```

```
Header: X-Authorization <<authentication token>>
```

All API calls must contain an authentication token in the request header. Use the `Authentication` API to generate a JSON web token. See [Authentication API](#).

Request Parameters

Parameter	Type	Required	Description
user ID	Integer	Yes	Enter the Id of the user.

Response

```
200 OK
```

Note: You can view the in the , but API functionality is limited. You need a licensed Edition to access the full functionality of the APIs.

The REST API responds to each request with an HTTP response code. For response codes, see [API response codes](#).

Ensure you have an admin role or a custom role with **Edit Users** permission.

- URL: `http://<your_control_room_url>/v1/usermanagement/users/2 <user ID>`
Replace the content in the angle brackets with your Control Room URL.
- Method: **DELETE**

1. Add the authentication token to the request header. Add an authentication token to the request header.
2. In the request header, add an existing user ID you want to delete.
3. Use the **DELETE** method. and endpoint URL: `<your_control_room_url>/v1/usermanagement/users/2 <user ID>`
4. Send the request.

Response body:

```
{
```

```

    "id": 3014,
    "email": "a@a.com",
    "username": "docstest01",
    "domain": null,
    "firstName": null,
    "lastName": null,
    "version": 4,
    "principalId": 3014,
    "deleted": false,
    "roles": [],
    "sysAssignedRoles": [],
    "groupNames": [],
    "permissions": [],
    "licenseFeatures": [],
    "emailVerified": true,
    "passwordSet": false,
    "questionsSet": false,
    "enableAutoLogin": false,
    "disabled": false,
    "clientRegistered": false,
    "description": null,
    "createdBy": 2623,
    "createdOn": "2020-01-31T17:33:16Z",
    "updatedBy": 3215,
    "updatedOn": "2020-03-22T22:51:48Z",
    "publicKey": null,
    "appType": null,
    "routingName": null,
    "appUrl": null
  }

```

The REST API responds to each request with an HTTP response code. For details about the response codes, see [API response codes](#).

Roles and permissions

Assign roles from the Automation 360 Administration user interface or through the User Management API to enable users to access features. You can assign a system-created role or create a custom role with specific permissions.

Roles are a logical container for permissions and have interdependencies with bots, users, and licenses. Users with the `AAE_Admin` role can create custom roles and assign roles to users.

The following topics provide descriptions of the features and the necessary information to create and assign roles with the [User Management API](#).

Related concepts

[Control Room APIs](#)

The Automation Anywhere Control Room provides APIs that allow you to customize the way that you (and your bots) interact with Automation Anywhere. Control Room APIs allows you to perform tasks such as manage bot deployments, create and manage credentials in the Credential Vault, create and manage user accounts and roles, and create and manage queues.

[Code analysis](#)

Code analysis enables you to evaluate a program without running the code. In Automation 360, the code analysis feature analyzes the code and displays a list of violations based on a set rules. You can review and fix any coding or stylistic errors for your automation.

Related reference

[Create role](#)

Use `Create role` API to create a new role with permissions in the Control Room.

Feature permissions for a role

A user with the **AAE_Admin** role or a custom role with the **Manage roles** permission can create and assign roles to users to provide them with access to features and operations.

System-created roles

Automation 360 includes predefined roles that cannot be edited or deleted. Each role has the standard permissions, plus the permissions necessary to perform the tasks within the scope of that role.

Standard permissions

All system-created roles include the following permissions:

- View dashboards
- View my in progress activity
- Manage my credentials and lockers
- Create standard attributes for a credential (except for Discovery Bot roles)
- View and manage my Bot runners, Bot creators, and devices
- View and manage my queues
- View users and roles basic information

System-created roles

Find the role IDs using the [List roles](#) and assign the role to a user in the [Create user](#) or [Update an existing user details API](#) endpoints.

Note: Since the role IDs vary for each cloud Control Room, you must look up the role ID by navigating to **Administration > Roles** and clicking the role name. The URL is `https://<control_room>/#/admin/roles/allroles/2/edit`, where 2 is the role name.

Name	Description
AAE_Admin	Allows access to all features, including creating other Admin users and access to all folders and files. The only role that can access Control Room settings.
AAE_Basic	Permissions to create credentials and set a standard attribute value, view and run their bots, view the Bot Store, register a device, and view packages.
AAE_Locker Admin	Can view all credentials and all lockers. They can change the owner of a credential that they do not own. For lockers they do not own, they can delete the locker, edit permissions, and remove credentials.
AAE_IQ Bot Validator	For a Bot Runner with an IQ Bot license. Permissions to access the IQ Bot Validator screen. Limited access to Control Room features.
AAE_Bot Insight Consumer	When combined with an Analytics license, this role grants the user the ability to view data in Bot Insight.
AAE_Bot Insight Expert	When combined with an Analytics license, this role grants the user the ability to view and manage data in Bot Insight.

Name	Description
AAE_IQ Bot Services	Permissions to access the IQ Bot console. Limited access to Control Room features.
AAE_Queue Admin	Permissions to view and manage all queues.
AAE_Pool Admin	Permissions to view and manage all device pools. Note: This role does not grant permission to view bots.
AAE_Bot Insight Admin	The only role that can use Bot Insight APIs to access the data logged by the Control Room, and by a task during Production runs.
AAE_IQ Bot Admin	Allows access to all IQ Bot features.
AAE_Bot Store Publisher	Permissions to submit bot package or Digital Worker to Bot Store.
AAE_Bot Developer	Permissions view, run, and import their bots, create folders, manage packages, and download bots and Digital Workers from the Bot Store to their private workspace. Note: This role does not grant permission to register a device, or check bots in or out of the public workspace.
AAE_Discovery Bot Admin	Allows access to view all Discovery Bot processes. Manages the creation, deletion, and editing of processes.
AAE_Discovery Bot User	Allows access to view the assigned Discovery Bot process assigned to a user. Create and run the Discovery Bot recorder for assigned business processes. Permissions to view, edit, and delete a user's own recordings.
AAE_Discovery Bot Analyst	Allows access to view and edit all approved recordings from assigned users for a given process. Permissions for system generated aggregated view of recordings to view, create, edit, and delete views. Permissions to create, view, edit, and delete opportunities for assigned processes. Export the opportunity to a word document and convert to a bot.
AAE_Robotic Interface Admin	Allows access to the Control Room and AARI on the web.
AAE_Robotic Interface Manager	Allows access to AARI on the web.
AAE_Robotic Interface User	Allows access to AARI on the web.

Related concepts[Control Room APIs](#)

The Automation Anywhere Control Room provides APIs that allow you to customize the way that you (and your bots) interact with Automation Anywhere. Control Room APIs allows you to perform tasks such as

manage bot deployments, create and manage credentials in the Credential Vault, create and manage user accounts and roles, and create and manage queues.

Related reference

[Create role](#)

Use `Create role` API to create a new role with permissions in the Control Room.

Administration permissions

Enable users to create and manage users and roles, to manage and update migrations, and to install Control Room licenses.

You will be able to use the [Retrieve role](#) endpoint with the role ID to retrieve the permissions assigned to any system or user defined roles.

Users and roles permissions

Action	Resource Type	Description
usermanagement	usermanagement	Allows you to only view all other users in the system. You cannot create, edit, or delete users. <hr/> Note: You must assign this permission before assigning the <code>createuser</code> <code>updateuser</code> , or <code>deleteuser</code> permission.
deleteuser	usermanagement	Allows you to delete other users the Control Room.
createuser	usermanagement	Allows you to create new users in the Control Room.
updateuser	usermanagement	Allows you to edit all users in the system.
rolesview	rolesmanagement	Users with this permission are able to view the roles in the Control Room. <hr/> Note: You must assign this permission before assigning the <code>rolesmanagement</code> permission.
rolesmanagement	rolesmanagement	Allows you to view and manage all roles in the Control Room.
viewuserrolebasicinfo	usermanagement	Allows you to view basic information on users and roles.

Migration permissions

Action	Resource Type	Description
view	migration	Allows you to view new migrations, but not run them <hr/> Note: You must assign this permission before assigning the <code>manage</code> migration permission

Action	Resource Type	Description
manage	migration	Allows you to view and run new migrations
updatestatus	migration	Allows Bot Runner Run-as user to update the bot conversion status in the Control Room

Licenses permissions

Action	Resource Type	Description
licensemanagementlicensemanagement		Allows you to view the license details for the Control Room.
licenseinstall	licensemanagement	Allows you to install Automation 360 licenses for the Control Room.
licenseuserallocationlicensemanagement		Allows you to assign device licenses to other users.

Note: Only a user with the `AAE_Admin` role has the ability to view and manage settings in the Control Room. See [System-created roles](#).

Runtime Client Management permissions

Action	Resource Type	Description
runtimeclientsmanagementruntimeclientsmanagement		Allows you to use the device mentioned in the resourceId for deployment. This permission is assigned when you are assigned a default device.
accessresourceany runtimeclientsmanagement		Allows you to use any device for deployment. This permission is currently granted for all users with <code>AAE_ADMIN</code> role. ¹

Global Values Permissions

Action	Resource Type	Description
manageuserscopevaluesglobalvalues		Manage tenant level global values, given to <code>AAE_Admin</code> only. This cannot be given to any custom role at the moment. ¹
managetenantscopevaluesglobalvalues		Not used, created for future purpose. ¹

¹ Not available in the UI and is seen only in the API response.

other permissions

Action	Resource Type	Description
systemadmin	system	This permission is given to AAE_Admin only. It is a system call and cannot be called manually. This permission is used to count the number of pages consumed against the entitled pages for the IQ bot application. It fetches a list of all the users with basic details and license information. ¹
view	settings	View settings. <hr/> Note: You will be allowed to view settings only with the system-created Admin role to view Settings. <hr/>
all	botrunners	Allows you to use any runAsUser for deployment. This permission is currently granted for all users with <u>AAE_ADMIN</u> role. ¹
operationroom	operationroom	Legacy, not used and will be removed from the future releases. ¹
manage	mfa	Legacy, not used and will be removed from the future releases. ¹

Related reference[Roles and permissions](#)

Assign roles from the Automation 360 Administration user interface or through the User Management API to enable users to access features. You can assign a system-created role or create a custom role with specific permissions.

[Create role](#)

Use `Create role` API to create a new role with permissions in the Control Room.

API permissions

Enables access to Bot Insight APIs and the ability to generate an API key.

Action	Resource Type	Description
botinsightapi	api	Allows access to Bot Insight RESTful APIs to the data logged by the Control Room and by a task during production runs.

Action	Resource Type	Description
generateapikey	api	Generate an apiKey that can be used in the Authentication API. <i>Authenticate (username and apiKey)</i> <hr/> Note: Without the <code>generateapikey</code> permission, use APIs by authenticating using their username and password. <i>Authenticate (username and password)</i>
coadmin	botinsightapi	Reserved. Not used for now and will be used when COE dashboard is available in A360. Allows you to access the COE dashboard when it is made available in A360.
accessreportingapi	iqbotapi	Allows you to access reporting details via an API.
accessuploadanddownloadapi	iqbotapi	Allows you to upload a document and download the digitized result via an API.
accessnlapi	iqbotapi	Allows you to access natural language processing capabilities of the IQ Bot portal via an API.

[Roles and permissions](#)

Assign roles from the Automation 360 Administration user interface or through the User Management API to enable users to access features. You can assign a system-created role or create a custom role with specific permissions.

[Create role](#)

Use `Create role` API to create a new role with permissions in the Control Room.

Audit log permissions

View logs and details to record user activities. Enable users to view logs from the Control Room.

Action	Resource Type	Description
recentactivities	recentactivities	Allows you to view all audit log activity for the Control Room
archiveaudit	recentactivities	Allows you to archive all audit log activity for the Control Room

Related reference

[Roles and permissions](#)

Assign roles from the Automation 360 Administration user interface or through the User Management API to enable users to access features. You can assign a system-created role or create a custom role with specific permissions.

[Create role](#)

Use `Create role` API to create a new role with permissions in the Control Room.

Automation Anywhere Robotic Interface (AARI) permissions

Assign AARI permissions to a custom role.

Action	Resource Type	Description
aaricrossteamread	aari	View all teams and see the team members
aaricrossprocessread	aari	View all processes and see team members and managers
aariteammanagement	aari	Create and view teams, edit team names, descriptions, and process tags. Add new teams, team members, and assigned processes
aaritaskmanagement	aari	Submit and view tasks from processes that are assigned to the team
aaricasemanagement	aari	Create and view requests from processes that are assigned to the team
aariglobalcasemanagement	aari	View process requests and tasks. Note: This permission does not grant the ability to create a request or submit a task
aariglobalprocessmanagement	aari	View checked-in public processes and assigned managers and teams, edit process tags, and assign managers and teams Note: This permission does not grant the ability to create a process.
aariglobalteammanagement	aari	View teams and assigned users, edit team names and descriptions. Add new processes, managers and users to a team Note: This permission does not grant the ability to create a team.
aarischeduler	aari	Allows users to be used as AARI scheduler

Bot and bot credential permissions

Enables users to access features for managing bots and the credentials used by bots.

Bots permissions

Action	Resource Type	Description
view	repositorymanager	Allows you to view the bots they created and bots that were assigned to them. Note: You must assign this permission before assigning any other bots permissions.

Action	Resource Type	Description
run	repositorymanager	Allows you to run the bots they created and bots that were assigned to them.
export	repositorymanager	Allows you to export bots and related bot dependencies for which they have download permission.
import	repositorymanager	Allows you to import bots and bot dependencies for which they have upload permission.
createfolders	repositorymanager	Allows users to create folders within the folders that they have access to.
renamefolders	repositorymanager	Allows you to rename the folders they have access to. Note: Only empty folders can be renamed.
cancelcheckout	repositorymanager	Allows you to cancel bot checkout and unlock the file from the public repository.
forceunlock	repositorymanager	Allows you to unlock locked bots.
accessresourceany	repositorymanager	Allows you to get permissions to the resources. For example, <i>runtimeclientsmanagement, pool, queue</i> and so on.
setproductionversion	repositorymanager	Allows you to set the production version of bots.
all	repositorymanager	Allows you to get all the repository permissions.
gitrestore	repositorymanager	Allows you to get git restore permissions.

Credentials and lockers permissions

Action	Resource Type	Description
managecredentials	credentials	Allows you to create, edit, and delete their own credentials. In addition, the user can interact with credentials from their assigned lockers. Note: All roles have this permission by default.
create	locker	Allows you to create and manage their own lockers.
consume	locker	Allows you to consume a locker locker
createstandard	credentialattribute	Allows you to create a standard attribute for a credential that is shared across all users of that credential .
updateany	credentialattributevalue	Allows you to view and edit their own masked attributes.
botautologinapi	credentialattributevalue	Allows you to automate the login process to run bots remotely.
addcredential	credentialmanager	Legacy, not used and will be removed from the future releases.
updatecredential	credentialmanager	

Action	Resource Type	Description
deletecredential	credentialmanager	

Note: A user with the `AAE_Locker Admin` role can view all credentials and lockers in the Control Room. See [System-created roles](#).

[Create role](#)

Use `Create role` API to create a new role with permissions in the Control Room.

Bot Store permissions

Enables users to view and manage Bot Store packages.

Action	Resource Type	Description
view	botstore	Allows you to view Bot Store.
addfrom	botstore	Allows you to add bot packages from Bot Store to their Control Room private workspace.
submit	botstore	Allows you to submit bot packages to Bot Store.

Related reference

Assign roles from the Automation 360 Administration user interface or through the User Management API to enable users to access features. You can assign a system-created role or create a custom role with specific permissions.

[Create role](#)

Use `Create role` API to create a new role with permissions in the Control Room.

Dashboard and activity permissions

Enables all users to view dashboards. Activity permissions enable users to view, manage, and schedule bot activities.

Dashboard and Activity Permissions

Action	Resource Type	Description
view	dashboard	View dashboard.
		Note: All roles have this permission by default.

Action	Resource Type	Description
myschedule	taskscheduling	All users can view their own activity. Note: All roles have this permission by default.
managemyschedule	taskscheduling	All users can pause, resume, or cancel their own activity and move their finished activities to history.
manageeveryoneschedule	taskscheduling	A user can monitor ongoing automations where a user has either run or schedule access on the respective bot. The user can monitor and manage ongoing automations.
view	taskscheduling	Users can see their scheduled bots regardless of which user scheduled the bot.
addschedule	taskscheduling	It requires permission to view and manage Bot Runners.
updateschedule	taskscheduling	Users can edit their scheduled bots, even if the bots are scheduled by a different user.
deleteschedule	taskscheduling	Users can delete schedules for any of their bots regardless of which users scheduled the bot.
manageallmyfolderschedules	taskscheduling	Users can view, edit, and delete all the schedules on the bot folders that the user has access to. This includes the schedules that the user created or schedules created by other users.
manageallschedules	taskscheduling	Users can view, edit, and delete all the schedules in the system. This includes the schedules that the user created or schedules created by other users.
setautomationpriority	taskscheduling	Users can set the automation priority to high from the default medium. Automations with high priority are deployed ahead of automations with medium and low priority.
everyoneschedule	taskscheduling	Users can monitor those ongoing automations where they have either run or schedule access on the respective TaskBot.

Assign roles from the Automation 360 Administration user interface or through the User Management API to enable users to access features. You can assign a system-created role or create a custom role with specific permissions.

[Create role](#)

Use `Create role` API to create a new role with permissions in the Control Room.

Devices permissions

Enable you to register, view, and manage devices used to run bots.

Action	Resource Type	Description
register	devices	Allows you to register a localhost device.
all	devices	Allows you to view and manage all devices in the Control Room.
delete	devices	Allows you to delete devices that they registered.

Action	Resource Type	Description
edit	devices	Allows you to edit the devices that they have permission to see.
view	devices	Allows you to view and manage Bot Creators, Bot Runners, and device pools. <hr/> Note: All roles have this permission by default. <hr/>
attestcredentials	devices	Allows you to deploy the bot during a session on the user's device without system password.
create	pool	Allows you to create and manage their own device pools.

Note: A user with the `AAE_Pool Admin` role is able to manage all device pools in the Control Room. See [System-created roles](#).

[Roles and permissions](#)

Assign roles from the Automation 360 Administration user interface or through the User Management API to enable users to access features. You can assign a system-created role or create a custom role with specific permissions.

[Create role](#)

Use `Create role` API to create a new role with permissions in the Control Room.

Discovery Bot permissions

Enable users to view or manage Discovery Bot processes, recordings, aggregations, and opportunities.

Process permissions

Action	Resource Type	Description
viewprocess	processdiscovery	Allows users to view assigned processes. <hr/> Note: This is the standard permission. You must assign this permission before assigning any process discovery permissions. <hr/>
viewallprocess	processdiscovery	Allows users to view all the defined processes.
editprocess	processdiscovery	Allows users to create and edit processes.

Recording permissions

Action	Resource Type	Description
viewrecording	processdiscovery	Allows users to view their own recording. Note: You must assign this permission before assigning any of the permissions below.
createrecording	processdiscovery	Allows users to run recorder and create recording.
editrecording	processdiscovery	Allows users to edit their own recording.
deleterecording	processdiscovery	Allows users to delete their own recording.
viewallrecording	processdiscovery	Allows users to view all recordings.
editallrecording	processdiscovery	Allows users to edit all recordings.

Aggregation permissions

Action	Resource Type	Description
viewmanualaggregation	processdiscovery	Allows users to view their own aggregations.
viewallaggregations	processdiscovery	Allows users to view all aggregations.
createdeletemanualaggregation	processdiscovery	Allows users to create and delete aggregations.
updatemanualaggregation	processdiscovery	Allows users to update aggregations.
viewsystemaggregation	processdiscovery	Allows users to view system aggregations.

Opportunity permissions

Action	Resource Type	Description
viewopportunity	processdiscovery	Allows users to view opportunities within an assigned process. Note: You must assign this permission before assigning any of the opportunity permissions.
editopportunity	processdiscovery	Allows users to edit opportunities within an assigned process.
viewalloppportunity	processdiscovery	Allows users to view all the opportunities.
createdeleteopportunity	processdiscovery	Allows users to create and delete opportunities within the assigned process.
converttobot	processdiscovery	Allows users to convert an opportunity to a bot.
exportopportunity	processdiscovery	Allows users to export an opportunity.

[Create role](#)

Use `Create role` API to create a new role with permissions in the Control Room.

Event triggers permissions

Enable users to run bots automatically depending on a specific event, such as a new window opening. You can limit users ability to only view or to view and manage triggers.

Action	Resource type	Description
view	eventtriggers	Allows users to view event triggers.
manage	eventtriggers	Allows users to view and manage event triggers.
managemytriggers	eventtriggers	Allows users to view and manage event triggers from their private repository, on their local devices.

Additionally, you must enable the view packages permission as well:

Action	Resource type	Description
view	packagemanager	Allows users to view packages

Related reference[Roles and permissions](#)

Assign roles from the Automation 360 Administration user interface or through the User Management API to enable users to access features. You can assign a system-created role or create a custom role with specific permissions.

[Create role](#)

Use `Create role` API to create a new role with permissions in the Control Room.

[Package manager permissions](#)

Enable users to view and manage packages.

IQ Bot permissions

Enable users to view IQ Bot permissions, create and manage learning instances, import and export domains, and manage IQ Bot configuration settings and migration.

IQ Bot permissions

Action	Resource Type	Description
viewiqbot	iqbot	Allows you to view the default dashboards in the IQ Bot portal.
		Note: You must assign this permission before assigning any of the permissions below.

Action	Resource Type	Description
view	iqbotpages	Allows to view the iqbot pages licensed
utilize	iqbotpages	Allows to utilize the iqbot pages licensed

Learning instance permissions

Action	Resource Type	Description
viewlearninginstance	viewiqbot	Allows you to view their learning instances in the IQ Bot portal. Note: You must assign this permission before assigning any other learning instance permission.
viewlearninginstanceforotherrole	viewlearninginstance	Allows you to view learning instances created by other you with the same role in the IQ Bot portal.
assignroletolearninginstance	viewlearninginstance	Allows you to assign some custom roles to a learning instance.
viewalllearninginstance	viewlearninginstance	Allows you to view all learning instances in the IQ Bot portal.
launchvalidator	viewlearninginstance	Allows you to access the IQ Bot Validator to review and update documents with exceptions.
createlearninginstance	viewlearninginstance	Allows you to create learning instances in the IQ Bot portal.
editlearninginstances	viewlearninginstance	Allows you to edit learning instances in the IQ Bot portal.
deletelearninginstances	viewlearninginstance	Allows you to delete their learning instances in the IQ Bot portal.
sendlearninginstances	viewlearninginstance	Allows you to send their learning instances to production in the IQ Bot portal.
trainlearninginstancegroups	viewlearninginstance	Allows you to train their learning instance groups in the IQ Bot portal.

Domains permissions

Action	Resource Type	Description
viewdomain	viewiqbot	Allows you to view all domains in the IQ Bot portal. Note: You must assign this permission before assigning any other domain permissions.
createdomains	viewdomain	Allows you to create domains in the IQ Bot portal.
editdomains	viewdomain	Allows you to edit domains in the IQ Bot portal.

Action	Resource Type	Description
importdomains	viewdomain	Allows you to import domains in the IQ Bot portal.
exportdomains	viewdomain	Allows you to export domains in the IQ Bot portal.
deletedomains	viewdomain	Allows you to delete domains in the IQ Bot portal.

Administration permissions

Action	Resource Type	Description
viewadministration	viewiqbot	Allows you to access the Administration tab in the IQ Bot portal. Note: You must assign this permission before assigning any other administration permissions.
viewandmanagesettings	viewadministration	Allows you to manage the IQ Bot portal advanced configuration settings.
viewandmanagemigration	viewadministration	Allows you to access the migration utility to import and export learning instances in the IQ Bot portal.

Use `Create role` API to create a new role with permissions in the Control Room.

Workload permissions

Enable you to create and manage workitems, workitem models, queues, and automations in the Control Room.

Action	Resource Type	Description
myschedule	taskscheduling	Allows you to view and manage their own schedules.
view	queue	Allows you to view their own queues.
create	queue	Allows you to create and manage their own queues.
calculate	sla	Allows you to calculate workload Service Level Agreements (SLA).
view	workload	Legacy, not used and will be removed from the future releases.
accessresourceany	queue	Legacy, not used and will be removed from the future releases.

Note: A user with the `AAE_Queue Admin` role has all the above permissions. In addition, the `AAE_Queue Admin` is able to manage all the queues in the Control Room. See [System-created roles](#).

Assign roles from the Automation 360 Administration user interface or through the User Management API to enable users to access features. You can assign a system-created role or create a custom role with specific permissions.

[Create role](#)

Use `Create role` API to create a new role with permissions in the Control Room.

Audit API

Use the Audit API to request audit data for a given input combination of date filter, sorting mechanism, and pagination.

Note: You can view the in the , but API functionality is limited. You need a licensed Edition to access the full functionality of the APIs.

- All API calls must contain an authentication token in the request header. Use the `Authentication` API to generate a JSON web token. See [Authentication API](#).
- Users with the **AAE_Admin** role or users with the **View everyone audit log actions** permission can view audit logs for the Control Room.

1. All API calls must contain an authentication token in the request header. Use the `Authentication` API to generate a JSON web token. See [Authentication API](#).
2. Apply filters to perform basic conditional queries and pagination control for processing web pages. There are three basic features related to filtering: filtering conditions, sorting columns, and pagination parameters.

Filtering, pagination, and sorting

3. Use the POST method and endpoint URL: `<your_control_room_url>/v1/audit/messages/list`.

The following example requests unsuccessful login attempts for the month of December, 2019.

Request body:

```
{
  "sort": [
    {
      "field": "createdOn",
      "direction": "desc"
    }
  ],
  "filter": {
    "operator": "and",
    "operands": [
      {
        "operator": "gt",
        "field": "createdOn",
        "value": "2019-12-01T00:00:00.001Z"
      },
      {
        "operator": "lt",
        "field": "createdOn",
        "value": "2019-12-31T23:59:59.999Z"
      },
      {
        "operator": "eq",
        "field": "status",
        "value": "Unsuccessful"
      },
      {
        "operator": "substring",
        "field": "activityType",
        "value": "LOGIN"
      }
    ]
  }
}
```

```

    {
      "operator": "substring",
      "field": "userName",
      "value": "joe.typical@myemiil.com"
    }
  ]
},
"page": {
  "length": "1000",
  "offset": "0"
}
}

```

4. Send the request.

The response for this example returns data for the date filter, sorting, and pagination. If no filtering is used in the request, a successful response returns all pages for the specified Control Room.

Response body:

```

{
  "page": {
    "offset": 0,
    "total": 731064850,
    "totalFilter": 9
  },
  "list": [
    {
      "id": "XlHj6G4BFXSp00ji5B7S",
      "eventDescription": "User does not exist in Control Room.",
      "activityType": "LOGIN",
      "environmentName": "",
      "hostName": "12.xxx.xx.x",
      "userName": "joe.typical@myemiil.com",
      "status": "Unsuccessful",
      "source": "Control Room",
      "objectName": "N/A",
      "detail": "",
      "createdOn": "2019-12-09T04:21:19Z",
      "requestId": "04965c2e-82e0-4ce4-a88d-bebe1dc3a2a8",
      "createdBy": "0"
    },
    {
      "id": "g1Hj6G4BFXSp00ji2Rwx",
      "eventDescription": "User does not exist in Control Room.",
      "activityType": "LOGIN",
      "environmentName": "",
      "hostName": "12.xxx.xx.x",
      "userName": "joe.typical@myemiil.com",
      "status": "Unsuccessful",
      "source": "Control Room",
      "objectName": "N/A",
      "detail": "",
      "createdOn": "2019-12-09T04:21:16Z",
      "requestId": "61672553-477d-4012-ab47-2a27f6553c4e",
      "createdBy": "0"
    },
    .....
    {
      "id": "ETyk6G4BFXSp00jiaJjt",
      "eventDescription": "User does not exist in Control Room.",
      "activityType": "LOGIN",
      "environmentName": "",
      "hostName": "12.xxx.xx.x",

```

```

    "userName": "joe.typical@myemiil.com",
    "status": "Unsuccessful",
    "source": "Control Room",
    "objectName": "N/A",
    "detail": "",
    "createdOn": "2019-12-09T03:11:58Z",
    "requestId": "ebeb01de-1f81-4a7c-8978-405806e146bd",
    "createdBy": "0"
  }
]
}

```

The REST API responds to each request with an HTTP response code. For response codes, see [API response codes](#).

Related concepts

[Example of createdOndate and userName filters in Audit API](#)

Create a filter that retrieves audit log entries for a specified date range for a user with a specific value in the **userName** field.

Example of createdOndate and userName filters in Audit API

Create a filter that retrieves audit log entries for a specified date range for a user with a specific value in the **userName** field.

Use filtering to help narrow your results. The following example identifies unsuccessful login attempts for users with the value "john, doe" in the **userName** field from December 1, 2020 through December 31, 2020.

Request body:

```

{
  "sort": [
    {
      "field": "createdOn",
      "direction": "desc"
    }
  ],
  "filter": {
    "operator": "and",
    "operands": [
      {
        "operator": "gt",
        "field": "createdOn",
        "value": "2020-12-01T00:00:00.001Z"
      },
      {
        "operator": "lt",
        "field": "createdOn",
        "value": "2020-12-31T23:59:59.999Z"
      },
      {
        "operator": "eq",
        "field": "status",
        "value": "Unsuccessful"
      }
    ],
    {
      "operator": "substring",
      "field": "activityType",

```

```

      "value": "LOGIN"
    },
    {
      "operator": "substring",
      "field": "userName",
      "value": "john,doe"
    }
  ]
},
"page": {
  "length": "1000",
  "offset": "0"
}
}

```

This request identified three audit log entries out of 731,148.339 entries from this Control Room log entries.

Response body:

```

{
  "page": {
    "offset": 0,
    "total": 731148339,
    "totalFilter": 3
  },
  "list": [
    {
      "id": "kLjB8G4BFXSp00jiomK1",
      "eventDescription": "User does not exist in Control Room.",
      "activityType": "LOGIN",
      "environmentName": "",
      "hostName": "50.xxx.xxx.xx",
      "userName": "john,doe@mycompany.com",
      "status": "Unsuccessful",
      "source": "Control Room",
      "objectName": "N/A",
      "detail": "",
      "createdOn": "2020-12-10T17:00:52Z",

      "createdBy": "0"
    },
    {
      "id": "7bjB8G4BFXSp00jicEGO",
      "eventDescription": "User does not exist in Control Room.",
      "activityType": "LOGIN",
      "environmentName": "",
      "hostName": "50.xxx.xxx.xx",

```

```

    "userName": "john,doe",
    "status": "Unsuccessful",
    "source": "Control Room",
    "objectName": "N/A",
    "detail": "",
    "createdOn": "2020-12-10T17:00:39Z",
    "requestId": "64184450-aad5-4024-bcf5-491fb5276d0c",
    "createdBy": "0"
  }
]
}

```

The REST API responds to each request with an HTTP response code. For response codes, see [API response codes](#).

Related concepts

[Filtering, pagination, and sorting](#)

The Control Room API supports filtering, pagination, and sorting for endpoints that return arrays of resources.

Related tasks

[Audit API](#)

Use the Audit API to request audit data for a given input combination of date filter, sorting mechanism, and pagination.

Device API

Identify all available users with unattended Bot Runner licenses, or filter for users by name.

Note: You can view the in the , but API functionality is limited. You need a licensed Edition to access the full functionality of the APIs.

[Return available Bot Runners](#)

Return a list of available users with unattended Bot Runner licenses. This endpoint returns the user id, which is a numeric value that is used by APIs to identify users.

```
POST <control_room_URL>/v1/devices/runasusers/list
```

List available unattended Bot Runners API

Return a list of available users with unattended Bot Runner licenses. This endpoint returns the user id, which is a numeric value that is used by APIs to identify users.

Note: You can view the in the , but API functionality is limited. You need a licensed Edition to access the full functionality of the APIs.

- All API calls must contain an authentication token in the request header. Use the [Authentication API](#) to generate a JSON web token. See [Authentication API](#).
- You must be assigned a custom role that is associated with a Run As user device.

1. Add the authentication token to the request header.

- Use the POST method and endpoint URL: <your_control_room_url>/v1/devices/runasusers/list.

Request body:

```
{
  "sort": [
    {
      "field": "username",
      "direction": "asc"
    }
  ],
  "filter": {},
  "page": {}
}
```

Filtering, pagination, and sorting

- Send the request.

Response body: In a successful request, this endpoint returns the following data:

- id:** a unique numeric identifier for a user with the Bot Runner license.
- device:** if the user is configured with a default device, the device name is returned. For example, DESKTOP-DBO6SIE. Otherwise, this parameter returns the message Picked at run time, indicating that a device must be selected from a device pool in order to run a bot.

```
{
  "page": {

If you are performing the steps to deploy a bot or to create an automation schedule, and the user associated with the Bot Runner license does not have a default device assigned or if you want to select a different device, perform this task: [List device pools API](#).

To deploy a bot that runs on the default device assigned to the Bot Runner user, perform this task: [Bot deployment - V3](#).

To create an automation schedule with a bot that runs on the default device assigned to the Bot Runner user, perform this task: [Schedule bot to run API](#).

Related reference

[Bot deployment - V3](#)

As a user with a Bot Runner license, deploy bots on your assigned devices. You can also pass variables to bots when they are deployed.

Assign default device API

Use the default device allocation API to set a specific device as the default deployment device for the specific user.

Note: You can view the in the , but API functionality is limited. You need a licensed Edition to access the full functionality of the APIs.

- All API calls must contain an authentication token in the request header. Use the [Authentication API](#) to generate a JSON web token. See [Authentication API](#).
- You must have User management rights or admin rights.

1. Add the authentication token to the request header.
2. Use the POST, PUT, GET, DELETE method and endpoint URL: `<your_control_room_url>/runasusers/default`.

Request body:

Enter the valid `deviceId` and `userId`.

```

{
  "deviceId": 1046,
  "userId": 589
}

```

3. Send the request.

When the request is successful, a default device is allocated to the specified user. Now this device will be used as default for the deployment.

Response body:

In this example, the `deviceId` with value 1046 is allocated as default device for the specified user with `userId` 589.

```
{
  "deviceId": 1046,
  "userId": 589
}
```

The REST API responds to each request with an HTTP response code. For response codes, see [API response codes](#).

Trigger API

Map triggers to users or roles for an attended Bot Runner user by using the Trigger API. With the Trigger API, you can also create and delete event triggers.

Note: You can view the in the , but API functionality is limited. You need a licensed Edition to access the full functionality of the APIs.

Create an event trigger

Create an event trigger for a Bot Runner user, role, or bot file. Ensure that the associated users and roles have a Bot Runner license.

Request

```
POST http://{{ControlRoomURL}}/v1/triggers/triggermapping
```

```
Header: X-Authorization <<authentication token>>
```

All API calls must contain an authentication token in the request header. Use the [Authentication API](#) to generate a JSON web token. See [Authentication API](#).

Request body for users:

```
{
  "botFileId":106587,
  "botFileLabel":"string",
  "users":{
    "userIds":[
      "985"
    ]
  }
}
```

Request body for roles:

```
{
```

```

"botFileId":106587,
"botFileLabel":"string",
"roles":{
  "roleIds":[
    721, 645
  ]
}
}

```

Request Parameters

Parameter	Type	Required	Description
botFileId	Integer	Yes	Unique identifier of the bot file.
botFileLabel	String	No	Bot file label. It can be PRODUCTION or empty for the latest version.
userIds	Array	Yes*	<p>Enter the IDs of the user. Only the users listed here will be associated with the trigger.</p> <hr/> <p>Note: The user associated with these <code>userIds</code> must have a Bot Runner license to run the API.</p>
roleIds	Array		<p>Enter the IDs of the role. Only the roles listed here will be associated with the trigger.</p> <hr/> <p>Note: The users associated with these <code>roleIds</code> must have a Bot Runner license to run the API.</p>
*One of the previously mentioned parameters is required to create an event trigger.			

Response

```

{
  "triggerMappings": [
    {
      "id": "399",
      "userId": "985",
      "botPath": "Automation Anywhere\\Bots\\botA",
      "modifiedBy": "289",
      "lastModified": "2022-04-06T09:09:43.893256Z",
      "botName": "botA",
      "botId": "106587",
      "botLabel": "string"
    }
  ]
}

```

Response Parameters

Parameter	Type	Description
triggerMappings	Array	<p>The triggerMappings array returns with all the details of the triggerMapping created. Each array element contains the following values:</p> <ul style="list-style-type: none"> • id: ID of the trigger mapping • userId: ID of the user • roleId: ID of the role • botPath: The path of the bot • modifiedBy: The ID of the user that did the triggerMapping • lastModified: The timestamp of the triggerMapping • botName: The name of the bot that got the triggerMapping. • botId - The Id of the bot that got the triggerMapping • botLabel: The label of the bot that got the triggerMapping • licenseFeatures: License assigned to the user

Delete an event trigger

Delete an event trigger that is associated with a user, role, or bot.

Request

```
DELETE http://{{ControlRoomURL}}/v1/triggers/triggermapping/{id}
```

```
Header: X-Authorization <<authentication token>>
```

All API calls must contain an authentication token in the request header. Use the [Authentication API](#) to generate a JSON web token. See [Authentication API](#).

Request Parameters

Parameter	Type	Description
Id	Integer	Event trigger identifier that you want to delete

Response

```
204 No Content
The relationship was deleted.
```

For more information about return codes, see [API response codes](#).

Credential Vault APIs

As an Control Room user with **Manage my credentials and lockers** feature permissions, you have the option to use the Credential Vault API to manage your attributes, credentials, and lockers in the Control Room.

Note: You can view the in the , but API functionality is limited. You need a licensed Edition to access the full functionality of the APIs.

By default, all users can create credentials. You are the Credential owner of any credentials that you created. As a Credential owner, you can update, delete, and transfer the ownership of your credentials.

Configure the Credential Vault for your organization

As a Locker admin, configure a locker and a credential, then assign the credential to the locker. It is also acceptable to first configure a credential, then a locker.

1. [Authenticate the user.](#)
Use the POST method to generate an authentication JSON Web Token.
2. [Configure a locker using API](#)
3. [Configure a credential with attribute values using API](#)
4. [Assign credential to locker API](#)

Manage your credentials

Authenticate yourself as a basic user to retrieve the list of credentials that you have access to then assign a value to a specific attribute.

1. [Authenticate the user.](#)
Use the POST method to generate an authentication JSON Web Token.
2. [List credentials using API](#)

3. *Update attribute values*

Retrieve masked credentials

You will be able to retrieve your masked credentials, if you have **View and edit ALL credentials attributes value** permissions.

1. *Authenticate the user.*

Use the POST method to generate an authentication JSON Web Token.

2. Get the Masked Attribute Value (For more information, see [Get Masked credentials](#))

- a. Get Credential ID.
- b. Get Credential Attribute ID.
- c. Use the Credential ID and Credential Attributed ID to retrieve the masked attribute value.

Set device login credentials API

Use the login setting endpoint of the Credential Vault API to update the user name and password for a device. You can use this endpoint to set or update the login credentials for your own device without additional permissions. To set or update the login credentials on other users' devices, for example, to deploy bots on unattended Bot Runners, you must have the AAE_admin role or a custom role with the Bot Auto-Login Credentials API permission.

Request

To update the credentials for your own device, you only need the device username and password:

```
PUT http://{{ControlRoomURL}}/v2/credentialvault/loginsetting
```

Request body:

```
{
  "loginUsername": "aai\\jane.doe",
  "loginPassword": "Automation123"
}
```

To update the credentials for another user's device, you must also include either the username or userid of that user, as demonstrated in this code example:

```
{
  "loginUsername": "aai\\jane.doe",
  "loginPassword": "Automation123",
  "username": "john-doe"
}
```

Request Parameters

Parameter	Type	Description
loginUsername	String	Enter the device login user name.
loginPassword	String	Enter the device login password.
username	String	Enter the user name of the user's device you want to update/set.

Response

```
"Credentials updated for jane"
```

Note: For an Control Room that is deployed on Cloud and has SAML authentication enabled, generate the web token with your `username` and `apiKey`.

Authenticate (username and apiKey)

Configure a locker using API

Use a combination of endpoints to create a locker and assign locker access permissions to users.

Note: You can view the in the , but API functionality is limited. You need a licensed Edition to access the full functionality of the APIs.

- All API calls must contain an authentication token in the request header. Use the `Authentication API` to generate a JSON web token. See *Authentication API*.
- You must be assigned the **AAE_Admin**, **AAE_Locker Admin** role or have a custom role that includes the `Manage my lockers` permission.

You will provide the role ID to assign consumer access to users *List roles*.

1. Add the authentication token to the request header.
2. Use the POST method and endpoint URL: `<your_control_room_url>/v2/credentialvault/lockers` to create the locker.

Request body:

```
{
  "name": "HumanResourcesCredentials",
  "description": "Login credentials for the HR dept"
}
```

3. Send the request.

Response body: In a successful request, this endpoint returns the `id`, which is a unique numeric identifier for the locker. Use the locker ID in subsequent API requests, such as to add consumers or credentials to the locker.

```
{
  "id": "1551",
  "name": "HumanResourcesCredentials",
  "description": "Login credentials for the HR dept",
  "createdBy": "1508",
  "createdOn": "2020-12-28T22:24:40.462253Z",
  "updatedBy": "1508",
  "updatedOn": "2020-12-28T22:24:40.462259Z",
  "version": "0"
}
```

The REST API responds to each request with an HTTP response code. For response codes, see [API response codes](#).

Assign locker access permissions to users. [Locker permissions](#)

4. Optional: Assign another locker owner. Use the PUT method and endpoint

URL:<your_control_room_url>/v2/credentialvault/lockers/{lockerId}/members/{userId}.

Note: The locker creator is automatically assigned the locker owner permission.

Request body:

```
{
  "permissions": [
    "own"
  ]
}
```

5. Send the request.

Response body: This endpoint does not return data.

6. Optional: Assign a locker manager. Use the PUT method and endpoint

URL:<your_control_room_url>/v2/credentialvault/lockers/{lockerId}/members/{userId}.

Request body:

```
{
  "permissions": [
    "manage"
  ]
}
```

7. Send the request.

Response body: This endpoint does not return data.

8. Optional: Assign a locker participant. Use the PUT method and endpoint

URL:<your_control_room_url>/v2/credentialvault/lockers/{lockerId}/members/{userId}.

Request body:

```
{
  "permissions": [
    "participate"
  ]
}
```

```
}

```

9. Send the request.

Response body: This endpoint does not return data.

10. Assign locker consumers. Use the POST method and endpoint URL:: <your_control_room_url>/v2/credentialvault/lockers/{lockerId}/consumers

Request body: Provide the role ID. All users who are assigned that custom role can build and run bots using the credentials in this locker, as well as enter values into credentials that accept user-provided attribute values.

```
{
  "id": "516"
}
```

11. Send the request.

Response body: This endpoint does not return data.

If you are following the steps to configure your Credential Vault, do this next: [Assign credential to locker API](#).

Configure a credential with attribute values using API

Create a credential with a standard attribute and add two additional attributes with user-input values.

Note: You can view the in the , but API functionality is limited. You need a licensed Edition to access the full functionality of the APIs.

- All API calls must contain an authentication token in the request header. Use the [Authentication API](#) to generate a JSON web token. See [Authentication API](#).
- All roles have the `Manage my credentials` and `lockers` permission that is necessary to configure credentials and attributes. No additional permissions are necessary to use this endpoint.

In this example, you configure a credential with three attributes to hold email hostname, username, and password.

1. Add the authentication token to the request header.

Create a credential:

2. Use the POST method and endpoint URL: <your_control_room_url>/v2/credentialvault/credentials.

Request body: This example request includes the following required parameters:

- `userProvided`: a boolean value that configures whether the attribute requires a user's input (**true**) or is standard for all users (**false**).
- `masked`: a boolean value that configures whether the attribute value is masked with asterisks (**true**) or is visible to users (**false**).

```
{
  "name": "Email",
  "attributes": [
    {
      "name": "hostname",
      "userProvided": false,
      "masked": false
    }
  ]
}
```

3. Send the request.

Response body: In a successful request, this endpoint returns the following data:

- `id`: a unique numeric identifier for the credential.
- `attributes.id`: a unique numeric identifier for attribute.

```
{
  "id": "1630",
  "name": "Email",
  "description": "",
  "ownerId": "1508",
  "attributes": [
    {
      "id": "3335",
      "name": "hostname",
      "description": "",
      "userProvided": false,
      "masked": false,
      "createdBy": "1508",
      "createdOn": "2020-12-28T22:04:41.366448Z",
      "updatedBy": "1508",
      "updatedOn": "2020-12-28T22:04:41.366450Z",
      "version": "0",
      "passwordFlag": false
    }
  ],
  "createdBy": "1508",
  "createdOn": "2020-12-28T22:04:41.366460Z",
  "updatedBy": "1508",
  "updatedOn": "2020-12-28T22:04:41.366464Z",
  "version": "0"
}
```

The REST API responds to each request with an HTTP response code. For response codes, see [API response codes](#).

Assign a standard value to the hostname attribute to the credential:

4. Use the POST method and endpoint URL: <your_control_room_url>/v2/credentialvault/credentials/{credentialId}/attributevalues.

```
{
  "list": [
    {
      "credentialAttributeId": "3335",
      "value": "mail.example.com"
    }
  ]
}
```

5. Send the request.

Response body:

```
{
  "list": [
    {
      "id": "1630",
      "credentialAttributeId": "3335",
      "value": "mail.example.com",
      "userId": "1508",
      "createdBy": "1508",
      "createdOn": "2020-12-28T22:04:41.366460Z",
    }
  ]
}
```

```

    "updatedBy": "1508",
    "updatedOn": "2020-12-28T22:04:41.366464Z",
    "version": "0"
  }
]
}

```

6. Add the `username` and `password` attributes to the `Email` credential. Use the `PUT` method and endpoint URL: `<your_control_room_url>/v2/credentialvault/credentials/{credentialId}`.

Note: You must include the existing attributes along with the new attributes in the request, otherwise the current attributes will be overwritten.

Request body: Since you have specified the credential ID in the request URL, it is not required to include the credential ID or name in the request body. In this example request body, the `username` and `password` attributes are configured with values that accept a different input from each user. Additionally, the `password` attribute is configured to mask the entered value with asterisks.

```

{
  "attributes": [
    {
      "name": "username",
      "userProvided": true,
      "masked": false
    },
    {
      "name": "password",
      "userProvided": true,
      "masked": true
    },
    {
      "name": "hostname",
      "userProvided": false,
      "masked": false
    }
  ]
}

```

7. Send the request.

Response body: The response body returns the credential with details of the three attributes.

```

{
  "id": "1630",
  "name": "Email",
  "description": "",
  "ownerId": "1508",
  "attributes": [
    {
      "id": "3335",
      "name": "hostname",
      "description": "",
      "userProvided": false,
      "masked": false,
      "createdBy": "1508",
      "createdOn": "2020-12-28T22:04:41.366448Z",
      "updatedBy": "1508",
      "updatedOn": "2020-12-28T22:04:41.366450Z",
      "version": "0",
      "passwordFlag": false
    },
    {

```

```

        "id": "3336",
        "name": "username",
        "description": "",
        "userProvided": true,
        "masked": false,
        "createdBy": "1508",
        "createdOn": "2020-12-28T22:04:41.366450Z",
        "updatedBy": "1508",
        "updatedOn": "2020-12-28T22:04:41.366450Z",
        "version": "0",
        "passwordFlag": false
    },
    {
        "id": "3337",
        "name": "password",
        "description": "",
        "userProvided": true,
        "masked": true,
        "createdBy": "1508",
        "createdOn": "2020-12-28T22:04:41.366450Z",
        "updatedBy": "1508",
        "updatedOn": "2020-12-28T22:04:41.366450Z",
        "version": "0",
        "passwordFlag": false
    }
],
"createdBy": "1508",
"createdOn": "2020-12-28T22:04:41.366460Z",
"updatedBy": "1508",
"updatedOn": "2020-12-28T22:06:35.366464Z",
"version": "2"
}

```

If you are following the steps to configure your Credential Vault, do this next: [Assign credential to locker API](#).

Assign credential to locker API

Add a credential to a locker to enable other users to access the credential to build and run bots.

Note: You can view the in the , but API functionality is limited. You need a licensed Edition to access the full functionality of the APIs.

- All API calls must contain an authentication token in the request header. Use the [Authentication API](#) to generate a JSON web token. See [Authentication API](#).
- You must have **own**, **manage**, or **participate** access permissions to the locker.

To assign a credential to a locker, you provide the credential and locker IDs in the URL.

1. Add the authentication token to the request header.
2. Use the PUT method and endpoint URL:: <your_control_room_url>/v2/credentialvault/lockers/{lockerId}/credentials/{credentialId}.
Request body: This endpoint does not have a request body.
3. Send the request.
Response body: This endpoint does not return data.

List credentials using API

Return a list of the credentials for which you are the owner or have access through a locker. If you have the **AAE_Locker Admin** role, this endpoint returns all the credentials in the Control Room.

Request

```
POST http://{{ControlRoomURL}}/v2/credentialvault/credentials/list
```

```
Header: X-Authorization <<authentication token>>
```

All API calls must contain an authentication token in the request header. Use the [Authentication API](#) to generate a JSON web token. See [Authentication API](#).

You must have access to the credential, either as the credential owner or through a locker.

Request body:

```
{
  "filter": {
    "operator": "and",
    "operands": [
      {
        "operator": "gt",
        "field": "createdOn",
        "value": "2022-10-12T00:00:00.123Z"
      },
      {
        "operator": "lt",
        "field": "createdOn",
        "value": "2022-10-12T23:00:00.123Z"
      }
    ]
  },
  "sort": [
    {
      "field": "name",
      "direction": "asc"
    }
  ],
  "page": {
    "offset": 0,
    "length": 100
  }
}
```

Request Parameters

Parameter	Type	Required	Description
consumed	Boolean	No	Filter credentials by fact if credential is user Provided and consumed by current user.

Parameter	Type	Required	Description
sort	Array	No	By default, search results are sorted in ascending order of the IDs. To specify an alternate sorting, use the sort query parameter. Enter the field by which you want to sort along with the direction <code>asc</code> (ascending) or <code>desc</code> (descending).
filter	Object	No	Filters the result based on operator, field, or value. operator Allowed enumerations are NONE, lt, le, eq, ne, ge, gt, substring, and, or, not. field Allowed values are name, lastModified, path, or folder. value Specify a value for the name, lastModified, path, or folder that you have selected in the field parameter.
page	Object	No	The page object allows you to get the desired number of pages.

For more information on Filtering, Pagination, and Sorting, see [Filtering, pagination, and sorting](#).

Response

```
{
  "page": {
    "offset": 0,
    "total": 7,
    "totalFilter": 1
  },
  "list": [
    {
      "id": "307",
      "name": "Sample-Credential",
      "description": "Test credential Created from API request",
      "completed": true,
      "lockerId": "15",
      "ownerId": "21",
      "attributes": [
        {
          "id": "916",
          "name": "Username",
          "description": "Username for a sample API call",
          "userProvided": false,
          "masked": false,
          "passwordFlag": false,
          "createdBy": "21",
          "createdOn": "2022-10-28T00:15:09.319987Z",
          "updatedBy": "21",
          "updatedOn": "2022-10-28T00:15:09.319988Z",
          "version": "0"
        }
      ]
    }
  ]
}
```

```

    }
  ],
  "createdBy": "21",
  "createdOn": "2022-10-12T20:42:32.896315Z",
  "updatedBy": "21",
  "updatedOn": "2022-10-12T20:42:32.896317Z",
  "version": "0"
}
]
}
400
Bad Request

```

Response parameters

Parameter	Type	Description
offset	Integer	The starting list offset, used for pagination.
total	Integer	Total number of records.
totalFilter	Integer	Number of records after applying the filter.
List	Array	The list of directories and files.
List objects		
id	Integer	The unique ID of the credential.
name	String	Name of the credential.
description	String	Description of credential
completed	Boolean	Shows if consumer(s) needs to provide a value for user-provided attr
lockerId	String	Id of the locker which has this credential, can be null if the credential assigned to any locker
ownerId	String	Id of Credential owner User

Parameter	Type	Description
attributes	Object	Displays the credential attributes: <ul style="list-style-type: none"> id Id of credential attribute name Name of credential description Description of credential attribute userProvided A flag to indicate if the credential attribute is user-provided or system-provided masked A flag to indicate if the credential attribute value is masked passwordFlag A flag to indicate if the credential attribute is used for password input fields createdBy Id of the user who created the object createdOn Creation date of the object updatedBy Id of the user who made a latest update on the object updatedOn Latest updated date of the object version Version of the object, has to be provided by the client to track simultaneous updates
createdBy	String	Id of the user who created the object
createdOn	String	Creation date of the object.
updatedBy	String	Id of the user who made a latest update on the object
updatedOn	String	Latest updated date of the object
version	String	Version of the object, has to be provided by the client to track simultaneous updates

Now that you have the IDs of attributes that accept a user-input value, next [Update attribute values](#).

Note: You can view the [attributes](#) in the [Control Room](#), but API functionality is limited. You need a licensed [Enterprise](#) Edition to access the full functionality of the APIs.

The REST API responds to each request with an HTTP response code. For response codes, see [API response codes](#).

Update attribute values

Update either a standard or user-input value to an attribute, based on your access permissions to the credential. A standard value is accessible by all users of the credential; an attribute with a user-input value enables each user to provide their own value which the other users cannot access.

Request

```
POST https://{ControlRoomURL}/v2/credentialvault/credentials/
{credentialId}/attributevalues
```

```
Header: X-Authorization <<authentication token>>
```

All API calls must contain an authentication token in the request header. Use the [Authentication API](#) to generate a JSON web token. See [Authentication API](#).

Tip:

- To set the standard value, you must have access to the credential, either as the credential owner or as a locker Admin or Manager.
- To set the user-input value, you must have access to the credential, either as the credential owner or as a locker consumer.
- Verify whether the attribute accepts a standard or user-input value. This is indicated in the userProvided output parameter. [List credentials using API](#).

Request body:

```
{
  "list": [
    {
      "credentialAttributeId": "890",
      "value": "aVerySecurePassword"
    }
  ]
}
```

Request Parameters

Parameter	Type	Required	Description
credentialAttributeId	String	Yes	Id of credential attribute.
value	String	Yes	Value of credential attribute.

Response

```
201 Created
```

For more information on the return codes, see [API response codes](#).

```
{
  "list": [
    {
      "id": "131",
      "credentialAttributeId": "890",
      "value": "00172qLH9JgAHUB21vCGj4ZheVokDL6unV1HIX8rWUw=",
      "userId": "38",
      "createdBy": "38",
      "createdOn": "2022-09-22T14:42:02.876540Z",
      "updatedBy": "38",
      "updatedOn": "2022-09-22T14:42:02.876544Z",
      "version": "0",
      "password": false
    }
  ]
}
```

Response Parameters

Parameter	Type	Description
id	String	Id of credential attribute value.
credentialAttributeId	String	Id of credential attribute.
value	String	Value of credential attribute.
userId	String	Id of user to which the value belongs to.
createdBy	String	Id of the user who created the Credential.
createdOn	String	Date of creation of the Credential.
updatedBy	String	Id of the user who made a latest update on the Credential.
updatedOn	String	Date of the latest update of the Credential.
version	String	Version of the Credential, has to be provided by the client to track successive updates.
password	Boolean	Flag to indicate if there is a password set to the Credential.

Note: You can view the `credentialAttributeId` in the `credentialAttributeId`, but API functionality is limited. You need a licensed `Enterprise` Edition to access the full functionality of the APIs.

The REST API responds to each request with an HTTP response code. For response codes, see [API response codes](#).

Get Masked credentials

Use the `credentialAttributeValues` endpoint of the Credential Vault API to get the masked credentials.

Note: You can view the `credentialAttributeId` in the `credentialAttributeId`, but API functionality is limited. You need a licensed `Enterprise` Edition to access the full functionality of the APIs.

- All API calls must contain an authentication token in the request header. Use the `Authentication` API to generate a JSON web token. See [Authentication API](#).
- You will be able to retrieve your masked attributes using the API and with **View and edit ALL credentials attributes** permission.

1. Use the POST method and endpoint URL: `<control_room_URL>/v2/credentialvault/credentials/list`.

Request body:

The following example will look for the credential called `ED10355` using POST with the endpoint `<control_room_URL>/v2/credentialvault/credentials/list`

```
{
  "filter":{
    "operator":"and",
    "operands":[
      {
        "operator":"eq",
        "field":"name",
        "value":"ED10355"
      }
    ]
  }
}
```

2. Send the request.

Response body:

```
{
  "page": {
    "offset": 0,
    "total": 6,
    "totalFilter": 1
  },
  "list": [
    {
      "id": "25",
      "name": "ED10355",
      "description": "",
      "ownerId": "132",
      "attributes": [
        {
          "id": "90",
          "name": "name",
          "description": "",
          "userProvided": false,
          "masked": true,
          "createdBy": "132",
          "createdOn": "2022-01-28T19:21:59.388237Z",
          "updatedBy": "132",
          "updatedOn": "2022-01-28T19:45:57.351698900Z",
          "version": "2",
          "passwordFlag": false
        }
      ]
    },
    {
      "createdBy": "132",
      "createdOn": "2022-01-28T19:21:59.388237Z",
      "updatedBy": "132",
      "updatedOn": "2022-01-28T19:45:57.353647200Z",
      "version": "2",
      "completed": false,
    }
  ]
}
```

```

    "externalVaultCredentialName": ""
  }
]
}

```

Note: The response shows the credential id ("id": "25") and credential attribute id ("id": "90"). In case if you want to retrieve the attribute id, to see if it has masked values or not. Use the GET method with the `v2/credentialvault/credentials/25` to list the attributes pertaining to the credential id ("id": "25").

- To get the masked attribute value, use the GET method with the endpoint `<control_room_URL>/v2/credentialvault/credentials/25/attributevalues?credentialAttributeId=90`

Note: You will be able to view your masked credential attributes, only if you have the **View and edit ALL credentials attributes**. You will not be able to view the masked credential attributes of other users.

- Send the request.

Response body:

```

{
  "list": [
    {
      "id": "46",
      "credentialAttributeId": "90",
      "value": "maskedsecret",
      "createdBy": "132",
      "createdOn": "2022-01-28T19:21:59.635310800Z",
      "updatedBy": "132",
      "updatedOn": "2022-01-28T19:40:04.495291100Z",
      "version": "1",
      "password": false
    }
  ]
}

```

The REST API responds to each request with an HTTP response code. For details about the response codes, see [API response codes](#).

Bot Execution Orchestrator API

As a Control Room administrator or a user with **View and Manage Scheduled Activity** permission, you can monitor the bot progress using a set of Control Room APIs.

Note: You can view the in the , but API functionality is limited. You need a licensed Edition to access the full functionality of the APIs.

High-level process for monitoring bots

Searchable fields for devices:

- hostName:** The host name of the device configured as a Bot Runner. If a naming convention is used for host names, searching on a unique **substring** in the host name is an effective way to identify Bot Runner devices.

- **userId:** The unique numeric identification for a specific user also identifies the Bot Runner device. Unique user naming conventions can be used to identify users and devices that are licensed and configured as Bot Runners.

Searchable fields for bots:

- **name:** The unique name of a bot. You can search on the exact name (**eq**) or a text string (**substring**) that is contained in the bots name.
- **path:** The relative path of a folder in the Control Room. You can search on a full path or a **substring** contained in the path.

Request device details

Use this API to retrieve a list of devices that are available for bot deployment.

Roles and license

You have to authenticate as a user with an **Unattended bot runner license**.

- **URL:**

```
http://<your_control_room_url>/v2/devices/list
```

- **Method: POST**

Supported filterable parameters:

id

The numeric identifier for a device.

- **Field:** id
- **Type:** integer

```
{
  "filter": {
    "operator": "eq",
    "value": "7",
    "field": "id"
  }
}
```

hostName

The name of the registered device.

- **Field:** hostName
- **Type:** string

```
{
  "filter": {
    "operator": "substring",
    "value": "AA",
    "field": "hostName"
  }
}
```

userId

A unique numeric identifier for the user associated with the registered device.

- **Field:** userId

- **Type: long**

```
{
  "filter": {
    "operator": "eq",
    "value": "13",
    "field": "userId"
  }
}
```

status

The connection status of device.

- **Field: status**
- **Type: string**

```
{
  "filter": {
    "operator": "eq",
    "value": "CONNECTED",
    "field": "status"
  }
}
```

This task requests a list of all devices with a specific string in the hostname parameter and specific status of the device. Use the list in the response to identify which devices are connected and available to run bots.

1. Use the **POST** method to generate an authentication JSON Web Token. Add the generated authentication token to the request header.

[Authentication API](#)

2. Select the **POST** method.
3. Enter the URL for the API:

```
https://<your_control_room_url>/v2/devices/list
```

4. In the request body, add the filtering, sorting, and pagination rules to retrieve the device list that you want to deploy.

Note: The `fields` array filter parameter in the request body is currently not supported. When you send the field name in the request body to restrict the number of fields in the response, it does not work as expected and instead returns all the fields.

For example, this request body uses "and" as `operator` and the device "status" and "hostname" as `field` to filter the required results. The results will be sorted in "descending" order based on "status".

```
{
  "sort": [
    {
      "field": "status",
      "direction": "desc"
    }
  ],
  "filter": {
    "operator": "and",
    "operands": [
      {
        "operator": "eq",
```

```

        "value": "CONNECTED",
        "field": "status"
      },
      {
        "operator": "substring",
        "value": "win",
        "field": "hostName"
      }
    ]
  },
  "page": {
    "offset": 0,
    "total": 71,
    "totalFilter": 18,
    "length": 100
  }
}

```

5. Send the request.

- In a REST client, click **SEND**.
- In the Swagger interface, click **Execute**.

Response body:

The response returns the details of two devices that are in the "connected" status and for which the hostName starts with "win" based on the requested filter criteria.

```

{
  "page": {
    "offset": 0,
    "total": 71,
    "totalFilter": 7
  },
  "list": [{
    "id": "163",
    "type": "ATTENDED_BOT_RUNNER",
    "hostName": "winwlm-2",
    "userId": "",
    "userName": "",
    "status": "CONNECTED",
    "poolName": "",
    "fullyQualifiedHostName": "-",
    "updatedBy": "b2",
    "updatedOn": "2020-07-07T08:24:56.091061Z",
    "botAgentVersion": "12.1"
  }, {
    "id": "162",
    "type": "ATTENDED_BOT_RUNNER",
    "hostName": "winwlm-1",
    "userId": "",
    "userName": "",
    "status": "CONNECTED",
    "poolName": "",
    "fullyQualifiedHostName": "-",
    "updatedBy": "b1",
    "updatedOn": "2020-07-07T08:24:55.982047Z",
    "botAgentVersion": "12.1"
  }
}

```

You can use the device IDs received in the response to deploy the bots on Bot Runners.

Activity list (deprecated)

Returns a list of bot executions based on filtering, ordering, and pagination rules. Fetches execution details for specific automation id as returned by the deployment API.

Due to the challenges observed while using this endpoint Activity List API (`/v2/activity/list`), particularly with the use of `botOutVariables` with large tables. The size of the output variables should be limited to 3 MB – for more information, see [Your variables \(user-defined\)](#).

Note: This API `/v2/activity/list` is now in the sunset phase with the release of A360.25 and will be removed from release A360.27 to be released in December (January 2023 on A360 Cloud). As an alternative, use the new [Activity list](#).

If you want to get the `botOutVariables` or `callbackInfo`, use [Activity job execution](#).

Request

```
POST https://{{ControlRoomURL}}/v2/activity/list
```

```
Header: X-Authorization <<authentication token>>
```

All API calls must contain an authentication token in the request header. Use the [Authentication API](#) to generate a JSON web token. See [Authentication API](#).

Request body:

```
{
  "sort": [
    {
      "field": "endDateTime",
      "direction": "desc"
    }
  ],
  "filter": {
    "operator": "eq",
    "value": "UPDATE",
    "field": "status"
  },
  "page": {
    "length": 100,
    "offset": 0
  }
}
```

Filter the results using `automationId`, `deviceId`, `status`, or `deploymentId`. You can also use the combination of these filters to optimize your search results.

Request body using deploymentId:

```
{
  "filter": {
    "operator": "eq",
    "field": "deploymentId",
    "value": "14c2b6f8-c2a0-4a57-959d-ef413df0d179"
  }
}
```

Note: Use the empty filter or no filter to retrieve all the information in the search results.

Request Parameters

Parameter	Type	Required	Description
sort	Array	No	By default, search results are sorted in descending order. alternative sorting is specified using the sort query parameter. Enter the field by which you want to sort along with the desc (descending).
filter	Object	No	Filters the result.
fields	Array	No	Filter the result based on the fields.
page	Object	No	The page object allows you to get the desired pages.

For more information on Filtering, Pagination, and Sorting, see [Filtering, pagination, and sorting](#).

Response

200 OK

For more information on the return codes, see [API response codes](#).

```

Response Parameters

Parameter	Type	Description
offset	Integer	The starting list offset, used for pagination.
total	Integer	Total number of records.
totalFilter	Integer	Number of records after applying the filter.
List	Array	The array of List activity object.
List activity object		
id	Integer	The unique Id of a specific activity.
automationName	String	Name of the automation.
fileName	String	Bot file name.
filePath	String	The file path of the bot. Note: As filePath is deprecated, use Get Immediate Parents API , endpoint <pre>GET http://{{ControlRoomURL}}/v2/repository/files/parents</pre> to retrieve the file path based on the input file id.
type	String	File Type associated to this bot. Following are the possible values for <ul style="list-style-type: none"> TASK : A regular bot. RUN_NOW: A bot that is deployed to be run instantly WLM_TASK: A Work life cycle management. WORKFLOW: This is a part of WLM_TASK. WORKORDER: This is a part of WLM_TASK. AARI: A process bot.
startDate	String	The date and time of when this bot started.
endDate	String	The date and time of when this bot ended.
command	String	The current command the bot is on.

Parameter	Type	Description
status	String	The status of the bot. Following values are possible: <ul style="list-style-type: none"> COMPLETED: bot successfully completed execution. DEPLOYED: auto-login is successful and bot is deployed to a device. DEPLOY_FAILED: bot failed to deploy to the device. For example failed. QUEUED: requested user or device is busy running another execution. PENDING_EXECUTION: device has been selected, but bot has not yet been deployed to that device. RUNNING or UPDATE: bot is executing on a device. RUN_FAILED: bot failed after being deployed to a device. RUN_PAUSED: user paused the bot. RUN_TIMED_OUT: bot failed to complete tasks within a specific time. UNKNOWN: connection between the service and the device was lost.
progress	Integer	The progress of the bot in percentage.
totalLines	Integer	Total number of command lines the bot contains.
currentLine	Integer	The current line the bot is processing.
timeTaken	Integer	Time taken in milliseconds by the bot to complete the operation.
progress	Integer	The progress of the bot in percentage.
automationId	Integer	The Id of the automation.
userId	Integer	The Id of the user.
deviceId	Integer	The Id of the device.
currentLine	Integer	The current line the bot is processing.
totalLines	Integer	Total number of command lines the bot contains.
fileId	Integer	Unique Identifier of the bot file.
modifiedBy	Integer	The Id of the user who modified the activity.
createdBy	Integer	Id of the user who created the activity.
modifiedOn	String	The timestamp when it got modified.
createdOn	String	The creation timestamp of the activity.
deploymentId	String	The deployment Id of the bot.
queueName	String	Name of the queue.
queueId	String	Id of the queue.
usingRdp	Boolean	Flag that shows whether or not the bot is using remote deployment protocol.
message	String	Error message that returns details about the state of the execution.
canManage	Boolean	Flag to show if the bot can be managed.
deviceName	String	Name of the device.
userName	String	The user name of the user who is running the bot.
tenantUuid	String	The tenant's unique UUID.

Parameter	Type	Description
automationPriority	String	The automation Priority. By default it is set to <code>PRIORITY_MEDIUM</code> . Possible values for <code>automationPriority</code> includes: <code>PRIORITY_MEDIUM</code> , <code>PRIORITY_HIGH</code> , <code>PRIORITY_LOW</code> .
callbackInfo	String	<code>callbackInfo</code> provides the callback API URL (For example, https://callbackserver.com/storeBotExecutionStatus) and authentication token for the callback server. After the bot is deployed, the Control Room sends the deployment status and output variable values to this callback server. Note: The callback server must accept POST calls to receive the bot output data and the deployment status from the Control Room.
runElevated	Boolean	Flag showing whether the bot is deployed using elevated permissions. Possible values include - <code>false</code> , <code>true</code>
botLabel	String	Label for the bot. It can be used to distinguish bots from categories and testing
currentBotName	String	The bot's current bot name. It can change during the execution.
botOutVariables object		
Output	varies	A data structure containing all the Output Objects. See below for more details.
type*	Any	Possible values for <code>type</code> includes: <code>STRING</code> , <code>NUMBER</code> , <code>BOOLEAN</code> , <code>FILE</code> , <code>LIST</code> , <code>DICTIONARY</code> , <code>TABLE</code> , <code>VARIABLE</code> , <code>CONDITIONAL</code> , <code>WINDOW</code> , <code>TEXT</code> , <code>DATETIME</code> , <code>UIOBJECT</code> , <code>RECORD</code> , <code>EXCEPTION</code> , <code>CREDENTIAL</code> , <code>COORDINATE</code> , <code>IMAGE</code> , <code>REGION</code> , <code>PROPERTIES</code> , <code>TRIGGER</code> , <code>CONDITIONALGROUP</code> , <code>FORMELEMENT</code> , <code>HOTKEY</code> , and <code>WORKITEM</code> .
*The structure of the output varies depending on the output.		

Note: You can view the `botOutVariables` in the `botOutput` object, but API functionality is limited. You need a licensed `Enterprise` Edition to access the full functionality of the APIs.

The REST API responds to each request with an HTTP response code. For response codes, see [API response codes](#).

Activity list

Returns a list of bot executions based on filtering, ordering, and pagination rules. Fetches execution details for specific automation IDs as returned by the deployment API, with the exception of bot output variables and callback information.

Note: If you want to get the `botOutVariables` or `callbackInfo`, use [Activity job execution](#).

Request

```
POST https://{{ControlRoomURL}}/v3/activity/list
```

```
Header: X-Authorization <<authentication token>>
```

All API calls must contain an authentication token in the request header. Use the [Authentication API](#) to generate a JSON web token. See [Authentication API](#).

Request body:

```
{
  "sort": [
    {
      "field": "endDateTime",
      "direction": "desc"
    }
  ],
  "filter": {
    "operator": "eq",
    "value": "UPDATE",
    "field": "status"
  },
  "page": {
    "length": 100,
    "offset": 0
  }
}
```

Filter the results using `automationId`, `deviceId`, `status`, or `deploymentId`. You can also use a combination of these filters to optimize your search results.

Request body using deployment ID:

```
{
  "filter": {
    "operator": "eq",
    "field": "deploymentId",
    "value": "14c2b6f8-c2a0-4a57-959d-ef413df0d179"
  }
}
```

Note: Use the empty filter or no filter to retrieve all the information in the search results.

Request parameters

Parameter	Type	Required	Description
sort	Array	No	By default, search results are sorted in descending order with respect to the field. If an alternative sorting is specified using the sort query parameter, the results are sorted according to the specified field and direction. Enter the field by which you want to sort along with the direction <code>asc</code> (ascending) or <code>desc</code> (descending). For more information on sorting, see Filtering, pagination, and sorting .
filter	Object	No	Filters the result. For more information on sorting, see Filtering, pagination, and sorting .

Parameter	Type	Required	Description
fields	Array	No	Filter the result based on the fields.
page	Object	No	The page object allows you to get the desired pages. For more information on pagination rules, see Filtering, pagination, and sorting .

Response

200 OK

For more information on return codes, see [API response codes](#).

Response parameters

Parameter	Type	Description
offset	Integer	The starting list offset, used for pagination
total	Integer	Total number of records
totalFilter	Integer	Number of records after applying the filter
List	Array	The array of List activity objects
List activity object		
id	Integer	The unique ID of a specific activity
automationName	String	Name of the automation
fileName	String	Bot file name

Parameter	Type	Description
filePath	String	<p>The file path of the bot</p> <hr/> <p>Note: As filePath is deprecated, use Get Immediate Parents API, endpoint</p> <pre>GET http://{{ControlRoomURL}}/v2/repository/files/ parents</pre> <hr/> <p>to retrieve the file path based on the input file ID.</p>
type	String	<p>File type associated with the bot. Following are the possible values for</p> <ul style="list-style-type: none"> • TASK: A regular bot. • RUN_NOW: A bot that is deployed to be run instantly • WLM_TASK: A work lifecycle management task • WORKFLOW: Part of WLM_TASK. • WORKORDER: Part of WLM_TASK • AARI: A process bot
startDate	String	The date and time of when this bot started
endDate	String	The date and time of when this bot ended
command	String	The current command the bot is on
status	String	<p>The status of the bot. Following values are possible:</p> <ul style="list-style-type: none"> • COMPLETED: Bot successfully completed execution. • DEPLOYED: Autologin is successful, and bot is deployed to a device. • DEPLOY_FAILED: Bot failed to deploy to the device because, for autologin failed. • QUEUED: Requested user or device is busy running another execution. • PENDING_EXECUTION: Device has been selected, but bot has not been deployed to that device • RUNNING or UPDATE: Bot is executing on a device. • RUN_FAILED: Bot failed after being deployed to a device. • RUN_PAUSED: User paused the bot. • RUN_TIMED_OUT: Bot failed to complete tasks within a specific time. • UNKNOWN: Connection between the service and the device was lost.
progress	Integer	The progress of the bot in percentage.
totalLines	Integer	Total number of command lines the bot contains.
currentLine	Integer	The current line the bot is processing.
timeTaken	Integer	Time taken in milliseconds by the bot to complete the operation.
progress	Integer	The progress of the bot in percentage.
automationId	Integer	The ID of the automation.
userId	Integer	The ID of the user.
deviceId	Integer	The ID of the device.
fileId	Integer	Unique identifier of the bot file.

Parameter	Type	Description
modifiedBy	Integer	The ID of the user who modified the activity.
createdBy	Integer	The ID of the user who created the activity.
modifiedOn	String	The timestamp when it was modified.
createdOn	String	The creation timestamp of the activity.
deploymentId	String	The deployment ID of the bot.
queueName	String	Name of the queue.
queueId	String	ID of the queue.
usingRdp	Boolean	Flag that shows whether or not the bot is using remote deployment p
message	String	Error message that returns details about the state of the execution.
canManage	Boolean	Flag to show whether the bot can be managed.
deviceName	String	Name of the device.
userName	String	The user name of the user who is running the bot.
tenantUuid	String	The tenant's unique UUID.
automationPriority	String	The automation priority. By default it is set to <code>PRIORITY_MEDIUM</code> . P for <code>automationPriority</code> include: <code>PRIORITY_MEDIUM</code> , <code>PRIORITY</code> <code>PRIORITY_LOW</code> .
callbackInfo	Object	No value is returned for this parameter; will need individual bot API t information
runElevated	Boolean	Flag showing whether the bot was deployed using elevated permission Possible values include <code>false</code> and <code>true</code> .
botLabel	String	Label for the bot. It can be used to distinguish bots from categories s production and testing.
currentBotName	String	Current name of the bot. It can change during execution.

Note: You can view the in the , but API functionality is limited. You need a licensed Edition to access the full functionality of the APIs.

The REST API responds to each request with an HTTP response code. For response codes, see [API response codes](#).

Activity job execution

Fetch the execution details for a specific execution ID by using the `/v3/activity/execution/<id>` endpoint.

Request

```
GET https://{{ControlRoomURL}}/v3/activity/execution/<id>
```

```
Header: X-Authorization <<authentication token>>
```

All API calls must contain an authentication token in the request header. Use the [Authentication API](#) to generate a JSON web token. See [Authentication API](#).

Sample Call

```
GET https://{ControlRoomURL}/v3/activity/execution/ed880baa-675a-4569-bd82-985f7e8260f7_7df4a4fb6307ebdb
```

Request parameters

Parameter	Type	Required	Description
id	String	Yes	The unique ID of a specific activity. You can retrieve the ID from Activity list .

Response

200 OK

```

Response parameters

Parameter	Type	Description
id	Integer	The unique ID of a specific activity.
automationName	String	Name of the automation.
fileName	String	Bot file name.
filePath	String	The file path of the bot. Note: As filePath is deprecated, use the Get Immediate Parents API endpoint to retrieve the file path based on the input file id: <pre>GET http://{{ControlRoomURL}}/v2/repository/files/parents</pre>

Parameter	Type	Description
type	String	File type associated with the bot. Following are the possible values for <ul style="list-style-type: none"> TASK: A regular bot. RUN_NOW: A bot that is deployed to be run instantly WLM_TASK: Work life cycle management. WORKFLOW: This is a part of WLM_TASK. WORKORDER: This is a part of WLM_TASK. AARI: A process bot.
startDate	String	The date and time of when this bot started.
endDate	String	The date and time of when this bot ended.
command	String	The current command the bot is on.
status	String	The status of the bot. Following values are possible: <ul style="list-style-type: none"> COMPLETED: Bot successfully completed execution. DEPLOYED: Autologin is successful and bot is deployed to a device. DEPLOY_FAILED: Bot failed to deploy to the device, for example, failed. QUEUED: Requested user or device is busy running another execution. PENDING_EXECUTION: Device has been selected, but bot has not been deployed to that device. RUNNING or UPDATE: Bot is running on a device. RUN_FAILED: Bot failed after being deployed to a device. RUN_PAUSED: User paused the bot. RUN_TIMED_OUT: Bot failed to complete tasks within a specific time. UNKNOWN: Connection between the service and the device was lost.
progress	Integer	The progress of the bot in percentage.
totalLines	Integer	Total number of command lines the bot contains.
currentLine	Integer	The line that the bot is processing currently.
timeTaken	Integer	Time taken in milliseconds by the bot to complete the operation.
progress	Integer	The progress of the bot in percentage.
automationId	Integer	The ID of the automation.
userId	Integer	The ID of the user.
deviceId	Integer	The ID of the device.
currentLine	Integer	The line that the bot is processing currently.
totalLines	Integer	Total number of command lines the bot contains.
fileId	Integer	Unique identifier of the bot file.
modifiedBy	Integer	The ID of the user who modified the activity.
createdBy	Integer	ID of the user who created the activity.
modifiedOn	String	The timestamp when it got modified.
createdOn	String	The creation timestamp of the activity.

Parameter	Type	Description
deploymentId	String	The deployment ID of the bot.
queueName	String	Name of the queue.
queueId	String	ID of the queue.
usingRdp	Boolean	Flag that shows whether or not the bot is using remote deployment p
message	String	Error message that returns details about the state of the execution.
canManage	Boolean	Flag to show whether the bot can be managed.
deviceName	String	Name of the device.
userName	String	The user name of the user who is running the bot.
tenantUuid	String	The tenant's unique UUID.
automationPriority	String	The automation Priority. By default it is set to <code>PRIORITY_MEDIUM</code> . P values for <code>automationPriority</code> include the following: <code>PRIORITY_PRIORITY_HIGH</code> , and <code>PRIORITY_LOW</code> .
callbackInfo	String	<code>callbackInfo</code> provides the callback API URL (For example, https://callbackserver.com/storeBotExecutionStatus) and authentication token for server. After the bot is deployed, the Control Room sends the deployment and output variable values to this callback server. Note: The callback server must accept POST calls to receive the bot data and the deployment status from the Control Room.
runElevated	Boolean	Flag showing whether the bot deployed using elevated permissions o values include the following: <code>false</code> , <code>true</code>
botLabel	String	Label for the bot. It can be used to distinguish bots based on category production and testing.
currentBotName	String	The bot's current bot name. It can change during the execution.
botOutVariables object		
Output	varies	A data structure containing all the output objects. More details follow
type*	Any	Possible values for <code>type</code> include the following: <code>STRING</code> , <code>NUMBER</code> , <code>BO</code> , <code>FILE</code> , <code>ITERATOR</code> , <code>LIST</code> , <code>DICTIONARY</code> , <code>TABLE</code> , <code>VARIABLE</code> , <code>CONDIT</code> , <code>WINDOW</code> , <code>TASKBOT</code> , <code>DATETIME</code> , <code>UIOBJECT</code> , <code>RECORD</code> , <code>EXCEPTION</code> , <code>C</code> , <code>COORDINATE</code> , <code>IMAGE</code> , <code>REGION</code> , <code>PROPERTIES</code> , <code>TRIGGER</code> , <code>CONDITIO</code> , <code>FORM</code> , <code>FORMELEMENT</code> , <code>HOTKEY</code> , and <code>WORKITEM</code> .
*The structure of the output varies depending on the output.		

Note: You can view the in the , but API functionality is limited. You need a licensed Edition to access the full functionality of the APIs.

The REST API responds to each request with an HTTP response code. For response codes, see [API response codes](#).

Bot Scheduler APIs

Use the Bot Scheduler APIs to create, update, delete, and return details on scheduled automations.

Note: You can view the in the , but API functionality is limited. You need a licensed Edition to access the full functionality of the APIs.

Prerequisites

Ensure that you are allocated the following resources:

- **Schedule my bots to run** feature permission
- **Run and schedule** permissions for the folders that contain the bots.
- Access to the Bot Runner licensed users.
- Access to either a default device or a device pool

Note: If the user associated with the Bot Runner license has a default device assigned to their account, the bot deploys on that device. If no default device is assigned, or you want to select a different device, then you must specify a device pool.

Create an automation schedule

1. [Authenticate the user](#)
2. [List files and folders by workspace API](#)
3. [List available unattended Bot Runners API](#)
4. **Optional:** [List device pools API](#)
5. [Schedule bot to run API](#)

Schedule bot to run API

Schedule a bot to run on an unattended Bot Runner either one time or on a recurring basis.

Note: You can view the in the , but API functionality is limited. You need a licensed Edition to access the full functionality of the APIs.

- All API calls must contain an authentication token in the request header. Use the [Authentication API](#) to generate a JSON web token. See [Authentication API](#).

- Ensure that you are allocated the following resources:
 - **View and Run my bots** feature permission
 - **Run and schedule** permissions for the folders that contain the bots
 - Access to Bot Runner licensed users
 - Access to either a default device or a device pool

Note: If the user associated with the Bot Runner license has a default device assigned to their account, the bot deploys on that device. If no default device is assigned, or you want to select a different device, then you must specify a device pool.

To schedule a bot, you provide the following information to the API:

Parameter	Required	Type	Description
fileId	Yes	Number	Identifier for the bot. List files and folders by workspace API
runAsUserIds	Yes	Number	Identifier for a user that is registered with your Control Room as an Unattended bot runner. List available unattended Bot Runners API
status	Yes	String	Indicates whether to create an active or draft schedule. Enter either <code>ACTIVE</code> or <code>DRAFT</code> .
poolIds	No	Number	Identifier of a device pool that has at least one active device. Note: If the user associated with the Bot Runner license has a default device assigned to their account, the bot deploys on that device. If no default device is assigned, or you want to select a different device, then you must specify a device pool. List device pools API
overrideDefaultDevice	No	Boolean	If the Bot Runner user is assigned to a default device and you want to use a device pool, set this parameter to <code>true</code> . If deploying to the default device, set this parameter to <code>false</code> .

1. Add the authentication token to the request header.
2. Use the POST method and endpoint URL: `<control_room_url>/v1/schedule/automations`.

Request body:

This example request body contains the required parameters to schedule a bot to run one time.

```
{
  "name": "UpdateInventory.20.12.16.10.40.48",
  "fileId": 14277,
  "poolIds": [
    "27"
  ],
  "timeZone": "Asia/Calcutta",
  "runAsUserIds": [
    "472",
    "480",
    "80"
  ],
  "startDate": "2020-12-16",
  "startTime": "15:00",
  "scheduleType": "NONE",
  "status": "ACTIVE"
}
```

```
}

```

This example request body contains the required parameters to schedule a bot to run on a recurring basis.

```
{
  "name": "UpdateInventory.20.12.16.10.40.48",
  "fileId": 14277,
  "poolIds": [
    "27"
  ],
  "timeZone": "Australia/Melbourne",
  "runAsUserIds": [
    "1103",
    "36",
    "80"
  ],
  "startDate": "2020-12-16",
  "repeatOccurrence": {
    "endTime": "23:59",
    "runEvery": "1",
    "timeUnit": "HOURS"
  },
  "repeatEnabled": true,
  "endDate": "2020-12-24",
  "startTime": "20:45",
  "weeklyRecurrence": {
    "interval": "1",
    "daysOfWeek": [
      "TUE",
      "THU",
      "FRI"
    ]
  }
},
  "scheduleType": "WEEKLY",
  "status": "ACTIVE"
}
```

3. Send the request.

Response body: The two example responses include the following information about the automation:

- **id:** the numerical value that identifies the automation. Use this parameter in the `Update automations` or `Delete automations` APIs.
- **zonedNextRunDateTime:** the date and time of the next time the bot is scheduled to run.

This is an example response for a bot scheduled to run one time.

```
{
  "id": "989",
  "name": "UpdateInventory.20.12.16.10.40.48",
  "fileId": 14277,
  "status": "ACTIVE",
  "deviceIds": [],
  "description": "",
  "rdpEnabled": false,
  "scheduleType": "NONE",
  "timeZone": "Asia/Calcutta",
  "startDate": "2021-12-16",
  "endDate": "",
  "startTime": "15:00",
  "repeatEnabled": false,

```

```

"zonedNextRunDateTime": "2021-12-16T09:30:00Z",

    "36",
    "1103"
  ]
}

```

```

    ],
    "botInput": {},
    "tenantUuid": "e100fbce-008c-04ec-4063-7af0af91fb2f",
    "poolId": [
      "7"
    ],
    "overrideDefaultDevice": false,
    "runElevated": false
  }

```

The REST API responds to each request with an HTTP response code. For response codes, see [API response codes](#).

Use the [List automation schedules API](#) to retrieve details on all the scheduled automations.

List automation schedules API

Retrieve details of the automation schedules that you have permissions to view.

Note: You can view the in the , but API functionality is limited. You need a licensed Edition to access the full functionality of the APIs.

- All API calls must contain an authentication token in the request header. Use the [Authentication API](#) to generate a JSON web token. See [Authentication API](#).
- You must be assigned a role that includes the `View and manage all scheduled activity` from my `Folders` permission.

In this example, you list all the scheduled automations sorted by the next run date and time.

1. Add the authentication token to the request header.
2. Use the POST method and endpoint URL: `<control_room_url>/v1/schedule/automations/list`.

Request body:

```

{
  "sort": [
    {
      "field": "zonedNextRunDateTime",
      "direction": "asc"
    }
  ]
}

```

3. Send the request.

Response body: The response includes the following data about each automation:

- **id:** the numerical value that identifies the automation. Use this parameter in the `Update automations` or `Delete automations` APIs.
- **status:** returns whether the scheduled automation is `ACTIVE` or `INACTIVE`.

```

{
  "page": {
    "offset": 0,
    "total": 3,
    "totalFilter": 3
  },
  "list": [

```

```

{

    ],
    "overrideDefaultDevice": false,
    "runElevated": false
}
]

```

```
}

```

The REST API responds to each request with an HTTP response code. For response codes, see [API response codes](#).

Repository Management APIs

Use the Repository Management APIs to return information on or to delete the objects (bots, folders, and files) that you have permissions to access in the Control Room.

Note: You can view the in the , but API functionality is limited. You need a licensed Edition to access the full functionality of the APIs.

The Automation 360 repository is comprised of the private and public workspaces, which contain folders of bots and their dependency files. The private workspace holds objects that are only accessible to the logged-in user. Bots in the private workspace can only be run on that user's device. The public workspace holds objects that are accessible to all users who have the necessary permissions. When a bot is checked-in from a private workspace to the public workspace, it can be checked out by another user to their private workspace for editing or deployed to a Bot Runner.

Note:

- To view objects in your private workspace, you must have a Bot Creator license and a role that includes the `View my bots` feature permission.
 - To view objects in the public workspace, you must be assigned a role that includes the `View my bots` feature permission and the `View content` bot permission to folders in the public workspace.
-

Choosing a Repository Management list API

The following Repository Management APIs return information on objects (bots, files, and folders), based on the access granted by the user's role.

- `/file/list` returns details on all the objects for which you have access permissions.

[List files API](#)

- `/folders/{folderid}/list` returns details on only the objects in a specific folder.

[List files and folders in a specific folder API](#)

- `/workspaces/{workspaceType}/files/list` returns details on only the objects in either the public or private workspace.

[List files and folders by workspace API](#)

Supported filterable fields

Use the following filters in the request bodies of the list APIs to narrow down the response data.

createdBy

The numeric identifier for the user who created a folder or bot.

```
{
  "operator": "eq",

```

```
"field": "createdBy",
"value": "2587"
}
```

folder

This example searches for only folders. Set the value to `false` to search for only bots and files.

```
{
  "operator": "eq",
  "field": "folder",
  "value": "true"
}
```

name

This example searches for objects that are named **Finance** or **finance**. This search is not case-sensitive.

- **Field:** name
- **Type:** string

```
{
  "filter": {
    "operator": "eq",
    "value": "finance",
    "field": "name"
  }
}
```

path

This example searches for objects that contain the string **Finance** in the path parameter. This search is not case-sensitive.

- **Field:** path
- **Type:** string

```
{
  "filter": {
    "operator": "substring",
    "value": "Finance",
    "field": "path"
  }
}
```

Related concepts

[Bot permissions for a role](#)

Assign bot permissions when creating a role with the **View my bots** feature permission.

List files API

Use the `List files` API to view the details of all the objects (file, folder, or bot) in the Control Room. This API returns an `id` parameter as the response, which is a numeric value that can be used in different APIs to identify the file, folder, or bot.

Request

```
POST http://{{ControlRoomURL}}/v2/repository/file/list
```

```
Header: X-Authorization <<authentication token>>
```

All API calls must contain an authentication token in the request header. Use the `Authentication` API to generate a JSON web token. See [Authentication API](#).

- To view objects in your private workspace, you must have a Bot Creator license and a role that includes the `View my bots` feature permission.
- To view objects in the public workspace, you must be assigned a role that includes the `View my bots` feature permission and the `View content` bot permission to folders in the public workspace.

You can send an API request with or without filter parameters. An API request without any filter parameters specified retrieves the details of all the objects in the Control Room. You can use the filter parameters to retrieve a specific set of file or folder objects instead of fetching all objects in the Control Room. For more information, see [Filtering, pagination, and sorting](#).

Request body without filters:

```
{
  "filter": null,
  "sort": [
    {
      "field": "directory",
      "direction": "desc"
    },
    {
      "field": "name",
      "direction": "asc"
    }
  ],
  "page": {
    "offset": 0,
    "length": 100
  }
}
```

Request body with filters:

```
{
  "filter": {
    "operator": "substring",
    "value": "bot",
    "field": "name"
  },
  "sort": [
    {
```

```

        "field": "directory",
        "direction": "desc"
      },
      {
        "field": "name",
        "direction": "asc"
      }
    ],
    "page": {
      "offset": 0,
      "length": 100
    }
  }
}

```

Request parameters

Parameter	Type	Required	Description
filter	Object	No	Filters the result based on operator, field, or value. operator Allowed enumerations are NONE, lt, le, eq, ne, ge, gt, substring, and, or, not. field Allowed values are name, lastModified, path, or folder. value Specify a value for the name, lastModified, path, or folder that you have selected in the field parameter.
sort	Array	No	By default, search results are sorted in descending order of their IDs. To specify an alternative sorting, use the sort query parameter. Enter the field by which you want to sort along with the direction <code>asc</code> (ascending) or <code>desc</code> (descending).
page	Object	No	The page object allows you to get the desired pages.

Response

```

{
  "page": {
    "offset": 0,
    "total": 4619,
    "totalFilter": 100
  },
  "list": [
    {
      "id": "137169",
      "parentId": "111492",
      "name": ".25Bot",
      "permission": {

```

```

        "delete": true,
        "download": true,
        "upload": true,
        "run": true,
        "publishBotstore": false
    },
    "lastModified": "2022-04-11T10:28:18.098323Z",
    "lastModifiedBy": "291",
    "path": "Automation Anywhere\\Bots\\.25Bot",
    "directory": false,
    "size": "2615",
    "locked": false
}
}}

```

Response parameters

Parameter	Type	Description										
offset	Integer	The starting list offset, used for pagination.										
total	Integer	Total number of records.										
totalFilter	Integer	Number of records after applying the filter.										
List	Array	The list of directories and files.										
List objects												
id	Integer	The unique ID of the displayed objects (bots, folders, or files).										
parentId	Integer	The unique ID of the parent folder.										
name	String	Name of the file or folder.										
permission	Object	Displays permissions for the current user with the values True or False. <table border="0" style="width: 100%; margin-top: 10px;"> <tr> <td style="width: 30%;">delete</td> <td>Indicates whether the current user has rights to delete the bot.</td> </tr> <tr> <td>download</td> <td>Indicates whether the current user has rights to download the bot.</td> </tr> <tr> <td>upload</td> <td>Indicates whether the current user has rights to upload the bot.</td> </tr> <tr> <td>run</td> <td>Indicates whether the current user has rights to run the bot.</td> </tr> <tr> <td>publishBotstore</td> <td>Indicates whether the current user has rights to publish to the bot store.</td> </tr> </table>	delete	Indicates whether the current user has rights to delete the bot.	download	Indicates whether the current user has rights to download the bot.	upload	Indicates whether the current user has rights to upload the bot.	run	Indicates whether the current user has rights to run the bot.	publishBotstore	Indicates whether the current user has rights to publish to the bot store.
delete	Indicates whether the current user has rights to delete the bot.											
download	Indicates whether the current user has rights to download the bot.											
upload	Indicates whether the current user has rights to upload the bot.											
run	Indicates whether the current user has rights to run the bot.											
publishBotstore	Indicates whether the current user has rights to publish to the bot store.											
lastModified	Integer	Date and time when the bot was last updated.										
lastModifiedBy	String	ID of the user who last updated the bot or file.										
path	Integer	Path of the file or folder in the repository.										
directory	String	Flag for directory.										

Parameter	Type	Description
size	Integer	Size of the file. It is available only if the item type is file.
locked	String	Indicates whether the file is locked. It is available only if the item type is file.

Note: You can view the [APIs](#) in the [Control Room](#), but API functionality is limited. You need a licensed [Edition](#) to access the full functionality of the APIs.

The REST API responds to each request with an HTTP response code. For response codes, see [API response codes](#).

Create folder

Use the `Create a folder` API to create a folder within a parent folder. You can create a folder in either the private workspace or the public workspace in the Control Room.

Request

```
POST http://{{ControlRoomURL}}/v2/repository/folders/{folderid}
```

```
Header: X-Authorization <<authentication token>>
```

All API calls must contain an authentication token in the request header. Use the `Authentication` API to generate a JSON web token. See [Authentication API](#).

You must specify the ID of a parent folder. To view the ID of the parent folder, use the [List files and folders in a specific folder API](#) endpoint.

Request body:

```
{
  "folderName": "my_bots"
}
```

Request parameters

Parameter	Type	Required	Description
folderId	Integer	Yes	Unique ID of the parent folder.
folderName	String	Yes	Name of the new folder that you want to create.

Response

```
{
  "id": "155524",
  "parentId": "108889",
  "name": "new marks bots",
  "permission": {
```

```

    "delete": true,
    "download": true,
    "upload": true,
    "run": true
  },
  "lastModified": "2022-07-19T23:08:49.150494Z",
  "lastModifiedBy": "275",
  "path": "Automation Anywhere\\\\\\\\Bots\\\\\\\\new marks bots",
  "directory": false,
  "size": 947,
  "locked": true,
  "productionVersion": null,
  "lockedBy": "0",
  "latestVersion": null,
  "fileLastModified": "2022-07-19T23:08:49.150494Z"
}

```

Response parameters

Parameter	Type	Description
id	String	Unique ID of the folder created.
parentId	String	Unique ID of the parent folder.
name	String	Name specified for the folder.
permission	Object	Displays permissions for the current user with the values True or False. delete Indicates whether the current user has rights to delete the folder. download Indicates whether the current user has rights to download the folder. upload Indicates whether the current user has rights to upload the folder. run Indicates whether the current user has rights to run the folder.
lastModified	String	Date and time when the folder was last updated.
lastModifiedBy	String	ID of the user who last updated the folder.
path	String	Path of the folder in the repository.
directory	String	Flag for directory.
size	Integer	Size of the folder in KB.
locked	String	Indicates whether the folder is locked. It is available only if the item is locked.
productionVersion	String	Current production version of the folder (applicable only with VCS ON).
lockedBy	String	User ID who has locked the folder (applicable only with VCS ON).
latestVersion	String	Latest version of the folder (applicable only with VCS ON).

Parameter	Type	Description
fileLastModified	String	Date and time when the folder was last updated.

Note: You can view the in the , but API functionality is limited. You need a licensed Edition to access the full functionality of the APIs.

The REST API responds to each request with an HTTP response code. For response codes, see [API response codes](#).

Delete folder

Use the `Delete folder` API to delete a folder.

Request

```
DELETE https://{ControlRoomURL}/v2/repository/folders/{folderid}
```

```
Header: X-Authorization <<authentication token>>
```

All API calls must contain an authentication token in the request header. Use the `Authentication` API to generate a JSON web token. See [Authentication API](#).

Request parameters

You must specify the folder ID. To view the folder ID, use the [List files and folders in a specific folder API](#) endpoint.

Parameter	Type	Required	Description
folderid	Integer	Yes	Unique ID of the folder to be deleted.

Response

```
200 OK
```

Note: You can view the in the , but API functionality is limited. You need a licensed Edition to access the full functionality of the APIs.

The REST API responds to each request with an HTTP response code. For response codes, see [API response codes](#).

Edit details of folder

Use the `Edit details` endpoint to edit the details of a folder, such as name, parent folder ID, and description.

Request

```
PUT http://{{ControlRoomURL}}/v2/repository/folders/{folderid}
```

```
Header: X-Authorization <<authentication token>>
```

All API calls must contain an authentication token in the request header. Use the `Authentication API` to generate a JSON web token. See [Authentication API](#).

You must specify the unique folder ID to edit or update the folder details. To view the folder ID, use the [List files and folders in a specific folder API](#) endpoint.

Request body:

```
{
  "folderId": "164086",
  "name": "my_bots",
  "description": "My sample bots",
  "parentId": "14"
}
```

Request parameters

Parameter	Type	Required	Description
folderId	Integer	Yes	Unique ID of the folder.
name	String	No	Name of the folder.
description	String	No	Description of the folder.
parentId	String	No	Unique ID of the parent folder.

Response

```
{
  "id": "155524",
  "parentId": "108889",
  "name": "new marks bots",
  "permission": {
    "delete": true,
    "download": true,
    "upload": true,
    "run": true
  },
  "lastModified": "2022-07-19T23:08:49.150494Z",

Response parameters

Parameter	Type	Description
id	String	Unique ID of the folder created.
parentId	String	Unique ID of the parent folder.
name	String	Name specified for the folder.
permission	Object	Displays permissions for the current user with the values True or False. delete Indicates whether the current user has rights to delete the folder. download Indicates whether the current user has rights to download the folder. upload Indicates whether the current user has rights to upload (create) the folder. run Indicates whether the current user has rights to run on the folder.
lastModified	String	Date and time when the folder was last updated.
lastModifiedBy	String	ID of the user who last updated the folder.
path	String	Path of the folder in the repository.
directory	String	Flag for directory.
size	Integer	Size of the folder in KB.
locked	String	Indicates whether the folder is locked. It is available only if the item is locked.
productionVersion	String	Current production version of the folder (applicable only with VCS ON).
lockedBy	String	User ID who has locked the folder (applicable only with VCS ON).
latestVersion	String	Latest version of the folder (applicable only with VCS ON).
fileLastModified	String	Date and time when the folder was last updated.

Note: You can view the response in the [API Explorer](#), but API functionality is limited. You need a licensed [Enterprise Edition](#) to access the full functionality of the APIs.

The REST API responds to each request with an HTTP response code. For response codes, see [API response codes](#).

List files and folders in a specific folder API

Return details about objects (bots, folders, and files) in a specific parent folder. This endpoint returns the object id, which is a numeric value that is used in other APIs to identify the file, folder or bot.

Note: You can view the in the , but API functionality is limited. You need a licensed Edition to access the full functionality of the APIs.

- All API calls must contain an authentication token in the request header. Use the [Authentication API](#) to generate a JSON web token. See [Authentication API](#).
- To view objects in your private workspace, you must have a Bot Creator license and a role that includes the `View my bots` feature permission.
- To view objects in the public workspace, you must be assigned a role that includes the `View my bots` feature permission and the `View content bot` permission to folders in the public workspace.
- You require the folder ID for the folder you want to search in. Use one of the following Repository Management APIs to retrieve the object ID:
 - [List files API](#)
 - [List files and folders by workspace API](#)

The example in this task searches for subfolders that contain the string **finance**.

1. Add the authentication token to the request header.
2. Use the POST method and endpoint URL: `<control_room_url>/v2/repository/folders/{folderId}/list`

{folderId} is the object ID of the folder that in which you want to search.

Request body: The following example request searches for folders that contain the word **finance** in the name.

```
{
  "filter": {
    "operator": "and",
    "operands": [
      {
        "operator": "substring",
        "field": "name",
        "value": "finance"
      },
      {
        "operator": "eq",
        "field": "folder",
        "value": "true"
      }
    ]
  }
}
```

[Supported filterable fields](#)

3. Send the request.

Response body: In a successful request, this endpoint returns the following data:

- **id:** a unique numeric identifier for the object that matches the search parameters.
- **parentId:** a unique numeric identifier for the parent folder.
- **folder:** a boolean value that returns `true` if the object is a folder and `false` if it is a bot or other file.

In this example response, the endpoint returns a folder with the object `id` of 40378.

```
{
  "page": {
    "offset": 0,
    "total": 329,
    "totalFilter": 1
  },
  "list": [
    {
      "id": "40378",
      "parentId": "2",
      "name": "EOD-finance-reports",
      "path": "Automation Anywhere\\Bots\\APAC\\EOD-finance-reports",
      "description": "",
      "type": "application/vnd.aa.directory",
      "size": "0",
      "folder": true,
      "folderCount": "0",
      "productionVersion": "",
      "latestVersion": "",
      "locked": false,
      "lockedBy": "0",
      "createdBy": "2587",
      "lastModifiedBy": "2587",
      "lastModified": "2020-09-02T05:26:51.162916Z",
      "permission": {
        "delete": true,
        "download": false,
        "upload": false,
        "run": true,
        "publishBotstore": false,
        "viewContent": true,
        "clone": false,
        "editContent": true,
        "createFolder": true,
        "move": true,
        "cancelCheckout": false,
        "revertCheckout": false
      },
      "workspaceId": "0",
      "botStatus": "DRAFT",
      "hasErrors": false,
      "workspaceType": "UNKNOWN",
      "metadata": false,
      "uri": "",
      "version": "0",
      "hasTriggers": false
    }
  ]
}
```

Use the numeric identifier, such as an `id` in subsequent APIs.

Related reference[Start migration API](#)

Use this API to migrate bots (TaskBots and MetaBots) created using the Enterprise Client version 11.x to Automation 360.

List files and folders by workspace API

Return details on objects (files, folders, and bots) in either the public or private workspace. This endpoint returns the object id, which is a numeric value that is used in other APIs to identify the file, folder or bot.

Note: You can view the in the , but API functionality is limited. You need a licensed Edition to access the full functionality of the APIs.

- All API calls must contain an authentication token in the request header. Use the [Authentication API](#) to generate a JSON web token. See [Authentication API](#).
- To view objects in your private workspace, you must have a Bot Creator license and a role that includes the `View my bots` feature permission.
- To view objects in the public workspace, you must be assigned a role that includes the `View my bots` feature permission and the `View content bot` permission to folders in the public workspace.

1. Add the authentication token to the request header.
2. Use the POST method and endpoint URL: `<control_room_url>/v2/repository/workspaces/{workspaceType}/files/list`

{workspaceType} specifies whether to search in the public or private workspace.

The following example request searches for objects that contain the string **finance** in the name.

Request body:

```
{
  "filter": {
    "operator": "substring",
    "field": "name",
    "value": "finance"
  }
}
```

Supported filterable fields

3. Send the request.

Response body:

In this example response, this endpoint returns a bot with the object id of 14277.

```
{
  "page": {
    "offset": 0,
    "total": 1114,
    "totalFilter": 1
  },
  "list": [
    {
      "id": "14277",
      "parentId": "9",
      "name": "financeWeeklyReport",
      "path": "Automation Anywhere\\Bots\\exampleBots",
      "description": "v1",
      "type": "application/vnd.aa.taskbot",
      "size": "799",
    }
  ]
}
```

```

    "folder": false,
    "folderCount": "0",
    "productionVersion": "",
    "latestVersion": "",
    "locked": false,
    "lockedBy": "0",
    "createdBy": "22",
    "lastModifiedBy": "22",
    "lastModified": "2020-10-21T17:42:10.140037Z",
    "permission": {
      "delete": false,
      "download": false,
      "upload": false,
      "run": true,
      "publishBotstore": false,
      "viewContent": false,
      "clone": false
    },
    "workspaceId": "0",
    "botStatus": "PUBLIC",
    "hasErrors": false,
    "workspaceType": "UNKNOWN",
    "metadata": false,
    "uri": "",
    "version": "3",
    "hasTriggers": false,
    "isModified": false
  }
]
}

```

Response parameters:

- **id**: a unique numeric identifier for the object that matches the search parameters.
- **parentId**: a unique numeric identifier for the parent folder.
- **folder**: a boolean value that returns `true` if the object is a folder and `false` if it is a bot or other file.

The REST API responds to each request with an HTTP response code. For details about the response codes, see [API response codes](#).

If you are performing the steps to run a bot or to create an automation schedule, perform this task: [List available unattended Bot Runners API](#)

Get Immediate Parents API

Use this API to get the immediate parents of a Task Bot. The Get Immediate Parents API gets a *fileId* as input and lists the immediate parent details.

Request

```
GET http://{{ControlRoomURL}}/v2/repository/files/{fileid}/parents
```

```
Header: X-Authorization <<authentication token>>
```

All API calls must contain an authentication token in the request header. Generate a token with the [Authenticate \(username and password\)](#).

Request Parameters

Parameter	Type	Required	Description
fileid	Integer	Yes	File id for which you want to view the parents.

```
GET http://{{ControlRoomURL}}/v2/repository/files/698/parents
```

Response

```
{
  "dependencies": [
    {
      "id": "349",
      "name": "Parent",
      "path": "Automation Anywhere\\Bots\\demo_test\\Parent",
      "size": "1536",
      "type": "application/vnd.aa.taskbot",
      "dependencyType": "SCANNED",
      "url": "",
      "requiredByFileId": "349",
      "version": "0",
      "lockedBy": "0",
      "botStatus": "PUBLIC",
      "permission": {
        "delete": true,
        "download": true,
        "upload": true,
        "run": true,
        "publishBotstore": false,
        "viewContent": true,
        "clone": true,
        "editContent": false,
        "createFolder": false,
        "move": false,
        "cancelCheckout": false,
        "revertCheckout": false,
        "viewHistory": false,
        "labelBots": false
      },
      "versionNumber": "0",
      "label": ""
    }
  ]
}
```

Response Parameters

Parameter	Type	Description
id	Integer	File Id of the parent.
name	String	Name of the parent.

Parameter	Type	Description
path	String	Path of the parent file.
size	Integer	Size of the parent file.
type	String	Type of the parent.
dependencyType	String	The type of the related object. <ul style="list-style-type: none"> NONE: It is the relation with the parent file. Parent to parent relation. SCANNED: It is the relation with the child bots or files which are scanned and found automatically. MANUAL: It is the relation with the bots or files that are added to the parent bot manually.
url	String	Not pertinent to this API.
requiredByFileId	Integer	The Id of the parent bot that is calling the child bot.
version	Integer	Version of the parent file.
lockedBy	Integer	The user that has checked out this file.
botStatus	String	<i>bot</i> status. Possible values can be: NEW, CHECKED_OUT, CLONED, and PUBLIC.
permission	Object	Lists all the permissions of the parent.

Delete file/folder API

Use this API to delete objects (bots, files, or folders) from the public or your private workspace.

Note: You can view the in the , but API functionality is limited. You need a licensed Edition to access the full functionality of the APIs.

- All API calls must contain an authentication token in the request header. Use the [Authentication API](#) to generate a JSON web token. See [Authentication API](#).
- You can delete bots, files, or folders from your private workspace. To delete objects from the public workspace, you must be assigned a role that contains the `Delete` bot permission on the folder that contains the objects that you want to delete.
- If you are deleting a folder, ensure that it is empty. Only empty folders can be deleted.
- To delete a file or folder, you must provide the object ID. Use one of the Repository Management list APIs to retrieve the object ID. [Choosing a Repository Management list API](#)

1. Add the authentication token to the request header.

- Use the DELETE method and endpoint URL: <control_room_URL>/v2/repository/files/{id}
{id} is the object id of the file or folder that you want to delete.
- Send the request.

Response body: A successful request returns the following message

```
204 Successful delete
```

The REST API responds to each request with an HTTP response code. For details about the response codes, see [API response codes](#).

File dependencies

Use the `Get file dependencies` API to view all the dependencies for a particular file in the Control Room workspace.

Request

```
GET https://{ControlRoomURL}/v2/repository/files/{fileid}/dependencies
```

```
Header: X-Authorization <<authentication token>>
```

All API calls must contain an authentication token in the request header. Use the `Authentication` API to generate a JSON web token. See [Authentication API](#).

Request parameters

Parameter	Type	Required	Description
file ID	Integer	Yes	Enter the unique ID of the file.

Response

```
200 OK
```

```
{
  "dependencies": [
    {
      "id": "1008",
      "name": "sample.txt",
      "path": "Automation Anywhere\\\\\\\\Bots\\\\\\\\Example_bots\\\\\\\\sample.txt",
      "size": "72",
      "type": "text/plain",
      "dependencyType": "NONE",
      "url": "https://contorlroom.com/v1/repository/97/1008/download?

      "revertCheckout": true,
      "viewHistory": true,
      "labelBots": true
    },
    "versionNumber": "0",
    "label": null
  }
]
}

```

Response parameters

Parameter	Type	Description
dependencies	Array	Lists the dependencies associated with the file. The parameters mentioned below are a subset of the dependencies.
Dependencies objects		
id	Integer	Unique identifier representing the file.
name	String	Name of the file created.
path	String	Path of the file in the repository.
size	Integer	Size of the file. Only available in case the item type is file.
type	String	The content type, also known as MIME type, of the file. Indicates whether the file type is text or plain.
dependencyType	String	Dependency type of the file with another file or folder.
URL	String	URL of the bot or file.
requiredByFileId	String	Parent file or folder ID.
lockedBy	String	User ID who has locked the file. Only available if the item type is bot and VCS is ON.

Parameter	Type	Description
botStatus	String	Status of the bot [Public/Checkout/New/Clone].
permission	Object	Permissions associated with the logged-in user to delete, download, clone, upload, run, view content, and other actions for the file.
versionNumber	String	Version number of the file.
label	String	Label associated with the file.

Note: You can view the in the , but API functionality is limited. You need a licensed Edition to access the full functionality of the APIs.

The REST API responds to each request with an HTTP response code. For response codes, see [API response codes](#).

Update file dependencies

Use the `Update File dependencies` API to update the manual dependencies of a file. You can update the dependencies for files that are residing only in the private workspace.

Request

```
PUT https://{{ControlRoomURL}}/v2/repository/files/{fileid}/dependencies/
{workspaceId}
```

```
Header: X-Authorization <<authentication token>>
```

All API calls must contain an authentication token in the request header. Use the `Authentication` API to generate a JSON web token. See [Authentication API](#).

Request parameters

You must specify the file ID and your private workspace ID to update the dependencies.

```
{
  "childFileIds": [1042, 1048]
}
```

Parameter	Type	Required	Description
file ID	Integer	Yes	Enter the unique ID of the file.
workspaceId	Integer	Yes	Enter the unique private workspace ID.

Parameter	Type	Required	Description
childFileIds	Array	Yes	Array of integers indicating the child file IDs that must be added as a dependency to the specified parent file ID.

Response

```
200 OK
```

Note: You can view the in the , but API functionality is limited. You need a licensed Edition to access the full functionality of the APIs.

The REST API responds to each request with an HTTP response code. For response codes, see [API response codes](#).

Bot Insight API

Users with the `AAE_Bot_Insight_Admin` or `AAE_Admin` role and the `Bot_Insight` license can access the Bot Insight API to retrieve business and operations data.

Automation Anywhere bots are built, run, and monitored in the Control Room. Bot Insight accesses real-time business insights and digital workforce performance data to use content-level productivity data from the bots that are deployed.

Business data

The Business data endpoints return Bot Insight data retrieved from deployed bots.

- [Delete task log data](#)

Delete the business data that is logged in the Bot Insight database on a deployed bot.

```
DELETE /v2/botinsight/data/api/deletetasklogdata
```

- [Get bot variables data](#)

Retrieve information about the variables in deployed bots, such as the variable name, data type, minimum value, and maximum value.

```
GET /v2/botinsight/data/api/gettaskvariableprofile
```

- [Get task log data](#)

Use the get task log data to retrieve the analytical variables data that is logged during a bot run.

```
GET /v2/botinsight/data/api/gettasklogdata
```

Operations data

The Operations data endpoints return information about bots that were deployed to Bot Runner devices. You can use this information to enhance productivity and take measures based on real-time information for RPA deployments.

- [Get audit trail data](#)

Retrieve information about Control Room events.

```
GET /v2/botinsight/data/api/getaudittraildata
```

- [Get bot run data](#)

Retrieve information about a bot run, such as the server information and whether it ran successfully or encountered an error.

```
GET /v2/botinsight/data/api/getbotrundata
```

Get task log data

Use the get task log data to retrieve the analytical variables data that is logged during a bot run.

Request

```
GET https://{{ControlRoomURL}}/v2/botinsight/data/api/gettasklogdata?
botname=ATMReconciliation&fromdate=2022-07-04T00%3A00%3A00&todate=2022-07-07T23%3A59%3A59
```

```
Header: X-Authorization <<authentication token>>
```

All API calls must contain an authentication token in the request header. Use the [Authentication API](#) to generate a JSON web token. See [Authentication API](#).

The URL includes the example query parameter botname. For large datasets, use the pageno and limit parameters to avoid a timeout error.

- You must have the **AAE_Bot Insight Admin** role and the Bot Insight license.
- The bot must run at least for one time with the Bot Creator (Private workspace).
- The bot must be checked in and deployed to the public workspace.

Request Parameters

Parameter	Type	Required	Description
botname	string	No	Name of the bots for which you retrieve data Enter up to 10 bot names and separate each name with a comma. If you do not provide this parameter, the API will return data on all the bots.
pageno	integer	No	Page number from which to retrieve the data

Parameter	Type	Required	Description
limit	integer	No	<p>Specifies the number of parts in which the information is retrieved</p> <p>For example, if you specify the limit as 2500 to retrieve a total of 10000 records, then the information retrieved is as follows:</p> <ul style="list-style-type: none"> • 0 page returns 1 - 2500 • 1st page returns 2501 - 5000 • 2nd page returns 5001 - 7500 • 3rd page returns 7501 - 10000 • Min value: 1
fromdate	date	No	<p>Start date of the period for which to retrieve the data</p> <p>If you do not provide this parameter, the API will return all available data.</p> <p>Format: <code>yyyy-mm-ddThh:mm:ss</code>.</p>
todate	date	No	<p>End date of the period for which to retrieve the data</p> <ul style="list-style-type: none"> • Format: <code>yyyy-mm-ddThh:mm:ss</code> • Default: current date

Note: View the migration status using the [List migration results API](#).

Response

This response example contains data on the *ATMReconciliation* bot and the first record returned.

```
{
  "businessData": [
    {
      "totalRecords": 1,
      "count": 1,
      "pageNo": 1,
      "botId": "PROD_581",
      "botName": "ATMReconciliation",
      "repositoryPath": "repository:///Automation%20Anywhere/Bots/Gettasklogdata?fileId=580&workspace=PRIVATE&version=0&label=",
      "list": [
        {
          "transactionName": "Default",
          "transactions": [
            {
              "runId": "e29732ad-5339-4012-941b-e9a1eb47806c_1a82fe211fc8865e",
              "transactionId": "2bda3a08-3049-4147-9e2b-8dc9dd8d7665",
              "dateLogged": "2022-07-06T10:33:11",
              "variables": {
```

```

    "variable1": "123.0",
    "variable3": "789.0",
    "variable2": "456.0"
  }
}
]
}
]
}
]
}
}

```

The REST API responds to each request with an HTTP response code. For response codes, see [API response codes](#).

Response Parameters

Parameter	Type	Description
runId	String	Identifier for the bot run that retrieved this data. All the transactions in a single run have a common <code>runId</code> .
transactionId	String	Identifier for the data set that was retrieved in a single loop iteration.
dateLogged	date	Date and time the bot retrieved the data. Format: <code>yyyy-mm-ddThh:mm:ss</code>
variables	Any	Variable names and values.

Note: You can view the in the , but API functionality is limited. You need a licensed Edition to access the full functionality of the APIs.

Delete task log data

Delete the business data that is logged in the Bot Insight database on a deployed bot.

Note: You can view the in the , but API functionality is limited. You need a licensed Edition to access the full functionality of the APIs.

- All API calls must contain an authentication token in the request header. Use the `Authentication` API to generate a JSON web token. See [Authentication API](#).
- You must have the **AAE_Bot Insight Admin** role and the `Bot Insight` license.

To delete data from the Bot Insight database, you provide the following information to the API in the request body:

Parameter	Required	Type	Description
botname	yes	string	Name of the bot for which you retrieve data
repositorypath	yes	string	Control Room repository path of the bot
environment	yes	string	Specifies the environment: <code>DEV</code> or <code>PROD</code>

Parameter	Required	Type	Description
runId	no	string	ID number that is generated when the bot runs. Use the get task log data to retrieve the runId: Get task log data.
fromDate	no	date	Start date of the period for which to retrieve the data Format: yyyy-mm-ddThh:mm:ss If you do not provide this parameter, the API will return all available data. <hr/> Note: Do not provide this parameter if you provide the runId parameter.
toDate	no	date	End date of the period for which to retrieve the data <ul style="list-style-type: none">Format: yyyy-mm-ddThh:mm:ssDefault: current date <hr/> Note: Do not provide this parameter if you provide the runId parameter.

1. Add the authentication token to the request header.
2. Use the DELETE method and endpoint URL:<control_room_url>/v2/botinsight/data/api/deletetasklogdata

Request body:

```
{
  "botName": "AnalyticsMortgageProcessing",
  "runId": "a4e706f2-6806-49eb-8d8f-4b915f9a67b0_aaa8b68b1ef888a0",
  "repositoryPath": "repository:///Automation%20Anywhere/Bots/
folder8092/AnalyticsMortgageProcessing?fileId=40642&workspace=PRIVATE",
  "environment": "Prod"
}
```

3. Send the request.

Response body: This example response returns the one thousand rows of data that were deleted.

```
{
  "botName": "AnalyticsMortgageProcessing",
  "repositoryPath": "repository:///Automation%20Anywhere/Bots/
folder8092/AnalyticsMortgageProcessing?fileId=40642&workspace=PRIVATE",
  "deleteCount": 1000
}
```

The REST API responds to each request with an HTTP response code. For response codes, see [API response codes](#).

Get bot run data

Retrieve information about a bot run, such as the server information and whether it ran successfully or encountered an error.

Request

```
GET http://{{ControlRoomURL}}/v2/botinsight/data/api/getbotrundata?
pageno={pageno}&limit={limit}&fromDate={fromDate}&toDate={toDate}
```

```
Header: X-Authorization <<authentication token>>
```

- All API calls must contain an authentication token in the request header. Use the [Authentication API](#) to generate a JSON web token. See [Authentication API](#).
- To view the bot run data, you must have one of the following:
 - **AAE_BOT_INSIGHT_ADMIN** role
 - ANALYTICSCLIENT_VALUE license along with **AAE_ADMIN** role

Request parameters

Parameter	Type	Required	Description
pageno	Integer	No	The page number of the Bot Run Data that you want to retrieve.
limit	Integer	No	<p>Limits the number of results returned. Defaults to 1000.</p> <p>For example, if you specify the limit as 2500 to retrieve a total of 10000 records, then the information retrieved is as follows:</p> <ul style="list-style-type: none"> • 0 page returns 1 - 2500 • 1st page returns 2501 - 5000 • 2nd page returns 5001 - 7500 • 3rd page returns 7501 - 10000

Parameter	Type	Required	Description
fromDate	String	No	<p>The starting timestamp for the date range.</p> <p>If you do not provide this parameter, the API will return all available data.</p> <p>Format: yyyy-mm-ddThh:mm:ss</p>
toDate	String	No	<p>The ending timestamp for the date range.</p> <ul style="list-style-type: none"> Format: yyyy-mm-ddThh:mm:ss Default: current date

```
GET http://{{ControlRoomURL}}/v2/botinsight/data/api/getbotrundata?
pageno=1&limit=2&fromDate=2022-01-27T00%3A30%3A00Z&toDate=2022-02-27T06%3A30%3A00Z
```

Response

```
{
  "totalRecords":2,

Response Parameters

Parameter	Type	Description
totalRecords	Integer	Total Records that has been retrieved as part of the request.
botRunDataList	Array	The array of Bot Run Data objects.
botRunDataList Object		
id	Integer	The bot run unique Id for the particular run.
userName	String	The user name of the user who is running the bot.
hostName	String	The host name.
fileName	String	Bot file name.
fileType	String	File Type associated to this bot. Following are the possible values for <ul style="list-style-type: none"> RUN_NOW : A regular run as users bot. WLM_TASK: A Work load management bot that is run in a queue. SCHEDULED: A bot that is scheduled. API: A bot that is run from the API. AARI: A process bot.
startDate	String	The date and time of when this bot started.
endDate	String	The date and time of when this bot ended.
status	String	The status of the bot. Following values are possible: <ul style="list-style-type: none"> COMPLETED: bot successfully completed execution. DEPLOYED: auto-login is successful and bot is deployed to a device. DEPLOY_FAILED: bot failed to deploy to the device. For example failed. QUEUED: requested user or device is busy running another execution. PENDING_EXECUTION: device has been selected, but bot has not been deployed to that device. RUNNING or UPDATE: bot is executing on a device. RUN_FAILED: bot failed after being deployed to a device. RUN_PAUSED: user paused the bot. RUN_TIMED_OUT: bot failed to complete tasks within a specific time. UNKNOWN: connection between the service and the device was lost.
totalLines	Integer	Total number of command lines the bot contains.
currentLine	Integer	The current line the bot is processing.
timeTaken	Integer	Time taken in milliseconds by the bot to complete the operation.
progress	Integer	The progress of the bot in percentage.

Note: You can view the in the , but API functionality is limited. You need a licensed Edition to access the full functionality of the APIs.

The REST API responds to each request with an HTTP response code. For response codes, see [API response codes](#).

Get Bot Insight audit trail data

Retrieve information about Control Room events.

Note: You can view the in the , but API functionality is limited. You need a licensed Edition to access the full functionality of the APIs.

- All API calls must contain an authentication token in the request header. Use the `Authentication` API to generate a JSON web token. See [Authentication API](#).
- You must have the **AAE_Admin** role or a custom role with the `View everyone's audit log actions` permission.

To retrieve information about Control Room events, you provide the following query parameters to the API:

Parameter	Required	Type	Description
<code>pageno</code>	no	integer	Page number from which to retrieve the data
<code>limit</code>	no	integer	Specifies the number of parts in which the information is retrieved For example, if you specify the limit as 2500 to retrieve a total of 10000 records, then the information retrieved is as follows: <ul style="list-style-type: none"> • 0 page returns 1 - 2500 • 1st page returns 2501 - 5000 • 2nd page returns 5001 - 7500 • 3rd page returns 7501 - 10000
<code>fromDate</code>	no	date	Start date of the period for which to retrieve the data If you do not provide this parameter, the API will return all available data. Format: <code>yyyy-mm-ddThh:mm:ss</code>
<code>toDate</code>	no	date	End date of the period for which to retrieve the data. <ul style="list-style-type: none"> • Format: <code>yyyy-mm-ddThh:mm:ss</code> • Default: current date

1. Add the authentication token to the request header.
2. Use the GET method and endpoint URL: `<control_room_URL>/v2/botinsight/data/api/getaudittraildata`

3. Send the request.**Response body:**

```
{
  "totalRecords": 10000,
  "auditTrailDataList": [
    {
      "activityType": "BI_LOAD_DASHBOARD",
      "createdBy": 1121,
      "createdOn": "2021-01-11T11:15:06Z",
      "detail": {},
      "environmentName": "DEV",
      "eventDescription": "BI Load Dashboard",
      "hostName": "192.xxx.xxx.xxx",
      "id": "AnalyticsMortgageProcessing",
      "objectName": "N/A",
      "requestId": "f36e040e-02a6-4fae-8415-9ff57067b7a3",
      "source": "Bot Insight",
      "status": "Successful",
      "userName": "ram"
    },
    // The remaining data is omitted from this code example.
  ]
}
```

The REST API responds to each request with an HTTP response code. For response codes, see [API response codes](#).

Get bot variables data

Retrieve information about the variables in deployed bots, such as the variable name, data type, minimum value, and maximum value.

Note: You can view the in the , but API functionality is limited. You need a licensed Edition to access the full functionality of the APIs.

- All API calls must contain an authentication token in the request header. Use the [Authentication API](#) to generate a JSON web token. See [Authentication API](#).
- You must have the **AAE_Bot Insight Admin** role and the [Bot Insight](#) license.
- The bot must be checked into the public workspace.
- You must publish at least one dashboard to get the results using this API.

To retrieve information about the variables in a deployed bot, you provide the following query parameters to the API:

Parameter	Required	Type	Description
botname	no	string	Name of the bot for which data is retrieved
repositorypath	no	string	Control Room repository path of the bot

1. Add the authentication token to the request header.
2. Use the GET method and endpoint URL:<control_room_URL>/v2/botinsight/data/api/gettaskvariableprofile

3. Send the request.

Response body: This response example contains data on the AnalyticsMortgageProcessing bot and the first record returned. To keep this block of code short, the remaining data is omitted.

```
{
  "dataProfiles": [
    {
      "botId": "PROD_40642",
      "botName": "AnalyticsMortgageProcessing",
      "standardDashboardName": "",
      "profileVariables": [
        {
          "variableName": "state",
          "displayName": "State",
          "attributeType": "US_STATE_CODE",
          "sumOfValue": 0.0,
          "minimumValue": "",
          "maximumValue": "",
          "averageOfValues": 0.0,
          "totalDistinct": "53",
          "enabled": "Y",
          "isTransactionVariable": ""
        },
        // The remaining data is omitted from this code example.
      ]
    }
  ]
}
```

The REST API responds to each request with an HTTP response code. For response codes, see [API response codes](#).

Bot Lifecycle Management API

Use the Bot Lifecycle Management API to export and import bots with dependent files and command packages for comprehensive automation lifecycle management. Users can export bots from public workspace and import to a private workspace in another Control Room and check into a public workspace.

Note: You can view the in the , but API functionality is limited. You need a licensed Edition to access the full functionality of the APIs.

Overview

You can use the Control Room Export and Import REST API to manage your automation TaskBots, including dependent files in different environments such as development, testing, and production based on your organization's automation requirements.

For example, you can move bots that are verified as production-ready from test to production.

Import Enterprise 11 bots in Automation 360 for migration

The Bot Lifecycle Management import feature also support to import your Enterprise 11 bots from Enterprise 11 Control Room instance to Automation 360. This enables you to consolidate the Enterprise 11 bots from multiple Control Room repository in a single Automation 360 repository.

Permissions required to move bots

To export bots from the Control Room, you must have the following permissions:

- **Export bot** and **View packages** feature permissions
- **Check in** or **Check out** folder permissions

To import bots to the Control Room, you must have the following permissions:

- **Import bot** and **Manage package** feature permissions
- **Check in** folder permission
- Bot Creator license

Moving a bot

To move a bot from one environment to another, follow these steps:

1. Use the Export API to export the bot from the Control Room in the source environment.
[Export files using API](#)
2. Use the Import API to import the bot into the Control Room in the destination environment.
[Import files using API](#)

Related concepts

[Bot Lifecycle Management](#)

The Bot Lifecycle Management feature enables you to move a bot from one environment to another. For example, you can move a bot from the development or testing environment to the production environment.

Export files using API

You can export bots with their dependent files using the Export API.

Note: You can view the in the , but API functionality is limited. You need a licensed Edition to access the full functionality of the APIs.

- You must have Export bots, View package, and Check in or Check out permissions to the required folders.
- All API calls must contain an authentication token in the request header. Use the [Authentication API](#) to generate a JSON web token. See [Authentication API](#).
- A file ID of the bot you want to export from the public folder.

[List files and folders by workspace API](#)

Note: Users can only view the folders and subfolders they have permissions to access.

- The following API URLs:
 - `https://<your_control_room_url>/v2/blm/export`: To export repository bots
 - `https://<your_control_room_url>/v2/blm/status/{requestId}`: To get export status by request ID
 - `https://<your_control_room_url>/v2/blm/download/{downloadFileId}`: To download the exported bot

1. Add the authentication token to the request header.
2. Search for one or more file IDs of the bot you want to export.
3. Use the POST method and endpoint URL: `https://<your_control_room_url>/v2/blm/export`.
The following example request body, exports the bot with `fileId` 2197 along with the packages required for bot.

Request body:

```
{
  "name": "export-docs",
  "fileIds": [
    2197
  ],
  "includePackages": true
}
```

4. Send the request.
The following response body returns the `requestId`.

Response body:

```
{
  "requestId": "987c0de3-b158-4e71-975e-27d10b9a83fb"
}
```

5. Use the GET method and endpoint URL: `<your_control_room_url>/v2/blm/status/{requestId}`
Enter the `requestId` generated in Step 4 to know the status of export.

```
https://192.0.2.0/v2/blm/status/987c0de3-b158-4e71-975e-27d10b9a83fb
```

6. Send the request.
The following response body returns the `status` and `downloadFileId`.

Response body:

```
{
  "requestId": "987c0de3-b158-4e71-975e-27d10b9a83fb",
  "type": "EXPORT",
  "status": "COMPLETED",
  "downloadFileName": "export-docs",
  "downloadFileId": "ZXhwb3J0LWRvY3M=",
  "errorMessage": ""
}
```

7. Use the GET method and endpoint URL: `<your_control_room_url>/v2/blm/download/{downloadFileId}`
Enter the `downloadFileId` generated in Step 6.

```
https://192.0.2.0/v2/blm/download/ZXhwb3J0LWRvY3M=
```

8. Send the request.

The dialog box appears. Browse the path and save the exported package in zip file format.

The REST API responds to each request with an HTTP response code. For response codes, see [API response codes](#).

Import the exported file in the private folder of the target Control Room.

Related tasks[Export bots](#)

You can export a bot from one Control Room to another.

Import files using API

You can import bots with their dependent files using the Import API.

Note: You can view the in the , but API functionality is limited. You need a licensed Edition to access the full functionality of the APIs.

- You must have following permissions and licenses:
 - Import bots
 - Manage package
 - Check in permissions to the necessary folders to import bots in the public workspace
 - Bot Creator license to import bots in the private workspace
- All API calls must contain an authentication token in the request header. Use the [Authentication API](#) to generate a JSON web token. See [Authentication API](#).
- The following API URLs:
 - `https://<your_control_room_url>/v2/blm/import`: To import repository bot
 - `https://<your_control_room_url>/v2/blm/status/{requestId}`: To get import status by request ID
- To import the Enterprise 11 bots into your Control Room, you must have the required `aapkg` package that you created using the Bot Lifecycle Management Export API in the Enterprise 11 Control Room instance.

The `aapkg` package must be present in the same Automation 360 machine where you want to import the Enterprise 11 bots.

You can import the password-protected `aapkg` packages using the Import API only.

1. Add the authentication token to the request header.
2. Use the POST method and endpoint URL: `https://<your_control_room_url>/v2/blm/import`.

Provide the following parameters for the request header.

- `upload`: Choose the required zip file that you want to import in your Control Room.
Choose the required `aapkg` file to import Enterprise 11 bots to your Control Room.
- `actionIfExists`: Select either the `SKIP` or `OVERWRITE` option if the file you are importing already exists.
- `publicWorkspace`: This is a Boolean value. Select either `true` or `false`. Enter `true` if you want to import the file to the public workspace.

3. Send the request.
The following response body returns `requestId`.

Response body:

```
{
  "requestId": "eafef543-2d7a-47f5-81d0-490d09dd68d2"
}
```

4. Use the GET method and endpoint URL: `<your_control_room_url>/v2/blm/status/{requestId}`
Enter the `requestId` generated in Step 3 to know the status of import.
5. Send the request.
The following response body returns the `status`.

Response body:

```
{
  "requestId": "fa4b0c56-fab8-42ef-8d96-fc6b53e1cbaa",
  "type": "IMPORT",
  "status": "COMPLETED",
  "downloadFileName": "",
  "downloadFileId": "",
  "errorMessage": ""
}
```

The `COMPLETED` status indicates that the file is successfully imported. You can find the imported file in your Control Room

Enterprise 11 bots migration:

- a. The Enterprise 11 bots are imported in the **Bots > My Tasks** folder or **Bots > My Metabots** folder in the `.atmx` or `.mbot` file format.
- b. Use the migration wizard to convert the Enterprise 11 bots files into the `.bot` format that is supported in Automation 360.

The REST API responds to each request with an HTTP response code. For response codes, see [API response codes](#).

Related tasks[Import bots](#)

You can import bots with their dependencies from one Control Room to another. The source environment can be Automation 360 Control Room, Enterprise 11, or Enterprise 10 Control Room instance.

Device pool API

Identify all available device pools or filter device pools by name. Retrieve detailed device pool information for a device by searching for its unique numeric identifier (ID).

A device pool is a logical grouping of devices used by a Bot Runner to distribute and manage the running of unattended bots.

Note: You can view the in the , but API functionality is limited. You need a licensed Edition to access the full functionality of the APIs.

List device pools API

List all available device pools in your Control Room, or filter the list by the name of the device pool.

Note: You can view the in the , but API functionality is limited. You need a licensed Edition to access the full functionality of the APIs.

- All API calls must contain an authentication token in the request header. Use the [Authentication API](#) to generate a JSON web token. See [Authentication API](#).
- You must be assigned a role that includes the `View and manage all devices` permission.

This task searches for all device pools that contain the string **finance** in the name.

1. Add the authentication token to the request header.
2. Use the POST and endpoint URL: `<your_control_room_url>/v2/devices/pools/list`.

```
{
  "filter": {
    "operator": "substring",
    "field": "name",
    "value": "finance"
  }
}
```

Filtering, pagination, and sorting

3. Send the request.

Response body:

```
{
  "page": {
    "offset": 0,
    "total": 15,
    "totalFilter": 1
  },
  "list": [
    {
      "id": "27",
      "name": "finance-device-pool",
      "status": "CONNECTED",
      "detailedStatus": "ALL_DISCONNECTED",
      "automationCount": "0",
      "ownerIds": [
        "48"
      ],
      "deviceCount": "3"
    }
  ]
}
```

A successful response lists one or more device pools. Use the ID of a device pool to view the details.

Retrieve details of device pool by ID

If you are performing the steps to run a bot perform this task: [Bot deployment - V3](#)

If you are performing the steps to create an automation schedule perform this task: [Schedule bot to run API](#)

Retrieve details of device pool by ID

Retrieve the details of a specific device pool by its numeric identifier (ID).

Note: You can view the in the , but API functionality is limited. You need a licensed Edition to access the full functionality of the APIs.

Ensure you have the following to use this API:

- View and manage ALL device(s): View and manage all the devices, including devices registered by other users.
- All API calls must contain an authentication token in the request header. Use the `Authentication` API to generate a JSON web token. See [Authentication API](#).
- Device pool id: The unique numeric identifier of the device pool for which you want to retrieve details.

This task searches in the Control Room for a specific device pool. The API passes the device pool {id} as part of the URL string. No request body is required.

1. Add the authentication token to the request header.

[Authentication API](#)

2. Use the GET method and endpoint URL: `<your_control_room_url>/v2/devices/pools/{id}`. Enter the device pool ID in the URL. In this example, the device pool ID is **27**.

```
https://<your_control_room_url>/v2/devices/pools/27
```

3. Send the request.

When the request is successful, all the details associated with the passed device pools ID are returned in response body.

In this example, the name, automation scheme, status, Bot Runners, owners, and consumers, associated with the device pool ID **27** are returned in the response body

Response body:

```
{
  "id": "27",
  "name": "finance-device-pool",
  "description": "Finance department device pool",
  "automationScheme": "ROUND_ROBIN",
  "status": "CONNECTED",
  "timeSlice": "5",
  "timeSliceUnit": "MINUTES",
  "deviceIds": [
    "10",
    "23",
    "41"
  ],
  "ownerIds": [
    "48"
  ],
  "consumerIds": [],
  "detailedStatus": "ALL_DISCONNECTED",
  "updatedBy": "48",
  "updatedOn": "2020-04-27T14:29:05.655896Z",
  "createdBy": "48",
  "createdOn": "2020-04-25T10:46:44.642586Z",
  "tenantUuid": "c0a8f10a-717f-130b-8171-7f4762280000",
  "tenantId": "4"
```

```
}

```

Review the details of the listed device pool to determine if it meets your bot deployment requirements. Some of the fields in the response are used as input to other APIs.

Evaluate these details:

id	The id uniquely identifies this device pool in the Control Room. Use this id as input for the poolIds for bot deployment. <i>Bot deployment - V3</i>
name	This is the user-defined name for the device pool. Filter the device pool name using filters in the list device pools task. <i>List device pools API</i>
deviceIds	List of the unique numeric IDs for Bot Runner devices that are part of this device pool.
ownerIds	The IDs of the owners of this device pool. Device pool owners can view, edit, or delete the device pool.
consumerIds	The IDs for users who can view this device while running automations.

The REST API responds to each request with an HTTP response code. For response codes, see [API response codes](#).

Create device pool API

Device pools are a logical grouping of devices or similar Bot Runner machines on which you can run your workload management automations or scheduled automations. Create a device pool using an API with a unique name and add unattended Bot Runners to the device pool.

Note: You can view the in the , but API functionality is limited. You need a licensed Edition to access the full functionality of the APIs.

Ensure you have the following:

- AAE_Pool_Admin role and View and manage ALL device(s) permission
- All API calls must contain an authentication token in the request header. Use the [Authentication API](#) to generate a JSON web token. See [Authentication API](#).
- Endpoint URLs:
 - <your_control_room_url>/v2/devices/pools
 - <your_control_room_url>/v2/devices/list

1. Add the authentication token to the request header.

2. Use the POST method and endpoint URL: <your_control_room_url>/v2/devices/pools.
If you want to search or get a list of all the available **deviceIds**, use the following endpoint URL:
`https://<your_control_room_url>/v2/devices/list`

Request device details

For example:

```
POST https://192.0.2.0/v2/devices/pools
```

The this example request body enables you to add automation scheme, unattended Bot Runners, owners, and consumers in the device pool.

Request body:

```
{
  "name": "Finance-device-pool",
  "description": "Pool for Finance RPA",
  "deviceIds": [
    "1",
    "10"
  ],
  "automationScheme": "ROUND_ROBIN",
  "ownerIds": [
    "1",
    "24",
    "26"
  ],
  "consumerIds": [
    "21",
    "22"
  ]
}
```

3. Send the request.

When the request is successful, a unique device pool **id** is returned in the response body. The details of the devices, owners, and consumers associated with the device pool are also provided.

In this example, the response body returns the unique device pool **id** as 4.

Response body:

```
{
  "id": "4",
  "name": "Finance-device-pool",
  "description": "Pool for Finance RPA",
  "automationScheme": "ROUND_ROBIN",
  "status": "CONNECTED",
  "timeSlice": "5",
  "timeSliceUnit": "MINUTES",
  "deviceIds": [
    "1",
    "10"
  ],
  "ownerIds": [
    "1",
    "24",
    "26"
  ],
  "consumerIds": [
    "21",
    "22"
  ],
  "detailedStatus": "SOME_CONNECTED",
}
```

```

"updatedBy": "24",
"updatedOn": "2020-05-26T09:26:54.556280800Z",
"createdBy": "24",
"createdOn": "2020-05-26T09:26:54.556280800Z",
"tenantUuid": "4db5b32c-5c4b-4aee-8ca0-f53ec241563c",
"tenantId": "4"
}

```

The REST API responds to each request with an HTTP response code. For response codes, see [API response codes](#).

If you are performing the steps to [Create workload automation](#), next [Run bot with queue API](#).

If you are performing the steps to [Deploy a bot](#), next [Bot deployment - V3](#).

License API

The License API contains endpoints to retrieve Control Room license details (such as expiration date and license mode) and manually sync the Control Room with the license server after license reallocation or renewal.

Note: You can view the in the , but API functionality is limited. You need a licensed Edition to access the full functionality of the APIs.

Manage licenses

1. [Authenticate the user](#).

Use the POST method to generate an authentication JSON Web Token.

2. [Retrieve Control Room license details API](#).

Retrieve details of the Control Room license, including license type, expiration date, Fail-Safe status, and license server sync status.

3. If the `controlRoomLicenseServerSyncStatus` parameter returns `False`, use the Sync endpoint to update the license allocations and expiration date from the license server.

List the license allocations

1. [Authenticate the user](#).

Use the POST method to generate an authentication JSON Web Token.

2. If the license is cloud-based: If new licenses were purchased, or if licenses were reallocated between Control Room instances, use the Sync endpoint to update the license allocations and expiration date from the license server.

3. [List Control Room licenses](#)

Retrieve Control Room metadata including the license type, number of available licenses, number of licenses used in a specific Control Room instance, and number of licenses used in all Control Room instances.

Related reference

[Automation 360 licenses](#)

The **All Licenses** page displays detailed information about current product and device licenses.

Retrieve Control Room license details API

Retrieve details of the Control Room license, including license type, expiration date, Fail-Safe status, and license server sync status.

1. Use the GET method and endpoint URL: <your_control_room_url>/v2/license/details.
2. Send the request.

Response body: In a successful request, this endpoint returns the following data:

- `failSafeStatus`: A numerical value that represents the Fail-Safe status of the Cloud Control Room. Values: 0 means the Control Room is connected, 1 means the Control Room is in Fail-Safe mode, and 2 means the Fail-Safe status has expired.

If the Control Room was configured with a file license, the returned value is always 0.

Control Room fail-safe status

- `controlRoomLicenseServerSyncStatus`: A Boolean value that determines whether the license allocations in this Control Room are in sync with the license server.
- `licenseMode`: Whether the Control Room license was configured from a file or through a connection with the license server.

#unique_126/unique_126_Connect_42_entitlement-models

In this first example response, the `licenseMode` confirms that the Control Room is on a file-based license, thus the `failSafeStatus` is 0 and no value is returned for the `installedCrId`.

```
{
  "type": "PURCHASED",
  "installationDate": "2020-09-09T15:06:05.211Z",
  "expirationDate": "2021-06-30T18:29:59.999Z",
  "failSafeStatus": 0,
  "controlRoomLicenseServerSyncStatus": true,
  "installedCrId": "",
  "licenseMode": "FileLicense"
}
```

In the second example response, the `licenseMode` confirms that the Control Room is on a cloud-based license, the `failSafeStatus` has returned 1, which means that requests to other Control Room APIs will fail until the connection with the license server is reestablished, and the `controlRoomLicenseServerSyncStatus` has returned false.

```
{
  "type": "PURCHASED",
  "installationDate": "2020-09-14T18:30:00Z",
  "expirationDate": "2021-04-27T18:30:00Z",
  "failSafeStatus": 1,
  "controlRoomLicenseServerSyncStatus": false,
  "installedCrId": "b96edac7-b7e3-57bf-b857-ad14ac754674",
  "licenseMode": "CloudLicense"
}
```

The REST API responds to each request with an HTTP response code. For details about the response codes, see [API response codes](#).

If the `controlRoomLicenseServerSyncStatus` parameter returns `False`, use the Sync endpoint to update the license allocations and expiration date from the license server.

List Control Room licenses

Retrieve Control Room metadata including the license type, number of available licenses, number of licenses used in a specific Control Room instance, and number of licenses used in all Control Room instances.

Request

```
POST https://{{ControlRoomURL}}/v2/license/product/list
```

```
Header: X-Authorization <<authentication token>>
```

All API calls must contain an authentication token in the request header. Use the [Authentication API](#) to generate a JSON web token. See [Authentication API](#).

Response

```
200 OK
```

```

Response Parameters

Parameter	Type	Description
offset	Integer	The starting list offset, used for pagination.
total	Integer	Total number of records.
totalFilter	Integer	Number of records after applying the filter.
List	Array	The array of List object.
List object		
name	String	Returns the product license name, such as <code>ControlRoom</code> , <code>Analytics</code> , <code>BotFarm</code> , <code>Cognitive</code> , <code>DiscoveryBot</code> , and <code>AutomationAnywhereRoboticInterface</code> .
Feature object		
id	Integer	Unique ID of the feature.
name	String	Returns the device license, such as <code>Development for Bot Creator</code> , <code>Runtime for unattended Bot Runner</code> , and <code>AttendedRuntime</code> for attended Bot Runner licenses.
Enable	Boolean	A flag indicating if a license is enabled or disabled. If the returned value is <code>False</code> , that license cannot be assigned to a user.
PurchasedCount	Integer	The total number of licenses purchased.
usedCountByThisCr	Integer	The number of licenses used in this Control Room instance.
usedCountByAllCr	Integer	The total number of licenses that are used. If the license is file-based, this number matches the number in the <code>usedCountByThisCr</code> parameter. If the license is cloud-based, this parameter returns the total number of licenses used in all of the customer's Control Room instances.
availableCount	Integer	The number of licenses that are available for allocation.
licenseType	String	Shows whether the license is purchased or is a trial license.

Note: You can view the in the , but API functionality is limited. You need a licensed Edition to access the full functionality of the APIs.

All API calls must contain an authentication token in the request header. Use the `Authentication API` to generate a JSON web token. See [Authentication API](#).

Deploy bots using API

Use a combination of endpoints to deploy bots from the public workspace to Bot Runner devices.

Note: You can view the in the , but API functionality is limited. You need a licensed Edition to access the full functionality of the APIs.

Prerequisites to deploy a bot

Ensure that you are allocated the following resources:

- **View and Run my bots** feature permission
 - **Run and schedule** permissions for the folders that contain the bots
 - Access to Bot Runner licensed users
 - Access to either a default device or a device pool
-

Note: If the user associated with the Bot Runner license has a default device assigned to their account, the bot deploys on that device. If no default device is assigned, or you want to select a different device, then you must specify a device pool.

Deploy a bot

1. [Authenticate \(username and password\)](#)
2. [List files and folders by workspace API](#)
3. [List available unattended Bot Runners API](#)
4. **Optional:** [List device pools API](#)
5. [Bot deployment - V3](#)
6. [Bot deployment - V4](#)

Related concepts

[User management APIs](#)

Use `User Management` APIs to create, search, update, or delete roles and users in your Control Room.

Related tasks

[List available unattended Bot Runners API](#)

Return a list of available users with unattended Bot Runner licenses. This endpoint returns the user id, which is a numeric value that is used by APIs to identify users.

Bot deployment - V3

As a user with a Bot Runner license, deploy bots on your assigned devices. You can also pass variables to bots when they are deployed.

Request

```
POST https://{{ControlRoomURL}}/v3/automations/deploy
```

```
Header: X-Authorization <<authentication token>>
```

All API calls must contain an authentication token in the request header. Use the [Authentication API](#) to generate a JSON web token. See [Authentication API](#).

Note: Bot deploy request can be made without any input fields. If you specify inputs, make sure that the bot to successfully receive these mapped in values, the variable for that bot must be marked as input. Additionally, the name of the variable in the bot has to match the value that is being mapped in the request body.

Request body with LIST input:

```
{
  "fileId": 86,
  "runAsUserIds": [
    3
  ],
  "poolIds": [],
  "overrideDefaultDevice": false,
  "callbackInfo": {
    "url": "https://callbackserver.com/storeBotExecutionStatus",
    "headers": {
      "X-Authorization": "{{token}}"
    }
  },
  "botInput": {
    "iTestList": {
      "type": "LIST", //Type can be [ STRING, NUMBER, BOOLEAN, LIST,
      DICTIONARY, DATETIME ]
      "list": [
        { "type":"STRING",
          "string": "TestValues1"
        },
        { "type":"STRING",
          "string": "TestValues2"
        }
      ] //key must match type, in this case string
    }
  }
}
```

Request body with STRING input:

```
{
  "fileId": 87,
```

```

"runAsUserIds": [
  3
],
"poolIds": [],
"overrideDefaultDevice": false,
"callbackInfo": {
  "url": "https://eogplyk2wlo3ec2.m.pipedream.net",
  "headers": {
    "X-Authorization": "{{token}}"
  }
},
"botInput": {
  "sInput1": {
    "type": "STRING",
    "string": "Test Values1"
  },
  "sInput2": {
    "type": "STRING",
    "string": "Test Values2"
  }
}
}

```

Request body with NUMBER input:

```

{
  "fileId": 87,
  "runAsUserIds": [
    3
  ],
  "poolIds": [],
  "overrideDefaultDevice": false,
  "callbackInfo": {
    "url": "https://eogplyk2wlo3ec2.m.pipedream.net",
    "headers": {
      "X-Authorization": "{{token}}"
    }
  },
  "botInput": {
    "sInput1": {
      "type": "NUMBER",
      "integer": 123
    },
    "sInput2": {
      "type": "NUMBER",
      "integer": 345
    }
  }
}

```

Request body with DICTIONARY input:

```

{
  "fileId": 86,
  "runAsUserIds": [
    3
  ],
  "botInput": {
    "iTestList": {
      "type": "DICTIONARY", //Type can be [ STRING, NUMBER, BOOLEAN, LIST,
DICTIONARY, DATETIME ]
      "dictionary": [
        {

```

```

        "key": "key1",
        "value": {
            "type": "STRING",
            "string": "value1"
        }
    },
    {
        "key": "key2",
        "value": {
            "type": "STRING",
            "string": "value2"
        }
    }
] //key must match type, in this case string
}
}
}

```

Request body with DATE TIME input:

```

{
  "fileId": 87,
  "runAsUserIds": [
    3
  ],
  "botInput": {
    "dt_input1": {
      "type": "DATETIME",
      "string": "2022-04-07T00:15:00-06:00 [USA/New York]"
    },
    "dt_input2": {
      "type": "DATETIME",
      "string": "2022-04-07T00:15:05-06:00 [USA/New York]"
    }
  }
}
}

```

Request Parameters

Parameter	Type	Required	Description
fileId	Integer	Yes	File Id of bot to be deployed. List files and folders by workspace API
automationName	String	No	Name of the automation to be deployed.
runAsUserIds	Integer	Yes	List of runAs user ids to deploy bot. The bot will be deployed on one of the devices provided. List available unattended Bot Runners API

Parameter	Type	Required	Description
callbackInfo	String	No	<p><code>callbackInfo</code> provides the callback API URL (For example callbackserver.com/storeBotExecutionStatus) and authenticates the bot to the callback server. After the bot is deployed, the Control Room sends the output variable values to this callback server. For example, you can create an account in https://pipedream.com/ and use the token eogp1yk2w1o3ec2.m.pipedream.net) to receive the status of the bot.</p> <p>Note: The callback server must accept POST calls to receive the output and the deployment status from the Control Room.</p>
poolIds	Integer	No	<p>You will define the <code>poolIds</code> only when you are running the bot in a pool of runners instead of an individual runner. Identifier of at least one active device. If you enter multiple pool IDs, the bot will run on any of which you want the API to check for available devices. If no devices are available at the time of deployment, the automation is queued.</p> <p>Note: If the user associated with the Bot Runner license is not assigned to their account, the bot deploys on that device if it is assigned, or you want to select a different device, then you need to create a pool.</p> <p>List device pools API</p>
overrideDefaultDevice	Boolean	No	<p>If the Bot Runner user is assigned to a default device and you want to use a different device pool, set this parameter to <code>true</code>.</p> <p>If deploying to the default device, set this parameter to <code>false</code>.</p>
runElevated	Array	No	<p>Whether to deploy the bot using elevated permissions or not. Possible values: <code>false</code>, <code>true</code>.</p>
numOfRunAsUsersToUse	Integer	No	<p>Specifies how many Bot Runners to use from the list of Bot Runners. The weighted system algorithm selects the Bot Runners with the highest weight.</p> <ul style="list-style-type: none"> System will pick the specified number of <code>runAsUsers</code> from the list of Bot Runners for tasks queued for the user at the moment of deployment. If 0 then all the users will be used. If the number is greater than the number of <code>runAsUsers</code> then it will error out.
automationPriority	String	No	<p>The automation Priority. By default it is set to <code>PRIORITY_MEDIUM</code>. Possible values for <code>automationPriority</code> includes: <code>PRIORITY_MEDIUM</code>, <code>PRIORITY_LOW</code>, <code>PRIORITY_HIGH</code>.</p>
botLabel	String	No	Label for the bot to be deployed.
botInput	Object	No	A data structure containing a botInput Object. See below for the structure of the botInput Object
type*	Any	No	<p>By default it is <code>STRING</code>. Possible values for <code>type</code> include: <code>BOOLEAN</code>, <code>FILE</code>, <code>ITERATOR</code>, <code>LIST</code>, <code>DICTIONARY</code>, <code>TAB</code>, <code>CONDITIONAL</code>, <code>WINDOW</code>, <code>TASKBOT</code>, <code>DATETIME</code>, <code>UIOBJECT</code>, <code>CREDENTIAL</code>, <code>COORDINATE</code>, <code>IMAGE</code>, <code>REGION</code>, <code>PROPERTY</code>, <code>CONDITIONALGROUP</code>, <code>FORM</code>, <code>FORMELEMENT</code>, <code>HOTKEY</code>, <code>TEXT</code>.</p>

Parameter	Type	Required	Description
*The structure of the input varies depending on the type you want to input. This topic provides you with a few of			

Response

```
200 OK
```

For more information on the return codes, see [API response codes](#).

```
{
  "deploymentId": "340a2949-aa44-41ab-af9b-f9343ae2581c"
}
```

Tip: Check the bot deployment status and the bot output variables using [Activity list](#).

Response Parameters

Parameter	Type	Description
deploymentId	String	The deployment Id created.

Note: You can view the in the , but API functionality is limited. You need a licensed Edition to access the full functionality of the APIs.

The REST API responds to each request with an HTTP response code. For response codes, see [API response codes](#).

Related tasks

[List available unattended Bot Runners API](#)

Return a list of available users with unattended Bot Runner licenses. This endpoint returns the user id, which is a numeric value that is used by APIs to identify users.

Related reference

[Search for users API](#)

Use the `Search for users` API to search for all users in the Control Room.

[Create user](#)

Use the `Create user` API to create a new user in the Control Room.

[Create role](#)

Use `Create role` API to create a new role with permissions in the Control Room.

Bot deployment - V4

As a user with a Bot Runner license, you can perform either attended or unattended deployments. You can also pass variables to bots when they are deployed.

Request

```
POST https://{ControlRoomURL}/v4/automations/deploy
```

```
Header: X-Authorization <<authentication token>>
```

All API calls must contain an authentication token in the request header. Use the `Authentication` API to generate a JSON web token. See [Authentication API](#).

Tip: V4 Bot Deploy API has all the functionalities of the V3 Bot Deploy API. The reason V4 Bot Deploy is introduced is to clearly segregate between attended and unattended deployments. The parameters for the attended deployment is different from the unattended deployment parameters. Unlike V3 Bot Deploy API, V4 Bot Deploy API is extendable for any new use cases. It is recommended to use the enhanced V4 Bot Deploy API over the V3 Bot Deploy API.

Note: Bot deployment requests can be made without any input fields. If you specify inputs, make sure that the bot successfully receives these mapped-in values and that the variable for that bot is marked as input. Additionally, the name of the variable in the bot must match the value that is being mapped in the request body.

Request body with LIST input (Attended sample):

```
{
  "botId":21,
  "attendedRequest":{
    "deploymentDeviceId":1,
    "queueDeployment":false,
    "launchInChildWindow":false
  },
  "runElevated":true,
  "hideBotAgentUi":true,

          "type":"STRING",
          "string":"TestValues2"
        }
      ]
    }
  }
}

```

Request parameters

Parameter	Type	Required	Description
botId	Integer	Yes	Bot Id of bot to be deployed. To list all the bot IDs, you can use this API: List files and
automationName	String	No	Name of the automation to be deployed

Parameter	Type	Required	Description
callbackInfo	String	No	<p>callbackInfo provides the callback API URL (for example storeBotExecutionStatus) and authentication token for the bot. When the bot is deployed, the Control Room sends the deployment variable values to this callback server. For example, to test create an account in https://pipedream.com/ and use the email eogp1yk2w1o3ec2.m.pipedream.net to receive the status a</p> <p>Note: The callback server must accept POST calls to receive and the deployment status from the Control Room.</p>
runElevated	Boolean	No	Whether to deploy the bot using elevated permissions or not. <code>false</code> and <code>true</code> .
automationPriority	String	Yes	Automation priority. By default, it is set to <code>PRIORITY_MEDIUM</code> . Possible values for automationPriority include <code>PRIORITY_MEDIUM</code> , <code>PRIORITY_LOW</code> .
botLabel	String	No	Label for the bot to be deployed.
botInput	Object	No	A data structure containing a botInput object. More details are available in the botInput object.
hideBotAgentUi	Boolean	No	Flag to indicate whether you want to hide the bot agent UI.
botInput Object			
type*	Any	No	By default, it is <code>STRING</code> . Possible values for type include <code>BOOLEAN</code> , <code>FILE</code> , <code>ITERATOR</code> , <code>LIST</code> , <code>DICTIONARY</code> , <code>TAB</code> , <code>CONDITIONAL</code> , <code>WINDOW</code> , <code>TASKBOT</code> , <code>DATETIME</code> , <code>UIOBJECT</code> , <code>CREDENTIAL</code> , <code>COORDINATE</code> , <code>IMAGE</code> , <code>REGION</code> , <code>PROPERTY</code> , <code>CONDITIONALGROUP</code> , <code>FORM</code> , <code>FORMELEMENT</code> , <code>HOTKEY</code> , <code>...</code>
*The structure of the input varies depending on the type you want to input.			
Attended parameters			
deploymentDeviceId	Integer	No	Specify the deployment device.
queueDeployment	Boolean	No	Flag to indicate whether you want to queue the deployment.
launchInChildWindow	Boolean	No	Flag to indicate whether you want to launch in the child window.
Unattended parameters			
deviceUsageType	String	Yes	<p>Specifies the device usage type. Following values are possible:</p> <ul style="list-style-type: none"> <code>PREFER_DEFAULT_DEVICE</code>: Prefer using the default device. Devices in the pool will be used only if the default device is not available. <code>RUN_ON_POOL_DEVICE</code>: Deployment will use device from the pool if available, otherwise use default device. <code>RUN_ONLY_ON_DEFAULT_DEVICE</code>: Deployment will use only the default device, even when a device pool is present.
runAsUserIds	Integer	Yes	<p>List of runAs user IDs to deploy bot. The bot will be deployed on the device for each runAsUserIds or on one of the device if not provided.</p> <p><i>List available unattended Bot Runners API</i></p>

Parameter	Type	Required	Description
poolIds	Integer	No	<p>You will define the <code>poolIds</code> only when you are running a pool of runners instead of an individual runner. Identifier at least one active device. If you enter multiple pool IDs, the order in which you want the API to check for available devices. If no devices are available at the time of deployment, the automation is queued.</p> <p>Note: If the user associated with the Bot Runner license is not assigned to their account, the bot deploys on that device if it is assigned, or you want to select a different device, then you need to create a pool.</p> <p>List device pools API</p>
numOfRunAsUsersToUse	Integer	No	<p>Specifies how many Bot Runners to use from the list of runners. The weighted system algorithm selects the Bot Runners with the most runners for the tasks.</p> <ul style="list-style-type: none"> System will pick the specified number of <code>runAsUsers</code> for the tasks queued for the user at the moment of deployment. If 0, then all the users will be used. If the number is greater than the number of <code>runAsUsers</code>, it will error out.

Response

```
200 OK
```

For more information on the return codes, see [API response codes](#).

```
{
  "deploymentId": "120a1243-a434-22aa-ab3f-f1123ae2523b"
}
```

Note: Check the bot deployment status and the bot output variables using [Activity list \(deprecated\)](#).

Response parameters

Parameter	Type	Description
deploymentId	String	The deployment ID created.

Note: You can view the response in the REST API, but API functionality is limited. You need a licensed [Automation Anywhere](#) Edition to access the full functionality of the APIs.

The REST API responds to each request with an HTTP response code. For response codes, see [API response codes](#).

Workload Management API

Use the Workload Management API to programmatically manage and create Work Item models, queues, Work Items, and automations in your Control Room.

Note: You can view the in the , but API functionality is limited. You need a licensed Edition to access the full functionality of the APIs.

Prerequisites

To create a *Workload Management* automation process, ensure that you are allocated the following roles and permissions:

- AAE_Pool Admin role and View all devices permission
- AAE_Queue Admin role or Create queues permission
- Run bot permission
- Run or schedule permission on the bots folder
- Device pool consumer permission

Create workload automation

1. *Authenticate the user.*

Use the POST method to generate an authentication JSON Web Token.

2. Create workload management queues:

- Create Work Item model API*
- Create queues API*
- Add queue owner or member API*
- Add queue participants API*
- Add queue consumer API*
- Add Work Items to the queue API*

3. *Create device pool API*

4. *Run bot with queue API*

Retrieve workload management entities using list APIs

When you create workload management queues for workload automation (see previous section), you can use the Workload Management list APIs to retrieve a list of workload management entities such as Work Item models, queues, and Work Items in queues associated with the Control Room.

Workload Management list APIs

Create Work Item model API

Define a Work Item structure (model) for processing in a queue. This enables you to manually upload the Work Item from the system in the absence of ready data in a file.

You must have the following:

- Create queues or AAE_Queue Admin permission
- The endpoint URL: <your_control_room_url>/v3/wlm/workitemmodels

1. Use the POST method and endpoint URL: <your_control_room_url>/v3/wlm/workitemmodels.

Enter the parameters such as Work Item model **name**, **attribute** names, and **type** value in the request body to create a Work Item structure. The value of **type** can be TEXT, NUMBER, or DATE, depending on the **attribute** value format.

For example:

```
POST https://192.0.2.0/v3/wlm/workitemmodels
```

In this example, the Work Item model **name** is Finance-template and it includes the first_name, last_name, and email as **attributes**. For these attributes, use TEXT value as the **type** parameter.

Request body:

```
{
  "name": "Finance-template",
  "attributes": [
    {
      "name": "first_name",
      "type": "TEXT"
    },
    {
      "name": "last_name",
      "type": "TEXT"
    },
    {
      "name": "email",
      "type": "TEXT"
    }
  ]
}
```

2. Send the request.

When the request is successful, the Work Item model **id** and the display column **id** are returned in the response. You will use these IDs when you create queues.

In this example, the response body returns the Work Item model **id** as 10 and the display column **id** as 59, 60, 61 for the first_name, last_name, and email, respectively.

Response body:

```
{
  "id": 10,
  "createdBy": 24,
  "createdOn": "2020-05-26T06:14:27.520336200Z",
  "updatedBy": 24,
  "updatedOn": "2020-05-26T06:14:27.520336200Z",
  "tenantId": 1,
  "version": 0,
  "displayColumnId": 59,
  "displayColumnId": 60,
  "displayColumnId": 61
}
```

```
"tenantUuid": "4db5b32c-5c4b-4aee-8ca0-f53ec241563c",
"name": "fin",
"attributes": [
  {
    "id": 59,
    "name": "first_name",
    "type": "TEXT"
  },
  {
    "id": 60,
    "name": "last_name",
    "type": "TEXT"
  },
  {
    "id": 61,
    "name": "email",
    "type": "TEXT"
  }
]
```

The REST API responds to each request with an HTTP response code. For details about the response codes, see [API response codes](#).

[Create queues](#)

Related tasks

[List Work Item models](#)

Use the Work Item model list API to get the list of all the Work Item templates that are associated with the specified Control Room.

Create queues API

A queue is one of the main building blocks of workload management. It holds specific sets of data that your bot is expecting for automation.

Ensure you have the following:

- Create queues or AAE_Queue Admin permission

- The endpoint URLs:
 - <your_control_room_url>/v3/wlm/queues
 - <your_control_room_url>/v3/wlm/workitemmodels/list
- 1. Use the POST method and endpoint URL: <your_control_room_url>/v3/wlm/queues. Enter values for the following parameters to create a queue. Use the same **workItemModelId** and **displayColumnIds** that you received in response when you created the Work Item model.

Note: If you want to search or get a list of all the available **workItemModelId**, use the endpoint URL <your_control_room_url>/v3/wlm/workitemmodels/list.

[List workload management queues](#)

For example:

```
POST https://192.0.2.0/v3/wlm/queues
```

In this example, use **workItemModelId** as 10 and **displayColumnIds** as 59, 60, 61.

Request body:

```
{
  "name": "Finance-Q",
  "description": "Queue for Finance",
  "reactivationThreshold": 1,
  "displayColumns": [
    "first_name",
    "last_name",
    "email"
  ],
  "workItemProcessingOrders": [
  ],
  "workItemModelId": 10,
  "displayColumnIds": [
    59,
    60,
    61
  ]
}
```

2. Send the request.

When the request is successful, a queue **id** is returned in the response body. This queue **id** will be used in the subsequent tasks when you add owners, participants, consumers, and Work Items in the queue.

In this example, the response body returns the queue **id** as 17.

Response body:

```
{
  "id": "17",
  "createdBy": "24",
  "createdOn": "2020-05-26T06:13:57.644499300Z",
  "updatedBy": "24",
  "updatedOn": "2020-05-26T06:13:57.644499300Z",
  "tenantId": "1",
  "version": "0",
  "tenantUuid": "4db5b56c-5c2b-4aee-8ca0-f53ec241563c",
  "name": "Finance-Q",
}
```

```
"description": "Queue for Finance",
"reactivationThreshold": "1",
"status": "NOT_IN_USE",
"manualProcessingTime": "0",
"manualProcessingTimeUnit": "",
"workItemProcessingOrders": [

],
"workItemModelId": "10",
"displayColumnIds": [
  "59",
  "60",
  "61"
],
"considerReactivationThreshold": false
}
```

The REST API responds to each request with an HTTP response code. For details about the response codes, see [API response codes](#).

[Add queue owner or member](#)

Related reference

[List workload management queues](#)

Use the Workload Management queues list API to get the list of all the queues that are associated with the specified Control Room. .

Add queue owner or member API

Add queue owners who can create, edit, and view queues. The queue creator is the default queue owner and can add other Control Room users as queue owners if required.

You must have the following:

- Create queues or AAE_Queue Admin permission

- The endpoint URLs:
 - `<your_control_room_url>/v3/wlm/queues/{queueId}/members/{userId}`
 - `<your_control_room_url>/v1/usermanagement/users/list`
 - `<your_control_room_url>/v3/wlm/queues/list`
1. Use the PUT method and endpoint URL: `<your_control_room_url>/v3/wlm/queues/{queueId}/members/{userId}`.

Enter the **queueId** to which you want to add the owner and the **userId** that will be the owner of the queue. This **queueId** is the same ID that was returned when you created the queue.

Note:

- If you want to search or get a list of all the available **queueId**, use the endpoint URL `<your_control_room_url>/v3/wlm/queues/list`.

[List workload management queues](#)

- If you want to search or get a list of all the **userId**, use the endpoint URL: `<your_control_room_url>/v1/usermanagement/users/list`.

[Search for users API](#)

For example, use **queueId** as 17 and **userId** as 1.

```
PUT https://192.0.2.0/v3/wlm/queues/17/members/1
```

Add one or more **permissions** in the request body to allow the user to perform the specific queue actions. In this example, `manage` and `own` permissions are added.

Request body:

```
{
  "permissions": [
    "manage",
    "own"
  ]
}
```

2. Send the request.

When the request is successful, the required user is added as a queue owner. In this example, the user with **userId** as 1 is added as a queue owner.

Response body:

```
{
  "id": 1,
  "permissions": [
    "own",
    "manage"
  ]
}
```

The REST API responds to each request with an HTTP response code. For details about the response codes, see [API response codes](#).

[Add queue participants](#)

Add queue participants API

Add queue participants from different roles defined in the Control Room.

You must have the following:

- Create queues or AAE_Queue Admin permission
- The endpoint URLs:
 - `<your_control_room_url>/v3/wlm/queues/{queueId}/participants`
 - `<your_control_room_url>/v3/wlm/queues/list`

1. Use the POST method and endpoint URL: `<your_control_room_url>/v3/wlm/queues/{queueId}/participants`.

Enter the **queueId** to which you want to add the participants. This **queueId** is the same ID that was returned when you created the queue.

Note: If you want to search or get a list of all the available **queueId**, use the endpoint URL `<your_control_room_url>/v3/wlm/queues/list`.

[List workload management queues](#)

For example, use **queueId** as 17.

```
POST https://192.0.2.0/v3/wlm/queues/17/participants
```

Enter one or more role **id** in the request body that you want to add as queue participants. In this example, one role **id** as 21 is added as queue participant.

Request body:

```
[
  {
    "id": 21
  }
]
```

2. Send the request.

When the request is successful, the participants are added to the queue.

In this example, the participant with role **id** as 21 is added to the queue.

Response body:

```
[
  {
    "id": 21,
    "createdBy": null,
    "createdOn": null,
    "updatedBy": null,
    "updatedOn": null,
    "tenantId": null,
    "version": 0,
    "tenantUuid": null,
    "description": null,
    "name": null,
    "accessRestriction": null,
    "permissions": [
    ],
  },
]
```

```

    "countPrincipals": 0,
    "principals": [
      ]
    }
  ]

```

The REST API responds to each request with an HTTP response code. For details about the response codes, see [API response codes](#).

[Add queue consumer](#)

Add queue consumer API

Add queue consumers from different roles defined in the Control Room.

You must have the following:

- Create queues or AAE_Queue Admin permission
- The endpoint URLs:
 - `<your_control_room_url>/v3/wlm/queues/{queueId}/consumers`
 - `<your_control_room_url>/v3/wlm/queues/list`

1. Use the POST method and endpoint URL: `<your_control_room_url>/v3/wlm/queues/{queueId}/consumers`.

Enter the **queueId** to which you want to add the consumers. This **queueId** is the same ID that was returned when you created the queue.

Note: If you want to search or get a list of all the available **queueId**, use the endpoint URL `<your_control_room_url>/v3/wlm/queues/list`.

[List workload management queues](#)

For example, use **queueId** as 17.

```
POST https://192.0.2.0/v3/wlm/queues/17/consumers
```

Enter one or more role **id** in the request body that you want to add as queue consumers. In this example, one role **id** as 21 is added as queue consumer.

Request body:

```

[
  {
    "id": 21
  }
]

```

2. Send the request.

When the request is successful, the consumers are added to the queue.

In this example, the consumer with role **id** as 21 is added to the queue.

Response body:

```

[
  {
    "id": 21,

```

```

    "createdBy": null,
    "createdOn": null,
    "updatedBy": null,
    "updatedOn": null,
    "tenantId": null,
    "version": 0,
    "tenantUuid": null,
    "description": null,
    "name": null,
    "accessRestriction": null,
    "permissions": [

    ],
    "countPrincipals": 0,
    "principals": [

    ]
  }
]

```

The REST API responds to each request with an HTTP response code. For details about the response codes, see [API response codes](#).

[Add Work Items to the queue](#)

Add Work Items to the queue API

Add or insert Work Items to an existing queue in the Control Room per the defined model or structure.

- The user must be a Queue owner and participant
- You must have the endpoint URLs:
 - `<your_control_room_url>/v3/wlm/queues/{queueId}/workitems`
 - `<your_control_room_url>/v3/wlm/queues/list`

1. Use the POST method and endpoint URL: `<your_control_room_url>/v3/wlm/queues/{queueId}/workitems`.

Enter the **queueId** to which you want to add a Work Item in the queue.

Note: If you want to search or get a list of all the available **queueId**, use the endpoint URL `<your_control_room_url>/v3/wlm/queues/list`.

[List workload management queues](#)

For example, use **queueId** as 17.

```
POST https://192.0.2.0/v3/wlm/queues/17/workitems
```

Enter a **workitem** in the request body.

Note: In the request body, ensure there are no hidden, invalid, new line, or EOL characters. You can check for these using text or source code editors.

Request body:

```
{
  "workItems": [
```

```

{
  "json": {
    "first_name": "Jane",
    "last_name": "Doe",
    "email": "jane.doe@example.com"
  }
}
]
}

```

2. Send the request.

When the request is successful, a unique Work Item **id** is returned in the response body and the Work Items are added to the queue per the defined Work Item model or structure.

In this example, the Work Item with the **first_name** as Jane, **last_name** as Doe, and **email** as jane.doe@example.com is added to the queue based on the defined structure.

Response body: (truncated output)

```

{
  "id": 77,
  "createdBy": 24,
  "createdOn": "2020-05-19T17:41:57.602092100Z",
  "updatedby": 24,
  "updatedOn": "2020-05-26T09:13:31.090241700Z",
  "version": 2,

        "jobExecutionId": ""
    }
]
}

```

4. Optional: If you want to update the Work Item data, when the automation is running, you need to perform the following steps:
 - a) Pause the automation. Use the PUT method and the following endpoint URL:
`<your_control_room_url>/v3/wlm/automations/{id}`
 - b) Update the Work Item by using queue ID and Work Item ID. Use the PUT method and the following endpoint URL: `<your_control_room_url>/v3/wlm/queues/{id}/workitems/{workitemId}`
 - c) Resume the automation. Use the PUT method and the following endpoint URL:
`<your_control_room_url>/v3/wlm/automations/{id}`

Create an automation to run a bot with a queue

Related tasks

[List Work Items in queue](#)

Use the Workload Management Work Item list API to get the list of all the Work Items in the queues that are associated with the specified Control Room.

Run bot with queue API

Create an automation to collectively process all the Work Items of a queue across all the Bot Runners present in one or more device pools using the API.

- You must have the following permissions:
 - Run bot
 - Run or schedule permission on the bot folder
 - Queue consumer
 - Device pool consumer

- You must have the endpoint URLs:
 - <your_control_room_url>/v3/wlm/automations
 - <your_control_room_url>/v1/usermanagement/users/list
 - <your_control_room_url>/v3/wlm/queues/list
 - <your_control_room_url>/v2/devices/pools/list
- Use the POST method and endpoint URL: <your_control_room_url>/v3/wlm/automations. Enter parameters such as **name** of the automation, **fileId**, **filename**, **queueID**, **queueName**, **runAsUserIds**, and **poolId**.
 - If you want to search or get a list of all the available **queueId**, use the endpoint URL <your_control_room_url>/v3/wlm/queues/list.
List workload management queues
 - If you want to search or get a list of all the **runAsUserIds**, use the endpoint URL: <your_control_room_url>/v1/usermanagement/users/list.
Search for users API
 - If you want to search or get a list of all the **poolId**, use the endpoint URL: <your_control_room_url>/v2/devices/pools/list.
List device pools API

In this example, the parameters are entered as follows:

- Automation **name** as Finance-RPA-Run
- Bot **fileName** as wlmql
- runAsUserIds** as 4 and 5 that will log in to the device to run the automation
- queueID** as 17, associated with the queue to run the automation
- poolId** as 1 that is associated with the pool

Request body:

```
{
  "name": "Finance-RPA-Run",
  "automationName": "Finance-RPA-Run",
  "fileName": "wlmql",
  "botInput": {
  },
  "status": "ACTIVE",
  "description": "WLM for Finance",
  "rdpEnabled": false,
  "setAsDefaultDevice": false,
  "poolIds": [
  ],
  "workspaceName": "public",
  "timeZone": "Asia/Calcutta",
  "runAsUserIds": [
    "4",
    "5"
  ],
  "queueId": "17",
  "poolId": "1"
}
```

2. Send the request.

When the request is successful, a unique automation **id** is returned in the response body after the workload management automation run successfully. The details of the associated queue name and ID, and the user name IDs for which the automation is run are also provided.

In this example, the response body returns the unique automation **id** as 12.

Response body:

```
{
  "id": "12",
  "name": "Finance-RPA-Run",
  "status": "ACTIVE",
  "description": "WLM for Finance",
  "rdpEnabled": false,
  "priority": "1",
  "queueId": "17",
  "queueName": "Finance-Q",
  "poolId": "1",
  "runAsUserIds": [
    "4",
    "5"
  ],
  "fileId": "17",

  "tenantId": "1",
  "version": "0",
  "tenantUuid": "4db5b32c-5c4b-4aee-8ca0-f53ec241563c"
}
```

The REST API responds to each request with an HTTP response code. For details about the response codes, see [API response codes](#).

Workload Management list APIs

List APIs use the POST method to return the list of the entities. You can use the Workload Management list APIs and get the list of workload management entities, for example, Work Item models, queues, and Work Items in the queues.

Use the following Workload Management APIs to get the list of the workload management entities:

- [List Work Item models](#)
- [List workload management queues](#)
- [List Work Items in queue](#)

List Work Item models

Use the Work Item model list API to get the list of all the Work Item templates that are associated with the specified Control Room.

You must have the following:

- Queue Consumer permission

- An authentication token for a user registered in the Control Room

Authentication API

- The endpoint URL: <your_control_room_url>/v3/wlm/workitemmodels/list

1. Use the POST method to generate an authentication JSON Web Token.

Authentication API

2. Use the POST method and endpoint URL: <your_control_room_url>/v3/wlm/workitemmodels/list.
Use the following URL and leave the request body blank to request information about all available Work Item models:

```
https://192.0.2.0/v3/wlm/workitemmodels/list
```

Request body:

```
{}
```

3. Send the request.
 - In the REST Client, click **SEND**.
 - In the Swagger interface, click **Execute**.

Because there is no filtering used in the request, a successful response returns all of the queues for the specified Control Room. In this example, the response returned data for two Work Item models.

Response body:

```
{
  "page": {
    "offset": 0,
    "total": 50,
    "totalFilter": 50
  },
  "list": [
    {
      "id": "1",
      "name": "q1",
      "attributes": [
        {
          "name": "Customer Name",
          "type": "TEXT",
          "id": "2"
        },
        {
          "name": "email",
          "type": "TEXT",
          "id": "4"
        }
      ]
    },
    {
      "id": "2",
      "name": "q2",
      "attributes": [
        {
          "name": "Customer Name",
          "type": "TEXT",
          "id": "7"
        }
      ]
    }
  ]
}
```

```

        "name": "email",
        "type": "TEXT",
        "id": "9"
    },
]
}

```

Related tasks

[Create Work Item model API](#)

Define a Work Item structure (model) for processing in a queue. This enables you to manually upload the Work Item from the system in the absence of ready data in a file.

List workload management queues

Use the Workload Management queues list API to get the list of all the queues that are associated with the specified Control Room. .

Request

```
POST http://{{ControlRoomURL}}/v3/wlm/queues/list
```

```
Header: X-Authorization <<authentication token>>
```

All API calls must contain an authentication token in the request header. Use the [Authentication API](#) to generate a JSON web token. See [Authentication API](#).

Request body without filters:

```

{
  "sort": [
    {
      "field": "name",
      "direction": "asc"
    }
  ],
  "filter": {
  },
  "page": {
    "offset": 0,
    "total": 100,
    "totalFilter": 100,
    "length": 200
  }
}

```

Request body with filters:

```

{
  "sort": [
    {
      "field": "name", //set sort by criteria
      "direction": "asc"
    }
  ],
  "filter": {

```

```

    "operator": "and",
    "operands": [
      {
        "operator": "eq",
        "value": "DRAFT",
        "field": "status"
      },
      {
        "operator": "substring",
        "value": "Test",
        "field": "name"
      }
    ]
  },
  "fields": [],
  "page": { //return a limited number of results with offset for pagination
    "offset": 0,
    "total": 100,
    "totalFilter": 100,
    "length": 200
  }
}

```

Request Parameters

Parameter	Type	Required	Description
sort	Array	No	By default, search results are sorted in descending order with respect to their ids. An alternative sorting is specified using the sort query parameter. Enter the field by which you want to sort along with the direction <code>asc</code> (ascending) or <code>desc</code> (descending). For more information on sorting, see Filtering, pagination, and sorting
filter	Object	No	Filters the result. For more information on sorting, see Filtering, pagination, and sorting
fields	Array	No	Filter the result based on the fields.
page	Object	No	The page object allows you to get the desired pages. For more information on pagination rules, see Filtering, pagination, and sorting

For the above sample request, the response returns all the details of the queue that has `Test` in their name and `NOT_IN_USE` as status.

Response

```

{
  "page": {
    "offset": 0,
    "total": 17,
    "totalFilter": 1
  },
  "list": [

```

```

    {
      "id": "32",

      "workItemModelId": "28",
      "displayColumnIds": [
        "156",
        "157",
        "158",
        "159",
        "160"
      ],
      "considerReactivationThreshold": false
    }
  ]
}

```

Response Parameters

Parameter	Type	Description
offset	Integer	The starting list offset, used for pagination.
total	Integer	Total number of records.
totalFilter	Integer	Number of records after applying the filter.
List	Array	The array of List of queues.
List roles object		
id	Integer	The unique Id of a specific queue.
createdBy	Integer	Id of the user who created the role.
createdOn	String	The creation timestamp of the role.
updatedBy	Integer	Id of the user who made a latest update to the role.
updatedOn	String	The latest update timestamp of the role.
tenantId	Integer	Id of the tenant.
version	Integer	Version of the role instance.
tenantUuid	String	Unique Id of the tenant.
name	String	Name of queue.
description	String	Description of queue.
reactivationThreshold	Integer	Minimum number of workItems in the queue to reactivate queue.

Parameter	Type	Description
status	String	The current status of the queue. The values can be DRAFT, IN_USE, NOT_IN_USE.
manualProcessingTime	Integer	Efforts required to process the queue manually.
manualProcessingTimeUnit	String	Unit of the manual Processing time. The values can be SECONDS, MINUTES, HOURS, or DAYS.
workItemProcessingOrder	Array	An array of work item processing orders.
workItemModelId	Integer	Id of the Work Item Model.
displayColumnIds	Array	An array displaying the list of column Ids.
considerReactivationThreshold	Boolean	Flag to indicate if the Reactivation Threshold is required or not.

Note: You can view the in the , but API functionality is limited. You need a licensed Edition to access the full functionality of the APIs.

The REST API responds to each request with an HTTP response code. For response codes, see [API response codes](#).

Related tasks

[Create queues API](#)

A queue is one of the main building blocks of workload management. It holds specific sets of data that your bot is expecting for automation.

List Work Items in queue

Use the Workload Management Work Item list API to get the list of all the Work Items in the queues that are associated with the specified Control Room.

You must have the following:

- Queue Consumer permission
- An authentication token for a user registered in the Control Room

[Authentication API](#)

- The endpoint URL: `<your_control_room_url>/v3/wlm/queues/{queueId}/workitems/list`

Leave the request body blank to request information on all available Work Items. Add one or more filter parameters in the request body to limit the information returned from all available workload management Work Items.

Supported filterable parameters:

status

The status of queue for example: New, On hold, Failed, Completed, Data error, Active, and Ready to run.

- **Field:** status
- **Type:** string

```
{
  "filter": {
    "operator": "eq",
    "value": "ACTIVE",
    "field": "status"
  }
}
```

result

```
}
}
```

The Work Item result string. For example, the Work Item was completed or skipped.

- **Field:** result
- **Type:** string

```
{
  "filter": {
    "operator": "substring",
    "value": "skipped",
    "field": "result"
  }
}
```

col

The column number corresponding to the custom column name. For example, email, firstname, and lastname.

- **Field:** col
- **Type:** string

```
{
  "filter": {
    "operator": "substring",
    "value": "Brian",
    "field": "col1"
  }
}
```

1. Use the POST method to generate an authentication JSON Web Token.

[Authentication API](#)

2. Use the POST method and endpoint URL: <your_control_room_url>/v3/wlm/queues/{queueId}/workitems/list

For example, enter the queueId as 20 in the following URL for which you want to get the Work Items:

```
https://192.0.2.0/v3/wlm/queues/20/workitems/list
```

Use filters in the request body to retrieve the list of all the Work Items that are in NEW status and have Brian in their first_name (col1).

Request body:

```
{
  "sort": [
    {
      "field": "computedStatus",
      "direction": "asc"
    }
  ],
  "filter": {
    "operator": "and",
    "operands": [
      {
        "operator": "eq",
```

```

        "value": "NEW",
        "field": "status"
    },
    {
        "operator": "substring",
        "value": "Brian",
        "field": "col1"
    }
]
},
"page": {
    "offset": 0,
    "total": 5,
    "totalFilter": 1,
    "length": 100
}
}

```

3. Send the request.

- In the REST Client, click **SEND**.
- In the Swagger interface, click **Execute**.

The response returns all the details of the Work Item that has `Brian` in their `first_name (col1)` and `status` is `NEW`.

Response body:

```

{
  "page": {
    "offset": 0,
    "total": 5,
    "totalFilter": 1
  },
  "list": [
    {
      "id": "11804",
      "createdBy": "24",
      "createdOn": "2020-05-26T10:19:34.786711300Z",
      "updatedBy": "24",
      "updatedOn": "2020-05-26T10:19:34.786711300Z",
      "version": "1",
      "json": {},
      "result": "",
      "deviceId": "0",
      "status": "NEW",
      "col1": "Brian",
      "col2": "Matthews",
      "col3": "bmatthews0@example.com",
      "col4": "",
      "col5": "",
      "deviceUserId": "0",
      "queueId": "20",
      "comment": "",
      "automationId": "0",
      "totalPausedTime": "0",
      "error": "",
      "col6": "",
      "col7": "",
      "col8": "",
      "col9": "",
      "col10": ""
    }
  ]
}

```

```
]
}
```

[Add Work Items to the queue API](#)

Add or insert Work Items to an existing queue in the Control Room per the defined model or structure.

Migration APIs

Use migration APIs to migrate MetaBots and TaskBots that were created in Enterprise client versions Enterprise 11 and Enterprise 10 to Automation 360. Use this page to review the migration prerequisites and access Enterprise 11 and Enterprise 10 Migration APIs.

Note: You can view the in the , but API functionality is limited. You need a licensed Edition to access the full functionality of the APIs.

Prerequisites

Complete the prerequisites before migrating Enterprise 11 bots to Automation 360. [Prerequisite tasks for migrating bots](#)

Enterprise 11 Migration APIs

1. [Start migration API](#)
2. [Migrate all bots in a sub-folder API](#)
3. [List migration results API](#)
4. [Bot migration results by id API](#)
5. [Migration action mapping results API](#)

Enterprise 10 Migration APIs

1. [Connect to Enterprise 10 database](#)
2. [Validate master key and repository path](#)
3. [Initiate Enterprise 10 data migration process](#)

(Optional) Use any the following APIs to retrieve the migration results.

- [Retrieve migrated roles](#)
- [Retrieve migrated users](#)
- [Retrieve migrated credentials](#)
- [Retrieve migrated bots](#)
- [Retrieve migrated schedules](#)

Start migration API

Use this API to migrate bots (TaskBots and MetaBots) created using the Enterprise Client version 11.x to Automation 360.

Request

```
POST https://{ControlRoomURL}/v3/migration/start
```

```
Header: X-Authorization <<authentication token>>
```

All API calls must contain an authentication token in the request header. Use the [Authentication API](#) to generate a JSON web token. See [Authentication API](#).

Request body:

```
{
  "name": "Migration.migrator.22.07.06.17.59.47",
  "description": "Migrating Legacy Bot",
  "overwriteBots": true,
  "botIds": [
    13
  ],
  "userIds": [
    5
  ],
  "legacyExcelCellRow": true,
  "includeChildFolders": false,
  "folderIds": [

  ],
  "emailEwsSettings": true,
  "emailEwsExchangeVersion": "Exchange2010",
  "emailEwsAuthenticationType": "Basic"
  "convertToEdgeWithIeMode": true,
  "botAnalytics": true,
  "webServicesProxySettings": true,
  "excludeBotDependencies": true
}
```

Note: Complete the prerequisite tasks before migrating Enterprise 11 bots to Automation 360. [Prerequisite tasks for migrating bots](#)

Request parameters

Parameter	Type	Required	Description
name	String	Yes	The name for the migration entity.
description	String	No	A short description for the migration.
overwriteBots	Boolean	No	Set this parameter to <code>true</code> if you want to migrate already migrated bots again. The default value is <code>false</code> .

Parameter	Type	Required	Description
botIds	integer	Yes	Bot IDs to run the migration.
userIds	Integer	Yes	Bot Runner users' IDs where this migration will be run on.
legacyExcelCellRow	Boolean	No	Set this parameter to <code>true</code> if you want to use the "Excel Cell Row" legacy behavior. If you are migrating from 11.3.0 or earlier, select this option. The default value is <code>false</code> .
includeChildFolders	Boolean	No	Set this parameter to <code>true</code> if you want to include the child folders during the migration. The default value is <code>false</code> .
folderIds	Integer	No	Folder IDs for all the bots contained in the subfolder with the <i>folderIds</i> .
emailEwsSettings	Boolean	No	Set this parameter to <code>true</code> if you have used EWS in Enterprise 11. The default value is <code>false</code> .
emailEwsExchangeVersion	String	No	This is used to specify the version of the EWS server configured in Enterprise 11. When you set <i>emailEwsSettings</i> to <code>true</code> , you can set a value to the email exchange server (<i>emailEwsExchangeVersion</i>). The possible values are as follows: <i>Exchange2010</i> , <i>Exchange2010_SP1</i> , <i>Exchange2010_SP2</i> , <i>Exchange2007_SP1</i> , and <i>Exchange2013</i> .
emailEwsAuthenticationType	String	No	This is used to specify the authentication type set for the EWS server configured in Enterprise 11. The possible values are as follows: <i>Basic</i> and <i>OAuth2</i> .
convertToEdgeWithIeMode	Boolean	No	Set this parameter to <code>true</code> if you want to migrate bots that use Internet Explorer to use Microsoft Edge with IE mode. The default value is <code>false</code> .
botAnalytics	Boolean	No	Set this parameter to <code>true</code> if you want to tag bots and variables for analytics through Bot Insight. If you are not using Bot Insight in legacy bots, set it to <code>false</code> . The default value is <code>false</code> .
webServicesProxySettings	Boolean	No	Set this parameter to <code>true</code> if you want to migrate along with the web services proxy host and port. If this value is true, precreated global values will be available to the bot for connecting with the web services proxy. The default value is <code>false</code> .
excludeBotDependencies	Boolean	No	Set this to <code>true</code> if you want all the bot dependencies to be excluded during migration. The default value is <code>false</code> .

Note: View the migration status using [List migration results API](#).

Response

```
200 OK
```

The successful response includes a 200 success response and an empty body.

The REST API responds to each request with an HTTP response code. For response codes, see [API response codes](#).

Note: You can view the in the , but API functionality is limited. You need a licensed Edition to access the full functionality of the APIs.

- [Migrate all bots in a sub-folder API](#)
- [Migration action mapping results API](#)

Migrate all bots in a sub-folder API

Migrate all the bots separately as well as from a given folder and all if its sub-folders in your Control Room repository.

- Find the folder ID you want to migrate. The [List files and folders by workspace API](#) searches for files and folders in the private or public Control Room repositories. Filter the results to identify the folder ids to be used in the request body.
- For one or more users with a RUNTIME device license. Use `userIds` for registered users in the Control Room as unattended bot runners with a RUNTIME device license and registered device. [Search for users API](#)
- You must have an admin role to migrate bots and folders.

1. Add the authentication token to the request header.
2. Use the POST method and endpoint URL: `<your_control_room_url>/v3/migration/start`

Request parameters:

Parameter	Required	Type	Description
folderIds	Yes	Integer	Folder IDs for all the bots contained in the sub-folder with th
userIds	Yes	Integer	User IDs for an unattended Bot Runner user.
includeChildFolders	No	Boolean	Set this parameter to true if you want to include child folders migration. The default value is false.

This following request starts a migration for all the bots contained in the sub-folder with the folderIds: 7 and userIds: 18.

Request body:

```
{
```

```

"name": "Follow a convention that is meaningful and easy to search.",
"description": "Add a meaningful description.",
"overwriteBots": true,
"userIds": [
  18
],
"folderIds": [
  7
],
"includeChildFolders": true
}

```

3. Send the request.

The successful response includes a 200 success code and an empty body.

```
{ }
```

The REST API responds to each request with an HTTP response code. For response codes, see [API response codes](#).

You can view the status of the migration using the [List migration results API](#) API.

List migration results API

List the overall migration results for each migration you run. Filter by selected fields to get the specific results.

Note: You can view the in the , but API functionality is limited. You need a licensed Edition to access the full functionality of the APIs.

You must have an admin role or a custom role with **View Migration** permission.

Supported filterable fields: Use the following filters in the request body to narrow the results.

- name: The migration name.
- status: The migration status.
 - Success
 - Skipped
 - Failed
- migrationType: The migration type: BOT, ROLE, or AUDIT_DATA.

1. Add the authentication token to the request header.

2. Use the POST method and endpoint URL: <your_control_room_url>/v3/migration/list.

Request body:

This request searches for migrations that contain the word **HRBotMigration** in the name field that was started between the specified dates.

```

{
  "sort": [
    {
      "field": "startTime",
      "direction": "desc"
    }
  ],

```

```

"filter": {
  "operator": "substring",
  "value": "HRBotMigration",
  "field": "name"
},
"page": {
  "offset": 0,
  "total": 100,
  "totalFilter": 100,
  "length": 200
}
}

```

3. Send the request.

Response body:

The example response returned the migration name, startTime and endTime, migration status, migrationType and other details.

```

{
  "page": {
    "offset": 0,
    "total": 17,
    "totalFilter": 1
  },
  "list": [
    {
      "id": 3,
      "name": " HRBotMigration ",
      "startTime": "2021-01-20T14:26:27.347Z",
      "endTime": "2021-01-20T14:27:36.617Z",
      "createdBy": 1,
      "duration": "69s",
      "numSuccess": 1,
      "numFailed": 0,
      "numSkipped": 0,
      "numTotal": 1,
      "status": "SUCCESSFUL",
      "updatedOn": "2021-01-20T14:26:47.850Z",
      "updatedBy": 1,
      "durationMillis": 69270,
      "migrationType": "BOT"
    }
  ]
}

```

Note: There are some response fields that are not used for Enterprise 11 migration:

- duration: A legacy field that is no longer used for migration.
- migrationType: It is used for Enterprise 10 migrations only. It is not used for Enterprise 11 migration.

The REST API responds to each request with an HTTP response code. For response codes, see [API response codes](#).

To view details about a specific migration, enter a specific migration id in the [Bot migration results by id API](#).

Bot migration results by id API

List bot migration results by a unique numeric identifier, migrationId and filter the results by selected fields.

Note: You can view the in the , but API functionality is limited. You need a licensed Edition to access the full functionality of the APIs.

- You must have an admin role or a custom role with **View Migration** permission.
- Use the numeric identifier, migrationId for the migration you want to view.

Supported filterable fields:

Use the following filters in the request body to narrow the search results:

- sourceName: Source bot name.
- sourceType: Source bot type.
- status: Migration status.
 - Success
 - Skipped
 - Failed
- reason: A reason why this bot migration is failed.
- targetName: Migrated bot target name.
- targetType: Migrated bot target type.

1. Add the authentication token to the request header.
2. Use the POST method and endpoint URL: <your_control_room_url>/v3/migration/<migrationId>/results/list
Enter the migration ID you want to view.
3. Create a request to find the search results. This filter searches for a string in the sourceName of the migrated bot.

Request body:

```
{
  "sort": [
    {
      "field": "sourceName",
      "direction": "asc"
    }
  ],
  "filter": {
    "operator": "substring",
    "value": "mbot-dep",
    "field": "sourceName"
  },
  "page": {
    "offset": 0,
    "total": 100,
    "totalFilter": 100,
    "length": 200
  }
}
```

4. Send the request.**Response body:**

```

{
  "page": {
    "offset": 0,
    "total": 3,
    "totalFilter": 1
  },
  "list": [
    {
      "sourceId": 24,
      "sourceName": "mbot-dep01.mbot",
      "sourcePath": "Automation Anywhere\\Bots\\My MetaBots\\mbot-
dep01.mbot",
      "sourceType": "application/vnd.aa.mbot",
      "targetId": 941,
      "status": "SUCCESS",
      "reason": "",
      "selectedByUser": true,
      "userId": 9,
      "id": 469,
      "targetName": "logic-launchweb01",
      "targetPath": "Automation Anywhere\\Bots\\My MetaBots\\mbot-
dep01\\logic-launchweb01",
      "targetType": "application/vnd.aa.taskbot"
    }
  ]
}

```

The response returned 1 out of 3 responses for bot migration results.

add link to the next API Migration Action mapping results.

The REST API responds to each request with an HTTP response code. For response codes, see [API response codes](#).

To view the list action mapping results, see [Migration action mapping results API](#).

Migration action mapping results API

List action mapping results for bots by unique numeric identifiers for the migration <migration ID> and the journal <journal ID>, and then filter the results by selected fields.

Request

```
POST https://{ControlRoomURL}/v3/migration/<migration ID>/journal/<journal ID>/actionmappings/list
```

```
Header: X-Authorization <<authentication token>>
```

All API calls must contain an authentication token in the request header. Use the [Authentication API](#) to generate a JSON web token. See [Authentication API](#).

Request body

```
{
  "sort": [
    {
      "field": "targetLineNumber",
      "direction": "asc"
    }
  ],
  "filter": {
    "field": "reviewRequired",
    "operator": "eq",
    "value": "true"
  },
  "page": {
    "offset": 0,
    "length": 100
  }
}
```

Make sure you have the following:

- You have an admin role or a custom role with **View migration** permission.
- The numeric identifier, <migration ID>, for the migration you want to view.
- The numeric value for the <journal ID> associated with the migration identifier. See [How to find a migration journalid](#)

Request parameters

Parameter	Type	Required	Description
sort	Array	No	By default, search results are sorted in descending order with respect to their IDs. An alternative sorting is specified using the sort query parameter. Enter the field by which you want to sort along with the direction <code>asc</code> (ascending) or <code>desc</code> (descending).
filter	Object	No	Filters the result.
page	Object	No	The page object allows you to get the desired pages.

For more information on filtering, pagination, and sorting, see [Filtering, pagination, and sorting](#).

Response

```
{
  "page": {
    "offset": 0,
    "total": 1,
    "totalFilter": 1
  },
  "list": [
    {
      "targetLineNumber": 1,
      "targetAction": "TerminalEmulator-connectV2",
      "isReviewRequired": true,

```

```

    "reason":"'Terminal Emulator - Connect' action has been migrated.\n
\nThe connection type is configured as 'SSH2' since 'SSH1' is not supported
in A360.\n\nNo further action required.\n\nMessage Code: R114",
    "remarks": "",
    "id":1309,
    "sourceLineNumber":1,
    "sourceAction":"TE-Connect",
    "targetNodeUid":"ba97973a-e231-44b3-b208-1056dc2520d8",
    "targetPackageName":"TerminalEmulator",
    "targetPackageVersion":"4.3.0-20211016-070439",
    "isActionRequired":false,
    "actionRequiredReason": "",
    "reviewRequiredReasonMarkdown": "",
    "actionRequiredReasonMarkdown": ""
  }
]
}

```

The REST API responds to each request with an HTTP response code. For response codes, see [API response codes](#).

Response parameters

Parameter	Type	Description
targetLineNumber	Integer	The target line number in the migrated bot.
targetAction	String	The target action in the migrated bot.
isReviewRequired	Boolean	Specifies whether the action migrated requires your review.
reason	String	Describes the reason for the review required.
remarks	String	Provides more information on this migrated action.
id	Integer	ID of the migration action mapping result.
sourceLineNumber	Integer	Source line number in source bot.
sourceAction	String	Source action in source bot
targetNodeUid	String	Target node UID
targetPackageName	String	Target action package name
targetPackageVersion	String	Target action package version
isActionRequired	Boolean	Specifies whether the action migrated requires your action
actionRequiredReason	String	Describes what action is required
reviewRequiredReasonMarkdown	String	Review required reason with support help link for the message code
actionRequiredReasonMarkdown	String	Action required reason with support help link for the message code

Note: You can view the in the , but API functionality is limited. You need a licensed Edition to access the full functionality of the APIs.

How to find a migration journalid

Migrations can have more than one journalid. You can find the journalid in the response of a results list for a specific migration id.

In this request, we searched for results for the migration with the id **16**.

```
<your_control_room_url>/v3/migration/16/results/list
```

The request returned the id in each object list as the journalid. In this example, there are two journal identifiers, 30 and 31, for the migration id 16.

```
{
  "page": {
    "offset": 0,
    "total": 2,
    "totalFilter": 2
  },
  "list": [
    {
      "sourceId": 12,
      "sourceName": "Dependency of IGN-23437.mbot",
      "sourcePath": "Automation Anywhere\\Bots\\My MetaBots\\
      \\Dependency of IGN-23437.mbot",
      "sourceType": "application/vnd.aa.mbot",
      "targetId": 0,
      "status": "FAILED",
      "reason": "The logic IGN-23437 has some commands or actions
      which are not yet supported for migration.",
      "selectedByUser": true,
      "userId": 9,
      "id": 30,
      "targetName": "",
      "targetPath": "",
      "targetType": ""
    },
    {
      "sourceId": 12,
      "sourceName": "Dependency of IGN-23437.mbot",
      "sourcePath": "Automation Anywhere\\Bots\\My MetaBots\\
      \\Dependency of IGN-23437.mbot",
      "sourceType": "application/vnd.aa.mbot",
      "targetId": 0,
      "status": "FAILED",
      "reason": "Migration of MetaBot failed.",
      "selectedByUser": false,
      "userId": 9,
      "id": 31,
      "targetName": "",
      "targetPath": "",
      "targetType": ""
    }
  ]
}
```

You can use the migration id and journal id in an action mapping request.

```
<your_control_room_url>/v3/migration/16/journal/31/actionmappings/list
```

Enterprise 10 Migration APIs

Use migration APIs to migrate MetaBots and TaskBots that were created in Enterprise Client version Enterprise 10 to Automation 360. With these APIs, you can connect to the Enterprise 10 Control Room database, validate the master key and the repository path, and then start copying the Enterprise 10 data to Automation 360.

- Complete the prerequisites before migrating Enterprise 10 bots to Automation 360. See [Prerequisite tasks for migrating bots](#).
- You must have an admin role or the Manage Migration permission to validate connection parameters, connect to the Enterprise 10 database, and start 10.x migration process. If you want to retrieve a list of roles, users, credentials, and schedules, you need an admin role or the View Migration permission.
- Execute the following three APIs in order they are listed below. You can retrieve roles, users, credentials, bots, or schedules after you executed the mandatory APIs.

Connect to Enterprise 10 database

Use this API to connect to the Enterprise 10 Control Room database from which you can copy the data to Automation 360.

Note: You can view the in the , but API functionality is limited. You need a licensed Edition to access the full functionality of the APIs.

- Review the prerequisites before migrating bots to Automation 360.

[Prerequisite tasks for migrating bots](#)

- You must have an admin role or a custom role with **Manage Migration** permission to validate connection parameters and connect to the Enterprise 10 database.
1. All API calls must contain an authentication token in the request header. Use the [Authentication API](#) to generate a JSON web token. See [Authentication API](#).
 2. Use the POST method and endpoint URL:<your_control_room_url>/v2/migration/connection

Request body:

```
{
  "host": "10.000.000.000",
  "port": 1433,
  "databaseName": "CRDB",
  "username": "Admin",
  "password": "<password>",
  "integratedSecurity": false,
  "encrypt": false
}
```

Request parameters:

Parameter	Required	Type	Description
host	Yes	String	SQL server host name or IP address
port	Yes	Integer	SQL server port number
databaseName	Yes	String	Source Control Room database name
userName	Yes	String	A user name to connect to the database

Parameter	Required	Type	Description
password	Yes	String	Password to connect to the database
integratedSecurity	Yes	Boolean	Set this to <code>true</code> if you want use Windows authentication. value is <code>false</code> .
encrypt	Yes	Boolean	Set this to <code>true</code> if you want to use a secure connection to database. The default value is <code>false</code> .

3. Send the request.

Response body:

It returns a success response code and an empty string.

```
{ }
```

The REST API responds to each request with an HTTP response code. For response codes, see [API response codes](#).

Validate master key and repository path

Validate master key and repository path

Use this API to validate the Credential Vault master key and the repository path.

- You must have an admin role or a custom role with **Manage Migration** permission to validate the master key and the repository path.
- Complete this step [Connect to Enterprise 10 database](#) before executing this API.

1. Add the authentication token to the request header.

2. Use the POST method and endpoint URL:<your_control_room_url>/v2/migration/masterkey

Request body:

```
{
  "privateKey": "<CV master key value>",
  "repoPath": "C:\\Migration\\10X\\A2019.14\\Automation Anywhere Server Files"
}
```

If you are not able to get a response, add an additional backslash in the repoPath or use a single forward slash.

Request parameters:

Parameter	Required	Type	Description
privateKey	Yes	String	The master key to connect to Enterprise 10 Credential Vault. This is available for configuration during the initial Control Room setup.
repoPath	Yes	String	The shared repository path where the Control Room Enterprise 10 is located.

3. Send the request.**Response body:**

It returns a success response code and an empty string.

```
{ }
```

The REST API responds to each request with an HTTP response code. For response codes, see [API response codes](#).

*Initiate the 10.x data migration process***Initiate Enterprise 10 data migration process**

Use this API to start the Enterprise 10 data migration.

- You must have an admin role or a custom role with **Manage Migration** permission to start the Enterprise 10 data migration.
- Complete this step [Validate master key and repository path](#) before executing this API.

- Add the authentication token to the request header.
- Use the POST method and endpoint URL:<your_control_room_url>/v2/migration/start

Request body:

```
{
  "name": "Migration-10x-001",
  "description": "10x bot migration to A2019 001"
}
```

Request parameters:

Parameter	Required	Type	Description
name	Yes	String	The name for the migration entity.
description	No	String	A short description for the migration.

3. Send the request.**Response body:**

```
{
  "id": "1",
  "name": "Migration-10x-001",
  "createdBy": "10",
  "migrationType": "ROLE",
  "entities": []
}
```

Response parameters:

Parameter	Description
id	The migration ID This is used for internal purpose only.
name	The migration name.

Parameter	Description
createdBy	ID of the user who has initiated this migration.
migrationType	Indicates the data migration type: Role or Bot This is used for Enterprise 10 migration only.
entities	List of migration entities.

The REST API responds to each request with an HTTP response code. For response codes, see [API response codes](#).

Retrieve a list of migration roles

Retrieve migrated roles

Use this API to retrieve Enterprise 10 roles that are copied to the Automation 360 database.

You must have an admin role or a custom role with **View Migration** permission to retrieve migrated roles.

1. Add the authentication token to the request header.
2. Use the ID from the API response body as the migrationId.
See [Initiate Enterprise 10 data migration process](#).
3. Use the POST method and endpoint URL:<your_control_room_url>/v2/migration/{migrationId}/roles/list

Request body:

```
{
  "sort": [],
  "filter": {},
  "page": {
    "offset": 0,
    "total": 100,
    "totalFilter": 100,
    "length": 200
  }
}
```

Request parameters:

Parameter	Required	Type	Description
sort	No	String	Sort directions
filter	No	String	Filter rules
page	Yes	Integer	Pagination rules
offset	Yes	Integer	Page starting index
total	No	Integer	Total number of items
totalFilter	No	Integer	Total number of items matching the filter
length	Yes	Integer	Number of items to be returned

4. Send the request.**Response body:**

```

{
  "page": {
    "offset": 0,
    "total": 9,
    "totalFilter": 9
  },
  "list": [
    {
      "id": 1,
      "type": "ROLE",
      "sourceId": "1",
      "targetId": 1,
      "name": "Admin",
      "status": "SUCCESS",
      "reason": "",
      "targetPath": ""
    },
    {
      "id": 2,
      "type": "ROLE",
      "sourceId": "2",
      "targetId": 2,
      "name": "Basic",
      "status": "SUCCESS",
      "reason": "",
      "targetPath": ""
    },
    .....
    {
      "id": 9,
      "type": "ROLE",
      "sourceId": "9",
      "targetId": 24,
      "name": "Admin_Role01",
      "status": "SUCCESS",
      "reason": "",
      "targetPath": ""
    }
  ]
}

```

Response parameters:

Parameter	Description
list	List of roles.
id	The role ID. This ID is used for UI purposes only.
type	The migration type.
sourceId	The source (database) role ID.
targetId	The migrated role ID.
name	A role name.

Parameter	Description
status	The migration status Valid values: Success, Skipped, or Failed.
reason	The reason why the migration failed.
targetPath	The migrated bot file location. It is only applicable for the bot migration.

The REST API responds to each request with an HTTP response code. For response codes, see [API response codes](#).

Retrieve a list of migrated users

Retrieve migrated users

Use this API to retrieve Enterprise 10 database users that are copied to the Automation 360 database.

You must have an admin role or a custom role with **View Migration** permission to retrieve migrated users.

1. Add the authentication token to the request header.
2. Use the ID from the API response as the migrationId.
See [Initiate Enterprise 10 data migration process](#).
3. Use the POST method and endpoint URL: <your_control_room_url>/v2/migration/{migrationId}/users/list

Request body:

```
{
  "sort": [],
  "filter": {},
  "page": {
    "offset": 0,
    "total": 100,
    "totalFilter": 100,
    "length": 200
  }
}
```

Request parameters:

Parameter	Required	Type	Description
sort	No	String	Sort directions
filter	No	String	Filter rules
page	Yes	Integer	Pagination rules
offset	Yes	Integer	Page starting index
total	No	Integer	Total number of items
totalFilter	No	Integer	Total number of items matching filter

Parameter	Required	Type	Description
length	Yes	Integer	Number of items to be returned

4. Send the request.

Response body:

```
{
  "page": {
    "offset": 0,
    "total": 5,
    "totalFilter": 5
  },
  "list": [
    {
      "id": 10,
      "type": "USER",
      "sourceId": "1",
      "targetId": 11,
      "name": "admin_1",
      "status": "SUCCESS",
      "reason": "The user admin has been renamed to admin_1 as the user
with same name already exists",
      "targetPath": ""
    },
    .....
    {
      "id": 14,
      "type": "USER",
      "sourceId": "5",
      "targetId": 15,
      "name": "admin10503",
      "status": "SUCCESS",
      "reason": "",
      "targetPath": ""
    }
  ]
}
```

Response parameters:

Parameter	Description
list	List of users
id	The user ID It is used for UI purpose only.
type	The migration type
sourceId	The source (database) user ID
targetId	The migrated user ID
name	A user name
status	The migration status Valid values: Success, Skipped, or Failed.
reason	The reason why the migration failed.

Parameter	Description
targetPath	The migrated bot file location It is only applicable for bot migration.

The REST API responds to each request with an HTTP response code. For response codes, see [API response codes](#).

Retrieve a list of migrated credentials

Retrieve migrated credentials

Use this API to retrieve Enterprise 10 database credentials that are copied to the Automation 360 database.

You must have an admin role or a custom role with **View Migration** permission to retrieve migrated credentials.

1. Add the authentication token to the request header. Use the HTTP request syntax (URL):
2. Use the ID from the API response body as the migrationId.
See [Initiate Enterprise 10 data migration process](#).
3. Use the POST method and endpoint URL: <your_control_room_url>/v2/migration/{migrationId}/credentials/list

Request body:

```
{
  "sort": [],
  "filter": {},
  "page": {
    "offset": 0,
    "total": 100,
    "totalFilter": 100,
    "length": 200
  }
}
```

Request parameters:

Parameter	Required	Type	Description
sort	No	String	Sort directions
filter	No	String	Filter rules
page	No	Integer	Pagination rules
offset	Yes	Integer	Page starting index
total	No	Integer	Total number of items
totalFilter	No	Integer	Total number of items matching the filter
length	Yes	Integer	Number of items to be returned

4. Send the request.**Response body:**

```

{
  "page": {
    "offset": 0,
    "total": 2,
    "totalFilter": 2
  },
  "list": [
    {
      "id": 15,
      "type": "CREDENTIAL",
      "sourceId": "4",
      "targetId": 2,
      "name": "admin10501 - Email Settings",
      "status": "SUCCESS",
      "reason": "",
      "targetPath": ""
    },
    {
      "id": 16,
      "type": "CREDENTIAL",
      "sourceId": "5",
      "targetId": 2,
      "name": "admin10502 - Email Settings",
      "status": "SUCCESS",
      "reason": "",
      "targetPath": ""
    }
  ]
}

```

Response parameters:

Parameter	Description
list	List of credentials
id	The credential ID
type	The migration type
sourceId	The source (database) credential ID
targetId	The migrated credential ID
name	A credential name
status	The migration status Valid values: Success, Skipped, or Failed.
reason	The reason why the migration failed
targetPath	The migrated bot file location It is only applicable for the bot migration.

The REST API responds to each request with an HTTP response code. For response codes, see [API response codes](#).

Retrieve a list of migrated bots

Retrieve migrated bots

Use this API to retrieve a list of Enterprise 10 migrated bots that are copied to the Automation 360 database.

You must have an admin role or a custom role with **View Migration** permission to retrieve migrated bots.

1. Add the authentication token to the request header. Use the HTTP request syntax (URL):
2. Use the ID from the API response body as the migrationId.
See [Initiate Enterprise 10 data migration process](#).
3. Use the POST method and endpoint URL: <your_control_room_url>/v2/migration/{migrationId}/bots/list

Request body:

```
{
  "sort": [],
  "filter": {},
  "page": {
    "offset": 0,
    "total": 100,
    "totalFilter": 100,
    "length": 200
  }
}
```

Request parameters:

Parameter	Required	Type	Description
sort	No	String	Sort directions
filter	No	String	Filter rules
page	No	Integer	Pagination rules
offset	Yes	Integer	Page starting index
total	No	Integer	Total number of items
totalFilter	No	Integer	Total number of items matching the filter
length	Yes	Integer	Number of items to be returned

4. Send the request. Send the request.

Response body:

```
{
  "page": {
    "offset": 0,
    "total": 1004,
    "totalFilter": 1004
  },
  "list": [
    {
      "id": 17,
      "type": "BOT",
      "sourceId": "186",
      "targetId": 15,
      "name": "DelayLoop - Copy (129).atmx",

```

```

    "status": "SUCCESS",
    "reason": "",
    "targetPath": "Automation Anywhere\\Bots\\My Tasks\\Migration
Extra"
  },
  {
    "id": 18,
    "type": "BOT",
    "sourceId": "438",
    "targetId": 17,
    "name": "DelayLoop - Copy (115).atmx",
    "status": "SUCCESS",
    "reason": "",
    "targetPath": "Automation Anywhere\\Bots\\My Tasks\\Migration Extra
\\RM-APIAutomation"
  },
  .....
  {
    "id": 216,
    "type": "BOT",
    "sourceId": "703",
    "targetId": 221,
    "name": "DelayLoop - Copy (132).atmx",
    "status": "SUCCESS",
    "reason": "",
    "targetPath": "Automation Anywhere\\Bots\\My Tasks"
  }
]
}

```

Response parameters:

Parameter	Description
list	List of bots
id	The bot ID
type	The migration type
sourceId	The source (database) bot ID
targetId	The migrated bot ID
name	The bot name
status	The migration status Valid values: Success, Skipped, or Failed.
reason	The reason why the migration failed
targetPath	The migrated bot file location

The REST API responds to each request with an HTTP response code. For response codes, see [API response codes](#).

Retrieve a list of migrated schedules

Retrieve migrated schedules

Use this API to retrieve a list of Enterprise 10 migrated schedules that are copied to the Automation 360 database.

You must have an admin role or a custom role with **View Migration** permission to retrieve migrated schedules.

1. Add the authentication token to the request header.
2. Use the ID from the API response body as the migrationId .
See [Initiate Enterprise 10 data migration process](#).
3. Use the POST method and endpoint URL:<your_control_room_url>/v2/migration/{migrationId}/schedules/list

Request body:

```
{
  "sort": [],
  "filter": {},
  "page": {
    "offset": 0,
    "total": 100,
    "totalFilter": 100,
    "length": 200
  }
}
```

Request parameters:

Parameter	Required	Type	Description
sort	No	String	Sort directions
filter	No	String	Filter rules
page	No	Integer	Pagination rules
offset	Yes	Integer	Page starting index
total	No	Integer	Total number of items
totalFilter	No	Integer	Total number of items matching the filter
length	Yes	Integer	Number of items to be returned

4. Send the request.

Response body:

```
{
  "page": {
    "offset": 0,
    "total": 7,
    "totalFilter": 7
  },
  "list": [
    {
      "id": 1173,
      "type": "SCHEDULE",
      "sourceId": "3",
      "targetId": 2,
      "name": "Monthly",
      "status": "SUCCESS",
    }
  ]
}
```

```

    "reason": "",
    "targetPath": ""
  },
  {
    "id": 1174,
    "type": "SCHEDULE",
    "sourceId": "5",
    "targetId": 3,
    "name": "alternatemonths",
    "status": "SUCCESS",
    "reason": "",
    "targetPath": ""
  },
  .....
  {
    "id": 1179,
    "type": "SCHEDULE",
    "sourceId": "15",
    "targetId": 8,
    "name": "none",
    "status": "SUCCESS",
    "reason": "",
    "targetPath": ""
  }
]
}

```

Response parameters:

Parameter	Description
list	List of schedules
id	The schedule ID
type	The migration type
sourceId	The source (database) schedule ID
targetId	The migrated schedule ID
name	The schedule name
status	The migration status Valid values: Success, Skipped, or Failed.
reason	The reason why the migration failed
targetPath	The migrated bot file location It is only applicable for the bot migration.

The REST API responds to each request with an HTTP response code. For response codes, see [API response codes](#).

Filtering, pagination, and sorting

The Control Room API supports filtering, pagination, and sorting for endpoints that return arrays of resources.

The filtering mechanism filters the required resources, the sorting mechanism places the resources in order; and the pagination mechanism then returns a specific range of those ordered resources. This topic provides you the details to filter and sort the results of an API requests and also guides to handle the pagination of large result sets returned from an API request.

Note:

- Sorting and filtering are supported for substrings. For example, if you want to search for bots or files that have `fin` in their names, enter `fin` as the search criterion. All the bots and files that contain `fin` in the names will be displayed, for example, Finance, Finder, DeltaFinance, and Dolfin.
 - Wildcards are not supported for searching and filtering bots or files.
-

Filtering

Filtering allows you to apply Boolean condition against a collection of returned resources in order to subset the collection to only those resources for which the condition is `true`. The most basic operation in an Control Room API filters is to compare a field to a given value. It is possible to use *equality comparison*, *range comparison*, or *logical* . Use the following operators to compare a field to a constant value.

Operation	Description	Example
Equality comparison		
<code>eq</code>	Equals	UserEmailAddress, eq first.last@aa.com
<code>ne</code>	Not Equals	UserEmailAddress, ne first.last@aa.com
Range comparison		
<code>lt</code>	Less than	Quantity lt 1500
<code>le</code>	Less Than or Equal	Quantity le 1500
<code>ge</code>	Greater Than or Equal	CreatedDateUtc ge 2021-03-15
<code>gt</code>	Greater Than	CreatedDateUtc gt 2021-03-15
Logical		
<code>and</code>	And	Field1 eq 'abc' and Field2 eq 'def'
<code>or</code>	Or	Field1 eq 'abc' or Field2 eq 'def'

The `filter` query parameter allows you to apply basic, multiple, and convention oriented filters to a request. The filters in the Control Room APIs are applied with single parameter or with multiple parameters.

Single parameter filter

Single parameter filter allows the API request to select the responses by matching one or more members of the response to the value passed in the query. The single parameter filter is represented in the following image:

The JSON equivalent of the above image (single parameter filter) looks like:

```
{
  "filter": {
    "operator": "<NONE, lt, le, eq, ne, ge, gt, substring, and, or, not>",
    "field": "string",
    "value": "string"
  }
}
```

For example, to list all the device pools that has a substring `finance`, use the following single parameter filter:

```
POST http://{{ControlRoomURL}}/v2/devices/pools/list
```

```
{
  "filter": {
    "operator": "substring",
    "field": "name",
    "value": "finance"
  }
}
```

For more detailed sample on a single parameter filter, see [List device pools API](#).

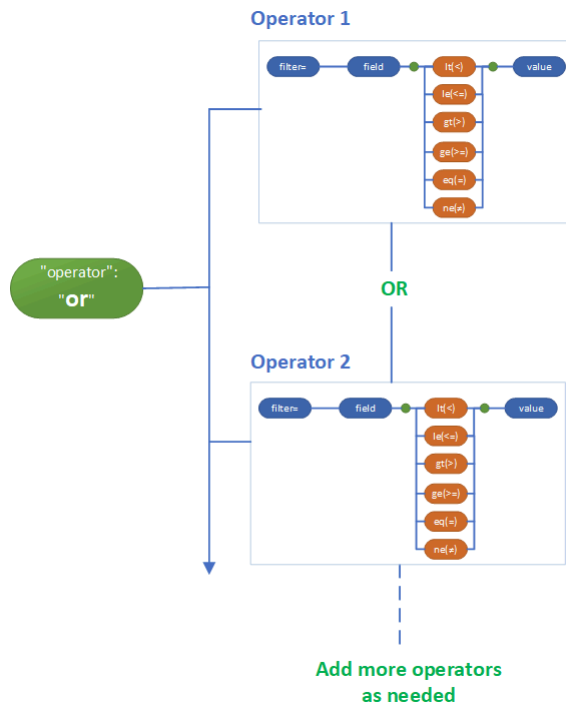

Multiple parameter filter

Multiple parameter filter allows you to filter the results based on combining multiple conditions wrapped in logical operands `and` and `or`.

- `and`: A binary operator that evaluates to `true` if all the conditions in the operands evaluate to `true`.

- **or**: A binary operator that evaluates to `true` if atleast one of the conditions in the operands evaluate to `true`.

The JSON equivalent of the above image (multiple parameter filter) looks like:

```
{
  "filter": {
    "operator": "<and, or>",
    "operands": [
      {
        "operator": "<NONE, lt, le, eq, ne, ge, gt, substring, and, or,
not>",
        "field": "string",
        "value": "string"
      },
      {
        "operator": "<NONE, lt, le, eq, ne, ge, gt, substring, and, or,
not>",
        "field": "string",
        "value": "string"
      }
    ]
  }
}
```

For example, to list all the roles that has a substring `Device`, `createdOn` is after `2022-04-01`, and `createdOn` is before `2022-05-31`, use the multiple parameter filtering with logical `and` operator as follows:

```
POST http://{{ControlRoomURL}}/v1/usermanagement/roles/list
```

```
{
  "filter": {
    "operator": "and",
    "operands": [
```

```

    {
      "operator": "substring",
      "field": "name",
      "value": "Device"
    },
    {
      "operator": "gt",
      "field": "createdOn",
      "value": "2022-04-01T00:00:00.989Z"
    },
    {
      "operator": "lt",
      "field": "createdOn",
      "value": "2022-05-31T23:00:00.123Z"
    }
  ]
}
}

```

For more detailed sample on a single parameter filter, see [List roles](#).

Pagination

Pagination allows you to:

- Retrieve a limited collection of results.
- Offset a collection of results.

All Control Room APIs that returns a collection of records are paginated. API methods that support pagination takes two (optional) parameters:

Operation	Description
offset	The offset parameter controls the starting point within the collection of response results. Default value is 0.
length	The length parameter is the maximum number of records to retrieve starting from the offset. Default value is 200.

The JSON snippet for pagination looks like:

```

"page": {
  "offset": 5,
  "length": 10
}

```

For more detailed sample on a single parameter filter, see [List roles](#).

Sorting

Sorting allows you to order the results by any field, in ascending or descending order. For example, if you are returning the roles, you can sort the roles by last modified date.

```

"sort": [
  {
    "field": "string",
    "direction": "<asc, desc>"
  }
]

```

}

Direction

Type: Enum [desc, asc]

- asc = ascending (smallest to largest, 0 to 9, A to Z)
- desc = descending (largest to smallest, 9 to 0, Z to A)

For more detailed sample on a single parameter filter, see [List roles](#).

API response codes

Review the HTTP status codes of responses for Automation 360 APIs.

Status code	HTTP name	Description
200	OK	Success
201	Created	Success, for POST, PATCH or PUT requests.
202	Accepted	Indicates that the request has been accepted for processing, but the processing has not been completed.
204	No content	Success, for DELETE requests and some PATCH requests.
400	Bad request	Request URL or request parameters are incorrect.
401	Authentication required	Provide authentication details.
403	Unauthorized access	The operation is not authorized.
404	Not found	Control Room server did not find the requested URL.
409	Conflict	The request could not be completed because the code conflicts with the current state of the resource, for example, a duplicate entry.
500	Internal server error	Indicates that the server encountered a problem. Clear the cookies and cache, and then reload the page.

Comparing Automation 360 and Enterprise 11 APIs

Compare Automation 360 and Enterprise 11 APIs to understand the contract changes when you migrate from Enterprise 11 to Automation 360.

API details	Enterprise 11	Automation 360
Authentication API: Use this API to obtain the authentication token. The token is then used for all subsequent API calls.		
Method	POST	POST
Endpoint	v1/authentication	v1/authentication

API details	Enterprise 11	Automation 360
Request body changes	Not applicable	No change
Response body changes	Not applicable	<ul style="list-style-type: none"> Multi-factor authentication is not supported Automation 360 response returns the <code>tenantUUID</code>
Auto login credentials API: Use this API to set the Windows credentials for a Bot Runner. These credentials are used for automatically login (auto-login).		
Method	POST	PUT
Endpoint	<code>v1/credentialvault/external/credentials/loginsetting</code>	<code>v2/credentialvault/loginsetting</code>
Request body changes	Not applicable	Endpoint version change
Response body changes	Not applicable	<p>Message displayed after successfully updating the credentials: <code>Credentials updated for <username></code>.</p> <p>Enterprise 11 displays this message: <code>Credentials were successfully updated.</code></p>
Automation management API: Use this API to create automations (schedule bots), and edit and delete automations.		
Method	POST, PUT, and DELETE	POST, PUT, GET, and DELETE
Endpoint	<code>v1/schedule</code>	<code>v1/schedule</code>
Request body changes	Not applicable	Minor change in request body to pass bot input variables
Response body changes	Not applicable	Detailed response with bot input variable details
User Management API: Use this API to create, edit, and delete users and roles.		
Method	POST, PUT, GET, and DELETE	POST, PUT, GET, and DELETE
Endpoint	<code>v1/usermanagement</code>	<code>v1/usermanagement</code>
Request body changes	Not applicable	No change
Response body changes	Not applicable	No change
Migration API: Use this API to migrate bots from Enterprise 11 or Enterprise 10 to Automation 360		
Method	GET and POST	GET and POST
Endpoint	<ul style="list-style-type: none"> <code>v1/migration</code> <code>v2/migration</code> 	<code>v2/migration</code>

API details	Enterprise 11	Automation 360
Response body changes	Not applicable	<ul style="list-style-type: none"> Endpoint version change APIs used to connect to the Enterprise 10 database to migrate users, roles, schedules, and bots
Request body changes	Not applicable	Because the endpoints and request body are different, the response body is also different.
Manual Dependency API: Use this API to add or remove a dependency (data files and such) to or from a bot.		
Method	POST and DELETE	Not available
Endpoint	v1/files/ manualdependencies/	Not available
Request body changes	Not applicable	Not available
Response body changes	Not applicable	Not available
Repository Management API: Use this API to get bots and files from the Control Room repository.		
Method	POST, DELETE, and GET	POST, DELETE, and GET
Endpoint	v1/repository	v1/repository
Request body changes	Not applicable	Additional APIs added to get folder permissions
Response body changes	Not applicable	No change
File Dependency API: Use this API to get the file dependency metadata to run and schedule bots.		
Method	GET	Not available
Endpoint	v1/files/ manualdependencies/	Not available
Request body changes	Not applicable	Not available
Response body changes	Not applicable	Not available
Bot Lifecycle Management (BLM) API: Use this API to move (export or import) bots and dependent files across different Control Room environments.		
Method	POST	POST
Endpoint	v1/blm	v2/blm
Request body changes	Not applicable	<ul style="list-style-type: none"> Endpoint version change You cannot choose dependencies when exporting and importing
Response body changes	Not applicable	No change
Audit API: Use this API to get audit information about the product.		

API details	Enterprise 11	Automation 360
Method	POST	POST
Endpoint	v1/audit	v1/audit
Request body changes	Not applicable	No change
Response body changes	Not applicable	No change
Two-factor Authentication (2FA) API: Use this API to generate a 2FA token		
Method	GET and POST	Not available
Endpoint	v1/mfa	Not available
Request body changes	Not applicable	Not available
Response body changes	Not applicable	Not available
Credential Vault API: Use this API to create, edit, and delete credentials and lockers.		
Method	POST, PUT, GET, and DELETE	POST, PUT, GET, and DELETE
Endpoint	v2/credentialvault	v2/credentialvault
Request body changes	Not applicable	No change
Response body changes	Not applicable	No change
Bot Execution Orchestration API: Use this API to get the repository, automations, and devices list.		
Method	POST	POST, PUT, GET, and DELETE
Endpoint	v2/automations/deploy	v3/automations/deploy
Request body changes	Not applicable	Bot deployment includes run-as users
Response body changes	Not applicable	Returns <code>deploymentID</code> . Enterprise 11 API response returns <code>automationID</code> .
License API: Use this API to get product license information.		
Method	GET	GET
Endpoint	v2/license	v2/license
Request body changes	Not applicable	No change
Response body changes	Not applicable	Additional APIs added to update with license server and additional details
Workload Management (WLM) API: Use this API to create, edit, and delete workload queues, templates, and work items.		
Method	POST, PUT, GET, and DELETE	POST, PUT, GET, and DELETE
Endpoint	v2/wlm	v3/wlm
Request body changes	Not applicable	No change
Response body changes	Not applicable	More APIs to manage WLM entities

API details	Enterprise 11	Automation 360
Bot Insight API: Use this API to get Bot Insight data for an automation.		
Method	POST, GET, and DELETE	POST, GET, and DELETE
Endpoint	v2/botinsight/data/api	v2/botinsight/data/api
Request body changes	Not applicable	No change
Response body changes	Not applicable	No change
Bot Insight JSON API: Use to get business insights for an automation.		
Method	GET	Not applicable
Endpoint	v2/botinsight/data/api	Not applicable
Request body changes	Not applicable	Not applicable
Response body changes	Not applicable	Merged with Bot Insight API

Related concepts

[Control Room APIs](#)

The Automation Anywhere Control Room provides APIs that allow you to customize the way that you (and your bots) interact with Automation Anywhere. Control Room APIs allows you to perform tasks such as manage bot deployments, create and manage credentials in the Credential Vault, create and manage user accounts and roles, and create and manage queues.
