Welcome to Automation Anywhere Automation 360. Review these pages to get an introduction to our latest RPA and Intelligent Automation platform.

## Overview

Automation 360 is the RPA industry's first purely web-based Intelligent Automation platform that is cloud-native. Delivered in the Cloud or On-Premises, Automation 360 is designed for ease of use by all types of users across technical skill levels. The platform enables businesses of all sizes to achieve unprecedented scale with enterprise-class security, data privacy, and reduced time to value and costs of ownership. With Automation 360, businesses can also leverage built-in artificial intelligence (AI) capabilities and easily integrate third-party AI solutions, such as computer vision, natural language processing, and predictive modeling—all with the simplicity of drag-and-drop AI into any automation workflow.

The Automation 360 platform also includes attended automation and plug-ins that enable business users to automate tasks from within their business applications such as Microsoft Excel and Salesforce. This capability makes automation of front-office processes easier, faster, and more cost-efficient.

Automation 360 is available globally and in 10 languages, including English, French, German, Japanese, Korean, Italian, Portuguese, Russian, Spanish, Simplified Chinese, and Traditional Chinese.

## Available products

The Automation 360 platform includes the following offerings:

- Automation 360 delivered in the cloud, hosted by Automation Anywhere with no client installation or additional infrastructure required
- Automation 360, the full platform delivered On-Premises
- Automation 360 Free Trial, with 30 days to try the cloud-based offering with full tech support included during the trial period
- Community Edition, a free web-based option for users to experience a wide-range of Automation 360 bot creation capabilities

## About Automation 360

The Automation Anywhere Digital Workforce platform is the foundation to deliver the automation of complex business work securely and at scale. Automation 360 is an industry-leading RPA and digital workforce platform that combines an easy-to-use user interface with enterprise-class reliability and the security to enable real-time self-automation.

### Overview

Automation 360 is an industry-leading RPA and digital workforce platform that combines an easy-to-use user interface with enterprise-class reliability and the security to enable real-time self-automation. It delivers a browser-based, intuitive experience for business users to quickly automate tasks and tools for developers to build process automation. Automation 360 provides both On-Premises and Cloud deployment options and is the first platform that provides RPA-as-a-Service as an automation solution. It enables users to automate applications across different infrastructures and industries such as banking, telecommunications, and business process outsourcing (BPO) organizations.

Automation 360 provides capabilities such as the following:

- An intuitive interface to create a bot and design business process automation workflows.
- Support for multiple operating systems including Windows, Linux, and MacOS.
- Different views of bot to facilitate collaboration: flow view for business users, list view for developers, and dual view for collaboration.
- Recorder that works across various platforms such as Microsoft Windows, Citrix, Web, and SAP.
- Advanced variables capabilities and support for JavaScript, Python, and VBScript.
- A flexible architecture that enables you to add new command packages.

## Automation 360 components

### Automation Anywhere Robotic Interface (AARI)

AARI is an easy-to-use interface that enables business users to collaborate with bots. Users can start process automations, provide feedback to bots to resume processes, and escalate requests to additional users for downstream processing. AARI enables the enterprise to unlock new automation opportunities between humans and bots that RPA could not previously address.

[Automation Anywhere Robotic Interface \(AARI\)](#) on page 1460

### RPA Workspace

A web-based workspace that provides the tools and capabilities to create, upload, and deploy bots to automate repetitive tasks and processes. It includes the following:

- Control Room
- Bot Runner
- Bot editor
- Bot Creator
- Credential Vault

RPA Workspace provides the following capabilities:

- Enables users to manage, schedule, and execute bots
- Enables user management through Active Directory role mapping
- Enables users to manage large number of Work Items through workload management

### Process Discovery

An intelligent business solution that delivers a real-time, data-driven map of your business to help you uncover transformational process insights across all applications, through each department, and for every single task. Process Discovery follows the human instead of process logs by using advanced computer vision, machine learning, and artificial intelligence to capture every step in every process across every system. It requires zero integration, is universally compatible, and provides the privacy and security of an on-premises solution.

### Privacy Enhanced Gateway

Using Privacy Enhanced Gateway (PEG), enterprises can confidently execute on their strategic business initiatives by filtering their sensitive data in a secure and scalable manner. PEG works by redacting sensitive data that has been obtained on customer's machines within their own network before forwarding the data to the Process Discovery cloud for analysis. As all traffic from the agents goes through PEG before leaving the customer's

perimeter, PEG removes personally identifiable information (PII) and sensitive data.

[Getting started with Privacy Enhanced Gateway](#) on page 1629

## Discovery Bot

An intelligent business solution for enterprise businesses that provides capabilities for end users to discover opportunities for automation using process discovery. Discovery Bot focuses on process automation by capturing document processes, identifying opportunities from business centric processes, and prioritizing opportunities based on ROI, and create bots automatically. Discovery Bot aligns business workers to uncover automation opportunities that can optimize the return on your RPA investment.

[Process discovery by using Discovery Bot](#) on page 1653

## IQ Bot

An intelligent document processing solution that can read and process various complex documents and emails. IQ Bot combines RPA with multiple AI techniques to intelligently capture, classify, and extract semi-structured and unstructured data, allowing document-centric business processes to be automated end-to-end.

[Install and update Automation 360 IQ Bot](#) on page 1025

## Bot Insight

The analytics platform that provides real-time, interactive, and smart insights about business processes and operational intelligence. Bot Insight uses the large amount of content-level and productivity data that the deployed bots generate and translates the data into insights through automatically generated and customizable dashboards.

[Business analytics through Bot Insight](#) on page 2250

## Bot Store

Online marketplace for pre-built bots and Digital Workers that run on the Automation 360 platform. Access Bot Store directly from the Control Room to download or submit bots and packages.

[Bot Store](#) on page 1780

### Private Bot Store

A secure internal bot marketplace for a company to post and share details and documentation for all internally developed bots. Employees can easily discover internal bots and commands to reuse in addition to all

of bots from the Automation Anywhere Bot Store.

*Private Bot Store* on page 1784

The following image shows the components of Automation 360:

## Benefits

### Faster time to value

- Instant web-based deployment that enables you to start developing bots quickly
- An intuitive interface that enables users with varying skill levels to easily use the product and speed up the learning process
- Easy collaboration between business, process, and IT

### Business agility

- Regular updates to stay up-to-date on any device anywhere
- Business continuity with high availability and disaster recovery
- Scalability

### Lowest total cost of ownership (TCO)

- No additional infrastructure investment required
- Single platform across front office, back office, and employee applications
- Reduced maintenance cost

## Deployment models

Automation 360 provides the following deployment models:

### Cloud

Automation 360 Cloud is hosted by Automation Anywhere, providing an easy consumption model of the Automation 360 platform built on a cloud-native architecture. With the Automation 360 Cloud service, the Automation 360 platform, which includes the Automation 360 Control Room and applications (RPA Workspace, IQ Bot, Bot Insight, AARI, and Discovery Bot), is hosted by Automation Anywhere and accessed by users through a web browser. The Bot Agent devices where the bots run and execute the automations remain on the customer's infrastructure and securely connect to the Automation 360 Cloud service through HTTPS.

### Cloud-enabled

In this deployment model, data is hosted On-Premises. This model is suitable for customers who have to adhere to strict regulatory norms where data sovereignty is mandatory.

### On-Premises with packages updates through Cloud

With Automation Anywhere On-Premises with packages updates through Cloud service, all business, personal, and operational data is kept on and deployed from the server on-premises on the customer network.

The following image shows the deployment models for Automation 360:

See also [Cloud operational responsibilities](#) on page 30.

## In-product guide

Automation Anywhere uses a digital adoption platform to provide in-product user assistance (guides and walkthroughs) and anonymously analyze product usage such as page views and feature clicks. This data is used to inform user research and improve the overall experience of Automation Anywhere solutions.

### Services performed

- In-product guides and user notifications
- In-product educational spotlights
- Informational tips and other contextual user assistance elements within the product to help onboard users
- Anonymized user analytics to understand usage patterns of Automation Anywhere products

### Data processed

- Clicks on user interface elements within Automation Anywhere products
- User ID in a form that does not disclose the identity of the user (for example, 159:0a664495-7f3e-126a-817f-513aedef003e)
- Web-browser type, web-browser version
- Server Control Room URL
- Language selected (English, Japanese, and so on)
- User's first visit and last visit
- User's permissions settings
- List of features to which the user has access
- Product features that are used
- Automation Anywhere license type (Developer, Attended User, and so on)
- Automation Anywhere product version number
- User provided ratings and feedback comments on product features and functionality

---

**Note:** The digital adoption platform does not receive the user's IP address or bot information such as which bot was run and what the bot does.

---

### Types of data captured

Automation Anywhere captures the following three types of data when using the digital adoption platform:

- **Event data**

Includes click and focus events providing usage metrics. This enables us to understand the adoption of features and usage patterns to inform future improvements to the experience of our products.

For example:

- Clicking the **Run Bot** option
- Clicking the paths to open a bot in the Bot editor

- Tabbing into a search input

---

**Note:** The platform does not collect any user-entered text.

---

- **Page load data**

Includes data captured as users navigate to various parts of the web application, such as root paths of links and page titles

---

**Note:** The platform does not collect any input parameters sent through a link.

---

- **Metadata**

Includes metadata that is associated with clicks and page loads when a user logs in to Automation Anywhere products.

Metadata that is sent to the digital adoption platform includes the following types of information:

- Pseudonymized user ID
  - Pseudonymized account ID
  - Selected language
  - Build number
  - Browser version
- 

**Note:** The platform **explicitly does not:**

- Record the screen
  - Perform any sort of screen-scraping
  - Capture data entered in any input field
- 

## Blocking the platform

Blocking the digital adoption platform will block in-product user assistance and important system messages such as the following:

- Productivity boosts through targeted user tutorials
- Targeted important announcements and direct communications
- Opportunity for in-app direct feedback, requests, and support
- In-app integration to Automation Anywhere documentation and support
- Ability to see user behavior so that we can proactively make improvements to the product

## Automation 360 FAQ

For details and questions on the latest Automation Anywhere platform, Automation 360, review this FAQ.

### **What is Automation 360?**

Automation 360 delivers a browser-based, intuitive experience for business users to easily automate tasks and powerful tools for developers to build process automation, delivering security, governance, and control on a scalable infrastructure for IT.

### **What is included in Automation 360?**

Everything to build the bots you need to automate your business processes: Control Room cluster, Bot editor, Bot Runner, Universal Recorder, Enterprise-grade security certifications, support, access to the Bot Store, and courses on Automation Anywhere University.

### **How is Automation 360 deployed?**

Automation 360 can be deployed On-Premises as well as in the Cloud.

For Automation 360 On-Premises deployment, the installation is on the customer's servers. With the web-based nature of the Bot Creator, there is no installation or deployment required on the user machines, resulting in a significant reduction in total cost of ownership (TCO).

Automation 360 deployed in the Cloud offers a turnkey solution where the buyers do not have to worry about choosing the cloud provider, or any other infrastructure elements— Automation Anywhere takes care of it all. Admins get the complete set of features for user management, security, governance, and control that they also access through a web browser. The end users can then access the platform using their browser, log in, and start creating their bots.

### **What additional cloud hosting options are available?**

Automation 360 can be hosted on AWS, Microsoft Azure, Google Cloud, IBM, and any public, private, or hybrid cloud service.

### **How is Automation 360 delivered?**

You can start your automaton journey with Automation 360 in one of the following ways:

- Automation 360 (Cloud or On-Premises): Automation 360 is an intelligent cloud-native end-to-end platform you can use to automate

your business processes across systems and applications.

For more information see: [About Automation 360](#) on page 10.

- Community Edition: Community Edition provides a free web-based option for users to experience a range of Automation 360 bot creation capabilities. Community Edition can be used by small organizations (less than 250 machines).

Community Edition provides one Bot Creator license that you can use to log in to one device, and deploy one bot at a time. There is no limitation to the number of automations that you can create, but you will have access to only limited features.

For more information, see: [Get started with Community Edition](#) on page 980 | [Community capacity and limitations](#) on page 981.

- Free trial: Free trial license provides an evaluation period of 30 days that you can use to assess the product and make an informed decision. Free trial supports both Cloud and On-Premises deployments and provides access to the full set of features along with full tech support for these 30 days. You will have access to three Bot Creator and two Bot Runner licenses.

For more information, see: [Trial licenses](#) on page 953.

### **What scripting languages does Automation 360 support?**

Automation 360 supports JavaScript, Python, and VBScript.

### **Is Automation 360 available in languages other than English?**

Yes, Automation 360 is available in 10 languages: English, French, German, Italian, Japanese, Korean, Portuguese, Spanish, Simplified Chinese, and Traditional Chinese.

### **How is Automation 360 updated?**

For Cloud deployed Automation 360, customers are always on the latest version with updates rolled out by Automation Anywhere on a regular basis. For features such as action packages, admins and users have the ability to test the latest packages before choosing to accept the update.

For On-Premises customers, regular updates are made available through the customer portal, providing admins an opportunity to keep their business-wide installation on the version of their choice.

### **What are some of the data privacy and security aspects of Automation 360?**

Automation Anywhere Cloud privacy is engineered with a comprehensive set of security features that either automatically provide or are configurable by the data owner to provide data

**Is Automation Anywhere Cloud highly available?**

protection. Automation Anywhere Cloud includes comprehensive security and encrypts data both in transit and at rest. No personal data goes outside of the environment—unless you tell it to; it remains completely under the control of the IT manager.

To ensure customers can trust the AAI Enterprise Cloud, Automation Anywhere Cloud services are secured based on industry standards and frameworks like NIST Cybersecurity Framework, AWS Cloud Adaption Framework, Center for Information Security (CIS) baselines, and others.

**Is Automation Anywhere Cloud protected with disaster recovery?**

Automation Anywhere Cloud is deployed using fully load balanced Control Room environments of Automation 360 deployed on fully HA public cloud infrastructure services within a region.

Backups are taken every 6 hours to another region (except Australia where backups are kept in country). If a disaster is declared for the primary region, then a secondary region is instantiated for all tenants using the backup. The current objectives for this recovery are:

- RTO (Recovery Time Objective): Time to get a new region up and running with the last backup data restored = 6 hours.
- RPO (Recovery Point Objective): The maximum duration for data loss during a restore = 6 hours.

---

**Note:** A DR region might be in a different country.

Review the new capabilities, changes, fixes (resolved issues), security fixes, deprecated features, and limitations in each release.

## Automation 360 architecture and resiliency

Automation 360 is a single, integrated platform that transcends front office and back office technology silos to automate business processes across all systems and applications, including both SaaS and legacy apps.

The Automation 360 platform is deployed using a distributed architecture.

Centralized management is done through a web-based server, called the Control Room, to manage all development and execution of the digital workforce. The Bot Agent executes automation and are run time systems installed on the devices.

The following image shows the architecture and relation between Control Room and Bot Agent:

- \*indicates that the Control Room creates a unique user name and device ID to persist in the public key in the database.
- \*\*indicates that device public key is validated by the Control Room and a new token is created.

The following table describes the flow and the actions that occur between the Control Room, Bot Agent and the back end services (as numbered in the previous image):

Actions	Description
1	The browser sends the device token to the Bot Agent for registration.
2	The Bot Agent then registers the device request to create a public key and a token.
3	The back end services of the Control Room sends a response to the Bot Agent that the device has been registered with a unique user name and device ID.
4	The Bot Agent sends a message to the browser that the device has been registered successfully.
5	The Bot Agent sends a message to the back end services of the Control Room to indicate that the JSON web token has been authenticated successfully.
6	The back end services of the Control Room then validates the device public key and establishes a Web Socket connection with the new token.

## Control Room and Bot Agent resiliency

The following table provides you the behavior and resiliency differences between Automation 360 and Enterprise 11.

Bot Agent in Automation 360	Bot Runner Client in Enterprise 11	Notes
<b>Installation</b> Installation services are run on the local device.	Installation services are run inside an active user session.	
<b>Registration</b> Registered to the device on the Control Room.	An active user is registered to the Control Room.	Bot Agent service runs on the local system.
<b>Authentication</b> Control Room stores the agent public key in the database.	Control Room stores the authentication key in the memory.	In Automation 360, the Control Room stores the public key in the database. So when the Control Room restarts, the reconnection is accepted faster. The Bot Agent is resilient across Control Room restarts.  However, in Enterprise 11, the Control Room reconnection does not happen after a restart.
<b>Priority of bots is verified at deployment.</b>  When bots are queued for a Bot Runner user, higher-priority bots are deployed before lower-priority bots.  However, if a lower-priority bot is already running, higher-priority bots are deployed only after the lower-priority bot completes running.	When a low-priority bot is running and a high-priority bot is deployed, the system pauses the low-priority bot and runs the high-priority bot.  After the high-priority bot is run, the low-priority bot resumes.	Advantage in Automation 360 is that lower priority bots are not paused and complete their deployment before the high-priority bots are deployed.
<b>Error handler package contains MetaBot Logic</b> MetaBot Logic easily handle exceptions a bot encounters and transfers control to other actions within that bot.	Error Handling command helps in debugging when the TaskBot and MetaBot Logic are run.	
<b>Device</b> Reconnects when device is registered with the Control Room.  Reconnects when the device restarts.	When the Bot Runner Client restarts or loses connectivity with the Control Room, you must re-log to the Client to reconnect.	Bot Agent reconnects without individually logging in to every single device.
<b>Bot Agent</b> Reconnects automatically if there is an interruption.	The Bot Runner client needs to be reconnected manually.	Bot registration in Automation 360 is more robust and can reconnect automatically to the Control Room.

Bot Agent in Automation 360	Bot Runner Client in Enterprise 11	Notes
<p><b>Public</b> and private key is generated at the time of device registration.</p> <p>This key is used to authenticate to the Control Room.</p>	<p>Same behavior as in Automation 360.</p>	
<p><b>Bot Agent</b> is run as a service. When device reboots, the services are automatically connected to the Control Room.</p> <p>Bot Agent continues to check for connection even if the Control Room is down by using the public and private key.</p>	<p>Requires a client to log in and perform tasks.</p>	
<p><b>Remote Desktop Protocol</b> is supported only on multi-user devices.</p> <p>The Control Room does not maintain the RDP.</p>	<p>Remote Desktop Protocol is supported on both single and multi-user devices.</p> <p>In Enterprise 11, Remote Desktop Protocol connection is established from the Control Room and maintained by the Control Room.</p>	
<p><b>Control Room administrator</b> can update to automatically update the Bot Agent to a later version using auto-update capability.</p>	<p>Auto-update option is not available.</p>	<p>Auto-update reduces downtime because each user is not required to log in to the Control Room to update the Bot Agent installed on the user device.</p>
<p><b>Configurations</b> are pushed through updates.</p>	<p>No standalone configuration updates, but you can change it manually.</p> <p>Enhancements to the configurations are released as patches.</p>	
<p><b>Configure device settings</b> to automatically set a user's current device as default device after the user logs in to the Control Room.</p>	<p>Not available</p>	

Bot Agent in Automation 360	Bot Runner Client in Enterprise 11	Notes
Bots that are already running can run to completion during the update from Bot Agent to Control Room		<p>In general, bots already running can run to completion during the update. Exceptions are as follows:</p> <ul style="list-style-type: none"> <li>• If the bot tags data for Bot Insight, the bot will not run.</li> <li>• Parent/child bots will run to completion because the child bots are downloaded at the start of running the parent bot. However, if child bots are referenced using a variable parameter, calling those child bots need the Control Room to be available during parent bot runs.</li> <li>• Bots that use workload management (WLM) will not run.</li> <li>• If a bot is using values from Credential Vault, the bot execution might fail if the Control Room connection is interrupted or lost. This happens as the bot fetches the value from Credential Vault at the time of use.</li> </ul>

## Scheduling resiliency

Device pools provide built-in high availability (HA) for the Bot Runner devices if your unattended license is free to use. You are not tied to a single Bot Runner device, so if your device is unavailable for any reason and your unattended license is free for deployment, your automation is not affected. The scheduled automation will automatically run on the next available Bot Runner device, thereby providing high availability.

See [About device pools](#) on page 1955.

## Control Room overview

The Control Room manages, schedules, executes, and configures various capabilities of bots and Bot Runners using a collection of specialized web services.

## Components

The Control Room is a centralized management point for all bots. A reverse proxy is responsible for listening for remote connection requests and forwarding those requests to the correct specialized service. The following figure shows the On-Premises Control Room components and general data center

interaction. Control Room components are shown in orange and data center components provided by your organization are shown in blue. Components that are centrally hosted on cloud and managed by Automation Anywhere such as license server are shown in white.

In the data center, Control Room is installed on a server and configured to interact with the other data center components.

The Control Room includes objects that performs the following:

- Control Room reverse proxy is managed through the following functions:
  - Control Room services
  - Control Room messaging
  - Control Room caching
- Elasticsearch
- Licensing

The Control Room required data center components include:

- An SQL server with a Control Room database.
- A Server Message Block (SMB) file share

For Cloud Control Room architecture, see [Cloud Control Room architecture image](#).

## Centralized Automation Deployment

- Control Room acts as the single point of access and control for bot execution.
- Control Room provides bot upload and download features to facilitate seamless collaboration for end to end business process automation by multiple users.
- All scheduling is managed by the Control Room. Bots are deployed on the Bot Runners either ad hoc or on pre-defined schedules. Once the schedules are created, Control Room automatically and intelligently picks up the subsequent updates to bots, without any need to alter automation schedules.

## Centralized Access Control

- Least Privilege and Access controls user access. They are implemented in the Control Room through Role Based Access Control (RBAC).
- All Users and Roles are created and managed from the Control Room.

## Collaboration Centralized Workforce Management

- Control Room dashboards provide a single view of the entire automation infrastructure.
- Control Room receives real time heartbeat and telemetry from automations with events, exceptions and alerts.
- Unauthorized users cannot pause, resume or stop any of the ongoing automations on any Bot Runner.
- All historical automation data is logged in and available through Control Room Audit Logs.

### Related information

[Control Room overview](#)

## Distributed architecture

Automation Anywhere platform is deployed using a distributed architecture.

Centralized management is accomplished via a web-based server, called the Control Room, to manage all development and execution of the digital workforce. The Control Room is connected to Bot Creators and Bot Runners. Bot Creators are development systems used for authoring and tailoring of automations. Bot Runners execute the automations; they are run-time systems installed on machines. Bot Runners can be deployed on desktops, on virtual machines in data centers or cloud.

## Distributed architecture with HA/DR support

The Automation 360 self-contained platform within the customer environment mitigates the risk of "cross-contamination" from an unlikely event of a security breach from another network.

Automation Anywhere supports distributed architecture to deliver the optimal performance and security. Following are the main distributable components of Control Room which can be clustered to achieve High Availability (HA). In the image below, Automation Anywhere components are shown in orange and

components provided by your organization are shown in blue. Components that are centrally hosted on cloud and managed by Automation Anywhere such as license server are shown in white.

**Figure 1: Distributed Mode**

## Distributed Cache

Control Room architecture uses distributed cache to update all other nodes as soon as any information is updated in one of the nodes. This ensures fastest data synchronization across all the nodes and delivers seamless user experience. Automation 360 platform uses clustering mechanism to implement distributed cache, to synchronize all data operations. For example, when the Credential Vault is opened from one node, it is automatically opened for all other nodes too.

For information on HA/DR architecture for Automation 360 Cloud, see [Automation 360 Cloud Security and Data Privacy](#).

## Related concepts

[HA and DR deployment models](#) on page 847

Automation 360 provides several deployment options to meet various levels of enterprise cost/price performance and resiliency requirements. The options include installation on single nodes and on multiple nodes. Multi-node deployments can be configured for highly available (HA) clusters and disaster recovery (DR) sites.

## Security architecture

Many of the largest financial organizations in the world rely on the Automation 360 secure digital workforce platform to automate security-sensitive operations.

The platform's security architecture is founded on Least Privilege principles and a strict Separation of Duty model with 41 technical controls implemented across seven NIST 800-53r4 Control Families. Controls are applied across three components: the Control Room, Bot Creators (development systems), and Bot Runners (bot execution run times) through the bot life cycle from creation through decommissioning. This security architecture and the underlying controls are mapped to industry best practices as defined by NIST and can be readily mapped to other frameworks, for example, CoBIT (SOX) and ISO 27002.

### Access controls

Automation 360 limits and controls human and bot access to logical resources across components.

- Two independent control planes enforce least privilege. Only developers are enabled to read or write, only authorized Control Room users to execute automations, (Control Room authorizes and executes) subject to fine-grained Role Based Access Controls (RBAC) down to individual automations (bot), Bot Runners and domains.
- Bot- level Separation of Duty is enforced. Each bot is obfuscated and executed by its corresponding authorized Bot Runners.
- Bot execution is controlled via RBAC. Domain privileges are defined across groups of bot and Bot Runners.
- Security at-rest and in-transit: All access credentials are secured at-rest via a central Credential Vault with support for third-party credential stores. All communications are secured in-transit via SSL and TLS.

### Configuration management

Configuration management is controlled at both bots and Bot Runner levels.

- The Control Room authorizes, enforces, and logs changes to all Bot Creators and Bot Runners.
- Bots are controlled via a robust version control system, for rollback and full event logging.
- Bot change control on execution is enforced through encryption and authentication.

### Identification and authentication

Identification and authentication is controlled through Microsoft Windows authentication services.

- Bot Creators use Active Directory for authentication
- Bot Runners have two levels of authentication, one for autologin authentication of the runner and the other for execution of bots.
- Credentials are secured at-rest and in-motion through the Credential Vault or integration with third-party products.

### Risk assessment

Risk assessment is undertaken on Static, Dynamic, and Network-based Vulnerability Assessments. Audit and accountability are established through event capture, logging and auditing on all three components

with granular event capture at the bot level and nonrepudiation. Bot Insight embedded analytics provides near-real-time Incident Response and integration with Security Event and Information Management systems.

### Related information

[RPA Security](#)

## Security architecture model

Automation Anywhere Cognitive security architecture is founded on Least Privilege principles and a strict Separation of Duty model with 41 technical controls implemented across seven NIST Control families.

The NIST framework was selected as a foundation for best practices as a way to enumerate the controls implemented throughout. Translations from NIST to other control frameworks are widely available, resources are provided at the end of this topic.

The product security architecture is maintained by the Automation Anywhere Product Management team and forms part of a formal policy model as an integral part of the Automation Anywhere Development Roadmap. The following table lists the Control families and the corresponding features and security impacts. Details on each Control family and how the security architecture is implemented in Automation Anywhere products are in the corresponding topics.

Control Family	Control Code	Control Room Feature	Security Impact
Access controls	AC-3, 6, 7, 9, 10, 12	Central policy control	Enforce access restrictions for change control and least privileges on system components: <ul style="list-style-type: none"> <li>• Fine grained access to bots and Bot Runners is controlled via RBAC,</li> <li>• Bot and Bot Runner domains can be assigned to roles via RBAC</li> <li>• RBAC roles are fully audited</li> </ul>
	AC-2, 3, 5, 6	Role-based access control (RBAC)	Enable user access, restricts operational privileges, enforces least privilege principles
	AC-17	Bot repository	Bot versioning system with access restrictions
	AC-3, 7, 9, 10, 11	Bot and Bot Runner encryption	Encryption and obfuscation of sensitive information at bot level through credential vault and integration with key management systems

Control Family	Control Code	Control Room Feature	Security Impact
Configuration (change) management	CM-2, 5, 6, 7, 9	Centralized Bot Runner control	Restrict functionality based on roles, domains, implement deny-all and allow-by exception
	CM-10	Centralized licensing	Centralized provisioning, tracking and enforcement of Bot Creator and Bot Runner licensing
	CM-2, 5, 6, 8	Bot operations room	
	CM-8	Inventory control	Maintains centralized inventory control of all bots and runtimes
Bot Creator configuration management	SA-10	Bot Creator management, bot check-in, check-out	Control Room applies software life cycle management to bots from development, test, and production. Bot versioning enables change control of automations.
Audit and accountability	AU-1 through 15	Audit trail	Automated event logs captured on three levels: Control Room, Bot Runners, and Bot Creators. Non-repudiation is assured through read-only logs, all user identities are bound to actions.
Identification and authentication	IA-1 through 5	Active Directory integration, Bot Runner ID and Attestation	Implements Windows platform security including cryptographic bidirectional authentication, Bot Runner identification and attestation, and password management policies. Credential vault with integration with key management systems, protects the integrity of credentials.
Incident response	IR-4, 6	Incident response	Bot Insight embedded analytics capabilities can monitor events and generate alerts to SIEM systems for response.

Control Family	Control Code	Control Room Feature	Security Impact
Controlled maintenance	MA-2	Automated maintenance	Control Room versioning system provides an automated mechanism to roll out updates to bots, historical information is maintained.

(1) Resources: ISACA provides guides that map NIST SP800-53 to other security frameworks such as CoBIT (SOX), SANS Top20.

#### Cloud operational responsibilities

Learn about secure deployment models, data element locations, and operational responsibilities.

## Securing the Cloud

Automation Anywhere Cloud is deployed to only allow access to Automation Anywhere Cloud Operations personnel and Security Team resources. Network and cloud control plane access is restricted using VPN with multi-factor authentication for AAI operational and security personnel. All AAI users must first authenticate using MFA tokens to retrieve short-term credentials to access cloud resources. User credentials are continuously monitored for compliance. All other operational users, cloud resources, and applications are restricted from access to the Control Room. Regular AAI user access certification is conducted to ensure only necessary access is provided to cloud operations personnel.

The cloud service is multi-tenanted and each customer control room environment uses a unique tenant identifier to ensure data separation between the Control Rooms. Automation Anywhere members cannot access a customer environment unless specific permission is provided by the customer, typically under support troubleshooting procedures and controls.

### Cloud

With the Automation AnywhereCloud offering, all business, personal, and operational data is stored on Automation Anywhere administered cloud. Automation Anywhere is the cloud data controller and is responsible for customer data privacy as published in accordance with Automation Anywhere cloud security and compliance with data privacy.

[Privacy Policy for Automation Anywhere](#)

### Cloud-enabled

With the Automation Anywhere Cloud-enabled solution, business, personal, and operational data is stored and managed on the customer-controlled infrastructure, while specific operational data related to RPA is shared between the Automation Anywhere Cloud and the customer infrastructure. All data privacy and compliance rests with the customer.

### On-Premises with updates through Cloud

With Automation Anywhere On-Premises with updates through Cloud service, all business, personal, and operational data is kept on and deployed from the server on-premises on the customer network. All data privacy and compliance rests with the customer.

The following table lists the securing data and operations responsibilities:

Data requirement	Cloud	Cloud-enabled	On-Premises with updates through Cloud
Infrastructure and data security	Automation Anywhere Cloud	Shared customer and Automation Anywhere Cloud	Customer
Continuity and disaster recovery	Automation Anywhere Cloud	Shared customer and Automation Anywhere Cloud	Customer
High availability	Automation Anywhere Cloud	Shared customer and Automation Anywhere Cloud	Customer
Data localization	Automation Anywhere Cloud	Customer	Customer
Data privacy	Automation Anywhere Cloud	Customer	Customer
Software upgrades	Automation Anywhere Cloud	Shared customer and Automation Anywhere Cloud	Customer

The following table lists data types and storage locations:

Data type	Cloud	Cloud-enabled	On-Premises with updates through Cloud
<b>Customer business data</b> <ul style="list-style-type: none"> <li>Customer personal data</li> <li>Business data used in automation</li> </ul>	<b>Cloud.</b> For more information on Cloud storage information, see <a href="#">Automation 360 Cloud FAQ</a> on page 49.	<b>Customer network</b>	<b>Customer network</b>
<b>Operational data</b> <ul style="list-style-type: none"> <li>Operations users, roles, passwords</li> <li>Device information</li> <li>Device credentials</li> <li>Bot schedule</li> <li>Bot definition</li> <li>Audit and application logs</li> <li>Workload management definitions and schedules</li> </ul>	<b>Cloud</b>	<b>Customer network</b>	Management shared: <b>Cloud</b> Action package updates <b>Customer</b> All other data management

Data type	Cloud	Cloud-enabled	On-Premises with updates through Cloud
<b>Personal data</b> <ul style="list-style-type: none"> <li>• Username and password</li> <li>• Security key</li> <li>• User device information and credentials</li> <li>• Bot Runner device access</li> <li>• Bot device IP/FQDN</li> <li>• Bot application credentials</li> <li>• User application logs</li> </ul>	<b>Cloud</b>	<b>Customer network</b>	<b>Customer network</b>

## Securing the RPA environment with external controls

The Automation Anywhere architecture consists of a standard desktop and server class infrastructure for the registered devices and the Control Room.

### RPA platform

This topic details the best practices for securing the RPA platform with external security controls. Network-based firewalls, Intrusion Detection Systems, anti-malware, and external log servers are all standard security controls that are relevant to RPA deployment and the other infrastructure in your environment. The following figure shows logically where these components are deployed in the RPA deployment:

In the image, Control Room components are shown in orange and data center components provided by your organization are shown in blue.

Each external security control is discussed in detail in the following sections, in terms of placement and configuration. Supporting network services such as Active Directory, SMB File Share, Microsoft SQL Server, and production applications, and are accessed through network firewalls or directly, depending on their placement relative to the RPA components.

## Network-based access control to protect RPA with firewalls

Network-based firewalls and local server-based firewall are used to protect the Control Room or all nodes in a Control Room cluster. By default, required protocols on the Control Room are permitted from the corporate network. Additionally, all clustering protocols are permitted only between the nodes in the Control Room cluster. Network-based firewalls are used to isolate Development, Test, and Production RPA environments from the corporate network and from each other.

For unattended automation environments, the Bot Runners are placed in a specific isolated network and protected by a network-based firewall. Attended automations run from corporate workstations with the

Bot Runner Bot Agent installed and are protected via the corporate perimeter firewalls or internal firewalls protecting the corporate desktop infrastructure, like any desktop.

## Anti-malware to protect RPA from viruses and malware

The Automation Anywhere Bot Agent runs on desktop class infrastructure and is considered a corporate desktop. Anti-malware or anti-virus software is used to protect the registered device environment from malicious software in the form of viruses and malware.

## Intrusion detection systems to protect RPA from direct attacks

Intrusion Detection and Prevention Systems (IPS) protect the corporate network by detecting network-based attack through network traffic analysis. Like any other critical section of the data center, an IPS protects the RPA platform at the egress point, behind the network-based firewall.

## Independent categories for Bot Creators and Bot Runners

For logical separation of duties, Control Room divides automation users into two broad categories: Bot Creators (development) users and Bot Runners (run-time) users.

Bot Creators exist on a separate Microsoft Windows system with its own credentialing system to create, update, and unit test the bots on the Bot Creator. Bot Creators only upload and download bots to and from the Control Room. Users on the Control Room users have privileges to execute bots on Bot Runners but have no access to the Bot Creators. This separation of duty constitutes a dual authorization by requiring both the developer and the business user to create and execute the bot in conformance with NIST AC-3 best practices.

## RBAC in Control Room

Control Room implements Least Privileges and Separation of Duties through a configurable Role-Based Access Control (RBAC) capability that conforms to requirements in NIST AC 2, 3, 5, and 6.

All Control Room users are assigned one or more roles. Access are available based on the usage conditions assigned to each role when users are a member. Authorized users can temporarily or permanently suspend other users when needed. RBAC enforces session handling to prevent unauthorized access. If an unauthorized user attempts to view session details or gain access, the Control Room cluster will prevent this progress and immediately terminates the unauthorized session. The unauthorized user will be prompted to log in with valid credentials. Inactive accounts can be disabled.

The administrator controls are responsible for all security functions, consistent with best practices in NIST SC-3: Security Function Isolation.

The Control Room includes segmented administrator roles by default. Many permissions are supported for creating new roles.

Controls are implemented at the Control Room, Bot Creators, and Bot Runners layers, for NIST Access Controls (AC) and Change Management (CM) guidelines. The following technical controls are implemented to ensure access is governed through NIST Least Privileges.

### *RBAC on bots*

Access is deny all and allow by exception based on roles, except for admin roles. Addressing NIST AC-17 (access control), NIST configuration managements for NIST CM-2 (base line configurations), access restrictions for NIST CM-5, NIST CM-6, and NIST CM-7 (least functionality), and monitoring NIST CM-9 for bot activity across the development, test, and production environment.

### *RBAC on Bot Runners*

RBAC on Bot Runners facilitates complete isolation of one department Bot Runner seamlessly from the remaining departments' Bot Runners.

Bots are executed from the Control Room cluster. Local bot executions are protected through multiple layered security, and are designed to prevent fraud as a result from escalation of privileges on Microsoft Windows. The Bot Runner are executed by Windows, addressing access control enforcement in accordance with NIST AC-3 Access Enforcement and AC-6 Least Privilege for Code Execution.

If user roles does not have access to sets of Bot Runners, as a result, these users are unable to view the Bot Runners' executions or remote scheduling automation. See ([Role-based processing domains](#) on page 36).

#### *RBAC for Credential Vault credentials management*

Credentials created in the Control Room are used across Bot Creators and Bot Runners.

These credentials are securely stored in the centralized Credential Vault to facilitate access control, and to divide in logical groups called lockers. These lockers enable complete separation between the credentials of one department from another.

## Role-based permissions

Permissions for credential management-related roles include the following:

### **Manage my credentials and lockers**

By default, all users can manage their own credentials and interact with the lockers to which they have permissions.

### **Manage my lockers**

Allows the user to create and manage their own lockers.

### **Administer ALL lockers**

User can do all the actions in the Admin row of the Locker permissions table below.

### **Create standard attributes for a credential**

User can set an attribute value that remains the same for other users of that credential attribute.

## Locker permissions

Locker permissions are set when a locker is created or edited. A user can have the following permissions in a locker:

	View locker	Edit locker	Delete locker	Add participant owner	Remove participant owner	View credential	Assign credential	Remove credential	User-provided value	Standard value
Consume						#			#	
Participate						#	#			
Manage	#	#	#			#	#	#		#
Own	#	#	#	#	#	#	#	#		#
Admin	#	#	#	#	#	#	#	#		#

### Related tasks

[Create credential](#) on page 2150

Create a credential and add the required attributes.

[Create locker](#) on page 2152

Create a locker to group similar credentials to share with other users.

### Related reference

[Credentials and lockers in the Credential Vault](#) on page 2147

The Credential Vault securely stores sensitive information such as passwords, account numbers, and social security numbers in credentials and lockers for use in automation tasks. It facilitates role-based access for users of a Control Room and ensures that sensitive values are not stored in bots or on devices.

#### *Role-based processing domains*

The Control Room RBAC applies the least privilege principles to domains by implementing Processing Domains, specifying role-based privileges and permissions at the bots and Bot Runners level.

RBAC is applied at a folder level to completely and seamlessly isolate one department bot from the remaining department bots. If the user role does not have access to a set of bots, those bots do not exist, thereby enabling the separation of duties across different domains. For example, finance and accounting roles can access only the bots that automate their respective functions, and specific Bot Runners can execute these bots. This is consistent to best practices as defined by NIST AC-4 Processing Domains.

Authorized users assign various roles based on the business need.

#### *RBAC on Audit Log*

Audit is automated for all privileged and nonprivileged roles to conform to best practices, as defined in NIST AC-6.

Access is view-only based on a deny all and allow by exception based on roles and domains as defined in the Audit section 7 addressing Audit and Accountability (NIST AU 1 through 15) and as required by NIST AC-2 Automated System Account Management. If a role does not have permission to view Audit Logs, then the Audit Trail tab is not visible to all members of that role. Audit automatically captures all events related to creation, modification, enablement, disablement, and removal of users, bots, Bot Creators, and Bot Runners.

#### *RBAC on viewing bot activity*

The Control Room **Activity** menu provides options shows the status of the Automation Anywhere Enterprise automations. These options are: **In Progress**, **Scheduled**, and **Historical**.

Access to bot Activity status is deny all and allow by exception based on roles and domains as defined in RBAC. Two levels of checks are applied to access the bot Activity data. The user is required to be a member of a role that has access to view the Control Room. Users with Control Room access that can view only the bots belonging to their departments, as applied through RBAC on bots.

#### *RBAC on User Management*

Access is deny all and allow by exception based on roles, domains as defined in RBAC. Only those users with access to User Management can manage other users in system.

This permission is further divided into the following sub permissions:

<b>Create Users</b>	Only those users that create new users from the Control Room.
<b>Edit Users</b>	Only those users that edit existing users from the Control Room.
<b>Delete Users</b>	Only those users that delete existing users from the Control Room.

Authorized users assign various combinations of these access permissions to different sets of users and roles based on the business requirements.

#### *RBAC on roles and permissions management*

Access is deny all and allow by exception based on roles, domains as defined in RBAC.

Users with access to roles and permissions management can create, edit, and delete roles in the system. This permission is typically assigned to administrators and power users from across enterprises.

*RBAC on bot schedules*

Access is deny all and allow by exception based on roles and domains as defined in RBAC.

This permission is further divided into the following sub permissions:

<b>Schedule my bots to run</b>	Only those users that create new schedules.
<b>Edit my scheduled activity</b>	Only those users that edit their schedules.
<b>Delete my scheduled activity</b>	Only those users that delete their schedules.
<b>View and manage ALL scheduled activity</b>	Only those users that manage (edit or delete) all the existing schedules created by any user.

Administrators assign various permutation and combinations of these accesses to different sets of users and roles based on the business requirements.

*RBAC on license management*

Access to license management is deny all and allow by exception based on roles and domains as defined in RBAC.

Only those users with access to license management permission are able to update the license from the Control Room. A common license exists for all the users across Automation 360 for a specific Control Room. The updated license is effective for all the Bot Creators and Bot Runners registered with the corresponding Control Room.

## Bot execution access by dynamic access token

The Control Room implements and enforces a Trusted Path for registration and authentication of Bot Creators and Bot Runners in accordance with NIST SC-11 to protect against any attempt to execute unauthorized bots.

The Control Room issues new client access tokens or identifiers through hashing, signed by the Control Room and sent to Bot Creators and Bot Runners over HTTPS. Every subsequent communication between Control Room and Bot Creator or Bot Runner is serviced by the Control Room after validation of the signature of the latest access token sent by the Bot Creator or Bot Runner. Each access token is unique to every Bot Creator or Bot Runner. This ensures that even if an unauthorized user could bypass enterprise security and access the system, the Control Room security restricts any damage.

## Secure credential store through Credential Vault

The Automation Anywhere platform provides a centralized Credential Vault to securely store all credentials and provision them to bots on an on-demand basis.

Use the Credential Vault to store other information deemed confidential or sensitive. The credential store implements NIST controls IA-2 to uniquely identify and authenticate organizational users (or processes acting on behalf of organizational users).

Sensitive information does not have to be stored in bots or on Bot Runner systems, the Credential Vault facilitates a logical separation of credentials from the bots.

Credential Vault variables (credentials) are created in the Control Room. They are available to the Bot Creators and Bot Runners who are assigned roles that provide them access to the lockers that contain the credentials.

The Credential Vault adds flexibility and dynamic character to bots because only the credential references are present in the bots, and not the credentials. When bots are moved from one environment to another environment, absolutely no change is required in the bots. Bots can seamlessly pick up the credentials values applicable for the new environment from the Credential Vault of that environment. Additionally, the Control Room automatically stores configuration-related sensitive data into the Credential Vault by default.

*Credential Vault encryption*

The Automation 360 platform offers the embedded Credential Vault and provides an extensive set of safeguards to protect data at rest and in transit, but also while it is in use on individual systems.

## Encryption keys and vault

During the Automation 360 installation process, the system generates an RSA 2048 bit public/private key pair and an AES 256 bit key. The private key of the RSA 2048 pair is referred to as the Master Key, while the AES 256 key is referred to as the Data Key. The Master Key is presented to the installing administrator for safekeeping in a physically secure location off system. The public key is used to encrypt the Data Key. Both the public key and the encrypted Data Key are then stored in the database. When in use, all keys and encrypted data are placed in encrypted secure memory using the Microsoft Data Protection API (DPAPI).

During Automation Anywhere Control Room startup or reboot, the administrator is prompted to supply the Master Key. The encrypted Data Key is retrieved from the database and decrypted using the Master Key. The Data Key is now ready for use. As the system stores and retrieves data from the Credential Vault, the Data Key is used to encrypt and decrypt that data.

vault is used to store all system managed credentials and critical system configuration data. It can also be used to store any other sensitive data used in an organization's automations. As a result, bot builders can avoid the insecure practice of hard-coding credentials and other sensitive data/ arguments directly within their automations.

Multi-layer authentication and fine-grained access control are essential for a tightly controlled environment. So is end-to-end data protection, which is also necessary to maintain the confidentiality and integrity of business-critical processes, sensitive data, and related credentials.

### Master key

This RSA-2048 bit key is managed by an administrator outside of the system. This key unlocks the Credential Vault. The administrator types the Master key each time the Control Room is started. When the vault is open, the master key is immediately erased from memory and it is not stored anywhere in the Automation Anywhere product.

### Data encryption key

This AES-256 bit key is stored in the Control Room database and is used to encrypt and decrypt the credentials at the time of storage or provisioning. This key is encrypted using the Master key. The Data encryption key does not leave the Credential Vault at any time. Credential encryption and decryption are done at the Credential Vault.

## Protection of data at rest

In addition to encrypting local credentials and selecting runtime data used by bots, the Credential Vault provides secure storage for sensitive configuration parameters and details pertaining to the integral version control and email services.

### *Credential storage*

All sensitive data is stored in the Credential Vault using AES-256 encryption.

These credentials are encrypted by the Credential Vault service to conform to NIST SC-28 and to prevent unauthorized access or disclosure of credentials. Only encrypted credentials travel from the Control Room to the Database server and are stored in the database in an encrypted form. The data encryption key encrypts all credentials using an AES 256-bit key generated by a FIPS 140-2 Level 1 validated module to meet the NIST IA-7, SC-12, and 13 requirements for implementation of mechanisms for authentication to a cryptographic module that meets the requirements of applicable federal laws.

The data for *Active Directory* user credentials for autologin to Bot Runners is also encrypted and securely stored in the Credential Vault with the bot credentials.

### *Credential provisioning to bots*

Credentials are provisioned only during the execution of automation.

Bot Runners or bots do not store credentials locally. Credentials are provisioned only during the execution of the automation. When the credentials are requested by Bot Runners, encoded (64 bit) credentials travel from the Control Room to Bot Runner over HTTPS protocol. When the bots finish execution, credentials are erased from the memory.

## Secure recording

You can enable or disable image captures of business applications by setting up secure recording in the Control Room.

## Overview

When secure recording is enabled, Bot Creators or Bot Runners cannot capture the application images, values, or texts. As a result, no sensitive data is (intentionally or unintentionally) stored in the bots in the form of images. The remaining automation data, for example, UI object details are captured, and they continue to be captured so that the automation can work seamlessly.

As an administrator, you can apply this setting from the Control Room for all Bot Creators and Bot Runners (for all users or for specific user roles).

## Set up secure recording

1. Log in to the Control Room as an administrator.
2. Navigate to **Administration > Settings > Bots**.
3. In the **Secure recording** section, click **Edit** to configure the settings.
4. Select **Enable**.

The default value is **Disable**.

5. In the **Recorder preview image** tab, select one of the following options:
  - **Enabled:** A preview of the image is shown in the Bot editor when the object is captured but discarded after you refresh the Bot editor. The image is stored in the Control Room and deleted after 60 minutes.
  - **Disabled:** Image is not captured and not stored in the Control Room.

Secure recording
Cancel Save changes

When Secure Recording is on, images and control values will NOT be captured during business process recording by Bot creators. Recommended when you are automating secure applications (e.g. Bank accounts).

Enable
  Disable

Recorder preview image

Enabled  
 Preview image is available in the Bot Editor when objects are captured but discarded after save

Disabled  
 Preview image is not available and will not be stored in Control Room

6. Choose the settings based on your requirements:

Option	Action
<b>All users</b>	Select this option to enable secure recording for all users who have access to the product.

Option	Action
<b>Users with selected roles</b>	To enable secure recording for users with specific roles: <ol style="list-style-type: none"> <li><b>a.</b> From the <b>Available roles</b> column, search and select roles for which you want to enable secure recording.</li> <li><b>b.</b> Move these roles to the <b>Selected</b> column.</li> </ol>

7. Save your changes.

## Authentication with Control Room

When a Bot Creator or Bot Runner tries to connect to Control Room, the credentials are encrypted using AES (256 bits key length) and RSA (2048 bits key length) and then transmitted on top of the existing layer of Transport Layer Security (TLS).

This extra layer of message level encryption provides protection against network stack issues (such as Heartbleed where OpenSSL was leaking sensitive data from memory) and also adds protection to the last hop of the connection when TLS is terminated at the load balancer. These credentials are decrypted by Control Room and authenticated against the hashed (PBKDF2 and HMAC SHA512 algorithm) user passwords or against *Active Directory* via Lightweight Directory Access Protocol (LDAP).

*Supported authentication methods for Automation 360 On-Premises*

Review the authentication methods supported by Automation 360 On-Premises.

## Supported authentication methods

- *Active Directory* using LDAP
- Active Directory using Kerberos
- SAML
- Local authentication using a database

The benefits of integrating with Active Directory include the following:

<b>Easier adoption</b>	Integrates with an existing authentication solution, compliant with the standards.
<b>Maintenance</b>	All passwords and password policies are centrally administered.
<b>Better user experience</b>	Fewer passwords to remember.

Kerberos provides additional benefits over NTLM pass-through authentication.

- Open standard versus closed proprietary standard
- Mutual authentication of client and server
- Integration with smart cards for 2FA

Local authentication manages user passwords through the Credential Vault. Passwords are hashed using the HMACSHA512 algorithm, which is keyed by the output of the Password-Based Key Derivation Function (PBKDF2). User passwords are encrypted in transit through TLS 1.2.

All authentication and session management is handled through the well-tested Spring Security framework. Kerberos integration is provided through the well-tested Waffle framework. SAML integration is provided through the well-tested OneLogin framework.

## Active Directory integration for authentication

Automation Anywhere offers seamless integration with Microsoft Windows Active Directory for access to the Control Room, Bot Creators, and Bot Runners. When Control Room is integrated with the Active Directory, all the Active Directory users with basic details are directly available in the Control Room without any extra configuration. For Active Directory integration, user passwords stay in only Active Directory and are not saved in the platform.

In addition to Active Directory authentication, the Control Room has its own controls to prevent unauthorized access to an [Dynamic access token authentication of Bot Runners](#) on page 44y automation data.

[Dynamic access token authentication of Bot Runners](#) on page 44

Bot Runner users can also configure their [Active Directory](#) credentials for Bot Runners machine autologin. These credentials are saved in the centralized Credential Vault.

## Multi-domain Active Directory support

Automation Anywhere platform architecture supports multi-forest multi-domain Active Directory integration. Multi-forest multi-domain integration requires trust relationships between the forests and the domains. Refer to [Configure Control Room for Active Directory: auto mode](#) for details. Automation 360 On-Premises can be configured with Active Directory global catalog server in a way that the Control Room, Bot Creators and Bot Runners can all be in the same or different Active Directory forests and domains. This gives the added flexibility and control for large-scale complex deployment where users are spread across geographies.

Multi-domain support is provided out of the box and no additional configuration is required. The Automation 360 On-Premises user provisioning from different Active Directory domains is also seamless. It enables the Automation 360 On-Premises admin to centrally orchestrate the digital workforce running across the globe.

## Support for secure protocols

The Automation Anywhere platform supports secure protocols (TLS 1.2 and TLS 1.3).

- Deployment of bots from the Control Room to remote Bot Runners is done over secure communication.
- Upload and download of bots from the Bot Creator to the Control Room is done over HTTPS.
- Transfer of any information from the Control Room to the database and vice versa is done over secure communication.
- Transfer of encoded credentials from the Control Room to Bot Runners is done over HTTPS.
- WebSocket communication with the real-time data service in the Control Room is done over HTTPS.

## Network security overview

All communication between the Control Room, Bot Creators and Bot Runners is done using outbound WCF TLS 1.2 communications and inbound HTTPS TLS 1.2.

Bot deployment to remote bot runners, provisioning of credentials, automation scheduling, and event capture are done exclusively through the Control Room. Use only HTTPS in the production environment.

- The REST APIs use Distributed Cache Service to get shared cached data required for specific functionality.
- The Scheduler Service makes REST API calls to run a task on a specific client machine at a specific time.

- Real-time Data Service makes REST API calls to authenticate incoming connection requests. It receives task execution progress updates by Bot Runners and sends that information to all connected browser clients using WebSocket Secure (WSS) protocol.
- The Control Room makes REST calls for user authentication and repository operations, for example, upload a task, download a task, or compare two tasks.
- The Control Room makes REST calls to the validate user session at regular intervals. The Control Room deploys and runs a task on a specific device using Bot Agent. It uses a TCP/IP channel.
- The Scheduler Service makes REST calls for autologin credentials. It also communicates to the Control Room to get a license and user session-related information.
- The Control Room makes REST calls to get autologin credentials for a logged-in device. It also communicates to the Control Room to get the license and user session-related information.

## Change management

Access restrictions for configuration management.

### **Baseline inventory controls for Bot Creators, Bot Runners and bots**

The Control Room provides a single-pane-of-glass on all automation operations and infrastructure, providing a way to baseline the configuration of the environment. Inventory controls are maintained through the application of RBAC and the use of the Bot Repository, Operations Room, and License Management to establish a single point of control for Base Line Configurations (NIST CM 2) access restrictions for configuration management (NIST CM 5 and 6). Configure automated baseline reporting using the auditing and reporting systems in the Control Room.

### **Change control and documentation RBAC**

The Control Room RBAC provides a point of access control and management for all changes to the Control Room, Credential Vault, Bot Creators, bots, and Bot Runners with an automated mechanism to prohibit changes and report on any attempts to make unauthorized changes. The logging and auditing system on the Control Room provides the reporting mechanism for change management to conform to best practices as described in NIST CM-3 through 5.

### **Software usage and license management**

The Control Room provides an automated mechanism for tracking and controlling the use of licensed software across Bot Creators and Bot Runners, addressing NIST Change Management CM 10.

### **Dual authorization change management**

Separation of duties is implemented at multiple levels. Dual authorization is achieved through separation of control planes for the Bot Creators and Bot Runners. Only bots created by an authorized Bot Creator can be executed by a separately authorized Bot Runner and only by a user who has been given the privileges to do so by an administrator.

## Identity and authentication

All automation actions, for example, create, view, update, deploy, and delete, across Automation 360 are done only after Control Room authentication is successfully completed.

After authentication is successful, the platform applies a second mandatory level of access control enforcement in the form of fine-grained Role-Based Access Control (RBAC).

The Control Room has its own controls to prevent unauthorized access to any automation data.

#### *Password hashing*

Password hashing does a one-way, permanent transformation of the passwords of the Control Room users, inline with standard password management practices.

Control Room passwords are concatenated with a salt and then hashed using the PBKDF2WithHmacSHA512 algorithm before being stored in the database.

- The salt is 256 bits in size and is randomly generated by a cryptographically secure PRNG.
- The HMAC SHA512 algorithm is used for hashing and provides additional security over traditional approaches.
  - A keyed hash provides protection against hash length extension attacks.
  - SHA 512 bit key is larger than the commonly used SHA 256 bit key.
- The key used for the HMAC is from the secure Password-Based Key Derivation Function (PBKDF2).
- Hashing is done for 100,000 rounds (based on NIST recommendations).

Every time a Bot Creator or Bot Runner authenticates against Control Room, its credentials are authenticated against the hashed credentials.

#### *Authentication failure messages*

If an authentication attempt fails, the Automation 360 platform does not specifically state if the username or password is incorrect. It only states that the supplied credentials are incorrect.

This is one critical information security requirement for Automation Anywhere customers and defends the system against a brute force attack.

This authentication involves the following:

- Bot Creator, Bot Runner connection to Control Room
- User log in to the Control Room from the browser
- Connection from the Control Room to the SQL Server

All failed authentication attempts are logged. See [Audit log](#) on page 1972. Audit Log access is provided as per RBAC and audit logs are made available on a read-only basis for all users.

#### *Authentication for Bot Runners*

Two layers of authentication are present for deploying the bots on remote Bot Runners.

The Bot Runner is logged on/connected/unlocked using the configured credentials. These credentials are fetched from the centralized Credential Vault over HTTPS. This first level of authentication is done against the [Active Directory](#) domain automatically, on behalf of the user and is called Bot Runner autologin.

After being authenticated, Bot Runners can be authorized to execute bots independently and asynchronously.

The following table shows what happens to the user session on the Bot Runner after bot deployment.

User session status before bot deployment	During deployment	User session after bot execution finishes
No session exists	Create a new session and deploy the bot	Log off
Unlocked	Deploy the bot	Session remains unlocked
Locked	Unlock the session and deploy the bot	Session is relocked

User session status before bot deployment	During deployment	User session after bot execution finishes
Disconnected	Unlock the session and deploy the bot	Log off

#### *Dynamic access token authentication of Bot Runners*

The Control Room implements and enforces a Trusted Path for registration and authentication of Bot Creators and Bot Runners in accordance with NIST SC-11.

The Automation 360 platform protects the automation data against any attempt to subvert the path. The Control Room issues new client access tokens, or identifiers, after a predefined time period. These tokens are protected to conform to NIST IA-5 by being signed by the Control Room and sent to Bot Creators and Bot Runners over HTTPS. Every subsequent communication between the Control Room and Bot Creator/Bot Runner is serviced by the Control Room only after validation of the signature of the latest access token sent by the Bot Creator/Runner.

The access token is unique to every Bot Creator/Bot Runner. This protects the system from an unauthorized attempt to bypass security and execute an unauthorized bot, and is consistent with the best practices to conform to NIST IA-9 Service Identification and Authorization. These controls implement IA-3 for cryptographically based bidirectional authentication and attestation of Bot Runners and Bot Creators before establishing connections. This also addresses requirements around unique, automated, identifier management IA-4 for multiple forms of authorization and identification. Identifiers are dynamically managed for audit and control purposes. Identifiers are used as authenticators and managed for verification on initial deployment, revoke, and prevent reuse. There are no static, unencrypted, identifiers in use by Bot Creators or Bot Runners and cached tokens are cleared periodically.

## Defenses against common vulnerabilities

The Automation 360 platform provides some defenses against common attacks on applications.

The list below contains several examples of these attacks and the security controls in place to prevent them.

## SQL Injection (SQLi)

SQL injection is a high-risk vulnerability that can seriously impact the confidentiality, integrity, and availability of a database. It enables an attacker to execute any SQL of his or her choosing inside the DB, thus allowing them to read sensitive data, modify/insert data, and execute various operations.

The Control Room prevents SQL injection using query provided by the Hibernate framework.

## Cross Site Scripting (XSS)

Cross-site scripting is a high-risk vulnerability that can seriously impact the confidentiality, integrity, and availability of any user web session. It enables an attacker to execute any JavaScript inside the victim's browser, allowing them to spy on the user's input/output or take unauthorized actions on behalf of the user. They could also redirect the user offsite to a malicious malware download or a credential phishing page.

The Control Room prevents cross-site scripting using automatic output encoding provided by the ReactJS framework.

## OWASP Top 10

Automation Anywhere provides the following controls to protect against the OWASP Top 10:

Risk	Control
A1: Injection	All input is escaped before commands or queries are executed.
A2: Broken authentication and session management	See the identification and authentication section.
A3: Cross-site scripting	All output is encoded before being returned.
A4: Insecure direct object references	Centralized authorization via Spring Security.
A5: Security misconfiguration	No default passwords, stack traces hidden, secure server configuration
A6: Sensitive data exposure	See the Security at rest and Security in motion sections
A7: Missing function level access control	Centralized authorization via Spring Security
A8: Cross-site request forgery	Using authorization HTTP header
A9: Using components with known vulnerabilities	Black Duck software composition analysis tool
A10: Unvalidated redirects and forwards	N/A - No redirect functionality present

## Compliance and vulnerability scanning

Review details about Automation Anywhere compliance and vulnerability scanning.

## Secure software development life cycle (S-SDLC)

Automation Anywhere has implemented a development security plan and protocol that defines a specific depth of testing and evaluation to be done by the Engineering team on each release, conforming with

best practices as defined by NIST SA-11 Developer Security Testing and Evaluation and NIST SA-15, Development Process, Standards, and Tools. This plan has been documented and shared with the Automation Anywhere Engineering teams.

## Veracode vulnerability scanning for static and dynamic code analysis

In each weekly build, during the development process and before every release, all Automation Anywhere software is scanned for flaws using the Veracode tool. Automation Anywhere Enterprise meets the requirements for the strictest security policy available in the tool, Veracode Level 5, which is defined as no Very High, High, or Medium severity vulnerabilities. Analysis reports are available with each release.

## Dependency analysis

In each weekly build, during the development process and before every release, all of the third-party libraries and dependencies in Automation Anywhere software are scanned for known vulnerabilities using the Black Duck tool. Automation Anywhere upgrades vulnerable libraries when new versions become available. Analysis reports are available with each release.

All Critical/High vulnerabilities are fixed for each release. Medium vulnerabilities will be considered for fixes in future releases depending on the scope of the Automation Anywhere releases. The list of OSS used by the application is published for each release.

## Penetration testing

Automation Anywhere does a penetration test through a third-party vendor before each major release. Additionally, Automation Anywhere incorporates the feedback from penetration tests conducted by customers, which includes some of the largest financial institutions in the world. Analysis reports are available with each release.

## Cryptographic providers

Use only the listed supported cryptographic providers.

## Control Room

Cryptographic Provider	Supported Version
<b>AES-256</b>	All Bouncy Castle FIPS versions mentioned in the Automation Anywhere Open Source Software (OSS) Notice
<b>AES/CBC/PKCS5Padding</b>	
<b>ECDH/AES/GCM/NoPadding</b>	
<b>HMAC-SHA256</b>	
<b>PBKDF2 with HMAC-SHA512</b>	
<b>RSA-2048</b>	
<b>RSA/ECB/OAEP with SHA-256 and MGF1 Padding</b>	

See: [Compliance and vulnerability scanning](#) .

## Additional security controls

Automation Anywhere Control Room restricts the database connection configuration with the system administrator account.

### **Restrict installation from database system administrator account**

All the database level transactions are done with a nonsystem administrator account. The Control Room installer passes the SQL Server 2012 certification test.

### **Autolock the device**

When Automation Anywhere bots are deployed from the Control Room to remote Bot Runners, they revert the Bot Runner system to its original state. For example, if the Bot Runner machine was logged off and our bot logged into the machine, it logs it off after the automation execution finishes. This ensures that system level security is not compromised.

### **Using SHGetKnownFolderPath function**

Automation Anywhere software uses the SHGetKnownFolderPath function and Knownfolder\_ID to determine the full path to the special folders. This is a recommended practice from Microsoft and use of this function ensures that system will never redirect automation data to any other folder, even if someone attempts to hack the function call. This is also one of the InfoSec requirements of Automation Anywhere customers.

### **API level security**

Automation Anywhere software does authentication and authorization level checks at the API level. API calls are serviced only for those users who have permission on the automation data. Unauthorized users cannot bypass system security through rogue API calls.

### **Clean uninstall**

When Automation Anywhere Enterprise Client software is uninstalled, it leaves no trailing files or folders behind. This clean uninstall of the Enterprise Client software complies with InfoSec policies.

### **Store data in Program Data folder**

Automation Anywhere software allows storing of automation data in the Program Data folder, for the files which must be edited by end users. Permissions are also set on the directory during the installation so that the user can edit the content of the folder. This complies with the InfoSec requirements of Automation Anywhere customers.

### **Protected handling of MSVC DLL files**

Automation Anywhere Enterprise Client software uses MSVCxxx.dll files for automation purposes, but it does not install these files by itself. Client software directly uses the DLL files installed by only the Microsoft operating system. This ensures that client software does not overwrite the DLL files installed by Microsoft

and our customers do not have to worry about doing one more cycle of checking for any introduced vulnerabilities.

## Assembly manifest

All the executables (.exe file) of the Automation Anywhere Control Room and Enterprise Client software contain the manifest files which describe assembly metadata, for example, filename, version number, and culture. This makes our platform comply with organizational InfoSec policies.

## Application path on network

Automation Anywhere supports configuration of reading and writing automation data to a location on a network drive. This enables users to keep all automation data at one place.

## Autologin without disabling legal disclaimer

When Automation Anywhere bots are deployed from the Control Room to remote Bot Runners, our customers do not need to change security settings, for example, disable login page, disable legal disclaimer, or disable screensaver. Automation deployment works seamlessly without disabling these settings.

## Secure Java automation

The Automation Anywhere platform can securely automate even those difficult-to-automate business applications which download the Java runtime environment (jre) during automation execution. Whenever these applications are started, an Automation Anywhere agent gets associated with Java executable noninvasive and automates the business application. After the automation finishes, the Automation Anywhere agent is automatically terminated.

## Automation in nonEnglish languages

Users can securely use German, French, Italian, and Spanish language keyboard characters through the embedded automation commands in Bot Creators. This enables users to write data into these languages. Automation Anywhere customers do not need to depend on less secure third-party libraries for this automation.

## General Data Protection Regulation guidelines

The General Data Protection Regulation (GDPR) is one of the strictest compliance frameworks for maintaining privacy of personal data. The GDPR defines personal data as any data that can be used to identify a natural person (Data Subject).

For the most current description of Automation Anywhere GDPR compliance statement, see [Cloud Automation Agreement](#) and [Privacy Policy for Automation Anywhere](#).

## Automation 360 Cloud FAQ

Answers to frequently asked questions (FAQ) and related information provide insight into various aspects related to Automation 360 Cloud.

### **Where can I find an overview of Automation 360 Cloud security?**

An overview and details about Automation 360 Cloud security can be found in this document: [Automation 360 Cloud Security and Data Privacy](#).

### **As a customer, how can I start using Automation 360 Cloud?**

The prerequisites and additional, optional steps for getting started can be found on the Automation Anywhere documentation portal at the following location: [Get started with Automation 360 Cloud](#) on page 790.

For most customers, the basic requirement is to allow secure access, using HTTPS, to their new Control Room environment hosted on Automation 360 Cloud. If this is not already enabled, you need to open port 443 in your firewall to allow outward HTTPS communication from your browser and the Bot Agent to the Control Room. After the Bot Agent is installed, it establishes a web socket connection to the Control Room. No ports need to be open on the customer site for these inbound connections.

### **Does Automation 360 Cloud provide a service-level agreement (SLA) for service availability?**

Yes, an SLA for 99.9 percent monthly availability is provided for the customer's access to their production Control Room environment. The SLA does not include planned downtime for maintenance and updates to the service. If a customer believes that the SLA has not been met, a service credit can be claimed through Support. Details can be found in our [Availability Service Level Terms](#).

### **How does Automation 360 Cloud support high availability (HA)?**

Each customer's Automation 360 environment is deployed using application load balancing across highly available public Cloud infrastructure services. The infrastructure services support both microservices running on Docker containers in Kubernetes clusters and datastores (database, cache, logging, file system, storage) supporting HA across multiple zones within a region. Both AWS and GCP public clouds are used.

### **Does Automation 360 Cloud support disaster recovery (DR)?**

Yes, Automation 360 Cloud supports DR. Under a disaster recovery scenario the customer's tenants will be brought up in another region using the same URL and their Bot Agent will reconnect automatically. In case of major incidents, where imminent resolution seems unavailable, a disaster situation is declared and all the tenants within the region affected by the incident are failed over to

another, remote region. The current objectives for this recovery are as follows:

<b>Recovery Time Objective (RTO)</b>	The time taken to get a new region up and running with the last backup data restored is 4 hours.
<b>Recovery Point Objective (RPO)</b>	The maximum duration for data loss during a restore is 4 hours.

---

**Note:** RPO is based on backups taken and pushed to another backup region.

---

**Do all customers receive notifications about upcoming general releases from Automation Anywhere via email?**

All Cloud and On-Premises customers receive general release announcements from Automation Anywhere via email. The release announcements are sent two weeks before the release date. Additionally for Cloud customers, the announcement is also sent to the administrators who registered when first provisioning the Control Room.

**How do customers determine what region their Control Room is in?**

A Customer License User (CLU) can log in to the Control Room and find the region where Control Room is hosted. To find the region, navigate to the **License and Cloud Services** portal on the A-People site and click the **Cloud Control Room Instances** tab. For more information, see [Licenses and cloud services](#) on page 967.

**Are there maintenance windows for the Automation 360 Cloud?**

Yes, Automation Anywhere updates Automation 360 Cloud every 3 months so that customers will receive automatic and regular updates to the latest software version. For more information, see [Automation 360 software lifecycle policy](#) on page 64.

The primary channel for communicating the timing of Cloud status and maintenance windows is the [Automation 360 Cloud Service Status site](#). You can subscribe to this website and receive the updates. Note that you cannot choose when the updates are rolled out across the multitenant Cloud. The Automation 360 architecture is designed to allow these timeless updates to roll out without affecting customers' bot development lifecycles.

**As a customer, what actions should I take to plan for an Automation 360 maintenance window?**

A customer's bot operations should take account of scheduling bots to run outside of the published maintenance windows. These updates are scheduled to run outside of normal business hours on the same day and time per region, and focuses on mid-month, avoiding month ends. More details

### Is customer data stored on the Automation 360 Cloud?

guiding customers on planning around maintenance windows can be found on this KB article: [Automation 360 Cloud updates](#) on page 61.

Yes, basic automation processes allow customers to keep customer business data on their own infrastructure using careful bot design. However, Automation 360 applications increasingly store customer data on the Cloud. Several Automation Anywhere products store customer data as part of customer-defined automations, although typically only temporarily, that is, during the automation process defined by the customer.

For example:

- IQ Bot use typically involves uploading images for processing.
- Recorder and AISense Recorder store recorded screenshots.

---

**Note:** Secure recording can be enabled by administrators to ensure that these are not stored.

---

- AARI stores data processed by attended forms.
- Bot Insight can be used to create dashboards made from tagged business data being processed by a bot.
- WLM stores Work Items in its queues.

The customer has control over what business data is stored on the Automation 360 Cloud. Note that the source data remains with the customer, and the customer is in control of deleting the data on the Automation 360 Cloud. In general, the business data a customer keeps in our Cloud through the use of bots is for automation purposes only and can then be deleted. The primary storage for the data is not on our Cloud. Customers might need to keep audit logs and dashboard data. Both of these can be exported.

### What is the Automation 360 Cloud Data Retention Policy?

During a customer's subscription period, data on the Automation 360 Cloud is in their control. Audit logs have a retention policy maximum of 270 days.

Backups are taken every 4 hours and kept for seven days. After a subscription ends, according to our retention policy, data is held for another 30 days, to allow for renewal or recovery of bots and reports, and is deleted after that. After 60 days, the entire tenant environment is deleted.

### Is data stored on the Automation 360 Cloud using common storage infrastructure?

Yes. The data storage services used by Automation 360 Cloud are shared across customers as part of the multitenant design. In this way, the infrastructure and operational costs are not passed

**Can Automation Anywhere personnel access customer data stored on the Automation 360 Cloud?**

on to our customers. Automation Anywhere applications use a unique tenant ID to ensure that data access is logically segregated by tenant. No data processing or storage operations can expose the data of one customer to another customer.

Yes. However, operational controls governed by Automation Anywhere compliance certifications ensure that such access is limited to a well-defined set of individuals in CloudOps, SecOps, and Support organizations under strict separation of duties. Customer data will be accessed only based on a customer granting permission in order to resolve a support case.

**What compliance covers Automation 360 Cloud?**

CloudOps is governed by the following certifications based on third-party audits: SOC 1 Type 2, SOC 2 Type 2, ISO 27001, and HITRUST

The Automation Anywhere Business Continuity Management system is also certified with ISO 22301.

Customers rely on industry standard certifications for regulatory and compliance reasons. SOC 2 is created by the American Institute of CPAs (AICPA), and it measures IT security controls. The SOC 2 Type 2 certification verifies that Automation Anywhere CloudOps and SecOps teams have taken the appropriate controls and have put operational processes in place to meet industry standards for secure Cloud operations.

**Are the compliance certifications and summary reports for the certifications available for customers to review?**

Yes, customers can now access the various summary reports and certifications on the [Security and Compliance Portal](#) under NDA.

**How does Automation 360 Cloud support GDPR and an individual's privacy?**

Automation Anywhere has put processes in place to handle individuals' data privacy rights, and reviews them on a regular basis to ensure GDPR compliance. For more information, see our [Privacy Policy](#).

**Do Automation Anywhere personnel monitor an Automation 360 Cloud tenant's environment?**

Yes. All infrastructure and application-level audit logs are monitored to ensure the correct operation of the environment under load. This way, when load thresholds are reached, additional resources can be applied to ensure service availability and performance.

**Does Automation Anywhere report unsuccessful data breaches to a customer?**

No, Automation Anywhere reports only successful breaches to a customer when that customer's data has been compromised and on a timeline determined by local law.

**What data does Automation Anywhere collect to improve the Automation 360 Cloud service?**

To operate and support the service, Automation Anywhere captures logs that can include usernames from the system. These rotate and are overwritten every 30 days. Automation Anywhere collects and uses telemetry data only for purposes of improving

the service. Collected telemetry data includes the following:

- Audit logs: These reflect user activities in the Control Room and applications, for example, a bot was run successfully or a user created a bot.

---

**Note:** The actual username is masked. Logs might include IP addresses, device names, and bot names.

---

- User clicks on a UX feature: Helps in providing user-specific help and guidance options to the user in the UI based on their experience.
- Where documents are uploaded for processing (for example, when using IQ Bot or AISense), Automation Anywhere may reconstruct the format of the document, without the customer's data, for the purpose of further training the Automation Anywhere AI/ML models to recognize document fields that might contain data for extraction. This aids in improving the application's data extraction accuracy.

This telemetry data can be used to monitor the service and is visible per tenant Control Room, and in aggregate, so that feature usage and adoption can be estimated. This can be used by product management to determine which features to prioritize for improvement and to identify features or applications not being adopted. This data can also help CSMs to advise customers on unused features that they could start using and benefit from.

**In which geographical region is a customer's data stored when using Automation 360 Cloud?**

In general, for the pure Cloud deployment model, a customer specifies the regional location at the time of provisioning their Control Room instances, for example, US East or Japan.

Note that we cannot provide the detailed address or location of the physical data center because we use public Cloud providers, who reserve the right to move and do not disclose locations for safety and security reasons. We provide this regional capability to ensure that the Control Room is located in the same region where the customer will perform most of their operations to ensure high performance and usability and to reduce latency. For most locations, for business continuity, the disaster recovery element of the service sends data backups every six hours to another region. The other region is usually in another country.

**Which regional locations does Automation 360 Cloud support?**

Automation Anywhere Control Room environments can be hosted in the following regions:

Primary	Backup/DR
US West	US East
US East	US West
EU-West	EU-Central
Japan	Singapore
Singapore	Japan
Brazil	US East
Bahrain	EU-West
India	Singapore
Australia	-
South Africa	EU-West
US Central	US East
EU-West4	EU-Central
Canada	-

**What if the customer is concerned about data sovereignty (that is, maintaining data in a specified region)?**

For customers concerned about data sovereignty, the Pure Cloud model can only guarantee that data is **stored** in the US, EU, and in Australia. This does not prevent the data from being accessed from outside those regions (for example, for support purposes). For the US, the DR region is kept within the US.

**Note:**

1. The DR service is not supported in Canada and Australia (specifically because most customers in Canada and Australia are conscious of data sovereignty).
2. For EU, we cannot guarantee that data is kept within a specific country within the EU.

**Which public Cloud providers are used to deliver Automation 360 Cloud services?**

Automation 360 Cloud uses Amazon Web Services (AWS) and Google Cloud Platform (GCP) to deliver Automation 360 Cloud services. Automation Anywhere decides on the default provider to use. However, if you have a strong preference for AWS or GCP, you should work with your account team to choose the preferred Cloud service at the time of closing the sales transaction. For existing customers in the US and EU who provision for a new Control Room, the new tenants are created in the same region where your other tenants are located.

**Note:**

- IQ Bot classic is not supported on GCP.
- Migration of Enterprise 11 On-Premises Control Room to Automation 360 Cloud service on GCP using the Cloud Migration Utility is not supported.

---

### What is a sandbox Control Room?

A sandbox is a fully functional and supported Control Room that receives new release updates at least 3 weeks prior to a customer's main Control Room for Bot Lifecycle Management (Dev/Test/Prod). The sandbox environment primarily allows customers to try out new releases and sanity-test their production bots.

---

**Note:** IQ Bot and DR are not supported on sandbox environments.

---

### Is the sandbox the same as a trial environment?

No. Unlike a sandbox, a trial or proof-of-concept Control Room is provided free of charge for 30 days ahead of a sale, as part of the selling motion with customers.

## Automation 360 Cloud Service Status site

The Automation 360 Cloud Service Status site displays real-time operational status, historical operational status, maintenance information, and incident history for all Automation 360 Cloud services worldwide, across all hosting regions.

[Automation 360 Cloud Service Status site](#)

### How you can use the site

You can use the Automation 360 Cloud Service Status site to view various updates:

---

**Note:** In addition to viewing updates, you can also receive updates regarding ongoing incidents and upcoming scheduled maintenance by email or RSS feed by using the **Subscribe** option on the top-right corner.

---

- Use the **Component Summary** section to view the real-time operational status of all the Cloud services hosted from all regions worldwide.
- Use the **Component Status History** section to view the historical operational status of all Automation 360 Cloud services hosted across all regions worldwide.

---

**Note:** This historical information can be traced back for a maximum of three months.

---

- Use the **Upcoming Maintenance - Next 14 days** section to view maintenance information about ongoing and upcoming incidents for the next 14 days.
- Use the **Incident History** section to view information about incidents that are resolved and scheduled maintenance events that are completed .

---

**Note:** In the Automation 360 Cloud Service Status site and in this documentation, the term "component" refers to the Automation Anywhere service within a hosting region.

---

## Real-time operational status

Automation Anywhere frequently monitors the accessibility and health of components from various geographical regions across the world to report on the operational statuses of components in real time. The **Component Summary** section provides a real-time view of the operational status of various components.

The following table provides a list of operational statuses along with definitions and examples:

Component statuses along with definitions and examples

Component status	Definition	Example
Operational	All the services in the region are operational and available.	All the Control Room URLs are accessible, and customers can log in to their Control Room instances.
Informational	All the services in the region are operational but have an incident that does not affect customers.	
Under Maintenance	The services in the region are currently unavailable.	The service is undergoing a planned maintenance event.
Degraded Performance	There is an incident that affects performance significantly.	<ul style="list-style-type: none"> <li>The service is available, but one or more capabilities of the service are not performing optimally.</li> <li>Services in the region are occasionally inaccessible or interrupted.</li> <li>Bots in the region occasionally fail for some customers.</li> </ul>
Partial Outage	There is a major incident that affects a few customers significantly.	<ul style="list-style-type: none"> <li>Services in the region are inaccessible, or some customers (more than 25 percent of customers in the region) cannot log in to their Control Room instances.</li> <li>Bots in the region fail for some customers.</li> <li>A security or data breach has occurred for some customers in the region.</li> </ul>

Component status	Definition	Example
Major Outage	There is a critical incident with very high impact across the region.	<ul style="list-style-type: none"> <li>Services in the region are inaccessible, and customers cannot log in to their Control Room instances.</li> <li>Bots fail to run successfully on the Control Room instances in the region.</li> <li>A security or data breach has occurred for all the customers in the region.</li> <li>A Cloud region has completely failed, triggering a disaster recovery event.</li> </ul>

## Historical operational status

The **Component Status History** section provides a historical view of the availability status of all the components over the preceding seven days. You can use the **Search Components** option at the top-left corner of the section to search for the historical operational status of a specific component. You can use the arrows on the top-right corner of the section to view the historical operational status of components, one week at a time, for the preceding three months.

This section also provides an aggregated incident status for all the incidents for any given day. Click the days with incidents to view a summary of uptime details along with a list of incidents reported for that day.

---

**Note:** Planned maintenance windows are reported as incidents.

---

## Maintenance information

Two types of incidents are monitored for and reported on the Automation 360 Cloud Service Status site:

- **Planned incidents:** Incidents that are primarily related to planned maintenance windows for software updates, such as patch updates, security updates, and infrastructure updates.
- **Unplanned incidents:** Unplanned interruptions that result in reduced or degraded service performance or total interruption to service availability for some or all customers.

### Planned maintenance events

The planned maintenance window is published well in advance of scheduled events and is conducted to improve multiple aspects of a service. A planned maintenance event is scheduled to deploy a software update, a patch to fix an existing issue, a security patch to resolve a security vulnerability, or an infrastructure component update to improve the reliability, resiliency, and availability of the service. Users who are subscribed to incident notifications receive an email notification about the details of maintenance windows.

Planned maintenance events typically last for four to six hours per geographical region when updates are rolled out. Although the actual downtime during the update varies, completion is typically within 10 to 15 minutes. If IQ Bot is in use, completion time is typically 20 to 30 minutes.

The Automation 360 Cloud Service Status site provides information about the following types of planned maintenance events:

**Planned maintenance event for deploying Automation 360 release update**

This planned maintenance event deploys new Automation 360 software release update to the Automation 360 Cloud. Here are the notification fields for this software release update:

**Title** Planned upgrade for Automation 360 Cloud for a region

**Description** Planned upgrade for Automation 360 to the Automation 360 Cloud, which results in minor interruptions to the service during this period.

---

**Note:** We recommend that you do not run bots during this period.

---

**Advance Notice** The notification announcing this maintenance window is published at least two weeks in advance on the Automation 360 Service Status site. The release notes are published in advance of the update.

**Planned maintenance event for deploying patch (non-security) release for Control Room**

This planned maintenance event deploys Automation 360 software patches to Automation 360 Cloud to fix existing or unknown issues. Here are the notification fields for this patch release update:

**Title** Emergency patch for Automation 360 Cloud for a region

**Description** This is a critical, non-security patch upgrade for Automation 360 to the Automation 360 Cloud, which results in minor interruptions to the service during this period.

---

**Note:** We recommend that you do not run bots during this period.

---

### Planned maintenance event for deploying patch (security) release for Control Room

#### Advance Notice

The notification announcing this maintenance window is published with best effort, in advance, on the Automation 360 Service Status site. The release notes are published in advance of the update.

This planned maintenance event deploys Automation 360 security fixes to Automation 360 Cloud to fix existing vulnerabilities, known security issues, and Cloud component updates to resolve vulnerabilities. Here are the notification fields for this update:

#### Title

Emergency security patch for a region

#### Description

This is a critical security patch upgrade for Automation 360 to the Automation 360 Cloud, which results in minor interruptions to the service during this period.

---

**Note:** We recommend that you do not run bots during this period.

---

#### Advance Notice

The notification announcing this maintenance window is published with best effort, in advance, on the Automation 360 Service Status site depending on how critical the security issue is. The release notes are published in advance of the update.

### Planned maintenance event for Automation 360 infrastructure updates

This planned maintenance event deploys updates related to the Automation 360 Cloud infrastructure. Here are the notification fields for this update:

#### Title

Planned infrastructure upgrade for Automation 360Cloud for a region

#### Description

This is a planned infrastructure upgrade

		<p>for Automation 360 Cloud, which results in minor interruptions to the service during this period.</p>
		<p><b>Note:</b> We recommend that you do not run bots during this period.</p>
	<p><b>Advance Notice</b></p>	<p>The notification announcing this maintenance window is published at least two weeks in advance on the Automation 360 Service Status site. The release notes are published in advance of the update.</p>
<p><b>Planned maintenance event for patch (security) release for IQ Bot Hybrid</b></p>	<p><b>Title</b></p>	<p>Planned upgrade for Automation 360 Cloud for IQ Bot Cloud servers for a region</p>
	<p><b>Description</b></p>	<p>This is a critical patch update for IQ Bot on the Automation 360 Cloud, which results in interruptions to the IQ Bot service during this period. Access to the main Automation 360 Cloud Control Room and other services are not affected.</p>
		<p><b>Note:</b> We recommend that you do not schedule bots that use IQ Bot capabilities to start during this period.</p>
	<p><b>Advance Notice</b></p>	<p>The notification announcing this maintenance window is published at least two weeks in advance on the Automation 360 Service Status site. The release notes are published in advance of the update.</p>

## Incident history

The **Incident History** section shows a detailed list of resolved incidents and completed scheduled maintenance events for the preceding seven days.

The list includes the following details about each incident:

- Incident description
- Incident duration (start time, end time, and duration of the outage)
- Affected components
- Incident status updates
- Information in cases of unplanned service outages

## Automation 360 Cloud updates

Automation 360 Cloud is a multitenant cloud service that leverages the latest best practices in delivering web-scale SaaS to rolling out incremental updates globally using a continuous deployment pipeline.

Automation 360 Cloud provides updates to the Bot Agent instances running on your infrastructure. The Bot Agent is a lightweight, Java-based, modular application that handles particular bots and their packages when they are scheduled to run.

Bot Agent updates are transparent to active Bot Creator users. For operations, the Bot Agent updates are carried out automatically, by default, without requiring administrative privileges (much like browser updates).

---

**Note:** This is regardless of whether the Bot Agent was installed as a system user or local user.

---

With each update, products such as RPA Workspace, Control Room, IQ Bot, Bot Insight, Discovery Bot, and AARI have improved security and enhanced features. Application command packages can also be enhanced and made available for inclusion into bots on your release cycle.

Updates are rolled out over a 3-hour maintenance window per geographical region. These maintenance windows are posted on the Automation 360 Cloud Service Status site. Although the actual downtime during the update varies, completion is typically within 10-15 minutes. If IQ Bot is in use, completion time is typically 20 - 30 minutes. In general, bots run to completion during updates, with the following scenarios being exceptions:

- The bot tags data for Bot Insight.
- Bots that run WLM.
- Credentials directly entered as command input are pulled from the Control Room at execution time. Instead, use credential type variables.
- Child bots: Parent/child bots run to completion because the child bots are downloaded when the parent bot starts its run.

Exceptions:

- If a child bot is referenced using a variable parameter because the child bot requires the Control Room to be available when the parent bot runs.
- If a child bot does not use the same global variables as the parent bot.
- If a child bot is using credential type variables.

After the Bot Agent has reconnected to the Control Room, the bot status is updated in the bot run activity logs.

Automated Bot Agent update takes place after an agent completes any current bot run and the Bot Agent reconnects to the Control Room.

During this short downtime, any bots scheduled to run will not be run. It is therefore recommended that bots are not scheduled to start to run during the planned maintenance window.

The following table provides a list of regions and the day and time of their maintenance windows. The upgrade occurs sequentially over a three week period:

- Week 1 - First rollout will begin in the AP-AUS and AP-Sing regions
- Week 2 - Second rollout begins in the EU-West1, EU-West4, LATAM, ME, S, Africa, US-East, US-Central, and India regions
- Week 3 - Third and final rollout begins in the US-West, Canada, and Japan

---

### Important:

Times mentioned below are in UTC (Coordinated Universal Time). To convert to your local time, refer to a universally recognized online resource such as <https://www.worldtimezone.com/>.

---

Region	Day and time in UTC
AP-AUS	Wednesday, 12:00 to 15:00
AP-Sing	Wednesday, 16:00 to 19:00
EU-West1	Tuesday, 20:00 to 23:00
EU-West4	Tuesday, 20:00 to 23:00
LATAM	Thursday, 02:00 to 05:00
ME	Thursday, 20:00 to 23:00
S. Africa	Thursday, 20:00 to 23:00
US-East	Friday, 02:00 to 05:00
US-Central	Friday, 02:00 to 05:00
India	Friday, 20:00 to 23:00
US-West	Monday, 02:00 to 05:00
Canada	Monday, 02:00 to 05:00
Japan	Monday, 16:00 to 19:00

---

**Note:** A small interim update might be planned to address urgent, priority updates mid-cycle between the primary quarterly updates. These will occur on the same day of the week and time as the schedule mentioned previously.

---

### Regular updates

Regular updates are planned approximately every 3 months and are scheduled to occur during non-business hours and not close to the beginning or end of a month. Notifications are posted to the Service Status site 2 weeks in advance of the update. A notification message is also pushed to administrators in the Control Room in advance.

You can review changes in the release notes that are made available 3 weeks before each update.

---

**Note:** As a customer, you can use a sandbox Control Room environment to try out the next update at least 3 weeks before the main Dev/UAT/Prod environments are updated.

---

Command packages might be updated and made the default for creating new bots. Existing bots continue to use their existing package versions. New bots use the new default package version. However, as a user, you can also choose to revert to the previous version.

## Cloud infrastructure updates

Cloud infrastructure updates are carried out typically once every 3-month period. If these infrastructure updates involve planned downtime for Automation 360 Cloud, notifications are posted on the Service Status site at least 1 week in advance.

## Critical patch updates

Patch updates might be required for either critical security updates or where serious issues with an update affect the majority of Cloud customers.

Patches require a maintenance window although they typically do not require a Bot Agent update. For patch updates, advance notice will be provided on the Service Status site.

## Planned maintenance windows

Automation Anywhere offers planned update maintenance windows to enable customer operations to support Bot Lifecycle Management. Outside of planned maintenance windows for the updates mentioned previously, the Automation 360 Cloud availability SLA is 99.9 percent per month.

---

**Note:** For more information, see [Cloud Automation Agreement](#).

---

The following table provides information such as frequency, time expectation, and client action for different types of updates:

Type of update	Frequency	Time expectation	Client action
Regular Automation 360 Control Room and Bot Agent	3 - 4 months	3-hour window Around 10 minutes of downtime	Bots can run to completion. Do not schedule bots to start during this 3-hour window.
Sandbox	At least 3 weeks prior to regular Cloud updates		Try new features out after the window. Sanity-test production bots.
Cloud infrastructure	Once every 3-month period	Varies. Scheduled on weekends.	Bots can run to completion. Do not schedule bots to start during the window.
Critical patch	As needed	Critical notice given	

## Subscribing to notifications

In the Automation 360 Cloud Service Status site, subscribe to email notifications about planned maintenance events and unplanned incidents that affect service availability.

To subscribe to email notifications from the Automation 360 Cloud Service Status site about planned maintenance events and unplanned incidents that affect service availability, click **Subscribe** on the top-right corner of the Service Status site.

Provide your name and email address when subscribing to notifications.

You can manage your subscription by clicking **Manage Existing Subscription**. The system sends you a link, by email, with which you can manage your incident notification subscription. You can select the service and the region for which you want to receive status notifications.

To subscribe to incident notifications for the Cloud region where your services are hosted, open an Automation Anywhere support ticket.

## Personalizing the Service Status site

You can personalize the Automation 360 Cloud Service Status site by selecting the language and time zone of your choice for showing incidents. To select language and time zone, click the gear icon on the top-right corner.

### Language

You can select a language from among seven supported languages.

### Time zone

When you select a time zone, the incidents from the selected time zone will be shown.

## Automation 360 software lifecycle policy

Automation Anywhere software lifecycle policy aims to make innovations and enhancements available to you quickly. Through this policy, we provide you predictability, quality, and importantly nondisruptive access to the latest innovations and enhancements so that you can control when and how you want to adopt these enhancements.

---

**Note:** The policies mentioned on this page apply to both Automation 360 Cloud and On-Premises deployments unless where the differences are called out explicitly.

---

### Overview

The software lifecycle policy helps you with change management while providing you the latest software updates with enhancements in the Control Room, Bot Agent, and packages.

Our policy aims to provide faster access to features, bug fixes, and other enhancements for a better customer experience:

- **Predictability:** With frequent, regular deployment cycles, you can get access to new and enhanced packages sooner than before with predictable release cadence.
- **Deploy new features:** With control over introducing changes to your bots, you can test new features and deploy them at your own pace.
- **Quality:** With automated deployments from Automation 360 Cloud, you can use new packages that include critical bug and security fixes.
- **Nondisruptive access:** You can update packages without disrupting your existing configurations.

- **Backward compatibility:** You now have the option to safely update bots while still having the option to change back to a previous version of a package.

The following image shows the advantages of this lifecycle policy:

## Bot Agent updates

When a new version of Bot Agent is available, by default, the Bot Agent is deployed automatically across a customer's pool of devices without impacting existing bot functionality. However, Control Room administrators can disable this default update capability and choose to update the Bot Agent manually. In case of manual updates and in the event of a mandatory update, users will be notified that the Bot Agent must be updated and all bot execution on these devices will stop until the Bot Agent is updated.

For larger deployments where device pools are deployed using standard device Amazon Machine Images (AMI) on separate schedules, these updates will require coordination, change management processes, and approvals in the customer environment. Therefore, Automation 360 will support backward-compatible Bot Agent for a release every 6 months.

Starting with Automation 360 v.24 release, **4** Bot Agent updates will be released each year with **2 optional** and **2** updates that might be declared mandatory. You can skip the optional update and update to the next mandatory Bot Agent update.

Our Q2 and Q4 releases will have optional Bot Agent updates and you can choose to skip the Bot Agent update. However, the Q1 and Q3 updates might have mandatory Bot Agent updates. We will notify customers 3 months in advance if a mandatory Bot Agent update is required with a Control Room release.

## Package updates

Starting with Automation 360 v.24 release, delivery of packages is developed to be separate from the main platform updates. This will help us respond quickly to changes and fixes required and provide the flexibility to deliver updates in packages, going forward.

With this capability, new packages and new package versions can now be automatically downloaded from Automation Anywhere Cloud when they are predictably released on a quarterly release cadence. These downloaded packages become the default package so that customers can start using these package versions on an ongoing basis as they become available.

This capability is enabled differently for Cloud and On-Premises Control Room instances, as listed in the following table:

Seamless package update capability	Cloud Control Room	On-Premises Control Room
Download packages from Automation Anywhere Cloud	Enabled by default and cannot be disabled.	Disabled by default and can be enabled.
Set downloaded package to default version	Enabled by default and can be disabled.	Enabled by default and can be disabled.

- **Cloud users:** Automatic package download capability is now enabled across all Control Room instances in all regions at the same time.

You can start using the latest packages on your current Control Room version before the Control Room update is made available in your region.

- **On-Premises users:** This capability is disabled by default but it can be enabled by package administrators.

We recommend that bot developers always use the latest version of the packages because that version provides the latest innovations and all the code and security fixes from previous versions. However, administrators can change this default behavior at any time and roll out the packages to developers after verifying them. These new package versions are also backward-compatible with the existing platform version.

Note that this capability has no impact on existing bots, which continue to run unchanged. Bots that are developed with a particular package version will always continue to do so unless explicitly changed by the bot developer. This provides bot developers the flexibility to adopt new package versions when they are ready for it. Bot developers must explicitly edit the bots in the Bot editor view and use the new package version.

## Support and deprecation policy for packages

Support and deprecation policy for packages aims to provide bot longevity and reduce overall maintenance efforts to keep bots updated. The design consideration is to minimize the bot changes required to keep the bot functioning.

---

**Note:** This policy is in effect from Control Room release v.23.

---

**Package versions supported for a minimum of 2 years**

Package versions that are released will continue to be supported for a minimum of 2 years after the release. Even after 2 years, a package version will continue to be supported unless it is deprecated.

Typically, a new version of the package will be made available if a package is deprecated. All issues and security fixes reported for the package will be fixed in the latest version, with no backporting.

You will be notified 3 months in advance when a package version is planned for deprecation. If there is a critical security vulnerability, we will make the best effort to send an advanced notification.

**Packages version compatibility with Bot Agent and Control Room**

Package versions and bots that use these versions will be compatible with all the Control Room and Bot Agent versions released within the 2 years after the package version release. Bots that use these supported package versions do not have to be configured to be compatible with the Control Room and Bot Agent versions.

**Deprecation policy on package version**

Package versions will not be depreciated within the 2 years after their release unless there is a critical security vulnerability that has to fixed. In such a case, a new package version will be made available with the fix.

**Minimal bot changes**

The package version support policy aim is to minimize the effort required to change existing bots and to keep them functioning.

Bots using a specific package version do not have to be updated to use the package versions if the existing package version is supported. However, we recommend that you use the latest version of the package when developing the bot to increase the longevity of the bot. The package versions used in a bot will have to be updated before they are deprecated for the bot to remain supported.

**Bot lifecycle**

The design assumption for bots is that the version of the package used in the bots is present in the Control Room that is used to run the bots. Before developers promote bots, we recommend that the developers verify that the package version used in the bots matches the package version in the higher environments.

When promoting bots to higher environments (for example, testing and production) that are on a lower software version, ensure that you include the dependent packages for bots. This will ensure that the target environment has all the package versions required by the bot.

**Note:** Some package versions will not be backward compatible with an earlier version of the Control Room or Bot Agent. Therefore, refrain from using such incompatible package versions during the Control Room environment update phase.

---

**See also:** [Automatic package updates for On-Premises Control Room](#).

### Related concepts

[Feature deprecations affecting Automation Anywhere products](#) on page 68

Review the features and capabilities (from Automation Anywhere or third party) that are deprecated or nearing deprecation to understand how they affect your automation and what action is required.

[Automation 360 Cloud FAQ](#) on page 49

Answers to frequently asked questions (FAQ) and related information provide insight into various aspects related to Automation 360 Cloud.

[Automation 360 Cloud updates](#) on page 61

Automation 360 Cloud is a multitenant cloud service that leverages the latest best practices in delivering web-scale SaaS to rolling out incremental updates globally using a continuous deployment pipeline.

## Feature deprecations affecting Automation Anywhere products

Review the features and capabilities (from Automation Anywhere or third party) that are deprecated or nearing deprecation to understand how they affect your automation and what action is required.

---

**Definition:** *Deprecation* refers to features or capabilities available in the current (latest) release that are planned to be removed or unsupported in a future release.

You can use the specified alternatives or updated versions when they are made available.

---

### Third-party feature deprecations

**Upcoming:** The following table lists third-party features that will be deprecated by the date mentioned:

Feature or capability	Deprecation date	Customer impact and recommendation	Resources
<p>EWS API</p> <p>See <a href="#">Upcoming API Deprecations in Exchange Web Services for Exchange Online</a></p>	<p>Ongoing deprecation</p>	<p>Automation 360 currently uses EWS API in Email package and Email trigger for the EWS option to connect to Exchange Online hosted on Azure Cloud and access emails from Microsoft 365.</p> <p>Microsoft has recommended that customers move to a REST-based Graph API, which is more secure and scalable compared with the legacy SOAP-based EWS API. Therefore Automation 360 will provide support for Microsoft 365 Outlook package based on Graph APIs which will enable you to switch from EWS API to Graph API from an upcoming release.</p> <p>This deprecation by Microsoft might impact bots for email automations (Email package and Email trigger) that connect to Exchange Online using EWS API. Note that there is no immediate impact on your existing bots and they continue to run properly.</p> <p><b>Recommended:</b> Update the impacted bots by replacing each email-related action with the equivalent new actions in the Microsoft 365 Outlook package, planned in the upcoming release if your bots are impacted by the deprecation.</p>	<p>--</p>

Feature or capability	Deprecation date	Customer impact and recommendation	Resources
Transport Layer Security (TLS) 1.0 and TLS 1.1	April 2023	<p>Automation 360 Cloud deployments currently support the following TLS protocol versions:</p> <ul style="list-style-type: none"> <li>• TLS 1.0</li> <li>• TLS 1.1</li> <li>• TLS 1.2</li> <li>• TLS 1.3</li> </ul> <p>However, the TLS 1.0 and TLS 1.1 protocol versions have security vulnerabilities as per the industry security standards. Therefore, Automation 360 Cloud deployments for Amazon Web Services and <i>Google Cloud Project</i> will support only the TLS 1.2 and TLS 1.3 protocol versions.</p> <hr/> <p><b>Note:</b> For Automation 360 Cloud deployments, the changes will be effective as part of the Cloud deployment configurations, not as part of the Automation 360 release.</p> <hr/>	<i>Deprecating TLS 1.0 and TLS 1.1</i>

Feature or capability	Deprecation date	Customer impact and recommendation	Resources
Manifest V2 based extensions by Google  See also: <a href="#">Overview and timelines for migrating to Manifest V3</a>	January 2023	Automations that use Google Chrome Manifest V2 based extensions will stop working sometime after June 2023. The deprecation timelines of Manifest V2 based extensions are currently under review and subject to change by Google. <ul style="list-style-type: none"> <li>For Google Chrome Manifest V2 extensions timelines, see <a href="#">Manifest V2 support timeline</a>.</li> <li>For Microsoft Edge Manifest V2 extensions timelines, see <a href="#">Overview and timelines for migrating to Manifest V3</a>.</li> </ul> <p>This might impact customer bots that automate web applications over Google Chrome and Microsoft Edge.</p> <p><b>Recommended:</b> Switch to Manifest V3 based extensions for Google Chrome and Microsoft Edge.</p> <p><b>Releases:</b></p> <ul style="list-style-type: none"> <li>Automation 360 v.26</li> <li>Version 11.3.5.8</li> </ul>	<ul style="list-style-type: none"> <li><a href="#">Chrome and Edge Manifest V3 extensions</a> on page 116</li> <li><a href="#">Enterprise 11: Deprecation of Basic authentication and MV2 extensions</a></li> <li><a href="#">Version 11.3.5.8 Release Notes</a></li> </ul>

**Completed:** The following table lists third-party features that are already deprecated:

Feature or capability	Deprecation date	Customer impact and recommendation	Resources
<a href="#">Basic authentication in Exchange Online</a>	October 2022	Bots for email automations (Email package and trigger) that connect to Exchange Online by using IMAP, POP3, or EWS protocols with Basic authentication will be impacted. <p><b>Recommended:</b> Update the impacted bots by replacing each email-related action with OAuth 2.0.</p> <p><b>Released:</b></p> <ul style="list-style-type: none"> <li>A package only release for Automation 360 v.25</li> <li>Version 11.3.5.7 client patch</li> </ul>	<ul style="list-style-type: none"> <li><a href="#">Deprecation of Basic authentication in Exchange Online</a> on page 101</li> <li><a href="#">Enterprise 11: Deprecation of Basic authentication and MV2 extensions</a></li> </ul>

<a href="#">Internet Explorer EOL</a>	June 2022	<p>Customers who are running IE-based bots on Windows 10 Semi-Annual Channel are impacted.</p> <p>Releases with tools to convert IE-based bots to Microsoft Edge with IE mode:</p> <ul style="list-style-type: none"> <li>Automation 360 v.24R2</li> <li>Version 11.3.5.6</li> </ul>	<p><a href="#">Microsoft Internet Explorer EOL overview</a> on page 75</p> <p><a href="#">Microsoft Internet Explorer 11 EOL FAQ</a> on page 79</p>

## Automation Anywhere feature deprecations

**Upcoming:** The following table lists Automation Anywhere features that will be deprecated by the date mentioned:

Feature or capability	Deprecation date	Customer impact and recommendation	Resources
V2 Repository Files List API	June 2023	<p>From Automation 360 v.29, the Repository Files List API (v2/repository/file/list) will be deprecated.</p> <p><b>Recommended:</b> You can use the /v2/repository/workspaces/{workspaceType}/files/list</p>	Deprecated API: v2/repository/file/list

Feature or capability	Deprecation date	Customer impact and recommendation	Resources
Descoped language support	June/July 2023	<p>Beginning with Automation 360 v.29, the User Interface for Automation Anywhere product will no longer support Italian, Russian, and Simplified Chinese languages. In addition, updated release documentation will no longer be available in these three languages though older documentation will be accessible.</p>	--

**Completed:** The following table lists Automation Anywhere features that are already deprecated:

Feature or capability	Deprecation date	Customer impact and recommendation	Resources
IQ Bot Extraction package	October 2022	<p>From Automation 360 v.25, the IQ Bot Extraction package no longer supports pretrained machine learning model for invoice data extraction but will continue to support learning instance group based-training extraction.</p> <p><b>Recommended:</b> Use the new command package called Document Extraction, released in v.25 as part of Document Automation.</p> <p><b>Released:</b> Automation 360 v.25</p>	<a href="#">Move from to</a>
IQ Bot - Tesseract OCR v3	October 2022	<p>For all existing learning instances trained using Tesseract OCR v3, we recommend that you plan to train them with alternative OCRs (including Tesseract4 OCR) before you update to v.26. Note that Automation 360 IQ Bot Cloud customers will receive the v.26 release by default from October 2022.</p> <p><b>Released:</b> Automation 360 v.26</p>	--
G-Suite Apps	September 2022	<p>From Automation 360 v.26, the GSuite Apps package no longer supports using the <b>Connect</b> and <b>Disconnect</b> actions to establish a connection with the Google server and automate tasks.</p> <p><b>Recommended:</b>For specific G-Suite applications, the functionality of the G-Suite Apps package is available in the following G-Suite packages:</p> <ul style="list-style-type: none"> <li>• Google Drive</li> <li>• Google Calendar</li> <li>• Google Sheets</li> </ul> <p>To automate tasks, in the appropriate G-suite package, use the corresponding <b>Connect</b> and <b>Disconnect</b> actions.</p>	<a href="#">Using the Connect action for Google packages</a>

Feature or capability	Deprecation date	Customer impact and recommendation	Resources
Human-Bot Collaboration 11.3.x	August 2020	<p>Human-Bot Collaboration (HBC) 11.3.x was deprecated from August 2020 with the release of Enterprise A2019.15.</p> <p><b>Recommended:</b> Migrate to Automation 360 to use the Automation Anywhere Robotic Interface (AARI) that includes Desktop and Web.</p> <hr/> <p><b>Note:</b> For this migration, there is no automated migration path between HBC 11.3.x and AARI because of an absence of parity between the two products (including sets of features).</p>	<p>New: <a href="#">Automation Anywhere Robotic Interface (AARI)</a> on page 1460</p> <p>Deprecated: :</p>
Automation Anywhere Mobile app	July 2022	The Automation Anywhere Mobile app is deprecated and will not be updated to subsequent versions of iOS and Android. The mobile app is no longer available and no further support will be offered. A replacement product is currently not available.	Archived Documentation (PDF): <a href="#">EN-US</a>
V2 Activity List API	June 2022	<p>From Automation 360 v.25, the Activity List API (<code>v2/activity/list</code>) is deprecated.</p> <p><b>Recommended:</b> With the newly implemented <b>Activity List API</b> (<code>v3/activity/list</code>), you can return the job executions without call back and bot output information.</p> <hr/> <p><b>Note:</b> If you want to get the <code>botOutVariables</code> or <code>callbackInfo</code>, use <code>/v3/activity/execution/{id}</code> <a href="#">Bot Execution Orchestrator API</a>.</p>	<p>New API: <a href="#">Activity List v3/activity/list</a> <a href="#">Bot Execution Orchestrator API</a></p> <p>Deprecated API: <code>v2/activity/list</code></p>

Feature or capability	Deprecation date	Customer impact and recommendation	Resources
RPA Bots for Excel	January 2022	<p>RPA Bots for Excel has been deprecated. The plug-in is no longer available to download as a product. However, support will be offered to current customers already using the product.</p> <p>A replacement product as a plug-in for Microsoft Excel is not available. However, as an alternative, new customers can develop bots for Excel within the Automation 360 RPA Workspace and use input variables to allow specifying file names, worksheets, and ranges for bots to operate on. In RPA Bots for Excel, this action was triggered from within the Excel application, whereas now, this action is taken from the Automation Anywhere Control Room.</p>	<p>Documentation:  <a href="#">Archived docs for RPA Bots for Excel v2.0</a></p>

**See also:** [Automation 360 software lifecycle policy](#) on page 64

#### Related concepts

[Automation 360 software lifecycle policy](#) on page 64

Automation Anywhere software lifecycle policy aims to make innovations and enhancements available to you quickly. Through this policy, we provide you predictability, quality, and importantly nondisruptive access to the latest innovations and enhancements so that you can control when and how you want to adopt these enhancements.

[Deprecation of Basic authentication in Exchange Online](#) on page 101

Microsoft will permanently disable Basic authentication for specific protocols in Exchange Online starting from October 1, 2022. This impacts customers running bot for email automation that connect to Exchange Online using IMAP, POP3, or EWS protocols with Basic authentication.

[Chrome and Edge Manifest V3 extensions](#) on page 116

As Google will deprecate Manifest V2 extensions, this might impact your existing automations that use the current Manifest V2 extensions for Google Chrome and Microsoft Edge browsers. We have published Manifest V3 extensions with the Automation 360 v.26 release to help you start switching to Manifest V3 extensions.

[Microsoft Internet Explorer EOL overview](#) on page 75

Microsoft has announced retiring Internet Explorer (IE) for certain versions of Windows operating systems and recommends impacted users to move their apps or websites running on IE to Microsoft Edge with IE mode.

## Microsoft Internet Explorer EOL overview

Microsoft has announced retiring Internet Explorer (IE) for certain versions of Windows operating systems and recommends impacted users to move their apps or websites running on IE to Microsoft Edge with IE mode.

While support for the Control Room (Automation 360 v.25) on IE will end, new and advanced features will be added to Automation 360 v.24R2 patch that will be supported on alternative browsers.

To ensure your existing IE bots are supported on Microsoft recommended browsers, such as Microsoft Edge with IE mode, based on the release you have installed, we recommend that you update to Automation 360 v.24R2 patch. To support conversion of IE bots to Microsoft Edge with IE mode, the following tools are available in this patch:

- Bot Scanner to scan Enterprise 11 bots for IE usage. This helps you to plan your efforts in the IE bot conversion process whether you continue on Enterprise 11 or migrate to Automation 360.

[Bot Scanner overview](#) on page 1116 | [Scan Enterprise 11 or 10 bots using Bot Scanner](#) on page 1118

- Bot Migration Wizard to support conversion of IE bots to Microsoft Edge with IE mode. This will help Enterprise 10 or Enterprise 11 users to migrate bots to Automation 360 and convert the IE bots at the same time.

[Bot Migration Wizard](#) on page 1170

- Update Bot wizard to help Automation 360 new users as users who have migrated from Enterprise 10 or Enterprise 11 and want to convert their IE bots to Microsoft Edge with IE mode.

[Update Bot wizard for converting IE bots](#) on page 95

See the following video on preparing your automations for IE EOL:

## Update scenarios

- If you are using **Enterprise 10**, to update your IE bots to Microsoft Edge with IE mode, you can choose one of the following methods:
  - Upgrade to Automation Anywhere Enterprise Version 11.3.5.6 that supports IE bot conversion to Microsoft Edgewith IE mode, convert your IE bots to Microsoft Edge with IE mode, and later migrate to the latest Automation 360 release.
  - Upgrade to Automation 360 v.24R2 patch, migrate your IE bots and update the IE bots to Microsoft Edge with IE mode.
- If you are using Enterprise 11 and are **yet to migrate** to Automation 360, update to Automation Anywhere Enterprise Version 11.3.5.6, which supports Microsoft Edge with IE mode. You can then migrate to Automation 360.

[Supported Control Room versions for migration](#) on page 1094

- If you are using Enterprise 11 and plan to complete migration to Automation 360 **before** IE EOL, you can migrate to the latest Automation 360 v.24R2 patch, which supports Microsoft Edge with IE mode.
- If you are using Enterprise 11 and plan to complete migration to Automation 360 **after** IE EOL, you can use one of the following methods:
  - Update to the latest Automation 360 release, convert the migrated bots created in IE to Microsoft Edge with IE mode.
  - Update to the latest Enterprise Client version that supports Microsoft Edge with IE mode and convert the pending bots created in IE to Microsoft Edge with IE mode in Enterprise 11, and later migrate these bots to the latest Automation 360 release.
- If you are using Automation 360 v.24 On-Premises or earlier and have created IE bots, you can update to Automation 360 v.24R2 patch to convert your IE bots to Microsoft Edge with IE mode.

---

**Note:** To ensure that your bots continue to run on Internet Explorer after EOL, Microsoft recommends that you register your site or application running on Internet Explorer to the Microsoft Site List manager. See [Enterprise Mode and the Enterprise Mode Site List](#).

---

For additional information on different upgrade scenarios, see [Enterprise 11 and upcoming Internet Explorer 11 EOL FAQ](#) | [Microsoft Internet Explorer 11 EOL FAQ](#) on page 79

## IE bot update workflow

### Update from Automation 360 to Automation 360 On-Premises

1. Update to the latest Automation 360 release.  
*Update to latest Automation 360 version* on page 1022
2. Set up Automation 360 Bot Runners for bot updates.  
*Install Bot Agent and register device* on page 998
3. Back up the Control Room repository.  
*Restore bots from Git repository* on page 2074
4. Identify bots created in Internet Explorer using the Bot Scanner.  
*Scan Enterprise 11 or 10 bots using Bot Scanner* on page 1118
5. Convert the bots created in IE to Microsoft Edge with IE mode using the Update Bot wizard.  
*Update Bot wizard for converting IE bots* on page 95
6. Analyze the updated bots report using the Update Bot wizard.  
*Viewing conversion details for Internet Explorer bots* on page 98
7. Verify that the updated bots can run or be deployed.  
*Schedule a bot* on page 1937 | *Run a bot* on page 1354

---

**Important:** Before you deploy your bots, register your site or application running on Internet Explorer to the Microsoft Site List manager. For details, see *Enterprise Mode and the Enterprise Mode Site List*.

---

Note that you can convert your IE bots to Microsoft Edge with IE mode in one environment (for example, DEV) and then move these bots to another environment (for

example, UAT and PROD) without updating the bots in each environment.

## Upgrade from Enterprise 11 to latest Automation 360 On-Premises

1. Upgrade from Enterprise 11 to the latest Automation 360 release that supports Microsoft Edge with IE mode.

*Prepare for Enterprise 11 to Automation 360 On-Premises migration* on page 1146

2. Set up Automation 360 Bot Runners for bot updates.

*Install Bot Agent and register device* on page 998

3. Back up the Control Room repository.

*Restore bots from Git repository* on page 2074

4. Identify the bots created in Internet Explorer using the Bot Scanner.

*Scan Enterprise 11 or 10 bots using Bot Scanner* on page 1118

5. Migrate Bot Runners and IE bots from Enterprise 11 to Automation 360.

*Bot Migration Wizard* on page 1170

6. View the bot migration report.

*View migration reports* on page 1251

7. Verify that the migrated bots can run or be deployed.

*Schedule a bot* on page 1937 | *Run a bot* on page 1354

**Related information**

[Enterprise 11 and upcoming Internet Explorer 11 EOL FAQ](#)

**Microsoft Internet Explorer 11 EOL FAQ**

Microsoft has announced end-of-life (EOL) for Internet Explorer beginning June 2022 and recommends using Microsoft Edge or Microsoft Edge in Internet Explorer (IE) mode. This will impact automations (bots) based on the operating system currently in use where the bots are run.

For details, see the following table:

Microsoft operating system	Automation 360 and Enterprise 11 bots
Windows 10 Semi-Annual Channel	Update bots to use a compatible browser. For a list of supported browsers, see <a href="#">Browser requirements for RPA Workspace</a> on page 829.
All other supported operating systems	No immediate impact

Starting from the Automation 360 v.25 release, you will be prompted to access the Control Room through an alternative supported browser, such as Google Chrome or Microsoft Edge (Chromium) instead of Internet Explorer. Your Control Room will no longer be accessible on Internet Explorer. By aligning with the Microsoft strategy for browser support, we can provide you with enhanced functionality that latest browsers such as Google Chrome and Microsoft Edge make technologically possible.

**General FAQ****How do I know if I am going to be impacted by the Internet Explorer EOL?**

To assess whether you are actually impacted by the Internet Explorer EOL, you need to do the following:

- Check whether the underlying legacy application or website can run only on Internet Explorer and is not moved to any other browser.
- Check whether the device on which the bot is running has Windows 10 version using Semi-Annual Channel (SAC) license.

If the answer to both of the above is Yes, you are impacted by the Internet Explorer EOL.

**Why this change?**

Microsoft recently announced that Internet Explorer will be retired on June 15, 2022 for certain versions of Windows operating systems.

While we will end support for the Control Room on Internet Explorer, we will continue to add new and advanced features that will be supported on alternative browsers.

[Browser requirements for RPA Workspace](#) on page 829 | [Internet Explorer EOL](#)

**When will the support end?**

Starting from the upcoming Automation 360 v.25 release, any user trying to access the Control Room through Internet Explorer will be prompted to use

**Can I connect to Enterprise 11 or Enterprise 10 Control Room?**

alternative browsers such as Google Chrome or Microsoft Edge (Chromium).

You can continue to use Internet Explorer to connect to the Enterprise 11 Control Room.

**What about the automations that I have already built using Internet Explorer?**

Microsoft is planning to discontinue support for Internet Explorer from June 2022 on certain operating systems. If this change impacts you, you should start planning to update your automations to use other browsers, such as Microsoft Edge (Chromium).

See [Internet Explorer EOL](#) for list of Windows operating systems supporting Internet Explorer.

For information about scenario-based automation updates, see [Migration FAQ](#) on page 81.

**Does the EOL impact my running automations if they are running on OS versions other than Windows 10 Professional or Enterprise licensed through the Semi-Annual Channel (SAC)?**

No, your automations will not be impacted if they are running on OS versions other than Windows 10 Professional or Enterprise licensed through SAC. For more information, see the FAQ available from Microsoft.

[Internet Explorer EOL](#)**My organization has legacy apps and websites based on Internet Explorer 11 that are automated using Automation 360. We plan to move our legacy apps to Microsoft Edge with Internet Explorer mode before the EOL date. What will happen to my existing automations built on Internet Explorer 11?**

After you move your legacy apps to Microsoft Edge with Internet Explorer mode, the automations that you previously built on Internet Explorer 11 will run only after you edit them and make them work for Microsoft Edge with Internet Explorer mode.

You might have to capture the objects again and update the corresponding actions on these objects so that the automations can run successfully on Microsoft Edge with Internet Explorer mode.

**My application is running on Microsoft Edge with Internet Explorer mode. Can I create and run object-based automations on Microsoft Edge with Internet Explorer mode using Automation 360?**

Yes, starting from Automation 360 v.23, object-based automations are supported for Microsoft Edge with Internet Explorer mode. You can record objects and perform various actions by using Universal Recorder to automate your applications that run on Microsoft Edge with Internet Explorer mode.

---

**Note:** A separate plug-in extension is not required. You can use the Microsoft Edge plug-in extension for your Microsoft Edge browser with Internet Explorer mode as well.

---

**Will Automation Anywhere provide any tool to convert automations that use Internet Explorer to Microsoft Edge?**

Microsoft recommends users to use Microsoft Edge in Internet Explorer Compatibility mode. We will be providing a utility to convert automations that use Internet Explorer to use Microsoft Edge in Internet Explorer Compatibility mode.

## Migration FAQ

### What is the guidance for Automation 360 users on the general availability of a conversion tool?

For Automation 360 users, we are planning a patch release on Automation 360 v.24 for On-Premises and Cloud users. You must apply this patch to take advantage of the support for Microsoft Edge with Internet Explorer mode. This patch contains packages that are certified on Microsoft Edge in Internet Explorer mode and a bot update wizard. You can either manually update your bots or use the bot update wizard to update your bots in bulk so that they work with Microsoft Edge in Internet Explorer mode.

---

**Note:** On-Premises users can get early access to this patch to test it in the dev environment.

---

### What is the guidance for Enterprise 11 users on the general availability of a conversion tool?

For Enterprise 11 users, we are planning to release a patch on the Version 11.3.5.x trail to support Microsoft Edge in Internet Explorer mode. You must update to the latest version to take advantage of this patch. Along with this patch, a conversion utility and an enhanced Bot Scanner will also be released. With the enhanced Bot Scanner, you can get statistics on the usage of Internet Explorer in your bots so that you can plan and devise an overall conversion strategy. You can either manually update your bots or use the conversion utility to convert your bots in bulk to work with Microsoft Edge in Internet Explorer mode.

---

**Note:** You can get early access to this patch to test it in the development (dev) environment.

---

If you are migrating from Enterprise 11 to Automation 360, you can combine the migration and conversion of your bots to use Microsoft Edge in Internet Explorer mode in a single operation after updating to the Automation 360 v.24 patch.

### What options are available for users to maintain business continuity if their automations are being affected by the Internet Explorer EOL?

You can maintain business continuity by choosing one of the following options:

1. Change the license of your Windows version from Semi-Annual Channel (SAC) to Long-Term Servicing Channel (LTSC).

For details, see [Internet Explorer EOL](#).

2. Upgrade the Windows operating system version for your device that is running automations to a version other than Windows 10 SAC.

For details, see [Internet Explorer EOL](#).

3. Manually edit the affected bots by recapturing the application objects by using supported

browsers (other than Internet Explorer) and change the window titles, variables, or any of the corresponding actions that are browser-specific. Validate your automation and run the updated bots on target applications in the selected browser.

---

**Note:** This is not applicable to migrated Enterprise 11 or Enterprise 10 bots that use the Web Recorder command.

---

4. Recreate the bots, replacing the old ones by using any of the supported browsers, such as Microsoft Edge or Google Chrome.
5. Use the conversion tool provided by Automation Anywhere to convert your bots based on Internet Explorer to Microsoft Edge with Internet Explorer mode.

---

**Note:** The tool cannot be used to convert bots built in Internet Explorer to other supported browsers, such as Google Chrome, Microsoft Edge (Standard mode), or Mozilla Firefox.

---

**After the Windows update, Internet Explorer requests are redirected to Microsoft Edge. Will the IE mode be set automatically or need to be set manually?**

- The approach recommended by Microsoft is to register your site or application running on Internet Explorer to the Microsoft Site List manager.

For details, see [Enterprise Mode and the Enterprise Mode Site List](#).

- Alternatively, you can list certain websites to open only in IE mode by using the Microsoft Edge IE mode compatibility settings in Microsoft Edge. Note that these settings need to be updated every 30 days.

**Migration scenario A:** If you are new to Automation 360 and have bots built using Internet Explorer, or if you have migrated from Enterprise 11 or Enterprise 10 to Automation 360 and have bots built using Internet Explorer, review the following information.

**What do I need to do to ensure that my automations built on Internet Explorer continue to run after Internet Explorer reaches EOL?**

To ensure that your automations continue to run on Internet Explorer after EOL, you need to do the following:

- Register your site or application running on Internet Explorer to the Microsoft Site List manager. For details, see [Enterprise Mode and the Enterprise Mode Site List](#).
- Update Automation 360 to the latest patch on Automation 360 v.24 release with support for Microsoft Edge with Internet Explorer mode.

- Use the Update bot wizard to convert each bot running on Internet Explorer to Microsoft Edge with Internet Explorer mode.
  - Bots that do not use commands related to Internet Explorer will not be converted.
  - If the bot update is completed without any errors, a new version of the bot will be created in the Control Room public repository.
- Check the update bot report to see whether you need to review the updated bot or take any action.
- Run the updated bot to validate that the bot runs fine in Microsoft Edge with Internet Explorer mode.

**I am using an earlier version of Automation 360 On-Premises. Can I directly update to Automation 360 v.24 patch release or should I manually uninstall the previous version and install the new patch version?**

Yes, you can directly update your existing Automation 360 version to the latest Automation 360 v.24 patch release.

Note that we support directly updating from  $n-3$  releases (where  $n$  is the latest release). For updating from a version of Automation 360 earlier than that, you must perform a multistep update. For example, if you are on Automation 360 v.19, you must first update to Automation 360 v.22 and then to Automation 360 v.24.

**Do I need to update my Automation 360 Bot Agent?**

Yes, the Bot Agent needs to be updated.

Starting from the Automation 360 v.24 release, Bot Agent update is optional with some releases.

**Migration scenario B:** If you are currently on Enterprise 11 or Enterprise 10 and plan to migrate to Automation 360, review the following information.

**I have not started the migration to Automation 360 yet. What is your recommendation for planning the migration?**

Migration to Automation 360 involves the conversion of the Enterprise 11 or Enterprise 10 bots to Automation 360 compatible format so that the converted bot runs successfully in Automation 360.

If these bots are automated using Internet Explorer 11, then you will have to include the efforts involved in further converting these bots to Microsoft Edge with Internet Explorer mode and validate the bots in the new browser.

If you are on Enterprise 11 and are impacted by Internet Explorer EOL, our recommendation is that you continue on Enterprise 11 and convert the bots related to Internet Explorer to Microsoft Edge with Internet Explorer mode so that you can test and validate the bots before the EOL date.

For details on the conversion tool, see [Enterprise 11 and upcoming Internet Explorer 11 EOL FAQ](#).

Migration to Automation 360 can be planned at a later date according to your convenience.

If you are on Enterprise 10 and are impacted by Internet Explorer EOL, we recommend that you migrate to Enterprise 11 first and convert the bots related to Internet Explorer to Microsoft Edge with Internet Explorer mode so that you can test and validate the bots before the EOL date.

For details on the conversion tool, see [Enterprise 11 and upcoming Internet Explorer 11 EOL FAQ](#).

Migration to Automation 360 can be planned at a later date according to your convenience.

For any new bots that you plan to build in Enterprise 11 or Enterprise 10, we recommend that you build them in Automation 360 by using any of the supported browsers to minimize the impact of the Internet Explorer EOL.

**Migration scenario C:** If you are currently on Enterprise 11 or Enterprise 10 and are in the middle of migration to Automation 360, review the following information.

**I have migrated a few bots to Automation 360, which use Internet Explorer, and have a few bots that are pending migration in Enterprise 11, which use Internet Explorer. What is your recommendation regarding maintaining two parallel environments?**

If you are in the middle of your migration journey, maintaining two parallel environments where there are bots based on Internet Explorer on both Enterprise 11 and Automation 360 versions, then you need to ensure that these bots are converted to Microsoft Edge in Internet Explorer mode in their respective environments in case you cannot complete migration of your pending Enterprise 11 bots to Automation 360 before the Internet Explorer EOL.

For Enterprise 11 bots based on Internet Explorer, upgrade your Enterprise 11 to the latest Version 11.3.5.x patch release, which supports Microsoft Edge with Internet Explorer mode. After the upgrade, use the Enterprise 11 conversion utility to convert these bots in Microsoft Edge with Internet Explorer mode so that these bots continue to run in Enterprise 11 even after the Internet Explorer EOL.

Similarly, for Automation 360 bots based on Internet Explorer, update to the latest Automation 360 v.24 patch release, which supports Microsoft Edge with Internet Explorer mode. After the update, use the Automation 360 bot update wizard to convert these bots in Microsoft Edge with Internet Explorer mode so that these bots continue to run in Automation 360 even after Internet Explorer EOL.

You can later decide when to migrate the Enterprise 11 bots converted to Microsoft Edge with Internet Explorer mode to Automation 360. When you decide to do so, note that you can use the Automation 360 Bot migration wizard without the

### Convert bots built using IE to Edge with IE mode option.

For details, see [Bot Migration Wizard](#) on page 1170.

---

**Note:** For Enterprise 10 bots based on Internet Explorer, we do not plan to release a patch on Enterprise 10 that supports Microsoft Edge with Internet Explorer mode. Hence, Enterprise 10 users must ensure that their bots based on Internet Explorer are migrated to Automation 360 v.24 patch release.

---

### How can I determine which bots use commands or actions related to Internet Explorer and hence require conversion to Microsoft Edge with Internet Explorer mode?

For Enterprise 11 bots, you can run the Bot Scanner utility with an option to scan bots for Internet Explorer usage. This utility generates a report that lists all the bots that use commands related to Internet Explorer.

For Automation 360 bots, the tool to scan bots and generate Internet Explorer usage report is currently not available.

### Do I need to manually change the bot after it is migrated to Automation 360 using the Bot Migration Wizard along with the Convert bots built using IE to Edge with IE mode option?

Yes, only for bots that are migrated to Automation 360 with **Action Required** or **Review Required** messages. Review the messages in the Migration Report that suggest that the user edit the bot, for example, if the bot uses a reference of Internet Explorer in the window title through a variable, file, and so on.

Contact your assigned CSM or Support for any further questions about this change.

## Known behavior and limitations

The following table lists known behavior and limitations that apply to bots migrated from Enterprise 11 to Automation 360 and to Automation 360 bots that run on Microsoft Internet Explorer and are converted to Microsoft Edge with IE mode.

Description	Applies to Enterprise 11 to Automation 360 (migration)	Applies to Automation 360 to Automation 360 (updating)
The bot conversion utility updates only bots that use Internet Explorer for automations and does not update bots that use other browsers.	Yes	Yes
For web pages or URLs to open in Microsoft Edge with Internet Explorer mode, you must register your site or application running on Internet Explorer to <b>Microsoft Site List Manager</b> or Group Policy within your organization.  <a href="#">Enterprise Mode and the Enterprise Mode Site List</a>	Yes	Yes

Description	Applies to Enterprise 11 to Automation 360 (migration)	Applies to Automation 360 to Automation 360 (updating)
The Open Program/File command that contains a variable to store the location of the program or file property is not migrated or converted to use Microsoft Edge with Internet Explorer mode. If the variable is pointing to Internet Explorer, update it to point to Microsoft Edge browser instead.	Yes	Yes
<p>The following commands are not migrated or converted because browser components such as the menu bar, status bar, favorites bar, command bar, and other non-web page components differ in each browser. This can potentially impact captured screens or properties of the actions. We recommend that you review and recapture the screen or update the properties if required.</p> <ul style="list-style-type: none"> <li>• Image Recognition</li> <li>• OCR</li> <li>• Mouse</li> <li>• Wait&gt; <b>Wait for screen</b> (Menu/Non-HTML objects)</li> <li>• Screen</li> <li>• Recorder</li> <li>• App Integration &gt; <b>Capture area</b></li> </ul>	Yes	Yes
Keystroke action that is based on the menu bar of a browser is not migrated or converted.	Yes	Yes
<p>For Mouse commands such as <b>Click, Move or Scroll</b>, due to the difference in header bar height in Internet Explorer and Microsoft Edge with Internet Explorer mode, there might be an incorrect Y-axis after the migration or conversion.</p> <hr/> <p><b>Note:</b> This difference applies only to the Y-axis and not X-axis.</p> <hr/>	Yes	Yes
In the Image Recognition command, when the target image is on the lower and upper boundaries of the source image, the command is not migrated or converted because of the difference in the height of the header bar in Internet Explorer and Microsoft Edge browsers. The following target actions are impacted: <b>Right click, Left click, and Double click.</b>	Yes	Yes
<p>Review and recapture all commands, except Image Recognition that captures window coordinates with negative values, after migration or conversion.</p> <hr/> <p><b>Note:</b> In Enterprise 11, the coordinates are captured the top-left of the screen at 0, 0. In Automation 360, the coordinates are captured as negative values.</p> <hr/>	Yes	Yes

Description	Applies to Enterprise 11 to Automation 360 (migration)	Applies to Automation 360 to Automation 360 (updating)
<p>Due to differences in the height of the header bar in Internet Explorer and Microsoft Edge with Internet Explorer mode, the output of the actions might not be as expected. The following commands are impacted:</p> <ul style="list-style-type: none"> <li>• OCR&gt; <b>Capture area</b></li> <li>• Mouse <ul style="list-style-type: none"> <li>• Button: Left button, Middle button, Right button</li> <li>• Event: Click, Double click, Button down, Button up</li> </ul> </li> <li>• Screen&gt; <b>Capture area</b></li> </ul>	Yes	Yes
<p>Window titles with regular expression variables containing partial text from Internet Explorer might be converted to the corresponding title in Microsoft Edge. However, sometimes the conversion might not happen. For example:</p> <ul style="list-style-type: none"> <li>• Internet</li> <li>• .Int,</li> <li>• Int</li> <li>• Expl*</li> <li>• .Expl</li> <li>• Internet Exp</li> </ul>	Yes	Yes
<p>Using the Microsoft registry setting, if you have changed the default text of the Internet Explorer window title bar to your preferred text, the changes applied on the title bar are not available after conversion.</p>	Yes	Yes
<p>In the Open Program/File, if you have used the <code>taskkill /F /IM iexplore.exe</code> command to terminate Internet Explorer, then after conversion, when you run the bot, it will forcefully terminate <code>msedge.exe</code>. But when you run the bot for the second time, it will display a Microsoft Edge Closed Unexpectedly error message. We recommend that you avoid the use of <code>/F</code> so that the bots run seamlessly.</p>	Yes	Yes
<p>Local HTML files are not supported for loading in Microsoft Edge with Internet Explorer mode through <b>Enterprise Site List Manager</b>.</p> <p><b>Workaround:</b> You can deploy the local HTML file in localhost.</p> <p>Example: The <code>file:///C:/SampleHTML/sample.html</code> URL will be replaced with <code>https://localhost/SampleHTML/sample.html</code></p>	Yes	Yes

Description	Applies to Enterprise 11 to Automation 360 (migration)	Applies to Automation 360 to Automation 360 (updating)
The wait for the browser does not work for Microsoft Edge with Internet Explorer mode for commands such as Mouse, Insert Keystrokes, or Recorder. After conversion, the User32 API does not return the child window list. As a result, it cannot find the page Microsoft Edge with Internet Explorer mode.	Yes	Yes
Object Cloning commands developed on a Citrix environment with Xen App Remote Agent and Microsoft Edge with Internet Explorer mode are not supported.  Object Cloning commands developed on Silverlight and Flash technologies and Microsoft Edge with Internet Explorer mode are not supported.	Yes	Not applicable
<ul style="list-style-type: none"> <li>Object Cloning commands (with coordinates play mode) where Internet Explorer based toolbar is enabled and locked are not migrated or converted.</li> <li>Object Cloning commands (with coordinates play mode) are not migrated or converted because browser components such as menu bar, status bar, favorites bar, command bar, and other non-web page components differ in each browser. This can potentially impact the captured screens or the properties of the actions. We recommend that you review and recapture the screen or update the properties if required.</li> <li>Due to the difference in the height of the header bar in Internet Explorer and Microsoft Edge with Internet Explorer mode, an incorrect Y-axis might occur after the migration or conversion. This difference can be seen in <b>Get text, Set text, Left click, Right click, Middle click, Double click</b> of the coordinates play mode.</li> </ul> <hr/> <p><b>Note:</b> This difference applies only to the Y-axis and not X-axis.</p> <hr/>	Yes	No
Migrated bots with Mouse <b>Click</b> command might not work as expected when the <b>Relative to</b> property is Screen. This is because of the difference in the offset of the address bar between Internet Explorer and Microsoft Edge.	Yes	Yes
Objects captured on Internet Explorer using <b>Standard</b> or <b>Legacy</b> technology in the Object Cloning command will not work after migration or conversion.	Yes	No
The commands that store window titles with wildcard characters such as *Applet* are based on the Internet Explorer browser window with Web Java technology. If you have selected the <b>None of the above</b> option for such commands, note that the commands will not work in Microsoft Edge with IE mode as these are not migrated to Edge.	Yes	No

Description	Applies to Enterprise 11 to Automation 360 (migration)	Applies to Automation 360 to Automation 360 (updating)
Bot Scanner does not count the commands that use variables to store the window title as part of the statistics. However, these commands are displayed in the <b>Review Required</b> tab so you can review these commands manually to verify if the window title is based on the Internet Explorer browser window.	No	Yes
User Interface (UI) based and window triggers with Internet Explorer based window title are not migrated or converted.	No	Yes
Recorder developed on a Citrix environment with Xen App Remote Agent, and Microsoft Edge with Internet Explorer mode is not supported.  Recorder actions developed on Silverlight and Flash technologies and Microsoft Edge with Internet Explorer mode is not supported.	Not applicable	Yes
For the Bot Migration Wizard and Update Bot wizard, when you select the <b>Bot Assistant</b> screen to view the migration review and action messages, the review message is not displayed based on the version. In the <b>Update Bot Assistance</b> menu, the review message is overridden by the migration review message.	No	Yes
When you use the Update Bot wizard to convert Automation 360 bots that run on Microsoft Internet Explorer to Microsoft Edge, the <b>In progress</b> status will be shown indefinitely for the following scenarios: <ul style="list-style-type: none"> <li>• When the bot fails to compile</li> <li>• When the bot fails to deploy</li> <li>• When the Bot Agent service stops or fails</li> <li>• When the Bot Runner user is not assigned the <b>Allow a Bot user to update bots</b> permission</li> </ul>	Not applicable	Yes

## Scan Automation 360 bots for Internet Explorer usage

Microsoft Internet Explorer end of life (EOL) is in June 2022, and Microsoft recommends that you to move your legacy applications and websites running on Internet Explorer to Microsoft Edge with IE mode. Use the Automation 360 Bot Scanner for IE utility to scan your Automation 360 bots for Internet Explorer usage.

- Ensure that your Control Room user has the **View content** permission on the `Bots` folder.
- Ensure that you meet the following system requirements for using the Bot Scanner:

- **Hardware requirements**

<b>Processor</b>	2.66 GHz or higher (64-bit)
<b>RAM</b>	2 GB or higher
<b>Disc space</b>	200 MB

- **Software requirements**

**Operating systems:** Windows 7 or later (32-bit or 64-bit)

1. Navigate to [A-People Downloads page \(Login required\)](#).
2. Download `automation-360-bot-scanner-for-ie-1.0.zip` from **Automation 360 v.24 R2 (13343) > Installation Setup**.
3. Extract the files from the zip file you have downloaded and double-click the executable file to run the utility.
4. Click **Get started**.
5. Enter the Control Room URL of Automation 360 (On-Premises or Cloud) that you want to connect to, and access the `Bots` repository that contains the Internet Explorer bots that you want to scan.

---

**Note:** The Bot Scanner for IE utility does not support a proxy server. If you use a proxy to provide the Control Room URL, you will not be able to establish the connection.

---

6. Based on the authentication type configured in your Control Room, choose one of the following authentication methods in the **Authentication Type** field:

Authentication type	Steps
<b>Database</b>	<ol style="list-style-type: none"> <li>a. Enter the <b>Username</b> (Control Room database username).</li> <li>b. Enter the <b>Password</b> (Control Room database user password).</li> </ol>
<b>Active Directory (default)</b>	<ol style="list-style-type: none"> <li>a. Enter the <b>Username</b> (Domain\\username).</li> <li>b. Enter the <b>Password</b> (domain user password).</li> </ol>
<b>Single Sign-On</b>	<ol style="list-style-type: none"> <li>a. Enter the <b>Username</b>.</li> <li>b. Enter the <b>API Key</b>.</li> </ol>

7. Click **Test connection**.  
A connection success or failure message is displayed. Recheck your credentials if the connection fails.

8. In the **Select destination path** field, enter the location where you want to save the generated report.
9. Click **Scan bots**.

The scanner scans all the bots in the Control Room repository for Internet Explorer usage. After the scan is complete, a report is generated (.CSV file) containing all the details. If a .CSV file already exists in the output folder, you are prompted with a message indicating that the old .CSV file will be deleted, and after you click **Continue**, a new .CSV file is generated. If the old .CSV file is in use, a message is displayed indicating that the file cannot be deleted. Close the file and try again.
10. Click **Open report** to analyze the report generated by the scanner to get usage statistics about Internet Explorer in your bots.

The report contains the following details:

  - TaskBot name: Name of the TaskBot
  - Line number: The line number of the bot where the Internet Explorer browser is used
  - Package and action name: The package and action name where the Internet Explorer browser is used
  - Searched text: Provides the window or browser title
  - Action and review message: Contains the reviews or action required by the user after conversion
  - TaskBot path: The path to the repository where the bot resides

---

**Note:** Based on the report generated by the scanner, you can plan and implement a strategy to convert bots that use Internet Explorer to Microsoft Edge with IE mode. Using the report you can identify the following:

- Unique TaskBot names that use Internet Explorer
  - The action in each bot that uses Internet Explorer
  - Whether an action can be converted or not
  - Whether an action needs review after conversion
- 

See the following video on how to scan Automation 360 bots for Internet Explorer usage:

The Bot Scanner does not convert your bots from Internet Explorer to Microsoft Edge with IE mode. For conversion, you must use the Update Bot wizard. See [Update Bot wizard for converting IE bots](#) on page 95.

## Analyze report for Internet Explorer bots

You can analyze the report generated by the Bot Scanner to get usage statistics about Internet Explorer used in your bots.

Based on the report that Bot Scanner generates, you can plan and implement a strategy to convert bots that use Internet Explorer to Microsoft Edge with IE mode.

Bot Scanner provides the following information about these bots:

- Number of bots analyzed
- Number of bots scanned for Internet Explorer usage and those that were not scanned
- Internet Explorer usage statistics on the percentage and number of bots using Internet Explorer
- Reasons for bots that were not scanned
- Reviews required by users after conversion

The Bot Scanner is designed to scan bots (TaskBots and MetaBots) created using both Enterprise 10 and Enterprise 11 versions of Enterprise Client. The total file count includes the number of files that were skipped and not scanned.

## Folder location and reports

The reports are available at the output location you specified in the **Select destination folder** field in the **Automation Anywhere Bot Scanner** dialog box. The Bot Scanner generates a summary report and a separate report for each bot that it scanned. It creates a separate report for each logic available in a MetaBot.

A `raw-data` folder is created that contains the reports (in XML format) for each bot scanned. It helps our developers to further analyze the scanning process and take corrective actions, if required. No personally identifiable information (PII) is included in the summary report or the individual reports of the scanned bots.

If you choose to share the reports with us to help improve the product, compress the files in the `rawdata` folder and coordinate with your Customer Success Manager (CSM) or Partner Enablement Manager (PEM). No data is automatically shared with Automation Anywhere.

The system creates three folders within the `raw-data` folder that contain various reports:

- `Migratable_Bots`: Contains reports of bots that are possibly using Internet Explorer.
- `Failed_to_Analyze`: Contains reports of bots that Bot Scanner failed to analyze.
- `MetaBots`: Contains reports of MetaBots that can and cannot be migrated to Automation 360 and the ones that the Bot Scanner failed to analyze.

## Summary report for all bots

The summary report provides information about the total number of bots scanned, the number of bots scanned for Internet Explorer usage, the number bots that could not be scanned. It also provides Internet Explorer usage statistics about the percentage and number of bots using Internet Explorer.

For example, consider the Bot Scanner has scanned 31 bots. Of the 31 bots, consider 26 bots are scanned for Internet Explorer usage, and 0 bots could not be scanned. The percentage of bots using Internet Explorer is 84%.

### Reviewing the Bot Scanner report

Consider a scenario where you have scanned a total of 72 bots, of which 22 bots are scanned for Internet Explorer usage and 3 bots could not be scanned. In such a scenario, the report enables you to perform the following actions:

- Identify bots (8) that require review after conversion and take action if required.
- Identify bots (14) that do not require any review after conversion.
- Identify the reason why the bots (3) cannot be currently scanned for Internet Explorer usage. The reason might be that the bot is built using a version earlier to Enterprise 10 such as Enterprise 8.

The following image is a sample report from the Bot Scanner:

### Internet Explorer Usage Statistics:

- 31% of bots are using Internet Explorer (22 Bots)
- 20 distinct command(s) use Internet Explorer

Each metabot is counted as the number of logics that it holds, in the Bot Scanner report.

The screenshot shows the Bot Scanner report interface. At the top, there are two summary cards: '22 Bots scanned for IE usage' (marked with a checkmark) and '3 Bots that can't be scanned now' (marked with a warning triangle). Below these are two tabs: 'Review required' (marked with a '1') and 'No review required' (marked with a '2'). The 'Review required' tab is active, showing a sub-tab 'Bots' and a message: '8 out of 22 bots will require review after Internet Explorer conversion'. Below this is a table of bots requiring review, with columns for 'Bot name' and 'Path'. The table lists 8 bots, numbered 1 through 8. A 'Messages' tab is also visible, marked with a '3'.

Bot name	Path
1 AppInt IE Regex Variable Review	C:\W
2 Elself All Conditions	C:\W
3 If Condition all	C:\W
4 IR Review Positive Coord	C:\W
5 Wait Review	C:\W
6 Loop Conditions	C:\W
7 OPF Review IE Var	C:\W
8 OPF Review Non IE Var	C:\W

The following table describes the various fields in the sample Bot Scanner report (as numbered in the previous image):

Field/option	Description
1	<ul style="list-style-type: none"> <li>• <b>Bots scanned for IE usage &gt; Review required &gt; Bots:</b> Go to this view for a list of bots (8 in this scenario) that should be reviewed after conversion.</li> <li>• To view the review required message for a specific bot, click the bot name. The message provides information about changes if any are required in the bot after conversion.</li> </ul>
2	<p><b>Bots scanned for IE usage &gt; No review required &gt; Bots:</b> Go to this view for a list of bots (14 in this scenario) that do not require any review after conversion. Click any bot name in this list to view the XML report offline.</p>

Field/option	Description
3	<ul style="list-style-type: none"><li>• <b>Bots that can't be scanned now &gt; Bots:</b> Go to this view for a list of bots (3 in this scenario) that cannot be currently scanned.</li><li>• To view the error message for a specific bot, click the bot name. An XML report opens in a new tab where you can view the error due to which the bot cannot be scanned.</li></ul>
4	Download (as a CSV file) the list of bots or commands that can or cannot be scanned so that you can review the file offline or share the file with others.

## Report validity

The report is valid until the next version of Bot Scanner is available. When the next version is available, a report expiry message is displayed. You must download the latest version of Bot Scanner and use that version to scan the bots again.

## Update Bot wizard for converting IE bots

Use the Update Bot wizard to convert Internet Explorer bots created in Automation 360 to Microsoft Edge with IE mode.

- Ensure you are logged in as an administrator or have given the following permissions to the user performing the bot update and to the Bot Runners you have selected:
  - Users performing the bot update:
    - **View bot update**
    - **Manage bot update**
    - **View Users and Roles basic information**
    - **View everyone's audit log actions**
    - **View packages**
    - **View my bots**
    - **Run my bots**
    - You must have the below-mentioned permissions for `Bots`, `Sample bots`, and the folders containing the bots you want to update:
      - **Run**
      - **Check in**
      - **Check out**
      - **View content**
    - A role that has access to Bot Runners that you want to select for running the update (on the **Administration > Bot update > Bot Runners** page)
  - Bot Runners:
    - An unattended Bot Runner license
    - **Autologin Set** status
    - **Allow a bot-runner user to update bots**
    - **Create folders**
    - **View packages**
    - **Register device**
    - **View my bots**
    - **Run my bots**
    - Below permissions for the folders containing the bots you want to update,
      - **Check in**
      - **Check out**
    - **Default device** settings

For more information on creating users and roles, see [Create a user](#) on page 2004 and [Create a role](#) on page 2012.

- The Internet Explorer bots should already be identified for conversion.
- The bots must be **Checked in** and available in the **Public** workspace.

---

**Note:** You cannot use the Update Bot wizard to convert Enterprise 10 and Enterprise 11 bots created using Internet Explorer. For details, see [Bot Migration Wizard](#) on page 1170.

---

See the following video for an overview of the Bot update wizard:

1. Navigate to **Administration > Bot update** in the Control Room.  
If you have **not** performed any bot updates previously, the **Bot update list** on the **Bot update** page will not display bot updates.
2. Click **Update bots** to open the Update Bot wizard.
3. In the **Settings** tab, add details such as the name and description to update bots.
4. Click **Next**.
5. On the **Bots** tab, navigate to the Bots folder that contains the Internet Explorer bots.
6. Select bots from the list of available files and add the bots to the list of selected files.  
You can choose from the latest or production version bots.

---

**Note:** You do not have to select the dependent bots because the dependent bots are selected automatically.

---

7. Click **Next**.
8. Select Bot Runner devices from the list of Bot Runners to run the bot update.
9. Click **Next**.
10. Verify details such as the bot type, name, version, and folder path on the Bot and Dependent Bots tab.
11. Click **Update bots**.  
The selected bots and dependent bots are deployed on the selected Bot Runners for conversion from IE to Microsoft Edge with IE mode. The bots are converted one at a time and a new version of the

bots is uploaded to the Control Room public repository. A new entry for updated bots is created during the bot conversion process on the **Bot update list** page.

The page shows the status and summary of the bots updated for conversion. You can refresh the page to view the current bot conversion status.

**Bot update list** Update bots

Before you update bots

1. Make sure Bots are not checked out till the process is complete.
2. You have the appropriate permissions for the bots

[Feature permissions for a role](#) on page 2013

A user with the **AAE\_Admin** role or a custom role with the **Manage roles** permission can create and assign roles to users to provide them with access to features and operations.

## Viewing conversion details for Internet Explorer bots

For each update bot action, you can view details about the overall summary and status of individual bot conversion that is converted from Internet Explorer to Microsoft Edge with IE mode.

### Viewing bot details

1. In the Control Room, go to **Administration > Bot update**.
2. Select an instance of the bot conversion from the list and click **View update bot details** action from the action menu for that instance.

The **Update details** page opens with detailed information about the name of the instance and the overall status of the bot conversion (at the top of the page). For more information, you can navigate to different tabs on this page: Summary, Settings, Bot Runners, and Results.

### Summary details

You can view the following details in the **Summary** tab:

- Start time: Indicates the time when the bot conversion started
- End time: Indicates the time when the bot conversion completed
- Duration: Total duration taken for bot conversion to complete
- Completed items: Total list of items that are converted with completed status
- Failed items: Total list of items that failed to convert
- Skipped items: Total list of skipped items during conversion based on appropriate reasons
- Details of the selected bots and dependencies, listed in a table

The data is listed by file name by default. You can search for specific bots and dependencies by file name.

### Settings

The **Settings** tab displays the following fields:

- Description: Displays any description you might have added before running the Update Bot wizard
- Update the bots built using Internet Explorer to Microsoft Edge Internet Explorer mode. By default, this field is set to **Yes**

### Bot Runners

This tab displays the list of Bot Runners on which the bot conversion is done.

### Results

View the status of individual bot conversion on this tab:

- Status: Status of the individual bot conversion (completed, skipped, failed)

- Type: Type of the bot, for example TaskBot
- File name: Name of the bot
- Folder path: Path where the bot resides in the public workspace
- Bot Runner: The Bot Runner machine used to perform the bot conversion
- Reason: Reason why the bot conversion is in either failed, skipped, completed with review required, or completed with action required status

**General Details**

Last modified: 13 minutes ago      Modified by: jigsrunner

When you click the **View Bot update** for an individual bot status entry in this tab, the following reason and action values for the bots are shown.

Status	Reason	Action
Pending	-	-
Completed	-	-
Skipped	The bot is not updated as it does not use actions based on Internet Explorer	-

Status	Reason	Action
Completed with Review Required	The bot has some actions updated that requires your review	View bot update issues
Completed with Action Required	The bot has some actions updated that requires your action	View bot update issues
Failed	The bot uses some actions that are not supported for update to Microsoft Edge with IE mode	View bot update issues

The view bot update page displays the following columns:

- Line number
- Action name
- Reason for Recommendation

You can view the information listed in the reason column for the line number and open the corresponding bot, go to the line number and review based on the information provided in the window or take action as required.

The screenshot displays the Automation Anywhere web interface. A modal window titled "Mouse\_Click\_WindowTitle\_1" is open, showing a notification: "Your bot update needs review. The bot has some actions migrated that require review." Below the notification is a table with 4 issues:

Line number	Action name	Reason / Recommendation
Line 20	Mouse: mouseClick	Browser components such as Menu bar, Status bar, Favorites bar, Comman... <a href="#">more &gt;&gt;</a>
Line 21	Mouse: mouseClick	Browser components such as Menu bar, Status bar, Favorites bar, Comman... <a href="#">more &gt;&gt;</a>
Line 22	Mouse: mouseClick	Browser components such as Menu bar, Status bar, Favorites bar, Comman... <a href="#">more &gt;&gt;</a>
Line 23	Mouse: mouseClick	Browser components such as Menu bar, Status bar, Favorites bar, Comman... <a href="#">more &gt;&gt;</a>

The background interface shows the "Update details" section for a bot named "Updatebots.iqscreeator.22.04.19.12.16.44" with a status of "Completed". The left sidebar includes navigation options like Activity, Manage, Administration, Audit log, Users, Roles, Licenses, Settings, Migration, and Bot update. The user "admin" is logged in.

## Deprecation of Basic authentication in Exchange Online

Microsoft will permanently disable Basic authentication for specific protocols in Exchange Online starting from October 1, 2022. This impacts customers running bot for email automation that connect to Exchange Online using IMAP, POP3, or EWS protocols with Basic authentication.

**Important:** We have updated the Email package and Email trigger with newer versions as mentioned below:

Package or trigger	New version	Old version
Email package	<ul style="list-style-type: none"> <li>Version: 3.14.3-20220923-220748</li> <li>Filename: bot-command-email-3.14.3.jar</li> </ul>	<ul style="list-style-type: none"> <li>Version: 3.14.1-20220831-084727</li> <li>Filename: bot-command-email-3.14.1.jar</li> </ul>

Package or trigger	New version	Old version
Email trigger	<ul style="list-style-type: none"> <li>Version: 2.8.3-20220923-171042</li> <li>Filename: bot-trigger-email-2.8.3.jar</li> </ul>	<ul style="list-style-type: none"> <li>Version: 2.8.1-20220831-123116</li> <li>Filename: bot-trigger-email-2.8.1.jar</li> </ul>

We recommend that you update your impacted bots with the new versions as they are compatible with the upcoming Automation 360 v.27 release. If you continue to use the old versions and update to Automation 360 v.27 release, you might encounter issues when importing or exporting of bots or when uploading the old versions of the Email package or trigger to Automation 360 v.27. To resolve this issue, see the workaround provided in [Everything about Basic Authentication deprecation in Microsoft Exchange online \(A-People login required\)](#).

We will provide a new version of the Email package with OAuth 2.0 support in an upcoming Automation 360 **package-only** release by the week of August 29, 2022.

To ensure that your existing bots that are using Basic authentication in Exchange Online are supported after Basic authentication is deprecated, we recommend that you update the bots to use OAuth 2.0. To identify the Automation 360 bots that are using Basic authentication in the Email package or Email trigger, use the Bot Scanner to scan bots. This helps you to plan your efforts to update your existing bots to OAuth 2.0 in Automation 360.

- [Bot Scanner overview](#) on page 1116
- [Scan Automation 360 bots for Email action with Basic authentication usage](#) on page 112

## Update Automation 360 bots to use OAuth 2.0

### 1. Update to the latest Automation 360 release.

[Update to latest Automation 360 version](#) on page 1022

2. Back up the Control Room repository.  
*Integrating Control Room with Git repositories* on page 2066
3. Identify bots that are using Basic authentication using the Bot Scanner.  
*Scan Automation 360 bots for Email action with Basic authentication usage* on page 112
4. Download the latest version of the Email package and add it to your Control Room.  
*Add packages to the Control Room* on page 1970
5. Update the bots that are using Basic authentication in the **Connect, Send, Forward, or Reply** actions or Email trigger to use OAuth 2.0.  
*Update bots using Basic authentication to OAuth 2.0* on page 103
6. Verify that the updated bots can be deployed.  
*Run a bot* on page 1354

---

**Note:** You can update your bots to use OAuth 2.0 in one environment (for example, development or DEV) and then move these bots to another environment (for example, UAT and production or PROD) without updating the bots in each environment.

---

## Protocols impacted for Basic authentication deprecation

Microsoft is removing the capability to use basic authentication in Exchange Online for these specific protocols: MAPI, RPC, Offline Address Book (OAB), Exchange Web Services (EWS), POP, IMAP, Exchange ActiveSync (EAS), and Remote PowerShell.

---

**Note:** SMTP AUTH is excluded from this deprecation.

---

Any client (for example, user app, script, or integration) using Basic authentication for one of the affected protocols will not be able to connect to Exchange server starting October 1, 2022. An HTTP 401 error (`bad username or password`) will be displayed.

---

**Note:** Any app using OAuth 2.0 for these same protocols will not be impacted.

---

For more information, see *Basic authentication deprecation in Exchange Online – Updates*.

## Update bots using Basic authentication to OAuth 2.0

You should update your bots that are using Basic authentication to OAuth 2.0 in the **Connect, Forward, Reply, and Send** actions of the Email package and Email trigger before Basic authentication is deprecated.

---

**Note:** This procedure is applicable to both Automation 360 Cloud and On-Premises customers.

---

### Prerequisites

- The **Installation Setup folder** in the Automation 360 v.25 Basic Authentication MS Online - Deprecation downloads folder contains the following JAR files:
  - Email package (bot-command-email-3.14.1.jar)
 

Ensure that you download this package and add it to your Control Room in Automation 360.
  - Email trigger (bot-trigger-email-2.8.1.jar)
 

Ensure that you download this package and add it to your Control Room in Automation 360
  - Trigger listener (triggerlistener.jar)
 

If you are on Automation 360 v.25 release, ensure that you download and install the trigger listener file. See [Install the trigger listener file](#) on page 106.

For information on adding packages to the Control Room, see [Add packages to the Control Room](#) on page 1970.

To download these JAR files, see [Everything about Basic Authentication deprecation in Microsoft Exchange online \(A-People login required\)](#).

- Ensure that you have run the Bot Scanner utility for the deprecated features to identify the bots that are using Basic authentication in your Control Room repository.
 

See [Scan Automation 360 bots for Email action with Basic authentication usage](#) on page 112.
- Ensure that you have registered your application on the [Azure portal](#) and performed the following configurations for Client credentials flow:
  - IMAP/POP3
    1. [Register an application](#)
    2. [Authenticate an IMAP, POP or SMTP connection using OAuth](#)
  - EWS
    1. [Register an application](#)
    2. [EWS OAuth authentication](#)
    3. [Configure application access policy](#)

## Procedure

1. Log in to your Control Room as Bot Creator.
2. Select the bot that was identified in the Bot Scanner report for updating.
3. Check out the bot to edit it.
4. In the Bot editor, click the vertical ellipsis in the top right-corner and click **Packages**.
5. Expand the row for the Email package.
6. From the drop-down list of package versions, select the **Default** version.

---

**Note:** For Email package, ensure that the package version is **3.14.1-20220831-084727** or later. For Email trigger, ensure that the package version is **2.8.1-20220831-123116** or later.

---

7. Click **Change Version** and **Save**.
8. Click **Return to editor**.
9. Click the Email action or Email trigger that is using the **Basic** authentication mode.
10. Click the **Email server** or **EWS server** option.

**11.** In the **Authentication mode** drop-down list, choose the required OAuth 2.0 mode.

**Note:** For unattended Email automation, use Client credentials or ROPC flows, and for attended Email automation, use Implicit or PKCE flows. Microsoft does not recommend the use of ROPC and Implicit legacy flows. Therefore, we recommend that you either use the Client credentials or PKCE flow.

The following table provides information about the OAuth 2.0 authentication modes that are available for Email action in the Email server and EWS server options:

Email actions	Email server	EWS server
Connect	<ul style="list-style-type: none"> <li>OAuth2 – Authorization code with PKCE</li> <li>OAuth2 – Client credentials</li> </ul>	<ul style="list-style-type: none"> <li>OAuth2 – ROPC</li> <li>OAuth2 – Implicit</li> <li>OAuth2 – Authorization code with PKCE</li> <li>OAuth2 – Client credentials</li> </ul>
Send	OAuth2 – Authorization code with PKCE	<ul style="list-style-type: none"> <li>OAuth2 – ROPC</li> <li>OAuth2 – Implicit</li> <li>OAuth2 – Authorization code with PKCE</li> <li>OAuth2 – Client credentials</li> </ul>
Forward	OAuth2 – Authorization code with PKCE	--
Reply	OAuth2 – Authorization code with PKCE	--

The following table provides information about the OAuth 2.0 authentication modes that are available for Email trigger in the Email server and EWS server options:

Triggers	Email server	EWS server
Email trigger	OAuth2 – Client credentials	OAuth2 – Client credentials

- **OAuth2 – ROPC:** Uses Resource Owner Password flow (*Microsoft identity platform and OAuth 2.0 Resource Owner Password Credentials*)

**Note:** The existing Silent flow has been renamed to ROPC.

- **OAuth2 – Implicit:** Uses implicit grant flow (*Microsoft identity platform and implicit grant flow*)

**Note:** The existing Interactive flow has been renamed to Implicit.

- **OAuth2 – Authorization code with PKCE:** Uses authorization code with PKCE grant flow (*Microsoft identity platform and OAuth 2.0 authorization code flow*)
- **OAuth2 – Client credentials:** Uses client credentials flow (*Microsoft identity platform and the OAuth 2.0 client credentials flow*)

**12.** Depending on the authentication mode that you selected, you might have to update some of the following fields:

- **Username:** Enter the username that you want to use to access the mail server.  
For example, john.smith@myCompanyName.com
- **Password:** Enter the password for the username you provided.
- **Email provider:** Select the email provider from the drop-down list.

---

**Note:** For **Client ID**, **Tenant ID**, **Redirect URI**, and **Client secret** options, use the information that is provided for your account on your [Azure portal](#).

---

See [Email package](#) and [Add an email trigger](#) on page 1557.

**13.** For **EWS server**, click **Test connection** to sign in to your account, accept the permissions requested to authenticate, and establish a connection with the server.

---

**Note:** In the Microsoft Azure app registrations portal, in **Manage** > **Authentication**, ensure that the URI you have added is either <https://outlook.office365.com> or <https://outlook.office365.us> for the connection to work properly.

---

**14.** Click **Save**.

Repeat these steps for all the impacted bots and run the bots to ensure that they can connect to Exchange Online using OAuth 2.0 successfully.

## Install the trigger listener file

To use the Email trigger with OAuth 2.0, you have to update the `triggerlistener.jar` in the Bot Agent.

- 1.** In the Windows Task Manager, stop the **Automation Anywhere Bot Agent** service.
- 2.** Go to the folder where the Bot Agent is installed (C:\Program Files\Automation Anywhere\Bot Agent).
- 3.** Locate the `triggerlistener.jar` file and rename the file to `triggerlistener.jar_old`.
- 4.** Copy the downloaded `triggerlistener.jar`.
- 5.** In the Windows Task Manager, start the **Automation Anywhere Bot Agent** service.

## Other resources

- [Automation 360 and Basic authentication deprecation FAQ](#) on page 107
- [Scan Automation 360 bots for Email action with Basic authentication usage](#) on page 112
- [Everything about Basic Authentication deprecation in Microsoft Exchange online \(A-People login required\)](#)

## Automation 360 and Basic authentication deprecation FAQ

Microsoft has announced EOL for Basic authentication that is used to connect to Exchange Online. This will impact automations (bots) using Email package or Email trigger that uses Basic authentication. Review the FAQ for details about the deprecation of Basic authentication.

### What is Basic authentication deprecation?

Microsoft has announced that starting October 1, 2022, Basic authentication will be permanently turned off (disabled) for specific protocols in Exchange Online for MAPI, RPC, Offline Address Book (OAB), Exchange Web Services (EWS), POP, IMAP, Exchange ActiveSync (EAS), and Remote PowerShell.

**Exclusion:** SMTP AUTH is excluded from this deprecation for tenants which are already using it. Any client (user app, script, integration, and so on) using Basic authentication for one of the affected protocols will be unable to connect after that specified date. The app will display an HTTP 401 error: `bad username or password`. Any app using OAuth 2.0 for these protocols will be unaffected.

#### *Basic authentication in Exchange Online*

### What is Microsoft's recommendation to mitigate Basic authentication deprecation?

Per Microsoft's recommendation, you are requested to switch from Basic authentication to OAuth 2.0 if your clients or apps are using Basic authentication with any of the affected protocols to connect to Exchange server via Exchange Online.

---

**Note:** The Basic authentication deprecation applies to Exchange Online only and not to Exchange on-premises version.

---

### Why this change?

Basic authentication is an outdated industry standard, less secure, and poses high risks to accessing customers' sensitive data. The latest industry standard is OAuth 2.0 which is more secure and less vulnerable to cyber attacks.

### What if I am not ready for this change?

If you are not ready to switch to OAuth 2.0 by **October 1, 2022**, Microsoft has provided a one-time re-enablement option that will allow you to continue to use Basic authentication for specific protocols until **end of December 2022**. Per the Microsoft announcement, customers will be able to use the self-service diagnostic to re-enable Basic authentication for any protocols they need, *once per protocol*. After the diagnostic is run, Basic authentication will be re-enabled for the specified protocols and will stay enabled until the end of December 2022.

---

**Where is Basic authentication used in Automation 360 product?**

---

**Note:** During the first week of calendar year 2023, the specified protocols will be disabled for Basic authentication use permanently.

---

*[Basic Authentication Deprecation in Exchange Online – September 2022 Update](#)*

In Automation 360, the Basic authentication feature is available in the **Connect**, **Send**, **Forward**, and **Reply** actions of the Email package and in Email trigger where you configure connection parameters using any of the IMAP, POP3, SMTP, or EWS protocols.

**How do I know if I am going to be impacted by Basic authentication deprecation?**

Basic authentication deprecation will impact you for the following cases:

- If you are automating email using Email package or Email trigger
- If you are using Basic authentication to connect to Exchange Online
- If you are using the IMAP, POP3, or EWS protocol

When Basic authentication will be disabled by Microsoft starting October 1, 2022, then all the Automation 360 bots for Email automation that meets the previously mentioned criteria will fail because the bot cannot connect to the Email server.

**When will the support end?**

Basic authentication will be disabled by Microsoft starting October 1, 2022.

**How can I identify Automation 360 bots in my repository that are using Basic authentication with Email package or Email trigger?**

For Automation 360 bots, you can run the Bot Scanner utility for EOL features.

*[Scan Automation 360 bots for Email action with Basic authentication usage](#)* on page 112

- The scanner will scan all the bots that are using Basic authentication with Email package or Email trigger and having IMAP, POP3, or EWS protocols.
- The scanner will then generate a CSV output listing all the impacted bots, including the specific line numbers and the specific actions to be performed.

**Which feature will be provided in Automation 360 to mitigate the risk of Basic authentication deprecation?**

The OAuth 2.0 feature will be available in Automation 360 in the Email package for the **Connect**, **Send**, **Forward**, and **Reply** actions and Email trigger for IMAP, POP3, and EWS protocols so that you can use this feature to switch from Basic authentication to OAuth 2.0.

**What is the schedule and release version for introducing the OAuth 2.0 feature in Automation 360?**

The OAuth 2.0 feature will be delivered as a package only release in the week of August 29, 2022. This release will include the following:

- Bot Scanner utility
- Updated versions of Email package, Email trigger, and trigger listener

**Where can I download the Email package?**

You can download the Email package from the link in the following article: [Everything about Basic Authentication deprecation in Microsoft Exchange online \(A-People login required\)](#).

**Is the OAuth 2.0 feature backward-compatible with any of the previous releases of Automation 360?**

No. The OAuth 2.0 feature is not backward-compatible with previous Automation 360 releases. Therefore, you are requested to manually update the package released with Automation 360 v.25.

**What are the steps involved to update my impacted bots to switch to OAuth 2.0?**

See to the following documentation page for the steps to update your impacted bots and switching from Basic authentication to OAuth 2.0: [Deprecation of Basic authentication in Exchange Online](#) on page 101.

**What are the different grant types or flows supported for OAuth 2.0 in Automation 360?**

In Automation 360, there are two primary grant types that are supported for OAuth 2.0 across Email package and Email trigger:

- Client credentials: Email package and Email trigger
- Authorization code with PKCE: Email package

Within Email package, the individual **Connect**, **Send**, **Forward**, and **Reply** actions support each of these grant types as listed in the following table:

Action name	Email Server option	EWS option
<b>Email &gt; Connect</b>	Client credentials	Client credentials
	Authorization code with PKCE	Authorization code with PKCE
	—	ROPC or Silent
	—	Implicit or Interactive
<b>Email &gt; Send</b>	—	Client credentials
	Authorization code with PKCE	Authorization code with PKCE
	—	ROPC or Silent

Action name	Email Server option	EWS option
	—	Implicit or Interactive
<b>Email &gt; Forward</b>	Authorization code with PKCE	—
<b>Email &gt; Reply</b>	Authorization code with PKCE	—
<b>Email Trigger</b>	Client credentials	Client credentials

**Note:**

- The existing Silent flow has been renamed as ROPC (Resource Owner Password Credentials) and the existing Interactive flow has been renamed to Implicit.
- Both ROPC and Implicit grant flows are legacy flows, less secure, and are not recommended by Microsoft.
- The Client credentials flow for SMTP protocol is currently not supported by Microsoft to access Exchange Online.

- [OAuth grant types](#)
- [Authentication flow support in MSAL](#)
- [OAuth 2.0 Client Credentials Flow support for POP and IMAP protocols in Exchange Online](#)

**What will happen to my existing bots that use email automation when I update to the Automation 360 v.25 to update the default version of the Email package or Email trigger to the latest version?**

When you update to the latest version of the Email package or Email trigger, the existing bots that use email automation will include the following changes:

- If your bots are using the **Email server** option with IMAP or POP3 protocol, the **Authentication mode** option will be set to **Basic** by default to indicate that the action uses Basic authentication.

If the **Host** field in the **Email server** option uses a variable, the **Authentication mode** option will be set to **Basic**.

- If your bots are using the **EWS server** option with the **Authentication mode** option set to **Basic**, there is no change in the bots.

**Note:** This is the default scenario when you update the Email package.

### Why is the Send Email action marked as Deprecated in my existing bots?

- If your bots are using the **EWS server** option with the **Authentication mode** option set to **OAuth2-Silent**, the **Authentication mode** option will be set to **OAuth2 - ROPC** to indicate that the action uses the ROPC grant flow.
- If your bots are using the **EWS server** option with the **Authentication mode** option set to **OAuth2-Interactive**, the **Authentication mode** option will be set to **OAuth2 - Implicit** to indicate that the action uses the implicit grant flow.

When you update your bots with the latest version of the Email package, you will notice that the Send Email action used in your bots are marked as **Deprecated** due to the following reasons:

- We have created a new version of the Send Email action which provides support for OAuth 2.0 mode of authentication.
- The new Send Email action is available in the Email package version 3.14.1-20220831-084727 or later.
- The **Deprecated** message will help you differentiate the old Send Email action from the new Send Email action.

---

**Note:** The Send Email action that is marked as **Deprecated** will continue to work the same way as earlier without any changes. However, if you want to switch from Basic authentication to OAuth 2.0, you must replace the deprecated Send Email action with the new Send Email action and configure the required OAuth 2.0 parameters.

---

### Will Automation Anywhere provide any tool for Automation 360 customers to update their bots from Basic authentication to OAuth 2.0?

No. You will have to manually update your impacted bots to switch to OAuth 2.0.

### What is the guidance for Enterprise 11 customers if their bots are impacted by Basic authentication deprecation?

Enterprise 11 customers are recommended to migrate their Email automation bots to Automation 360 and leverage the OAuth 2.0 support. After migration, you can perform the following:

- Upload the new version of the Email package or Email trigger to Automation 360.
- Edit the impacted bots and set the latest version of Email package or Email trigger as default.
- Manually update your bots by switching from Basic authentication to OAuth 2.0.

---

**Note:** This guidance is applicable to both Cloud and On-Premises customers who are migrating to Automation 360.

---

### Are there any limitations when you update the Email package?

We recommend that you do not perform a bulk update of bots to change Basic authentication to OAuth 2.0. You must manually edit the bots and update to OAuth 2.0.

*[Deprecation of Basic authentication in Exchange Online](#) on page 101*

## Scan Automation 360 bots for Email action with Basic authentication usage

Automatically identify Automation 360 bots that are using Basic authentication mode in the Connect, Send, Forward, and Reply actions in the Email package and Email trigger, which are using IMAP, POP3, or EWS protocols.

- Ensure that the user credentials used to connect to the Control Room has the **View content** permission on the `Bots` folder.

The Bot Scanner utility connects to your Control Room using these credentials.

- Ensure that you meet the software and hardware requirements for using the Bot Scanner.

See *[Scan Enterprise 11 or 10 bots using Bot Scanner](#)* on page 1118.

1. Download the Bot Scanner utility using the link provided in the following article: *[Everything about Basic Authentication deprecation in Microsoft Exchange online \(A-People login required\)](#)*.
2. Extract the files from the zip file that you have downloaded and double-click the `Automation_360_Bot_Scanner_For_EOL_Features.exe` executable file to run the utility.

3. In the **Bot Scanner** page, ensure that the **Bots using Email action with Basic authentication** option is selected from the drop-down list, and then click **Continue**.

4. In the **Automation 360 Bot Scanner EOL features page**, perform these steps:
- Enter the Control Room URL that you want to connect to
  - Based on the authentication type configured in your Control Room, choose one of the following authentication methods in the **Authentication Type** field:

Authentication type	Steps
<b>Active Directory</b>	<ol style="list-style-type: none"> <li>1. Enter the <b>Username</b> (Domain\\username).</li> <li>2. Enter the <b>Password</b> (domain user password).</li> </ol>
<b>Database</b>	<ol style="list-style-type: none"> <li>1. Enter the <b>Username</b> (Control Room database username).</li> <li>2. Enter the <b>Password</b> (Control Room database user password).</li> </ol>

Authentication type	Steps
<b>Single Sign-On</b>	<ol style="list-style-type: none"> <li>1. Enter the <b>Username</b>.</li> <li>2. Enter the <b>API Key</b>.</li> </ol>

- Click **Test connection**.  
A connection success or failure message is displayed. Validate your credentials if the connection fails.
- In the **Select destination path** field, enter the location where you want to save the generated report.
- Click **Scan bots**.

**Automation 360 Bot Scanner for EOL Features**

**Control Room URL**

e.g. https:\\Automation Anywhere\\acmehealth.com\\CR23CN

---

**Authentication Type**

Database

**Username**

**Password**

[Test connection](#)

---

**Select destination path**

**Browse...**

Choose where to save report

**Scan bots** **Cancel**

The scanner scans all the bots in your Control Room repository for Basic authentication mode usage in the **Connect**, **Send**, **Forward**, and **Reply** actions in the Email package and Email trigger. After the scan is complete, a report (.CSV file) is available in the destination path you selected for your review.

- If a .CSV file already exists in the output folder, a message is displayed that the previous .CSV file will be deleted. When you click **Continue**, a new .CSV file is generated.

- If the previous .CSV file is in use, a message is displayed that the file cannot be deleted. Close the file and click **Scan bots**.

5. Click **Open report** to analyze the report.

The report contains the following details:

- TaskBot name: Name of the TaskBot.
- Line number: The line number of the **Connect**, **Send**, **Forward**, or **Reply** actions that are using Basic authentication.

For **Email trigger**, the line number will be empty.

- Package and action name: The Email package and action that is using Basic authentication.
- Searched text: The hostname of the Email server or the domain name of the EWS server for the respective action.
- Action and review message: Use this information to understand the action that you have to perform or the information that you have to review for the corresponding action containing Basic authentication.

See [Basic authentication scanning messages](#) on page 115.

- TaskBot path: The path to the repository where the bot resides.

After you identify the bots that are impacted due to Basic authentication, you can plan to update these bots in the Control Room repository to switch to OAuth 2.0 authentication. For more information on how to switch to OAuth 2.0, see [Deprecation of Basic authentication in Exchange Online](#) on page 101.

## Basic authentication scanning messages

The Bot Scanner report might display some messages for your review or action for updating bots that are using Basic authentication to OAuth 2.0 in the Email package or Email trigger. Messages provide detailed information about the action, error, or review required to update the bots.

<b>Code</b>	A1001
<b>Message</b>	<p>The Basic authentication mode that is used to connect to the email server is deprecated by Microsoft.</p> <p>For the bot to run, update the authentication mode by selecting OAuth 2.0 and configuring the required parameters. Otherwise, a connection error will occur.</p>

<b>Code</b>	A1002
<b>Message</b>	<p>The Basic authentication mode that is used to connect to the EWS server is deprecated by Microsoft.</p> <p>For the bot to run, update the authentication mode by selecting OAuth 2.0 and configuring the required parameters. Otherwise, a connection error will occur.</p>

<b>Code</b>	R1004
-------------	-------

**Message**

A variable is used in the 'Host' property of this bot. If the variable is pointing to 'office365.com', this can potentially have an impact on the action since the Basic authentication mode that is used to connect to the email server is deprecated by Microsoft.

You are advised to review the variable and update the authentication mode by selecting OAuth 2.0 and configuring the required parameters.

## Chrome and Edge Manifest V3 extensions

As Google will deprecate Manifest V2 extensions, this might impact your existing automations that use the current Manifest V2 extensions for Google Chrome and Microsoft Edge browsers. We have published Manifest V3 extensions with the Automation 360 v.26 release to help you start switching to Manifest V3 extensions.

### Manifest V2 based deprecation

A **manifest** is a specification that is used to build browser extensions. As Google is deprecating Manifest V2 based extensions, we recommend that you update to Manifest V3 based extensions, which provides an enhanced security, privacy, and performance.

**Impact to our customers:** Automations that use Google Chrome Manifest V2 based extensions will stop working sometime after June 2023. The deprecation timelines of Manifest V2 based extensions are currently under review and subject to change by Google.

- For Google Chrome Manifest V2 extensions timelines, see [Manifest V2 support timeline](#).
- For Microsoft Edge Manifest V2 extensions timelines, see [Overview and timelines for migrating to Manifest V3](#).

Post the given date, you must switch to Manifest V3 extensions for your automations to work. You can choose to use the enterprise group policy for both Google Chrome and Microsoft Edge to continue to use Manifest V2 based extensions. For more information on Manifest extensions support and timelines, see, [Manifest V3 transition timeline](#).

### Automation 360 features that use browser extensions

The following Automation 360 features use the Google Chrome or Microsoft Edge browser extension for web applications running on Google Chrome or Microsoft Edge:

- Bot Agent device registration with the Control Room (uses Chrome extension only)
- Automation of web applications through Universal Recorder or Browser package
- User interface based triggers
- Packages that use window titles, for example, OCR and Mouse Click

---

## Plan the switch to Manifest V3 extensions

---

**Note:** Manifest V3 extension is supported on Google Chrome and Microsoft Edge browsers version 91 and later only.

---

### Automation 360 customers:

We have published new Google Chrome and Microsoft Edge Manifest V3 extensions with the Automation 360 v.26 release. We will also continue to support Manifest V2 extensions until June 2023 to provide you time to switch to Manifest V3 extensions before Jan 2024 for Google Chrome. To know about Microsoft Edge Manifest V2 extensions timelines, see [Overview and timelines for migrating to Manifest V3](#).

You have the following options to switch to Manifest V3 extensions:

- **New customers:** Users starting with Automation 360 v.26 will directly use Manifest V3 extensions. You will not be impacted by the deprecation of Manifest V2 extensions.
- **Cloud customers:** Our Cloud deployments is updated to Automation 360 v.26 in October, and customers can switch to Manifest V3 extensions when they update their Bot Agent.
- **On-Premises customers:**
  - **Updating to v.26:** Customers updating from an earlier version to Automation 360 v.26 will switch to Manifest V3 extensions when they update their Bot Agent.
  - **v.25:** We have provided a Control Room patch with Automation 360 v.25. After installing the patch, the V2 extensions is switched to Manifest V3 extensions when you update the Bot Agent.
  - **v.24, v.23, and v.22:** For customers on Automation 360 v.24 or earlier, we strongly recommend that you update to Automation 360 v.26 or later releases. If you choose not to update, we will provide a set of steps to perform on all Bot Agent and Bot Runner devices to switch to Manifest V3 extensions. See [Manifest extension manual upgrade](#).
  - **v.21 and earlier:** We strongly recommend that you update to the latest version of Automation 360.

---

**Note:** You can choose to delay switching to MV3 extensions by using a Chrome group policy that extends support for Manifest V2 extensions until Jan 2024 for Google Chrome, see [Manifest V3 transition timeline](#). To know about Microsoft Edge Manifest

V2 extensions timelines, see [Overview and timelines for migrating to Manifest V3](#).

### Customers migrating to Automation 360

We recommend that you migrate to Automation 360 v.26, which uses Manifest V3 extensions by default. If you are migrating to Automation 360 v.25, install the Control Room patch, that we released in October.

### Enterprise 11 customers

For details, see [Enterprise 11: Deprecation of Basic authentication and MV2 extensions](#).

## Extend Manifest V2 extensions usage through group policy

You can choose to use the enterprise group policy for both Google Chrome and Microsoft Edge to continue to use Manifest V2 extensions till **Jan 2024**.

For information about Manifest V2 extension timelines for Google Chrome, see [Manifest V3 transition timeline](#). For Microsoft Edge, see [Overview and timelines for migrating to Manifest V3](#).

You can extend the Manifest V2 deprecation only using the group policy. This extension provides you adequate time to plan upgrading to Manifest V3 extensions. You can use any extension group policy to extend the use of Manifest V2 extensions.

To update the policy, perform these steps:

1. Copy the following entries to a `.txt` file and save the file as a `.reg` file.

- **Chrome:**

```
Windows Registry Editor Version 5.00
[HKEY_LOCAL_MACHINE\SOFTWARE\Policies\Google\Chrome
\ExtensionInstallForcelist]
"ExtensionSettings"="{\"kammdlphdfejlopponbapggpbgakimokm\":
{\"installation_mode\": \"normal_installed\", \"update_url\": \"http://
clients2.google.com/service/update2/crx\"}}"
```

- **Edge:**

```
Windows Registry Editor Version 5.00
[HKEY_LOCAL_MACHINE\SOFTWARE\Policies\Microsoft\Edge
\ExtensionInstallForcelist]
"ExtensionSettings"="{\"dbmodiepejcigljbmeebdkmegndokbk\":
{\"installation_mode\": \"normal_installed\", \"update_url\": \"https://
edge.microsoft.com/extensionwebstorebase/v1/crx\"}}"
```

2. Run the `.reg` file.
3. Restart the browser for the changes to take effect.

[Feature deprecations affecting Automation Anywhere products](#) on page 68

Review the features and capabilities (from Automation Anywhere or third party) that are deprecated or nearing deprecation to understand how they affect your automation and what action is required.

### Related tasks

[Switch Manifest V3 to Manifest V2 extension manually](#) on page 128

If you want to switch from Manifest V3 extension to Manifest V2 extension while remaining on Automation 360 v.26, you can manually switch to v2 extension.

[Manage multiple browser profiles for Manifest V3 extension](#) on page 126

Automation 360 v.26 automatically includes Manifest V3 extensions to support browser-based automation. However, these V3 extensions in v.26 are by default for a **single** browser profile only.

## Manifest V3 extensions FAQ

As Google will deprecate Manifest V2 extensions by June 2023, this might impact your existing automation that use the current Manifest V2 extensions for Google Chrome and Microsoft Edge browsers.

We have published Manifest V3 extensions with the Automation 360 v.26 release to help you start switching to Manifest V3 extensions.

### What is Manifest V2 extension deprecation?

A **manifest** is a specification using which browser extensions are built. Google is deprecating Manifest V2 extensions by **June 2023** for Google Chrome. To know about Microsoft Edge Manifest V2 extensions timelines, see [Overview and timelines for migrating to Manifest V3](#). The deprecation might impact your existing automations that use Manifest V2 extensions for Google Chrome and Microsoft Edge browsers. So, we recommend that you plan to switch to Manifest V3 extensions, which provide enhanced security, privacy, and performance. See the following resources for information on Manifest V2 extensions deprecation timelines: :

- Google Chrome: [Manifest V2 support timeline](#)
- Microsoft Edge: [Overview and timelines for migrating to Manifest V3](#)

### When will the Manifest V2 support end?

In **June 2023**, Manifest V2 extensions for Google Chrome will stop functioning. You can update the group policy for both Google Chrome and Microsoft Edge to extend the use of Manifest V2 extensions until **Jan 2024** . For Microsoft Edge Manifest V2 extension timelines, see [Overview and timelines for migrating to Manifest V3](#) for more information.

Support for Manifest V2 for Google Chrome ends in **Jan 2024** (see [Manifest V3 transition timeline](#)). To know about Microsoft Edge Manifest V2 extensions timelines, see [Overview and timelines for migrating to Manifest V3](#). You must switch to Manifest V3 based Google Chrome and Microsoft Edge browser extensions by then.

To extend support for Manifest V2, see [Extend Manifest V2 extensions usage through group policy](#) on page 118.

### How do I know if I am going to be impacted by the deprecation?

If you are using any or all of the following features on Google Chrome or Microsoft Edge browsers, you will be impacted by the Manifest V2 deprecation.

- Automation of web applications through Universal Recorder or Browser package
- User interface based triggers
- Bot Agent device registration with the Control Room
- Packages that use Browser variables, for example, Recorder, OCR and Mouse Click

### Do I have to do anything in advance of the deprecation?

To avoid being affected by the deprecation, you can choose one of the following options:

- Upgrade to Automation 360 v.26, which includes the latest Manifest V3 extensions.
- Switch to Manifest V3 extensions before **June 2023** if you are using Google Chrome. For Microsoft Edge Manifest V2 extensions timelines, see [Overview and timelines for migrating to Manifest V3](#).
- Update the group policy to extend support for Manifest V2 extensions.

See [Extend Manifest V2 extensions usage through group policy](#) on page 118.

### What should I do to extend the group policy to continue using Manifest V2 extensions?

You can use the group policy for both Google Chrome and Microsoft Edge browsers to extend support for Manifest V2 extensions. For more information, see the following articles:

- [Extend Manifest V2 extensions usage through group policy](#) on page 118
- [Manifest V3 transition timeline](#)
- [Overview and timelines for migrating to Manifest V3](#)

### Will the Manifest V2 extensions be automatically updated to V3 or do I have to manually add V3 extensions to the browser?

- If you are on Automation 360 v.26 or later, and if you have updated to Bot Agent 21.222 or later, you will be automatically updated to Manifest V3.
- If you are on Automation 360 v.25 and earlier, you must manually upgrade the Manifest V2 to V3. See [Manifest extension manual upgrade](#).

### Which Automation 360 versions are certified for upgrading from Manifest V2 to V3 extensions?

The following versions are certified for the upgrade:

- v.25
- v.24
- v.23
- v.22

**I plan to continue with Automation 360 v.25, so what should I do to continue using MV2 extensions?**

You can continue to use Manifest V2 extension only till **Jan 2024** for Google Chrome (see [Manifest V3 transition timeline](#)). To know about Microsoft Edge Manifest V2 extensions timelines, see [Overview and timelines for migrating to Manifest V3](#). You will have to perform manual steps to extend the support.

For more information, see [Extend Manifest V2 extensions usage through group policy](#) on page 118.

**What about the automations that I have already built using Chrome or Edge?**

If your automations are dependent on browser extensions, you must either upgrade to Manifest V3 extensions or extend support for Manifest V2 extensions for your automations to continue working after the deprecation.

**Do I need to update the Recorder package in the bots or will they continue to work with the earlier versions?**

The Recorder package will work as intended, so there is no need to update the package.

**I am using Automation 360 Cloud, so will my automations be impacted by the deprecation?**

Cloud deployments are automatically updated to the Automation 360 v.26 release, which includes Manifest V3 extensions. The Bot Agent in v.26 refers to Manifest V3 extensions.

---

**Note:** If the **Automatically update all bot agents** option in your Control Room settings is disabled on your device, you will not be automatically updated to Manifest V3 extensions. So ensure that this option is enabled to receive automatic updates. Alternatively, you have to install the Bot Agent manually on all the Bot Runner devices.

---

**How does the deprecation impact my migration?**

We recommend that you migrate to Automation 360 v.26, which uses Manifest V3 extensions by default.

If you are using Automation 360 v.25 or earlier, you must either upgrade to Manifest V3 extensions or extend Manifest V2 extensions before you migrate browser-based automations.

**Will the URL for the extensions change? Will the URLs that I have added in the trusted list for proxy settings be impacted?**

Yes, the URLs for the extensions are different for Manifest V2 and V3. Use the following URLs for Manifest V3:

- **Chrome:** [Google Chrome extension for Automation 360](#)
- **Edge:** [Microsoft Edge extension for Automation 360](#)

**Will Manifest V2 extensions be retained after I upgrade to Manifest V3?**

Until **Jan 2024**, you can continue to use the extensions for Google Chrome. To know about Microsoft Edge Manifest V2 extensions timelines, see [Overview and timelines for migrating to Manifest V3](#). However, these extensions cannot be modified after **December 2022**, so Automation Anywhere will not be able to make any updates to these

extensions after December 2023. Also see, [Manifest V3 transition timeline](#).

---

**Note:** If you are on Automation 360 v.26 release and using Bot Agent 21.222, you will see both Manifest V2 and Manifest V3 registry entries in the Windows Registry.

- You can remove the Manifest V2 entry from Windows Registry by uninstalling the existing Bot Agent 21.222 and installing the Bot Agent 21.222 again.
- You can remove the Manifest V2 extension from the **Extensions** page.

Uninstalling the Bot Agent will remove both Manifest V2 and Manifest V3 extensions.

[Uninstall or remove apps and programs in Windows](#)

---

**If Enterprise 11 and Automation 360 are running on the same device , will there be any conflicts due to the Manifest V2 deprecation?**

**As I am currently on Cloud deployment, I'd prefer to continue using Manifest V2 extensions. Can I continue to use Manifest V2?**

**Do I have an option to upgrade my devices in a phased or staggered manner?**

**Can I continue to use Manifest V2 extensions with the latest version of Automation 360?**

There will be no impact in such scenarios because the Manifest V3 extensions IDs are different for Enterprise 11 and Automation 360.

We recommend that you upgrade to the latest Automation 360 version to get the benefits of Manifest V3 extensions. However, if you still want to continue using Manifest V2 based extensions, ensure that you disable the **Automatically update all bot agents** option (in the Control Room settings) for all devices and ensure that users do not install the latest Bot Agent. This is required because the Automation 360 v.26 Bot Agent supports only Manifest V3 extensions.

Yes, you can upgrade your devices in a staggered manner to Manifest V3. You can disable the **Automatically update all bot agents** option for all devices and then select the devices individually for which you want to upgrade the Bot Agent.

Manifest V2 extensions are updated to Manifest V3 extensions when you update Bot Agent to the corresponding version of Automation 360 v.27. Any existing configurations in the Manifest V2 extensions are overwritten.

Starting from Automation 360 v.26, Manifest V3 extensions are bundled with the Bot Agent installation. Therefore, Manifest V3 extensions are installed when you update the Bot Agent. To continue using the Manifest V2 extensions:

- Ensure that you do not update the Bot Agent.
- Select **Disable auto updates** option in Control Room before updating your existing Automation 360 version.

**Can I revert the upgrade from Manifest V3 to V2?**

See [Automatically update the Bot Agent](#) on page 1001.

Yes, you can switch from Manifest V3 to V2. Update the JSON file with following Manifest V2 extension IDs:

- Chrome V2 Extension ID:  
kammdlphdfejlopponbapggpbgakimokm
- Edge V2 Extension ID:  
dbmodiepejcgjljbmeebdkmegndokbk

For more information, see [Switch Manifest V3 to Manifest V2 extension manually](#) on page 128.

**I had switched from Manifest V3 to V2 extensions for Automation 360 v.26. Can I now update to Manifest V3 extensions when I update Automation 360 to v.27?**

When you update to Automation 360 v.27, the corresponding Bot Agent is also updated. Manifest V3 extensions are installed with the latest version of Bot Agent.

Additionally, ensure that you select **Enable Automation 360 extension for this browser profile** option on Google Chrome and Microsoft Edge browsers. See [Manage multiple browser profiles for Manifest V3 extension](#) on page 126.

---

**Note:** If you are currently using Manifest V2 extensions or earlier versions, we recommend that you update and use the Manifest V3 extension.

---

**My bot uses a Recorder package from an earlier Automation 360 version and has a hard-coded Manifest V2 extension ID in it. How do I change the extension ID?**

When you update to Automation 360 v.26, the extension ID for Manifest V3 is updated automatically.

**My application has IFrame with Content Security Policy enabled. Will the Run JavaScript action run the JavaScript inside the IFrame?**

With Manifest V3, Google has restricted access to IFrame where Content Security Policy (CSP) is enabled in target page. If your business application does not have CSP enabled, you will be able to run JavaScript inside the IFrame. If your business application has CSP enabled, you will not be able to run JavaScript inside the IFrame and the **Run JavaScript** action will timeout or fail.

**What version of the browsers are supported for Manifest V3?**

Manifest V3 is supported on Google Chrome and Microsoft Edge Version 91 and later.

**I am currently on Automation 360 v.26. Can I switch to Manifest V2 extension?**

Yes, you can switch to Manifest V2 extension while being on Automation 360 v.26. For more information, see [Switch Manifest V3 to Manifest V2 extension manually](#) on page 128.

**I am currently on Automation 360 v.26. Are there any settings that I have to configure to continue to avail the latest browser extension versions?**

If you have an internet connection, you will continue to receive the updates through automatic updates.

**Can I use MV3 extension offline or without internet connection?**

MV3 extensions are automatically installed when you update the Bot Agent to the latest version. MV3 based offline extensions are available for:

- Google Chrome from Automation 360 v.26.  
See [Install Chrome Plugin offline or without internet access in Automation 360](#).
- Microsoft Edge from Automation 360 v.27.

For additional help, contact Automation Anywhere support.

### Will there be any impact to the remote agent that I have been using?

The remote agent installed with Automation 360 v.25 or earlier is not compatible with the Manifest V3 extension. You must install the latest Automation Anywhere remote agent and use the latest Recorder package.

See [Install Automation Anywhere remote agent for Citrix 2.0: Recorder package version 2.8.6](#) on page 845.

### What are the prerequisites to configure the browser extension settings?

Following are the prerequisites to configure the browser extension settings:

- Bot Agent version 21.222 or later.
- You must have installed the Bot Agent with installation type as system-wide.

### How to remove the Manifest V3 group policy?

**For Google Chrome:** Navigate to [HKEY\_LOCAL\_MACHINE\SOFTWARE\Policies\Google\Chrome\ExtensionInstallForcelist] and remove the entries that contain bbocnojhhoegfffpcllbeigipedjedf as the extension ID.

**For Microsoft Edge:** Navigate to [HKEY\_LOCAL\_MACHINE\SOFTWARE\Policies\Microsoft\Edge\ExtensionInstallForcelist] and remove the entries that contain fnmjcdajlonpigpcfnemeikipmolbfii as the extension ID.

Restart the browser for the changes to take effect.

### After updating to Automation 360 v.26, do I have to disable Manifest V2 extensions?

When you upgrade to Automation 360 v.26, Manifest V3 extensions is installed automatically, without impacting the already installed Manifest V2 extensions. Both Manifest V2 and V3 extensions can co-exist. The Manifest V2 extension does not interfere with Manifest V2 extensions. You can remove the Manifest V2-based extensions as needed.

### How to remove the MV2 extension?

**For Google Chrome:** Navigate to HKEY\_LOCAL\_MACHINE\SOFTWARE\WOW6432Node\Google\Chrome\. Expand Extensions folder and remove the folder by name kammdlphdfejlopponbapppbgakimokm.

### How to remove the MV3 extension?

**For Microsoft Edge:** Navigate to HKEY\_LOCAL\_MACHINE\SOFTWARE\WOW6432Node\Microsoft\Edge. Expand `Extensions` folder and remove the folder by name `dbmodiepejcgjljbmeebedkmegndokbk`.

Alternatively, go to the **Extensions** page of your respective browser and remove the entry related to Manifest V2.

**For Google Chrome:** Navigate to HKEY\_LOCAL\_MACHINE\SOFTWARE\WOW6432Node\Google\Chrome\. Expand `Extensions` folder and remove the folder by name `bbocnojhhoegfffpcllbeigipedjedf`.

**For Microsoft Edge:** Navigate to HKEY\_LOCAL\_MACHINE\SOFTWARE\WOW6432Node\Microsoft\Edge. Expand `Extensions` folder and remove the folder by name `bbocnojhhoegfffpcllbeigipedjedf`.

Alternatively, go to the **Extensions** page of your respective browser and remove the entry related to Manifest V3.

### How to force enable Google Chrome or Microsoft Edge extension for user-specific Bot agents?

You can force enable the Manifest V3 extension on Google Chrome or Microsoft Edge by running the .reg files for Manifest V3. See [Manifest extension manual upgrade](#).

### How to add an extension force group policy if another extension policy has already been added by my IT team?

If a key by name **1** is already present, create a key name with the subsequent number, in this case, **2**. See the following articles:

- [ExtensionInstallForcelist](#) for Google Chrome
- [ExtensionInstallForcelist](#) for Microsoft Edge.

### I have installed the latest Bot Agent and am currently on Automation 360. However, I ignored the browser extension pop-up dialog box. What do I do?

If you updated the Bot Agent when you launched a browser, you will be prompted to add or remove the Manifest V3 extension with a pop-up dialog box. To enable the Manifest V3 extension, you must select the **Add Extension** option. If you ignore the pop-up dialog box, the Manifest V3 extension is disabled. To enable the extension and apply the group policy, you must restart your browser.

### How do I continue to use Manifest V2 extensions with Automation 360 v.26 and later versions?

We recommend that you upgrade to the latest Automation 360 version to get the benefits of Manifest V3 extensions. However, if you still want to continue using Manifest V2 based extensions, ensure that you disable the **Automatically update all bot agents** option (in the Control Room settings) for all devices and ensure that users do not install the latest Bot Agent. This is required because the Automation 360 v.26 Bot Agent supports only Manifest V3 extensions.

You can continue using Manifest V2 extensions until for Google Chrome until **Jan 2024** (see [Manifest V3](#)

*transition timeline*). To know about Microsoft Edge Manifest V2 extensions timelines, see [Overview and timelines for migrating to Manifest V3](#).

### Related concepts

[Chrome and Edge Manifest V3 extensions](#) on page 116

As Google will deprecate Manifest V2 extensions, this might impact your existing automations that use the current Manifest V2 extensions for Google Chrome and Microsoft Edge browsers. We have published Manifest V3 extensions with the Automation 360 v.26 release to help you start switching to Manifest V3 extensions.

[Manually upgrade from Manifest V2 to V3 extensions for Chrome and Edge](#)

[Feature deprecations affecting Automation Anywhere products](#) on page 68

Review the features and capabilities (from Automation Anywhere or third party) that are deprecated or nearing deprecation to understand how they affect your automation and what action is required.

## Manage multiple browser profiles for Manifest V3 extension

Automation 360 v.26 automatically includes Manifest V3 extensions to support browser-based automation. However, these V3 extensions in v.26 are by default for a **single** browser profile only.

You can enable browser extension for only one browser profile at a time. If you have multiple browser profiles, you must enable browser extension only from the profile that is used to run the bots. You must disable the Automation 360 browser extension from all other browser profiles. You also have the option to debug logging, for troubleshooting purposes.

---

**Note:** This procedure is applicable only if your browser is using Manifest V3 extension.

---

To enable or disable the browser extension individually for each browser profile, perform these steps:

1. Open the Google Chrome or Microsoft Edge browser:
  - On Microsoft Edge, navigate to **Extensions > Automation 360 > Extension Options**.
  - On Google Chrome, navigate to `chrome://extensions/` and select **Details** in Automation 360 and select **Extension options**.

The following page is displayed:

### Enable Extension Functionality

Enable Automation 360 extension for this browser profile

Only one profile per browser is supported. Enable this option only on the profile which will be used for automation.

### Debug Logging Options

Enable debug logging

Displays extension activity messages on the developer console. Enable this option for troubleshooting issues with the extension.

Enable ALL logging

Enable native messenger logging

Enable script execution logging

**Save**

2. Select or deselect the **Enable Automation 360 extension for this browser profile** option.

---

**Note:** When you enable this option, only the current active profile is used for communication with the Bot Agent.

---

3. Select the **Enable debug logging** option to troubleshoot any browser extension issues.
4. Click **Save** and then restart the browser for the changes to take effect.
5. Verify that the debugging option is enabled for this browser profile by performing these steps:
  - a) Press **F12** key or **Ctrl+Shft+I** keys on an active browser window.
  - b) In the **Developer** console, select the **Application** tab and then select **Service Workers**.
  - c) Click **See all registrations**.

In the **Service Workers** window, the extension ID in `chrome://extensions` and the ID in the **ServiceWorker** window will be the same. Also, the **Log** field displays the logs continuously.

### Related tasks

[Switch Manifest V3 to Manifest V2 extension manually](#) on page 128

If you want to switch from Manifest V3 extension to Manifest V2 extension while remaining on Automation 360 v.26, you can manually switch to v2 extension.

## Switch Manifest V3 to Manifest V2 extension manually

If you want to switch from Manifest V3 extension to Manifest V2 extension while remaining on Automation 360 v.26, you can manually switch to v2 extension.

To switch Manifest V3 extension to Manifest V2 extension manually, perform these steps:

1. Disable the Manifest V3 extension from the browser extension options.  
See [Manage multiple browser profiles for Manifest V3 extension](#) on page 126.
2. Edit the browser agent JSON file to replace the browser extension ID.
  - **Chrome**
    - a. Navigate to `C:\Program Files\Automation Anywhere\Bot Agent\AABrowserAgent\`.
    - b. Open the `AAChromeAgentManifest.json` file.
    - c. Replace the browser extension ID `bbocnojhhoegffpcllbeigipedjedf` to `kammdlphdfejlopponbapppbgakimokm`.
    - d. Restart the browser for the changes to take effect.
  - **Edge**
    - a. Navigate to `C:\Program Files\Automation Anywhere\Bot Agent\AABrowserAgent\`.
    - b. Open the `AAEdgeAgentManifest.json` file.
    - c. Replace the browser extension ID from `fnmjcdajlonpigpcfnemeikipmolbfii` to `dbmodiepejcgjljbmeebdkmegndokbk`.
    - d. Restart the browser for the changes to take effect.

Alternatively, download the JSON files from the link given below, and replace the files at the Bot Agent installation location ( typically located at `C:\Program Files\Automation Anywhere\Bot Agent\AABrowserAgent`) on your Bot Agentmachines.

- **For Chrome:** Download the `AAChromeAgentManifest.json` from [Google Chrome JSON file download for Manifest V2](#).
- **For Edge:** Download the `AAEdgeAgentManifest.json` file from [Microsoft Edge JSON file download for Manifest V2](#).

If you have uninstalled the Manifest V2 extension manually, you must reinstall it from the [Chrome web store](#). Otherwise, your web-based automation might not continue to work.

If you are facing any issues, see [Google Chrome extension troubleshooting](#) on page 1323.

As Google will deprecate Manifest V2 extensions , this might impact your existing automations that use the current Manifest V2 extensions for Google Chrome and Microsoft Edge browsers. We have published

Manifest V3 extensions with the Automation 360 v.26 release to help you start switching to Manifest V3 extensions.

[Manually upgrade from Manifest V2 to V3 extensions for Chrome and Edge](#)

## Deprecation of Tesseract OCR v3

IQ Bot will permanently discontinue Tesseract OCR v3 starting from Automation 360 v.26. This affects customers who have created learning instances using Tesseract OCR v3. We recommend that you plan to train your learning instances with alternative OCRs (including Tesseract OCR) before you update to Automation 360 v.26.

Removal of Tesseract OCR will affect the following product areas:

- **My Learning Instances page:**

Instance name	ID	Provider	# of IQ Bots	# of Files	Training %	Actions
20-8815-Smoke-Invoice-T4		Tesseract3 OCR	8	0	38%	<input type="checkbox"/> <input type="checkbox"/>
26		Tesseract4 OCR	0	1	0%	<input type="checkbox"/> <input type="checkbox"/>
26Shiva		Tesseract4 OCR	0	1	0%	<input type="checkbox"/> <input type="checkbox"/>
26www		Tesseract4 OCR	3	18	0%	<input type="checkbox"/> <input type="checkbox"/>
CheckValidationIssue		Abbyy OCR	0	2	0%	<input type="checkbox"/> <input type="checkbox"/> <input type="checkbox"/>
checkvalidations		Tesseract4 OCR	2	2	0%	<input type="checkbox"/> <input type="checkbox"/> <input type="checkbox"/>

For all **Tesseract3 OCR** learning instances, the **Set the instance to Production** button and **Launch Validator** button are unavailable.

- **My Learning Instance details page:**

- Select the Tesseract OCR v3 learning instance and go to the **Learning Instance details** page.
- The **Set to staging**, **Add group**, **Validate**, **Edit**, and **Train** buttons are unavailable.

The screenshot shows the 'Learning Instance details' page for '20-8815-Smoke-Invoice-T4'. The page is titled 'IQ Bot' and shows a progress bar with stages: create, classify, train, and production. The 'production' stage is active. Below the progress bar, there is a 'Production' button and a set of disabled buttons: 'Set to staging', '+ Add group', 'Validate', 'Edit...', and 'Train...'. The page also displays a 'DOCUMENT GROUPS' section with a 'SUMMARY' tab. A 'Groups' table is shown with 13 groups, and a 'Training %' bar chart indicates 38% training progress.

Name	Description	Label	In use by	# of traini...	Training ...	Training ...	# of prod ...	Pages up...	Productio...	Productio...	Pri...	IT	Actions
Group_42	--		--	1	0	1	0	0	0	0			Create bot
Group_5681	test	shiva	--	1	0	1	0	0	0	0			Edit bot

- **Edit Bot page:**
  - In the **My Learning Instance** page, click the **Edit bot** button of any existing bot.

The screenshot shows the Automation Anywhere interface for a bot named '20-8815-Smoke-Invoice-T4' in 'Production' mode. The left sidebar contains navigation options: DASHBOARDS, LEARNING INSTANCES, DOMAINS, BOT, and ADMINISTRATION. The main area shows 'DOCUMENT GROUPS' with a 'SUMMARY' tab. A progress bar indicates 'Training %' at 38%. Below is a table of groups:

Name	Description	Label	In use by	# of train...	Training ...	Training ...	# of prod ...	Pages up...	Productio...	Productio...	Pri...	IT	Actions
Group_42	--		--	1	0	1	0	0	0	0			Create bot
Group_5681	test	shiva	--	1	0	1	0	0	0	0			Edit bot
Group_5682	Add description	--	--	1	0	1	0	0	0	0			Edit bot
Group_5683	--	123 Abc	--	1	0	1	0	0	0	0			Create bot

- The **See extraction result**, **Save and close**, **Save and go to next group**, and **Delete Bot** buttons are unavailable.

The screenshot shows the 'Review group 5681 mapping' page. The top navigation bar includes 'IQ Bot' and 'Learning Instances > 20-8815-Smoke-Invoice-T4 > Review group 5681 mapping'. The main heading is 'Review group 5681 mapping'. Below the heading are three buttons: 'See extraction results', 'Save and close', and 'Save and go to next group', which are highlighted with a red box. The page is divided into two main sections: 'To train a group:' and 'Fields'.

**To train a group:**

- Click each field (left panel) to verify the label and value (center panel) is the same as the document (right panel).
- Preview the mapping after all fields are verified.
- Save and go to the next group.

**Fields:**

Field	Status

Group_5685	--	20-8815-Smoke-Invoice-T4		active	0 / 0	0 / 0	

- There is no change in the **Dashboard** page, and it continues to show Tesseract 3 metrics.

## Automation 360 Cloud for secure access and connectivity

You can develop and run bots securely using the Automation 360 Cloud access security.

### High-level architecture of Cloud deployment

The following information provides a high-level workflow of the Automation 360 Cloud deployment:

1. Using a browser, you log into the Control Room and create users and roles. You perform this process on the Automation 360 Cloud.
2. You install the Bot Agent on your Windows device to run bots locally. You perform this process on your infrastructure.
3. Data flow between the Automation 360 Cloud and the Bot Agent on your Windows device on your infrastructure is encrypted using TLS 1.2 (outbound port 443 only).

The following image shows the Automation 360 Cloud architecture:

## Identity and Access Management (IAM) security for user system

- When an admin user logs into the Automation 360 Control Room for the first time, the admin can configure SAML 2.0 to connect the Automation 360 Cloud Control Room to their own Identity Provider (IdP) so that their users can log in to the Control Room using MFA (multi-factor authentication).
- The admin can then create the required users and roles or permissions to perform certain activities (such as developing and running bots) in the Control Room.
- The Automation 360 Control Room users can then log in through MFA and start creating and running bots.
- Additionally, the admin can configure an allowed IP address range to manage user logins through the Administrator settings in the Control Room.

To learn more about Automation 360 Cloud, see [Get started with Automation 360 Cloud](#) on page 790.

## Secure connectivity to run bots

You run bots locally on a Windows machine on which the Bot Agent is deployed. You can download and install the Bot Agent on your devices or deploy to a pool of virtual machines.

Before you install the Bot Agent, the following criteria must be met:

- The integrity of the device on which the Bot Agent is installed is not compromised.
- The user organization has instituted security safeguards and controls to prevent Bot Agent takeover and system-level user breaches.
- The user environment is safe from network-based attacks such as Domain Name System (DNS) cache poisoning, Address Resolution Protocol (ARP) spoofing, and so on.

---

**Note:** Automation 360 Cloud includes security operation controls to check for man in the middle (MITM) attacks and malicious intercepts.

---

### Bot Agent installation and registration

When you register your device, the Bot Agent device is provided a JSON Web Token (JWT) to start the registration process with the Control Room. If the token provided by the Bot Agent device does not match the token provided by the Control Room, the registration process will fail. This authenticates the client Bot Agent device to the Control Room.

In the bulk installation and registration mode of the Bot Agent, the Bot Agent device comes online preregistered with the Control Room URL specified in the `autoregistration.properties` file. When using the bulk registration settings, one cannot enter or specify a fake Control Room URL without administrator privileges on that device. When the Bot Agent starts for the first time, it will read the `autoregistration.properties` file and register itself to the Control Room URL specified in the properties file. By default, the option to switch the Bot Agent registration from one Control Room to another is disabled. Only the Control Room administrators can enable this option. If someone tries to register another URL when this option is disabled, the registration would

## Communication between Bot Agent and Control Room

fail immediately and generate an error mentioning that says Control Room is already registered and switching of the Control Room URL is not allowed.

By providing write access to a cache folder for the admin only and read permissions to all other users who can run bots, we can assure that when a bot is downloaded to the device cache, it cannot be manipulated to perform potentially harmful things.

The Bot Agent device establishes a websocket connection to the Control Room using HTTPS (outbound port 443) and no inbound connection is required.

- **Server authentication:** The Transport Layer Security (TLS) handshake ensures that the Common Name (CN) in the server certificate issued by the well-known certification authority (CA) matches the legitimate hostname as included in the certificate chain of trust.
- **Client authentication:** After registration, a valid token key is always required from the Bot Agent to establish a connection to the Control Room. The token is encrypted using the Bot Agent private key and can only be decrypted by using the Bot Agent public key that was used when the Bot Agent device was registered to the Control Room. The token also authenticates the Bot Agent device every time the Bot Agent connects to the Control Room.

Data connection between a customer's network and the Cloud service is protected with a strong TLS connection that leverages at least 2048-bit RSA server certificates, 128-bit symmetric encryption keys, and stronger TLS protocols. This secure connection makes it virtually impossible to breach the established TLS connection.

After the websocket connection is established, the communication between a customer's network and the Cloud service is secured and bidirectional. The connection between the Bot Agent device and the Automation 360 Cloud hosted Control Room is permanent and automatically reestablished if connectivity is lost. This connection is used to download the bots to run and send operational status information to the Control Room.

---

**Note:** The connectivity is established only one time and not for each bot.

---

## Schedule bots to run

Control Room users can schedule bots to run. Compiled bots are downloaded to run on the Bot Agent devices and operational logs are sent from the Bot Agent devices to the Control Room.

## Secure credentials for bots

For the bots to run, the Bot Agent establishes an active Windows session by authenticating as the licensed Bot Runner user on the Bot Agent device.

Bots that run on the Bot Agent devices need to log in to the device using credentials. You can store credentials securely in the Automation 360 Cloud Control Room credential vault. Alternatively, you can store credentials in a customer-hosted key management system (for example, CyberArk). When you store credentials in the customer-hosted key management system, you must have connectivity between the Control Room and the customer's key management system. To provide connectivity and allow access, you must configure the Automation 360 Cloud IP addresses for the specific Automation 360 Cloud region that is hosting the Control Room in their firewall. For more information, see [Automation 360 IP addresses for external integrations](#) on page 2070.

## Secure operations in Automation 360 Cloud

Automation 360 Cloud is run securely and meets compliance standards for: SOC 1, SOC 2, ISO 27001, and HITRUST.

- For information about Automation 360 Cloud deployment and operational models, see [Automation 360 Cloud Security and Data Privacy](#).
- For Automation 360 Cloud compliance reports, see [Security and Compliance Portal](#).

## Automation 360 v.28 Release Notes

*Release date: 5 April 2023*

Review the top 5 features in this release as well as other new features and exciting enhancements for Automation 360 v.28 release. Automation 360 and IQ Bot are on Build 17506 (for On-Premises).

### Highlights of this release

Here are the **top 5** features in the v.28 release:

#### **Document Automation and Google Document AI**

*Validation-based improvement on Google Document AI extractions:* Empower your employees to save time and automate more documents using Document Automation and Google Document AI validation feedback, which in turn provides improved extraction accuracy for Document AI learning instances.

*Leverage integration update with the latest Google Document AI parsers:* Improve extraction accuracy and enable 7 additional languages (including Italian and Portuguese) for Document AI invoices, and Japanese for Document AI expense receipts.

The screenshot shows a 'Create Learning Instance' dialog box with the following fields and options:

- Name:** Text
- Description (optional):** Demo test scenario
- Document Type:** Invoices
- Language:** English
- Locale:** English (United States)
- Provider:** Google Document AI

Additional features highlighted by callouts:

- Improved accuracy using validation:** Indicated by a checkmark icon and a callout box.
- Additional languages:** Indicated by a globe icon and a callout box.
- Ability to format dates and number:** Indicated by a calendar icon and a callout box.

At the bottom of the dialog, there is a checkbox labeled 'Improve accuracy using validation' which is checked. Below it, a note states: 'Google Document AI can extract documents in other languages besides the language you selected above. The system learns from user-provided changes in the Validator.'

### CoE Manager: Value tracking for On-Premises automations

Calculate ROI for automations running on an On-Premises Control Room by running a bot to push automation-run data to CoE Manager. View your ROI data in real-time dashboards and create a healthy pipeline of automations that will help propel your business forward.

### Empower business users with Automation Co-Pilot and Microsoft Teams

Bring automation to your employees in their favorite collaboration tool Microsoft Teams. Employees can be in a chat or team channel, or open Automation Co-Pilot from the Apps menu to view a list of the AARI processes and desktop automations they have access to. They can start and monitor these automations, without having to leave Teams.

## Workday package

Easily automate your Workday processes such as reporting, data upload/download, or triggering workflows with our new point-and-click experience. Our new package provides deep API-level integration with Workday that enables you to build automations easily, without having to code.

## Enhance developer productivity

*Next-gen Recorder:* Improve automation reliability for web applications when the UI element is not visible

on the screen. The Recorder will automatically work around this without any developer intervention.

*Email automation through a shared mailbox:* Automate email tasks over a shared mailbox in Microsoft 365 Outlook using IMAP or EWS protocols and Client Credential flow or PKCE flow with Exchange Online. This feature saves you money, time, and effort in maintaining individual personal mailboxes.

*Quickly search and replace any text or variables in the action properties of the bot:* Save time and improve developer productivity with an automatic search and replace tool in Bot Assistant. Users can quickly search for any specific text or variable, navigate through the search results, and selectively replace each occurrence of the text or variable in the automation.

*Enhancement to bulk package update:* As an automation administrator, update multiple packages in bulk or perform updates to specific bots and view outcomes of these applied updates in a system-generated report.

## What's new and changed in each product

Navigate to the following pages for details on all the updates (what's new, changed, fixed, and limitations) in each product:

<a href="#">RPA Workspace v.28 release</a> on page 148
<a href="#">CoE Manager v.28 release</a> on page 165
<a href="#">AARI v.28 release</a> on page 166
<a href="#">IQ Bot and Document Automation v.28 release</a> on page 168
<a href="#">Bot Insight v.28 release</a> on page 171

## RPA Workspace v.28 release

Review what's new and changed, and the fixes and limitations in RPA Workspace for the v.28 release.

### What's new

<b>Control Room, devices, and Bot Agent</b>
<p><b>Select the Control Room services to run at startup</b> (Service Cloud case ID: 00781074, 00804237, 00799057, 01260425, 01271130, 01793867)</p> <p>You can optimize application process utilization on your device by selecting the Control Room services that you want to automatically run at startup during the On-Premises installation.</p>
<p><b>Improved notifications administration to manage user access</b></p> <p>A Control Room administrator can manage a user's access to the event categories set in the <b>Administration &gt; Settings &gt; Notification settings</b> section. A Control Room administrator can lock the required preferences and notifications only for those enabled event categories that are sent to the end users.</p>
<p><b>Monitor bot runtime, device pool, and license events through notifications</b></p> <p>Through notifications, you can monitor all:</p> <ul style="list-style-type: none"> <li>• Bot runtime events: Bot runtime event notifications are sent to the respective users based on bot access permissions.</li> <li>• Device pool related events: Device pool-related event notifications are sent to users based on their user role and permission in the Control Room.</li> <li>• License events (such as license over subscription or consumption): Email notifications are sent for license over subscription or consumption events.</li> </ul>
<p><b>Monitor AARI events through Control Room notifications</b></p> <p>With the <b>Process events</b> category, the Control Room notifies you about various AARI events related to requests and tasks through notifications. The task and request event notifications are sent to the task owner and request creator team, respectively.</p>
<p><b>Audit log event when a package is deleted</b> (Service Cloud case ID: 01780700, 01885638)</p> <p>An audit log event is logged when a user deletes a package.</p>
<p><b>Import intermediate certificates for secure access to Control Room</b> (Service Cloud case ID: 00673966, 01889608)</p> <p>An intermediate certificate is used to determine if a certificate was issued by a valid and trusted root CA (certificate authority). If the intermediate certificate is not installed on the server where the TLS certificate is installed, applications might not trust the TLS certificate. To have clients trust the TLS certificate, you must make the intermediate certificates available on the server.</p> <p>You can import the intermediate certificates when you install the Control Room or after you install the Control Room using the Windows command prompt.</p>

<b>Control Room, devices, and Bot Agent</b>
<p><b>Validate remote deployments to avoid unauthorized device access</b> (Service Cloud case ID: 01608589)</p> <p>Prior to assigning a device for bot deployment, you can reset the bot running device for Bot Creator, Citizen Developer, and attended Bot Runner users to prevent unauthorized deployments. This enhancement enables you to clear an existing bot running device when users log into the Control Room and there is no Bot Agent available on the local device.</p>
<p><b>Configure username for different Automation 360 services using the CyberArk secret response</b> (Service Cloud case ID: 01852428, 00675147, 01950039, 00819460, 00830696, 00822765)</p> <p>You can configure usernames for auto-login, Lightweight Directory Access Protocol (LDAP), and service credentials using the CyberArk secret response. Usernames can be a combination of values from the secret response or string literals. The CyberArk secret response contains field values that you must enclose within dollar signs (\$\$) to construct the username. For example, to configure the username in the format <code>domain\username</code>, you must enter: <code>\$\$domain\$\$\\$\$username\$\$</code>. The domain and username values in this expression will be replaced with the corresponding values from the secret response.</p>
<p><b>Customize device registration settings</b></p> <p>Control Room administrator can customize the device registration settings while adding a device. For example, if there are multiple users who will log into a single device, an administrator can change the <b>Device type</b> to <b>Multiple users</b>.</p>
<p><b>Minimize security risk for trigger-based bot deployment</b></p> <p>Prior to deploying a trigger-based bot, you can select to validate the device credentials for Bot Creator, Citizen Developer, and attended and unattended Bot Runner users. This provides users additional security for trigger-based bot deployment.</p>
<p><b>Auto-connect to non-UI triggers for unattended users</b></p> <p>As an unattended user who uses non-UI triggers (such as File/Folder trigger that do not require user session) you can auto-connect to the RPA Workspace when the machine is rebooted. You do not need to log in to ensure the triggers are running.</p> <p><b>Service Cloud case ID:</b> 00758775, 01754312, 01754887, 01803179, 01844357, 01845563, 01568082, 01866287, 01920491, 01951355, 01951355, 01957771</p>

<b>Packages, actions, and Bot editor</b>
<p><b>Workday package</b></p> <p>You can use the new Workday package from Automation 360 to automate your Workday processes such as reporting, data upload/download, or triggering workflows with our new point-and-click experience. The package provides deep API-level integration with Workday that enables you to build automations easily, without having to code.</p>
<p><b>Apigee package</b></p> <p>You can use the new Disconnect and Resume Integration features in the Apigee package. You can disconnect from your Apigee instance and clear the session using the Apigee Disconnect action. You can resume an integration that is suspended in Apigee using the Apigee Resume Integration action.</p>

<p><b>Packages, actions, and Bot editor</b></p>
<p><b>Salesforce package</b></p> <p>You can retrieve the entire result set in the response of the Salesforce Execute SOQL actions. In the previous version, the response was limited to retrieve the first 2000 records and this limit has been removed.</p>
<p><b>View mode supports the ability to copy</b></p> <p>You can use the <b>Copy to shared clipboard</b> functionality to copy actions, triggers, and metadata from a bot in a private repository that is in <b>View</b> mode. You can then use the <b>Paste from shared clipboard</b> to paste the information to an editable bot.</p>
<p><b>Credential Picker listing enhancement</b></p> <p>For easier navigation when you pick a credential, the <b>Credential Picket</b> option displays the <b>Locker</b>, <b>Credential</b>, and <b>Attributes</b> items alphabetically across the bot packages.</p>
<p><b>Extended attributes supported in the Terminal Emulator Package</b> (Service Cloud case ID: 01870633, 01928396, 01809815)</p> <p>The TN3270E terminal type supports extended attributes. To enable extended attributes for TN3270E terminals, select the <b>Extended Attribute</b> check box in the <b>Connect</b> action.</p>
<p><b>Enhanced Packages landing page</b></p> <p>The Package Manager landing page has been enhanced to provide more clarity with consolidated rows. When all versions of a package are disabled the status displays as <b>Disabled</b>. All related fields, such as recommended Control Room version, Bot Agent version, and Last modified, will show the status as <b>Not Available</b>.</p> <p>The <b>Version</b> column has been renamed to <b>Default version</b>.</p>
<p><b>Enhanced error messages display errors from the child bots</b> (Service Cloud case ID: 01264352)</p> <p>When you create a bot where the parent bot calls a child bot, and if an error occurs in the child bot, the error message provides the following details:</p> <ul style="list-style-type: none"> <li>• Line number of the parent bot which ran the child bot.</li> <li>• Line number of the child bot where the error occurred.</li> <li>• Error message details, such as what went wrong with that line number and the corresponding corrective action.</li> </ul>
<p><b>Timeout option in Database Connect action</b> (Service Cloud case ID: 00753858)</p> <p>We added a timeout option in the <b>Connect</b> action of the Database Package. When you connect with Microsoft SQL Server to automate database-related tasks, and if the database is down or experiences any network issues, the automation will time out and fail if the database connection is not established in the specified time.</p>

**Packages, actions, and Bot editor****Improved readability with new formatting capabilities in XML document** (Service Cloud case ID: 01886455, 01925386)

When you insert, update, or delete nodes, the XML package does not remove carriage return characters between nodes but does remove all blank text nodes from the XML document. By using **Prettyprint** to format XML files, developers can easily improve the readability of a document. Developers can save time by using the following new options that have been added to the XML Package:

- **Use Prettyprint:** The **Save session data** action supports the Prettyprint format in the XML document. When you select the **Use Prettyprint** check box and use the **Insert node, Update node, or Delete node** actions and then save the XML document, the code is formatted with proper indentation as per Prettyprint.
- **Remove text nodes that contain only white space:** The **Start Session** action provides an option to remove blank text nodes when you parse the XML document.

**New features added to the Email Package** (Service Cloud case ID: 01835214, 01846425, 01756713, 01882482)

To support extensive process automation, we added the following action-related features to the Email Package:

- Ability to use the **Reply All** action.
- Enhanced the **Delete all** action to delete all emails from a specific folder. Additionally, you can apply filter parameters to emails such as:
  - All, Read, and Unread
  - Subject
  - From a specific sender
  - Before, on, or after a received date
- The dictionary variable for email properties includes a new variable, *emailNoOfAttachments*, used to retrieve the attachment count.

**Automate controls using Microsoft UI Automation (COM) technology**

You can use the Microsoft UI Automation (COM) technology to automate the following scenarios:

- Capture and automate link controls
- Capture and automate tree controls

**Insert Custom column in Data Table**

A new **Custom column** option has been added to the **Data Table > Insert column** action that enables you to insert a new column at a specified index in a data table. When you read an Excel spreadsheet and assign it to a data table, you can modify the table by adding a new column and entering any required data.

**New Label option in Loop package**

A new **Label** option has been added to the Loop package that enables you to break or continue a specific loop from the nested loops.

**Add and configure If action conditions**

You can add and configure a maximum of 32 conditions in a single **If** action.

<b>Packages, actions, and Bot editor</b>
<p><b>Improved automation reliability for web applications</b></p> <p>When you use the <b>Recorder &gt; Capture</b> action to automate web pages running on Google Chrome and Microsoft Edge browsers, the <b>Recorder &gt; Capture</b> action no longer scrolls down the web page if the target object is visible on the screen. This feature improves the user experience and reliability of automation when there is a fixed top pane on the web page and if some physical actions such as mouse clicks do not work as expected.</p> <hr/> <p><b>Note:</b> Ensure that you install the browser extension (version 3.0.8.0) and use the Recorder package (version 2.10.2) to capture the control.</p>
<p><b>Preferred view retained as default view in the Bot editor</b></p> <p>As a bot developer, you no longer have to manually select the preferred view when you open the Bot editor. To improve the developer's productivity and user experience, when creating bots in the Bot editor, your preferred view (List, Flow, or Dual) in the Bot editor will persist across user sessions and browsers. When you navigate in the Control Room or after your next log in, the Bot editor will retain your last used or selected view.</p>
<p><b>Line markers for collapsible sections of code in the Bot editor</b></p> <p>When you create bots using <b>Loop, If/If-else, Step, Trigger-loop, Try, Catch, and Finally</b> statements, the Bot editor clearly shows the collapsible sections. When building automations, developers can use these visual indicator line markers at the beginning and end of the collapsible section to improve their productivity.</p> <hr/> <p><b>Note:</b> The visual indicator line marker for the collapsible section applies only to the <b>List</b> view in the Bot editor.</p>
<p><b>Enhanced user experience through refreshed and intuitive icons</b></p> <p>With the new and intuitive icons for actions in the Bot editor, Citizen Developers and RPA developers can quickly locate the correct action while creating automation for a day-to-day task. These unique and renewed icons are developed according to brand and global standards.</p>
<p><b>Update to the Capture text of window action</b></p> <p>The <b>Capture text of window</b> action in the App Integration package can be used to capture a text from a window on two different user sessions.</p>
<p><b>Search and replace in Bot editor</b> (Service Cloud case ID: 00792784, 01943783)</p> <p>Use the <b>Search and replace</b> feature in the Bot editor to search for any text or variables, string within an action and replace it.</p>
<p><b>The experience of building a process has improved.</b></p> <ul style="list-style-type: none"> <li>• Copy, cut, and paste behaviors are the same in Process Composer as in the Bot editor.</li> <li>• You can access hidden variables for all applicable conditions, through the variable picker in the Process Composer.</li> </ul>
<p>The Process Composer supports Global Values. You can enter Global Values as variables and select them from the variable picker.</p>

### Packages, actions, and Bot editor

#### Upload Storage file action added to Process Composer package

You can use the new **Upload Storage file** action in a task bot to upload data to storage for further consumption in a process. This makes AARI requests more versatile by enabling bots to process files rather than requiring users to upload at request creation.

### Building and running bots

#### Notification for bot import

You are informed through **Notifications** when you import a bot from the Control Room. However, this notification is sent only to the user who imported the bot.

**Bulk update of multiple packages to default version for multiple bots** (Service Cloud case ID: 00712719, 00728499, 00737694, 00803673, 01255722, 00838604, 00772147, 01760236, 01762679, 01771416, 01761859, 01782588, 01778220, 01784255, 01789551, 01809167, 01818690, 01831969, 01813413, 01287311, 01923711, 01927867, 01945464, 01946912, 01819540, 01945315)

You can update multiple packages to default version for multiple bots. This feature enables you to update multiple package versions across all available bots with one action thereby increasing the efficiency of a bulk package update. Additionally, you can review the bots and dependencies before a bulk update.

#### Enhancements to code analysis

- You can access the new administration settings tab for policy management. The enable or disable functionality of code analysis has been moved from **Administration > Policies** to **Administration > Settings > Policies**.
- You can define multiple named policies with different rules that have different severity levels.
- You can apply different policies to different folders in the **Automation** page. When you run code analysis on a file, it uses the applicable policy for the folder (assigned or inherited) where the file is located.

#### Notifications integration in embedded automations

Notifications in embedded automations (such as Workday, Salesforce) provide you information about automations initiated from these applications and remote bot executions. It enhances the user experience by notifying you about the remote bot executions in their respective applications, thereby increasing the notifications effectiveness.

**Building and running bots****Enhanced Automation Command Centre home page**

The Automation Command Center (ACC) home page provides comprehensive visibility, actionable insight, and oversight capability into all aspects of your automation domain. The ACC home page provides operational insights such as automation and device status, license utilization information, and code analysis policy compliance metrics.

This enhanced home page provides the following benefits and capabilities:

- Effective monitoring of the automation landscape, leading to:
  - Improved reliability
  - Improved utilization
- Ensures compliance by highlighting results of code analysis
- Helps CoEs scale efficiently and achieve automation success
- Easier navigation to other areas such as AARI, CoE Manager, and Bot Insight

**APIs and integrations****Export repository bots by version or label** (Service Cloud case ID: 01805699, 01838251)

Use the new `POST /v2/blm/export/version` API to export repository bots by specifying the label or version of the files. These bots are exported to an archived file.

**Process composer APIs**

Use the **Process Composer** APIs to create a new request from AARI processes. You can also retrieve the initial form and request by specifying the reference ID. You can use the following endpoints in the process composer APIs:

- `/requests/create`: Create a new AARI request.
- `/requests/ref/{refId}`: Retrieve a request.
- `/processes/{id}/form`: Retrieve initial form.

**What's changed****Control Room, devices, and Bot Agent****Improved secure registration for Community Edition or Automation 360 users**

When a user registers for the Community Edition or Automation 360 account, the registration email sent to the user contains a temporary registration link used to create the user credentials. This registration method is more secure than sending the user their password in plain text.

<b>Control Room, devices, and Bot Agent</b>
<p><b>Licenses page enhancements</b></p> <p>To provide easy access to license usage and availability, the <b>Licenses</b> page includes information for the following elements:</p> <ul style="list-style-type: none"> <li>• License mode</li> <li>• Control Room expiration date and time</li> <li>• Date when the <b>Licenses</b> page was last updated</li> <li>• List of products with license availability</li> <li>• License total details and where used</li> </ul>
<p><b>Upgrade changes in code analysis policy from Automation 360 v.28 or later versions</b></p> <p>If you have configured a policy for code analysis prior to upgrading to Automation 360 v.28, this policy is migrated to Automation 360 v.28 and is named default policy. This policy is applied to the <b>Automation</b> root folder and is applicable for all bots prior to Automation 360 v.28 release.</p>
<p><b>Active Directory enhancements for configuring domains</b> (Service Cloud case ID: 00733422, 01853744, 01862164, 01794663)</p> <p>The following enhancements were made for administrators who configure domains for Active Directory (AD):</p> <ul style="list-style-type: none"> <li>• The Control Room login and the <b>Create user</b> pages automatically select the default domain that is configured. You can select a different domain by either entering the letters of the domain or selecting the domain from the drop-down list.</li> <li>• You can configure the domains listed on the Control Room login, the <b>Create user</b>, and the <b>Create an Active Directory role mappings</b> pages to hide domains.</li> </ul>
<p><b>Support for multiple roles in Active Directory role mappings</b> (Service Cloud case ID: 01133364, 01133364, 01929400, 01776684)</p> <p>When you create multiple Active Directory (AD) role mappings for multiple security groups, the roles used in the mappings are combined for the users who belong to the security groups.</p>
<p>Users who have an Attended Bot Runner license can no longer add Bot deployments to a queue. However, there are no changes for triggers.</p>
<p>As part of the <b>OpenSerach</b> service adoption, when you upgrade nodes in a cluster setup, you must perform a workaround to fix an installation issue.</p> <p><a href="#">Upgrade nodes in a cluster setup</a> on page 882</p>

<b>Packages, actions, and Bot editor</b>
<p>The name of the AARI Web package has been changed to Process Composer.</p>

## Fixes

<p>Control Room now sends email notifications when a scheduled bot fails prior to its execution for example, when the Bot Runner machine is not available.</p> <p><b>Service Cloud case ID:</b> 01768120</p>
--

The **Schedule** column on the **Scheduled activity** page shows the frequency of a scheduled bot in your local language.

Previously, the frequency of a scheduled bot was not translated and not shown in the user's local language, for example, Japanese.

**Service Cloud case ID:** 01936850

When you restart the Control Room services and execute a bot, the bot deployment no longer fails on the connected devices nor generates an error on the **In progress** and **Audit log** pages.

Previously, the `AtmosphereResource Cancelled` error displayed on the **In progress** page and the error was registered on the **Audit log** page.

**Service Cloud case ID:** 01937388

You no longer see duplicate deployments (current and previous) for the same device on the **In Progress** page.

Previously, duplicate deployments were displayed.

**Service Cloud case ID:** 01954716

On the **In progress activity** page, the **Activity type** column displays the correct bot activity type.

Previously, the column displayed inconsistent activity types.

**Service Cloud case ID:** 01958801

When you create a locker, the **Create locker** page displays tabs such as **Credentials**, **Owners**, **Managers**, and so on.

Previously, tabs were not displayed.

**Service Cloud case ID:** 01949499

Attended Bot Runner users can view the **Schedule bot** menu on the following pages:

- **Automation (Run bot > Schedule bot)**
- **In progress activity**
- **Scheduled activity**
- **Devices**
- **Device pools**

Previously, this menu was not displayed on these pages.

**Service Cloud case ID:** 01085127, 01805063

You can run bots in **Debug** mode even when the data table variables contain a large amount of data (up to 3 MB for a single data table variable that is being watched only). Previously, the browser stopped responding.

**Service Cloud case ID:** 01949707, 01955034

If you deploy a task with a Bot Runner that has a disconnected default device and no device pool is selected, an error message displays in your local language.

Previously, an error message displayed in English even when the user's local language (for example, Japanese) was selected.

**Service Cloud case ID:** 01919213

The Bot Runner device will unregister from the Control Room only if there is a valid authentication error.

Previously, during the Bot Runner authentication, the device was unregistered from the Control Room after two unsuccessful authentication attempts. The reason for the error could be due to a valid unsuccessful authentication attempt or any other error.

**Service Cloud case ID:** 01947943, 01946249, 01956026, 01945438

When a bot is deployed with multiple run-as users and if one or more devices disconnect from the Control Room during the bot execution, reconciliation of reconnecting devices no longer triggers the `NonUniqueResultException` error.

Previously, when you select X number of run-as users (where  $X > 1$ ), the query returned X number of entries from the table, which results in the `NonUniqueResultException` error. As a result, reconciliation failed and also the bot execution was terminated.

You no longer encounter issues when you create a bot using the DLL **Open** and **Close** actions and then use the **If > DLL session exists** condition to check whether a DLL session is closed in a bot.

Previously when you used the **If > DLL session exists** condition, it failed to check a closed DLL session and displayed an error.

**Service Cloud case ID:** 01868691

When you use the **Get node value** to retrieve the JSON object in the JSON package, it returns the JSON value in the correct format.

Previously, the **Get node value** action displayed the output in the wrong format.

**Service Cloud case ID:** 01864551

You can use the **Connect** action to establish a connection with the FTP/SFTP server with keyfile authentication and automate a task.

Previously, the bot could not automate the FTP/SFTP operations if the SFTP keyfile server was installed on a Windows machine.

**Service Cloud case ID:** 01858323

You no longer encounter any errors when you create a bot using the **Create workbook** action from the Google Sheets package.

**Service Cloud case ID:** 01918952

When you use the **Connect** action in the Active Directory package, you can select objects in the **Object Explorer** window successfully.

Previously, an error was displayed when you selected objects in the **Object Explorer** window.

**Service Cloud case ID:** 01925109

In the Email package, you can use the **Email > Send** action to send an email without issues.

Previously, when you used Email package `version 3.14.3-20220923-220748` or later, an issue occurred when using the **Email > Send** action.

**Service Cloud case ID:** 01912097, 01931592, 01934137, 01940215, 01932494, 01942202, 01942055, 01946339, 01949164

You can create bots using the **Run stored procedure** action of the Database package even when you include a large amount of data as an **Input** parameter.

When you use the **Connect** action of the Terminal Emulator package with the prompt value and then the **Wait** action, the **Wait** action waits for the prompt value to appear on the terminal screen.

When a new package (first version) is added to the Control Room and you select **Disable** setting for the new version of the package, the package will show the status as **Disabled**.

Previously, it showed the status as **Enabled and set as default**.

In the **Datetime > Add** action, you can now specify a fraction value in the **Time value to add** field to increase the value in the *Datetime* variable by that specific fraction value.

When you use any browser action to automate a browser window or a tab, and run the bot, the browser action now waits for the time specified in the **Time out after** field to execute action on the browser tab before the bot fails. Previously, the browser action failed after 30 seconds when the bot did not execute successfully, regardless of the wait time set in the **Time out after** field was less than or greater than 30 seconds.

**Note:**

- As a result of this fix, if the **Time out after** field has a value other than 30 seconds, you might have to change the value for your existing bots. This will ensure that your bots continue to run properly with the latest Browser package.
- This fix does not apply for the **Find broken links** action.

**Service Cloud case ID:** 01880159

When you perform the following sequence of actions and then rename the variable that was used in these actions, the name of the variable will now be updated for the **Group** conditions and the conditions in the **Condition** tab:

- Use the If package
- Add a specific condition with a variable
- Add a specific condition with a variable
- Save the bot.

In the **Datetime > Subtract** action you can now specify a fraction value in the **Time unit to subtract** field to decrease the value in the *Datetime* variable by a specific time value and unit.

When you use the **Capture** action with the Recorder package (version 2.9.x or earlier) to navigate to another web page in the Google Chrome browser (version 105.0 or later), and then use another **Capture** action to automate objects in the navigated web page, the bot no longer encounters an error.

In any package, when you select the **Add argument** option, select **String** or **Number** as the **Argument type**, and try to insert a value, you can now use the mouse to scroll or click the scroll bar to navigate through the options.

When you use multiple Recorder actions in a bot to automate a specific web page running in Microsoft Edge with IE mode, and then run the bot, the second Recorder action now works properly, and the bot no longer encounters an error.

**Service Cloud case ID:** 01848824, 01868337

You can now use the **Folder > Unzip** action to extract compressed files and folders from an AES-256 encrypted zip file.

**Service Cloud case ID:** 01854767

When you try to automate web applications, the **Click** action in the Recorder now works properly with the MV3 extension on Google Chrome and Microsoft Edge browsers. Previously, when the object on a web page contained inline JavaScripts and the document to be automated was secured, the Recorder failed to perform the **Click** action.

**Service Cloud case ID:** 01927058, 01951022

When you use the **Click** action in the Recorder to automate applications running on Microsoft Edge with IE mode, the bots now time out automatically and no longer freeze when a pop-up appears during bot execution.

**Service Cloud case ID:** 01790352

When you assign a **Production** label to a TaskBot and deploy it, the bot no longer encounters an error at the **Image Recognition > Find window in window** action and runs successfully.

**Service Cloud case ID:** 01825541

When you use the Recorder package (version 2.10.2 or later) to capture a control on a web page, select **Currently active** window from the **Application** tab and then run the bot in a loop, the bot now captures the target control accurately and runs through all the loop iterations successfully even if the control appears behind the bot runtime window.

**Service Cloud case ID:** 01904537

When you use any of the following actions to determine if a window does not exist, select the web page opened in the Google Chrome browser from the list of active tabs in the **Browser** tab, and then run the bot, the following actions now wait for the specified time value to close the browser tabs before the bot fails.

- **Window does not exist** condition in the If and Loop packages
- **Window with same title does not exist** condition in the If and Loop packages
- **Window does not exist** condition in the **Wait > Wait for condition** action
- **Window with same title does not exist** condition in the **Wait > Wait for condition** action
- **Wait > Wait for window** action

**Note:** When you run the bot, the actions might wait for an additional two to three seconds later than the specified time out value to execute actions before the bot fails.

**Service Cloud case ID:** 00790336, 00822573, 00832864, 01268577, 01586174, 00790336, 01778857, 01804828, 01809565, 01791209, 01848262, 01867832, 01877740, 01959172, 01959278

When you create or delete a folder (or form) that contains . . characters in the folder (or form) name, the folder structure no longer affected.

Previously, when you deleted a folder (or form) that contained . . characters in its name, the parent folder was deleted which caused issues with the folder structure.

**Service Cloud case ID:** 01886058

The resiliency of the **File/Folder** trigger has been improved to continue listening after a network disruption has occurred. Previously, a network error caused the trigger to lose connection with the Bot Agent.

**Service Cloud case ID:** 01769532, 01773584, 01834098, 01867418

When you check in a bot that contains the string "bot\_" in its name and some recorder metadata, the metadata is no longer deleted. As a result, you can check out a bot without generating an exception or error message.

Previously, the recorder metadata was deleted and you were blocked from making recorder changes to any of the bots that contain "bot\_" in its name. The bot checkout failed and generated an exception or error message.

**Service Cloud case ID:** 01915726, 01933409, 01939124, 01944665, 01939124

When you upgrade the Control Room to Automation 360 v.27, the work items are deployed successfully for all scenarios.

Previously, when you upgraded the Control Room to Automation 360 v.27, the work item failed to deploy when queues were paused or stopped.

**Service Cloud case ID:** 01948038, 01950948

When you run a bot with a queue and select the queue category, the task bot (that contains a *TABLE* type variable and no row data) no longer fails and shows the *Missing work item template* error message.

Previously, when there was no row content for a *TABLE* type variable, you could not select the queue category while running a bot with a queue. As a result, the *Missing work item template* error message was shown even if a template was mapped.

**Service Cloud case ID:** 01922641

When you import a BLM package (zip file) to the Control Room, the Automation Anywhere Control Room Messaging service restarts and you no longer get an error message. Additionally, the bot import and export operations complete successfully.

Previously, when the **ActiveMQ broker** service is stopped, the broker is stopped but the process did not exit due to which the Automation Anywhere Control Room Messaging service was not restarted. As a result, when you import a BLM package, the *JMSException: failover time 5000ms exceeded* error was displayed.

**Service Cloud case ID:** 01924119

When you compare bot versions from the **View history Task Bot** page in the public workspace, the **Compare versions** displays any modifications made in the latest two versions of your bot without any error.

Previously, an error was displayed if you used the **Compare versions** feature through the **View history Task Bot** page.

**Service Cloud case ID:** 01949094, 01946533

After you update the Bot Agent to the *21.240.19897* version, you can deploy multiple bots using the API without any failure caused by the *AA-DB* file size.

Previously, when you deployed multiple bots using the API the *AA-DB.mv.db* and *AA-DB.trace.db* file sizes continued to increase and eventually caused the bots to fail. Additionally, the **device configuration refresh initiated** message continuously displayed.

**Service Cloud case ID:** 01776544

The following issues were fixed on the **In progress activity** page:

- Active bot deployments no longer disappear after a page refresh.
- Duplicate bot entries were removed whose status was displayed as active.

**Service Cloud case ID:** 01937581

Variables that you configure as input type are encrypted in the log files generated for Control Room.

Previously, input type variables were not encrypted and displayed as plain text in the log files.

**Service Cloud case ID:** 01768904

Users can only view activities to which they have permission on the **Activity > In progress** page.

Previously, some users were able to view the activities of other users even though they did not have permission.

**Service Cloud case ID:** 01839276, 01919244, 01940793, 01941503

In attended and unattended automation, if a bot fails to run and generates the "Node Manager went Down unexpectedly and could not complete this bot execution." error, the start time on the **Historical** and **Audit log** pages display correctly.

Previously, the start time was displayed incorrectly.

**Service Cloud case ID:** 01881736

All users can view the scheduled activities on the **Scheduled activity** page.

Previously, some users were unable to view the scheduled activities.

**Service Cloud case ID:** 01885890, 01848429

The Control Room Access URL length is set to a maximum of 4,000 characters.

Previously, the URL length was not set.

**Service Cloud case ID:** 01923035

Sorting users using the **Last login** option on the **Users** page sorts users correctly.

Previously, sorting users by last login was not sorting the users correctly.

**Service Cloud case ID:** 01813134

If you created a bot using the REST API command, the REST GET command is parsed without any errors even when the response body is empty.

**Service Cloud case ID:** 01922332

Japanese characters are supported in the REST API commands with the multipart/form-data option and the output PDF name is rendered correctly.

**Service Cloud case ID:** 01909753

All files in the specified OneDrive location are downloaded successfully when you use the **Download file** action from the Office 365 OneDrive package.

**Service Cloud case ID:** 01886501

If you selected the **Read cell value** option in the **Read row** action of the Excel advanced package, the data from the next sheet of the specified Excel file is extracted correctly using the **Switch to sheet** action.

**Service Cloud case ID:** 01904504

If a bot contains **Get multiple cells** or **Get single cell** action from the Excel advanced package to retrieve the underlying scientific values, the values from the specified Excel file are successfully extracted when you run this bot.

**Service Cloud case ID:** 01882225, 01938812

Exception errors are no longer displayed for the following actions in the Excel advanced package:

- **Get single cell**
- **Get cell color**
- **Get multiple cell**
- **Get number of cells**
- **Get worksheet as data table**
- **Insert/Delete rows/columns**
- **Read cell formula**
- **Read column**
- **Read row**
- **Remove blank row**
- **Rename worksheet**
- **Replace**
- **Select cells/rows/columns**
- **Set call**
- **Switch to sheet**
- **Close**

**Service Cloud case ID:** 01780178, 01926325

If there are many (more than 500) bots deployed in one of the device when there are multiple devices connected to a Control Room, bot deployments across other devices are no longer blocked.

**Service Cloud case ID:** 01791784, 01950118, 01904686, 01795862, 01945357, 01941048

If you create a folder with the same name as an existing folder in the private workspace, an error message is now displayed, and the folder is not created.

Previously, a false successful folder creation message was displayed, but the last modified date of that particular folder remained the same as that of the previously existing folder.

When you create, view, or edit roles and then navigate to the **Bots** section, the folder list is sorted alphabetically making it easier to find a specific folder.

Previously, the folders were not sorted alphabetically, and it was difficult to find a particular folder when there were many folders in the repository.

**Service Cloud case ID:** 01762755, 01843015, 01874823

<p>When you import a bot using the overwrite option and do not have permission to access one or more dependent folders, the import dependency is not broken because of the import failure on the dependent folder.</p> <p>Previously, importing the bot when you had no permission to access the dependent folder resulted in a break in the dependency if the file or folder was already present.</p> <p><b>Service Cloud case ID:</b> 01929592, 01946078</p>
<p>When you import a bot that has more than 2,100 manual dependencies, the import is successful without any issues.</p> <p>Previously, the bot import failed when the bot contained more than 2,100 manual dependencies. You had to reduce the number of dependencies to import the bot successfully.</p> <p><b>Service Cloud case ID:</b> 01913648, 01942373</p>
<p>The group Managed Service Account (gMSA) provides functionalities such as install, update and perform LDAP authentication within a domain, and also extends those functionalities across multiple servers.</p>
<p>When you update Automation 360 to the v.28 release, the Elasticsearch credentials are replaced with OpenSearch credentials.</p>
<p>Automation 360 for auto-login and RDP-based deployment supports the user name in the User Principal Name (UPN) format (username@domain.com).</p> <p><b>Service Cloud Case ID:</b> 01816116, 01906692</p>

## Limitations

<p>(Service Cloud case ID: 01833352)</p> <p>When you want to move emails from one folder to another, and if you apply multiple filters such as <b>Subject</b>, <b>From specific sender</b>, <b>When received date is on or after</b>, or <b>When received date is before</b>, you cannot move an email when its sender id is: noreply@**.com.</p> <hr/> <p><b>Note:</b> You might observe this issue when you use <b>Save All attachments</b>, <b>Delete All</b>, <b>Move All</b>, and <b>Loop</b> actions.</p> <hr/> <p><b>Workaround:</b> Use only the <b>From specific sender</b> filter to move emails.</p>
<p>The <b>Create User</b> audit log entry page shows a valid device license even when the license allocation for a user had failed.</p>
<p>In a clustered environment, when you update bots to the default package versions, the <b>Bot update list</b> page shows <b>Failed</b> status and bots are auto-checked out even if they are updated with the latest default packages.</p>

In an Oracle environment, the **Bot update list** page shows an `Code : db.connection.exception` error message.

**Workaround:**

1. Log in as an administrator.
2. Navigate to **Manage > Packages** and set the required package version as the default version.
3. Log in as a Bot Creator, and then check out and edit the bot.
4. In the Bot editor, click the three vertical ellipses at the top right corner.
5. Select required Packages and update the package version manually.

While updating bots to the default package version, when you select the **Production label** bots, the package update is applied for the latest version of bots instead of the **Production label** bots.

When you check out and edit a bot after the bot updates to the default package version, an error is displayed in the System Date for these commands: **SystemsDate**, REST Web Service, and Number.

**Workaround:**

1. Edit the bot and navigate to **Manage > Packages**.
2. Set the Date and Time for the non-default package, and then set it back to the default Date and Time.

**Note:**

- If previous version of the package does not exist, then upload the package and assign the default Date and Time.
- If previous version of package is available, then edit the bot, assign it to the previous package and save. Then, re-assign the bot to the new default package.

When a user (who created the workload automation) is deleted, work items are not processed even if they are available to process. As a result, you must delete and re-create the automation.

If you select the **Search type** as **Variable name** in the **Search and replace** feature, the content is not replaced when you use a number variable in the expression.

**Workaround:** To replace a specific variable in a number expression, open that action and change the variable manually.

(Service Cloud Case ID: 01950021) If **Auto update** is enabled for the Bot Agent in Control Room, registered devices running Windows10 Enterprise might restart intermittently after the Bot Agent update has completed.

Associated bot deployments fail if the **Log collector** option is enabled while updating Automation 360 to v.28.

**Workaround:** Before updating to Automation 360 v.28 from any of the previous versions (such as v.25), ensure that the **Log collector** option under **Administration > Settings > Devices** is disabled.

**Note:** Starting from Automation 360 v.28, the **Log collector** option will not be available in Automation 360 On-Premises installation.

**Limitations from previous releases**

While running a bot in debug mode, the bot will fail if the variable size gets greater than 3 MB. An error message appears showing that a variable has exceeded the 3 MB limit.

When you create a device pool with a temporary (disconnected) device, the device deletion job does not complete successfully. Additionally, the **Audit log** page shows the device is deleted, whereas the **Device list** page shows the deleted device in the list.

**Feature deprecations**

Review features and capabilities (from Automation Anywhere or other third-party vendors) that are deprecated or nearing deprecation to understand how they impact your automation.

**Deprecated weaker Transport Layer Security protocols: TLS 1.0 and TLS 1.1**

Automation Anywhere has deprecated weaker communication protocols TLS 1.0 and TLS 1.1, and their corresponding ciphers (Cryptographic algorithms) in Automation 360 Cloud deployments (AWS and GCP). Automation 360 Cloud deployments support TLS 1.2 and later versions only.

*Feature deprecations affecting Automation Anywhere products* on page 68

**CoE Manager v.28 release**

Review what's new and changed, and the fixes and limitations in CoE Manager for the v.28 release.

**What's new****Access CoE Manager from the Control Room**

As an administrator, you can enable access to CoE Manager from the Control Room. This enhances the user experience because the user no longer needs to open CoE Manager through a separate browser tab. Once CoE Manager is enabled, users can directly access the CoE Manager login page from the quick link section on the Control Room home page.

**Support for ROI tracking in On-Premises Control Room**

You can integrate both the Cloud and the On-Premises Control Room with the CoE Manager. This enables you to monitor your automations and analyze the savings achieved. You can connect up to 3 Control Room instances in your CoE Manager.

For the On-Premises Control Room, to upload the bot activity data from the Control Room to the CoE Manager, download and run the CoE Manager bot available in the Bot Store. To run this bot, you must have a valid license such as a Bot Creator, Bot Runner, or a Citizen Developer.

## What's changed

### Plan delivery for your opportunities from the pipeline stage

The **Activities** tab is available in the pipeline stage enabling you to start the delivery planning of an opportunity when it moves into the pipeline stage.

Previously, you could plan delivery of an opportunity using the **Activities** tab only after the opportunity had moved into the in-progress stage.

## AARI v.28 release

Review what's new and changed, and the fixes and limitations in AARI for the v.28 release.

## What's new

### Stationary action buttons

While completing forms in AARI, action buttons are positioned in the fixed footer of the form. The footer and its contents are responsive to the size of your window and adjust to fit buttons and minimize the footprint.

## What's changed

### Enhancements to tags

When you configure a process, tag improvements provide a more accurate tag selection when you look for available tags:

- You can select and manage up to 500 tags at a time, in tag selector.
- Your search results will vary depending on the number of search terms you use with the most recently created tags always showing at the top.
- You can use the **search all tags** option to search for all available tags.

### Improved formatting options for Label element

The **Label** element has been improved with new formatting properties where you can configure the font sizes, colors, and text alignments in a form.

The name of the Process Editor has been changed to Process Composer to better reflect its comprehensive capabilities.

Forms have improved responsiveness due to this next generation of form rendering technology.

Users receive a notification in the Warning tab when a task is assigned or reassigned to them.

**Service Cloud case ID:** 01869263

## Fixes

<p>When you use a table element in your form which contains a text area data type, the text area generates data from the database without issues.</p> <p><b>Service Cloud case ID:</b> 01905252</p>
<p>In a table cell field, when you enter Chinese, Japanese, and Korean characters, the characters renders correctly.</p> <p><b>Service Cloud case ID:</b> 01914818</p>
<p>When you create a form with a column width that is less than 20% in Automation 360 v.26 and you open the form in the current version, the will now render without issues.</p> <p><b>Service Cloud case ID:</b> 01944387</p>
<p>In an AARI process, when you use the <b>if/else</b> condition, a process error no longer occurs when you add the <b>else if</b> condition after the <b>if</b> condition.</p> <p><b>Service Cloud case ID:</b> 01949808</p>
<p>In AARI Web forms, the text area size renders as specified. Previously, the height did not render as designed.</p> <p><b>Service Cloud case ID:</b> 01911488, 01910936, 01914476, 01924252, 01929268, 01946479, 01958805, 01961238</p>
<p>When filtering AARI requests by date, the date displays correctly.</p> <p><b>Service Cloud case ID:</b> 01915259</p>
<p>AARI forms works as expected when adding a new rule to an existing form.</p> <p><b>Service Cloud case ID:</b> 01925778</p>
<p>When a required field has not been completed, the process prevents users from submitting the task.</p> <p><b>Service Cloud case ID:</b> 01932933, 01958556</p>
<p>When a parent process in a private folder references a child process in a public folder the Process Composer alerts the user to the missing dependency with a local error. Previously a process with this dependency would fail when run, throwing a global error.</p> <p><b>Service Cloud case ID:</b> 01849502</p>
<p>In AARI Assistant, the last runtime information no longer causes performance issues.</p>

## Limitations

When you view your bot details in the **Historical Activity** page, the description for the bot errors are not populated.

**Workaround:** To access the description of the bot error, you can access the error log from the **Audit Logs** panel.

**Service Cloud case ID:** 01850454, 01908923

When you use the Search and Replace option to replace a form variable in a bot, the Search and Replace option does not function properly and cannot locate the form variable.

When using a form with an image, users require the View permission to access the image and have it render in forms.

## IQ Bot and Document Automation v.28 release

Review what's new and changed, and the fixes and limitations in IQ Bot and Document Automation for the v.28 release.

## Document Automation

### What's new

#### Standardize the format of extracted numbers and dates

You can configure your learning instances to convert extracted dates and numbers to a standard format. This ensures consistency and accuracy in your databases and other systems of record.

For example, if you select to standardize dates to MM/DD/YYYY and a processed document contains a date that appears as 12 Feb 2023, the learning instance will reformat the date to 02/12/2023.

If you select to standardize numbers to the English (United States) locale and a processed document contains a number that appears as 100,00, the learning instance will reformat the number as 100.00.

The new Document Workspace license tracks consumption for customers who brought their own license for Google Document AI or Standard Forms.

#### New Google Document AI features

- Validation feedback is available for new and existing learning instances that use Google Document AI to extract data.

---

**Note:** You must manually enable validation feedback for existing learning instances

---

- The invoices document type supports these additional languages: Estonian, French, German, Latvian, Lithuanian, Portuguese (Continental), Romanian, Spanish, and Swedish.
- The receipts document type supports Japanese language documents and can extract two new fields: payment type and last four digits of credit card.

**What's new****New features for the Document Workspace dashboard in Bot Insight**

- Create custom widgets
- The `Validator performance by # of documents validated` widget includes invalid documents.

**What's changed****Download bots have the highest priority in a queue**

To optimize system performance, the Control Room prioritizes running the download bot of one process before running the extraction bot for another process. Previously, the system was configured with the extraction bots at equal priority to the download bots, which created a large queue of extracted data waiting to download.

**Note: For users with Control Room environments configured prior to v.28:** The Control Room admin must edit the `aari-document-processor` custom role to assign the new **Set automation priority to high** permission.

**Important: New Community Edition users will have access to Document Automation but not IQ Bot**

As of Automation 360 v.27 release and later, only Document Automation will be provisioned to new Community Edition users. New users will not have IQ Bot permissions, however, IQ Bot will be available for existing, registered users.

**Fixes**

When you create a learning instance, the interface allows field names that start with a letter only. Previously, the interface allowed field names to start with a number, which caused processing errors.

The **Test regular expression** field supports a maximum of 100 characters.

You can create a learning instance with custom fields that do not have a field name and field label, as long as the custom fields are unselected.

Document Automation extracts multiline fields without adding an extra space after each line.

Document Automation supports document processing on devices configured with an authenticated or unauthenticated Proxy Auto-Configuration (PAC) file.

The Document Workspace dashboard shows the correct page consumption metrics for On-Premises Control Room instances.

The "Average validation time" and "Validator performance by number of documents" widgets show the correct values when you mouse over the data points.

In Document Automation, the correct error message is displayed while fetching a Standard Forms model that is missing configuration settings. Previously, an incorrect error message was displayed.

While reconfiguring a table, you can add a table name within the 99 character limit and a table field name within the 154 character limit. Previously, you could add more characters than the default limit of 100 characters and 155 characters, respectively.

Fixes
You can create a new project for Standard Forms in the Linux environment. Previously, the ability to create a project using <b>Create project</b> for Standard Forms was not supported in Linux.
Limitations
Document Automation supports a device username of 17 characters or fewer.
Pattern-based validation is not enabled by default in imported learning instances. You must edit the learning instance and select the <b>Validation</b> option in the Validation rules section.
Bots containing actions from the Document Extraction package do not support the advanced check-out options.
For a public learning instance, if you delete a learning instance and then try to create a new learning instance using that same name, an error is displayed. <b>Workaround:</b> If you delete a learning instance as well as the learning instance folder, then you can create a new learning instance using the same name.
When you create a learning instance with <b>Google Document AI</b> , an <b>UNKNOWN</b> option is displayed under the <b>OCR Engine</b> filter in the <b>Document Workspace</b> dashboard.
If you apply a filter that includes <b>User Name</b> , <b>Status</b> , or <b>OCR Engine</b> , the <b>Accuracy% by field</b> widget does not show the correct results.
If you submit a document that contains a validation error due to a regular expression, the page keeps loading and you must refresh the page to continue. You cannot submit a document that has a pattern validation rule with a regular expression that contains pipe symbol ( ). For example, the following expression has ( ) characters and will show an error: (^0[1-9] [12][0-9] 3[01])-(0[1-9] 1[0-2])-(\d{4})\$ However, you can edit the regular expression in the learning instance and reprocess the document to continue with validation.
As of Automation 360 v.28, document extraction fails via proxy in the bring your own key ( <b>BYOK</b> ) use case.

## IQ Bot

Fixes
If you test an invalid Python script when configuring custom logic, the system displays an error message without any file path. Previously, the error message included the execution file path.
When you upload high-resolution or invalid documents to a custom group, if the document is not processed, it is either moved to the validator folder or the fail folder. You can eventually download the files from the fail or invalid folder.  Previously, the validator or the fail folder did not receive the uploaded files. You had to transition the learning instance from production to staging and back again to move the file to the output folder.  <b>Service Cloud case ID:</b> 01926196

Fixes
<p>The ability to create or edit a bot for a manual group has been fixed. You can now create a bot with a manual group that has invalid or corrupted documents. You can also move the created bot from staging to production and back again.</p> <p>Previously, after creating a manual group for a learning instance with an invalid or corrupted document, you were unable to create a bot.</p> <p><b>Service Cloud case ID:</b> 01878143</p>

Limitations
<p>If the IQ Bot archive (IQBA) file size is above 268 MB, then the file storage does not upload the exported file from the output folder to the desired location. You should restart the <b>Project Services</b> from <b>IQ Bot Services</b> if the system is stuck and you are unable to perform any actions.</p>
<p>If IQ Bot Cloud is configured with a proxy server, learning instances cannot access Google Vision API or Microsoft Azure Computer Vision OCR engine.</p>
<p>The maximum upload file size limit is set to 2 GB when importing and exporting files in the IQ Bot archive (IQBA) file. If the file size is greater than 2 GB, then you must delete unwanted groups to decrease the file size and migrate successfully. Earlier, maximum upload file size limit was 5 GB.</p>
<p>When you change from full screen mode to small screen mode in the <b>Logic</b> window, the Python scripts and these options are hidden: <b>Test Run</b>, <b>Clear Box</b>, <b>Fullscreen</b>, and <b>Save</b>.</p> <p><b>Workaround:</b></p> <ol style="list-style-type: none"> <li>1. Click <b>Logic</b> to minimize the window</li> <li>2. Click <b>Logic</b> to expand the window and view the Python scripts.</li> <li>3. Place a cursor inside the Python script screen and click Enter.</li> </ol>
<p>For an existing Community Edition user, the <b>Help</b> icon is not available on IQ Bot interface.</p>
<p>If you are an Automation Anywhere free trial version user and you upgrade to Automation 360 v.28, the Community Edition logo displays on the homepage. However, the functionality is not impacted.</p>

## Bot Insight v.28 release

Review what's new and changed, and the fixes and limitations in Bot Insight for the v.28 release.

### What's new

<p><b>Enhanced Bot Insight filters and widget setting for Document Workspace dashboard</b></p> <p>In a Document Workspace dashboard, you can use the custom dashboard filters to build custom widgets. Additionally, you can edit the widget settings for an effective data visualization.</p>
--

## Fixes

For Bot Insight business analytics reporting, you can use the Bot Insight APIs to export all the available data records from the Operations Bots dashboard's **DataTable** widget.

Previously, you could export a maximum of 100 records at a time from the Operations Bots dashboard's **DataTable** widget.

**Service Cloud case ID:** 00760252, 01819244, 01857905, 01945720

Bot Insight Operations dashboard (which includes links to the Audit, Bots, and Device dashboards) now retrieves and shows the complete volume count for a bot run.

Previously, due to a maximum volume count limit in KPI charts, the Bot Insight Operations dashboard could not retrieve the complete volume count. Additionally, a maximum count of 10,000 was shown as the total bot run in the Bots dashboard which led to incorrect results.

**Service Cloud case ID:** 01825287

A user with the **AAE\_Bot Insight Consumer** role can only view a published analyze dashboard. The **Delete** dashboard action is greyed out and no longer available.

Previously, the **Delete** action was available and when the user tried to delete a dashboard, an error message was displayed preventing the user from deleting the dashboard.

**Service Cloud case ID:** 01870477

## Limitations

In the Bots dashboard, the **Total Bot Runs** count does not match what the total count should be when the **Total Completed (Success)**, **Total in Progress**, and **Total Failed** counts are added together.

## Automation 360 v.27 Release Notes

*Release date: 11 January 2023*

Review the top five features in this release and view other new features and exciting enhancements for Automation 360 v.27 release.

- Build 16701: Automation 360 (Cloud and Cloud Sandbox) and IQ Bot (Cloud)
- Build 16685: Automation 360 (On-Premises) and IQ Bot (On-Premises)

We have released updated builds for fixes after the GA release of v.27 (Build 16667). For information about the fixes in these updated builds, see [Updated release builds](#) on page 174.

## Highlights of this release

Here are the **top 5** features in the v.27 release:

### **Embedded smart forms and dynamic data mapping for embedded widgets**

*Faster design and use of your embedded automation:*  
You can now design your forms using a responsive and real-time canvas that automatically adjusts to

the desired form size. This feature provides a faster way to create embedded interfaces that interact with any web applications. You can also configure these forms in your business applications, such as Workday or ServiceNow, to securely retrieve data when embedded as an iFrame widget.

*Eliminate data re-entry and save time:* Use our new PostMessage API to map and prepopulate data from business applications in embedded widgets. Dynamic data mapping provides safe and secure communication of data from your business (host) applications to initial process forms in the widget.

See [Smart embedded forms and dynamic data mapping](#) on page 1583.

### **Enhanced citizen developer experience**

Our updated and intuitive icons enable citizen developers to quickly select actions and use the Help for contextual information about actions, providing a more seamless development of automations. We have also enhanced the AISense Recorder user experience so that you can use anchors easily and automate UI objects that are not detected by the recorder automatically.

See [AISense recorder enhancements](#).

### **Strengthen governance and management**

*Notifications:* Our new notifications capability provides a centralized, consistent, and proactive medium for users to stay informed on their automation estate and to take actions based on the events they are alerted on. Alerts on various platform events, bot events, and other automation lifecycle events are delivered via in-app (default) and email (based on user preference).

See [Notifications](#) on page 2218.

*Automatically pick available Bot Runner users:* Scale your automations easily by selecting all the Bot Runner users that can run a given automation and the number of Bot Runners to use. This capability ensures that when you run or schedule an automation, the system automatically picks the available run-as users from the specified list.

### **Standard forms**

Standard forms is now integrated in Document Automation with the other document processing capabilities. With enhanced accuracy, this feature enables you to extract data from densely structured forms including those with handwritten input. Use cases for structured documents include tax forms, mortgages, vehicle registration address, and so on.

See [Using Document Automation for Standard Forms](#) on page 1919.

## PEG enhancements

We continue to improve our Privacy Enhanced Gateway (PEG) for sensitive information redaction with a new configuration UI so you can easily change the configurations in the UI instead of the command line. We have also recently released a new PEG serverless architecture for higher-scale data collection use cases.

See [Manage redaction and forwarding settings from the UI](#) on page 1643.

## Updated release builds

We have released the following updated builds:

- **Build 16701** Service Cloud case ID: 01829572, 01947340, 01949323, 01950696, 01944637, 01951100, 01953055, 01950639, 01951722, 01949415, 01949033, 01949372
  - Fix for bots that were failing when **all** of these conditions were met:
    - Bot contained more than 2,000 steps
    - Bot had one or more nested actions (such as IF or loop)
    - At least one of the nested actions contained more than 250 steps
  - Fix for inconsistencies that were observed on the **In-progress activity** page.
  - Fix for bots that were failing because of file dependency or interactive form that included multibyte characters in file names.
  - Changes to AARI desktop Assistant to manage and clear automations with start, stop, and resume actions.
- **Build 16685 (for US West, Canada, and Japan regions only)** Service Cloud case ID: 01947340
 

This updated build includes a fix for this issue: If a bot has a file dependency and the file name contains multibyte characters, then when the Bot Agent downloads the file, the download will fail during run time causing the bot to fail as well.

## What's new and changed in each product

**What's new**

<b>Control Room, devices, and Bot Agent</b>
<p><b>Windows 365 Cloud PC now supported as Bot Runner</b> (Service Cloud case ID: 01792699)</p> <p>We support Windows 365 Cloud PC as a Bot Runner to create and run bots on Windows 365 Cloud PC.</p> <p><a href="#">Automation 360 Bot Runner device requirements</a> on page 792</p>
<p><b>Oracle Database is now supported on Linux</b> (Service Cloud case ID: 00726728)</p> <p>We now support Control Room with Oracle Database on Linux, so you can now choose to install the Control Room with Oracle Database on Linux.</p> <p><a href="#">Installing Control Room on Linux</a> on page 909   <a href="#">Database requirements</a> on page 809</p>

<p><b>Control Room, devices, and Bot Agent</b></p> <p><b>Microsoft Edge offline extension is supported</b> (Service Cloud case ID: 01829649, 01880289)</p> <p>You can now install the Microsoft Edge offline extension for Microsoft Edge Enterprise browser users even when the device is offline.</p> <p>When the Bot Runner machines do not have Internet connectivity, you can use these features with the Microsoft Edge offline extension:</p> <ul style="list-style-type: none"> <li>• Automation of web apps</li> <li>• User interface triggers</li> <li>• Device registration</li> </ul> <p>The Microsoft Edge offline extension is transparent and works similarly to the Microsoft Edge online extension for users.</p> <p><a href="#">Install Bot Agent and register device</a> on page 998   <a href="#">Browser extensions for Automation 360</a> on page 765</p>
<p><b>Centralized notifications repository for various events and capability updates</b></p> <p>You can now track all the platform and automation events through a centralized repository. With this feature, you can identify the severity of events, consider possible actions based on the severity of events, and then take appropriate actions. You can also be notified about platform updates, such as bot export and package updates. Thus, it improves platform and user productivity.</p> <p><a href="#">Notifications</a> on page 2218</p>
<p><b>Automatically select the number of Bot Runners</b> (Service Cloud case ID: 00821020, 00715598, 00723191, 00784822, 01830238, 01870817)</p> <p>You can enable Automation 360 to automatically select the Bot Runner users for specific tasks to:</p> <ul style="list-style-type: none"> <li>• Scale automations easily</li> <li>• Run bots concurrently</li> <li>• Use resources efficiently</li> </ul> <p>This capability ensures that when you run or schedule an automation, the system automatically picks the available run-as users from the specified list.</p> <p><a href="#">Automatically select the number of Bot Runners users</a> on page 1944   <a href="#">Schedule a bot</a> on page 1937</p>
<p><b>Manage domain accounts using gMSA</b> (Service Cloud case ID: 00731119)</p> <p>You can use a group Managed Service Account (gMSA) to manage and run Control Room and other Automation 360 services.</p> <p><a href="#">Configure service credentials</a> on page 871</p>
<p><b>View keyboard shortcuts in Bot editor</b></p> <p>In Bot editor, you can now open a menu to view the available keyboard shortcuts.</p> <p><a href="#">Keyboard shortcuts list</a> on page 1310</p>
<p><b>Validate device credentials prior to bot deployment</b></p> <p>Prior to bot deployment, you can select to validate the device credentials for Bot Creator, attended Bot Runner, Citizen Developer, and unattended Bot Runner users. This provides users additional security for bot deployment.</p> <p><a href="#">Switch device registration between Control Room instances</a> on page 2052</p>

## Control Room, devices, and Bot Agent

### Export roles to view users and their permissions (Service Cloud case ID: 01804955)

You can export selected roles and their permissions to CSV files to view the following information:

- User information
- Run-as user information
- User permissions
- Folder permissions

[Export roles](#) on page 2036

### TLS 1.3 encryption support for a more secure connection to Control Room services (Service Cloud case ID: 00549240, 00606859, 01925085)

Automation 360 On-Premises supports both TLS 1.3 and TLS 1.2 cryptographic protocols for HTTPS and TCP communications between our components.

[Support for secure protocols](#) on page 41 | [Configure application Transport Layer Security](#) on page 868

### Enhanced Automation Anywhere Debugger tool

The Automation Anywhere Debugger tool is available in the **Bot Assistant** utility to provide a better user experience. When you invoke the Debugger tool from the Bot editor, you can add, update, or delete actions and variables in a bot.

By default, the **Watched variables** lists is empty. With a single click, you can add all the used variables in a bot. These variables display in a pop-up window where you can select or deselect, one or more variables, from the list.

[Debugger tool](#)

### Google Chrome and Microsoft Edge certification for operating systems

Google Chrome and Microsoft Edge extensions are certified for the following operating systems:

- Microsoft Windows Server 2012 Standard R2
- Microsoft Windows Server 2016
- Microsoft Windows Server 2019

## Packages, actions, and Bot editor

### Notification for package updates

When you add or update a package or upload a custom package to the Control Room, you are now notified about this platform event. This notification is displayed to all the Control Room users through the **Notifications** repository.

[Capabilities supporting notifications](#) on page 2227 | [Add packages to the Control Room](#) on page 1970 | [Add custom package to your Control Room](#) on page 1752 | [Upload custom package to your Control Room](#) on page 1697

### ServiceNow package

You can use the ServiceNow package from Automation 360 to authenticate and perform several actions with records and attachments in ServiceNow tables.

[ServiceNow](#)

<p><b>Packages, actions, and Bot editor</b></p> <p><b>ServiceNow triggers</b></p> <p>You can use ServiceNow triggers to call an action when there is a new or updated record.</p> <p><a href="#">ServiceNow New Record trigger</a> on page 1566</p>
<p><b>Cut, copy, paste keyboard shortcuts added for TN3270 and TN5250 Terminal Emulator</b></p> <p>In the Terminal Emulator package, the following keyboard shortcuts are now available specifically for TN3270 and TN5250:</p> <ul style="list-style-type: none"> <li>• Shift + Control + A = Select all</li> <li>• Shift + Control + C = Copy</li> <li>• Shift + Control + X = Cut</li> <li>• Shift + Control + V = Paste</li> </ul> <p><a href="#">Using Send text action</a></p>
<p><b>Quick assistance at hand for the developers in the Bot editor</b></p> <p>The accessibility and usability of the Bot editor, actions, and packages have been improved. As a citizen developer or an RPA developer, when you are creating bots, you can quickly look up information about the actions without navigating outside the Bot editor. Under the <b>Actions</b> pane, quick help is enabled with contextual information about actions. Additionally, an icon is configured with a link to the documentation. If you want more information about an action, you can click the link, which redirects you to the relevant page in the documentation portal. This feature is currently available in the following actions and packages.</p> <ul style="list-style-type: none"> <li>• Database</li> <li>• Email</li> </ul>
<p><b>Enhanced user experience through refreshed and intuitive icons</b></p> <p>With the new and intuitive icons for actions in the Bot editor, citizen developers and RPA developers can quickly locate the correct action while creating automation for a day-to-day task. These unique and renewed icons are developed according to brand and global standards.</p>
<p><b>Seamless package updates</b></p> <p>When a package version is added to the Control Room, either from a Cloud download or Control Room upgrade, as an administrator, you have the flexibility to disable the new version of packages. This feature helps you to restrict users from using the new package version until it is verified.</p> <p><a href="#">Updating packages in Control Room</a> on page 1967   <a href="#">Automatic package updates for On-Premises Control Room</a> on page 1968   <a href="#">Automatic package updates for Cloud Control Room</a> on page 1969</p>
<p><b>New option in Read from action of Database package</b> (Service Cloud case ID: 01263940)</p> <p>A new check box is available when you use the <b>Read from</b> action to retrieve records from the database and save the retrieved data in a CSV file. When you select this check box, no CSV file is created if the executed SQL query does not return any data.</p>
<p><b>Proxy support for EWS-OAuth2</b> (Service Cloud case ID: 00771400, 01574715, 01815888)</p> <p>When you create a bot with the Email package that uses EWS OAuth2 for authentication and the Bot Runner machine is configured behind the firewall, then all outbound requests are routed through the proxy server configured on the Bot Runner machine.</p>

**Packages, actions, and Bot editor****64-bit ODBC driver now supported in Database package** (Service Cloud case ID: 01256142, 01829360, 01849908)

We now support connecting to databases by using the 64-bit ODBC driver. This option is available when the connection mode is the default. Organizations transitioning to Office 365 will benefit from leveraging this enhancement and can sustain automation build with 32-bit ODBC drivers.

*[Using Connect for database](#)*

**OAuth 2.0 support in Email and Email trigger packages** (Service Cloud case ID: 01798311, 01803702, 01791859, 01828526)

Microsoft is deprecating the ability to use Basic authentication in Exchange Online for these specific protocols:

- IMAP
- POP3
- EWS

We support OAuth 2.0 authentication for these protocols in the Email and Email trigger packages. For enhanced security, you can maintain the business continuity of your email automations by switching the authentication type from Basic to OAuth 2.0, (as recommended by Microsoft).

*[Using Connect for](#)*

**Retry mechanism supported in credential variables** (Service Cloud case ID: 01786319, 01887182)

The credential variables support the retry mechanism. When you create a bot that uses credential variables, if the bot fails during run time to retrieve those variables from the Credential Vault because the Control Room is disconnected or the Control Room services stop intermittently, then the bot tries three times to retrieve the credential variables from the Credential Vault.

**Note:** Ensure that the Bot Agent version installed on your system is the version that is released with Automation 360 v.27.

**Packages, actions, and Bot editor**

**Support of other domain name in the Active Directory package** (Service Cloud case ID: 01807358, 01910765)

We now support Active Directory user operations by logon name with domain and can provide the domain name to extract user details. When you retrieve the user property or perform any user operation based on the logon name (userPrincipalName), and if the user domain name differs from the domain specified in the LDAP path, the user properties are now successfully retrieved with or without a domain name.

For example, LDAP Path: LDAP://ADServer/DC=automation, DC=net

User	Logon name
userPrincipalName: kim@aaengg.net	User can provide logon name as kim@aaengg.net.
userPrincipalName: shaun@aasales.net	User can provide logon name as shaun@aasales.net.
userPrincipalName:sarah@automation.net	user can provide a logon name as either sarah or sarah@automation.net.

The following list of actions supports logon name with domain.

- Update user details
- Rename user
- Delete user
- Enable user account
- Disable user account
- Set user property
- Get user property

[User account operations](#)

**Shared mailbox support for Email automation** (Service Cloud case ID: 00797231, 01816574, 01829499, 01854615, 01871861, 01933058, 01834152, 01829684, 01853949, 01880386, 01869636, 01894591, 01867553, 01911371. 01925438)

The Email package supports the email automation of a shared mailbox in Outlook for Office 365/ Microsoft 365 using IMAP/EWS protocols, and OAuth 2.0 authentication using Client Credentials and Authorization Code with PKCE grant flows. You can automate emails retrieved from a shared mailbox and perform all email-related tasks by accessing each folder(s) and its subfolder(s) in the shared mailbox.

**New action in Text file package**

You can use the new **Read variables** action in the Text file package to read the values of variables from the text file.

**Note:** The **Import string from text file** action in the String package has been deprecated and will not be available for new bots. We recommend that you use the new **Read variables** action with enhanced capabilities. This deprecation does not impact any existing bots or bots which were migrated previously and they will continue to run properly. See [Support and deprecation policy for packages](#) on page 66 for package lifecycle and deprecation policy.

[Read variables](#)

## Packages, actions, and Bot editor

### Call an existing JavaScript function in a webpage

You can use the new **Call a JavaScript function** action in the Browser package to call an existing JavaScript function directly in a webpage or in an iFrame within a webpage in Google Chrome and Chromium-based Microsoft Edge browsers. In the bot, you can also pass one or more input parameters to the JavaScript function and process the return value from the function.

[Call a JavaScript function](#)

### Automate controls using Microsoft UI Automation (COM) technology

You can use the Microsoft UI Automation (COM) technology to automate the following scenarios:

- Capture and automate client controls
- Capture and automate password text controls
- Capture and automate page tab controls

[Actions performed on objects captured with Universal Recorder](#) | [Capture using specific technology](#)

### Capture objects on applications running in administrator mode

You can use the Recorder to capture objects on applications running in administrator mode. To capture the object, select the **Capture and run with admin privileges** option from the Bot editor.

[Recorder package](#)

### Enhanced bot performance when using global values across bots

When you use global values across a parent bot and a child bot, the bot performance is enhanced by reducing the bot execution time. To enable enhanced bot performance, you must set the **Bot compatibility version** to **3** in the **Advanced settings** page of the Bot editor.

**Note:** Ensure that the Bot Agent version installed on your system is the version that is released with Automation 360 v.27.

[Bot compatibility version](#) on page 1375

### Enhanced user interface for Define functionality in AISense Recorder

- We have enhanced the user interface of **Define** window in the AISense Recorder that enables you to use anchors easily and automate UI objects that are not detected by AISense Recorder automatically. To improve functional clarity, the following object types are renamed:
  - **Active text** is renamed to **Link**
  - **Passive text** is renamed to **Text value**
- If you unintentionally click the screen or click before the highlighter appears, the AISense Recorder provides visibility into it. You must confirm to capture the object again or use the **Define** functionality to define the object on the screen.
- In the **Define** window, the AISense Recorder shows embedded help for each of the control types so you can select the correct control types for custom objects.

[Use variable anchor](#) on page 1345 | [Capture Textbox, Radio, Checkbox, and Combobox](#) on page 1340 | [Capture text value through AISense Recorder](#) on page 1339 | [Capture link button through AISense Recorder](#) on page 1338 | [Capture Image button through AISense Recorder](#) on page 1336

**Packages, actions, and Bot editor****New virtual key added to the Simulate keystrokes package**

In the **Simulate Keystrokes > Keystrokes** action, a new key named **Return** has been added to the virtual keyboard for Enter functionality and the Enter key in the Number pad has been renamed to **Num Enter**. As a result, the **Return** key is the main Enter key on the keyboard. This enhancement keeps the keyboard in sync with the physical keyboard. The nomenclature has been changed to avoid confusion between the Enter key on the keyboard and the Enter key on the Number pad.

**Support for global variable for all Datetime actions**

In the Datetime package, you can use the Datetime global variable across all **Datetime** actions. You can select to use either **String** variable or a **Global** variable in the **Source date and time variable** option. This avoids creating multiple local variables and reduces the total number of actions used in a bot.

[Datetime package](#)

The resiliency of the **File/Folder** trigger has been improved to continue listening after a network disruption has occurred. Previously, a network error caused the trigger to lose connection with the Bot Agent.

**Service Cloud case ID:** 01769532, 01773584, 01834098, 01867418

**Important:** For information about the supported packages for this release, see [Packages updated in v.27](#) on page 203.

**Building and running bots****Notification for bot export**

When you export a bot in the Control Room, you are now informed through the **Notifications** repository. This notification is sent only to the user who exported the bot.

[Capabilities supporting notifications](#) on page 2227 | [Export bots](#) on page 2143

**Code analysis runs automatically for all unscanned bots in public workspace**

Code analysis now runs automatically on all the bots with the **Not Scanned** status in the public workspace. This ensures visibility on the coding best practices for policies configured in the Control Room and will show the results of code analysis for all the bots in the public workspace without the need to run code analysis on each bot one by one.

**Check out multiple bots and files** (Service Cloud case ID: 00628344, 00822352)

You can now select multiple bots and their dependent files from different folders that belong to the same process and check them out from the public to the private workspace. You can check out a maximum of 10 parent bots, but there is no limitation on the number of dependent child bots.

[Check out multiple bots](#) on page 1360

<b>Building and running bots</b>
<p><b>Choose specific version of non-bot dependency to check out with parent bot</b></p> <p>When you check out a parent bot, you can now choose the version of a non-bot file dependency to check out. Every version of a parent bot can have different versions of non-bot file dependencies.</p> <p>With this feature, you can roll back the dependencies while rolling back the parent bot. You can make changes to a specific version of the dependent non-bot file.</p> <p><a href="#">Check out non-bot file dependencies</a> on page 1404</p>
<p><b>Compare bot version in private workspace</b> (Service Cloud case ID: 01761840, 01771389, 01763432, 01904500, 00798356, 01780116)</p> <p>You can now see the changes made to your bot logic in the private workspace before checking in your bot. As a Bot Creator, it was difficult to identify the changes made to the bot logic, input, and output parameters. With this functionality, you can now easily identify where you have made the modifications to the bot logic, variables, triggers, dependencies, and packages compared to the latest version or any other previous version of the bot.</p> <p><a href="#">Compare bot versions</a> on page 1366</p>
<p><b>Edit non-empty folder description in public workspace</b> (Service Cloud case ID: 01820406)</p> <p>You can edit the description of non-empty folders in the public workspace. Meaningful descriptions provide more insight of the bots contained in that folder. This feature enables an administrator or a user with rename folder permissions to better manage the repository when it contains many folders.</p> <p><a href="#">Create and rename folders</a> on page 1377</p>
<p><b>Specify queue running times in workload automations</b> (Service Cloud case ID: 01816260, 00331357, 01924895, 01274769)</p> <p>You can set the specific time period when to run a workload automation. When creating the workload automation, you can set the queue running days and time to ensure that the automation does not run during these scenarios:</p> <ul style="list-style-type: none"> <li>• Applications are not available</li> <li>• During scheduled upgrades</li> <li>• Non-working days (holidays, weekends)</li> </ul> <p><a href="#">Run bot with queue</a> on page 2116</p>
<p><b>Check for duplicates when adding work items</b> (Service Cloud case ID: 00825850, 01792046, 01806516)</p> <p>You can check for duplicate work items before adding them to the queue. This feature prevents re-processing the same work items multiple times, thus saving time and resources. You can either move the work items marked as duplicate for re-processing or discard them.</p> <p><a href="#">Insert Work Items</a> on page 2115</p>
<p><b>Generation of API Key is audited</b></p> <p>The generation of the API key is now audited and will display the expiry time of the api-key in the audit logs.</p>

**APIs and integrations****Workato Integration**

You can integrate the Automation 360 platform and Workato by using the Automation Anywhere connector. You can establish a connection with the Automation Anywhere Control Room and perform various operations using the Control Room APIs.

[Workato integration](#)

**SnapLogic Integration**

You can now integrate the Automation 360 platform and SnapLogic. You can establish a connection with the Automation Anywhere Control Room and perform various operations by using the Control Room APIs.

[Snaplogic integration](#)

**RPA Bots for Salesforce**

Now when creating new connections, you have the option to include an API Gateway certificate.

**What's changed****Control Room, devices, and Bot Agent****Automated reprocessing of failed WLM work items** (Service Cloud case ID: 00825872)

When you create or edit a queue, you can now use the **Max auto retry attempt** option to ensure that failed WLM work items are reprocessed automatically. With this option, you can specify the number of times for which the automatic reprocessing of failed work items will be attempted.

Automatic reprocessing of failed work items is attempted after all the work items in a queue are processed.

**Better device management with improved device permissions** (Service Cloud case ID: 01264963, 01871530)

You can now view and manage Bot Agent devices even if you have not registered them by using the enhanced **Edit the device(s)** permission. The **Edit the device(s)** permission is improved as follows:

- **Device(s) from my device pools:** To edit devices from device pools
- **Run as users default device(s):** To edit Run as user(s) default device

The Control Room administrator grants you access to a specific set of devices based on your role. When the **Edit the device(s)** permission with the **Device(s) from my device pools** and **Run as users default device(s)** options is selected, you can view and manage all (registered and non-registered) devices from a specific accessible group.

**Enhanced bot Compare versions page**

The bot **Compare versions** page shows changes in the dependencies between two versions of the bot. It shows changes for the first level of dependencies only and displays those dependencies sorted in alphabetical order.

**Control Room, devices, and Bot Agent****Specify time period to put work item on hold** (Service Cloud case ID: 00825875)

You can put a work item on hold for a specific date and time. This ensures that the work item moves automatically to processing (new state) on the specified date and time and no longer requires you to manually move it for re-processing. A new column in the **Edit queue** page displays the hold status of the work item, either date and time or indefinite if you do not specify the date and time.

[Edit queues](#) on page 2123

**Packages, actions, and Bot editor****Control Room version compatibility check with specific packages**

When you manually upload a package or a bot in the Control Room, the system now checks if the specific packages used in the bot are compatible with the Control Room version.

**Analyze button renamed in Bot editor**

The analyze button of Bot Insight (**Analyze Task Bot**) has been renamed to **Bot Insight "Analyze" dashboard** in the Bot editor page.

**Fixes**

**Build 16701:** This build includes the following fixes (along with fixes from the previous builds):

Fix for inconsistencies that were observed on the **In-progress activity** page.

**Service Cloud case ID:** 01949323, 01950696, 01944637, 01951100, 01953055, 01950639, 01951722

**Build 16694:** This build includes the following fixes (along with fixes from the previous builds):

If the **Manage my activity** feature is enabled for a user role, then the user can view the pause, resume, and stop status on the **In progress activity** page. If this feature is disabled, then the user cannot view these statuses.

Previously, users were able to view these statuses even when the feature was disabled.

**Service Cloud case ID:** 01937106

**Build 16667:** This build includes the following fixes:

When syncing with the Active Directory (AD), the user mapping no longer overwrites the **Description** field in the Control Room with blanks.

The Automation 360 Control Room no longer generates an error in the User Management log when a mapped security group has no members.

<p>The <b>In progress activity</b> page no longer shows bots after they are run.</p> <p>Previously, the page incorrectly showed bots in the active state even after execution.</p> <p><b>Service Cloud case ID:</b></p> <p>01914651, 01924866, 01923265, 01928088, 1918956, 01922321, 01931985, 01921849, 01938985, 01939812, 01940084, 01940585, 01940258, 01938868, 01934451, 01940222, 01941187, 01940900, 01941742, 01939639, 01941503, 01941496, 01939639, 01942720, 01942430, 01943379, 01943617, 01938885</p>
<p>When a user is assigned an admin role to create schedules and later the admin access is removed for that user, an audit log will be logged when the schedule is canceled because of the user not having the admin privileges.</p> <p>Previously, when such schedules were canceled, no audit logs were logged indicating that the schedule was canceled because the user did not have the required privileges.</p> <p><b>Service Cloud case ID:</b> 01830359</p>
<p>The <b>Administration &gt; Licenses</b> page and the Control Room banner displayed on the same licenses page now display correct information about license expiry.</p> <p>Previously, the correct information about license expiry was not displayed.</p> <p><b>Service Cloud case ID:</b> 01807324</p>
<p>When you edit a role, the <b>Edit role</b> audit log page now displays the correct old, new, and run-as user values.</p> <p>Previously, these values were not displayed.</p> <p><b>Service Cloud case ID:</b> 01759116</p>
<p>When you edit your first or last name on the <b>My profile</b> page, the description and auto login values on the <b>Edit user</b> audit log page will not be updated.</p> <p><b>Service Cloud case ID:</b> 01846878</p>
<p>You can correctly filter the status for activities on the <b>Activity &gt; Historical</b> page.</p> <p>Previously, some filters were not displaying the correct status for activities.</p> <p><b>Service Cloud case ID:</b> 01869361, 01875216</p>
<p>Users without permission cannot view the activities of other users on the <b>In progress activity</b> page.</p> <p>Previously, some users were able to view the activities of other users even though they did not have permission.</p> <p><b>Service Cloud case ID:</b> 01911289, 01910582</p>
<p>If you configured the log collection level as <b>Debug</b>, the logs collected from some packages do not include customer data.</p> <p>Previously, the logs collected from some packages included customer data.</p> <p><b>Service Cloud case ID:</b> 01862053, 01870001</p>

If the CPU utilization and device memory threshold values are outside the percentage range defined by the Control Room administrator in the **Administration > Settings > Devices > Threshold settings for multi-user devices**, a clear error message now indicates the device unavailability and provides an appropriate action.

Previously, when the CPU utilization and device memory thresholds values exceeded the defined value, bot deployment failed with an unknown error message.

Device shows an accurate status when the Bot Agent is disconnected from the Control Room.

Previously, due to the default time (15 minutes) of the WebSocket connection, a device was shown as connected even when the Bot Agent was disconnected from the Control Room.

**Service Cloud case ID:** 01843990

In the Oracle Database environment, a checked-in bot is now automatically refreshed and can be viewed in the **Public** folder.

Previously, to view a checked-in bot in the **Public** folder, you had to manually refresh the **Automation** page by using the **Refresh** button.

When a **Stop Task** command is used, WLM work items are now marked as completed successfully and show the correct status in the Control Room.

Previously, WLM work items were marked as failed even if the bot was executed successfully.

**Service Cloud case ID:** 01841320, 01840748

When you run WLM automations, if the Control Room restarts during deployment, the WLM deployment continues without delay when Control Room services are active.

Previously, after the Control Room restarted, there was a delay of 15 minutes before the WLM deployment continued.

When you run a bot by using the **Run bot with queue** option, the correct value of the work item is now selected, irrespective of the modification source. Previously, when the value of a work item was modified through the API or bot setting, the older value was selected by the bot

**Service Cloud case ID:** 01786785

In an Oracle Database environment, when you select the number format and sort order for the work items in a queue and then run bot by using the **Run bot with queue** option, the queues are now deployed successfully. Also, the correct log entry is shown in the **Audit log** or **Activity** page.

Previously, queues were not deployed, and no errors were shown in the **Audit log** or **Activity** page.

In a clustered environment, the bot deployment progress is no longer stuck and the Bot Runner device connects to the Control Room successfully.

Previously, the bot deployment progress would get stuck sometimes and show an error message `Waiting for user: <username> and/or device: <device-name>` on the **In progress > In progress activity** page.

**Service Cloud case ID:** 01830285

When a bot keeps running for a few hours, an error no longer occurs due to high memory usage with the Recorder package version 2.9.2 or later.

Previously, an increase in memory usage caused the bot to fail after a few hours with a `Java heap space` error.

**Service Cloud case ID:** 01911565

When you read emails within a loop using a Microsoft Outlook Client connection with a subject filter, use the **Delete** action and run the bot, the bot now completes the set iteration and deletes the emails from the specified folder. Additionally, the variable that was used to display the count of total emails versus deleted emails now displays the correct counts in the message box.

**Service Cloud case ID:** 01845642,01857791,01880424

When you establish a connection with the **EWS** server, and emails are read within a loop to filter and move all emails from a subfolder created within the custom folder, the bot now executes without an error.

Previously, an error occurred because the bot could not read the emails from the folders created outside the predefined folder, such as Inbox, Junk, or Draft.

**Service Cloud case ID:** 01823238

You can now successfully create a bot by using the **Upload file** action from the Office 365 OneDrive package.

Previously, the bot displayed an error when you used the **Upload file** action and if the file name had special characters such as brackets [ ].

**Note:** Brackets [ ] are now supported in the file name.

**Service Cloud case ID:** 01798568

When you choose the variable option to perform a task and during bot creation process you delete the variable you created (Your variables), and when you click the **Add** option in the variable field to insert a variable (such as global variable), the option is now enabled.

Previously, the **Add** option for inserting the variable was disabled.

**Service Cloud case ID:** 01869139

When you create a bot, you can now use the **Update node** action of the XML package to update the value of a node. Previously, the attributes were removed when you updated the text value of an XML element.

**Service Cloud case ID:** 01805643

In the Email package, connect to the **EWS** server and use **Loop > For each mail in mail box**. If the source mail is sent on behalf of some other user, for example, user `xyz@aa.com` sent mail on behalf of user `abc@aa.com`, the email dictionary variable `emailFrom` now returns the correct sender ID, which is `abc@aa.com`.

Previously, the email dictionary variable `emailFrom` returned the sender ID as `xyz@aa.com`.

**Service Cloud case ID:** 01856149

When you run a stored procedure in Oracle and it returns `SYS_REFCURSOR`, the **Run stored procedure** action closes the cursors.

Previously, the **Run stored procedure** action was not closing the cursor after the maximum cursor limit was reached.

**Service Cloud case ID:** 01842046, 01898572

In the Active Directory package, when you perform a user account operation such as **Add users to group**, **Delete user**, **Disable user account**, or **Rename user**, and if the username has an asterisk (\*), open parenthesis, or close parenthesis, you can now add a user without any error.

Previously, the username did not support the following special characters: asterisk (\*), open parenthesis, and close parentheses.

**Service Cloud case ID:** 01884962

When you create a folder in Outlook with a percentage (%) in its name (for example, `Clients %ClientA`), create a bot using the **Connect** action from the Email package and then use the **Folder exists or Folder does not exist** condition, the bot finds the `Clients%ClientA` and retrieves mail from it.

Previously, the bot was not able to retrieve mails from the folder because percentage (%) was not supported in the folder name.

When you connect to the Microsoft Access Database with JDBC and specify the database path, if you use the following specific aggregation functions in the query, an error is no longer encountered when you run the bot:

```
ASC, ATN, SQ, CBOOL, CCUR, CDATE,
CDBL, CDEC, CDATE, CDBL, CINT, CLONG, CLNG,
CSIGN, CSTR, CVAR, DATEADD, DATEDIFF, DATEPART,
DATESERIAL, DATEVALUE, FORMAT, IIF, INSTR, INSTRREV,
ISDATE, IsNull, ISNUMERIC, LEFT, LEFTS, LEN, MID,
MONTHNAME, DATE, NOW, NZ, SIGN, SPACE, STR, TIME, VAL,
WEEKDAYNAME, WEEKDAY, STRING, TIMESERIAL, CONCAT
```

When using the **Task Bot: Run** action, you can search dictionary and session variables to use as input parameters. Previously, no results displayed when using this Advanced search feature.

**Service Cloud case ID:** 01879539

A TaskBot no longer fails when you debug or run it when any **in\_Window** input variable is set.

Previously, in edit mode, when you debugged or ran a TaskBot with an input variable by selecting the **Use as input** check box, the bot failed.

**Service Cloud case ID:** 01919263

When you use the **Save** action in the Email package, and if the email subject includes a comma (,), the emails are saved successfully.

Previously, if the email subject included a comma (,) and you saved the email, the comma (,) was replaced with an underscore (\_).

**Service Cloud case ID:** 01786211

When you select the **Package** details page, and select the **Availability** tab, if the package (all users or selected roles) is changed, then the **Package** details page displays the last modified information of the user who made the changes, and the changes made at the access level (all users or selected roles).

You can create bots using the **Download file** action of the Google Drive package.

Previously, when you used the **Download file** action and marked the **Overwrite existing file** option to overwrite the file of the same name, the downloaded file became corrupted. If you then used the **Excel advanced > Open** action to open this file, or manually tried to open the Excel file, an error message displayed indicating that the Excel file was corrupted.

**Service Cloud case ID:** 01833815

<p>You no longer have an incorrect starting date when you create an event using the Google Calendar package.</p> <p>Previously, when you created an event in Google Calendar and entered the value in the <b>Start Date</b> field with the event type set to <b>All Day</b>, the Google Calendar package decremented the day value by one when you selected the <b>All Day</b> option.</p> <p><b>Service Cloud case ID:</b> 01815644</p>
<p>When you use the <b>Excel advanced</b> &gt; <b>Open</b> action to open an Excel spreadsheet which did not exist and then run the bot, the bot now displays the correct error message in Japanese.</p> <p><b>Service Cloud case ID:</b> 01857992, 01925567</p>
<p>You can successfully extract fields from a PDF file when you use the <b>PDF</b> &gt; <b>Extract field</b> or <b>Extract text</b> actions.</p> <p><b>Service Cloud case ID:</b> 01818304</p>
<p>When you use the 3.6.1-20220428-010115 version of the Simulate keystrokes package to enter keystrokes against specific webpages running in the Microsoft Edge browser with IE mode, the bot processes the keystrokes faster.</p> <p><b>Service Cloud case ID:</b> 01820418</p>
<p>When you use the <b>PDF</b> &gt; <b>Split document</b> action to split multiple PDFs into various folders and then use the <b>For each file in folder</b> iterator to run the bot in a loop to split each file in the specified folder, the bot no longer encounters an error.</p> <p><b>Service Cloud case ID:</b> 01803983</p>
<p>When you use the <b>File</b> &gt; <b>Copy Control Room file</b> action and choose the dynamic file path option to select a file from the Control Room repository, the bot no longer encounters an error. Previously, even if the uploaded file was available in the Control Room, the bot failed and displayed this error message: <code>Get Resource failed: Error: Could not find the file at the Control Room path. Check the file path and try again.</code></p> <p><b>Service Cloud case ID:</b> 01805364</p>
<p>When you use the <b>File</b> &gt; <b>Rename</b> action to rename and overwrite an existing file, the bot no longer shows an incorrect error message. Previously, when you tried to rename an existing file, the bot showed an incorrect file name in the error message.</p> <p><b>Service Cloud case ID:</b> 01845943, 01858350</p>
<p>You can successfully rename the file and remove an extension from the file name by using the <b>File</b> &gt; <b>Rename</b> action. Previously, when used the <b>Rename</b> action to remove an extension from the file name, the bot trimmed the last character from the file name instead.</p> <p><b>Service Cloud case ID:</b> 01842995</p>
<p>When you use the Recorder to capture objects on an application that is installed on a virtual machine, finish the recording after the objects are captured, and then relaunch the Recorder, the bot successfully launches the Recorder and no longer inserts any actions that were recorded earlier.</p>
<p>When you use the <b>Recorder</b> &gt; <b>Capture</b> action to automate Citrix virtual apps running on Google Chrome and Microsoft Edge browsers, add a delay of 60 seconds and run the bot, then if the object does not exist, the bot waits for the specified time (60 seconds) in the <b>Keep trying for (seconds)</b> field before executing the next steps.</p>

When you run the bot using the following sequence of actions, the bot shows accurate data for each loop iteration:

1. Use the **Database > Connect** action to connect to the database
2. Use the **Database > Read** action to read the values from the database
3. Use the **For each row in a SQL query dataset** iterator to run the bot in a loop
4. Use the **Database > Disconnect** action to disconnect from the database and select the **Keep database schema in cache until bot finishes running** option.

Previously, during the second loop iteration, the action picked up data from the previous loop.

**Service Cloud case ID:** 01817192, 01853717, 01880154, 01940546

An error no longer occurs when you use Recorder package 2.8.6 and later versions to perform a click operation on a link element that opens a pop-up window on a web page running in Microsoft Edge with IE mode.

**Service Cloud case ID:** 01845776, 01858872, 01923003

When you install the AARemoteAgent\_2.0, the DLL files are now copied to the correct **A360 Remote Agent** folder and the AARemoteAgent\_2.0 runs properly. Previously when you installed the AARemoteAgent\_2.0, the DLL files were copied to an incorrect **A360 Remote Agent\Java** folder.

**Service Cloud case ID:** 01935630

You can now successfully use the **PDF > Extract field** action to extract values from a PDF that contains a string data type with the dollar sign (\$).

**Service Cloud case ID:** 01848220

You can now successfully run all migrated web actions of the Legacy Automation package in multiple steps of a bot in Microsoft Edge with IE mode.

**Service Cloud case ID:** 01853563, 01865846

In the **File > Copy Desktop file** action, when you use a variable that contains a number sign (#) instead of a file path to locate the file that you want to copy, the bot no longer encounters an error.

**Service Cloud case ID:** 01808009, 01845923

When exporting data to Excel CSV files, Boolean values return accurately. Previously, a bug caused values to return as -1 while using OLE DB Driver for SQL Server (version 18 or later).

**Service Cloud case ID:** 01826530

Updating the Bot Agent version sometimes failed. However, when you select the **Automatically update all bot agents** option, the Bot Agent updates to the latest version without failures.

Control Room now supports Windows NT in French.

**Service Cloud case ID:** 00682337

All `DELETE /v1/configurations` endpoints are not accessible anymore.

**Service Cloud case ID:** 01920980

While installing Automation 360 on a three-node cluster, the installer prompts you to enter the **Elasticsearch** password for the first node only and replicates this data across the other two nodes.

<p>Bots that are running for longer duration display correctly on the <b>In progress activity</b> page. Previously, these bots displayed only after bot updates and were removed after the page refresh.</p> <p><b>Service Cloud case ID:</b> 01921149</p>
<p>You can now update Internet Explorer bots created in Automation 360 to <b>Microsoft Edge with IE mode</b> using the <b>Update Bot wizard</b> even if these bots (or its dependencies) contain a '.' (dot) character in its name.</p> <p><b>Service Cloud case ID:</b> 01809003, 01814904, 01822014, 01858820</p>
<p>If you selected the <b>Log off windows session post bot execution</b> option under <b>Auto-login settings</b> in the Control Room, data in the resource folder is cleared after the bot run.</p> <p><b>Service Cloud case ID:</b> 01795752, 01778828, 01804711,01864871,01923299, 01823515</p>
<p>If you delete a device entry from <b>Manage &gt; Devices</b> in the Control Room, the device registration properties are removed. This enables you to reregister the device.</p> <p><b>Service Cloud case ID:</b> 01808450</p>
<p>You can successfully log in to Automation 360 using Active Directory credentials when the <b>Auto-login users into Control Room</b> option is enabled, without encountering any issues..</p> <p><b>Service Cloud case ID:</b> 01808170, 01826805</p>
<p>The generated Control Room operational log files contain readable characters.</p> <p><b>Service Cloud case ID:</b> 01872473</p>
<p>The Repository Management (/v2/repository/files/&lt;file_id&gt;/content) API now returns file contents only for the files the logged-in user has permission to view. The content of these files cannot be updated using a different API.</p> <p>Previously, this Repository Management API returned file contents for the files that the logged-in user did not have permission to view. And the user could update the content of these files.</p> <p><b>Service Cloud case ID:</b> 01819101</p>
<p>Bot deployment now resumes and completes without any issue when the <b>Task Bot &gt; Pause</b> action executes before or while the runtime window is loading.</p> <p>Previously, the resume option was not displayed in the runtime window, and the bot deployment was not completed.</p> <p><b>Service Cloud case ID:</b> 01835794</p>
<p>You can create a folder within the <b>Bots</b> folder in the public workspace.</p> <p>Previously, folder creation failed with an error in the public workspace.</p> <p><b>Service Cloud case ID:</b> 01257981</p>
<p>You can now successfully compare different versions of your bots and dependencies in both the public and the private workspaces.</p> <p>Previously, comparing the bot versions failed with a timeout error.</p> <p><b>Service Cloud case ID:</b> 01770115, 01905037</p>

<p>When you export the user data to a CSV file, it now shows the correct user type and device license information for all users.</p> <p>Previously, user data exported to the CSV file showed incorrect information.</p> <p><b>Service Cloud case ID:</b> 01840507</p>
<p>You can now check in a bot successfully to the public workspace.</p> <p>Previously, the bot check in failed because the audit trial was processed unsuccessfully.</p> <p><b>Service Cloud case ID:</b> 01860361</p>
<p>The BLM export is an asynchronous call and when used with the existing API endpoint <code>/v2/blm/status/{requestId}</code>, there is a delay associated with the API call. Due to this delay, you cannot retrieve the current status of the export if there is not enough time gap between the export and the status call. To bypass this limitation, a new API endpoint has been added <code>GET /v2/blm/status/{requestId}/timeout/{timeout}</code> which introduces a time delay that waits for the export process to complete and then retrieves the status.</p> <p><b>Service Cloud case ID:</b> 01806109</p>
<p>Upgraded Swagger UI and Swagger Editor to version 4.15.5 to fix a security vulnerability.</p> <p><b>Service Cloud case ID:</b> 01843148</p>
<p>When you create bots that use the <b>Excel advanced &gt; Select cells/rows/column</b> action and set the <b>Cell Range</b> with an expression (such as <code>B1:\$SampleNumber.Number:toString\$</code>), the Bot editor no longer displays an error and the action now works properly.</p> <p><b>Service Cloud case ID:</b> 01941537</p>
<p>When you use the File trigger to modify a BAT or VBS file, the trigger is generated once. Previously, the trigger would generate twice when you enabled the <b>file modified</b> scenario.</p> <p><b>Service Cloud case ID:</b> 01816589, 01877498</p>
<p>You no longer encounter issues with bot check-in or cancel check-out after the bulk package update operation. When you try multiple bulk updates of packages, now an appropriate error message indicates to perform bulk updates of one package at a time.</p> <p>Previously, when you performed multiple bulk updates of packages, it resulted in check-in or cancel check-out errors.</p> <p><b>Service Cloud case ID:</b> 01849828, 01881950</p>
<p>Bots with a large number of automations complete successfully without any pre-processing issues or errors.</p> <p><b>Service Cloud case ID:</b> 01949415, 01949372, 01949033</p>

## Security fixes

<p>The version of Springframe Work is updated to 5.3.22 and does not exhibit the security vulnerability.</p> <p><b>Service Cloud case ID:</b> 01850811</p>
--

## Limitations

When you create a device pool with a temporary (disconnected) device, the device deletion job does not complete successfully. Additionally, the **Audit log** page shows the device is deleted, whereas the **Device list** page shows the deleted device in the list.

When you check out bots in bulk, you cannot check out the bots for which you have the required permissions. This is because bots for which you have the required permissions are also excluded along with the bots for which you do not have the required permissions.

The bot checkout fails in the following scenarios:

- If a bot with same name (but different case) exists in your private workspace with the same path.

---

**Note:** In such cases, the bot checkout or overwrite fails even when an overwrite confirmation message displays.

---

- If a folder with the same name exists in your private workspace with the same path.

When you compare bot versions from the **View history** page in a **Public** workspace, the **Compare versions** page shows an error message.

**Workaround:** To fix this error, perform one of the following actions:

- In a **Public** workspace, click the three dots icon next to the required bot in the **Action** menu and click **Compare versions**.

---

**Note:** You cannot compare the bot versions when only one bot version is available.

---

- If you check out a bot to a **Private** workspace and then modify and save it, click the three dots icon in the **Action** menu and click **Compare versions**.

**Service Cloud case ID:** 01949094, 01946533

In Windows and Linux operating system, notifications are not working with the Oracle Database.

We use a third-party parser to convert from HTML format to plain text. As a result, when you convert an email from HTML format to plain text, you will see that, sometimes, the text is not converted into plain text and is not displayed in the correct format. For example, you might see that some lines are added or skipped.

**Service Cloud case ID:** 01822614

In any package, when you select the **Add argument** option, select **String** or **Number** as the **Argument type**, and then try to insert a value, you might not be able to navigate through the options using the scroll functionality.

When you use the **System > Get environment variable** action to select the list of environment variables to return the system parameters of the device, some environment variables might not be visible.

After you upgrade to Automation 360 v.27, if a new package (first version) is added to the Control Room and in the setting for packages you selected **Disable** for the new version of package, you will see that the package will have status as **Enabled and set as default** instead of **Disable**.

In an Oracle Database environment, when you upgrade to Automation 360 v.27, the new package versions that are shipped through the installer remain in the disabled state and are not set as the default version.

**Workaround:** You must enable each updated or new package manually and set the package as the default version.

In the **Automation** page, column customizations made on the **Files and folders** are not retained when you navigate away from that page. For example, if you customize the columns in the private workspace, move out, and navigate back to the private workspace, the previous customization is not retained. It returns to the default view.

Similarly, searches and customizations such as filters, sort orders, custom columns, and partially completed edits are not retained when you navigate away from the page.

#### Limitations from previous releases

When you run a bot in the Google Chrome or Microsoft Edge browser, use the If, Loop, or Wait action, select the webpage from the list of active tabs in the **Browser** tab, close the browser window, and then run the bot, the bot might take two minutes to open the webpage in the browser irrespective of the timeout value mentioned.

**Workaround:** Move the If, Loop, or Wait action inside the **If** block and use the **Application is running** condition with same browser application to check whether the browser is running.

You will encounter an error when you run a standard workflow in the SAP BAPI package.

**Workaround:** To execute SAP BAPI, use the Run Function call (RFC) with a combination of **Create function**, **Set** or **Get field value**, **Set** or **Get structure**, and **Set** or **Get table** actions.

*A360 : SAP BAPI functions - Run Standard Workflow - Error while selecting BAPI\_SALESORDER\_CHANGE (A-people login required)*

When you migrate a bot that contains **XML command > Get single node**, after migration, the bot encounters the following error: No node found at XPath while executing the Get Single node command. **Workaround:** If the XPath expression is not starting with (/) , apply XPath starting with “/” so that at the time of execution, the modification can be skipped or the XPath expression can be designed to get the desired result.

When you use the **Capture** action with the Recorder package (version 2.9.x or earlier) to navigate to another web page in the Google Chrome browser (version 105.0 or later), and then use another **Capture** action to automate objects in the navigated web page, the bot might encounter an error.

**Workaround:** Before you use the **Recorder > Capture** action in the bot, maximize the Google Chrome window .

When you use the If package, add a specific condition with a variable, then add specific conditions within a group, save the bot, and if you rename the variable that was used, the name of the variable might not update for the **Group** conditions but is only updated for the conditions in the **Condition** tab.

Command prompt API allows you to switch the device registration even if the **Allow devices (single user) to be switched to another Control Room without reinstalling bot agent** option is disabled.

### Limitations from previous releases

When you upgrade from Automation 360 v.25 to a later version, although you enabled code analysis in the Control Room, the rules set in the policy are not retained after the upgrade.

**Workaround:** Before upgrading, we recommend that you keep a note of the rules enabled in Automation 360 v.25 and then re-enable them after upgrading to a later version.

When you uninstall Automation 360 from the Control Panel, the name of the file is displayed incorrectly (for example, 3e592.msi) on the **User Account Control** window.

While running a bot in debug mode, the bot will fail if the variable size gets greater than 3 MB. An error message appears showing that a variable has exceeded the 3 MB limit.

## Updates to the interface

### RPA Workspace

The **Max auto retry attempt** option is added to reprocess the failed WLM work items automatically.

The screenshot shows the 'Create queue' wizard in RPA Workspace. The 'General settings' section is highlighted, showing the 'Max auto retry attempt' field set to 2. The field is highlighted with a yellow box. The wizard includes a sidebar with sections: General (checked), Owners (checked), Participants (checked), Consumers (checked), and Define work item structure (checked). The 'General settings' section includes fields for Queue name (Auto-retry-q1), Description (optional), Reactivation Threshold (1 work items), Time it takes for a person to complete 1 work item (optional), and Max auto retry attempt (2 times). The 'Max auto retry attempt' field is highlighted with a yellow box.

*Automated reprocessing of failed WLM work items*

### Keyboard shortcuts

The **Device(s) from my device pools** and **Run as users default device(s)** options are added in the **Edit the device(s)** permission to manage registered and non-registered devices.

*Better device management with improved device permissions*

**RPA Workspace**

The gMSA option enables you to manage your domain accounts across multiple

The image displays two side-by-side screenshots of the 'Service Credentials' dialog box in RPA Workspace. Both screenshots show the 'Control Room windows service credentials' window with the following fields:

- Local System Account
- User Name: mydomain\ellie.brown (For eg. Domain\Username)
- Password: [Redacted]
- Confirm password: [Redacted]

The right screenshot highlights the  Use a Group Managed Service Account option with a red box. Both screenshots include '< Back', 'Next >', and 'Cancel' buttons at the bottom.

servers.

*Manage domain accounts using gMSA*

## RPA Workspace

The **Custom number of bot runners** option allows you to choose the number of Bot Runners that you want to use to run

Schedule bot Cancel Schedule bot

## Updating to v.27 release

Review requirements and support information about updating your Control Room and Bot Agent for the v.27 release.

## Bot Agent updates

---

**Note:** This release includes an **optional** Bot Agent update. You can continue to run your existing bots without updating the Bot Agent. However, if you want to use the new features in Automation 360 v.27, you must update the Bot Agent available with this release.

---

For more information on updating to this release, see these resources:

- [Automatically update the Bot Agent](#) on page 1001 | [Manually update the Bot Agent](#) on page 1002
- [Compatibility with release builds](#) on page 985

## Certified Control Room builds for direct update

You can update to the latest version of Automation 360 from the previous three releases (that is, from  $n-3$  releases, where  $n$  refers to the latest release).

The following previous releases are certified for update to Automation 360 v.27:

- v26 (Build 15450)
- v.25 (Build 15112)
- v.24R2 (Build 13343) and v.24 (Build 12350)

If you are on one of these previous releases, for information about updating, see [Update to latest Automation 360 version](#) on page 1022. If you are not on an  $n-3$  release, update Automation 360 to one of the  $n-3$  releases before updating to Automation 360 v.27.

For the latest updates to the Automation 360 extensions for Google Chrome, Microsoft Edge, and Mozilla Firefox, see [Browser extensions for Automation 360](#) on page 765.

**Migration updates for v.27 release**

Review what's new, changed, and the fixes and limitations to migrating from Enterprise 11 and 10 versions to Automation 360 v.27.

**What's new**

<b>Enterprise 11 and Enterprise 10</b>
<p><b>Scan Automation 360 bots that use Basic authentication in Email action</b></p> <p>This release introduces an option to use the Bot Scanner to scan all Automation 360 bots and identifies those that use Basic authentication in the Email package and Email trigger action so that you do not have to identify them manually.</p> <p>You can use the Bot Scanner report to analyze the impact to the bots due to the Basic authentication and the estimated effort required to switch the authentication mode from Basic to OAuth 2.0.</p> <p>For more information, see <a href="#">Scan Automation 360 bots for Email action with Basic authentication usage</a> on page 112   <a href="#">Basic authentication scanning messages</a> on page 115</p>
<p><b>Variables created automatically after migration</b></p> <p>In the Bot Scanner utility, bots that contain the following non-referenced system variables are no longer flagged as <b>Action Required</b> or <b>Review Required</b>:</p> <ul style="list-style-type: none"> <li>• \$Excel Column\$</li> <li>• \$Filedata Column\$</li> <li>• \$Dataset Column\$</li> <li>• \$Table Column\$</li> <li>• \$XML Data Node\$</li> <li>• \$PDFTitle\$</li> <li>• \$PDFSubject\$</li> <li>• \$PDFFileName\$</li> <li>• \$PDFAuthor\$</li> </ul> <p>After migration, the system automatically creates these variables based on the Automation 360 naming convention, and the migrated bots run successfully.</p>
<p><b>Support for SMTP server type with Send Email command</b></p> <p>When you migrate bots with the Send Email command, you can select the <b>Use outgoing Email server settings</b> option in the Bot Migration Wizard to identify and select the server type for the Enterprise 11 bots. You can configure required server details using a new SMTP server type option.</p> <p>See <a href="#">Migrate Enterprise bots</a> on page 1173.</p>

**Enterprise 11 and Enterprise 10****Improved automated editing ability for legacy bots**

When you migrated legacy bots that contained the Log To File command, the Carriage Return and Line Feed (**CRLF**) characters were converted to LF characters automatically. In Automation 360, the text is displayed in a single line with no line feed, whereas in Enterprise 11, the CRLF is added at the end of each line as a line feed. As a result, you had to add the **\$String:Newline\$** variable to insert a CRLF in the migrated bot.

The new **Convert \n characters to \r\n Log to File action** option in the Bot Migration Wizard enables you to add a new CRLF automatically to migrated bots and avoid manual edits. Migrated bots that use the Log To File sub-commands to log files can use the CRLF characters in a string.

See [Migrate Enterprise bots](#) on page 1173

**Enterprise 11 only****Migration enhancement to packages and actions**

- When you migrate Enterprise 11 bots with variables whose values are read from a text file, the system adds the **String: Import string from text file** subcommand to import the variables from the text file into a string variable. As a result, extra lines are added in the migrated bots.

The **Read variables** action has been added in the Text filepackage to address the extra lines.

You can use this action to read the values of all variables in a text file as a single line in a migrated bot which simplifies the post-migration efforts and reduces the number of lines added in a migrated bot.

See [Read variables](#)

- Microsoft is removing the capability to use Basic authentication in Exchange Online for the following protocols:
  - RPC
  - MAPI
  - Offline Address Book (OAB)
  - Exchange Web Services (EWS)
  - POP
  - IMAP
  - Exchange ActiveSync (EAS)
  - PowerShell

For those customers running bot for Email automation that connect to Exchange Online using the IMAP, POP3, or EWS protocol with Basic authentication, we have added authentication options to support **OAuth2** authentication.

You can migrate Enterprise 11 botswith the authentication type set to the **OAuth2** option with **Authorization code with PKCE** or **Client credentials**.

- In the **Read from** action of the Database package, the following option is introduced: **Don't create file if no data is found**. This option is selected by default for migrated bots with the Database package, and the migrated bots now follow the same behavior as Enterprise 11. If the executed SQL query does not return any data, the behavior is as follows:
  - If this option is selected, no CSV file is created.
  - If this option is not selected, a 0 KB CSV file is created.

For more information, see [Using the Read from](#).

- Migrated bots support the newly added **Return** key in the **Simulate Keystrokes > Keystrokes** action. These bots will continue to display the **Enter** key (which has been renamed to **Num Enter**) and the newly added **Return** key.
- Migrated bots support access to the Datetime global variable across all actions in the Datetime commands.

You can successfully migrate TaskBots that contain references to multiple MetaBots which include DLLs with same name. The session name of the first DLL is created using the name of the DLL. When the subsequent DLL with the same name from another MetaBot is migrated, the ID of the folder in which the DLL resides is used as a session name.

For example: `M_DLL_Session-<MetabotFolderId>_<DLLName>`.

## Fixes

<p>If the Enterprise 11 bots used the Send Email command without configuring authentication, now after migration the <b>Email server host</b>, <b>Email server port</b>, and <b>My server requires authentication</b> values are set to the appropriate values.</p> <p>Previously, after migration, these values were set to null variables and authentication failed.</p> <p><b>Service Cloud case ID:</b> 01849475</p>
<p>After migration, bots that are using Visual Basic script or JavaScript in the Run Script legacy automation action and using multiple parameters that include spaces without quotation marks will now display the correct output after execution.</p> <p>Previously, such bots were displaying incorrect output.</p> <p><b>Service Cloud case ID:</b> 01901882</p>
<p>An error no longer occurs during migration when the <b>Select Query</b> bot runs validation. Previously, the following error randomly occurred with text drivers.</p> <p>[Microsoft][ODBC Text Driver] Object invalid or no longer set.</p>
<p>After migrating to Automation 360, if the <b>Application</b> window does not exist for the bots that use the If, IF/ELSE, or Loop in Windows control, then these bots no longer encounter errors during bot run.</p> <p><b>Service Cloud case ID:</b> 01846262</p>
<p>The <b>Stored Procedure</b> parameters are set correctly with <b>Nvarchar</b> when you migrate bots to Automation 360.</p>
<p>When a bot that contained the <b>File</b> and <b>Folder</b> loop was migrated to Automation 360, an error was displayed if the corresponding folder did not exist. You can migrate such bots like the corresponding legacy bot as the <b>If</b> condition is now added before the <b>File</b> and <b>Folder</b> loop to check if the folder exists.</p>
<p>You can migrate bots that contain the <b>Substring</b> command from the String package to Automation 360, even if the optional <b>Length</b> attribute is blank.</p>
<p>When you migrate a bot that has <b>\$counter</b> variable within a nested loop to Automation 360, the child loop counter is now set to the parent loop counter and the child loop iteration is processed correctly.</p>
<p>When you run a <b>Select</b> query inside a Loop package, and you reiterate its result set further, the resultant Loop now reiterates the latest record as expected.</p> <p><b>Service Cloud case ID:</b> 01799961</p>
<p>You can successfully migrate bots that have the <b>Wait for object to exist value</b> option set to <b>0</b> seconds in the Object Cloning command.</p>
<p>When you use the <b>Run Logic</b> command with an IF/ELSE condition that uses a <b>Credential variable</b>, all credential variables migrate successfully.</p>
<p>When you migrate Enterprise 11 bots with string variables that have static values, variable parsing through legacy expressions is no longer performed. This avoids unnecessary parse expressions from being added to the migrated bots.</p> <p><b>Service Cloud case ID:</b> 01819830</p>

You can successfully run migrated bots that contain multiple Clipboard variables as an output. Automation 360 adds the **Clipboard:Copy to** action after every variable so that migrated bot is run properly.

**Service Cloud case ID:** 01815938

When you migrate Enterprise 11 bots that use the **Connect** action with the Terminal Emulator command, and if the **Hostname** field contains a Credential Variable, then the field is mapped correctly after migration.

**Service Cloud case ID:** 01861600

When you run migrated bots that contain the **Legacy Automation > Manage web controls > Select Item by Text** action, the list that contains variables is now displayed as expected.

**Service Cloud case ID:** 01782998

You can now change, reallocate, or delete the license of a Bot Runner user in a migrated Automation 360 Control Room, even if the Bot Runner user had logged in to Enterprise 11 Client at least once.

Previously, an error was displayed in such cases.

**Service Cloud case ID:** 01829547

You can run migrated bots successfully on SMTP servers when you include the Send Email command inside a Loop, and that loop iterates more than 100 times.

**Service Cloud case ID:** 01792886

Migrated bots do not create duplicate variables when the `Error_description` variable is case-sensitive.

**Service Cloud case ID:** 01861530

You can now successfully migrate audit logs using the audit log export utility on a multi-node setup from the Enterprise 11 Control Room.

Previously, the audit log export utility displayed an exception error in such cases and the audit logs could not be migrated.

**Service Cloud case ID:** 01912835

## Limitations

In Enterprise 11, if bots were using certain keys (such as: Ctrl, Shift, Caps Lock, Num Lock, and so on) in the Insert Keystrokes command, the keys were reset when an error was encountered during the execution of child bots. However; after migration, these keys are not reset when an error is encountered during the execution of child bots. As a result, different output or behavior might occur during the execution of the other subsequent child bots or the main bot.

**Service Cloud case ID:** 00773679

When you migrate a bot that uses the **Send email** command and run the bot in Automation 360, the predefined placeholders in the email body are not replaced with their actual content.

For example:

```
Task Name: <taskname>
Repeat: <repeat>
Status: <status>
Last Run Time: <lastruntime>
```

Whereas when you run the bot in Enterprise 11 with these placeholders, the following output is generated:

```
Task Name: PLACEHOLDER_SEND.atmx
Repeat: Do not Repeat
Status: Failed
Last Run Time: 11/29/2022 13:04:22
```

**Service Cloud case ID:** 01908010

When you run a migrated bot with an XML package that contains an **Xpath** expression, the running bot might fail and generate this error message: No node found at XPath

This issue might occur for these specific scenarios:

- If the root element does not have a namespace, and the child element of the XML package has a default namespace.
- If there are more than one xmlns (the default XML namespace) defined in the XML document.

**Service Cloud case ID:** 01874203, 01798339

See [XML path is not working which works fine in Enterprise 11](#)

## Updates to the interface

**Migration**

The **Bots using Email action with Basic authentication** option is added to the Bot Scanner to scan bots that use basic authentication in the Email package and Email

trigger.

*Scan Automation 360 bots that use Basic authentication in Email action*

## Migration

The **Use outgoing Email server settings** option is added to the Bot Migration Wizard to specify the type of email server you use.

Migrate bots Cancel Migrate bots

**Settings** ✔

Name  
• Migration.admin.23.01.04...

Description  
• ...

**Bots** ✔

• Bots selected (0)

**Bot Runners** ✔

**Bots and Dependent Bots** ○

**Settings**

**Bot Migration settings**

Overwrite if a bot with the same name exists

Exclude bot dependencies  
If this option is selected, all the bot dependencies will be excluded while migrating.

**Bot behaviour configuration**

Use 'Excel Cell Row' legacy behavior  
If you are migrating from 11.3.0 and below, we recommend selecting this option.

**Use outgoing Email server settings**  
If this option is selected, settings will be applicable to bots that contain send email action. You may need to update the global value if required.

SMTP email server

Server uses secure connection (SSL/TLS)

Server requires authentication

EWS email server

Include web services settings  
This allows you to migrate along with the web services proxy host and port. If this value is selected, pre-created global values will be available to the bot for connecting with web services proxy.

Convert bots built using Internet Explorer to Edge with Internet Explorer mode  
If you are migrating bots built on Internet Explorer, we recommend selecting this option to convert them to Edge with Internet Explorer mode.

Convert \n characters to \r\n in 'Log to File' action  
This allows you to convert \n characters (LF) into \r\n characters (CRLF), which automatically take new line in bots using Log to File action.

**Bot Insight configuration**

Tag bots and variables for analytics  
This allows you to tag bots and variables for analytics through Bot Insight. If you are not using Bot Insight in legacy bots, we recommend you not to select this option.

Next >

*Support for SMTP server type with Send Email command*

### Migration

The **Convert \n characters to \r\n** **Log to File** action option is added to the Bot Migration Wizard to provide you an option to not have to edit the bots manually and a new line is added automatically in migrated

Review requirements and support information about updating your Control Room and Bot Agent for the v.27 release.

### Remote agent v.2.1.0 updates

A new version of the Remote agent is released with Automation 360v.27. This section includes the fixes for Remote agent version 2.1.0.

### Fixes

When a bot keeps running for a few hours, an error no longer occurs due to high memory usage with the Recorder package version 2.9.2 or later.

Previously, an increase in memory usage caused the bot to fail after a few hours with a `Java heap space error`.

**Service Cloud case ID:** 01911565

An error no longer occurs when you use Recorder package 2.8.6 and later versions to perform a click operation on a link element that opens a pop-up window on a web page running in Microsoft Edge with IE mode.

**Service Cloud case ID:** 01845776, 01858872, 01923003

When you install the AARemoteAgent\_2.0, the DLL files are now copied to the correct **A360 Remote Agent** folder and the AARemoteAgent\_2.0 runs properly. Previously when you installed the AARemoteAgent\_2.0, the DLL files were copied to an incorrect **A360 Remote Agent\Java** folder.

**Service Cloud case ID:** 01935630

In the Recorder package, you can now use the **Left click**, **Right click**, and **Set Text** with delay actions for cross-domain IFrames to automate web pages on Google Chrome and Microsoft Edge browsers with Manifest V3 extensions. Previously, these actions were not working for cross-domain IFrames with Manifest V3 extensions.

In the Recorder package, you can now use the **Click** action for the Link and Form tag controls that have inline scripting with JavaScript using Manifest V3 extensions.

When you use the **Recorder** > **Capture** action to automate Citrix virtual apps running on Google Chrome and Microsoft Edge browsers, add a delay of 60 seconds and run the bot, then if the object does not exist, the bot waits for the specified time (60 seconds) in the **Keep trying for (seconds)** field before executing the next steps.

## Process Discovery v.27 release

Review what's new in Process Discovery for the v.27 release.

### What's new

#### PEG Serverless

With support of up to 100 simultaneous sensors, businesses can easily redact sensitive data at scale before the data is sent to the Process Discovery platform. Businesses can run Process Discovery data collection across multiple teams simultaneously, while still providing one interface for IT Admins to manage the configuration, and one interface for the business to review the redactions.

#### PEG Configuration UI

IT Admins can easily manage forwarding configurations, redaction configurations, and export logs from a web UI instead of having to run commands on the command line.

[Manage redaction and forwarding settings from the UI](#) on page 1643

## Fixes

Discovery Bot admins can now view all created processes without having the Discovery Bot recorder license.

Previously, if a Discovery Bot admin did not have a Discovery Bot recorder license and was using version A360.24, A360.25, or A360.26, all created processes did not display on the Processes page.

**Service Cloud case ID:** 01859123, 01877311, 01860901

## AARI v.27 release

Review what's new and changed, and the fixes and limitations in AARI for the v.27 release.

## What's new

### Smart embedded forms and dynamic data mapping for embedded widgets

You can now design your forms using a responsive and real-time canvas that can automatically adjust to the desired form size. This enables a faster way for you to create an embedded interface for use in any web application. You can also use these forms in your business applications to securely retrieve data when embedded as an iFrame widget.

To save time and eliminate data re-entry, you can use the postMessage API to map and pre-populate data from business applications in embedded widgets. Dynamic data mapping provides a safe and secure communication from your business (host) applications to the initial process forms in the widget.

[Smart embedded forms and dynamic data mapping](#) on page 1583

### Build forms easily by dragging elements to form builder

You can now build your forms by just dragging your elements to a blank form builder. As you add elements to the form builder, it automatically adjusts without your input, letting you focus on the form-building experience. You can also re-size the columns of your elements.

[Create a form](#) on page 1536

### Map data in host web applications for AARI Integrations

You can now map your host applications data to your AARI forms so that when you create a request, the initial form field will be automatically populated with the mapped data.

[Map host data to process](#) on page 1585

### URL parameters support for iFrame widget

You can use URL parameters to pass data types (date, time, number, and text box) through query parameters for your initial forms in the iFrame widget. Because the iFrame URL allows you to modify the URL to add data types, you can now directly populate data from a host application for form elements without having to keep re-entering the data.

[Deploy automations in web application](#) on page 1582 | [URL parameters](#) on page 1507

### Virtual window support for iFrame widget

You can now run your bots in a virtual window (picture-in-picture view) for AARI Integrations. With this option, you can run an attended bot in a small virtual window on your screen (instead of another desktop page or application) simultaneously while you complete tasks on the same page without obstructing your automation experience.

[Deploy automations in web application](#) on page 1582 | [Configure an AARI bot](#) on page 1526

### Select tags in widget setup

When you configure your widget in the **Integrations** page, the **Filter automations** option allows for you to select existing tags that can be added to your widget. You can now reference tags with the corresponding widgets in the **widgets** tab for easier reference in the **tags** column.

[Setup iFrame widget using AARI Integrations](#) on page 1575

### View status and run time details in automation list

You can now view the status and run time of your bots and processes in the automation list. The status and run time are based on your bots and processes last activities. You can quickly review whether a bot was completed in x amount of days or time ago, or shows no activity at all.

[Deploy automations in web application](#) on page 1582

### AARI shortcut link

You can now access AARI directly from your RPA Workspace. The **Explore AARI** link in the new **AARI** tab from the homepage is a shortcut that redirects you to the AARI portal. This is an easier way for you to access AARI if you forget how to access AARI or need to modify the URL to access AARI.

[Deploy processes](#) on page 1509

### New actions in the Process Composer

In the Process Composer, you can now use a set of actions when you build out your process. For example, you can double-click a task, such as **Bot Task** and **Human Task**, and the task will be updated in your process flow automatically. With this, you can save time because you do not need to task specific tasks to your process. In addition, you can now copy, cut, and paste using **CTRL + C**, **CTRL + X** and **CTRL + V**, respectively to retain, reuse, or replace data.

[Behaviors supported in the Process Composer](#) on page 1498 | [Create an AARI process](#) on page 1487

**Use a reference ID meta type in Process Composer**

You can now use a reference ID with a **Meta** variable type for your variables in the Process Composer. When you set a reference ID as a meta variable type, you can now use your reference ID data when you run your tasks in the web interface. This simplifies your references because you only need to rely on using the reference ID instead of relying on other variable types or references.

[Create an AARI process](#) on page 1487

**Center your forms in preview**

You can now preview your forms in the new preview window and get an accurate assessment on how your form will look when it is rendered. You can select the **Make form preview centered** option to enable the preview window. You can also set the appropriate display resolution, x and y coordinates, and even center your form.

[Create a form](#) on page 1536

**Upload images directly to the form composer**

You can now upload images directly to the form composer by using the **Image** element. This saves you time to view the images in the form without a file reference, rather than in the initial step, where the image requires a file reference to be viewed.

---

**Note:** Image files are limited to 150 kb (like a logo).

---

[Using the Image element](#) on page 1545

**Change label action for Button element**

The change label action in the form rules now applies to the **Button** element. When you use the change label action in form rules and apply it to the buttons in your form, the changes will be automatically applied to the buttons where you set the rules. This keeps the flow consistent with the elements that you are using because all the buttons inherit the same rule.

[Add rules to form elements](#) on page 1552

**Rules editor for Table element**

The rules editor is now applicable to the **Table** element. When you use the rules editor for your tables, the rules conditions are applied for each individual columns while any actions that you set are applied for each row in the row level. This makes things consistent for each new or existing row that you use because all the rows inherit the same rule.

[Add rules to form elements](#) on page 1552

**What's changed**

**Build 16701:** This build includes the following enhancement:

### Enhanced automation experience in AARI Assistant

We have improved the automation experience for your automation activities in AARI Assistant.

- You must have the **Manage my activity** permission as a prerequisite to use the bot controls.
- When you run your automation, the bot, its progress page, controls for pause, start (resume), and stop, are all unified inside AARI Assistant. Previously, there was a separate window for the bot run and its controls. (This will still be seen in this version but will be hidden in future releases.)
- You can view the status of your bot progress and its details, and is reflected on the activity page.
- You can view and manage pending automation that have been initiated and users can navigate between bot list view and progress view. If you have multiple AARI Assistant instances or disconnect and then reconnect to a different instance, the pending automation will be visible from the progress page for you to control.

**Service Cloud case ID:** 01793119, 1815462

[AARI Assistant automation activities](#) on page 1533

**Build 16667:** This build includes the following enhancements:

#### Define tags in process configuration

When you edit a process, you can use the **Tags** field to search and specify tags based on keywords, to define your process. You can add tags from new or existing tags and use them to reference specific tags related to your process.

[Configure an AARI process](#) on page 1528

## Fixes

**Build 16701:** This build includes the following fixes (along with fixes from the previous builds):

In AARI Assistant, you can continue your pending automation in different AARI Assistant instances. Automations are no longer stuck, and you can run bots as usual.

**Service Cloud case ID:** 01829572

**Note:** This fix was first included with Build 16694 for Cloud Sandbox and Community Edition. Build 16701 now includes this fix for Cloud, Cloud Sandbox, and Community Edition.

**Build 16685:** This build includes the following fixes (along with fixes from the previous builds):

When bots have a file dependency or an interactive form that includes any multibyte character in its name, the bots run as expected. Previously, having the multibyte character in a form name caused an error.

**Service Cloud case ID:** 01947340

**Build 16667:** This build includes the following fixes:

<p>You can now view signatures when you preview files using the AARI document viewer. Previously, signatures could be viewed only when files were opened in a separate tab.</p> <p><b>Service Cloud case ID:</b> 01879533</p>
<p>Bots are no longer triggered when you modify a file in an authenticated network. Previously, bots would trigger when you modified a bot in a network that required authentication.</p> <p><b>Service Cloud case ID:</b> 01256344, 01756709, 01854164, 01888188</p>
<p>The resiliency of the <b>Create</b> &gt; <b>Request</b> action has improved in the Process package.</p> <p><b>Service Cloud case ID:</b> 01886231</p>
<p>You can add, delete, and change values to the column cells when you create forms using the Column Filter function. Previously, an error altered the accuracy of this operation by sometimes changing rows or filtering newly edited values.</p> <p><b>Service Cloud case ID:</b> 01854490, 01941416</p>
<p>When scrolling past 100 task bots in AARI Assistant page, fresh bots now load to successfully complete the list of bots not yet displayed.</p> <p><b>Service Cloud case ID:</b> 01804139, 01845208, 01881927</p>
<p>You can select Reference ID as a Meta variable type from the Variable drop-down list.</p> <p><b>Service Cloud case ID:</b> 01861551</p>
<p>When you enter data in a password field in the initial form, the password field retains your data after you submit the form without requiring you to re-enter the data.</p> <p><b>Service Cloud case ID:</b> 01846222</p>
<p>When you use a file element to select multiple files, the file element functions properly without having to reset the form.</p> <p><b>Service Cloud case ID:</b> 01840888</p>
<p>Buttons in forms work as expected. Previously, some users encountered an exception error and were unable to click <b>Confirm</b> to submit their form.</p> <p><b>Service Cloud case ID:</b> 01846856</p>
<p>When you run a bot in AARI, you can edit the auto-populated fields after you select an option from the drop-down menu.</p> <p><b>Service Cloud case ID:</b> 01853623</p>
<p>When you use a number element and enable the <b>Use comma to separate thousands</b> format option, the bot will run without issues. Previously, some users encountered an exception error.</p> <p><b>Service Cloud case ID:</b> 01869566</p>
<p>When you use the <b>File modified trigger</b> option to modify the contents or files, the trigger works properly.</p> <p><b>Service Cloud case ID:</b> 01812596</p>
<p>When you use a document element in your form to upload PDF files, the PDF files that are uploaded renders the contents properly.</p> <p><b>Service Cloud case ID:</b> 01802898, 01833266</p>

## Known Limitations

Image files uploaded to forms for access in the Process Composer are limited to 150 kb.

*[Example of uploading and downloading file for web](#) on page 1482*

**Service Cloud case ID** 01922815

## Updates to the interface

**AARI**

The form builder now automatically adjusts the size for each form element you drag into the canvas. The sizes can also be manually adjusted.

The screenshot displays the AARI form builder interface. At the top, there is a dark header with the AARI logo and the text "Form title". Below the header, the form canvas contains several elements:

- Date:** A date input field with a calendar icon and the placeholder text "MM/DD/YYYY".
- Button:** A dark blue button with the text "Button".
- Image:** A light gray box with a camera icon and the text "Image".
- Label:** The text "Label" is positioned to the right of the image box.
- Rich Text Editor:** A text editor with a toolbar containing icons for bold, italic, underline, and text color. Below the toolbar, the text "Paragraph" and "12 pt" are visible, along with icons for bold (B), italic (I), underline (U), and text color (A).
- Select a file:** A section with the text "Select a file" and a dashed box containing the text "Drop file here or [browse](#)".

At the bottom of the canvas, there is a footer that reads "Powered by Automation Anywhere".

*Build forms easily by dragging elements to form builder*

**AARI**

The **Tags** field in the Edit Process page now has a drop-down menu for you to create new or select from existing tags.

### Edit Process: 35 - Returns

## IQ Bot and Document Automation v.27 release

Review what's new and changed, and the fixes and limitations in IQ Bot and Document Automation for the v.27 release.

### Document Automation

What's new
<p><b>Standard forms integrated with Document Automation</b></p> <p>You can create and manage learning instances entirely within Document Automation. Previously, you had to create standard form learning instances in IQ Bot and then process them through the <b>Connect Learning Instance</b> feature in Document Automation. With standard forms integrated with Document Automation, you benefit by having an entire workflow consolidated into a single system.</p> <p><i>Using Document Automation for Standard Forms</i> on page 1919.</p>
<p><b>Support for Microsoft Form Recognizer v3.0 models in Document Automation</b></p> <p>Microsoft Form Recognizer v3.0 provides additional capabilities to the existing model creation, including options to select <b>Template</b> and <b>Neural</b>. While training a model, you can select either 2.1 or 3.0 version.</p>
<p><b>New Document Automation product licenses</b></p> <p>Document Automation now offers the following licenses to enable users to process documents and track metrics for learning instances in production:</p> <ul style="list-style-type: none"> <li>• Document Automation Standard Forms (Number of pages): Required to create a model and process documents in a Standard form in Document Automation.</li> <li>• Document Automation 360 Extraction (Number of pages): Required to process documents in an Automation Anywhere (Pre-trained) model, including the User-defined document type.</li> </ul> <p>Also, there are updates to license consumption tracking.</p> <p><i>License tracking release note</i></p>
<p><b>Extract data with Google Vision OCR</b></p> <p>If you are a user with a Cloud Control Room, you can process documents using Google Vision OCR technology by creating or updating a learning instance.</p>
<p><b>Improved table extraction in Automation Anywhere models</b></p> <p>You can use validation feedback to train a learning instance to extract data from a cell that contains more than one field.</p> <p>For example, if a product description column also includes item number, you can outline the item number in the Validation interface. When the learning instance processes subsequent documents, it will extract the item number and ignore the product description.</p> <p><i>Using validation feedback to extract specific values in a table</i> on page 1895</p>

What's new
<p><b>Visualize performance metrics with a new Document Automation widget</b></p> <p>You can view data visualizations on Validator user performance. This new widget is a horizontal bar chart that shows the weighted average time each Validator user spent performing manual validation per document.</p> <p><a href="#">Document Workspace dashboard</a> on page 2261</p>
<p><b>Document Automation supports regular expression pattern-based extraction</b></p> <p>When configuring fields that the learning instance will extract, you can specify a regular expression (regex) pattern to help the extraction engine find the field. After entering the regex pattern you can test the expression using sample content within the <b>Create Learning instance</b> window. You can use regex pattern extraction for values that follow a specific pattern, such as a VAT number or a PO number.</p>
<p><b>Validation interface support for shortcut keys</b></p> <p>Zoom in and out on documents in the Validation interface by holding the Alt key and scrolling with your mouse wheel.</p>

What's changed
<p>The following updates impact how the Control Room tracks license consumption:</p> <ul style="list-style-type: none"> <li>• The Control Room checks enough product licenses prior to deploying the bot.</li> <li>• The IQ Bot Pages license and the Standard Forms Pages license track documents that are processed through learning instances created in Automation 360 IQ Bot. This includes documents processed in the learning instance in Automation 360 IQ Bot and learning instances connected to Document Automation.</li> <li>• In the Licenses page, the Document AI license is called the Google Document AI (number of documents)</li> <li>• The Control Room also tracks documents processed in Google Document AI for users who brought their own license. Previously, the Control Room only tracked such documents for users who bought their licenses through Automation Anywhere.</li> </ul>
<p>You can now configure Oracle Database with on-premises and Linux installations of Document Automation.</p>
<p>When you import a learning instance created in previous versions of Document Automation, the check box to send validation feedback to the system is now not selected by default. You must edit the learning instance to select the check box.</p>

Fixes
<p><b>Build 16694:</b> This build includes the following fixes (along with fixes from the previous builds):</p>
<p>Now users with either the Standard Forms for Document Automation or the Standard Forms (for IQ Bot) licenses can create a Standard Forms model in Document Automation.</p>
<p><b>Build 16685:</b> This build includes the following fixes:</p>
<p>The Bot Agent now clears out the resources folder after running actions from the Document Extraction package.</p>

Fixes
When you import a learning instance created in a previous version of Document Automation, the <b>Improve accuracy using validation</b> check box is now unselected by default.
Document Automation now correctly tracks license consumption in all On-Premises installations, irrespective of the port number.
You can now add formula validation to learning instances with the user-defined document type.
Standard forms in Document Automation is now supported in a fresh installation or upgraded multi-tenant Control Room. Previously, Standard forms in Document Automation was only supported on a fresh installation of a multi-tenant Control Room.
When you refresh the Validator page, the Validator displays the last document you worked on. Previously after a page refresh, the Validator sometimes displayed the first document you had validated.
Bot Runner devices configured with a proxy can successfully run actions from the Document Extraction package. <b>Service Cloud case ID:</b> 01856276, 01862174, 01911425

Limitations
Standard forms only support unique field extraction for any document. If there are fields with the same name on multiple pages, then the document must be trained with different tag names in the model creation tool. For example, if there is a field named <code>date</code> on two different pages, then you must use <code>date1</code> and <code>date2</code> to make the tag names unique in the model creation tool for training.
You cannot use spaces in model names when you create models for Standard forms v3.0. If the model name contains any spaces, then an <b>InvalidParameter</b> error message is generated.
There is no average accuracy for standard forms v.3.0 from the Microsoft Azure Form Recognizer service. As a result, the standard forms training displays the average accuracy as 0.00% for the v.3.0 service.
When fetching a Standard Forms model, an incorrect error message displays when no configurations are available in Document Automation.
The resizing functionality is not working properly for the model list table. As a result, you cannot resize the table header or column in Standard Forms.
The run analysis result does not display in standard forms when creating a v.3.0 model with multipages.
There is a default character limit of 100 characters for the table name, and 155 characters for the field name of the table. However, if you reconfigure the table, you can add more characters than the default limit.
The System-Identified Regions (SIRs) for checkboxes or radio buttons are not generated for the standard forms v.3.0 model.
Standard forms is not supported on Linux.

Limitations
Any re-mapping or re-drawing in the System-Identified Regions (SIRs) in the Validator results in detection of an incorrect check box. However, you can enter the check box value as <b>checked</b> or <b>unchecked</b> after changing the auto-generated mapping.
When migrating a learning instance from one Control Room to another, the same user must export and import the .dw file.
If the learning instance extracts data from a multi-line field and transfers it to a CSV file, an extra space is added at the end of each line.
When you mouse over data points in the "Average validation time" and "Validator performance by number of documents" widgets, the correct values do not immediately display in the pop-up window.
Document Automation prevents you from creating a learning instance if you create a custom table field without providing a field name and field label, even if you have unselected the field.
If you click <b>Test regular expression</b> and replace the value in the <b>Regular expression</b> field, the field now has a limit of 50 characters. <b>Workaround:</b> Click <b>Cancel</b> to leave the Test regular expression window and make the revisions in the <b>Regular expression</b> field.
The <b>Table</b> icon is not generated on the Form OCR Testing Tool (FOTT) for the Standard form v3.0 Model.
If a field name contains more than 100 characters, the scroll bar does not appear and you cannot see the value of the form field.
If a table name contains more than 50 characters, you cannot expand the table size. Additionally, the field name in the table does not display when you hover over it.
If you test an invalid Python script when configuring custom logic, the system returns an error message that contains the Python execution path.
Sometimes document extraction fails and one of the following error messages appear in the AARI request status: <code>Extraction bot failed. Please check activity/audit logs for more detail</code> <b>OR</b> <code>Download bot failed. Please check activity/audit logs for more detail</code> <b>with this message in the audit log:</b> <code>Existing deployment in progress for this user session.</code> If this happens, restart the Bot Agent on the impacted device.
The Document Workspace dashboard sometimes shows incorrect page consumption metrics if the Control Room is installed On-Premises.
Documents cannot be processed with Google Vision OCR if your proxy is configured with a Proxy Auto-Configuration (PAC) file.
When you create or edit a Learning Instance, if a field name starts with a numerical value, then the formula validation for that field fails. This issue applies to form fields and table fields.
If you import a learning instance with the validation feedback option disabled, the validation feedback option becomes enabled and you must manually edit the learning instance to disable the option.

**Limitations**

For Standard Forms, when a document with multiple pages is processed and enters into validation, one page is being duplicated in the Validator even when the System-Identified Regions (SIRs) in the Validator are correct.

**IQ Bot****What's changed**

If you are using an older version of Microsoft SQL Server that does not support TLS 1.2, then you must keep an IQ Bot database backup and update to a Microsoft SQL Server version that supports TLS 1.2.

IQ Bot now uses the latest version of Python (3.11.0) for custom logic validation. To use the latest version, you must upgrade from cx\_Oracle 8.3 to python-oracledb. See [Upgrading from cx\\_Oracle 8.3 to python-oracledb](#)

**Fixes**

IQ Bot now performs post-processing on fields with Python custom logic that contain single quotation marks, such as `print('Test')`.

In IQ Bot, when a document is either corrupted, deleted, or is not loading in Validator or Designer, a placeholder image is displayed. The applications will not be consistent until you upload new documents.

**Service Cloud case ID:** 00792976, 00835371

During the production process, you must not move the learning instances or bots from Staging to Production, or vice-versa.

**Service Cloud case ID:** 01808931, 00821541, 01253373, 00836954, 01271722

When you upload any invalid document in manual or custom groups, then the document gets processed. However, the System Identified Region (SIR) will not be generated for the unsupported pages.

Previously, when an invalid document was uploaded with a valid document and processed for extraction, the **See extraction** page kept loading.

**Service Cloud case ID:** 01786098

In Healthcheck API, the output shows the proper branch name convention, for example: `RC-A360.27`. Previously, improper health information was displayed when the branch name convention was `heads/RC-A360.27`.

If an error or exception is encountered during document validation, the error or exception is processed, and the files are displayed consistent in the output.

**Service Cloud case ID:** 00827940

Fixes
<p>In IQ Bot, if the RabbitMQ v3.8.17 and v3.8.18 is not working, then the log directory location can now be changed by updating the system environment variable as <code>RABBITMQ_LOG_BASE</code>. If this variable is provided manually with the required directory location, then the logs are created and updated in a new location. Previously, the configuration given for the <code>log.dir</code> variable in <code>rabbitmq.conf</code> file did not support RabbitMQ v3.8.17 and v3.8.18.</p> <p><b>Service Cloud case ID:</b> 01844995</p>
<p>The system-identified regions (SIRs) are now generated for manual groups when the PDFBox is enabled. Previously, when the PDFBox was enabled, during Learning Instance creation the SIRs for some vector PDFs were not generated for manual groups.</p> <p><b>Service Cloud case ID:</b> 01844223, 01849638</p>
<p>You cannot import an IQ Bot archive (IQBA) file when the designer for the same Learning Instance is open in another window. Previously, the import was failing because the LockedTimestamp field in the <b>visiobotDetails</b> table had a value at the time of IQBA export. This caused an error because the LockedTimestamp field was expecting a null value.</p> <p><b>Service Cloud case ID:</b> 01818474</p>

Limitations
<p>During the express installation upgrade of IQ Bot, an error message is shown in the installation steps. You must click <b>OK</b> to proceed further.</p>
<p>The maximum upload file size limit is set to 5 GB when importing and exporting files in the IQ Bot archive (IQBA) file. If the file size is greater than 5 GB, then you must delete unwanted groups to decrease the file size and migrate successfully.</p>
<p>If the IQ Bot archive (IQBA) file size is above 2,147,483,647 bits, then the File Storage does not upload the exported file from output folder to the desired location.</p>
<p>Sometimes, the PDFBox is unable to detect PDF (Portable Document Format) documents accurately. We recommend that you use Adobe Acrobat to convert the documents to PDF before you upload it to IQ Bot.</p>

## Updates to the interface

**IQ Bot and Document Automation**

The Create learning instance window now contains a drop-down menu to select an OCR provider.

**Create Learning Instance** Cancel Next

▲ Name

Description (optional)

## Bot Insight v.27 release

Review the fixes in Bot Insight for the v.27 release.

### Fixes

In the Bot Insight **Operations > Bots Dashboard**, the bot duration shows the correct data.

Previously, there was a mismatch between the bot duration data and the manual calculation of the bot duration from the historical menu because of a start time mismatch.

**Service Cloud case ID:** 01796106

When you upgrade to Automation 360 v.27 and launch the Control Room, no kernel bootup failure occurs due to a failed Elasticsearch initialization. Thus, it does not show the `Bad Gateway` error. As a result, the Control Room service is available and you can access the Control Room URL.

Previously, Elasticsearch initialization failed during startup which was causing the kernel bootup failure. As a result, the Control Room service was showing the `Bad Gateway` error.

**Service Cloud case ID:** 01908667, 01919727, 01919309, 01911464, 01921747, 01926887, 01925309, 01924168, 01929814, 01930226, 01931125, 01925270, 01934212

You can check out and republish the dashboard with a new name for a specific bot after import it into the public workspace.

**Note:** In case of public import, you must run the bot at least one time before you export it.

Previously, you could not publish the dashboard for a specific bot even if it was checked in.

**Service Cloud case ID:** 01763067

## Updates to the interface

### Bot Insight

The Bot Insight user interface is changed as per Common Frontend Component (CFC) standards. Only the look and feel of the components (such as colors, fonts, icons, paddings, borders, buttons, and so on) is changed, while the underlying functionality remains the same. You can view these changes from the following user interface elements:

- All Bot Insight pages
- Table pagination position at the center of the page
- The **Create widget** dialog back drop with the **Close** button
- **Add Widget** title in the **Create widget** dialog
- The **Switch Widget** button position in the **Add widget** window for all charts

## Automation 360 v.26 Release Notes

*Release date: 6 October 2022*

Review the top 5 features as well as other new features, enhancements, fixes, and limitations in the Automation 360 v.26 release. Automation 360 and IQ Bot are on Build 15459 (for On-Premises and Cloud).

We have released updated builds for fixes after the GA release of v.26 (Build 15436). For information about the fixes in these updated builds, see [Updated release builds](#) on page 243.

---

**Note:** The release builds include Manifest V3 browser extensions for Google Chrome and Microsoft Edge browsers. For more information, see:

- [Chrome and Edge Manifest V3 extensions](#) on page 116
  - [Support for Manifest V3 extensions](#)
  - [Browser extensions for Automation 360](#) on page 765
- 

### Highlights of this release

Here are the **top 5** features in the v.26 release:

#### **Embedded automation with OAuth 2.0**

Business users can directly access authorized automation from within their favorite business applications, without having to open a new interface or learn a new app. OAuth 2.0 enables seamless authentication across systems, reducing complexities of system-specific sign-ins.

Learn more: [Embedded Automation](#) on page 1568.

## Coding standards through code analysis

Administrators can establish coding best practices by setting a code analysis policy and improve their team's code to quickly find and correct rule violations. They can select which rules to check for and enable summary reports for a snapshot of all bots within a project.

Bot builders can quickly check the status of their bots and receive feedback on what to fix, speeding up bot development and deployment and promoting coding best practices.

Learn more: [Code analysis](#) on page 2096.

### Package role-based access (RBAC)

Administrators can tailor package access to the business needs and expertise of bot developers and enforce access policies for custom groups. They can maintain policy control and ensure confidence and ease-of-use for developers by providing group-based package access with clear policies.

Citizen developers can access simpler packages and build easy-to-complete automation, and professional developers can access a broader set of complex packages.

Learn more: [RBAC on packages](#) on page 1962.

### Salesforce integration with command package

RPA developers can build robust integrations with Salesforce through direct API interaction. They can automate repetitive processes involving access and updates to Salesforce data, enabling business users to focus on high-value business tasks such as strategic planning and optimization. Commands available include authentication, database querying, record updates, and file processing.

**Automation 360 integration with Google Cloud Apigee**

Learn more: [Salesforce](#).

RPA developers can fast-track end-to-end automation development by combining API components from Apigee and RPA bots from Automation 360 to access any data in the enterprise. Our prebuilt integration packages make the integration seamless, enabling you to drive more value from reusing existing assets created by your organization's automation teams.

Learn more: [Apigee integration](#).

## Updated release builds

We have released the following updated builds:

- **Build 15459** Service Cloud case ID: 01941769, 01945068

This build is updated to include a critical security fix for the issue related to Multi-Factor Authentication (MFA) when used with database authentication. This vulnerability is not applicable when using SAML or AD authentication. For more information on this security fix, see [Unexpected behavior observed with Two Factor Authentication post A360.26 upgrade, where a valid authenticator code alone is sufficient to login to CR, in spite of an incorrect password](#).

---

**Note:** This issue exists only in Automation 360 v.26 release. For v.26 On-Premises customers using or planning to use MFA with database authentication, we recommend that you install this update at your earliest convenience. No action is required from customers on other Automation 360 releases.

---

- **Build 15450** with fixes for the following issues:
  - When you import a bot or file that is a manual dependency of other bots using the overwrite option, the import process no longer removes the dependencies from the other bots (Service Cloud case ID: 01911410, 01920508).
  - When you have large and complex bots with many dependencies and if the size of the deployment messages that are sent from the Control Room to the Bot Agent is more than 2 MB, the bots run successfully. (Service Cloud case ID: 01882630).
  - The following IQ Bot issues were fixed:
    - IQ Bot can now perform post-processing on a field if the custom logic uses Python script containing single quotes, such as `print('Test')`.
    - If your IQ Bot custom logic uses the `Pandas` library, the script no longer needs to have the `import Pandas` statement.
    - IQ Bot can now perform post-processing on a field if the custom logic uses Python script containing characters from non-Latin languages (Unicode characters), such as `äöüñ`.
  - Security fixes for Cross-Site Scripting (XSS) vulnerabilities (Service Cloud case ID: 01843148).
- **Build 15443 (for US-East and US-West regions only)** Service Cloud case ID: 01911410, 01920508

This build is updated to include a fix for the issue related to the manual dependency file that is shared between multiple parent bots upon export and import. If one of the child bot files is exported and imported into the Control Room with overwrite options in the import process, then links to the manual dependency are unlinked from other parent bots. Use Bot Agent version 21.222 for this issue.

- **Build 15439 (Japan region only)** Service Cloud case ID: 01911093, 01911209, 01911190, 01911116, 01911259

This build is updated to include a fix for the following issue: `Cannot retrieve values assigned to global values having Japanese characters after upgrading Automation 360`. Build 15439 is available for download for On-Premises customers who need this fix.

## What's new and changed in each product

Go to the following pages for details on all the updates (what's new, changed, fixed, and limitations) in each product:

<a href="#">RPA Workspace</a> <ul style="list-style-type: none"> <li>• <a href="#">Updating to this release</a></li> <li>• <a href="#">Migration updates</a></li> </ul>

## RPA Workspace v.26 release

Review what's new and changed, fixes and limitations, and the feature deprecations in RPA Workspace for the v.26 release.

## What's new

<b>Control Room, devices and Bot Agent</b>
<p><b>Microsoft Windows 11 Enterprise now supported</b> (Service Cloud case ID: 01252605, 1252605, 1253745, 01255134, 01379865, 01801610, 01810148)</p> <p>We now support Microsoft Windows 11 Enterprise, so you can now install and update the Bot Agent and run bots on the Windows 11 Enterprise operating system.</p> <p><a href="#">Bot Agent compatibility</a> on page 984</p>

**Control Room, devices and Bot Agent****Support for Manifest V3 extensions**

Automations that use Google Chrome Manifest V2 based extensions will stop working sometime after June 2023. The deprecation timelines of Manifest V2 based extensions are currently under review and subject to change by Google.

- For Google Chrome Manifest V2 extensions timelines, see [Manifest V2 support timeline](#).
- For Microsoft Edge Manifest V2 extensions timelines, see [Overview and timelines for migrating to Manifest V3](#).

This might impact your existing automations that use Manifest V2 based extensions for Google Chrome and Microsoft Edge browsers. Automation 360 v.26 and later includes Manifest V3 extensions by default to support features that use Google Chrome and Microsoft Edge browsers.

You can automatically enable Manifest V3 based extensions for Google Chrome and Microsoft Edge on all the Bot Runner devices by enabling the **Browser extensions** option from the Control Room. Enabling this option applies the browser extension settings on all the registered Bot Agent devices.

**Note:** We will continue to support Manifest V2 based extensions for Google Chrome until June 2023. To know about Microsoft Edge Manifest V2 based extensions timelines, see [Overview and timelines for migrating to Manifest V3](#).

**Note:** Manifest V3 extension is supported on Google Chrome and Microsoft Edge browsers version 91 and later only.

[Configure browser extensions](#) on page 2046 | [Chrome and Edge Manifest V3 extensions](#) on page 116

**Bot Agent updates by using installation file from local drive**

You can now download the Bot Agent installation file to your local drive as a one-time activity and then update the Bot Agent on several devices by providing the local drive path to the installation file. This way, you can avoid downloading the installation file multiple times from the Control Room for several devices.

**Important:** This functionality is implemented in v.26 and can be used from v.27. That is, after you update your Bot Agent to v.26, future updates can be performed from the local drive.

[Automatically update the Bot Agent](#) on page 1001 | [Update the Bot Agent from a local drive](#) on page 1002

**Oracle Database now supported** (Service Cloud case ID: 00726728)

We now support Oracle Database, so you can now choose to install the Control Room on Oracle Database.

**Note:** Oracle database for Control Room installation is supported only in Custom mode and not in Express mode. Oracle Database support on the Control Room starts with the v.26 release.

[Installing Control Room using custom mode for Oracle installation](#) on page 862 | [Configure Oracle database type and server](#) on page 875 | [Database requirements](#) on page 809

**Control Room, devices and Bot Agent****Active Directory mappings filters stored in the database**

When you update to a newer version of the Control Room, you no longer have to define the Active Directory mapping filters again after installation. This is because the Active Directory mapping filters defined in the `um.properties` file are now stored in and can be referenced from the database. However, if you define new filters in the `um.properties` file, the Control Room references the filters defined in the `um.properties` file and overwrites the ones stored in the database.

**Packages, actions, and Bot editor****RBAC on packages**

Based on your business requirements, you can now control the access that Bot Creators have to packages in the Control Room. As an administrator or user with the **Manage** package permission, you can restrict access to packages to either **all the users** or **users with specific roles**.

Depending on the access that is configured by the admin, Bot Creators and Citizen Developers can view and use specific packages:

- Bot Creators can access a broad set of complex packages and create bots, which can be reused.
- Citizen Developers can access simpler and easy-to-use packages and build automations quickly.

[RBAC on packages](#) on page 1962 | [Configure RBAC for packages](#) on page 1964

**Salesforce command package**

You can now authenticate from Automation 360 to access Salesforce and run several command actions by using the new Salesforce command package.

[Salesforce](#)

**SAP GUI 770 version now supported** (Service Cloud case ID: 01793132, 01792775, 1776805, 01792623, 787725, 01805482, 01805479, 01792623, 01810356, 01822839, 01851451, 01853577, 01860050)

SAP GUI 770 (patch 6) is now certified and supported with Recorder and SAP package.

[supported in various versions](#)

**Configure and use custom proxy configuration in REST Web Service package** (Service Cloud case ID: 01271527, 01765084, 01839282)

REST Web Service package is now enhanced to support custom proxy configuration for each **Delete, Get, Patch, Post, and Put** action. This provides you more flexibility in calling REST APIs with different proxy configuration and allow you to create hybrid API automation.

[REST Web Service package](#)

**Keyboard shortcuts to reduce scrolling**

When developing large bots, you can now use keyboard shortcuts to expand and collapse individual or all sections and move through the lines of code quickly instead of scrolling and minimizing sections individually.

[Keyboard shortcuts to expand or collapse elements in bot logic](#) on page 1309

Packages, actions, and Bot editor
<p><b>Set value in any editable control field to be blank in SAP application</b> (Service Cloud case ID: 00821861, 01807129)</p> <p>When you use the <b>Set text</b> action of the SAP package, you can now set the value in any editable control field in the SAP application to be blank. For example, you can set the value in the text field or the date field to be blank.</p>
<p><b>Loop through emails and move them one at a time</b> (Service Cloud case ID: 00749763, 01807189, 01840743)</p> <p>You can now loop through all the emails in a mailbox and move one email at a time to a destination folder by using the <b>Move</b> action in the Email package.</p> <p><i>Move</i></p>
<p><b>Configure p12 certificate for SOAP-based automations</b> (Service Cloud case ID: 00757213)</p> <p>In the SOAP Web Service action, you can now select the p12 certificate file and provide a password for user authentication. With this enhancement, you can now access web services that use the p12 certificate-based authentication (a more secure type of SSL certificate).</p> <p><i>Example of using the SOAP web service action on page 1431</i></p>
<p><b>Improved accessibility, usability of content on Terminal Emulator window</b> (Service Cloud case ID: 01609467)</p> <p>You can now have improved accessibility and usability of the content displayed on the Terminal Emulator window. When you use the enhanced <b>Get text</b> action of the Terminal Emulator package, you can now view and extract all the lines and text present in the Terminal Emulator window and perform an operation based on your requirement.</p> <p><i>Using Get text for</i></p>
<p><b>Run bots with or without window title matching in letter case</b></p> <p>You can now run bots even when the title of a captured window does not match the letter case. For a bot to identify a static window or browser titles and titles with a wildcard character, you can opt for a case-sensitive match if you want the letter case to be matched, or a case-insensitive match otherwise, by using the <b>Case sensitive</b> option.</p>
<p><b>Control image preview and storage in Control Room during secure recording</b></p> <p>You can now choose whether or not the object images are available for preview and stored in the Control Room during secure recording by enabling the <b>Recorder preview image</b> setting. When you enable the setting, the image is previewed in the Bot editor and stored in the Control Room for 60 minutes. If you choose not to preview, images are not captured.</p> <p><i>Secure recording on page 39   Secure recording mode on page 1327   Settings on page 2042</i></p>
<p><b>Automate Microsoft Excel spreadsheets from SharePoint</b></p> <p>You can now automate Microsoft Excel spreadsheets that are uploaded and shared on SharePoint. Use <b>Excel advanced &gt; Open</b> action to open the Microsoft Excel spreadsheets from SharePoint location.</p> <p><i>Using the Open for</i></p>
<p><b>Automate Citrix Virtual Apps in Edge with IE mode</b></p> <p>When using the Recorder, you can now automate Citrix Virtual Apps running on Microsoft Edge Chromium with IE mode.</p>

### Packages, actions, and Bot editor

#### Automate controls using Microsoft UI Automation (COM) technology

For automation, you can now use the Microsoft UI Automation (COM) technology in the following scenarios:

- Capturing controls with secure recording mode
- Capturing and automating combo box and list view controls
- Using **Object exists** and **Object does not exist** Recorder conditions in If, Loop, and Wait packages

[Capture using specific technology](#) | [Actions performed on objects captured with Universal Recorder](#)

#### Seamless automation of Citrix Virtual Apps and other Citrix applications

With the new Automation 360 remote agent for Citrix, you can now seamlessly automate all types of Citrix Virtual Apps and other Citrix applications that are supported on desktop applications using the Recorder.

The new Automation 360 remote agent for Citrix supports the following browsers and technologies:

- Google Chrome
- Internet Explorer
- Microsoft Edge
- Microsoft Edge with IE mode
- Mozilla Firefox
- Java
- Electron apps
- Microsoft Active Accessibility (MSAA)
- Microsoft UI automation

[Installing Automation Anywhere remote agent on Citrix servers](#) on page 844 | [Using the Recorder on Citrix Virtual Apps servers](#) on page 840

**Important:** For information about the supported packages for this release, see [#unique\\_220/unique\\_220\\_Connect\\_42\\_a2019-officially-supported-packages](#).

### Building and running bots

#### Implement coding standards with code analysis

You can now implement best coding practices by configuring coding rules in the Control Room. This feature helps you prevent potential errors, improve bot reliability, and makes the code more uniform, accessible, reliable, and efficient.

- As an administrator or a user with **View policies** and **Manage policies** permission, you can configure the code analysis policy for all users.
- As a Citizen Developer, you can run code analysis to analyze your bots against readability, maintenance, security, and compliance best practices.

[Code analysis](#) on page 2096

<b>Building and running bots</b>
<p><b>Choose specific version of child bot to check out with parent bot</b> (Service Cloud case ID: 01771388)</p> <p>When you check out a parent bot, you can now choose the version of the child bot to check out. Every version of a parent bot can have different versions of child bot dependencies. With this feature, you can roll back the dependencies while rolling back the parent bot. You can make changes to a specific version of the dependent bot.</p>
<p><b>Easily move bots and files between folders in the private workspace</b> (Service Cloud case ID: 00733125)</p> <p>You can now move bots and files effortlessly and without requiring any permissions from one folder to another in the private workspace. With this feature, if a bot is placed in an incorrect folder, you no longer have to clone it in the correct folder and then delete it from the incorrect folder.</p> <p><a href="#">Move a bot</a> on page 1356</p>
<p><b>Better organization with bulk checkin of related bots and files</b></p> <p>You can now select multiple bots or dependent files from different folders that belong to the same process and check them in, in bulk, from private to the public workspace with the same check-in message. You can check in a maximum of 10 parent bots, but there is no limitation on the number of dependent child bots.</p>
<p><b>Email notifications for failed checkins</b> (Service Cloud case ID: 01598642)</p> <p>As an administrator, you can now configure sending email notifications to bot developers whenever their checkins fail. Without such email notifications, bot developers will be unaware of their failed checkins because although the checkin status is always logged in the audit log, they cannot access the audit log access without permission. With email notifications, bot developers can know about their failed checkins and retry immediately.</p>
<p><b>Export work items for offline records</b> (Service Cloud case ID: 01769378, 01798514)</p> <p>You can now export work items to a CSV file for offline audits and records. With this feature, you can export selected, filtered, or all work items to a CSV file.</p> <p><a href="#">Export work items to CSV file</a> on page 2135</p>
<p><b>Export and import queues for efficient and flexible usage</b></p> <p>You can now export and import queues across development, testing, and production environments. This way, you can create a queue in the development environment, test it in the testing environment, and then promote it to the production environment to efficiently execute business process workload. You can also include work items when importing a queue.</p> <p><a href="#">Export queues</a> on page 2129   <a href="#">Import queues</a> on page 2131</p>
<b>APIs and integrations</b>
<p><b>Connect Bot Agent to Control Room through v1/registration/auto API</b></p> <p>You can now use the <code>v1/registration/auto</code> API to register and connect your device to a Control Room automatically. You must specify the Control Room <code>URL</code> and the <code>userName</code> properties in the API Request.</p> <p><a href="#">Bot Agent API: Auto registration</a> on page 2308</p>

**APIs and integrations****Fetch execution details for specific execution IDs with new Control Room API**

You can now fetch the execution details, such as `botOutVariables` and `CallbackInfo`, for a specific execution ID by using the new API endpoint, `V3/activity/execution/<id>` API.

**Authorization with bearer token**

Automation 360 supports the Authorization header with a *Bearer token* for API requests to the Control Room. This header was previously unsupported and ignored on API requests. Obtain the *Bearer token* from our OAuth services. All API calls must contain either an authentication token from Authentication API (generates JSON Web token) or a bearer token from OAuth services. You cannot use both together in an API.

**What's changed****Control Room, devices, and Bot Agent****Missed schedules redeployed automatically**

You can now ensure that schedules missed because of Control Room shut down (Control Room maintenance or upgrade) are automatically redeployed.

When you use the **Redeploy the schedule again** option, an audit log entry identifies the event type as `Schedule misfired`, and the bot is automatically redeployed after the Control Room is restarted.

**Low disk space issues resolved with automatic deletion of temp files**

Automation 360 now supports automatic clearing of the files in the temp folder, thereby resolving low disk space issues.

During bot import operations, temporary files were written to the following path, leading to increased usage of disk space and resultant low disk space issues: `C:\Users\<aa cr admin account>\AppData\Local\Temp`. As a result, the bots failed, and the temp files had to be cleared manually.

**Enhanced Active Directory role mappings page**

The Active Directory role mappings page no longer has default validation of mappings.

Validating all the role mappings can take a longer time on slow networks and with a higher number of mappings because it requires communication between the Control Room database and the Active Directory server. Also, changes in security groups and roles are infrequent and do not require frequent validation on this page. The Active Directory role mappings page now displays only the list of mappings which loads at a faster speed as validation of mappings is not done.

**Enhanced autologin functionality for Bot Agent** (Service Cloud case ID: 01788805)

Bot Agent autologin now works successfully even if the **Interactive logon: Do not require CTRL+ALT+DEL** group policy is disabled.

Previously, for the Bot Agent to autologin successfully, you had to enable this group policy, which was not possible due to the security policy. As a result, Bot Agent autologin failed.

**Control Room, devices, and Bot Agent****Improved administration for WLM automations**

You can now view all the queues with the **AAE\_Admin** role. Also, you can pause, resume, and stop all WLM automations.

**Note:** If you are not an owner, participant, or consumer of that queue, you can view only queue names and not the queue details.

**Packages, actions, and Bot editor****Run DLL file without namespace** (Service Cloud case ID: 01765712)

You can now run a DLL function even if the namespace is not specified because the **Enter the namespace** field in the **Run Function** action of the **DLL** package is now optional.

**Casing and format changes in Technology and Control types**

When you use the Recorder to capture objects, you can now read and identify the names of technology types and control types easily because the names of the properties now use a more user-friendly casing and format. For example, MS\_ACTIVE\_ACCESSIBILITY is renamed Microsoft Active Accessibility.

**Fixes**

**Build 15459:** This build includes the following fixes (along with fixes from the previous builds):

A critical security fix for the issue related to Multi-Factor Authentication (MFA) when used with database authentication. This vulnerability is not applicable when using SAML or AD authentication. For more information on this security fix, see [Unexpected behavior observed with Two Factor Authentication post A360.26 upgrade, where a valid authenticator code alone is sufficient to login to CR, in spite of an incorrect password.](#)

**Service Cloud case ID:** 01941769, 01945068

**Build 15450:** This build includes the following fixes (along with fixes from the previous builds):

If you have large and complex bots with many dependencies and if the size of the deployment messages that were sent from the Control Room to the Bot Agent is up to 5 MB, then the bots will run without failure.

Previously, bots were failing to execute when the size of the deployment messages that were sent from the Control Room to the Bot Agent was more than 2 MB.

**Service Cloud case ID:** 01882630

When you import a bot or file that is a manual dependency of other bots using the overwrite option, the import process no longer removes the dependencies from the other bots.

Previously, manual dependencies were removed for the overwrite option from the other bots during bot import.

**Service Cloud case ID:** 01911410, 01920508

You can select a path containing a dollar sign (\$) in a folder trigger for a file and folder, and the bot will execute successfully. Previously, the bot failed when you selected a path containing a \$ in a folder trigger for a file and folder.

**Service Cloud case ID:** 01829534

**Build 15443 (for US-East and US-West regions only):** This build includes the following fixes (along with fixes from the previous builds):

When you import a bot or file that is a manual dependency of other bots using the overwrite option, the import process no longer removes the dependencies from the other bots.

Previously, manual dependencies were removed for the overwrite option from the other bots during bot import.

**Service Cloud case ID:** 01911410, 01920508

**Build 15439 (Japan region only):** This build includes the following fixes (along with fixes from the previous builds):

You can now successfully retrieve values assigned to Global values with Japanese characters after upgrading the Control Room to the Automation 360 v.26 release.

**Service Cloud case ID:** 01911093, 01911209, 01911190, 01911116, 01911259

**Build 15436:** This build includes the following fixes:

You can now successfully delete a device from the device pool without any error.

Previously, when you deleted a device from the device pool, it was deleted from the Control Room but remained in the *DEPLOYMENT\_ALLOCATION\_QUEUE* table. Hence, the device could not be deleted and an error was shown.

**Service Cloud case ID:** 01791502, 1840575

If you run a bot from the Bot editor workspace for debugging using the **Run from here** option and if the bot contains packages that use the session (**Local** or **Global** session), the following compiler error no longer occurs: `Unable to find any open session`

**Service Cloud case ID:** 01080318, 01759454, 01785168, 01790014, 01786670

In a multi-user environment, for simultaneous bot deployments, bot launcher logs are now generated for all the users.

Previously, in such cases, bot launcher logs were not generated for all the users.

**Service Cloud case ID:** 01759506

You can now successfully list a scheduled task, and the following error no longer occurs: `Unknown timezone ID:US-Pacific-New`

Previously, an unsupported time zone could be selected, which resulted in this error.

**Service Cloud case ID:** 01759074

If a device is shared between a Bot Creator and a Bot Runner, when you try to edit a schedule, the following updated message is now displayed: UNKNOWN: All runAsUser(s) should have default device as no pool is provided. RunAsUser(s): [dprunner] does not have a default device or that device is shared with a bot creator

Previously, if a device was shared between a Bot Creator and a Bot Runner, when you tried to edit a schedule, the following incorrect message was displayed: Automation failure due to deploy failure

When you update the Bot Agent from user level to system level, you can now capture objects using the Recorder actions or from a window list in a Google Chrome browser. You no longer have to manually delete the registry entry in Windows from the current user level (HKEY\_CURRENT\_USER).

**Service Cloud case ID:** 00731155, 00778022

After connecting to a device, when you set the global cache location to an invalid path, an audit log entry is generated against the device, and the default global cache path is now used.

**Note:** Depending on the device used and the path you specified on your drive, validation of the default cache path might not be supported.

When you want to edit a *DataTable* variable in debug mode, you can now scroll horizontally to view all the columns in the *DataTable* variable.

**Service Cloud case ID:** 01818834

In the FTP / SFTP package, you can now create bots using actions such as **Delete files**, **Put files**, and **Get files** even if the file name contains characters such as the comma (,) and the colon (:).

Previously, characters such as the comma (,) and the colon (:) were not supported in file names.

**Service Cloud case ID:** 01772186

You can now run an Enterprise 11.3.3 bot from Automation 360 in the Enterprise 11 Control Room by using the **Run** action.

Previously, the **Run** action did not work for v.11.3.3 because the device V1 API was not working with an empty filter for release 11.3.3.

**Service Cloud case ID:** 00825696, 01747999

You can now successfully connect to the Excel or Access (Microsoft Office 2016 or later) engines with ODBC drivers.

Previously, if you tried to connect frequently to the Excel or Access (Microsoft Office 2016 or later) engines with ODBC drivers, bot execution failed intermittently.

**Service Cloud case ID:** 01762290, 01755335, 01778149, 01778899, 01793064, 01788154, 01810754, 01806851, 01811703, 1815437, 01807133, 01799364, 01755642, 01749480, 01767869, 01807133, 01818989, 01815300, 01826839, 01804882, 01842384, 01846477, 01762300, 01331003

When you send an email with multiple file attachments and if attachment size exceeds 24 MB, the bot now waits for 120 seconds before encountering a timeout error.

Previously, when you sent emails with a large file attachment, bot execution failed after 30 seconds if the attached file exceeded the file size.

**Service Cloud case ID:** 01763214

When you use the **Connect** action to connect with the **EWS** protocol, the **Send** email action and read email now print the email message body in a new line character in the following scenarios:

- When you create a bot and connect with the **EWS** server, then use the **Loop** action to read email as a plain text messages, and then use the **Log to file** action to log text into a file.
- When you use the **Send** email action and connect with the **EWS** server with **OAuth authentication** to send email.

**Service Cloud case ID:** 01770645, 01780628

In the Email package, when you use the **Move all** action and establish a connection with the EWS server, if the destination folder contains any of the following special characters in the folder name, then use a backslash (\) as escape character before the special character: , + , \* , ? , ^ , \$ , ( , ) , [ , ] , { , } , | , \

For example, if the destination folder name is "4) folder name", enter it as "4\) folder name".

**Service Cloud case ID:** 01803958

If your bot contains an error, **Bot error** now shows the correct line number of the error within the **Finally** block in the following scenario: When you add the **Try/Finally** block around the corresponding action, then insert more actions in the **Finally** block, and then save and run the bot.

You can now successfully upload files whose file names are in the Japanese language by using the **Rest web service** action with multipart form data.

Previously, file upload did not work for files whose file names were in the Japanese language.

**Service Cloud case ID:** 01801767

You can now use the Terminal Emulator package to perform tasks associated with the terminal without any issues. We now provide support for the Start PC Command (STRPCCMD), so when you run the bot, the terminal now successfully opens the application with the STRPCCMD command.

Previously, when you passed the appropriate key on the Terminal Emulator, the bot did not open the expected application because the STRPCCMD command was not supported in the Terminal Emulator.

**Service Cloud case ID:** 01816577

In the Terminal Emulator package, you can now use the **Connect** action to connect with a host machine on which you want to automate a task.

Previously, when you used the **Connect** action, a black screen was displayed for a few terminal hosts.

**Service Cloud case ID:** 01823081, 01841800

After migration, when you open a **Load Add-ins**-enabled Excel file using the **Excel advanced > Open** action and run a bot, the bot now runs successfully without any error.

Previously, the bot failed because some Excel files with the **Load Add-ins** option enabled stopped functioning and the workbook was closed unexpectedly.

**Service Cloud case ID:** 00950745, 01835066

When you use the **PDF > Merge documents** action and select **All pages** option in the **Pages** field to merge all pages of multiple PDF documents into a single PDF document, the output PDF now retains and merges all the attributes such as bookmarks, links, layers, attachments, and signatures from the individual source documents.

**Service Cloud case ID:** 01792105

When the Recorder fails on a computer where the operating system language is not English, the error message for the bot runtime failure is now shown in the same language as that of the operating system.

Previously, the error message was shown in English even on computers where the operating system language was not English.

**Service Cloud case ID:** 01813050

You can now successfully extract text from within the captured area of a window using the App Integration package even if the screen resolution is more than 100 percent.

Automate and capture window authentication dialog boxes in the Google Chrome browser using a specific technology with the Recorder.

Bots are no longer stuck when you work with Microsoft Access database queries.

**Service Cloud case ID:** 01756390

You can now open local files by using the **New window** option in the **Browser > Open** action even if Microsoft Edge is your default browser.

**Service Cloud case ID:** 01799784

At bot runtime, when you assign a new window title to a window variable, the window variable now detects the correct window.

**Service Cloud case ID:** 01788466, 01791773

You no longer encounter a compilation error in the UI in the following scenario:

1. Use the Datetime package released with Automation 360 v.23 or earlier to create a bot that uses the **Datetime > Assign** action.
2. Then, select the **Variable** option to add the variable value.
3. Then run the bot with the package released with Automation 360 v.24 or later.

You can now successfully capture objects from applications that are launched from a Citrix machine.

**Note:** This fix is available only with the new Automation 360 remote agent, which you can use with the upgraded Recorder package (version 2.8.6-20220823-160834).

**Service Cloud case ID:** 00831939

When you assign a window title to a window variable, if the variable field has an empty regular expression value, the bot no longer passes it without scrutiny. Instead, the following error message is now displayed: Unable to find the window '<window\_name>'. The provided regular expression '<regular\_expression>' is invalid. Please provide a valid regular expression for the variable '<variable\_value>'.

When you merge multiple PDF documents by using the **PDF > Merge documents** action, all the form field attributes in Adobe Acrobat are merged and the output PDF document is now rendered properly.

**Service Cloud case ID:** 01760279, 01792301

When you use the **If > Folder does not exist** condition to determine whether a folder does not exist, if the specified folder exists, the bot now successfully recognizes the folder and does not attempt to create it again.

Previously, because of the presence of leading and trailing spaces in the input folder path, the bot failed to recognize an existing folder and hence attempted to create the folder, leading to an error.

**Service Cloud case ID:** 01466067

If you migrate a bot and select the **HTML Tag**, **HTML InnerText**, and **HTML type** properties and then select HTML-type properties in **Search Criteria**, the bot now successfully locates and identifies the object and performs the selected action.

**Service Cloud case ID:** 00829817, 01757049, 01761452, 01822711

When you use the Recorder package for the **Get property** action, the correct values are now displayed for the top, left, height, and width properties.

**Note:** The **Get property** action does not display correct values for cross-domain iFrames elements.

**Service Cloud case ID:** 01251758

The AISense Recorder package now works as expected when you use the Windows 10 operating system in the Japanese language. Because UTF-8 is now enabled, you no longer need to use any workaround.

**Service Cloud case ID:** 01821267, 01822433

When you use 2.8.0-20220601-034227 and later versions of the Recorder package, the automated bot now returns the correct value for the HTML InnerText property in Google Chrome and Microsoft Edge browsers.

**Service Cloud case ID:** 01257098 , 01754795, 01791073, 01787461, 01813080, 01846403

For WLM queues, the date is now displayed in the correct format as *YYYY-MM-DD*.

Previously, this date was shown in the *years ago* format, which did not match the date format in the CSV file and was confusing.

In a multitenant environment, when you upload a work item file to a queue in one of the tenants, the **In progress** tab now displays the correct file upload status only in the corresponding tenant.

Previously, the **In progress** tab displayed the upload status for all the tenants.

When a WLM automation is in progress, an administrator can no longer delete the user who created that automation.

Previously, the user who created an automation could be deleted, after which that automation could not be paused or resumed by another user.

When you stop a WLM automation, work items are no longer stuck in the ready-to-run state and are now moved to the **New** state.

Previously, when you stopped a WLM automation, a few work items were stuck in the ready-to-run state and could not be deleted.

After you change any configuration field in the **Administration > Settings > Devices > Advanced options** settings in versions prior to v.25, if the Control Room is updated to v.25, the **Global Cache Location** is now set to the default `C:/ProgramData/AutomationAnywhere/GlobalCache` value.

Previously, in such cases, no value was shown for the **Global Cache Location** field, which was confusing.

**Service Cloud case ID:** 01869048

When you use the **Run bot** option to run a bot in the **Activity > Historical > View** page for any activity, the bot now runs successfully.

Previously, in such cases, bot execution failed with an error.

When you import a bot that contains manual dependencies, for the overwrite option, the import process now removes the manual dependencies.

Previously, during bot import, the manual dependencies were not removed for the overwrite option.

**Service Cloud case ID:** 01813452

When you import a bot into a folder, if a folder with the same name but different letter case already exists in the repository, bot import now fails with an error.

Previously, in such cases, bot import was successful, but the imported bot failed at the time of execution because of the wrong folder path.

**Service Cloud case ID:** 01270324, 01816507

You can now successfully access all the folders in the public workspace without any issues.

Previously, when you imported and cloned a bot under a folder in the public workspace and then tried to access that folder, sometimes an error occurred, and the folder could not be accessed. This occurred some times when there were more than 2100 folders under the bots directory.

**Service Cloud case ID:** 01852748

When you update from Enterprise 11 to Automation 360 or upgrade from an earlier version of Automation 360 to a later version, the earlier defined group mappings are retained, even when the Distinguished Name (DN) column of the mapping entries are empty in the database.

Previously, some of the earlier-defined group mappings were deleted due to the empty value for the DN column.

After you update to Automation 360 v.22 or later, the Repository Management (`v2/repository/file/list`) API now returns the correct file size as response output.

Previously, the Repository Management (`v2/repository/file/list`) API returned the file size as zero in the response output.

**Service Cloud case ID:** 01151460

The Azul Zulu JDK is now updated to version 11.0.15+10. The previous version, 11.0.14+9, contained some vulnerabilities.

Common Vulnerabilities and Exposures (CVEs) for this version are as follows: CVE-2022-34169, CVE-2022-21540, CVE-2022-21541, CVE-2022-21549, and CVE-2022-34169

**Service Cloud case ID:** 01854652, 01868897, 01857973, 01854652, 01887083

## Limitations

When you connect to the Microsoft Access Database with JDBC and specify the database path, and if you use the following specific aggregation functions in the query, an error occurs when you run the bot.

```
ASC, ATN, SQ, CBOOL, CCUR, CDATE,
CDBL, CDEC, CDATE, CDBL, CINT, CLONG, CLNG,
CSIGN, CSTR, CVAR, DATEADD, DATEDIFF, DATEPART,
DATESERIAL, DATEVALUE, FORMAT, IIF, INSTR, INSTRREV,
ISDATE, IsNull, ISNUMERIC, LEFT, LEFTS, LEN, MID,
MONTHNAME, DATE, NOW, NZ, SIGN, SPACE, STR, TIME, VAL,
WEEKDAYNAME, WEEKDAY, STRING, TIMESERIAL, CONCAT
```

### Workaround:

1. Go to **Administration > Settings > Devices > Advanced options > Bot launcher JVM options** and set the value as follows: –  
`Dhsqldb.method_class_names=net.ucanaccess.converters*`
2. Restart the Automation Anywhere Bot Agent service.

External key vault integrations are not supported on Oracle Database.

Not all missed recurring schedules are redeployed with the **Redeploy the schedule again** option. Also, only one entry is shown for the missed recurring schedules in the **In progress** tab.

As an IQ Bot user, you can check out only the latest version of a process. You cannot check out previous versions of a process because version check is performed based on the Automation Anywhere file version and not the Git version.

The OAuth2 configuration settings in the Control Room will not enable you to connect to the OAuth2 service at this time. Customers planning an OAuth2 integration with our partner application should expect the service to be available by November.

In the Oracle Database environment, you cannot view a checked-in bot in the **Public** folder because version check is performed based on the Automation Anywhere file version and not the Git version.

**Workaround:** To view a checked-in bot in the **Public** folder, you must refresh the **Automation** page manually by using the **Refresh** button.

In an Oracle Database environment, when you select the number format and sort order for the work items in a queue, and then run bot using the **Run bot with queue** option, the queues are not deployed. Also, no errors are shown in the **Audit log** or **Activity** page.

For regular or scheduled automations using the unattended Bot Runners, bot deployments remain in the queued state and accumulate on the **In progress** page for these following scenarios:

- If the devices are down or not available.
- If a run-as user is busy executing the bot.

For devices not in the deployment state, if the number of queued bots reaches 500, it blocks the bot deployments for all devices or for all run-as users.

**Workaround:** To run the blocked deployments, perform one of the following actions:

- Select the queued jobs on the **In progress** page and move it to the **Historical** page
- Reconnect the Bot Runner devices.

When you set the default package version using the **Update bots to default package version** option for bots in the public workspace that are using the **Excel Advanced > Open** action, the TaskBots do not display the session name and file path values.

**Workaround:** Perform one of the following workarounds:

- Update the **Excel Advanced** package manually to use the latest version of the package. See [Select the package version used in your bot](#) on page 1374
- Check out the bot and revert to the previous version of the **Excel Advanced** package. Then, check in the bot to use the latest version of the package. See [Update to default version](#)

**Service Cloud case ID:** 01905290, 01882083, 00712719, 00728499, 00737694, 00803673, 01255722, 00838604, 00772147, 01760236, 01762679, 01771416, 01761859, 01782588, 01778220, 01784255, 01789551, 01809167, 01818690, 01831969, 01813413, 01287311, 01923711, 01927867

You will encounter an error when you run a standard workflow in the SAP BAPI package

**Workaround:** To execute SAP BAPI, use the Run Function call (RFC) with a combination of **Create function**, **Set** or **Get field value**, **Set** or **Get structure**, and **Set** or **Get table** actions.

When you use 2.6.1-20220428-010714 or later versions of the Recorder package to automate a web page on Microsoft Edge browser, the Recorder might not be able to perform **Click** or **Left click** actions on the JavaScript alert, prompt, and confirmation pop-up windows.

**Workaround:** For performing the click actions successfully, downgrade the Recorder package to 2.5.4-20220309-151830 version or earlier.

When you use the **Browser > Close** action to close a tab or a window opened in the Microsoft Edge browser, if only one Microsoft Edge browser window is open, the bot encounters the following error: Error occurred while closing the tab

**Workaround:** See [Configure Microsoft Edge browser settings when Close action of Browser package encounters an error \(A-people login required\)](#)

When you run a bot in the Google Chrome or Microsoft Edge browser, use the If, Loop, or Wait action, select the webpage from the list of active tabs in the **Browser** tab, close the browser window, and then run the bot, the bot might take two minutes to open the webpage in the browser irrespective of the timeout value mentioned.

**Workaround:** Move the If, Loop, or Wait action inside the **If** block and use the **Application is running** condition with same browser application to check whether the browser is running.

When you run a stored procedure in Oracle and it returns SYS\_REFCURSOR, the **Run stored procedure** action is not closing the cursors. As a result, after the maximum cursor limit is reached, this action results in an error.

When you migrate a bot that contains **XML command > Get single node**, after migration, the bot encounters the following error: No node found at XPath while executing the Get Single node command

**Workaround:** If the XPath expression is not starting with (/), apply XPath starting with "" so that at the time of execution, the modification can be skipped or the XPath expression can be designed to get the desired result.

While running a bot in debug mode, the bot will fail if the variable size gets greater than 3 MB. An error message appears showing that a variable has exceeded the 3 MB limit.

When you use the **Browser > Open** action to automate a browser window running on Google Chrome and Microsoft Edge browsers, then from the browser window, select **More tools > Name window** option to update the title of this window during bot run and then when you try to run the bot with the updated window title, the bot might fail.

When you use the actions in the App Integration package to extract text from a window, the bot might not be able to detect the new UI of the Windows 11 operating system and capture the text.

**Workaround:** Enable the old classical UI in Windows 11 operating system. See [Restore Old Classic Notepad in Windows 11](#)

When you use the `/v2/repository/file/list`, the response lists bots restricted by user role. If you use this API as an AAE\_Admin, you can view bots from the private repository in the response. Whereas if you use this API as a bot creator, you can view system bots (recorder) in the response.

**Workaround:** Use the `/v2/repository/workspaces/{workspaceType}/files/list`.

Command prompt API allows you to switch the device registration even if the **Allow devices (single user) to be switched to another Control Room without reinstalling bot agent** option is disabled.

When you upgrade from Automation 360 v.25 to a later version, although you enabled code analysis in the Control Room, the rules set in the policy are not retained after the upgrade.

**Workaround:** Before upgrading, we recommend that you keep a note of the rules enabled in Automation 360 v.25 and then re-enable them after upgrading to a later version.

## Feature deprecations

Review features and capabilities (from Automation Anywhere or other third-party vendors) that are deprecated or nearing deprecation to understand how they impact your automation.

### Automation Anywhere Mobile app deprecated

The Automation Anywhere Mobile app is deprecated as of July 2022 and will not be updated to subsequent versions of iOS and Android. The mobile app is no longer available and no further support will be offered. A replacement product is currently not available.

**Tesseract OCR v3 deprecated**

Tesseract OCR version 3 is deprecated as of September 2022. If you have created learning instances using Tesseract OCR version 3, we recommend that you plan to train your learning instances with alternative OCRs (including Tesseract4 OCR) before you update to Automation 360 v.26.

[Deprecation of Tesseract OCR v3](#) on page 129

**Deprecation of IQ Bot Extraction package**

The IQ Bot Extraction package has been deprecated as of September 2022. As part of Automation 360 v.26, IQ Bot will no longer support pretrained machine learning models for invoice data extraction.

To move your bots from the IQ Bot Extraction package to Document Automation, see [IQ Bot Extraction package](#).

**RPA Bots for Excel deprecated**

RPA Bots for Excel has been deprecated as of January 2022. The plug-in is no longer available to download as a product. However, support will be offered to current customers already using the product.

A replacement product as a plug-in for Microsoft Excel is not available. In RPA Bots for Excel, this action was triggered from within the Excel application. However, as an alternative, new customers can develop bots for Excel within Automation 360 RPA Workspace and use input variables to allow specifying file names, worksheets, and ranges for bots to operate on. In RPA Bots for Excel, this action was triggered from within the Excel application, whereas now this action is taken from the Automation Anywhere Control Room.

**G-Suite Apps package deprecated**

The G-Suite Apps package has been deprecated as of September 2022 and it no longer supports using the **Connect** and **Disconnect** actions to establish a connection with the Google server and automate tasks.

**Recommended:** For specific G-Suite applications, the functionality of the G-Suite Apps package is available in the following G-Suite packages:

- Google Drive
- Google Calendar
- Google Sheets

To automate tasks, in the appropriate G-suite package, use the corresponding **Connect** and **Disconnect** actions.

**Related concepts**

[Packages available in Automation 360](#) on page 1369

Actions are grouped into version-specific packages. Bot Creators can select which package version to use for a specific bot.

## Updating to v.26 release

Review requirements and support information about updating your Control Room and Bot Agent for the v.26 release.

## Control Room update

If you are updating to this release, ensure that the Server audit is not enabled on SQL Server Database. If the server audit is enabled, use SQL administrator user account to turn off the SQL Server audit before initiating the update.

## Bot Agent updates

---

**Important:** This release includes an **optional** Bot Agent update. You can continue to run your existing bots without updating the Bot Agent. However, if you want to use the new features in Automation 360 v.26, you must update the Bot Agent available with this release.

---

For more information on updating to this release, see these resources:

- [Automatically update the Bot Agent](#) on page 1001 | [Manually update the Bot Agent](#) on page 1002
- [Compatibility with release builds](#) on page 985

## Supported Control Room builds for direct update

You can update to the latest version of Automation 360 from the previous three releases (that is, from  $n-3$  releases, where  $n$  refers to the latest release).

The following previous releases are certified for update to Automation 360 v.26:

- v.25 (Build 15112, 15097)
- v.24R2 (Build 13343), and v.24 (Build 12350, 12342)
- v.23 (Build 11513)

If you are on one of these previous releases, for information about updating, see [Update to latest Automation 360 version](#) on page 1022. If you are not on an  $n-3$  release, update Automation 360 to one of the  $n-3$  releases before updating to Automation 360 v.26.

For the latest updates to the Automation 360 extensions for Google Chrome, Microsoft Edge, and Mozilla Firefox, see [Browser extensions for Automation 360](#) on page 765.

## Migration updates for v.26 release

Review what's new, changed, and the fixes and limitations to migrating from Enterprise 11 and 10 versions to Automation 360 v.26.

## What's new

Enterprise 11 and Enterprise 10
<p><b>Migrate parent bots independently, avoiding overwrites and loss of updates</b> (Service Cloud case ID: 01258572, 01778107, 01275417, 01880168)</p> <p>You can now migrate a parent bot independently even if it has associated child bots. You now have a choice to select whether you want to migrate a parent bot independently or along with its dependent child bots.</p> <p>This helps in avoiding overwrites and loss of updates that might happen when child bots that are migrated to Automation 360 are updated after migration.</p> <p><a href="#">Migrate Enterprise bots</a> on page 1173</p>
<p><b>Migrate more bots with specific features</b></p> <p>You can now successfully migrate bots in the following cases:</p> <ul style="list-style-type: none"> <li>• Bots that use spreadsheets residing in <b>SharePoint</b> by using the <b>Excel advanced &gt; Open</b> action.</li> <li>• You can now migrate bots with REST commands with custom proxy configuration at the <b>Action</b> level. For custom proxy configuration support, in the <b>Bot Migration Wizard</b>, select the <b>Include web service settings</b> option.</li> </ul> <p>When you select this option, the REST commands are migrated with custom proxy configurations that use the following global variables:</p> <ul style="list-style-type: none"> <li>• <code>AAProxyHost</code> for <b>Hostname</b></li> <li>• <code>AAProxyPort</code> for <b>Port</b></li> </ul> <p><a href="#">Migrate Enterprise bots</a> on page 1173</p> <ul style="list-style-type: none"> <li>• Bots in which the user interface or window extends beyond the screen on the top-left corner (truncated) for the following actions: Object Cloning, If, Loop, Web Recorder, and Manage Web Control.</li> </ul> <p>Now, migrated bots support windows with negative coordinates (truncated windows).</p>

**Enterprise 11 only****Migrate bots independent of Bot Insight migration**

Before migration of legacy bots, you can now declare whether these bots were using the Bot Insight option in Enterprise 11 by selecting the **Tag bots and variables for analytics** option in the **Bot Migration Wizard**. The Bot Insight **Open** and **Close** actions are created only for such migrated bots where this option is selected.

[Migrate Enterprise bots](#) on page 1173

**What's changed****Assess migration readiness of processes with Bot Scanner**

The Bot Scanner scans your repository for processes that can be migrated to Automation 360 and provides information under the following categories:

**Note:** A process is a bot that is not used in any other bot and can include child bots.

- **All:** List of all the processes.
- **Action required:** List of processes that require action after migration to Automation 360. A process is flagged as **Action Required** even if one of its child bot requires action.
- **Review required:** List of processes that require review after migration to Automation 360. A process is flagged as **Review Required** even if one of its child bot requires review.
- **No review required:** List of processes that can be migrated. All the bots in the process can be migrated.
- **Non Migratable:** List of processes that cannot be migrated. All the bots in the process cannot be migrated.

**Note:** For generating processes summary report, the maximum repository size that is supported is up to 10 GB.

[Analyze Bot Scanner report for migration](#) on page 1121

**Direct link to upgrade launchpad and migration resource portal in Bot Scanner**

Bot Scanner report now also contains direct links to:

- Upgrade Launchpad: Use the information provided on this page for a self-guided experience that is customized for your migration requirements.

[Upgrade Launchpad](#)

- Enterprise Migration Resources: Use the information on this page to plan for migrating to Automation 360.

[Enterprise Migration Resources | Cloud RPA | Automation Anywhere](#)

[Analyze Bot Scanner report for migration](#) on page 1121

**Direct link to corresponding migration messages**

With a direct link to migration messages in **Bot Assistant**, you now have quicker access to information about migrated bots that require action or review.

**Validate letter case in window titles**

You can now validate the letter case in window titles in window variables. By using the **Case sensitive** option, you can now decide whether to match or not match the letter case in window titles that have the same titles but differ in letter case.

With this option, you can ensure that the migrated bots produce the same output as that of their corresponding Enterprise 11 bots.

**Review bots more efficiently with exact line number in Bot Scanner report**

The Bot Scanner report now displays the exact line number in the bots that need review or action even in cases where some of the commands used in Enterprise 11 bots are not available in Automation 360.

**Fixes**

When you migrate bots with the **Select item by index** action of the SAP package, the index is now displayed correctly. The migrated bot selects items according to the correct index, and no error is displayed.

MetaBots that were captured using the following configurations will now be migrated to Legacy AISense in Automation 360:

Linked object play mode	Main object play mode
Text	Text
None	Text

Previously, bots that used such MetaBot configurations failed to migrate.

**Service Cloud case ID:** 01774261

You can now migrate TaskBots that use MetaBot Logic whose DLL file contains classes without a namespace.

Previously, an error occurred when you ran such TaskBots.

**Service Cloud case ID:** 01765712

When you migrate from Enterprise 11 to Automation 360, capturing MetaBot screen commands is changed as follows:

Enterprise 11	Automation 360
<ul style="list-style-type: none"> <li>Main objects captured with the <b>Object</b> play mode</li> <li>Linked objects captured with the <b>Coordinate</b> play mode</li> </ul>	Record capture actions with the <b>Object</b> play mode

You can now use commas in the filenames of bots that use FTP actions and use colons in the filenames of bots that use Delete files and Delete folder FTP actions.

Previously, such bots encountered an error during bot run.

**Service Cloud case ID:** 01772186

When you migrate bots that use the same window titles but have different letter case in window variables, the bots now run successfully.

Previously, bots that used the same window titles but had different letter case in window variables failed to run successfully after migration.

**Service Cloud case ID:** 00825181

You can now successfully run migrated bots that use the *Email Received Date* variable twice in subactions inside the Email Loop action.

Previously, a parse error occurred in such cases.

**Service Cloud case ID:** 01275815

In migrated bots, when you use the Recorder package, you can now use the **Click** action on **Client Control** in **HTML technology** without any issues.

Previously, the **Click** action button on **Client Control** did not work as expected.

**Service Cloud case ID:** 01713357

You can now successfully re-edit a migrated bot with the **Record** > **Dataset** variable.

**Service Cloud case ID:** 01807170

When you want to open web pages, in the Browser package, when you use the **New window** option of the **Open** action, you can now specify a URL without the protocol information, such as http, https, or file.

Previously, when protocol information was not provided in the URL, some web pages did not open properly.

You can now successfully migrate Enterprise 11 bots with analytics flags.

Previously, migration failed when variables with analytics flags were checked.

**Service Cloud case ID:** 01768545

When you click the **Back** button in the migration details page for a migration run, you are now redirected to the **Migration runs** tab.

Previously, when you clicked the **Back** button, you were redirected to the **Overview** tab.

**Service Cloud case ID:** 01816558

When you migrate a bot that uses the **Manage Window Controls** action, the height value is now set correctly after migration.

Previously, after migration, the last digit of the height value was not available.

**Service Cloud case ID:** 01756996

When you run a bot to automate spreadsheet data, all the requests are now processed successfully in the following scenario:

When an Excel session is active in SAP and a corresponding Excel process starts in the background, Automation 360 creates a separate Excel process other than the one that SAP started, and the correct window is now activated for all the subsequent requests.

Previously, only the first request was processed successfully because the correct window was not activated for automating the spreadsheet data for the subsequent requests.

**Service Cloud case ID:** 00815159

When you migrate bots from Enterprise 11, the automation priority of each bot is now adjusted to match its equivalent priority level in Automation 360, as follows:

- In Enterprise 11, if the automation priority for a bot was set to low, after migration, the automation priority for the bot is changed to medium.
- In Enterprise 11, if the automation priority was set to medium, the automation priority in the migrated bot is set to high.

**Note:** There is no change in automation priority when it is set to high.

Previously, the automation priority of migrated bots remained the same as in Enterprise 11.

You can now migrate bots even if the properties value of the Manage Window Controls action is set to 65536 or more.

Previously, when the properties value was set to 65536 or more, the bots encountered an error during bot run.

**Service Cloud case ID:** 01768555, 01825071

After migration, you can now get all the lines of text from the Terminal Emulator by using the **Get text > All lines** action.

Previously, you could get only 24 lines of text from the Terminal Emulator.

**Service Cloud case ID:** 01609467

In the Bot migration wizard, the Bot Scanner and the Bot migration report now display the correct status for bots that are flagged for the R134 migration message.

Previously, in the Bot Scanner and the Bot migration report, the status of bots that required review was incorrectly displayed as **No review required**.

You can now successfully migrate bots whose queue category name contains a space.

Previously, migration of such bots failed because Enterprise 11 bots whose queue category name contained a space went into an infinite loop until the loop timed out at 90 minutes.

**Service Cloud case ID:** 01850864

After you migrate a bot that uses the Terminal Emulator package, when you run the bot, the terminal window is now activated and remains in the front. This is because the **Show terminal window in the front** option in the **Connect** action is now enabled by default.

Previously, when you ran such a bot, the terminal window was not activated and remained minimized because the **Show terminal window in the front** option was not present in the **Connect** action.

When you run a bot with the Database package, the bot no longer becomes stuck at the **Insert** or the **Update** command when run for a long duration.

Previously, in such cases, the bot became stuck intermittently.

**Service Cloud case ID:** 01836733

## Limitations

In Enterprise 11, if bots were using the **String > Replace** action to find a carriage return line feed (CRLF) character and replace it with another character, after migration, the output might not be the same as the output seen in Enterprise 11.

**Workaround:** In the **Find string** option, instead of the **Enter** (LF) variable, use the **Newline** (CRLF) variable.

**Service Cloud case ID:** 01808878

In Enterprise 11, if bots were using the If, IF/ELSE, or Loop While command in Windows Control and if the Application window does not exist, after migration, the bots will encounter an error during bot run.

**Service Cloud case ID:** 01846262

When the **Select** query is used inside a Loop command and its result set is further iterated, if the query returns no record, the result set Loop reiterates the previous record.

**Service Cloud case ID:** 01799961

Review requirements and support information about updating your Control Room and Bot Agent for the v.26 release.

## AARI v.26 release

Review what's new and changed and the fixes in AARI for the v.26 release.

## What's new

### Embedded automation with OAuth 2.0

Embedded automation streamlines access to the automation experience.

[Embedded Automation](#) on page 1568

- AARI Integrations embeds in web applications as a widget, so if you are an end user, you can access automated processes and bots without leaving your environment.
- AARI Extensions offers further adaptability through Chrome browser extensions, enabling automation directly in any web scenario. Business users can now access automations through a widget, available through an extension in their web browser.
- With an OAuth 2.0 connection, existing access to automations in the Control Room are now shared with the Extensions to offer you a seamless user experience.

[AARI Integrations and AARI Extensions](#) on page 1571

### Oracle Database support

We now support AARI on Oracle Database. When you install or update to this release, you can now choose Oracle Database to work with AARI.

### Delete files permanently from AARI cloud storage

You can now delete files permanently from AARI cloud storage. When you delete a request, the associated file is also permanently deleted now and not just sent to the recycle bin.

[Cloud storage usage](#) on page 1484

### Append or overwrite operations in your form

Append or overwrite operations in your form by using the **Assign** form rules for the web, with the **Checkbox** and **Radio Button** elements, which now support form rules.

### Assign dynamic values with support for new elements in your forms

When you use the interactive forms package, you can now assign dynamic values with the **Assign** action, which now supports **Checkbox** and **Radio Button** elements in your form.

You can also change the label of the selected form elements with the **Change label** action for the **Button** element.

[Interactive forms package](#)

### Run processes more seamlessly by setting expiration time for human tasks (Service Cloud case ID: 00806522)

You can now run your process more seamlessly even when a human task takes longer to run. You can achieve this by setting an expiration time for your tasks in **Human Task** in a process.

When you set an expiration time, if a human task takes longer to address, the task times out and the process moves to the next step to ensure there is no break to the flow.

You can set the expiration time by number of days, hours, and minutes, depending on your requirement.

[Create an AARI process](#) on page 1487

## What's changed

### Simplify your workflow by grouping multiple conditions in form rules

You can now group multiple conditions for your form rules by using the **And** logic with the **Or** logic. Previously, you could group only the **And** logic or the **Or** logic. This change, which is similar to the **If-Then-Else** logic, facilitates grouping multiple conditions and helps simplify your workflow.

## Fixes

You can now have greater security validation because it is no longer possible to upload files that have double extensions, such as File.PDF.PDF, to your web application.

Previously, uploading files with double extensions was possible, which represented a significant risk to applications.

**Service Cloud case ID:** 00828289

Clean up operations now include recursive request files to prevent spam in audit logs. Previously, an Unsuccessful Request alert appeared repeatedly in the audit log, from root error:

```
org.hibernate.exception.ConstraintViolationException: could not execute statement
```

**Service Cloud case ID:** 01816489, 01839604

When you use the **Has Errors** rule to show the number of errors in your form, the error message now shows the correct number of errors.

When you update from Automation 360 v.24R2 to Automation 360 v.25, the bot setup now correctly shows the number of bots and assigned teams.

## IQ Bot and Document Automation v.26 release

Review what's new and changed, and the fixes and limitations in IQ Bot and Document Automation for the v.26 release.

### Document Automation

What's new
<p><b>Improve extraction by providing changes to the Validator</b></p> <p>You can now improve extraction by providing learning instances with validation feedback for Automation Anywhere models. You can achieve this by enabling the <b>Validation feedback</b> option in the <b>Create learning instance</b> and <b>Edit learning instance</b> windows.</p> <p><a href="#">Data extraction in Document Automation</a> on page 1894</p>
<p><b>Search for form or table fields</b></p> <p>When creating a learning instance, when you are configuring fields, you can now search for fields by field name, field label, or data type.</p>
<p><b>Process invoice-like documents with user-defined document type</b></p> <p>You can now process documents that are visually similar to invoices, such as purchase orders and sales orders, which contain key-value pairs and a table structure. You can achieve this by create learning instances with the user-defined document type, using which you can also achieve the following results:</p> <ul style="list-style-type: none"> <li>• Extract from English, Dutch, French, German, Italian, Portuguese (Brazilian), and Spanish language documents.</li> <li>• Define exactly which values to extract from a field, such as when a date of birth field also contains the age.</li> <li>• Use the Address data type for form fields, which identifies and extracts the structure of an address.</li> </ul>
<p><b>Enhancements to the Validator</b></p> <ul style="list-style-type: none"> <li>• The Validator now shows the group number for documents processed in a learning instance connected from Automation 360 IQ Bot</li> <li>• You can now configure a list of valid values when creating learning instance.</li> <li>• When you click a field that requires validation, a message now appears with the confidence level determined by the system and the threshold set in the learning instance.</li> </ul>
<p><b>Monitor document processing metrics in Bot Insight dashboards</b></p> <p>You can now visualize data, such as the number of documents uploaded per day, extraction time per document by learning instance, and STP percentage by learning instance, by using the customizable dashboards in the <b>Document Workspace</b> tab.</p> <p><a href="#">Document Workspace dashboard</a> on page 2261</p>

What's new
<p><b>Document Automation now supports the bring your own key (BYOK) use case for the Google Document AI product license</b></p> <p>Users can now configure their Control Room environment with Google Document AI licenses purchased from Google. This allows the learning instance to send documents to Google Document AI for extraction and for the Control Room to track consumption in the <b>All licenses</b> page.</p> <p><a href="#">Configure key for Google Document AI</a> on page 1889   <a href="#">Automation 360 licenses</a> on page 970</p>
<p><b>View Document Automation user activities in the audit log</b></p> <p>With the <b>AAE_Admin</b> role or a custom role with the <b>View audit log</b> permission, you can now view the status of events related to learning instances, domains, and documents.</p> <p><a href="#">Audit log</a> on page 1972</p>
<p><b>Create and train standard forms within the Control Room</b></p> <p>Users with the <b>AAE_IQ Bot Admin</b> or <b>AAE_IQ Bot Services</b> roles can now create new standard forms in Document Automation. It is no longer necessary to leave the Control Room and open a third-party service to create or modify a standard form. The interface to configure the extraction model is launched from the <b>Learning instances</b> page.</p> <hr/> <p><b>Note:</b> To process documents in a learning instance which uses the standard forms model in Document Automation:</p> <ol style="list-style-type: none"> <li>1. Create the standard form in Document Automation.</li> <li>2. Create and train the learning instance in Automation 360 IQ Bot.</li> <li>3. Connect the learning instance to Document Automation.</li> </ol> <hr/> <p><a href="#">Create standard form in Document Automation</a> on page 1924</p>

What's changed
<p>To connect a learning instance from Automation 360 IQ Bot, you must have one of the following roles:</p> <ul style="list-style-type: none"> <li>• <b>AAE_IQ Bot Admin</b></li> <li>• <b>AAE_IQ Bot Services</b></li> <li>• A custom role with the <b>Connect learning instance</b> permission</li> </ul>
<p>Uploaded documents and extracted data are now removed after 90 days even if a document has not completed processing, except in the following cases:</p> <ul style="list-style-type: none"> <li>• If data is downloaded and deleted, the source documents are immediately deleted.</li> <li>• If the document is manually validated, the document is stored for 90 days from the date of extraction.</li> </ul>
<p>If a document is renamed to a new file extension and uploaded to a Google Document AI pretrained model, the document will fail processing.</p> <p><b>Workaround:</b> Rename the document to the correct file extension.</p>

Fixes
<p>Beside the <b>Validate documents</b> link, the value that reflects the number of documents awaiting validation is no longer hidden, and you can now view it without adjusting the width of the Actions column.</p> <p>Previously, you had to adjust the width of the Actions column to see the value.</p>
<p>You can now successfully draw a box, zoom in, fit the box to match the screen size, and then redraw the box without any issue.</p> <p>Previously, when you drew a box, zoomed in, clicked <b>Fit to screen</b>, and then tried to redraw the box, the box appeared at a different location from where you clicked.</p>
<p>In the Validator, you can now adjust the system-identified region (SIR) by dragging the corners of the SIR when you zoom in or zoom out.</p> <p>Previously, you could drag the corners of the SIR but not when you zoomed in or zoomed out.</p>
<p>When you connect to a learning instance from Automation 360 IQ Bot, if the learning instance has an optional field with a set default value and some fields that are unmapped, when you process documents in that learning instance in Document Automation, the default value now appears only in the mapped fields.</p> <p>Previously, the default value appeared incorrectly in the unmapped fields.</p>
<p>In Community Edition, when you try to delete a learning instance, the following, correct message is now displayed and you can successfully delete the learning instance: <code>Community edition users are limited to 5 learning instances</code></p> <p>Previously, although you could delete the learning instance, the following, incorrect message was displayed: <code>Community edition users are limited to 5 learning instances and will not be able to delete.</code></p>
<p>Fixed an issue where Document Automation sometimes failed to extract data from tables that span across multiple pages. Document Automation now supports data extraction from tables that span across multiple pages for Automation Anywhere models.</p>
<p>You can now use the <b>Document Extraction &gt; Download</b> action in a standalone bot that is not part of an AARI process.</p> <p>Previously, this action could be used only in the <code>Downloadbot</code> within the AARI process that was automatically generated when a user created a learning instance.</p>
<p>After the Validator times out because of inactivity, when you refresh it, instead of showing the most recent document that you validated, the Validator shows the first document that you validated.</p>

Limitations
<p>Document Automation does not support Cloud-enabled (SDS) deployment.</p>
<p>Formula validation does not support numbers that contain delimiters. For example, <code>1,000</code> and <code>2.0</code> are not supported.</p>
<p>In some cases, the Bot Agent does not clear out its resources folder. Until the disk space is freed, the production documents in processing will be affected. This issue occurs intermittently.</p> <p><b>Workaround:</b> Based on the issue, you must create a task scheduler to clean out the resources folder every day or every week.</p>

Limitations
There is no notification when the product license is about to expire. When the product license expires, the <b>Learning Instances</b> tab is removed from the Control Room.
Learning instances that use Google Document AI models do not reliably extract all the fields in a table, if the table that spans multiple pages.
In On-Premises installation in Linux environments, document processing sometimes fails because of a storage service error. <b>Workaround:</b> In the command prompt, run the following script:
<pre>cd /opt/automationanywhere/automation360/appdata/Server Files/ sudo chown -R crstorage:controlroom storageservice</pre>
Document Automation does not support Oracle Database for On-Premises installations.
Document Automation supports only the following standard ports for On-Premises installations: <ul style="list-style-type: none"> <li>• For HTTP: Port 80</li> <li>• For HTTPS: Port 443</li> </ul>
Sometimes, files uploaded to train a standard form appear corrupted although the data is still usable.
Standard forms in Document Automation is not supported in a multi-tenant Cloud Control Room that was upgraded from v.25. This limitation does not occur on a fresh installation of a multi-tenant Cloud Control Room.
Learning instances with the user-defined document type do not support Dutch language documents.
The first time you click a learning instance connected from Automation 360 IQ Bot, you are redirected to the IQ Bot homepage instead of the details page for that learning instance.
Formula validation is not supported for custom fields if the field name contains a space.
When you import a learning instance created in a previous version of Document Automation, the check box to send validation feedback to the system is unselected by default. You must edit the learning instance to select the check box.
Document Automation does not perform post-processing on connected learning instances that contain Python custom logic with either of the following: <ul style="list-style-type: none"> <li>• Single quotes, such as <code>print('Test')</code>. Ensure the Python script uses only double quotes.</li> <li>• Characters from non-Latin languages (Unicode characters), such as <code>äöüññ</code>.</li> </ul>
Formula validation is not supported in learning instances with the user-defined document type.
When you process documents using the IQ Bot Extraction package, the Python scripts are not applied properly on the form fields for the classic learning instances connected on Document Automation. This results in improper data extraction in the output CSV files and the Validator.
When you click the <b>Table</b> icon on Form OCR Testing Tool (FOTT) editor, the text appearing on the pop-up window is not readable.
If IQ Bot, Control Room, and Bot Agent are installed on the same Windows Server 2012, then data extraction fails for any Classic learning instances connected in Document Automation.

## IQ Bot

What's new
<p><b>When user logs out, lock released immediately on documents in Validator</b></p> <p>When a user logs out of IQ Bot, the lock on the documents in validation is now released immediately so that other users can view or validate the documents. Previously, when a document was in the Validator queue, if the logged out, the lock on the document in the validator was not released immediately, as a result of which other users could not view or validate the document.</p> <p><i>Use the <a href="#">IQ Bot Validator</a> on page 1853</i></p>
<p><b>IQ Bot Database Migration Assistant Tool now supports Windows Authentication</b></p> <p>When you migrate from Enterprise 11 to Automation 360 by using the Database Migration Assistant Tool, you can now use Windows Authentication for connecting to the IQ Bot database server.</p>
<p><b>Choose classification type while creating learning instance</b></p> <p>When you create a learning instance, you can now choose which aliases and fields are considered for classification by using the <b>Disable classification changes on domain modification (fields, alias)</b> check box.</p> <ul style="list-style-type: none"> <li>• When this check box is selected, the classification process uses only the aliases or fields that were present in the domain when the learning instance was created. Aliases and fields added to the domain after the learning instance was created are not considered for classification.</li> <li>• When this check box is cleared, the classification process uses all the aliases or fields that are part of your domain. Aliases and fields added to the domain after the learning instance was created are also taken into consideration for classification.</li> </ul> <p>This feature classifies the document to the same group even if there are any updates in the domain.</p>

What's changed
<p><b>Upgraded machine learning models</b></p> <p>IQ Bot now uses an upgraded machine learning model for detection of check boxes and Advanced tables.</p>
<p><b>Python libraries upgraded to 64-bit</b></p> <p>All the Python libraries provided in IQ Bot by Automation Anywhere for this release are now upgraded to 64-bit from 32-bit. If you are using third-party libraries, ensure that you upgrade to 64-bit libraries. After upgrading the third-party libraries, ensure that these libraries work successfully.</p>

Fixes
<p>When you download an unclassified document, click <b>Delete from the server</b>, and then toggle the learning instance from production to staging and back, the document no longer appears in the untrained folder. Previously, when you downloaded an unclassified document from the untrained groups, even after you deleted it, the document still reappeared in the folder.</p> <p><b>Service Cloud case ID:</b> 01781935</p>

Fixes
<p>When you upload documents, the Classifier no longer halts or becomes stuck. Documents that are not classified are now cleared from the queue, allowing smoother processing of subsequent documents. If these documents fail to be processed within the timeout limit, they are now categorized as unclassified and you can download these unclassified documents.</p> <p><b>Service Cloud case ID:</b> 01762844, 01272642, 01750753</p>
<p>You can now install IQ Bot by using Windows authentication and CyberArk Vault and then rotate the key. Previously, when you tried to rotate the Vault key, the following error message was displayed: <code>Error occurred while setting up the new key. Please check the logs</code></p>
<p>You can now select multiple learning instances for backup by using the <b>Search</b> drop-down list. Previously, after you clicked the <b>Create Backup</b> option on the <b>Migration Management</b> page, if you selected a learning instance and then used the <b>Search</b> drop-down list to select another learning instance, the previously selected learning instance became deselected.</p>
<p>The value displayed in the <b>My totals &gt; Accuracy</b> field now matches the value in <b>My learning instances &gt; Field accuracy</b> for the available learning instances.</p>
<p>You can now add documents to manually created groups and upload documents to staging. Previously, when you edited a manually created group or tried to upload a document, you encountered an error and the following error message was displayed: <code>Failed to update manual group: Duplicate label found.</code></p> <p><b>Service Cloud case ID:</b> 01849616, 01845590</p>
<p>You can now use the migration utility to successfully migrate learning instances created for a custom domain. When you import IQBA files with duplicate fields (even through an API), the following message is displayed alerting you to the existence of duplicate fields: <code>Error: Duplicate field found Invoice number.</code> Previously, the migration utility could not be used to migrate learning instances created for a custom domain.</p> <p><b>Service Cloud case ID:</b> 00729627</p>
<p>During migration, you can now successfully import and export IQBA files. Previously, the import and export of IQBA files failed because the content classification table contained duplicate training fields.</p> <p><b>Service Cloud case ID:</b> 00826891</p>
<p>When a document is successfully downloaded, it is now placed in the <b>Success</b> folder. Previously, documents that were successfully processed were sent to the untrained folder, causing inconsistencies in the download process.</p> <p><b>Service Cloud case ID:</b> 00780227,00842077</p>
<p>When there is an update in the domain, IQ Bot now classifies a document to the same group. Previously, whenever there was any update in the domain, IQ Bot created new groups for the same document.</p> <p><b>Service Cloud case ID:</b>01622981</p>
<p>If a document without content is uploaded to a learning instance in production, the following message is logged in the <code>bot_launcher.log</code> file: <code>Unable to upload file &lt;filename&gt; to the Learning Instance. No content in file, size 0" whenever there is a 0 KB file is uploaded.</code></p>

Fixes
<p>The security vulnerability related to <b>Unquoted Service Path</b> has been fixed. Previously, the Windows host referred to an installed service that used an unquoted service path containing whitespace Automation Anywhere Cognitive Console: <code>D:\Program Files (x86)\Automation Anywhere IQ Bot\Portal\node modules\winser\bin\nssm64.exe</code>, which resulted in the vulnerability.</p> <p><b>Service Cloud case ID:01880370</b></p>

Limitations
<p>You cannot create a bot in IQ Bot when an invalid document is uploaded to a custom or manual group. Also, when an invalid document is uploaded along with a valid document and processed for extraction, the <b>See extraction</b> page keeps loading.</p>
<p>IQ Bot does not support Oracle Database for on-premises installations.</p>
<p>During production processing, if a learning instance is switched from Production to Staging or the other way around, for any documents processed during this switch, the production document that appears in Validator is blurred and not in human-readable form.</p>
<p>IQ Bot does not perform post-processing on a field if the custom logic uses Python script containing single quotes, such as <code>print('Test')</code>. Ensure the Python script uses only double quotes.</p> <p><i><a href="#">Custom Logic Python script challenges in A360.26 IQBot (A-people login required)</a></i></p>
<p>If your IQ Bot custom logic uses the <code>Pandas</code> library, the script must have the <code>import Pandas</code> statement.</p>
<p>IQ Bot does not perform post-processing on a field if the custom logic uses Python script containing characters from non-Latin languages (Unicode characters), such as <code>äöüññ</code>.</p>
<p>In IQ Bot, when you run a script created on versions prior to Automation 360 v.26, you might see a warning. However, this does not impact the script execution and the functionality.</p>

## Bot Insight v.26 release

Review what's changed and the limitations in Bot Insight for the v.26 release.

### What's changed

With the expanded user interface, you can now gain more insights into the Document Workspace. A new dashboard is available that delivers insights to Document Automation activity and trends, such as number of uploaded documents, pages and average extraction time. See more information in the following topic.

[Document Workspace dashboard](#) on page 2261

### Limitations

DataTable widgets for Bot Insight dashboards currently show a maximum of 100 records.

**Service Cloud case ID:** 01820004, 01851999, 00760252, 00806950

To avoid errors from occurring during bot lifecycle management, the private workspace dashboards will be imported only when the bot is imported directly to the private workspace.

Importing a bot to the public workspace and checking the bot out to the private workspace will not import the associated private workspace dashboards.

**Service Cloud case ID:** 00760022, 01803726, 01794757, 01777561, 01780407, 01842554, 01874606

Connectors for Bot Insight, such as Tableau or Power BI, work only with the following authentication mechanisms:

- Authentication based on Control Room database
- Authentication based on Active directory

**Service Cloud case ID:** 01863601, 01909212

## Automation 360 v.25 Release Notes

*Release date: 28 June 2022*

Review what's new and changed, and the fixes and limitations in the Automation 360 v.25 release.

- **Control Room:** Cloud Build 14304 (replaces Build 14298) and On-Premises Build 15112 (replaces Build 15097)
- **IQ Bot:** Cloud Build 14304 (replaces Build 14298) and On-Premises Build 15112 (replaces Build 15097)

---

**Important: Manifest V3 based extensions** - Google will deprecate Manifest V2 based extensions for Google Chrome by **January 2024**. To know about Microsoft Edge Manifest V2 based extensions timelines, see [Overview and timelines for migrating to Manifest V3](#). The deprecation might impact your existing automation that use current Manifest V2 based extensions in Google Chrome and Microsoft Edge browsers. Use the Automation 360 v.25 Build 15118 and Bot Agent version 21.211 for the latest Manifest V3 based extensions updates to support features that use Google Chrome and Microsoft Edge browsers. This build is available for download in the link provided in the following article: [Everything about the Chrome/Edge Manifest V2 Deprecation](#). See [Chrome and Edge Manifest V3 extensions](#) on page 116 and [Everything about the Chrome/Edge Manifest V2 Deprecation](#).

If you want to continue using the earlier builds of Automation 360 v.25 (Build 15112 or 15097) but want to upgrade to Manifest V3, you can manually upgrade to Manifest V3. See [Manifest extension manual upgrade](#).

---

**Important:** We have updated the Cloud Build 14304 and On-Premises Build 15112 to include fixes for the following issues. Fixes specific to On-Premises or Cloud builds are indicated.

- When you created or deleted new users, multiple, duplicate audit log entries were generated for a single user (Service Cloud case ID: 01836296).
  - When you logged in to the Control Room with bot export permissions, when you exported a task, no corresponding entry was immediately visible in historical activity (Service Cloud case ID: 01834139, 01839933, 01841993, 01839817, 01834108, 01846407, 01845706, 01843349, 01846220, 01846819, 01845547, 01847028, 01847024, 01847094, 01847114, 01847115, 01846998, 01847840, 01846757, 01848123, 01846944, 01848104, 01848294, 01848905, 01846596, 01849748).
  - When you updated to Automation 360 v.25 and attempted to use the previous settings with instance names, the previous settings were not allowing an update (Service Cloud case ID: 01838276, 01835897).
  - (On-Premises only) When you deployed a task On-Premises without direct Internet access, the compilation slowed down (Service Cloud case ID: 01841448, 1839118, 1844817, 01846153, 01846332, 01839254).
  - When the wait for condition package was used with any command package, the set timeout value for the wait was not met (Service Cloud case ID: 01842547, 01846156, 01847338, 01846324, 1842368, 01847054, 01848080, 01848789, 01848151, 01848963, 01847054, 01847121, 01848236, 01848260, 01849016, 01848248, 01848572, 01847828, 01847055, 01848826, 01848191, 01848944, 01851181, 01849792, 01852057, 01846152).
  - When you update from any build to Automation 360 v.25, if changes were made to the If/Else logic in nest and saved, a new Go to End point element was added, which created a process error (Service Cloud case ID: 01848192).
  - (On-Premises only) When an AARI process was checked in and then checked out, the mapped variables did not persist and were lost (Service Cloud case ID: 01847675).

## Top 5 developer features in this release

View the following video on the **top 5** developer features:

## Updating to this release

If you are on the previous build (Build 15097) of Automation 360 v.25, you must update to the latest Build 15112.

You can update to the latest version of Automation 360 from the previous three releases (that is, from  $n-3$  releases, where  $n$  refers to the latest release).

The following previous releases are certified for update to Automation 360 v.25:

- v.24R2 (Build 13343), and v.24 (Build 12350, 12342)
- v.23 (Build 11513)

- v.22 (Build 10526)

See also [A360 | Upgrading to A360.23, A360.24, A360.25 from A360.22 \(A-People login required\)](#).

When updating from previous releases to v.25 (Build 15097), ensure that you review the information in the following article: [Error parsing the SQL instance name while upgrading to Automation 360 v.25 \(A-People login required\)](#).

If you are on one of these previous releases, for information about updating, see [Update to latest Automation 360 version](#) on page 1022. If you are not on an n-3 release, update Automation 360 to one of the n-3 releases before updating to Automation 360 v.25.

---

**Important:** This release includes an **optional** Bot Agent update. You can continue to run your existing bots without updating the Bot Agent. However, if you want to use the new features in Automation 360 v.25, you must update the Bot Agent available with this release.

---

For more information, see these resources:

- [Automatically update the Bot Agent](#) on page 1001 | [Manually update the Bot Agent](#) on page 1002
- [Compatibility with release builds](#) on page 985

For the latest updates to the Automation 360 extensions for Google Chrome, Microsoft Edge, and Mozilla Firefox, see [Browser extensions for Automation 360](#) on page 765.

## Migration

### Enterprise 11 and Enterprise 10 features

#### Migrate TaskBots when the referred MetaBot Logic is renamed

You can now successfully migrate TaskBots where referred MetaBot Logic name is renamed or has changed the relative path after mapping.

If a MetaBot Logic is renamed or changed the path after being mapped in the TaskBot then the TaskBot is now migrated with the new MetaBot Logic name or path.

The command path in the TaskBot is updated with the renamed name or with the updated path.

Changing the relative path is applicable in the following scenarios:

- Logic is moved from one folder to another.
- Logic is moved from a MetaBot root level folder to a sub folder.
- Logic is moved from a sub folder to a folder at MetaBot root level.
- The folder that has the Logic is renamed.

This enhancement applies to the following commands:

- Run Logic
- If > Logic Successful
- If > Logic Unsuccessful
- Error Handling

#### Enhanced Bot Scanner output report

In the Bot Scanner output report, when you click the name of a bot that requires corrective action, you can now view the **Line number** of commands instead of the **Total message count (frequency)**.

### Enterprise 11 and Enterprise 10 features

#### Migration support for Send Email action with multiple attachments

You can now migrate bots that have the Send Email command with a filepath in a variable for the following scenarios:

- A single file is sent as an attachment.
- Multiple attachments are sent in a single email.
- Files are attached from a network drive.

#### Migration support for Work Item variable (Service Cloud case ID: 01270496)

You can now migrate bots with the Work Item variable for scenarios in which the Work Item variable includes the following:

- A number
- Both number and string, for example, a message box
- A date
- A combination of Datetime and string, for example, a message box

---

**Note:** If the Work Item variable is a Datetime type, the action **Record:Assign** is added automatically, which then gets converted to Datetime type string variable, before applying the Work Item variable.

---

#### Variables created automatically after migration

In the Bot Scanner utility, bots that contain the following non-referenced variables are no longer flagged as **Action Required** or **Review Required**:

- \$FileName\$
- \$Error Description\$
- \$Error Line Number\$
- \$Extension\$
- \$Folder Name\$

After migration, the system automatically creates these variables according to the Automation 360 naming convention, and the migrated bots run successfully.

#### Migration enhancement to packages and actions

- If the migrated bots use the **PDF Extract Text > Structured Text** action, the new **Reduce Data Loss** option ensures that characters are retained in the extracted text and the bots run successfully.
- If you have bots with a specific Xpath expression in the SOAP Web Service package, ensure that the SOAP command output for **Selected Response** is returned accordingly by selecting **String Delimited** or **List of Strings**. For migrated bots, the **String delimited by None** option is selected by default.
- If migrated bots use the Terminal Emulator, the **Set cursor position to the beginning** option now enables you to edit the Terminal Emulator screen manually, and the focus is set to the beginning of the editable field. Note that this option is selected by default only when the **Show terminal** option is selected for these bots. (Service Cloud case ID: 00812730, 01252363, 01804623)

### Enterprise 11 and Enterprise 10 features

#### Support for 7-Zip

We have certified 7-Zip, a third-party tool, to handle backing up the Control Room repository with lengthy file names, bot names, and folder names. You can now back up and restore the repository of bots even when the length of the filepath to the repository of bots exceeds 256 characters. You can run either 7z.exe commands using the command line interface or run the 7.Zip as an application.

The 7-Zip tool support is available on the following Automation Anywhere certified Windows operating systems:

- Microsoft Windows Server 2016
- Microsoft Windows Server2019

You can download the 7-Zip tool from [7-zip Download page](#).

#### New Update window title action to update browser name in window title

When you are migrating Enterprise 10 or Enterprise 11 bots that use the Internet Explorer browser, the **Update window title** action now converts the window titles of these bots to Microsoft Edge with IE mode. The window titles are updated based on browser used by the bots. For example, consider bots that use Internet Explorer and have `Internet Explorer` in the window title. After migration, the new action updates the window title to reflect the new browser, Microsoft Edge, and the format of the text as `*Microsoft*Edge`.

[Using legacy Web actions](#)

### Enterprise 11 only features

#### Automate objects that appear behind bot runtime window (Service Cloud case ID: 00710929)

For the following commands, when you run a bot, you can now automate objects that appear behind the bot runtime window:

- **Image Recognition > Find window in window**
- **If/Else > Image Recognition > Window is found in window or not**
- **Mouse > Click**
- **OCR > Capture area or window**

## RPA Workspace

### What's new

#### Support for Azure Application Gateway

On Microsoft Azure cluster environment for On-premises, Azure Application Gateway is now a supported load balancer..

[Supported data center component versions on Microsoft Azure](#) on page 896

What's new
<p><b>Install Bot Agent on devices that have Enterprise 11 Enterprise Client</b></p> <p>When you are creating a bot in Automation 360, you can now install the Bot Agent on a device with an existing Enterprise 11 Enterprise Client. You can create or run bots from both the Control Room instances.</p> <p><a href="#">Install Bot Agent and register device</a> on page 998</p>
<p><b>IE 11 EOL notification banner displayed in Control Room</b></p> <p>Starting from the Automation 360 v.25 release, if you use the Microsoft Internet Explorer browser to access the Control Room, you will be prompted to use an alternative supported browser, such as Google Chrome or Microsoft Edge (Chromium). When you log in to the Control Room, a notification banner is displayed indicating that support for Internet Explorer 11 is ending.</p> <p><a href="#">Log in to Automation Anywhere Control Room</a> on page 981</p>
<p><b>Switch Bot Agent to another Control Room without reinstalling the Bot Agent</b></p> <p>You can now enable a single-user device to be switched to another Control Room without reinstalling the Bot Agent. Log in as an administrator and select <b>Enabled</b> and the <b>Allow fast switching</b> check box from the device settings.</p> <p><a href="#">Switch device registration between Control Room instances</a> on page 2052</p>
<p><b>Configure the VM instance to delay Bot Agent registration</b></p> <p>You can now configure the VM instance (golden image) to delay the Bot Agent registration until the user logs in to the Control Room from that instance. You can also configure up to 20 Control Room URLs so that you can use the same golden image to connect to any Control Room from that list.</p> <p><a href="#">Bulk install Bot Agent on devices</a> on page 1012</p>
<p><b>Automation 360 support for Amazon Linux 2 on AWS EC2 environment</b></p> <p>Automation 360 now supports the Amazon Linux 2 operating system for Automation 360 On-Premises Control Room installation on the AWS Elastic Compute Cloud (EC2) environment.</p> <p><a href="#">Amazon Linux 2</a></p>
<p><b>Out-of-sync licenses and Control Room license expiry</b></p> <p>When licenses are oversubscribed, the Control Room enters the fail-safe state and continues to operate in fail-safe mode for 30 days, after which the Control Room becomes locked.</p> <p>When a Control Room license is within 30 days of expiration, a warning message is displayed in a banner until the license either expires or is renewed.</p> <p><a href="#">Control Room fail-safe status</a> on page 963   <a href="#">Control Room license expiry notifications</a> on page 977</p>
<p><b>Support for integration with SIEM</b></p> <p>The Automation 360 Cloud Control Room now supports integration with security information and event management (SIEM) to forward the audit logs.</p> <p><a href="#">Configure integration with SIEM</a> on page 2079</p>

What's new
<p><b>Enforce coding standards with code analysis</b></p> <ul style="list-style-type: none"> <li>Code analysis enables you to define and enforce coding standards to improve automation coding practices. You can set different rules that will govern how you code. With code analysis, you can implement coding best practices and make the code more uniform, accessible, reliable, efficient, and secure.</li> <li>Two new permissions, <b>View policies</b> and <b>Manage policies</b>, are introduced in the Control Room for code analysis policy.</li> </ul> <p><a href="#">Code analysis</a> on page 2096</p>
<p><b>Two-factor authentication for Control Room users</b></p> <p>If you are a Control Room administrator, you can now enable two-factor authentication (2FA) for users logging in to the Control Room. 2FA provides an additional security layer for all logins to the Control Room, which can be set either for all users or for users with specific roles.</p> <p><a href="#">Two-factor authentication</a> on page 2054</p>
<p><b>View version history of non-bot file dependencies</b> (Service Cloud case ID: 01615105)</p> <p>You can now view the version history of your non-bot file dependencies. This helps to identify relevant changes made to your file by other users during a specific date and time along with the check-in messages.</p> <p><a href="#">View version history of non-bot file dependencies</a> on page 1405</p>
<p><b>Edit non-empty folder names in private workspace</b> (Service Cloud case ID: 00535388, 00730075, 00786633, 00791528, 01615295, 01820406)</p> <p>You can now edit your non-empty folder names in the private workspace. With this feature, you can now manage folders more easily. Ensure the following when you rename a folder:</p> <ul style="list-style-type: none"> <li>It does not contain checked-out or cloned bots even at subfolder levels.</li> <li>It does not contain more than 100 items including subfolders and files.</li> </ul> <p><a href="#">Create and rename folders</a> on page 1377</p>
<p><b>View dependency maps for bots</b></p> <p>You can now view the dependency map for your bot in both the public and private workspaces. The dependency map shows the immediate parent and child bots for any selected bot. If you are an RPA developer, you can use the dependency map to better understand where a bot is invoked and which child bots are invoked by the bot. With this information, you can gauge the impact of the change in a bot, use the bot effectively, maintain better bot code and reusability, and prevent conflicts.</p> <p><a href="#">View bot dependency map</a> on page 1368</p>
<p><b>Support to automate applications supported on Citrix Workspace app</b> (Service Cloud case ID: 01758063)</p> <p>The Citrix Workspace app is now supported on Automation 360. You can now automate applications that are accessed through the Citrix Workspace app by using the <b>Recorder</b> &gt; <b>Capture</b> action or the <b>Start recording</b> option.</p>

**What's new****AISense Recorder: Support for Korean language and complex table operations**

- You can now use AISense Recorder to automate applications that use Korean and a combination of Korean and English interfaces.

*AISense for recording tasks from remote applications* on page 1328

- With AISense Recorder, you can now extract tabular data from complex tables. You can capture and automate tables with wider columns and tables that have columns with controls such as check boxes and options. You can also capture specific columns from tables.

---

**Note:** If the table is not detected automatically, use the **Define** option to detect the table.

---

*Table data extraction through AISense Recorder* on page 1342

**Enhancements to Recorder**

- When you run a bot, you can now automate objects that appear behind the bot runtime window by using the **Recorder** > **Capture** action. (Service Cloud Case ID: 00684306, 00770636, 01146672)
- You can now use the Recorder to capture and automate objects with a specific technology. The **Capture object** tab now has the option to select a specific technology and capture using that technology. You can capture objects with the following technologies:
  - Microsoft Active Accessibility (MSAA)
  - UI automation
  - Microsoft (MS) COM UI Automation

*Capture using specific technology*

(Service Cloud Case ID: 01760871, 01865823)

- You can now use the Recorder to automate third-party plug-in window objects on Google Chrome or Microsoft Edge browsers by using a specific technology.

**Reduce Data Loss option in PDF package**

In the **PDF** > **Extract text** action, for the **Structured text** type field, a new **Reduce Data Loss** option is now available. When you use this option, you can extract the complete text with minimal overlap of characters.

*Using Extract text from PDF*

**Enhancement to the String package** (Service Cloud case ID: 00770822)

In the **String** > **Extract text** action, a new **When extracting** option is now available. You can use this option to specify whether the case of the text in the extracted substring must match that in the source string.

*Using Extract text action of String package*

**Download files from URLs that require NTLM authentication** (Service Cloud case ID: 01189873)

With the enhanced Browser package, you can now download files from URLs that require NTLM authentication by using the **Browser** > **Download file** action.

What's new
<p><b>New option in Connect action of the Terminal Emulator package</b> (Service Cloud case ID: 00812730, 01252363, 01804623)</p> <p>You can now edit the screen of the Terminal Emulator session manually by selecting the <b>Set cursor position to the beginning</b> check box. By selecting this option, you can now set the focus to the first editable field. By default, this option is not selected.</p>
<p><b>Bulk update to default package version across bots</b> (Service Cloud case ID: 00712719, 00728499, 00737694, 00803673, 01255722, 00838604, 00772147, 01760236, 01762679, 01771416, 01761859, 01782588, 01778220, 01784255, 01789551, 01809167, 01818690)</p> <p>Use <b>Update bots to default package version</b> to update bots to use the default version for any package. User with the <b>View Packages</b> and the permission to edit the bots can now update bots in bulk to use the default package version. This feature provides you with an efficient way to securely update all the bots in the Control Room repository that you have access to with the default package version in a few clicks.</p> <p><a href="#">Update to default version</a>   <a href="#">Example of updating default package version across bots</a> on page 1449</p>
<p><b>Advanced search feature in the Bot editor</b> (Service Cloud case ID: 01615310, 01780115)</p> <p>The <b>Bot Assistant</b> now provides <b>Advanced search</b> capabilities to enhance the overall search experience in the Bot editor. This helps improve the productivity of the Bot Creator. The <b>Advanced search</b> page allows you to enter a search text, select the search filter criteria, and navigate through the search results. You can use the filter criteria to narrow down the search results and quickly locate the search text. When you edit or view a bot, you can use the advanced search feature to find the exact line of action and the corresponding action details where the search text appears, that is, as a string, text value, or a variable name.</p>
<p><b>Note: Find in this bot</b> is now renamed to <b>Search in this bot</b>.</p>
<p><a href="#">Advanced search option in</a></p>
<p><b>Enhancement to multiple attachments option in Send email action</b> (Service Cloud case ID: 00800976, 00817136, 00821405, 00936080, 01256523, 01256320, 01262069, 01259369, 00936080, 01801928)</p> <p>When you send email from bots, you can now send multiple attachments as a list of files or a variable that contains the list of file objects. With this feature, you can attach files such as data files, spreadsheets, and word processor documents to your email. You can attach multiple filepaths from a local drive or a network drive, or you can use a variable that contains a filepath.</p> <p><a href="#">Using the Send</a></p>
<p><b>Enhancement to SOAP Web Service package</b></p> <p>When you build a SOAP response for an Xpath expression in the SOAP Web Service package, the result of the Xpath expression can be stored as a list of strings.</p> <p><a href="#">Example of using the SOAP web service action</a> on page 1431</p>
<p><b>Common table expression supported in Export to data table action</b> (Service Cloud case ID: 00655318)</p> <p>You can now simplify complex joins and subqueries by using common table expressions (CTE) in SQL-compliant databases. Use CTEs in the <b>Export to data table</b> action of the Database package by using the WITH keyword.</p>

What's new
<p><b>Enhancement to OCR package</b></p> <p>When you use actions from the OCR package, such as <b>Capture area</b> or <b>Capture window</b>, the bot now identifies the controls even if the controls are behind the bot runtime window. It also extracts the text behind the Automation 360 bot runtime window from any application window.</p>
<p><b>New package SDK version</b></p> <p>You can now set up the default value for a global session by using <b>default_session_value</b> in <b>CommandPkg</b> in the newly released package SDK version.</p>
<p><b>Configure packages for On-Premises</b></p> <p>On-Premises administrators can now disable the latest package version from becoming the default version automatically. Administrators can also enable a feature that fetches and installs new package versions as and when they are released even without a Control Room upgrade.</p> <p><a href="#">Automatic package updates for On-Premises Control Room</a> on page 1968</p>
<p><b>Workload automations supported on PostgreSQL and Oracle databases</b></p> <p>Workload automations are now supported on the PostgreSQL and Oracle databases, as well. All the workload automations work well with both the databases.</p> <p><a href="#">Workload management</a> on page 2108</p>
<p><b>Trigger API</b></p> <p>Map triggers to users or roles for an attended Bot Runner user by using the Trigger API. With the Trigger API, you can also create and delete event triggers.</p> <p><a href="#">Trigger API</a></p>
<p><b>Enhancement to the Authentication using apikey</b></p> <p>With .24 or previous versions, you must replace any escape character '\' with '\\' in the API key. With .25 or later versions, the API key will no longer have any escape characters('\').</p>
<p><b>Newly implemented Activity List API</b></p> <p>With the newly implemented <b>Activity List API</b> (<code>v3/activity/list</code>) you can return the job executions without call back and bot output information. The old Activity List API (<code>v2/activity/list</code>) is now deprecated.</p> <p><code>v3/activity/list</code> <a href="#">Bot Execution Orchestrator API</a></p> <hr/> <p><b>Definition:</b> <i>Deprecation</i> refers to features or capabilities available in the current (latest) release that will be removed or unsupported from a future release.</p> <p>You can use the specified alternatives or updated versions when they are made available.</p> <hr/>
<p><b>Migrate from Enterprise 11 Control Room version 11.3.4.7 to Automation 360 On-Premises</b></p> <p>We now support migrating from Enterprise 11 Control Room version 11.3.4.7 to Automation 360 On-Premises v.25 and later releases.</p> <p><a href="#">Supported Control Room versions for migration</a> on page 1094</p>

What's changed
<p><b>Enhancement to the String package</b> (Service Cloud case ID: 00770822)</p> <p>After migrating bots, when you are extracting a text string based on a source string, the default option is set to not match the case of the source string. For new bots, the default option is set to match the case of the source string.</p>
<p><b>Enhancement to the Browser package</b></p> <p>In Enterprise 11, if a bot is using the Launch Website action to open a URL in Internet Explorer and when migrating the bot to Automation 360, if you select the <b>Convert bots built using Internet Explorer to Edge with Internet Explorer mode</b> option in the <b>Settings</b> panel of the <b>Bot Migration Wizard</b>, the URL is automatically set to open in Microsoft Edge after migration.</p>
<p><b>Option to change the global cache location</b> (Service Cloud case ID: 00745395, 00781135,00831182, 01124360, 01764952)</p> <p>As an administrator, you can now change the default location for global cache according to your requirements by going to <b>Administration &gt; Settings &gt; Devices &gt; Advanced options</b>.</p> <p><a href="#">Manage device settings</a> on page 2045</p>
<p><b>Enhancement to database server for Control Room instance</b></p> <p>To set up the connection and authentication for your database server, use the port number of your database server instance (default port number, 1433) instead of the instance name.</p> <p><a href="#">Configure Microsoft database type and server</a> on page 872</p>
<p><b>For user credential changes, add new configuration for LDAP settings without causing in-progress authentication to fail</b></p> <p>When a user's credential is changed or updated, an LDAP settings page is now provided so that the Control Room administrator can add the new configuration for the LDAP settings without causing the in-progress authentication to fail.</p>
<p><b>Support for exact match in the subject field for email triggers</b> (Service Cloud case ID: 00953823)</p> <p>When you connect the Control Room to one of the email services on your system and trigger a bot when you receive a new email, the email trigger is now executed depending on the following subject conditions:</p> <ul style="list-style-type: none"> <li>• When the subject line is provided within double quotation marks (""), for example, "ABC spreadsheet", the trigger is executed only when the email subject has an exact match for the string provided within quotation marks.</li> <li>• When multiple subject lines are separated by semicolons, for example, ABC spreadsheet; ABC project logs, the trigger is executed when the email subject matches any of the subject lines mentioned.</li> </ul>
<p><b>Import Enterprise 11 bots with or without MetaBots</b> (Service Cloud case ID: 01261325)</p> <p>You can now import the Enterprise 11 bots (.aapkg file) with or without the dependent MetaBots into the public workspace. If you are importing the .aapkg file into the private workspace, ensure that the dependent MetaBots are included.</p>

## Summary of changes in packages

The following table summarizes the new and updated features in the Control Room packages:

Name of package or action	New or changed feature	Version number	Bot agent version
AI Sense Recorder	Support for Korean language and complex table operations  <i>Korean language and complex table support</i>	2.7.3-20220527-004608	21.210 or later
Browser package	Support to download files from URLs that require NTLM authentication  <i>NTLM authentication</i>	3.5.1-20220527-172031	21.210 or later
Database package	Support for common table expression in <b>Export to data table</b> action  <i>CTE support in Export to data table</i>	4.8.0-20220504-130202	21.88 or later
Email package	Support for sending mail with multiple attachments through bots  <i>Send email with multiple attachments</i>	3.12.3-20220516-114854	21.210 or later
OCR package	Support to identify and capture controls behind bot runtime window  <i>Support to capture controls that appear behind the runtime window</i>	2.10.0-20220502-204318	21.118 or later
PDF package	Support to extract complete text with minimal overlap of characters  <i>Extract text accurately</i>	3.5.2-20220414-101844	21.31 or later

Name of package or action	New or changed feature	Version number	Bot agent version
Recorder	<ul style="list-style-type: none"> <li>Support to automate objects that appear behind bot runtime window <i>Automate objects behind bot runtime window</i></li> <li>Support to automate objects with specific technology <i>Automate objects with a specific technology</i></li> <li>Support to automate applications accessed through Citrix Workspace app <i>Automate applications on Citrix Workspace app</i></li> </ul>	2.7.3-20220527-004608	21.210 or later
SOAP Web Service package	Support to store output of Xpath expression as list of strings <i>Store Xpath expression output as a list of strings</i>	3.11.3-20220426-064423	21.90 or later
String package	Support to match case of text in extracted substring to that in source string <i>Match case of substring to that of source string</i>	5.4.2-20220412-134724	20.18 or later

**Important:** For information about the packages supported with this release, see also [Packages available in Automation 360](#) on page 1369.

Fixes		
Build	Service Cloud case ID	Description
15112	01838276, 01835897	When you update to Automation 360 v.25, an error no longer occurs when the database server includes the instance name.

Fixes		
Build	Service Cloud case ID	Description
Builds 14304 and 15112	01834139, 01839933, 01841993, 01839817, 01834108, 01846407, 01845706, 01843349, 01846220, 01846819, 01845547, 01847028, 01847024, 01847094, 01847114, 01847115, 01846998, 01847840, 01846757, 01848123, 01846944, 01848104, 01848294, 01848905, 01846596, 01849748	When you successfully export a bot, the latest bot export activity is now displayed on the <b>Historical activity</b> page. Previously, the latest export event was not displayed as the <b>Ended on</b> column was displaying the value as N/A.
Builds 14304 and 15112	01836296	When you delete a user or a role, only one entry is now generated for each action in the audit log. Previously, multiple duplicate audit log entries were generated for a single action, affecting the user management workflows.

Fixes		
Build	Service Cloud case ID	Description
Build 14304 and 15112	01842547, 01846156, 01847338, 01846324, 1842368, 01847054, 01848080, 01848789, 01848151, 01848963, 01847054, 01847121, 01848236, 01848260, 01849016, 01848248, 01848572, 01847828, 01847055, 01848826, 01848191, 01848944, 01851181, 01849792, 01852057	When you use the <b>Wait &gt; Wait for condition</b> action with conditions that have specific timeout values set, the bot now waits only for the specified waiting time then runs the subsequent action. Previously, even when you specified a timeout value, the bot waited indefinitely.
15097	01274643, 01812436	If you have a function in a DLL that uses a credential variable as an input parameter and if the credential variable is not available in Automation 360, you will see the A108 migration message. Previously, you used to see the E153 migration message.  <i>Migration messages</i> on page 1254
15097	--	You can now migrate bots even if the date and month are in single-digit or double-digit format and the year is in single-digit, double-digit, or quadruple-digit format for the <b>Modified before</b> and <b>Modified between</b> dates in the File and Folder action. Previously, you had to specify the dates in the MM/DD/YY format before migrating the bots.
15097	01260742	After migration, when the system passes a <b>Credential Value</b> (CV) type variable from a parent bot to a MetaBot Logic's non-CV variable, the temporary string-type variable that is created to hold the CV now does not exceed 50 characters or include an invalid space character.
15097	00796546	The Bot Insight pre-migration utility can now resolve corrupted dashboard IDs that are present in the BI tables and generate the dashboards.zip file for the migration. Previously, when corrupted dashboard IDs were detected in the BI tables, the Bot Insight pre-migration utility encountered an error and closed.

Fixes		
Build	Service Cloud case ID	Description
15097	01758427, 01805913	<p>In the SAP application, when you use the <b>Click</b> action control, the tabs are now selected precisely.</p> <hr/> <p><b>Note:</b> The <b>Type</b> value in Enterprise 11 is renamed as <b>Role</b> in Automation 360.</p> <hr/> <p>When you migrate from Enterprise 11 to Automation 360, the <b>Role</b> value is automatically set to the value that was the <b>SAP Control Type</b> value under <b>SubType</b> if the <b>Type</b> value in Enterprise 11 was set to <b>GuiShell</b>. For example, in Enterprise 11, if the <b>Type</b> value was set to <b>GuiShell</b> and the <b>SubType</b> value was set to <b>Gridview</b>, in Automation 360, the <b>Role</b> value is automatically set to <b>GridView</b>.</p>
15097	01376353, 01449535, 01713118, 01627144, 01762404	When you update your Control Room from Automation 360 v.21 or v.22 to Automation 360 v.25, the installation now completes successfully without any issues. Previously, the installation failed when users who created migration schedules lost the permissions after migration.
15097	01257547, 01722892, 01291187, 01770716, 01777450	You can now edit or delete a schedule because you can no longer delete an .atmx file that is associated with a schedule from the Automation 360 Control Room. Previously, the .atmx file could be deleted, which resulted in an error that prevented you from editing or deleting a schedule.
15097	01255723, 01252824, 01260677, 01608653	<p>When you migrate Enterprise 11 bots with the Comment command enabled, the command now remains enabled after migration.</p> <hr/> <p><b>Note:</b> If the Comment command contains a variable or a \$ symbol, the command is disabled after migration.</p> <hr/>
15097	01755175	<p>You can now migrate bots with system variables (such as date, month, or year) as an <b>Export Data to CSV</b> option without encountering an error.</p> <p>Previously, a preprocessing error was displayed in such cases.</p>
15097	01261863	You can now migrate bots with system variables or expressions that include array variables without an error. Previously, a preprocessing error occurred in such cases.

Fixes		
Build	Service Cloud case ID	Description
15097	01758814	You can now migrate bots when the MetaBots Logic call each other and another, third Logic calls one of these in recursion. Previously, in such cases, bot migration failed with an "An unexpected error occurred" message.
15097	01255810	When you perform the <b>Send Text</b> action two times for the same value in the Terminal Emulator and the first field is protected, when the Terminal Emulator screen is loaded for the second time, it now works properly after the migration.  Previously, when the Terminal Emulator screen was loaded for the second time, an incorrect behavior was observed.
15097	01770547	In Automation 360 commands, expressions in which a variable is included within parentheses and is preceded by a \$ character are now migrated properly, with the variable inside parentheses prefixed and suffixed with the \$ character.
15097	01258964	After migration, the <b>Capture</b> action can now identify popup windows that use the same title as that of a main window in the SAP GUI. Previously, the <b>Capture</b> action could not identify popup windows that used the same title as that of a main window.
15097	00745395, 00781135, 00831182, 01124360, 01764952	If the path for global cache exceeds 256 characters, Automation 360 automatically changes the path to the default location although the path in the UI displays the path configured by the user. Previously, when the path for global cache exceeded 256 characters, Automation 360 displayed an error when downloading packages.
15097	01767018, 01755092, 01765551, 01764245, 01778477, 01782790, 01795043	If a user does not have access permission for a trigger or a folder with trigger under the public tab, no error message is now displayed on the event triggers page. Previously, if a user did not have access permission, the event trigger page for the user displayed an error under the public tab.
15097	01765445,01759831, 01779960, 01799422	When you log in to the Control Room as an administrator, you can no longer delete users that have active schedules.
15097	01255678	In the <b>Manage &gt; Devices</b> page, the <b>Modified by</b> column now correctly displays the username of the latest user to modify the details. For example, if user1 registers a device and later user2 modifies the device details, such as <b>Deployment type</b> , the username of user2, instead of the username of user1, is displayed in the <b>Modified by</b> column.

Fixes		
Build	Service Cloud case ID	Description
15097	--	When you are installing the Control Room (On-Premises), even if an external key vault is configured, you can now manually enter the database credentials and configure them for database authentication in the <b>Windows installer Database Server</b> page.
15097	01753671	When you update to this release, in the <b>View history Task Bot</b> page, the <b>Checked In</b> and <b>Checked In By</b> columns now display the correct information.
15097	--	Now when you run bots that have the <b>Get Total Rows</b> command in the SAP GUI, the values are returned as Integer data type. Previously, such commands returned values as a <b>Float</b> string type.
15097	01212822	During workload automation, you can now view and use queues even if the name of a work item template contains leading or trailing spaces. Although the spaces are displayed in the queue name, they are automatically removed when the work item template is created. Also, leading or trailing spaces in queue names are ignored during execution. Previously, queue names and template names with leading or trailing spaces were not displayed and hence were unavailable for selection.
15097	01772061	When you update to this release, Automation 360 does not allow multiple license-sync jobs to run concurrently. Previously, when multiple license-sync jobs were running, the audit logs displayed <b>Licenses synced</b> errors.
15097	01754415	When you update from Automation 360 v.21 or later, the Bot Agent devices are no longer shown as disconnected in the Control Room <b>Manage &gt; Devices</b> page. When you try to update Bot Agent in versions prior to Automation 360 v.21, a message now indicates that the device is not compatible.
15097	01780460	<p>When you update to this release, the Control Room <b>Advanced</b> options for devices (<b>Administration &gt; Settings &gt; Devices</b>), such as <b>Autologin timeout</b>, <b>Maximum simultaneous downloads</b>, and <b>Bot response wait time</b>, no longer revert to default values.</p> <p>For example, if you set the <b>Autologin timeout</b> to 70, after updating to this release, the value remains at 70 and does not change back to the default value.</p> <p>Previously, when you upgraded the Control Room, for example, from Automation 360 v.22 to Automation 360 v.23, the <b>Advanced</b> options for devices reverted to default values.</p>

Fixes		
Build	Service Cloud case ID	Description
15097	01762582, 01808698, 01815446	The Control Room <b>Activity</b> page now displays the total number of scheduled activities correctly. Previously, when you had more than 200 scheduled activities, the Control Room <b>Activity</b> page displayed only 200, and you had to sort by the <b>Activity name</b> , <b>Automation priority</b> , or <b>Modified by</b> columns to view the correct number of scheduled activities.
15097	01764492	When you install Automation 360 Control Room, the installer-generated log file no longer displays the password in clear text.
15097	--	In the <b>Administration &gt; Settings &gt; Email</b> page, if the <b>Require verification</b> option is not selected, you no longer receive a verification link in the email notification to verify you as a user. You can now log in to the Control Room without verifying the email ID and setting the login credentials. Previously, an email notification with verification link was sent to verify the email address even if you did not select the <b>Require verification</b> option.
15097	01783110	When you launch a bot, if the bot fails during the run, the <b>Activity &gt; Historical</b> page in the Control Room now shows the correct <b>Started on</b> time, that is, the time when the bot started running. Previously, when a bot run failed, the <b>Started on</b> time incorrectly showed the time when the bot failed. As a result, the <b>Started on</b> and <b>Ended on</b> columns displayed the same time, which was incorrect and confusing.
15097	01826944, 01828683	When you log in to the Control Room, the <b>Activity &gt; Historical</b> page now loads without error. For the historical data in the <i>JOBEXECUTION</i> table, a new Cloud data retention policy of 90 days is implemented, whereby the Cloud historical data is deleted along with the rollout of Automation 360 v.25 to the different regions. Previously, when you logged in to the Control Room, the <b>Activity &gt; Historical</b> page did not load because of a large number of records, and the following error message was displayed: An unexpected problem has occurred <ul style="list-style-type: none"> <li>• <a href="#">View completed activity</a> on page 1935</li> <li>• <a href="#">Automation 360 Cloud FAQ</a> on page 49</li> </ul>
15097	01753337, 01785865	On the <b>Activity &gt; In progress</b> page, when you use the sort function to list the items in the <b>Started on</b> column in ascending or descending order, the items are listed correctly now.

Fixes		
Build	Service Cloud case ID	Description
15097	--	You can now successfully establish a secure SQL connection in the Linux environment by choosing the <b>Enable</b> option in the <b>Database Configuration &gt; Secure Configuration &gt; Secure Connection</b> field. The Linux installer now successfully imports the SSL certificate, and the connection is established. Previously, the Linux installer failed to import the SSL certificate and the connection was not established.
15097	00781974	In the Linux environment, you will no longer encounter issues with services stopping due to disk storage issue. Previously, some of the Control Room log messages were stored in the /var/log/messages file instead of the /var/log/automationanywhere directory, leading to low disk space.
15097	01260701	When you run bots on user devices, bots no longer become stuck in queues. Also, the following messages are no longer displayed: <ul style="list-style-type: none"> <li>• Waiting for user <i>username</i></li> <li>• Picked at runtime</li> </ul>
15097	01760032	Domain names are no longer case-sensitive, and you can now create users by using the Active Directory group mapping and map a role to a user in the Control Room. Previously, because some Active Directory servers were returning domain names in uppercase whereas others were in lowercase, domain names could not be found and there was an issue with the group mapping feature.
15097	00828289	The <b>Global Value</b> fields are now validated and have a maximum length of 4000 characters.
15097	00828289	When you navigate to <b>My settings &gt; My Profile &gt; Edit</b> in the Control Room and provide a link, for example, <code>&lt;a href="www.google.com"&gt;LinkInjection&lt;/a&gt;</code> , the email sent contains a link, and the email text sent is validated against HTML injection and you will no longer see a functional link.

Fixes		
Build	Service Cloud case ID	Description
15097	01754431, 01773662, 01789555, 01791065, 01784255, 01785653, 01780070	<p>When you use the Recorder to capture an object, set the waiting time for detecting the object to fewer than 30 seconds in the <b>Keep trying for (seconds)</b> field, and run the bot, the Recorder now waits for the specified time to detect the object and waits for the page to load completely. Previously, the Recorder waited for a minimum of 30 seconds to detect the object regardless of the time specified.</p> <hr/> <p><b>Note:</b> This fix is applicable only to Google Chrome and Microsoft Edge Chromium browsers.</p>
15097	01614810	<p>You can now use a blank space as the delimiter in the <b>Specify delimiter (optional)</b> field. In the <b>Open</b> action of the CSV/TXT package, when you browse the filepath to open a file, add a blank space as the delimiter in the <b>Specify delimiter (optional)</b> field, and run the bot, the blank space is now treated correctly as a delimiter and the bot no longer fails.</p>
15097	01387738	<p>When you use the <b>Browser &gt; Open</b> action to open a new window in Google Chrome, the new window is now activated and displayed in front of the other open windows. Previously, when you ran a bot, the window remained in the minimized state.</p>
15097	01273095	<p>When you enter a decimal value with 16 or more decimal points in a cell of a Microsoft Excel spreadsheet and when you use the <b>Read cell value</b> option in the <b>Excel advanced &gt; Get single cell, Get multiple cells, or Get worksheet as data table</b> actions to retrieve the decimal value from the cell, the format of the cell value no longer changes from <b>General</b> to <b>Scientific</b>.</p>
15097	01144509, 01767881	<p>When you connect to an SAP session, use the <b>If &gt; Object exists</b> Recorder condition to identify and capture objects on the SAP application, disconnect the SAP session, and then run these actions in a loop, the bot now detects the objects correctly in every iteration of the loop. Previously, when the bot was run in a loop, it captured the objects correctly only during the first iteration and failed during subsequent iterations.</p>
15097	01769573	<p>If you use the <b>App integration &gt; Capture text of window</b> action to capture the text in a command prompt window, when you run the bot, the bot now captures all the characters in each line correctly. Previously, the bot failed to capture the last characters in each line.</p>

Fixes		
Build	Service Cloud case ID	Description
15097	01628448, 01766957, 01788709, 01788801, 01789538, 01803156, 01781597, 01810230, 01811694, 01802054, 01815687, 01823526,01814962, 01833962, 01835418, 01835382, 01837832,01830790	The Excel advanced package now works as expected and without any issues. Previously, the package threw a generic exception error intermittently.
15097	00824995, 01451063, 01274854	In the <b>PDF &gt; Extract field</b> action, when you select the <b>Open PDF viewer</b> option, select a PDF file from the Control Room or Desktop, click <b>Load</b> , and open the PDF viewer, you can now view the PDF document. Previously, when you selected the <b>Open PDF viewer</b> option to view the selected PDF document, a blank page was shown, and you could see the value in the PDF document only when you selected a specific rectangular area in the blank field.
15097	00957308	In the <b>File &gt; Copy Desktop file</b> action, when you specify a source filepath where the folder name contains a number sign (#) character or the filename contains a wildcard character, specify a destination filepath to copy the file, and run the bot, the bot now detects the source filepath and copies the file to the specified destination location successfully. Previously, when you ran the bot, the bot failed to detect the source filepath and hence did not copy the file to the destination folder.
15097	01685239	You can now use the Recorder to capture objects on the Citrix Xenapp application, use the <b>If &gt; Object does not exist</b> condition to verify whether a specific object exists in the application, and successfully run a bot from a parent bot. Previously, when you tried to do this, an error occurred.

Fixes		
Build	Service Cloud case ID	Description
15097	01260387	A password-protected Microsoft Excel file is no longer corrupted when you open the file manually after successfully running a bot using the Excel basic package. Previously, when you used the actions in the Excel basic package to open a password-protected Excel file, made some updates to the file, and closed the file by selecting <b>Save changes when closing file</b> in the <b>Excel basic &gt; Close</b> action, the password-protected Excel file became corrupted when you opened it manually from its location.
15097	00920617	When you connect to your mailbox through the IMAP protocol, use <b>For each mail in mail box</b> as email loop iterator to retrieve all email message received before date filter, and run the bot, the bot now retrieves all the email messages received before the specified date, including the email messages received on the specified date before the specified time.
15097	--	In Google Chrome, Microsoft Edge, and Mozilla Firefox browsers, you can now successfully open network URLs that start with two backslash (\) characters by using the <b>Browser &gt; Open</b> action.
15097	01015001	When you specify the total number of packages that you want to view per page under the <b>Manage &gt; Package</b> section in the Control Room, the page now displays the correct number of packages specified. Previously, all the packages were displayed on a single page even if you chose to view only a specific number of packages.
15097	01711629	In the <b>Recorder &gt; Capture</b> action, when you select a specific browser window whose title matches another browser window from the <b>Browser</b> tab and run the bot, the bot now accurately opens the selected browser window. Previously, when the title of two browser windows matched, the bot randomly opened a browser window with a matching title.
15097	--	You can now use the <b>Browser &gt; Run JavaScript</b> action to successfully run JavaScript on web pages that have iFrames.
15097	01075660, 01273111	The <b>Excel advanced &gt; Open</b> and <b>Create workbook</b> actions now display the <b>Default</b> session value under the <b>Local session</b> field.

Fixes		
Build	Service Cloud case ID	Description
15097	01252773, 01278029, 01772301, 01765017	<p>An error no longer occurs when you use the <b>Excel advanced</b> &gt; <b>Open</b> action to open a worksheet that is a type of hidden chart or a macro. You can specify the sheet name to open the worksheet of type macro.</p> <hr/> <p><b>Note:</b> When you open the default sheet, ensure that the active sheet is an Excel Worksheet. If the active sheet is of type chart, the following error message is now displayed: <code>The Excel file does not contain an active sheet to open. Please make sure the Excel file you want to open has at least one active sheet.</code></p>
15097	--	After migration, when you run the bots that use File and Folder packages, the year under the <b>Date</b> option now accepts the value 00 as input, which is considered as year 2000.
15097	01257829	In the <b>REST Web Services</b> package actions, you can now add a <code>Custom</code> content type, using which you can add content that does not fall under a standard content type.
15097	--	In the <b>REST Web Services</b> package actions, you can now perform <b>Add Substitution</b> , using which you can enter variables in the REST request body.
15097	01784553, 01794924	In the <b>SOAP Web Service</b> package actions, the ampersand character (&) is now automatically escaped. Previously, the ampersand character (&) which is a reserved control character, was not automatically escaped, which resulted in invalid XML files.
15097	01767571	In the <b>REST Web Services</b> package actions, new lines in the request body are no longer altered at runtime. For example, when the request body contains a new line, it is no longer replaced by a space at runtime. Previously, when a request body contained a new line, it was replaced by a space.
15097	00773353, 00787270	In the <b>REST Web Services</b> package actions, you can now use the user token option to access the Control Room APIs. When you log in to the Control Room, a token is generated, which is used by the bot to access the endpoints of the Control Room API used within the bot.
15097	01372460	You can now run bots by using the <b>RunScript</b> action of the Legacy Automation package. When you pass multiple arguments to replace values from a Microsoft Word document, the bot now runs the function and replaces and displays the text on a new line. Previously, the text was displayed on the same line.

Fixes		
Build	Service Cloud case ID	Description
15097	01758458	When you use the <b>Connect</b> action to establish a connection with an email server, use the <b>Disconnect</b> action to close the connection with the same session name. You will then not encounter any issue when you establish a new connection again with the same or different credentials.
15097	01273357	You can create a bot to run a standard workflow in <b>SAP BAPI</b> , and the output is now generated correctly as a .CSV file. Previously, when you ran a standard workflow in <b>SAP BAPI</b> , the generated output was varied.
15097	01342887	When you run a process by using the Terminal Emulator package, the terminal window is now activated and remains in the front. Previously, when you ran a process, the terminal window was not activated and stayed minimized.
15097	01251933	In the Terminal Emulator package, when you use the <b>Connect</b> action to establish a connection with TN3270E, an error no longer occurs. Previously, an error occurred, and the following error message was displayed on the mainframe screen: ISPP904 Panel ISR@PRIM error - x'0E' or x'0F' is invalid as an attribute character
15097	01432885	When you run a bot, the <b>Task bots run</b> metric on the <b>Home</b> dashboard page of the Control Room now displays the correct count. Previously, the metric displayed an incorrect count. For example, on the <b>Home</b> dashboard page, if the <b>Task bots run</b> count showed 39, when you ran the bot, the count displayed was 42 instead of 40.
15097	00742840	When you use actions such as <b>Open</b> and <b>Run function</b> from the <b>DLL</b> package, you no longer encounter any issues. The bot now opens the DLL file even if the DLL filepath length is fewer than 256 characters.
15097	01261786, 01615115	When you edit a bot and disable any action within it, you can now use the Ctrl+Z keyboard shortcut to undo an action. Previously, the Ctrl+Z keyboard shortcut did not work as expected.
15097	01080067	In the Active Directory package, when you use usernames with special characters, the bot now runs successfully. Previously, when you added a user to a group, if the username had special characters, when you tried to remove the user from the group, the bot failed.

Fixes		
Build	Service Cloud case ID	Description
15097	00962414	You no longer encounter an issue when you connect to a puTTY application through Terminal Emulator. Previously, when the terminal was connected to the host, the host prompted for a password. Subsequently, the terminal screen went blank, and the bot displayed the following error: <code>Unable to connect to a terminal. Please check connection details</code>
15097	00829259	In Active Directory, you can now successfully create a user with one of the following options: <b>Require password change at next login</b> or <b>Do not require password change at next login</b> . Previously, when you used the <b>Connect</b> action to establish a connection, if the LDAP connection path contained the <code>OU</code> attribute with a space value such as <code>OU=aa unit</code> , an error occurred when you ran the bot.
15097	00961069	When you are using the <b>Send text</b> action from the Terminal Emulator package, you can now send numeric keyboard minus (-) keys using Simulate keystrokes action [ALT DOWN] - [ALT UP] keys to the mainframe application.  For more information, see <a href="#">A360 : How to send hyphen(-) in Terminal Emulator TN5250E (A-people login required)</a> .
15097	00825675	When you delete the variables mapping from parent and child bots and then run the parent bot, the bot no longer encounters an error. Previously, when you deleted the variables mapping from parent and child bots and then ran the parent bot, the bot failed.
15097	00798604	When you use the <b>Run Function</b> action from the VBScript package, the bot no longer encounters an error. You can now specify the function name to run and pass arguments that contain brackets ([ ]). Previously, the <b>Run Function</b> action failed to run if an open or close bracket was included in any position in a string parameter.
15097	--	When you use a DLL file that is available in the Control Room, and if the DLL filepath is fewer than 260 characters, the bot now retrieves the DLL file successfully.
15097	01149730	You can now connect to an email server, select the <b>IMAP</b> protocol, use <b>Loop &gt; For each mail in mail box</b> iterator, and successfully download attachments from an email message and save them to a specified folder. Previously, if the attachments had a <code>bin</code> file, the attachments were not downloaded or saved to a folder.

Fixes		
Build	Service Cloud case ID	Description
15097	00919896	When you use actions such as <b>Send text</b> or <b>Send key</b> from the Terminal Emulator package, the bot launcher no longer stops working. Previously, bots created using actions from the Terminal Emulator package sometimes stopped working at random when a double-byte character set (DBCS) was enabled and the host screen had a wrapped field.
15097	00950682	You can now use the <b>Open spreadsheet</b> action in the Google Sheets package without any issue, even if you use a Proxy Auto-Configuration (PAC) file or a proxy-enabled environment.
15097	01257464	When you connect to an email server with the <b>IMAP</b> configuration and use the <b>Move all</b> action with a filter for all mail received before a certain date, all email messages that meet the criterion can now be moved from one folder to another without any issue.
15097	01753270	In the Google Drive package, you can now use the <b>Create file permission</b> action with the <b>File ID</b> option. Previously, when you used <b>Create file permission</b> , if no other Google Drive action was placed before it, an error occurred.
15097	01276141	In the email package, when you use the <b>Move all</b> action or the <b>Loop &gt; For each mail in mail box</b> iterator, you can now add any number of email addresses in the <b>From specific sender</b> field. Previously, the email loop did not work if the <b>From specific sender</b> field had more than two email addresses.
15097	01689348	You can no longer import bots with incomplete package files from one Control Room to another because the system now disallows and rejects the import of incomplete package files.
15097	01763262, 01762153	You can now create a bot and run stored procedures successfully. Previously, if you had two stored procedures in different databases, for example, <code>Database_A.dbo.SP_A</code> and <code>Database_B.dbo.SP_B</code> , in the SQL Server, if you were connected to <code>Database_A</code> and wanted to run the stored procedure in <code>Database_B</code> , the execution failed because the fully qualified stored procedure name was not supported in the <b>Run stored procedure</b> action.
15097	--	You can now successfully download exported bots by navigating to <b>Activity &gt; Historical &gt; Bot Export: Export.&lt;date_name &gt; Download exported zip file</b> .

Fixes		
Build	Service Cloud case ID	Description
15097	01762348	Bots that are deployed from the Control Room on user devices are no longer stuck in a queue after the unattended Bot Runners are added from a device pool.
15097	01151181	If you have the required permissions, you can now successfully delete an inactive schedule from the <b>Manage &gt; Scheduled &gt; Scheduled activity</b> page. Previously, even if you had the required schedule permissions, when you tried to delete an inactive schedule, you encountered an error message about permissions.
15097	00917927, 01255618	The <b>Modified by</b> field in the <b>Manage &gt; Scheduled</b> page now displays the correct username for recurring schedules. Previously, when schedules were imported from one environment to another, the <b>Modified by</b> field showed the username of the original Bot Creator or administrator.
15097	01778350, 01803570	When you create a schedule in the Control Room, the <b>Manage &gt; Scheduled &gt; View activity &gt; Schedule</b> page now displays the correct end time for the <b>End date</b> field. Previously, when an end date was selected for a schedule, the end time shown for the <b>End date</b> field was incorrect.
15097	--	In the Kubernetes environment, when you try to create a queue, you no longer encounter an error.
15097	00716776, 00778659, 01820190, 01856732	If you check out an item at certain time T1 and then cancel the checkout later at time T2, the canceled checkout is not considered as a modification to the item. Also, the last modified time is rolled back to time T1 that is when the bot was checked-out last time from the <b>Public</b> folder. Previously, the canceled checkout at certain time T2 was incorrectly considered as a modification to the item. Also, the last modification time was incorrectly shown as time T2 that is when checkout was canceled. Thus, it was difficult to keep track of actual modification dates of items.
15097	--	In the Kubernetes environment, you can now delete work items even after pausing a queue. Previously, when you paused a queue and tried to delete a work item, an error sometimes prevented you from deleting the work item.
15097	01255617	The WLM filters in the <b>Queue &gt; Work items</b> page now return accurate results. Previously, filters were not working accurately when you combined them.

Fixes		
Build	Service Cloud case ID	Description
15097	01806221, 01805371, 01818356, 01828330	After you update to Automation 360 v.24, WLM tasks no longer fail. Previously, after an update, bot execution processes or actual bot execution sometimes failed, resulting in the failure of WLM tasks as well.
15097	01769740	Bot descriptions are now displayed even after you check in or check out bot. Previously, after you checked in or checked out a bot for the first time, the bot descriptions stopped being displayed.
15097	01764336	An appropriate error message is now displayed when you try to change the work item status from <b>Ready to run</b> to <b>On hold</b> or <b>Complete</b> . The error message now informs you that because the queue is already in use, you must either pause or stop a queue automation to change the status of the work item. Previously, the error message displayed did not help with rectifying the issue.
15097	01273374	The <code>gettasklogdata</code> API now shows real-time data, whereby local time values are converted to UTC values for that API request.

The following table lists the limitations identified in the current release:

Limitations
<p>Bots whose queue category name contains a space (for example, Input – Emails) cannot be migrated because during migration, such bots enter and remain in an infinite loop until the loop times out at 90 minutes. (Service Cloud case ID: 01850864)</p> <p><b>Workaround:</b> You can migrate to Automation 360 v.26 release where this issue is fixed or remove the space in the queue category name and then migrate the bots.</p>
<p>After you migrate your bots, an error occurs in the following situations:</p> <ul style="list-style-type: none"> <li>• When you use FTP actions on bots with commas in filenames</li> <li>• When you use the <b>Delete files</b> and <b>Delete folder</b> FTP actions on bots with colons in filenames</li> </ul> <p><b>Workaround:</b></p> <ul style="list-style-type: none"> <li>• For bots that use FTP actions, ensure that you remove commas from the filenames.</li> <li>• For bots that use the <b>Delete files</b> and <b>Delete folder</b> FTP actions, ensure that you remove colons from the filenames.</li> </ul>
<p>When you try to migrate bots in which the If condition is used for more than 95 times in a single line, migration fails with the following error message: <code>Unexpected response status: 500</code> (Service Cloud case ID: 01830793)</p> <p><b>Workaround:</b> Divide the bot into multiple logical sub-bots.</p>

Limitations
<p>(Service Cloud case ID: 01773164) If the number of cells in a table object exceeds 300,000, the Control Room might become unresponsive.</p> <p><b>Workaround:</b> Ensure that the number of cells in a table object does not exceed 300,000.</p>
<p>Even if the Control Room path is invalid or does not exist, the invalid path is still displayed instead of the default path: C:\ProgramData\AutomationAnywhere\GlobalCache\</p>
<p>When you run a migrated bot with the Recorder package, the <b>Click Action</b> on <b>Client Control</b> might not work. This issue occurs because some Microsoft Windows operating systems might not be activated properly on a few Windows applications.</p> <p><b>Workaround:</b> Use the <b>Left Click</b> action.</p>
<p>When you try to re-edit a migrated bot with the <b>Record &gt; Dataset</b> variable, an error occurs, and the following error message is displayed: An unexpected problem occurred. If the problem persists, please contact your system administrator.</p> <p><b>Workaround:</b> Refresh the Bot editor page to reload the details.</p>
<p>A parse error occurs when you run a migrated bot with the <b>Email Received Date</b> variable used twice in subactions inside the Email loop action.</p>
<p>When you create a bot by using the <b>Send email</b> action, if the attachment includes the less-than symbol (&lt;) as a special character in the filepath, the special character will be removed after bot execution. The Windows operating system does not support this special character.</p>
<p>In a bot, when you create a <b>List</b> variable with the <b>File</b> subtype, select the value as a Control Room file, and add the List package, the bot execution fails when you run the bot.</p>
<p>If your bot has an error, you add the <b>Try/Finally</b> block around the corresponding actions, and insert more actions in the <b>Finally</b> block, when you save and run the bot, the <b>Bot error</b> dialog shows the wrong error line number within the <b>Finally</b> block.</p> <p><b>Workaround:</b> If you are using <b>Try</b> and <b>Finally</b> without using the <b>Catch</b> action, the <b>Bot error</b> dialog does not show the correct line number. Instead, use <b>Try/Catch</b>. The <b>Try</b> action handles the error and sends execution to <b>Catch</b> with line number and description. This gives the correct line number within the <b>Finally</b> block.</p>
<p>When you frequently connect to the Excel or Access (Microsoft Office 2016 or later) engines with ODBC drivers, bot execution fails intermittently.</p>
<p>When you use the <b>Connect</b> action to connect with the <b>EWS</b> protocol, read email skips the newline characters and prints the email message body on a single line. This issue is also observed in the <b>Send email</b> action. Following are the scenarios where these issues are observed:</p> <ul style="list-style-type: none"> <li>• Create a bot and connect with the <b>EWS</b> server. Use the <b>Loop</b> action to read emails as a plain text message and use the Log to file action to log text into a file.</li> <li>• Use the <b>Send email</b> action and connect with the <b>EWS</b> server with OAuth authentication to send the email.</li> </ul>
<p>In a device pool, when you select the <b>Run bot now</b> option for a WLM bot, the WLM bot run is triggered and an error message is also displayed.</p> <p><b>Workaround:</b> To run a WLM bot in a device pool, ensure that you select the <b>Run bot with queue</b> option.</p>
<p>In a multitenant environment, when you upload a work item file to queue in one of the tenants, the <b>In progress</b> tab displays the same work item file for all the other tenants, as well.</p>

Limitations
<p>In a device pool, when you stop a WLM automation, a few work items are still in the ready-to-run state. As a result, these work items cannot be deleted.</p> <p><b>Workaround:</b> To delete work items that are in the ready-to-run state, perform one of the following actions:</p> <ul style="list-style-type: none"> <li>• Pause and stop the automation.</li> <li>• Rerun, pause, and then stop the automation.</li> </ul>
<p>After migration, when you use the <b>Excel advanced &gt; Open</b> action to open a file with the <b>Load Add-ins</b> option enabled and the system has COM add-ins enabled, when you run the bot, the bot might fail with an error.</p> <p><b>Workaround:</b> Disable the <b>Load Add-ins</b> option to run the bots successfully.</p>
<p>When you use the <b>If &gt; Folder does not exist</b> condition to determine that a folder does not exist, even if the folder exists, the bot might fail to identify it due to the leading and trailing spaces in the input folder path. As a result, the bot might throw an error.</p>
<p>When you update the Control Room to the latest version, you might see some packages with two default versions.</p> <p><b>Recommendation:</b> Sometimes, you might notice the duplicate packages a few weeks after the Control Room is updated. Hence, we recommend that you compress and save the Control Room logs dir that contains all the WebCR*.log files 30 minutes after the Control Room is updated. This way, if you discover the issue later, these logs from the time of update will be available and help in investigating this issue.</p>
<p>In the <b>Data Table &gt; Assign</b> action, when you select the <b>Table with values</b> option, select the <b>Edit table (1 X 1)</b> option to edit a table, enter variables in the rows and columns and then run the bot, the output still shows the input \$variable\$ instead of the evaluated value of the variable.</p>
<p>When you try to upload packages to the Control Room manually, the system does not check for the minimum required version of the Control Room that is compatible with the packages before they are uploaded. It allows the packages to be uploaded in the Control Room even if the version of the packages is not compatible with the currently installed version of the Control Room.</p>
<p>When you use the <b>Run bot</b> option to run a bot in the <b>Activity &gt; Historical &gt; View</b> page for any activity, the bot execution fails with an error.</p>
<p>(Service Cloud case ID: 01784401) To ensure that multiple Git processes are not modifying the same repository at the same time in the Control Room, Git lock is implemented for a short interval. After the lock is released, repository-related operations are resumed without any issues. However, in some instances, the Git lock is not released, and new Git operations cannot be processed. As a result, repository-related operations, such as edit, save, import, and check-in, are delayed and eventually time out.</p> <p><b>Workaround:</b> Contact Automation Anywhere Support.</p>
<p>When you use the If package, add a specific condition with a variable, then add specific conditions within a group, save the bot, and if you rename the variable that was used, the name of the variable might not update for the <b>Group</b> conditions but is only updated for the conditions in the <b>Condition</b> tab.</p>
<p>When you use AISense Recorder to automate applications on a Windows 10 Japanese operating system, the bot might encounter an error.</p> <p><b>Workaround:</b> Enable UTF-8 encoding and restart the Bot Agent machine.</p>

Limitations from previous releases
When you migrate a bot that was using the Manage Window Controls action, the last digit of the height value is not available after migration. However, the bot will execute successfully. (Service Cloud Case ID: 01756996)
When an Excel session is active in SAP, a corresponding Excel process starts in the background. In such a scenario, Automation 360 uses the same Excel process that SAP started. When you run a bot to automate spreadsheet data, Automation 360 processes the first request successfully. However, during execution, if the Excel is closed and a subsequent request is sent for automating the spreadsheet data, Automation 360 does not process the request because the Excel process is still being accessed by SAP. Therefore, the correct window is not activated for automating the spreadsheet data. (Service Cloud Case ID: 00815159)
<ul style="list-style-type: none"> <li>If you are updating from Automation 360 On-Premises v.21, remove the following Bot Agent files and folders: <ul style="list-style-type: none"> <li>C:\Windows\System32\config\systemprofile\AppData\Local\AutomationAnywhere\AA-DB.mv.db</li> <li>C:\ProgramData\AutomationAnywhere\GlobalCache\embedded-resources</li> </ul> </li> <li>Before you update from Automation 360 On-Premises v.22, refer to the upgrade considerations in <a href="#">Update to latest Automation 360 version</a> on page 1022.</li> </ul>
(Service Cloud case ID: 00837271) If you are migrating from Enterprise 11 with a database that has a large amount of repository data, the installation might fail. This issue occurs because Liquibase update for a few SQL queries is not completed during migration. <b>Workaround:</b> Contact Automation Anywhere Support.
When you try to automate any process in a Java application that uses version 11.0.8 of AdoptOpenJDK, the Recorder might not capture the drop-down elements on the application.
When you use the Recorder to capture an object, select <b>HTML Tag</b> , <b>HTML InnerText</b> , and <b>HTML type</b> properties in <b>Search Criteria</b> , or migrate a bot with similar properties selected in <b>Search Criteria</b> , the bot fails to identify or locate the object and perform the selected action. <b>Workaround:</b> Modify the <b>DomXPath</b> according to the controls you capture, or add more properties in <b>Search Criteria</b> .
When you use the <b>Browser &gt; Close</b> action to close a tab or a window opened in the Microsoft Edge browser, if only one Microsoft Edge browser window is open, the bot encounters the following error: Error occurred while closing the tab <b>Workaround:</b> See <a href="#">Configure Microsoft Edge browser settings when Close action of Browser package encounters an error (A-people login required)</a>

## Internet Explorer EOL updates

**Note:** This release (Automation 360 v.25) includes features from Automation 360 v.24R2 (Build 13331). For information about what's available in the v.24R2 release, see [Automation 360 v.24R2 Release Notes for Internet Explorer 11 EOL](#) on page 323.

Features
<p><b>Packages and actions</b></p> <p>You can now migrate Internet Explorer bots from Enterprise 11 and Enterprise 10 to Automation 360 and convert the bots to <b>Microsoft Edge with IE mode</b> for the following actions and commands in the Web Recorder package:</p> <ul style="list-style-type: none"> <li>• <b>Navigate URL</b>, <b>Go Back</b>, and <b>Search by Caption</b> actions.</li> <li>• <b>Open Browser</b> and <b>Close Browser</b> commands. These commands are mapped to the <b>Legacy Automation &gt; Open Page</b> and <b>Close Page</b> actions in <b>Microsoft Edge with IE mode</b>.</li> </ul> <p>To launch Internet Explorer bots, in the <b>Legacy Automation</b> package, select the <b>Launch Internet Explorer in Edge compatibility mode</b> option.</p> <p>To migrate and convert Internet Explorer bots, in the Control Room, from <b>Administration &gt; Migration &gt; Migrate bots</b>, select the <b>Convert bots built using Internet Explorer to Edge with Internet Explorer mode</b> option.</p>

## Automation Anywhere Robotic Interface (AARI)

**Note:** For Automation 360 v.25, AARI does not support an Oracle Database. You can continue to use AARI with Microsoft SQL Server.

What's new
<p><b>Use Bot Task labels to identify bot version to run</b></p> <p>In <b>Bot Task</b>, you can now select the version of a bot for deployment by choosing between the <b>Latest version</b> and <b>Production label</b> options. When you deploy the bot, the version of the bot that you selected is run.</p> <p><a href="#">Create an AARI process</a> on page 1487</p>
<p><b>Bot priority reference</b></p> <p>In <b>Bot Task</b>, you can now refer to the priority level of your bots. For bots that were set to a priority level, the <b>Bot priority</b> section now displays a <b>Low</b>, <b>Medium</b>, or <b>High</b> read-only label.</p> <p><a href="#">Create an AARI process</a> on page 1487</p>
<p><b>Create request in new tab</b></p> <p>You can now open and run your new requests in a separate tab when you select the <b>Open request in New Tab</b> option in the initial form. With this option, you can create requests concurrently without changing your current page navigation.</p> <p><a href="#">Create a request and complete a task</a> on page 1516</p>
<p><b>Invalid scheduler</b></p> <p>An invalid scheduler is when a scheduler user has their role removed or when they cannot access a file because of missing permissions. Users who are notified of the invalid scheduler are the Control Room admin, the AARI admin, and the AARI user. Now, the Control Room admin will see an audit log change, the AARI admin will see an error message to reassign a new scheduler user, and the AARI user will see an error message in their process.</p> <p><a href="#">Assign scheduler user to process in the web interface</a> on page 1473</p>

**What's new****Duplicate rows for Table element**

In the web interface, when you are adding rows to your form by using the **Table** element, you can now save time by duplicating a row in the table with the new **Duplicate row** option. The duplicated row will now be placed under the highlighted row that you had selected.

**Interface triggers support more technologies**

You can now use interface triggers with the following technologies:

- Windows native
- SAP Desktop
- Google Chrome and Edge Chromium browsers

[Add an interface trigger](#) on page 1563

**Enhancements to form rules**

- **Use custom formatting**

When you are adding a rule, if you use the **If** menu to set the rule conditions on certain elements such as **Text Box** or **Text Area**, you can now select **Is** from the drop-down menu to enable additional options. Select the **Custom** option and click **Add regular expression** to apply custom formatting requirements on the selected element.

Consider a scenario where the user IDs of all your employees have AV as prefix. For example, for an employee whose name is Adam, the user ID is AVAdam. Use the **Add regular expression** option to set the value in the **Regular expression** field as ^AV. If a user enters Adam in the user ID field, an alert is displayed.

- **Set custom value or append element value**

When you are adding a rule, use the **Then** menu to select a form element. For this form element, you can set one of the corresponding actions using **Set Value** or **Append value**:

- **Value:** Data entered in the **Enter value** field is applied to the selected element.
- **Form element:** Data from the form element selected in the **Select element** drop-down menu is appended.

Consider a scenario where a user registration form has 'First name' and 'Employee ID' fields. You can set one of the following rules for the value in the Employee ID field:

- Select **Value** and enter *Emp1013* as preset value.

This value is displayed in the 'Employee ID' field when the bot runs.

- Select **Form element** and set 'First name' element in the **Select element** drop-down menu.

The value from the 'First name' field is appended to the 'Employee ID' field when the bot runs.

You can use elements in the same way that variables are used in the Bot editor. You can enter **\$** to view a list of elements.

[Add rules to form elements](#) on page 1552

What's changed
<p><b>Request reference for AARI web package</b></p> <p>The AARI web package now supports reference IDs. A reference ID is a combination of a prefix and a number that is created from a process key and is incremented every time a request is created. <b>Request ID</b> is replaced by <b>Request Reference</b>, and <b>Team ID</b> is replaced by <b>Team Reference</b>.</p> <p><i>Web</i></p>
<p><b>Process and package version changes in Get Storage file action</b></p> <p>The <b>Get Storage file</b> action now requires the matching of versions between the version of the process and the version of the package. Processes created before Automation 360 v.25 must be used with package versions from before Automation 360 v.25. Similarly, processes created after Automation 360 v.25 must be used with package versions after Automation 360 v.25.</p> <p><i>Web</i></p>

Fixes		
Build	Service Cloud case ID	Description
15112	01841448, 1839118, 1844817, 01846153, 01846332, 01839254	When you download a series of packages from the bot compilation, the download is now faster.
15112	01847675	After you update to Automation 360 v.25, when you modify a process in a private workspace, you can now save your changes successfully, without encountering an error. Previously you will get a process error when you attempt to modify and save your process, or when you open the same process again.
15112	01848192	After you update to Automation 360 v.25, you can now insert or modify conditions, such as the <b>If/Else</b> logic, to your process without any issues. Previously when you made changes or add the <b>If/Else</b> element to the process logic, a <b>Go to</b> element would be added to the logic which caused a process error.
15097	01807181, 01809192, 01816444	<b>Cloud users:</b> You can now successfully upload a file for your requests. This applies to some scenarios when you upload a file and the request creation fails.
15097	01771877	In the process editor, at the end of your process, you can now drag <b>Go To</b> and add it to your <b>End Point</b> .
15097	01774331	When you use the <b>Row before scrolling</b> option from the <b>Table</b> element and specify a number of rows, the web interface now renders the correct number of rows that you specified.
15097	--	When you use the <b>Document</b> element and click the <b>Fit</b> option to fit your document in request view, the document is now scaled to fit the frame entirely.

Fixes		
Build	Service Cloud case ID	Description
15097	--	If you design a form with a drop-down rule applied to it, when you view the drop-down in read-only mode in the web interface, you can now view the changed data.
15097	--	After you are disconnected, when you log back in to the web interface, the <b>next=</b> parameter is no longer shown in the URL and you are now redirected to the page that you were on before you were disconnected.
15097	--	For the <b>Text Box</b> element, the <b>Does not contain</b> form rule now works correctly.
15097	--	For the <b>Rich Text Editor</b> element, the <b>Contains</b> form rule is now working correctly.
15097	--	When you create a form with the <b>Document</b> and <b>Dropdown</b> elements, you can now submit your form without issues.
15097	--	You can now use <b>Request Reference</b> as a parameter in the <b>AARI web</b> package.
15097	01803846	You can now use <b>Request Reference</b> in the <b>AARI web</b> package, for example, as an output for the <b>Create a Request</b> action. <b>Request ID</b> is now replaced by <b>Request Reference</b> .
15097	--	You can now successfully submit an initial form that has a table with no content, data, or rows.
15097	01803019	When you open and view a task, the task assignment now correctly shows the user assigned to that task.

Limitations
When you attempt to delete a request that is associated with more than one file, the deletion fails.
After you create a request from a private process, when you attempt to open and run the request in a new tab, a new tab is generated but it fails to run the request and the URL is not correct.

## Discovery Bot

Fix	
Service Cloud case ID	Description
00971940, 01018262, 01255326, 01829662	<p>You can now successfully record a process without encountering an error because when you log in to the Control Room, the proxy settings now support the following scenarios:</p> <ul style="list-style-type: none"> <li>• No proxy is enabled.</li> <li>• Proxy is entered with username and password.</li> <li>• Proxy is entered without username and password.</li> </ul> <p>Previously, when you recorded a process, if there was no proxy and if you entered a username and password with proxy enabled, an error occurred.</p>

## Document Automation

**New capability:** Document Automation is the new Cloud-native intelligent document processing solution that business users can set up to automatically read and process documents quickly using pretrained models and validation feedback.

Document Automation is fully integrated into Automation 360: Document Automation is installed as part of the Control Room, RPA bots are used to extract semi-structured data to automate document-centric business processes, and Automation Anywhere Robotic Interface manages the end-to-end extraction process and validation tasks.

[Document Automation](#) on page 1876

Limitations
Although the v.26 Document Extraction package appears in the .v25 On-Premises Control Room, features will not work as expected.
<b>Workaround if the package version is auto-synced:</b> Manually change the Document Extraction package version to v.25. See <a href="#">Update to default version</a> .
Document Automation does not support SDS deployment.
Google Document AI pretrained models are available only for Cloud customers who purchased licenses through Automation Anywhere.
Customers who install Document Automation on Linux must separately download the Document Extraction package.
Document Automation supports a device username of 21 characters or fewer.
The value beside the <b>Validate documents</b> link, which indicates the number of documents awaiting validation for a learning instance, sometimes does not appear.
Learning instances that use Google Document AI models do not reliably extract tables that span multiple pages.
When you are validating a document in public mode, if you zoom in or out, you cannot drag the corners of the system-identified region (SIR) selection.

Limitations
When you are validating a document, if you draw a box, zoom in, and then click <b>Fit to screen</b> , the box appears at a different location from where you clicked.
If you connect to a learning instance from Automation 360 IQ Bot with an optional field that has a set default value and some fields that are unmapped, when you process documents in that learning instance in Document Automation, the default value appears in the unmapped fields.
There is no notification if the product license is about to expire. When the product license expires, the <b>Learning Instances</b> tab is removed from the Control Room.
You might encounter extraction issues when you process documents with tables that span multiple pages. <b>Workaround:</b> Contact your Customer Success Manager to download a patch for the Document Extraction package.
When a bot runs an action from the Document Extraction package, the <b>Activity &gt; In progress</b> page shows the item name as IQBotAutoExtract.
The Bot Agent does not verify whether the Document Extraction package version is compatible with the Control Room version prior to running a bot.
Document Automation cannot process documents in Automation Anywhere pretrained models if the Bot Agent runs through a proxy. <b>Workaround:</b> <ul style="list-style-type: none"> <li>• <b>With authentication:</b> Create a Windows environment variable HTTP_PROXY with a value of <code>http://&lt;username&gt;:&lt;password&gt;@&lt;proxyhost&gt;:&lt;proxyport&gt;</code>.</li> <li>• <b>Without authentication:</b> Create a Windows environment variable HTTP_PROXY with a value of <code>http://&lt;proxyhost&gt;:&lt;proxyport&gt;</code>.</li> </ul>
If a document is renamed to a new file extension and uploaded to a Google Document AI pretrained model, the document will fail processing. <b>Workaround:</b> Rename the document to the correct file extension.
Bots containing actions from the Document Extraction package must be deployed as part of an AARI process. Standalone bots are not supported.
In some cases, the Bot Agent does not clear out its resources folder. Until the disk space is freed, the production documents in processing will be affected. This issue occurs intermittently. <b>Workaround:</b> Based on the issue, you must create a task scheduler to clean out the resources folder every day or every week.

## IQ Bot

**Note:** For Automation 360 v.25, IQ Bot does not support an Oracle Database. You can continue to use IQ Bot with Microsoft SQL Server.

What's new
<p><b>Migrate the roles associated with a learning instance</b></p> <p>You can now retrieve a list of custom roles with access to a learning instance in a source environment and grant users in a destination environment access to the learning instance by using the <b>Roles migration</b> API.</p> <p><a href="#">IQ Bot roles migration APIs (A-People login required)</a></p>
<p><b>Track the number of pages processed in standard forms separately from IQ Bot</b></p> <p>The Control Room Licenses page now shows the number of pages processed in standard forms, the Classifier, and through IQ Bot. If the licenses are added to the Control Room from the Cloud, the Licenses page also shows the number of pages processed in other Control Room instances.</p> <p><a href="#">Automation 360 licenses</a> on page 970</p>

What's changed
<p><b>Reinstall IQ Bot services using a new script</b></p> <p>You can now reinstall all the IQ Bot services together in a batch or choose to reinstall them individually by using the <code>reinstall-allservices.bat</code> script.</p> <p><a href="#">Postinstallation checklist</a> on page 1046</p>

Fixes	
Service Cloud case ID	Description
00780662	A round-off error no longer causes documents to fail formula validation. Previously, these documents were manually validated.
01763658	For the <b>Concatenate Images</b> action in the IQ Bot Pre-processor package, if a filename does not exceed 256 characters, the output is now successfully generated.
01795651	When you export the IQBA file from a learning instance of a custom domain type with manual groups to another learning instance, the manual <b>Group Label</b> is now exported successfully. Previously, without a manual <b>Group Label</b> , it was difficult to distinguish between system-generated groups and manual groups for new learning instances.
00780712	When you import IQBA files using VisionBot data, among the learning instances, you can now see new groups created. Previously, new groups were not created when documents were uploaded.
--	An error message is no longer displayed when you change the display language of any learning instance that has a document in Validator. Previously, even if the selected display language was applied successfully to a learning instance, the system showed an error.
--	When you use the <b>Overwrite</b> option to import a learning instance, the <b>Default validations group</b> is now successfully overwritten. Previously, the <b>Default validations group</b> was not overwritten, and you needed to manually edit the learning instance after importing the IQBA file and then change the default group.

Fixes	
Service Cloud case ID	Description
--	When you use the IQ Bot Extraction package, you can now view your document count on the <b>Details</b> page of the learning instance. Previously, if you processed documents that did not belong to any created groups, they were not displayed on the <b>Details</b> page of the learning instance.
--	You can now sort the <b>PagesUpload</b> column in the <b>Learning instance &gt; Document Group</b> tab. Previously, the following error message was displayed: <i>System error, please try again after some time</i>
--	On the Designer, when you resize the system identified region (SIR) of an automapped field, the values from the resized selection are now captured accurately in the corresponding value field.
--	Database Migration Assistant Tool now notifies with an error if there are any environmental issues (such as missing DLL). Previously, the tools and logs indicated that migration was complete, even if a unified database was not created.
--	When a non-English filename is uploaded using the Invoice domain and processed using the AutoExtract command, system identified regions are now generated. Previously, to process the documents successfully, you had to convert the non-English filename to English characters.
--	If you import a learning instance with a set default validation group to an environment where the learning instance was previously deleted, the default validation group setting stays intact. Previously, the imported learning instance appeared without the default validation group.
--	The column header name for the <b>Default validations group</b> now appears in the <code>Projectdetails.csv</code> file obtained from exporting a learning instance.
--	For a standard forms learning instance, if you try to process a large number of documents (more than 10,000) by using the <b>Process documents</b> action from the IQ Bot Extraction package, some of the documents might not be processed.
--	During IQ Bot Extraction package updates, even when you use the Tesseract4 OCR, there is no delay in the document processing time and throughput results.
--	In standard forms learning instances, you can now set a default value for optional fields. If extraction fails for an optional field, the system uses the default value you set.
--	You can now access standard forms learning instances created in earlier IQ Bot versions that were installed with the CyberArk vault key.

Limitations
<p>IQ Bot Cloud: If you do not access IQ Bot within the configured <b>Ideal time out</b> value set on the IQ Bot server, the following things happen:</p> <ul style="list-style-type: none"> <li>• A message to restart IQ Bot is displayed.</li> <li>• Bots that use IQ Bot APIs fail when the server is restarted.</li> </ul> <p>Refresh the IQ Bot web page after some time (more than 5 minutes) to log in to IQ Bot.</p>
<p>On the Validator screen, if incorrect values are used to update a field on which you have applied validations, an alert is not displayed when the focus is lost from that field.</p>
<p>If you use the <b>Process documents</b> action from the IQ Bot Extraction package to extract content from a large number of documents (more than 1 million), an error message is displayed and IQ Bot might stop responding.</p>
<p>When you access the IQ Bot application on Internet Explorer11, the following functions do not work as expected:</p> <ul style="list-style-type: none"> <li>• <b>Export</b> option on the dashboard</li> <li>• Icons in the menu list</li> <li>• <b>Actions list</b> on the <b>Bots</b> page</li> <li>• <b>Action</b> icon for learning instance</li> <li>• Validator functionality, such as the following: <ul style="list-style-type: none"> <li>• Add rows</li> <li>• Delete rows</li> <li>• Search functionality</li> <li>• Hide icon</li> <li>• Data type for form fields</li> </ul> </li> </ul>
<p>In the IQ Bot Community Edition, when you use a Cloud OCR to create a learning instance, if you use the IQ Bot <b>Process document</b> action from the IQ Bot Extraction package, the values from the uploaded invoices or documents are not processed successfully.</p> <p><b>Workaround:</b> If you use the Cloud OCR to create a learning instance, use the IQ Bot <b>Upload Document</b> action from the IQ Bot package.</p>
<p>When you click the <b>Create Backup</b> option on the <b>Migration Management</b> page and select the learning instances to be backed up by using the <b>Search</b> drop-down list, the learning instances selected become deselected. As a result, you cannot take a backup of the learning instances.</p> <p><b>Workaround:</b> Instead of using the <b>Search</b> drop-down list, select learning instances from the list on the <b>Backup Learning Instance</b> page.</p>
<p>In a Native Validator learning instance, when you try to enter data into or modify the data in a child table that does not exist in the parent table, no error is prompted, which leads to documents being saved with incorrect values.</p>
<p>When you use the IQ Bot Extraction package along with other OCR-based commands (such as IQ Bot Pre-processor, IQ Bot Classifier, AISense Recorder, and OCR) in a single bot, the bot fails.</p> <p><b>Workaround:</b> Ensure that you create separate bots for IQ Bot Extraction, and do not run IQ Bot Extraction in conjunction with other packages that include the 12.2 Abbyy OCR.</p>
<p>When you install IQ Bot with Windows authentication and CyberArk Vault, it is not possible to rotate the key, and the following error message is displayed: <code>Error occurred while setting up the new key. Please check the logs</code></p>

Limitations
<p>In some cases, the Bot Agent does not clear out its resources folder. Until the disk space is freed, the production documents in processing will be affected. This issue occurs intermittently.</p> <p><b>Workaround:</b> Based on the issue, you must create a task scheduler to clean out the resources folder every day or every week.</p>
<p>If you have a document with more than 100 pages, an error message is displayed intermittently when you click <b>See extraction results</b> for an existing learning instance.</p>
<p>If you use the ABBYY FineReader Engine version 12.4 instead of version 12.2, the MICR feature does not support data extraction from documents in Japanese language.</p>
<p>When you download an unclassified document, click <b>Delete from the server</b>, and then toggle the learning instance from production to staging, and vice versa, as a consequence, the same document starts reappearing in the untrained output folder, and when you download the document from untrained groups, the same document reappears even though it has been deleted.</p>
<p>When you upload documents to production using <b>IQ Bot Upload &gt; Run the command</b>, toggle the learning instance from production to staging, and then toggle back to production, all unprocessed documents appear blurred.</p> <p><b>Workaround:</b> Upload documents to Staging using an API. <a href="#">Upload document to Staging API (A-People login required)</a></p>
<p>As a result of upgrading Control Room and IQ Bot from A360.21 to A360.25, you are unable to edit groups in the learning instances, and move groups from Staging to Production.</p> <p><b>Workaround:</b></p> <ol style="list-style-type: none"> <li>1. Restore the latest IQ Bot database backup.</li> <li>2. Run the delete query.</li> <li>3. Delete from EncryptionKey.</li> <li>4. Run the following query: <code>INSERT INTO EncryptionKey ([Key], [Type]) VALUES ('xDxQoAhIc/R0nF+bFXHuo6/UGnmm6Hqs/uBVxYpz1IdU6UAEUUVYf5vnFJU6qkBcnCAvdQOUjdwJWwWW4LdKA==','data')</code></li> <li>5. Start the A360.25 installer.<b>Post upgrade checklist:</b></li> <li>6. Ensure that following logs details are not available in installion-helper.log file: [ INFO]: main/com.automationanywhere.cognitive.installationhelper.infrastructure.datarotation.DataRotationServiceImpl - Rotation starts.</li> <li>7. Run the API, and ensure that the filename has proper value (it should not be "fileName" : "THIS STRING IS NOT ENCRYPTED"), <a href="http://localhost:9996/organizations/1/projects/%7BLearningInstanceID%7D/categories/%7BgroupNumber%7D/files">http://localhost:9996/organizations/1/projects/%7BLearningInstanceID%7D/categories/%7BgroupNumber%7D/files</a></li> </ol> <hr/> <p><b>Note:</b> Replace the value of {LearningInstanceID} and {groupNumber} properly. Also, GroupNumber should belong to same learning instance.</p> <hr/>
<p>There is no notification if the product license is about to expire. When the product license expires, the <b>Learning Instances</b> tab is removed from the Control Room.</p>

## Bot Insight

What's changed
<p>Dashboards now require the use of the Analyze package version 2.3.0-20210922-121532 or later. This version of the package is available from Automation 360 v.23.</p> <p><a href="#">Bot Insight dashboards</a> on page 2254</p>

Fixes	
Service Cloud case ID	Description
01755186	When you use a filter on an individual widget, the filter is now correctly applied only to that filter, as expected. Previously, a filter meant for a specific widget was sometimes applied to other widgets, as well.

## Automation Anywhere for Genesys

What's new
<p><b>Automate tasks for Genesys platform with Genesys package for Automation 360</b></p> <p>Use the actions in this package for onboarding and updating records in the repository. Each action palette offers single and bulk record creation and delete/remove actions for records. You can list or search records for referencing the IDs required for updating other records. You can also organize the records for communication purposes and contextual insight. The action palettes in this package include the following:</p> <ul style="list-style-type: none"> <li>• Record creation: User, Division, Phone, External contacts</li> <li>• Organize records: Group, Queue, External organization</li> <li>• Record attributes: Language, Role, Skill</li> </ul> <p><a href="#">Genesys</a></p>

## Feature deprecations

Review features and capabilities (from Automation Anywhere or other third-party vendors) that are deprecated or nearing deprecation to understand how they impact your automation. For more information, see also this page: [Feature deprecations affecting Automation Anywhere products](#) on page 68.

**Human-Bot Collaboration 11.3.x deprecated**

The Human-Bot Collaboration (HBC) 11.3.x was deprecated from August 2020 with the release of Enterprise A2019.15, after which the product has not been actively developed or maintained. Customers that are using HBC 11.3.x are required to migrate to the Automation 360 platform to use Automation Anywhere Robotic Interface (AARI), Web or Desktop. For this migration, there is no automated migration path because of an absence of parity between the two products (including sets of features). Any path that you take to migrate from HBC 11.3.x to the Automation 360 platform will involve significant manual steps to convert and map bots and other assets (such as forms, teams, and tasks) to AARI assets (such as bots, forms, processes, teams).

[Feature deprecations affecting Automation Anywhere products](#) on page 68

**Basic authentication in Exchange online**

Microsoft has announced that starting October 1, 2022 Basic authentication will be permanently disabled in Exchange Online. This change will impact bots used for email automation that connect to Exchange Online with Basic authentication using IMAP, POP3, or EWS protocols. Hence, Microsoft recommends customers to switch from Basic authentication to OAuth 2.0.

To maintain business continuity of the impacted bots, Automation 360 customers and partners can leverage the OAuth 2.0 feature support in Email package and Email trigger that will be delivered in the week of Aug 29th, 2022.

[Deprecation of Basic authentication in Exchange Online](#) on page 101 | [Everything about Basic Authentication deprecation in Microsoft Exchange online \(A-People login required\)](#)

**Manifest V2 extensions for Google Chrome and Microsoft Edge**

As Google will deprecate Manifest V2 extensions by June 2023, this might impact your existing automations that use our current MV2 extensions in Google Chrome and Microsoft Edge browsers. You can choose to use the enterprise group policy to continue to use Manifest V2 extensions until June 2023([Manifest V3 transition timeline](#)). However, post this date, you have to switch to Manifest V3 extensions for your automations to work.

We plan to provide Manifest V3 extensions for Google Chrome and Microsoft Edge with our next release Automation 360 v.26. We recommend that you now start planning to switch to Manifest V3 extensions.

[Chrome and Edge Manifest V3 extensions](#) on page 116

**Tesseract v3 OCR planned change from October 2022**

Tesseract is an open source OCR engine leveraged by Automation 360 IQ Bot as part of document processing and extraction. Tesseract v3 has not been updated since 2018, and it will no longer be packaged with Automation 360 IQ Bot from the next release v.26 (planned for October 2022).

Tesseract 3 OCR was removed as an option from the IQ Bot learning instance creation user interface about 2 years back (in our v.13 release). However, we continued to package this older OCR version, which ensured that learning instances previously created on Tesseract 3 can function.

Starting from our next release Automation 360 v.26, Automation 360 IQ Bot will no longer package Tesseract 3. From v.26 release, document processing against learning instances with Tesseract 3 will result in an error, indicating that this OCR version is not available. However, the learning instances will remain in the system, allowing customers to view their details and train with alternative OCR options (including Tesseract v4 OCR).

For all existing learning instances trained using Tesseract v3 OCR, we recommend that you plan to train them with alternative OCRs (including Tesseract v4), before you update to v.26. Note that Automation 360 IQ Bot Cloud customers will receive v.26 release by default from October.

**IQ Bot Extraction package deprecation from October 2022**

As part of Automation 360 v.25, IQ Bot Extraction package will no longer support pre-trained machine learning model for invoice data extraction, but will continue to support learning instance group based-training extraction.

We have released a new set of capabilities on pre-trained models with Document Automation as part of v.25 release, including a new command package called **Document Extraction**. IQ Bot Extraction package will be deprecated starting from the next release Automation 360 v.26, so we recommend our customers to start leveraging this new Document Extraction package.

For more information about Document Extraction package and instructions on how to move learning instances to Document Automation, see [Move from to](#).

## Automation 360 v.24R2 Release Notes for Internet Explorer 11 EOL

*Release date: 17 May 2022*

This release notes applies to the Automation 360 v.24R2 patch release for **Cloud, On-Premises, Sandbox, and Community Edition** users impacted by the Internet Explorer end-of-life (IE EOL) and who have therefore chosen to convert IE bots.

Cloud, On-Premises, IQ Bot, Sandbox, and Community Edition are on **Build 13343**.

---

**Note:** The IQ Bot build does not include any specific updates and is available to match the Control Room build.

---

### Why this release

Microsoft has announced end-of-life (EOL) for Internet Explorer beginning June 2022 and recommends Microsoft Edge or Microsoft Edge in IE mode. This release contains packages certified on Edge in IE mode and an IE Update Bot wizard to help you update bots in bulk to work with Edge in IE mode. The upcoming IE EOL might affect your deployments based on the operating system you are currently using where the bots are run.

See the following table for details:

Microsoft operating system	Automation 360 bots
Windows 10 Semi-Annual Channel	Upgrade the bots to use a compatible browser. For a list of supported browsers, see <a href="#">Browser requirements for RPA Workspace</a> on page 829.
All other supported operating systems	No immediate impact

Starting from the upcoming Automation 360 v.25 release, you will be prompted to access the Control Room through an alternative supported browser, such as Google Chrome or Microsoft Edge (Chromium) instead of Internet Explorer. Your Control Room will no longer be accessible on Internet Explorer. By aligning with Microsoft's strategy for browser support, we can provide you with enhanced functionality that latest browsers such as Google Chrome and Microsoft Edge make technologically possible.

## Updating to this release

You can update to Automation 360 v.24R2 On-Premises from the following previous releases that are certified for update:

- v.24 (Build 12350)
- v.23 (Build 11513)
- v.22 (Build 10526)
- v.21 (Build 9664, 9642, 9595)

As Community Edition and Sandbox are Cloud deployments, no manual upgrade is required. These environments are automatically updated to Automation 360 v.24R2 Build 13343.

If you are not on any of the above certified releases, update Automation 360 to one of the certified releases (listed previously) before updating to this release.

For information on updating to this release, see these resources:

- [Update to latest Automation 360 version](#) on page 1022
- [Automatically update the Bot Agent](#) on page 1001 | [Manually update the Bot Agent](#) on page 1002
- [Compatibility with release builds](#) on page 985

For the latest updates to the Automation 360 extensions for Google Chrome, Microsoft Edge, and Mozilla Firefox, see [Browser extensions for Automation 360](#) on page 765.

## Bot Agent updates

This release includes an **optional** Bot Agent update. To use the features in Automation 360 v.24R2 patch, update the Bot Agent available with the following builds:

- Bot Agent version 21.200 for Build 13343
- Bot Agent version 21.1000.14009 for Build 13331 (On-Premises pre-GA)

Note that if you want to run your existing bots, you do not have to update your Bot Agent to this release.

If you have installed the Automation 360 v.24R2 pre-GA patch (Build 13331) with Bot Agent version 21.1000.14009, perform the following steps.

1. Uninstall the pre-GA Bot Agent version 21.1000.14009.
2. Install Bot Agent version 21.200 for Automation 360 v.24R2 (Build 13343).

---

**Important:** If you have moved your bots from the user acceptance testing (UAT) environment and deployed them in a production (PROD) environment with Bot Agent version 21.1000.14009, you must update the packages with the latest Bot Agent version 21.200.

---

## Community Edition features

Packages
<p><b>Microsoft Edge browser support for Browser package and window variables</b></p> <ul style="list-style-type: none"><li>• The following actions of the Browser package now support Chromium-based Microsoft Edge browser:<ul style="list-style-type: none"><li>• Close</li><li>• Get source code</li><li>• Go back</li><li>• Open</li><li>• Run JavaScript</li></ul></li><li>• In the <b>Browser</b> option, you can now select the Microsoft Edge tabs from the list of active tabs.</li></ul>
<p><b>Support for last used browser tab in Browser &gt; Open action for Microsoft Edge and Google Chrome</b></p> <p>You can now open a web page on a new tab or an existing tab using the <b>Last used browser tab</b> preset in the following browsers:</p> <ul style="list-style-type: none"><li>• Microsoft Edge</li><li>• Microsoft Edge with IE mode</li><li>• Google Chrome</li></ul>
<p><b>Automate Java web applications</b></p> <p>You can now automate Java web applications that run on Microsoft Edge Chromium with IE mode by using the <b>Recorder &gt; Capture</b> or the <b>Start recording</b> option.</p>
<p><b>Default wait time for loading page in Microsoft Edge browser with IE mode</b></p> <p>When you automate any web applications in Microsoft Edge browser with IE mode, the Recorder now waits for 30 seconds by default to allow the web page to load completely before recording any objects on the page, thereby making object detection more reliable.</p>

## Cloud, On-Premises, and Sandbox features

### Control Room and Packages

#### New Update Bot wizard for Internet Explorer

- Use the new **Update Bot wizard** in the Control Room to convert your existing Internet Explorer bots to Microsoft Edge with IE mode to ensure that these converted bots continue to run after IE EOL.

*Update Bot wizard for converting IE bots* on page 95

- As an administrator, you can enable a user to use the **Update Bot wizard** by assigning the new Bot update feature permissions to access and convert a bot from Internet Explorer to Microsoft Edge with IE mode.

*Feature permissions for a role* on page 2013

- Use the **View Bot update** action in a bot conversion instance to view the summary and status of each bot conversion. You can review action details at the individual line numbers and take action if required for the bots that are in failed status, or in completed with action or review required status.

*View conversion details for IE bots*

#### Automate Java web applications

You can now automate Java web applications that run on Microsoft Edge Chromium with IE mode by using the **Recorder > Capture** or the **Start recording** option.

## Control Room and Packages

### Convert Automation 360 bots with browser-specific packages using Internet Explorer to Microsoft Edge with IE mode

You can convert bots that use Internet Explorer to Microsoft Edge Chromium with IE mode for the following packages:

- Recorder
- Browser
- Application
- Simulate keystrokes
- Screen
- Mouse
- Window
- OCR
- App Integration
- Image Recognition
- If
- Loop
- Wait

To convert these bots, use the Update Bot wizard in the **Administration** > **Bot update** tab in the Control Room.

[Update Bot wizard for converting IE bots](#) on page 95

The following properties of browser-based packages and actions are updated from Internet Explorer to Microsoft Edge browser with IE mode:

- Bots created using the browser or application-based window, window title, and application path
- Window variable's default value, window title, and window application path
- Browser variables and browser title

### Microsoft Edge browser support for Browser package and window variables

- The following actions of the Browser package now support Chromium-based Microsoft Edge browser:
  - Close
  - Get source code
  - Go back
  - Open
  - Run JavaScript
- In the **Browser** option, you can now select the Microsoft Edge tabs from the list of active tabs.

### Support for last used browser tab in Browser > Open action for Microsoft Edge and Google Chrome

You can now open a web page on a new tab or an existing tab using the **Last used browser tab** preset in the following browsers:

- Microsoft Edge
- Microsoft Edge with IE mode
- Google Chrome

**Control Room and Packages****Default wait time for loading page in Microsoft Edge browser with IE mode**

When you automate any web applications in Microsoft Edge browser with IE mode, the Recorder now waits for 30 seconds by default to allow the web page to load completely before recording any objects on the page, thereby making object detection more reliable.

**Migration features****Scan bots that use Microsoft Internet Explorer**

You can now use the Bot Scanner to scan and identify Internet Explorer bots. You can also analyze the report generated by the Bot Scanner to get usage statistics about Internet Explorer used in your bots.

[Scanning bots that use Internet Explorer](#) on page 1117 | [Analyze report for Internet Explorer bots](#) on page 91 | [Internet Explorer conversion or scanning messages](#) on page 1285

## Migration features

### Packages and actions

You can now migrate and convert Internet Explorer bots from Enterprise 11 or Enterprise 10 to Automation 360 with Microsoft Edge with IE mode for the following packages and actions:

- App Integration
- Delay
- IF/ELSE and Loop
- Image Recognition
- Launch Website
- Manage Window Controls
- MetaBot Screen
- Mouse
- Object Cloning

**Image Play** mode and **Coordinates Play** mode are supported. **Coordinates Play** mode supports the mouse click action with keystrokes after it.

- OCR
- Open Program/File
- Screen
- Simulate keystrokes
- Wait

Support for **Wait for condition**, **Wait for screen change**, and **Wait for window** actions

- Web Recorder
- Windows Actions

For more information, see [Package mapping for migration](#) on page 1201.

To migrate and convert bots, go to **Administration > Migration > Migrate bots** and select the **Convert bots built using Internet Explorer to Edge with Internet Explorer mode** option in the Control Room.

The following properties of browser-based commands and actions are updated from Internet Explorer to Microsoft Edge with IE mode:

- Bots created using the browser or application-based window, window title, and application path
- Window variable's default value, window title, and window application path

---

**Note:** Bots that use value type variables are not updated to Microsoft Edge. You must first enable the configure settings in the Legacy Automation package to open bots built using Internet Explorer to Microsoft Edge compatibility mode.

---

- Browser variables and browser title

### Convert IE bots to Microsoft Edge with IE mode

When you migrate your bots from Enterprise 10 or Enterprise 11, you can use the new **Convert bots built using Internet Explorer to Edge with Internet Explorer mode** option in the Bot Migration Wizard to convert your bots from Internet Explorer to Microsoft Edge with IE mode.

[Migrate Enterprise bots](#) on page 1173

**Migration features****History and version updated for migrated bots**

In the Bot Migration Wizard, when you migrate your Enterprise 10 or Enterprise 11 bots, the version history is now updated to show that it is a migrated bot (the check-in comment shows that the bot is migrated from Enterprise 10 or Enterprise 11 version). You can use this check-in comment to identify which version of the bot is migrated.

[Bot Migration Wizard](#) on page 1170

**Fixes**

The following fixes are available for **Cloud**, **On-Premises**, and **Sandbox**:

Service Cloud case ID	Description
01784593	You can now run migrated bots successfully even when a \$ (dollar sign) is present as a value in the <b>User Variables</b> field. The Bot Scanner no longer displays a preprocessing error.
--	When you automate web applications running on Microsoft Edge Chromium with IE mode or Internet Explorer, the Recorder now captures the object from the currently selected browser tab. Previously, the Recorder captured the object from the last used tab.
01189873	After migration, when you use the <b>Browser &gt; Open</b> action to open a URL that has a space character, use the <b>Browser &gt; Download files</b> action to download the file from the specified URL, and then run the bot, the bot now opens the URL in a single tab and downloads the file from the specified URL.  Previously, when the specified URL had a space character, the bot split the URL and opened it in two separate tabs.

**Known behavior and limitations**

The following limitations apply to **Cloud**, **On-Premises**, and **Sandbox**:

- When you execute a stored procedure with name parameter arguments that resides in another database in the SQL Server, the bot displays an error because of the JDBC driver issue with executing a stored procedures with name parameters of another database in the same SQL instance.

**Workaround:** When you add parameters to provide an input parameter or configure an output parameter, ensure you do not enter any value in the **Parameter name** field. The bot will not encounter any error when executing the stored procedure because the Database package considers blank values as indexing.

- Note that even when the number of schedules listed on the Control Room **Schedules** page is less (for example, five or six schedules), you might see the following error because of a query timeout: `An unexpected problem occurred`. This is an existing Control Room database performance related issue.
- There are other limitations and behavior that apply to bots migrated from Enterprise 11 to Automation 360 and to Automation 360 bots that run on Internet Explorer and are converted to Microsoft Edge with IE mode. For more information, see [Known behavior and limitations](#) on page 85.

- When you use the **Browser > Close** action to close a tab or a window opened in the Microsoft Edge browser, if only one Microsoft Edge browser window is open, the bot encounters the following error:  
Error occurred while closing the tab  
**Workaround:** See [Configure Microsoft Edge browser settings when Close action of Browser package encounters an error \(A-people login required\)](#)
- When you use the **Browser > Open** action to open network URLs that start with two backslash (\\) characters in the Google Chrome, Microsoft Edge, or Mozilla Firefox browser, the URLs might not open properly.  
**Workaround:** Replace the two backslash (\\) characters with file:// protocol.
- When you use the **Browser > Open** action, select **New tab** or **Existing tab** option to open a specific webpage in Microsoft Edge with IE mode, the bot might throw an error after opening the webpage.  
**Workaround:** Use any of the following workarounds based on specific scenarios:
  - **Option 1:** Add **Try/Catch** block around the **Open** action and ignore the exception as the website opens.
  - **Option 2:** In the **Browser > Open** action, select the **New window** option instead for such websites.
- When you use the **New window** option in the **Browser > Open** action with the 3.4.x version of the Browser package to open a URL with arguments, the bot might not perform the specific action as the 3.4.x version of the Browser package does not support argument flags.  
**Workaround:** Use any version other than the 3.4.x version of the Browser package to automate.

## Automation 360 v.24 Release Notes

*Release date: 08 April 2022*

Review what's new and changed, and the fixes and limitations in the Automation 360 v.24 (Build 12350) release.

---

**Important:** We have updated the Automation 360 v.24 (Build 12350) to include fixes for the following issues:

- After migration, when you ran the migrated bots, they displayed an error for variables within double quotation marks (" ") (Service Cloud case ID: 01802575, 01803323, 01803800, 01804121, 01804820).

- When you clicked the AARI icon, the Control Room was displayed instead of the AARI Assistant sign-in screen (Service Cloud case ID: 01803979).

---

- **Migration**

[What's changed](#) | [Fixes](#) | [Limitations](#)

## Updating to this release

You can update to Automation 360 v.24 from the previous three releases (that is, from  $n-3$  releases, where  $n$  refers to the latest release). The following previous releases are certified for update to this release:

- v.23 (Build 11513)
- v.22 (Build 10526)
- v.21 (Builds 9664, 9642, 9595)

You can directly update to v.24 from any of these builds (see [Update to latest Automation 360 version](#) on page 1022). If you are not on an  $n-3$  release, update Automation 360 to one of the three certified releases (listed previously) before updating to this release.

- If you are directly updating to this release from Automation 360 On-Premises v.21, remove the following Bot Agent files and folders:
  - C:\Windows\System32\config\systemprofile\AppData\Local\AutomationAnywhere\AA-DB.mv.db
  - C:\ProgramData\AutomationAnywhere\GlobalCache\embedded-resources
- Before you update to this release from Automation 360 On-Premises v.22, refer to the upgrade considerations in [Update to latest Automation 360 version](#) on page 1022.

---

**Important:** This release includes an **optional** Bot Agent update. To use the new features in v.24 (including updates to Bot Migration, Browser, DLL, Process Discovery, and Recorder packages), update the Bot Agent available with this release. However, note that if you want to run your existing bots, you do not have to update your Bot Agent to this release.

---

For information on updating to this release, see these resources:

- [Automatically update the Bot Agent](#) on page 1001 | [Manually update the Bot Agent](#) on page 1002
- [Compatibility with release builds](#) on page 985

For the latest updates to the Automation 360 extensions for Google Chrome, Microsoft Edge, and Mozilla Firefox, see [Browser extensions for Automation 360](#) on page 765.

**Important:** This release includes new command packages in which the Apache log4j2 library is no longer bundled. However, older command packages, from Automation 360 v.23 and earlier, might continue to have the log4j2 library bundled within. If you want to use command packages without the log4j2 bundled within, we recommend that you use the newer Automation 360 v.24 packages in your tasks.

## Migration

Enterprise 11 and Enterprise 10 features
<p><b>Self-service Control Room migration</b></p> <p>You can now manage the migration provisioning process with self migration capabilities. You can also choose between manual and automated migration.</p> <p><a href="#">Self-service Control Room Migration</a> on page 974</p>
<p><b>Enhancement to migration of Credential Vault variables</b></p> <p>Migration is now supported when Credential Vault variables are passed from one MetaBot Logic to another MetaBot Logic for the following commands:</p> <ul style="list-style-type: none"> <li>• <b>IF &gt; Logic Successful</b></li> <li>• <b>IF &gt; Logic Unsuccessful</b></li> <li>• <b>Begin Error Handling &gt; Run Logic</b></li> </ul>
<p>You can now successfully migrate Enterprise 11 bots that use the 32-bit <code>wscript.exe</code> to the 64-bit architecture, without exception errors. This enhancement helps you to successfully execute VBScript.</p>
<p><b>Migrate MetaBot with parent and child Logic with renamed Logic</b></p> <p>You can now migrate a MetaBot with a Logic (parent) that includes a renamed Logic (child). If a child Logic is renamed after it is mapped to the parent Logic, this parent Logic mapping is now migrated with the new name.</p> <p>This enhancement applies to the following commands:</p> <ul style="list-style-type: none"> <li>• <b>IF &gt; Logic Successful</b></li> <li>• <b>IF &gt; Logic Unsuccessful</b></li> <li>• <b>Else If &gt; Logic Successful</b></li> <li>• <b>Else If &gt; Logic Unsuccessful</b></li> <li>• <b>Error Handling &gt; Run Logic</b></li> <li>• <b>Run Logic</b></li> </ul>

### Enterprise 11 and Enterprise 10 features

#### Migrate when MetaBot and Logic have the same name

You can now successfully migrate your Enterprise 11 bots when the name of the MetaBot and the assets folder or the Logic name inside that MetaBot are the same. The Logic name is suffixed with *-bot*. The name is appended only when the Logic or the folder is on the same hierarchy as the MetaBot.

- If an existing bot has the renamed Logic or assets folder, the Logic is then renamed with the next available number. For example, *-botn*, where *n* indicates the next available number. Additionally, an action required message is displayed.
- If a MetaBot or a Logic calls a renamed Logic or TaskBots, the command path is updated to include the new name.
- If a Logic, MetaBot, or a folder name exists with a new name, the existing bot is overwritten.

[Migration messages](#) on page 1254

#### Consolidated view of migrated bots and their status

Use the **Overview** tab in the Control Room to get a consolidated view of the status of the migrated bots. View the overall status of bot migration for all the bots that are successfully migrated, those that failed to migrate, and those that require review or action. You also have the option to rerun migration on selected bots and view the history of each bot that has gone through multiple migrations.

[Bot Migration Wizard](#) on page 1170

### Enterprise 11 only features

#### Update to AAApplicationPath, CurrentDirectory, and AAInstallationPath variables

If your migrated bot contains \$AAApplicationPath\$, \$CurrentDirectory\$, or \$AAInstallationPath\$ variables in any file or folder path, a validation check for the absolute path is no longer performed during migration. Also, a temporary variable (\$m-string-start-in-path\$) is not created and assigned to the migrated bot for validation. As a result, the size of a migrated bot is now reduced and the bot performance is enhanced.

#### Enhancement to migrate bots with Email Connect command

When you migrate Enterprise 11 bots that contain the **Email > Connect** and **Email > Send** commands configured for EWS server, the **Azure Cloud** field is set to **Azure Global** and the **Authentication type** is set to **OAuth2-Silent** which was previously called OAuth2.

Note that **OAuth2** now supports two modes: **Silent** and **Interactive**.

[Using Connect for](#)

#### Migrate bots with timeout configured to send REST and SOAP request

The timeout value configured in Enterprise 11 to send REST and SOAP requests is now migrated to Automation 360 as part of the global values (AARestTimeOut and AASoapTimeOut). The default timeout value is set as 60000 ms in Automation 360. You can update this value if the REST Web Service takes more time to receive a response.

[REST Web Service package](#) | [Example of using the SOAP web service action](#) on page 1431

**Enterprise 10 only features****Migrate new or modified Enterprise 10 bots to Automation 360** (Service Cloud case ID 00719524)

You can now migrate new or modified Enterprise 10 bots to Automation 360 after an earlier migration. A new export utility is now available that enables you to export such new and modified bots from the Enterprise 10 Control Room repository. You can then import the exported bots later to Automation 360 using Bot Lifecycle Management (BLM) and then finally migrate them using the Bot Migration Wizard.

[Migrate new or updated Enterprise 10 bots to Automation 360](#) on page 1167

**RPA Workspace****What's new****Bot Agent updates and early availability of packages**

Starting from this release, you can choose or skip some Bot Agent updates and start using packages as soon as new package versions become generally available regardless of your region.

Bot Agent updates that support new packages or updates to packages will be made available quarterly, with updates alternating between mandatory and optional.

Previously, Bot Agent updates were available automatically across user device pools without affecting bot execution. In some large and complex deployment scenarios, these updates were cumbersome but could not be skipped. (Examples include deployments where the device pools were deployed using standard device Amazon Machine Image (AMI) on separate schedules requiring greater coordination, change management processes, and approvals in the user environment for the Bot Agent update.) Now, you can skip an optional update and update to the next mandatory Bot Agent update as Automation 360 will start providing reverse compatibility with Bot Agent for a release every six months.

Also, with every release, you can start using the latest packages as soon as new package versions are released. For Automation 360 Cloud users, package updates are now available asynchronously across all regions, so you can start using the latest packages on the current Control Room version even before the Control Room update is made available for your region.

[Compatibility with release builds](#) on page 985

**Create multi-login users**

You can now create a multi-login user. A multi-login user is allowed multiple sessions to the Control Room through the API.

[Multi-login user](#) on page 2010 |

**Do more with Microsoft Edge Chromium**

You can now use the Microsoft Edge Chromium browser extension for the following:

- Bot Agent proxy configuration
- Automatic population of device credentials

[Browser requirements for RPA Workspace](#) on page 829

What's new
<p><b>Reduce turnaround time</b></p> <p>You can now reduce the turnaround time for collecting information on issues by capturing log files from the Bot Runner device. You can save the log files by using the new <code>-collectlogs</code> command with the Bot Agent diagnostic utility.</p> <p><a href="#">Perform Bot Agent diagnostic checks</a> on page 1007</p>
<p><b>Google Chrome policy change impact on Bot Agent</b></p> <p>From Google Chrome version 101, Google Chrome is deprecating direct access to private network endpoints from public websites as part of the Private Network Access (PNA) specification for URLs using <code>https</code>. To mitigate its impact, starting from this release, response headers are added to the Bot Agent that enable the Bot Agent to communicate with Control Room on Google Chrome browsers. This will ensure that operations such as device registration, bot recording, playback, and deployment are not adversely affected because of this change.</p>
<p><b>Enhancement to AISense Recorder</b></p> <p>You can now use AISense Recorder to automate applications that use Japanese and a combination of Japanese and English interfaces.</p> <p><a href="#">AISense for recording tasks from remote applications</a> on page 1328</p>
<p><b>Wait time option in SOAP Web Service and REST Web Service packages</b> (Service Cloud case ID: 00756730, 00792793, 01255869, 01753287)</p> <p>When you create a bot, you can now set a time-out value for actions in REST and SOAP requests. To indicate how long a bot should wait for a response from the server before timing out, you can set a wait time (in milliseconds) in the <b>Wait for actions to complete</b> field. You can enter a number or a variable or provide a global value.</p>
<p><b>Format text with new HTML editor in Email package</b></p> <p>In the Email package, when you use the <b>Send</b>, <b>Reply</b>, and <b>Forward</b> actions, you can now create and customize your email layout and body by using the new <b>HTML</b> design editor. Use the editor toolbar to make various changes to your text, such as applying bold, italic, and other formatting effects, inserting links, and changing the font and size of the text. You can copy the content from the design editor and paste it to other windows.</p>
<p><b>Task Bot package now supports passing Window variable to child bot</b> (Service Cloud case ID: 00691890, 00804359, 01258948, 01764292)</p> <p>In the <b>Run</b> action of the Task Bot package, when you select <b>Input values</b> fields and enter the values or variables to pass to the child bot, you can now choose the <code>Window</code> type variable and pass it from parent bot to child bot.</p>
<p><b>New option in Content type field of REST Web Service package</b> (Service Cloud case ID: 00666852, 00789910, 00771194, 00785116, 00825945, 01762199)</p> <p>You can now use the <b>multipart/form-data</b> option to upload files and data through REST Web Service. The content type <code>multipart/form-data</code> can be used to submit form elements containing files, non-ASCII data, and binary data. This option is available for actions such as <b>POST</b>, <b>PUT</b>, and <b>PATCH</b>.</p>
<p><b>Custom delimiter option in SOAP Web Service package</b></p> <p>For responses specific to XPath, you can now use the custom delimiter option to delimit the return content from the SOAP response. In the <b>Custom Delimiter</b> field, you can provide a character or a variable, and the output of the delimited response will be a complete string.</p>

What's new
<p><b>New option in Run function action of DLL package</b> (Service Cloud case ID: 00830568, 01063654, 01259336, 01767965)</p> <p>In the <b>Run function</b> action of the DLL package, when the C# DLL interacts with the Windows API to perform system-related operations, such as keystroke, mouse click, or window switching, an intermediate window (AAZeroSizeForm) is displayed occasionally and interrupts the user's operation when the bot is running. In some cases, the DLL function does not interact with the Windows API to perform actions, such as keystroke, mouse click, or window switching, on the operating system UI through the DLL function. In such cases, you can now select the <b>Run function in background</b> check box to bypass the intermediate window (AAZeroSizeForm) and run the C# DLL in the console application without the form. This feature also helps to improve the performance of the DLL execution if the <b>Run function in background</b> check box is selected.</p>
<p><b>Autoscroll supported in Bot editor</b> (Service Cloud case ID: 00730747)</p> <p>When you are creating or editing bots with a large number of lines of code and when you drag actions up or down the page, the page now automatically scrolls up or down accordingly. This feature is supported in both <b>Flow</b> and <b>List</b> views.</p>
<p><b>Configure session timeout in Control Room settings</b> (Service Cloud case ID: 00765320)</p> <p>You can now ensure that your web session does not time out, such as when you are creating a bot, by configuring a suitable session timeout duration in the Control Room settings. Depending on the timeout duration configured, you will be timed out only after the specified number of minutes of inactivity, which prevents loss of work due to early timeout.</p>
<p><b>New JSON package</b></p> <p>Use the JSON package to automate JSON data. You can now extract the required information from JSON text or file and directly use the values in the bot.</p> <p><i>Json</i></p>
<p><b>New option in Catch action of Error handler package</b> (Service Cloud case ID: 00766117)</p> <p>In the Error handler package, you can now ignore errors from actions inside the <b>Catch</b> block by using the <b>Catch &gt; On error, continue with next action</b> option. When you select the <b>On error, continue with next action</b> check box, even if there is an error from an action in the <b>Catch</b> block, no exception is thrown and the bot ignores the error and continues to the next action.</p> <p><b>Note:</b> This enhancement applies to all nested actions in the <b>Catch</b> block. For example, if you have a <b>Try/Catch</b> action inside a main <b>Catch</b> action, if the check box is selected on the main <b>Catch</b> action, any error from actions within the nested block will also be ignored.</p>
<p><b>Enhancements to the Connect action of the Email package</b> (Service Cloud case ID: 00830611, 01264796, 00788467)</p> <ul style="list-style-type: none"> <li>You can now connect to an EWS server hosted on Azure US GCC high cloud.</li> <li>The action now enables Federated Azure users to connect to an EWS server in Attended Automation mode.</li> </ul> <p><i>Using Connect for</i></p>
<p><b>Enhancement to String package</b></p> <p>In the <b>Extract text</b> action of the String package, when you use the <b>After</b> or <b>Before and/or after</b> option, you can now extract a substring from a specified source string that occurs in the range of 1 through 999999 times in a file.</p>

**What's new****Search for files by specific date**

You can now search for files created or modified on a specific date by using the new **On a date** option available in the **File Date** condition of various packages.

You can use this feature with the following packages and actions:

- File package
  - **Copy Desktop files** action
  - **Delete** action
  - **Print** action
  - **Print multiple files** action
  - **Rename** action
- Folder package
  - **Copy** action
  - **Delete** action
  - **Rename** action
- If > File date condition
- Loop > While > File date condition

**New action in Excel advanced package** (Service Cloud Case ID: 01263892, 01782290)

When you perform actions in a Microsoft Excel worksheet, you can now disable or enable real-time screen update by using the new **Disable or enable real-time screen update** action of the Excel advanced package. This action is useful to improve the performance of Excel-based automations at run time when dealing with large data sets.

[Worksheet operations in](#)

**Support for copying metadata from one bot to another**

You can now copy image and metadata files from one bot to another by using the **Copy to shared clipboard** option.

**Add document extraction capabilities to bots**

You can now make bots connect to your Google Cloud service account, send documents to a specific processor, and retrieve the extracted data in JSON format by using the actions in the Google Document AI package.

[#unique\\_293](#)

**Use Recorder conditions in Chromium-based Microsoft Edge with Internet Explorer (IE) mode**

You can now use the **Object exists** and **Object does not exist** Recorder conditions in Chromium-based Microsoft Edge with IE mode for the following packages:

- Loop > While condition
- Wait > Wait for condition
- If package

What's new
<p><b>Use custom datetime formats</b></p> <p>Use the following conventions to specify custom datetime formats and convert a datetime value:</p> <ul style="list-style-type: none"> <li>• D: Specify a day in a year as D or DD.</li> <li>• a: Specify an AM/PM marker for the 12-hour time format.</li> </ul> <p><i>Datetime formats</i></p>
<p><b>Internet Explorer browser support for Browser package and window variables</b></p> <ul style="list-style-type: none"> <li>• The following actions of the Browser package now support the Internet Explorer browser: <ul style="list-style-type: none"> <li>• Open</li> <li>• Close</li> <li>• Go back</li> <li>• Get source code</li> </ul> </li> <li>• In the <b>Browser</b> option, you can now select the Internet Explorer tabs from the list of active tabs.</li> </ul> <p><i>Browser package</i></p>
<p><b>Enhancement to Datetime package</b></p> <p>The <b>Variable</b> option in the <b>Datetime &gt; Assign</b> action is now enhanced and divided into two options:</p> <ul style="list-style-type: none"> <li>• <b>Datetime:</b> Enables you to select the date and time along with the time zone manually and assign it to a Datetime variable.</li> <li>• <b>Variable:</b> Enables you to select the Datetime variable or other variables that can have Datetime as a subtype, such as the Dictionary, Record, and list variables.</li> </ul> <p><i>Using the Assign action</i></p>
<p><b>Enhancement to Recorder package</b></p> <p>You can now capture and automate objects inside a cross-domain IFrame that has multiple IFrames with the same frame source and IFrames that are loaded at run time in Google Chrome and Microsoft Edge Chromium browsers. You can do this by using the <b>Recorder &gt; Capture</b> or the <b>Start recording</b> option. This support is also available for offline Google Chrome extensions.</p> <p><i>Recorder package</i></p>
<p><b>Support for pop-up windows and dialog boxes in Google Chrome, Microsoft Edge Chromium, and Mozilla Firefox browsers</b> (Service Cloud Case ID: 00762207, 00769773, 00781196, 00786646, 00777907, 00795677, 00785995, 00808600, 00811044, 00767486, 01282172, 01286665, 01256750, 01762040)</p> <p>When you are automating a web page on the supported browsers, you can now capture the pop-up windows, alert dialog boxes, confirmation dialog boxes, and prompt dialog boxes that appear. You can do this by using the <b>Recorder &gt; Capture</b> or <b>Start recording</b> option.</p> <p><i>Recorder package</i></p>

**What's new****Retrieve source code of an iFrame in Google Chrome browser**

You can now retrieve the source code of an iFrame in the Google Chrome browser by using the **Browser > Get source code** action. You can use the new **Capture object** option to capture these iFrames.

**Note:** The **Capture object** feature is optional and is only used to retrieve the source code of an iFrame.

**Run JavaScript inside an iFrame in Google Chrome browser**

You can now run JavaScript in a page that contains iFrames in the Google Chrome browser by using the **Browser > Run JavaScript** action. You can use the new **Capture object** option to capture iFrames on which you want to run JavaScript.

**Note:** The **Capture object** feature is optional and is only used to run JavaScript inside an iFrame.

**Global session support for Excel basic package**

- The Global session option is now supported for the Excel basic package. Use the Global session option to share a Microsoft Excel session across multiple bots so that you can use the same Excel worksheet across these bots.
- The **Session name** field is now renamed **Create Excel session**.

*Using the Open for*

**Default variable to hold number type data**

When you are building or testing a bot, you can now use the default number variable `SampleNumber`, which is included in the Variables palette.

**Note:** The default number variable is only available in new bots.

**Export and import password-protected files**

To improve security by providing protection against unauthorized access and malicious editing and also to protect privacy, the export and import features are now enhanced to include the password option. With this feature you can now perform the following:

- Set a password for the files that you want to export from your Control Room.
- Import the password-protected exported file into your Control Room.

*Export bots* on page 2143 | *Import bots* on page 2145

What's new
<p><b>New options in Git configuration</b> (Service Cloud case ID: 00782957, 00837059, 00687394, 00783715, 00714059, 00659476, 00749755, 00786233, 00748166, 00776417)</p> <p>You can now perform the following actions for Git configuration:</p> <ul style="list-style-type: none"> <li>• Choose either the HTTPS or SSH authentication method to set up the Git configuration. The SSH authentication method is more secure as the authentication is based on a public and private key pair.</li> <li>• Specify the branch to which you want to push your Git commits. This helps with team coordination and workflow management.</li> <li>• Connect to your Git repository by using a proxy server.</li> </ul> <p><a href="#">Configure a remote Git repository in Control Room</a> on page 2067   <a href="#">Restore bots from Git repository</a> on page 2074</p>
<p><b>Force push now a configuration setting for Git Integration in the Control Room</b> (Service Cloud case ID: 00683762)</p> <p>You can now configure the Git push to be with or without the force push flag. Previously, updating a remote Git from the Control Room exclusively functioned as a force push. This force push is the recommended and optimal setting.</p>
<p><b>Support for Azure DevOps (On-Premises or Cloud) Git for SSH authentication</b> (Service Cloud case ID: 00652012, 00690526)</p> <p>You can now use either the SSH or the HTTPS authentication method to connect to Azure DevOps (On-Premises or Cloud) Git through the Control Room to check in a bot and its dependent files to the remote Azure DevOps Git repository.</p> <p><a href="#">Connect to Azure DevOps Git from Control Room</a> on page 2070</p>
<p><b>Spring core vulnerability - CVE-2022-22965</b> (01793279, 01793398, 01793497, 01793679, 01794189)</p> <p>Updated to the Spring Framework which has the patch for <a href="#">CVE - CVE-2022-22965</a> vulnerability.</p>

What's changed
<p><b>Migration validation checks for default device settings</b></p> <p>The prerequisites validation for migration now validates whether Bot Runners selected for bot migration have the default device set. If the default device is not set, then bot migration cannot proceed and the validation report lists a validation error. The report also shows the specific Bot Runner devices that do not have a default device.</p> <p>Note that bot migration cannot use devices that are selected at runtime.</p>
<p><b>Bot migration report shows migrated bot with action and review required</b></p> <p>The bot migration report now separately lists bots that might require an action or review after migration. This feature enables you to view the list of bots that will require action or review and to plan post-migration steps accordingly.</p>

What's changed
<p><b>Migrate 11.x bots with forward slash in file and folder path</b> (Service Cloud case ID 00808534)</p> <p>You can now migrate Enterprise 11 bots that include a forward slash in the path used within the <b>File and folder</b> action. Previously, only the backslash was supported in the path and so the user could not create a folder on SharePoint.</p>
<p>You can now manually migrate Enterprise 11 bots even when the <code>My MetaBots</code> folder is not present in the Control Room because this folder is no longer validated during migration.</p>
<p><b>Enhanced user management</b></p> <p>You can now view the activity of bots started by other users from the folders for which you have run and scheduling permissions.</p>
<p><b>Enhancement to API key validity setting</b> (Service Cloud case ID: 00543590, 00719480, 01373359)</p> <p>You can now increase the duration of validity for API keys to 9999 days from the Control Room settings for authentication. Previously, the duration of validity for API keys was 45 days. With this enhancement, a Control Room admin need not regenerate the API key every 45 days to authenticate Automation 360 APIs.</p>
<p><b>Enhanced security in Image Recognition package</b></p> <p>You now have enhanced security when you use any of the Image Recognition actions from the Image Recognition package. Image logging is now disabled to ensure that if a bot fails while running one of the Image Recognition actions, the captured source and target images are no longer stored in the log folder.</p>
<p><b>Enhancement to subject filter in Email package</b> (Service Cloud case ID: 00776374, 00953823, 975605)</p> <p>When you connect to an Exchange Web Services (EWS) server, to repeat a set of actions on all the email messages that meet a set of criteria, use the <b>Move all</b> action from the Email package or use <b>Loop &gt; Iterator &gt; For each mail in mailbox</b>. The <b>When subject contains</b> field is now case sensitive. When you enter text inside a pair of double quotation marks ("" ) in the <b>When subject contains</b> field, the bot retrieves all the email messages whose subject exactly matches the text and the case that you entered inside a pair of double quotation marks.</p>
<p><b>Change to default variable name</b></p> <p>The name of the default string-type variable is now changed from <code>prompt-assignment</code> to <code>SampleString</code>.</p> <hr/> <p><b>Note:</b> This change only impacts new bots.</p> <hr/>
<p><b>Change in activity information on Historical page</b></p> <p>The information about bot execution activity is retrieved for 90 days in the Control Room <b>Historical</b> activity page. Information older than 90 days can be viewed in the audit logs.</p> <p><a href="#">View completed activity</a> on page 1935</p>

What's changed
<p><b>Enhanced Secure Recording mode control</b></p> <p>If you are an administrator, you can now enable or disable the Secure Recording mode based on assigned user roles (permissions) for more granular control of the Control Room.</p> <p><a href="#">Secure recording</a> on page 39</p>

The following table lists fixes alongside the build in which each issue was fixed. Build 12350 is the latest build and includes fixes from the previous builds.

Fixes		
Build	Service Cloud case ID	Description
12350	01768021, 01803781	After the upgrade, the Control Room is no longer unresponsive and behaves normally. Previously, the Control Room was unresponsive after the upgrade due to Java deadlocks.
12350	01802575, 01803323, 01803800, 01804121, 01804820	<p>After you update from a previous release to this release, when you run the bots, the migrated bots no longer show an error for variables within double quotation marks (" "). You do not have to remove the double quotation marks as a workaround to run the bots.</p> <p>For example, after you update from Automation 360 v.23, you can run a bot with the Excel advanced package that contains the following variable: "\$HeaderCounter\$"</p>
12342	00827504, 00788652, 00827730, 01259452	With the required permissions, you can now view the correct information in the <b>Historical Activity</b> page. Previously, a "Do not have sufficient permissions" error sometimes prevented even users with administrative permissions from viewing some of the entries in the <b>Historical Activity</b> page.
12342	00823799, 01623586	<p>When you migrate Enterprise 11 MetaBots with Input, Output, and None variable parameter types, these are now correctly mapped to the respective parameter type in Automation 360 after migration.</p> <p>Previously, the Enterprise 11 Input, Output, or None variable types were mapped to Input/Output type after migration.</p>
12342	00819756	After migration, when you run a bot that contains <b>Switch to sheet</b> action and the action is performed, the worksheet is now visible and is activated for further operations.
12342	01773270, 01781001	<p>The <b>Cloud Migration Utility</b> can now connect successfully to the database even when the database credentials contain the following special characters:</p> <p>&amp; # @ % \$</p>

Fixes		
Build	Service Cloud case ID	Description
12342	00988580, 01200161	<p>After you migrate from Enterprise 11 to Automation 360, you can now <b>Check out</b> bots and dependent files to the Control Room <b>Public</b> workspace.</p> <p>Previously, the dependent files were not available for <b>Check out</b> in the Control Room <b>Public</b> workspace. The parent bots had to be checked out first so that the dependent files could be automatically cloned and available for <b>Check out</b>.</p>
12342	00788046	<p>When you run a bot with the <b>Wait, File, Folder</b> as <b>Actions</b> or <b>If/Loop</b> as <b>Conditions</b> and if the <b>Start Date</b> and <b>End Date</b> options are set to the same date, these bots now execute the respective action or conditions based on the end date that is set.</p>
12342	01598462	<p>The <b>Run Logic</b> command now works correctly when MetaBots contain Logic with different parameters assigned to each Logic. If you disable one Logic in a MetaBot, the other Logic and its command will work correctly.</p> <p>Previously, if one Logic in a MetaBot was disabled, commands related to another Logic were disabled.</p>
12342	01251985, 01264753, 01272804	<p>In the SAP BAPI package, the <b>Get Table</b> command for the <b>Table</b> subtype now successfully retrieves results for the <b>Import, Export</b> and <b>Table</b> parameters.</p> <p>Previously, if you ran the <b>Get Table</b> command for the <b>Table</b> subtype for <b>Import</b> or <b>Export</b> parameters, the command failed.</p>
12342	01262390	<p>When you migrate Enterprise 11 bots that use the <b>IF &gt; File exists</b> condition with a wildcard in the file name, they now run successfully irrespective of whether the parent folder is available in the path.</p> <p>Previously, if the parent folder was not present in the condition path, the bot stopped running and encountered an error.</p> <p>If you are on this release or an earlier one, you can use <b>IF &gt; File exists</b> condition with the parent folder, along with current <b>IF &gt; File exists</b> condition with wildcard.</p>
12342	--	<p>A migrated that includes the <b>File and folder</b> command has the <b>Include start and end dates</b> check box enabled by default. As a result, Enterprise 11 bots no longer fail in Automation 360 when the file rename operation is performed, even if the start and end dates specified are the same for comparison using the <b>Is between</b> condition.</p>

Fixes		
Build	Service Cloud case ID	Description
12342	01751462	When the Run Task command with a variable path is disabled and the variable used in the path is deleted, the TaskBot can now be migrated, without any error. Previously, migration failed and a preprocessing error was displayed.
12342	00824337	The migration result no longer shows an error message when you migrate a bot with the credential name in Japanese.
12342	00783883	The HTML technology-based action (for example, <b>GetProperty</b> ) now supports the retry mechanism, which enables you to migrate bots that include the recorder command with an inner text.
12342	--	You can now successfully migrate Enterprise 11 bots that have negative values for x and y coordinates for top and left fields.
12342	00827997	Bot Scanner now allows the migration of bots with multiple expression conditions that include a disabled line of code and no longer shows an error.
12342	00834597	Bot Scanner now successfully analyzes a MetaBot screen and no longer shows an error for the preprocessing of the source file.
12342	01213241	All plug-ins now successfully load when you open an Excel sheet using the <b>Excel &gt; Open</b> action.
12342	01504682	Bot Scanner no longer shows an internal error even if a bot contains any of these special characters: &#26.
12342	--	You can now successfully migrate Enterprise 10 bots that have roles with folder permissions. Previously, such permissions were not migrated.  <b>Note:</b> The <b>Run and Schedule</b> role is not migrated.
12342	01632298	You can now successfully migrate bots with the <b>Analytics</b> variable through the Bot Migration Wizard, and after migration the status is displayed as successful. Previously, these bots were stuck in the <b>In Progress</b> state and therefore the bots did not run.
12342	00828781, 01258567, 01273170, 01469879	Bots now complete their execution faster than previously when a proxy is enabled through a PAC file in Cloud deployments.
12342	01385567, 01749465	The Control Room now correctly shows the information for <b>Display intranet sites in Compatibility View</b> in <b>Compatibility View Settings</b> . Previously, in Automation 360 v.23, a blank page was displayed because of an internal issue.

Fixes		
Build	Service Cloud case ID	Description
12342	00807226, 01148097	<p>If an IP subnet address contains the numeral 80 (for example, 192.30.80.25), you can now configure the Control Room port to 80 in the installer.</p> <p>Previously, if the subnet address contained the numeral 80, the Control Room port could not be configured to 80. A different port number that did not contain 80 had to be configured for the IP.</p>
12342	00836549	<p>When you copy a role by using <b>Create Role</b> within a Control Room, user and bot permissions are now correctly retained. Previously, editing the associated role caused all associated bot permissions to be lost.</p>
12342	01434341, 01755003, 01755713, 01756244, 01757083, 01756871, 01758346	<p>You can now successfully search for Japanese characters within bots by using the Find in this bot search box. Previously, the Japanese characters typed through the keyboard were not entered correctly and you had to use a workaround to search for Japanese characters.</p> <p><a href="#">Japanese language search support</a></p>
12342	--	<p>If you <b>Check in</b> a bot to the Control Room <b>Public</b> workspace after filtering any dependency data, when you export the bot, only the filtered data is displayed now. Previously, even after filtering the dependency data, all data was displayed.</p>
12342	00819477	<p>You can now view dependent files when you open a bot in the bot editor. Previously, the dependent files were listed only in view mode.</p>
12342	--	<p>When a device pool name includes the underscore character (_), the MSI Installer now completes autoregistration of device pool properties, resulting in device pool names with underscores to populate. Previously, the MSI Installer did not complete autoregistration of a device if the device pool included an underscore character.</p>
12342	01758029, 017596611	<p>You can now use Azure AD authentication to connect to Azure database server when you install the Control Room using Windows installer and installation script. Previously, if Azure AD authentication was selected on the Database server window, Control Room installation failed.</p>
12342	--	<p>After you install or upgrade Automation 360 from a previous release, the Control Room <b>Installation summary</b> page now displays the correct version number. Previously, the page displayed an incorrect version number.</p>

Fixes		
Build	Service Cloud case ID	Description
12342	00796190, 00827493, 01251725	When you deploy a bot, the run-time window now displays the correct line number and package name for the <b>capture desktop</b> action of the Error Handling package. You can find the exact line number that caused the error by using a variable in the <b>Error handler: Catch &gt; Assign line number to</b> option.
12342	00800990	<p>You can now rename a bot by changing the text from uppercase to lowercase or from half-width to full-width characters. For example, you can rename a bot from <code>Automate</code> to <code>automate</code>.</p> <p>Previously, the text in the bot name could not be changed. When the text was changed, the following error message was displayed:</p> <pre>Unable to create a file with the name &lt;filename&gt;. That name is already in use. To continue, please rename your file. Code: repository.exception.file.exists</pre>
12342	01258242	When you run a bot that contains multiple conditions and a missing operator in one of the conditions through the Bot editor, an error message is now displayed about the missing operator. When you update an action and save the changes and if there is a missing operator, an <b>AND</b> operator is now added by default. Previously, bots with multiple conditions failed intermittently with a preprocessor error.
12342	00805738	An error message is now displayed and you can no longer check in or check out files whose filepaths are identical except for differences in case. Previously, when the filepath had different cases and was checked in or checked out, there were issues during bot deployment.
12342	01753711	You no longer encounter any issue when you check out a folder that contains tasks with dependencies. Previously, casing-related issues occurred in string comparison operations, which caused errors in check-in and check-out operations.
12342	01271474, 01761856	When you assign a production label to a child bot that has more than one version, the production version is now displayed during bot operations. Previously, instead of the production version, the latest version of the child bot was displayed.

Fixes		
Build	Service Cloud case ID	Description
12342	01270601, 01260628, 01255632, 01758499, 01775489,01773778	When you connect with <b>Microsoft Outlook, IMAP, or POP3</b> , you can now create a bot and save all emails to a folder even if the email subject line contains slash (/) or backslash (\) characters. When you save the emails, the slash (/) and backslash (\) characters in the subject line are now replaced by an underscore (_) character.
12342	01755993, 01782945, 01775161, 01792954	In the Email package when you connect to Microsoft <b>Outlook</b> to automate an email-related task, you can now use the <b>Move all</b> action followed by <b>Loop</b> action to move unread emails from one folder to another folder. Previously, when you ran the bot, the bot failed to move the unread emails because of an error.
12342	01264563	You can now create a bot using the <b>Global session</b> option in the <b>Open</b> action of the DLL package and choose <b>DLL session does not exist</b> for the <b>If</b> condition. Previously, an error was encountered when the <b>Open</b> action of the DLL package and the <b>If (DLL session does not exist)</b> condition were called multiple times in a sequence.
12342	01258059	In the XML package, when you create a bot to retrieve the data by using the <b>Get single node</b> action and if the XML file has some lines that are commented out, the output no longer shows those lines. Previously, the output displayed the lines that were commented out.
12342	--	In SOAP Web Service, when you select <b>Raw data parameter</b> and use the <b>Build Xpath</b> option, you can now successfully extract values from the SOAP response and store the XML output in a variable. Previously, you could not extract values from the SOAP response because the <b>Build Xpath</b> option did not work as expected.
12342	01071731, 01762875	When you open a CSV or TXT file, read data from that file, and write data from a <i>Table</i> type variable to the file, the bot no longer fails if the CSV or TXT file contains large data sets. The bot now runs successfully even when the <b>Create folders/files if it doesn't exist</b> and <b>Override existing file</b> check boxes are selected in the <b>Write to file</b> action.
12342	00968574	An error no longer occurs when you create a bot by using the <b>Open</b> action of the VBScript package and select a <code>vBScript</code> file from the desktop with the file extension in uppercase. Previously, if the file extension was in uppercase, the bot failed because the file was considered an invalid script file.

Fixes		
Build	Service Cloud case ID	Description
12342	00831463	Using the Email package, you can now send emails with the email subject containing a combination of Japanese half-width characters and katakana characters. Previously, if email subject contained a combination of Japanese half-width characters and katakana characters, the output displayed was garbled in the mail received.
12342	00822222	When you connect to the <b>EWS</b> server to automate an email-related task, you can now send multiple emails without providing any value in the subject field when you use the <b>Send email</b> action in a loop. Previously, when there was an empty value in the subject field, the bot failed to read such mails.
12342	00823283	In the FTP / SFTP package, you no longer encounter an error when you provide the folder name as a dot (.) in the <b>Get folders</b> action. When you run the bot, it downloads all the folders from the current directory to the local folder path provided in the action.
12342	00824379	In the Google Sheets package, when you open a spreadsheet and use the <b>Go to cell</b> with the cell option as <b>Specific cell</b> and if the spreadsheet has more than 40000 rows and you select the <b>One cell below</b> option, the bot now executes successfully. Previously, an error occurred on bot execution.
12342	00788970	The bot name is now translated correctly in Chinese (Simple Chinese) in the <b>Bot running</b> window. Previously, the bot name was displayed as garbled in the <b>Bot running</b> window.
12342	01270344, 01767148	When you use the Google Sheets package and open a Google spreadsheet, you can now use the <b>Get all sheet names</b> action to successfully retrieve the names of all the sheets. Previously, if the Google spreadsheet had more than five sheets in it, the bot encountered an error.
12342	01709026, 01755897, 01768689, 01761434, 01554474	An error no longer occurs when you establish a connection by using the ODBC driver in the Database package. For Microsoft SQL Server, the blank value is now inserted as 0 in the database table for the <code>int</code> column.
12342	01602081	When you use actions from the REST Web Service package to send requests and receive responses from a REST API and to store the response status of the API in a dictionary variable, REST now returns headers and empty body content in response even if the API does not have response body.

Fixes		
Build	Service Cloud case ID	Description
12342	01758733	When you migrate from Enterprise 11 to Automation 360, after you edit or add some actions to a bot that does not exist in a parent bot, when you save the bot, it is now saved without any delay. Previously, it took some time to save the bot.
12342	01254323	An error no longer occurs when you use the <b>Create workbook</b> action of the Excel advanced package to create a workbook inside a folder in a network drive path.
12342	01036851	When you open a file with <code>.xlsx</code> extension by using the <b>Open</b> action of the Excel advanced package, the bot no longer fails even if an intermediate parent folder does not have access privileges. For example, the <b>Open</b> action can open the file from <code>\\share\A\b\c\file.xlsx</code> if the <code>\\share\A\b\c</code> folder has access privileges even if the <code>\\share\A</code> or <code>\\share\A\b</code> folder does not have access privileges.
12342	00827204	On computers that use the Japanese and Chinese versions of operating systems, an error no longer occurs when you try to return a tab to the first web page it opened by using the <b>Go back</b> action of the Browser package and deselect the <b>Throw an error if step exceeds history</b> option.
12342	00777283, 00829912	When you use the <b>Open</b> action of the Excel advanced package to open a Microsoft Excel worksheet, use the <b>Replace</b> action of the Excel advanced package to replace a string in the worksheet, and then run the bot, the bot now runs as expected and is not stuck even if the string to be replaced is not present in the Excel worksheet.
12342	00835312	An error no longer occurs when you create a shortcut to a folder by using the <b>Open program/file</b> action of the Application package to open a file and then using the <b>Create shortcut</b> action of the Folder package.
12342	00757943, 00787404, 00788421, 00807528, 00822941, 01018972	You can now use the AI Sense action in a parent bot and the OCR action in a child bot, or both actions together, to successfully run your bot. Previously, this caused an ABBYY FineReader Engine 12 error.
12342	01212753, 01470071	When the current session of an application on Citrix is closed and the application is restarted, the Recorder now identifies the object and successfully performs the correct action. Previously, the Recorder failed to identify the object.

Fixes		
Build	Service Cloud case ID	Description
12342	00742936, 00808117	You can now convert a datetime value by specifying custom datetime formats (for example, <code>hh:mm:ss</code> ). Previously, an error occurred when you used the <code>hh</code> convention to specify a custom datetime format.
12342	01266752	When you use the 6.2.0-20210903-141520 version of the Excel advanced package to run a macro on a Microsoft Excel worksheet, the values in the referenced cells in the Excel worksheet are now updated correctly.
12342	01755439	An error no longer occurs when you use the 2.5.3-20220304-010651 version of the Recorder package to capture an object. Previously, when you used the 2.4.0-20211118-080716 version of the Recorder package, the bot failed with the following error message: <code>The bot could not be executed due to an error in setting up the execution environment</code>
12342	01276429	After migration, you can now call a reusable bot with the new package version from the same parent bot with which it shared a session. You can do this by inserting a session variable initialized with a value to a key in the dictionary with the <b>Dictionary &gt; Put</b> action.
12342	00805417, 00815023, 01049408	You can now use the Recorder to successfully run keystrokes and capture objects on a new tab opened in the Google Chrome browser.
12342	--	In the <b>Browser &gt; Open</b> action, when you select the <b>Last used browser tab</b> preset for the Internet Explorer window under the <b>Existing tab</b> option, the corresponding tab and window are now activated.
12342	01755590	In RPA Workspace, when you navigate to <b>Automation &gt; Bot Store</b> and log in, you can now access the Bot Store without issues.
12342	--	When you add or remove a consumer role from the locker, role values are no longer changed when you sort the table. Previously, the values in the Modified By and Last Modified columns were inadvertently modified.
12342	01272058, 01752731	You can now pause or stop your in-progress workload automations and the <code>Internal server error</code> no longer occurs.  Previously, the workload automation could not be paused or stopped after the user who created the automation was deleted from the Control Room.

Fixes		
Build	Service Cloud case ID	Description
12342	01181402, 01260706	When you run your workload automations, you no longer have to pause and then resume to run the queued bots that are stuck in the <b>In progress</b> state.
12342	00790086	The incorrect Japanese translation for schedule description of the daily and monthly frequency fields for the <b>Run repeatedly</b> option ( <b>Manage &gt; Schedules &gt; Schedule a bot</b> ) is now fixed. The correct Japanese description is now available on the <b>Schedule a bot</b> page.
12342	00852637	When you edit a bot schedule in the Control Room, the schedule column on the <b>Scheduled</b> page now displays the correct schedule date instead of the previous day. Previously, for example, if a bot was scheduled for 01-Oct-2021, the <b>Scheduled</b> page displayed the schedule date incorrectly as 30-Sep-2021.
12342	00821057, 01188160	If a file is exported after the bot name and folder path are changed, the bot name now reflects the new name. Previously, the bot was exported with the old name.
12342	01252294	You can now successfully import the zip files in the <code>zip64</code> format from the development environment to the production environment.
12342	--	You can now run multiple queues without any delay in between queues. Previously, when you ran multiple queues, a delay of 5 to 15 minutes sometimes occurred between queues.
12342	00800831, 00815411, 00826054, 00826058	When you use the <b>Export checked items to csv</b> option, the schedule data in a <code>.csv</code> file is now saved correctly. Previously, when you exported the schedule data to a <code>csv</code> file from the Control Room <b>Scheduled activity</b> page, the file data was saved incorrectly. For example, the schedule type was saved as <b>Recurring</b> in the <code>csv</code> file instead of <b>One time</b> .
12342	01754721, 01753460, 01767806 01759361, 01763327, 01764201, 01767827, 1770574	If the system locale setting is changed, the weekly scheduled bots now run as scheduled from the Control Room. Previously, when the system locale setting was changed, the bots did not run according to schedule.

Fixes		
Build	Service Cloud case ID	Description
12342	00714546, 00759029, 01257992	The Control Room can now integrate a Git repository that rejects force push. Previously, some security protocols rejected all force push updates making the git integration incompatible without a configuration for the force push flag. You can now change the configuration of the Git push from the Control Room to disable the force push flag.

The following table lists the limitations identified in the current release:

Limitations
<p>(Service Cloud case ID: 01765712) If a MetaBot Logic was using a DLL file that used classes without namespaces, after migration, any TaskBot that uses the MetaBot Logic does not work.</p> <p><b>Workaround:</b> Manually update the DLL file to include namespaces for classes.</p>
<p>If you created the <b>Active Directory</b> role mapping in previous releases, when you update to Automation 360 v.24, some previously defined group mappings are deleted because the Distinguished Name (DN) column of the mapping entries in the database contains empty rows, with no values. Before you update to Automation 360 v.24, run a script to populate the DN column. (Service Cloud case ID: 00751756)</p> <p>For support on this issue, contact the support team: <a href="#">Open a support case (A-People login required)</a></p>
<p>The Bot Insight premigration utility encounters an error and closes when it detects corrupted dashboard IDs in BI tables. (Service Cloud case ID: 00796546)</p> <p><b>Workaround:</b> Download and install the latest Bot Insight premigration utility from the Automation Anywhere Support site.</p>
<p>When you build bots by using drag actions from the <b>Actions palette</b>, the bot workflow shifts to the right side in the <b>Flow</b> view.</p> <p><b>Workaround:</b></p> <ul style="list-style-type: none"> <li>When you create or edit a bot in the Bot editor, add new actions from the <b>Actions palette</b> by double-clicking the action that you want to use.</li> </ul> <p>For example, if you are editing a bot and you want to add an action after line 7, place the insertion point after line 7, and then, from the <b>Actions palette</b>, double-click the action that you want to add.</p> <ul style="list-style-type: none"> <li>If you want to use the drag option, ensure that when you drag the actions, you move them a little faster on the canvas.</li> </ul>
<p>(Service Cloud case ID: 01798098) When you update Automation 360 from a previous release to this release on a Windows machine, you might see the following error message about an invalid digital signature:</p> <pre>Error 1330: A file that is required cannot be installed because the cabinet file       E:\AA\....\Data1.cab has an invalid digital signature.</pre> <p><b>Workaround:</b> <a href="#">A360.24 Installation Failure "Error 1330 Invalid Digital Signature" (A-People login required)</a></p>

Limitations
<p>If the <b>Automatically update all bot agents</b> option is selected and if you update to this release, some Bot Agent might fail to automatically update to the latest version.</p> <p><b>Workaround:</b></p> <ol style="list-style-type: none"> <li>1. Manually uninstall the existing version of the Bot Agent.</li> <li>2. Install the latest version of the Bot Agent.</li> </ol>
<p>When you migrate Enterprise 11 bots with the Comment command enabled, the command is disabled after migration. (Service Cloud case ID 01255723, 01252824, 01260677, 01608653)</p>
<p>When you log in as an administrator after migration and then start a bot migration, the <b>Audit Logs</b> pane intermittently displays an unsuccessful message with a <code>Bot Launcher has crashed</code> error.</p>
<p>When you migrate bots with system variables (such as date, month, or year) as an <b>Export Data to CSV</b> option, a preprocessing error is displayed. (Service Cloud case ID 01755175)</p>
<p>When you update your Control Room from Automation 360 v.21 or v.22 to Automation 360 v.23 or v.24, the installation might fail because of schedule migration issues. (Service Cloud case ID: 01376353, 01449535, 01713118, 01627144, 01762404)</p> <p><b>Workaround:</b> <i>Open a support case (A-People login required).</i></p>
<p>Administrators can export data, up to 100,000 entries, to a CSV file. Downloaded audit .csv files are stored in the <code>C:\Windows\TEMP\</code> folder in the On-Premises environment temporarily. Files in this folder with names starting with <code>cr-audit</code> should not be deleted for at least 90 days and can be downloaded from the Control Room.</p> <p>See <a href="#">.Export audit data to CSV</a> on page 2000</p>
<p>When you autoupdate the Bot Agent simultaneously on 500 to 1000 devices in the Control Room (On-Premises), the autoupdate fails.</p> <p><b>Workaround:</b> Manually update the Bot Agent on a few devices at a time from the Control Room <b>Devices</b> page.</p>
<p>In browsers such as Microsoft Edge (Chromium) and Mozilla Firefox, when the Bot Agent installer file is downloaded, the download information is shown at the top-right corner although the download arrow points to the bottom-left corner of the browser's taskbar.</p> <p>The download arrow points to the correct direction only for the Google Chrome browser, in which the download information is shown at the bottom-left corner of the browser's taskbar.</p>
<p>For a Control Room installed on Linux operating system, the <code>AutomationAnywhereBotAgent.msi</code> file is not available for download with the <b>Download installer</b> option from the <b>Control Room &gt; Administration &gt; Settings</b> page.</p> <p><b>Workaround:</b> To install the Bot Agent, use the <code>AutomationAnywhereBotAgent.msi</code> file from the <code>&lt;application filepath&gt;\crui\asset</code> folder of a Control Room (On-Premises) installed on Windows operating system. For more information, see <a href="#">Sample steps to create Bot Agent golden image (A-People login required)</a>.</p>

Limitations
<p>In the Email package, when you use the <b>HTML design</b> option to create and customize your email layout and body and then paste content copied from another source, such as Outlook or Notepad+, the font style, size, and color are currently not retained for the following actions:</p> <ul style="list-style-type: none"> <li>• Send</li> <li>• Reply</li> <li>• Forward</li> </ul>
<p>When you create a bot using actions such as <b>Send</b>, <b>Reply</b>, or <b>Forward</b> from the Email package, choose an option from <b>Plain text</b>, <b>HTML design</b>, or <b>HTML code</b> to format your email body. When you switch between these tabs (<b>Plain text</b>, <b>HTML design</b>, or <b>HTML code</b>), the previously set value in the message body is not retained, and the message body is blank.</p>
<ul style="list-style-type: none"> <li>• Nested IFrames are not supported in the Google Chrome and Microsoft Edge Chromium browsers.</li> <li>• Support to capture window authentication pop-ups is not available when automating Google Chrome browser.</li> <li>• After performing an action in an application or page, if a frame is added at run time to the application or page, and if any pop-up windows, alert dialog boxes, confirmation dialog boxes, or prompt dialog boxes appear on that frame, then the pop-up windows and dialog boxes are not captured.</li> </ul> <p><b>Workaround:</b> Use the actions in the Image recognition package or the <b>Mouse &gt; Click</b> action instead to run the bot.</p>
<p>On computers where SystemLocale is set to a non-English language, when you open multiple tabs in a browser, try to execute any action on a new tab that is currently inactive, and run the bot, the inactive new tab does not become activated.</p>
<p>In Internet Explorer, to activate one among multiple web pages with no titles, only the fully qualified domain names (FQDN) are compared. If pages that have no titles but have the same FQDN are opened in Internet Explorer, any tab that matches the FQDN is activated.</p>
<p>In Internet Explorer, when you use the <b>Close</b> action to close a tab or a window, it is closed only if it does not have an alert dialog box.</p>
<p><b>Note:</b> An Internet Explorer tab or window with an alert dialog box is closed only when the alert dialog box is closed manually.</p>
<p>When you use the <b>Open</b> action of the Excel advanced package to open files with <code>.xlsx</code> extension that have charts, the bot fails with an error.</p> <p><b>Workaround:</b> Provide the Excel sheet name in the <b>Specific sheet name</b> field and then run the bot. If there are any hidden sheets, unhide the specific sheet and make it as the active sheet.</p>
<p>When you automate web applications running on Microsoft Edge Chromium with IE mode or Internet Explorer, the Recorder sometimes fails to capture the object from the currently selected browser tab and captures from the last used tab instead.</p> <p><b>Workaround:</b> Refresh the Bot editor and then start recording again.</p>

Limitations
<p>When you use the Recorder to capture an object, select <b>HTML Tag</b>, <b>HTML InnerText</b>, and <b>HTML type</b> properties in <b>Search Criteria</b>, or migrate a bot with similar properties selected in <b>Search Criteria</b>, the bot might fail to identify or locate the object and perform the selected action.</p> <p><b>Workaround:</b> Modify the <b>DomXpath</b> according to the controls you capture or add more properties in <b>Search Criteria</b>.</p>
<p>When you use the Datetime package released with Automation 360 v.23 or earlier to create a bot that uses the <b>Datetime Assign</b> action, then select the variable option to add the variable value and try to run the bot with package released with Automation 360 v.24 or later, the UI shows a compilation error, and the user must select the variable value again.</p>
<p>In the Recorder package, the <b>Run in background</b> option that enables an automation to run in the background is not supported for applications running on Google Chrome, Microsoft Edge, and Mozilla Firefox browsers for any of the Recorder actions.</p>

The following table lists limitations from previous releases that are also applicable to this release:

Limitations from previous releases
<p>When you migrate a bot that was using the Manage Window Controls action, the last digit of the height value is not available after migration. However, the bot will execute successfully. (Service Cloud Case ID: 01756996)</p>
<p>When an Excel session is active in SAP, a corresponding Excel process starts in the background. In such a scenario, Automation 360 uses the same Excel process that SAP started. When you run a bot to automate spreadsheet data, Automation 360 processes the first request successfully. However, during execution, if the Excel is closed and a subsequent request is sent for automating the spreadsheet data, Automation 360 does not process the request because the Excel process is still being accessed by SAP. Therefore, the correct window is not activated for automating the spreadsheet data. (Service Cloud Case ID: 00815159)</p>
<p>If you are directly updating from Automation 360 On-Premises v.21 to this release, you might face issues updating your Bot Agent on some Bot Runner machines in the following scenarios:</p> <ul style="list-style-type: none"> <li>• After a Control Room update, the device status keeps changing and the Bot Agent fails to update automatically.</li> <li>• If the <code>embedded_resources</code> file is missing, the Recorder does not recognize the user interface elements or does not capture a single object in the Google Chrome browser.</li> </ul> <p><b>Workaround:</b> Before updating to this release, remove the following Bot Agent files and folders:</p> <ul style="list-style-type: none"> <li>• C:\Windows\System32\config\systemprofile\AppData\Local\AutomationAnywhere\AA-DB.mv.db</li> <li>• C:\ProgramData\AutomationAnywhere\GlobalCache\embedded-resources</li> </ul> <p>For more information, see <a href="#">Bot agent auto update fails post the Control Room Upgrade with 'device.connection.lost' (A-People login required)</a>   <a href="#">The recorder is not able to recognize the GUI elements in Google Chrome browser (A-People login required)</a></p>
<p>When you use the Terminal Emulator command with the <b>Send Text</b> action that contains the LF key (Enter), the command might fail if the LF key is not supported by the Terminal Emulator.</p> <p><b>Workaround:</b> Ensure that you replace the LF key with supported characters such as the space character.</p>

Limitations from previous releases
After migration, a user is able to delete an <code>.atmx</code> file even when the file is associated with a schedule from the Automation 360 Control Room.
<p>If you configure an external key vault in <b>External Key Vault Integration</b> and select the <b>SQL authentication</b> mode for database authentication in the Windows installer <b>Database Server</b> page to install Control Room (On-Premises), the installation fails, and the following error message is shown: <code>Control Room database tables fail to create</code>.</p> <p><b>Workaround:</b> Add the database credentials in the external key vault and use those credentials for database configuration.</p>
<p>Newly created Control Room users on Windows for On-Premises Google Cloud Platform VMs cannot change their password. The security questions option is not available on the <b>Change password</b> screen and as a result the Control Room displays an error when they try to save the password.</p> <p><b>Workaround:</b> Refresh the page and change the password again.</p>
<p>(Service Cloud case ID: 01768545) <b>Update status stuck as <code>IN_PROGRESS</code> during migration from Enterprise 11 to Automation 360</b></p> <p>When you migrate from Enterprise 11 to Automation 360, even if bot migration is successful, Bot Insight does not update the status to the Control Room. Until version 11.3.2, the analytical flag was historically enabled by default, so all created bots are identified as analytical bots. Some bots identified as analytical bots have no processed data available to the Bot Insight dashboard. As a result, the migration status becomes stuck as <code>IN_PROGRESS</code> even if bot migration is successful.</p>
When you try to automate any process in a Java application that uses version 11.0.8 of AdoptOpenJDK, the Recorder sometimes does not capture the drop-down elements on the application.

## Automation Anywhere Robotic Interface (AARI)

What's new
<p><b>Microsoft Edge Chromium and Safari supported for AARI</b></p> <p>You can now create forms and processes in the RPA Workspace and run your requests, tasks, and bots in the web interface on Microsoft Edge Chromium and Safari browsers.</p> <p><a href="#">Browser requirements for RPA Workspace</a> on page 829</p>
<p><b>Create password fields and hide sensitive information</b> (Service Cloud case ID: 00714159, 01063512)</p> <p>In the RPA Workspace, you can now create password fields by using the <b>Password</b> element in your form builder. You can use the <b>Password</b> element in the web interface to add masked text to your password fields in the initial forms to hide sensitive information.</p> <p><a href="#">Configure processes</a> on page 1475   <a href="#">Password element properties</a> on page 1508</p>

What's new
<p><b>Configure a scheduler user for each team</b></p> <p>You can now access the <b>Process</b> page in the web interface to edit a process and assign a scheduler user for each team. This ensures that the bots in the process are deployed on the devices assigned to a team and that these devices are not used by another team. The <b>Team</b> scheduler user is set by default, but if a scheduler user is undefined, then the <b>Process</b> scheduler user is selected. The <b>Global</b> scheduler user will be selected only if the <b>Team</b> or <b>Process</b> scheduler users are not selected.</p> <p><a href="#">Assign scheduler user to process in the web interface</a> on page 1473</p>
<p><b>Configure scheduler deployment type</b> (Service Cloud case ID: 00814885, 01276257)</p> <p>You can now configure the scheduler deployment type for bot tasks in your process setup and determine how the bots in the process will be deployed. You can define the mapping between run-as user and the device that helps take care of constraints, such as credential constraints that require one-to-one mapping between the run-as user and the device.</p> <p><a href="#">Configure deployment type for bots</a> on page 1474</p>
<p><b>Reference ID enhancement to requests</b></p> <p>You can now view the reference ID associated with your process in the <b>Reference</b> column of the <b>Requests</b> page. The reference ID is a combination of a prefix and a number that is created from a <b>Process Key</b> that you can enter when you edit your process for the first time. This reference ID is incremented whenever a request is created from the corresponding process.</p> <p><a href="#">Reference ID properties</a> on page 1513   <a href="#">Configure an AARI process</a> on page 1528</p>
<p><b>Request retention settings</b></p> <p>When you edit a process, you now have the option to set when your completed requests are moved from the <b>Requests</b> page to the <b>Recycle bin</b>. With this feature, you can avoid manually moving completed requests individually to the <b>Recycle bin</b>. You can choose to disable the settings to move completed requests to the <b>Recycle bin</b>. You can also set the number of days after which requests are deleted from the <b>Recycle bin</b>.</p> <p><a href="#">Configure an AARI process</a> on page 1528</p>
<p><b>Default team assigned to process</b></p> <p>You can now edit a process to display the default team that the process is assigned to in the <b>Default team</b> field. The first team that a process is assigned to is automatically set as the default team. With this feature, you can view the default team that a process is assigned to without viewing each individual team.</p> <p><a href="#">Configure an AARI process</a> on page 1528</p>
<p><b>View status of queued bots</b></p> <p>You can now view the status of your bots that are queued and are not actively running. The request view page now shows the <b>In Queued</b> label next to your queued bots that are not active.</p>
<p><b>Cancelled status for tasks</b></p> <p>You can now filter tasks by the <b>Cancelled</b> status in the <b>Tasks</b> page. This status will show a <b>Cancelled</b> label next to the filtered results to inform you of the tasks that were cancelled by a user. You can filter by this status from the drop-down menu in the status bar.</p> <p><a href="#">Filter and search for a task</a> on page 1523</p>

What's new
<p><b>Fill initial form elements by URL parameters</b></p> <p>When you create a request, you can now fill initial form elements by creating query scripts that enter specific parameters in the initial form URL. These parameters are applicable only for <b>Date</b>, <b>Number</b>, <b>Text Box</b>, and <b>Time</b> elements.</p> <p><a href="#">URL parameters</a> on page 1507</p>
<p><b>Storage service enhancement</b> (Service Cloud case ID: 00768394)</p> <p>As a tenant admin, you can now set a configuration option to block upload of executable files to prevent a security breach. You can block the upload of files with the following extensions: .acm, .ax, .cpl, .dll, .drv, .efi, .exe, .mui, .ocx, .scr, .sys, and .tsp.</p>
<p><b>Run virtual window in bot configuration</b></p> <p>If you are an AARI Admin, you can configure bots in the <b>Bots</b> page and enable the <b>Run your bot in virtual window</b> option. With this option, an attended user in AARI Assistant can run bots in a virtual window without losing their user experience.</p> <p><a href="#">Configure an AARI bot</a> on page 1526</p>
<p><b>Add rules to Button element</b></p> <p>You can now add rules to the <b>Button</b> element.</p> <p><a href="#">Using the Button element</a> on page 1540</p>
<p><b>Customize text in forms using updates to Label element</b></p> <p>You can now customize the text in your forms in various ways, such as applying bold, italic, underline, and other formatting effects, changing the font size and color, and so on, by using the <b>Label</b> element. With these options, you can highlight specific messages or texts, such as next steps, warnings, or errors, when they are rendered in the initial form in the web interface.</p> <p>The <b>Label</b> element now provides the following formatting options:</p> <ul style="list-style-type: none"> <li>• <b>Emphasis</b></li> <li>• <b>Font color</b></li> <li>• <b>Font size</b></li> <li>• <b>Text alignment</b></li> </ul> <p><a href="#">Using the Label element</a> on page 1546</p>
<p><b>Search and filter columns in a table</b></p> <p>On the form builder screen, if you select the <b>Enable column filtering</b> check box for the <b>Table</b> element, users can search and filter the content for all the available columns when the bot is running.</p> <p>When you use the <b>Table</b> element to render a table in your initial forms, you now have the enhanced ability to search each column of your table by value.</p> <p><a href="#">Using the Table element</a> on page 1550</p>

What's new
<p><b>Additional options for rules</b></p> <p>With additional options included for rules in the form builder, you can now perform the following:</p> <ul style="list-style-type: none"> <li>• Find a rule but using the search bar. In the search bar, enter the name of the rule or the element label that is associated with any condition or action in the rule.</li> <li>• Create a copy of a rule by using the <b>Duplicate rule</b> option.</li> <li>• For multiple rules, you can use the following options to rearrange the order in which these rules are executed at bot run time: <ul style="list-style-type: none"> <li>• <b>Move up</b></li> <li>• <b>Move down</b></li> <li>• <b>Move to top</b></li> <li>• <b>Move to bottom</b></li> </ul> </li> </ul> <p><a href="#">Add rules to form elements</a> on page 1552</p>
<p><b>Apply an action to multiple elements</b></p> <p>If you are adding or editing a rule, when you are adding an action, you can now apply an action to more than one element by selecting multiple elements in the <b>Then</b> menu.</p>
<p><b>Additional If conditions for some elements</b></p> <p>When you are creating or editing a rule, you can now select additional <b>If</b> conditions for the following elements:</p> <ul style="list-style-type: none"> <li>• <b>Dropdown</b></li> <li>• <b>Checkbox</b></li> <li>• <b>Radio Button</b></li> <li>• <b>Date</b></li> <li>• <b>Time</b></li> <li>• <b>Hyperlink</b></li> </ul>
<p><b>Use Assign for updating the value of the Dropdown element</b></p> <p>When you are adding a rule, if you select the <b>Dropdown</b> element as an action item from the <b>Then</b> menu, you can now use the <b>Assign</b> drop-down menu to append or overwrite values when the bot is running.</p> <p><a href="#">Add rules to form elements</a> on page 1552</p>
<p><b>Elements in If condition are available in Then action</b></p> <p>All the elements that are used as part of the <b>If</b> condition are now available as part of <b>Then</b> action.</p>
<p><b>Multiple lines supported for Text Area and Rich Text Editor</b></p> <p>Text across multiple lines is now supported for <b>Text Area</b> and <b>Rich Text Editor</b> elements within <b>If</b> and <b>Then</b> options.</p> <p><a href="#">Add rules to form elements</a> on page 1552</p>

What's changed
<p><b>Enhancements to importing process to public folder</b></p> <p>When you import your process to a public folder, the process is now automatically published in AARI. Previously, you were required to check in the imported processes in the private repository and then check in the process again for it to be published in AARI.</p> <p><a href="#">Import an AARI process</a> on page 1504   <a href="#">Import process dependencies</a> on page 1504</p>
<p><b>Process page layout updated</b></p> <p>The layout of the <b>Process</b> page has now been updated to be consistent with the <b>Bot</b> and <b>Team</b> pages. The changes include columns for reference ID, key, name, description, tags, and teams. You can now filter your results in the search bar for faster sort and quickly reference the current global scheduler user on the page.</p>
<p><b>Active bot status</b></p> <p>In the request view page, you can now view the exact status of your bots by referring to the <b>In Progress</b> label next to your active bots that are currently running. Previously, the <b>In Progress</b> label showed both active bots and queued bots that were not running.</p>
<p><b>Reference to replace Request ID in AARI on the web</b></p> <ul style="list-style-type: none"> <li>You can now filter or query your requests in the <b>Requests</b> and <b>Recycle bin</b> tabs and tasks in the <b>Tasks</b> tab (<b>Table View</b> and <b>Detail View</b>) using the new <b>Reference</b> instead of the <b>Request ID</b>.</li> <li>The <b>Requests</b>, <b>Team</b>, <b>Process</b>, and <b>Bots</b> URL is now changed to <code>entity/ref/:ref</code> from <code>entity/:id</code>. If you open any request using <b>Request ID</b>, the URL now redirects using <b>Reference</b>. For example, consider the <b>Request ID</b> as 896 and <b>Reference</b> as 2-34 for a request. If you view the request using the <b>Request ID</b> (<code>/aari/#/requests/all#/requests/896</code>), the URL will redirect using the <b>Reference</b> (<code>/aari/#/requests/all#/requests/ref/2-34</code>).</li> </ul> <p>Reference is a unique key that helps you identify your related processes and requests in the <b>Requests</b>, <b>Team</b>, <b>Process</b>, and <b>Bot</b> pages. Reference is easier to use and more meaningful than Request ID as it provides a logical sequence of referential number incremented per tenant. Reference is unique within a tenant, but it can be the same for two tenants.</p> <p><a href="#">Reference ID properties</a> on page 1513</p>

The following table lists fixes alongside the build in which each issue was fixed. Build 12350 is the latest build and includes fixes from the previous builds.

Fixes		
Build	Service Cloud case ID	Description
12350	01788376	You can now launch AARI using the Bot Agent (version 21.133) connection without errors.
12350	01803979	If you have Control Room configured with SAML and you click the <b>AARI</b> icon on the Windows Desktop, you are now redirected to the AARI Assistant web page instead of the Control Room home page.

Fixes		
Build	Service Cloud case ID	Description
12342	01759135	When you use the <b>Date</b> element and select the <b>Use the local system date when this form is loaded</b> option, the date is now correctly displayed, with the local system date.
12342	01766579	If you are a Bot Creator, after creating a request using your AARI process, you can now submit the initial form and complete tasks without being stuck on the request view page.
12342	--	For RPA Workspace with SDS setup, when you enter data or upload files in your initial forms after selecting a process to run the request, you no longer encounter an exception error message.
12342	--	When you use the <b>Checkbox</b> element to create a <b>CheckBoxGroup</b> in your form and set form rules and conditions for each box in this group (C1, C2, C3, and so on), the selections now function properly in the initial form as defined your form rules.
12342	--	If you are a Bot Creator and an AARI manager, you no longer encounter an error when you run a bot by using the <b>Team Members</b> action from the <b>AARI Web</b> package to access teams.
12342	--	If you are a member of a team by role (that is, if you were first added to a role in the Control Room and the role was then synced to a team), you will now be able to view updated information for your requests and tasks. The page now automatically refreshes the latest request and task details.
12342	--	In the web interface, when tasks are completed in the request view, and you confirm by clicking <b>Finish</b> , <b>Cancel</b> , or any other primary or secondary option, these types of events are now captured in the <b>Audit log</b> history in RPA Workspace, as an AARI Human Task type of event.
12342	--	In Linux environment, you can now use the file upload functionality of AARI on the web without any issues. Previously, the file upload functionality failed with an access denied error because the <code>filestorage</code> directory was not automatically created to store the files.
12342	--	The <b>Edit</b> button no longer appears enabled for processes that are checked in, checked out, or cloned. Previously, you could edit the names of processes that were checked in, checked out, or cloned although the changes were not saved.

Fixes		
Build	Service Cloud case ID	Description
12342	--	For any element in a form, if you use the <b>Mark field uneditable</b> option on the form builder or disable it when you run the associated bot, form validations applied to that element are overruled.

Limitations
In some scenarios, when you launch a bot that was configured to run in a virtual window, the virtual window starts and you are prompted to log into the window with your credentials. <b>Workaround:</b> Reboot your system and launch the bot again.
When you design a form, you can create references for hidden elements by using the <b>Hidden elements</b> option from the form properties. However, after you have designed the form, you cannot view or change the variables among hidden elements.
After you design a form with a drop-down rule assigned to your form, if you view the drop-down in read-only mode, you will not be able to view the changed data in read-only mode.
If you have <b>Select file</b> element in the form, then you cannot upload a file that has special characters (such as , ( ) & ; - =) in the filename when you run the bot.
In the web interface, when you are on a page other than the main page and your login session disconnects and returns you to the login page again, the <b>next=</b> parameter is shown in the URL indefinitely. This can be an issue as the <b>next=</b> parameter is used to redirect the URL to a previous page but is currently not supported.
For the <b>Text Box</b> element, the <b>Does not contain</b> form rule is not working.
For the <b>Rich Text Editor</b> element, the <b>Contains</b> form rule is not working.
For the <b>Table</b> element, the <b>Rows before scrolling</b> option can support only up to four rows. If you specify five or more rows, this option is not supported and you must scroll instead.
If you create a form with the <b>Document</b> and <b>Dropdown</b> elements, when you attempt to submit this form, an error occurs. This error is due to the dynamic form schema, such as a drop-down field filled by a process that is present in the form with the document field and causes an error.

## Discovery Bot

What's new
<p><b>Save the recording with a name</b></p> <p>After recording a process, you can now save the recording with a name. The name of the recording is displayed on the <b>Recordings</b> page for that process.</p> <p><a href="#">Record a Discovery Bot business process</a> on page 1672</p>

What's new	
<p><b>Share a description of the recording</b></p> <p>You can now provide a description for a recording of a process by using the <b>Recordings</b> page for that process. In the <b>Recordings</b> page, use the <b>Description</b> field to share the context and the purpose of the recording with the analyst. The description provided is also displayed in the PDD.</p> <p><a href="#">Record a Discovery Bot business process</a> on page 1672</p>	
<p><b>Delete a recording</b></p> <p>After you record a process, if you do not want to submit the recording data to an analyst for review, you can delete the recording by using the <b>Recordings</b> page for that process. In the <b>Recordings</b> page, use the <b>Delete</b> option to delete the recording.</p> <p><a href="#">Record a Discovery Bot business process</a> on page 1672</p>	
<p><b>Record business processes using AARI Assistant</b></p> <p>You can now use AARI Assistant to record business processes without signing in to the Control Room. To record a business process, start AARI Assistant by double-clicking the AARI icon on your desktop.</p> <p><a href="#">Record a Discovery Bot process using AARI Assistant</a> on page 1677</p>	
<p><b>Enhancements to custom opportunities</b></p> <p>You can now update the potential cost and savings for custom opportunities and save your changes to the process diagram. The potential cost and potential savings can be updated at any time as you review the steps from various recordings and make changes within the process diagram.</p> <p><a href="#">Review opportunities, convert to bot, and generate PDD</a> on page 1679</p>	
<p><b>Enhancement to PDD</b></p> <p>You can now view the entire process diagram from within Discovery Bot by clicking the URL link provided in the PDD. The PDD does not display the process diagram if more than 100 steps are selected.</p> <p><a href="#">Review opportunities, convert to bot, and generate PDD</a> on page 1679</p>	

What's changed	
<p>The process discovery document (PDD) now displays Chinese Unicode characters in both Word format and PDF.</p>	

Fixes	
Service Cloud case ID	Description
--	<b>Cloud users:</b> When you capture more than 250 steps, you can now create a customized opportunity for automation and generate a PDD.
--	You can now download a PDD for custom opportunities and recordings without any issue. Previously, an error occurred intermittently and the following error message was displayed: <code>Error generating PDD</code>

Fixes	
Service Cloud case ID	Description
--	An error message is now displayed when you cannot connect to the Control Room. For example, this occurs when a signed or wildcard certificate is used for the Control Room setup for On-Premises deployments and you have not pre-installed the certificate. The <b>Processes</b> page fails to load. Follow the instructions in the message to connect to the Control Room.
00829246	<b>Cloud users:</b> You can now download a PDD for an automation opportunity with 200 or more steps. Previously, when you created an opportunity with 200 or more steps, clicking <b>Download PDD</b> returned an error.
--	For autogenerated and custom opportunities, the <b>Recordings</b> table now works as expected. Previously, it encountered an error intermittently.
00827381	When you search for the Recorder package in the Japanese UI, you can now view the correct package name for the Recorder.

The following table lists the limitations identified in the current release:

Limitations
In rare situations when a device CPU is busy, the recording screenshot might not be captured from the <b>Recordings</b> page for a process. However, user actions, such as text selection, are displayed on the <b>Recordings</b> page.

The following table lists limitations from previous releases that are also applicable to this release:

Limitations from previous releases
When you add branches to the left and right sides of a main branch, the Recording flow chart section of the PDD might not capture the entire process workflow, including all the branches.

## Feature deprecation for Discovery Bot

Review the deprecated feature to understand how it can impact your automation.

Discovery Bot red highlight
In the recording session, the red outline that highlights when you move the mouse over the area to capture the action has been deprecated as of June 2021. The red outline is displayed in the screenshot images when you review your captured steps from the Recordings page.

## IQ Bot

What's new
<p><b>Document Automation limited availability release</b></p> <p>A select group of early adopters can now use Document Automation to automate processing business documents in the new Automation Anywhere Cloud-native intelligent document processing solution.</p> <p>Document Automation is integrated into the Control Room. When you create a learning instance, IQ Bot automatically creates RPA bots to extract and download the data and an AARI process to manage the entire process. Learning instances do not require training. Instead, Document Automation uses pre-trained models to process invoices and receipts.</p> <p><a href="#">Document Automation</a> on page 1876   <a href="#">Intelligent Document Processing solutions feature comparison matrix</a> on page 1884</p>
<p><b>Total number of pages uploaded for Process Documents action</b></p> <p>In Automation 360 IQ Bot, when you use the <b>Process documents</b> action from the IQ Bot Extraction package to process documents, you can now view the total number of pages uploaded displayed under <b>Dashboards &gt; My totals</b></p> <p><a href="#">Using IQ Bot Process documents action</a></p>
<p><b>Role-based access control (RBAC) available</b></p> <p>Automation 360 IQ Bot now offers role-based access control (RBAC). You can use RBAC to handle the following user permissions:</p> <ul style="list-style-type: none"> <li>• Edit learning instance</li> <li>• Delete learning instance</li> <li>• Send learning instance to production</li> <li>• Import domain</li> </ul> <p><a href="#">Defining a custom role for IQ Bot</a> on page 1804</p>
<p><b>Rotate encryption key as AAE_IQ Bot Admin</b></p> <p>With the <b>AAE_IQ Bot Admin</b> role, you can now rotate the encryption key by changing the object name in the new <b>Administration &gt; Key rotation</b> page.</p> <p><a href="#">Rotate the external key</a> on page 1852</p>
<p><b>New model for Cognitive MLWeb Service</b></p> <p>In On-Premises installations of Automation 360 IQ Bot, you can now achieve improved check box and table detection when you use the new model of the Cognitive MLWeb Service.</p>

What's changed
<p>For on-premises installations of IQ Bot, the MLScheduler Service in the Microsoft Windows services window is now disabled, by default, to free up system resources.</p>

Fixes	
Service Cloud case ID	Description
00764550, 00765854	When you migrate from Enterprise 11 to Automation 360, any learning instance with custom domain that has Chinese language fields is now displayed correctly. Previously, these fields were populated with incorrect values in place of Chinese characters.
00758208, 00632965, 00727063, 00715124, 00828988, 01251514	The <b>MLScheduler</b> service is now disabled on IQ Bot On-Premises, and the system no longer slows down or stops responding. Previously, the autocorrection and autosuggestion features, which are part of the <b>MLScheduler</b> service, used system resources extensively and caused the system to slow down or stop responding.
01757917	Documents are now successfully classified using Microsoft Azure 3.2 OCR. Previously, due to deprecation of the Microsoft Azure preview OCR v3.2-preview.2, the documents remained unclassified.
--	Documents extracted using the Auto Extract command are now successfully processed. Previously, when documents were extracted using the Auto Extract command, validations from the default validation group were not applied to them.
01261531	When you create a learning instance and use the IQ Bot upload command, the display is now stable, without any issues. Previously, this caused resizing and toggling between larger and smaller fonts, making the display flicker.
--	To manually create a group, you require only the IQBot_admin role now. Previously, to manually create a group, you required both the aae_basic and IQBot_admin roles.
--	In the IQ Bot UI, for groups that were created manually, you can now see the <b>Group label</b> in its entirety. Previously, you could see only a part of the <b>Group label</b> .
--	Documents whose file names begin with a special character, such as a hyphen (-), are now properly classified and processed. Previously, such documents were held up in the classification queue or remained unprocessed.
01063054	You can now import a learning instance that has a lengthy name, with more than 50 characters, without any errors because the <b>Label</b> field now supports more than 50 characters.
--	For a standard forms learning instance, if you upload a document that contains a table with an empty cell, the document is now sent to IQ Bot Validator. Previously, documents with empty table cells were sent to the <b>Failed</b> folder.
--	An error no longer occurs when you run a bot that contains actions from IQ Bot Pre-processor, IQ Bot Classifier and OCR packages. Previously, in such cases, an 'Assertion failed' error occurred.
01777853	You can now create standard forms learning instances using pretrained models that have long field names (up to 250 characters). Previously, pretrained models that had lengthy field names caused an error.

Limitations
When you upload vector PDF documents to a new learning instance, a few documents are identified as unclassified. Alternatively, if you convert the documents from PDF to TIFF and upload them, the documents are processed successfully.
When you are running IQ Bot using service account credentials, if the password contains a space, IQ Bot logs will not be updated.
In some cases, even if the correct number or amount is accurately reflected, some documents still fail the validation rule because of a round-off error and are sent for manual validation.
In formulas, if you use delimiters, such as commas or periods as thousand separators, formula validation fails.
<b>Workaround</b> <ul style="list-style-type: none"> <li>• <b>For English language:</b> Remove all delimiters, such as commas used as thousand separator.</li> <li>• <b>For other European languages:</b> Remove all delimiters, such as periods used as thousand separator. Use the English number convention for formula validations.</li> </ul>
If you use the ABBYY FineReader Engine version 12.4 instead of version 12.2, the MICR feature does not support data extraction from documents in Japanese language.
After you back up the databases and run the DB Migration Assistant tool, the tool and the logs indicate that migration is successfully completed even if the unified database is not created.
<b>Workaround:</b> Ensure that you install both the x86 and x64 versions of the Microsoft Visual C++ 2015-2019 Redistributable package.

## Bot Insight

What's changed
<b>startDateTime data now in standard format</b> When you export data to Microsoft Excel, the date format will be exported based on the date format of the widget.

Fixes	
Service Cloud case ID	Description
--	Now when you are using a proxy network, when you click <b>Analyze</b> , the network dashboard generates an analysis. Previously, this dashboard did not generate an analysis.
--	When you run a bot that was checked in to a public folder and then checked out into a private folder, the last refreshed date is now displayed accurately. Previously, the last refreshed date was displayed as invalid.
01252869, 01259449	The Business Dashboard is now visible to users assigned the BI Admin Role and BI User License. Previously, users with this role and license were not able to access this dashboard.

Limitations
<p><b>Cannot drill down for data used in group by duration</b></p> <p>When <b>Group By</b> is selected as <b>duration (time/date)</b> in the widget, the drill down is applicable only to a single level. If you try to drill down for data at the second level or further, you might encounter the following error: No data found.</p>
<p>(Service Cloud case ID: 00777595) When you attempt to refresh the data in a Microsoft Excel worksheet, an authentication error can occur from multiple simultaneous attempts through open windows and tabs.</p> <p><b>Workaround</b></p> <ol style="list-style-type: none"> <li>1. In the Power BI desktop application, navigate to <b>File &gt; Options and settings &gt; Options</b>.</li> <li>2. From the <b>Current File</b> section, select <b>Data Load</b>.</li> </ol> <hr/> <p><b>Note:</b> Do not select <b>Data Load</b> from the Global section.</p> <hr/> <ol style="list-style-type: none"> <li>3. Disable the check box <b>Enable parallel loading of tables</b>.</li> </ol>

## Automation 360 v.23 Release Notes

*Release date: 30 December 2021*

Review what's new and changed, and the fixes and limitations in the Automation 360 v.23 (Build 11513) release. Build 11513 replaces Builds 11499 and 11486.

### Important:

- This build includes the Apache Log4j2 library version 2.17.1 to address the exposure to CVE-2021-44832, CVE-2021-45105, CVE-2021-44228, and CVE-2021-45046 vulnerabilities.

Though the command packages are not upgraded to Apache Log4j2 library version 2.17.1, the Bot Agent is upgraded to Apache Log4j2 library version 2.17.1. At runtime, the packages will use Apache Log4j2 library version 2.17.1 through the Bot Agent and hence will not be exposed. As an additional security measure, the Automation 360 v.23 Bot Agent installer also disables the Apache Log4j2 library look-up feature by default.

Third-party security scans might find traces of earlier versions of the Apache Log4j2 library. However, with the upgrade to Automation 360 v.23 and the mitigation in place, there will be no exposure to vulnerabilities. For more information, see [FAQs related to Automation Anywhere Releases regarding zero-day vulnerabilities \(CVE-2021-44228, CVE-2021-45046\) \(A-People login required\)](#).

- This build also includes fixes for the following issues:
  - When you update from Automation 360 v.22 to v.23, background jobs related to cloud license server sync-ups were deleted because of incorrect license job name.
  - When you install or update to Automation 360 v.23 for On-Premises deployments, log files were not updated for a few additional services.
  - If you did not have the **View Package** permission, bot deployments failed when you scheduled or ran a bot.

## Updating to this release

The updated Build 11513 for Automation 360 v.23 includes Log4j2 library version 2.17.1 and fixes. If you are on the previous v.23 Build 11499 (with Log4j2 library version 2.17.0) or Build 11486 (with Log4j2 library version 2.16.0), update to Build 11513 for the updated Log4j2 library version and the fixes.

You can also update to Automation 360 v.23 from the previous three releases (that is, from  $n-3$  releases, where  $n$  refers to the latest release). The following previous releases are certified for update to this release:

- v.22 (Build 10526)
- v.21 (Builds 9664, 9642, 9595)
- v.20 (Build 8815)

You can directly update to v.23 from any of these builds (see [Update to latest Automation 360 version](#) on page 1022). If you are not on an  $n-3$  release, update Automation 360 to one of the three certified releases (listed previously) before updating to this release.

If you are directly updating to this release from Automation 360 On-Premises v.20 or v.21, remove the following Bot Agent files and folders:

- C:\Windows\System32\config\systemprofile\AppData\Local\AutomationAnywhere\AA-DB.mv.db
- C:\ProgramData\AutomationAnywhere\GlobalCache\embedded-resources

---

**Important:** To use the new features in v.23 (including updates to Recorder packages) and for the Log4j2 vulnerability fix, update the Bot Agent for this release. Note that the Bot Agent update from the previous release is not required if you want to run your existing bots as Bot Runners.

---

For information on updating to this release, see these resources:

- [Automatically update the Bot Agent](#) on page 1001 | [Manually update the Bot Agent](#) on page 1002
- [Compatibility with release builds](#) on page 985

For the latest updates to the Automation 360 extensions for Google Chrome, Microsoft Edge, and Mozilla Firefox, see [Browser extensions for Automation 360](#) on page 765.

## Migration features

<p><b>Enterprise 11 and Enterprise 10 features</b></p>
<p><b>MetaBots containing linked objects</b></p> <p>Migrate MetaBots that contain a text play type linked object that is linked with the object play mode object, an image play type linked object linked with the image play type object, and a coordinate play type linked object linked with the coordinate play type object.</p>
<p><b>Migrate bots with the following attributes:</b></p> <ul style="list-style-type: none"> <li>• Bots with variables that contain data larger than 64 KB ( Service Cloud case ID: 00716311,00756449,00819149)</li> </ul> <p>The migration process stores the data in a text file. The text file is uploaded to the Cloud Control Room and is used in the migrated bot.</p> <ul style="list-style-type: none"> <li>• MetaBots with DLLs that return list and array type values with any delimiters combination and store these values in the clipboard</li> <li>• You can now migrate MetaBots with <b>image play</b> mode that use the action <b>GetVisibility</b></li> <li>• You can now migrate bots with the <b>GetSelectedIndex</b> and <b>GetSelectedText</b> actions for the UI Automation technology used in the <b>Object Cloning</b> command and MetaBot screens.</li> <li>• You can now migrate bots which automate applications with Java technology <b>Type</b> using the <b>Object Cloning</b> command with the action <b>GetDataofAllchildren</b>.</li> </ul>
<p><b>Bots with different variable casing</b></p> <p>When you migrate a bot that has passed a variable from a TaskBot to a MetaBot Logic or from a MetaBot Logic to a TaskBot and if the casing of the variable name is modified in the MetaBot Logic, the migration process updates the variable name with the same casing as that of the bot corresponding to the migrated MetaBot Logic in the parent TaskBot.</p>
<p><b>Migrate bots with locator image</b> (Service Cloud case ID: 00754508, 00776192)</p> <p>You can now migrate bots that contain images that are captured using the Object Cloning command.</p>
<p><b>MetaBots as dependencies are not downloaded</b></p> <p>The migration process does not download MetaBots that are available as dependencies. This restriction is to avoid downloading MetaBots and creating multiple copies of the same MetaBots because they are already available in the Control Room repository.</p>
<p><b>New action in Legacy Automation package for migration</b> (Service Cloud case ID: 00797140, 00849161)</p> <p>Use the <b>Get keystrokes delay</b> action to match the duration of delay defined in Enterprise 11 bots for the <b>Insert keystrokes</b> command and simulate the same value in Automation 360 for the <b>Simulate keystrokes</b> action.</p>
<p><b>Notification about bots with issues in Bot Scanner report</b></p> <p>The Bot Scanner report now flags Enterprise 11 or Enterprise 10 bots that have issues and therefore require action or review. For example, bots that have security issues or bots that refer to non-existent variables are flagged with an icon in the action or review message.</p>

### Enterprise 11 and Enterprise 10 features

#### Improved validation of migrated bots

- Additional compile time validations are now available to validate a bot at run-time. For example, if a parent bot calls a child bot and the child bot has compilation errors, these errors are displayed when you try to run the parent bot. This ensures that an error does not occur in the middle of an automation or make it an incomplete automation.

This feature enables you to proactively identify all migrated bots that have compilation errors. Migrated bots with compilation errors are shown in **Successful with Review** section of the **Migration Report** and ensures that you can get a list of bots that require your attention.

To enable the bot validation feature, navigate to **Administration > Settings > Bots > Bot validation** and set it to **On**. See [Settings](#) on page 2042.

- The Bot Migration Wizard now displays validation error details for each bot in the bot migration results. Details about the errors help you to review and take action on the migrated bots, thereby saving time.

[Migrate Enterprise bots](#) on page 1173

#### Enhanced bot migration assistant

The migration assistant is now merged with the error assistant to provide a comprehensive view of all the lines in a bot that require review or action by you, or which have errors in these and therefore require you to address them. This feature helps you to quickly identify the areas of bots that require your attention.

#### Support for 32-bit driver to connect database (Service Cloud case ID: 00757466)

To enable migration of Enterprise 11 bots with VBScript, 32-bit drivers are now supported in Automation 360 to connect the database.

### Enterprise 11 only features

#### Migrate bots with the following attributes:

- Bots that include images that are captured using the **Object Cloning** command, **OCR > Capture area** command, **App Integration > Capture area** command, and **Mouse click** action.
- Bots that contain an HTML email body with local image references if the referenced images are available on the Bot Runner machine (Service cloud case ID: 00780065, 00790657, 00827527, 00822092, 00928116, 01181845)
- Bots that contain Microsoft Excel commands with file extensions such as `.ods`, `.htm`, `.html`, `.mht`, `.mhtml`, `.slk`, and `.pdf` to open an Excel file (Service Cloud case ID: 00799071)
- MetaBots that use the credential variable of non-string type to pass a numeric value as an input to a DLL function

## RPA Workspace

What's new
<p><b>Enhanced administrator capabilities</b> Properly licensed Automation Anywhere Control Room administrators can now create valid RPA users based on authentication with username and password and select not to require live authentication via email response. This feature enables administrators to resend "Welcome" authentication emails without having to reset the credentials assigned to RPA users.</p>
<p><b>Microsoft Edge (Chromium) supported for Control Room and Bot Agent</b></p> <p>You can now perform Control Room operations, and install and register your Bot Agent device using the Microsoft Edge based on Chromium browser.</p> <p><a href="#">Browser requirements for RPA Workspace</a> on page 829</p>
<p><b>Support for Azure Key Vault</b></p> <p>Automation 360 now supports Azure Key Vault, and you can now retrieve the following from the external key vault:</p> <ul style="list-style-type: none"> <li>• Active Directory (AD), services account, and SMTP credentials</li> <li>• Auto-login credentials</li> <li>• Credentials by automations</li> </ul>
<p><b>Bot Validation</b></p> <p>Bot validation check happens for new bots and when you run a bot. Control Room administrators can now turn the Bot Validation feature on or off. By default, this feature is turned off for every Control Room.</p> <p><a href="#">Migrate Enterprise bots</a> on page 1173</p>
<p><b>Credential Vault variable supported in Run function action of the DLL package</b></p> <p>As a Bot Creator, you can now use the Credential Vault variable or credential type variable for the <code>Number</code> data type and pass it as an input parameter in the DLL function.</p> <p><a href="#">Using the Run function</a></p>
<p><b>File ID supported in Check permission action of Google Drive package</b> (Service Cloud case ID: 00777716)</p> <p>The <b>Check permission</b> action of the Google Drive package now supports the <b>File ID</b> option to refer to files available in the <code>Shared with me</code> folder of Google Drive. By providing the <b>File ID</b>, you can now verify the <b>Read</b>, <b>Write</b>, or <b>Delete</b> access granted to you in the <code>Shared with me</code> folder of the Google Drive files.</p> <p><a href="#">Google Drive package</a></p>
<p><b>New Credential package</b></p> <p>You can now use the <b>Assign</b> action in the Credential package to assign an insecure string or a variable directly to the credential variable.</p> <p><a href="#">Credential</a></p>

**What's new****Web Services security supported in SOAP Web Service package** (Service Cloud case ID: 00481836)

As a Bot Creator, you can now provide credential variables in the raw data of the **SOAP Web service** action. You can create a credential variable, map the credential with a reference name in the credential mapper, and use the reference name in the raw data. Because this ensures that all security-related data can be defined in the Credential Vault and the credentials can be used in bots, you can safely deploy tasks without compromising security.

*Example of using the SOAP web service action* on page 1431

**New option in SOAP Web Service package**

Use the **Build Xpath** option in the SOAP Web Service package to extract values from the SOAP response. You can now specify the Xpath expression or select the appropriate node from the response body and store the output in a variable.

**Outlook server supported in Change status, Save email, and Delete actions** (Service Cloud case ID: 00544534, 00557623, 00642506, 00659724, 00763565, 00680801, 00803975, 00818304, 00819362)

In the Email package, to automate a task you can now establish a connection with the **Outlook** server for the **Change status**, **Save email**, and **Delete** actions.

**Read email from shared mailbox in Microsoft Outlook** (Service Cloud case ID: 00728579, 00831622)

To automate email-related tasks, you can now select a shared account in Microsoft Outlook so that email messages can be read from the shared mailbox.

**New encoding types supported in the Write to file action of Data Table package** (Service Cloud case ID: 00767158)

When you use the **Write to file** action to write data from a Table type variable to a CSV or TXT file, you can now use the following encoding types from the encoding list:

- UTF-8: Works as UTF-8 without BOM
- UTF-8 with BOM (called UTF-8 previously)
- UTF-16LE
- Shift-JIS (Japanese encoding)

What's new
<p><b>Auto-save functionality in Bot editor</b></p> <p>In the Bot editor, when you use actions to build an automation, when a bot is not manually saved, an auto-save is performed and the bot now automatically saves the changes for specific events.</p> <hr/> <p><b>Note:</b> The auto-save functionality is currently available only for specific events.</p> <hr/> <p>Some of the events that support auto-save functionality are as follows:</p> <ul style="list-style-type: none"> <li>• Recorder: When you create a bot with certain actions and click <b>Recorder</b>, the event is saved, and when the recording is complete, the event is automatically saved.</li> <li>• Variable manager: When you create or edit a variable to insert it in an action, the changes are saved.</li> </ul> <hr/> <p><b>Note:</b> The auto-save functionality is not supported when you delete a variable or insert it by pressing F2 to open the variable list.</p> <hr/> <ul style="list-style-type: none"> <li>• Actions menu (vertical ellipsis): When you select any action from this menu, for example <b>Packages</b>, the event is saved automatically. When you make any change to the <b>Packages</b> page and return to the Bot editor, the event is saved.</li> <li>• Find a file: When you click the <b>Find a file</b> icon, the bot is saved if it is not manually saved. Also, after you click the <b>Add</b> option, the bot is automatically saved.</li> <li>• Dialog boxes: When a dialog box is opened, it is automatically saved if any changes are made.</li> </ul> <hr/> <p><b>Note:</b> Auto-save is triggered only for top-level dialog boxes and not for nested dialog boxes.</p> <hr/> <ul style="list-style-type: none"> <li>• Deleting variables: When you delete unused variables, the event is saved.</li> <li>• Bot name change: If you edit the name of a bot, the event is saved.</li> </ul>
<p><b>New option in FTP / SFTP package</b> (Service Cloud case ID: 00792346)</p> <p>Use the <b>Credential</b> option when you connect with the <b>Secure FTP</b> server type to automate a task. You can now use username and password for authentication.</p> <p><a href="#">Connect</a></p>
<p><b>Enhancement to AISense Recorder</b></p> <p>AISense Recorder now supports automation of applications that use Brazilian-Portuguese and a combination of Brazilian-Portuguese and English interfaces.</p> <p><a href="#">AISense for recording tasks from remote applications</a> on page 1328</p>
<p><b>Support for Capture anchor in AISense Recorder</b></p> <p>The AISense Recorder now supports the <b>Capture Anchor</b> option. When you run a bot to search for an object in an application in which the anchor changes frequently, you can use <b>Capture anchor</b> to override the default anchor and manually select an anchor to detect the object.</p> <p><a href="#">Edit a task recorded using AISense</a> on page 1332</p>
<p><b>Enhanced support when selecting Object property in Recorder package</b></p> <p>After you capture an object using the <b>Recorder</b> &gt; <b>Capture</b> action, you can now select a particular object property name from the list of available properties in order to retrieve the value of the object property using the <b>Get property</b> action. The list includes suggested property names from the search criteria in the <b>Object Properties</b> table.</p> <p><a href="#">Recorder package</a></p>

**What's new****Enhancements to Number package**

- In the **Random** action of the Number package, you can now specify and limit the number of decimal digits required in the random number generated in the output.
- The existing **Save the outcome to a number variable** field is now renamed as **Save the outcome to a variable**.

*Number package*

**Enhancements to Wait package**

Use the new **Capture region** feature in the **Wait for screen change** action of the Wait package to capture a specific region on an application by drawing a rectangle around it so that the bot automatically captures the coordinates of this region. You can perform the following actions:

- Capture a specific region on a Windows application.
- Preview the captured image in the **Preview** window.
- Recapture a region if the image in the **Preview** window is not per user requirement.

The coordinates are renamed as follows:

- **Left** is now **X**
- **Top** is now **Y**
- **Right** is now **Width**
- **Bottom** is now **Height**

*Using Wait for screen change*

**Enhancement to String package**

In the **Extract text** action of the String package, you can now extract a substring from a specified source string that occurs more than 1000 times in a file and up to a maximum limit of 999999.

**Enhancement to File conditions in If package**

You can now use the new **File extension** condition from the **Condition** list in the **If** package to check the extensions of files and then execute actions based on the results.

**Support for cross-domain IFrames in Google Chrome and Microsoft Edge Chromium browsers** (Service Cloud case ID: 00825656)

You can now capture and automate objects inside a cross-domain IFrame in Google Chrome and Microsoft Edge Chromium browsers by using **Recorder > Capture** or the **Start recording** option. After you capture an object inside a cross-domain IFrame, the path to the frame is stored in the **FrameDOMXPath** property, by default.

The new **FrameDOMXPath** property identifies the path to the frame in which the object is located. You must select this property to run the bot successfully to capture objects on a cross-domain IFrame.

**Note:** This feature is available for the bots you create using the 2.4.0-20211016-070100 version of the Recorder package starting from this release.

*Recorder package*

What's new
<p><b>Support to automate Microsoft Edge Chromium with Internet Explorer compatibility mode</b> (Service Cloud case ID: 00767502, 00787186)</p> <p>You can now automate web applications running on Microsoft Edge Chromium, by enabling the Internet Explorer compatibility mode, using the Universal Recorder where the objects are captured using HTML technology.</p> <p><a href="#">Record a task with the Universal Recorder</a> on page 1314</p>
<p><b>Global session support for loop iterator based on Excel advanced</b></p> <p>You can now use the <b>Global session</b> option when you loop through each row in an Excel advanced worksheet. Use the <b>Global session</b> option to share a Microsoft Excel session across multiple bots so that you can use the same Excel worksheet across these bots.</p> <p><a href="#">Using the Open for</a></p>
<p><b>Enhancement to Excel advanced package</b> (Service Cloud case ID: 00799071)</p> <p>Use the <b>Open</b> action of the Excel advanced package to open files with .ods, .htm, .html, .mht, .mhtml, .slk, and .pdf extensions.</p> <p><a href="#">Excel advanced package</a></p>
<p><b>Check out a specific version of a bot</b></p> <p>To edit a bot in the Control Room <b>Automation</b> page, when you check out a bot from the <b>Public</b> to a <b>Private</b> workspace, you can now choose a specific version of the bot along with its dependencies by using the new <b>Advanced options</b>.</p> <p><a href="#">Check out a single bot</a> on page 1360</p>
<p><b>New APIs for devices</b></p> <p>You can now allocate default devices by using the new APIs introduced in the <code>v1/Devices</code> section. Choose to set or not set a specific device as the default deployment device for a specified user by using the following APIs respectively:</p> <ul style="list-style-type: none"> <li>• <code>/runasusers/default</code></li> <li>• <code>/runasusers/default/unset</code></li> </ul>
<p><b>Configurable API-key validity</b> (Service Cloud case ID: 00763420)</p> <p>You can now configure the validity of the API-key using the <b>API-Key Duration</b> feature available in the <b>Administration &gt; Setting &gt; Security Configuration</b> in Automation 360. You can set validity minimum of 1 minute or maximum of 45 days.</p>
<p><b>Bot version comparison</b></p> <p>You can now compare various versions of the bots in your public workspace. You can use the <b>Compare versions</b> option to select two versions of a bot and compare them for differences, and any modifications in your work flow are highlighted for your reference. You can also view the differences in the actions, packages, triggers, and variables between the versions.</p> <p><a href="#">Compare bot versions</a> on page 1366</p>

What's new
<p><b>Production label support in bot development work flow</b></p> <p>You can now assign a <b>Production label</b> to a particular version of a bot. After you assign a label, you can run or export bots with a bot version of your choice. You can select the version associated with a production label to schedule, run, queue, and trigger bot development work flows.</p> <p><a href="#">Assign label to a bot</a> on page 1365</p>
<p><b>Access to Automation Anywhere RPA Training &amp; Certification</b></p> <p>A direct link to Automation Anywhere RPA Training &amp; Certification is now added in the Automation 360 Help Center.</p> <p><a href="#">Automation Anywhere University: RPA Training and Certification (A-People login required)</a></p>

What's changed
<p><b>Bot Scanner recommendation</b></p> <p>The Bot Scanner now recommends to proceed with migration (with or without review or action) when <b>95% or more than 95%</b> of your bots can be migrated.</p>
<p><b>Assign credential variable to non-credential type variables for migrated bots</b></p> <p>For migrated bots, Automation 360 no longer restricts you from assigning the credential variable to a non-credential type variable in an insecure (non-secure) way. So you can now successfully run migrated bots that use the <b>Run Logic</b> command to pass the credential variable to a non-credential type variable in an insecure manner.</p>
<p><b>Enhancement to Recorder package</b></p> <p>The search algorithm for the Recorder package is now enhanced so that when you run a bot an object is captured only if its properties match the exact search criterion that you selected in the <b>Object properties</b> table. If the properties of the object do not match the search criterion exactly, then the bot fails with an error message. However, if the search criterion includes a wildcard character, then the bot captures the first object that matches the criterion.</p> <p>For example, to capture a text box from an application that has three text boxes named <b>firstname1</b>, <b>firstname2</b>, and <b>firstname3</b>, if you select <b>HTML name</b> as the search criterion, enter the value <code>firstname</code> in the HTML name field, and run the bot, then the bot fails with an error message because a text box with the HTML name <code>firstname</code> does not exist. However, in the <b>HTML name</b> field, if you enter <code>firstname*</code>, and run the bot, then the bot captures the first text box that matches the criterion.</p> <p>Previously, if there were no objects whose properties matched the search criterion exactly, instead of failing, the bot captured the first object whose properties matched the search criterion partially. For instance, in the previous example, if you selected <b>HTML name</b> as the search criterion, entered the value <code>firstname</code> in the <b>HTML name</b> field, and ran the bot, then instead of failing, the bot captured the first text box that matched the criterion partially.</p> <p><b>Note:</b> This enhancement is available for the bots you create using the 2.4.0-20211016-070100 version of the Recorder package starting from this release. To use this functionality in the bots created using a previous version of the package, you must recapture the objects.</p>

**What's changed****Enhancement to File package** (Service Cloud case ID: 00755631, 00780237)

- In the **Copy Control Room file** action of the File package, the new **Dynamic file path** option in the **Control Room file** field now enables you to use variables in the file path to copy a file from the Control Room repository where the file path is dynamic.
- Some actions and properties in the File package are now updated, as follows:
  - The **Copy** action is now renamed **Copy Desktop file**.
  - The **Download CR file** action is now renamed **Copy Control Room file**.
  - In the **Copy Control Room file** action, the following fields are renamed:
    - The **Select a Control Room file** field is now renamed **Control Room file**.
    - The **Save CR file to location** field is now renamed **Target file path**.
  - In the **Copy Control Room file** action, the **Control Room file** field now has two new options: **Static file path** and **Dynamic file path**.

The **Static file path** option is an existing feature in the **Control Room file** field that enables you to browse the Control Room repository and select the file. When you browse the repository using **Static file path**, files with `.bot` extension are no longer displayed.

---

**Note:** The renaming of actions within the File package does not impact existing bots that use these actions.

---

*File package***Changes to Connect action in FTP / SFTP package** (Service Cloud Case ID: 00792346)

The following changes are made to the **Connect** action:

- **SSH FTP** server type is now renamed **Secure FTP**.
- When you select the server type **FTP Secure**, the **User credentials** authentication type is now renamed **Username & Password**.

---

**Note:** From this release, if you use the Secure FTP credentials in FTP Secure, the bot will fail. Instead, we recommend you to use the **Credential** option available in **Secure FTP** to connect with the Secure FTP server.

---

- Change in **Connect** action: If you created bots using the **Connect** action using Automation 360 v.22 and earlier releases and you update to v.23, the bots display some of the **Connect** action settings as deprecated due to changes in the interface. However, your existing bots will continue to run successfully. For new bots, we recommend that you create them using the **Connect** action available from this release.

**Support for copying one or more variables** (Service Cloud case ID: 00549368, 00751052, 01260498)

You can now copy one or more variables from one bot and then paste them in another bot. Previously, the copy operation also copied the actions along with the variables.

**Support for reserved characters in Distinguished Names (DN) for Active Directory Control Room** (Service Cloud case ID: 01133364, 00952301)

You can now use reserved characters, such as the comma (,), in the DN or the username of a Control Room configured for Active Directory users.

The following table lists the fixes and the builds in which they were fixed. Build 11513 is the latest build and includes fixes from the previous builds.

Fixes		
Build	Service Cloud case ID	Description
11513	00797196, 00818347	<p>Updates to the Private workspace API ( /v2/repository/workspaces/{workspaceType}/files/list):</p> <ul style="list-style-type: none"> <li>• Only private workspace authorized users can list the bots from the private workspace.</li> <li>• Admin cannot list the private workspace bots.</li> <li>• Only public workspace authorized users cannot list the private bots.</li> <li>• One private workspace authorized user cannot list another user private workspace files.</li> </ul>
11513	00808478, 00814198, 01260666	If you are a Control Room administrator, when you change the viewing permissions of some bot folders so that they can be viewed only by specific users, the change is now correctly applied. Previously, changes made to the viewing permissions of bot folders were not applied correctly.
11513		When you update from Automation 360 v.22 to v.23, background jobs related to cloud license server sync-ups are no longer deleted because of incorrect license job name.
11513	01753484, 01754939	<p>You can now deploy (both schedule and run) bots from the Control Room without any issue if you have the <b>View Package</b> permission.</p> <hr/> <p><b>Note:</b> The <b>View Package</b> permission is required to deploy (both schedule and run) bots from the Control Room.</p> <hr/>
11513	--	When you install or update to Automation 360 v.23 for On-Premises deployments, the log files are now updated for all the services without any issue. Previously, the log files for a few additional services were not updated with any information or time stamp of the activities.
11486	00793800	When you migrate to this release, issues related to JRE while installing the Control Room on machines using Microsoft Hyper-V servers are now fixed. The following error no longer occurs: <code>Unknown Failure. Please check the database login credentials and check if this machine has a network connection to the database server.</code>

Fixes		
Build	Service Cloud case ID	Description
11486	00815340	User folder names given similar leading portions or naming conventions no longer display folders that share naming conventions but not the assigned or specific user permissions.
11486	00836898, 01259938	The Cloud Migration Utility now includes enhanced logic to enable you to successfully upload data even when the network is connected through a proxy server.
11486	00817173	You can now perform a Run DLL function when both the input and output parameters are set to a String value, and the Date and Time value is now passed as a String parameter successfully. Previously, the Date and Time value was converted and not displayed as expected.
11486	00754305, 00769128	The configuration tagging works properly now, based on the settings configured in the nodemanager-logging.xml file. Previously, the node manager and bot launcher logs were purged either after two days or if the log count was increased by specific amounts due to tagging issues with tags such as the following: "IfLastModified age" and "DirectWriteRolloverStrategy"
11486		When you decide to select or deselect all the bots and dependencies, you can now select or clear the <b>Select All</b> check box without any issues. Previously, after selecting the <b>Select All</b> check box, when you cleared the check box, it did not work as expected, and you had to deselect the bots and dependencies individually.
11486	00798037, 00814184	The <b>Manage</b> and <b>Administration</b> labels in the navigation pane are now updated to ensure that roles and permissions are distinct in the following languages: Simplified Chinese, Traditional Chinese, Japanese, and Korean.
11486	01218053	You can now import parent and child bots with dependencies even if you do not have permissions to all folders.  Previously, if a user with no folder permissions imported parent and child bots with dependencies, the dependency between them was lost.
11486	01046249	When you migrate from Enterprise 11 to Automation 360, duplicate entries are no longer created for any of the existing commands.

Fixes		
Build	Service Cloud case ID	Description
11486	--	<p>You can now migrate an Enterprise 11 bot that uses the <b>Run Task</b> command successfully even if the <b>Upon error, continue with next repeat</b> option is not selected.</p> <p>Previously, the parent bot stopped running if the child bot encountered an error. Now, when this option is not selected, an error handler ensures migration is successful even if the child bot encounters an error.</p>
11486	--	If you used the <b>Go to cell</b> action from the Excel advanced package in an Enterprise 11 bot, the setting is now retained when you migrate it to Automation 360.
11486	00779016	You can now use the XML package to open any <code>.xml</code> files without any issue after migrating to Automation 360.
11486	00794202	You can now migrate Enterprise 11 bots with If command to Automation 360 without any issues.
11486	00790245	You can now use the SOAP Web Service action of the SOAP Web Service package without any issues after migrating to Automation 360.
11486	00795518, 00832462	If you used the <b>Delete cells</b> action from the Excel advanced package in an Enterprise 11 bot, correct cell addresses are now displayed when you migrate it to Automation 360.
11486	00808601	Migrated bots that include Extract and Substring actions of the String Operation no longer encounter an error if the input string is empty.
11486	00807945, 01258127	When you migrate Enterprise 11 bots using the Error Handling command, an error no longer occurs if the file path value in the variable is missing the file extension from the <b>Snapshot</b> and the <b>Log to file</b> . After migration, the Snapshot file now saves files with <code>.png</code> extension and <b>Log to file</b> with <code>.txt</code> extension.
11486	00777395, 00807705, 00814087	The migration process now adds the <b>Window &gt; Set title</b> action for all the <b>ElseIf-window exists</b> conditions. This setting enables you to make the window title dynamic, eliminating the need for you to recapture the window title when it changes.
11486	00820094, 01019195	After you migrate to Automation 360 from Enterprise 11 or Enterprise 10, the <b>Error Handler</b> snapshot error is now logged to the <b>Snapshot</b> image path. If the snapshot image path is provided as a variable, then the snapshot error is logged to the default application path.

Fixes		
Build	Service Cloud case ID	Description
11486	00810389	You can now migrate bots with variables whose names start with or contain <code>arrayRows</code> . You no longer encounter a stack overflow error and the bots are successfully migrated.
11486	00795347	The <b>DLL Run</b> action now successfully copies your data from one Excel sheet to another even if the .Net DLL uses the OLE mechanism (for example, clipboard) to copy data. Previously, when data was copied from one Excel sheet to another, a threading-related exception occurred.
11486	00787562	After migration to Automation 360, an Enterprise 11 large bot (with 2000 or more commands) no longer encounters the <code>Code too Large for try statement</code> preprocessing error when the bot is used in Automation 360. However, if the migrated bot includes a <b>Loop</b> or <b>Trigger Loop</b> command with <b>Continue</b> or <b>Break</b> as a child command, a preprocessing error might still occur when the bot is run.
11486	00782594, 00786968	When you migrate to Automation 360, an Enterprise 11 bot with large array sizes no longer encounters Java heap errors. If the total size of the arrays in one bot exceeds the threshold value of the array size, then the arrays variables are migrated as is till it breaches the threshold value. However, the remaining array variables are migrated as table variables with no default value using the <b>Database &gt; table</b> action.
11486	00792346	If your Enterprise 11 bot was configured with <b>Secure FTP</b> without <b>Key File Authentication</b> , the migration process now appropriately configures the bot with the <b>Secure FTP</b> server type in Automation 360. Previously, the migration process incorrectly configured the bot with the <b>FTP secure</b> server type.
11486	--	Users with the <b>AAE_Bot Migration Admin</b> role no longer encounter an issue when they migrate bots using the Bot Migration Wizard.
11486	--	The Bot Migration Wizard now displays the correct number of MetaBots on the <b>Select bots to migrate</b> screen.
11486	--	Enterprise 11 bots that are migrated no longer encounter an error when a variable that is mapped between the parent bot and a child bot is not available in either of the bots.
11486	00729719, 00959356	You can now add or update SAP automation using the <b>Capture</b> action of the Recorder package when the SAP scripting is disabled in the Enterprise 11 bot.

Fixes		
Build	Service Cloud case ID	Description
11486	00639940, 00770561	If the migration process fails, the <b>All migration</b> screen now shows the status as <code>unsuccessful</code> . Previously, when the migration process failed because of invalid device credentials, the screen showed that the migration process is in progress but the <b>Audit log</b> displayed the correct status.
11486	00840456	The migration process no longer encounters an error when you migrate a MetaBot that contains a logic that has an extra space character at the end of its name.
11486	00786646, 00808600, 00822029	Migrated bot no longer encounter an error when they contain commands that perform an action on a pop-up window of a browser.
11486	00777467	Migrated bots no longer encounter an error when they are checked out in Automation 360 and they contain an invalid expression that is added by the migration process.
11486	00786002	You can now delete <code>.atmx</code> and <code>.mbot</code> files from the Control Room if you have all the required permissions.
11486	00796725	The Bot Scanner no longer encounters an error when it scans a bot in which the window title is specified using a variable within brackets.
11486	00790861, 00836849	Migrated Enterprise 11 or Enterprise 10 bots no longer encounter an error when they use the <b>Run Logic</b> command to run a MetaBot logic and the location of the logic is specified up to the folder that contains that logic. For example, consider that you have a MetaBot named <code>Finance1</code> and you want to run <code>Logic1</code> that is available in the MetaBot at the <code>Metabots\Logics\Finance</code> location. Previously if you specified only <code>Metabots\Logics\Finance</code> instead of the complete path ( <code>Metabots\Logics\Finance\Logic1</code> ) of the logic, an error occurred.
11486	00804550	You can now import bots from an Enterprise 11 production environment to an Automation 360 development environment even if these bots include the user ID of the user who had checked out the bot in Enterprise 11.
11486	--	When you search for bots with the following characters, the bots are now displayed in the search results: <code>r\$@1&amp;#klu%)((){,!~`\$^&amp;()_ -+=[ ]</code>
11486	00729393	After you migrate from Enterprise 11 to this release, you can now view the bot subfolders in your Control Room <b>Public</b> workspace on the <b>Automation</b> page.

Fixes		
Build	Service Cloud case ID	Description
11486	--	After you migrate from Enterprise 11 to this release, you can now check in bots to the Control Room Public workspace from a folder for which you have the <b>Check in</b> permission using the Repository Manager API. The API response code no longer shows the following: "upload": false.
11486	01032367, 01066099	An issue with the bot deployment progress window is now fixed. Previously, even after the bot completed the run, the window was displayed for a long time (for example, for more than 10 seconds in some cases).
11486	00826923, 01081380, 01259907	After you migrate from Enterprise 11 to this release, you can now add work items to queues using the Workload API through AWS Lambda. A StackOverflow error no longer occurs in the Control Room logs.
11486	00801810	<p>When you update Automation 360 On-Premises to this release, Bot Agent devices now remain in connected state. WebSocket errors are no longer generated in the C:\ProgramData\AutomationAnywhere\BotRunner\Logs\Node_manager.log file.</p> <p>Previously, when you updated from Automation 360 v.19 (Build 8147) to Automation 360 v.21 (Build 9664), some issues were reported where the Bot Agent devices remained in disconnected state and WebSocket errors were generated even without any proxy configuration changes.</p>
11486	00831028, 00830336, 00827031, 00832413, 00833089, 00833436, 00832850, 00839997, 00849904, 00857296, 00831062, 00833436, 01140913, 01145306, 01252819, 01127960, 01256324, 01257414, 01258281, 01263606	When you update your Control Room that is configured with Active Directory to this release, you can now use the log in with Windows option and the following error no longer occurs: <code>java.lang.NoSuchMethodError</code> .

Fixes		
Build	Service Cloud case ID	Description
11486	00719407	For On-Premises deployments, when you configure multiple IP addresses for Control Room nodes in a cluster, the primary IP address is now automatically configured. You no longer have to manually configure the primary IP addresses in the <code>cluster.properties</code> file.
11486		<p>When you are installing the Bot Agent, if you run out of disk space and click <b>OK</b> on the <b>Out of disk space</b> window, the wizard returns you to the previous <b>Setup type</b> window so that you can cancel the Bot Agent installation.</p> <p>Previously, when you clicked <b>OK</b> on the <b>Out of disk space</b> window, the wizard displayed multiple windows.</p>
11486	--	When the Bot Agent is updated automatically from a previous release to this release, you can perform various operations simultaneously, such as running bots, configuring device settings in the Control Room, and updating the Control Room. You no longer have to restart the Bot Agent service from the Task Manager.
11486	00781135	After you install the Bot Agent on a user device, when you restart the Bot Agent, the global cache folder ( <code>C:\ProgramData\AutomationAnywhere\GlobalCache\</code> ) is no longer deleted.
11486	00709309, 00766163	You can now upgrade the Control Room installed on Linux to this release and the Elasticsearch service now starts successfully. Previously, the upgrade failed because the service did not start and the following message was displayed: <code>Elasticsearch service fail to start during certificate retrieval process.</code>
11486	00742074	License allocation for users configured to use multi-user devices is now honored for concurrent bot deployments on unattended Bot Runners.
11486	00822176	On multi-user devices, you can now create an RDP session that uses a custom port. Previously, if you configured a multi-user device to use a custom port for RDP-based deployments, the deployments failed.
11486	00806583, 00805381	When you perform RDP-based deployments on a device, FreeRDP no longer fails when connecting to a Windows server for per-device RDS licensing.

Fixes		
Build	Service Cloud case ID	Description
11486	--	If you deploy bots using event triggers and install the Bot Agent on a device as a non-admin user for yourself or a local admin user, the Bot Agent is now updated automatically. The device is no longer shown as disconnected in the Control Room.
11486	00803434	Issues with the change in Jetty HTTP client behavior on load balancers with custom rule for host headers to route a request are now resolved. Device registration now does not fail and the port numbers are added to the host when default ports are used.
11486	00815334	Performance issues related to logging in to the Control Room and editing and running bots in the Cloud Control Room are now fixed.
11486	00543141, 00674098, 00714238, 00744991, 00750325	With Splunk integration and enhancements to syslog, you can now forward audit logs to remote Splunk servers and view audit logs on Splunk dashboards.
11486	00776569	When a bot you run encounters an error, an appropriate preprocessing or runtime error message is now shown. Previously, a preprocessing or runtime error message was shown even if the bot did not contain an error or if the bot was empty.
11486	00781638, 00805371, 00804784	Issues with a checked-out bot and its clone are now resolved. When one user checks out a bot, makes changes to it, and checks in the bot, the clone of the bot in another user's <b>Private</b> workspace is now updated with the changes.
11486	00784252	If you do not have Control Room admin privileges and you check in bots to the Cloud Control Room <b>Public</b> workspace in subfolders, the bot folders no longer take time to load in the Control Room.
11486	00786716, 00801631, 01189873	An error no longer occurs when you use the <b>Download</b> action in the Browser package to download a file from a web URL. Previously, if a web URL had a backslash at the end or space characters at the beginning or end, the bot failed to download the file.
11486	00783197, 00818698, 00820666	When you use the <b>Assign</b> action of the Number package to assign decimals to an existing number variable, an error no longer occurs irrespective of the device locale settings on the machine.
11486	00778496	You can now successfully import the bot archive into the public workspace even if the archive creates a folder named <b>System</b> in the <b>Bots</b> folder.

Fixes		
Build	Service Cloud case ID	Description
11486	00774026	You no longer encounter an issue when you use the <b>CSV/TXT &gt; Open</b> action and the <b>Task Bot &gt; Run</b> action to search for a file or a bot with a name that contains Japanese characters.
11486	00761035, 00786113	You can now use the <b>Recorder &gt; Capture</b> action to capture an object on a window that has a tree view and also retrieve the <b>Item name</b> property of that object by using the <b>Get property</b> action. Previously, when you ran a bot, the recorder captured the object on the window successfully but failed to retrieve the item name of that object in the output.
11486	00763925	An error no longer occurs when you use the <b>Split</b> action of the String package to split a source string that has any combination of Unicode characters.
11486	00767074	In Internet Explorer, when you use the <b>Browser &gt; Open</b> action to open a new window or tab, the new window or tab is now displayed in front of the other, non-admin open windows.
11486	00819664	You can now create bots using the SOAP Web Service action. XML calls no longer return corrupted data when the SOAP response has an XML document as an inner element.
11486	00748494, 00829735, 01018622	You no longer encounter any issues when you deploy a bot containing email triggers. Now, each time an email message is sent, the bot is triggered and runs successfully. Previously, the email trigger worked only for the first time an email message was sent, and for subsequent email messages, the bot was not triggered and did not run.
11486	--	The <b>Task bots runs</b> metric on the <b>Home</b> dashboard page of the Control Room now displays the correct count. Previously, the <b>Task bots runs</b> metric displayed the count as zero even if you have run bots from the same Control Room.
11486	00824309	In the <b>Run stored procedure</b> action of the Database package, when you click <b>Add parameter</b> to provide an input or output parameter, the label for the parameter type field now displays as <b>Parameter type</b> . Previously, the label for the parameter type field was not displayed correctly.
11486	00810212	When you use the <b>Run</b> action of the Task Bot package and select the <b>Multiple variables</b> option in the <b>Save outcome to a variable</b> field, the variable name is now displayed in the correct case. Previously, the variable name was displayed in lowercase even if the variable name was created using uppercase.

Fixes		
Build	Service Cloud case ID	Description
11486	00796913, 00836389	You can now use the <b>Move all</b> action from the Email package to move multiple email messages from Inbox to another folder. Previously, the <b>Move all</b> action was not able to process a large number of email messages because disk storage ran out of space.
11486	00798673, 00815700	An error no longer occurs when you use the Database <b>Connect</b> action, enter the connection string that uses Windows authentication, and run the <b>Run stored procedure</b> action that has an input parameter value of more than 36 characters. Previously, an error was displayed when the length of the input parameter value exceeded 36 characters.
11486	00799450	When an excel spreadsheet is opened in the <b>SAP</b> editor and simultaneously you use <b>Open</b> action of the Excel advanced package to open an excel file, any error no longer occurs when the bot is run and the Excel file is opened successfully. Previously, an Excel file opened in the <b>SAP</b> editor was considered the default window and therefore when you ran the bot, an error was displayed stating that the Excel file could not be opened.
11486	00794102	In the REST Web Service package, the description below the <b>Assign the output to a variable</b> field is now translated correctly for the following languages. <ul style="list-style-type: none"> <li>• Japanese</li> <li>• French</li> <li>• Italian</li> <li>• Portuguese (Brazil)</li> <li>• Simplified Chinese</li> </ul> <p>Previously, the description was not correctly translated for these languages.</p>
11486	00788920, 00796452	In the Email package, when you use <b>Connect</b> action to connect to the <b>Outlook</b> or <b>IMAP</b> server, you can now successfully download the email attachment in .eml file format. Previously, if you had email attachments in .xlsx and .eml file formats, only .xlsx files were downloaded.
11486	--	If you create a <i>Dictionary</i> variable with the <i>Any</i> subtype and select <b>Datetime</b> as the default value, when you click the time icon, you can now see the time values displayed in the drop-down list. Previously, when you clicked the time icon to select the time from the drop-down list, the values were not displayed.

Fixes		
Build	Service Cloud case ID	Description
11486	00746630	You can now create a new task using Excel advanced with <b>Loop</b> and you select the <b>For each row in worksheet (Office 365 Excel)</b> option from the <b>Iterator</b> list, create a <i>Record</i> type variable, and run the bot. An error no longer occurs when you edit the same bot and select the <b>For each row in worksheet (Excel basic or Excel advanced)</b> option from the <b>Iterator</b> list. Previously, a preprocessing error was displayed on bot execution.
11486	00762978	If you use the <b>Windows &gt; Close</b> action and select <b>Currently active</b> as the window title to close active windows, when you run the bot, the <b>Shut Down Windows</b> pop-up is no longer activated even if there are no active windows on the machine.
11486	00805654	The <b>Split</b> action of the String package now allows you to select the <b>Any</b> variable type to hold the output values. Previously, you could select only the <b>list</b> variable.
11486	00761189, 00764563, 00785751, 00794273, 00835194	Performance issues related to the <b>Run macro</b> action in the Excel advanced package are now fixed.
11486	00796120	When you use the <b>Data table &gt; Sort</b> action to sort a column, if the column does not contain any value, the bot now runs as expected and does not get stuck. Previously, you had to stop the bot manually.
11486	00830011	In the Excel advanced package, when you perform the <b>Go to next empty cell</b> action on an Excel sheet, the system no longer runs out of memory.
11486	00765210, 00790641	An error no longer occurs when you use the <b>Excel advanced &gt; Open</b> action to open an Excel file that contains a pivot table.
11486	00776021	When you use the Open action of the Excel advanced package to open an Excel workbook, even if the workbook has invalid links, the bots now run as expected.
11486	00692220, 00785965, 00798035	Performance issues related to the <b>Write from data table</b> action of the Excel advanced package are now fixed, and the action now performs better on Excel sheets with large amounts of data.

Fixes		
Build	Service Cloud case ID	Description
11486	00808137	<p>The format of <b>Start date</b> and <b>End date</b> under the <b>Date</b> condition is now updated to <b>MM/dd/YY</b> for the following actions of the File and Folder packages, where <b>dd</b> now correctly shows the date:</p> <ul style="list-style-type: none"> <li>• File package <ul style="list-style-type: none"> <li>• <b>Copy Desktop files</b> action</li> <li>• <b>Delete</b> action</li> <li>• <b>Print</b> action</li> <li>• <b>Print multiple files</b> action</li> <li>• <b>Rename</b> action</li> </ul> </li> <li>• Folder package <ul style="list-style-type: none"> <li>• <b>Copy</b> action</li> <li>• <b>Delete</b> action</li> <li>• <b>Rename</b> action</li> </ul> </li> </ul> <p>Previously, the format of <b>Start date</b> and <b>End date</b> was <b>MM/DD/YY</b>, where <b>DD</b> gave the day count of the year instead of date.</p>
11486	--	<p>When you run a bot with the following sequence of actions, the file is now successfully deleted at the end of the sequence:</p> <ol style="list-style-type: none"> <li>1. <b>CSV/TXT &gt; Open</b> action to open a <code>.csv</code> file</li> <li>2. A loop action within another loop action to retrieve values from the <code>.csv</code> file</li> <li>3. <b>CSV/TXT &gt; Close</b> action to close the file</li> </ol> <p>Here, all the actions are using the same, default session.</p> <ol style="list-style-type: none"> <li>4. <b>File &gt; Delete</b> action to delete the file</li> </ol> <p>Previously, the file was not deleted because the bot failed to close the default session.</p>
11486	01164436, 01209626, 00975390, 01080879, 01254846, 01256132, 01255004, 01263774,01253240	<p>An error no longer occurs when you use the 2.4.0-20211118-080716 version of the Recorder package to capture a control using HTML technology in the Google Chrome or Microsoft Edge Chromium browser and run the bot. Previously, when you used the 2.3.0-20210806-215200 version of the Recorder package, the bot failed with the following error message: Unable to find control. Search Criteria did not match</p>

Fixes		
Build	Service Cloud case ID	Description
11486	00818990	The capture anchor option in the Recorder package is now supported for the Citrix XenApp application. You can now select an anchor to search for an object in a user interface during bot run and execute actions based on it.
11486	00782962	An error no longer occurs when you loop through multiple Excel sheets and use keystrokes inside the loop to copy and paste the retrieved values into another Excel sheet. Previously, when you opened and closed multiple Excel sheets within a loop, the bot did not identify the correct Excel sheet for performing the keystroke action.
11486	--	You can now use the <b>String &gt; Import string from text file</b> action to read values from a text file when a bot runs if the text file encoding was set to any of the following encodings: <ul style="list-style-type: none"> <li>• UTF-16BE</li> <li>• UTF-8</li> <li>• ANSI</li> <li>• Window-1251</li> <li>• UTF-16LE</li> <li>• Shift-JIS</li> </ul>
11486	--	When you update the Control Room on Linux from any earlier version to Automation 360 v.21, the Control Room now displays the updated interface. Previously, when you updated to Automation 360 v.21, the Control Room continued to display the old interface from the previous version.
11486	00816941	You can now run bots with a queue based on the sorting order that was selected for the work item column in the work item template. Previously, the bots were deployed based on the sequence in which work items were inserted into the queue.
11486	00804330, 00822092	After a bot is deployed on a user device, the <b>Run History</b> page ( <b>Manage &gt; Scheduled</b> ) now shows the correct details about the run history of the bot.
11486	--	When you pause and resume a workload automation after using the run bot with queue in the Control Room, the audit entries are now captured on the <b>Audit logs</b> page.
11486	00803717	In the Control Room <b>Historical activity</b> page, the <b>Modified by</b> column now shows the name of the user (Bot Creator or Bot Runner) who scheduled a bot on a user device. Previously, the column displayed the username of the latest bot user.

Fixes		
Build	Service Cloud case ID	Description
11486	--	When you deploy workload bots from the Control Room, you can now run workload automation with elevated privileges by using the <b>Run as administrator</b> option.
11486	00780635, 00791587, 00795559, 00795632, 00797130, 00797113, 00791783, 00765770, 00826805, 01859661	When you update from a previous release, schedules no longer disappear from a Control Room configured on a single-node or multi-node environment. Also, previously deactivated schedules no longer disappear and become reactivated automatically after the update.
11486	00974353	You can now deploy workload bots on Bot Runner devices because the bots associated with a queue cannot be deleted. Previously, user had permission to delete the workload bots while running with queue.
11486	00830546, 01181402	When work items are inserted for workload automations, an Apache Ignite StackOverflow error no longer occurs, and the Control Room server no longer stops running.
11486	01021889	When you schedule or deploy a bot from the Control Room, if a bot fails to run, an email notification is now sent. Previously, even if the Control Room administrator enabled the <b>A Task Bot stops running because it is unsuccessful</b> setting in the Control Room, an email notification was not sent.
11486	00949288	Scheduled bots are no longer stuck in the pending execution status intermittently on the <b>Activity</b> page, and subsequent bots scheduled for execution are not stuck in queue.
11486	01253045, 01256337	Each scheduled bot is now deployed on Bot Runner device one time in a day. Previously, some scheduled bots were deployed twice on Bot Runner device.
11486	00750399	You can now capture objects from Microsoft Internet Explorer running as XenApp on a Citrix Server that has multiple Citrix applications installed.

The following table lists the limitations identified in the current release:

Limitations in this release
<p>In Enterprise 11, if bots were using windows variable where the window title value did not use the exact case as that of the application window title, after migration, the bots will fail to execute.</p> <p><b>Workaround:</b> You can migrate to Automation 360 v.26 release where this issue is fixed or ensure that you change the case of the window titles in windows variables to match the case of the window titles and then migrate the bots.</p>

Limitations in this release
When you migrate a bot that was using the Manage Window Controls action, the last digit of the height value is not available after migration. However, the bot will execute successfully. (Service Cloud Case ID: 01756996)
When an Excel session is active in SAP, a corresponding Excel process starts in the background. In such a scenario, Automation 360 uses the same Excel process that SAP started. When you run a bot to automate spreadsheet data, Automation 360 processes the first request successfully. However, during execution, if the Excel is closed and a subsequent request is sent for automating the spreadsheet data, Automation 360 does not process the request because the Excel process is still being accessed by SAP. Therefore, the correct window is not activated for automating the spreadsheet data. (Service Cloud Case ID: 00815159)
When you run the bot, the <b>Task bots run</b> metric on the <b>Home dashboard</b> page of the Control Room does not display the correct count. For example, the task bot run count shows 39 on the <b>Home dashboard</b> page, but when you run the bot, the count is displayed as 42 instead of 40. (Service Cloud case ID: 01753337 ) In the "In progress" table, the column sort function cannot be used to list items in ascending or descending order.
After migration, when you run a parent-child bot that share a session and use different DLL package versions, the bot fails with a run-time error message.
<ul style="list-style-type: none"> <li>• Nested IFrames are not supported in Google Chrome and Microsoft Edge Chromium browsers.</li> <li>• After performing an action in an application or page, if a frame is added during run time to the application or page, and the frame is populated and page is not refreshed or reloaded, elements in the application frame or page cannot be captured or played until you manually refresh that page.</li> </ul>
(Service Cloud case ID: 00988580, 01200161) After you migrate from Enterprise 11 to Automation 360, you might not be able to <b>Check out</b> some bots and dependencies to the Control Room <b>Public</b> workspace. <b>Workaround:</b> Check out the parent bots to the Control Room <b>Public</b> workspace. The dependencies are then automatically cloned. For more information, see <a href="#">Cannot Check Out With Child Dependencies Due To No Versions (A-People login required)</a> .
If you are directly updating from Automation 360 On-Premises v.20 or v.21 to this release, you might face issues updating your Bot Agent on some Bot Runner machines in the following scenarios: <ul style="list-style-type: none"> <li>• After a Control Room update, the device status keeps changing and the Bot Agent fails to update automatically.</li> <li>• If the <code>embedded_resources</code> file is missing, the Recorder does not recognize the user interface elements or does not capture a single object in the Google Chrome browser.</li> </ul> <b>Workaround:</b> Before updating to this release, remove the following Bot Agent files and folders: <ul style="list-style-type: none"> <li>• C:\Windows\System32\config\systemprofile\AppData\Local\AutomationAnywhere\AA-DB.mv.db</li> <li>• C:\ProgramData\AutomationAnywhere\GlobalCache\embedded-resources</li> </ul> For more information, see <a href="#">Bot agent auto update fails post the Control Room Upgrade with 'device.connection.lost' (A-People login required)</a>   <a href="#">The recorder is not able to recognize the GUI elements in Google Chrome browser (A-People login required)</a>

Limitations in this release
<p>In some cases, if you <b>Check in</b> a bot to the Control Room <b>Public</b> workspace after filtering any dependency, when you export the bot, all the dependencies are displayed instead of the filtered data.</p>
<p>(Service Cloud case ID: 00773700) The migration process fails to migrate bots that contain more than 96 conditions in a single If command.</p> <p><b>Workaround:</b> Split the If command into two If commands in Enterprise 11 and then migrate the updated bot.</p>
<p>If you create a bot that has invalid JSON tags with an Error Handling action (Try/Catch) in it, and if the <b>Bot validation service</b> is enabled (ON) in the <b>Settings &gt; Bots</b> page, when you run the bot, the bot fails because of a preprocessing error.</p> <p><b>Workaround:</b> In the Bot editor, open the bot that displays the error. Select and click any line of code, edit it, and save it. For example, if you have created a bot using the <b>Comment</b> action, select and click the <b>Comment</b> action, edit it by entering a space in the comment box, and then click <b>Save</b>. When you run the bot now, it no longer displays a preprocessing error.</p>
<p>In SOAP Web Service, selecting the <b>Raw data</b> parameter and using the <b>Build Xpath</b> option to extract values from SOAP response to store the XML output in a variable does not work.</p> <p><b>Workaround:</b> Enter the Xpath expression manually instead of using the <b>Build Xpath</b> option in the selected response.</p>
<p>When you try to establish a secure SQL connection in the Linux environment by choosing the <b>Enable</b> option in the <b>Database Configuration &gt; Secure Connection</b> field, the Linux installer fails to import the SSL certificate, and the connection fails.</p> <p><b>Workaround:</b> Select the <b>Disable</b> option in the <b>Database Configuration &gt; Secure Connection</b> field. The Linux installer successfully establishes a secure SQL database connection.</p>
<p>In Linux environment, the file upload functionality of AARI on the web fails with an access denied error. This error occurs because the <code>filestorage</code> directory is not automatically created to store the files.</p> <p><b>Workaround:</b> Create the filestorage directory in the Automation 360 repository path and assign the appropriate permissions as outlined in the following steps:</p> <ol style="list-style-type: none"> <li>1. Navigate to the Automation 360 repository path: <code>/opt/automationanywhere/automation360/appdata/Server Files</code></li> <li>2. Enter the following commands in the Linux console: <ol style="list-style-type: none"> <li>a. <code>sudo mkdir storageservice</code></li> <li>b. <code>sudo chown -R crkernel:controlroom storageservice</code></li> <li>c. <code>sudo chmod -R 775 storageservice</code></li> </ol> </li> </ol>
<p>When you upgrade the Control Room from the previous version, the <b>Task bots runs</b> metric on the <b>Home</b> dashboard page does not display the historical count of tasks bot that ran in the earlier version. It shows only the count of task bot runs from the upgraded Control Room.</p>

Limitations in this release
<p>When you use the Recorder to capture objects on applications running on Microsoft Edge Chromium with Internet Explorer mode, use Recorder conditions in the bot to check whether the element exists in the application, try to capture UI elements in the application based on the result of the condition, and run the bot, then the bot always goes to the next action because the Recorder condition is unable to locate the UI element in the application.</p> <p><b>Workaround:</b> Use the Image Recognition condition instead to locate a UI element in an application.</p>
<p>Copying Form variables across bots by using the <b>Copy to shared clipboard</b> option is not supported.</p>

The following table lists limitations from previous releases that are also applicable to this release:

Limitations from previous releases
<p>If you configure an external key vault in <b>External Key Vault Integration</b> and select the <b>SQL authentication</b> mode for database authentication in the Windows installer <b>Database Server</b> page to install Control Room (On-Premises), the installation fails, and following error message is shown: <code>Control Room database tables fail to create.</code></p> <p><b>Workaround:</b> Add the database credentials in the external key vault and use those credentials for database configuration.</p>
<p>Newly created Control Room users on Windows for On-Premises Google Cloud Platform VMs cannot change their password. The security questions option is not available on the <b>Change password</b> screen and as a result the Control Room displays an error when they try to save the password.</p> <p><b>Workaround:</b> Refresh the page and change the password again.</p>
<p>(Service Cloud case ID: 00837271) If you are migrating from Enterprise 11 with a database that has a large amount of repository data, the installation might fail. This issue occurs because Liquibase update for a few SQL queries is not completed during migration.</p> <p><b>Workaround:</b> Contact Automation Anywhere Support.</p>

Security fixes	
Service Cloud case ID	Description
00836486, 00942844, 01264029	Disabled the module for caching that was using credential authentication.

## AARI (Automation Anywhere Robotic Interface)

What's new
<p><b>New query filter in Query Requests and Query Tasks actions</b></p> <p>Use the new filter now available in the <b>Query Requests</b> and <b>Query Tasks</b> actions of the <b>AARI Web</b> package to filter query requests and tasks by team name in the AARI web interface.</p>

**What's new****Team name filter**

You can filter your tasks and requests by team name in the **Task** and **Request** pages in the web interface, respectively. Select the **Team** label from the filter and search by team name to view the teams assigned to a task or request.

[Filter and search for a request](#) on page 1522 | [Filter and search for a task](#) on page 1523

**Support for audit logs** (Service Cloud case ID: 00801166)

You can now view the audit logs and refer to events relating to requests, teams, scheduler, process setups, bot setups, human tasks, and bot tasks that you have created, deleted, updated, submitted, or recovered.

[Audit log](#) on page 1972

**Enhancement to user task assignment in Human Task**

In the process editor, the **Auto-assign this task** option in **Human Task** provides the following alternatives:

- **The user who created the request:** The task is automatically assigned to the user creating the request in the web interface.
- **The user who opens this task:** The task is automatically assigned to the user who opens the task in the web interface.

This feature helps to reduce conflicts in assigning a task to oneself, particularly in case of specialized users such as Validator for whom the action of opening a task is equivalent to assigning the task to oneself.

**Enhancement to team setup**

You can now simultaneously add multiple users with similar roles (custom role) to the AARI team in the web interface. The custom role in the Control Room is now aligned with a team in the AARI web interface, and the enhanced team setup works as follows:

- The users added with the role are assigned a **Member** role in the team. The role cannot be changed to **Owner** or **Admin**.
- You cannot view these users in the **Users** tab of the **Team** page.
- If a user is both part of a role and added manually to the team, their role in the team will be the same as the role assigned to them manually. For example, if a user is a member, they will continue to have the **Member** role whereas if the user is an owner, they will be assigned the **Owner** role in the team.
- If the user is no longer part of a role, the user will also not be a part of the team.

Also, the **Team** page is now enhanced with navigation options at the top so that you can navigate through the various tabs (**General**, **Users**, **Roles**, **Processes**, and **Bots**). Use the **General**, **Users**, and **Roles** tabs to create teams and add users to them. The **Processes** and **Bots** tabs display the processes and bots assigned to teams, respectively.

[Team management](#) on page 1511 | [Create an AARI team and assign team roles to members](#) on page 1518

**What's new****Bot setup support**

The AARI Admin can use the **Bot Setup** page to view the bots that are assigned to a team, assign teams to a bot, and edit bots to remove or reassign teams. Attended Bot Runners who can view all the bots that are checked in to the **Public** workspace can now view the bots that are assigned to teams in AARI Assistant.

[Bot setup](#) on page 1530

**Enhancement to the form logo**

You can now use the **Logos in footer** field to select up to two separate logos that are displayed in the footer of the form during bot runtime.

**Add rules to various form elements**

When you are creating or editing a form in the form builder, you can now add rules to the following form elements by using the **Form rules** tab:

- **Checkbox**
- **Date**
- **Document**
- **Dropdown**
- **Label**
- **Number**
- **Password**
- **Radio Button**
- **Rich Text Editor**
- **Text Area**
- **Text Box**
- **Time**

For the **Checkbox** and **Radio Button** elements, the rules are triggered only if the corresponding presets are selected. For example, if a form has two mutually exclusive options, such as **Yes** and **No**, the rules associated with these options are triggered only when you select one of the two options.

[Add rules to form elements](#) on page 1552

What's new
<p><b>Updates to triggers</b></p> <p>The following triggers are now available to run a bot:</p> <ul style="list-style-type: none"> <li>• <b>Process trigger:</b> Starts a bot when the status of the specified process in Microsoft Windows meets one of the following preset conditions: <ul style="list-style-type: none"> <li>• <b>Starts</b></li> <li>• <b>Stops</b></li> </ul> <p><i>Add a process trigger</i> on page 1564</p> </li> <li>• <b>Service trigger:</b> Starts a bot when the status of the specified service in Microsoft Windows meets one of the following preset conditions: <ul style="list-style-type: none"> <li>• <b>Starts</b></li> <li>• <b>Stops</b></li> <li>• <b>Resumes</b></li> <li>• <b>Pauses</b></li> <li>• <b>Is running</b></li> <li>• <b>Has stopped</b></li> <li>• <b>Is paused</b></li> </ul> <p><i>Add a service trigger</i> on page 1564</p> </li> <li>• <b>Window trigger:</b> Starts a bot when the specified application window meets one of the following preset conditions: <ul style="list-style-type: none"> <li>• <b>Opens</b></li> <li>• <b>Closes</b></li> </ul> <p><i>Add a window trigger</i> on page 1565</p> </li> </ul>

What's changed
<p><b>Enhancement to Create a Request package</b></p> <p>In the <b>Create a Request</b> package, you can now browse and choose the public process for which you want to create a request. With this enhancement, you can choose the public process without having to contact the AARI admin for the URI of the public process and enter the URI manually. This feature also simplifies mapping process inputs for initial form fields.</p> <p><i>Web</i></p>

Fixes	
Service Cloud case ID	Description
00800192	You can now use an email trigger to start a bot without any issues, even when the email server is POP3.
00801428	You can now add an email trigger to a Gmail account to start a bot for new email messages.
00736309, 00765069, 00784362	For documents that are in the .csv, .xlsx, or .xls format, you can now use a file trigger to start a bot when a document is modified.

Fixes	
Service Cloud case ID	Description
00796697	When you check in a bot, the associated private event trigger is now retained.
00802427	With the Bot Creator license, you can now view all the requests and tasks regardless of your role or other licenses assigned to you.
00829282	When you create a request in the web interface, your bot now runs properly and does not encounter any processing issues, such as an idle status that prevents progress on your bot.
--	When more than four text box elements of a form are populated in a process, the document is now displayed correctly on the document viewer irrespective of the state of the text box elements. Previously, the document was not displayed.
--	When you delete a request from the <b>Request</b> tab and it is sent to the recycle bin, the related task from the <b>Task</b> tab is now removed.
--	When you use the <b>Date</b> and <b>Boolean</b> type <b>If/Else</b> conditions, there is now parity in validating conditions between a bot and a process. Also, the <b>String</b> type <b>If/Else</b> condition now allows the target values to be empty. Previously, validation for <b>Date</b> and <b>Boolean</b> type conditions were not supported when used in a process and the target values could not be empty.
--	Issues with the <b>Hyperlink</b> element in the <b>Human Task</b> are now fixed. The <b>Hyperlink</b> element now works correctly with the following behaviors: <ul style="list-style-type: none"> <li>• If the hyperlink URL is empty, either at design time or when passed from the process, the hyperlink is now unavailable. Previously, the hyperlink was set to the Control Room domain.</li> <li>• If the <b>Hyperlink</b> element is used in a <b>Human Task</b> that is read-only, data is now passed from the process editor to the form. Previously, the data from the process editor was ignored.</li> </ul>
--	For <b>Time</b> element in forms, when the <b>Use the local time when form is first displayed</b> and <b>Make field required</b> options are selected, the time element now treats the system time as the default value and can be modified in the initial form.

The following table lists the limitations identified in the current release:

Limitations in this release
The web interface lacks the <b>Set Warning</b> action and the <b>Set Error</b> action for the <b>Checkbox</b> , <b>Dropdown</b> , <b>Radio Button</b> , and <b>Rich Text Editor</b> elements.
For the <b>Date</b> and <b>Time</b> elements, when the date and time are included in a rule, changes made to the rule format are not reflected in the rules section. As a result, when you try to process a rule that contains that date and time, bot execution fails.  <b>Workaround:</b> Open the rules editor, expand the corresponding rules, and select a respective data value from the calendar before saving. Do not change the format after the date and time element are included as part of any rule. You can also delete older date and time elements.

Limitations in this release
When you use the <b>Select File</b> element in your forms and select the <b>Make field uneditable</b> option, the element can still be edited.
When you run a bot using the <b>Team Members</b> command from the <b>AARI Web</b> package, you will be prompted with an exception error.
In AARI on the web interface, if you create a variable by using the <b>Form</b> type in a bot, you cannot copy that variable to another bot even when you select the <b>Keep</b> or <b>Overwrite</b> option.
When a user is a member of a team by role (the user was added to a role in the Control Room then the role was synced to the team), the user will not be able to view updated information on the user interface of the request or task details. This is due to the <b>Request</b> page not automatically refreshing. <b>Workaround:</b> Refresh the <b>Request</b> page to view the updated request or task details.

The following table lists limitations from previous releases that are also applicable to this release:

Limitations from previous releases
In an SDS setup, when you create a request to upload a file, the upload fails and a <code>SecurityTokenInvalidException</code> error message is displayed.

## Discovery Bot

What's new
<p><b>Install Bot Agent seamlessly</b></p> <p>If you have not already installed the Bot Agent, you are now prompted to install the Bot Agent from the <b>Processes</b> tab. Follow the screen instructions to install the Bot Agent. After the installation, you are prompted to enable a Chrome plug-in in order to proceed with your recording tasks.</p> <p><i>Prerequisites for Discovery Bot</i> on page 1661</p>
<p><b>Enhancement to auto-generated opportunities</b></p> <p>You can now begin reviewing an auto-generated opportunity from the <b>Opportunities</b> tab when at least one process recording is submitted for review. Review the auto-generated opportunity and choose to create a custom opportunity from an auto-generated opportunity, as required.</p> <p><i>Review opportunities, convert to bot, and generate PDD</i> on page 1679</p>
<p><b>New recordings for review for custom opportunity</b></p> <p>You can now review new recordings submitted by a Discovery Bot user for a custom opportunity. You can choose to accept or dismiss the recording updates as part of the custom opportunity work flow. This option allows you to quickly and easily review new recordings in real time as the recordings are submitted by the user for that process.</p> <p><i>Review opportunities, convert to bot, and generate PDD</i> on page 1679</p>

What's new
<p><b>Enhancements to Opportunities page</b></p> <p>The opportunities page is now updated to include an opportunities evolution map, along with other graphs, to help you review and analyze data for a potential opportunity for automation. Use the opportunities evolution map to help guide you on which opportunities to automate first.</p> <p><a href="#">Analyzing opportunities for automation</a> on page 1678</p>
<p><b>Download PDD document from the Recordings page</b></p> <p>You can now download and export a PDD document from the <b>Recordings</b> page. After you submit a recording for an analyst to review, the PDD begins processing in the background automatically. When the PDD is generated, the field changes from Processing PDD to <b>Download</b>. You can now choose to download the document in Word format, PDF, or both. An email notification to the business user is also sent to the email address on file. The Download PDD for Word or PDF document is also available for a custom opportunity from the Opportunities list table.</p> <p><a href="#">Review opportunities, convert to bot, and generate PDD</a> on page 1679</p>

Fixes	
Service Cloud case ID	Description
--	You will now receive one email notification for a PDD generated in Automation 360 v.21. Previously, when you upgraded to Automation 360 v.22, you might have received multiple email notifications about the PDD generated in Automation 360 v.21.

The following table lists the limitations identified in the current release:

Limitations in this release
<p>During upgrade the PDD documents are not getting generated intermittently, for both recordings and opportunities.</p> <p><b>Workaround:</b> Edit the flowchart for the custom opportunity that displayed an error, and save. Or alternatively, create a new opportunity from the existing opportunity.</p>
<p>Depending on the memory available in your system, the PDD (in PDF or Microsoft Word format) can support up to 250 recorded steps captured in the document. If a process is recorded with more than 250 steps, the PDD generation periodically stops functioning.</p> <p><b>Workaround:</b> Regenerate the PDD and click <b>Download</b>.</p>
<p>The PDD PDF document for business users and analysts does not display Unicode characters when entered in the opportunity name and step description fields.</p>
<p><b>Cloud users:</b> For an auto-generated or custom opportunity, an error is displayed from the <b>Recordings</b> table intermittently.</p> <p><b>Workaround:</b> Refresh the page to update the <b>Recordings</b> table.</p>

Limitations in this release
<p>After you save your changes, if you update a process workflow by adding or removing steps, the values from the <b>Overview</b> pane might not be updated to include the recent changes.</p> <p><b>Workaround:</b> Refresh the page to update and include the recent changes made to the opportunity values in the <b>Overview</b> pane.</p>
<p><b>Cloud users:</b> Creating a custom opportunity with more than 250 steps is not supported.</p>
<p><b>Linux users:</b> The recording flowchart section is not displayed in the PDD.</p>
<p>For On-Premises deployments, when a self-signed or wildcard certificate is used for the Control Room setup, the <b>Processes</b> page fails to load.</p> <p><b>Workaround:</b> Update or add the Control Room certificate to the Java Credential Store on all your Bot Runner machines for the <b>Processes</b> page to load.</p> <p><i>Add Control Room certificate to Windows certificate stores</i> on page 952</p>
<p>For custom opportunities and recordings, there is an intermittent issue and error generating PDD message. You will not be able to access and download a PDD and instead see an <code>Error generating PDD</code> error message.</p> <p><b>Workaround:</b> Only for custom opportunities, you can either create a new opportunity in your workflow using the <b>Save As</b> option OR edit the your workflow chart with any small change and save it. After doing this, the PDD generation will work properly.</p>
<p>Discovery Bot supports bot conversion to template only. To generate the automation task, you must manually update or enhance the template generated by Discovery Bot in the RPA workspace. (Service Cloud case ID: 01840856, 01822803, 01860950)</p>

## Feature deprecation for Discovery Bot

Review the deprecated feature to understand how it can impact your automation.

Discovery Bot Aggregated and Comparison options
<p>The Discovery Bot Aggregated and Comparison tabs from the Processes page has been deprecated as of June 2021. You can use the Opportunities tab to view processes in an aggregated workflow.</p>

## IQ Bot

What's new
<p><b>Document Automation released in Community Edition</b></p> <p>Community Edition now offers limited features from the Document Automation version. This version is integrated with the Community Control Room. When you create a learning instance, IQ Bot automatically creates RPA bots to extract and download the data and an AARI process to manage the end-to-end process. Validation now takes place in AARI tasks.</p> <p>Use IQ Bot Community Edition to extract data from invoices in English.</p> <p><i>Community Edition</i> on page 1794</p>

What's new
<p><b>IQ Bot standard forms enhancements</b></p> <p>IQ Bot now provides the following enhancements related to standard forms:</p> <ul style="list-style-type: none"> <li>You can now extract data from tables.</li> <li>You can now use container deployment.</li> </ul> <p><a href="#">Using IQ Bot for standard forms</a> on page 1862</p>
<p><b>CyberArk support</b></p> <p>The On-Premises installation process now enables users to connect to CyberArk to store their custom keys for encrypting and decrypting IQ Bot data.</p> <hr/> <p><b>Note:</b> This feature is only available for new installations.</p> <hr/> <p><a href="#">Installing IQ Bot in Custom mode</a> on page 1038</p>
<p><b>Classifier enhancements</b></p> <p>You can now create custom document groups in a learning instance. This reduces the possibility of an OCR failing to detect fields in a document, which will cause the Classifier to create a document group unnecessarily or send the document to a wrong group.</p> <p><a href="#">About the Classifier</a> on page 1810</p>
<p><b>View the number of pages purchased and uploaded</b></p> <p>The IQ Bot dashboard now shows the number of pages purchased and uploaded in the current license period.</p> <p><a href="#">Review the dashboard</a> on page 1857</p>

What's changed
(Service Cloud case ID: 00656822) Credential Vault integration is now available for passwords in IQ Bot.

Fixes	
Service Cloud case ID	Description
00727633	When you import or export learning instances, duplicate classification entries no longer occur.
00768600, 00783773, 00815546, 00795424 , 00788180	When you import an existing IQ Bot archive (IQBA) file, you can now use the <b>Overwrite</b> option without any issues.
00770638, 00746545, 00827208, 00746545, 00827208	When you import the IQ Bot archive (IQBA) file, you will no longer see duplicate group entries.
00773631	(On-Premises) After you install, restart the IQ Bot services using a different Windows user. Prior to this release, IQ Bot services could not be run with a different account post-installation, resulting in an incompatible FilePath for Liquibase changesets.

Fixes	
Service Cloud case ID	Description
--	You can now access <b>IQ Bot</b> > <b>Explore IQ Bot</b> with a refined user experience. Previously, a user could not navigate back to the Control Room landing page. Users can now access the landing page by clicking the back button.
00766454	The <b>Manage your IQ Bots</b> no longer displays the incorrect UI for trained bots currently in production. Previously, it displayed a link to create a bot.
00804476	When you update the classification report, you can now successfully classify the documents in IQ Bot. Previously, because the classification report field name was longer than 75 characters, document classification failed.
--	On the <b>Learning Instance</b> summary page, the number of unclassified documents and the number of documents uploaded are now accurately displayed.
00695159	An internal exception in the RemoveLines module that caused documents to remain unprocessed has now been fixed, and documents no longer remain unprocessed due to this error.
00806557	You can now successfully assign a group to a bot, and move the bot to production. Previously, in a few instances, the IQBA contained multiple bots for the same group, making the state of the bot inconsistent.
-	You can now download output files without any issues even if API requests are sent frequently to the database during download for any standard forms learning instance.
-	You can now use the IQ Bot Extraction action without any issues even if you selected the <b>Only for me</b> option when you installed the Bot Agent.
--	For bots associated with standard forms learning instances, you can now successfully upload a large number of documents.
00776423, 00829915, 00949561	You can now use a custom port (apart from port 1433) to run the Migration Assistant tool on the database server.
--	When documents with lengthy non-English (for example, Japanese) file names fail, the issue is now logged in the bot_launcher.log file.
00814577, 00812300, 00823120	An unexpected error that occurred due to large unnamed RabbitMQ message queues has been fixed and the user can now navigate to the <b>Learning instances</b> page.
--	The <b>MLScheduler</b> service is now disabled on IQ Bot Cloud, and the system no longer slows down or stops responding. Previously, the auto-correction and auto-suggestion features, which are part of the <b>MLScheduler</b> service, used extensive system resources and caused the system to slow down or stop responding.

Fixes	
Service Cloud case ID	Description
--	The <b>Process Document</b> action in IQ Bot Extraction package now fetches the ABBYY pre-processing settings from the IQ Bot server and applies these settings to the classic side of processing during bot runtime.

The following table lists the limitations identified in the current release:

Limitations in this release
<p>When a bot is moved to production, documents become unavailable in the validator output folder or the following error is displayed: <code>Project not found/No documents found</code>.</p> <p><b>Workaround:</b> Ensure that the length of the filename does not exceed 100 characters.</p>
<p>In a cluster setup, sometimes, a specific document in production becomes unavailable. Also, an incorrect learning instance summary is displayed.</p> <p><b>Workaround:</b> Upload again and reprocess documents that are not successfully processed.</p>
<p>In the <b>Designer</b>, some documents for the user-created group and their extraction results do not load.</p> <p><b>Workaround:</b></p> <ol style="list-style-type: none"> <li>1. Reload the <b>Designer</b>.</li> <li>2. To obtain extraction details on On-Premises, go to the <code>Settings.txt</code> file and increase the value for <b>See extraction timeout</b>.</li> </ol>
<p>On the learning instance details page, because of the 150-character limit, the group labels for user-created groups are not displayed completely.</p>
<p>When you create an IQ Bot administrator user, if you do not include the <b>AAE_Basic</b> role along with the <b>AAE_IQ Bot Admin</b> role, that administrator user cannot add a new group to a learning instance.</p> <p><b>Workaround:</b> Ensure that you include the <b>AAE_Basic</b> role along with <b>AAE_IQ Bot Admin</b> role in the Control Room.</p>
<p>For a standard forms learning instance, if you upload a document that contains a table with an invalid field, that document is sent to the <b>Failed</b> folder.</p>
<p>For the <b>Concatenate Images</b> action in the IQ Bot Pre-processor package, no output is generated if a filename contains more than 256 characters.</p> <p><b>Workaround:</b> Use English language characters and number convention.</p>
<p>When you use the IQ Bot Extraction package along with other OCR-based commands (such as IQ Bot Pre-processor, IQ Bot Classifier, AISense Recorder, and OCR) in a single bot, the bot fails.</p> <p><b>Workaround:</b> Ensure that you create separate bots for IQ Bot Extraction, and do not run IQ Bot Extraction in conjunction with other packages that include the 12.2 Abbyy OCR.</p>

**Limitations in this release**

From a learning instance of custom domain type with manual groups, when you export the IQBA file to another instance, the manual **Group Label** is not exported. Without a manual group label, it is difficult to differentiate between system-generated groups and manual groups in new learning instances.

The following table lists limitations from previous releases that are also applicable to this release:

**Limitations from the previous releases**

If you have a document with a large number of pages (> 100), an error message is displayed intermittently when you click **See extraction results** for an existing learning instance.

**Bot Insight****What's changed**

To change the language in Bot Insight, you must apply the language settings from either your browser or operating system that is configured to the language of your choice.

[Internationalization, localization, and language support](#) on page 833

**Fixes****Service Cloud case ID****Description**

00799262, 00826862

An error no longer occurs when you run a bot that includes special characters in the name and the analyze command. Previously, bots with an ampersand (&) in the name and the analyze command included encountered an error.

The calculation in the device dashboard is now corrected to show an accurate maximum of 100 percent for daily utilization. Previously, a calculation error caused the device dashboard to display over 100 percent.

The following table lists the limitations identified in the current release:

**Limitations in this release**

Bot Insight is not compatible with Microsoft Internet Explorer 11. For a list of alternative browsers, see [Browser requirements for RPA Workspace](#) on page 829.

**Important:** For information about the packages supported with this release, see [Packages available in Automation 360](#) on page 1369.

**Automation 360 v.22 Release Notes**

*Release date: 21 September 2021*

Review what's new and changed, and the fixes and limitations in the Automation 360 v.22 release. Build 10535 is for Cloud and Build 10526 is for On-Premises. For Automation 360 IQ Bot, Cloud is on Build 10535 and On-Premises is on Build 10520.

---

**Important:** We have updated the Automation 360 Cloud build to include additional fixes for the Apache Log4j2 component vulnerability. The build includes the new Log4j2 library version 2.16.0.

## Updating to this release

You can update the Automation 360 v.22 release from the previous three releases (that is, from  $n-3$  releases, where  $n$  refers to the latest release).

The following previous releases are certified for update to this release:

- v.21 (Builds 9664, 9642, 9595)
- v.20 (Build 8815)
- v.19 (Builds 8147, 8145, 8122, 8098)

You can directly update to v.22 from any of these builds. For details on how to update, see [Update to latest Automation 360 version](#) on page 1022.

---

**Recommendation:** If you are not on an  $n-3$  release, update Automation 360 to one of the three certified releases before updating to this release.

---

**Important:** This release includes a required update to your . Ensure that you complete the update to continue with your automation activities when upgrading from a previous release to this release.

[Automatically update the Bot Agent](#) on page 1001 | [Manually update the Bot Agent](#) on page 1002

---

To verify which version is compatible with this release, see [Compatibility with release builds](#) on page 985.

For information about the latest updates to the Automation 360 extensions for Google Chrome, Microsoft Edge, and Mozilla Firefox, see [Browser extensions for Automation 360](#) on page 765.

## Migration features

Enterprise 11 and Enterprise 10 features
<p><b>Migrate bots that use Credential variables</b> (Service Cloud case ID: 00705937, 00761271, 00776189)</p> <p>You can now migrate bots that use Credential variables that are not available in the Cloud Control Room. However, you must create the required credentials after migration in the Credential Vault and use them in the migrated bots to run these bots successfully.</p>
<p><b>Migration support for Browser, Java, and Java Applet applications for App Integration command</b></p> <p>You can now migrate bots that contain the App Integration command with application types such as Browser, Java Applet, and Java applications.</p>
<p><b>New Action Required tab in Bot Scanner report</b></p> <p>In the <b>Bot Scanner</b> report, we have introduced the <b>Action Required</b> tab within the <b>Bots that can be migrated now</b> section to provide advance notification about bots that require manual intervention after migration so that they can run successfully in Automation 360. View messages associated with the bot that requires action to understand the cause and the specific action you must perform in Automation 360.</p> <p><a href="#">Analyze Bot Scanner report for migration</a> on page 1121</p>
<p><b>Action required, Review required, and Error messages for migration</b></p> <p>Migration messages are now classified into the following categories: Action required, Review required, and Error messages:</p> <ul style="list-style-type: none"> <li>• <b>Action required</b> and <b>Review required</b> messages are displayed for bots that contain unsupported commands but which you can still migrate and run after migration by performing specific actions. The messages provide specific actions you have to perform or information that you have to review to ensure that these bots run successfully after migration to Automation 360.</li> <li>• <b>Error messages</b> are displayed when a specific bot is not migrated successfully. The messages also include the cause for the failure.</li> </ul> <p><a href="#">Migration messages</a> on page 1254</p>

Enterprise 11 only features
<p><b>Migrate bots with the following attributes:</b></p> <ul style="list-style-type: none"> <li>• Bots with timeout specified in their property</li> <li>• Bots that contain the <b>GUI Automation</b> command with the <b>Restore Window</b> or the <b>Execute Script</b> option selected</li> <li>• Bots that open a session for Terminal Emulator and Microsoft Excel in the parent bot and close that session in the child bot</li> <li>• Bots that automate email-related tasks on Microsoft Exchange 2013</li> <li>• Bots that use SAP BAPI standard and custom workflows to automate tasks on SAP applications</li> <li>• Bots that contain the Window command with the <b>Close All Open Windows</b> selected to close all multiple active windows (Service cloud case ID: 00773227)</li> </ul>

## RPA Workspace

What's new
<p><b>Save bandwidth on devices through preloaded offline bot packages</b></p> <p>Customized or most commonly used bot packages in a bot are now saved offline on a user device to the following new folder: <code>AAPreloadedPackages</code>. When a bot is deployed on a user's device, the packages are used from this <code>AAPreloadedPackages</code> folder instead of downloading them from the Control Room.</p> <p>When a specific version of the package is available, you can download it from the Control Room repository to save the time required to download the package during bot execution.</p> <p><a href="#">Preload packages</a> on page 1364   <a href="#">Devices</a> on page 1949</p>
<p><b>Introducing Text file package</b></p> <p>A new Text file package is now available and includes the <b>Get text</b> action. Use this action to extract text from files that have Japanese characters with Shift-JIS encoding and then save the content in the files to a string variable.</p> <p><a href="#">#unique_351</a></p>
<p><b>New actions in Window package</b></p> <ul style="list-style-type: none"> <li>• Use the <b>Close all</b> action to close all windows or programs running on the system, except the windows added in the <b>Add window</b> field.</li> <li>• Use the <b>Restore</b> action to restore the size of a maximized or a minimized window or application running on the system.</li> </ul> <p><a href="#">#unique_352</a></p>
<p><b>Share session across bots</b></p> <p>Share a DLL, Excel, and Terminal Emulator session across multiple bots using the <b>Global session</b> option. You can also share a session with specific child bots using the <b>Variable</b> option and share a session with only the current bot using the <b>Local session</b> option.</p> <p><a href="#">Sharing sessions across</a></p>
<p><b>Enhancements to Excel advanced package</b></p> <ul style="list-style-type: none"> <li>• Open files with <code>.xml</code> and <code>.txt</code> extensions using the <b>Open</b> action.</li> <li>• Use the wildcard character (*) in the <b>Open</b> action for file names to search based on the wildcard pattern.</li> <li>• When you use the <b>Run macro</b> action and specify an argument that has a blank value, this blank value can now be passed to the macro.</li> </ul>
<p><b>New option in Database: Disconnect action</b></p> <p>In the <b>Database: Disconnect</b> action, you can now use the <b>Keep database schema in cache until bot finishes running</b> option to enable the <b>Loop</b> action to iterate the dataset by using cached schema after disconnecting from the database.</p>
<p><b>TNS name supported for Oracle Database connection</b></p> <p>TNS (Transparent Network Substrate) name is now supported in the Oracle Database. You can connect to the Oracle Database by specifying the TNS name and path of the <code>tnsnames.ora</code> configuration file.</p>

What's new
<p><b>New Exchange version supported in Email package</b></p> <p>In the Email package, when you choose an <b>EWS</b> server to establish a connection, you can now use the <b>Exchange2013</b> option in the <b>Exchange Version</b> field.</p>
<p><b>Enhancement to AISense Recorder</b></p> <p>AISense Recorder now enables automation of applications that use Russian and a combination of Russian and English interfaces.</p> <p><i><a href="#">AISense for recording tasks from remote applications</a> on page 1328</i></p>
<p><b>Enhancements to recorder conditions for packages</b></p> <ul style="list-style-type: none"> <li>• Use the new <b>Object does not exist</b> condition from the Condition list of any package to verify whether a specific object in a window exists and then execute actions based on the result. This condition works with SAP technology as well.</li> <li>• The existing <b>Object</b> condition is now renamed as <b>Object exists</b>.</li> </ul> <p><i><a href="#">Loop package</a></i></p>
<p><b>Enhanced support for SOAP Web Service URI</b> (Service Cloud case ID: 00759811)</p> <p>In the SOAP Web Service package, if the input to the <b>Address location</b> field is empty, the bot now retrieves the address location from the WSDL file.</p>
<p><b>New option in SOAP Web Service package</b></p> <p>Use the <b>Build SOAP request</b> option in the SOAP Web Service package to retrieve SOAP request details from the SOAP URI or the WSDL file. You can now select any operations from the list of services and ports available in the SOAP Request to automatically populate data in the fields of the SOAP Web Service action.</p> <p><i><a href="#">Example of using the SOAP web service action</a> on page 1431</i></p>
<p><b>New option in REST Web Service</b> (Service Cloud case ID: 00764198, 00800287)</p> <p>In the REST Web Service package, you can now use the <b>Allow insecure connection when using https</b> option to skip SSL certificate validation and to allow non-secure connections.</p>
<p><b>Relative click and occurrence supported in packages</b> (Service Cloud case ID: 0055643,00754173)</p> <p>When you capture a target image using the Image Recognition package, you can now use the <b>Preview</b> option to select a specific captured occurrence and position your click location relative to the image.</p> <p>The feature is supported in the following packages and actions:</p> <ul style="list-style-type: none"> <li>• Image Recognition &gt; Find image in window</li> <li>• Image Recognition &gt; Find window in window</li> <li>• If &gt; Image Recognition condition</li> <li>• Loop &gt; While &gt; Image Recognition condition</li> <li>• Wait for condition action &gt; Image Recognition condition</li> </ul> <p><i><a href="#">Using Find image in window</a> <a href="#">Using the Find window in window</a></i></p>

What's new
<p><b>Wait time option in Google Sheets package</b> (Service Cloud case ID: 00738249, 00817449, 00814775)</p> <p>When you use the <b>Connect</b> in the action in the Google Sheets package to establish a connection with the Google server, you can now set a wait time in the <b>Wait for actions to complete</b> field when performing actions such as <b>Get</b>, <b>Set</b>, or <b>Delete</b>. For example, if you have a large file that takes a long time to open, you can now set the wait time for the file to open before the system executes the next set of actions.</p>
<p><b>New option for Put action in Dictionary package</b></p> <p>You can now assign a static value to a key for a dictionary variable by using the <b>Static value</b> option in the <b>Put</b> action in the Dictionary package.</p> <p><a href="#">Dictionary package</a></p>
<p><b>Java applications supported in App integration package</b></p> <p>The App integration package now supports Java applications that are based on the Standard Widget Toolkit and Abstract Window Toolkit, which can draw text using Windows text-drawing APIs.</p>
<p><b>Use regular expressions in File &gt; Open action</b> (Service Cloud case ID: 00737614)</p> <p>Use regular expressions (regex) in the <b>Open</b> action of the File package to support pattern-based search.</p>
<p><b>Specify timeout for bots</b> (Service Cloud case ID: 00667049, 00690892, 00699158, 00706491, 00739420, 00739415, 00741590, 00769795)</p> <p>You can now specify the amount of time by which the execution of a bot must be completed. The system stops the bot execution if it is not completed within the time you specified.</p> <p><a href="#">Configure timeout for bot execution</a> on page 1376</p>
<p><b>New option to search text within bot content in Bot editor</b> (Service Cloud case ID: 00735685, 00736201, 00739122, 00740481, 00733885, 00748970, 00746459, 00738181, 00756441, 00759037, 00761453, 00764478)</p> <p>In the Bot editor, use the search box in the Flow, List, or Dual view to search for text, variables, or actions in the entire bot content such as package name, action name, string name, or variable name. This feature helps you to view or edit a bot with long code lines to determine where the searched text, such as variables, strings, or actions, is used and in which line.</p> <p><a href="#">Actions to build bots</a></p>
<p><b>Enhancements to the bot structure</b></p> <p>We have enhanced the overall readability of the bot structure and updated the node labels of the bot to show selected properties and parameters of each action in detail in the Flow, List, and Dual views. You no longer have to expand each action to view these details.</p> <p>The Flow, List, and Dual views display the following properties of actions:</p> <ul style="list-style-type: none"> <li>• The value you enter for actions such as <b>Set text</b> for all supported technologies</li> <li>• Names of objects on which actions such as <b>Set text</b>, <b>Click</b>, <b>Left click</b>, <b>Get property</b>, and <b>Select item by index</b> are performed</li> <li>• Name of the object property mentioned in the action</li> <li>• Name of the return variable if some value is assigned to a variable</li> <li>• List of properties for the <b>Get property</b> action</li> </ul>

What's new
<p><b>Enhanced network security control</b></p> <p>As a Control Room administrator, you can now configure and audit specific, permitted URLs for more granular control of the network access points.</p> <p><a href="#">Set callback URLs</a> on page 2054</p>
<p><b>Enhanced proxy support</b></p> <p>Connections to the internet are often run through proxy servers. Automation 360 provides enhanced support for proxy configuration for packages, such as REST and SOAP packages, for building and running bots.</p> <p><a href="#">Connect Bot Agent to a device with a proxy</a> on page 1005</p>
<p><b>Connect to Azure DevOps (Cloud) Git from Control Room</b></p> <p>You can now connect to Azure DevOps (Cloud) Git through the Control Room to check in a bot and its dependent files to the remote Azure DevOps (Cloud) Git repository.</p> <p><a href="#">Connect to Azure DevOps Git from Control Room</a> on page 2070</p>
<p><b>Work item ID and time filters for workload automations</b></p> <p>Combine the work item ID and start time of a queue to search for specific work items and monitor the progress of these work items. The start time filters the list of all work items that start between specified start date and start time.</p> <p><a href="#">Actions allowed on view queue page</a> on page 2126</p>
<p><b>Enhancements to execution type key in AATaskExecutor variable</b></p> <ul style="list-style-type: none"> <li>When you schedule a bot to run, the <code>Execution_Type</code> key in the <code>AATaskExecutor</code> variable now returns information about the execution type with schedule type (frequency) such as <code>Run as schedule Daily</code>, <code>Run as schedule Weekly</code>, or <code>Run as schedule Monthly</code>.</li> <li>When you use a trigger in a bot, the <code>Execution_Type</code> key can be accessed through the trigger data. The <code>Execution_Type</code> key returns the <code>Run through Trigger</code> as a string for triggers.</li> </ul>
<p><b>Language support for variable names</b></p> <p>Variable names now support Greek and Japanese languages. You can now create variable names using the following characters:</p> <ul style="list-style-type: none"> <li>Greek uppercase and lowercase characters</li> <li>Japanese Katakana full-width and half-width characters.</li> </ul>
<p><b>ML services support in Linux package installer</b></p> <p>The python package in the Linux installer package is now updated to support ML services. When you download and install Control Room on Linux, ML services are up and running as part of the installation process.</p> <p><a href="#">Installing Control Room on Linux</a> on page 909   <a href="#">Stop and start Control Room services on Linux</a> on page 2105</p>

What's new
<p><b>Direct download support in Bot Store</b></p> <p>Users who cannot connect their Control Room to the internet can now directly download Automation 360 bots and packages locally from Bot Store and then import them to their Control Room.</p> <p><a href="#">Download locally and import bots and packages from Bot Store to Control Room</a> on page 1783</p>
<p><b>MS-SQL database management enhancement</b></p> <p>Administrators are no longer required to re-install Automation 360 to have the ability to change MS-SQL configuration related settings. The editable settings include username, password, database server name, database server IP and port numbers.</p>

What's changed
<p><b>Changes to Runtime Window</b></p> <p>The title on the <b>Runtime Window</b> is now changed to <b>Bot running</b> from the previous <b>Automation Anywhere</b>.</p> <p>If any issue occurs in your automation due to this title change, see this article on how to resolve it: <a href="#">A360.22   Runtime Window: Minimize Command Fails Due to Title Change (A-People login required)</a></p>
<p><b>Changes to Run DLL package</b></p> <ul style="list-style-type: none"> <li>The <b>Run function (Legacy)</b> action is no longer available in the Run DLL package. We recommend that you use the <b>Run Function</b> action from the Run DLL package because this action is an improved version of the <b>Run function (Legacy)</b> action.</li> </ul> <p>Note that existing bots that use the <b>Run function (Legacy)</b> will continue to run successfully without any issues.</p> <ul style="list-style-type: none"> <li>The <b>Set session variable</b> action is no longer available in the Run DLL package. Instead, we recommend that you create a new DLL session using the <b>Variable</b> option in the <b>Open</b> action of the Run DLL package.</li> </ul> <p>Note that existing bots that use the <b>Set session variable</b> action will continue to run successfully without any issues.</p>
<p><b>Messages for migrated bots for which referenced MetaBot logic is not available</b></p> <p>Bot Scanner and Migration Assistant now display action required messages for Enterprise 11 or Enterprise 10 bots for which the referenced MetaBot logic is not available.</p>
<p><b>Migration of bots with missing variable is blocked</b></p> <p>The migration process does not migrate Enterprise 11 bots that use a variable which is no longer available and that variable is used in the If, Loop, Variable Operation, or Clipboard command. Previously, these bots were successfully migrated but an error occurred when the bots were run.</p>
<p><b>Update to MetaBots that use same DLL in multiple logic</b> (Service Cloud case ID: 00684185, 00730248, 00742840, 00742840, 00779629, 00779788, 00727977, 00743986, 00764872)</p> <p>Migrated bots that use the same DLL in multiple MetaBot logic now work as expected without any modification. Previously, you had to update the migrated bots to run them successfully.</p>

<p><b>What's changed</b></p>
<p><b>Migrated bots run successfully when mapped variables are not available</b> (Service Cloud case ID: 00746651, 00785703)</p> <p>Migrated bots now run successfully when mapped variables are not available in the child bot or the parent bot.</p>
<p><b>Enhancements to Bot Agent device settings</b></p> <p>To easily access local and remote devices, a user can now change the Bot Agent device settings from the <b>My Settings</b> page in the Control Room pane below your username. You can perform the following actions:</p> <ul style="list-style-type: none"> <li>• Update device credentials</li> <li>• Change the default Bot Runner device</li> <li>• View local device name, status, and Bot Agent version</li> </ul> <p><a href="#">Set user device credentials</a> on page 1011   <a href="#">View and update Bot Agent device settings</a> on page 1012</p>
<p><b>Enhancement to auto discovery for multiple domains</b></p> <p>You can now configure the maximum number of sites that can be discovered across the domain in the <code>um.properties</code> file for a Control Room set up for auto discovery across multiple domains in different locations.</p> <p><a href="#">Configure Control Room for Active Directory: auto mode</a> on page 942</p>
<p><b>Enhancement to OpenDistro for Elasticsearch</b></p> <p>As part of enhanced security, OpenDistro (cron-utils) is now upgraded to v.1.13.2 for Elasticsearch v.7.10.2</p>
<p><b>Update to Printer package</b></p> <p>In the <b>Remove</b> and <b>Set default</b> actions of the Printer package, you can now select a specific printer from the list of available printers.</p> <p><a href="#">Printer package</a></p>
<p><b>Insert recorded actions in the middle of a bot</b></p> <p>You can now insert any recorded actions that are newly captured at a specified location in an existing bot. Previously, recorded actions were added to the existing bot at the end by default and users had to drag the action to the specified location.</p> <p><a href="#">Universal Recorder for object-based automation</a> on page 1313</p>

What's changed
<p><b>Migration: system variable behavior outside a loop</b> (Service Cloud case ID: 00761281)</p> <p>When you migrate bots that use system variables outside a Loop package, the variables are now converted to record type or string type user-defined variables as applicable and assigned to a record action. As a result, when bots that contain these variables are run, data from the last row is displayed. Previously, an empty value was displayed after migration.</p> <p>The following system variables are converted to record type variables:</p> <ul style="list-style-type: none"> <li>• \$Filedata Column\$</li> <li>• \$Excel Column\$</li> <li>• \$Dataset Column\$</li> <li>• \$Table Column\$</li> </ul> <p>The system variable \$XML Data Node\$ is converted to a string type variable.</p> <p><a href="#">Variable mapping for migration</a> on page 1232</p>
<p><b>Support removed for Redirect URI attribute in Google Sheets package</b> (Service Cloud case ID: 00777287)</p> <p>The <b>Redirect URI</b> attribute in the <b>Connect</b> action of the Google Sheets package is now removed. After updating to this release from previous Automation 360 releases, you can continue to successfully execute your bots by entering the fixed redirect URL in Google Cloud Platform: <code>http://localhost:8888/Callback</code></p>
<p><b>Updates to device credentials recorded in audit log</b> (Service Cloud case ID: 00691511)</p> <p>You can now view audit log entries if your device credential is updated either manually through the Bot Agent device or through the Control Room API. Activity details such as the user name updating the device credentials and the time of the update are logged.</p>
<p><b>Enhancement to Image Recognition package</b></p> <p>When secure recording is enabled, the target image that is captured using the actions in the Image Recognition package is now hidden after the initial capture to enhance security. Previously, the user was able to view the target image even when secure recording was enabled.</p> <p><a href="#">Image Recognition package</a></p>
<p><b>Enhancement to File and Folder package</b></p> <p>Users with a valid role permission can now create a shortcut to a selected source file at a specified location using the <b>Create shortcut</b> action in the File and Folder package.</p>
<p><b>Support for HTTP method HEAD</b> (Service Cloud case ID: 00754096)</p> <p>The HTTP method <code>HEAD</code> is now supported as an API call to connect to the load balancer of a Control Room configured for high availability.</p>

What's changed
<p><b>Update to Linux installation and log path</b></p> <ul style="list-style-type: none"> <li>• <b>Installation files</b> <ul style="list-style-type: none"> <li>• If you are on a version earlier than Automation 360 v.22 or if you have updated from an earlier version to v.22, the installation files are now stored in this path <code>/opt/automationanywhere/enterprise</code></li> <li>• If you perform a new installation of v.22, the files are stored in this path: <code>/opt/automationanywhere/automation360</code></li> </ul> </li> <li>• <b>Log files</b> <ul style="list-style-type: none"> <li>• If you are on a version earlier to v.22 or if have updated to v.22 from an earlier version, the log files are stored in this path: <code>/var/log/automationanywhere/enterprise</code></li> <li>• If you perform a new installation of v.22, the log files are stored in this path: <code>/var/log/automationanywhere/automation360</code></li> </ul> </li> </ul>
<p><b>Check out a TaskBot with specific version</b></p> <p>If a bot has multiple versions, you can now select and check out the specific version of the bot. As a Bot Creator, this enables you to roll back to an earlier version of the bot.</p>
<p><b>Signed DLLs for bots and packages</b></p> <p>Automation 360 now signs all DLLs, including third-party DLLs, for bots and packages.</p> <p>The following are exceptions:</p> <ul style="list-style-type: none"> <li>• The IQ Bot Pre-processor package does not have a new version in this Automation 360 v.22 release. The v.21 package version is copied to v.22 without modification, including a few unsigned DLLs.</li> <li>• The Process Discovery package in this v.22 release does not have the signing applied.</li> <li>• Automation Anywhere</li> <li>• Azul Systems (Java JRE in Bot Agent)</li> <li>• TeamDev Ltd. (third-party library)</li> </ul>

Fixes	
Service Cloud case ID	Description
00712808, 00765752	In previous releases, Automation Anywhere related files were sometimes generated in <code>C:\Windows\Temp</code> . This issue is now fixed.
00800392	An error no longer occurs when you migrate from a Enterprise 11 version where a database is stored on Google Cloud Platform.
00811887	The Cloud Migration Utility no longer encounters an error when you use a custom port number to connect to the Enterprise 11 database.
00815097	Enterprise 11 bots that are checked out by a user are now successfully migrated to Automation 360 Cloud.

Fixes	
Service Cloud case ID	Description
00802360	You can now update the value of Enterprise 11 credential attributes after they are migrated to Automation 360 Cloud. Previously, the system encountered an error when you updated the value of a credential attribute that was added or updated by a user in Enterprise 11 and that user was no longer available when Enterprise 11 data was migrated to Automation 360 Cloud.
--	When you migrate from Enterprise 11 to Automation 360 Cloud, an error no longer occurs when a locker is deleted in Enterprise 11 but its related permissions are still used in other entities.
--	An error no longer occurs when you update from Version 11.3.5.2 to any Enterprise 11 version and then migrate from that Enterprise 11 version to Automation 360 Cloud.
--	The <b>Refresh</b> and <b>Back</b> options are now available on the <b>Summary</b> screen of the Cloud Migration Utility when enough disk space is not available to store the backup of Enterprise 11 Control Room data.
00787240, 00781349	Migrated bots no longer encounter an error when a parent bot and its child bot are opened through Internet Explorer and the child bot extracts a table from Internet Explorer.
--	There is no limitation now on the number of ActiveMQ connections that are allowed when running an automation that is looped 5 times, with each loop running over 20 bots. In previous releases, the automation sometimes failed after the fourth loop.
0074312	You can now successfully migrate bots that contain <b>Trim</b> operation of the <b>String</b> and the output is assigned to an <b>Array</b> variable.
00760963	Migrated bots that contain the <b>Go To Cell</b> command now work properly in Automation 360 after migration.
--	Bot Scanner now loads the modified <code>cache.properties</code> file from the <code>conf</code> folder. Previously, you had to place the modified <code>cache.properties</code> file in the executable file location of the Bot Scanner for the file to be loaded.
00754003	Bots that contain the SOAP Web Service command now successfully run after migration without encountering any error. Previously, an unexpected error occurred when the SOAP Web Service with WSDLs defined with external dependencies were not invoked.
00790360	In the <b>Terminal Emulator</b> package, when you send any key to the terminal with the <b>Send text</b> or <b>Send key</b> action, if the terminal is in a busy state or the keyboard is in a locked state, these actions now wait for 5 seconds for the terminal to return to a normal state. After 5 seconds, the system moves to execute the next action without any exception.
00742000	Migrated bots that contain the <b>Prompt &gt; For value</b> command with the <b>Don't write in any windows</b> option selected now work as expected in Automation 360 after migration and no text is written in the file if any window is open. Previously, even if this option was selected, if any text file window was open, the text was written in the file.

Fixes	
Service Cloud case ID	Description
00781072	When bots are migrated using the Bot Migration Wizard, migration no longer fails if the bot name includes a special character. Previously, an internal error occurred when the bot name included an apostrophe (') character.
00780713, 00778164	A migrated bot is no longer unresponsive when that bot uses the App Integration package to capture text from a target application and the target application becomes unresponsive.
--	Migrated Enterprise 11 bots that use the Terminal Emulator command to clear the terminal screen of the VT and ANSI type terminals no longer encounter an error when they are executed.
00748647	Migrated Enterprise 11 bots that use two-dimensional array and the Variable Operation command no longer encounter an error. Previously, the migration process used to set the number of rows and columns for the two-dimensional array to 1x1 irrespective of the values set in Enterprise 11.
--	The migration process continues to migrate bots if the connection between the Control Room and the Bot Agent is lost and then reestablished. Previously, the migration process failed when the connection between the Control Room and the Bot Agent was lost.
00764441	In the <b>Excel: Get single cell</b> action of the <b>Excel advanced</b> package, you can now access the value of a specific cell defined in the cell address. Previously, migrated bots encountered a <code>Must match pattern</code> error when a Japanese character was entered in the <b>Cell address</b> field.
00757713, 00764985, 00820376	The <b>Excel advanced</b> package now enables you to read from a protected sheet. Previously, migrated bots encountered an error when you retrieved a cell from a protected sheet using the <b>Excel advanced: Open</b> action.
00761911	You can now migrate bots using the <b>Excel column</b> system variable where the key is the <b>column name</b> ; an error is no longer encountered.
00769321	Migrated bots no longer encounter an error when the <b>Run Excel Macro</b> command is included in the bots. Migrated bots now run properly using the <b>Run macro</b> action of the <b>Excel advanced</b> package.
00790858	You can now migrate a bot when there is a variable mismatch and the respective command is disabled. Previously, when the bot was assigned a certain variable type and the <b>Variable Operation</b> command in that variable was disabled, Bot Scanner displayed an error for the variable when the type was later changed.
00744318, 00744326, 00745318	You can now download an exported bot file with Japanese characters in the filename through email. Previously, when an exported file with a Japanese name was downloaded using the email link, an error occurred or the characters in the exported zip filename were garbled and <code>.zip</code> was appended to the filename.

Fixes	
Service Cloud case ID	Description
00762975	After you migrate Enterprise 11 bots that use the <b>Error handling</b> command with the <b>Send email</b> function and the <b>Attach variable and Attach snapshot</b> option, the bots now correctly send error emails with attachments containing a snapshot or variable text file.
00731577, 00746226, 00760649, 00759973, 00767618, 00789545, 00821824	The <code>includePackages</code> parameter of the Export API now works as expected. If you set the value of the parameter as <b>True</b> the packages are included in the exported file, and if the value is set to <b>False</b> the packages are not included in the exported file.
--	You can now migrate bots with variable names that include full-width and lowercase characters. Previously, migration of bots with a variable name that included full-width and uppercase characters was not supported because the variable was mistakenly converted to a half-width character.
00759189	Migrated bots now use the date format specified in the <code>AADefaultDateFormat</code> global value for email-related automation. You must create the <code>AADefaultDateFormat</code> global value before migrating the bots and specify the date format you want to use in the migrated bots.  <b>Recommended:</b> Specify the same date format in the <code>AADefaultDateFormat</code> global value that is used in Enterprise 11.
00784001	Enterprise 11 bots that are migrated now contain all the properties of an object captured from a SAP application.
00786362, 00802274	Enterprise 11 bots that are migrated no longer encounter an error when the child bot and parent bot use different versions of the If package.
00807986	Enterprise 11 bots that are migrated no longer encounter an error when a variable that is mapped between a child bot and the parent bot is not available in the child bot.
00808026	Enterprise 11 bots that are migrated no longer encounter an error when they use a shared session for Terminal Emulator related tasks when a session is shared between nested child bots and an intermediate child bot does not contain any Terminal Emulator actions.  For example, consider that you have three bots: Bot1, Bot2, and Bot3, where Bot1 calls Bot2 and Bot2 calls Bot3. Bot1 and Bot3 share a session for Terminal Emulator related tasks; however, Bot2 does not contain any actions from the Terminal Emulator package. When you share a session between Bot1 and Bot3, an error is no longer encountered.
00762368	Previously, when bots were migrated using Oracle database processes with passwords containing the symbol, an issue occurred. The issue is now fixed and passwords using the "@" symbol are now supported.
00768466, 00769099	An error no longer occurs when you migrate MetaBots that contain logic that are available within a folder.
00772885	The system now retrieves all rows in a table in a SAP application when the last page of the table contains a single row.

Fixes	
Service Cloud case ID	Description
00801733	An increase in CPU usage no longer occurs when the Control Room is in an idle state.
00774821	An error no longer occurs when you run migrated bots that contain a Loop action within another Loop action.
00786732	For Enterprise 11 bots that use the <b>Extract Table</b> command along with other commands within the Error Handling command and only the <b>Extract Table</b> command is disabled, only the equivalent action for the <b>Extract Table</b> command is disabled after migration. Previously, all the actions within the Error Handling action were disabled in the migrated bot.
00743892	An error no longer occurs when you run migrated bots that use DLLs that return a value of user-defined type. Such values are converted to the string type in the migrated bots.
--	Enterprise 11 bots that use variable operations to re-initialize an array type variable to contain more than 160,000 cells (for example, 400 rows and 400 columns, or 800 rows and 200 columns) no longer encounter an error when they are executed after migration.
00737025	Enterprise 11 bots that pass system variables such as Month, Year, and Day as an input variable to a MetaBot no longer encounter an issue after they are migrated.
00773407	Previously, historical activity reports exported to CSV did not display the <b>Last Modified</b> information correctly because some of the <b>Modified On</b> and <b>Modified By</b> information was not accurately processed. The error is now fixed and historical activity reports can now be correctly exported to CSV files.
00767597	The <b>Last Modified</b> (date) value displayed in the historical activity and bot page reporting was previously not translated correctly when the Control Room language was changed from English to non-English, and then back to English. This error is now fixed, and the data is preserved when the language is changed in the Control Room.
00762975	Japanese language text is now updated in the interface for recent user experience (UX) changes. Previously, there were some errors in the translated text in the interface, which are now fixed.
00763228, 00776154	Database constraints, such as foreign key constraint violations, previously prevented users from deleting bots after migration. This limitation is now fixed and users can delete migrated bots (.atmx files) without any issue.
00749375,00763262	After migration, if text file encoding was set to <b>UNICODE</b> or <b>UTF8</b> , you can now use the <b>String: Import string from text file</b> key to read values from the text file during bot runtime.
00739268	You can now migrate bots that have large <code>html</code> data associated with the Object Cloning command without any issues.

Fixes	
Service Cloud case ID	Description
00674147, 00682390	The <b>Stop service</b> action of the <b>Service</b> package now enables you to stop all child and dependent services of a selected window or application. Previously, the dependent service did not stop automatically when a user tried to stop any window or application service.
00754835	Temporary devices are now automatically deleted if the auto-delete option is enabled for device settings in the Control Room.
00751058, 00761099	When you use the Database Connect action for workload automation, work items from the second iteration are now executed for automation. Previously, only the first work item in the workload automation was executed.
00771098	After you edit a schedule from the <b>Scheduled activity</b> page and save the schedule, the correct page ( <b>Scheduled activity</b> ) is now opened instead of the <b>In progress activity</b> page.
00733614, 00741358	You can now use the <b>Extract image</b> action of the PDF package to convert a PDF file that contains JPX images to any other image format. Previously, the action failed to extract image from the PDF file because the JPX image reader was not supported.
00765851	Recorder actions now work properly and do not cause any delay when the <b>Set text</b> value contains brackets or [] (which enables you to run a migrated bot without delay). Previously, it took a longer time to run the bot when <b>Set text</b> contained [] (brackets).
00771197	In the <b>Open</b> action of the Browser package, the description below the <b>Time out after (seconds) (optional)</b> field is now translated correctly as <code>Min= 9 seconds</code> in the Japanese language. Previously, the description was translated as <code>Max= 9 seconds</code> .
00761395	In the Database package, when you connect with the Oracle Database and use the <b>Read from action</b> option in a loop to retrieve records from the database, the bot is now executed successfully. Previously, bot execution failed with an error.
00727530	The <b>Move all</b> action in the Email package now works properly and does not encounter any issue.
00739978	An error no longer occurs when you choose the <b>Manual input</b> option to open a VB Script file.
00728180	The issue with event triggers when creating folders in bulk is now resolved. If you configure an event trigger to start a bot whenever a folder is created and then create folders in bulk, the bot is now deployed for every folder that you create. Previously, the bot was not deployed for all the folders created.
00711134, 00750164, 00847916	If you configure multiple triggers to start bots based on file events and if all the files reside in the same folder, the bots associated with all the triggers are now deployed. Previously, only some bots were deployed.
00719612	When you log in to the Control Room as an unattended Bot Runner, you can now execute bots using the <b>Run as self</b> option. Previously, an unattended Bot Runner could not run the bot with the <b>Run as self</b> option even when the device was set as the default device.

Fixes	
Service Cloud case ID	Description
00745095	In the Database package, when you connect to the Microsoft Access database using the JDBC connection, the select query now extracts the file name for the Attachment data type. Previously, an error was displayed.
00772194	Data from any database type is now exported correctly in CSV format. Previously, if the data had special characters such as double quotation marks, the output was displayed in a new line.
00773961	When you create a new worksheet by name in the Google Sheets package, an error no longer occurs when you execute the bot.
00762029	An error no longer occurs when you execute a bot using the Google Calendar package. Previously, when the <b>Disconnect</b> action was used to terminate the connection, the email address attribute was stored in the session name instead of the user session name attribute. As a result, bot execution failed with an error.
00758333	If all versions of a particular package are disabled, then the package is no longer listed in the Actions palette of the Bot editor.  Previously, when a package was disabled, the Bot Creator still displayed it in the Actions palette and users were able to use the package when creating a bot. However, these bots failed on execution because the package was disabled.
00780221	A bot created using the <b>Run function</b> action in the Run DLL package now executes without any issues. Previously, an error was displayed on bot execution due to the unavailability of some embedded resources such as satellite assembly.
--	An error no longer occurs when you create a bot using the <b>Send text</b> action of the Terminal Emulator package and pass a variable with an empty value. Previously, the bot failed to execute when any variable options (Credential, Variable, Insecure String) that had no value was selected.
00776430	When you connect to the Terminal type <b>TN3270E</b> in the Terminal Emulator package, select any of the <b>Terminal model</b> options from the list, and execute the bot, the correct screen resolution is now displayed. Previously, a wrong value was sent for each Terminal model and a screen with incorrect resolution was displayed.
00773415, 00781487	When you open a spreadsheet in the Google Sheets package and select the <b>Beginning of the row</b> option in the <b>Go to cell</b> action, the output is now displayed correctly. Previously, the output was displayed at the column level.
00773415, 00781493	An error no longer occurs when you open a new or blank spreadsheet in the Google Sheets package and you select an action such as <b>Go to cell</b> or <b>Set cell</b> to perform an operation. Previously, bot execution failed with an error.

Fixes	
Service Cloud case ID	Description
00779561	In the System package, when you use the <b>Get environment variable</b> action in view mode, the environment variables are now always displayed in the list. Use the refresh option to retrieve all the environment variables in the list. Previously, the environment variables were sometimes not displayed in the list.
00775073	In the Excel advanced package <b>Get worksheet as data table &gt; Read</b> option, the description for the <b>Read cell value</b> option now reads correctly as 50% will be read as 50 when it is translated to the Japanese language. Previously, the description was translated as 50% will be read as 50%.
00767246	The SOAP Web Service package now works for URIs, where the service endpoint can be passed as a URI parameter. Previously, an error was displayed for such requests.
00734463, 00754570, 00766456	When the <b>Connect</b> action of the Database package is used to establish a connection with the Microsoft SQL Server using Windows authentication, the bot now executes successfully even when the parent and child bots use different versions of the Database package. Previously, the bot failed if the parent and child bots used different versions of the Database package.
00780921	An error no longer occurs when you use the <b>PDF extract text</b> action to extract text from a PDF file. Previously, when structured text was extracted from a PDF file, an error was displayed because the index exceeded the 1000 range.
--	In the Excel advanced package, when you use the same session name to open multiple Excel spreadsheets, the bot now displays an error on execution. Previously, if the same session name was used in multiple spreadsheets, the bot overwrote the existing open session when the second <b>Open</b> action was executed.
00785198	In the Data Table package, when you now use the <b>Write to file</b> action to extract data from a table with large records, 1000 rows of data are read in batches and written to a CSV file. Previously, a Java heap space error was displayed because the configured Java heap memory ran out of space. As a result, data could not be retrieved from a table with large data and written to a CSV file.
00757593	In a Cloud deployment, child bots can now be migrated using the Migrate Bot action from the Bot Migration package. Previously, child bots were not migrated but a migration successful message was displayed.
00731012, 00747385, 00746320	If you install the Control Room in the default location in C:\ and configure the logs directory in another location (for example, E:\), WebCr logs are now generated dynamically in the custom location.
00768318, 00760835	An error no longer occurs when you try to capture objects using AISense Recorder on any version of Windows that does not have the default media feature pack. Previously, the AISense Recorder did not highlight the objects on a page.

Fixes	
Service Cloud case ID	Description
00737710	In the <b>Capture</b> action of the Recorder package, when you select the <b>Set Text</b> action and enter a string variable with a delay set for each keystroke, the output is now displayed correctly on a new line for all Microsoft applications. Previously, on bot execution, the output was shown on one line when a delay was set in the <b>Keystroke</b> .
--	If you deploy bots using event triggers and you install the Bot Agent on a device as a non-admin user for self or a local admin user, the Bot Agent is now updated automatically. The device is no longer shown as disconnected in the Control Room.
00782596	You can now migrate workload automation bots from Enterprise 11 to this release. A client protocol exception message is no longer displayed.
00743810, 00785703	You can now map variables with different letter cases between parent and child bots when you run bots after migrating them from Enterprise 11 to this release. For example, if the variable name in Enterprise 11 is <code>Var1</code> and the variable name is changed to <code>var1</code> after migration, you can map the variables and continue to run the bots.
--	Bot deployments on Bot Agent devices no longer fail when you close a terminal window using the close Window action from the Window package or manually close the Terminal Emulator window.
00767587	You can now run bots from the <b>In progress activity</b> page. Previously, bots were stuck in the <b>Pending execution</b> state and as a result other bots did not run. You had to manually move the bots stuck in this state to the <b>Historical activity</b> page to run the other queued bots.
00789682, 00798933	You can now delete, reset, or place on hold workload automations because work items are no longer stuck in the ready to run status. Also, the following message is no longer displayed: <code>Work item cannot be deleted in this state.</code>
00720471	An error no longer occurs when you use the Recorder package to capture an object and perform the click action on the capture coordinates. Previously, when you captured the object properties and if the download bar in Google Chrome was open, object properties in the browser could not be captured.
00754651	In the <b>If</b> action of the If package, when you select any condition from the <b>Condition</b> list, and drag any other action inside the If action, the condition is no longer deleted from the <b>Condition</b> list and the action no longer disappears from the <b>List</b> and <b>Flow</b> view.
00768354	An error no longer occurs when you use the AISense Recorder in child bots when running them in a loop. Previously, when the AISense Recorder was used in a child bot and the bot was executed, external processes were not terminated, causing the system to run out of memory.

Fixes	
Service Cloud case ID	Description
--	Previously, when bot migration was performed, the process sent various, occasionally multiple, email notifications to all existing Control Room users, even if the administrator had disabled email notifications. An option is now added to enable the administrator to disable email notifications when Credential Vault data is created during bot migration.
00762368	Previously, when bots were migrated using Oracle Database processes with passwords containing the "@" symbol, an issue occurred. The issue is now fixed and passwords using the "@" symbol are now supported.
--	Previously, during migration, a parent bot was successfully processed even if associated child bots did not exist. This created errors during runtime. In this release, if associated child bots do not exist for the parent bot, a message notifies the user of the required action before migration can continue.
00762975	Bots that used the Error Handling action to capture screenshots were incorrectly modified and appended as .PNG files. Migrated bots are no longer modified and appended in this manner.
00751496	Attended Bot Runner devices now show an improved time performance when running bots on Microsoft Edge browser.
00753673	When you run a migrated bot that contains the <b>Excel Advanced</b> > <b>Delete cell</b> > <b>Specific cell</b> option with comma-separated input cell values such as <b>A1, B1</b> , the migrated bot now runs successfully and displays the output correctly.
00736473	Fixed an issue where a migrated bot containing the <b>Excel Advanced</b> > <b>Open</b> action did not load the Excel add-ins even when the <b>Load Add-ins</b> check box was selected. Now, the Excel add-ins are loaded successfully.
00767917	You can now run bots with a queue on single user devices that were previously configured for multiple users.
00712719	An error no longer occurs when you run bots that contain actions from the Terminal Emulator package on your device. Previously, bots could not be run due to a synchronization issue with the terminal.
00753121	An error no longer occurs when you use the <b>Convert excel to PDF</b> action of the Excel advanced package to save a converted PDF to a shared network drive.
00763746, 00773924	When you select the <b>Keystrokes</b> action in the Simulate keystrokes package and enter a variable or static text containing half-width Japanese characters, the output now displays the correct Japanese characters. Previously, on bot execution, the output displayed incorrect characters.

Fixes	
Service Cloud case ID	Description
00774872, 00807106, 00824486	When you use the <b>Close</b> action of the Browser package to close the last Chrome browser window, the last tab of a Chrome browser window, or all Chrome browsers, the bot no longer encounters an error. Previously, when the <b>Close</b> action was used to close the last Chrome browser window, the last tab of a Chrome browser window, or all Chrome browsers, bot execution failed because the Chrome communication channel was shut down.
00762178	When you deploy bots using RDP on unattended user devices configured for multiple users, a black screenshot is no longer captured.
00800573, 00796393, 00804854	When you select a run-as user to deploy a bot, you can add a Bot Runner user back from the list of Selected Bot Runners to the list of available Bot Runners on the <b>Run bot now</b> page.
00744929	When incorrect Git credentials are entered, the credentials are now hidden and not recorded in the <code>WebCR_Commons.log</code> file. Previously, incorrect Git login credentials were recorded and not hidden in the log file.
00751304	The error model in Swagger docs is now updated to display all the fields appearing in the API response body. Previously, there was a mismatch between the fields displayed in the API response body and the error model in Swagger docs.
00763398	An error no longer occurs when multiple Excel files are opened and you use the <b>Run macro</b> action in the Excel advanced package. Previously, an error was displayed when a macro was run with multiple sessions.
00759183	The <b>Open</b> action of the File package now opens any file using the default application set by the user. For example, if Microsoft Paint is set as the default application for all <code>.jpg</code> files, the action now opens these files without any error. Previously, bot execution failed with an error.
00750185	An error no longer occurs when you run a migrated Enterprise 11 bot containing the Object Cloning command even if it contains some Unicode 8964 characters in some of its properties. The bot now captures objects after migration without any error. Previously, the bot failed to capture objects after migration if it contained Unicode characters in its properties.
00774091	All object properties of the Object Cloning command are now migrated without any errors. Previously, bot execution failed with an error because the HTML ID and HTML name properties were changed after migration.
00796322, 00823082	When you insert a variable as a parameter in any action of a package, add additional text to this variable, save the bot, and then edit the name of the variable from the variable list, the additional characters added to the variable are no longer deleted.
00731066	The <b>Capture</b> action in the Recorder package now works properly, and you no longer encounter any delay when creating and running new bots to extract any data from a DataGridView control in certain UI automation applications.

Fixes	
Service Cloud case ID	Description
00784177	A bot deployment error is no longer displayed when you edit and run a bot using <b>Run bot now</b> from the Bot editor of a Cloud Control Room.
00782307, 00787807, 00811404, 00788178	Bot deployments are no longer stuck in a queue and now display the error <code>Picked at runtime</code> after Automation 360 On-Premises is updated from the previous release to this release.
00786786, 00806775	You can now capture a single object using a recorder from Google Chrome browser, and the following message is no longer displayed: <code>Error performing single capture.</code>
00780202, 00798826, 00808779	When you deploy bots using RDP on unattended user devices configured for multiple users and you set the RDP screen resolution to 1366x768, the resolution no longer changes to 1368x768 during bot execution.
00769647, 00767674, 00773115, 00777239, 00778972, 00777752, 00792839, 00804603, 00806606, 00815687, 00829496	The <b>View historical activity</b> page now shows the correct run details of start date and time for bots that fail during execution.

Limitations
<p>If you configure an external key vault in <b>External Key Vault Integration</b> and select the <b>SQL authentication</b> mode for database authentication in the Windows installer <b>Database Server</b> page to install Control Room (On-Premises), the installation fails, and the following error message is shown: <code>Control Room database tables fail to create.</code></p> <p><b>Workaround:</b> Add the database credentials in the external key vault and use those credentials for database configuration.</p>
<p>The <b>Task bots runs</b> metric on the <b>Home</b> dashboard page of the Control Room displays the count as zero even if you have run bots from the same Control Room.</p>
<p>(Service Cloud case ID: 00837271) If you are migrating from Enterprise 11 with a database that has a large amount of repository data, the installation might fail. This issue occurs because Liquibase update for a few SQL queries is not completed during migration.</p> <p><b>Workaround:</b> Contact Automation Anywhere Support.</p>
<p>When you are installing the Bot Agent, if you run out of disk space and click <b>OK</b> on the <b>Out of disk space</b> window, the Bot Agent installation wizard might display the previous installer windows.</p> <p><b>Workaround:</b> In the <b>Setup type</b> window, click <b>Cancel</b> and relaunch the Bot Agent installation wizard.</p>
<p>(Service Cloud Case ID: 01021889) In this release, when you schedule or deploy a bot from the Control Room, you will not receive an email notification if the bot fails to run.</p>

Limitations
<p>(Service Cloud Case ID: 00780635, 00791587, 00795559, 00795632, 00797130, 00797113, 00791783, 00765770, 00826805, 01859661) When you update from the previous release, schedules disappear from Control Room instances configured on a single-node or multi-node environment. In some cases, after the update, previously deactivated schedules disappear and are reactivated automatically.</p> <p><b>Workaround:</b> Divide large schedules into smaller schedules or reduce the schedule frequency.</p> <ul style="list-style-type: none"> <li>• Divide large scheduled automations into smaller schedules of two hours each. For example, divide an automation schedule that runs for a 12-hour period, such as 9 AM to 9 PM daily, into two-hour intervals, such as 9 AM to 10:59 AM, 11:00 AM to 12:59 PM, and 1:00 PM to 2:59 PM.</li> <li>• Reduce the schedule frequency to 10 minutes.</li> </ul>
<p>Migration of Enterprise 10 MetaBots with the password type variable with null value is not yet supported. To migrate successfully, provide a default value to the password variable when creating MetaBots in Enterprise 10.</p>
<p>When you attempt to log in to the Control Room configured with Active Directory, using the <b>Log in with Windows</b> option is not currently supported in this release. Selecting this option can generate a <code>java.lang.NoSuchMethodError</code> error.</p> <p><b>Recommended:</b> Enter the domain credentials directly.</p>
<p>(Service Cloud case ID: 00831886) As a Bot Creator, you cannot run bot tasks through the AARI process. Although human tasks appear fine, the <b>Activity</b> page displays the <b>In Progress</b> state and seems stuck on the <b>Waiting for user and/or device</b> action.</p> <p><b>Workaround:</b> Remove the <b>process discovery license - recorder</b> from the AARI Bot Creator user. Please refer to <a href="#">AARI process discovery license assignment</a> for more information.</p>
<p>You cannot use the <b>Global session</b> option to share a Microsoft Excel session using the Excel advanced package with the Loop package.</p> <p><b>Alternate solution:</b> Use the <b>Get multiple cells</b> action and save the data into a datatable variable. Then, use the Loop package with the <b>Data Table</b> option selected.</p>
<p>The migration process successfully migrates bots that contain brackets or [] but the process fails when you migrate the same bots again to migrate the delta changes even when the overwrite option is selected.</p> <p><b>Workaround:</b> Delete existing bots from Automation 360 that contain brackets or [] before migrating them again.</p>
<p>Users with the <b>AAE_Bot Migration Admin</b> role are not able to run migrated bots because the <b>Run my bots</b> and <b>Create folders</b> permissions are not available in this role. As a result, these users can start the migration process, convert the bots but cannot run the migrated bots.</p> <p><b>Workaround:</b> Create a custom role with the <b>Run my bots</b> and <b>Create folders</b> permissions and assign this role to the users with the <b>AAE_Bot Migration Admin</b> role.</p>
<p>When Enterprise 11 MetaBots that use a DLL that returns a two-dimensional array of type single as output and stores the value to a file using the Log To File command are migrated as TaskBots to Automation 360, these TaskBots encounter an error when they are executed.</p>
<p>Migrated bots that are used to automate tasks using RDP encounter an error when the DPI of the remote device is different from the current device.</p>

Limitations
<p>Newly created Control Room users on Windows for On-Premises Google Cloud Platform VMs cannot change their password. The security questions option is not available on the <b>Change password</b> screen and as a result the Control Room displays an error when they try to save the password.</p> <p><b>Workaround:</b> Refresh the page and change the password again.</p>
<p>(Service Cloud case ID: 00770816) When you connect to an Exchange Web Services server, multi-factor authentication (MFA) must be disabled, including in all organizational level security policies where multi-factor authentication might be enabled. If multi-factor authentication is not disabled completely, users might encounter connection and or authorization errors.</p>
<p>Automation 360 does not support the Kibana version in Elasticsearch for which a privilege escalation error is shown in the Black Duck report.</p>
<p>The Bot Agent is not updated automatically from a previous release to this release when you perform different operations simultaneously such as running bots, configuring device settings in the Control Room, and updating the Control Room.</p> <p><b>Workaround:</b> Restart the Bot Agent from the Task Manager.</p>
<p>A file is not deleted when you execute the bot with the following sequence of actions:</p> <ol style="list-style-type: none"> <li>1. You use the <b>CSV/TXT &gt; Open</b> action to open a <code>.csv</code> file.</li> <li>2. You use a loop action within another loop action to retrieve values from the <code>.csv</code> file.</li> <li>3. You use the <b>CSV/TXT &gt; Close</b> action to close the file. Here, all the actions are using the same Default session.</li> <li>4. You use the <b>File &gt; Delete</b> action to delete the file.</li> </ol> <p>The issue (file is not deleted) occurs because the bot fails to close the Default session.</p>
<p>Bot execution can fail with an error when you execute the bot with the following sequence of actions inside a loop:</p> <ol style="list-style-type: none"> <li>1. You use the <b>Browser &gt; Open</b> action to open a window.</li> <li>2. You use the <b>Recorder &gt; Capture</b> action to capture required objects on the window.</li> <li>3. You use the <b>Browser &gt; Close</b> action to close the window.</li> </ol> <p><b>Workaround:</b> Use the <b>Window &gt; Close</b> action to close the window instead.</p>
<p>If you update the device information from the <b>Administration &gt; Settings &gt; Devices</b> page, only the first update is captured in the <b>Audit Log</b> page. Subsequent updates to the device are not captured.</p>
<p>When you register a new Bot Agent user device from the bot editor after creating and running a bot, the following message is intermittently displayed: <code>Device is either disconnected or it needs to be upgraded.</code></p> <p><b>Workaround:</b> Click <b>Run</b> to deploy the bot on the new Bot Agent user device.</p>
<p>When you use the Universal Recorder to record multiple tabs in a SAP application, the <b>Set text</b> action in the Client control of SAP does not work because it is currently not supported.</p>
<p>When multiple users check in their bots simultaneously, some of the check-ins fail although Git is not corrupted and no data is lost.</p>

Limitations
<p>When you use the 2.3.0-20210806-215200 version of the Recorder package to capture any control using HTML technology in Google Chrome or Microsoft Edge Chromium browser and run the bot, the bot might fail with the following error message: <code>Unable to find control. Search Criteria did not match</code></p> <p><b>Workaround:</b> Use the 2.2.0-20210722-211132 version of the Recorder package instead.</p>
<p>When you try to automate any process in a Java application that is using version 11.0.8 of AdoptOpenJDK, the Recorder might not be able to capture the drop-down elements on the application.</p>

## AARI (Automation Anywhere Robotic Interface)

What's new
<p><b>Output variables support in Process Editor</b></p> <p>The <b>Output variables</b> section in the process editor enables you to create a user-defined variable that can be set as an output to any process. This helps you pass the output from the child (sub) process, which was called in the <b>Process Task</b>, to the parent (main) process.</p> <p><a href="#">Use an Output variable</a> on page 1497</p>
<p><b>Select File element input supported for Create a Request action</b></p> <p>The <b>Create a Request</b> action in the AARI Web package now supports passing input in the request creation forms for the <b>Select File</b> element. You can now use bots to create a request and upload or download files as input with the <b>Select File</b> element. These input files are uploaded to the storage service to be available for further processing in the request.</p>
<p><b>Detail view in Tasks page</b></p> <p>The new <b>Detail view</b> option in the <b>Tasks</b> page provides better insight into individual tasks for better task management. The detail view previews each task in its respective request view page without opening another page, which helps organize and correspond your tasks with the available requests. Users can interact with their tasks as well.</p>
<p><b>Additional support for interface triggers on Google Chrome</b></p> <p>You can use the following additional actions for interface triggers on the Google Chrome browser during bot runtime:</p> <ul style="list-style-type: none"> <li>• <b>Hyperlink</b> element: Click, <b>Set focus</b>, or <b>Lost focus</b> actions</li> <li>• <b>Checkbox</b> element: Select, cleared, <b>Set focus</b>, <b>Lost focus</b>, or <b>Selection changed</b> actions</li> <li>• <b>Radio Button</b> element: Select, deselect, <b>Set focus</b>, <b>Lost focus</b>, or <b>Selection changed</b> actions</li> </ul> <p><a href="#">Add an interface trigger</a> on page 1563</p>

What's changed
<p><b>Font size retained during bot runtime</b></p> <p>When you create a form, the font size that you selected in the <b>Formatting</b> &gt; <b>Font size</b> drop-down menu is retained on the form during bot runtime.</p>

What's changed
<p><b>Cancel option in the process and team setup page</b></p> <p>When a user edits a process or team in the <b>Process setup</b> and <b>Process setup</b> pages, the <b>Cancel</b> option replaces the previous <b>X</b> option to provide better clarity for the user to cancel the current page.</p>

Fixes	
Service Cloud case ID	Description
00781358	You can now add bots with table variables that do not have a default value to a process without encountering any errors.
00791703	When you use the desktop tray icon to open AARI Assistant, dependent files are no longer displayed along with the application.
--	In the process editor, the <b>Go To</b> option now shows the <b>Filter Task</b> and <b>Process Task</b> options.
--	When you enter data in a form of your process that contains a hyperlink, the process data is no longer ignored and now works correctly.
--	When you use <b>Process Task</b> in the process editor, you can now use the <b>Public folder</b> option in the <b>Select process file</b> field.
--	In <b>Bot Task</b> and <b>Human Task</b> , when you select a box, the input is now accurately selected.
--	The <b>Requests</b> page is now correctly updated with the latest request events (such as completion of tasks) for users with an Attended license.
--	When you update to this release, a built-in scheduler now periodically checks for any disconnected or temporary devices and clears these entries.
--	When you open a form in the public folder, it cannot now be edited by changing the term <b>View</b> to <b>Edit</b> in the URL.
--	When a user logs in to AARI Assistant, all the triggers associated with that user name are now available.

Limitations
<p>Users cannot edit a form or process in a public workspace, they must check out a form or process in order to edit in a private workspace. However, when users attempt to edit a form or process in a private workspace, they receive an <b>Access denied</b> error message due to the cache not being refreshed.</p> <p><b>Workaround:</b> Navigate to your private workspace, refresh the page to clear the cache, then edit your form or process.</p>
<p>An AARI user with the <b>AAE_Robotic Interface User</b> license who is not part of an assigned team can view all requests and tasks from other teams in the web interface. However, when the user attempts to access a request or task, they are prompted with an error message.</p>

Limitations
<p>When a form is opened during bot runtime, the automated focus on the first form element is lost. For example, consider that Form A has various elements, and a <b>Text Box</b> element called Name is the first one. When Form A is opened during bot runtime, the focus is lost from the Name element and you cannot enter any values.</p> <p><b>Workaround:</b> When a form is opened during bot runtime, click the form element to enter or change the value.</p>
<p>When you log in to the web interface as an administrator, for certain languages, the translated text on the left navigation pane is truncated (not displayed completely).</p> <p><b>Workaround:</b> Hover over the menu item to view the tooltip, which displays the completely translated text.</p>
<p>In the Google Cloud Platform instance of the AARI on the web interface, when you open a request that contains previously uploaded files, you might intermittently experience an error while downloading the files.</p> <p><b>Workaround:</b> Retry downloading the file.</p>
<p>If a form has a table element and you use the <b>Set</b> action from the Interactive forms package during bot runtime, values are not applied to the table element.</p>
<p>If you selected the action trigger as <b>Changed value</b> for a <b>Dropdown</b> element within a trigger loop, any associated event is triggered during bot runtime even when there is a <b>Reset</b> action.</p>
<p>In an SDS setup, when you create a request to upload a file, the upload fails and a <code>SecurityTokenInvalidException</code> error message is displayed.</p>
<p>The <b>Override output variable</b> option in the <b>End Process</b> endpoint is not currently functional for users to override a variable definition.</p>

## Discovery Bot

What's new
<p><b>View Groups of steps</b></p> <p>When reviewing a process view, you can now use the group option or icon to display groups of steps that belong to the primary level action and secondary level action (and subgroup level actions) used during the recording session.</p> <p>Use the group icon to help you decide what groups of steps to select for a task you want to automate. For example, a primary level action displays Microsoft Outlook, a secondary level action displays Outlook mail notification, and subgroup level actions display terms such as Email -Add To, Email – Add Subject.</p> <p><a href="#">Create a process view with branches and opportunities</a></p>

**What's new****Use Dynamic option for system-generated views**

You can now use the **Dynamic** option from the Model options to view recordings where groups of steps display a set of repeating patterns that belong to the same application or same primary level action used during the recording session.

Use this option to decide the context of the process or the task you want to automate. Groups of steps that are labeled belong to supported applications such as Microsoft (Excel, Outlook, and Notepad), Notepad++, text editors, most windows use cases, and Chrome browser functionality.

*[Create a process view with branches and opportunities](#)*

**Enhancements to PDD Word document**

The PDD Word document now includes a process recording flow chart and the time on each individual step in hours, minutes, and seconds.

*[Review opportunities and convert to](#)*

**Fixes****Service Cloud case ID****Description**

--

The Control Room installer for Red Hat Enterprise Linux (version 7.7 or 7.9) now includes the Discovery Bot package. Previously, you had to log in to the Control Room as admin, select **Manage > Package > Upload**, and upload the Discovery Bot package.

Limitations
<p>In a Linux environment, when you record a process using the Discovery Bot recorder, the recorder window opens for 4 seconds and then disappears. The error occurs because the <code>ProcessDiscovery</code> folder is missing in the following directory: <code>/var/automationanywhere/enterprise/appdata/Server Files/</code>.</p> <p><b>Workaround:</b> Perform the following steps to create an empty <code>ProcessDiscovery</code> folder manually and provide write access to the folder:</p> <ol style="list-style-type: none"> <li>1. Navigate to the following path in the Control Room directory: <ol style="list-style-type: none"> <li>a. If you have updated from an earlier version to v.22, navigate to <code>/opt/automationanywhere/enterprise/appdata/Server Files</code></li> <li>b. If you perform a new installation of v.22, navigate to <code>/opt/automationanywhere/automation360/appdata/Server Files</code></li> </ol> </li> <li>2. Run the <code>sudo mkdir ProcessDiscovery</code> command to create an empty folder for <code>ProcessDiscovery</code> in the specified Control Room directory.</li> <li>3. Run the following command to provide the required read and write permission for the newly created <code>ProcessDiscovery</code> folder: <ol style="list-style-type: none"> <li>a. <code>sudo chown -R crkernel:controlroom ProcessDiscovery/</code></li> <li>b. <code>sudo chmod -R 775 ProcessDiscovery/</code></li> </ol> </li> </ol>
<p>When you upgrade to A360 v.22, you might receive multiple email notifications about the PDD generated in A360 v.21.</p>
<p>When you add branches to the left and right sides of the main branch, the Recording flow chart section of the PDD might not capture the entire process work flow, including all the branches.</p>

## IQ Bot

What's new
<p><b>IQ Bot standard forms integration with IQ Bot Extraction</b></p> <p>You can now use the IQ Bot Extraction package for data extraction from standard forms documents.</p> <p><i><a href="#">Using IQ Bot Process documents action</a></i></p>
<p><b>Confidence threshold applicable on standard forms learning instance</b></p> <p>For a standard forms learning instance, if the <b>Confidence threshold</b> value that you have set does not match any field, the document is moved to the <b>Validator</b> and a notification icon is displayed. This update now enables you to validate the document for the learning instance and also save the document.</p>

What's new
<p><b>Additional OCR engines for IQ Bot Extraction package</b></p> <p>In addition to the existing OCR engines, IQ Bot Extraction package now supports the following OCR engines:</p> <ul style="list-style-type: none"> <li>• Microsoft Azure 2.0</li> <li>• Google Vision API</li> </ul> <p><a href="#">IQ Bot Extraction package</a></p>
<p><b>Export IQ Bot dashboard data</b></p> <p>A user with the <b>AAE_IQ Bot Admin</b> role can now export the following data from the dashboard to a CSV file using the <b>Export</b> icon:</p> <ul style="list-style-type: none"> <li>• Documents processed</li> <li>• Pages uploaded</li> <li>• Straight-Through Processing</li> <li>• Accuracy</li> </ul> <p>The CSV file is saved to the local <i>Downloads</i> folder.</p>
<p><b>IQ Bot support for self-signed certificates</b></p> <p>You can create a self-signed certificate with Subject Alternative Name (SAN) to use an SSL certificate for multiple domains.</p> <p><a href="#">Creating a self-signed certificate with Subject Alternative Name</a> on page 1051</p>

What's changed
<p><b>IQ Bot package supports external proxy server settings</b> (Service Cloud case ID: 00727414, 00725235, 00757568, 00753560, 00753560, 00786609)</p> <p>The <b>Download all documents</b> and <b>Upload Document</b> actions in the IQ Bot package now support external proxy server settings.</p>
<p><b>IQ Bot Python library upgrade</b> (Service Cloud case ID: 00756943, 00791511)</p> <p>IQ Bot now uses Python version 3.9.5 for data extraction.</p>

What's deprecated
<p><b>IQ Bot [Local Device] package</b></p> <p>The IQ Bot IQ Bot [Local Device] package is deprecated from this Automation 360 v.22 (Build 10526). Instead, use the IQ Bot Extraction package, which provides the same capabilities as the IQ Bot [Local Device] package, along with additional improvements.</p> <p><a href="#">IQ Bot [Local Device] package replaced by IQ Bot Extraction package (A-People login required)</a></p> <hr/> <p><b>Note:</b> Before using the IQ Bot Extraction package, update the bots associated with the IQ Bot [Local Device] package and restructure the output folders.</p> <hr/> <p><a href="#">IQ Bot Extraction package</a></p>

Fixes	
Service Cloud case ID	Description
--	If you delete a <code>.csv</code> file from the <code>Success</code> folder, you can now download the remaining files from that folder.
--	When you use the IQ Bot Extraction package for processing a large set of documents, you no longer encounter any document processing issues with Bot Agent.
--	If an incorrect value was used in the <code>providerVersion</code> field when you uploaded standard forms configurations to IQ Bot, an error notification is now displayed when you select this configuration when creating a standard forms learning instance.
00806805	You can now import a learning instance using the Migration Utility feature as the <code>Invalid Group</code> error message is now resolved.
--	When you creating a learning instance using standard forms, all the available pre-trained models are now listed in the <b>Select Model</b> drop-down menu.
00703856	IQ Bot now correctly extracts table rows with numeric values even when they are within parenthesis.
--	The File Download API now returns a correctly formatted JSON response with a colon ( <code>:</code> ) separating the key-value pairs.
00694656	IQ Bot now successfully extracts values from the documents that have new table fields added after training.
00636887	An error notification is now displayed if you upload documents with file names longer than 150 Asian language characters in the staging environment. <hr/> <b>Note:</b> This is not applicable to a production environment. <hr/>
--	IQ Bot cloud data query is now optimized to prevent overloading of the Amazon Relational Database Service.
00782994	When you use the Migration Utility to move a learning instance between environments, unclassified data is no longer exported.
00747137	You can now import learning instances using the Migration Utility feature without any issues.

Limitations
The value displayed in the <b>My totals &gt; Accuracy</b> field sometimes does not match the value in the <b>My learning instances &gt; Field accuracy</b> for the available learning instances.
If you try to import a learning instance into an IQ Bot environment that has a deleted learning instance with the same name, the following message is displayed even though the learning instance is not imported: <code>Import process initiated</code>
If you access IQ Bot without the correct permissions, they are redirected to an <code>Access denied</code> page, where the back button does not work. <b>Workaround:</b> Close the current tab and open the Control Room.

Limitations	
When you select <b>Other domain</b> in the learning instance creation page, the tooltips for the table and form fields state that these fields are optional. However, these fields are required to create a learning instance.	
IQ Bot installation sometimes fails and the following message is displayed: <code>Failed to upgrade the DB: -1</code> . When this issue occurs, retry the installation.	
(Service Cloud case ID: 01016516, 00757943, 00787404, 00788421, 00807528, 00822941, 01018972) If you add multiple ABBY OCR based commands (such as IQ Bot Pre-processor, IQ Bot Classifier, AISense Recorder, OCR) in a single bot, an error message is displayed when you run the bot. <b>Workaround:</b> Ensure that you do not add multiple commands in a single bot.	
(Service Cloud case ID: 01063054) You cannot import a learning instance with a long name (>50 characters) because IQ Bot only supports up to 50 characters in the <b>Label</b> field.	
If you use the <b>Process documents</b> action from IQ Bot Extraction package to upload documents, the validation rules from the default the validation group that you set are not applied. As a result, the failed documents are not classified into any of the existing groups and are moved to Validator.	
In the IQ Bot Community Edition, when you use a Cloud OCR to create a learning instance, if you use the IQ Bot <b>Process document</b> action from the IQ Bot Extraction package, the values from the uploaded invoices or documents are not processed successfully. <b>Workaround:</b> If you use the Cloud OCR to create a learning instance, use the IQ Bot <b>Upload Document</b> action from the IQ Bot package.	
After you train a bot and click <b>Save and go to next group</b> , the system fails to load the next group. Instead, it reloads the same group. <b>Workaround:</b> Perform the following steps: <ol style="list-style-type: none"><li>1. Refresh the page.</li><li>2. Navigate to <b>Learning Instances</b> and click <b>Bots</b> to edit the <b>Learning Instances</b>.</li></ol>	
System identified regions are not generated when a non-English filename is uploaded using the Invoice domain and processed with the AutoExtract command. <b>Workaround:</b> To process the document, convert the non-English filename to English characters.	

## Bot Insight

Fixes	
Service Cloud case ID	Description
00788583	In the <b>Profile</b> tab, when you edit, save and generate a business dashboard and the dashboard is not saved, the error message description is now translated correctly in the Chinese language. Previously, if an error occurred when you saved the edits in the <b>Profile</b> tab of the <b>Business</b> dashboard, the error message description displayed garbled text.

Fixes	
Service Cloud case ID	Description
00729920	When you migrate a task from a source (UAT) to a target (production) environment, a <b>Published</b> dashboard copy is no longer deleted from the source environment.
00742260	You can now export data from operational or custom dashboards after applying a non-metric variable in the filter. Previously, the data was not exported when you toggled between different chart types.
00738228	Multiple dashboards are no longer created for a TaskBot when you update and execute a bot that is checked out from the public workspace. Previously, when a bot was executed after an update, multiple dashboards were created.
00757992	A user with the Bot Creator license can now access all the Bot Insight dashboards (Operations and Business tabs) irrespective of their assigned role. Previously, if the user had the Bot Creator license with the <b>AARI Admin</b> role, they were not able to access these dashboards.

Limitations
(Service Cloud case ID: 00733555, 01912503) In a dashboard, the data labels in the pie chart overlap if it contains many slices. As a result, the labels in pie chart are not clear and shown only when you hover over the slices.  <b>Workaround:</b> To view the data labels in a pie chart in clear and readable format, export the dashboard data to Excel file.  <b>Note:</b> Due to a limitation within the third-party recharts library, you might observe labels overlapping issue with data in downloaded PDF as well.

**Important:** For information about the packages supported with this release, see [Packages available in Automation 360](#) on page 1369.

## Automation 360 v.21 Release Notes

*Release date: 09 June 2021*

Review what's new and changed, and the fixes and limitations in the Automation 360 v.21 release. Automation 360 (Cloud and On-Premises) is on Build 9664. Automation 360 IQ Bot Cloud is on Build 9664 and On-Premises is on Build 9642.

### Patch release updates

We have updated Automation 360 Build 9664 (Cloud and On-Premises) for the following fixes:

- Process deployments containing forms with empty table, check box, or text box are failing after the AARI Cloud build is updated from the previous release to this current release (Service Cloud case ID 00788255).

- The layout of the request view page changes when another language other than English is selected (Service Cloud case ID 00772925).
  - Warning messages in the process editors render garbled characters due to missing UTF-8 encoding (Service Cloud case ID 00781891, 00784947).
  - Users (with the attended license) are not redirected to the AARI Assistant application due to users (without the attended license) trying to connect to the AARI Assistant application beforehand on the same device.
  - Not able to capture keystroke actions on an application using the Universal recorder (Service Cloud case ID 00785310).
  - Files were missing from the embedded resource folder, causing issues in using the Recorder package (Service Cloud case ID 00767315, 00777786, 00775209, 00788523, 00797261, 00795511, 00785246).
  - Bot deployments are getting stuck in a queue after Automation 360 Cloud is updated from the previous release to this release (Service Cloud case ID 00784333, 00784890, 00784382, 00784338).
  - Cloned bots are losing their dependency when they are checked-in (Service Cloud case ID 00780756).
  - The recording duration was not updated correctly under **Process Cycle** on the process card, and the recorded steps were not captured by the recorder (Service Cloud case ID 00790884, 00781022).
- **Migration**

## Updating to this release

You can update the Automation 360 v.21 release from the previous three releases (that is, from  $n-3$  releases, where  $n$  refers to the latest release). The following previous releases are certified for update to this release:

- v.20 (Build 8815)
- v.19 (Builds 8147, 8145, 8122, 8098)
- v.18 (Build 7560)

You can directly update to v.21 from any of these builds. For details on how to update, see [Update to latest Automation 360 version](#) on page 1022.

---

**Note:** If you are not on an  $n-3$  release, update Automation 360 to one of the three certified releases before updating to this release.

---

**Important:** This release includes a required update to your . Ensure that you complete the update to continue with your automation activities when upgrading from a previous release to this release.

[Automatically update the Bot Agent](#) on page 1001 | [Manually update the Bot Agent](#) on page 1002

---

To verify which version is compatible with this release, see [Compatibility with release builds](#) on page 985.

**Enhancements to browser extensions:** The Automation 360 extensions for Google Chrome (version 1.2.0.0), Microsoft Edge (version 1.2.0.0), and Mozilla Firefox (version 1.2.0.2) now include the following enhancements:

- Support for HTML buttons and text actions in Interface trigger
- Enhancements to the default search criteria for text boxes and check boxes using Recorder package.
- Fixes for capturing objects with characters not valid in XML using the Recorder package.
- Fixes to the Discovery Bot recorder with default browser (Google Chrome) search page.

## Migration features

Enterprise 11 and Enterprise 10 features
<p><b>New system role to perform migration</b></p> <p>Assign the <b>AAE_Bot Migration Admin</b> system role to the user who will perform migration. This role contains all the permissions required to view and manage the bot migration process. Using this role eliminates the manual effort of creating custom roles, selecting the required permissions, and assigning them to the users who perform the migration.</p>
<p><b>Enhanced bot runtime window</b></p> <p>When you migrate bots using the Bot Migration Wizard, the bot runtime window now shows the name of the Enterprise 11 or Enterprise 10 bot file that is currently migrated.</p>
<p>You can now migrate bots with the <b>Open webpage in a new window</b> and <b>Open a webpage in an existing window</b> settings.</p>
<p>You can now migrate Enterprise 11 and Enterprise 10 bots with multiple versions of a DLL.</p>

Enterprise 11 only features
<p><b>MetaBot screens: Custom objects and play mode enhancements</b></p> <ul style="list-style-type: none"> <li>• Custom objects within the Image play mode are now fully supported.</li> <li>• Linked objects are now captured.</li> </ul>
<p><b>Enhanced Hide/Show option in Control Room</b></p> <p>For bots available in the Control Room (the <code>My bots</code> folder), a filter is available to hide or show older <code>.mbot</code> and <code>.atmx</code> files displayed in the window.</p>
<p><b>Global values for SAP</b></p> <p>The migration process creates the <code>JcoDllPath</code> and <code>JcoJarPath</code> global values of type string to support migration of SAP BAPI.</p>
<p><b>Enhanced Database action functionality</b></p> <p>The Database action now supports connecting to Oracle databases using <code>SID</code> and or <code>Service_name</code>. In previous releases, only connecting with <code>SID</code> was supported.</p>
<p><b>New email variable strings</b></p> <p>New email sent and received string variables are available for the Loop, Import DataSet, and Export Dataset actions to insert sent values for date and time.</p>

**Enterprise 11 only features****Enhanced Microsoft Exchange Web Services support**

The Send function in the Email package supports EWS OAuth2.0, improving backward-compatibility.

**Manually migrate from Enterprise 11 to Cloud-enabled environment**

You can now manually migrate from Enterprise 11 to a Cloud-enabled environment. In this migration, you must create all the entities such as users, roles, and credentials manually, except bots. All Enterprise 11 versions are supported for this migration.

[Prepare for Enterprise 11 to Automation 360 Cloud-enabled migration](#) on page 1158

**Enterprise 10 only features****Migrate MetaBots screen with Password type variable**

You can now migrate Enterprise 10 bots based on the MetaBot screen, which uses the **Password** type variable. During the migration, the logic (.logic file) in the .mbot file is migrated as a new TaskBot within the MetaBot folder. Also, the **Password** type variable is migrated as a credential variable and is assigned to a predefined locker.

**Migrate TaskBots based on MetaBot Screen and DLL assets without using Logic**

You can now migrate a TaskBot that references the Run MetaBot action for the MetaBot Screen and DLL assets directly, without using the MetaBot Logic. So you can migrate a TaskBot that contains MetaBot Screen and DLL assets.

**RPA Workspace****What's new****Automation 360 navigation enhancements**

We have enhanced the overall readability and accessibility of the Automation 360 interface. To make navigation easier, menus and views are organized based on frequently used features and related tasks.

The interface includes the following updates:

- The Device, Profile, and Help icons are now located at the bottom of the navigation menu, consolidating all controls on the left for easy access.  
When you click these icons, flyout panels of content and actions are shown.
- The side navigation menu can be collapsed to a slim bar to maximize the main workspace area.  
You can continue to use the side navigation in collapsed mode, with flyouts for each section.

[Automation 360 navigation updates](#)

**Authenticate database connection with Microsoft Azure Active Directory credentials (Service Cloud case ID 00676448)**

You can now authenticate the Control Room database connection using Microsoft Azure Active Directory credentials when you install the Control Room on Microsoft Azure.

[Configure Microsoft database type and server](#) on page 872

<b>What's new</b>
<b>External Key Vault enhancements</b> External Key Vault support for AWS Secrets Manager and CyberArk for Auto-login and Automation credentials has been added to Automation 360. Auto-login credentials and Automation credentials (credentials used by bots) can now be retrieved from the configured external key vault. <a href="#">Integrate external key vaults</a> on page 868
<b>Deploy workload automation on a multi-user Windows terminal server</b> To optimize workload automation and multi-user devices, you can deploy workload automations on a multi-user Windows terminal server so that a single device can process multiple work items concurrently. <a href="#">About multi-user devices</a> on page 1952   <a href="#">About device pools</a> on page 1955
<b>Control Room and Bot Agent compatibility checks for automation</b> To manage the lifecycle of your automation, you can view dependency information about minimum compatible Control Room and Bot Agent versions when you create and deploy automations. You can then update your automation and reduce runtime errors caused by an incompatible Control Room or Bot Agent version. <a href="#">Actions to build bots</a>
<b>New actions in the SAP BAPI package</b> Use the following new actions: <ul style="list-style-type: none"><li>• <b>Run standard workflow:</b> Runs a standard workflow in SAP BAPI.</li><li>• <b>Run custom workflow:</b> Runs a custom workflow in SAP BAPI.</li></ul> <a href="#">SAP BAPI</a>
<b>New actions in File package</b> Use the following new actions: <ul style="list-style-type: none"><li>• <b>Get name:</b> Reads a file name and stores it to a string.</li><li>• <b>Get path:</b> Reads the path of the file and stores it to a string.</li></ul> <a href="#">File package</a>
<b>Common table expression supported in Database package</b> You can now use common table expression (CTE) in the <b>Read from</b> action using the <code>WITH</code> keyword in SQL-compliant databases such as Oracle and MySQL. Use CTE statements within a SQL query to simplify complex joins and subqueries. <a href="#">Using the Read from</a>
<b>Support for large numbers in Number package</b> (Service Cloud case ID:00557619) You can now perform mathematical operations for large numbers with more precision in the Number package. <a href="#">Number package</a>

What's new
<p><b>Snowflake database support using ODBC driver</b> (Service Cloud case ID:00761695)</p> <p>Snowflake ODBC driver is now supported in the Database package. You can connect to the Snowflake database using ODBC-based client applications.</p> <p>The following actions support this feature:</p> <ul style="list-style-type: none"> <li>• Connect</li> <li>• Disconnect</li> <li>• Read from</li> <li>• Export to data table</li> <li>• Insert/Update/Delete</li> </ul>
<p><b>Variables: new features and enhancements</b> (Service Cloud Case ID:00740585)</p> <ul style="list-style-type: none"> <li>• Edit the variable name after the variable is created.</li> <li>• Delete all or a specific selection of unused variables from a bot.</li> </ul>
<p><b>Universal Recorder new features and enhancements</b></p> <ul style="list-style-type: none"> <li>• Record object interactions in applications built on the Electron framework.</li> <li>• Perform double-click in all supported applications and browsers.</li> </ul>
<p><b>Limit credential attribute use to password fields only</b> (Service Cloud Case ID:00740585)</p> <p>When you create or edit a credential attribute, ensure that bots input the attribute value only in fields that are identified as password fields by selecting the <b>Set this attribute as a password</b> option.</p>
<p><b>Organize device pools to check for available devices in a preferred order</b></p> <p>If you select multiple device pools (either in the <b>Run now</b> or <b>Schedule</b> window), you can now arrange the device pools in the order of preference. When a bot is deployed, the Control Room selects the first available device based on the order in which you organized the device pools. If none of the devices are available at the time of deployment, the bot is queued.</p>
<p><b>Default names for output variables</b></p> <p>When you configure an output variable for the actions in the Error handler and Python Script packages, the Control Room automatically generates a descriptive default variable name. If you create more than one output variable for an action, the subsequent variable names are appended with a -1, -2, -3, and so on to avoid a variable name conflict.</p>
<p><b>New string action to support nested variables</b></p> <p>Use the <b>String &gt; Evaluate value</b> action to compare a user-specified string variable with the string variables in the bot. If a match is found, the action returns the value of the matching variable.</p> <p><a href="#">String package</a></p>
<p><b>Delete Global values</b></p> <p>A user with the <b>AAE_Admin</b> role can delete a global value from the <b>All global values</b> page.</p> <p><a href="#">Global values</a> on page 1400</p>
<p><b>High availability support</b></p> <p>For Cloud-enabled users, high availability is supported through three-node deployments.</p>

What's new
<p><b>String package enhancement</b></p> <p>A new option to support local numbering styles is now available in the String package. You can now select your local format, represented by ISO-3166.</p>
<p><b>Dependent files and package information in Export package audit details</b></p> <p>In the Audit details of an exported package, you can now view the list of dependent files and packages associated with the exported package. This feature enables you to analyze what the exported package contains and identify any discrepancies. If you chose to include packages during an export, then only the package information is included in the audit details.</p>
<p><b>ODBC driver support for all connection strings</b> (Service Cloud Case ID: 00748887, 00777676)</p> <p>An Open Database Connectivity (ODBC) driver is now available to support all the ODBC connection strings in the same way it was used in the Enterprise 11 version. Using SQL as a standard for accessing and managing data, you can connect to MySQL, Google BigQuery, Snowflake, and other databases using the ODBC driver.</p>
<p><b>Share a DLL session</b></p> <p>You can now share a DLL session between bots.</p>
<p><b>New CredentialAllowPassword annotation</b></p> <p>Use the new <b>CredentialAllowPassword</b> annotation in the package SDK to allow the selection of a credential attribute marked as a password. You can use this annotation when creating a new SDK package or when modifying an existing one.</p> <p><a href="#">Configure and use credential allow password annotation</a> on page 1738</p>
<p><b>Enhancements to check-in, check-out, and cloning permissions</b> (Service Cloud Case ID: 00645904, 00720237, 00752197, 00760306, 00764684)</p> <ul style="list-style-type: none"> <li>• When performing a check-in, you can now choose the dependencies to check in along with the bot. Directly referenced dependencies will be automatically checked in with the bot.</li> <li>• When a bot is checked in along with a cloned bot and there are no other bots dependent on the clone, the cloned bot is now deleted.</li> <li>• When performing a check-out, you can now choose the dependencies you want to check out with the bot. The dependencies that are not selected during the check-out are now cloned.</li> <li>• During check-out, you can now overwrite or replace a cloned bot.</li> </ul>
<p><b>Bot Agent installer includes shortcut for AARI Assistant</b></p> <p>A shortcut to access AARI Assistant easily is added on the desktop and Windows menu when you install a Bot Agent.</p> <p><a href="#">Install Bot Agent and register device</a> on page 998</p>

What's changed
<p><b>Bot Scanner shows invalid bots in "cannot be migrated" list</b></p> <p>The Bot Scanner is updated to show invalid bots as blocked from migration because these invalid bots were failing before and after migration. For example, Enterprise 11 or Enterprise 10 bots that referenced non-existent variables failed. So some bots will no longer be shown in the <b>can be migrated</b> list of bots but will instead be shown in the <b>cannot be migrated</b> list in the output report. This can decrease the number of bots that can be migrated to Automation 360.</p>

What's changed
<p><b>Change in names of file locations and folders</b></p> <p>File locations and folder names are now updated for the change in product name (from Enterprise A2019 to Automation 360). For example, the file location for the default installation path is changed from <code>C:\Program Files\Automation Anywhere\Enterprise\</code> to <code>C:\Program Files\Automation Anywhere\Automation360</code>. We will be updating these locations and names on our documentation pages soon.</p>
<p><b>Source string is optional in Split action</b> (Service Cloud case ID: 000687257, 00702258)</p> <p>In bots (including bots migrated from Enterprise 11), when you use the <b>Split</b> action in the String package, the <b>Source string</b> field is now optional. You can run the bot without providing a source string value. Migrated bots that contain empty input strings now execute successfully.</p>
<p><b>Mandatory prerequisites validation before migrating bot</b></p> <p>When you migrate bots using the <b>Migrate bots</b> option in the Bot Migration Wizard, a prerequisite validation message appears with a checklist of all the validation items. The system now validates these prerequisites automatically to ensure that all prerequisites are met before you start the bot migration. Previously, validating prerequisites was optional.</p> <p>If the prerequisite validations are completed with a failure, a validation report appears with the list of items for which validation failed. If the prerequisite validations are completed without any failure, the bot migration is started.</p>
<p><b>Change in default Control Room database name</b></p> <p>The default Control Room database name is now changed from <i>AAE-Database</i> to <i>Automation360-Database</i>.</p> <p>If you are upgrading from an earlier release to this release, enter your existing Control Room database name to preserve your data.</p>
<p><b>Microsoft SQL Server clustering for high availability</b></p> <p>You can now use Microsoft SQL Server clustering for automatic and graceful failover of high availability deployments in Control Room clusters.</p> <p><a href="#">Database requirements</a> on page 809</p>
<p><b>Bot Agent nickname is hidden</b></p> <p>The nickname of a Bot Agent (added during installation) is now hidden when you switch the registration of a user device from one Control Room instance to another.</p>
<p><b>User interface change in the Open action of Excel packages</b></p> <p>In the Excel basic and Excel advanced packages, the <b>Sheet contains header</b> check box now appears below the <b>Select file</b> field.</p>
<p><b>User interface change in the Variables palette</b></p> <ul style="list-style-type: none"> <li>The <b>User-defined</b> variables list is now named <b>Your variables</b></li> <li>System, String, and Clipboard variables are organized within <b>Predefined variables</b></li> </ul>
<p><b>Digits with comma considered a valid number</b> (Service Cloud case ID: 00623458)</p> <p>In migrated bots, a set of digits that uses a comma is now considered a valid number. This change enables you to successfully verify mathematical operations and If, ElseIf, and Loop variable conditions containing various operators.</p>

What's changed
<p><b>Date comparison works with dates in different formats</b> (Service Cloud case ID: 00723479)</p> <p>Date condition actions are now successfully migrated to the equivalent date conditions in On-Premises. The date condition now works with multiple subformats of the main format (MM/dd/yyyy). Therefore, you do not have to manually change the date format per the source format of the migrated bots that contain date strings.</p>
<p><b>Use string value with numeric operators</b></p> <p>Migrated bots that contain If or While actions that use string values or a variable containing a string value with &lt;, &lt;=, &gt;, and &gt;= numeric operators now run successfully.</p>
<p><b>Enhancement to Extract field action in PDF package</b></p> <p>Use the <b>PDF viewer</b> in the <b>Extract field</b> action to extract all the form field data and selected text, and store the form data to variables.</p> <p><i>Using the Extract field</i></p>
<p><b>Connect automatically to SQL server for Windows authentication</b> (Service Cloud case ID: 00691554)</p> <p>When you upgrade the Bot Agent, you no longer have to add <code>d11</code> files manually to connect to the Microsoft SQL Server using Windows authentication.</p> <p>Previously, users had to manually add <code>d11</code> files to configure devices and use the Connect action from the Database package to connect to the Microsoft SQL Server with Windows NT authentication.</p>
<p><b>Enhancement to Active Directory mapping</b></p> <p>You can now create AD groups using commas in the naming on the AD server side and the Control Room side. Previously, this caused an error.</p>
<p><b>Enhancement to the Split action of String package</b></p> <p>Migrated bots now run successfully when the <b>Split</b> action is used to split a string available in an input variable and that variable is empty.</p>

The following table lists the fixes and the builds in which they were fixed. Build 9664 is the latest build for Cloud and includes fixes from the previous builds. On-Premises is on Build 9664.

Fixes		
Build	Service Cloud case ID	Description
9664	00803314	<p>The following issues are fixed in the latest version of the Cloud Migration Utility:</p> <ul style="list-style-type: none"> <li>The utility checks the current version of your Enterprise 11 Control Room and proceeds only if that version is supported for migration to Automation 360.</li> <li>The utility displays the target tenant information on the successful validation screen when you navigate to the migration code screen.</li> <li>An error is no longer encountered when access is provided to: <a href="https://aws.amazon.com">https://aws.amazon.com</a> and <a href="https://aa-provsvc.globalservices.automationanywhere.com">https://aa-provsvc.globalservices.automationanywhere.com</a>.</li> <li>The utility uploads all the required data to Automation 360 Cloud.</li> </ul>
9664	00790884, 00781022	The recording duration for a process is now correctly displayed under <b>Process Cycle</b> on the process card. Previously, you were not able to view the recording duration because of a delay in the network connectivity. You can now view all recorded steps captured by the recorder from the <b>Recordings</b> page.
9664	00785310	You no longer encounter any issue when you use Universal Recorder to record keyboard actions on an application. The Universal Recorder now captures the value of keystrokes properly. Previously, the Universal Recorder captured only the first value of the keystroke.
9664	00767315, 00777786, 00775209, 00787736, 00797261, 00795511, 00796245, 007956217, 00798533, 00795084	<p>You no longer face issues because of global cache expiry and partially deleted files in the embedded-resources folder (C:\ProgramData\AutomationAnywhere\GlobalCache\embedded-resources) when you install a Bot Agent for this release and capture objects in Google Chrome using the Recorder package.</p> <p>Note that, if the Bot Agent device has embedded resources folder partially deleted, you must first delete the global cache and update the Bot Agent.</p>
9664	00796598	When you run workload bots with queue on Bot Runner devices, the bots do not fail intermittently after Automation 360 Cloud is updated from the previous release to this release.

Fixes		
Build	Service Cloud case ID	Description
9642	--	Control Room instances configured with Active Directory for authentication with the retrieval of credentials from an external key vault were unsuccessful due to incorrectly prepending domain names in object names (CyberArk) and secret names (AWS) and caused authentication to fail. This issue is now fixed and object names (CyberArk) and secret names (AWS) are now properly formatted.
9637	00784333, 00784890, 00784382, 00784338, 00780635, 00791587, 00795559, 00795632, 00797130, 00797113, 00791783	Bot deployments are no longer stuck in a queue after Automation 360 Cloud is updated from the previous release to this release.
9637	00780756	You can now check in bots that have a shared dependency with other bots successfully. Previously, check-in failed because of an issue with the cloned bots losing the dependency during check-in, irrespective of their existing parent bots.
9595	00733638, 00756399	Bots that use a variable to specify the child bot to run no longer encounter an error because the variablized path contains a backslash.
9595	00711390	The retry mechanism now enables you to migrate large .atmx files. Previously, when a large .atmx file was migrated, the connection with the Control Room became stale or unauthenticated, resulting in a <code>NoHttpResponseException</code> error. With the retry mechanism, the Migration utility attempts to build a connection with the Control Room 5 times until the connection is successfully rebuilt.
9595	00730369, 00747866	Recorder actions now work properly, which enable you to run the migrated bot without any delay. Previously, it took a longer time to run the bot due to a long delay.
9595	00733383, 00754559	The Loop counter variable now works properly for migrated bots. The variable is now migrated as part of the <b>XML</b> and the <b>Data Table</b> commands.

Fixes		
Build	Service Cloud case ID	Description
9595	--	When updating the SQL queries on a migrated bot using the <b>Read from</b> and the <b>Insert/Update/Delete</b> actions of the Database package, the existing format of the query is no longer automatically modified. Previously, when editing the SQL queries on a migrated bot, the characters were being misplaced.
9595	00721238	You can now use the <b>Browser</b> action to access a URL with parameters using the Microsoft Edge browser. Previously, when a URL with parameters through the <b>Browser</b> action was accessed using Microsoft Edge, the URL parameters were truncated from the & (ampersand) character after the bot was run.
9595	00721488	Enterprise 11 bots that use the <b>Get multiple nodes</b> command no longer provide a different output after migration. Previously, the migrated bot returned output per the structure of the XML file, while the Enterprise 11 bot provided output in a single line.
9595	--	You no longer encounter an issue when you run bots migrated from Enterprise 11 that use identical names for variables differentiated by a hyphen or an underscore (for example, L-Lower and L_Lower). The variable name that contains a hyphen is now appended with some keywords (for example, variable Arr-val is updated to Arr-val-MIG-SPL-25). Previously, bots failed to execute after migration.
9595	00729931	After migration, when the bot file is generated, the correct DOMXPath is now migrated. Previously, an incorrect DOMXPath was migrated.
9595	00738643	The If and Loop conditions when used in a combination of multiple <b>AND</b> or <b>OR</b> conditions now works properly. Previously, using the If and the Loop conditions with multiple conditions resulted in a bot logic error.
9595	00743808, 00754554	Migrated bots that use the If command with a variable in the HH:MM format now work properly and no longer encounter any issue.

Fixes		
Build	Service Cloud case ID	Description
9595	00678059	You can now download exported packages if the bot name contains Japanese characters and an underscore (_). Previously, if the name contained such characters, an unexpected error occurred that restricted the user from downloading the package.
9595	--	When you run a migrated bot that contains the <b>Excel Advanced &gt; Find</b> action, the found cell is now active and subsequent actions can perform operations on that active cell.
9595	00731512	You can no longer edit a bot and change the bot repository file path from the public to private folder by updating the Control Room URL and repository path in the browser.
9595	00734059	INFO type messages are no longer duplicated in the Control Room <code>WebCR.log</code> file.
9595	--	When you install a Bot Agent at the user level, the user device is now registered as admin.
9595	00744663, 00747831, 00737488, 00752613	You can now successfully export a bot that contains the Recorder package.
9595	00726433	Fixed an issue with Microsoft Graph APIs that caused errors when a bot downloaded files from OneDrive. Bots can now successfully run the <b>Office 365 OneDrive &gt; Download file</b> action.
9595	00703553	When a new user is created, the Audit API now returns the correct values for the <b>eventDescription</b> and <b>userName</b> parameters.
9595	00729563	The <code>atmx</code> file extension is no longer case-sensitive. You can now migrate tasks that include uppercase or lowercase letters in their file extensions. Previously, tasks with uppercase letters in their file extensions were not migrated by the Bot Migration Wizard.
9595	00740548	Bot status is now correctly displayed after a process is executed. Previously, scheduled bots were occasionally mislabeled as <code>In progress activity</code> even though the bot had completed the process.
9595	00731508	You can now enter Nordic characters in the credential attribute and credential variable values.

Fixes		
Build	Service Cloud case ID	Description
9595	00695176, 00692676	Newly copied bots containing an event trigger now run when the triggering event occurs.
9595	00759742	When you insert a variable in a text string, the variable is now inserted at the cursor position. Previously, the variable was inserted at the end of the string and not at the cursor position.
9595	--	You can now successfully deploy bots from the Bot editor. Previously, when the Bot Creator or Bot Runner (attended or unattended) user logged in to the Control Room and if the package download option was enabled, the package download took priority and bot deployment had to wait until the package download was completed.
9595	00730211	When you use the Recorder package > <b>Get property</b> action to extract the path property of the object, the recorder now retrieves the value of the height and path attributes of the captured object. Previously, the height and path attributes of the recorded object were not retrieved by the bot.
9595	00716793	An issue is no longer encountered when you execute a bot using the SOAP Web Service package with unformatted input parameters. Previously, bot execution failed with an error because the unformatted input parameters were not formatted in XML format by the bot.
9595	00706709	In the Email package, when you use the Outlook connection to retrieve emails with the date filter, all emails are now retrieved correctly. Previously, all the emails were not retrieved from the application when the date filter was applied.
9595	00714292	To support double backslashes (\\) in the file location for actions that use file input, you must now set the <b>Bot compatibility version</b> as 2 in the <b>Advanced settings</b> page of the Bot editor. Previously, the bot execution failed because the double backslash (\\) in the file location was replaced with a forward slash when you select a network path using <b>Browse</b> option.

Fixes		
Build	Service Cloud case ID	Description
9595	00697460	When you select the recorder in the If condition, the recorder now locates the object in the Oracle EBS application and captures the correct object properties without any error. Previously, the recorder failed to find the object when captured in the If condition.
9595	--	In Microsoft Edge or Firefox, when a bot opens a website inside a loop, the Recorder <b>Capture</b> action now works properly after the launch website operation is executed. Previously, the action failed after launch website was executed.
9595	00710257	In the Recorder package, the <b>Capture</b> action now works without encountering any issues. Previously, the Recorder failed with a timeout error because the network proxy details were not retrieved.
9595	00735480	A TaskBot now performs better when you use the <b>Loop</b> action to execute a bot. Previously, the TaskBot took a long time to complete execution.
9595	00559868	When you use Datetime package > <b>Assign</b> action to convert a DateTime variable using the custom format dd-MMM-yyyy, the bot now executes without any errors. Previously, the bot execution failed due to case-sensitive characters in the DateTime format.
9595	--	Migration of PaaS database (Azure SQL) connection strings by using an ODBC driver is now supported.
9595	00733651	You can now view the average time spent to create a TaskBot metric in the Control Room on different pages when you click a page number.
9595	00742305	When you turn off one node on a three-node cluster and log in to the Control Room, the following error is no longer displayed: Cluster group is empty.
9595	00712190, 00698197, 00700574	When you deploy a bot with string values that exceed the allowed limit of 2 - 4 MB, the Control Room recognizes it as an exception and now shows the following error message: 400 Bad Request.
9595	00754585, 00755448	When you run a bot, dependencies including the child bots are now downloaded. The bot no longer shows an unknown status and session as expired.

Fixes		
Build	Service Cloud case ID	Description
9595	--	When you now migrate the Database command, no additional configuration is required.
9595	00745046	You can now check in your bots without encountering any issues. Previously, bot check-in failed because the Git repository was corrupted intermittently.
9595	00677638	When you add a user device as the default device in the Control Room, the <b>Devices</b> page now automatically displays it as the default device. You no longer have to re-log in to the Control Room or refresh the Control Room page.
9595	00733370	Users signed in to temporary (non-persistent) shared devices can now sign in to the Control Room after a previous session on the temporary device is deleted by the Control Room administrator.
9595	00736950	MetaBots using Japanese characters (double-byte string) as the output variable can now be successfully saved and executed after the MetaBots are migrated to On-Premises using the migration wizard.
9595	00723924	The Terminal Emulator type ANSI now accepts a password that contains braces or {}. Previously, when braces were used in the password, an invalid username and password error message was shown in the terminal screen.

Limitations
<p>(Service Cloud Case ID: 00797199) If multiple instances of Bot Agent in Google Chrome browser are displayed and multiple Google profiles (accounts) are open in the browsers, you might not be able to use the <b>Recorder &gt; Capture</b> command. You might see an error message that informs you that the Google Chrome plug-in not installed.</p> <p><b>Workaround:</b> Automation 360 supports only a single profile for automation. Therefore, we recommend that you either configure a single Google profile in Google Chrome or, if you are using multiple profiles simultaneously in Google Chrome and want to automate one profile, enable the <a href="#">Automation 360 extension for Chrome</a> on only one of the Google profiles.</p>

Limitations
<p>(Service Cloud Case ID: 01071731) When you open a CSV or TXT file, read data from that file, and write the data from a Table type variable to the file, the bot fails with an error if the CSV or TXT file contains large data sets. Also, <b>Create folders/files if it doesn't exist</b> and <b>Override existing file</b> check boxes are selected in the <b>Write to file</b> action.</p> <p><b>Workaround:</b> Perform one of the following:</p> <ul style="list-style-type: none"> <li>• In the task, when you use the <b>Open</b> action for a CSV or TXT file, select the <b>Contains header</b> check box to prevent your bot from failing.</li> <li>• Use the Excel advanced <b>Open</b> action to open a CSV file and then use the <b>Write from data table</b> action to write data into the file.</li> </ul>
<p>(Service Cloud case ID: 00793818) If you edit a large number of schedules simultaneously (for example, more than 40) in the Control Room from the <b>Scheduled activity</b> page, the schedules will not be activated.</p> <p><b>Recommendation:</b> Use the edit option for each schedule to avoid overwhelming the scheduler.</p>
<p>(Service Cloud case ID: 00805571) When the Bot Agent is automatically updated for Cloud deployments, the status of the Bot Agent flickers (changes) between <b>Connected</b> and <b>Updating</b> on the <b>Devices</b> page. The Bot Agent logs indicate that the auto-update process is initiated, but the device does not connect to the WebSocket server.</p> <p><b>Workaround:</b> Delete the local database file <code>AA-DB.mv.db</code> from <code>C:\Windows\System32\config\systemprofile\AppData\Local\AutomationAnywhere</code> and restart the Bot Agent service. If auto-update is enabled in the Control Room settings, the Bot Agent will be updated automatically. Note that if the setting is disabled, you have to update the Bot Agent manually.</p>
<p>If a device or Bot Agent service restarts when you are running bots, the bots are shown as <b>Active</b> in the <b>Activity</b> page instead of <b>Failed</b> because of response schema changes in the product.</p> <p><b>Workaround:</b> Delete the <code>AA-DB.mv.db</code> file from <code>C:\Windows\System32\config\systemprofile\AppData\Local\AutomationAnywhere</code> and restart the Bot Agent service. The deployments stuck in <b>Active</b> state will be moved to the <b>Historical</b> page and will be marked as <b>Failed</b> so that subsequent deployments can continue to run.</p>
<p>Intermittent issues occur with the execution of scheduled bots where some existing schedules behave inconsistently or some newly created schedules disappear. The new feature to set the priority to <b>High</b> has been reverted to address this occurrence. For users who have used this feature in Build 9637 or earlier and have updated to Build 9664, the schedules work without the relevance of the priority setting.</p> <p><b>Workaround:</b> If you encounter these issues, split large scheduled automation to smaller schedules of 2 hours each to run throughout the day. For example, reconfigure an automation that is scheduled for a 12-hour period such as 9 AM to 9 PM daily to two-hour intervals such as 9 AM to 10:59 AM, 11:00 AM to 12:59 PM, and 1:00 PM to 2:59 PM. We strongly recommend that you use 2-hour intervals in such deployments. Further recommendations for schedules and time intervals: any schedules with a lower time frequency ( &lt; 10 minutes) should be spaced out to at least 10 minutes (Service Cloud case ID 00792385, 00785679, 00795915, 00793147, 00794555).</p>

Limitations
<p><b>Known behavior for configured ports on multiple instances</b></p> <p>When you install the Control Room and configure the database, the ports for multiple instances should match the TCP ports configured in TCP/IP properties. For example, for the first instance if the configured TCP port is 1434 and for the second instance the configured TCP port is 1435, ensure you add 1434 as the port for the first instance and 1435 as the port for the second instance during Control Room installation.</p>
<p>The Universal Recorder has the following limitations when capturing objects in Electron apps:</p> <ul style="list-style-type: none"> <li>• The <b>Check</b> action in a check box is not currently supported. <b>Workaround:</b> Use <b>Toggle</b>, <b>Click</b>, or <b>Left click</b> instead.</li> <li>• The Universal Recorder cannot capture tabular data. <b>Workaround:</b> When the Universal Recorder captures an object control of <code>Client</code>, select the <b>GetAllChildrenNames</b> action and store the data to a list variable.</li> <li>• The Universal Recorder might capture the window containing Microsoft Teams as a Client technology, instead of the intended object. <b>Workaround:</b> Close and reopen Microsoft Teams.</li> <li>• The Universal Recorder only supports object capture from Electron apps in a computer that has the display scale configured to 100% or has a DPI awareness setting.</li> </ul>
<p>If the maximum number of allowed activeMQ connections is exceeded, an AMQ failure can occur when running a RunTask automation that is looped 5 times, with each loop running 20+ bots after the fourth loop.</p>
<p><b>External key vault</b></p> <p>The Create/Edit User configure options still include the field permitting the administrator to enter the device credentials for the user. When auto-login is configured for the external key vault, these fields are still viewable and appear editable; however, the credentials added have no effect on the auto-login credential retrieval from the external vault.</p>
<p>You might observe an increase in CPU usage by about 10 percentage when the Control Room is in an idle state (Service Cloud case ID 00801733).</p>
<p>When you update the Control Room on Linux from Automation 360 v.19 or v.20 to Automation 360 v.21, the Control Room continues to display the interface from the previous version. <b>Workaround:</b> Refresh the browser to load the user interface in the new version.</p>

## Automation Anywhere Robotic Interface (AARI)

What's new
<p><b>AARI Assistant for attended Bot Runners</b></p> <p>The AARI Assistant application enables users with the attended Bot Runner license to access their bots without logging in to the Control Room. AARI web users can use the AARI Assistant when the attended Bot Runner license is enabled along with their AARI User license without impacting their existing functionality.</p> <p><a href="#">About AARI Assistant</a> on page 1532</p>

What's new
<p><b>Download, delete, or view files in browser in initial forms or tasks</b></p> <p>Users can now use the <b>Select File</b> element to download files that are uploaded to the initial forms or tasks, and they can also delete files or access the hyperlink file to view the file in within the browser. The uploaded file can be accessed as a hyperlink, and new icons are available for download and delete.</p>
<p><b>Enhancement to team roles</b></p> <p>The AARI team consists of three roles:</p> <ul style="list-style-type: none"> <li>• Member: Can create, view, and delete their own requests. All the tasks are automatically assigned to the member when they create the request in a private team. In a shared team, the member can assign tasks to other members.</li> <li>• Owner: Can create, view, delete, and assign all the requests from the members in the team.</li> <li>• Admin: Can create, view delete, and assign all the requests from the members in the team. The admin can also modify the team.</li> </ul> <p>An AARI admin or manager can edit their teams and update their team members' roles. They also have the option to add or remove team members. The AARI manager is the team admin by default when they create a team.</p>
<p><b>Enhancement to creating requests</b></p> <p>A request can now be created either by a user or by a bot in the <b>Edit Process</b> page.</p> <ul style="list-style-type: none"> <li>• Choose the <b>by user</b> option to view the process in the <b>Processes</b> page.</li> <li>• Choose the <b>by bot</b> option so that the request is created either by a bot or by another process using the <b>Process Task</b>.</li> </ul> <p>You cannot view the process or create a request with this option. Because the request is created from within a team, specify the default team in the <b>Default team to take the bot created request</b> field in the <b>Edit Process</b> page.</p> <p><a href="#">Assign an AARI team to a process</a> on page 1519</p>
<p><b>Assign to me feature in tasks</b></p> <p>When a task is unassigned and users access the tasks, use the <b>Assign to me</b> option to allow the tasks to be assigned to the current user so that they can immediately access the form.</p> <p><a href="#">Assign or unassign a task</a> on page 1520</p>
<p><b>New Bot page</b></p> <p>When AARI team members with attended Bot Runner licenses access the web interface, they are automatically redirected to AARI Assistant. Users can view all the bots created by them on this page. They can also pin, search, and sort their assigned bots.</p>
<p><b>New team reference in Request and Process pages</b></p> <p>The user can now reference the team from which a request is created by referring to the new <b>Team</b> column in the <b>Request</b> page or the team name added in the process tile in the <b>Process</b> page, to help guide their team assignment.</p>

What's new
<p><b>New Request Visibility field</b> (Service Cloud case ID: 00718119)</p> <p>Request visibility enables users to allow or restrict access to a request they created to other team members. When the <b>Request Visibility</b> field is set to <b>Shared</b>, all the requests are accessible by all members, owners, and team admins. If the field is set to <b>Private</b>, the requests are available only to the user who has created the request, owner, and the team admin.</p>
<p><b>Enhancement to the Processes page</b></p> <p>The following enhancements are available on the <b>Processes</b> page:</p> <ul style="list-style-type: none"> <li>• Sort the processes by name, in ascending or descending order.</li> <li>• Toggle the pinning of a process.</li> <li>• Use the responsive view to adjust the display to the screen size.</li> </ul>
<p><b>Cloud storage usage</b></p> <p>Based on the maximum file and storage sizes, users who upload files can use cloud storage. The quota for storage is as follows:</p> <ul style="list-style-type: none"> <li>• The size of the file uploaded using the <b>Select File</b> element cannot exceed 25 MB.</li> <li>• By default, the storage can store a maximum of 100 MB of data.</li> <li>• It is extended to an additional 1 GB for every AARI user license allocated.</li> </ul>
<p><b>Copy process to URI feature</b></p> <p>The AARI admin can use the new <b>Copy process to uri to clipboard</b> feature in the <b>Process setup</b> page to obtain the URI data and share with team members as reference when they enter the URI data to the <b>Create a Request</b> action.</p> <p><a href="#">Web</a></p>
<p><b>Add rows from header row context menu</b></p> <p>Only the header row is displayed when a form that has a table is launched during bot runtime. Use one of the following methods to add new rows to the table:</p> <ul style="list-style-type: none"> <li>• Header row context menu of the table <ul style="list-style-type: none"> <li>• <a href="#">Using the Table element</a> on page 1550</li> </ul> </li> <li>• The <b>Set</b> action in a bot <ul style="list-style-type: none"> <li>• <a href="#">Set</a></li> </ul> </li> </ul>
<p><b>Support for interface triggers on Google Chrome</b></p> <p>Interface triggers are now supported on the Google Chrome browser for the following actions during bot runtime:</p> <ul style="list-style-type: none"> <li>• When you click a button element in a form</li> <li>• For <b>Got focus</b> and <b>Lost focus</b> actions in a text box</li> <li>• When a preconfigured hot key is used with the <b>Got focus</b> action in a text box</li> </ul> <p><a href="#">Add an interface trigger</a> on page 1563</p>

What's changed
<p><b>Upgrade changes to teams and processes</b></p> <p>For users who had access to processes, when they upgrade to the latest Automation 360 version, their existing teams remain the same but is now set to a <b>shared</b> team type, regardless of their existing team assignment. AARI users and managers, are now converted to <b>member</b> and <b>admin</b> team roles, respectively. While any existing processes assigned to your team are shown as <b>Team Migrated for Process</b> after the upgrade.</p> <p>For AARI managers (process manager) who could create requests without assigning process to teams. After the upgrade, the AARI managers must create teams, ask the AARI admin to assign teams to a process in order to create new requests.</p> <p>Processes have the <b>by user</b> option set by default for teams to view a process. You must choose the <b>by bot</b> option to have request be created by bots or another process.</p> <p><i>Using AARI on the web interface</i> on page 1464   <i>Assign an AARI team to a process</i> on page 1519</p>
<p><b>Update to Auto Assign feature</b></p> <ul style="list-style-type: none"> <li>In the <b>Human Task</b>, you can no longer use the auto-assign feature to assign the task automatically to the manager. You can auto-assign the task to the user who created the request.</li> <li>The option to assign the target task to the manager is now removed from the <b>Go to</b> element.</li> </ul> <p>You can now override the previous auto-assign setting by selecting the <b>Override task assignment setting</b> option in the <b>Go to</b> panel by either unassigning the task or assigning the task to the user who created the request.</p>

The following table lists the fixes and the builds in which they were fixed. Build 9664 is the latest build for Cloud and includes fixes from the previous builds (including Build 9604). On-Premises is on Build 9664.

Fixes		
Build	Service Cloud case ID	Description
9664	00788255	After upgrading from v.19 to this release version, processes containing forms with the <b>Table</b> , <b>Checkbox</b> , or <b>Text Box</b> element now execute successfully. Previously, if the process contained a form with an empty table, check box, or text box, it failed during execution if no changes were made in the form.
9664	00772925	The layout of the request view page no longer changes when the user selects a language other than English.
9664	00781891, 00784947	Warning texts in the process editor now render correctly with UTF-8 encoding.
9664	--	Users with the attended license are now correctly redirected to the AARI Assistant application when they log in from the same device where a user without the attended licenses tried to access the application beforehand.

Fixes		
Build	Service Cloud case ID	Description
9604	00765406	When you enter more than four number values with a comma in a <b>Number</b> element field in the initial forms or tasks, the field can now accept the large number value without issues.
9595	00719862	In the <b>Team Setup</b> page, you can now view the members of your team and check if the member count is consistent with the number of team members.
9595	00738934	Users can now view, upload, download, or delete their files when they add the <b>Select File</b> element to forms to complete tasks in the web interface.
9595	00767008	When you upload a file with the <b>Select File</b> element in your tasks, the bot now downloads your file through the <b>Get Storage file</b> action without issues.
9595	--	Long text for the label name of <b>Radio button</b> and <b>Checkbox</b> elements in a form is now displayed completely.

Limitations
<p>(Service Cloud case ID: 00831376) When you use the storage service to upload or download files from the web interface, the download is redirected to an AWS and GCP presigned URL. You will not be able to download files unless you whitelist the AWS and GCP URLs.</p> <p><b>Workaround:</b> You must whitelist the following URL in order to download:</p> <ul style="list-style-type: none"> <li>• AWS: <code>https://&lt;bucket-name&gt;.s3.&lt;region&gt;.amazonaws.com/</code></li> <li>• GCP: <code>https://storage.googleapis.com/&lt;bucket-name&gt;/</code></li> </ul>
<p>(Service Cloud case ID 00789181) When a bot is deployed in AARI and the deployment is not completed even after an hour, the bot fails and the status changes to <code>failed</code> in AARI. However the same bot still executes in the Control Room.</p> <p><b>Workaround:</b></p> <p>Choose one or both of the following options:</p> <ul style="list-style-type: none"> <li>• Define an adequate duration for your bot execution.</li> <li>• Increase the size of your device pool.</li> </ul>
<p>For On-Premises, when you log in to AARI Assistant application as a non-attended user, it shows an error as expected. However if you use that same credentials, or credentials from another non-attended user, and log in again to the application, it takes you to the web interface page.</p> <p><b>Workaround:</b></p> <ol style="list-style-type: none"> <li>1. Log in to the AARI Assistant application as an attended user.</li> <li>2. First, log in to the web interface (<code>aari/#/assistant</code> URL) then log out without changing anything in the browser. Second, navigate to the AARI Assistant application on your desktop and log in as an attended user.</li> </ol>

Limitations
<p>The <b>Teams</b> column in the <b>Process setup</b> page is not automatically updated when the AARI admin adds or removes their team in a process.</p> <p><b>Workarounds:</b> Use the following options on the <b>Process setup</b> page:</p> <ul style="list-style-type: none"> <li>• Click the <b>Refresh the list</b> option.</li> <li>• Click the browser's refresh option to reload the page.</li> <li>• Navigate to another tab then return to this page.</li> </ul>
<p>When you use the <b>Process Task</b> in the process editor, you cannot use the <b>Public folder</b> option in the <b>Select process file</b> field because adding a public process as a dependency to the private process is not supported.</p>
<p>When users use the <b>Image</b> element to render images, the images does not render external images in the request view when users run their tasks.</p>

## Discovery Bot

What's new
<p><b>Sort for a process tile from the Processes page</b></p> <p>You can now use the sort field to help you locate a process tile quickly. From the <b>Processes</b> page, use the drop-down menu to sort on a process tile based on the process name in alphabetical order. Alternatively, you can sort in the order of the newest process created to the oldest process and vice versa.</p> <p><a href="#">Create a Discovery Bot process</a> on page 1669</p>
<p><b>Enhancements to opportunities</b></p> <p>You can now review and analyze automatically generated (or system-generated) opportunities immediately from the <b>Opportunities</b> page. Auto-generated opportunities are created when at least two recordings are approved by the user. You can create a custom opportunity from an auto-generated opportunity and apply the <b>Model</b> and <b>Filter</b> options to target a specific opportunity for automation.</p> <p>You can now prioritize opportunities based on a simple formula for all recordings in a process. From the Opportunities table, you can view the cost without automation and savings for an opportunity. The system automatically calculates the cost and potential savings for each opportunity generated. You can customize these metrics based on your organization's model for cost and savings.</p> <p><a href="#">Review opportunities and convert to</a></p>
<p><b>Generated PDD files are available on your local server</b></p> <p>The generated PDD file for an opportunity is now stored locally on your server for On-Premises deployments. The existing PDD files are automatically moved to the new location and are not deleted when a re-installation or upgrade is performed in the Control Room.</p> <p><a href="#">Prerequisites for Discovery Bot</a> on page 1661</p>

Fixes	
Service Cloud case ID	Description
--	Double-click, drag-drop, click and hold, and text select are now supported when you are recording a business process.
--	When you record a process with more than 1000 steps, the <b>Recordings</b> page now displays the process without any delay. Previously, the <b>Recordings</b> page took some time to load.

Limitations
The Control Room installer for Red Hat Enterprise Linux (version 7.7 or 7.9) does not include the Discovery Bot package.
<b>Workaround:</b> Log in to the Control Room as an admin, select <b>Manage &gt; Package &gt; Upload</b> and upload the Discovery Bot package. The package is included in the list of default packages.
<ul style="list-style-type: none"> <li>• <b>Cloud users:</b> When an opportunity is created with 50 steps, the <b>Download PDD</b> option is disabled and the PDD is not available for download.</li> <li>• <b>On-Premises users:</b> When an opportunity is created with 100 steps, the <b>Download PDD</b> option is disabled and the PDD is not available for download.</li> </ul>

## IQ Bot

What's new
<p><b>IQ Bot standard forms</b></p> <p>Create learning instances using the standard forms, which use an existing pretrained model and classification for extracting a large number of data fields from structured documents that typically have less or no variations in the layout.</p> <hr/> <p><b>Note:</b> Standard forms are currently available only as a beta feature.</p> <hr/> <p><i>Using IQ Bot for standard forms</i> on page 1862</p>
<p><b>Additional learning instances for IQ Bot Process documents action</b></p> <p>Use the new <b>Azure 3.2</b> and <b>japanese_Tegaki</b> learning instances for the IQ Bot <b>Process documents</b> action in the IQ Bot Extraction package.</p> <p><i>Using IQ Bot Process documents action</i></p>

What's changed
<p><b>IQ Bot file paths</b></p> <p>File locations and folder names are updated to use the new product name. For example:</p> <ul style="list-style-type: none"> <li>The default installation path is changed from <code>C:\Program Files (x86)\Automation Anywhere IQ Bot A2019\</code> to <code>C:\Program Files (x86)\Automation 360 IQ Bot\</code>.</li> <li>The default log path is changed from <code>C:\Users\Public\Documents\Automation Anywhere IQ Bot A2019</code> to <code>C:\Users\Public\Documents\Automation 360 IQBot Platform</code>.</li> </ul>
<p><b>Provider column on Learning Instances page updated</b></p> <p>The <b>Provider</b> column in the <b>Learning Instances &gt; My learning instances</b> page is now updated to display a list of all available OCR engines associated with the corresponding learning instance.</p>
<p><b>Enhancements to IQ Bot Extraction package</b></p> <p>IQ Bot Extraction package now supports the following OCR engines:</p> <ul style="list-style-type: none"> <li>Microsoft Azure Computer Vision OCR engine 3.2 This significantly improves the OCR extraction from Chinese language documents.</li> <li>Tegaki API OCR engine</li> </ul> <p><i><a href="#">IQ Bot Extraction package</a></i></p>
<p><b>Enhancement to IQ Bot security</b> (Service Cloud Case ID: 00677507)</p> <p>You can now further improve security in IQ Bot by configuring RabbitMQ v3.8.18 communication through a secure SSL/TLS channel. Set <code>secureRabbitMQCommunication = true</code> in the <code>system.properties</code> file and then restart all IQ Bot services, including RabbitMQ v3.8.18. By default, this flag is set to <code>false</code>.</p> <p>This enhancement also fixes an issue that caused a RabbitMQ v3.8.18 security vulnerability.</p>
<p><b>Reuse the name of a deleted learning instance</b>   Automation 360 IQ Bot On-Premises</p> <p>While creating or editing a new learning instance, you can now reuse the name of a learning instance that was deleted. Ensure you backup the documents in your <b>Output</b> folder before deleting a learning instance. You can then clear the documents of the <b>Output</b> folder before creating or editing a new learning instance with the same name.</p> <p>If you have not cleared the documents from the <b>Output</b> folder for the deleted learning instance, you cannot download the contents. However, you can download only the documents processed by the new learning instance.</p>
<p><b>Support for Microsoft Azure SMB</b></p> <p>IQ Bot now supports Microsoft Azure files storage system using the SMB (Server Message Block) protocol. You can now also install IQ Bot using the shared folder configured with SMB and access the output files from the same directory.</p>

What's changed
<p><b>Switch between databases without re-installing IQ Bot</b></p> <p>You can now switch between configured databases without re-installing IQ Bot using the <code>SwitchDBServer.bat</code> utility.</p> <p>To use this utility, perform the following steps:</p> <ol style="list-style-type: none"> <li>1. Download and extract the <code>SwitchDBServer.bat</code> utility from the <code>&lt;IQBot installation Dir&gt;\Configurations</code> folder, and then open the command prompt in this directory.</li> <li>2. Run the batch (.bat) file with an IP address or hostname of the destination DB server.</li> </ol> <p><b>Example:</b> <code>SwitchDBServer 171.xx.xx.11</code></p>

The following table lists the fixes and the builds in which they were fixed. Build 9642 is the latest build for On-Premises and includes fixes from the previous build.

Fixes		
Build	Service Cloud case ID	Description
9596	00777932, 00766332	While you update to this IQ Bot release, the output path from the previous version is now retained during installation.
9595	00686444	When exporting learning instances from one environment to another, IQ Bot now updates the <code>visionBotId</code> in the exported data. So you can now edit bots in the destination environment without any errors.
9595	--	Duplicate table row entries in the Validator are now significantly reduced due to the improved table extraction logic.
9595	00651057	IQ Bot can now connect to Control Room Ignite cache without any errors. This fixes an issue where all learning instances were not displayed.
9595	00616038	When you update or restart Control Room, error messages are no longer displayed when you use the link or click <b>Explore IQ Bot</b> to open IQ Bot.
9595	00668412, 00644948, 00717414	When you now upload a document in production, deadlocks no longer occur in the system and documents are correctly sent to the Validator.
9595	00651572, 00650959	If no files are available in the <code>Output \Successful</code> folder and you click the <b>Download all documents</b> action, IQ Bot now displays the correct error message.
9595	--	Documents in Chinese (Simplified) language are now processed successfully without any issues.

Fixes		
Build	Service Cloud case ID	Description
9595	--	If you add a blocked library to a custom Python logic and click <b>Test Run</b> for any field, an error message is no longer displayed on the Designer page.
9595	--	The Enterprise 11 IQ Bot command can now be migrated to the <b>Upload Documents</b> action in Automation 360 IQ Bot. Therefore, you no longer have to manually create bots when you migrate the learning instances.

Limitations
<p>IQ Bot Cloud: If you do not access IQ Bot within the configured <b>Ideal time out</b> value set on the IQ Bot server:</p> <ul style="list-style-type: none"> <li>• A message to restart IQ Bot is displayed.</li> <li>• Bots using IQ Bot APIs fail when the server is restarted.</li> </ul> <p>Refresh the IQ Bot web page after some time (more than 5 minutes) to log in to IQ Bot.</p>
<p>When you create a learning instance, if the PDF that you upload contains small fonts, the document is classified as an image. If you use the PDFBox OCR to create a learning instance for a multipage document, the segments are not displayed.</p> <p><b>Workaround:</b> Turn off the PDFBox OCR.</p>
<p>For a standard forms learning instance, when you try to download output files and at the same time send frequent API requests to that database, the system might stop responding.</p> <p><b>Recommended:</b> When using the standard forms learning instance, wait for the files to be downloaded. After the download, ensure you allow some time (&gt; 60 seconds) between the API requests.</p>
<p>If an incorrect configuration is used to create the <code>providerVersion</code> file of a standard forms learning instance, an error message is displayed when you move this learning instance to production.</p> <p><b>Note:</b> Ensure you use valid configurations.</p>
<p>If you use a bot associated with a standard forms learning instance to upload a large number of documents, some of the documents are not processed.</p> <p><b>Workaround:</b> Because this issue might be caused due to a timeout, try to upload the documents after some time.</p>
<p>If you have used an earlier version of IQ Bot (11.x) to move documents to the <b>Validator</b>, you cannot download these documents when you migrate to this Automation 360 IQ Bot version.</p> <p><b>Workaround:</b> If you are migrate to this version, ensure you clear all the documents in Validator.</p>
<p>When you use the <b>Download all documents</b> or <b>Upload Document</b> actions from the IQ Bot package, the upload and download can fail as the proxy settings specified in the Control Room are not used.</p>

Limitations
<p>If you manually delete any <code>.csv</code> file from the <code>Success</code> folder, other files in the folder might not be downloaded when you use the <b>Download</b> option.</p> <p>Ensure you do not manually delete any files from the <code>Success</code> folder.</p>
<p>Only SQL authentication is supported when you use the Migration Assistant tool to migrate from IQ Bot 11.x to Automation 360 IQ Bot.</p>
<p>If you have a document with a large number of pages (&gt; 100), an error message is displayed intermittently when you click <b>See extraction results</b> for an existing learning instance.</p>
<p>The unclassified documents count in <b>Staging results</b> and <b>Production results</b> in the <b>Summary</b> tab of a learning instance might be displayed incorrectly.</p>
<p>On the Validator screen, if incorrect values are used to update a field on which you have applied validations, an alert is not displayed when the focus is lost from that field.</p>
<p>If any of the available number fields include parenthesis or (), the selected system identified region (SIR) on the document panel changes to a hyphen (-) when you click the extracted value.</p>
<p>If you use the name of a deleted learning instance when creating a new learning instance, both the instances are listed in the <b>Learning instance name</b> drop-down menu of the <b>Upload document</b> action when a bot is created.</p> <p><b>Workaround:</b> Click the new learning instance to remove the old learning instance from the list.</p>
<p>If you use the Tesseract4 OCR during IQ Bot Extraction package updates, there is a delay in the document processing time and throughput results.</p>
<p>For a learning instance created with standard forms, if the extraction is not successful for the <b>Field options &gt; Optional</b> field, the value set in <b>Default value</b> is not assigned to that form field.</p> <p><b>Workaround:</b> Use Python script from the <b>Logic</b> tab to set the value that must be assigned as the <b>Default field</b>.</p>
<p>(Service Cloud case ID: 00601790) For documents processed using the IQ Bot Extraction package, document details such as <b>Documents processed</b> and <b>Pages uploaded</b> are not displayed correctly in the <b>Dashboard</b> page.</p>
<p>As the Preview2 version of the Microsoft Azure 3.2 is deprecated, if you have used the Microsoft Azure 3.2-Preview2 OCR engine to create a learning instance, the documents will be unclassified.</p> <p><b>Workaround:</b> Ensure that you replace all occurrences of Microsoft Azure 3.2-Preview2 with Microsoft Azure 3.2:</p> <ul style="list-style-type: none"> <li>In <code>Azure3OCREngineSettings.json</code> file, change <b>Version: v3.2-preview.2</b> to <b>Version: v3.2</b>. You can then update the OCR engine version by uploading this file to database using API <a href="#">How to change OCR Settings in IQ Bot (A-People login required)</a></li> <li>In the IQ Bot <b>Installation &gt; Configurations</b> folder, update <code>Azure3ContainerOCREngineSettings</code> with Microsoft Azure 3.2. This is for the containerized deployment of Microsoft Azure 3.2 OCR engine.</li> </ul>

**Limitations**

(Service Cloud case ID: 00799842) When you process vector-based PDF documents in IQ Bot, the OCR results are sometimes inaccurate. For instance, in some cases, spaces between words are missed in the extracted data. This might happen because of reasons related to the document that you uploaded or the tool that you used to generate the PDF file.

**Workaround:** To process your vector-based PDF document successfully, perform either of the following steps:

1. Convert your vector-based PDF document again to a vector-based PDF document by using a tools such as Adobe Acrobat.
2. Convert your vector-based PDF documents to a raster file format, such as TIFF.

---

**Important:** For information about the packages supported with this release, see [Packages available in Automation 360](#) on page 1369.

---

## Enterprise A2019.20 Release Notes

*Release date: 20 April 2021*

Review what's new and changed, and the fixes and limitations in the Enterprise A2019.20 release. Build 8846 is for Cloud and Build 8815 is for On-Premises. IQ Bot A2019 is on Build 8815.

---

**Important:** We have updated the Cloud build to include the following fixes:

- Migrated bots failing to execute due to preprocessing error (Service Cloud case ID 00760877, 00761211)
- Unable to deploy bots because the resource path exceeds the maximum length supported by Microsoft (Service Cloud case ID 00764731, 00763373, 00765172, 763334)

---

## Updating to this release

You can update to this release from the previous three releases (that is, from  $n-3$  releases, where  $n$  refers to the latest release). The following builds are certified for update to this release:

- Build 8147 (v.19)
- Build 7560 (v.18)
- Build 7103 (v.17)

For details on how to update, see [Update to latest Automation 360 version](#) on page 1022.

---

**Recommendation:** If you are not on an  $n-3$  release, update to one of the three certified releases before updating to this release.

---

**Important:** This release includes a required update to your . Ensure that you complete the update to continue with your automation activities when upgrading from a previous release to this release.

[Automatically update the Bot Agent](#) on page 1001 | [Manually update the Bot Agent](#) on page 1002

---

To verify which version is compatible with this release, see [Compatibility with release builds](#) on page 985.

## Migration features

Enterprise 11 and Enterprise 10 features
<p><b>Select folders for migration</b> (Service Cloud case ID: 00689307)</p> <p>In the Bot Migration Wizard, you can now select folders that contain bots (TaskBots and MetaBots) that you want to migrate to Enterprise A2019. As a result, you no longer have to migrate individual bots from that folder.</p>
<p><b>Migrate MetaBots with screens</b></p> <p>Migrate MetaBots that contain screens as assets. You can migrate screens based on HTML, MSA, Java, .Net technologies and use credential variables.</p>
<p><b>Migrate bots with the following attributes</b></p> <ul style="list-style-type: none"> <li>• Bots that contain the <b>IF &gt; Logic successful</b> or <b>IF &gt; Logic unsuccessful</b> command and these commands return a variable as output</li> <li>• Bots that contain the Run Task command with the <b>Repeat until I stop it</b> option to the <b>Run</b> action in the TaskBot package</li> <li>• Bots that use the \$Clipboard\$ system variable as input and output variables to pass the value to the MetaBot logic</li> </ul>

Enterprise 11 only features
<p><b>Migrate bots that use SAP BAPI to automate SAP-related tasks</b></p> <p>Migrate bots that use SAP BAPI to automate the SAP-related tasks. The SAP commands are migrated to equivalent actions of the SAP BAPI package, and the username, password, and hostname attributes used to connect to the SAP server in the Enterprise 11 bots are migrated as credential variables in Enterprise A2019.</p>

**Enterprise 11 only features****Retain legacy behavior of \$Excel Cell Row\$ system variable**

Use the **Use "Excel Cell Row" legacy behavior** option in the Bot Migration Wizard to retain the legacy behavior of the \$Excel Cell Row\$ system variable used in bots created in versions earlier than Version 11.3.1 after they are migrated to Enterprise A2019.

**Migrate bots with the following attributes:**

- Bots that use the **Delete** or **Get All Messages** command to delete or download attachment from all emails that use Exchange Web Services (EWS) using OAuth authentication.
- Bots that contain objects captured using the Object Cloning command that are based on Firefox and Silverlight technologies
- Bots that use the **Modify user** command with the **Update Account Options** and the **Change Password** option in the Active Directory command
- Bots that use the **Create user** option in the Active Directory command
- Bots that use the Variable Operation command and the **Decimal configuration** option is selected
- Bots that use the \$AATaskExecutor\$ system variable
- Bots from Version 11.3.5 or later that use the **Get Single Cell** command with the **Specific cell** and **Get Cell Value** options selected to retrieve value from a cell in a Microsoft Excel file.

**Enterprise A2019****What's new****Support for IPv6 addresses**

You can install Enterprise A2019 in distributed load balancer cluster mode in an IPv6 network to comply with your organization's infrastructure and information security requirements.

The following are not supported:

- Geo location is not available for IPv6 addresses.
- Link-local addresses for IPv6 addresses are removed from the Enterprise A2019 installer's IPv6 list.

[Configure IP cluster](#) on page 878

**Switch device registration between Control Room instances**

You can now switch your device registration between multiple instances of the Control Room without reinstalling the Bot Agent. This setting is applicable to single user devices installed at the system or user level.

[Switch device registration between Control Room instances](#) on page 2052 | [Switch Bot Agent to a different Control Room](#) on page 1004

**New permission to attest device user name** (Service Cloud case ID: 00576058)

Use the new permission to assign a default device to a user name to bypass credential validation when you deploy a bot on unattended Bot Runners. The permission is applicable to default device users with an unlocked and active user session.

[Feature permissions for a role](#) on page 2013

What's new
<p><b>Resource threshold settings to optimize bot deployments</b></p> <p>Configure resource threshold settings in the Control Room so that the system deploys the next bot only when the system resources on the device are within the specified thresholds. Specify the settings at the Control Room level for all devices, and customize these settings at each device level.</p> <p><a href="#">Manage device settings</a> on page 2045</p>
<p><b>Reduce bot startup time</b></p> <p>You can now reduce the bot startup time using settings in the Control Room to preload the most frequently used packages in the automation on all user devices when they connect to the Control Room.</p> <p><a href="#">Automatic package updates for Cloud Control Room</a> on page 1969</p>
<p><b>Express queue in workload automation</b></p> <p>You can now quickly create workload automation queues with default parameters in the Control Room by using the <b>Create express queue</b> option in the <b>Queues</b> page.</p> <p><a href="#">Create express queues</a> on page 2111</p>
<p><b>Group filters for Active Directory users</b></p> <p>You can provide additional filters for the <code>Users</code> directory as part of the <code>um.properties</code> file. As a result, you can filter the security groups that are in the <code>Users</code> directory for role mapping in the Control Room.</p> <p><a href="#">Manage Active Directory role mapping</a> on page 2036</p>
<p><b>Automate SAP-related tasks using SAP BAPI</b></p> <p>Use the actions available in the SAP BAPI package to automate SAP-related tasks using SAP BAPI.</p> <p><a href="#">SAP BAPI</a></p>
<p><b>Default names for output variables</b></p> <p>When you configure an output variable for the following packages, the Control Room shows a descriptive default variable name. If you create several output variables, subsequent variable names are appended with a <code>-1</code>, <code>-2</code>, <code>-3</code>, and so on to avoid duplication.</p> <ul style="list-style-type: none"> <li>• Browser</li> <li>• CSV/TXT</li> <li>• Email</li> <li>• Excel advanced</li> <li>• JavaScript</li> <li>• Loop</li> <li>• Recorder</li> <li>• VBScript</li> <li>• Window</li> </ul>
<p><b>PDF split with blank pages supports scanned image documents</b> (Service Cloud case ID: 00683923)</p> <p>Use the PDF <b>Split</b> action to separate a blank page from pages with scanned images. With pixel-based split, you can now use <b>Split document</b> to split a PDF with blank page separators for scanned (image-based) documents.</p>

<b>What's new</b>
<p><b>SMTP port range expanded to include ports 1 through 65535</b></p> <p>The Email package now supports ports in the range of 1 through 65535 for the SMTP server. You can use the <b>Send</b> email action by configuring the SMTP port in this range.</p>
<p><b>New actions in the Active Directory package</b></p> <ul style="list-style-type: none"> <li>• <b>Update account options:</b> Sets account attributes for the user.</li> <li>• <b>Change user password:</b> Use this option to change a user's password.</li> </ul> <p><i>User account operations</i></p>
<p><b>Enhancement to Create user action in Active Directory package</b></p> <p>You can now use the <b>Create user</b> action to create an Active Directory user with password.</p> <p><i>Using the Create user</i></p>
<p><b>Universal Recorder expanded support and new features</b></p> <p>Use the Universal Recorder to perform the following:</p> <ul style="list-style-type: none"> <li>• Automate clicks and data retrieval in drop-down lists and combo boxes in Oracle EBS applications such as Compass.</li> <li>• Link an object that the bot cannot reliably identify to a nearby object (such as a link or button) that is easier for the bot to find. Use this feature in MSA, UI Automation, or Java applications.</li> </ul>
<p><b>Support for new languages in variable names</b></p> <p>You can now use Czech, Danish, Dutch, Finnish, French, German, Hungarian, Italian, Norwegian, Polish, Portuguese, Romanian, Spanish, and Swedish characters in variable names.</p> <p><i>Unicode range supported in variables</i> on page 1392</p>
<p><b>Search and add child bot in the parent bot</b></p> <p>Search for a child bot in the public and private workspaces so that you can add it in the parent bot. You can search for the child bot from the Bot editor and the <b>Run</b> action of the Task Bot package.</p> <p><i>Using the Run   Bot editor for creating bots</i> on page 1306</p>
<p><b>Obtain information about user that deployed the bot</b></p> <p>Use the <i>AATaskInvoker</i> system variable to return the username, first name, last name, and email of the user that ran or scheduled the bot. If the bot is deployed to an attended Bot Runner, this variable returns information about the logged-in user. If the bot is deployed by a trigger, this variable returns information about the user who set the trigger.</p> <p><i>System settings and parameters</i> on page 1381</p>
<p><b>Git restoration enhancements</b></p> <ul style="list-style-type: none"> <li>• If your database is deleted or corrupted, as an administrator you can now restore files from the Git repository to a repository that is not fully empty.</li> <li>• You can also overwrite or skip the files if you have duplicate files in the Git repository.</li> <li>• If you are restoring files in an empty repository, you can choose to use either your existing credentials (configured with Control Room) or the credentials of any other repository.</li> </ul> <p><i>Restore bots from Git repository</i> on page 2074</p>

What's new
<p><b>View version history of TaskBots</b></p> <p>You can now view the version history of your TaskBots to identify relevant changes performed by other users to your TaskBots during a specific date and time along with the check-in messages.</p> <p><a href="#">View TaskBot version history</a> on page 1365</p>
<p><b>External key vault support</b></p> <p>Use external key vaults to securely store and retrieve credentials using a third-party key manager such as CyberArk and AWS Secrets Manager. External Key Vault support for AWS Secrets Manager and CyberArk for Bootstrap (database credentials,) and System (Service account credentials, Active Directory service account credentials, and SMTP credentials).</p> <p><a href="#">Integrate external key vaults</a> on page 868</p>
<p><b>New condition in If package</b> (Service Cloud case ID: 00536088, 00690073,00717514, 00737243, 00702383)</p> <p>Use the new <b>Window with same title does not exist</b> or <b>Window with same title exist</b> condition available in the If package to verify whether a window with the same title exists or whether the window title has changed.</p> <p><a href="#">If package</a></p>
<p><b>Google packages are now generally available</b></p> <p>Google Calendar, Google Drive, and Google Sheets packages are now generally available in Enterprise A2019, with a major change to the authentication method:</p> <ul style="list-style-type: none"> <li>• Each Google package contains a <b>Connect</b> action to authenticate your account before adding other actions from that package to your automation. This action replaces the deprecated <b>OAuth</b> action from the G-Apps package.</li> <li>• Each Google package contains a <b>Disconnect</b> action to terminate the connection.</li> </ul> <p><a href="#">Using the Connect action for Google packages</a></p>

What's changed
<p><b>Bots wait for Internet Explorer to fully render in Mouse package</b></p> <p>Bots (including bots migrated from Enterprise 11) that use the Mouse package now wait for the Internet Explorer to finish loading the page before executing the <b>Click</b> action. This prevents the bots from failing while the page is loading.</p>
<p><b>Interface change in the Edit variable window</b></p> <p>When editing a variable, if you deselect the <b>Use as input</b>, <b>Use as output</b>, or <b>Constant (read-only)</b> check box, a message now informs you of the impact of this change and requests you to confirm this update.</p>
<p><b>Enhancement to audit log entries</b> (Service Cloud case ID: 00656155)</p> <p>The audit log entries are now enhanced to display the <b>Item Name</b> and <b>Event Type</b> for import, export, check-in, and check-out requests.</p>

What's changed
<p><b>The .atmx file not downloaded during migration</b></p> <p>The migration process does not download the <code>.atmx</code> file if the associated bot is used as a child bot in the parent bot. The <b>Download CR file</b> action from the File package is no longer added in the migrated bot to download the depended bot (<code>.atmx</code>) file during migration.</p>
<p><b>Option to either upgrade Recorder package version or downgrade to older Google Chrome extension</b></p> <p>Bots that use the Recorder package version 2.0.5 or older to automate in the Google Chrome browser, now need to be updated to use a Recorder package version that is newer than 2.0.5. This is only necessary for Bot Runner devices that have the new Google Chrome extension (ID:kammdlphdfejllopponbapgpbgakimokm) installed, and have not previously run bots that use the Recorder package version 2.0.5 or older.</p> <p>If you do not want to upgrade the Recorder package, you can manually install the old Google Chrome extension. See <a href="#">Google Chrome extension troubleshooting</a> on page 1323.</p>

The following tables lists the fixes and the builds in which they were fixed. Build 8846 is the latest build for Cloud and includes fixes from the previous builds. On-Premises is on Build 8815.

Build 8846	
Service Cloud case ID	Description
00764731, 00763373, 00765172, 763334	You can now deploy bots and dependent files stored in a repository with a file path that exceeds the maximum supported character length (256 characters) for your Windows operating system.
00714248	Only those Bot Runners and Bot Creators expressly configured as credential vault consumers for a given bot can use that bot.
00751728	When you migrate Enterprise 11 bots that use the String Operation command with the space character as a delimiter, the extracted value now retains the space and works properly. Previously, after migration, the space from the String Operation command was removed.
00760877, 00761211	Bots that are migrated, modified, and scheduled now successfully deploy without a preprocessing error. Previously, migrated bots failed to execute due to the following preprocessing error: <code>Attribute type ANY is not supported.</code>

Build 8840	
Service Cloud case ID	Description
00747869, 00750571, 0744918	When you create a bot using a loop with the Recorder Capture action to perform operations on the Chrome browser, the bot now executes without any disruption. Previously, the bot failed to run and displayed an error.

Build 8840	
Service Cloud case ID	Description
00733635, 00743082, 00750865	When you run a bot that contains the Excel Advanced > Find action, the found cell is now active and subsequent actions can perform operations on that active cell.
00723075, 00717920	When a bot encounters a workbook that contains links to cells in other workbooks, the system suppresses the Excel pop-up message so that the bot can run without interruption.
00746651, 00757879	After migrating bots, you can successfully run the bots without any preprocessing error. Previously, using variables inside brackets failed to process the task.
00742159, 00743092	The Excel Advanced Set cell and Delete cell actions now select the correct cells when the cell address column name contains more than one letter.
00743636	The Excel Advanced Set cell, Delete cell, and Go to cell actions now support all ranges. Previously, the actions encountered errors with ranges greater than AB1:AB100.
00726030	Bots can now use the Recorder to capture objects that contain characters that are not valid in XML.

Build 8815	
Service Cloud case ID	Description
00750668	A workload bot is no longer stuck in a queue, and the device does not display a <code>Pick up at run time</code> status.
00733227	Control Room database tables are now created when you use the restored 11.x database while installing Enterprise A2019.
00733720	Bot Migration Wizard no longer encounters an error when processing a large bot for migration. Previously, this issue was encountered when a large bot was downloaded to the Bot Runner device for migration from the Control Room and the connection between the Bot Runner device and Control Room was reset.
--	Bot Scanner is now updated to include scenarios that were previously failing after migration. As a result, some bots might be moved from the list of bots that <b>can be migrated</b> to the list of bots that <b>cannot be migrated</b> in the output report. This can decrease the number of bots that can be migrated to Enterprise A2019.

Build 8815	
Service Cloud case ID	Description
00703679, 00711398, 00729399	Enterprise 11 or Enterprise 10 bots that use the string variable or an object captured from Internet Explorer whose property is null or empty no longer encounters an error after these bots are migrated.
00667326	<p>Bot Scanner no longer becomes unresponsive when scanning bots for any of the following reasons:</p> <ul style="list-style-type: none"> <li>• Scanning a corrupted .atmx file of a bot</li> <li>• Bots that contains the If, IF/ELSE, or Loop command and that command is commented out</li> <li>• Bot that contains an object that is captured using the Object Cloning command using the <b>Coordinate</b> play mode and the <b>Click</b> action is performed on that object</li> </ul>
00731068, 00737025	An error is no longer encountered when you run a bot that contains multiple variables that return a number value in the same command after that bot is migrated.
00720261	An error is no longer encountered when you run a migrated bot that contains a special character.
00713303	In a migrated bot that uses the Run Task command, when you run a subtask within the main task and the subtask name contains Unicode characters, the bot now executes successfully without any error. Previously, the bot failed and displayed an error message.
00691133	You can now successfully delete migrated bots in your private workspace without encountering any issue. Previously, an error message was displayed when a migrated bot was deleted in the private workspace.
00736166	Previously, when the migration process was initiated, the process sometimes remained in the <code>In progress</code> status in the Bot Migration Wizard. Now the process starts running.
00730131	Bots that use the Run Script command with the \$Clipboard\$ system variable as an input or output variable no longer encounter errors when you run these bots after they are migrated to Enterprise A2019.
00726833	Enterprise 11 Work Items and queues that are associated with bots that use the Variable Operation command no longer encounter an error after the first item in the queue is processed successfully after migration to Enterprise A2019.

Build 8815	
Service Cloud case ID	Description
--	Bot Scanner no longer encounters an error when scanning MetaBots that contain the Object Cloning command that is commented out and the MetaBot is trying to find the play mode from those commented out commands.
00716557	An error is no longer encountered when you run a MetaBot in Enterprise A2019 that was created in Enterprise 10, migrated to Enterprise 11, and then migrated to Enterprise A2019.
00710569	When you migrate a MetaBot that contains screens as assets from Enterprise 11 to Enterprise A2019, Japanese characters in the object properties are now displayed correctly in the migrated bots. Previously, the Japanese characters in the object properties were garbled in the migrated bots.
00702262	The <b>Historical activity</b> page now shows a detailed error message that specifies the cause of the error and the line where the error is encountered for bots that are migrated from Enterprise 11 and use the Error Handling command.
00703513, 00708988	Parent bots that use the <b>Run</b> action of the Task Bot package with the <b>Upon error, start next repetition</b> option selected no longer encounter an error if their child bots encounter an error at runtime and do not return the output variable to the parent bot. Previously, parent bots encountered an error if the child bots did not return the output variable to the parent bots because the child bots encountered an error during runtime.
00702601	A bot that uses an array variable that contains a system variable and which returns an integer no longer encounters an error after that bot is migrated.
00707801	You can now migrate an Enterprise 11 bot that contains Mouse <b>Click</b> to capture the coordinates of a maximized window. Previously, the bot with a Mouse <b>Click</b> encountered an issue during migration because the window left and top parameters were set to negative values for maximized windows.
00710315, 00728228, 00729082, 00744242	Migrated bots that use the Object Cloning command with legacy technology to capture objects with multiple lines of text now work properly, without any issues.
00716650	When you migrate an Enterprise 11 bot that contains an Excel command with two Excel sessions in it, the <b>Get column name</b> or <b>Get row number</b> actions now displays the correct values in the output. Previously, the actions set the wrong session values in the migrated bot if it contained two Excel sessions.

Build 8815	
Service Cloud case ID	Description
00711148	Enterprise A2019 installation no longer fails if there is a space in the data and log path (for example, D:\Automation Anywhere\ProgramData). And, the following error message is no longer displayed: Control Room database tables fail to create.
00708902	You can now use the Google Drive package to upload files in the Google Shared Drive. Use only the <b>Folder ID</b> option to upload files to a shared folder in the drive and enter the ID of the shared folder. Previously, an error occurred when a user tried to upload a file in the shared folder in the Google Drive.
00735479	When you create a bot that has a dependency with a long repository path that exceeds the maximum limit of 256 characters and when you run the bot on the Bot Runner machine, the bot now displays a message, prompting you to reduce the length of the file path. Previously, the bot execution failed without any message providing the reason for the failure.
00727406	You can now successfully send an email in HTML format with an HTML attachment using the <b>Email server</b> . Previously, when an email was sent in HTML format along with an attached HTML file, the email body content and the content of the attached file were merged. As a result, only the attachment was seen in the mail without the body content.
00707734	In the App Integration package, when you use the <b>Capture text of window</b> action in a Japanese browser, the window title now displays properly for Japanese language. Previously, the output was not displayed correctly in the Japanese text format.
00699149,00707670	You can now use the <b>Unzip</b> action of the Folder package and execute your bots on a Windows 10 server. Now, if two Windows users with different device credentials try to deploy a bot on the same machine, the deployment does not fail. Previously, if a user deployed the bot on the same machine with a different user profile, the bot failed to execute.
00695224, 00730472, 00739431	When you use the <b>Find Image in a Window</b> action in the Image Recognition package, image files are now deleted from the Temp location and storage space is freed after bot execution. Previously, the image files were not deleted from the Temp location and as a result disk storage ran out of space.

Build 8815	
Service Cloud case ID	Description
00709162	The CSV/TXT <b>Open</b> action now works without encountering any issue even if there are blank values in the last row of the .txt file. Previously, if there were blank values in the last row of the file, the bot encountered an issue.
00711124	In the Email package, when you use the <b>Connect</b> action, add a loop, and select <b>For each in mail box to read emails</b> as the <b>Iterator</b> option, a new line is no longer deleted and correctly displays the email content. Previously, the new lines were deleted when the mail was sent and received in plain text format.
00673049	In the SAP package, if an error is encountered when the <b>Connect</b> action is used to connect with a SAP system, the error is now captured in the <b>Try</b> and <b>Catch</b> blocks. Previously, the connection issue was not captured in the <b>Try</b> and <b>Catch</b> blocks in the action.
00697215	A bot now executes successfully when you use the <b>Throw</b> action with an expression. Previously, when an expression such as <code>\$number.ToString\$</code> was used in the <b>Exception message</b> field of the <b>Throw</b> action, the bot encountered a preprocessing error.
00714260	Runtime errors are no longer displayed when you use the following: <ul style="list-style-type: none"> <li>• A MetaBot with run DLL migration function that takes more than one parameter type as Array or any type other than String</li> <li>• A TaskBot with run logic calling a child bot that takes more than one input parameter of type Array, which is mapped to a List variable in the parent bot run logic migration function</li> </ul>
00704547	The <b>Pause</b> action of the TaskBot package now works properly when you use it as the last task in the bot. Previously, the bot did not wait for the task to complete if the <b>Pause</b> action was used as last task in the bot.
00675344	A TaskBot now performs better when you use the Terminal Emulator <b>Send text</b> and <b>Send key</b> actions to execute a bot. Previously, the TaskBot took a long time to complete the execution.

Build 8815	
Service Cloud case ID	Description
00699650,00716648	When you use Image Recognition actions to execute a bot and if the bot fails during execution, the captured source and target images are stored in C:\ProgramData\AutomationAnywhere\BotRunner\Logs\IR with a maximum of 10 source and target image pairs. Now, when the maximum limit is reached, the oldest image pairs are overwritten with new images. Previously, the image logs were not overwritten.
00716817	A bot now executes successfully when you use the PDF <b>Extract text</b> action to extract structured text from PDF files. Previously, bot execution failed to extract structured text if it contained Thai characters.
00717204	You can now use a credential from the Credential Vault in the <b>URI</b> field of the REST Web Service actions.
00682726, 00678580, 00695359, 00684985	You can now use the Universal Recorder to automate in Oracle Fusion Middleware applications. Previously, an issue with the Java API caused the Recorder to select the entire window instead of the specific object.
00693770	Fixed an issue where numbers extracted from an SQL database to a data table variable were automatically converted to scientific notation.
00669959	You can now select the same start date and end date when you schedule bots with the <b>Run repeatedly</b> option ( <b>Activity</b> > <b>Scheduled</b> > <b>Schedule bot</b> ) in the Control Room.
00702841, 00700915	Disconnected devices are now displayed in the Control Room ( <b>Devices</b> > <b>My Devices</b> ) when you filter the devices list by <b>Status</b> as <b>Disconnected</b> .
00707318, 00711529	Work items in an active queue are now processed and you no longer have to delete the active queue and create another queue after you upgrade from a previous release to this release.
00705046	Bots that include embedded dependent files instead of a zipped folder are no longer queued intermittently for deployment on Bot Runner devices.
--	Disabled tenant IDs or removed tenants that are later reused on the same deployment with a different tenant might produce a licensing error. This conflict is now removed and deboarded tenants in later reuse no longer generate the error.

Build 8815	
Service Cloud case ID	Description
00685926	When you import an exported bot into the private workspace and check in the imported bot, the bot is now checked in successfully without any issues. Previously, the check-in failed due to a metadata validation error.
00682025	When a bot or a file is modified in the public workspace, the cloned dependent file in the private workspace now reflects the changes and the bot executes successfully. Previously, the cloned dependent file did not reflect the changes and the bot execution failed.
00726018	The Google Drive <b>Upload file</b> action now uploads files to subfolders.
00715080, 00731152	You can now perform concurrent unattended bot deployment on a multi-user device with multiple user sessions running simultaneously.
--	A non-admin Bot Agent user now remains connected to the Control Room and is not disconnected frequently.
00709737	Actions in the Google Sheets package now support worksheets that contain empty cells.
00710354	A hibernate exception error is no longer displayed when you log in to the Control Room as an admin user.
00732178	You can now check out bots from folders with similar names but in different letter cases and edit the bots in your private workspace in the Control Room.  For example, if there is a folder named <code>Automation1</code> in the public workspace and a folder named <code>automation1</code> folder in the private workspace, you can now check out bots from the <code>Automation1</code> folder in the public workspace.
--	Bots are now deployed on a multi-user device in a non-admin user session when another admin user session is also active on the device if auto-login setting in the Control Room is set to lock the session after the bot finishes executing from an existing unlocked session.
00719407	During a cluster installation of Enterprise A2019 on Red Hat Enterprise Linux, the installer now uses the same user ID across all cluster nodes.
00703325	The log file permission for an Control Room installed on Linux now maps to the <code>crkernel</code> user. Previously, it was mapped to the root user.

Build 8815	
Service Cloud case ID	Description
--	When you access the Control Room with the <b>Login with Windows</b> option selected, you must now enter the FQDN to log in successfully.
00732141, 00722919,00743006	When you preload a package, after the download is complete, the completion status updates in the <b>Activity &gt; Historical activity</b> page and the pending record is no longer displayed in the <b>Activity &gt; In progress</b> page.
00731376	When you migrate MetaBot logic, if there is case mismatch in the variable name and the mapping variable, variables are no longer created twice. As a result, a preprocessing error does not appear when you execute the task.
	Now, the migration of run logic with CV variables is supported.
	Now, when using the <b>Date</b> system variable in the <b>File</b> folders command, a migrated bot is no longer failing.
	When migrating bots (v11.x to A2019) with OC properties more than 64KB, such properties will be truncated and the bot will be migrated.

The following table lists the fixes and the builds in which they were fixed. Build 8846 is the latest build for Cloud and includes fixes from the previous builds. On-Premises is on Build 8815.

Fixes		
Build	Service Cloud case ID	Description
8846	00764731, 00763373, 00765172, 763334	You can now deploy bots and dependent files stored in a repository with a file path that exceeds the maximum supported character length (256 characters) for your Windows operating system.
8846	00714248	Only those Bot Runners and Bot Creators expressly configured as credential vault consumers for a given bot can use that bot.
8846	00751728	When you migrate Enterprise 11 bots that use the String Operation command with the space character as a delimiter, the extracted value now retains the space and works properly. Previously, after migration, the space from the String Operation command was removed.
8846	00760877, 00761211	Bots that are migrated, modified, and scheduled now successfully deploy without a preprocessing error. Previously, migrated bots failed to execute due to the following preprocessing error: <code>Attribute type ANY is not supported.</code>

Fixes		
Build	Service Cloud case ID	Description
8840	00747869, 00750571, 0744918	When you create a bot using a loop with the Recorder Capture action to perform operations on the Chrome browser, the bot now executes without any disruption. Previously, the bot failed to run and displayed an error.
8840	00733635, 00743082, 00750865	When you run a bot that contains the Excel Advanced > Find action, the found cell is now active and subsequent actions can perform operations on that active cell.
8840	00723075, 00717920	When a bot encounters a workbook that contains links to cells in other workbooks, the system suppresses the Excel pop-up message so that the bot can run without interruption.
8840	00746651, 00757879	After migrating bots, you can successfully run the bots without any preprocessing error. Previously, using variables inside brackets failed to process the task.
8840	00742159, 00743092	The Excel Advanced Set cell and Delete cell actions now select the correct cells when the cell address column name contains more than one letter.
8840	00743636	The Excel Advanced Set cell, Delete cell, and Go to cell actions now support all ranges. Previously, the actions encountered errors with ranges greater than AB1:AB100.
8815	00750668	A workload bot is no longer stuck in a queue, and the device does not display a <code>Pick up at run time</code> status.
8815	00733227	Control Room database tables are now created when you use the restored 11.x database while installing Enterprise A2019.
8815	00733720	Bot Migration Wizard no longer encounters an error when processing a large bot for migration. Previously, this issue was encountered when a large bot was downloaded to the Bot Runner device for migration from the Control Room and the connection between the Bot Runner device and Control Room was reset.
8815	--	Bot Scanner is now updated to include scenarios that were previously failing after migration. As a result, some bots might be moved from the list of bots that <b>can be migrated</b> to the list of bots that <b>cannot be migrated</b> in the output report. This can decrease the number of bots that can be migrated to Enterprise A2019.
8815	00703679, 00711398, 00729399	Enterprise 11 or Enterprise 10 bots that use the string variable or an object captured from Internet Explorer whose property is null or empty no longer encounters an error after these bots are migrated.

Fixes		
Build	Service Cloud case ID	Description
8815	00667326	<p>Bot Scanner no longer becomes unresponsive when scanning bots for any of the following reasons:</p> <ul style="list-style-type: none"> <li>• Scanning a corrupted <code>.atmx</code> file of a bot</li> <li>• Bots that contains the <code>If</code>, <code>IF/ELSE</code>, or <code>Loop</code> command and that command is commented out</li> <li>• Bot that contains an object that is captured using the <code>Object Cloning</code> command using the <b>Coordinate</b> play mode and the <b>Click</b> action is performed on that object</li> </ul>
8815	00731068, 00737025	An error is no longer encountered when you run a bot that contains multiple variables that return a number value in the same command after that bot is migrated.
8815	00720261	An error is no longer encountered when you run a migrated bot that contains a special character.
8815	00713303	In a migrated bot that uses the <code>Run Task</code> command, when you run a subtask within the main task and the subtask name contains Unicode characters, the bot now executes successfully without any error. Previously, the bot failed and displayed an error message.
8815	00691133	You can now successfully delete migrated bots in your private workspace without encountering any issue. Previously, an error message was displayed when a migrated bot was deleted in the private workspace.
8815	00736166	Previously, when the migration process was initiated, the process sometimes remained in the <code>In progress</code> status in the Bot Migration Wizard. Now the process starts running.
8815	00730131	Bots that use the <code>Run Script</code> command with the <code>\$Clipboard</code> system variable as an input or output variable no longer encounter errors when you run these bots after they are migrated to Enterprise A2019.
8815	00726833	Enterprise 11 Work Items and queues that are associated with bots that use the <code>Variable Operation</code> command no longer encounter an error after the first item in the queue is processed successfully after migration to Enterprise A2019.
8815	--	Bot Scanner no longer encounters an error when scanning MetaBots that contain the <code>Object Cloning</code> command that is commented out and the MetaBot is trying to find the play mode from those commented out commands.
8815	00716557	An error is no longer encountered when you run a MetaBot in Enterprise A2019 that was created in Enterprise 10, migrated to Enterprise 11, and then migrated to Enterprise A2019.

Fixes		
Build	Service Cloud case ID	Description
8815	00710569	When you migrate a MetaBot that contains screens as assets from Enterprise 11 to Enterprise A2019, Japanese characters in the object properties are now displayed correctly in the migrated bots. Previously, the Japanese characters in the object properties were garbled in the migrated bots.
8815	00702262	The <b>Historical activity</b> page now shows a detailed error message that specifies the cause of the error and the line where the error is encountered for bots that are migrated from Enterprise 11 and use the Error Handling command.
8815	00703513, 00708988	Parent bots that use the <b>Run</b> action of the Task Bot package with the <b>Upon error, start next repetition</b> option selected no longer encounter an error if their child bots encounter an error at runtime and do not return the output variable to the parent bot. Previously, parent bots encountered an error if the child bots did not return the output variable to the parent bots because the child bots encountered an error during runtime.
8815	00702601	A bot that uses an array variable that contains a system variable and which returns an integer no longer encounters an error after that bot is migrated.
8815	00707801	You can now migrate an Enterprise 11 bot that contains Mouse <b>Click</b> to capture the coordinates of a maximized window. Previously, the bot with a Mouse <b>Click</b> encountered an issue during migration because the window left and top parameters were set to negative values for maximized windows.
8815	00710315, 00728228, 00729082, 00744242	Migrated bots that use the Object Cloning command with legacy technology to capture objects with multiple lines of text now work properly, without any issues.
8815	00716650	When you migrate an Enterprise 11 bot that contains an Excel command with two Excel sessions in it, the <b>Get column name</b> or <b>Get row number</b> actions now displays the correct values in the output. Previously, the actions set the wrong session values in the migrated bot if it contained two Excel sessions.
8815	00711148	Enterprise A2019 installation no longer fails if there is a space in the data and log path (for example, D:\Automation Anywhere\ProgramData). And, the following error message is no longer displayed: Control Room database tables fail to create.
8815	00708902	You can now use the Google Drive package to upload files in the Google Shared Drive. Use only the <b>Folder ID</b> option to upload files to a shared folder in the drive and enter the ID of the shared folder. Previously, an error occurred when a user tried to upload a file in the shared folder in the Google Drive.

Fixes		
Build	Service Cloud case ID	Description
8815	00735479	When you create a bot that has a dependency with a long repository path that exceeds the maximum limit of 256 characters and when you run the bot on the Bot Runner machine, the bot now displays a message, prompting you to reduce the length of the file path. Previously, the bot execution failed without any message providing the reason for the failure.
8815	00727406	You can now successfully send an email in HTML format with an HTML attachment using the <b>Email server</b> . Previously, when an email was sent in HTML format along with an attached HTML file, the email body content and the content of the attached file were merged. As a result, only the attachment was seen in the mail without the body content.
8815	00707734	In the App Integration package, when you use the <b>Capture text of window</b> action in a Japanese browser, the window title now displays properly for Japanese language. Previously, the output was not displayed correctly in the Japanese text format.
8815	00699149,00707670	You can now use the <b>Unzip</b> action of the Folder package and execute your bots on a Windows 10 server. Now, if two Windows users with different device credentials try to deploy a bot on the same machine, the deployment does not fail. Previously, if a user deployed the bot on the same machine with a different user profile, the bot failed to execute.
8815	00695224, 00730472, 00739431	When you use the <b>Find Image in a Window</b> action in the Image Recognition package, image files are now deleted from the <code>Temp</code> location and storage space is freed after bot execution. Previously, the image files were not deleted from the <code>Temp</code> location and as a result disk storage ran out of space.
8815	00709162	The CSV/TXT <b>Open</b> action now works without encountering any issue even if there are blank values in the last row of the <code>.txt</code> file. Previously, if there were blank values in the last row of the file, the bot encountered an issue.
8815	00711124	In the Email package, when you use the <b>Connect</b> action, add a loop, and select <b>For each in mail box to read emails</b> as the <b>Iterator</b> option, a new line is no longer deleted and correctly displays the email content. Previously, the new lines were deleted when the mail was sent and received in plain text format.
8815	00673049	In the SAP package, if an error is encountered when the <b>Connect</b> action is used to connect with a SAP system, the error is now captured in the <b>Try</b> and <b>Catch</b> blocks. Previously, the connection issue was not captured in the <b>Try</b> and <b>Catch</b> blocks in the action.
8815	00697215	A bot now executes successfully when you use the <b>Throw</b> action with an expression. Previously, when an expression such as <code>\$number.ToString\$</code> was used in the <b>Exception message</b> field of the <b>Throw</b> action, the bot encountered a preprocessing error.

Fixes		
Build	Service Cloud case ID	Description
8815	00714260	Runtime errors are no longer displayed when you use the following: <ul style="list-style-type: none"> <li>• A MetaBot with run DLL migration function that takes more than one parameter type as Array or any type other than String</li> <li>• A TaskBot with run logic calling a child bot that takes more than one input parameter of type Array, which is mapped to a List variable in the parent bot run logic migration function</li> </ul>
8815	00704547	The <b>Pause</b> action of the TaskBot package now works properly when you use it as the last task in the bot. Previously, the bot did not wait for the task to complete if the <b>Pause</b> action was used as last task in the bot.
8815	00675344	A TaskBot now performs better when you use the Terminal Emulator <b>Send text</b> and <b>Send key</b> actions to execute a bot. Previously, the TaskBot took a long time to complete the execution.
8815	00699650,00716648	When you use Image Recognition actions to execute a bot and if the bot fails during execution, the captured source and target images are stored in C:\ProgramData\AutomationAnywhere\BotRunner\Logs\IR with a maximum of 10 source and target image pairs. Now, when the maximum limit is reached, the oldest image pairs are overwritten with new images. Previously, the image logs were not overwritten.
8815	00716817	A bot now executes successfully when you use the PDF <b>Extract text</b> action to extract structured text from PDF files. Previously, bot execution failed to extract structured text if it contained Thai characters.
8815	00717204	You can now use a credential from the Credential Vault in the <b>URI</b> field of the REST Web Service actions.
8815	00682726, 00678580, 00695359, 00684985	You can now use the Universal Recorder to automate in Oracle Fusion Middleware applications. Previously, an issue with the Java API caused the Recorder to select the entire window instead of the specific object.
8815	00693770	Fixed an issue where numbers extracted from an SQL database to a data table variable were automatically converted to scientific notation.
8815	00669959	You can now select the same start date and end date when you schedule bots with the <b>Run repeatedly</b> option ( <b>Activity &gt; Scheduled &gt; Schedule bot</b> ) in the Control Room.
8815	00702841, 00700915	Disconnected devices are now displayed in the Control Room ( <b>Devices &gt; My Devices</b> ) when you filter the devices list by <b>Status</b> as <b>Disconnected</b> .

Fixes		
Build	Service Cloud case ID	Description
8815	00707318, 00711529	Work items in an active queue are now processed and you no longer have to delete the active queue and create another queue after you upgrade from a previous release to this release.
8815	00705046	Bots that include embedded dependent files instead of a zipped folder are no longer queued intermittently for deployment on Bot Runner devices.
8815	--	Disabled tenant IDs or removed tenants that are later reused on the same deployment with a different tenant might produce a licensing error. This conflict is now removed and deboarded tenants in later reuse no longer generate the error.
8815	00685926	When you import an exported bot into the private workspace and check in the imported bot, the bot is now checked in successfully without any issues. Previously, the check-in failed due to a metadata validation error.
8815	00682025	When a bot or a file is modified in the public workspace, the cloned dependent file in the private workspace now reflects the changes and the bot executes successfully. Previously, the cloned dependent file did not reflect the changes and the bot execution failed.
8815	00726018	The Google Drive <b>Upload file</b> action now uploads files to subfolders.
8815	00715080, 00731152	You can now perform concurrent unattended bot deployment on a multi-user device with multiple user sessions running simultaneously.
8815	--	A non-admin Bot Agent user now remains connected to the Control Room and is not disconnected frequently.
8815	00709737	Actions in the Google Sheets package now support worksheets that contain empty cells.
8815	00710354	A hibernate exception error is no longer displayed when you log in to the Control Room as an admin user.
8815	00732178	You can now check out bots from folders with similar names but in different letter cases and edit the bots in your private workspace in the Control Room.  For example, if there is a folder named <code>Automation1</code> in the public workspace and a folder named <code>automation1</code> folder in the private workspace, you can now check out bots from the <code>Automation1</code> folder in the public workspace.
8815	--	Bots are now deployed on a multi-user device in a non-admin user session when another admin user session is also active on the device if auto-login setting in the Control Room is set to lock the session after the bot finishes executing from an existing unlocked session.

Fixes		
Build	Service Cloud case ID	Description
8815	00719407	During a cluster installation of Enterprise A2019 on Red Hat Enterprise Linux, the installer now uses the same user ID across all cluster nodes.
8815	00703325	The log file permission for an Control Room installed on Linux now maps to the crkernel user. Previously, it was mapped to the root user.
8815	--	When you access the Control Room with the <b>Login with Windows</b> option selected, you must now enter the FQDN to log in successfully.
8815	00732141, 00722919, 00743006	When you preload a package, after the download is complete, the completion status updates in the <b>Activity &gt; Historical activity</b> page and the pending record is no longer displayed in the <b>Activity &gt; In progress</b> page.
8815	00731376	When you migrate MetaBot logic, if there is case mismatch in the variable name and the mapping variable, variables are no longer created twice. As a result, a preprocessing error does not appear when you execute the task.
8815		Now, the migration of run logic with CV variables is supported.
8815		Now, when using the <b>Date</b> system variable in the <b>File</b> folders command, a migrated bot is no longer failing.
8815		When migrating bots (v11.x to A2019) with OC properties more than 64KB, such properties will be truncated and the bot will be migrated.

Limitations
<p>(Service Cloud case ID: 00822176) When you create an RDP session on multi-user devices and enter a custom port, RDP-based deployments will fail.</p> <p><b>Recommended:</b> Use the default port 3389 for RDP sessions.</p>
<p>When you create a bot with <b>Open</b> and <b>Close</b> browser actions in a loop and select the <b>Window</b> option to close the selected tab, an error might occur when you execute the bot.</p> <p><b>Workaround:</b> Use the <b>Close</b> action of the Window package instead of the <b>Close</b> action in the Browser package to close the window.</p>
<p>If you deploy bots using event triggers, and you install the Bot Agent on a device as a non-admin user for self or a local admin user, the Bot Agent will not be updated automatically. The device is will be shown as disconnected in the Control Room.</p> <p><b>Workaround:</b></p> <ol style="list-style-type: none"> <li>1. End the trigger listener Java process (javaw.exe) from the Task Manager.</li> <li>2. Re-install the Bot Agent to reconnect the user device in the Control Room.</li> </ol>

Limitations
<p>Configuring multiple IP addresses for Control Room nodes in a cluster is not supported during installation in On-Premises deployments. You must manually configure the primary IP address in the <code>cluster.properties</code> file.</p> <p><a href="#">Add primary IP address for cluster</a> on page 931   <a href="#">Configure additional IP address for a new cluster node</a> on page 932</p>
<p>Bot deployment on multi-user sessions is not supported for workload automation.</p>
<p>Using an Enterprise A2019.20 SDS On-Premises Control Room with an Enterprise A2019.19 SDS Cloud Control Room is not supported.</p>
<p>When you run a bot containing a <b>Capture</b> action that uses the anchor object feature, your device DPI settings must match the settings at which you configured the anchor object.</p>
<p>The Control Room does not allow hyphens and underscores to be used interchangeably when creating and calling global value names.</p>
<p>When you migrate an Enterprise 11 bot that uses Object Cloning command with Silverlight technology and execute that bot in Enterprise A2019, the bot might fail with an error due to a play reliability issue. The same play reliability is also seen in Enterprise 11 when you use Object Cloning command with Silverlight plugins.</p>
<p>For actions that use file input, when you select a network path using <b>Browse</b>, bot execution fails because the double backslash (\\) in the file location is replaced with a forward slash.</p> <p><b>Workaround:</b> Do not use the <b>Browse</b> option to select the file location. Instead, manually enter the complete file path.</p>
<p>When a Bot Creator, attended Bot Runner or unattended Bot Runner user logs in to the Control Room from their Bot Agent machine and if the package download option is enabled, the package download takes priority, and bot deployment waits until the package download is complete. This occurs only when the package is downloaded for the first time.</p>
<p>When a bot runs an automation in the Microsoft Internet Explorer browser, the Microsoft API responsible for the browser delay might encounter an exception, causing the bot to fail and a Chrome-related error message to appear in the Control Room.</p>
<p>(Service Cloud case ID: 00712808) Automation Anywhere related files are sometimes generated in <code>C:\Windows\Temp</code>. These files can be safely deleted.</p>
<p>For Enterprise 11 bots that contain an object that is captured using the Object Cloning command using the <b>Image</b> or the <b>Coordinate</b> play mode, the <b>Set Text</b> is performed on that object and the credential variable is used to set text for the object. The credential variable for these bots is not migrated when the bots are migrated to Enterprise A2019.</p>
<p>If you use the <b>Set text</b> action in the <b>Recorder &gt; Capture</b> action to enter data into a text box, when you run the bot, the data appears over the old data in the text box and is not entered. The old data is not cleared from the text box because the application requires a physical event to clear the old data.</p> <p><b>Workaround:</b> To ensure that the data is entered into the text box, along with the <b>Set text</b> action, add a value greater than 0 in the <b>Time between keystrokes</b> field.</p>
<p>When you use the Recorder to capture an object, set the waiting time for detecting the object to less than 30 seconds in the <b>Keep trying for (seconds)</b> field, and run the bot, the Recorder waits for a minimum of 30 seconds by default to detect the object.</p>

**Limitations**

When you use the Recorder to capture objects on an application that is installed on a virtual machine, finish the recording after the objects are captured, and relaunch the Recorder, the bot inserts the actions recorded earlier instead of launching the Recorder.

**Workaround:** Refresh the Bot editor or run the bot to launch a new session to start recording again.

**Automation Anywhere Robotic Interface (AARI)****What's new****Get Storage file action**

The new **Get Storage file** action in the **AARI Web** package enables you to download storage files to a bot device.

[Web](#)

**Upload files in initial forms or tasks**

Add the **Select File** element to forms to enable users to select and upload files in the initial forms or tasks in the web interface. Users can browse to upload a new file or replace an existing file. The uploaded file is shown as a hyperlink and redirects users to a new tab when opened.

[Configure processes](#) on page 1475

**Hyperlinks support for initial forms or tasks**

Use the new **Hyperlink** element to add links to forms and access them in initial forms and tasks.

[Configure processes](#) on page 1475

**Configure a scheduler user for each process** (Service Cloud case ID: 00713786)

As an AARI administrator, you can now configure a scheduler user for each process to allocate the Control Room resources (devices and unattended Bot Runners) on the web interface. By default, the **Global scheduler** user is selected if a scheduler user is not configured for individual processes.

[Configure scheduler user for AARI on the web](#) on page 1472

**Update to properties panel for human task** (Service Cloud case ID: 00718109)

As a Bot Creator, you can choose to not configure any actions in the human task by selecting the **Make the form read-only** check box in the **Properties** panel. The human task does not require any input and it is executed automatically to the next task.

**Bookmark any page as landing page for AARI on the web**

The web interface is now enhanced to a new multiple page system so that you can directly bookmark any page (**Requests**, **Tasks**, or **Recycle Bin**) as your landing page. Also, the tabs in the web interface have been removed so that the requests are opened one at a time and not simultaneously. To perform multiple tasks, you can open the requests pages in different browser tabs.

What's new
<p><b>Navigation enhancement in AARI on the web</b></p> <p>The web interface is now enhanced with a side navigation pane so that you can easily navigate to various pages (<b>Processes, Requests, Recycle Bin, and Tasks</b>).</p>
<p><b>New processes page</b> (Service Cloud case ID: 00694786)</p> <p>As an AARI user, navigate to your assigned processes and create new requests by using the new <b>Processes</b> page in the web interface. Use the navigation bar to quickly access the page.</p>
<p><b>Enhancements to the Button element</b></p> <ul style="list-style-type: none"> <li>• Use the <b>Disallow button click when this form is first loaded</b> option to disable the <b>Button</b> element in a form when it is displayed for the first time during bot runtime.</li> <li>• Use the <b>Subtle</b> option in the <b>Button type</b> drop-down menu if you want the button element to appear as a link during bot runtime.</li> </ul> <p><i>Using the Button element</i> on page 1540</p>
<p><b>Enhancement to the form logo</b></p> <p>You can now use the <b>Logos in footer</b> field option to select up to two separate logos that are displayed in the footer of the form during bot runtime.</p> <p><i>Create a form</i> on page 1536</p>
What's changed
<p><b>Enhancement to the delete process</b></p> <p>An AARI administrator or a user with the <b>Delete from Public</b> permission can now delete a process in the public workspace. When the process is deleted from the public workspace, it is removed from the process management page in the web interface. Additionally, if the process is already assigned to any AARI user or team, access is removed after the process is deleted.</p> <p><i>Delete an AARI process</i> on page 1502</p>
<p><b>Variable selector window update</b></p> <p>The variable selector is now organized by <b>Variable Source, Variable Type, and Variable</b> sections. The variable source contains a request or task. The variable type is now an interface option for you to select an input, output, or meta types. The variable option specifies the variable names and type.</p>
<p><b>Request variable source</b></p> <p>The variable selector now enables users to select a <b>Request</b> variable source with an <b>Input</b> (previously <b>InitialData</b>) and <b>Meta</b> variable types.</p> <p><i>Create an AARI process</i> on page 1487   <i>AARI variable types</i> on page 1495</p>
<p><b>Insert variables to existing text</b></p> <p>You can use the variable selector in the process editor to insert or add variables without replacing the existing texts.</p> <p><i>Create an AARI process</i> on page 1487</p>

What's changed
<p><b>Filter update</b></p> <p>In the web interface, when you filter or search for keywords, the filter user interface now updates and reflect the filter criteria accordingly. For example, if you search for the ending status of requests, the filter shows <code>Status: Pending</code>.</p>

Fixes	
Service Cloud case ID	Description
00702607	If you have a <b>Message box</b> action within a trigger loop, you can now use the <b>Run from here</b> option to run the bot without any error messages.
00725237	Error messages are no longer displayed when the <b>Dropdown</b> element in the form is populated with dynamic values during bot runtime.
00733978	Forms with read-only elements can now be submitted successfully without any issues when the value of the form field exceeds 100.
-	If you select any of the <b>Advance behavior</b> options in the <b>Dropdown</b> element, error messages are no longer displayed during bot runtime.
--	A <b>Bot Task</b> can now pass data to the next task ( <b>Human Task</b> or <b>Bot Task</b> ) if it contains Japanese characters in its output variable name. Previously, English characters had to be used for the variable name in the <b>Bot Task</b> .
--	In a cloud environment, the AARI web interface now displays the correct screen for the selected locale. Previously, the screen was not displayed correctly for the selected locale.

Limitations
<p>In the process editor, the <b>If/Else</b> condition of string type does not allow the source and target values to be empty. As a result, you cannot validate if a string variable is empty.</p> <p><b>Workaround:</b> Create an empty string output variable for the bot. Use this variable as the target value to compare with a form or bot source variable so that the validation in the <b>If/Else</b> condition does not fail.</p>
<p>When you enter data in a form of your process that contains a hyperlink, the data is ignored when you try to submit the form. The hyperlink instead displays the following behaviors:</p> <ul style="list-style-type: none"> <li>• When the hyperlink URL is configured at a designed time (the process of designing the interface or setting properties), the URL remains unchanged by the process.</li> <li>• When the hyperlink URL is not configured at a designed time, then the URL is set to the Control Room domain.</li> </ul>

## Discovery Bot

<b>What's new</b>
<p><b>Search for a business process from the Processes page</b></p> <p>You can now use the search field to help you locate a specific process by name. The field is not case-sensitive. The search field is available from the <b>Processes</b> page.</p> <p><a href="#">Create a Discovery Bot process</a> on page 1669</p>
<p><b>View all captured images from the screenshot modal window</b></p> <p>You can now navigate across all captured screenshots when you click an image in full size from the modal window. Click the pagination located below the image to select a step number or use the right or left arrows to quickly display all captured images.</p> <p><a href="#">Record a Discovery Bot business process</a> on page 1672</p>
<p><b>Process Discovery package is included in default packages</b></p> <p>The Process Discovery package is now included in the default packages. You can preload the default package when you connect to your device. Preloading the package helps to speed the start time of the recorder the first time you begin recording a process</p> <p><a href="#">Prerequisites for Discovery Bot</a> on page 1661</p>
<p><b>Recorder enhancements</b></p> <p>You can now perform actions such as double-click, drag-drop, click and hold, and text select when recording a business process. Actions performed using keyboard strokes are displayed in the <b>Data</b> field. Double-click is captured by the recorder and displayed in the screenshot from the <b>Recordings</b> page.</p> <hr/> <p><b>Note:</b> The Discovery Bot recorder does not capture the drag-drop and click and hold actions from the <b>Recordings</b> page. To include these actions performed during the recording, you can document the individual steps in the <b>Step description</b> text field for the analyst.</p> <hr/> <p><a href="#">Record a Discovery Bot business process</a> on page 1672</p>
<p><b>Support for IPv6 addresses</b></p> <p>IPv6 addresses are now supported for Discovery Bot.</p>
<p><b>Linux support</b></p> <p>Discovery Bot is now supported on Red Hat Enterprise Linux and Linux CentOS platforms.</p> <p><a href="#">Installing Control Room on Linux</a> on page 909</p>
<p><b>Support for high availability</b></p> <p>Discovery Bot now supports high availability deployment.</p> <p><a href="#">High availability deployment</a> on page 852</p>

What's changed
<p><b>Changing default repository path for custom installation</b></p> <p>For custom installation, you can now change the default repository path location to a new location on your server after installation.</p> <p><i>Prerequisites for Discovery Bot</i> on page 1661</p>

Fixes	
Service Cloud case ID	Description
--	You can now export a PDD for an opportunity with 2000 steps by using the <b>Download PDD</b> option from the <b>Opportunities</b> page.

Limitations
When <b>Tab</b> is used to move across fields to a password-type field, the entered data is displayed as clear text, for example, when you move from the <b>Username</b> to <b>Password</b> field. Review the text in the <b>Data</b> field for confidential information before you submit the process.
Some actions might not be supported during a recording session, for example, when you click through the Network tab in Inspect mode using Chrome. For such unsupported actions, pause the recorder, complete the action, and then resume the recording.
When you record a process with 1000+ steps, the <b>Recordings</b> page takes some time to load. <b>Workaround:</b> Depending on your environment, you can perform one of the following actions: <ul style="list-style-type: none"> <li>• Split the recording into multiple recording sessions. For example, you can divide 1000 steps into 10 separate recordings.</li> <li>• Wait for all the steps to load on the page before submitting the process for review.</li> </ul>

## IQ Bot

What's new
<p><b>Enhancement to the IQ Bot Classifier package</b></p> <p>The <b>Train Classifier</b> action now provides an option to retrain the documents using an existing model file.</p> <p><i>Using Train Classifier</i></p>

What's changed
<p><b>IQ Bot Pre-processor actions renamed</b></p> <p>The names of all the available actions in the IQ Bot Pre-processor package are now changed. For example, the <b>Get barcodes</b> action is now renamed as <b>GetBarCodes</b>.</p> <p><i>#unique_409</i></p>

What's changed
<p><b>Download all processed documents without any timeout</b> (Service Cloud case ID: 00587817)</p> <p>You can now download all your processed files from the Amazon S3 server to your local machine without causing any timeout, irrespective of the number of files. Even when you choose the <b>Delete files from the server after downloading</b> option and if your download fails, a compressed .zip file containing the failed documents is available for downloading again.</p> <p><a href="#">Download all documents action</a></p>
<p><b>Enhancements to IQ Bot APIs</b> (Service Cloud case ID: 00688683, 00688678, 00688675)</p> <ul style="list-style-type: none"> <li>• File upload API now returns the file ID of the uploaded file.</li> <li>• File status API now accepts a file ID and returns its status as a status code.</li> <li>• File download API now returns the extracted data in JSON format for a successfully uploaded file.</li> </ul> <p><a href="#">APIs to upload files, check file status, and downloading CSV file (A-People login required)</a></p>
<p><b>IQ Bot license renamed</b></p> <p>The license required to run IQ Bot is now renamed to <b>IQBot Platform</b> from the previous <b>Cognitive Platform</b>.</p> <p><a href="#">Licenses overview</a></p>

Fixes	
Service Cloud case ID	Description
00708806	You can now save documents of up to 20 MB after validating, without any issues.
00662968	Fixed an issue that caused the gateway service to become unresponsive.
00644948	When you now upload a document in production, deadlocks no longer occur in the system and documents are correctly sent to the Validator.
00707965	When you now migrate from IQ Bot Enterprise 11 to A2019 using the Migration Assistant tool, all database tables are correctly migrated, without any errors.
00715124	IQ Bot now deletes temporary files downloaded from Amazon S3 server in the C:\windows\temp\ folder when they are no longer required. As a result, storage is no longer consumed by these temporary files.
--	Logs are now available for the IQ Bot node servers in the C:\Users\Public\Documents\Automation Anywhere IQBot Platform\Logs\ folder.

Fixes	
Service Cloud case ID	Description
--	IQ Bot now displays the correct error message when you refresh the extraction results page for a learning instance when its associated bot is moved to production.
--	When creating a table on the Designer page, if you click <b>See Extraction results</b> without completing the table creation, the correct error message is now displayed.  Previously, the following incorrect message was displayed: <code>Preview will be opened in a new tab.</code>
--	When a bot is deleted and you click the <b>Test bot</b> option on the Bots listing page, the following correct error message is now displayed: <code>Bot not found.</code>
--	Python logic is now correctly applied on all the tables. Previously, IQ Bot failed to execute Python logic for tables other than the default one.
--	You can view more granular logs for troubleshooting RabbitMQ v3.8.18 issues. These logs are now stored in the <code>C:\Users\Public\Documents\Automation Anywhere IQBot Platform\Logs\RabbitMQ</code> folder, depending on the log level, log size, and the rotation limit.  If any error occurs in the RabbitMQ v3.8.18 connection, those crash logs are stored in <code>C:\Users\Public\Documents\Automation Anywhere IQBot Platform\Logs\RabbitMQ\log</code> folder.
--	When you now create a user role with 2-byte non-English characters, services no longer fail to execute.
--	If there is an existing database, IQ Bot installer now does not check for the <code>db_creator</code> role for that user.
--	A user with <code>AAE_IQ Bot Validator</code> role and <code>AAE_Basic</code> role can now successfully launch and validate documents in the IQ Bot Validator.

Limitations
IPv6 addresses are not supported for IQ Bot, so ensure that you use IPv4 addresses only.
If you try to apply Python logic to a linked column between two tables, an error message is displayed for the linked column in the second table and the applied logic fails.

Limitations
<p>If you add a blocked library to a custom Python logic and click <b>Test Run</b> for any field, an error message is displayed on the designer page.</p> <p><b>Workaround:</b> Remove the blocked library from the Python logic.</p>
<p>If you use the <b>Overwrite</b> option to import a learning instance, all the available bots and groups are imported.</p>
<p>When you use the <b>Process documents</b> action from the IQ Bot Extraction package to run a bot through workload management, the <b>Current Action</b> tab displays <code>Downloading additional resources</code> along with your command instead of <code>IQ Bot extraction</code> in the <b>In progress activity</b> page.</p>
<p>Average processing time increases when you use the IQ Bot Extraction package on a document with more than 30 pages.</p>
<p>Running existing bots that use the IQ Bot Pre-processor package might fail after you upgrade to this release.</p> <p><b>Workaround:</b> Because the names of the available actions in the IQ Bot Pre-processor package have changed, delete the existing actions in the bots and update them with the new names before running the bot.</p>
<p>(Service Cloud case ID: 00601790) You cannot register IQ Bot when the Control Room is installed on a Linux machine.</p>
<p>When you run a bot that has the IQ Bot Extraction package, the activity information under <b>In progress &gt; Current Action</b> does not display the details correctly.</p>
<p>If you use the <b>File Download API</b> option, the <code>json</code> response you receive does not have a valid format.</p> <p><b>Workaround:</b> This issue occurs because the <code>:</code> (colon) is replaced by <code>=</code> (equal sign) in the <code>json</code> key value. After you receive the <code>json</code> response, use these options:</p> <ul style="list-style-type: none"> <li>• Replace <code>=</code> with <code>:</code></li> <li>• Add <code>"</code> (double quotation marks) in each text</li> </ul>
<p>When you try to sort the <b>PagesUpload</b> column in the <b>Learning instance &gt; Document Group</b> tab, an error message is displayed.</p>
<p>On the Designer, if you resize the system identified region (SIR) of an auto-mapped field, the values from the resized selection are not captured in the corresponding value field.</p> <p><b>Workaround:</b> To update the content of an auto-mapped field:</p> <ol style="list-style-type: none"> <li>1. Select the entire SIR region.</li> <li>2. Draw a bigger bounding box around the region.</li> </ol>

## Bot Insight

What's new
<p><b>AAE_Admin role access to operations API from Power BI connector</b></p> <p>The Power BI connector now provides the <b>AAE_Admin</b> user role access to the botrundata operational API. With this role, you can connect to the botrundata API and extract operational metrics to be analyzed and visualized within Power BI.</p>
<p><b>Enhancements to the publish (production) dashboard</b></p> <p>Users with the <b>AAE_Bot Insight Admin</b> and <b>AAE_Bot Insight Expert</b> role can now edit the published dashboard. You can use the save as option to save the production dashboard as a custom production dashboard and add widgets to your custom dashboard. You can also delete a default production dashboard and a custom production dashboard.</p> <p><a href="#">Save a published dashboard</a> on page 2269   <a href="#">Delete a published dashboard</a> on page 2269</p>

## Enterprise A2019.19 Release Notes

*Release date: 11 February 2021*

Review the new features, changed features, fixed features, security fixes, deprecated features, and known limitations in the Enterprise A2019.19 release. Enterprise A2019.19 Build 8147 is available for On-Premises and Build 8145 is available for Cloud. IQ Bot is on Build 8098.

---

**Important:** We have updated the Enterprise A2019.19 builds to include fixes for the following issues:

- System variables that are displaying blank in the action field (Service Cloud case ID 00737695, 00737698)
- Editing the table size when creating a new table variable in On-Premises (Service Cloud case ID 00725978, 00727695, 00736105)
- Issues editing a bot in the Bot editor and opening the packages listing page that includes special characters (Service Cloud case ID 00733529, 00739634)
- Assigning a bot from the private workspace to a file variable (Service Cloud case ID 00727695)
- Actions in the Image Recognition package not allowing the use of files with .PNG extension and files with uppercase letters in the extension (Service Cloud case ID 00734972, 00734266)
- Variable names in uppercase changing to lowercase, hyphen changing to underscore, and variable not being displayed if it contained an uppercase character (Service Cloud case ID 00734784, 00734842, 00734999)
- Bots not getting deployed on a multi-user device when the user session is signed out and no active session existed (Service Cloud case ID 00727228, 00722888, 00732830, 00732835, 00733877, 00733362, 00726489, 00733070, 732959, 733160, 733269, 733321, 733391, 733435, 733438, 733451, 733680, 733765, 733770, 733790, 733940, 00734067)
- Child bots encountering an error if they contained the **Find window in window** action of the Image Recognition package (Service Cloud case ID 00727031, 00730358, 00733607, 00733544, 0073464)
- Use of variables with camel case names in the Data Table, List, and Loop packages (Service Cloud case ID 00733263, 00733459, 00733007, 00733988, 00734168, 00733141, 00733074, 00733087, 00733001, 00734019)

For more information, see the *Fixed features* sections for Enterprise A2019 and AARI.

- [IQ Bot](#) on page 516
- [Bot Insight](#) on page 519

## Migration features

Enterprise 11 and Enterprise 10 features
<p><b>Review messages in Migration Assistant</b></p> <p>The Migration Assistant displays review messages for migrated bots. Open the migration assistant for a bot to review messages for that bot.</p> <p><a href="#">View changes to migrated bots using Bot Assistant</a> on page 1253</p>
<p><b>Migrate MetaBots with screens</b></p> <p>Migrate MetaBots that contain screens as assets. You can migrate screens based on UI Automation technology and captured using the <b>Object</b> play mode.</p> <p><a href="#">How MetaBots are migrated</a> on page 1179</p>
<p><b>Review messages in Bot Scanner report</b></p> <p>The Bot Scanner report shows review messages about the behavior change in commands that are used in bots that can be migrated to Enterprise A2019.</p> <p><a href="#">Analyze Bot Scanner report for migration</a> on page 1121</p>
<p><b>Stop, or pause and resume migration</b></p> <p>You can stop, or pause and then resume the migration process from the bot launcher and the <b>Activity &gt; In progress</b> page.</p> <p><a href="#">Stop bot migration</a> on page 1199   <a href="#">Pause and resume bot migration</a> on page 1198</p>
<p><b>Migrate bots that use capture scrollable text action in App Integration command</b></p> <p>Enterprise 11 and Enterprise 10 App Integration commands that capture text from an application window with a vertical scroll bar are migrated to the <b>App integration &gt; Capture scrollable text</b> action in Enterprise A2019.</p> <p><a href="#">Package mapping for migration</a> on page 1201</p>

Enterprise 11 only features
<p><b>Map output of PDF integration command to multiple variables</b></p> <p>The output of an Enterprise 11 bot that uses the PDF integration command is mapped with multiple variables in the equivalent actions of the PDF package after the bot is migrated to Enterprise A2019.</p>

**Enterprise 11 only features****Migrate bots that use the following attributes:**

- Bots that send Japanese text in the VT100 terminal using the **Send Text** command
- Bots that use the **Get Single Node** or the **Get Multiple Nodes** command to extract nodes that contain namespaces from an XML file
- Bots that contain the **Connect** command of the Terminal Emulator command and the value in the **Wait Time Out** field that is less than hundred milliseconds

**Migrate bots that use the following options in the Active Directory command:**

- The **Modify Object** command with the Rename, Delete, Move, and Set Property actions for the **Computer** and **Organizational Unit** object type.
- The **Modify Group** command with the **Add users to a group** and **Remove users from a group** actions.

[Package mapping for migration](#) on page 1201

**Enterprise 10 only features****Migrate latest version of Enterprise 10 bots enabled with version control**

You can now migrate the latest version of bots from your Enterprise 10 Control Room configured with SVN version control to Enterprise A2019. Use the **Copy 10.x data** option to copy the latest version of the Enterprise 10 bots to Enterprise A2019 and then use the Bot Migration Wizard to migrate the bots to Enterprise A2019.

[Copy Enterprise 10 data](#) on page 1164 | [How Enterprise 10 data is copied to Automation 360](#) on page 1161

## Enterprise A2019

**Important:** This release includes a required update to your . Ensure that you complete the update to continue with your automation activities when upgrading from a previous release to this release.

[Automatically update the Bot Agent](#) on page 1001 | [Manually update the Bot Agent](#) on page 1002

To verify which version is compatible with this release, see [Compatibility with release builds](#) on page 985.

**New features****Auto-login settings**

Use the auto-login configuration in the Control Room to reduce bot startup time by reusing an existing user session. Configure auto-login in the **Administrator** settings for all devices or customize it from the **Devices** page for each device.

- Configure the auto-login settings for a user session to create a new session or reuse an existing session
- Keep user sessions unlocked
- Log off from a user session after the bot completes execution

[Configure auto-login settings](#) on page 2050 | [Devices](#) on page 1949

New features
<p><b>New CPU utilization and device memory settings</b></p> <p>Configure the CPU utilization and device memory threshold value in the Control Room settings to determine whether to deploy bots on devices or not.</p> <p><a href="#">Configure threshold settings for user devices</a> on page 2049</p>
<p><b>Install Bot Agent on devices without administrator privileges</b></p> <p>You can now choose to install the Bot Agent on user devices with either local user privileges (without administrator privileges) at the local user level or administrator privileges at the system level.</p> <p><a href="#">Install Bot Agent and register device</a> on page 998   <a href="#">Create device pools</a> on page 1956   <a href="#">Users</a> on page 2002</p> <p>When you install the Bot Agent at the user level, the device will not be available as a default device for another user or for device pool selection during bot deployment. For more information, see <a href="#">Bot Agent known limitations</a>.</p>
<p><b>New diagnostic utility for Bot Agent</b></p> <p>Use the Bot Agent diagnostic utility to perform diagnostic checks on Bot Runner devices and to resolve Bot Agent connectivity issues.</p> <p><a href="#">Perform Bot Agent diagnostic checks</a> on page 1007</p>
<p><b>New features in Data Table package</b> (Service Cloud case ID: 00656843, 00707635)</p> <ul style="list-style-type: none"> <li>• Use the <b>Change column type</b> action in the Data Table package to perform operations on the column of a data table. Use this action to change the column data type to <b>Boolean</b>, <b>Datetime</b>, <b>Number</b>, or <b>String</b>.</li> <li>• Sort the data in the data table in <b>Number</b>, <b>Datetime</b>, <b>Boolean</b>, or <b>String</b> format.</li> </ul> <p><a href="#">Data Table package</a></p>
<p><b>New action in App Integration package</b></p> <p>Use the <b>Capture scrollable text</b> action to extract text from the selected window or any control within the selected window and save it to a variable. If you click any control within the window, then text from that specific control is extracted. If you click outside the window, then all the text from that window is extracted.</p> <p><a href="#">App Integration package</a></p>
<p><b>New encoding combo box option in Terminal Emulator for VT Series</b></p> <p>To send and receive Japanese text, you can now use the <b>Encoding</b> and <b>CodePage</b> combo boxes when you connect to the Terminal Emulator for the VT series terminal type.</p> <p><a href="#">Using Connect for</a></p>

New features
<p><b>New actions in Active Directory package</b></p> <p>Use the following actions in the Active Directory to automate a task:</p> <ul style="list-style-type: none"> <li>• Move a computer <i>Using the Move computer</i></li> <li>• Move an organizational unit <i>Using the Move organizational unit</i></li> <li>• Add users to a group <i>Using the Add users to group</i></li> <li>• Remove users from a group <i>Using the Remove users from group</i></li> </ul>
<p><b>New system variable for new line character</b> (Service Cloud case ID: 00669232, 00672775, 00673578)</p> <p>Use the \$String:Newline\$ system variable to add a new line character. This variable adds a new line character in various applications regardless of the operating system of the device.</p>
<p><b>Zero-size form for Enterprise A2019</b> (Service Cloud case ID: 00677611)</p> <p>The <b>Run</b> action uses the zero-size form with name <code>AAZeroSizeForm</code> that can be used by DLLs to identify zero-size forms created by Enterprise A2019.</p>
<p><b>Enhancement to define parent path in Active Directory</b></p> <p>When you establish a connection with an LDAP server, you can now select the LDAP path by connecting to the server.</p> <p><i>Using Connect for</i></p>
<p><b>Obtain information about Run-As user after bot deployment</b></p> <p>Use the <code>AATaskExecutor</code> system variable to return the username, first name, last name, and email of the user that ran the bot. If the bot is deployed on an attended Bot Runner, this variable returns information about the logged-in user. If the bot is deployed by a trigger, this variable returns information about the user associated with that Bot Runner license.</p> <p><i>System settings and parameters</i> on page 1381</p>
<p><b>Enhancements to the Recorder</b></p> <ul style="list-style-type: none"> <li>• Universal Recorder now supports object capture in Mozilla Firefox. You must install the A2019 extension from Mozilla Firefox browser add-ons.</li> <li>• Capture table, grid view, and main window objects from SAP applications.</li> </ul> <p><i>Universal Recorder supported applications and browsers</i> on page 1321   <i>Actions performed on objects captured with Universal Recorder</i></p>
<p><b>Multi-user device supported on Citrix Windows 10 Enterprise</b> (Service Cloud case ID: 00526001)</p> <p>Multi-user device sessions are now supported on Windows 10 Enterprise on Citrix, enabling multiple users to access the same device at the same time.</p>

New features
<p><b>Event triggers on unattended Bot Runners</b> (Service Cloud case ID: 00681548)</p> <p>Ensure that you select the <b>Reuse an existing session</b> option for auto-login settings in the Control Room to use event triggers on unattended Bot Runners when a device is locked or is in a disconnected state (such as RDP).</p> <p><a href="#">Configure auto-login settings</a> on page 2050</p>
<p><b>Auto Login support on Citrix VDI</b> (Service Cloud case ID: 00680200)</p> <p>Auto Login is now supported on Citrix VDI, which enables bot deployment in unattended mode.</p> <p><a href="#">Configure auto-login settings</a> on page 2050.</p>
<p><b>Restore bots from Git repository</b></p> <p>If your database is deleted or corrupted, the admin user can restore all your bots and the associated dependent files from the Git repository to your new empty database.</p> <p><a href="#">Restore bots from Git repository</a> on page 2074</p>
<p><b>Bot Deploy API checks for available devices in the order of listed pool IDs</b></p> <p>If you enter multiple pool IDs in the request body, the API checks the pools for available devices in the order that you listed the pool IDs. If none of the devices are available at the time of deployment, the automation is queued.</p> <p><a href="#">Bot deploy API</a></p>
Changed features
<p><b>Enhanced security for multi-user Bot Agent devices</b> (Service Cloud case ID: 00695858)</p> <p>The Bot Agent configured on multi-user devices for RDP-based deployments now uses the updated version of <code>wfreerdp.exe</code> for enhanced security.</p>
<p><b>Deployment API enhancement</b> (Service Cloud case ID: 00655548)</p> <p>When you invoke a regular deployment API, if a RunAsUser is being used to deploy a bot, the deployment API will not deploy other bots until the RunAsUser is free to run the other bots.</p>
<p><b>Status change initiates workload automation deployment</b></p> <p>When you change the status of a Work Item from <b>Failed</b> to <b>New</b> in the Control Room (<b>Queues</b>), the deployment of a workload automation in queue is initiated.</p>
<p><b>Install Google Chrome Enterprise extension offline with Bot Agent</b> (Service Cloud case ID: 00623511, 00689623, 00715413)</p> <p>You can now install the extension for Google Chrome Enterprise offline from the Bot Agent setup and MSI files.</p>
<p><b>ANSI as default encoding in Data Table package</b></p> <p>For text write operations, Data Table package &gt; <b>Write to file</b> action supports ANSI as default encoding type.</p> <p>Bots created in the previous version of Enterprise A2019 with UTF-8 is not impacted by this change.</p>

Changed features
<p><b>Enhancement to PDF package</b></p> <p>In the PDF package, when you enter an incorrect page range in the <b>Page range</b> field and execute the bot, an error message is now displayed, requesting you to provide the correct page range. The message is displayed for the following actions:</p> <ul style="list-style-type: none"> <li>• Merge document</li> <li>• Split document</li> <li>• Extract text</li> <li>• Extract image</li> </ul>
<p><b>Bots wait for Google Chrome web page to load</b></p> <p>When automating a task in the Google Chrome browser, bots now wait up to 30 seconds for the web page to load, and then run the subsequent <b>Recorder &gt; Capture</b> action. When the page loads, bots search for the object for the duration specified in the <b>Wait for control</b> field. Waiting for the web page to fully render increases the bot's ability to identify the target object in the web page.</p>
<p><b>Enhancement to desktop operations</b></p> <p>When you create a bot and select an option for desktop operations, the data selected from the drop-down list now persists even when you navigate to other fields.</p>
<p><b>Flow view updates in the Bot editor</b> (Service Cloud case ID: 00701626)</p> <ul style="list-style-type: none"> <li>• The <b>Flow</b> view is disabled when you create or edit a bot and the bot exceeds 500 lines of code. Use the <b>Show list view</b> option to navigate to the list view.</li> <li>• In the Bot editor <b>Flow</b> view, a warning message is displayed when the bot exceeds 400 lines of code or if the bot has more than 100 variables.</li> </ul>

The following table lists the fixed features and the builds in which they were fixed (Build 8147 is the latest build, and builds 8145, 8134, 8122, and 8098 are the previous builds). These fixes are cumulatively available in the latest build.

Fixed features		
Build number	Service Cloud case ID	Description
8147	00737695	When you insert a system variable into an action field, the variable now appears in that field.
8147	00725978, 00727695	When you create a table variable in On-Premises, the table expands to the full size of the window. Previously the table only showed three rows at a time.
8147	00733529,00739634	You no longer encounter any issues when you edit a bot in the Bot editor and open the packages listing page. Previously, if an installed package had an object name with a space (' ') character in it, the package listing page displayed an error.
8145	00727695	You can now assign a bot from your private workspace to a file variable.

Fixed features		
Build number	Service Cloud case ID	Description
8145	--	When you create a variable in an action, the variable automatically appears in the field for which you created the variable.
8145	--	You can now use <code>.png</code> files in actions in the Image Recognition package.
8145	00734972, 00734266	You can now select a Control Room file with uppercase letters in the file extension in the <b>Image Recognition &gt; Find image in window</b> action.
8145	00734784	Variables names are now displayed correctly in the Bot editor List view; uppercase letters in the variable name are no longer changed to lowercase letters and hyphens are not changed to underscores.
8145	00734842, 00734999	Actions now display Boolean, date time, or list type variables if the variable name contains uppercase letters.
8145	00727228, 00722888, 00732830, 00732835, 00733877, 00733362, 00726489, 00733070, 732959, 733160, 733269, 733321, 733391, 733435, 733438, 733451, 733680, 733765, 733770, 733790, 733940, 734067	You can now deploy bots on a multi-user device when the user session is signed out and no active session (signed in, locked, or disconnected) exists either for that user or any other user. The following error message is no longer displayed on the <b>View historical activity (Activity &gt; Historical)</b> page: <code>Unable to perform auto-login for user &lt;username&gt;.</code>
8145	--	The Cloud migration utility no longer keeps running in the background if you close the utility when the Enterprise 11 data is being uploaded.
8134	00727031, 00730358, 00733607, 00733544, 00734642	You can now successfully execute bots when you use Image Recognition with the <b>Find window in window</b> action in a child bot. Previously, bot execution failed when you used Image Recognition with this action in the subtask.
8134	00733263,00733459, 00733007, 00733988, 00734168, 00733141, 00733074, 00733087, 00733001,00734019	The Data Table, List, and Loop packages now support variables with camel case names.
8122	00713867	Variables are now listed in alphabetical order in the Variables palette and in the <b>Insert a value</b> window that appears when you press the F2 key.

Fixed features		
Build number	Service Cloud case ID	Description
8122	--	The Control Room now does not take time to launch, and the following error message is no longer displayed: An Unexpected Problem Occurred.
8098	00689022, 00697417, 00697420, 00697079	A Bot Agent device no longer disconnects from the Control Room that is configured on Microsoft Azure. The following error message is no longer displayed: disconnecting due to outstanding pong.
8122	00719167, 00721731	Tasks such as scheduling bots and connecting to user devices are not delayed in an Control Room hosted on Cloud.
8098	00626595, 00680433	The actions in the Image Recognition package no longer return an incorrect error message about the target image data type.
8098	00698201	Fixed an issue where bots were stuck in the preprocessing mode when the bot was used as a child bot in several running bots or was deployed back to back using the Deploy API. Now bots are deployed from the cache and fewer calls are made to the database, thus avoiding a database deadlock.
8098	--	The Bot Scanner now displays the correct message for the MetaBot logic that contains credential variables that cannot be migrated to Enterprise A2019.
8098	00687223	An Enterprise 11 bot that passes a blank value as an input to the string, list, one-dimensional array, and two-dimensional array of string type variable used in a DLL no longer encounters an error when you run that bot after migrating to Enterprise A2019.
8098	00677231	A bot is no longer unresponsive if it contains an action to close the Google Chrome browser followed by an action to open the Google Chrome browser.
8098	00687207	When an Enterprise 11 bot contains objects captured using the Object Cloning command and that object has a property that contains an expression within the \$ character, the Enterprise 11 bot no longer encounters an error after migration.
8098	00689286	The Bot Scanner no longer encounters an error when you scan an Enterprise 11 bot that contains the If command with the <b>Windows control</b> condition selected and is automating a task on a Microsoft Excel file.

Fixed features		
Build number	Service Cloud case ID	Description
8098	00706438	An error is no longer encountered when you are installing Enterprise A2019 and: <ul style="list-style-type: none"> <li>You are migrating from Enterprise 11 to Enterprise A2019</li> <li>Active Directory is configured on the Enterprise 11 Control Room</li> <li>The restored Enterprise 11 database contains the <b>AAE_Meta Bot Designer</b> role</li> </ul>
8098	00708522	An error is no longer encountered when you clone a dependent file of an Enterprise 11 bot after it is migrated to Enterprise A2019. The error is encountered only when the migrated bot contains a null description.
8098	00626664	You can now migrate bots that automate tasks in BMC applications. The migrated bots use the <b>Legacy automation &gt; Manage web controls</b> action to automate interactions with objects.
8098	--	You can now select the regular expression <b>Case insensitive</b> option in actions that contain a window title field and successfully perform a recapture in the application window.
8098	00688134	In the Database package, Korean characters are now displayed properly when you use the <b>Insert/Update/Delete</b> action in an Excel file. Previously, the Korean characters were not displayed properly when the action was used.
8098	00675749	In the Email package, you can now forward an email using groupId or Alias. Previously, the mails were not sent by the SMTP server if the email address contained groupId or Alias in the <b>To address</b> field.
8098	--	You can now use a double backslash (\\) in the <b>Send text</b> action of the Terminal Emulator and execute bots. Previously, when a double backslash (\\) was used in this action and the bot was executed, the terminal displayed a single slash (\).
8098	00688692	When you connect to the EWS server to read mails using Loop, the retrieved email now displays the content correctly per the selected mode (HTML or plain text formats). Previously, when connecting to the EWS server to read an email in HTML format, the email body displayed a blank output.

Fixed features		
Build number	Service Cloud case ID	Description
8098	00659456	In the Loop package, when you select <b>For each file in folder</b> as the <b>Iterator</b> option, the <b>Note</b> below the <b>Assign file name and extension to this variable</b> field now displays the key name in English. Previously, the key name in the <b>Note</b> was translated to the languages you selected.
8098	--	A bot no longer runs intermittently when the focus changes from one window to another window and does not display the Type_015 Google Chrome plug-in error.
8098	00683528	In the Database package, single entries are now inserted in the database when you execute a store procedure to add rows in the table and the option <b>Export data to CSV</b> is selected. Previously, duplicate entries were added in the database.
8098	00693664	Fixed an issue where Japanese characters did not display correctly when input into a field that contained a variable.
8098	00677167	The locker <b>Participants</b> tab now shows only the assigned participants for that specific locker. Previously, the tab displayed the participants of the previously viewed locker, requiring the user to refresh the browser to see the correct participants.
8098	--	The Control Room services can now be run using the non-administrator service account users. The <code>Bad Gateway</code> error message is no longer displayed.
8098	00691232	Fixed an issue that did not allow users to update the value of a file type input variable after saving the bot.
8098	--	The <b>Save</b> option is now correctly enabled when users make any changes to the metadata, unique entity, or SAML assertion mode.
8098	--	The username is no longer saved in the login window after the user logs out unless the user has selected the <b>Remember my username</b> option.
8098	00682021	When you check in a bot that has cloned bots as dependencies, the dependent files are no longer lost from the private workspace. Also, after the check-in, if you create a new bot using the same dependencies as in the earlier bot, the new bot executes successfully.

Fixed features		
Build number	Service Cloud case ID	Description
8098	--	Work Items are now processed for workload automation after you add more Work Items to an existing queue.
8098	--	Work Items are now reprocessed for workload automation after you change the status from failed to new.
8098	00711410	You can now migrate workload automations in an Control Room configured to use a manual mode for Credential Vault.
8098	00667047, 00673289	Auto-login for a user session no longer fails for bots deployed on virtual machines when the VDI session is disconnected or is in a locked state, and the following token error message is no longer displayed: An attempt was made to reference a token that does not exist.
8098	00560593, 00585092	Universal Recorder is now aligned with the Bot Agent, so the recorder can capture objects on devices with any proxy server configuration.
8098	00675695	When you use the Excel advanced package, the bot now opens an Excel file without any issues. Previously, the bots failed to open an Excel file in some scenarios due to internal hardware components.
8098	00678567	CSV formulaic entries are no longer permitted in data fields of web applications, such as device names. These fields are limited to accept alphabetic characters, numbers, hyphen, and underscore entries only.
8098	00691551	Turkish characters are now supported in user names.

Known limitations
<p>When you update the Bot Agent from user level to system level, the user is unable to capture objects using recorder actions or from a window list in a Google Chrome browser.</p> <p><b>Workaround:</b> Remove the registry entry for the user. Ensure the registry entry is in HKLM: Computer\HKEY_CURRENT_USER\SOFTWARE\Google\Chrome\NativeMessagingHost\Automation*.</p>

<b>Known limitations</b>
<p>When you uninstall the Bot Agent, the Bot Agent service and registry entry are not removed. Therefore, subsequent Bot Agent reinstallations fail.</p> <p><b>Workaround:</b></p> <ol style="list-style-type: none"> <li>1. Stop the Bot Agent service from the Task Manager.</li> <li>2. Delete the Bot Agent registry key from <code>Computer\HKEY_LOCAL_MACHINE\SYSTEM\ControlSet001\Services\Automation Anywhere Bot Agent</code>.</li> <li>3. Reinstall the Bot Agent.</li> </ol>
<p>When you install a Bot Agent at the user level, the user device is not registered as admin.</p> <p><b>Workaround:</b> Before installing the Bot Agent, ensure that the user has write permission to the user profile folders (for example, <code>C:\Program Files</code>).</p>
<p>When you deploy a bot using a custom package and if the package has an object name with a semicolon (;) or percentage (%) character in it, the bot execution fails.</p> <p><b>Workaround:</b> Do not use special characters such as a semicolon (;) or percentage (%) in the custom package name.</p>
<p><b>Limitation for multi-user deployments with auto-login</b></p> <p>If the auto-login setting in the Control Room is set to lock the session when the bot finishes executing from an existing unlocked session, deployments will fail when you deploy a bot on a multi-user device with non-admin user session and another admin user session is also active on the device.</p> <p><b>Workaround:</b> Restart the Bot Agent service from the Windows Start menu and log off from the admin user session.</p>
<p><b>Bot Agent installation</b></p> <p>Starting from this release, when you install the Bot Agent at the local user level, keep the following in mind:</p> <ul style="list-style-type: none"> <li>• You cannot install the Bot Agent at the user level if you log in to the device as the root administrator.</li> <li>• Auto-login is not supported for local users and unattended Bot Runners.</li> <li>• The auto-update feature for the Bot Agent will be applicable from the subsequent release because the option to install the Bot Agent at the local user level is introduced in this release.</li> <li>• You cannot configure multi-user devices.</li> <li>• Enterprise A2019 recorders for third-party applications: <ul style="list-style-type: none"> <li>• No separate setup is required for JRE 6 and 7.</li> <li>• Citrix XenApp is not supported because administrator privileges are required to set up Citrix.</li> <li>• You must upgrade to the Enterprise A2019.19 Recorder package to use Discovery Bot.</li> <li>• You must have write permission to AISense Recorder logs.</li> </ul> </li> </ul>

Known limitations
<p>Bots encounter a Java heap space error when they use the Excel basic package to open an Excel file that is 20 MB or larger.</p> <p><b>Workaround:</b> Increase the Java virtual machine heap space to 8 GB:</p> <ol style="list-style-type: none"> <li>1. Navigate to <code>C:\Program Files\Automation Anywhere\Bot Agent\config</code>.</li> <li>2. If it does not already exist, create a new text file named <code>nodemanager.properties</code>.</li> <li>3. Open the file and copy the following text and paste it in the file: <code>bot.launcher.jvm.options=-Xmx8092m</code></li> <li>4. Open Windows Services and restart the Bot Agent.</li> </ol>
<p>Bots wait a maximum of 30 seconds for an object to appear in the Google Chrome browser, regardless of the value in the <b>Wait for control</b> field in the <b>Recorder</b> &gt; <b>Capture</b> action.</p>
<p><b>Limitations in Cloud migration</b></p> <ul style="list-style-type: none"> <li>• The backup of the Enterprise 11 data created by the Cloud migration utility is not deleted when you close the Cloud migration utility after the Enterprise 11 data is uploaded to Cloud.</li> <li>• Enterprise 11 bots that contain Japanese characters in their name encounter an error when you run these bots after they are migrated to Cloud.</li> <li>• The Cloud migration utility does not show a validation error when you run the utility and the Automation Anywhere Control Room Reverse Proxy service is running if you have reinstalled Enterprise 11 Control Room using the same database that you have used in the previous Enterprise 11 instance.</li> </ul>
<p>(Service Cloud case ID: 00737669) When you upgrade to this release, the Bot Agent is also updated. As a result, all the event triggers associated with Bot Runner (attended or unattended) users are stopped.</p> <p><b>Workaround:</b> Bot Runner (attended and unattended) users must re-login to the Control Room to activate the associated event triggers.</p>
<p>Enterprise 11 bots that use identical names for variables that are differentiated by a hyphen or an underscore (for example, L-Lower and L_Lower) encounter an error when you run them after migrating to Enterprise A2019.</p> <p><b>Workaround:</b> Update the name of one of the variables to a different name before migrating the bot.</p>
<p>String system variables do not function in Email action fields when the format is set to HTML.</p> <p><b>Workaround:</b> Use HTML tags that perform the same function as the string variables. For example, instead of <code>\$\$String:Enter\$</code> or <code>\$\$String:Newline\$</code>, you can use the HTML tag <code>&lt;br&gt;</code>. Similarly, for the string variable <code>\$\$String:Tab\$</code>, you can enter <code>&amp;nbsp;</code>.</p>
<p>When you insert a variable into an action field that contains other content, the variable appears at the end of the content, regardless of the cursor position.</p> <p><b>Workaround:</b> Highlight the variable name, and then cut and paste it to the correct position in the action field.</p>

**Known limitations**

(Service Cloud case ID: 00781974) In a Linux environment, some of the Control Room log messages are stored in the `/var/log/messages` file instead of the `/var/log/automationanywhere` directory. As a result, disk space increases, and the services might stop when the disk space is full.

**Workaround:** Clear the messages file regularly to avoid a disk storage issue.

**Automation Anywhere Robotic Interface (AARI)****New features****New filter task in the process editor**

In the process editor, the **Filter Task** enables users to filter variables such as human or bot task output with a specific filter criterion.

[Create an AARI process](#) on page 1487

**New process task in the process editor**

Use the new **Process Task** option in the process editor to call a subprocess within the main process. This feature enables you to separate tasks into different processes instead of including all the tasks in a single process. Multiple teams can now work at the same time on different tasks within the main process and remain segregated, without any conflicts.

[Create an AARI process](#) on page 1487

**Hide a task or view a hidden task**

With a Bot Creator license, you can now perform the following:

- Hide the display of human and bot tasks by selecting the **Hide this task after completion** option in the process editor.
- View a hidden human or bot tasks by selecting the **View hidden tasks** option in the tasks view page.

[Create an AARI process](#) on page 1487

**Edit title in process editor**

Users can now edit the title in the process editor.

**Rich-text editor updates (web interface)**

In the web interface, you can use rich-text editor features such as bold text, italics, underline, alignment, formatting, color, and size in tasks.

**Table element updates (web interface)**

In the web interface, the **Table** element now supports the use of date, number, drop-down, and text values in tasks.

New features
<p><b>Updates to elements in form builder</b></p> <p>The form builder now includes the following new elements:</p> <ul style="list-style-type: none"> <li>• <b>Select Folder</b> element: Add an upload folder option in the form. <i>Using the Select Folder element</i> on page 1544</li> <li>• <b>Hyperlink</b> element: Assign a URL in the form. <i>Using the Hyperlink element</i> on page 1545</li> </ul>
<p><b>Enhancement to the Checkbox action trigger</b></p> <p>If a form with a <b>Checkbox</b> element is used within a trigger loop package, you can now use the <b>Value selected</b> and <b>Value unselected</b> trigger actions. <i>Trigger loop package</i></p>

Changed features
<p><b>Create and view requests (AARI manager)</b></p> <p>An AARI manager can create and view requests from processes that are assigned to the team they belong to or own. They can also create and view requests from processes that are assigned to themselves but not to the team.</p>
<p><b>Same device cannot be assigned to Bot Creator and unattended Bot Runner for triggers</b></p> <p>After you update to this Enterprise A2019 version from an earlier version, a default device that is assigned to a Bot Creator or an attended Bot Runner cannot be assigned to an unattended Bot Runner for deploying triggers.</p> <p><b>Recommended action:</b> Use separate devices or device credentials (auto-login) for a Bot Creator and an attended Bot Runner as deployments can overlap or override across licenses.</p>
<p><b>Create a Request action URI</b></p> <p>The process selector in the <b>Create a Request</b> action is replaced with a public repository uniform resource identifier (URI). <i>Web</i></p>

Fixed features		
Build number	Service Cloud case ID	Description
8134	--	The table element now renders properly even when the <b>Row before scrolling</b> parameter value does not match the number of rows. Previously, the table did not render properly and displayed empty cells.
8122	--	When you check out a process, and add, modify, or remove tasks in the process editor, the dependencies are now correctly updated when the process is checked in.

Fixed features		
Build number	Service Cloud case ID	Description
8098	00707684, 00707688, 00707192, 00706781, 00707900, 00709109	All event triggers are now retained when you update to this version from an earlier version.
8098	--	In the process editor, undo and redo functions are now available for both canvas and properties panel interactions by default. Previously, the undo and redo functions were only available for canvas interactions.
8098	--	Previously during bot runtime, if you deleted all the existing rows from a table before adding a new row, the columns and rows of the table were misaligned. You can now drag and resize any column to reset the table alignment.
8098	--	All the trigger events within a form are now retained and no longer fail when the form is closed and reopened during bot runtime.
8098	--	In the process editor, if you replace the <b>Go to</b> option with an <b>End process</b> , the <b>End process</b> icon now displays the correct status (Completed, Failed, Canceled). Previously, the status was not displayed correctly and had to be changed manually by using the <b>End process</b> option.
8098	--	When you delete a request from the <b>Request</b> tab and it is sent to the recycle bin, the related task from the <b>Task</b> tab is now removed.
8098	--	When you filter your tasks in the <b>Task</b> tab, the results shown in the tab now retain the information when you navigate between different tabs.

Deprecated features
<p><b>Support removed for device pool configuration</b></p> <p>An AARI administrator can no longer use the device pool configuration to deploy bots in a process. After upgrading to Enterprise A2019.19 from an earlier version, verify that the scheduler user configuration is set up in order to successfully execute your bots in the process.</p> <p><a href="#">Configure scheduler user for AARI on the web</a> on page 1472</p>

Known limitations
<p>When you create a request from a process (public or private) and enter all the required information in the initial form, the initial form cannot be submitted because the <b>Submit</b> option does not work. This issue occurs for all initial forms with at least one mandatory field.</p> <p><b>Workaround:</b> Make all fields optional.</p>

Known limitations
When you submit an initial form or task in a request view that contains a check box with at least two options and at least one option is selected, the check box value is not changed and defaults to a false Boolean value.
If the <b>Set</b> action is used immediately after a <b>Get</b> action, the value assigned to a variable using the <b>Get</b> action is not retrieved in the specified form element of the <b>Set</b> action during bot runtime.
An AARI manager can create a request from a process that is assigned to them but not to their team. They can create and complete the request if the process contains only bot tasks. If the process contains a human task, the manager cannot assign the human task to themselves. <b>Workaround:</b> Assign the process to both the manager and their team.
In the process editor, the <b>Go To</b> option shows only the <b>Human Task</b> and <b>Bot Task</b> , it does not show the <b>Filter Task</b> or the <b>Process Task</b> .
(Service Cloud case ID: 00736309, 00765069, 00784362) If you use a file trigger for a document that is in <code>.csv</code> , <code>.xlsx</code> , or <code>.xls</code> format, the corresponding bot is not triggered when that document is modified.

## Discovery Bot

New features	
<p><b>View the duration of each recorded step</b></p> <p>A recorded step is now displayed in minutes and seconds for the business user and analyst. Use this information to understand which steps are a bottleneck in the current process and will provide most benefit from automation. The step duration is displayed from the <b>Recordings</b> page (below the screenshot image), and from the <b>View process</b> and <b>View opportunities</b> page from the Preview pane window.</p> <p><a href="#">Record a Discovery Bot business process</a> on page 1672</p>	
Changed features	
<p><b>Enhancement to the screenshot</b></p> <p>The screenshot image of the recorded step is now increased to full size for a more clear, detailed view of the recorded step.</p>	
Fixed features	
Service Cloud case ID	Description
--	You can now click the <b>Screen</b> icon to display an image that you have hidden and saved. Previously, you had to click <b>Screen</b> and then click <b>Save</b> to display the image again.

Fixed features	
Service Cloud case ID	Description
--	When an opportunity is created for a system-generated view with filters applied, the filter now persists across the view displayed in the <b>Aggregated</b> tab from the <b>Opportunities</b> page. The filter is not reapplied on the view from the <b>Opportunities</b> page and the <code>No recording data</code> message is no longer displayed.
--	When you now cancel a recording, the recording is not displayed on the process tile in <b>Process Cycle</b> .
--	You can now approve a recording with 2000 steps. The Recording status is displayed as approved.

Known limitations
Actions such as double-click, drag-drop, click and hold, and text select are not supported when you are recording a business process.

## IQ Bot

New features
<p><b>Support for variables in IQ Bot actions</b> (Service Cloud case ID: 00511178)</p> <p>IQ Bot On-Premises and Cloud</p> <p>You can now use variables in the <b>Download all documents</b> and <b>Upload Document</b> actions in the IQ Bot package.</p> <p><a href="#">Create a variable</a> on page 1387   <a href="#">#unique_437</a></p>

Changed features
<p><b>Rename a learning instance</b> (Service Cloud case ID: 00675803)</p> <p>You can now rename a learning instance in staging in IQ Bot.</p>
<p><b>Sequential document processing</b> (Service Cloud case ID: 00662968, 00665331)</p> <p>When you click <b>See Extraction Results</b>, IQ Bot now opens that request in a new browser tab where its number in the queue is displayed. This number keeps decreasing as the previous requests in queue are processed.</p>
<p><b>Dutch language support</b></p> <p>IQ Bot now supports the Dutch language with ABBYY FineReader Engine.</p>

Changed features
<p><b>Configure OCR settings using REST APIs</b></p> <p>A user with AA IQ Bot Administrator role can now use the <code>appConfigurations</code> API to read and update the OCR settings.</p> <p><a href="#">Select an OCR engine</a></p>

Fixed features	
Service Cloud case ID	Description
00639117	Numeric format in the Polish language is now accepted in the IQ Bot Validator.
--	When you upload a document immediately after deleting a bot it was associated with, extraction results are now displayed irrespective of when the bot was deleted. Previously, an interval of 3 minutes was required to view the extraction results of the deleted bot.
00636899, 00683451	When you create a learning instance using the custom domain, the field names now appear correctly, irrespective of the custom domain language.
00459301, 00677204, 00532325, 00658245	Custom Python logic now displays extraction results in the Designer without any errors.
00657928, 00679540	Exported IQ Bot archive (.iqba) files no longer contain any unclassified records in the .csv files.
00704365	If documents uploaded during production have fewer pages than the staging documents that the bot was trained with, these production documents are now processed without any errors.
00703560, 0062442	When you migrate learning instances using the append option, all records are now correctly migrated, irrespective of the number of records in the IQBA file.
00715124	IQ Bot now deletes temporary files downloaded from Amazon S3 server in the <code>C:\windows\temp\</code> folder when they are no longer required. As a result, storage is no longer consumed by these temporary files.
00686297	IQ Bot machine learning services are now correctly installed when you install IQ Bot.
00657928, 00679540, 00727633	You can now migrate learning instances to production, even if they contain unclassified documents.

Known limitations
<p>IQ Bot On-Premises and Cloud</p> <p>If you click <b>See Extraction results</b> multiple times, the <b>Learning instances listing</b> page is opened instead of the extraction results.</p>
<p>IQ Bot On-Premises and Cloud</p> <p>When creating a table on the <b>Designer</b> page, if you click <b>See Extraction results</b> without completing the table creation, extraction results are not displayed.</p> <p><b>Workaround:</b> Create the table first and then click <b>See Extraction results</b>.</p>
<p>IQ Bot On-Premises and Cloud</p> <p>An error message is displayed when you refresh the extraction results page for a learning instance when the associated bot is moved to production.</p>
<p>IQ Bot On-Premises and Cloud</p> <p>When a bot is deleted, an incorrect error message is displayed when you click the <b>Test bot</b> option on the <b>Bots listing</b> page.</p>
<p>IQ Bot On-Premises and Cloud</p> <p>If you rename a learning instance in production and download the files, all the files associated with the original learning instance are also downloaded. For example, if you rename a learning instance from Sales1 to Sales2, all the files associated with Sales1 are also downloaded when you download Sales2.</p>
<p>IQ Bot On-Premises and Cloud</p> <p>If you have multiple learning instances and you click <b>See Extraction results</b> for all of them, the extraction results are not processed in the order of their request.</p>
<p>IQ Bot On-Premises and Cloud</p> <p>When you create a learning instance with check box fields and run a Python script associated with the check box, an error message is displayed on the <b>Designer</b> page.</p>
<p>IQ Bot On-Premises and Cloud</p> <p>When you upload staging or production documents to a learning instance, temporary files are created in the C:\Windows\Temp folder, and the folder size might increase over a period of time. Therefore, manually delete the files from this folder because it can cause IQ Bot to stop responding.</p>
<p>IQ Bot On-Premises and Cloud</p> <p>If you select the <b>Only for me</b> option when installing the Bot Agent, the <b>IQ Bot Extraction</b> action has the following issues:</p> <ul style="list-style-type: none"> <li>• Takes a very long time to process a document.</li> <li>• Some of the documents might not be processed successfully.</li> </ul> <p><b>Workaround:</b> During Bot Agent installation, choose the <b>Anyone who uses this computer (all users)</b> option.</p>
<p>IQ Bot On-Premises</p> <p>(Service Cloud case: 00762174) Using the Database Migration Assistant to migrate from IQ Bot 11.x (five databases) to A2019 (unified database) in Microsoft Azure Database is not supported.</p>

Known limitations
<p><b>IQ Bot On-Premises and Cloud</b></p> <p>When you change the display language of any learning instance that has a document in Validator, although the selected display language is successfully applied to the learning instance, an error message is still displayed.</p>
<p><b>IQ Bot Cloud</b></p> <p>The auto-correction and auto-suggestion features, which are part of the <b>MLScheduler</b> service, use system resources extensively and cause the system to slow down or stop responding.</p>

Deprecated features
<p>IQ Bot On-Premises is no longer supported on Windows Server 2012.</p>

## Bot Insight

Fixed features	
Service Cloud case ID	Description
00669196	When you apply date filters on a dashboard and then apply an attribute filter in the widget, the system now filters by a specific date. Previously, the date filter applied at the dashboard level was ignored when the attribute filter was selected at the widget level. As a result, historical data was also displayed.

---

**Important:** The supported packages information is moved to this topic: [Packages available in Automation 360](#) on page 1369.

---

## Enterprise A2019.18 Release Notes

*Release date: 11 January 2021*

Review the new features, changed features, fixed features, known limitations, and supported packages in the Enterprise A2019.18 (Build 7560) release. For IQ Bot, Build 7553 is available for Cloud customers and Build 7554 is available for On-Premises customers. There are no security fixes in this release.

---

**Important:** We have updated Enterprise A2019.18 to Build 7560 to include fixes for issues with workload management (Service Cloud case IDs 00696614 and 00703339) and SSO authentication on Automation Anywhere Cloud (Service Cloud case IDs 00706042, 00706074, 00706201, 00706195, 00706134, 00706022, and 00707033). See the [Fixed features](#) section for more information.

---

- [Enterprise A2019](#) on page 521
- [AARI](#)
- [Discovery Bot](#) on page 532
- [IQ Bot](#) on page 534

- [Bot Insight](#) on page 536
- [Supported packages](#) on page 537

## Migration features

Enterprise 11 and Enterprise 10 features
<p><b>Migrate MetaBots with screens</b></p> <p>Migrate MetaBots that contain screens as assets. You can migrate screens based on HTML, MSAA, and .NET technologies and captured using the <b>Object</b>, <b>Image</b>, and <b>Coordinate</b> play modes.</p>
<p><b>Configure timeout in Bot Migration package</b></p> <p>When migrating bots, you can now set a timeout value in the range of 3 through 90 minutes (default value is 90 minutes). If the migration of any specific bot is not completed within the set time, a timeout message is displayed and the migration process moves to the next bot.</p>
<p><b>Use regular expressions in variables</b> (Service Cloud case ID: 00628227)</p> <p>Use regular expressions (regex) in value type variables to specify the entity on which you want to perform an operation. For example, actions in the File, Folder, String, and Window packages allow use of regular expression in variables.</p> <p>When Enterprise 11 or Enterprise 10 bots with commands that use regular expressions in variables are migrated, if their equivalent actions in Enterprise A2019 do not support regular expressions, the regular expression is converted to string in the migrated bots.</p>
<p><b>Migrate MetaBot that returns a list variable</b></p> <p>You can now migrate MetaBots that contain logic that return a list variable to the parent bot.</p>
<p><b>Migrate bots that use functional keys</b></p> <p>Migrate bots that use <b>functional keys</b> such as F1, F2, and F3 in the <b>Send Text</b> command.</p>
<p><b>Migrate bots that extract information from PDF</b></p> <p>Migrate bots that use the <b>Extract Form Fields</b> command to extract data from the fields in a PDF file.</p>

Enterprise 11 only features
<p><b>Migrate bots to Enterprise A2019 Cloud</b></p> <p>You can now migrate to Enterprise A2019 Cloud by using the Cloud Migration Utility. Use the utility to upload your Enterprise 11 data to Automation Anywhere Cloud.</p> <p><a href="#">Migrate from 11.x to Cloud</a></p>
<p><b>Migrate to Enterprise A2019 on Linux CentOS</b> (Service Cloud case ID: 00654757)</p> <p>You can now migrate from Enterprise 11 to Enterprise A2019 installed on Linux CentOS.</p> <p><a href="#">Migrate to Linux CentOS</a></p>
<p><b>Migrate imported Enterprise 11 bots to Enterprise A2019</b></p> <p>You can now migrate Enterprise 11 bots that you imported using the Bot Lifecycle Management feature or the Import API to Enterprise A2019 by using the migration wizard.</p>

**Enterprise 11 only features****Migrate bots that use the following attributes:**

- Bots that use **regular expression (regex)** to search for the string and title of an application window on which you want to perform an operation
- (Service Cloud case ID: 00616115) Bots for which **custom format** is configured for system dates  
The system uses the **AADefaultDateFormat** global value to store the format of the date.
- Bots that use the **Search Field** command to search a field index or field name by using text in the Terminal Emulator

**Enterprise A2019**

**Important:** This release includes a required update to your . Ensure that you complete the update to continue with your automation activities when upgrading from a previous release to this release.

[Automatically update the Bot Agent](#) on page 1001 | [Manually update the Bot Agent](#) on page 1002

To verify which version is compatible with this release, see [Compatibility with release builds](#) on page 985.

**New features****Create a Citizen Developer user**

Administrators can now use the Citizen Developer license to create Citizen Developer roles and users in the Control Room. Users with this license can create and run bots (including bots with triggers) on their devices.

[Automation 360 licenses](#) on page 970 | [Create a Citizen Developer role](#) on page 2026 | [Create a Citizen Developer user](#) on page 2009

**Recorder enhancements**

- Use the AISense Recorder **Define** option to record an interaction, such as click active text, with an object that is only visible when you hover the mouse over the object.
- If you record a click and keystrokes in a text box with a **Control Type** of `PASSWORD_TEXT`, the **Recorder** does not capture the keystrokes entered into the field. Instead, the action selects the **Set text** option and offers users the option to select a credential from the Credential Vault, enter a credential variable, or enter an insecure string.

**Export and import Bot Insight dashboards using Bot Lifecycle Management**

The Bot Lifecycle Management feature now enables you to export and import Bot Insight dashboards (default, custom, and published) associated with analytics bots from one Control Room instance to another. You can also export and import Bot Insight dashboards using the Bot Lifecycle Management export and import APIs.

[Export bots](#) on page 2143 | [Import bots](#) on page 2145

New features
<p><b>Support for non-persistent VDI</b></p> <p>Non-persistent virtual desktop infrastructure (VDI) is now supported for temporary devices so that you can configure settings for temporary devices in the Control Room or during Bot Agent installation.</p> <p>The feature includes the following capabilities:</p> <ul style="list-style-type: none"> <li>• Automatically register a device.</li> <li>• Automatically mark a device as default for the logged-in user.</li> <li>• Automatically add a device to an existing pool.</li> <li>• Delete offline devices from a list of devices.</li> <li>• Add parameters for temporary devices in the Bot Agent MSI file.</li> </ul> <p><a href="#">Manage device settings</a> on page 2045   <a href="#">Configure temporary devices</a> on page 2049   <a href="#">Bulk install Bot Agent on devices</a> on page 1012</p>
<p><b>Efficiently map input and output variables between parent and child bots</b> (Service Cloud case ID: 00537090, 00698697)</p> <p>For input variables, use the <b>Quick map</b> option to select the variables and set the values for the parent bot to pass. For output variables, use the <b>Multiple variables</b> tab to associate each dictionary key with a variable. This feature eliminates the need to use actions to extract the output dictionary values.</p> <p><a href="#">Task Bot package</a>   <a href="#">Using the Run</a></p>
<p><b>Support for PowerBuilder application in App Integration package</b> (Service Cloud case ID: 00680703)</p> <p>The App Integration package now supports PowerBuilder to capture and extract text from a window application. The <b>Capture text of window</b> action enables you to open a PowerBuilder screen to capture all the data and verify the captured text.</p>
<p><b>Enhancements to check-out option in the private workspace</b></p> <ul style="list-style-type: none"> <li>• The <b>My bots</b> page in the private workspace displays a new status <b>Checked out edited</b> for bots that are checked out and edited.</li> <li>• Use the <b>Revert edits</b> option to cancel any changes you made to the checked-out bot in the private workspace.</li> </ul>
<p><b>Programmatically delete bots, files, and folders</b></p> <p>Use the <code>Delete files/folders</code> API to delete objects from the private or public workspace.</p> <pre>DELETE &lt;control_room_URL&gt;/v2/repository/files/{id}</pre>
<p><b>Manage scheduled bots using APIs</b></p> <p>Use the <code>Bot Scheduler</code> APIs to create, update, and view details, and delete bot schedules. Bots can be scheduled to run at a specific date and time on an unattended Bot Runner, or on a recurring basis.</p>
<p><b>New action in Terminal Emulator package</b></p> <p>Use the <b>Search Field</b> action in the Terminal Emulator package to search for a field based on the text it contains. This action returns the name or index of the field based on the option selected.</p> <p><a href="#">Terminal Emulator</a></p>

New features
<p><b>New action in PDF package</b></p> <p>Use the <b>Get Property</b> action in the PDF package to retrieve the properties of a PDF file and assigns the properties to a dictionary variable.</p> <p><i>Using the Get property</i></p>
<p><b>New actions in Browser package</b></p> <p>Use the following actions in the Browser package:</p> <ul style="list-style-type: none"> <li>• <b>Close:</b> Closes a Google Chrome browser window or tab.</li> <li>• <b>Get source code:</b> Retrieves the source code of a web page and saves it to a string variable.</li> <li>• <b>Go back:</b> Returns to a web page that you previously visited in the current tab.</li> <li>• <b>Open:</b> Opens the browser to a specific web page in an existing tab, new tab, or window.</li> <li>• <b>Run JavaScript:</b> Executes JavaScript in a web page.</li> </ul> <p><i>Browser package</i></p>
<p><b>Specify application window dimensions</b></p> <p>Use the <b>Resize windows</b> option to set the window height and width to specific dimensions or to the dimensions at which it was captured. This feature enhances the bot's ability to identify the target object.</p> <p>The following packages support this feature:</p> <ul style="list-style-type: none"> <li>• App Integration</li> <li>• If <b>Image recognition</b> condition</li> <li>• If <b>Legacy Automation &gt; Window Control</b> condition</li> <li>• Image Recognition</li> <li>• Simulate keystrokes</li> <li>• Legacy Automation <b>Desktop &gt; Manage windows controls</b> action</li> <li>• Loop <b>While &gt; Image recognition</b> condition</li> <li>• Loop <b>While &gt; Legacy Automation &gt; Window Control</b> condition</li> <li>• Mouse</li> <li>• OCR</li> <li>• Screen</li> </ul>
<p><b>Support for function keys in Terminal Emulator package</b></p> <p>Function keys (F1 through F24) are now supported to automate processes using ANSI and VT100 terminals in the Terminal Emulator package.</p>

New features
<p><b>Use regex case insensitive flag for Window title</b></p> <p>Enable the regex <b>Case insensitive</b> flag to identify a <b>Window title</b> field as not case-sensitive. This feature enables you to successfully run the bots even if the letter case does not match the captured window title.</p> <p>The following packages and actions support this feature:</p> <ul style="list-style-type: none"> <li>• Wait</li> <li>• Image Recognition</li> <li>• Simulate keystrokes</li> <li>• Mouse &gt; <b>Click</b> action</li> <li>• Legacy Automation <b>Desktop</b> &gt; <b>Manage windows controls</b></li> <li>• OCR &gt; <b>Capture window, Capture area</b></li> <li>• Screen &gt; <b>Capture window, Capture area</b></li> <li>• Recorder &gt; <b>Capture</b></li> <li>• Window: <b>Activate, Close, Maximize, Minimize, Resize</b></li> </ul>
<p><b>Unattended Bot Runner supported on Citrix devices</b></p> <p>You can now deploy bots on unattended Bot Runners on virtual machines on Citrix XenDesktop and Citrix VDI Windows 2016.</p>

Changed features
<p><b>Only Bot Scanner related files and folders are deleted</b></p> <p>The Bot Scanner now deletes only Bot Scanner related files and folders from the destination folder.</p> <p><a href="#">Scan Enterprise 11 or 10 bots using Bot Scanner</a> on page 1118</p>
<p><b>Enhanced transport layer security</b> (Service Cloud case ID: 00677546, 00681830)</p> <p>The default Elasticsearch ports (47599, 47600) now use the more secure TLS version 1.2 and later as the communication channel between the Control Room and Elasticsearch server.</p>
<p><b>Enhanced Update node action in XML package</b> (Service Cloud case ID: 00663089)</p> <p>When you edit and save an XML node, the bot updates the required attributes and their values in an alphabetical order, without removing any existing attributes of the node.</p> <p>For example, consider two existing attributes in an XML node such as <code>Name=Peter</code> and <code>Phone=9829xxxxxx</code>. If you change the value of the phone attribute as <code>9887xxxxxx</code> and add a new attribute <code>Gender</code> with value as <code>Male</code>, the bot updates the phone value and adds the gender as a new attribute, without removing the existing name attribute.</p>
<p><b>Interface change in Excel basic and Excel advanced packages</b></p> <p>The <b>session name</b> field is now the last field in actions in the Excel basic and Excel advanced packages.</p>
<p><b>Access at subfolder level in Control Room repository</b> (Service Cloud case ID: 00634847, 00681221, 00685654)</p> <p>An administrator can now allow access at the subfolder level in the Control Room by assigning the <b>Run, Check-in</b> and <b>Check-out</b> permissions to the subfolder. You can only access the contents of the subfolder and not the other bots or files in the parent folder.</p>

Changed features
<p><b>Increased working area in the Bot editor</b></p> <p>More horizontal and vertical screen area is available in the Bot editor for developing bots. You can hide or display the <b>Actions</b> and <b>Details</b> panels to maximize the working area in the Bot editor.</p>

The following table lists the fixed features and the builds in which they were fixed (Build 7560 is the latest build, and Build 7554 is the previous build). The fixes are cumulatively available in the latest build.

Fixed features		
Build number	Service Cloud case ID	Description
7560	00696614	Bot deployment is no longer delayed after you insert Work Items if idle devices are available for the deployment in queues.
7560	00703339	The post Work Item insertion flow is now improved so that bot deployments are not delayed.
7560	00706042, 00706074, 00706201, 00706195, 00706134, 00706022, 00707033	An issue with Control Room login page not supporting SAML for SSO and reporting an errant IPD response has been addressed. The SSO function of the Control Room login works as expected.
7554	00659336	Enterprise 11 bots that use the Image Recognition command or <b>Image Recognition</b> condition of the If command now run successfully after migration.
7554	00647634	The Bot Scanner no longer becomes unresponsive when scanning a large repository.
7554	00678614	An error is no longer encountered when you migrate a bot with a credential name that contains a space character or a special character.
7554	00669247	An error is no longer encountered when you download a file from a URL that contains a Unicode character using the <b>Download files</b> action of the Browser package.
7554	00685916	If you have used the <b>Date</b> system variable as an input variable in a MetaBot, the <b>Date</b> system variable is now available after migration.
7554	00674594	The Bot Scanner no longer encounters an error when scanning a bot that uses the <b>Excel Column</b> system variable after the Loop command and the column name specified in that variable contains a space character.
7554	00691905	An error is no longer encountered when you edit a user after migrating to Enterprise A2019 from Version 11.3.3.

Fixed features		
Build number	Service Cloud case ID	Description
7554	00691072	An error is no longer encountered because of the bypass configuration of proxy settings when you use the Bot Migration Wizard.
7554	00689910	You can now import more than 2100 bot files without any SQL exception error.
7554	00669927	When you execute the Bot Insight <b>Business Data</b> and <b>Operations Data</b> APIs, only information limited to the logged-in tenant is now retrieved in the API response.
7554	00639779	After you log in to the Control Room and connect manually to a VPN, the Bot Agent now reconnects automatically. You do not have to restart the Bot Agent service to reconnect.
7554	00622075	When you run a bot on a user device that has an extended display, the runtime window is now completely visible on the main display. Previously, the window was partially visible between the main and extended display.
7554	00678454	In Excel advanced, you can now use the <b>Set cell</b> action to write more than 4100 characters in the excel file. Previously, the bot execution failed when the cell value had more than 4100 characters.
7554	00675333	In the Number package, the field in the <b>Assign</b> action is now corrected as <b>Select the source number variable/ value</b> . Previously, the <b>Select the source string variable/ value</b> field was incorrect.
7554	00674315, 00677925, 00684201	When you create a TaskBot using the <b>If</b> and <b>Else if</b> actions and change the placement of the <b>Else if</b> block action, there is improved visibility in the <b>Flow</b> view. Previously, the TaskBot was not displayed properly on a low contrast display when the <b>Else if</b> block placement was changed.
7554	00662072, 00674336	In the Terminal Emulator package, you can now correctly page up using the KEY_PGUP function key and page down using KEY_PGDOWN for the <b>TN5250</b> terminal type.
7554	00658261	The PDF <b>Extract image</b> action now supports CMYK (cyan, magenta, yellow, black) images format when you extract and save a CMYK image to an RGB (red, green, and blue) image. Previously, if PDF files contained CMYK images, the bot could not extract them and displayed an error.

Fixed features		
Build number	Service Cloud case ID	Description
7554	00675749	When you receive emails using the EWS server option, the <code>emailCc</code> and <code>emailTo</code> variables now return the proper value. Previously, these variables returned blank values.
7554	00663610	In the Ftp/Sftp package, you can now connect to <code>ftp.box.com</code> and use the <b>Get folder</b> action. Previously, the <b>Get folder</b> action downloaded files in the folder, causing the bot to run in an infinite loop.
7554	00675710	In the Data Table package, the <b>Remove duplicate rows</b> action now removes all duplicate rows rather than a single duplicate row.
7554	00539762	In the <b>For value</b> action of the Prompt package, characters are no longer visible during keystrokes of masked values.
7554	00679370, 00673085, 00674546, 00676912, 00678852, 00678796, 00692420, 00695390	An unknown error is no longer encountered when you run the <b>Open</b> Excel file action from a network drive.
7554	00672719, 00673048	Audit log entries in the Control Room are now retained even if the Elasticsearch data is configured to a file path other than <code>C:\</code> (C drive) during installation.
7554	--	You can now insert Work Items from one queue to another queue for workload automation.
7554	--	You no longer have to pause and resume queues because Work Items are now processed and not randomly skipped when you use the priority queuing or round-robin method for workload automation.
7554	--	The Recorder package no longer takes time to upload to a remote application repository path of an On-Premises Control Room deployed on Microsoft Azure.
7554	00683744	You can now capture objects from the Google Chrome browser using the Recorder capture action. The plug-in not installed or disabled error is no longer displayed.
7554	00672446, 00671782, 00671065, 00683870	When you upgrade to this release from an earlier release (for example, Enterprise A2019.16), the Elasticsearch OpenDistro error message is no longer displayed. Also, the previous <code>application_log</code> indices from Elasticsearch are deleted to free up disk space for the upgrade.

Fixed features		
Build number	Service Cloud case ID	Description
7554	00690003	You can now use the Terminal Emulator package without any change in the screen resolution for the mainframe terminal type TN3270. Previously, the screen resolution was not supported for terminal type TN3270.
7554	00679244	In Dictionary and List packages, you can now use the <b>Datetime</b> data type in the source dictionary variable field of the <b>Assign</b> action. Previously, an error was encountered during bot execution if you used <b>Datetime</b> data type in the source dictionary variable field.
7554	00673591	Fixed an issue in the Task Bot package where the system selected all the input variable options when the user clicked away from and returned to the action.
7554	00684905, 00703481	A TaskBot now runs as scheduled and no longer shows the device status as <b>Picked at runtime</b> on the <b>View task in progress</b> (Activity) page when the TaskBot is running.
7554	00573081	The audit log page in the Control Room now records all entries related to bot deployment. Also, when a parent task with many child bots is deployed, the audit log now shows correct entries. Previously, some audit log entries were missing for bot deployment and if a parent task with many child bots was deployed, the entries displayed were incorrect.

Known limitations
Enterprise A2019 does not yet support the counter behavior of the \$Excel Cell Row\$ system variable in Enterprise 11 when the variable is used in the Loop command and the <b>Each row in Excel Dataset</b> option is selected. This behavior is available in 11.3.0 and earlier versions by default, and in the Version 11.3.1.2 and later versions when the <code>retainexcelcellrowlegacybehavior</code> tag in the <code>AASettings.xml</code> file is set to true.
A bot fails when it runs an action that reloads the web page, such as the <b>Recorder &gt; Capture</b> action when it is used to click a link or the <b>Browser &gt; Open</b> action, followed by a <b>Browser &gt; Run JavaScript</b> or <b>Browser &gt; Extract source</b> action. You must add a delay of at least 5 seconds to give the browser time to load.
A bot fails when it runs the <b>Browser &gt; Close</b> action to close the last Google Chrome window and the window contains only one tab. Use the <b>Tab</b> or <b>All browsers</b> options instead.
A bot can return only a maximum of 3 MB to an output variable. <b>Workaround:</b> Store the bot output on the device, such as in a .txt file. If the output must be shared across multiple Bot Runners, store the output in a shared drive.

Known limitations
<p>The AISense Recorder fails if you manually upgrade the Recorder package version, such as by importing a bot that contains a Recorder package version from a more recent build than the destination Control Room. Always upgrade the Recorder package through the Control Room.</p>
<p>If you install the Google Chrome extension in the Microsoft Edge browser, it causes recording and runtime errors in bots that interact with the Google Chrome browser. Even if you did not manually install the Google Chrome extension, the auto-sync settings in the Microsoft Edge browser might have automatically installed the extension.</p> <p>If the Google Chrome extension is installed in the Microsoft Edge browser, you must remove the Google Chrome extension from the <code>edge://extensions</code> page.</p>
<p>When the regex <b>Case insensitive</b> flag is enabled for actions that include the window title, a recapture of the application window fails.</p>
<p>The input parameters for DLLs are not automatically passed from the parent bot to the child bot in Enterprise A2019 for migrated MetaBots.</p>
<p><b>Workload automation limitation for manual Credential Vault mode</b> (Service Cloud case ID: 00711410)</p> <p>You might face issues when migrating your workload automation if the Control Room is configured to use a manual mode for Credential Vault.</p> <p><b>Workaround:</b> As the Control Room administrator, perform the following steps:</p> <ol style="list-style-type: none"> <li>1. Change the Credential Vault mode to express from manual in the Control Room database configuration table.</li> <li>2. Add the credential vault key to the <code>CredentialVault.dat</code> file in the Control Room server repository.</li> <li>3. Restart the Automation Anywhere Control Room Service.</li> <li>4. Re-register the Bot Agent or restart the Bot Agent service.</li> </ol>
<p><b>Cloud migration limitations</b></p> <ul style="list-style-type: none"> <li>• The Cloud migration utility keeps running in background if you close the utility when the Enterprise 11 data is being uploaded.</li> <li>• If you have configured Enterprise 11 Control Room in cluster mode, you must stop the Automation Anywhere Control Room Service on all the nodes available in the cluster.</li> <li>• If the Cloud migration utility is installed on a different device than the device on which the Enterprise 11 Control Room you want to migrate is installed, an Elasticsearch unavailable error occurs.</li> <li>• If you have SSO configured on the Enterprise 11 Control Room, an error is encountered after migration to Cloud if you change the authentication from database to SSO.</li> <li>• If you provide the validation code within double quotation marks, the utility successfully validates the code but fails when uploading the Enterprise 11 data.</li> </ul>
<p>If you open a table variable for editing and then open another table variable and click <b>Cancel</b> in the <b>Edit table</b> window, the schema of that table reverts to the same schema of the first table. This occurs only in the interface; it does not impact the bot.</p> <p><b>Workaround:</b> Refresh the window containing the Control Room.</p>

**Known limitations**

If you use different versions of a package in a parent bot and a child bot, the capability to share a session across bots is currently not supported in the following packages: DLL, Excel advanced, Excel basic, and Terminal Emulator

To share a session across parent and child bots, ensure that you use the same version of the package in both the parent and child bots.

**Automation Anywhere Robotic Interface (AARI)****New features****New AARI on the web package**

Use the AARI on the web package to perform actions such as assign, query, and cancel tasks; create and query requests; and retrieve a list of team members.

[Web](#)

**Filter by time**

You can now filter your requests and tasks by time:

- **Requests** tab: Use the **Created** and **Updated** options in the **Filter** window to select any dates.
- **Tasks** tab: Use the **Task created** and **Task updated** options in the **Filter** window to select any dates.

[Filter and search for a request](#) on page 1522 | [Filter and search for a task](#) on page 1523

**View updated dates**

- Use the new **Updated** column in the **Requests** tab to view the dates and time of a request that was last updated.
- Use the new **Task Updated** column in the **Tasks** tab to view the date and time of a task that was last updated.

**Variable options**

In the **Insert a variable** window, the **Variable** field now shows child elements of available references, which include **Dictionary**, **List**, **Record**, and **Table** variable types.

**Delete a request**

AARI administrators, managers, and users can now delete requests created by the AARI process. The AARI administrator can delete any requests. AARI managers can delete requests of the team for which they are the owner. AARI users can delete only the requests they have created.

[Delete a request](#) on page 1517

**Automatically assign managers and users**

Users can now select the **Auto assign this task** option in the **Human Task** to assign managers or users to the task. Users can also select the **Auto assign the target task to** option in the **Go to** element to assign managers to the task.

[Create an AARI process](#) on page 1487

## New features

### Enhancements to elements in the form builder

- **Time** element: Includes the time element in a form.  
*Using the Time element* on page 1552
- **Date** element: Set the date format of the user machine as the default format for the date element in the form.  
*Using the Date element* on page 1541
- **Select file** element: Drag the selected file into the form during bot runtime.  
*Using the Select File element* on page 1543
- **Password** element: View the password you enter in this field during bot runtime.  
*Using the Password element* on page 1547

### Updates to interactive forms

- Use the **Change Form Title** to edit or change the title of the selected form during bot runtime.
- Use the **Validate form** option now for the **Table** element.

*Interactive forms package*

## Changed features

### Process package renamed to AARI on the web package

The **Process** package is now renamed to the AARI on the web package, which includes the **Create a Request** action and additional new actions.

*AARI web package*

### Enhancement to process management page

In the process management page, the AARI admin can now edit the **Process Title** and **Process Description** metadata. You can now add a title and provide a short description for the process.

### Enhancement to the activity page

All the Bot Runner (attended or unattended) trigger deployments in queue are now displayed in the **Activity > In progress** page.

*Activities* on page 1932

### Edit check box, radio button, and drop-down form elements in process editor

In the process editor, you can now edit and update the **List of options** and **Default value** fields for the following form elements: **Checkbox**, **Radio button**, and **Dropdown**.

Fixed features	
Service Cloud case ID	Description
00678572	You can now view the <b>strict-transport-security</b> header when using the AARI on the web interface. This attribute informs the web browser to automatically convert websites requesting HTTP to load HTTPS instead in order to comply with the HTTP Strict-Transport-Security (HSTS) policy.
--	The <b>Display message</b> field in the <b>If/Else</b> pair action now displays the status message in request view. Previously, the status message was not displayed in the request view.
--	When you access AARI through the web interface, the <b>Request ID</b> and <b>Task ID</b> now correctly identify the data as numeric data type and sort it accordingly. Previously, the data was considered as string type and the sorting was not appropriate.
00646148	A bot is no longer deployed multiple times when the files and folders triggers are used.

Known limitations
When a user with a Citizen Developer license deletes an event trigger, this activity is not captured in the <b>Audit log</b> tab.
When you delete a request from the <b>Request</b> tab, the tasks associated with the request are not deleted and they are displayed in the <b>Tasks</b> tab.
If you click the refresh option in the <b>Tasks</b> tab and navigate away and back to the tab, the task filter applied does not remain the same. The filter always switches to <b>Pending</b> status.

## Discovery Bot

New features
<p><b>Use Model option for system-generated views</b></p> <p>You can now use the <b>Model</b> option to compare and find the best aggregated view for your recordings. Use this option to save as many views with different combinations as required.</p> <p>You can also save the view as a manual view to further customize your view and compare side-by-side. Select either an <b>Easy</b> or <b>Strict</b> model so that you can view recordings where the steps are the same versus recordings with different results with more branches in the process path.</p> <p><i>Create a process view with branches and opportunities</i></p>

New features
<p><b>Use Filter option for system-generated views</b></p> <p>You can now use the <b>Filter</b> option to use a set of values to compare different sections of a process across various recordings by selecting a specific path and step filter. Used along with the <b>Model</b> option, the path and step filter options for a system-generated or manual view can help you to determine and decide on a good candidate for automation.</p> <p><i>Create a process view with branches and opportunities</i></p>
<p><b>Use toggle frequency counter option for system-generated views</b></p> <p>You can now use the toggle frequency counter to display the number of recordings that a particular path takes in the flow in a system-generated view. Use this option to help you understand the frequency of the path compared to other recordings or views.</p> <p><i>Create a process view with branches and opportunities</i></p>
<p><b>Remove recording screenshot for data privacy</b></p> <p>Use the <b>Screen</b> option (icon) to display or hide the recording screenshot before submitting the recording for the analyst to review. Use this option when you do not want to share personal image details with the analyst.</p> <p><i>Record a Discovery Bot business process</i> on page 1672</p>
<p><b>Download PDD from the Opportunities table</b></p> <p>You can now download a process definition document (PDD) for an opportunity directly from the Opportunities table listed on the <b>Opportunities</b> page. The PDD is automatically generated when the opportunity is created. After the PDD is generated, the field changes from generating PDD to <b>Download PDD</b>. You can then download and save the document.</p> <p><i>Review opportunities and convert to</i></p>

Changed features
<p><b>Screenshot image is increased</b></p> <p>The screenshot image is now increased to allow for better readability of captured steps. You can now use the scroll wheel to get a zoomed-in view of the step.</p>
<p>The <b>Export to Word</b> option now supports 2000 steps.</p>
<p>The <b>Convert to Bot</b> option now supports 2000 steps.</p>

Fixed features	
Service Cloud case ID	Description
--	The <b>Delete</b> icon is now properly visible in the edit recordings screen in Internet Explorer.
--	You can now change the zoom level in any canvas using the two-finger swipe on the trackpad of the <b>Aggregated</b> and <b>Comparison</b> tabs.

Fixed features	
Service Cloud case ID	Description
--	The red highlight is now visible on the captured screenshots from the <b>Recordings</b> page and from the preview pane from the <b>Aggregated</b> and <b>Opportunity</b> tabs for analyst review.

Known limitations	
When upgrading to this release, you must regenerate all PDDs created in Enterprise A2019.17. Click <b>Retry PDD Generation</b> to regenerate the PDDs.	
If you want to display an image that you have hidden and saved, you must first click the <b>Screen</b> icon and then click <b>Save</b> to display the image again.	
In the <b>Opportunities</b> table, the search field and filter drop-down option are not available for the <b>Process</b> and <b>Owner</b> columns.	
When an opportunity is created for a system-generated view with filters applied, the filter is reapplied on the view displayed within the <b>Aggregated</b> tab from the Opportunities page. The filter incorrectly displays <i>No recording data</i> . The <b>Convert to Bot</b> and the <b>Download PDD</b> options are not affected.	
When a recording is canceled, the recording is incorrectly incremented and displayed on the process tile in <b>Process Cycle</b> .	
You cannot approve a recording with more than 500 steps.	

## IQ Bot

New features
<p><b>New IQ Bot Extraction package</b></p> <p>On-Premises and Cloud</p> <p>IQ Bot now includes the IQ Bot Extraction package for processing invoices. The package uses Bot Runners on your local device instead of an IQ Bot server for processing.</p> <p><a href="#">IQ Bot Extraction package</a></p>

Changed features
<p><b>Enhancement to Migration Utility</b></p> <p>When you now export an IQ Bot archive (.iqba) file, only a single document associated with every available bot (group) training is exported.</p>
<p><b>Enhancement to IQ Bot Classifier package</b></p> <p>The IQ Bot Classifier package now supports all languages supported by ABBYY FineReader Engine. Previously, only English language was supported.</p> <p><a href="#">ABBYY FineReader Engine OCR supported languages</a></p>

Fixed features	
Service Cloud case ID	Description
00668625	When you upload documents containing digital signatures to learning instances, the Designer now displays the correct success or error message.
00619139, 00695157	When you now run a bot and try to edit it while it is still running, the following correct message is displayed: Staging Documents for this Vision bot is in progress. Please try after some time. Previously, the following incorrect message was displayed: Learning instance not found.
00408482	You can now successfully export a custom domain created using Korean or other Asian languages.
00669197, 00681599	Node.js is now upgraded to version v10.22.1 to fix a security vulnerability.
--	Fixed an issue that caused the following error: failed to upgrade DB -1. You can now install IQ Bot in express mode without any errors.
00633197	During validation, if there is an error in the validation pattern, the validation process now fails, the correct message is displayed, and error logs are generated.
00689326	You can now view the extraction results correctly even when the bot is trained with check box fields.
00666456	IQ Bot machine learning services are now correctly installed when you install IQ Bot.

Known limitations
<p>IQ Bot On-Premises and Cloud</p> <p>The following limitations apply to the IQ Bot Extraction package:</p> <ul style="list-style-type: none"> <li>• If you process documents that do not belong to any created groups, they are not displayed in the <b>Details</b> page of the learning instance.</li> <li>• The <b>Checkbox</b> extraction option is not supported.</li> <li>• Some of the input invoices are not processed when you set up workload management with shared input and output folders.</li> <li>• Pre-processing settings from IQ Bot server are not applied.</li> </ul>
<p>IQ Bot On-Premises and Cloud</p> <p>When creating learning instances, IQ Bot sometimes does not restrict users from creating duplicate fields.</p>

Known limitations
<p>IQ Bot On-Premises and Cloud</p> <p>Occasionally IQ Bot fails to execute Python logic for tables other than the default one.</p> <p><b>Workaround:</b> Retry after you perform one of the following actions:</p> <ul style="list-style-type: none"> <li>• Click <b>Save and close</b>.</li> <li>• Click <b>See Extraction results</b>.</li> </ul>
<p>IQ Bot On-Premises and Cloud</p> <p>In PDF documents containing multiple pages, at times the segments do not display correctly on all pages.</p> <p><b>Workaround:</b> Use PDFBox OCR to process the documents.</p>
<p>IQ Bot On-Premises and Cloud</p> <p>For the <b>Get page content</b> action of the IQ Bot Pre-processor package, if you select the <b>Create variable</b> option from the <b>List of strings extracted from page</b> menu, you can only use <b>Any</b> from the <b>Subtype</b> drop-down menu.</p>
<p>IQ Bot Community Edition, On-Premises and Cloud</p> <p>If you use Internet Explorer version 11.0.973.17763 to log in to IQ Bot and open <b>See extraction results</b> for a learning instance, you cannot open or download the <code>Preview.csv</code> file.</p>
<p>IQ Bot On-Premises</p> <p>You must be a service account user to install IQ Bot on a fresh machine.</p>
<p>IQ Bot On-Premises and Cloud</p> <p>The auto-correction and auto-suggestion features, which are part of the <b>MLScheduler</b> service, use system resources extensively and cause the system to slow down or stop responding.</p>

## Bot Insight

New features
<p><b>Access Bot Insight data from Tableau</b></p> <p>Use the Tableau connector in Bot Insight to access business and operational information. The Tableau connector connects to the Bot Insight APIs to create various business and operational metrics that you can analyze and visualize within Tableau.</p> <p><a href="#">Configure Tableau web data connector in Bot Insight</a> on page 2281</p>
<p><b>Assign Bot Insight license</b> (Service Cloud case ID: 00651973)</p> <p>Assign the Bot Insight license to users to enable them to view and perform tasks on the <b>Business</b> dashboard. You can now assign the license on a per-user basis, irrespective of the assigned roles.</p> <p><a href="#">Automation 360 licenses</a> on page 970</p>

Fixed features	
Service Cloud case ID	Description
00689802	You no longer encounter an issue when you create and view default dashboards in a development (dev) environment. Previously, an error was displayed when you open the bot and clicked <b>Analyze</b> to create the default dashboard.

## Supported packages

Package	Version
Application	2.1.0-20201112-22332
App Integration	2.3.0-20201210-171315
Active Directory	2.1.0-20201112-223323
Boolean	2.1.0-20201126-165109
Browser	2.3.0-20201211-222811
Clipboard	2.1.0-20201126-165124
Comment	2.3.0-20201126-165125
CSV/TXT	2.3.0-20201126-165126
Database	2.2.0-20201112-223343
Data Table	2.5.0-20201201-130615
Datetime	2.2.0-20201126-165136
Delay	2.2.0-20201126-165137
Dictionary	3.2.0-20201126-165138
Run DLL	3.3.0-20201126-165850
Email	3.2.0-20201120-062604
Error handler	2.3.0-20201126-165148
Excel basic	2.4.0-20201126-165604
Excel advanced	5.3.0-20201208-090251
File	3.2.0-20201126-165151
Folder	3.1.0-20201126-165154
FTP / SFTP	2.2.0-20201115-072759
Image Recognition	2.2.0-20201117-081754
JavaScript	2.4.0-20201126-165412
Simulate keystrokes	2.5.0-20201112-223902
Legacy Automation	3.2.0-20201124-064544 1.5.0-20201125-004358

Package	Version
List	2.2.0-20201126-165427
Log To File	2.2.0-20201126-165428
Loop	2.1.0-20201126-165429

## Migration features

---

### **Important: Migration to Enterprise A2019 (currently available only to customers in the Migration Early Adopter Program)**

Migration to Enterprise A2019 is currently only available to select customers through our Migration Early Adopter Program. If you are interested in learning more about this program or a timeline for when migration will be available to all customers, contact your Automation Anywhere representative.

---

The following features apply to both **Enterprise 11** and **Enterprise 10**:

#### **Obtain information about upcoming support for commands and variables**

Bot Scanner provides information about the upcoming Enterprise A2019 release in which a specific command or variable will be supported or available.

#### **Migrate MetaBots with screens**

Migrate MetaBots that contain screens as assets. You can migrate screens based on the Java technology and captured using the **Object**, **Image**, and **Coordinate** play modes.

[How MetaBots are migrated](#) on page 1179

#### **View progress of bot migration**

A progress bar is displayed in the migration results tab when the system starts migrating the bots.

#### **Migrate bots that use SAP command**

You can migrate Enterprise 11 bots that use the **GUI Automation** command to capture various objects from an SAP application.

[Package mapping for migration](#) on page 1201

#### **Migrate bots that use the following attributes:**

- Regular expression to search for files on which you want to perform an operation.
- Variable to specify the child bot you want to run.
- System variables to retrieve information about a device's settings and its performance.
- The **Save header To** option and containing array and dictionary variables in the REST Web Service command to store the response header.

- Bots that contain failure responses from the REST Web Service command by using the **Capture failure response** option in Enterprise A2019. For Enterprise 11 bots, this option is enabled by default.

[REST Web Service package](#)

- Variables with names containing Arabic or Russian characters, or Japanese double-byte numbers.

[Unicode range supported in variables](#) on page 1392

The following features apply to **Enterprise 11** only:

#### **Increment loop counter value by 1**

The \$Counter\$ variable used in loop in Enterprise 11 bots is replaced with the \$Condition-Counter\$ variable in the migrated bots and value for the variable set to 1.

Service Cloud case ID: 00659314

#### **View audit log migration reports**

View the status of audit log migration and other related information in the **All migrations** page. View additional information by using the **View migration** option for each audit migration instance.

[Migrate Enterprise 11 audit logs](#) on page 1153 | [View migration reports](#) on page 1251

#### **Migrate Enterprise 11 Bot Insight data and dashboards**

- Migrate Enterprise 11 Bot Insight data and published dashboards of bots enabled for analytics by using the Bot Insight pre-migration utility and Bot Migration Wizard.

[Export Enterprise 11 Bot Insight dashboards for migration](#) on page 1151 | [Migrate Enterprise bots](#) on page 1173

- View Bot Insight migration reports from the new **Bot Insight results** tab on the **Administration > Migration > View migration** page.

[View migration reports](#) on page 1251

#### **Migrate bots that use the following attributes:**

- MetaBots with DLLs that use credential variables of string, character, or byte data type.
- The **Launch website** action of the Browser package to open a website in the Microsoft Edge browser.
- Shared session to establish a connection with a terminal server or open a Microsoft Excel spreadsheet and close the shared session from the child bot.

- IBM 5555 B01 and C01 models for TN5250 terminal types and the **Default** terminal for the VT100 terminal type.

## Enterprise A2019

**Important:** This release includes a required update to your . Ensure that you complete the update to continue with your automation activities when upgrading from a previous release to this release.

[Automatically update the Bot Agent](#) on page 1001 | [Manually update the Bot Agent](#) on page 1002

To verify which version is compatible with this release, see [Compatibility with release builds](#) on page 985.

New features
<p><b>Connect to EWS server with OAuth authentication</b></p> <p>A new authentication is available for the Exchange Web Services (EWS) protocol with OAuth. You can use the OAuth authentication and enable your EWS-managed API applications to access Exchange online in Office 365.</p> <p><a href="#">Using Connect for</a></p>
<p><b>Google Cloud Platform supported for On-Premises deployment</b></p> <p>You can now host the Control Room, and create and deploy automation on devices configured to use the Google Cloud Platform environment.</p> <p><a href="#">Operating system, environment, and platform supported for Control Room</a> on page 814</p>
<p><b>LDAP channel binding for enhanced network security in On-Premises deployment</b></p> <p>Control Room supports LDAP channel binding in order to comply with a security release from Microsoft. LDAP channel binding provides enhanced security for network communications between an Active Directory and its clients. It provides a more secure LDAP authentication over SSL and TLS.</p> <p><a href="#">Configure LDAP channel binding</a> on page 942</p>
<p><b>Use Bot Agent with AWS WorkSpaces</b> (Service Cloud case ID: 00652474, 00676112)</p> <p>You can now deploy bots on Bot Agent devices that are configured on AWS WorkSpaces.</p> <p><a href="#">Bot Agent compatibility</a> on page 984</p>
<p><b>VT220 terminal type supported in Terminal Emulator</b></p> <p>To establish a connection and communicate with another machine, you can now use the VT220 terminal for sending and receiving text.</p> <p><a href="#">Using Connect for</a></p>

New features
<p><b>Permission to cancel checkout in Control Room</b></p> <p>Use the <b>Cancel checkout</b> permission to cancel checked-out TaskBots or files from the public or private workspace.</p> <ul style="list-style-type: none"> <li>In the public workspace, the status of the bot changes to public.</li> <li>In the private workspace, the status of the bot changes to new if any changes were made to the bot. If there are no changes, the bot is replaced with a clone.</li> </ul> <p><a href="#">Check out a single bot</a> on page 1360</p>
<p><b>Enhancements to the Recorder</b></p> <ul style="list-style-type: none"> <li>Record a task using the Universal Recorder or AISense Recorder from a single point of entry. Both recorders are now managed through a single package, which enables faster and more efficient updates.</li> <li>You can now record tasks in a Microsoft Edge browser that runs on Chromium (versions 79 and later).</li> <li>Use the AISense Recorder <b>Define</b> option to capture an object that is only visible when you hover the mouse over the object.</li> <li>Use the <b>Resize window</b> option in the <b>Recorder &gt; Capture</b> action to set the window width and height.</li> </ul> <p>This option delivers a more reliable bot. It resizes the window to the dimensions at which the task was recorded, thus increasing the likelihood that the bot identifies the target object.</p> <p><a href="#">Get started with recorders</a> on page 1312   <a href="#">Universal Recorder supported applications and browsers</a> on page 1321   <a href="#">Using the Capture</a></p>
<p><b>Use shared session in Terminal Emulator</b></p> <p>Use the new <b>Shared session</b> option to pass the exact state of an application to a concurrently occurring TaskBot or MetaBot logic. For example, instead of connecting to the same application multiple times for different tasks, you can use the option to connect to the application using a single task, thus optimizing your automation logic in the long run.</p> <p><a href="#">Share session between logic</a></p>
<p><b>Share an Excel session between bots</b></p> <p>Use the <b>Set session</b> action from the Excel basic or Excel advanced package to assign an Excel session to a variable, and then pass that variable from a parent to a child bot. This enables the child bot to access the worksheet opened in the parent bot.</p> <p><a href="#">#unique_462</a>   <a href="#">Excel advanced workbook operations</a>   <a href="#">Example of sharing an Excel session between bots</a></p>
<p><b>New option for Run Task</b></p> <p>In the Task Bot package, you can now use the <b>Run</b> action with an option to repeat the selected task until you choose to stop it.</p>
<p><b>New search for roles in User Management API</b></p> <p>Use the new <code>Search for roles</code> API in the User Management APIs in Swagger to obtain a list of all the roles or details for a specific role.</p>

New features
<p><b>Capture response status of REST API</b></p> <p>In the REST Web Service package, you can capture the response status of the REST API in the dictionary variable. The dictionary variable now shows the response key with its value.</p>
<p><b>New option for REST Web Service</b> (Service Cloud case ID: 00489741, 00646436)</p> <p>Use the <b>Capture failure response</b> action in the REST Web Service package to capture response details in the response body.</p>
<p><b>Use regular expressions in packages</b></p> <p>You can use regular expressions (regex) in certain actions to support pattern-based search in a file, folder, or Windows title. Regular expressions are supported in the actions of the File and File and Folder packages such as <b>Copy, Delete, Rename, Print Multiple files, and Zip</b>.</p> <p>You can also use regular expressions in some packages that support the wildcard character in their window titles.</p> <p>The following packages and actions support regular expressions:</p> <ul style="list-style-type: none"> <li>• Wait</li> <li>• Image Recognition</li> <li>• Simulate keystrokes</li> <li>• Mouse &gt; <b>Click</b> action</li> <li>• Legacy Automation &gt; <b>Manage windows control</b></li> <li>• OCR</li> <li>• Screen</li> <li>• Recorder &gt; <b>Capture</b></li> <li>• Run DLL &gt; <b>Run function (Legacy), Run function</b></li> <li>• Window: <b>Activate, Close, Maximize, Minimize, Resize</b></li> </ul> <p><i>Using Copy Desktop file for file   Using the Capture</i></p>
<p><b>Support for overloaded functions in DLL package</b></p> <p>The <b>DLL &gt; Run function</b> action can now handle .dll files that contain multiple functions of the same name. The action calls the function based on the number of parameters passed.</p> <p><i>Using the Run function</i></p>
<p><b>New actions for SAP captured objects</b></p> <p>Use new actions that are available for <b>Tree, Tab, and Label</b> controls to perform operations for the various objects captured from an SAP application.</p> <p><i>supported in various versions</i></p>

## New features

### Enhancements to elements in the form builder

- **Image** element: Upload image files to the form using this element.  
*Using the Image element* on page 1545
- **Button** element: Validate all the fields in a form using the **Validate all form fields when this button is clicked** option.  
*Using the Button element* on page 1540
- **Password** element: Use one of the following formatting options:
  - **Standard**: set the character limit and choose additional security options.
  - **Custom**: add a custom password on the **Regular expression** page.  
*Using the Password element* on page 1547
- **Rich Text Editor** element: Use this element in the **Set** action when creating a bot in order to add or overwrite the value of a variable.
- **Table** element: Includes the following updates:
  - New data types for **Column settings**:
    - Date
    - Number
    - Dropdown
  - The following actions, which you can use during bot runtime:
    - **Set** action to add rows to the table.
    - Trigger events to add rows and delete rows.
    - Sort table columns.
- **Text Box** element: Choose one of the following formatting options:
  - **Standard**: set the character limit for this field.
  - **Custom**: add a custom password on the **Regular expression** page.  
*Using the Text Box element* on page 1551
- **Select file** or **Snapshot** element: When you click **Preview** during bot runtime, the system default application is used to display the selected file.  
*Using the Select File element* on page 1543 | *Using the Snapshot element* on page 1549

### Enhancement to List view of bots

In the **List** view of the Bot editor, you now drag a selected action to the task logic.

## New features

### Import Enterprise 11 bots to Enterprise A2019 (Service Cloud case ID: 00512847)

- **Bot Lifecycle Management Import feature:** The Bot Lifecycle Management import feature enables you to import Enterprise 11 bots from multiple Enterprise 11 Control Room instances to a single Enterprise A2019 instance by using the `aapkg` file.

[Bot Lifecycle Management](#) on page 2141 | [Import bots](#) on page 2145

- **Bot Lifecycle Management Import API:** You can also use this API to import Enterprise 11 bots to the Enterprise A2019 instance by uploading the `aapkg` file. However, you can import a password-protected `aapkg` package only by using the Import API.

[BLM API](#) | see Import repository bots in [BLM API](#)

### New endpoint in License API

Use the **List details of Control Room licenses** endpoint to retrieve metadata including the license type, number of available licenses, number of licenses used in a specific Control Room instance, and number of licenses used in all Control Room instances.

[License API](#)

### Programmatically manage device login credentials

Use the **Login setting** endpoint of the Credential Vault API to set or update the device login credentials to allow bots to run on the device.

### Store multiple lines of text in a string variable

You can use a string variable containing multiple lines of text in the following actions:

- **String > Assign**
- **String > Extract text**
- **String > Compare**
- **String > Lowercase**
- **String > Replace**
- **String > Reverse**
- **Log to file**
- **Message box**
- The string condition in the **If**, **Wait**, and **While** actions

### Arabic, Japanese, and Russian characters supported in variable names

You can now create variables with names containing Arabic or Russian characters, or Japanese double-byte numbers.

[Unicode range supported in variables](#) on page 1392

Changed features
<p><b>Configure granular security for Bot Agent</b> (Service Cloud case ID: 00653807)</p> <p>Starting from this release, only registered Bot Agent device IP addresses that are added in the <b>Allowed IP addresses</b> list of the <b>Network Settings</b> can connect to the Control Room. In previous releases, devices from all subnets and IP addresses within the corporate network were allowed to connect to the Control Room URL.</p> <p><a href="#">Add access IP addresses</a> on page 2053</p>
<p><b>Update to Excel advanced package</b></p> <p>The <b>Open</b> action in the Excel advanced package now opens a Microsoft Excel spreadsheet even when a file extension is not provided.</p>
<p><b>Disable clone and view content permissions for check-in</b> (Service Cloud case ID: 00656157)</p> <p>When the <b>Check in</b> permission is selected, the <b>Clone</b> and <b>View content</b> permissions are also automatically selected. As a Control Room administrator, you can now disable the <b>Clone</b> and <b>View content</b> permissions when required.</p>
<p><b>Associate triggers with unattended Bot Runners</b></p> <p>Ensure that the default device is not in locked state if you are associating triggers with unattended Bot Runners.</p>
<p><b>Additional license support enhancements</b></p> <p>Control Room administrators are enabled to install a new GUID license before an existing license expires.</p>
<p><b>Change in edit device permission</b></p> <p>Starting from this release, the permission to edit devices is not available in the system-created <b>AAE_Basic</b> role by default in the Control Room. A user has to select the <b>Edit the device(s)</b> permission separately.</p> <p><a href="#">Devices</a> on page 1949</p>

The following table lists the fixed features and the builds in which they were fixed (Build 7103 is the latest build, and Build 7096 is the previous build). The fixes are cumulatively available in the latest build.

Fixed features		
Build number	Service Cloud case ID	Description
7103	00684905, 00703481	A TaskBot now runs as scheduled and no longer shows the device status as <b>Picked at runtime</b> on the <b>View task in progress</b> (Activity) page when the TaskBot is running.
7103	00676476	An error is no longer encountered when you run a child bot that contains a Japanese full-width space character in the name.

Fixed features		
Build number	Service Cloud case ID	Description
7103	00689935, 00689381, 00690368, 00690217, 0069053	License server syncing error generated when control room licenses and licenses stored on a server are updated on different schedules. This issue has been fixed. Should an error message appear, click "Sync licenses from Server" for any new licenses in production to manually sync the licenses.
7096	00667396, 00670001, 00653771, 00671553	Bot Scanner no longer encounters an error when scanning bots with non-ASCII characters in their name.
7096	00659334	The <b>Offset from match</b> option in the Image Recognition package now works correctly in migrated bots.
7096	00669166	You can now migrate large bots (for example, with 30+ dependencies and 500+ lines) using the Bot migration package. The system no longer encounters an error when migrating a bot that contains a large number of nested IF/ELSE commands.
7096	00659349	You can now migrate bots with special characters in their names.
7096	00670985, 00674145	The system no longer encounters an error due to Bot Store credentials when you migrate from Version 11.3.3 or a later version to Enterprise A2019.
7096	00679817	An <code>unknown</code> error is no longer displayed when you are migrating a bot that the Bot Scanner listed as ready for migration.
7096	00457898, 00488494	You can now register a device with a username that contains non-ASCII characters such as Korean language characters.  <b>Note:</b> Before upgrading the Bot Agent to the current version, ensure that the registered device is configured to use non-ASCII characters.  <a href="#">Configuring post-installation settings on page 927</a>

Fixed features		
Build number	Service Cloud case ID	Description
7096	00611887	You can now download an exported bot package using the Internet Explorer browser by opening the download link received in the email. You can also do this from the <b>Activity &gt; Historical</b> page.
7096	00647932	When you create a bot using the <b>Get method</b> action in the REST Web Service package, the UTF-8 character set is now supported. Therefore, Korean characters are processed correctly in the REST API response. Previously, UTF-8 characters were not supported.
7096	00641126	You can now use the <b>Get single cell</b> action in the Excel basic package to extract the date correctly for the Japanese date format. Previously, the Japanese date was displayed in double quotation marks.
7096	00634102	You can now use the Simulate keystrokes package with the Alt+F4 key and set a longer delay value between each keystroke. Previously, the bots displayed an error when a longer delay value was set with the Alt+F4 key.
7096	00655739	In REST Web Service, the Rest API Get call now works properly even when the encoded URL string has special characters such as double quotation marks. Previously, the Rest API Get call failed when the URL string had double quotation marks.
7096	00653944	The String package now shows the correct output when you use the loop action to read a file name that does not have an extension. Previously, when the file did not have any extension, the filename extracted using the loop displayed an incorrect output.
7096	00677941	When an optional field ( <b>Mark field required</b> is not selected) is now left blank, a form is validated without any error messages during bot runtime.

Fixed features		
Build number	Service Cloud case ID	Description
7096	00662011	When using the files and folders trigger, you can now use any available network drive to start a bot.
7096	00666441, 00673888	For a folder trigger, you can now select a folder name containing a space character and the bot runs successfully without encountering any issues.  For example, you can select a folder called 'Sales chart'.
7096	00622100	When <b>Simulate keystrokes</b> is enabled for a hot key trigger, you can now start a bot multiple times using the associated hot keys without encountering any issues.
7096	--	If an element is marked as <b>Read-only</b> on the form builder screen, a validation error is no longer displayed for that field during bot runtime.
7096	00570660	You can now use Windows forms with the <b>Run function</b> action of the DLL package.
7096	00624644	The system no longer encounters an error when you upgrade from an earlier version of Enterprise A2019 to a later version when the settings are preserved and the installation path is not the default location.
7096	00670008	You can now pause or resume a task from the <b>Activity &gt; In progress</b> page.
7096	00667210, 00672875	In the Excel advanced package, you can now use the <b>Go to cell</b> action even if the Excel sheet does not have any data or an active cell is out of the worksheet range. Previously, an issue was encountered when you used the <b>Go to cell</b> action and chose the cell option as <b>Active cell</b> with the <b>Beginning of the row, End of the row, Beginning of the column, or End of the column</b> option.

Fixed features		
Build number	Service Cloud case ID	Description
7096	00659098, 00669437	You can now edit the <b>Start date</b> of an existing schedule to today's date, provided the start time is set before the bot is scheduled to run.
7096	00671392	You can now stop a bot that is in progress using the <b>Stop</b> option from the <b>In progress (Activity)</b> page or the <b>Stop</b> option on the runtime window that appears when the bot is being executed.
7096	00647761	You can now define a list variable of subdata type Boolean or datetime within an action. Previously, the bot encountered an error in this scenario.
7096	00671478	Fixed an issue in the <b>Task Bot &gt; Run</b> action where the value of an input variable disappeared when the user clicked <b>Save</b> . This issue only occurred when the <b>Current Task Bot</b> option was selected.
7096	00663719, 00635437	Fixed an issue where the OCR package was missing from Control Room instances hosted on Microsoft Azure. The connection with the Microsoft Azure database timed out before the OCR package <code>.jar</code> file could complete the upload.
7096	00631133, 00636174	In the Wait package, the <b>Wait for condition</b> action in the recorder object no longer waits indefinitely during bot execution. If the required window or its control does not exist, the bot waits for the required window or its control for the time specified in the <b>Wait for control</b> field. If the required window or its control is not found within this specified time, the bot continues to perform the next set of actions.

Fixed features		
Build number	Service Cloud case ID	Description
7096	00628863	Bot files or dependencies are no longer lost when you check in or check out a bot from the private or public workspace when the Elasticsearch service is running and not in index read-only mode. Previously, an error occurred when a bot was either checked in or checked out, and the bot files or dependencies were lost and could not be recovered.
7096	00673520	When a bot is deployed through RDP with a predefined screen resolution, the RDP resolution settings are now applied correctly during bot execution. Previously, the bot was executed with an interchanged resolution (the height and width pixels were interchanged).
7096	00670346	After you edit a bot schedule, the input value of a variable in the bot no longer has to be reinitialized and the bot does not show the default output value for the variable when it is executed.
7096	00653056, 00651853, 00647949, 00657465,00670024	The <b>In progress</b> activity is now displayed correctly for bots deployed on Bot Runners by any user.
7096	--	<p>When developing custom packages, you can now set your name in the vendor column. To set the name, update the <code>author</code> property of the <code>build.gradle</code> file, as shown below:</p> <pre>packageJson{   artifactName =     project.name   group = "\$groupName"   author = "&lt;entername&gt;" }</pre> <p>Leaving the field empty shows the vendor name as unspecified.</p>
7096	--	Multiple users can now simultaneously run a bot associated with a form without encountering any issues on the same Bot Runner machine.

Fixed features		
Build number	Service Cloud case ID	Description
7096	--	You can now migrate Enterprise 11 bots that contain variables that are in a different letter case (uppercase or lowercase) than those in Enterprise A2019. Variables are case-sensitive in Enterprise A2019 but not in Enterprise 11, which previously resulted in an error.
7096	00592758	You can now create a variable with a name that starts with a numerical character.
7096	00670994	You can now register with the Control Room from a multiple-user device configured for Active Directory users.
7096	00677479	The deployment time of a priority queue no longer takes a long time (for example, more than 1 hour) to process Work Items required for workload automation.
7096	00667110	You no longer have to restart the Automation Anywhere Bot Agent service to resume queued Work Items that are stuck in in-progress state.
7096	00673043	When you specify a value in the numOfRunAsUsersToUse parameter of the Bot Deploy API, the weighted system algorithm now assigns tasks to the Bot Runners with the least number of tasks queued and currently running. Previously, the algorithm did not correctly calculate the weight of queued and running tasks, which resulted in an inefficient task allocation to the same one or two Bot Runners.

Known limitations
When a bot opens a website inside a loop, the Recorder <b>Capture</b> action fails after the execution of Launch Website.
<b>Workaround:</b> Add a delay of a few seconds in the loop between the Launch Website and Recorder <b>Capture</b> action.
The Recorder <b>Capture</b> action does not support object recapture for the AISense technology type.

Known limitations
The system does not display a value for a session variable when the variable is selected as <b>Watched variables</b> in <b>Debug</b> mode.
The session variable returns a blank value when it is used as output in a bot and the bot is deployed using the Bot Deploy API.
After an upgrade to the latest version of Enterprise A2019, the bot might encounter an error if you are using the <b>Close</b> action of the <b>Window</b> package version 2.1.0-20200813-181240 or earlier. <b>Workaround:</b> Add a delay of 50 milliseconds after the <b>Close</b> action in the bot.
The Recorder package takes a long time (for example, approximately 6 hours) to upload to a remote application repository path of an On-Premises Control Room deployed on Microsoft Azure. <b>Workaround:</b> <ol style="list-style-type: none"> <li>1. Before you install or upgrade to this version, configure the repository path in a local directory of the Control Room node to upload the package.</li> <li>2. After installing or upgrading, verify that all packages are available in the <b>Packages</b> page of the Control Room.</li> <li>3. Change the repository path to a remote file share.</li> </ol>
The AISense Recorder fails if you manually upgrade the Recorder package version, such as by importing a bot that contains a Recorder package version from a more recent build than the destination Control Room. Always upgrade the Recorder package through the Control Room.

## Automation Anywhere Robotic Interface (AARI)

New features
<p><b>Run a process in private workspace</b></p> <p>You can now run a process in your private workspace by using the <b>Run</b> option in the process editor. The bots in the process are then executed on the default device of the Bot Creator.</p> <p><a href="#">Configure processes</a> on page 1475</p>
<p><b>Use the Data Privacy tag field</b></p> <p>The <b>Data Privacy tag</b> enables users to generate hidden custom output in their process tasks (<b>Start</b> panel, <b>Human Task</b>, and <b>Bot Task</b>). Users can enter the variables for this field during runtime with values. In the web portal, the AARI admin can use this tag to check for requests or tasks by using personal user data. The admin can also filter using this field.</p> <p><a href="#">Create an AARI process</a> on page 1487   <a href="#">Filter and search for a request</a> on page 1522   <a href="#">Filter and search for a task</a> on page 1523</p>
<p><b>Use variables types</b></p> <p>You can now use new variables in the process editor such as <b>createdOn</b> and <b>updatedOn</b> (DateTime), <b>id</b> (Number), and <b>title</b> (String). These variables are part of a data flow (workflow engine) that moves data between each step of a process and requires variable input for the process to run properly.</p> <p><a href="#">AARI variable types</a> on page 1495</p>

New features
<p><b>View previous selected tasks</b></p> <p>AARI users can now reference selected actions of their tasks. When they view a submitted task in request view, a check mark indicator is now displayed next to the buttons that are selected.</p>

Changed features
<p><b>Configure scheduler user to allocate device pool to AARI on the web interface</b></p> <p>In the <b>AARI Settings</b> page, the AARI administrator can now configure a scheduler user to allocate the Control Room resources (devices and unattended Bot Runners) to AARI on the web interface.</p> <p>The scheduler user must have <b>View my bots</b> and <b>Run my bots</b> permissions and have access to a device pool and Bot Runners. The AARI process can then use those resources for each bot deployment.</p> <p><a href="#">Configure scheduler user for AARI on the web</a> on page 1472</p>
<p><b>End point display</b></p> <p>In the <b>Completed</b> panel, the <b>End point</b> has a new display option <b>Update request title</b> that enables the user to update the request title. When the user updates the <b>Display message</b> field, the update is now reflected in request view.</p> <p><a href="#">Create an AARI process</a> on page 1487</p>
<p><b>Use F2 to insert variables</b></p> <p>You can now use the F2 keyboard shortcut to insert variables in the process editor.</p>

Fixed features	
Service Cloud case ID	Description
--	The <b>Task display name</b> option in the <b>Start</b> panel is now set to <b>Request Creation</b> by default. Any name changes by the user is now reflected in the request view.
--	The <b>Feed data into form</b> table in the process editor now works properly and users can now edit the field.
--	In a form that contains a <b>Number</b> field set to a 10-character limit, when you enter the maximum character limit (for example, 1234567890) in the number field in request view, the number values are now accepted.
--	When you create a process with a form that contains a <b>Date</b> element, the <b>Condition</b> option in the <b>If/Else pair</b> action now allows you to enter a variable. Previously, the option did not allow you to enter a variable.

Known limitations
<p>In the process editor, if a bot contains an incorrect input variable, the properties panel highlights the wrong element: <b>Browse</b> in the <b>Select Task Bot</b> field is highlighted instead of the incorrect variable.</p> <p><b>Workaround:</b> Hover your mouse over the red icon next to the <b>Bot Task</b> in the process editor to see the error.</p>
<p>In the process editor, if you replace the <b>Go to</b> option with an <b>End Process</b>, the <b>End Process</b> icon does not display the status (Completed, Failed, Canceled) correctly.</p> <p><b>Workaround:</b> Click the <b>End Process</b> icon and change the status.</p>
<p>A <b>Bot Task</b> cannot pass data to the next task (<b>Human Task</b> or <b>Bot Task</b>) if it contains Japanese characters in its output variable name.</p> <p><b>Workaround:</b> Use English characters for the variable name in the <b>Bot Task</b>.</p>
<p>If a scheduler user has multiple sets of configurations (device pools and Bot Runners), due to a mismatch in the selection of the device pool and the Bot Runners, the bot deployment fails.</p> <p><b>Workaround:</b> Set Bot Runners in the <b>Run As</b> section of the consumer role. Ensure the scheduler user has access to only one device pool and one consumer role that has run-as users.</p>
<p>When you access AARI through the web interface, the <b>Request ID</b> and <b>Task ID</b> consider the data as string type instead of numeric data type and sorts it accordingly.</p> <p>For example, if a <b>Request ID</b> or <b>Task ID</b> starts from 1 through 30, the IDs are sorted as string data type (1, 10, 11, 12, 13, ..., 2, 22, 23, ..., 30) instead of numeric data type (1, 2, 3, 4, ..., 30).</p>
<p>In some bot development failure scenarios, for example, files are not found or the scheduler user does not have access to the bot file, bot development fails by timing out after one hour instead of displaying an error.</p>
<p>If an AARI manager creates a team with the same name as a team created by any other manager, no error message is displayed and two teams are created with the same name.</p>
<p>When you access AARI through the web interface, the task and case list pages do not display the following words in the localized languages:</p> <ul style="list-style-type: none"> <li>• Search task</li> <li>• Results</li> <li>• Request title</li> </ul>
<p>In the process editor page, the following words are not displayed in the localized languages:</p> <ul style="list-style-type: none"> <li>• Process entry</li> <li>• Run</li> <li>• Undo</li> <li>• Redo</li> <li>• Data privacy tag</li> <li>• Auto assign this task to</li> <li>• InitialData</li> <li>• Update request title (optional)</li> <li>• Update task name (optional)</li> <li>• Boolean condition</li> </ul>

## Discovery Bot

New features
<p><b>Column headers updated in Recordings page</b></p> <p>The <b>Recordings</b> page now displays labeled column headers when you review captured steps for recordings. The following headers are displayed for the associated text field:</p> <ul style="list-style-type: none"> <li>• Screenshot</li> <li>• Application</li> <li>• Data</li> <li>• Step description</li> </ul> <p><i>Record a Discovery Bot business process</i> on page 1672</p>
<p><b>Highlight where you click or enter data when recording processes</b></p> <p>The system now displays the area, component, or control where you click or enter data with a red highlighted box at the time of recording.</p> <hr/> <p><b>Note:</b> The red highlight is only shown in the captured screenshot in the generated bot. The highlight is not shown on captured screenshots from the <b>Recordings</b> page for review and after submission to the analyst. The highlight is also not shown from the preview pane from the <b>Aggregated</b> and <b>Opportunity</b> tabs for the analyst review.</p> <hr/> <p><i>Supported applications and browsers for Discovery Bot</i> on page 1671</p>
<p><b>Condition and value displayed for each branch in Aggregated view</b></p> <p>For the <b>System generated</b> view, the condition and its value for each branch are automatically retrieved and displayed as part of the auto-generated Aggregated view.</p>
<p><b>System-generated aggregation</b></p> <p>You can now merge multiple recordings into a single aggregated view automatically by selecting the required set of recordings.</p> <p><i>Create a process view with branches and opportunities</i></p>
<p><b>Convert system-generated aggregated view to a manual view</b></p> <p>You can now convert a system-generated aggregated view to a manual view using the <b>Save as [manual]</b> option or the <b>Convert to Manual</b> option from the <b>Views</b> table. This option enables you to add more recordings or steps from other recordings to your process view.</p> <p><i>Create a process view with branches and opportunities</i></p>
<p><b>Create an opportunity, including all steps and branches</b></p> <p>You can now use the <b>Select all steps</b> option to create an opportunity that includes all steps, branches, and sub-branches.</p> <p><i>Create a process view with branches and opportunities</i></p>

New features
<p><b>Download a process definition document (PDD) (previously, Export to Word)</b></p> <p>The <b>Export to Word</b> option is now renamed as <b>Download Process Definition Document (PDD)</b>. When an opportunity is created, the PDD begins processing in the background automatically. When the PDD is ready for download from the Control Room, an email notification is sent to the email address on file to the opportunity owner.</p> <hr/> <p><b>Note:</b> You must be the owner of the opportunity to be able to download the PDD.</p> <hr/> <p><a href="#">Review opportunities and convert to</a></p>
<p><b>Receive email notification when your bot is converted successfully</b></p> <p>You can now receive an email notification when your bot is successfully converted. Click the hyperlink in the email to take you to your folder in which the bot was generated.</p> <p><a href="#">Review opportunities and convert to</a></p>

Changed features
<p><b>Zoomed-in view of captured steps is increased</b></p> <p>The zoomed-in view in the <b>Screenshot</b> field is now increased from x4 to x8 for better readability of captured steps.</p>
<p><b>Permissions layout</b></p> <p>The layout of the permissions for Discovery Bot is now changed to separate the individual and "all" permissions to easily manage access control.</p>

Fixed features	
Service Cloud case ID	Description
--	When you create a branch in a view, typically a single step from the current branch is moved into the left branch while a new branch with an empty box is added to the right branch. You can add steps from a different recording only into the empty box in the right branch. Typically, only one step from the original branch is included in the left branch. If the branch is created following the last step in the flow, then no steps will be included in the left branch. You can now add new steps to the left branch in case it was the last step. You can also move the endpoint of the newly created branch lower or higher in the process to include additional steps in the left branch.

Known limitations
In the <b>Opportunities</b> tab, the process and owner column does not allow you to sort in ascending or descending order, or when you sort for both process and owner.

Known limitations
In the <b>Opportunities</b> tab, the search field and the filter drop-down option do not work when you search for the <b>Process</b> or <b>Owner</b> columns.
The <b>Download PDD</b> option is disabled if you are not the owner of the opportunity.
The <b>Delete</b> icon is not properly visible in the edit recordings screen in Internet Explorer. Two-finger swipe on the track pad does not change the zoom level in any canvas of the <b>Aggregated</b> and <b>Comparison</b> tabs.
Discovery Bot is currently not supported on Linux.
The red highlight is only shown in the captured screenshot in the generated bot. The red highlight is not shown on captured screenshots from the <b>Recordings</b> page for review and after submission to the analyst. The highlight is also not shown from the preview pane from the <b>Aggregated</b> and <b>Opportunity</b> tabs for analyst review.

## IQ Bot

New features
<p><b>Support for Arabic language</b></p> <p>When creating a learning instance, you can now choose the Arabic language from the <b>Primary language of documents</b> drop-down menu, with the following limitations:</p> <ul style="list-style-type: none"> <li>• Advance table extraction is not available.</li> <li>• Search field on the <i>Validator</i> is not supported.</li> <li>• Arabic numerals are not supported.</li> </ul> <p>For example, if the document has date or time in Arabic language, it is extracted as text and validations can fail.</p> <hr/> <p><b>Note:</b> You can still use string-based validation checks (such as regular expressions) for Arabic numerals.</p> <hr/> <ul style="list-style-type: none"> <li>• Arabic is only supported on ABBYY FineReader Engine 12.4.</li> </ul> <p><i>Creating a learning instance</i></p>
<p><b>Default validations for a group</b></p> <p>When editing a learning instance, you can now use the <b>Select the default validations group</b> drop-down menu to select an available group. This allows all the new group documents in production to be extracted based on the custom logic and validations defined in this selected group, before it goes to the Validator.</p> <p><i>Edit a learning instance</i></p>

Changed features
<p><b>Automatically detect check box</b></p> <p>IQ Bot can now automatically detect check boxes and radio buttons in a document. You can enable this feature when creating a learning instance.</p> <p><i>Creating a learning instance</i></p> <ul style="list-style-type: none"> <li>• With this feature enabled, during training, if you select <b>check box</b> from the <b>data type</b> drop-down list and then you select the <b>field value</b>, only the check box segments are displayed.</li> <li>• This feature does not work with the PDFBox option enabled.</li> </ul> <p><i>Disable PDFBox option</i></p>
<p><b>Tegaki API OCR improvements</b></p> <p>IQ Bot now uses enhanced Tegaki API OCR segmentation to improve accuracy in the following scenarios:</p> <ul style="list-style-type: none"> <li>• Multiple fields are merged into a single SIR</li> <li>• Segmentation on empty spaces</li> <li>• Overlapping SIRs</li> <li>• Incorrectly located SIRs</li> <li>• Partial or incorrectly captured values from SIRs</li> </ul> <p><i>IQ Bot Tegaki API OCR engine</i></p>
<p><b>Updated versions of RabbitMQ v3.8.18 and Erlang/OTP</b></p> <p>The IQ Bot installation package now includes RabbitMQ v3.8.18 version 3.8.8 and Erlang/OTP version 23.0.4.</p> <p><i>RabbitMQ and Erlang/OTP upgrade</i></p>
<p><b>PyArabic removed from Python installation</b></p> <p>PyArabic is one of the Python libraries that was used in content extraction for Arabic language (right to left). Because Arabic language is now supported by default with IQ Bot installation, PyArabic is removed from Python installation.</p> <p><i>List of Pandas Libraries which are supported and not supported on Automation 360 IQ Bot (A-People login required)</i></p> <hr/> <p><b>Note:</b> Ensure you update any bot that you have deployed using PyArabic.</p> <hr/>
<p><b>Performance improvement</b> (Service Cloud case ID: 00629302)</p> <p>IQ Bot now takes significantly less time to create a bot for groups containing only production documents.</p>

Fixed features	
Service Cloud case ID	Description
00500914	<p>The TesseractLog.log file is now available in the following directory: C:\Users\Public\Public Documents\Automation Anywhere IQBot Platform\Logs\Engine\.</p> <p>The log level is set to <code>error</code> by default. You can change this setting in the <code>CognitiveServiceConfiguration.json</code> file.</p>
00430923, 00618234, 00636422, 00478986, 00414921	All uploaded documents are now rendered correctly, irrespective of their content orientation while uploading, which enables you to train them without encountering any issues. Previously, when you created a learning instance, documents that did not have the correct content orientation (they were upside down or tilted) could not be trained.
00653929	IQ Bot On-Premises: With segmentation improvements, you can now train documents in the Korean language using the Tegaki API OCR engine without any system-identified region (SIR) errors.
--	The system no longer creates any unnecessary folders for successfully classified documents that are uploaded using the IQ Bot [Local Device] package.
--	You can now use the designer page when creating a learning instance to test all the documents, without any error messages.
00590165	For a learning instance, you can now use the <b>See extraction results</b> option to browse all the documents in the selected group.
00672470	After validating the fields of production documents, you can now use the <b>Save current document</b> option to save all the validated document, without any error messages.
--	Check box fields are now extracted with better accuracy. You can use the <b>Checkbox auto-detection</b> feature so that IQ Bot automatically detects the check box fields and radio buttons.
00652269, 00619139	When you now run a bot and try to edit it while it is still running, the following correct message is displayed: <pre>Staging Documents for this Vision bot is in progress. Please try after some time.</pre> Previously, the following incorrect message was displayed: <pre>Learning instance not found.</pre>
00601401	When creating a learning instance, you can now use the Thai language for form and field names without encountering any issues.
00624416	When you migrate a learning instance, group descriptions are now migrated without any errors.

Fixed features	
Service Cloud case ID	Description
--	If you select any field on the Validator screen, the focus from that field is no longer lost when you now click or draw to select SIR.
00662968	Sometimes, when you click <b>See Extraction Results</b> and the preview fails, IQ Bot now correctly displays the following error message after a timeout of 2 minutes: <code>Error occurred while extracting the document. Please re-check the training/document. Previously, when the preview failed, the page kept loading indefinitely.</code>
00674110	Production documents are now moved to the <i>Validator</i> without any errors, irrespective of how the bot was trained (number pages, number of segments in each page, or number of tables and fields extracted).

Known limitations
<p>IQ Bot On-Premises and Cloud</p> <p>In the table area of the Validator, if you add a new row, enter a value, and then delete this row, the value of the next row is replaced by the content you entered in the deleted row.</p>
<p>IQ Bot On-Premises and Cloud</p> <p>In the Validator, when you click any validated field and then click any other cell, the value in the validated field is deleted.</p>
<p>IQ Bot On-Premises and Cloud</p> <p>When you upload a document to production immediately after deleting a bot it was associated with, extraction results are not displayed.</p> <p><b>Workaround:</b> Use one of the following options:</p> <ul style="list-style-type: none"> <li>• Select the <b>Disable cache</b> option in the <b>Network</b> tab.</li> <li>• Ensure you wait at least 3 minutes between deleting the bot and uploading the document.</li> <li>• Empty the cache and reload the page.</li> </ul>
<p>IQ Bot On-Premises and Cloud</p> <p>You cannot use <b>Express</b> mode to install IQ Bot.</p>
<p>IQ Bot On-Premises and Cloud</p> <p>Numerals in the Polish language are not accepted or validated in the Validator.</p>
<p>IQ Bot On-Premises and Cloud</p> <p>If you create a user role with 2-byte non-English characters, services fail with an <code>invalid characters</code> message.</p>
<p>IQ Bot On-Premises and Cloud</p> <p>If the name of a learning instance has both English and Arabic characters, the time stamp of the backup file is appended in between the filename.</p>

Known limitations
<p data-bbox="289 205 649 233">IQ Bot On-Premises and Cloud</p> <p data-bbox="289 254 1446 312">You cannot use the draw functionality to generate an SIR when you zoom in on a document in the Validator.</p>
<p data-bbox="289 342 524 369">IQ Bot On-Premises</p> <p data-bbox="289 390 959 417">After installing IQ Bot, MLWeb services stops responding.</p> <p data-bbox="289 438 1019 466"><b>Workaround:</b> Manually stop and restart the MLWeb services.</p>
<p data-bbox="289 497 524 525">IQ Bot On-Premises</p> <p data-bbox="289 546 1438 604">If you add a new language after upgrading to IQ Bot A2019, the <b>Learning Instance</b> page is not displayed due to Language API cache issues.</p> <p data-bbox="289 625 1019 653"><b>Workaround:</b> Clear the cache and restart the IQ Bot service.</p>
<p data-bbox="289 682 649 709">IQ Bot On-Premises and Cloud</p> <p data-bbox="289 730 1446 789">If you try to process a PDF document with <b>pdfboxOCR</b> enabled, the SIRs are not placed correctly on the check boxes.</p> <p data-bbox="289 810 1192 837"><b>Workaround:</b> Disable the pdfbox OCR when you create a learning instance.</p>
<p data-bbox="289 867 649 894">IQ Bot On-Premises and Cloud</p> <p data-bbox="289 915 1455 974">If you create a learning instance with <b>Auto Checkbox Detection</b> enabled, check box SIRs cannot be selected.</p> <p data-bbox="289 995 1382 1022"><b>Workaround:</b> Draw on top of the check box SIR instead of selecting the identified SIR field.</p>
<p data-bbox="289 1052 649 1079">IQ Bot On-Premises and Cloud</p> <p data-bbox="289 1100 1459 1194">Starting with IQ Bot A2019.17, the default OCR engine is changed to ABBYY FineReader Engine 12.4 from the previous 12.2 version. Therefore, if you have migrated learning instances from earlier versions, you might have to retrain your bots because there could be a change in segmentation.</p>
<p data-bbox="289 1222 649 1249">IQ Bot On-Premises and Cloud</p> <p data-bbox="289 1270 1433 1329">The <b>Default validations group</b> is not overwritten on the imported learning instance even when the <b>Overwrite</b> option is used when you import that learning instance.</p> <p data-bbox="289 1350 1393 1409"><b>Workaround:</b> Edit the learning instance after importing the IQBA file and change the default group.</p>
<p data-bbox="289 1438 649 1465">IQ Bot On-Premises and Cloud</p> <p data-bbox="289 1486 1446 1581">A learning instance is exported as an IQBA file that contains <code>Projectdetails.csv</code>. ## Enterprise A2019.16 Release Notes

*Release date: 28 September 2020*

Review the new features, supported packages, changed features, fixed features, security fixes, and known limitations in the Enterprise A2019.16 (Build 6463) release. IQ Bot is on Build 6443.

---

**Important:** We have updated Enterprise A2019.16 to Build 6463 to include fixes for issues with checking in and checking out bots (Service Cloud case ID 00666880, 00670899, 00672441, 00670455, 00672346), and Universal Recorder (Service Cloud case ID 00664020). See the [Fixed features](#) section for more information.

---

- [Enterprise A2019](#) on page 565
- [Discovery Bot](#) on page 582
- [IQ Bot](#) on page 585
- [Bot Insight](#) on page 586
- [Automation Anywhere Robotic Interface \(AARI\)](#) on page 587

## Enterprise A2019

---

**Note:** Starting with this release, if you are installing the Control Room in Linux environment, ensure that Python 3.6 is installed.

---

**Important:** This release includes a required update to your . Ensure that you complete the update to continue with your automation activities when upgrading from a previous release to this release.

[Automatically update the Bot Agent](#) on page 1001 | [Manually update the Bot Agent](#) on page 1002

To verify which version is compatible with this release, see [Compatibility with release builds](#) on page 985.

New features
<p><b>Migration to Enterprise A2019 (currently available only to customers in the Migration Early Adopter Program)</b></p> <p>Enterprise A2019</p> <p>Migration to Enterprise A2019 is currently only available to select customers through our Migration Early Adopter Program. If you are interested in learning more about this program or a timeline for when migration will be available to all customers, contact your Automation Anywhere representative.</p> <ul style="list-style-type: none"> <li>• <b>Enterprise 11 only</b> <ul style="list-style-type: none"> <li>• Migrate audit logs to Enterprise A2019. <ul style="list-style-type: none"> <li><a href="#">Migrate Enterprise 11 audit logs</a> on page 1153</li> </ul> </li> <li>• Migrate bots that contain disabled commands that have validation errors.</li> <li>• Migrate bots that contain <b>Delete</b>, <b>Delete All Messages</b>, and <b>Get All Messages</b> commands to automate an email-related task on Exchange Web Services (EWS).</li> </ul> </li> <li>• <b>Enterprise 10 only</b> <p>Migrate user credentials to the Enterprise A2019 Credential Vault.</p> <ul style="list-style-type: none"> <li><a href="#">How Enterprise 10 data is copied to Automation 360</a> on page 1161</li> </ul> </li> <li>• <b>Enterprise 11 and Enterprise 10</b> <ul style="list-style-type: none"> <li>• Migrate bots that contain the <b>Variable Operation</b> command, which re-initializes the row and column index of an array variable using a variable.</li> <li>• Migrate bots that run MetaBot Logic and return the values to a dictionary variable.</li> <li>• Migrate MetaBots that contain DLLs that use lists, values, arrays, and two-dimensional arrays as input and output. <ul style="list-style-type: none"> <li><a href="#">How MetaBots are migrated</a> on page 1179</li> </ul> </li> <li>• Migrate bots that contain <b>Send Email</b> with <b>Attach Variable</b> option from the Error Handling command to the Enterprise A2019 Error handler package. <ul style="list-style-type: none"> <li><a href="#">Package mapping for migration</a> on page 1201</li> </ul> </li> <li>• Migrate bots that contain the <b>Image</b> and <b>Coordinates</b> play modes from the Object Cloning command to the Recorder package in Enterprise A2019. <ul style="list-style-type: none"> <li><a href="#">Package mapping for migration</a> on page 1201</li> </ul> </li> <li>• Migrate bots that contain credential variables in select commands such as Active Directory, Excel, REST Web Service, and Terminal Emulator to Enterprise A2019. <ul style="list-style-type: none"> <li>For the complete list of commands, see <a href="#">Variable mapping for migration</a> on page 1232.</li> </ul> </li> </ul> </li> </ul>

New features
<p><b>Support for using CSV and TXT files as databases</b></p> <p>Enterprise A2019 and Community Edition</p> <p>Use the actions from the Database package to connect with and perform create, read, and update operations on the file.</p> <p><a href="#">Using Connect for database</a>   <a href="#">Database package</a></p>
<p><b>Universal Recorder support for standard Microsoft controls in Microsoft Silverlight</b></p> <p>Enterprise A2019 and Community Edition</p> <p>The Universal Recorder can now capture calendars, buttons, check boxes, combo boxes, date pickers, labels, links, list views, radio buttons, sliders, tabs, tables, text boxes, and trees from applications running Microsoft Silverlight version 5.</p>
<p><b>Use variable to specify a child bot to run</b></p> <p>Enterprise A2019</p> <p>Use the Control Room path in the <b>Run</b> action of the Task Bot package to use a string variable to specify the child bot you want to run.</p> <p><a href="#">Task Bot package</a></p>
<p><b>Install Bot Agent in bulk using registration key</b> (Service Cloud case ID: 00616591)</p> <p>Enterprise A2019</p> <p>As an Control Room administrator, you can generate a registration key from the Control Room settings to install Bot Agent in bulk on multiple devices. You can use the registration key in an installation script or as part of the Active Directory group policy for configuring the Control Room users.</p> <p><a href="#">Generate registration key to install Bot Agent in bulk</a> on page 2077</p>
<p><b>Automatically detect proxy settings for Bot Agent installation to support NTLM authentication</b> (Service Cloud case ID: 00446932, 00639773)</p> <p>Enterprise A2019 and Community Edition</p> <p>The proxy settings for a Bot Agent are automatically detected if the <b>Automatically detect settings</b> option is selected in the LAN settings for a <b>System user</b> and <b>Current user</b> on the machine where the Bot Agent is installed. This allows Control Room users to be authenticated using NTLM.</p>
<p><b>Restrict network access to Cloud Control Room URL</b></p> <p>Enterprise A2019</p> <p>System administrators can restrict access to the Cloud Control Room URL from only those IP addresses within the corporate network for more granular security. The Automation Anywhere Control Room provides the ability to specify a list of IP addresses or IP subnets that are allowed for Cloud Control Room URL and API access. Enterprise A2019 users with Control Room administrator privileges, such as to access <b>Administration</b> &gt; <b>Settings</b>, can view, add, or edit this list.</p> <p><a href="#">Add access IP addresses</a> on page 2053</p>

New features
<p><b>Add Elasticsearch credentials for enhanced monitoring and alerting</b></p> <p>Enterprise A2019</p> <p>An option to provide Elasticsearch credentials is now available in the installer because the updated Elasticsearch version 7.8 configured for Control Room uses Open Distro version 1.9.0. This feature enables the server to deploy an enhanced monitoring and alerting system.</p> <p><a href="#">Add Elasticsearch credentials</a> on page 877</p>
<p><b>Support for Chinese, Japanese, and Korean characters in variable names</b></p> <p>Enterprise A2019 and Community Edition</p> <p>You can now create variables with names containing Chinese, Japanese, or Korean characters. You can also migrate bots that contain variables named using these characters.</p> <p><a href="#">Unicode range supported in variables</a> on page 1392</p>
<p><b>Support for Chinese language for Terminal Emulator</b> (Service Cloud case ID: 00500324)</p> <p>Enterprise A2019</p> <p>You can now use the simplified and traditional Chinese language with 5250E terminal DBCS models such as IBM 5555-C01 and IBM 5555-B01.</p>
<p><b>New Services package available</b></p> <p>Enterprise A2019 and Community Edition</p> <p>Use the new Services package to automate operations and application services. You can start, stop, pause, resume, or to get the status of a Windows or application service.</p> <p><a href="#">Service</a></p>
<p><b>Enhancements to the Excel advanced package</b></p> <p>Enterprise A2019 and Community Edition</p> <p>In the Excel advanced package, you can now use <b>Read value</b> from a cell. You can choose the <b>Read</b> option to read either visible text or the value from the cell. The default option is set to <b>Read visible text in cell</b>.</p> <p>For example, if the cell has \$50 as the value, then the <b>Read cell value</b> option reads the value as 50, ignoring the currency format. The <b>Read visible text</b> option reads the content along with currency format as \$50.</p> <p>This option is available for the following actions:</p> <ul style="list-style-type: none"> <li>• Get single cell</li> <li>• Get multiple cells</li> <li>• Read row</li> <li>• Read column</li> <li>• Get worksheet as datatable</li> <li>• Loop</li> </ul> <p><a href="#">Cell operations in</a>   <a href="#">Row and column operations in</a>   <a href="#">Loop package</a></p>

<p><b>New features</b></p> <p><b>Automate a task on a range of cells in an Excel worksheet</b> (Service Cloud case ID: 00651299)</p> <p>Enterprise A2019 and Community Edition</p> <p>In the Excel advanced package, you can perform operations on the range of cells for <b>Go to cell</b> and <b>Set Cell</b> actions.</p> <p><a href="#">Cell operations in</a></p>
<p><b>New condition in the If and Loop packages</b></p> <p>Enterprise A2019 and Community Edition</p> <p>Use the <b>Service is running</b> or <b>Service is not running</b> condition to execute actions based on whether a particular service is running or not. For example, when you send a mail using this condition, the bot can verify if the SMTP service is running or not.</p> <p><a href="#">If package</a>   <a href="#">Loop package</a></p>
<p><b>Capture hidden objects using AISense Recorder</b></p> <p>Enterprise A2019</p> <p>Use AISense Recorder to capture hidden image buttons on the application screen.</p> <p><a href="#">Edit a task recorded using AISense</a> on page 1332</p>
<p><b>New operations on SAP captured objects</b></p> <p>Enterprise A2019</p> <p>Use new options that are available to perform operations such as <b>Set Focus</b> and <b>Select item by key</b> for the various objects captured from an SAP application.</p>
<p><b>Pass parameters of various types to a DLL function</b></p> <p>Enterprise A2019</p> <p>Use the new <b>Run function</b> action to pass parameters of various types to a DLL function. The <b>Run function</b> that was available in earlier versions is now renamed to <b>Run function (Legacy)</b> and enables you to pass only dictionary variable as parameter to a DLL function.</p> <p><a href="#">Using the Run function</a>   <a href="#">Using the Run function (Legacy)</a></p>
<p><b>Form builder updates</b></p> <p>Enterprise A2019</p> <p>The form builder now includes the following new elements:</p> <ul style="list-style-type: none"> <li>• <b>Rich text editor</b>- Enables you to add a customizable element to the form.</li> <li>• <b>Table</b>- Enables you to add tables to a form.</li> </ul> <p><a href="#">Create a form</a> on page 1536</p>
<p><b>Enhancements to the form preview</b></p> <p>Enterprise A2019</p> <p>When you click the <b>Preview</b> option in the form builder screen, you can drag the form. The corresponding <b>X</b> and <b>Y</b> coordinates are updated automatically.</p>

New features
<p><b>Enhancement to the Snapshot element</b></p> <p>Enterprise A2019</p> <p>You can now create a folder if the filepath is not available or change the destination folder of the snapshot file during bot runtime.</p> <p><a href="#">Using the Snapshot element</a> on page 1549</p>
<p><b>Update to the Interactive forms package</b></p> <p>Enterprise A2019</p> <p>Use the <b>Validate form</b> action to validate all the elements of a selected form.</p> <p><a href="#">Interactive forms package</a></p>
<p><b>New permission to view basic information about users and roles</b> (Service Cloud case ID: 00491694)</p> <p>Enterprise A2019</p> <p>The <b>View Users and Roles basic information</b> permission enables you to view the names of users and roles when you are performing various tasks in the Control Room. For example, a user must have this permission to view the roles that can be assigned to a user when creating or editing that user. After you upgrade from an earlier version to this release, this permission is granted to all existing roles.</p>
<p><b>Securely pass values in header and parameters of calls to a REST or SOAP web service</b></p> <p>Enterprise A2019 and Community Edition</p> <p>Credential variables enable users to retrieve sensitive values from the Credential Vault and pass them to the web service. Use credential variables in the header or parameter fields of actions from the REST Web Service or SOAP Web Service package.</p> <p><a href="#">Credentials and credential variables in the Bot editor</a> on page 1395   <a href="#">REST Web Service package</a>   <a href="#">SOAP Web Service package</a></p>
<p><b>Return system parameters of the device on which a bot is running</b></p> <p>Enterprise A2019 and Community Edition</p> <p>Use the <b>Get environment variable</b> action from the System package to return the system parameters, including HomePath, ProgramData, ProgramFiles, SystemRoot, and UserDomain.</p> <p><a href="#">Get environment variable</a></p>
<p><b>Remove Git integration configuration</b> (Service Cloud case ID: 00633948)</p> <p>Enterprise A2019</p> <p>You can now remove or disable a Git integration configuration from your Control Room when the bot information stored in your Control Room does not have to be synchronized with the remote Git host.</p> <p><a href="#">Remove Git integration configuration</a> on page 2070</p>
<p><b>Expanded data type support in DLL package</b></p> <p>Enterprise A2019 and Community Edition</p> <p>The DLL package now accepts table variables as input parameters or to hold action output.</p> <p><a href="#">Using the Run function (Legacy)</a></p>

New features	
<p><b>Create variable within Dictionary &gt; Assign and List &gt; Assign actions</b></p> <p>Enterprise A2019 and Community Edition</p> <p>The <b>Assign</b> action from the Dictionary and List packages now offers users the option to create a new variable within the <b>Select source variable</b> field. Previously, users could only select a variable from a list of existing variables.</p>	
<p><b>New API for license management</b></p> <p>Enterprise A2019</p> <p>The License API contains endpoints to retrieve Control Room license details (such as the expiration date and license mode) and to update the Control Room after license reallocation or renewals.</p> <p><a href="#">License API</a></p>	
<p><b>New expression in the Legacy Automation package</b></p> <p>Enterprise A2019</p> <p>The <b>List to table</b> expression supports migrated bots containing a variable that has to be converted from a list type to a table type.</p> <p><a href="#">#unique_487</a></p>	
<p><b>Multi-user device sessions on terminal servers</b></p> <p>Enterprise A2019</p> <p>Multi-user device sessions are now supported on terminal servers. You can perform the following actions:</p> <ul style="list-style-type: none"> <li>• Set screen resolution at either the device or Control Room level.</li> <li>• Set a multi-user device as the default device for Bot Creator users and attended and unattended Bot Runner users.</li> <li>• As a licensed user (with a default device), set another device as your default device using the <b>Make default device</b> option from the device menu.</li> <li>• View and edit the device settings on the device landing page.</li> </ul> <p>The device landing page shows additional information about the user-provided device name (device nickname), device type, and the default user.</p> <ul style="list-style-type: none"> <li>• Convert an existing device to a multi-user device in order to share the same device between Bot Runner and Bot Creator users who can then coexist in different sessions simultaneously. (Service Cloud case ID: 00624046)</li> </ul> <p><a href="#">About multi-user devices</a> on page 1952   <a href="#">Convert an existing device to a multi-user device</a> on page 1954   <a href="#">Configure RDP-based deployment for multi-user devices</a> on page 1953</p>

Changed features
<p><b>Enhanced Capture area action in OCR package</b></p> <p>The <b>Capture area</b> action now captures text from the visible area of the screen even if the target area is below the visible screen. Previously, the bot showed an error when the captured area was below the visible screen.</p> <p><i>Using Capture area from</i></p>
<p><b>Bot Scanner update</b></p> <p>The Bot Scanner now displays error messages for bots that cannot be migrated to Enterprise A2019 in the summary report.</p> <p><i>Analyze Bot Scanner report for migration</i> on page 1121</p>
<p><b>Flow view update</b></p> <p>A line number is now displayed for each action in the <b>Flow</b> view of the Bot editor.</p>
<p><b>CSV/TXT package update</b></p> <p>The CSV/TXT package processes a space as character. For example, if your CSV or text file includes January, "March, April", then the output is displayed in the following format:</p> <p>January "March (space before the double quotation mark) April"</p> <p>If the CSV or text file contains the same information but without a space between January and March (for example, January, "March, April"), then the output is displayed in the following format:</p> <p>January March, April</p>
<p><b>Upgrade for resilient bot deployment</b></p> <p>After you upgrade the Control Room and Bot Agent to Enterprise A2019.16, scheduled and queued bots are not terminated. This is part of the resiliency improvements where the Control Room and Bot Agent are set in a consistent state. As a result, the device reconnects to the Control Room if there are any network disruptions, and scheduled and queued bots are deployed.</p> <hr/> <p><b>Important:</b> During the upgrade to Enterprise A2019.16, all bots that are running will be terminated. After the upgrade, if the system is in an inconsistent state, restart the Bot Agent so that the system is in a consistent state.</p> <hr/>
<p><b>Internet Explorer waits for completion before initiating Recorder action</b></p> <p>When you use the Recorder package, the bot now waits for the Internet Explorer browser to finish loading the page before executing any action. This enhances the reliability of the bot by preventing it from failing while the page is loading. For example, the Recorder does not try to search the object before the web page is fully loaded.</p> <p><i>Using the Capture</i></p>

Changed features
<p><b>High availability enhancement</b></p> <p>Starting from this release, configure the required minimum three Control Room nodes in an Enterprise A2019 data center cluster for high availability deployment.</p> <p><a href="#">High availability deployment</a> on page 852</p>

The following table lists the fixed features and the builds in which they were fixed (Build 6463 is the latest build, and Build 6453, and Build 6448 are previous builds). The fixes are cumulatively available in the latest build.

Fixed features		
Build number	Service Cloud case ID	Description
6463	00644915	The Bot Agent now checks for additional SSL certificate from the Windows CERT_SYSTEM_STORE_LOCAL_MACHINE system stores in addition to the Java Credential Store. This allows the Bot Agent to be updated automatically from an earlier release to this release.
6463	00666880, 00670899, 00672441, 00670455, 00672346	Bot files or dependencies are no longer lost when you check in or check out a bot from the private or public workspace. Previously, an error occurred while either checking in or checking out a bot, and the bot files or dependencies were lost and could not be recovered.
6463	00664020	You can now successfully run a bot that contains the <b>Capture</b> action from the Recorder package with both the <code>HTML InnerText</code> and <code>InnerHTML</code> object properties selected.
6463	--	Fixed an issue where the Universal Recorder failed to perform a click, set text, or append text action on the correct control in Google Chrome when a debug window or download bar was open.
6453	00669040, 00669164, 00668923, 669332, 00669473, 00671509, 00669178	<p>The Automation Anywhere Elastic Search Service now restarts during the certificate retrieval process when you upgrade from Enterprise A2019.15 to Enterprise A2019.16.</p> <p>However, if you encounter any issues with the Automation Anywhere Elastic Search Service during the restart, see <a href="#">Automation 360 v.16 upgrade error: Elasticsearch Service fail to start during certificate retrieval process (A-People login required)</a>.</p>

Fixed features		
Build number	Service Cloud case ID	Description
6448	00573048	You can now preview table variables in debug mode and validate the bot logic. Previously, watch variables containing Japanese and Chinese characters did not display values in the table variable.
6448	00656475	The Bot Deploy API call now consecutively executes all the runAs users that are set in the <b>runAsUserIds</b> parameter.
6448	00569832, 00628474, 00656267	The device registration issue due to Bot Agent version extraction is now fixed. The exception of "for input string null" no longer occurs.
6448	00609073	You can now successfully integrate your Control Room with your remote Git repository without any error. Previously, the Git integration failed because of a 404 error.
6448	00632444, 00626829, 00667531	When you import a main task containing subtasks using the overwrite option, the dependent subtask references are no longer deleted for other existing main tasks that use the same subtasks. As a result, the execution of other main tasks containing the same dependent subtasks does not fail.
6448	00501208, 00572346	For the <b>Create user</b> event name, the audit log now properly displays the username who created that user in the <b>Event Started By</b> column. Previously, the same column did not display any value.
6448	00616202, 00637626, 00653919, 00664039, 00664744	When the debug log is enabled in logs configuration and you use the <b>For each row in a SQL query dataset</b> option from the Loop action to iterate each row, the iteration now completes without any error. Previously, the iteration failed because of a change in the debug log configuration.
6448	00653064	After the caching service is restarted, the bot execution no longer fails. The caching client instances are reconnected and reinitialized after the restart.
6448	00577612	In a bot with dependencies, if you check out and edit a child bot in your private workspace and later check out the parent bot, you will no longer lose the changes made to the checked-out child bot. Previously, changes made to the child bot were overwritten.

Fixed features		
Build number	Service Cloud case ID	Description
6448	00623154	When a Bot Creator that does not have create folder permission tries to check in a bot to the public workspace, an appropriate error message is now recorded in the audit log, indicating the specific reason for the failure. Previously, the audit log recorded an <code>unexpected error occurred</code> message.
6448	00622977	In the <b>Edit role</b> page, file permissions are now correctly aligned in Internet Explorer. Previously, the <b>Delete from Public</b> option was displayed below the <b>Select all</b> option. As a result, the folder and permissions were not placed next to each other.
6448	00615437	You can now migrate MetaBots that contain input and output type variables with a description containing unsupported characters such as quotation marks (") and forward slash (/).
6448	00636169	The Control Room now disables a user account when the number of consecutive failed login attempts specified in the Control Room settings is reached or exceeded.
6448	00530550	A variable now returns the correct value when the regional setting of the device is set to the Brazilian metric system.
6448	00604893	A bot no longer encounters an error when the system cannot finish pre-processing the bot due to an ignite cache issue.
6448	00578277	An error is no longer encountered when the <b>Connect</b> and <b>Disconnect</b> actions of the SAP package are used in a loop and the iteration is set to more than 500 times.
6448	00635890	The Bot Scanner now scans all the bots in a repository and displays the correct count of child bots.
6448	00634238	You can now use the form builder in Internet Explorer (version 11 or later) to add more items to the <b>Checkbox</b> and <b>Radio Button</b> elements without encountering any issues.
6448	--	For the <b>Select file</b> element, you can now upload a file with a dot (.) in the filename. For example, <code>Sales.March.jpg</code> .
6448	--	Software version notification for Cloud was not always displayed in the UI. This issue is now fixed.

Fixed features		
Build number	Service Cloud case ID	Description
6448	00633793	You can run a bot when the operational parameter is used in the <b>SOAP Web Service</b> action. Previously, the bot encountered errors when the operational parameter was used in the action and the corresponding <code>wsdl</code> file did not have the <code>elementFormDefault</code> attribute.
6448	00630975	Captured images in a nested <b>If</b> action are now retained when you check in a bot to the public repository. Previously, when using any action that used an image in a nested <b>If</b> action, the image nested was missing after the check-in.
6448	00630004	When loop is used to read all <b>Unread</b> emails, the emails are now marked as <b>Read</b> only after emails are read. Previously, all unread emails were marked as read when a <b>Loop Break</b> action was used.
6448	00612913	In <b>Excel Advanced &gt; Remove blank rows</b> , when you select the <b>Specific row</b> option and set A1 as the beginning cell, an error is no longer encountered when you run the bot.
6448	00608265	In the CSV/TXT package, when you use Japanese OS ANSI (Shift-JIS) as encoding to read text file content, the Japanese Shift-JIS characters are now displayed correctly.
6448	00568718	Japanese language supported pop-up messages no longer appear truncated when multiple bots are deleted.
6448	00598023, 00611480	In the <b>DLL</b> package, <b>Run function</b> now works properly and does not display an error or show broken characters when the parameter includes Japanese characters.
6448	00638120	When you upgrade from an earlier version of Enterprise A2019 to a later version and change the <b>If</b> package version to the latest one, multiple conditions now appear in <b>If/Else If</b> after the <b>If</b> package is upgraded. Previously, some of the conditions did not show in the logic.
6448	00632228, 00649606	You can now use the <b>Send Email</b> action when the package version is different in the task and subtask. Previously, the <b>Send Email</b> action in the <b>Email</b> package had issues when the task and subtask had a different package version.

Fixed features		
Build number	Service Cloud case ID	Description
6448	00544219, 00635206	The <b>Get cell</b> action in <b>Excel Advanced</b> can now be used without any error. You can use the <b>Read</b> option to read visible data or the exact value of the cell.
6448	00646254, 00650712, 00653137, 00658122, 00666883	You can now change the package version of the <b>If</b> package. Previously, if there were multiple conditions in the <b>If</b> action, the system did not allow you to change the package version.
6448	00613453	Version 11.3 bots that used the Object Cloning command to find interface objects using coordinates or image recognition are now migrated to Enterprise A2019 with the <b>Mouse &gt; Click</b> action, <b>Simulate keystrokes</b> action, <b>OCR &gt; Capture area</b> action, or <b>Image recognition &gt; Find window in window</b> action.
6448	--	When you run migrated bots that perform mathematical operations on values containing decimals or commas, the output from Enterprise A2019 now matches the output from Version 11.3.5. Previously, an operation that resulted in an output of 0.999 in Version 11.3 resulted in an output of 0.9899999 in Enterprise A2019.
6448	00467664	Fixed an issue where the Universal Recorder entered characters in a text box incorrectly when the user configured the <b>Keystrokes</b> field using a Japanese keyboard.
6448	00630545, 00631418, 00621875	You can now assign input values from a parent bot in the <b>Task Bot &gt; Run</b> action. Previously, an issue caused input values to disappear when a bot containing more than two input values was saved.
6448	--	The Workload <b>In progress</b> activity page now displays the Workload bot name instead of the automation name.
6448	00635306	Fixed an issue where a red error screen appeared if a bot attempted to pass a file variable to another bot.
6448	00635326	You can now run bots built using Recorder package versions from earlier builds.
6448	00616261	You can now pass credential values to the main bot when you deploy it from the <b>Run bot now</b> page.

Fixed features		
Build number	Service Cloud case ID	Description
6448	00647135, 00647652, 00647665, 00647144, 00648742, 00646535, 00648883, 00648980, 00654937, 00657039, 00664049, 00663797, 00664138, 00667384	When you upgrade to the latest version of Enterprise A2019, bots in queued state now run without any issues because a new token is automatically generated when an existing session expires.
6448	00611109	Fixed an issue where the <code>\$System:CPUUsage</code> system variable returned an inaccurate value.
6448	00647239	In the Data Table package, when you use the <b>Merge</b> action to merge two data tables, the data is now properly merged and the merged content stores the correct data in the result data table. Previously, the <b>Merge</b> action had issues when no header data in a table was extracted, resulting in incorrect data export to CSV file.
6448	00444907, 00556374, 00582469, 00628801, 00624681, 00632668	A bot launcher error for a user session is no longer displayed when you run a bot on a Bot Agent device registered to a user who is assigned developer privileges.

Security fixes	
Service Cloud case ID	Description
00552076	The vulnerabilities found in Elasticsearch in Enterprise A2019 are now addressed.
00631233	In the Database package, when you connect to the database, the username and password are no longer visible in the logs.

Known limitations
<p>When you are upgrading from an earlier version of Enterprise A2019 to the current version, the system displays the error message <code>Self Sign Certificate Failure</code>, and the installation process is rolled back if both the following conditions occur:</p> <ol style="list-style-type: none"> <li>1. The earlier version was installed on a non-default installation path instead of the default path (C:\Program Files\Automation Anywhere\Enterprise). For example, the previous version was installed on D:\Program Files\Automation Anywhere\Enterprise.</li> <li>2. You also select <b>Yes</b> to retain the current installation parameters during upgrade in the message window that appears after the <b>Welcome</b> screen when the installation wizard detects an earlier version.</li> </ol> <p><b>Workaround:</b> Select <b>No</b> so that you can choose to enter the installation parameters during the upgrade.</p> <p><i>Control Room upgrade fails with self signed certificate failure error (A-People login required)</i></p>

Known limitations
<p>Service Cloud case ID: 00672719, 00673048</p> <p>When you are upgrading the Control Room to the current version, the installer uses an existing or creates a new Elasticsearch data folder in the default path (C:\ProgramData\AutomationAnywhere\elasticsearch\data) if the Elasticsearch data from the earlier version is saved to a non-default path. Therefore, the earlier Elasticsearch data and audit logs will not be available after the upgrade.</p> <p><b>Workaround:</b> Before upgrading to the current version, copy the existing Elasticsearch data from the non-default path to the default path.</p>
<p>When an Automation Anywhere package is manually uploaded using the Control Room interface, the <b>Vendor</b> column should show Automation Anywhere. Instead, the interface displays <code>Unspecified</code>. Automation Anywhere packages that are installed on a server as a part of an upgrade show the <b>Vendor</b> as Automation Anywhere, which is expected.</p>
<p>For existing device sessions, you cannot use the option to enforce the resolution set at either the device or Control Room level. The screen resolution set at these levels only work for new device sessions.</p>
<p>When attended and unattended Bot Runners are run concurrently, attended Bot Runner users are queued until the unattended Bot Runner session becomes available. This occurs even when the number of allowed concurrent sessions is not exceeded. For an attended Bot Runner user deployment, use a single user session to stop them from being queued.</p>
<p>When a user connects to a multi-user device and sets it as their default device, they are taken through the device registration wizard to enable the Google Chrome plug-in. During the registration process, users are allowed to select the device type and the concurrent sessions value. Users must ensure that they set the same value for the concurrent sessions as set by the administrator. If there is a difference in the value, other users will be impacted.</p>
<p>When a bot is deployed through RDP with a predefined screen resolution, the RDP resolution settings are not applied correctly during bot execution. The bot is executed with an interchanged resolution (the height and width pixels are interchanged). For example, if the resolution for bot deployment is set as 1366x768, the bot is deployed with the resolution 768x1366.</p> <p><b>Workaround:</b> For information about how to resolve this issue, see <a href="#">Automation 360 v.16 - RDP based deployment does not run bot with pre-defined set screen resolution (A-People login required)</a>.</p>
<p>The element label or text appears distorted during bot runtime when you add it in Japanese or any other non-English language, and the <b>Font name</b> is set to <b>System default</b>.</p>
<p>Service Cloud case ID: 00667210</p> <p>In Excel advanced, you cannot use the <b>Go to cell</b> action if the Excel sheet does not have data or if an active cell is out of the worksheet range. This issue is encountered when you use the <b>Go to cell</b> action and choose the cell option as <b>Active cell</b> with the <b>Beginning of the row</b>, <b>End of the row</b>, <b>Beginning of the column</b> or <b>End of the column</b> option.</p> <p><b>Workaround:</b> Use the earlier version of the Excel advanced package 4.0.0-20200723-234413 released with Enterprise A2019.15.</p>
<p>HTTP authenticated proxy is not supported for On-Premises users.</p>

## Discovery Bot

New features	
<p><b>Discovery Bot installer integrated with Enterprise A2019 installer</b></p> <p>Enterprise A2019</p> <p>The Discovery Bot installer is now integrated with the Enterprise A2019 installer. No separate installation is required for Discovery Bot On-Premises users. Discovery Bot supports custom installation for Windows.</p> <p><a href="#">Prerequisites for Discovery Bot</a> on page 1661</p>	
<p><b>Create multi-role users</b></p> <p>Enterprise A2019</p> <p>Combine up to three Discovery Bot system-generated roles and two process discovery licenses to provide additional functionality for your users.</p> <p><a href="#">Create multi-role users for Discovery Bot</a> on page 1664</p>	
<p><b>Create custom role user</b></p> <p>Enterprise A2019</p> <p>Create a unique custom role using the permissions from the Discovery Bot standard user roles (Admin, Business user, or Analyst roles).</p> <p><a href="#">Create a custom role for Discovery Bot</a> on page 1666</p>	
<p><b>Manual aggregated view integrated with Dashboard tab</b></p> <p>Enterprise A2019</p> <p>The Manual aggregated view is now integrated with the Dashboard tab. You can now select and display recordings and views from the <b>Dashboard</b>, <b>Aggregated</b>, and <b>Comparison</b> tabs, enabling you to make a change in one tab that will persist across all tabs. This feature enables a synchronized representation of your metadata for views and recordings.</p>	
<p><b>Internalization, localization, and language support for Discovery Bot</b></p> <p>Enterprise A2019</p> <p>Internalization and localization is now supported for Discovery Bot. For example, you can automate and translate the UI for your region in French, Spanish, and Italian, among other languages supported.</p> <p><a href="#">Internationalization, localization, and language support</a> on page 833</p>	

Fixed features	
Service Cloud case ID	Description
--	You can now sort on the recording ID. The recent recording (ID) created now displays at the beginning of the list in the Recordings table.
--	When editing the aggregated view, you can now move the endpoint upward in the path flow to change the selection of the steps. You can also move the branch endpoint lower in the path flow to include more than one step.

Fixed features	
Service Cloud case ID	Description
--	You can now select partial steps in a branch, and create and save an opportunity from the <b>Opportunities</b> tab.
--	The copy field now displays the correct view information from the view (view ID) that it is copied from.
00673381	If you are using an instance in an AWS special region, you can now view recordings for users that are successfully completed (not canceled by the user).

Known limitations
When manually editing an aggregated view, if you create a branch in the process flow where a step was deleted, the step will be missing on the left side of the branch. To add a step on the left side, you can drag the branch endpoint (small circle) down (below the next step) in the process flow to add a step back in the branch. <i>Missing step observed in aggregated view while using A2019.16 Discovery Bot (A-People login required)</i>
When an opportunity is created with 300+ steps, exporting the opportunity to Microsoft Word will fail.
The <b>Convert to Bot</b> option fails when an opportunity contains 140 or more steps.

## IQ Bot Community Edition

The IQ Bot Community Edition is available for this release and has feature parity with IQ Bot Version 11.3.4.2.

[Automation 360 IQ Bot feature comparison matrix](#) on page 781

[Automation 360 IQ Bot version compatibility](#) on page 786

---

**Important:** This new Community Edition includes a preview of IQ Bot with Auto-extraction.

---

Community Edition for IQ Bot is a special version of our product in the Cloud, available for all users who want to try RPA and IQ Bot at no cost. Users are not required to purchase a license, and there are no time limitations. However, there are some functionality constraints as follows:

- Users can create learning instances using pre-trained Invoices in English only.
- Users can create up to a maximum of 5 learning instances per user account.
- In the Learning Instance list, users can see and access only those learning instances and data created by them.
- Users can process up to a 100 pages per month for each user account.

[Community Edition](#) on page 1794

New features (using auto-extraction)
<p><b>Create a learning instance</b></p> <p>Use a pre-trained invoice (document type) to process and validate your documents in English (only).</p> <p><a href="#">Create a learning instance in Community Edition</a> on page 1795</p>
<p><b>Extract data from documents</b></p> <p>Create a bot to extract data from documents using the learning instance you created.</p>
<p><b>Validate documents</b></p> <p>Validate failed documents manually using the validator form.</p> <p><a href="#">Process documents in Community Edition</a> on page 1797</p>
<p><b>Bot Insight integration</b></p> <p>View learning instance dashboard metrics that is integrated with Bot Insight.</p>
<p><b>Use the IQ Bot (Preview) package</b></p> <p>Use the IQ Bot (Preview) package to process and validate documents using Enterprise A2019.</p>

Changed features
<p>For the Custom Logic feature, the identified list of Python libraries now includes an additional set of safe libraries for IQ Bot Community Edition. Go to Automation Anywhere support for a list of the safe libraries you can use.</p> <p><a href="#">List of Pandas Libraries which are supported and not supported on Automation 360 IQ Bot (A-People login required)</a></p>

Fixed features (using Auto-extraction)	
Service Cloud case ID	Description
00628958	The Task Bot now successfully processes all documents without displaying any error messages.

Known limitations (using Auto-extraction)
<p>PDF documents with raster format or JBIG2 encoding are not supported.</p> <p><b>Workaround:</b> Convert such documents to one of the supported formats before processing your documents for data extraction.</p> <hr/> <p><b>Note:</b> Digital PDFs, JPEG, JPG, and PNG are supported formats.</p> <hr/>
<p>Rotated documents are not supported.</p> <p><b>Workaround:</b> Pre-process such documents to correct their orientation before data extraction.</p>
<p>Only a predefined set of form and table fields are supported. The table header does not support multiple fields in a single column.</p>

Known limitations (using Auto-extraction)
<p>During the validation process, if a user deletes all rows from a table, the user is unable to add a new row.</p> <p><b>Workaround:</b> Perform these steps:</p> <ol style="list-style-type: none"> <li>1. Cancel the validation user form and open the document again.</li> <li>2. Create a new row before deleting the unwanted rows.</li> </ol>
<p>Documents that are pending review from Enterprise A2019.15 cannot be validated in Enterprise A2019.16 using the <b>Review documents</b> option.</p> <p><b>Workaround:</b> Create a Task Bot using the IQ Bot <b>Validation</b> action in the Enterprise A2019.15 package, and validate the review pending documents.</p>

## IQ Bot

New features
<p><b>Updates to IQ Bot Pre-processor package</b></p> <p>On-Premises and Cloud</p> <p>You can now perform the following tasks using the new actions in the IQ Bot package:</p> <ul style="list-style-type: none"> <li>• Link or combine two images using <b>Concatenate image</b></li> <li>• Adjust the size of the selected image file using <b>Edit image</b></li> <li>• Enhance the image resolution and other aspects using <b>Enhance image</b></li> <li>• Change the image orientation such as angle using <b>Orient image</b></li> </ul> <p><a href="#">#unique_409</a></p>
<p><b>IQ Bot [Local Device] package enhancements</b></p> <p>The IQ Bot [Local Device] package now enables you to add custom logic (Python scripts) in the Designer to extend text extraction and validation capabilities.</p> <p><a href="#">Add custom logic in IQ Bot to improve extraction</a></p>

Fixed features	
Service Cloud case ID	Description
00590165	You can now train the selected document because error messages are no longer displayed when you click <b>Learning instances &gt; See extractions</b> for a group.
--	If you remove a bot ( <b>Delete a bot</b> ) associated with a document from the staging environment, you must create a group before uploading this document to the production environment. After deleting the bot from the staging environment, you can now create or edit the group when you upload the same document to the production environment.

Fixed features	
Service Cloud case ID	Description
00601840	You can now view a public bot without any errors when you click <b>BOTS &gt; My bots &gt; PUBLIC</b> in Enterprise A2019.
00672482	You can now validate documents with a large number of fields (more than 100) and navigate between multiple documents without any issues on the <a href="#">Validator</a> .
00648013, 00670191	You can now migrate, export, import, or download IQ Bot learning instance backup (.iqba) files of up to 1.4 GB. The previous limit was 600 MB.

Known limitations
Migration of learning instances does not get completed if the IQBA file size is more than 2 GB. <b>Workaround:</b> <a href="#">Migration of learning instance is not getting completed if the IQBA is more than 2GB (A-People login required)</a>
In the IQ Bot Designer, sometimes while training documents when the user clicks <b>See extraction results</b> , an error message appears and the user cannot proceed with the task.
You cannot access Cloud OCR through a proxy server in IQ Bot.
In IQ Bot Community Edition, when you click <b>New instance</b> to create a learning instance, the <b>My learning instances</b> page appears and then automatically reloads after a few seconds. <b>Workaround:</b> Wait until the page reloads before you start entering the details to create a learning instance.

## Bot Insight

New features
<p><b>Power BI connector available as part of Microsoft Power BI desktop</b></p> <p>Enterprise A2019 and Community Edition</p> <p>The Automation Anywhere connector for Bot Insight is now certified and officially a part of the Microsoft Power BI Desktop August release.</p> <p><a href="#">Data connector for Power BI</a> on page 2278</p>
<p><b>Business analytics support for attended Bot Runners</b></p> <p>Enterprise A2019 and Community Edition</p> <p>Business analytics data is now logged when bots are run with attended Bot Runners licenses. Also, a new attribute <b>User Name</b> is available in the <b>Business Dashboard</b> in <b>Transaction Data</b>. This attribute shows the user who is running the bot.</p>

**Changed features****Convert bot duration metric to percentage**

In the **Device** dashboard, when you select the metric as **Bot Duration**, you have an additional option to convert the bot duration to percentage. This option appears only if a selected group or subgroup is of date type variable.

[Operations dashboard](#) on page 2257

**Known limitations**

Due to security reasons, you cannot access the following Bot Insight APIs and a 403 forbidden error is displayed.

```
GET/v2/botinsight/data/api/gettasklogdata
GET/v2/botinsight/data/api/gettaskvariableprofile
DELETE/data/api/deletetasklogdata
GET/data/api/getbotrundata
GET/data/api/getaudittraildata
```

**Automation Anywhere Robotic Interface (AARI)**

**Important:** This AARI version is available for all users starting from Enterprise A2019.16.

**New features****Assign tasks**

Enterprise A2019

AARI managers and users can now assign tasks. Managers can assign and reassign tasks to any users from teams with an assigned process. Users can assign tasks to other users of the same team.

[Assign or unassign a task](#) on page 1520

**Filter and search tasks**

Enterprise A2019

AARI users can now perform the following tasks:

- Filter, sort, and search tasks for quick results
- Search task names using **Search Title**
- Sort by completed, pending, and unassigned tasks using the **Filter** option
- Configure results based on assignee or title using **Advanced filter**
- Click a column to sort by ascending or descending orders

[Filter and search for a task](#) on page 1523.

**Summarized information of tasks**

Enterprise A2019

The **Tasks** tab in the main page shows statistical insight for the numbers of completed, pending, and unassigned tasks.

New features
<p><b>Process package</b></p> <p>Enterprise A2019</p> <p>The <b>Process</b> package enables users to create a request inside a specified process from a bot.</p> <p><i>Process</i></p>
<p><b>Preview bot</b></p> <p>Enterprise A2019</p> <p><b>Human Tasks</b> and <b>Bot Tasks</b> now include the <b>Preview bot</b> option, which enables users to quickly preview relevant bot or forms information.</p>
<p><b>Process editor metadata</b></p> <p>Enterprise A2019</p> <p><b>Human Tasks</b> and <b>Bot Tasks</b> now accept username and email metadata. Users can enter the name and email values to their process workflow such as <code>\$Task.assignedTo{username}\$</code> and <code>\$Task.assignedTo{email}\$</code>.</p>
<p><b>Enhancements to roles</b></p> <p>Enterprise A2019</p> <p>The AARI admin can now assign a process to a team they created and become the manager assigned to that process. The admin can also assign a process to a team they did not create and the manager of that team is assigned to the process.</p>
<p><b>Administration permission</b></p> <p>Enterprise A2019</p> <p>The AARI admin and manager are now assigned a new <b>Administration</b> permission by default called <b>View Users and Roles basic information</b>. The admin can now view the process management page to assign or unassign managers.</p>

Changed features
<p><b>Process management page</b></p> <p>The process management page in AARI on the web is now removed for managers.</p>
<p><b>Password field in request view</b></p> <p>The <b>Password</b> element is now removed when viewed in the request tab.</p>

Fixed features	
Service Cloud case ID	Description
--	A team name is no longer limited to 20 characters.
--	When you open many request tabs, the navigation bar now functions properly and allows you to navigate to your tabs by using the arrow icon.
--	When you view tasks in the request view, the request and task now show the correct status.

Fixed features	
Service Cloud case ID	Description
--	The manager can now be removed in the process management page.
--	The bot status in the request view is now represented as a progress bar.
--	The <b>Element name</b> field in the process editor now shows the correct error message when the field contains spaces.
--	When you select the <b>Make field uneditable</b> option for the <b>Checkbox, Date, Dropdown, Number, Password, Radio Button, Text Area, and Text Box</b> elements, the values can no longer be edited.
--	The team management page now shows the <b>Owner</b> column.
--	When number values are entered in a number field, such as a phone number box, the values are now accepted.
--	In the device pool configuration page, the Bot Runner users check box is now selected.
--	The <b>Checkbox</b> and <b>Radio Button</b> elements now support horizontal format.
--	The <b>Document</b> element can now access the <b>Open the doc in browser</b> link.
--	The <b>Number</b> element values are no longer limited to 8 characters and can now be rendered properly when the values contain trailing zeroes, commas, and decimals.
--	When you select the <b>Insert a variable</b> option in the process editor, the <b>Variable</b> field now shows specific variable names.
--	The redo functions now works properly in the process editor.
--	The <b>Text Box</b> element now accepts number-only inputs.
--	The timestamp of the closing step now shows the timestamp of the last step in request view.
--	When you access a public process, the existing variable in the field can no longer be changed.
--	The <b>Masked data</b> option is now fully supported for all elements.
--	When you edit a checked-out process that contains conditional steps with variables, you can now edit and save these conditional steps.
--	When a process is configured with two forms that contain a <b>Dropdown</b> element, the process creation shares the <b>Dropdown</b> element data between the forms. The <b>Dropdown</b> element in the second form now receives data from the first form.
--	The manager can now access their team without encountering any errors.

Fixed features	
Service Cloud case ID	Description
--	You can now update values in a prepopulated text field in request view.
--	When you create a request and encounter a preprocessing error, the request creation ends and the request view now shows the failed status.
--	The <b>Go To</b> option in the process editor now shows the <b>Human Task</b> or <b>Bot Task</b> name.
--	Users with the AARI manager and user roles are now automatically redirected to the web interface when they access the Control Room URL.

Known limitations
When you provide your <b>Bot Task</b> and <b>Human Task</b> the same element name, an error occurs for the <b>Go to</b> element, but the process editor does not prompt an error. <b>Workaround:</b> Create unique element names for your <b>Bot Task</b> and <b>Human Task</b> .
When you create a form that contains a <b>Document</b> element and access your <b>Human Task</b> in the process editor, you cannot assign your variable because the <b>Add element</b> option is not available.
The <b>Display message</b> field in the <b>If/Else pair</b> action does not function correctly when displaying a message in request view.
The titles ( <b>Title</b> field) of completed requests in AARI on the web are replaced by endpoint display names.
When you create a form that contains a <b>Number</b> field set to a 10-character limit and you enter 1234567890 in the number field in request view, the number values are not accepted.
When you create a process with a form that contains a <b>Date</b> element, the <b>Condition</b> option in the <b>If/Else pair</b> action does not allow you to enter a variable.

## Previous Automation 360 Release Notes

Review the release notes for previous Automation 360 releases.

## Enterprise A2019.15 Release Notes

*Release date: 14 August 2020*

Review the new features, supported packages, changed features, fixed features, security fixes, and known limitations in the Enterprise A2019.15 (Build 5933) release. IQ Bot and Discovery Bot are on Build 5931.

- [Enterprise A2019](#) on page 591
- [Discovery Bot](#) on page 600
- [IQ Bot](#) on page 601
- [Bot Insight](#) on page 604
- [Automation Anywhere Robotic Interface](#) on page 605

## Enterprise A2019

To verify which version is compatible with this release, see [Compatibility with release builds](#) on page 985.

<p><b>New features</b></p>
<p><b>Introducing Discovery Bot and Automation Anywhere Robotic Interface</b></p> <p>Enterprise A2019</p> <p><a href="#">Discovery Bot</a> on page 600   <a href="#">Automation Anywhere Robotic Interface</a> on page 605</p>
<p><b>Migration from Enterprise 11 and Enterprise 10 to Enterprise A2019 (currently available only to those in the Migration Early Adopter Program)</b></p> <p>Enterprise A2019</p> <p>Migration to Enterprise A2019 is currently only available to select customers through our Migration Early Adopter Program. If you are interested in learning more about this program or a timeline for when migration will be available to all customers, contact your Automation Anywhere representative.</p>
<p><b>Perform an action on multiple objects of the same type</b></p> <p>Enterprise A2019</p> <p>The variable anchor in AISense Recorder enables you to perform an action on multiple objects of the same type.</p> <p><a href="#">Use variable anchor</a></p>
<p><b>Run Enterprise 11 bots from Enterprise A2019</b></p> <p>Enterprise A2019</p> <p>The <b>V11 TaskBot package</b> enables you to run Enterprise 11 bots from Enterprise A2019 in the Enterprise 11 Control Room.</p> <p><a href="#">V11</a></p>
<p><b>Enhancements to the Interactive forms</b></p> <p>Enterprise A2019</p> <p>Interactive forms include the following updates:</p> <ul style="list-style-type: none"> <li>You can include the <b>Dynamic</b> element of the selected form in the <b>Change label</b> action.</li> <li>In the <b>Dynamic area</b> actions: <ul style="list-style-type: none"> <li>You can add a maximum of four elements for the <b>Add row in Dynamic area</b> action.</li> <li>In the <b>Add element</b> screen, use additional options from the <b>Type</b> drop-down menu such as Checkbox, Dropdown, File, Snapshot, RadioButton, Text Area, and TextBox.</li> </ul> </li> </ul> <p><a href="#">Interactive forms package</a></p>

New features
<p><b>Support for interactions with Oracle EBS tables</b></p> <p>Enterprise A2019 and Community Edition</p> <p>Use the Universal Recorder or the <b>Recorder &gt; Capture</b> action to read data from an Oracle EBS table. The following actions are now supported:</p> <ul style="list-style-type: none"> <li>• Get Total Row</li> <li>• Get Total Column</li> <li>• Get Cell text by Index</li> <li>• Get Cell index by text</li> </ul>
<p><b>Expanded data type support in DLL package</b></p> <p>Enterprise A2019 and Community Edition</p> <p>The DLL package now accepts dictionary and list variables as input parameters or to hold action output.</p> <p><i>Using the Run function (Legacy)</i></p>
<p><b>Create device pools using API</b></p> <p>Enterprise A2019</p> <p>You can now create a device pool and add unattended Bot Runners to the device pool using an API. This API uses <b>deviceIds</b>, <b>automationScheme</b>, <b>ownerIds</b>, and <b>consumerIds</b> as parameters to create a device pool.</p> <p><i>Device Pools API</i></p>

Supported packages	
Package	Version
Node Manager	12.1.6000
Application	2.0.0-20200721-221935
App Integration	1.0.0-20200721-221933
Analyze	2.2.3-20200624-011702
Active Directory	2.0.1-20200721-221930
Boolean	2.0.0-20200721-221936

VBScript	2.0.0-20200721-222503
Wait	3.0.0-20200721-222505
Window	2.0.0-20200721-222507
Workload	2.0.1-20200721-222508
XML	2.0.0-20200721-222509

Changed features
<p><b>User validation for change in authentication type</b> (Service Cloud case ID: 00602788)</p> <p>Enterprise A2019</p> <p>The username is now validated when an admin user updates the Control Room authentication configuration from <b>Database</b> to <b>SAML (Administration &gt; Settings &gt; User Authentication)</b>. An error message appears if the username already exists.</p> <p><a href="#">Set up SAML authentication</a> on page 954</p>
<p><b>The Before and After fields in the String &gt; Extract action are now optional</b> (Service Cloud case ID: 00617151)</p> <p>Enterprise A2019 and Community Edition</p> <p>Users can now build and run bots that do not have a value in the <b>Before</b> or <b>After</b> fields. This ensures migrated bots that contain the <b>String &gt; Extract</b> action can run without disruption.</p>

Changed features
<p><b>Improved debugging for Image Recognition actions</b></p> <p>Enterprise A2019 and Community Edition</p> <p>When a bot fails while running one of the Image Recognition actions, the captured source and target images are stored in the log folder. Users can review the images to identify issues such as the application image not captured correctly or low quality of the image due to differences in the Bot Creator and Bot Runner devices.</p> <p><a href="#">Image Recognition package</a></p>

Fixed features	
Service Cloud case ID	Description
00609293	The AATaskName system variable now uses a backslash (\) to support the migration of Enterprise 11 bots that use this variable to Enterprise A2019.
00600367, 00620149	When calling REST APIs for using the REST Web Service command, the API now returns the correct status and the response code.
--	When Work Items are processed for automation in the Bot Agent, you can now view the workload automation name in the <b>Workload &gt; Queue &gt; View Activity in progress</b> and <b>Run bot with queue &gt; View</b> pages, even when the workload automation ID and schedule automation ID are the same in the Control Room database.
00606636	The migration of 11.3.x bots that read a date from a file to an Enterprise A2019 variable now results in the correct date format: dd/mm/yyyy. Previously, a series of numbers were displayed in Enterprise A2019.
00576004	Fixed an issue where some emails were retrieved with HTML tags, even when the user selected the <b>Plain text</b> option.
00585830	Fixed an issue where the <b>Loop &gt; For each meeting in calendar</b> iterator only returned details for the first meeting of the day. Now, the output variable refreshes after each iteration and returns details for each meeting.
00505228, 00576757	When the browser language is set to Japanese, error messages from the <b>Control Room &gt; Administration &gt; Settings &gt; Email</b> page are now displayed correctly. The distorted Japanese character issue is now fixed.
--	You can now check in any forms or bots in the <b>Public</b> folder that were created using any of the earlier versions of Enterprise A2019.
--	You can now use the <b>Get</b> action without any errors for an empty dynamic element of a form during bot runtime.
00575400, 00597633	You can now use <b>Email trigger</b> to start a bot even when Microsoft Office is set to a non-English language.

Fixed features	
Service Cloud case ID	Description
--	If you are using the <b>Snapshot</b> element, the form is no longer minimized even if you set an invalid file path to save the snapshot during bot runtime.
00566225	If you add a form with a Japanese name, error messages are not displayed during bot runtime.
00571773	If you have added element label or text in Japanese and set <b>Font name &gt; System default</b> , the form elements are now displayed without any distortion during bot runtime.  <a href="#">Create a form</a> on page 1536
00620911	For the <b>Select file</b> element in a form, the file path is now displayed correctly when you select a file with a Japanese name during bot runtime.
--	If a form has a <b>Dynamic</b> field, any errors within any of the available elements are now displayed immediately during bot runtime.
--	An error is now displayed if you use the <b>Tab</b> key to navigate out of the <b>Dropdown</b> element in a form during bot runtime.
00616251	If a Bot Runner (attended or unattended) user is running a bot and an event trigger that is associated with this user starts, the event trigger is now queued and deployed after the current bot has completed.
00557617	The Simulate keystrokes action now supports ASCII characters when the device language is set to Russian.
--	Installing cloud-based license files is now supported on Control Room deployments using Linux CentOS 7.
00615038	All packages and actions now work with the "Portuguese (Brazil)" browser language. Previously, some packages and actions caused an unresponsive Control Room when "Portuguese (Brazil)" was selected as the browser language.
--	You can now reset the password successfully when the service credential expires or is disabled. Previously, users intermittently experienced issues while resetting the password.
--	The default logging for Bot Agent is no longer in debug mode. Previously, debug mode was the default logging, which caused an increase in the number of logs and resulted in high storage space and decreased system performance.
00588077	If you create a copy or edit the content of an existing CSV file, the modified content that is uploaded in the Control Room will now display correctly and will not cause any run-time error when the bot is executed.
00541524,00531540	You can now run bots even when the path of the bot location is more than 255 characters. Previously, the bot failed with an error.

Fixed features	
Service Cloud case ID	Description
00615106	The Bot Scanner now analyzes large bots within a few minutes.
00610366	Keyboard shortcuts such as Ctrl+C, Ctrl+V, and Ctrl+X work as expected on Internet Explorer.
00577850, 00608065, 00597132, 00596397, 00619463	The Control Room now does not become unresponsive after a period of inactivity.
00608824	An error is no longer encountered when a bot opens the Excel application after it is forcefully terminated.
00542144	The wait option in various packages now works as expected for applications based on HTML technology. Previously, the wait option used to wait for a period in multiples of 15 seconds based on the value provided. For example, if the wait value was in the range of 1-14, the system waited for 15 seconds.
00508478, 00504802, 00569822	An error is no longer encountered when a bot is running and an application window is closed when the bot is performing the find window operation.
00494857	A user that does not have the <b>Register device</b> permission can no longer register a device by creating a custom Bot Creator role.
00501619, 00614130, 00620198	An error is no longer encountered when a user deletes a device after upgrading to a later version of Enterprise A2019.
00616786	Fixed an issue where periodic scheduled bot deployments failed with the following error message (even though the credentials provided by the bot is correct):  <pre>Either your username or your password is incorrect. This might be due to a misspelling, your Caps Lock might be on, the password might have expired, or the domain might be required. To continue, retype your username and password.</pre>
00494893	Fixed an issue where the <b>Error handling &gt; Catch</b> action was not handling a runtime error with the record variable. Previously, the <b>Catch</b> action did not capture an <code>index out of bounds</code> error when the record variable was entered in a <b>Message box</b> action with the index specified by name.
--	The Get Property datetime format within the Active Directory package now displays the information using the system datetime format.
--	When you edit a bot using a previous package version (for example, Enterprise A2019.13 version) and the Desktop session automatically starts, if you exit the Bot editor while the Desktop session is trying to launch, the current package version will now be displayed when you open a new Bot editor instance. Previously, the previous package version (for example, Enterprise A2019.13 version) was displayed.

Fixed features	
Service Cloud case ID	Description
00563346	Credentials with non-ASCII characters are now allowed to be stored in the <b>Credential Vault</b> in the Control Room. Therefore, when you run TaskBots to open files that are protected using passwords containing non-ASCII characters, the application does not respond with an HTTP 500 error.
00525552, 00470841	The Run task no longer fails when the child bot name contains allowed special characters. Previously, when the child bot name contained allowed special characters, the run task displayed an error message.
00501212	Fixed an issue in the SMTP settings where the Control Room was sending notification emails for all of the conditions, including the disabled conditions.
00607005	A security scan of Enterprise A2019 no longer reports the Recorder package as a malicious software. Previously, the security scan reported it as a malicious software because the <code>check.exe</code> file was missing the root identification certificate.
00564129	On an operating system configured for Japanese, the Roles pages in the Control Room now shows English text as expected when you select English in the Control Room language selection.
00629523	When you upgrade from an earlier version of Enterprise A2019 to a later version and change the If package version to the latest one, conditions combined with the <b>AND</b> or <b>OR</b> condition now appear in the logic. Previously, except for the first condition, the rest of the conditions with the <b>AND</b> or <b>OR</b> condition were not shown.
00631477	When Work Items from multiple queues are processed for Workload automation from one device pool with the round-robin method for a time slice of 5 minutes, the Workload automation does not run in a loop and thereby causing an increased CPU usage.
00633829	As system admin permissions for Workload automation are verified by the application when you run a bot with queue from a single device pool to process multiple Work Items concurrently, CPU usage does not increase drastically.
00615086	Fixed an issue where the Java Application Launcher continued to run after a user stopped the Bot Scanner, which caused device performance issues for some users.
--	Variables of the List type are now available for migration from Enterprise 10 and Enterprise 11 to Enterprise A2019.
00607949	Disabled packages will not be enabled when you upgrade from an earlier version of Enterprise A2019 to a later version. Previously, packages that were disabled were enabled after an upgrade.
--	You can now debug a bot with watch variables that contain Japanese characters. Previously, watch variables containing Japanese characters did not output a value.

Fixed features	
Service Cloud case ID	Description
00623186, 00624876, 00624060, 00627123, 00629873, 00639523, 00630880, 00634577, 00636166	The correct status of a deployed bot now appears instead of <code>Device yet to be determined</code> in the Control Room <b>Activity</b> page, and the user is allowed to delete the device that has completed running a bot. The following message no longer appears: <code>Device is part of active deployment.</code>
00573461	Fixed an issue where a bot was failing in preprocessing mode if the user had inserted and then disabled the <b>Error Handler &gt; Catch</b> action without also disabling the <b>Finally</b> or <b>Catch</b> actions.
00629046	In the Database package, when you use Microsoft Excel as a database, the bot launcher now executes properly. Previously, the bot launcher stopped working when reading data from an Excel sheet that had some empty rows.

Security fixes	
Service Cloud case ID	Description
00491697	The Transport Layer Security (TLS) protocol using CBC mode of encryption for configuring the network security of the Control Room is now secured from man-in-the-middle or crystallographic timing attack.

Known limitations
When you add a form with the <b>Dynamic</b> element to a bot, click <b>Add element</b> , select <b>Dropdown</b> or <b>Radio group</b> as the <b>Type</b> , and leave the <b>Default value/ Default path</b> field blank, the elements appear as labels during bot runtime.
You can move a form around by dragging the title bar during bot runtime.
When you copy and paste the filepath for the <b>Select file</b> element of a form during bot runtime, invalid characters are displayed.
When the <b>Set focus</b> action is assigned to a disabled form element, an error icon is displayed when the focus is lost during bot runtime.
When you enable any of the disabled fields during bot runtime, error icons are not displayed.
Error messages during bot runtime are not displayed in the language selected in the Control Room.
If email trigger is used to start a bot, the status of the most recent email that you have viewed is changed to <b>Unread</b> every time any bot is triggered based on the trigger interval set in the <b>Check every</b> drop-down menu.
In an Control Room configured for Active Directory users, the following message appears after the first admin user is created: <code>Do you want to leave this page?</code> <b>Workaround:</b> Click <b>Stay on page</b> so that you can go to the Control Room login page.
If the device is already registered by a user other than the Bot Creator and the Bot Creator has the <b>Register device</b> permission, then when you run a bot from the Bot editor window, the deployment fails at the <code>Connecting your computer to Enterprise Control Room step.</code>

Known limitations
The migration process does not migrate manual dependency files added in the Enterprise 11 Control Room using the API. Bots associated with these dependencies will be migrated successfully but will fail during execution because the system cannot find these dynamically added dependency files at runtime in Enterprise A2019.
When a bot execution is in progress and the Control Room server refreshes, the progress status of the <b>In-Progress</b> activity will not be displayed even though the bot execution continues without interruption.

## Discovery Bot

### Introduction

Discovery Bot enables process automation by capturing document processes, identifying automation opportunities from business processes, and prioritizing opportunities based on ROI. Users can convert these opportunities into automated processes.

*Process discovery by using Discovery Bot* on page 1653

Known limitations
Discovery Bot is not supported in high availability (HA) mode. When two Control Room instances are used in a cluster configuration, the recording artifacts are split between the two Control Room instances and the recording might fail to process.
<p><b>Workaround:</b> To enable Discovery Bot in HA mode, you must update the <code>processdiscovery.properties</code> file to point to the repository path specified in the Control Room:</p> <ol style="list-style-type: none"> <li>1. From the Control Room, go to <b>Administration &gt; Settings &gt; General</b>.</li> <li>2. Select the <b>Control Room Database and Software</b> tab.</li> <li>3. Scroll to the <b>Control Room Repository</b> section.</li> <li>4. Copy the path specified in the <b>Repository path</b> field.</li> <li>5. Go to <code>C:\Program Files\Automation Anywhere\Enterprise\config</code>.</li> <li>6. Open the <code>processdiscovery.properties</code> file.</li> <li>7. In the <code>processdiscovery.data.staging</code> path, paste the repository path in the <code>&lt;yournetworkshareddrive&gt;</code> here: <code>\\&lt;yournetworkshareddrive&gt;\Processdiscovery\staging\data</code></li> <li>8. Restart the Discovery Bot service.</li> </ol>
When HTTP proxy is installed in a cloud environment, you can use the Discovery Bot recorder to record processes.
Custom role setup for Discovery Bot is currently not supported.
The Discovery Bot recorder continues to record your steps even after you have logged out of the Control Room.
<b>Note:</b> Manually stop the recorder to end the recording session.

Known limitations
The Discovery Bot recorder displays an internal error message when accessing Google Apps. Pause the recording and then resume the recording again to recapture the steps.
The recent recording (ID) created is displayed at the end of the list in the <b>Recordings</b> table. You cannot sort on the recording ID at this time.
The recording count for a process is incremented by one even if a user stops or cancels a recording session. The incremented number is displayed in the <b>Recordings</b> section in the tile for a process.
By default, you cannot move the endpoint in an upward direction in the path flow to change the selection of the steps. You can move the branch endpoint lower in the path flow to include more than one step.
You must add at least one step to a branch for you to select the branch and create an opportunity.
You must select all steps in a branch to create an opportunity. Selecting partial steps in a branch will result in branch being dropped in the opportunity that is displayed from the <b>Opportunities</b> tab.
Currently, the <b>copy of</b> field does not display the correct view information from the view (view ID) that it is copied from.
If the Control Room is not installed in the C:\ drive ( C:\Program Files\Automation \Enterprise), the Discovery Bot installer fails to install correctly. If the Control Room is not installed in the C:\ drive, then perform the instructions provided in this article: <a href="#">A2019.15 Discovery Bot installation issue with non-OS drive (A-People login required)</a> .
The <b>Export to Word</b> option supports a maximum of 500 steps.
The <b>Convert to Bot</b> option supports a maximum of 500 steps.

Changed features
.

## IQ Bot

Review the compatibility of the IQ Bot On-Premises version with the corresponding Control Room On-Premises version.

[Automation 360 IQ Bot version compatibility](#) on page 786

For feature information about IQ Bot, see [Automation 360 IQ Bot feature comparison matrix](#) on page 781.

The IQ Bot Cloud version provides users with automatic provisioning for up to three environments such as Development, Test, and Production.

---

**Note:** IQ Bot Build 5931 is compatible with Enterprise A2019 Build 5933.

---

New features
<p><b>New IQ Bot Pre-processor package</b></p> <p>On-Premises and Cloud</p> <p>The following new actions are available as part of the IQ Bot package:</p> <ul style="list-style-type: none"> <li>• Convert image to PDF</li> <li>• Get barcodes</li> <li>• Get document info</li> <li>• Get page content</li> </ul> <p><a href="#">#unique_409</a></p>
<p><b>Search by filename in Validator</b></p> <p>On-Premises and Cloud (Service Cloud case ID: 00372981)</p> <p>Use the <b>Search by filename</b> field in the <b>Validator</b> screen to search a document in IQ Bot.</p> <p><a href="#">IQ bot Validator enhancements</a></p>
<p><b>IQ Bot [Local Device] package</b> (currently available on request only)</p> <p>On-Premises and Cloud</p> <hr/> <p><b>Important:</b> Contact your Automation Anywhere representative to request the On-Premises package. For Cloud, it is available as a pre-installed package.</p> <hr/> <p>Use the <b>IQ Bot [Local Device] &gt; Process documents</b> action to process documents using TaskBots created in the Control Room. You can scale by processing documents on multiple devices simultaneously without setting up a separate IQ Bot cluster. You can set this up using workload management in the Control Room.</p> <p><a href="#">Workload management</a> on page 2108</p> <p>The validation is done using the current IQ Bot Validator and usage metrics on the dashboards, which is available with the installed IQ Bot server.</p> <hr/> <p><b>Note:</b> You can create validators using interactive forms if they do not want to send data to the IQ Bot server.</p> <hr/> <p><a href="#">IQ Bot [Local Device] package</a></p>
<p><b>IQ Bot Classifier package</b> (currently available on request only)</p> <p>On-Premises and Cloud</p> <p>The IQ Bot Classifier package enables you to group documents into appropriate learning instances for content extraction.</p> <p>This package is not available as part of the standard IQ Bot installation.</p> <hr/> <p><b>Important:</b> Contact your Automation Anywhere representative to request the package.</p> <hr/> <p><a href="#">IQ Bot Classifier package</a></p>

New features
<p><b>Migrate learning instances using Migration Utility</b></p> <p>On-Premises and Cloud</p> <p>Use the Migration Utility feature to migrate learning instances from one environment to another. Additionally, you can back up, restore, download, delete, and upload learning instances.</p> <p><a href="#">Migrate learning instances</a> on page 1295</p>
<p><b>Control creation of groups</b></p> <p>On-Premises and Cloud</p> <p>Use the <b>New groups creation setting</b> section in the <b>Learning Instance &gt; Edit</b> page to limit creating groups when uploading training documents to IQ Bot. Use the <b>Threshold to create new groups</b> value and <b>Never create new groups</b> check box to define the parameters.</p> <p><a href="#">Bots</a></p>

Changed features
<p>For the Custom Logic feature, the identified list of Python libraries now includes an additional set of trusted libraries for IQ Bot On-Premises and Cloud. Go to Automation Anywhere support for a list of the safe libraries you can use.</p> <p><a href="#">List of Pandas Libraries which are supported and not supported on Automation 360 IQ Bot (A-People login required)</a></p>

Fixed features	
Service Cloud case ID	Description
00376179	The Automation Anywhere Cognitive Project is now created without any errors even when you use the IQ Bot batch files to install or uninstall IQ Bot.
00560185	The <b>Download Document</b> in IQ Bot now runs without any errors, irrespective of the language in which the learning instances are saved.
00574815	You can now use the Google Vision API engine to classify the selected PDF files without creating any unclassified groups.
--	Documents are now classified correctly by the Google Vision API, irrespective of the display limitations set. Previously, an incorrect resolution limitation created unclassified documents.
--	You can now use Internet Explorer to save a document or mark it as invalid in the learning instances validator screen, without any error messages.
00620237, 00623175	After logging in to the Control Room as an IQ Bot administrator, the <b>IQ Bot</b> tab is no longer displayed in the navigation bar.
--	The <code>Output.csv</code> file generated for a validated document and validated data are now displayed without any error messages.

Fixed features	
Service Cloud case ID	Description
00605607	When you click <b>Save current document</b> in the validator screen, the document is saved without any errors and the corresponding <code>.CSV</code> file is created in the output folder.
--	IQ Bot deletes learning instances from Community Edition if they have not had activity in 60 days.

Known limitations	
IQ Bot On-Premises and Cloud	When you click the <b>Save and go to next group</b> option, the available groups or the learning instances are sometimes not displayed.
IQ Bot On-Premises and Cloud	A validation error message along with the corrected field is displayed in the output ( <code>.CSV</code> ) file for documents validated using ValidatorURL.
IQ Bot Cloud (Service Cloud Case ID: 00647700, 00657619, 00656643)	The output ( <code>.CSV</code> ) files are not downloaded even when you click <b>Download all documents</b> button, and an error message is displayed. Contact Automation Anywhere support for more information.

## Bot Insight

New features	
<b>Date Interval option</b>	Enterprise A2019 When you create new widgets that support date fields for a group or subgroup, the <b>Date Interval</b> option is enabled with the default option set to <b>Month</b> . <a href="#">Configuring a Line Bar Chart query</a> on page 2275
<b>New clustered line bar chart widget</b>	Enterprise A2019 and Community Edition The Clustered Line Bar Chart widget enables you to view and analyze information about your metrics and attributes. You can provide two metrics and two attributes in your clustered line bar chart. Now when two attributes are selected, a clustered graph grouped by primary and secondary attributes is displayed. <a href="#">Bot Insight visualizations</a> on page 2274

New features
<p><b>New Device dashboard in the Operations dashboard</b></p> <p>Enterprise A2019 and Community Edition</p> <p>The Bot Insight Device dashboard displays various widgets that provide information about the utilization of the machines on which the bots are executed. You can analyze the device utilization and activity history of different Bot Runner machines.</p> <p><a href="#">Operations dashboard</a> on page 2257</p>

Fixed features	
Service Cloud case ID	Description
00540647	Dates are now displayed correctly on the dashboard after the data is grouped based on the date. Previously, incorrect dates were shown on the dashboard.

Deprecated feature
The <b>Widget Event Distribution by workbench</b> is removed and will no longer be displayed in the <b>Audit Dashboard</b> .

## Automation Anywhere Robotic Interface

### Introduction

Automation Anywhere Robotic Interface (AARI) enables users to design a process workflow to address their business requirements. The processes incorporate human and bot tasks using forms to define parameters and render supported UI elements on the web. When using AARI on the web, users create requests to use their created process workflow for process instances (case) and run their tasks.

AARI is available as a part of the Enterprise A2019 installer. You can view the AARI components in the **Administration** page.

[Configure roles for AARI on the web](#) on page 1470

---

**Important:** This AARI version has limited availability and is available only to sales and internal users.

---

Known limitations
<p>When you edit a checked-out process that contains conditional steps with variables, you cannot edit and save these conditional steps. The steps will revert any new variables you add.</p> <p><b>Workaround:</b> Delete and add a new condition.</p>
<p>The <b>If</b>, <b>Else If</b>, and <b>Else</b> actions cannot be placed before another bot logic in your workflow. You can only place these actions at the end of the bot logic.</p> <p><b>Workaround:</b> Make a clear boundary on the conditional block.</p>

Known limitations
<p>In a process, when you use a date format such as 2020/07/04 in the <b>input_date</b> field in <b>Bot Task</b>, the bot does not accept the date input.</p> <p><b>Workaround:</b> Create a separate date variable to use an input.</p>
<p>Form elements that are not supported and are deleted by the process editor include: <b>Button</b>, <b>Dynamic</b>, <b>Select File</b>, and <b>Snapshot</b>.</p> <p><b>Workaround:</b> Instead of using the <b>Button</b> element, add a form action.</p>
<p>The <b>Import bots</b> and <b>Export bots</b> user interface labels do not match for a process but are still applicable to importing or exporting a process.</p>
<p>When you access a public process, the <b>Request display name</b> field in <b>Process entry</b> is not locked and can be edited. The existing variable in the field can be changed but not saved.</p>
<p>The <b>Task display name</b> option in <b>Process entry</b> has a field set to <b>initialData</b> that cannot be edited in the process editor.</p>
<p>The <b>Feed data into form</b> table in the process editor does not allow editing.</p>
<p>The <b>Element name</b> field in the <b>Bot Task</b> and <b>Human Task</b> cannot contain spaces.</p>
<p>When you create two forms and assign the data of the first form to the second form using <code>FormStep.input[]</code>, the second form data is not evaluated.</p>
<p>Redo functions are only available for canvas interactions. The redo functions are not available by default until your first canvas interaction. The functions are available again when you interact with your second canvas.</p>
<p>A team name that has a length of 20 characters or more is not accepted.</p>

Known limitations	
<b>Limitations in AARI on the web</b>	
<b>Navigation bar</b>	When you open too many request tabs, the tabs are hidden in the navigation bar.
<b>Timestamp</b>	The timestamp of the closing step shows a duplicate timestamp of the starting step in request view.
<b>Imported process</b>	<p>When you export a process from an Control Room and import that process as public to another Control Room, the imported process cannot be viewed.</p> <p><b>Workaround:</b> You can check in and then check out the process, or import the process as private and then do a check-in.</p>
<b>Configuration page</b>	<p>In the device pool configuration page, the Bot Runner users check box cannot be deselected.</p> <p><b>Workaround:</b> Double-click the check box in the header.</p>
<b>Process management page</b>	A check-in process that is deleted from the Control Room repository is still visible in the process management page.
<b>Form rendering</b>	<ul style="list-style-type: none"> <li>• The <b>Masked data</b> option is not fully supported for all elements. When this option is added to hide data, the data is visible.</li> <li>• The <b>Checkbox</b> and <b>Radio Button</b> elements do not fully support horizontal format. When these elements are configured to display horizontally, the elements are displayed vertically instead.</li> <li>• The <b>Document</b> element is not fully supported. When this element is configured to a <b>Default file</b> path, the entire document is not rendered.</li> <li>• The <b>Number</b> element encounters issues with large numbers. When this element is configured to contain three number fields and number values with trailing zeroes, commas, and decimals, these values are not honored and are not rendered. When number values are entered in a number field, such as a phone number box, the number values are not accepted.</li> <li>• The <b>Text Box</b> element encounters issues with number-only input. When this element is configured in a form to submit data, the <b>Submit</b> option is not enabled when the field contains only numbers.</li> <li>• The <b>Password</b> element encounters issues with maximum character limits. The maximum limit is not enforced when a password is entered in the initial form. This element does not contain values when</li> </ul>

## Enterprise A2019.14 Release Notes

*Release date: 9 July 2020*

Review the new features, supported packages, changed features, fixed features, and known limitations in the Enterprise A2019.14 (Build 5322) release. There are no security fixes in this release.

- [Enterprise A2019](#)
- [IQ Bot A2019](#)
- [Bot Insight A2019](#) on page 622

### Enterprise A2019

To verify which version is compatible with this release, see [Compatibility with release builds](#) on page 985.

New features
<p><b>Migration from Enterprise 11 and Enterprise 10 to Enterprise A2019 (currently available only to those in the Migration Early Adopter Program)</b></p> <p>Enterprise A2019</p> <p>Migration to Enterprise A2019 is currently only available to select customers through our Migration Early Adopter Program. If you are interested in learning more about this program or a timeline for when migration will be available to all customers, contact your Automation Anywhere representative.</p> <ul style="list-style-type: none"> <li>• Workload management data is automatically migrated to Enterprise A2019 when you install Enterprise A2019 and point the Control Room to the restored Enterprise 11 database. <ul style="list-style-type: none"> <li>• <a href="#">How workload management data is migrated</a> on page 1156</li> </ul> </li> <li>• Version 11.3.1 and Version 11.3 are certified for migration to Enterprise A2019. <ul style="list-style-type: none"> <li>• <a href="#">Migrate to Automation 360</a> on page 1084</li> </ul> </li> <li>• Additional support is provided for packages and variables. <ul style="list-style-type: none"> <li>• <a href="#">Package mapping for migration</a> on page 1201   <a href="#">Variable mapping for migration</a> on page 1232</li> </ul> </li> <li>• Migrate TaskBots and MetaBots created in Enterprise 10 to Enterprise A2019 using APIs. <ul style="list-style-type: none"> <li>• <a href="#">Migration API</a></li> </ul> </li> </ul>
<p><b>Bypass legal disclaimer</b></p> <p>Enterprise A2019</p> <p>When you allocate a device license to a user, the <b>Bypass legal disclaimer</b> option is automatically enabled to allow the user to run bots on the device without having to manually acknowledge a disclaimer.</p> <p><a href="#">Create a user</a> on page 2004</p>

New features
<p><b>Choose to automatically update Bot Agent</b> (Service Cloud case ID: 00497873)</p> <p>Enterprise A2019 and Community Edition</p> <p>An Control Room administrator can now choose to automatically update the Bot Agent to a later version (<b>Administration</b> &gt; <b>Devices</b>) using the auto-update capability. In the earlier version, each Bot Agent had to be updated manually after logging in to a device, resulting in more downtime.</p> <hr/> <p><b>Note:</b> In this release, Bot Agent users have to update each Bot Agent manually. From subsequent releases, the auto-update setting will be applied and each Bot Agent will be updated automatically.</p> <hr/> <ul style="list-style-type: none"> <li>• For Cloud and Community Edition, the auto-update option is enabled by default.</li> <li>• For On-Premises, the default update option is set to manual.</li> </ul> <p><a href="#">Automatically update the Bot Agent</a> on page 1001</p>
<p><b>Universal Recorder new features</b></p> <p>Enterprise A2019 and Community Edition</p> <ul style="list-style-type: none"> <li>• The Universal Recorder can now capture objects in SAP versions 730, 740, and 760 patch 5.</li> <li>• You can build automations in an SAP application using multiple connections (user accounts) and several sessions per connection at one time.</li> <li>• You can now record and run bots to capture objects from a Google Chrome browser that does not have a zoom level setting of 100%.</li> </ul>
<p><b>Capture active text, passive text, image button, and scroll in combo box in AISense Recorder</b></p> <p>Enterprise A2019</p> <p>You can now capture active text, passive text, image button, and scroll in a combo box from a remote application when recording a task with AISense Recorder.</p> <p><a href="#">Record a task with AISense Recorder</a> on page 1329</p>
<p><b>New Database package features</b> (Service Cloud case ID: 00537047)</p> <p>Enterprise A2019 and Community Edition</p> <ul style="list-style-type: none"> <li>• The <b>Connect</b> action now enables you to connect to an Excel database.</li> <li>• Use the <b>Export to data table</b> action to retrieve records from the database and store the retrieved data in a table variable.</li> <li>• You can now store the output of the <b>Run stored procedure</b> action in a dictionary variable.</li> </ul> <p><a href="#">Using Connect for database</a>   <a href="#">Using the Export to data table</a>   <a href="#">Using the Run stored procedure</a></p>
<p><b>New Active Directory package available</b></p> <p>Enterprise A2019 and Community Edition</p> <p>Use actions from the Active Directory package to manage users across a group or organization. You can perform operations such as create, modify, and delete users, groups, or organizational units with centralized control.</p> <p><a href="#">Active Directory package</a></p>

New features
<p><b>Log in securely when connecting to Active Directory server</b></p> <p>Enterprise A2019 and Community Edition</p> <p>You can use the <b>Connect</b> action from the Active Directory to enter your credentials (username and password). You can either insert the credentials from the Credential Vault or insert a variable that holds a credential type value.</p> <p><i><a href="#">Using Connect for   Credentials and credential variables in the Bot editor</a> on page 1395   <a href="#">Your variables (user-defined)</a> on page 1383</i></p>
<p><b>Support for Excel cell formats, including Number, Percentage, Currency, Scientific, and Date</b></p> <p>Enterprise A2019 and Community Edition</p> <p>Use the <b>Get single cell</b> and <b>Get multiple cell</b> actions from the Excel basic package and the <b>For each row in worksheet</b> Loop iterator to retrieve values in the format set in the Excel worksheet. For example, a value from a cell of Currency formatting retains the currency symbol when passed to a table or record variable.</p> <p><i><a href="#">#unique_462</a>   <a href="#">Loop package</a></i></p>
<p><b>Automate a task on a range of cells in an Excel worksheet</b></p> <p>Enterprise A2019 and Community Edition</p> <p>Specify a cell range in the <b>Delete cells</b> action to perform the operation on the cells in the range.</p> <p><i><a href="#">Excel advanced cell operations</a></i></p>
<p><b>New PDF package action</b></p> <p>Enterprise A2019 and Community Edition</p> <p>Merge multiple PDF files into a single PDF file using the <b>Merge documents</b> action.</p> <p><i><a href="#">Using the Merge documents</a></i></p>
<p><b>Support for Czech and United States 2 code pages in Terminal Emulator package</b></p> <p>Enterprise A2019 and Community Edition</p> <p>The TN3270E and TN5250E terminal types support the Czech and United States 2 code pages. Use the <b>Connect</b> action to select the terminal type and code page.</p> <p><i><a href="#">Using Connect for</a></i></p>
<p><b>Proxy support for packages</b></p> <p>Enterprise A2019</p> <p>If a device is configured with a proxy, all outbound requests from the following packages are routed through the proxy server:</p> <ul style="list-style-type: none"> <li>• Recorder</li> <li>• REST Web Service</li> <li>• SOAP Web Service</li> </ul>

New features
<p><b>Form builder enhancements</b></p> <p>Enterprise A2019</p> <p>The form builder now includes the following new elements:</p> <ul style="list-style-type: none"> <li>• <b>Dynamic</b> - Enables dynamic rendering of the selected area.</li> <li>• <b>Snapshot</b> - Enables you to take a snapshot of the form.</li> </ul>
<p><b>Enhancements to actions in Interactive forms</b></p> <p>Enterprise A2019</p> <ul style="list-style-type: none"> <li>• Enhanced highlight action <p>The <b>Highlight</b> action in the Interactive forms includes a <b>Highlight type</b> drop-down menu. You can use <b>Warning</b> or <b>Error</b> to highlight the selected form element during the bot runtime.</p> </li> <li>• New <b>Change label</b> action <p>Use this action to change the label or title of the selected element of a specific form.</p> </li> <li>• Dynamic area action <ul style="list-style-type: none"> <li>• The <b>Add row in Dynamic area</b> action enables you to append or overwrite a dynamic element of a form.</li> <li>• The <b>Clear</b> action enables you to remove the dynamic elements.</li> </ul> </li> </ul> <p><i><a href="#">Interactive forms package</a></i></p>
<p><b>Retrieve trigger event data</b></p> <p>Enterprise A2019</p> <p>You can now retrieve the trigger event data during bot runtime by defining a variable as the input type.</p> <p><i><a href="#">Add a file and folder trigger</a> on page 1561</i></p>
<p><b>Record variable support for schema</b></p> <p>Enterprise A2019 and Community Edition</p> <p>You can create a new record variable with a schema to set the order of the fields and the type of data that can be entered into each field.</p> <p><i><a href="#">Record variable</a> on page 1391</i></p>
<p><b>Product interface now available in Russian language</b></p> <p>Enterprise A2019</p> <p>Enterprise A2019 is now available in Russian.</p> <p><i><a href="#">Internationalization, localization, and language support</a> on page 833</i></p>

New features
<p><b>Clone and view content in Control Room</b></p> <p>Enterprise A2019</p> <p>The Control Room now includes the following new permissions:</p> <ul style="list-style-type: none"> <li>• <b>View content:</b> This permission allows you to view the contents of a cloned bot. This permission applies to both public and private workspaces.</li> <li>• <b>Clone:</b> This permission allows you to create a read-only copy of the bot from the public workspace. The same bot can be cloned by multiple users. This permission applies only to the public workspace.</li> </ul> <p><a href="#">Bot permissions for a role</a> on page 2025</p>
<p><b>New condition in the If and Loop packages</b></p> <p>Enterprise A2019 and Community Edition</p> <p>Use the <b>Dictionary &gt; Check key</b> condition to execute actions based on whether the value of the specified key is <b>Equal to</b> or <b>Not equal to</b>, or <b>Contains</b> or <b>Does not contain</b> the target value.</p> <p><a href="#">If package</a>   <a href="#">Loop package</a></p>
<p><b>New encoding type in CSV/TXT and Log To File packages</b></p> <p>Enterprise A2019 and Community Edition</p> <p>The UTF-16LE encoding option provides support for files that contain the byte order mark (BOM) Unicode character. In the <b>CSV/TEXT &gt; Open</b> action, selecting this option causes the BOM character to be ignored when data is retrieved from the file using a subsequent <b>Read</b> or <b>Loop</b> action. In the <b>Log to file</b> action, this option inserts a BOM character at the beginning of the file.</p> <p><a href="#">Using the Open for CSV/TXT file</a>   <a href="#">Using Log to file action</a></p>
<p><b>Retrieve a list of available users using Device API</b></p> <p>Enterprise A2019</p> <p>Use the Device API to identify all available users with unattended Bot Runner licenses, or to filter for users by name. This API returns details of each user, including the user ID, username, and device name.</p> <p><a href="#">Device API</a></p>
<p><b>Manually configure time interval value of database connection retries property</b> (Service Cloud case ID: 00573167)</p> <p>Enterprise A2019 and Community Edition</p> <p>You can manually configure the time interval value of the database connection retries in the <code>cluster.properties</code> file. If the database is reconnected within the time specified in the <code>cluster.properties</code> file, the Apache Ignite cache node in the cluster setup will not restart the Apache Ignite server, keeping the device and the Control Room user connected. The default value of the time property <code>ignite.max.duration.db.connection.retries</code> in the <code>cluster.properties</code> file is 10000. The recommended maximum time for this property is up to 5 minutes (300000 msec).</p> <hr/> <p><b>Note:</b> Restart the Control Room services on each node for the manually configured value of the time property to work effectively. Also, set the time in milliseconds.</p> <hr/>

New features
<p><b>Run as user to default device mapping in Workload automation</b> (Service Cloud case ID: 00563115)</p> <p>Enterprise A2019 and Community Edition</p> <p>Workload automation now allows one-to-one (1:1) mapping of the <b>Run As</b> user with default devices when these devices are part of a device pool. Therefore, you can select default devices that are mapped to a Bot Runner to avoid auto-login failures in environments where the security policy does not allow a user to log in to any other device or devices.</p> <p><i>Add queue, Bot Runner, and device pool</i> on page 2120</p>
<p><b>Authentication proxy support</b></p> <p>Support is now available for proxy authentication servers where any application going through the proxy is authenticated and authorized before accessing the internet.</p>

Supported packages	
Package	Version
Node Manager	12.1.6000
Application	2.0.0-20200624-041608
App Integration	1.0.0-20200624-041607

Changed features
<p><b>Changes in the Database &gt; Run stored procedure action</b></p> <ul style="list-style-type: none"> <li>It is now optional to enter an input or output parameter name.</li> <li>You must specify the data type of an input parameter. Choose from Boolean, date, number, or string date type.</li> </ul>
<p>The terminal screen for ANSI and VT100 terminals now displays 24 rows, instead of 25 rows as in earlier versions.</p>
<p><b>Email &gt; Send action interface changes</b></p> <p>For the <b>Use secure connection (SSL/TLS)</b> and <b>My server requires authentication</b> fields, you must now select <b>True</b> or <b>False</b>, or insert a Boolean variable. Previously, the fields were activated by selecting a check box.</p>
<p><b>Import bots in public or private workspace</b></p> <p>Service Cloud case ID: 00456712</p> <p>Users can now import bots into the public workspace if they have the required permissions, regardless of their licenses. Additionally, users with a Bot Creator license can now import the bots either into the public or private workspace.</p> <p><a href="#">Import bots</a> on page 2145</p>

Fixed features	
Service Cloud case ID	Description
00554068	In the Community Edition, when you upgrade your Bot Agent to a later compatible version, TaskBots created with system variables of numeric type now run successfully. The Control Room does not show a preprocessing error when you deploy the TaskBots.

Fixed features	
Service Cloud case ID	Description
00443421	The <b>Run stored procedure</b> action in the Database package runs as expected with Oracle Database when you use input and output parameters.
00557374	The Universal Recorder now consistently captures objects from an SAP application and identifies the technology for those objects as SAP when all prerequisites are met.
00611874	An error is no longer encountered when a variable containing Japanese characters is used in the <b>Write to file</b> action of the Data Table package.
00564534	A modified dependency file with the same name as the original file and a new size is now successfully checked in from the private to the public repository. The old file that was previously checked in is no longer referenced after the modified file is checked in to the public repository, thereby preventing a bot execution failure.
00570537	When you clone a bot with or without dependency files, the cloned bot now displays the actual file size for the bot and its dependency files.
00577247, 00587976	Fixed an issue where the <b>Email &gt; Move all</b> action did not move emails when a bot ran the action on an OS configured with the Japanese language setting.
00552729	The <b>PGP &gt; Decrypt</b> action now works for PDF files.
00487805	You can now access the TN3270 terminal without the terminal screen displaying all text with strike lines. Before using any type of terminal to execute terminal commands, install the latest VC ++ package.  <a href="#">Latest supported Visual C++ downloads</a>
00584051	Python 3 script now supports using Unicode characters in input variables. Bot error messages are no longer displayed when Python 3 is used to pass Japanese characters to a variable.
00540651, 00587963, 00593302	You can now use the <b>Assign, Join, Merge,</b> and <b>Sort</b> actions from the Data Table package when you change the default language from English to Simplified Chinese.  You can also use the <b>Assign</b> action when you change the default language from English to Japanese, Korean, and other non-English languages.
00577284	The <b>Split document</b> action in the PDF package now executes correctly for a horizontal PDF file, and the large-width output file is not cut off from the sides.
00595357	You can now export and import two different bots (with the same name) in different folders from a staging environment into a production environment.
00569527	You can now perform a check-in and check-out of bots with dependencies.

Fixed features	
Service Cloud case ID	Description
00574309	You can now update or remove <b>Cluster ip addresses</b> from the <b>Elastic search disaster recovery backup cluster</b> setting from the Control Room <b>Administration</b> page.
00525854	When a file type variable is used to open an Excel, CSV, or Java script file, bots can now be executed successfully when the file variable is used as an input.
00609184	After the existing license expires, the admin user can now successfully install a new Control Room license for a Control Room hosted on Linux CentOS.
00576202	You can now insert a user-defined string variable in a message box display when the string variable is included in the expression for multi-line values.
00560706	You can now view the actions menu (vertical ellipsis) to edit or delete the variable string name when the character length is more than 35 characters.
-	For the <b>Checkbox</b> element, changes made to the check box names in the <b>Checkbox content</b> field are now updated when you enable <b>Advance behaviors &gt; Make default selections</b> .
-	You can now set the default selection in <b>Advance behaviors</b> for the <b>Radio button</b> element in a form.
00557395	You can now check in bots that use the variable <code>\$prompt-assignment\$</code> without receiving an error message. Previously, when you opened the bot in List view, an error icon was displayed next to the actions that contain the variable.
00560356	Previously, when a task that consisted of one or more subtasks was run, the In Progress entry for the task was moved into a historical report with the completion of the first subtask, not the entire governing task. Now, the In Progress tasks are not moved to historical status until the completion of the entire task.
00556113	In Community Edition opened in Google Chrome, you can now select the device icon in a non-English language, and the <code>[link]</code> and <code>[icon]</code> tags are no longer displayed.
00559360	You can now re-import a bot that has failed previous imports. The <code>query did not return a unique result: 2</code> displayed during re-import attempts is now fixed.
00443590	Fixed an issue where after a bot is deployed on a Bot Runner device, that device is in a different state compared to the state before the bot deployment. For example, if a Bot Runner device is locked before bot deployment, after it is unlocked to deploy the bot, it will now be moved back to lock status.
00559507, 00594149	Support for scheduling bots with Internet Explorer version 11 is now improved. Users in the Control Room can scroll through multiple pages of scheduled bots without issues with scrolling through the interface.

Known limitations
<p>In Enterprise A2019 On-Premises, a security scan might report the Recorder package as malware because the <code>check.exe</code> file is missing the root identification certificate.</p> <p>You can contact Automation Anywhere Support to get an updated package with the signature fix and upload it to your Control Room.</p> <p><a href="#">Add packages to the Control Room</a> on page 1970</p>
<p>Version Enterprise 10 or Enterprise 11 bots containing commands that have white space in the credential attributes cannot be migrated to Enterprise A2019. The migration process stores some credential attributes in global values in Enterprise A2019. Global values do not support white spaces.</p> <p>To migrate bots that use credential attributes, you can remove the white spaces or replace them with characters.</p>
<p>If you use the <b>Get</b> action for an empty dynamic element of a form, errors are displayed during bot runtime.</p>
<p>If you use <b>Trigger loop: Handle</b> within a bot, link it to a form with <b>Select File</b> element, and set the <b>Select action trigger &gt; Lost focus</b>, the next event is not triggered when you click <b>Browse</b>.</p>
<p>The <b>Set focus</b> action in <b>Interactive forms</b> does not work when you use it to link the fields between two different forms.</p>
<p>In the form builder screen, text is displayed in English even when you change the display to non-English language.</p>
<p>You might see the schedule automation name instead of the Workload automation name in the <b>Workload &gt; Queue &gt; View Activity in progress</b> and <b>Run bot with queue &gt; View</b> pages when Work Items are processed for automation in the Bot Agent. This occurs if the Workload automation ID and schedule automation ID are the same in the Control Room database.</p>
<p>The <b>Task bot &gt; Run</b> action only supports files selected from the Control Room repository. Also, this action only supports file type variables with a set default value and the <b>input</b> option disabled. You cannot modify the file variable value using the <b>File &gt; Assign</b> action.</p>
<p>When you edit a bot using a previous package version (for example, an Enterprise A2019.13 version) and the Desktop session automatically starts, if you exit the Bot editor while the Desktop session is trying to launch, the previous package version will be displayed when you open a new Bot editor instance. However, you should see the Enterprise A2019.14 package version associated with the new Bot editor instance. If you close and reopen the new Bot editor instance, the Enterprise A2019.14 package version will be displayed.</p>

Known limitations
<p>There is an issue for a specific, manually generated license key file supplied by Automation Anywhere to upgrade from Enterprise A2109.13 to Enterprise A2019.14.</p> <p>This issue applies <b>only</b> to customers who are in the following specific category (<b>all</b> must be true):</p> <ol style="list-style-type: none"> <li>1. Control Room is at the customer premises</li> <li>2. Control Room is running Enterprise A2019.13 or earlier</li> <li>3. Installed a license file that was provided to them in July 2020 (not self-generated through the customer self-service license portal)</li> <li>4. User has upgraded the On-Premises Control Room to Enterprise A2019.14.</li> </ol> <p>For this issue, contact Automation Anywhere for updated license files.</p> <hr/> <p><b>Important:</b> Users who self-generated their license files through the A-People License portal are not affected by this issue. Cloud customers are also not affected by this issue.</p> <hr/> <p>A bot that contains the <b>Capture</b> action from the Recorder package fails when both the <code>HTML InnerText</code> and <code>InnerHTML</code> object properties are selected.</p> <p><b>Workaround:</b> Select only one of the object properties.</p> <hr/> <p>The Universal Recorder fails to perform a click, set text, or append text action on the correct control when a debug window or download bar is open. This occurs only in the Google Chrome browser with the device display set to 100%.</p> <p><b>Workaround:</b> Disable the Google Chrome download bar.</p> <hr/> <p>When you create, edit, or run a bot from the Bot editor window, close the Bot editor window when the socket connection has just been established, and then navigate to the <b>My bots</b> page, the Recorder window opens for a moment and then closes.</p>

Known limitation

## IQ Bot

The IQ Bot A2019 On-Premises version supports all the features and functionality available in IQ Bot Version 11.3.4.2.

[Automation 360 IQ Bot feature comparison matrix](#) on page 781

Review the compatibility of the IQ Bot On-Premises version with the corresponding Control Room On-Premises version.

[Automation 360 IQ Bot version compatibility](#) on page 786

The IQ Bot A2019 Cloud version is available for this release and supports all features and functionality available in IQ Bot Version 11.3.4.2. This version provides users with automatic provisioning for up to three environments such as Development, Test, and Production. Users can migrate learning instances between environments using APIs.

New features
<p><b>Delete bot option in IQ Bot Designer</b> (Service Cloud case ID: 00096258, 00595526)</p> <p>IQ Bot On-Premises and Cloud</p> <p>Users with Edit bot permission can view and use the <b>Delete bot</b> option in the Designer. After a bot is deleted from the system, it will not be displayed in the <b>Learning Instance</b> or <b>Bots</b> listing pages.</p> <p>IQ Bot removes all document details from staging, and all unprocessed production documents are moved to the Validator.</p> <hr/> <p><b>Note:</b> The <b>Migration Utility</b> &gt; <b>Import/Export</b> functionality is not affected in any way by the Delete bot feature.</p> <hr/> <p><a href="#">Bots</a></p>
<p><b>Extract data from a table that spans across multiple pages</b> (Service Cloud case ID: 00371795)</p> <p>IQ Bot On-Premises and Cloud</p> <p>IQ Bot can now extract data successfully from an entire table that spans across multiple pages and has a table header only on the first page.</p>
<p><b>Add fields and field alias to custom domain</b> (Service Cloud case ID: 00471075)</p> <p>IQ Bot On-Premises and Cloud</p> <p>You can now add additional fields (form or table) and field aliases to a custom domain for an existing learning instance.</p>
<p><b>Alert for successful or pending document validations</b></p> <p>IQ Bot On-Premises and Cloud</p> <p>Document validation status is now displayed on the <b>Learning instances</b> page. A green icon is used for all successful document validations, and a red icon shows any pending validations.</p>

Changed features
<p><b>Import custom domains from the staging to the production server in any order</b> (Service Cloud case ID 00472445)</p> <p>You can now edit and update an existing custom domain multiple times and import them to the production server multiple times, and in any order, before importing the learning instances. After importing the learning instances, the system classifies all documents in the production server correctly, allowing for successful processing of documents.</p> <p><a href="#">Custom domains in IQ Bot</a></p>

Changed features
<p><b>Validator enhancements</b> (Service Cloud case ID: 00470258)</p> <p>Some of the Validator enhancements are as follows:</p> <ul style="list-style-type: none"> <li>You can now hide the <b>Skip to next file</b> and <b>Mark as Invalid</b> options using configuration settings. The options are currently enabled by default.</li> </ul> <p>To enable the option to hide them, contact Automation Anywhere Support.</p> <ul style="list-style-type: none"> <li>You can now hide the <b>Hide successful fields</b> and <b>Hide optional fields</b> options using configuration settings. The options are enabled by default.</li> </ul> <p>To enable the option to hide them, contact Automation Anywhere Support.</p> <hr/> <p><b>Note:</b> Selecting the <b>Hide successful fields</b> and <b>Hide optional fields</b> check boxes hides all the valid fields and reduces the display of a large number of fields, thus making correction easier. However, if there is an invalid field, it continues to be displayed because the invalid field requires correction.</p> <hr/> <ul style="list-style-type: none"> <li>Clicking in any column field expands the column width to accommodate the text entry. The Validator shows the value of the field that is being validated, in the document.</li> <li>Draw an area around single or multiple values in the document image to automatically populate a field in the Validator. This function is similar to the Designer.</li> </ul>

Fixed features	
Service Cloud case ID	Description
00552830	You can now use the unique validation link to access the documents without any errors.
-	When you use table extraction from a document with multiple tables, the data from the specified table is now extracted correctly.
00551886	Unicode issue with table validation for Asian languages is now resolved.
00538480	The <b>Options</b> method is now disabled for HTTP requests.
00538480	Cross origin resource sharing is now restricted in IQ Bot.
00421067	The activities time stamp is now captured correctly in the Control Room <b>Audit Logs</b> tab.
00522817	The <b>TestRun</b> output of a custom logic now displays the characters without any distortion, irrespective of the language you select.
00605420, 00605741, 00606561	After upgrading to IQ Bot Cloud if you restart the Control Room, you can now view or create learning instances immediately without restarting the IQ Bot service.

Known limitations
<p>IQ Bot On-Premises and Cloud</p> <p>If you create a learning instance and click <b>Learning instances</b> &gt; <b>Edit</b>, a blank page is displayed.</p> <p><b>Workaround:</b> Clear your browser cache and try to edit the learning instances.</p>
<p>IQ Bot On-Premises and Cloud</p> <p>If you log in to the Control Room as an IQ Bot administrator, a 502 system error is displayed when you click the <b>IQ Bot</b> tab in the navigation bar.</p>
<p>IQ Bot On-Premises and Cloud</p> <p>You can view the <code>ValidatorURL</code> error message for a validated document along with the corrected field in the <code>.csv</code> output file.</p>
<p>IQ Bot On-Premises and Cloud</p> <p>In Internet Explorer, you cannot save a document or mark it as invalid in the learning instances validator screen.</p> <p><b>Workaround:</b> Use the Google Chrome browser to access the learning instances validator screen.</p>
<p>IQ Bot Community Edition</p> <p>If you remove a bot (<b>Delete a bot</b>) associated with the document from the staging environment, you must create a group before uploading this document to the production environment. However, after deleting the bot from the staging environment, you cannot create or edit the group when you upload the same document to the production environment.</p>

## Bot Insight A2019

New features
<p><b>Line Bar Chart widget available</b></p> <p>Enterprise A2019</p> <p>The <b>Line Bar Chart</b> widget enables you to view and analyze information about your metrics and attributes. You can input two metrics and one attribute and display a bar graph when only one attribute is selected or display a clustered graph when two or more attributes are selected. You can use <b>Date</b> types as interval options, grouped by <b>Day</b>, <b>Week</b>, <b>Month</b>, and <b>Year</b>.</p> <p><a href="#">Bot Insight visualizations</a> on page 2274</p>
<p><b>Advanced settings for a query</b></p> <p>Enterprise A2019</p> <p>You can use the <b>Advanced Settings</b> option to configure more of your queries when you create a new widget. You can now set limits to your attribute values as grouped by <b>10</b>, <b>20</b>, <b>50</b>, and <b>100</b> values. You can also sort your data by ascending or descending order.</p> <p><a href="#">Configuring a Line Bar Chart query</a> on page 2275</p>

## Enterprise A2019.13 Release Notes

*Release date: 15 June 2020*

Review the new features, supported packages, changed features, fixed features, and known limitations in the Enterprise A2019.13 release. There are no security fixes in this release.

A2019.13 Build 4701 is available for Cloud customers, and Build 4705 is available for On-Premises customers. Community Edition remains on A2019.12 and will be upgraded to A2019.14 upon availability.

- [Enterprise A2019](#)
- [IQ Bot](#) on page 631
- [Bot Insight](#) on page 634

### Enterprise A2019

To verify which version is compatible with this release, see [Compatibility with release builds](#) on page 985.

New features
<p><b>Migration from Enterprise 11 and Enterprise 10 to Enterprise A2019 (currently available only to those in the Migration Early Adopter Program)</b></p> <p>Migration to Enterprise A2019 is currently only available to select customers through our Migration Early Adopter Program. If you are interested in learning more about this program or a timeline for when migration will be available to all customers, contact your Automation Anywhere representative.</p> <ul style="list-style-type: none"> <li>• The Insert work item command, workload management queues, and device pools are now migrated to Enterprise A2019.</li> <li>• Schedules are migrated when you copy Enterprise 10 data to Enterprise A2019 or update Enterprise 11 data to Enterprise A2019. You then have to remap some dependencies to enable the migrated schedules.</li> </ul> <p><a href="#">Enable schedules after migration</a> on page 1197</p> <ul style="list-style-type: none"> <li>• Additional support is provided for packages and variables.</li> </ul> <p><a href="#">Package mapping for migration</a> on page 1201   <a href="#">Variable mapping for migration</a> on page 1232</p>
<p><b>Record tasks with a device display setting of 125% or 150%</b></p> <p>You can now record tasks using Universal Recorder in Java, Microsoft Active Accessibility, and Microsoft UI automation applications on a computer that has a device display setting configured at 125% or 150%, in addition to the existing setting of 100%.</p>
<p><b>Export bots without enabling SMTP in Bot Lifecycle Management</b></p> <p>When you export a bot, you can now download the exported package even when SMTP is not enabled. The link to download the exported package is available in the <b>ACTIVITY &gt; Historical</b> page.</p> <p><a href="#">Export bots</a> on page 2143</p>

New features
<p><b>Export and import files using Bot Lifecycle Management APIs</b></p> <p>Use the Bot Lifecycle Management export and import APIs to move bots from one environment to another based on your organization's automation requirements.</p> <p>You can export bots with dependent files and command packages from the public workspace of one Control Room and import them to a private workspace in another Control Room, and check them into a public workspace. To export and import bots, you must have the Export bots, Import bots, View and Manage packages, and Check in and Check out permissions to the necessary folders and have the Bot Creator license.</p> <p><a href="#">BLM API</a></p>
<p><b>Capture scroll action and table using AISense Recorder</b></p> <p>You can now capture the scroll action in an application window and table control from a remote application when recording a task with AISense Recorder.</p> <p><a href="#">Record a task with AISense Recorder</a> on page 1329</p>
<p><b>Form builder enhancements for interactive forms</b></p> <p>The form builder includes the following elements:</p> <ul style="list-style-type: none"> <li>• <b>Select File:</b> To enable file upload in the form.</li> <li>• <b>Dropdown:</b> To create a drop-down menu in the form.</li> </ul> <p><a href="#">Create a form</a> on page 1536</p>
<p><b>Extract text from a specific area in a window</b></p> <p>Use the <b>App Integration &gt; Capture area</b> action to extract text from within the captured area of a window and save it to a string variable.</p> <p><a href="#">App Integration package</a></p>
<p><b>Read string variable values from a text file</b></p> <p>Use the <b>String &gt; Import string from text file</b> action to read values from a text file and save them to a string variable.</p> <p><a href="#">String package</a></p>
<p><b>Automate in IBM-5555 terminals using the Terminal Emulator package</b></p> <p>The TN5250E terminal type now supports the IBM-5555-C01 and D01 terminal models.</p> <p><a href="#">Terminal Emulator</a></p>
<p><b>Specify events within email trigger</b></p> <p>For email triggers, specify an event within the server type (Outlook, Email, or EWS server) to trigger a bot.</p> <p><a href="#">Add an email trigger</a> on page 1557</p>
<p><b>Use hot key for interface trigger</b></p> <p>For interface triggers, you can select hot key as one of the conditions to trigger the bot</p> <p><a href="#">Add an interface trigger</a> on page 1563</p>

New features
<p><b>Assign action in interactive forms package</b></p> <p>The interactive forms package now includes an <b>Assign</b> action that you can use to assign values dynamically in the <b>Dropdown</b> element of a form.</p> <p><i><a href="#">Interactive forms package</a></i></p>
<p><b>Create a shortcut of a file or folder</b></p> <p>Use the <b>Folder &gt; Create shortcut</b> or <b>File &gt; Create shortcut</b> action to create a shortcut in the specified destination file path. The shortcut is dependent on the source file or folder. If you make changes to the source file or folder, the changes will also apply to the shortcut.</p> <p><i><a href="#">File package</a>   <a href="#">#unique_525</a></i></p>
<p><b>New conditions in the If and Loop packages</b></p> <ul style="list-style-type: none"> <li>• Use the <b>Data table &gt; Data table is empty</b> condition to execute actions based on whether the specified table contains values.</li> <li>• Use the <b>Data table &gt; Number of columns</b> and <b>Data table &gt; Number of rows</b> conditions to execute actions based on whether the number of columns or rows is <b>Equal to, Greater than,</b> or <b>Less than</b> the specified value.</li> </ul> <p><i><a href="#">If package</a>   <a href="#">Loop package</a></i></p>
<p><b>Generate a random string of a user-specified number of characters and assign it to a string variable</b></p> <p>Use the <b>String &gt; Random</b> action to generate a string of uppercase and lowercase alphanumeric characters. You can specify the number of characters that the generated string consists of, with a maximum of 300 characters.</p> <p><i><a href="#">String package</a></i></p>
<p><b>Upgrading Enterprise A2019 enables pre-filling installation parameters</b></p> <p>If you are upgrading from one Enterprise A2019 version to another, you have the option to pre-fill the installation parameters with existing installation content. Existing installation parameters include, for example, the installation path, HTTPS ports, database names, IP addresses, and TLS configuration. The username and password have to be manually entered.</p> <p>Note that this is applicable only to a Windows-based installation.</p> <p><i><a href="#">Run Control Room installer</a> on page 865   <a href="#">Installing Control Room on Linux</a> on page 909</i></p>

Changed features
The <b>Dictionary &gt; Put</b> action is now the <b>Dictionary &gt; Set value</b> action. When you provide the key name, if the key does not already exist, this action creates a new key-value pair. In addition, you can now manually enter a value; previously, you had to select from a list of variables.
In the <b>Excel advanced &gt; Get worksheet as data table</b> action, the <b>Tick if the first row is the header</b> option is now the <b>Sheet contains header</b> option. There is no change in functionality.

Changed features
The <b>File &gt; Rename</b> and <b>Folder &gt; Rename</b> actions now accept the full file path in the <b>New file name</b> and <b>New folder name</b> fields. Previously, these fields only accepted the new file or folder name.
When you select a file from the desktop for the JavaScript, Python Script, or VBScript packages, it is no longer necessary to isolate that file in a separate folder. Previously, when you selected a file with the <b>Open</b> action, all the files in that folder were selected too.
The <b>Database &gt; Run stored procedure</b> action now has a different interface that enables you to configure input parameter values and output parameter data types. This action is not backward-compatible because the user interface controls and input data type have changed. You must modify the <b>Run stored procedure</b> action fields in the bots that contain previous versions of this action.
The Cloud License feature is now enabled by default in the Control Room.

Fixed features	
Service Cloud case ID	Description
00492377, 00511639	Bots using the Image Recognition action can now recreate the recorded activity and run successfully.
00599586, 00600149, 00601142, 00599483	The <code>Processing failure</code> error encountered when using the <b>Wait for condition</b> action is now fixed. Bots using this action now run successfully.
00583248	During Work Item consumption, a running task is no longer canceled when the next bot is deployed.
00548456	The Workload Management v3 APIs are now successfully executed in Swagger and do not fail because of a case-sensitive issue.
00601083	For Cloud deployment, users can now successfully export bot files and download them without any errors.
00568664	The <b>Git integration</b> option is now displayed for admin users when they navigate to <b>ADMINISTRATION &gt; Settings</b> in the Control Room.
--	The minimum length value of a form element cannot be 0. If you set the value as 0 in <b>Character limit &gt; Min</b> field, the <b>Make field required</b> is disabled.
00571125	When you check in a non-bot file by itself, the file is now checked in without any error. Older files that exist in Build 4111 are also unlocked and checked in after upgrading to Build 4705.
--	The form preview feature is now consistent across the Internet Explorer and Google Chrome browsers.
--	A blank page is no longer displayed when you paste content into any of the existing form elements on the form builder.
--	A form that is linked to a bot through the <b>Display</b> action of interactive forms is now displayed in front of all other windows when the <b>Always display form window in front</b> option is selected.

Fixed features	
Service Cloud case ID	Description
--	When a user login failed due to a Global Catalog (GC) availability issue, the response only indicated a communication error. The process now checks for errors and exceptions in the GC and processes the authentication with appropriate messages, so users can take appropriate action.
00520394	The VBScript package actions now support Unicode characters.
00536881	When you delete a bot, any trigger that is associated with it is also deleted and is not listed in the <b>Activity list</b> page.
00506169	You can now use the interface trigger to run a bot without any errors in the Japanese operating system.
00537640, 00538369	When you check out a bot from the Control Room and add a trigger, you can now use <b>Run with triggers</b> to run this bot without any errors.
00531912	JavaScript package actions can now be used to parse the values in a list.
00475183	Double-byte characters returned unreadable ANSI characters in the bot Log To File text. This issue is now fixed and ANSI encoding takes the system default charset.
00475129	You can now use double-byte characters in a variable name.
00511675	The <b>Excel advanced &gt; Find</b> action now searches for values in merged cells when the <b>By rows</b> search option is used.
00468103, 00475142	Bot names using Unicode characters, such as German umlaut, Japanese characters, and others, display correctly in the pop-up window at runtime.
00552701, 00558919	You can now select multiple actions from the Bot editor and drag them into a <b>Step, Loop, or If</b> action.
00507240	Fixed an issue where a running parent bot could not be stopped after it ran a child bot. Now you can stop a bot at any time.
00482810	VBScript actions can now run scripts that contain Unicode characters.
00472684, 00541922, 00551632, 00534508, 00570602	The <b>Email &gt; Send</b> action now supports a user-input port number for sending emails from an SMTP server, such as AWS Simple Email Service. Previously, the action only used port 25, even if the user entered a different port number.
00475230	Fixed an issue where the <b>String &gt; Replace</b> action did not support an empty string in the <b>Replace with</b> field. You can now use the action to replace a specific string with an empty string.
00472665	When a child bot shows an error, the parent bot now handles the exception by running the <b>Error Handler &gt; Catch</b> action. Previously, the parent bot was also showing an error, even when it contained Error handler actions.

Fixed features	
Service Cloud case ID	Description
00566476, 00560339	Fixed an issue where bots that contain the <b>Capture</b> action stopped working when running the action during deployment, or they could not be checked out after they were checked-in for editing.
00537139	A bot running the <b>Capture</b> action can now capture specific objects from a Google Chrome browser on a device running the Windows 10 operating system. In some cases, bots running the <b>Capture</b> action from Version A2019.11 On-Premises could only capture the entire browser window.
00421864	The <b>Create a bot</b> screen now displays properly in Internet Explorer. Previously, some display issues occurred where the screen was cut on the right side and the screen could not be moved.
00584341	Fixed an issue where some of the historical activity entries were incorrectly displayed. These entries are now displayed correctly when a user drills down for more information.

Known limitations
When you create a Dictionary/Table variable and use it in the <code>name</code> field of the PROPERTIES control, the bot does not deploy successfully. This issue occurs because Dictionary/Table variables are not supported for the <code>name</code> field in the PROPERTIES control. You can pull the <code>name</code> value into a String or Number variable before using it in the PROPEPTIES control, and then use that String or Number variable in it.
You can use Swagger to export bots but not to download exported bots. You have to use the REST Client to download exported bots.
When you run a bot, the runtime window is minimized after you preset the desktop.
The OSS Disclosure report provided in the A2019 installer is outdated. Starting from this release, you can log in to Automation Anywhere Support site and download the updated report: <a href="#">A-People Downloads page (Login required)</a> .
When you capture a table control from an application using the AISense Recorder, you cannot set text using the <b>Set text</b> option from the <b>Actions</b> list. You can set text in the table by capturing a cell from the table as a text box and then using the <b>Set text</b> option from the <b>Actions</b> list.
When upgrading from one Enterprise A2019 version to another, you have the option to pre-fill the installation parameters with existing installation content, but only if you used the default installation path <code>C:\Program Files</code> .
<b>Note:</b> This is applicable only to a Windows-based installation.
Based on the permission assigned by an administrator, users can only view the <b>Public</b> tab that lists the available forms and bots. However, users can edit an available form or bot by replacing <b>View</b> with <b>Edit</b> in the Control Room URL.
When you create a bot and link a form to it, the bot is included only when you check in the form; it is not available on form check-out.

Known limitations
When you click multiple icons (Copy, Cut, and Paste) at the top of the form builder or bot creator page, the tooltips overlap.
<p>Issues in the form builder:</p> <ul style="list-style-type: none"> <li>• If you drag any form element into a specific position on the form builder, it always appears at the bottom of the available elements.</li> <li>• If you drag form elements around in the form builder screen in Internet Explorer, the mouse pointer flickers continuously.</li> <li>• For the <b>Radio button</b> element, you cannot set the default selection in <b>Advance behaviors</b>.</li> <li>• For the <b>Checkbox</b> element, changes made to the check box names in the <b>Checkbox content</b> field are not updated when you enable <b>Advance behaviors &gt; Make default selections</b>.</li> </ul>
When a bot runs Terminal Emulator package actions in an IBM-5555 terminal, the terminal window does not display double-byte characters, including Chinese and Japanese characters.
If you used the Universal Recorder to capture a menu item from a Microsoft Active Accessibility application on a computer that has a display scale setting configured to 100%, at runtime the bot does not click the correct menu item on a computer that has a display scale setting configured to 125% or 150%.
During GUID provisioning, License Sync is called internally after a successful installation. If the internal License Sync fails but the installation is successful, users can log in and continue to work.
When a task that consists of one or more subtasks is run, the In Progress entry for the task is placed into a historical report upon completion of the first subtask, not the entire governing task.
An error occurs if the parent bot contains actions for objects captured using the AISense Recorder and the child bot contains actions for objects captured using the Universal Recorder, or vice versa.

## IQ Bot

The IQ Bot On-Premises version supports all the features and functionality available in IQ Bot Version 11.3.4.2.

[Automation 360 IQ Bot feature comparison matrix](#) on page 781

Review the compatibility of the IQ Bot On-Premises version with the corresponding Control Room On-Premises version.

[Automation 360 IQ Bot version compatibility](#) on page 786

The IQ Bot Cloud version is available for this release and supports all features and functionality available in IQ Bot Version 11.3.4.2. This version provides users with automatic provisioning for up to three environments such as Development, Test, and Production. Users can migrate learning instances between environments using APIs.

For the Custom Logic feature, there is an identified list of Python libraries and packages that are safe to use for IQ Bot Cloud. Use only these packages to ensure security for your cloud infrastructure, file systems, databases, and network resources.

[List of Pandas Libraries which are supported and not supported on Automation 360 IQ Bot \(A-People login required\)](#)

New features
<p><b>Migrate data to a unified database</b></p> <p>IQ Bot On-Premises and Cloud</p> <p>The Database Migration Assistant enables you to migrate data from IQ Bot Version 6.5 or later databases to a unified database in IQ Bot A2019.</p> <p><a href="#">Migrate earlier IQ Bot versions to Automation 360 IQ Bot On-Premises</a> on page 1292</p>
<p><b>Support for custom validation Python scripts</b></p> <p>IQ Bot Cloud</p> <p>You can use custom logic in Python to modify intermediate extracted data in IQ Bot.</p> <p><a href="#">Add custom logic in IQ Bot to improve extraction</a></p>
<p><b>Select an OCR engine when creating a learning instance</b></p> <p>IQ Bot On-Premises and Cloud</p> <p>You can select different OCR engines directly from the UI based on your requirements for data extraction from specific document types, when creating a new learning instance. You do not have to stop and restart IQ Bot services for implementing the engine change.</p> <p><a href="#">Select an OCR engine</a></p>
<p><b>Enable or disable PDFBox option</b></p> <p>IQ Bot On-Premises and Cloud</p> <p>You can enable or disable the <b>My PDF documents do not have images</b> check box directly in the UI when creating a learning instance.</p> <p><a href="#">Disable PDFBox option</a></p>

Changed feature
<p>The draw box icon for document values is no longer available. However, you can still click and drag a box on the document to draw boxes for the labels along with the values.</p>

Fixed features	
Service Cloud case ID	Description
--	A new REST API is now available that contains the IQ Bot validator URLs of all the available documents that are not locked by any users. A validator URL retrieved from the REST API can be used in any browser to navigate directly to that specific document.
00343034	You are now redirected to a specific document using the validator URL after a successful login.
00471068, 00339407	The draw box functionality for field labels now ensures that the selected value is treated as an entire word rather than distinct characters. You can now select multiple system identified regions (SIRs) or a specific part of a single SIR from a field label, which enables accurate data extraction.

Fixed features	
Service Cloud case ID	Description
--	The PDF Box feature now enables you to generate an SIR for a PDF file that contains content in multiple formats.
00481720	The Service account user password can now include special characters. The service account will not be locked and all the IQ Bot services will start successfully after an installation, irrespective of whether the password has special characters.
00510286, 00548393	When the Automation Anywhere Cognitive Application service restarts after installing IQ Bot Build 4705, the user login information is now captured without any duplication.  However, if you upgrade from any earlier version of IQ Bot to IQ Bot A2019.13 (Build 4705), you must deregister and register IQ Bot services.
00522978	When you now install IQ Bot, the user account is not locked even when the password has special characters, and all the IQ Bot services start without any issues.
00581425, 00581949, 00604394, 00602630	You can now register IQ Bot with child tenant using API, which enables you to view all the available domains and learning instances.
00575939, 00417631, 00423076	The <code>.csv</code> file is now displayed in the <b>Output</b> folder when you upload a document with a long filename (more than 60 characters) using <b>IQ Bot Upload</b> .

Known limitations
<p>IQ Bot On-Premises</p> <p>The OSS Disclosure report provided in the IQ Bot A2019 installer is outdated. Starting from this release, you can go to Automation Anywhere support site to download the updated report: <a href="#">A-People Downloads page (Login required)</a>.</p>
<p>IQ Bot On-Premises and Cloud</p> <p>Images on the Designer in IQ Bot appear distorted while scrolling in Internet Explorer.</p>
<p>IQ Bot On-Premises and Cloud</p> <p>Installation errors are displayed for the Database Migration Assistant.</p> <p><b>Workaround:</b> Install the <code>MsSqlCmdLnUtils</code> utility and <code>Microsoft ODBC Driver 17 for SQL Server</code> before installing the Database Migration Assistant.</p>
<p>IQ Bot On-Premises and Cloud</p> <p>Logs are not captured if the Database Migration Assistant installation fails.</p>
<p>IQ Bot Cloud</p> <p>System suggestions are not updated when documents are validated by the user.</p> <p><b>Workaround:</b> Users must update the correction manually in the validator for IQ Bot Cloud if the system suggestions are not displayed.</p>

Known limitations
<p>IQ Bot Community Edition</p> <p>The <b>Create new learning instance</b> page refreshes automatically, which causes the user to lose data from the <b>General information</b> fields.</p>
<p>(Service Cloud case ID: 00737991)</p> <p>When you are creating a learning instance and training your document, IQ Bot system cannot extract data from tables with the same <b>Header Name</b> and <b>Column Value</b>.</p> <p><b>Workaround:</b> Try combining <b>Header Name</b> or <b>Column Value</b> with the adjacent column. Additionally, you can provide a Python postprocessing script to separate the values during extraction.</p>

## Bot Insight

New features
<p><b>Compare mode widget filter</b></p> <p>The Bot Insight compare mode introduces widget filters that you can apply to your existing dashboards. A new <b>Filter</b> option shows a <b>Filter</b> window with the <b>Attributes, Numeric, and Time</b> widgets.</p> <p><a href="#">Comparing dashboards</a> on page 2266</p>
<p><b>Hourly support for widgets</b></p> <p>The Bot Insight widgets include an <b>Hour</b> interval option in the <b>Group By</b> field for <b>Date</b> type. The analytics for this widget groups your data by hourly intervals and displays the chart accordingly.</p> <p><a href="#">Using widgets</a> on page 2272</p>

Changed features
<p><b>Power BI connector</b></p> <p>You can access the AABotInsightV3.mez data connector file from C:\Program Files\Automation Anywhere\Enterprise\Connectors\PowerBI and copy it to C:\Users\<your bi="" connector.<="" connectors="" deploy="" desktop\custom="" p="" power="" the="" to="" user&gt;\documents\powerbi=""> <p><a href="#">Deploy Power BI connector</a> on page 2279</p> </your></p>
<p><b>Bot Insight APIs</b></p> <ul style="list-style-type: none"> <li>• All of the parameters are now optional.</li> <li>• The botname parameter in the Get task log data API supports multiple bot names, separated with a comma.</li> <li>• There are no time period limitations now on the data retrieved.</li> </ul> <p><a href="#">Bot Insight API</a></p>

## Enterprise A2019.12 Release Notes

*Release date: 18 May 2020*

Review the new features, supported packages, changed features, fixed features, and known limitations in the Enterprise A2019.12 (Build 4111) release. IQ Bot Build 4088 is compatible with Enterprise A2019.12 Build 4111. There are no security fixes in this release.

- [Enterprise A2019](#)
- [IQ Bot A2019](#)
- [Bot Insight A2019](#)

### Enterprise A2019

**Important:** This release includes a required update to your . Ensure that you complete the update to continue with your automation activities when upgrading from a previous release to this release.

[Automatically update the Bot Agent](#) on page 1001 | [Manually update the Bot Agent](#) on page 1002

To verify which version is compatible with this release, see [Compatibility with release builds](#) on page 985.

New features
<p><b>Migration from Enterprise 11 and Enterprise 10 TaskBots and MetaBots to Enterprise A2019 (currently available only to those in the Migration Early Adopter Program)</b></p> <p>Enterprise A2019</p> <p>Migration to Enterprise A2019 is currently only available to select customers through our Migration Early Adopter Program. If you are interested in learning more about this program and requirements, contact your Automation Anywhere representative.</p> <ul style="list-style-type: none"> <li>• Migrate TaskBots and MetaBots created in Enterprise 10 to Enterprise A2019. <ul style="list-style-type: none"> <li><a href="#">Migrate Enterprise bots</a> on page 1173</li> </ul> </li> <li>• The summary report generated by the Bot Scanner now provides information about the number of bots that can or cannot be migrated to Enterprise A2019. <ul style="list-style-type: none"> <li><a href="#">Analyze Bot Scanner report for migration</a> on page 1121</li> </ul> </li> <li>• (Enterprise 11 only) Additional support is provided for packages and variables. <ul style="list-style-type: none"> <li><a href="#">Package mapping for migration</a> on page 1201   <a href="#">Variable mapping for migration</a> on page 1232</li> </ul> </li> <li>• (Enterprise 11 only) Migration APIs enable you to migrate a single Enterprise 11 bot or entire folders of bots to Enterprise A2019. Use the Repository Management API to identify bots and folders for migration. <ul style="list-style-type: none"> <li><a href="#">Migration API</a>   <a href="#">Repository Management API</a></li> </ul> </li> </ul>
<p><b>Integrate Control Room with a remote Git repository</b></p> <p>Enterprise A2019</p> <p>Integrate the Control Room with remote Git repositories to manage bot version controls, and back up and restore bots and the dependent files. The integration ensures one-to-one mapping of bots between the Control Room and the remote Git file structure. When you perform a bot check-in, a Git commit is performed at the remote Git host.</p> <p><a href="#">Integrating Control Room with Git repositories</a> on page 2066</p>

<p><b>New features</b></p> <p><b>Additional actions in the Interactive forms package</b></p> <p>Enterprise A2019 and Community Edition</p> <p>The Interactive forms package includes the following actions:</p> <ul style="list-style-type: none"> <li>• <b>Set focus:</b> Sets the focus on the selected form element.</li> <li>• <b>Highlight:</b> Highlights the selected element of a form.</li> <li>• <b>Unhighlight:</b> Removes the highlight from the selected element of a form.</li> </ul> <p><i>Interactive forms package</i></p>
<p><b>Form builder enhancements for interactive forms</b></p> <p>Enterprise A2019 and Community Edition</p> <p>The form builder includes the following elements:</p> <ul style="list-style-type: none"> <li>• <b>Document:</b> Use this element to render an image (.jpg) or PDF file along with the form.</li> <li>• <b>Password:</b> Use this element for a field that requires masking of the input data.</li> </ul> <p><i>Create a form</i> on page 1536</p>
<p><b>Run Task Bot option for attended Bot Runner</b> (Service Cloud case ID: 00453797)</p> <p>Enterprise A2019 and Community Edition</p> <p>If the default device is mapped to the Bot Agent, a user with an attended Bot Runner license in the Control Room can now use the <b>Run Task Bot</b> option from the bot context menu (vertical ellipsis) to run the bot.</p> <p><i>Considerations for running a bot</i> on page 1355</p>
<p><b>New features in Universal Recorder and actions that use the recorder feature</b></p> <p>Enterprise A2019 and Community Edition</p> <ul style="list-style-type: none"> <li>• Secure recording mode ensures that sensitive data is not stored in the bots. When secure recording mode is enabled, the bots do not capture application images or values.</li> </ul> <p>Actions in the Image Recognition, Mouse, OCR, Screen, and Recorder packages support this feature.</p> <ul style="list-style-type: none"> <li>• JRE 6 is supported on both 32-bit and 64-bit systems.</li> <li>• After you capture an object, you are returned to the window containing the Bot editor.</li> </ul> <p>Actions in the Image Recognition, Mouse, OCR, Screen, and Recorder packages support this feature.</p> <p><i>Recording tasks in applications that run on JRE</i> on page 1328   <i>Secure recording mode</i> on page 1327</p>
<p><b>Insert a work item action</b></p> <p>Enterprise A2019 and Community Edition</p> <p>The Insert work item action provides you the flexibility to insert a work item from an existing queue to another queue as part of the bot execution. You can orchestrate multiple bots, enabling optimal device utilization through the queueing mechanism of workload management.</p> <p><i>Workload package</i></p>

New features
<p><b>View error details of a work item</b></p> <p>Enterprise A2019 and Community Edition</p> <p>You can view the reason for a workload automation failure in the new <b>Error</b> section on the <b>View work item</b> details page.</p> <p><a href="#">View work items</a> on page 2134</p>
<p><b>Extract text from windows</b></p> <p>Enterprise A2019 and Community Edition</p> <p>Use the <b>Capture text of window</b> action to extract text from a window and save it to a string variable. You can capture text from UNIX shells and Windows applications.</p> <p><a href="#">App Integration package</a></p>
<p><b>Store string values securely in a credential variable</b></p> <p>Enterprise A2019 and Community Edition</p> <p>Configure a credential variable to hold a user-provided value or a credential from the Credential Vault. A credential variable cannot be converted to another data type, and the value cannot be displayed in a message box or written to a file.</p> <p><a href="#">User-defined variables: Credential</a></p>
<p><b>Preload packages for improved bot performance</b></p> <p>Enterprise A2019 and Community Edition</p> <p>Preload packages on your local device to shorten the bot runtime. When you preload packages used in a bot, the system skips the package download process at bot runtime, thereby improving the bot performance.</p> <p><a href="#">Preload packages</a> on page 1364</p>
<p><b>New features in the If and Loop packages</b></p> <p>Enterprise A2019 and Community Edition</p> <ul style="list-style-type: none"> <li>Execute actions based on whether the value of the source datetime variable is <b>Equal to</b> or <b>Not Equal to</b>, or is <b>Greater than</b> or <b>Equal to</b>, or is <b>Lesser than</b> or <b>Equal to</b> the value of the target datetime variable.</li> <li>Execute actions on migrated bots based on whether <b>Web control</b> exists or is active.</li> <li>Configure a <b>Loop</b> action with multiple conditions. <ul style="list-style-type: none"> <li>Specify whether all or either of the conditions must be met.</li> </ul> </li> </ul> <p><a href="#">If package</a>   <a href="#">Loop package</a></p>
<p><b>Run a bot by inserting a file variable in the Run action</b></p> <p>Enterprise A2019 and Community Edition</p> <p>The <b>Task Bot &gt; Run</b> action now supports a file variable input in the <b>Task Bot to run</b> field.</p>

New features
<p><b>Configure a table variable using the Assign action in Data Table package</b></p> <p>Enterprise A2019 and Community Edition</p> <p>You can use this action to manually enter values, assign column names, specify the column data type (string, number, datetime, or Boolean), and move columns and rows.</p> <p><a href="#">Data Table package</a></p>
<p><b>Configure Wait package actions to terminate a running bot if a condition is unsatisfied</b></p> <p>Enterprise A2019 and Community Edition</p> <p>Select the <b>Throw an exception</b> option in the Wait for screen change and Wait for window actions to show an error message and terminate a bot if the screen does not change or the window does not open or close within the specified amount of time.</p> <p><a href="#">Using Wait for screen change</a>   <a href="#">Using Wait for window</a></p>
<p><b>Email trigger for new emails</b></p> <p>Enterprise A2019 and Community Edition</p> <p>Use email triggers to start a bot when a new email message is received in the specified email service. Supported email services are:</p> <ul style="list-style-type: none"> <li>• Microsoft Outlook</li> <li>• Email Server</li> <li>• EWS Server</li> </ul> <p><a href="#">Add an email trigger</a> on page 1557</p>
<p><b>Generate a random integer from a user-specified range and assign it to a number variable</b></p> <p>Enterprise A2019 and Community Edition</p> <p>Use the <b>Random</b> action from the Number package to generate an integer in the range of -9,223,372,036,854,775,808 through 9,223,372,036,854,775,807.</p> <p><a href="#">Random number action</a></p>
<p><b>Enterprise A2019 Bot Agent OS support</b></p> <p>Enterprise A2019</p> <p>Enterprise A2019 Bot Agent is now supported for single users on Windows Server 2019, Windows Server 2016, Windows Server 2012, Windows 8, and Windows 7 SP1.</p> <p><a href="#">Bot Agent compatibility</a> on page 984</p>
<p><b>Return the Bot Agent installation path using the system variable AAInstallationPath</b></p> <p>Enterprise A2019 and Community Edition</p>
<p><b>Copy and paste actions and triggers between bots</b> (Service Cloud case ID: 00455116)</p> <p>Enterprise A2019 and Community Edition</p> <p>Use the <b>Copy to shared clipboard</b> and <b>Paste from shared clipboard</b> icons at the top of the Bot editor to duplicate actions, triggers, and metadata at a time.</p>

New features
<p><b>GDPR self-reporting</b></p> <p>Enterprise A2019 and Community Edition</p> <p>General Data Protection Regulation self-reporting enables the Control Room administrator to run reports that include the following data elements (sensitive data will be masked in the output):</p> <ul style="list-style-type: none"> <li>• User Bot Runner device access.</li> <li>• User data in associated credential vault.</li> <li>• Devices registered by the user.</li> <li>• All documents (artifacts) uploaded or updated to public or private repositories by the user.</li> <li>• All bots associated to the user.</li> <li>• Bot Insight dashboard report includes a list of all dashboards associated to this user ID.</li> </ul>

Changed features
<p><b>Build 4105 replaced with Build 4111</b></p> <p>Build 4105 has been deprecated and replaced with Build 4111. If you have installed Build 4105 on Windows, perform a regular upgrade to get the new build. If you have installed Build 4105 on Linux, you must uninstall it and reinstall Build 4111. After you are on Build 4111, an update to Bot Agent 7.0.4789 is also required.</p> <p><a href="#">Update to latest Automation 360 version</a> on page 1022</p>
<p><b>User interface changes in Excel basic and Excel advanced packages</b></p> <p>The text field titled <b>Cell name</b> is now <b>Cell address</b> in the actions from the Excel basic and Excel advanced packages.</p>
<p><b>Specify the column title in the Get cell address action in the Excel advanced package</b></p> <p>The <b>Specific cell</b> option is now the <b>Based on header</b> option, which accepts the column title as either the column heading or the default column title.</p> <p><a href="#">Using the Get cell address</a></p>
<p><b>Edit a work item without changing its status</b></p> <p>You no longer have to change the status of a new work item for editing. You can now edit work items that are in <b>New</b> status. Previously, you were allowed to edit the work item attribute values after changing the state of the attributes so that the edits to the work item could be saved.</p> <p><a href="#">Edit work items</a> on page 2134</p>
<p><b>Mark work items for reprocessing</b></p> <p>The <b>Ready to run</b> action is now updated to <b>Re-process</b> so that you can mark work items that are in <b>Failed</b>, <b>Data error</b>, or <b>On hold</b> state to <b>New</b> status for reprocessing.</p> <p><a href="#">View work items</a> on page 2134   <a href="#">Edit queues</a> on page 2123</p>

Fixed features	
Service Cloud case ID	Description
00560339	You can now do a second checkout of the same bot, make updates (for example delete a command) , and check it back in. The "File Not Found" error that prevented subsequent checkouts of the same bot and data deletion not actually getting deleted has been fixed.
--	Devices running an older version of the Bot Agent can now connect to A2019.12 Control Room.
--	Secure Data Store (SDS) installation on Enterprise A2019.12 is now working.
00530388	Multiple bot updates and check-ins succeed irrespective of the Enterprise A2019 version used to import the bot.  Bot check-in on Cloud deployments used to fail when the bot was imported multiple times and overwritten. This issue is now fixed.
00521691	After Excel files are extracted from a .zip file, common tasks such as renaming and deleting the Excel files failed. This issue is now fixed.
00519528	Bot Scanner version 2.0.0 now works as expected. The crash issue is now fixed.
00517040	When the Email package is used in Exchange Web Services, the action loop exited after processing 10 emails. This early exit is fixed. Now all specified emails are processed before the loop exits.
00504163	When bots are run using the <b>Open</b> and <b>Close</b> actions from the <b>DLL</b> package in a loop, the Bot Agent window now functions correctly. The Bot Agent service does not require a manual restart after a bot is run.
00494267	Actions from the <b>DLL</b> package can now be run inside and outside a loop.
00494273	The <b>Create worksheet</b> action in the Excel advanced package now supports default sheet names for all the supported languages in Enterprise A2019.
00492554	The <b>Sort table</b> action in the Excel advanced package now supports OS setting for the Swedish region.
00446956	The <b>Open</b> action in the CSV/TXT package can now read values from files encoded with UTF-8.
00503230	The SOAP Web Service action now supports responses with non-English characters.
00522147	The \$StringVar.String:trim\$ shorthand now trims leading and trailing spaces in a string when used in the <b>Message box</b> package.

Fixed features	
Service Cloud case ID	Description
--	You can now deploy bots on selected Bot Runner devices with the <b>Run as</b> option from the <b>My bots</b> page in an Control Room configured on Microsoft Azure.
--	Scheduled bots now run as expected and do not get stuck in the queue in an Control Room configured on Microsoft Azure.
--	<p>After you capture an object in a browser or application window, the browser window containing the Bot editor is now reactivated. Previously, users had to manually return to the Bot editor.</p> <p>Actions in the Image Recognition, Mouse, OCR, Screen, and Recorder packages support this feature.</p>
00475070	Exporting a report to CSV from <b>Activity &gt; Historical</b> now correctly outputs the data.
00516331	You can now build a bot that contains more than one <b>Database &gt; Read from</b> action that is followed by a <b>Loop</b> action, within the same database session. Each time the bot runs the <b>Read from</b> action, the query results are refreshed, and the loop will only iterate on the current results.
00509735	Auto Login now works when you deploy a bot as an unattended Bot Runner on a Horizon Virtual Desktop Infrastructure (VDI) session.
00509831	Prompt package actions now support long inputs. The user interface displays up to 512 characters. If the input is longer than 512 characters, the rest appear as a tooltip when the user hovers over the prompt box.
00518566	You can now use the recorder feature within actions to select window titles and file paths on a device that has proxy authentication enabled. Previously, users had to manually enter this information because they could not access the device through actions while building a bot.
00475107	The Japanese language now supports column names when using CSV-related actions.
00532894 00532253 00539241	When you reimport a bot using exported files from a different Control Room of the same version (from version A2019.12 onward) and choose to overwrite the bot, you can now check-in that bot. The error generated when you choose the overwrite option that prevented check-in of the reimported bot is now fixed only for version A2019.12 onward. Reimporting bots on A2019.11 and older releases are not supported at this time.
00521222, 00525635, 00529274, 00526613, 00526489, 00530609, 00530787, 00533445, 00535366, 00530900, 00538070	The progress of a TaskBot is not stalled at line 0 and does not remain in queue to run when you deploy the bot on a Bot Runner. The status of the device reflects <i>Yet to Be Determined</i> until the device is available to process the items.

Fixed features	
Service Cloud case ID	Description
00421195	You can now create a work queue by providing details such as the queue name, queue owners, participants, consumers, and work item structure. This feature is available from <b>Workload &gt; Queues &gt; Create Queue</b> .
00533465	When you delete any action from an existing bot, the corresponding metadata for the deleted action is now removed from the bot.

Known limitations
If you are running A2019.12 Enterprise On-Premises with build 4105 on Linux and want to use Build 4111, then you must uninstall Build 4105 and do a fresh installation of Build 4111. You cannot perform an upgrade to get Build 4111. See <a href="#">Uninstall Automation 360 On-Premises from Linux server</a> on page 916. A2019.12 Enterprise On-Premises on Windows can be upgraded as normal.
The <b>Send reset password email</b> functionality (from the <b>Administration &gt; User</b> page) to help users reset their password is not working and returns a 401 error. Users should use the "Forgot password?" flow to reset their password.
Folders created using the <b>Folder &gt; Create</b> action cannot have names that contain system actions or device references such as AUX, CON, LPT, NUL, and PRN.
Mouse click with key combo for preset triggers in SAP application is currently not supported.
The following are known limitations in the form builder: <ul style="list-style-type: none"> <li>• If the character limit is set to 0 and the field is marked necessary for the <b>Password</b> element in a form, an error message is displayed when you run the bot.</li> <li>• An invalid file path associated with the <b>Document</b> element in a form displays an error message when the <b>Get</b> and <b>Set</b> actions of the interactive forms are used.</li> <li>• A blank page is displayed on the form builder when you paste content into any of the existing form elements.</li> <li>• A form that is linked to a bot through the <b>Display</b> action of interactive forms is displayed in front of all other windows, even when the <b>Always display form window in front</b> option is not selected.</li> </ul>
Cloud-enabled deployments only support local authentication.
Linux is not supported for Cloud-enabled On-Premises installations.
<ul style="list-style-type: none"> <li>• Work items might be queued on the <b>View queues</b> page as the number of devices in the device pool increase. This should not affect the bot execution because the queues are cleared when the work items are processed.</li> <li>• You cannot simultaneously insert work items from multiple devices in a queue.</li> <li>• You cannot create a draft queue.</li> <li>• When you insert a number value using the <b>Insert work item</b> to a queue, the system shows an incorrect value. For example, if you insert 023456789, the system shows 2.3456789E7.</li> <li>• When you add more devices to a device pool that is processing workload management automations, the newly added devices might not immediately pick up the pending work items.</li> </ul> <p><b>Workaround:</b> Pause and resume the workload management automation.</p>

Known limitations
If a device goes idle while processing workload management work items in a device pool, it will not process the work items. However, those work items can be processed by other devices in the pool.
When you create a form with using the <b>Document</b> element and provide an incomplete file path, your bot will not run successfully.
When you create a form and specify that a password is required, the password length can be set to 0.

## IQ Bot (Build 4088)

Enterprise A2019.12 Build 4111 is compatible with IQ Bot A2019 (Build 4088).

The IQ Bot On-Premises version supports all the features and functionality available in IQ Bot Version 6.5.2.

[IQ Bot feature comparison matrix](#)

Review the compatibility of the IQ Bot On-Premises version with the corresponding Automation Anywhere Control Room On-Premises version.

[Automation 360 IQ Bot version compatibility](#) on page 786

The IQ Bot Cloud version is available for this release and supports all features and functionality available in IQ Bot Version 6.5.2. This version provides users with automatic provisioning for up to three environments such as Development, Test, and Production. Users can migrate learning instances between environments using APIs.

The IQ Bot Community Edition and the free trial version are available for this release. Both versions have feature parity and are based on IQ Bot Version 6.5.2.

Known limitations
IQ Bot On-Premises
IQ Bot registration is not supported for Cloud-enabled On-Premises installations.

## Bot Insight

New features
<p><b>View filtered data of the dashboard widgets</b></p> <p>Enterprise A2019 and Community Edition</p> <p>The Bot Insight dashboard widget filter enables you to apply filters across the widgets in the dashboard to display filtered data. While the dashboard filters enable you to view different combinations of information from a single dashboard, the widget filters enable you to drill down to information from the already filtered data. You can also save and publish the custom dashboards with the preset widget filters.</p> <p><a href="#">Bot Insight dashboard filter</a> on page 2264</p>

New features
<p><b>Retrieve information from the Bot Insight API, and generate and visualize data analytics on Microsoft Power BI</b></p> <p>Enterprise A2019 and Community Edition</p> <p>The Automation Anywhere custom connector enables you to establish a secure connection to Microsoft Power BI, and generate and visualize data analytics. You can select the Bot Insight APIs in Microsoft Power BI and apply specific parameters for each of the APIs. The custom connector transforms the Bot Insight API responses to data model visualizations in Microsoft Power BI.</p> <p><a href="#">Data connector for Power BI</a> on page 2278</p>
<p><b>Preview and analyze business information in the default business dashboard</b></p> <p>Enterprise A2019 and Community Edition</p> <p>The <b>Data Preview</b> menu in the Bot Insight default business dashboard displays information that is logged for multiple <b>Analyze Open</b> and <b>Close</b> commands used in the bot. The <b>Preview Data</b> menu does not appear when you perform a comparison between the default dashboards.</p>
<p><b>API enhancements</b></p> <p>Enterprise A2019</p> <p>The <code>deletetasklogdata</code> API is updated to include the <code>runId</code> parameter. The <code>getbotrundata</code> API retrieves information about the vital statistics of the bot. The <code>getaudittraildata</code> API retrieves information about the audit data that is logged for all users.</p> <p><a href="#">Bot Insight API</a></p>

To verify which version is compatible with this release, see [Compatibility with release builds](#) on page 985.

New features
<p><b>Migrate 11.x TaskBots and MetaBots to Enterprise A2019</b></p> <p>Enterprise A2019</p> <ul style="list-style-type: none"> <li>Additional support is provided for packages and variables.           <ul style="list-style-type: none"> <li><a href="#">Package mapping for migration</a> on page 1201   <a href="#">Variable mapping for migration</a> on page 1232</li> </ul> </li> <li>You can now migrate MetaBots (with DLLs) and their components from Enterprise 11 to Enterprise A2019. You cannot migrate screen-based MetaBots.           <ul style="list-style-type: none"> <li><a href="#">How MetaBots are migrated</a> on page 1179</li> </ul> </li> <li>Use the Bot Scanner to analyze MetaBots to determine if they can be migrated.</li> <li>Verify the list of certified Enterprise 11 bot versions available for migration: <a href="#">Supported Control Room versions for migration</a> on page 1094</li> </ul>
<p><b>Bot Store integration with the Control Room</b></p> <p>Enterprise A2019</p> <p>You can now access the Bot Store from within the Control Room. You can install, configure, and run the Bot Store bots within the Control Room.</p> <p>As a registered user, you can log in to the Bot Store from the Control Room and access all your downloads. You can install bots and packages from your downloads to the Control Room private repository. You can also submit your existing bots and packages from the Control Room to the Bot Store.</p> <p><a href="#">Bot Store</a> on page 1780</p>
<p><b>Use interactive forms in a bot</b></p> <p>Enterprise A2019</p> <p>Interactive forms provide a form builder experience for users to build interfaces for submitting and regrouping data being used to send and receive data from various applications within their attended automation process. Users with Bot Creator and Bot Runner license can use the interactive forms package to control and manage the form flow within a bot during runtime. Actions performed by users on the interactive forms can be monitored to execute logic using subtasks.</p> <p>Interactive forms are first-class citizens within the bot repository and have the same workflows for moving forms between public and private workspaces, and for export or import actions. No additional licenses or permission are required to use interactive forms.</p> <p>Action items in the interactive forms can be used to manage various forms within a bot.</p> <p><a href="#">Using interactive forms</a> on page 1536</p>

## New features

### Reuse an identical value between bots by configuring a global value in the Control Room

Enterprise A2019 and Community Edition

A global value enables users to reuse an identical value between bots instead of creating a new variable for each bot. Global values remain constant for all users and bots in an Control Room instance. A user with the `AAE_admin` role can configure a global value with a default value and enable non-admin users to overwrite the value to use in their bots.

[Global values](#) on page 1400 | [Create a global value](#) on page 1400 | [Overwrite the default value](#) on page 1402

## Workload enhancements

Enterprise A2019 and Community Edition

- Monitor the progress of ongoing workload automations. You can also pause, resume, or stop the automations as required.
- Configure and edit workload automations to ensure that the automations are deployed seamlessly to unattended Bot Runner devices. Execute the workload automations with priority or round-robin mode from the **Devices > Edit Device pool** page.
- Set the output status of the work item processed in the Control Room on the **Queues and Work item** details page using the `$workItemResult$` variable in a TaskBot.
- Edit work items that are in **Ready to run, On hold, Data error, or Failed** state.
- Set the individual work item status to **Mark complete, Defer, or Re-process** from the **Edit work item** page or in bulk from the **View queues** page.

[View automation of a queue](#) on page 2128 | [Edit device pools](#) on page 1959 | [Edit work items](#) on page 2134 | [Use Work Item variables](#) on page 1394

## Download a file from the Control Room to your device

Enterprise A2019 and Community Edition

Use the **Download CR file** action from the File package to download a file from the Control Room to your device.

**Note:** You cannot use this action to download a bot or a file from the `My Scripts` folder.

[File package](#)

## Clone a bot or files

Enterprise A2019 and Community Edition

Create a read-only copy of a selected bot or file from the public repository to the private repository. The clone is a local copy for the same user and will not be updated with the public repository copy automatically. This provides a testing environment experience for Bot Creators to make and validate changes locally and take advantage of reusable TaskBots in concurrent developments by reusing an existing bot or file as a dependency.

- Cloned bots and files cannot be edited, renamed, or moved.
- Cloned bots and files can be deleted from a private repository.
- Users can create a copy of the cloned bot.
- A cloned bot can be used in Run Task action in another bot.
- Cloned bots and files can be added as a manual dependency for another bot.

**New features****New features in the If package**

Enterprise A2019 and Community Edition

- Configure an **If** action with multiple conditions.  
Specify whether all or either of the conditions must be met.
- Verify whether JavaScript, Task, or VBScript ran successfully or not.
- Verify whether a string variable is empty or not.
- Execute actions only if two strings have matching uppercase and lowercase letters.

[If package](#) | [Example of using a conditional statement](#) on page 1414

**Universal Recorder enhancements**

Enterprise A2019 and Community Edition

Universal Recorder now enables you to:

- Automate in Java applications that run using Java Runtime Environment (JRE) 9, 10, and 11.
- Capture objects in tables in Oracle EBS applications.
- Automate interactions with user interface objects in the taskbar, desktop, or currently active window. This option is available in the window selection drop-down list in the following packages:
  - Image Recognition
  - Mouse
  - Recorder
  - Screen
  - Simulate keystrokes
  - Window

[Universal Recorder for object-based automation](#) on page 1313

**New features in the Excel advanced package**

Enterprise A2019 and Community Edition

- In the **Replace** action, you can choose to replace cell values with an empty character.
- In the **Get cell address** action, you can choose to save the retrieved cell address to a string variable.

[Using the Replace](#) | [Using the Get cell address](#)

**Add DLL dependencies**

Enterprise A2019 and Community Edition

As a bot creator, you can use a DLL that refers to a child DLL.

[Bot dependencies](#) on page 1402

**Licensing server failover**

Enterprise A2019

HA failover from a primary cluster to a secondary cluster applies to all the servers, including the licensing server, and is handled by the data center high availability tools.

[Distributed architecture with HA/DR support](#) on page 25

New features
<p><b>Automate locking, logging off, restarting, or shutting down the computer</b></p> <p>Enterprise A2019 and Community Edition</p> <p>Use actions from the System package at the end of tasks to automate locking, logging off, restarting, or shutting down the computer.</p>
<p><b>Manage running bots with the Pause and Stop actions from the Task Bot package</b></p> <p>Enterprise A2019 and Community Edition</p> <ul style="list-style-type: none"> <li>• Insert a <b>Pause</b> action to temporarily pause the running bot.</li> <li>• Insert a <b>Stop</b> action to terminate the running bot.</li> </ul> <p><a href="#">Task Bot package</a></p>
<p><b>Automate printer settings</b></p> <p>Enterprise A2019 and Community Edition</p> <p>Use actions from the Printer package to automate retrieving and setting the default printer.</p>

Changed features
<p><b>Change in the Dictionary &gt; Remove action</b></p> <p>The <b>Dictionary &gt; Remove</b> action offers the option to assign the removed value to a variable.</p> <p><i>Dictionary package</i></p>
<p>The <b>Update migration status</b> permission name has been changed to <b>Allow a bot-runner user to run migrations</b>. All functionalities remain the same.</p>

Changed features
<p>When multiple bots are scheduled to run on the same user or device, the bots are now queued and run whenever the previous bots completes its run.</p> <p>Service Cloud case ID: 00440072</p> <p><a href="#">Scheduled activities</a> on page 1937   <a href="#">Workload management</a> on page 2108</p>

## Fixed features

Service Cloud case ID	Description
00483976	When the copy function is used, nested subfolders were not visible when users clicked browse to search through directories. This issue has been fixed.
00457550	When a user checks out a bot that uses the <b>Run</b> action to run child bots, the child bots are now cloned from the public repository to the private.
00492706	When a user exports a bot from another Control Room and imports that same bot to a new Control Room, the imported bot and enabled packages now show all required actions.
00482934	Bot deployments and website launches are now optimized for quicker process.
00421864	When a user is viewing historical activity details in <b>Historical activity</b> , the run option is no longer displayed.
00505120	When bots fail the check-in process, the contents are now restored in the <b>Private</b> repository.
00488504	Bots with more than 100 dependencies are now exported successfully without an error, even if the parent bots are in the list of those 100 dependencies.
00444902	When the Control Room is used in Internet Explorer 11, the Bot Agent is now compatible and the UI is rendered properly.
00454079	When the <b>Capture</b> action in the Recorder package is used, content in the browser is captured successfully.
00460530	In a developer Control Room, a user can now successfully import a bot with cyclic dependency.
00493605	In the <b>Run</b> action in the TaskBot package, the <b>Assign the output to variable (optional)</b> option now functions properly when an assigned variable is removed.
00486734	When the <b>Set cell</b> action in the Excel advanced or Excel basic package is used with multiple Microsoft Excel files, the values of the <b>Active cell</b> operation now activate and set the cells accordingly in the respective Microsoft Excel file.
00530915	Migration is not advisable for Enterprise 11 customers using Workload Management due to known issues.

Service Cloud case ID	Description
--	You can now add date variables in the <b>Vertical Bar Graph</b> widget in the Bot Insight <b>Business</b> dashboard.
00475173	All fields of the <b>Recorder &gt; Capture</b> action have been translated to Enterprise A2019 supported languages.
00476820	When a Bot Runner machine is logged off, the device shows the state as Disconnected in the Control Room. Previously, the device showed the state as Connected in the Control Room.

Known limitations
MetaBot logic that uses a DLL function call with one or more parameters migrates successfully. However, when you run the migrated bot, an error is shown.
Global values of the Date time data type cannot be used in actions.
The Enterprise A2019 On-Premises Control Room installation does not support the semicolon (;) special character in the Windows user password. The installation fails if you use this special character.
When data is exported into a CSV file from <b>User Management, Audit Logs, and Roles Management</b> for all locales except English, the respective language is not displayed correctly. Workaround: Export to a CSV file and access a Microsoft Excel file. Import and save that CSV file as a CSV with UTF-8 encoding.
Users must explicitly enable the feature flag for the forms feature in the On-Premises build.
<b>Note:</b> Go to Automation Anywhere support site for more information: <a href="#">Interactive forms not available in Automation 360 v.11 On-Premises (A-People login required)</a>
Forms with many radio buttons and check boxes in the same row are not rendered correctly.
Only the <b>Form Events</b> and <b>UI Triggers</b> event types are supported by event loop as the file or folder triggers and hot keys have issues.

## IQ Bot

The IQ Bot On-Premises version is available for this release with additional features or updates since the last release. This IQ Bot version supports all the features and functionality available in IQ Bot Version 6.5.2.

[IQ Bot feature comparison matrix](#)

Review the compatibility of the IQ Bot On-Premises version with the corresponding Automation Anywhere Control Room On-Premises version.

[Automation 360 IQ Bot version compatibility](#) on page 786

The IQ Bot Cloud version is available for this release and supports all features and functionality available in IQ Bot Version 6.5.2. This version provides users with automatic provisioning for up to three environments such as Development, Test, and Production. Users can migrate learning instances between environments using APIs.

The IQ Bot Community Edition and the free trial version are available for this release. Both versions have feature parity and are based on IQ Bot Version 6.5.2 .

New features
<p><b>Upgrade from earlier versions of IQ Bot to the latest IQ Bot On-Premises</b></p> <p>IQ Bot On-Premises</p> <p>If you are using any of the earlier versions of IQ Bot (5.3.x or 6.5.x), you can upgrade to IQ Bot A2019 Build 3337 On-Premises.</p> <p><a href="#">Updating Automation 360 IQ Bot</a> on page 1071</p>
<p><b>Use API to migrate learning instances between environments</b></p> <p>You can use an API to migrate learning instances in IQ Bot On-Premises.</p>
<p><b>Access IQ Bot from the Control Room dashboard</b></p> <p>Enterprise A2019 and Community Edition</p> <p>You can access IQ Bot from the Control Room through a link, provided you have registered IQ Bot in the Control Room. Otherwise, the IQ Bot section remains hidden.</p>

Known limitations
<p>IQ Bot On-Premises</p> <p>IQ Bot installation fails if the user password contains any of these special characters: single quotation mark ( ' ), quotation mark ( " ), or semicolon ( ; ).</p>
<p>IQ Bot Cloud</p> <ul style="list-style-type: none"> <li>• ABBYY FineReader Engine is the default OCR for data extraction in IQ Bot Cloud.</li> <li>• Data validation using Python script is not supported.</li> <li>• IQ Bot extensions for custom extraction are not available.</li> </ul>
<p>IQ Bot On-Premises and IQ Bot Cloud</p> <p>When you upload vector PDF documents to a new learning instance, a few documents are identified as unclassified. Alternatively, if you convert the documents from PDF to TIFF and upload them, the documents are processed successfully.</p>

## Bot Insight

New features
<p><b>View filtered data of Bot Insight dashboards</b></p> <p>Enterprise A2019</p> <p>The Bot Insight dashboard filter enables you to apply filters across dashboards to display filtered data on the dashboard widgets. The filter enables you to view different combinations of information from a single dashboard, thereby eliminating the need to maintain separate dashboards for different sets of users.</p> <p><a href="#">Bot Insight dashboard filter</a> on page 2264</p>

**New features****View business analytics for multiple transactions simultaneously**

Enterprise A2019

The **Multiple Transaction Names** menu displays transactional information about bots with multiple **Analyze- Open** and **Close** commands. Each **Analyze- Open** and **Close** command is considered as a transaction, and each transaction is displayed as a unique block in the data preview section. The number of rows for each unique transaction block is limited to 100.

[Business dashboard](#) on page 2259

## Enterprise A2019.10 Release Notes

Review the new features, supported packages, changed features, fixed features, and known limitations in Enterprise A2019.10 (Build 2545). There are no security fixes in this release.

- [Enterprise A2019](#)
- [IQ Bot](#)
- [Bot Insight](#)

## Enterprise A2019

To verify which version is compatible with this release, see [Compatibility with release builds](#) on page 985.

**New features****Migrate 11.3.x TaskBots to Enterprise A2019**

Enterprise A2019

- Analyze whether you can migrate bots created in Enterprise Client version 10.x using the Bot Scanner.

[Analyze Bot Scanner report for migration](#) on page 1121

- Additional support is provided for packages and variables.

[Package mapping for migration](#) on page 1201 | [Variable mapping for migration](#) on page 1232

- Multiple Bot Runner users are supported for bot migration.

[Migrate Enterprise bots](#) on page 1173

**AI Sense Recorder to capture objects from remote applications**

This is a **Beta** release on Enterprise A2019 (Cloud deployment only) and Community Edition

Record a task and capture objects using the AI Sense Recorder from applications that are usually accessed remotely and with a complex user interface (UI).

[Record a task with AI Sense Recorder](#) on page 1329

**New features****Manage your automation as Work Items for resource optimization and workload automation**

Enterprise A2019 and Community Edition

Divide your automation into small, logical modules called Work Items using the new [Workload Management](#) feature. Process these Work Items simultaneously using queues to ensure that your organization's automation goals are achieved with optimum resource utilization.

Use the workload module to create and manage workload queues and run bots on unattended Bot Runners through the workload queues. Also, pass the Work Item attributes or values to the bot from the Control Room when you **Run bot with queue** with the help of Work Item variables.

[Workload management](#) on page 2108

**Install Control Room on Red Hat Enterprise Linux 7.7 and Linux CentOS 7.7**

Enterprise A2019

Use the command line to install your Control Room on your Linux servers in the datacenter.

[Installing Control Room on Linux](#) on page 909

**Use wildcard characters in folder and file path fields in the Encrypt and Decrypt actions**

Enterprise A2019 and Community Edition

Substitute an asterisk (\*) for one or more unknown alphanumeric characters or symbols. This maximizes the search results by returning all folders and files that contain the string that you have specified.

[Encrypt](#) | [Decrypt](#)

**Use system variables to return data from the computer that is connected to the running Bot Agent**

Enterprise A2019 and Community Edition

You can use the following system variables:

- **AAControlRoom:** Returns the URL of the Control Room.
- **CPUUsage:** Returns the percentage utilization of the CPU.
- **RAMUsage:** Returns the RAM usage in megabytes.
- **OSName:** Returns the operating system.
- **TotalRAM:** Returns the total amount of RAM available.

New features
<p><b>Automate tasks in Oracle EBS and Forms with the Universal Recorder</b></p> <p>Enterprise A2019 and Community Edition</p> <p>Open Oracle EBS applications in a browser as Java Web Start applications or as a thick client. The Universal Recorder can capture the following objects:</p> <ul style="list-style-type: none"> <li>• Window/Tab</li> <li>• Button</li> <li>• Text box</li> <li>• Label (read-only)</li> <li>• Radio button</li> <li>• Check box</li> <li>• Table/Grid</li> <li>• Scroll bar</li> <li>• Menu</li> <li>• Combo-box/Drop-down list</li> </ul>

XML	2.0.0-20200131-090339

Changed features
<p><b>Updated layout for the summary report generated by Bot Scanner</b></p> <p>The layout of the summary report is updated to provide information about the number of bots scanned, and the commands and variables used in the scanned bots that are supported in Enterprise A2019.</p> <p><a href="#">Analyze Bot Scanner report for migration</a> on page 1121</p>
<p><b>Python script and VBScript packages return output without quotation marks</b></p> <p>The actions in the Python script and VBScript packages now return output without any quotation marks. For example, if the action previously returned "ABC" as the output, now the action returns only ABC.</p>
<p><b>Use Microsoft SQL Server address as alias for database</b></p> <p>Service Cloud case ID: 00401484</p> <p>The Control Room now supports using a Microsoft SQL Server address as alias for a database during installation.</p> <p><a href="#">Automation 360: Steps to change database server post Control Room installation (A-People login required)</a></p>

## Fixed features

Service Cloud case ID	Description
00463210	In a virtual machine using Remote Desktop Protocol, the <b>Keystrokes</b> action now functions properly without prompting a special characters error.
00455359, 00466407, 00475122	When the Control Room is used in Google Chrome, renaming a folder in the <b>My bots</b> section no longer causes the browser to crash.
00440659	In the <b>Data Table</b> package, the <b>Create folders/files if it doesn't exist</b> option in the <b>Write to file</b> action now functions properly and does not create a file when the option is not selected.
00377861, 00466104	When you install Enterprise A2019 On-Premises with Amazon Relation Database Service (RDS) and there is no internet connectivity, the installation now completes successfully.
00472738, 00496476	In the Control Room, the bot now runs successfully without prompting an interactive bot error message in any circumstance.

Service Cloud case ID	Description
00472655	In the <b>Loop</b> action, selecting the <b>Cell range</b> in the <b>Loop through</b> option now functions properly with the <b>For each row in worksheet</b> in the <b>Iterator</b> option.
00475040	When a bot is developed in Google Chrome, the pause and resume options now function correctly.
00445671	The time taken to connect to the Control Room is now less than 2 minutes after you restart the Control Room services.
00421864	You can now configure your Bot Agent using the Google Chrome browser. The following error message is no longer displayed: <code>Please use Chrome to configure your bot agent.</code>
00462095	Bot compilation time has decreased, so it takes less time for the bot to run. Previously, some bots took up to 40 seconds in pre-processing mode.

## IQ Bot

The IQ Bot On-Premises version is available for this release with additional features or updates since the last release. This IQ Bot version supports all the features and functionality available in IQ Bot Version 6.5.2.

[IQ Bot feature comparison matrix](#)

Review the compatibility of the IQ Bot A2019 On-Premises version with the corresponding Automation Anywhere Control Room On-Premises version.

[Automation 360 IQ Bot version compatibility](#) on page 786

New features
<p><b>IQ Bot On-Premises unified database</b></p> <p>IQ Bot Build 2545 On-Premises now supports a unified database. You have to run a migration script to migrate the databases of Builds 1089, 1598, and 2079 to Build 2545.</p> <p><a href="#">Run IQ Bot On-Premises database migration script</a> on page 1072</p>

---

**Note:** The version number in the IQ Bot installer is incorrect and will be fixed in the next release.

---

## Bot Insight A2019

New features
<p><b>New Bot Insight homepage</b></p> <p>The new homepage displays all the available dashboards in a single page and enables you to directly access the dashboard of your choice. The smart search functionality enables you to search for dashboards in the <b>Search</b> text field. The homepage also enables you to bookmark your favorite dashboards and to sort the dashboards based on the following parameters:</p> <ul style="list-style-type: none"> <li>• <b>Dashboard Name</b></li> <li>• <b>Type</b></li> <li>• <b>Total Views</b></li> <li>• <b>Last Refreshed</b></li> </ul> <p><i>Bot Insight dashboards</i> on page 2254</p>
<p><b>Operations dashboard</b></p> <p>View information about the bots that are deployed on different Bot Runner machines and their statistics based on the performance from the Bot Insight <b>Operations</b> dashboard. You can use this information to enhance productivity and take measures based on real-time information for RPA deployments.</p> <p>You can directly access the <b>Bots</b> and <b>Audit</b> dashboards from the hyperlinks in the <b>Operations</b> dashboard.</p> <p><i>Operations dashboard</i> on page 2257</p>
<p><b>Transaction data</b></p> <p>View data that is aggregated and logged by the bots when they are deployed in the Bot Runner machines by using the <b>Transaction</b> data feature in the <b>Profile</b> menu. You can access this feature from the <b>Business</b> dashboard.</p> <p><i>Business dashboard</i> on page 2259</p>
<p><b>Exporting data from widgets</b></p> <p>Export data that is generated by the various smart widgets to comma-separated value (CSV) files on your local drive from the <b>Custom Business</b> dashboard. The export file for all the widgets, except the <b>Data Table Chart</b> and the <b>US Map</b>, contains the following headers:</p> <ul style="list-style-type: none"> <li>• Group</li> <li>• Subgroup</li> <li>• Metric</li> <li>• Volume</li> </ul> <p>The <b>Data Table Chart</b> export file contains all the headers that are present in the <b>Data Table Chart</b>. The <b>US Map</b> export file contains the state codes, metric values, and the volume headers.</p> <p><i>Exporting data from a dashboard widget</i> on page 2277</p>

**New features****Visualization updates**

Customize the widgets on the Bot Insight dashboards to gain insights for specific scenarios. The following widgets are added to Bot Insight:

- **Heat Map**
- **Data Table Chart**

[Bot Insight visualizations](#) on page 2274

**Known limitations**

Using the Universal Recorder in Oracle EBS applications:

- The **Select item by text** action does not retrieve the value of a selected **ListView** object.

Workaround: Manually enter the item value after capturing the object control or use the **Select item by index** action.

---

**Note:** Item index count starts at 1.

---

- At runtime, the **Select item by text** and **Select item by index** actions do not appear to select the item specified in a **PageTab** object, but the bot successfully executes the action.
- At runtime, the **Select item by text** and **Select item by index** actions do not appear to select the item specified in a **ComboBox** object, but the bot successfully executes the action.

In Enterprise A2019 On-Premises, the following activities are currently not logged in the workload logs:

- Create a queue
- Create a device pool
- Create a bot
- Run a bot with a queue

You can access the logs from the `C:\ProgramData\AutomationAnywhere\Logs` folder.

**Enterprise A2019 (Build 2094) Release Notes**

These release notes describe new features, changed features, fixed features, security fixes, deprecated features, and known limitations in Enterprise A2019 (Build 2094).

To verify which version is compatible with this release, see [Compatibility with release builds](#) on page 985.

**Enterprise A2019 Build 2094**

Build 2094 contains updates for the following:

- [Enterprise Community Edition](#)
- [Bot Insight A2019](#)
- [IQ Bot A2019](#)

- *On-Premises* (Build 2079)

## New features in Build 2094

Feature	Description
<b>Migration</b>	<p>Migrate Enterprise 11.3.x TaskBots to Enterprise A2019.</p> <ul style="list-style-type: none"> <li>• Run the Bot Scanner (previously called the pre-migration utility) to analyze if your Enterprise 11.x bot (currently only 11.3.1, 11.3.2, and 11.3.2.x versions are supported) can be migrated to Enterprise A2019. The utility generates a summary report in HTML format and a separate report for each bot in XML format. <ul style="list-style-type: none"> <li><a href="#">Bot Scanner overview</a> on page 1116</li> </ul> </li> <li>• Migrate multiple TaskBots with dependent TaskBots using a single Run-as user. <ul style="list-style-type: none"> <li><a href="#">Migrate Enterprise bots</a> on page 1173</li> </ul> </li> <li>• As part of the bot migration process, you can identify previously migrated TaskBots on the bot selection page and preview a list of the dependent TaskBots before finalizing the migration. <ul style="list-style-type: none"> <li><a href="#">Migrate Enterprise bots</a> on page 1173</li> </ul> </li> <li>• Analyze the status of individual bot migrations and identify any unsupported commands or attributes associated with the migrated bot and its dependencies. <ul style="list-style-type: none"> <li><a href="#">View migration reports</a> on page 1251</li> </ul> </li> <li>• Additional support is provided for packages and variables. <ul style="list-style-type: none"> <li><a href="#">Package mapping for migration</a> on page 1201</li> </ul> </li> </ul>
<b>SAML 2.0</b>	<p>Switch an authenticated environment Control Room database to a SAML identity provider (IDP).</p> <p><a href="#">Set up SAML authentication</a> on page 954</p>

Feature	Description
<b>Bot Deploy API</b>	<p>The Bot Deploy API now includes / <code>automations/deploy</code> and is introduced to support the <code>runAs user</code> feature for Bot deployment.</p> <ul style="list-style-type: none"> <li>The Bot Deploy API works only in Enterprise public accounts, and not in Community Edition.</li> <li>The API supports callback URL for environments that have both the Control Room and callback server on the same network.</li> </ul>
<b>Geo Presence</b>	The Geo Presence feature is a multi-tenant, secure, scalable, Cloud Control Room enhancement to securely communicate with users and Bot Runners over a customer network.
<b>Exchange Web Services support</b>	<p>Actions in the Email package enable users to automate email-related operations using Exchange Web Services (EWS).</p> <p><i>Email package</i></p>
<b>Variables in place of an index or key value</b>	<p>Data table, dictionary, list, and record type variables can express index and key values as variables.</p> <p><i>Variable types</i> on page 1384</p>
<b>Copy bot</b>	<p>The copy bot functionality retains the metadata of the original bot, including captured images, recorded objects, called files, and child bots.</p> <p><i>Copy a bot</i> on page 1364</p>
<b>Excel actions to retrieve cell, column, or row location</b>	<p>The following actions enable users to retrieve location information from an Excel sheet and save it to a variable.</p> <ul style="list-style-type: none"> <li><i>Get cell address</i></li> <li><i>Get column</i></li> <li><i>Get row</i></li> </ul>
<b>Recorder enhancements</b>	Users can discard the most recently captured object while the Recorder is running.

## Changed features

Feature	Description
Office 365 packages authorization	Authorize each Office 365 package separately through the <b>Connect</b> package in each package. <i>Using <a href="#">Connect for Office 365</a></i>

## Fixed features

Feature	Description
Bot Agent	In the Control Room, upgrading to the latest Bot Agent version now successfully executes the bot without any prompted error messages. See <i><a href="#">Switch Bot Agent to a different Control Room</a></i> on page 1004.

Feature	Description
Excel advanced package	In the <b>Excel advanced</b> package, the <b>Close</b> action now terminates only a specific open session as defined by the <b>session name</b> .
Keystrokes	The <b>Keystrokes</b> command now functions properly with the Japanese keyboard layout.

## Security fixes

The security fixes in this release have not changed since the previous release. For a list of these fixes, see [Enterprise A2019 \(Builds 1598 and 1610\) Release Notes](#) on page 669.

## Deprecated features

The deprecated features in this release have not changed since the previous release. For a list of these deprecations, see [Enterprise A2019 \(Builds 1598 and 1610\) Release Notes](#) on page 669.

## Known limitations in Build 2094

### Migration

- When selecting a bot for migration, values for the **Last Migrated** and **Migrated By** columns might differ for the same bot in the **Available Files** and **Selected** tables.
- The "System" value in the **Migrated By** column indicates that the bot has not been migrated previously.
- When viewing commands and variables associated with each migrated bot, you should only see the unsupported commands and variables. Currently, all commands and variables are shown.

## IQ Bot Build 2079

IQ Bot On-Premises version is available for this release with no additional features or updates since the last release. This version is based on IQ Bot Version 6.5.2 feature and functionality.

[IQ Bot feature comparison matrix](#)

IQ Bot On-Premises version is compatible with the corresponding Automation Anywhere Control Room On-Premises version.

[Automation 360 IQ Bot version compatibility](#) on page 786

For a fresh Control Room installation, the user has to upload the IQ Bot package manually. See [Add packages to the Control Room](#) on page 1970 for details.

Go to Automation Anywhere support site to download the package:

[A-People Downloads page \(Login required\)](#).

## IQ Bot fixed features

The fixed features in this release have not changed since the previous release.

## IQ Bot security fixes

The security fixes in this release have not changed since the previous release.

## IQ Bot deprecated features

The deprecated features in this release have not changed since the previous release.

## IQ Bot known limitations

There are no new known limitations in this release.

## Bot Insight new features in Build 2094

Feature	Description
<b>Visualizations</b>	<p>The <b>Visualization</b> widget in the Bot Insight dashboard provides a host of highly customizable widgets that you can use to gain insights on specific scenarios. Vertical and horizontal <b>Clustered</b> and <b>Stacked</b> bars are added.</p> <p><a href="#">Adding a dashboard widget</a> on page 2273</p>

## Bot Insight changed features

The changed features in this release have not changed since the previous release.

## Bot Insight fixed features

The fixed features in this release have not changed since the previous release.

## Bot Insight deprecated features

The deprecated features in this release have not changed since the previous release.

## Bot Insight known limitations

The known limitations in this release have not changed since the previous release.

## Enterprise A2019 (Builds 1598 and 1610) Release Notes

These release notes describe new features, changed features, fixed features, security fixes, deprecated features, and known limitations in Enterprise A2019 (Builds 1598 and 1610).

To verify which version is compatible with this release, see [Compatibility with release builds](#) on page 985.

## Enterprise A2019 Builds 1598 and 1610

Build 1598 contains updates for the following:

- [Enterprise Community Edition](#)
- [Bot Insight](#)
- [IQ Bot](#)

Build 1610 contains updates for the following:

- [On-Premises](#)
- [Bot Insight](#)
- [IQ Bot](#)

## New features in Builds 1598 and 1610

Feature	Description
<b>Pre-migration utility for On-Premises</b>	<p>The Automation Anywhere pre-migration utility evaluates your 11.x bots for migration to Enterprise A2019.</p> <p>Run the pre-migration utility to verify whether your existing 11.x bots can be migrated to Enterprise A2019. Use the summary report generated by the utility to identify the bots that can and cannot be migrated and decide if you want to start the migration.</p> <hr/> <p><b>Note:</b> This is an initial version of the pre-migration utility. We plan to include updates to the utility in upcoming releases to help migrate most of your bots.</p>
<b>On-Premises Windows installer</b>	Enterprise A2019 On-Premises Windows installer is certified for Azure.
<b>Bot Creator and Bot Runner on Azure Cloud</b>	Users can create and execute bots for devices on Azure Cloud.
<b>Action localization</b>	Labels, buttons, and tooltips are localized to the supported language set.
<b>Updated action packages</b>	<ul style="list-style-type: none"> <li>• Additional REST Web Service error codes for better troubleshooting of API calls</li> <li>• PGP package for encrypting and decrypting files</li> <li>• Improvements to SAP actions</li> </ul>
<b>Control Room to a SAML-based, SSO-authenticated Control Room</b>	Enterprise A2019 integrates with SAML identity providers (IDPs). Post installation, administrators can switch the Control Room to a SAML-based, SSO-authenticated Control Room.
<b>Move email messages to different folder</b>	The Move message command enables the user to move all the filter-matched emails to a different folder.

## Deprecated features

The deprecated features in this release have not changed since the previous release. For a list of these deprecations, see [Enterprise A2019 \(Builds 1082 and 1089\) Release Notes](#) on page 675.

## Known limitations in Builds 1598 and 1610

- IQ Bot is not supported in Automation Anywhere Cloud and users cannot register any IQ Bot instance with the Cloud Control Room.
- If a bot is deployed on a device, no other bots can be deployed on that device until the first bot has completed the deployed task.

- When deploying a bot using Unattended Bot Runner on a virtual machine with Windows 10 desktop, users have to enable remote access to the device (**Control Panel > System Properties > Allow Remote Access**).
- Deploying a bot with Bot Runner on a locked device will leave that device in an unlocked state.
- A Bot Creator is not able to view devices as assigned by the Control Room administrator. With this release, changes to the basic role has removed the **View and manage all devices** permission so that unless this permission is expressly granted by the Control Room administrator, the Bot Creator will no longer be able to see other devices in the Control Room. Bot Creators can register their devices directly; however, they will not be able to see the other devices in the Control Room.
- Unable to deploy bots from a private workspace using the wizard. Bot Creators can deploy bots from the editor.
- If users have set up Active Directory for Control Room authentication, changing to SAML or Control Room Database is not supported.
- Device pool administrators can delete a device pool after automation is scheduled and assigned to the pool.
- Users without SMTP can still import bots and packages.
- When users delete a bot from the Public workspace, the same bot is deleted from the Private workspace as well.
- Elastic Search Disaster Recovery backup is not supported.
- Using the Run Task action with the child task using triggers is not supported.
- User cannot export a bot with dependencies if that user does not have access to any of the related dependencies.
- Users cannot check out bots if they are linked through circular dependencies.
- Minimizing the window for some Microsoft Active Accessibility apps, such as Notepad, Calculator, or Remote Desktop Applications, can cause the operation to fail.
- UI Automation, such as Snagit Editor Window for example, will not work in the background unless expressly minimized.
- UI Triggers are not generating events with Snagit Editor or Inflow app.
- Applications such as calculator use different technologies on Windows 10 vs. Windows 2012 or other servers. In these cases, when a bot is created in one server configuration, the bot cannot be carried to another server. User triggers in these cases will not trigger bot deployment and there are no errors in the trigger listener or node manager logs.
- UI Triggers that are configured with multiple triggers are taking as much as 25 seconds to complete.
- UI Triggers with a single capture and a filter do not work with files larger than 2 MB.
- Button events where a user is switched from one window to a new window of an application fail to deploy a bot when listening for UI Triggers.
- For Automation Anywhere Elastic Search Service users, the `C:\ProgramData\AutomationAnywhere` folder has to be removed before installing Enterprise A2019.
- Users cannot enable SMTP with TLS for the On-Premises version of the Control Room (On-Premises only).
- User credentials are not editable (On-Premises only).
- Even when a newly added device is registered correctly, the indication icon does not turn green.
- **Activity - In Progress** table is not cleaning event records until the user performs a hard refresh (F5) of the browser.
- Domains are not shown for the **Device/Run as** tab when creating a role. This option is also missing when running a bot.
- Node manager is not able to establish a handshake SSL connection to the Control Room running on SSL certificate (On-Premises only).
- Repository Management API is incomplete; there is only one URL in the Swagger file.
- Device pools display completed automations, not scheduled automations.
- If a user is not the device pool administrator, the devices are not correctly displayed when editing a device pool.

- For an Unattended Bot Runner, with a device assigned and auto-login credentials set, and **Run as self** selected, the **Run now** option is disabled.
- When a user is running a bot from the Run Wizard and the Bot Agent requires an update, after the user has updated the agent from the pop-up box, the user cannot deploy the bot until the user navigates back to the previous page and returns to the workflow to run the wizard.
- Folder triggers do not deploy bots when a folder change event occurs.

## IQ Bot Builds 1598 and 1610

IQ Bot On-Premises version is available for this release with no additional features or updates since the last release.

## IQ Bot changed features

IQ Bot is compatible with A2019 Builds 1598 and 1610.

## IQ Bot fixed features

The fixed features in this release have not changed since the previous release.

## IQ Bot security fixes

The security fixes in this release have not changed since the previous release.

## IQ Bot deprecated features

The deprecated features in this release have not changed since the previous release.

## IQ Bot known limitations

There are no new known limitations in this release.

## Bot Insight new features in Builds 1598 and 1610

Feature	Description
<b>Operation dashboard</b>	<p>The <b>Operation</b> dashboard in Bot Insight displays the <b>Audit</b> dashboard.</p> <p>You can search for the dashboards using the <b>Search</b> text box. You can also customize the dashboards based on your requirements. Role-based access control and permissions are applied to the dashboards so that the dashboard shows data only a specific user is authorized to view.</p> <p>See <a href="#">Operations dashboard</a> on page 2257.</p>

Feature	Description
<b>Analytic visualization widgets</b>	<p>The following new widgets are added:</p> <ul style="list-style-type: none"> <li>• Stacked Bar Chart</li> <li>• Clustered Bar Chart</li> </ul> <p>See <a href="#">Adding a dashboard widget</a> on page 2273.</p>

## Bot Insight changed features

The changed features in this release have not changed since the previous release.

## Bot Insight fixed features

The fixed features in this release have not changed since the previous release.

## Bot Insight deprecated features

The deprecated features in this release have not changed since the previous release.

## Bot Insight known limitations

The deprecated features in this release have not changed since the previous release.

## Enterprise A2019 (Builds 1082 and 1089) Release Notes

These release notes describe new features, changed features, fixed features, security fixes, deprecated features, and known limitations in Enterprise A2019.

To verify which version is compatible with this release, see [Compatibility with release builds](#) on page 985.

## Enterprise A2019 Builds 1082 and 1089

Build 1082 contains updates for the following:

- [Enterprise Community Edition](#)
- [Bot Insight](#)

Build 1089 contains updates for the following:

- [On-Premises](#)
- [IQ Bot](#)
- [Bot Insight](#)

## New features in Builds 1082 and 1089

Feature	Description
<b>Universal recorder support for SAP</b>	The universal recorder now supports the SAP graphical interface for fast and accurate control and ease of editing generated scripts.
<b>Citrix support</b>	Citrix agent enables remote application recording for object cloning on Citrix servers and leverages ICA to create user sessions.
<b>Enhanced code editing</b>	Select multiple lines of code in editor to copy, move, disable, enable, as well as disable/enable a line of an action in a bot script.  Users can run bots from a particular line of code or action inside the bot.
<b>Bot import and export</b>	Users can export bots with dependencies into a common zip file, including all actions. Users can manually exclude packages from the export process.  All imported action packages will be automatically installed into the target Cloud Control Room and the bots placed inside the user private workspace.
<b>Background processing</b>	Background processing for Citrix Virtual Apps and Windows native applications. Excel packages inherently support background processes.
<b>REST package</b>	Support for GET, POST (text, XML, and HTML), PUT, and DELETE methods. Authentication types supported include Basic, Logged-in AD user, and NTLM.
<b>OCR Action</b>	Users can capture window and capture image by path.
<b>Active Directory integration for On-Premises</b>	Allowing auto-discovery of sites and domains, Enterprise A2019 On-Premises integrates Active Directory to support multi-domain as well as multi-forest deployments.

## Changed features

Changed features	
<b>TaskBot</b>	All rich features of MetaBot, such as DLL and code protection using execute permission, are now part of a standard TaskBot. This also includes inline scripting using Python, VBScripts, and more to help reduce the learning curve for new users and provides a uniform bot development experience.

## Fixed features

The fixed features in this release have not changed since the previous release. For a list of these features, see [Enterprise A2019 \(Build 550\) Release Notes](#) on page 682.

## Security fixes

The security fixes in this release have not changed since the previous release. For a list of these fixes, see [Enterprise A2019 \(Build 550\) Release Notes](#) on page 682.

## Deprecated features

The deprecated features in this release have not changed since the previous release. For a list of these deprecations, see [Enterprise A2019 \(Build 550\) Release Notes](#) on page 682.

## Known limitations in Builds 1082 and 1089

- IQ Bot is not supported in Automation Anywhere Cloud and users cannot register any IQ Bot instance with Cloud Control Room.
- To create database tables in Cloud Control Room where internet access is restricted and deploying Liquibase, users are required to unblock the Java process to connect to [www.liquibase.org](http://www.liquibase.org) in order to download the schema and allow java.exe to have internet access.

- The Folder trigger has the following event options: **create**, **modify**, and **delete**. The File trigger only has the **modify** and **delete** event options.
- A bot cannot have duplicate Triggers that point to the same directory.
- Using the action Run Task with the child task using triggers is not supported.
- Activity - In Progress is not cleaning the event record until user does hard refresh (F5) of the browser.
- User cannot export a bot with dependencies if that user does not have access to any of the related dependencies.
- Users cannot checkout bots if they are linked via circular dependencies.
- Minimizing the window for some Microsoft Active Accessibility apps, such as Notepad, Calculator, or Remote Desktop Applications, can cause the operation to fail.
- UI Automation, such as Snagit Editor Window for example, will not work in the background unless expressly minimized.
- If the system Citrix plugin is not updated, the Recorder will not launch.
- If the user renames a previously saved recorder bot, a download error is generated and results in loss of images.
- For Elasticsearch users, remove the `C:\ProgramData\AutomationAnywhere` folder prior to installing Enterprise A2019.
- Users cannot enable SMTP with TLS for the on-premises version of the Control Room (On-Premises only).
- User credentials are not editable (On-Premises only).
- Installer fails to create credentials using Windows Authentication. Use SQL Authentication service credentials (On-Premises only).
- In an On-Premises environment, creating credentials with the Credential Vault is not supported in this release.
- When using the Recorder with Citrix in an On-Premises deployment, the Citrix Agent could generate an internal server error during the recording process.

## IQ Bot Builds 1082 and 1089

IQ Bot Community Edition is available for this release. IQ Bot is not yet available on Automation Anywhere Cloud.

See [IQ Bot Community Edition quick start guide](#) .

## IQ Bot changed features

IQ Bot is compatible with Enterprise A2019 Build 1089.

## IQ Bot fixed features

The fixed features in this release have not changed since the previous release.

## IQ Bot security fixes

The security fixes in this release have not changed since the previous release.

## IQ Bot deprecated features

The deprecated features in this release have not changed since the previous release.

## IQ Bot known limitations

For On-Premises, if IQ Bot and Control Room are installed on the same machine, on restarting the machine, IQ Bot does not work, and displays an error message.

---

**Note:** We recommend restarting Automation Anywhere Control Room Reverse Proxy service to resolve the issue.

---

## Bot Insight new features in Builds 1082 and 1089

Feature	Description
<b>Smart data profiling for country, state, and zip codes</b>	Bot Insight analyzes information provided in the variables to automatically identify information based on the country, state, and zip or postal code. You can use this information to create the <b>World</b> and <b>US Map</b> widgets.  See <a href="#">Editing a data profile</a> on page 2263.
<b>Business data delete API</b>	Use this API to delete logged data from either the production mode or the development mode for a particular Control Room instance.  <code>DELETE &lt;control_room_url&gt;/v2/botinsight/data/api/deletetasklogdata.</code>
<b>Business data profile API</b>	Use this API to extract the business data profile logged in Bot Insight. <code>GET &lt;control_room_URL&gt;/v2/botinsight/data/api/gettaskvariableprofile</code>
<b>Business data API</b>	Use this API to extract the business data logged in Bot Insight.  <code>GET https://{{ControlRoomURL}}/v2/botinsight/data/api/gettasklogdata?botname=&lt;botname&gt;</code>
<b>Resize dashboard widgets</b>	You can resize and save the widgets in the Bot Insight dashboard based on your requirements. When you resize a dashboard widget, other widgets in the dashboard are automatically adjusted to fill in the available layout.  See <a href="#">Editing a dashboard widget</a> on page 2276.

Feature	Description
<b>US map widget</b>	The <b>US Map</b> widget enables you to visualize and analyze information about Country, State, City, and Zip Code.  See <a href="#">Adding a dashboard widget</a> on page 2273.
<b>World map widget</b>	The <b>World Map</b> widget enables you to visualize and analyze information about Country, State, Zip Code, Latitude, and Longitude.  See <a href="#">Adding a dashboard widget</a> on page 2273.
<b>Parent child dashboard</b>	When you create a new bot, Bot Insight automatically creates a default dashboard. If you have a parent bot and a child bot, Bot Insight creates a separate dashboard for each of the bots.  See <a href="#">Bot Insight dashboards</a> on page 2254.
<b>Notification of variable updates in the standard dashboard</b>	Data profile updates are highlighted with a red dot in the standard dashboard.  See <a href="#">Customizing a dashboard</a> on page 2267.
<b>Data logging</b>	When you deploy and run a bot on the Bot Runner machine, Bot Insight aggregates all the information about that bot. The published dashboard for that bot displays the aggregated bot information.  See <a href="#">Bot Insight dashboards</a> on page 2254.
<b>Bot Insight</b>	The <b>Analyze</b> package provides the following functions to enable business analytics in the Bot Insight dashboard: <ul style="list-style-type: none"> <li>• <b>Analyze Open</b></li> <li>• <b>Analyze Close</b></li> </ul>

## Bot Insight changed features

The changed features in this release have not changed since the previous release.

## Bot Insight fixed features

The fixed features in this release have not changed since the previous release.

## Bot Insight deprecated features

The deprecated features in this release have not changed since the previous release.

## Bot Insight known limitations

The known limitations in this release have not changed since the previous release.

## Enterprise A2019 (Build 550) Release Notes

These release notes describe new features, changed features, fixed features, security fixes, deprecated features, and known limitations in Enterprise A2019 (Build 550).

### New features in A2019 Build 550

Feature	Description
<b>On-premises installer</b>	The on-premises installation application for Enterprise A2019.
<b>IQ Bot supports IE11</b>	IQ Bot (Build 550) supports Internet Explorer version 11 (IE11).
<b>Download all documents</b> action	Use the <b>Download all documents</b> action to download the extracted results from an IQ Bot server that was created by running a TaskBot, using the <b>Upload Document</b> action.

### Supported packages in Build 550

The supported packages in this release have not changed since the previous release. For a list of these packages, see [Enterprise A2019 \(Build 543\) Release Notes](#) on page 683.

### Changed features

IQ Bot (Build 550) Changed Features	
Issue	Description
Language toggle UI redesigned	<p>On the IQ Bot landing page, user can click the language toggle at the top right corner, to select a language from the drop-down list. The UI displays in the selected language.</p> <p>User can select a language from either the Control Room or IQ Bot language toggle icon.</p> <hr/> <p><b>Note:</b> After logging out of the system, the system performs a reset. This requires the user to select the language again at login.</p>
<b>Upload document</b> action	The <b>Upload document</b> action lets you to upload documents for processing with IQ Bot, using a TaskBot.

## Fixed features

IQ Bot (Build 550) fixed features:

- Japanese documents using Microsoft Azure Computer Vision OCR engine get classified correctly.
- In the Designer window, during document training, user is able to move from one page to the other successfully along with mapping of form and table fields.
- Download API can download successfully processed documents after moving the bot and learning instance to production.

## Security fixes

No security features are introduced in this build.

## Deprecated features

No deprecated features are introduced in this build.

## Known limitations

IQ Bot (Build 550) known limitations:

- When using Internet Explorer (IE) 11, icons disappear after a page refresh. A hard refresh (Ctrl plus F5) helps fix the issue.
- When using Internet Explorer (IE) 11, if user imports a domain, the system shows an error message. However, the feature works as expected.
- User is unable to migrate IQBA files from other versions of IQ Bot.
- IQ Bot portal does not launch after a machine restart. User has to restart Automation Anywhere Control Room Reverse Proxy Service as well.

## Enterprise A2019 (Build 543) Release Notes

These release notes describe new features, changed features, fixed features, security fixes, deprecated features, and known limitations in Enterprise A2019 (Build 543).

To verify which version is compatible with this release, see [Compatibility with release builds](#) on page 985.

## New features in A2019 Build 543

Feature	Description
<b>Next generation bot workbench</b>	<p>Create bots from any device, from anywhere through a web browser. The intuitive new design for applying multiple personas with varying bot building skills and a redesigned work area for simple assembly and deployment. These include:</p> <ul style="list-style-type: none"> <li>• A universal recorder to simplify capturing processes</li> <li>• <b>List</b> and <b>Flow</b> views for TaskBot creation</li> <li>• Powerful bot code management capabilities</li> <li>• Rich variable passing with no cross-language mapping required</li> </ul>
<b>Bot Runner</b>	<p>Access and run bots from the cloud. When bots are deployed to Bot Runners, any dependent actions are also deployed. When updates to Actions are available, the updates are also automatically pushed.</p>
<b>Package manager</b>	<p>The package manager centralizes control over bundled actions to enable users to deploy and upgrade only those targeted actions being used.</p>
<b>Advanced variable types</b>	<p>Access expanded variables and array types for enhanced action implementation, including DateTime, numbers, list, Boolean, dictionary, multi-dimension arrays for reading Microsoft Excel documents, and file data column for .CSV files.</p>
<b>Inline scripting</b>	<p>Native support for Python and VBScript inline scripting languages enables simple data passing between scripts and bots.</p>
<b>New UX</b>	<p>The new user experience provides assistance for users who are getting started and includes step-by-step guidance for common tasks.</p>
<b>Excel automation</b>	<p>Configure Microsoft Excel TaskBot automation without installing Microsoft Office on the Bot Runner machine.</p>
<b>Recording of automation</b>	<p>Record automation, even from a remote device.</p>
<b>IQ Bot</b>	<p>Enterprise A2019 will fully support IQ Bot, the only AI-driven solution for users to automate processing of complex documents.</p>
<b>Bot Insight</b>	<p>The <b>Analyze</b> package provides the following functions to enable business analytics in the Bot Insight dashboard:</p> <ul style="list-style-type: none"> <li>• <b>Analyze Open</b></li> <li>• <b>Analyze Close</b></li> </ul>

## Changed features

This build does not include any changed features.

## Fixed features

No fixed features are introduced in this build.

## Security fixes

No security fixes are introduced in this build.

## Deprecated features

No deprecated features are introduced in this build.

## Known limitations

Feature	Limitation description
Recorder	.NET Framework 4.6.1 is required for the Recorder package.
Bot agent	Users of build 543 are required to download and install the latest agent.

Feature	Limitation description
Bot Insight	Bot Insight has the following limitations: <ul style="list-style-type: none"> <li>• Bot Insight dashboard does not support Drag and Drop to move and arrange the dashboard widgets within the dashboard.</li> <li>• The <b>Date</b> widget in the dashboard displays the Unix time stamp.</li> <li>• Bot Insight does not support the <b>Aggregate By</b> feature in the <b>Table</b> widget, if the table contains a <b>Timestamp</b>.</li> <li>• Once the bots run successfully, the default dashboard is generated after 5 to 10 seconds.</li> </ul>

## Community Edition Release Notes

Review the new capabilities in different Automation 360 Community Edition releases.

---

**Important:** Enterprise A2019 is now called Automation 360. Although the release notes for releases earlier than Automation 360 v.21 reference the old product name, the content in these releases notes is applicable and relevant to Automation 360.

---

**Note:** For information about Automation 360 v.24R2 patch for Community Edition, see [Automation 360 v.24R2 Release Notes for Internet Explorer 11 EOL](#) on page 323.

---

Follow the links to view the release note updates for the respective release.

### Related concepts

[Automation 360 Release Notes](#) on page 139

Review the new capabilities, changes, fixes (resolved issues), security fixes, deprecated features, and limitations in each release.

## Automation 360 v.28 Community Edition Release Notes

*Release date: 22 March 2023*

Review what's new in the Community Edition of the Automation 360 v.28 (Build 17464) release.

---

**Important:** This release includes an **optional** Bot Agent update. You can continue to run your existing bots without updating the Bot Agent. However, if you want to use the new features in Automation 360 v.28, you must update the Bot Agent available with this release.

For more information on updating to this release, see these resources:

- [Automatically update the Bot Agent](#) on page 1001 | [Manually update the Bot Agent](#) on page 1002
  - [Compatibility with release builds](#) on page 985
-

## RPA Workspace

What's new
<p><b>Workday package</b></p> <p>You can use the new Workday package from Automation 360 to automate your Workday processes such as reporting, data upload/download, or triggering workflows with our new point-and-click experience. The package provides deep API-level integration with Workday that enables you to build automations easily, without having to code.</p>
<p><b>Apigee package</b></p> <p>You can use the new Disconnect and Resume Integration features in the Apigee package. You can disconnect from your Apigee instance and clear the session using the Apigee Disconnect action. You can resume an integration that is suspended in Apigee using the Apigee Resume Integration action.</p>
<p><b>Extended attributes supported in the Terminal Emulator Package</b> (Service Cloud case ID: 01870633, 01928396, 01809815)</p> <p>The TN3270E terminal type supports extended attributes. To enable extended attributes for TN3270E terminals, select the <b>Extended Attribute</b> check box in the <b>Connect</b> action.</p>
<p><b>Enhanced error messages display errors from the child bots</b> (Service Cloud case ID: 01264352)</p> <p>When you create a bot where the parent bot calls a child bot, and if an error occurs in the child bot, the error message provides the following details:</p> <ul style="list-style-type: none"> <li>• Line number of the parent bot which ran the child bot.</li> <li>• Line number of the child bot where the error occurred.</li> <li>• Error message details, such as what went wrong with that line number and the corresponding corrective action.</li> </ul>
<p><b>Timeout option in Database Connect action</b> (Service Cloud case ID: 00753858)</p> <p>We added a timeout option in the <b>Connect</b> action of the Database Package. When you connect with Microsoft SQL Server to automate database-related tasks, and if the database is down or experiences any network issues, the automation will time out and fail if the database connection is not established in the specified time.</p>
<p><b>Improved readability with new formatting capabilities in XML document</b> (Service Cloud case ID: 01886455, 01925386)</p> <p>When you insert, update, or delete nodes, the XML package does not remove carriage return characters between nodes but does remove all blank text nodes from the XML document. By using <b>Prettyprint</b> to format XML files, developers can easily improve the readability of a document. Developers can save time by using the following new options that have been added to the XML Package:</p> <ul style="list-style-type: none"> <li>• <b>Use Prettyprint:</b> The <b>Save session data</b> action supports the Prettyprint format in the XML document. When you select the <b>Use Prettyprint</b> check box and use the <b>Insert node</b>, <b>Update node</b>, or <b>Delete node</b> actions and then save the XML document, the code is formatted with proper indentation as per Prettyprint.</li> <li>• <b>Remove text nodes that contain only white space:</b> The <b>Start Session</b> action provides an option to remove blank text nodes when you parse the XML document.</li> </ul>

What's new
<p><b>New features added to the Email Package</b> (Service Cloud case ID: 01835214, 01846425, 01756713, 01882482)</p> <p>To support extensive process automation, we added the following action-related features to the Email Package:</p> <ul style="list-style-type: none"> <li>• Ability to use the <b>Reply All</b> action.</li> <li>• Enhanced the <b>Delete all</b> action to delete all emails from a specific folder. Additionally, you can apply filter parameters to emails such as: <ul style="list-style-type: none"> <li>• All, Read, and Unread</li> <li>• Subject</li> <li>• From a specific sender</li> <li>• Before, on, or after a received date</li> </ul> </li> <li>• The dictionary variable for email properties includes a new variable, <i>emailNoOfAttachments</i>, used to retrieve the attachment count.</li> </ul>
<p><b>Automate controls using Microsoft UI Automation (COM) technology</b></p> <p>You can use the Microsoft UI Automation (COM) technology to automate the following scenarios:</p> <ul style="list-style-type: none"> <li>• Capture and automate link controls</li> <li>• Capture and automate tree controls</li> </ul>
<p><b>Insert Custom column in Data Table</b></p> <p>A new <b>Custom column</b> option has been added to the <b>Data Table &gt; Insert column</b> action that enables you to insert a new column at a specified index in a data table. When you read an Excel spreadsheet and assign it to a data table, you can modify the table by adding a new column and entering any required data.</p>
<p><b>New Label option in Loop package</b></p> <p>A new <b>Label</b> option has been added to the Loop package that enables you to break or continue a specific loop from the nested loops.</p>
<p><b>Add and configure If action conditions</b></p> <p>You can add and configure a maximum of 32 conditions in a single <b>If</b> action.</p>
<p><b>Improved automation reliability for web applications</b></p> <p>When you use the <b>Recorder &gt; Capture</b> action to automate web pages running on Google Chrome and Microsoft Edge browsers, the <b>Recorder &gt; Capture</b> action no longer scrolls down the web page if the target object is visible on the screen. This feature improves the user experience and reliability of automation when there is a fixed top pane on the web page and if some physical actions such as mouse clicks do not work as expected.</p>
<p><b>Note:</b> Ensure that you install the browser extension (version 3.0.8.0) and use the Recorder package (version 2.10.2) to capture the control.</p>

**What's new****Preferred view retained as default view in the Bot editor**

As a bot developer, you no longer have to manually select the preferred view when you open the Bot editor. To improve the developer's productivity and user experience, when creating bots in the Bot editor, your preferred view (List, Flow, or Dual) in the Bot editor will persist across user sessions and browsers. When you navigate in the Control Room or after your next log in, the Bot editor will retain your last used or selected view.

**Line markers for collapsible sections of code in the Bot editor**

When you create bots using **Loop, If/If-else, Step, Trigger-loop, Try, Catch, and Finally** statements, the Bot editor clearly shows the collapsible sections. When building automations, developers can use these visual indicator line markers at the beginning and end of the collapsible section to improve their productivity.

**Note:** The visual indicator line marker for the collapsible section applies only to the **List** view in the Bot editor.

**What's changed****Improved secure registration for Community Edition or Automation 360 users**

When a user registers for the Community Edition or Automation 360 account, the registration email sent to the user contains a temporary registration link used to create the user credentials. This registration method is more secure than sending the user their password in plain text.

**Automation Anywhere Robotic Interface (AARI)****What's new****Stationary action buttons**

While completing forms in AARI, action buttons are positioned in the fixed footer of the form. The footer and its contents are responsive to the size of your window and adjust to fit buttons and minimize the footprint.

Forms have improved responsiveness due to this next generation of form rendering technology.

**Document Automation****What's changed****Important: New Community Edition users will have access to Document Automation but not IQ Bot**

As of Automation 360 v.27 release and later, only Document Automation will be provisioned to new Community Edition users. New users will not have IQ Bot permissions, however, IQ Bot will be available for existing, registered users.

# Automation 360 v.27 Community Edition Release Notes

*Release date: 15 December 2022*

Review what's new in the Community Edition of the Automation 360 v.27 (Build 16701) release. Build 16701 replaces Build 16667.

**Note:** This release includes an **optional** Bot Agent update. You can continue to run your existing bots without updating the Bot Agent. However, if you want to use the new features in Automation 360 v.27, you must update the Bot Agent available with this release.

For more information on updating to this release, see these resources:

- [Automatically update the Bot Agent](#) on page 1001 | [Manually update the Bot Agent](#) on page 1002
- [Compatibility with release builds](#) on page 985

## Updated release build

The updated **Build 16701** includes fixes for the following issues (Service Cloud case ID: 01937106, 01947340, 01829572):

- Bots were failing because of file dependency or interactive form that included multibyte characters in file names.
- Changes to AARI desktop Assistant to manage and clear automations for start, stop, and resume actions.

## RPA Workspace

What's new
<p><b>Windows 365 Cloud PC now supported as Bot Runner</b> (Service Cloud case ID: 01792699)</p> <p>We support Windows 365 Cloud PC as a Bot Runner to create and run bots on Windows 365 Cloud PC.</p> <p><a href="#">Automation 360 Bot Runner device requirements</a> on page 792</p>
<p><b>View keyboard shortcuts in Bot editor</b></p> <p>In Bot editor, you can now open a menu to view the available keyboard shortcuts.</p> <p><a href="#">Keyboard shortcuts list</a> on page 1310</p>
<p><b>Enhanced Automation Anywhere Debugger tool</b></p> <p>The Automation Anywhere Debugger tool is available in the <b>Bot Assistant</b> utility to provide a better user experience. When you invoke the Debugger tool from the Bot editor, you can add, update, or delete actions and variables in a bot.</p> <p>By default, the <b>Watched variables</b> lists is empty. With a single click, you can add all the used variables in a bot. These variables display in a pop-up window where you can select or deselect, one or more variables, from the list.</p> <p><a href="#">Debugger tool</a></p>

<b>What's new</b>
<p><b>ServiceNow package</b></p> <p>You can use the ServiceNow package from Automation 360 to authenticate and perform several actions with records and attachments in ServiceNow tables.</p> <p><a href="#">ServiceNow</a></p>
<p><b>ServiceNow triggers</b></p> <p>You can use ServiceNow triggers to call an action when there is a new or updated record.</p> <p><a href="#">ServiceNow New Record trigger</a> on page 1566</p>
<p><b>Quick assistance at hand for the developers in the Bot editor</b></p> <p>The accessibility and usability of the Bot editor, actions, and packages have been improved. As a citizen developer or an RPA developer, when you are creating bots, you can quickly look up information about the actions without navigating outside the Bot editor. Under the <b>Actions</b> pane, quick help is enabled with contextual information about actions. Additionally, an icon is configured with a link to the documentation. If you want more information about an action, you can click the link, which redirects you to the relevant page in the documentation portal. This feature is currently available in the following actions and packages.</p> <ul style="list-style-type: none"> <li>• Database</li> <li>• Email</li> </ul>
<p><b>Enhanced user experience through refreshed and intuitive icons</b></p> <p>With the new and intuitive icons for actions in the Bot editor, citizen developers and RPA developers can quickly locate the correct action while creating automation for a day-to-day task. These unique and renewed icons are developed according to brand and global standards.</p>
<p><b>New option in Read from action of Database package</b> (Service Cloud case ID: 01263940)</p> <p>A new check box is available when you use the <b>Read from</b> action to retrieve records from the database and save the retrieved data in a CSV file. When you select this check box, no CSV file is created if the executed SQL query does not return any data.</p>
<p><b>64-bit ODBC driver now supported in Database package</b> (Service Cloud case ID: 01256142, 01829360, 01849908)</p> <p>We now support connecting to databases by using the 64-bit ODBC driver. This option is available when the connection mode is the default. Organizations transitioning to Office 365 will benefit from leveraging this enhancement and can sustain automation build with 32-bit ODBC drivers.</p> <p><a href="#">Using Connect for database</a></p>

**What's new****OAuth 2.0 support in Email and Email trigger packages** (Service Cloud case ID: 01798311, 01803702, 01791859, 01828526)

Microsoft is deprecating the ability to use Basic authentication in Exchange Online for these specific protocols:

- IMAP
- POP3
- EWS

We support OAuth 2.0 authentication for these protocols in the Email and Email trigger packages. For enhanced security, you can maintain the business continuity of your email automations by switching the authentication type from Basic to OAuth 2.0, (as recommended by Microsoft).

*[Using Connect for](#)*

**Retry mechanism supported in credential variables** (Service Cloud case ID: 01786319, 01887182)

The credential variables support the retry mechanism. When you create a bot that uses credential variables, if the bot fails during run time to retrieve those variables from the Credential Vault because the Control Room is disconnected or the Control Room services stop intermittently, then the bot tries three times to retrieve the credential variables from the Credential Vault.

**Note:** Ensure that the Bot Agent version installed on your system is the version that is released with Automation 360 v.27.

**What's new****Support of other domain name in the Active Directory package** (Service Cloud case ID: 01807358, 01910765)

We now support Active Directory user operations by logon name with domain and can provide the domain name to extract user details. When you retrieve the user property or perform any user operation based on the logon name (userPrincipalName), and if the user domain name differs from the domain specified in the LDAP path, the user properties are now successfully retrieved with or without a domain name.

For example, LDAP Path: LDAP://ADServer/DC=automation, DC=net

User	Logon name
userPrincipalName: kim@aaengg.net	User can provide logon name as kim@aaengg.net.
userPrincipalName: shaun@aasales.net	User can provide logon name as shaun@aasales.net.
userPrincipalName:sarah@automation.net	user can provide a logon name as either sarah or sarah@automation.net.

The following list of actions supports logon name with domain.

- Update user details
- Rename user
- Delete user
- Enable user account
- Disable user account
- Set user property
- Get user property

[User account operations](#)

**New action in Text file package**

You can use the new **Read variables** action in the Text file package to read the values of variables from the text file.

**Note:** The **Import string from text file** action in the String package has been deprecated and will not be available for new bots. We recommend that you use the new **Read variables** action with enhanced capabilities. This deprecation does not impact any existing bots or bots which were migrated previously and they will continue to run properly. See [Support and deprecation policy for packages](#) on page 66 for package lifecycle and deprecation policy.

[Read variables](#)

**Call an existing JavaScript function in a webpage**

You can use the new **Call a JavaScript function** action in the Browser package to call an existing JavaScript function directly in a webpage or in an iFrame within a webpage in Google Chrome and Chromium-based Microsoft Edge browsers. In the bot, you can also pass one or more input parameters to the JavaScript function and process the return value from the function.

[Call a JavaScript function](#)

What's new
<p><b>Automate controls using Microsoft UI Automation (COM) technology</b></p> <p>You can use the Microsoft UI Automation (COM) technology to automate the following scenarios:</p> <ul style="list-style-type: none"> <li>• Capture and automate client controls</li> <li>• Capture and automate password text controls</li> <li>• Capture and automate page tab controls</li> </ul> <p><a href="#">Actions performed on objects captured with Universal Recorder</a>   <a href="#">Capture using specific technology</a></p>
<p><b>Capture objects on applications running in administrator mode</b></p> <p>You can use the Recorder to capture objects on applications running in administrator mode. To capture the object, select the <b>Capture and run with admin privileges</b> option from the Bot editor.</p> <p><a href="#">Recorder package</a></p>
<p><b>Enhanced bot performance when using global values across bots</b></p> <p>When you use global values across a parent bot and a child bot, the bot performance is enhanced by reducing the bot execution time. To enable enhanced bot performance, you must set the <b>Bot compatibility version</b> to <b>3</b> in the <b>Advanced settings</b> page of the Bot editor.</p> <hr/> <p><b>Note:</b> Ensure that the Bot Agent version installed on your system is the version that is released with Automation 360 v.27.</p> <hr/> <p><a href="#">Bot compatibility version</a> on page 1375</p>
<p><b>Enhanced user interface for Define functionality in AISense Recorder</b></p> <ul style="list-style-type: none"> <li>• We have enhanced the user interface of <b>Define</b> window in the AISense Recorder that enables you to use anchors easily and automate UI objects that are not detected by AISense Recorder automatically. To improve functional clarity, the following object types are renamed: <ul style="list-style-type: none"> <li>• <b>Active text</b> is renamed to <b>Link</b></li> <li>• <b>Passive text</b> is renamed to <b>Text value</b></li> </ul> </li> <li>• If you unintentionally click the screen or click before the highlighter appears, the AISense Recorder provides visibility into it. You must confirm to capture the object again or use the <b>Define</b> functionality to define the object on the screen.</li> <li>• In the <b>Define</b> window, the AISense Recorder shows embedded help for each of the control types so you can select the correct control types for custom objects.</li> </ul> <p><a href="#">Use variable anchor</a> on page 1345   <a href="#">Capture Textbox, Radio, Checkbox, and Combobox</a> on page 1340   <a href="#">Capture text value through AISense Recorder</a> on page 1339   <a href="#">Capture link button through AISense Recorder</a> on page 1338   <a href="#">Capture Image button through AISense Recorder</a> on page 1336</p>
<p><b>New virtual key added to the Simulate keystrokes package</b></p> <p>In the <b>Simulate Keystrokes &gt; Keystrokes</b> action, a new key named <b>Return</b> has been added to the virtual keyboard for Enter functionality and the Enter key in the Number pad has been renamed to <b>Num Enter</b>. As a result, the <b>Return</b> key is the main Enter key on the keyboard. This enhancement keeps the keyboard in sync with the physical keyboard. The nomenclature has been changed to avoid confusion between the Enter key on the keyboard and the Enter key on the Number pad.</p>

What's new
<p><b>Support for global variable for all Datetime actions</b></p> <p>In the Datetime package, you can use the Datetime global variable across all <b>Datetime</b> actions. You can select to use either <b>String</b> variable or a <b>Global</b> variable in the <b>Source date and time variable</b> option. This avoids creating multiple local variables and reduces the total number of actions used in a bot.</p> <p><a href="#">Datetime package</a></p>
<p><b>Workato Integration</b></p> <p>You can integrate the Automation 360 platform and Workato by using the Automation Anywhere connector. You can establish a connection with the Automation Anywhere Control Room and perform various operations using the Control Room APIs.</p> <p><a href="#">Workato integration</a></p>
<p><b>SnapLogic Integration</b></p> <p>You can now integrate the Automation 360 platform and SnapLogic. You can establish a connection with the Automation Anywhere Control Room and perform various operations by using the Control Room APIs.</p> <p><a href="#">Snaplogic integration</a></p>

## Automation Anywhere Robotic Interface (AARI)

What's new
<p><b>Build forms easily by dragging elements to form builder</b></p> <p>You can now build your forms by just dragging your elements to a blank form builder. As you add elements to the form builder, it automatically adjusts without your input, letting you focus on the form-building experience. You can also re-size the columns of your elements.</p> <p><a href="#">Create a form</a> on page 1536</p>
<p><b>New actions in the Process Composer</b></p> <p>In the Process Composer, you can now use a set of actions when you build out your process. For example, you can double-click a task, such as <b>Bot Task</b> and <b>Human Task</b>, and the task will be updated in your process flow automatically. With this, you can save time because you do not need to task specific tasks to your process. In addition, you can now copy, cut, and paste using <b>CTRL + C</b>, <b>CTRL + X</b> and <b>CTRL + V</b>, respectively to retain, reuse, or replace data.</p> <p><a href="#">Behaviors supported in the Process Composer</a> on page 1498   <a href="#">Create an AARI process</a> on page 1487</p>
<p><b>Use a reference ID meta type in Process Composer</b></p> <p>You can now use a reference ID with a <b>Meta</b> variable type for your variables in the Process Composer. When you set a reference ID as a meta variable type, you can now use your reference ID data when you run your tasks in the web interface. This simplifies your references because you only need to rely on using the reference ID instead of relying on other variable types or references.</p> <p><a href="#">Create an AARI process</a> on page 1487</p>

What's new
<p><b>Center your forms in preview</b></p> <p>You can now preview your forms in the new preview window and get an accurate assessment on how your form will look when it is rendered. You can select the <b>Make form preview centered</b> option to enable the preview window. You can also set the appropriate display resolution, x and y coordinates, and even center your form.</p> <p><a href="#">Create a form</a> on page 1536</p>
<p><b>Upload images directly to the form composer</b></p> <p>You can now upload images directly to the form composer by using the <b>Image</b> element. This saves you time to view the images in the form without a file reference, rather than in the initial step, where the image requires a file reference to be viewed.</p> <hr/> <p><b>Note:</b> Image files are limited to 150 kb (like a logo).</p> <hr/> <p><a href="#">Using the Image element</a> on page 1545</p>
<p><b>Change label action for Button element</b></p> <p>The change label action in the form rules now applies to the <b>Button</b> element. When you use the change label action in form rules and apply it to the buttons in your form, the changes will be automatically applied to the buttons where you set the rules. This keeps the flow consistent with the elements that you are using because all the buttons inherit the same rule.</p> <p><a href="#">Add rules to form elements</a> on page 1552</p>
<p><b>Rules editor for Table element</b></p> <p>The rules editor is now applicable to the <b>Table</b> element. When you use the rules editor for your tables, the rules conditions are applied for each individual columns while any actions that you set are applied for each row in the row level. This makes things consistent for each new or existing row that you use because all the rows inherit the same rule.</p> <p><a href="#">Add rules to form elements</a> on page 1552</p>

## Document Automation

What's new
<p><b>Document Automation supports regular expression pattern-based extraction</b></p> <p>When configuring fields that the learning instance will extract, you can specify a regular expression (regex) pattern to help the extraction engine find the field. After entering the regex pattern you can test the expression using sample content within the <b>Create Learning instance</b> window. You can use regex pattern extraction for values that follow a specific pattern, such as a VAT number or a PO number.</p>
<p><b>Validation interface support for shortcut keys</b></p> <p>Zoom in and out on documents in the Validation interface by holding the Alt key and scrolling with your mouse wheel.</p>

# Automation 360 v.26 Community Edition Release Notes

*Release date: 22 September 2022*

Review what's new in the Community Edition of the Automation 360 v.26 (Build 15450) release. Build 15450 replaces Build 15439.

**Note:** The v.26 build supports Manifest V3 browser extensions for Google Chrome and Microsoft Edge browsers. For more information, see [Chrome and Edge Manifest V3 extensions](#) on page 116.

This release includes an **optional** Bot Agent update. You can continue to run your existing bots without updating the Bot Agent. However, if you want to use the new features in Automation 360 v.26, you must update the Bot Agent available with this release. For more information on updating to this release, see these resources:

- [Automatically update the Bot Agent](#) on page 1001 | [Manually update the Bot Agent](#) on page 1002
- [Compatibility with release builds](#) on page 985

## RPA Workspace

What's new
<p><b>Community Edition users provisioned to closest region</b></p> <p>Registered Community Edition users are now provisioned to a region that is closest to their country (either in the US or EU). Provisioning is based on the country of the users account.</p>
<p><b>Support for Manifest V3 extensions</b></p> <p>Automations that use Google Chrome Manifest V2 based extensions will stop working sometime after June 2023. The deprecation timelines of Manifest V2 based extensions are currently under review and subject to change by Google.</p> <ul style="list-style-type: none"> <li>• For Google Chrome Manifest V2 extensions timelines, see <a href="#">Manifest V2 support timeline</a>.</li> <li>• For Microsoft Edge Manifest V2 extensions timelines, see <a href="#">Overview and timelines for migrating to Manifest V3</a>.</li> </ul> <p>This might impact your existing automations that use Manifest V2 based extensions for Google Chrome and Microsoft Edge browsers. Automation 360 v.26 and later includes Manifest V3 extensions by default to support features that use Google Chrome and Microsoft Edge browsers.</p> <p>You can automatically enable Manifest V3 based extensions for Google Chrome and Microsoft Edge on all the Bot Runner devices by enabling the <b>Browser extensions</b> option from the Control Room. Enabling this option applies the browser extension settings on all the registered Bot Agent devices.</p> <p><b>Note:</b> We will continue to support Manifest V2 based extensions for Google Chrome until June 2023. To know about Microsoft Edge Manifest V2 based extensions timelines, see <a href="#">Overview and timelines for migrating to Manifest V3</a>.</p> <p><b>Note:</b> Manifest V3 extension is supported on Google Chrome and Microsoft Edge browsers version 91 and later only.</p> <p><a href="#">Configure browser extensions</a> on page 2046   <a href="#">Chrome and Edge Manifest V3 extensions</a> on page 116</p>

What's new
<p><b>Microsoft Windows 11 Enterprise now supported</b> (Service Cloud case ID: 01252605, 1252605, 1253745, 01255134, 01379865, 01801610, 01810148)</p> <p>We now support Microsoft Windows 11 Enterprise, so you can now install and update the Bot Agent and run bots on the Windows 11 Enterprise operating system.</p> <p><a href="#">Bot Agent compatibility</a> on page 984</p>
<p><b>Salesforce command package</b></p> <p>You can now authenticate from Automation 360 to access Salesforce and run several command actions by using the new Salesforce command package.</p> <p><a href="#">Salesforce</a></p>
<p><b>SAP GUI 770 version now supported</b> (Service Cloud case ID: 01793132, 01792775, 1776805, 01792623, 787725, 01805482, 01805479, 01792623, 01810356, 01822839, 01851451, 01853577, 01860050)</p> <p>SAP GUI 770 (patch 6) is now certified and supported with Recorder and SAP package.</p> <p><a href="#">supported in various versions</a></p>
<p><b>Configure and use custom proxy configuration in REST Web Service package</b> (Service Cloud case ID: 01271527, 01765084, 01839282)</p> <p>REST Web Service package is now enhanced to support custom proxy configuration for each <b>Delete, Get, Patch, Post,</b> and <b>Put</b> action. This provides you more flexibility in calling REST APIs with different proxy configuration and allow you to create hybrid API automation.</p> <p><a href="#">REST Web Service package</a></p>
<p><b>Keyboard shortcuts to reduce scrolling</b></p> <p>When developing large bots, you can now use keyboard shortcuts to expand and collapse individual or all sections and move through the lines of code quickly instead of scrolling and minimizing sections individually.</p> <p><a href="#">Keyboard shortcuts to expand or collapse elements in bot logic</a> on page 1309</p>
<p><b>Set value in any editable control field to be blank in SAP application</b> (Service Cloud case ID: 00821861, 01807129)</p> <p>When you use the <b>Set text</b> action of the SAP package, you can now set the value in any editable control field in the SAP application to be blank. For example, you can set the value in the text field or the date field to be blank.</p>
<p><b>Loop through emails and move them one at a time</b> (Service Cloud case ID: 00749763, 01807189, 01840743)</p> <p>You can now loop through all the emails in a mailbox and move one email at a time to a destination folder by using the <b>Move</b> action in the Email package.</p> <p><a href="#">Move</a></p>
<p><b>Configure p12 certificate for SOAP-based automations</b> (Service Cloud case ID: 00757213)</p> <p>In the SOAP Web Service action, you can now select the p12 certificate file and provide a password for user authentication. With this enhancement, you can now access web services that use the p12 certificate-based authentication (a more secure type of SSL certificate).</p> <p><a href="#">Example of using the SOAP web service action</a> on page 1431</p>

What's new
<p><b>Improved accessibility, usability of content on Terminal Emulator window</b> (Service Cloud case ID: 01609467)</p> <p>You can now have improved accessibility and usability of the content displayed on the Terminal Emulator window. When you use the enhanced <b>Get text</b> action of the Terminal Emulator package, you can now view and extract all the lines and text present in the Terminal Emulator window and perform an operation based on your requirement.</p> <p><i>Using Get text for</i></p>
<p><b>Run bots with or without window title matching in letter case</b></p> <p>You can now run bots even when the title of a captured window does not match the letter case. For a bot to identify a static window or browser titles and titles with a wildcard character, you can opt for a case-sensitive match if you want the letter case to be matched, or a case-insensitive match otherwise, by using the <b>Case sensitive</b> option.</p>
<p><b>Control image preview and storage in Control Room during secure recording</b></p> <p>You can now choose whether or not the object images are available for preview and stored in the Control Room during secure recording by enabling the <b>Recorder preview image</b> setting. When you enable the setting, the image is previewed in the Bot editor and stored in the Control Room for 60 minutes. If you choose not to preview, images are not captured.</p> <p><i>Secure recording</i> on page 39   <i>Secure recording mode</i> on page 1327   <i>Settings</i> on page 2042</p>
<p><b>Automate Microsoft Excel spreadsheets from SharePoint</b></p> <p>You can now automate Microsoft Excel spreadsheets that are uploaded and shared on SharePoint. Use <b>Excel advanced</b> &gt; <b>Open</b> action to open the Microsoft Excel spreadsheets from SharePoint location.</p> <p><i>Using the Open for</i></p>
<p><b>Automate Citrix Virtual Apps in Edge with IE mode</b></p> <p>When using the Recorder, you can now automate Citrix Virtual Apps running on Microsoft Edge Chromium with IE mode.</p>
<p><b>Automate controls using Microsoft UI Automation (COM) technology</b></p> <p>For automation, you can now use the Microsoft UI Automation (COM) technology in the following scenarios:</p> <ul style="list-style-type: none"> <li>• Capturing controls with secure recording mode</li> <li>• Capturing and automating combo box and list view controls</li> <li>• Using <b>Object exists</b> and <b>Object does not exist</b> Recorder conditions in If, Loop, and Wait packages</li> </ul> <p><i>Capture using specific technology</i>   <i>Actions performed on objects captured with Universal Recorder</i></p>

**What's new****Seamless automation of Citrix Virtual Apps and other Citrix applications**

With the new Automation 360 remote agent for Citrix, you can now seamlessly automate all types of Citrix Virtual Apps and other Citrix applications that are supported on desktop applications using the Recorder.

The new Automation 360 remote agent for Citrix supports the following browsers and technologies:

- Google Chrome
- Internet Explorer
- Microsoft Edge
- Microsoft Edge with IE mode
- Mozilla Firefox
- Java
- Electron apps
- Microsoft Active Accessibility (MSAA)
- Microsoft UI automation

[Installing Automation Anywhere remote agent on Citrix servers](#) on page 844 | [Using the Recorder on Citrix Virtual Apps servers](#) on page 840

**Implement coding standards with code analysis**

You can now implement best coding practices by configuring coding rules in the Control Room. This feature helps you prevent potential errors, improve bot reliability, and makes the code more uniform, accessible, reliable, and efficient.

- As an administrator or a user with **View policies** and **Manage policies** permission, you can configure the code analysis policy for all users.
- As a Citizen Developer, you can run code analysis to analyze your bots against readability, maintenance, security, and compliance best practices.

[Code analysis](#) on page 2096

**Fetch execution details for specific execution IDs with new Control Room API**

You can now fetch the execution details, such as `botOutVariables` and `CallbackInfo`, for a specific execution ID by using the new API endpoint, `v3/activity/execution/<id>` API.

## Automation Anywhere Robotic Interface (AARI)

What's new
<p><b>Embedded automation with OAuth 2.0</b></p> <p>Embedded automation streamlines access to the automation experience.</p> <p><a href="#">Embedded Automation</a> on page 1568</p> <ul style="list-style-type: none"> <li>• AARI Integrations embeds in web applications as a widget, so if you are an end user, you can access automated processes and bots without leaving your environment.</li> <li>• AARI Extensions offers further adaptability through Chrome browser extensions, enabling automation directly in any web scenario. Business users can now access automations through a widget, available through an extension in their web browser.</li> <li>• With an OAuth 2.0 connection, existing access to automations in the Control Room are now shared with the Extensions to offer you a seamless user experience.</li> </ul> <p><a href="#">AARI Integrations and AARI Extensions</a> on page 1571</p>
<p><b>Delete files permanently from AARI cloud storage</b></p> <p>You can now delete files permanently from AARI cloud storage. When you delete a request, the associated file is also permanently deleted now and not just sent to the recycle bin.</p> <p><a href="#">Cloud storage usage</a> on page 1484</p>
<p><b>Append or overwrite operations in your form</b></p> <p>Append or overwrite operations in your form by using the <b>Assign</b> form rules for the web, with the <b>Checkbox</b> and <b>Radio Button</b> elements, which now support form rules.</p>
<p><b>Assign dynamic values with support for new elements in your forms</b></p> <p>When you use the interactive forms package, you can now assign dynamic values with the <b>Assign</b> action, which now supports <b>Checkbox</b> and <b>Radio Button</b> elements in your form.</p> <p>You can also change the label of the selected form elements with the <b>Change label</b> action for the <b>Button</b> element.</p> <p><a href="#">Interactive forms package</a></p>

## IQ Bot

What's new
<p><b>Search for form or table fields</b></p> <p>When creating a learning instance, when you are configuring fields, you can now search for fields by field name, field label, or data type.</p>

## Automation 360 v.25 Community Edition Release Notes

Release date: 21 June 2022

Review what's new in the Community Edition of the Automation 360 v.25 (Build 14304) release.

**Important:** This release includes an **optional** Bot Agent update. You can continue to run your existing bots without updating the Bot Agent. However, if you want to use the new features in Automation 360 v.25, you must update the Bot Agent available with this release.

For more information on updating to this release, see these resources:

- [Automatically update the Bot Agent](#) on page 1001 | [Manually update the Bot Agent](#) on page 1002
- [Compatibility with release builds](#) on page 985

## RPA Workspace

What's new
<p><b>Support to automate applications supported on Citrix Workspace app</b> (Service Cloud case ID: 01758063)</p> <p>The Citrix Workspace app is now supported on Automation 360. You can now automate applications that are accessed through the Citrix Workspace app by using the <b>Recorder &gt; Capture</b> action or the <b>Start recording</b> option.</p>
<p><b>Install Bot Agent on devices that have Enterprise 11 Enterprise Client</b></p> <p>When you are creating a bot in Automation 360, you can now install the Bot Agent on a device with an existing Enterprise 11 Enterprise Client. You can create or run bots from both the Control Room instances.</p> <p><a href="#">Install Bot Agent and register device</a> on page 998</p>
<p><b>IE 11 EOL notification banner displayed in Control Room</b></p> <p>Starting from the Automation 360 v.25 release, if you use the Microsoft Internet Explorer browser to access the Control Room, you will be prompted to use an alternative supported browser, such as Google Chrome or Microsoft Edge (Chromium). When you log in to the Control Room, a notification banner is displayed indicating that support for Internet Explorer 11 is ending.</p> <p><a href="#">Log in to Automation Anywhere Control Room</a> on page 981</p>
<p><b>AISense Recorder: Support for Korean language and complex table operations</b></p> <ul style="list-style-type: none"> <li>• You can now use AISense Recorder to automate applications that use Korean and a combination of Korean and English interfaces.</li> </ul> <p><a href="#">AISense for recording tasks from remote applications</a> on page 1328</p> <ul style="list-style-type: none"> <li>• With AISense Recorder, you can now extract tabular data from complex tables. You can capture and automate tables with wider columns and tables that have columns with controls such as check boxes and options. You can also capture specific columns from tables.</li> </ul> <hr/> <p><b>Note:</b> If the table is not detected automatically, use the <b>Define</b> option to detect the table.</p> <hr/> <p><a href="#">Table data extraction through AISense Recorder</a> on page 1342</p>

What's new
<p><b>Enhancements to Recorder</b></p> <ul style="list-style-type: none"> <li>When you run a bot, you can now automate objects that appear behind the bot runtime window by using the <b>Recorder</b> &gt; <b>Capture</b> action. (Service Cloud Case ID: 00684306, 00770636, 01146672)</li> <li>You can now use the Recorder to capture and automate objects with a specific technology. The <b>Capture object</b> tab now has the option to select a specific technology and capture using that technology. You can capture objects with the following technologies: <ul style="list-style-type: none"> <li>Microsoft Active Accessibility (MSAA)</li> <li>UI automation</li> <li>Microsoft (MS) COM UI Automation</li> </ul> </li> </ul> <p><i>Capture using specific technology</i></p> <p>(Service Cloud Case ID: 01760871, 01865823)</p> <ul style="list-style-type: none"> <li>You can now use the Recorder to automate third-party plug-in window objects on Google Chrome or Microsoft Edge browsers by using a specific technology.</li> </ul>
<p><b>Reduce Data Loss option in PDF package</b></p> <p>In the <b>PDF</b> &gt; <b>Extract text</b> action, for the <b>Structured text</b> type field, a new <b>Reduce Data Loss</b> option is now available. When you use this option, you can extract the complete text with minimal overlap of characters.</p> <p><i>Using Extract text from PDF</i></p>
<p><b>Enhancement to the String package</b> (Service Cloud case ID: 00770822)</p> <p>In the <b>String</b> &gt; <b>Extract text</b> action, a new <b>When extracting</b> option is now available. You can use this option to specify whether the case of the text in the extracted substring must match that in the source string.</p> <p><i>Using Extract text action of String package</i></p>
<p><b>Download files from URLs that require NTLM authentication</b> (Service Cloud case ID: 01189873)</p> <p>With the enhanced Browser package, you can now download files from URLs that require NTLM authentication by using the <b>Browser</b> &gt; <b>Download file</b> action.</p>
<p><b>Enhancement to multiple attachments option in Send email action</b> (Service Cloud case ID: 00800976, 00817136, 00821405, 00936080, 01256523, 01256320, 01262069, 01259369, 00936080, 01801928)</p> <p>When you send email from bots, you can now send multiple attachments as a list of files or a variable that contains the list of file objects. With this feature, you can attach files such as data files, spreadsheets, and word processor documents to your email. You can attach multiple filepaths from a local drive or a network drive, or you can use a variable that contains a filepath.</p> <p><i>Using the Send</i></p>
<p><b>Enhancement to SOAP Web Service package</b></p> <p>When you build a SOAP response for an Xpath expression in the SOAP Web Service package, the result of the Xpath expression can be stored as a list of strings.</p> <p><i>Example of using the SOAP web service action</i> on page 1431</p>

What's new
<p><b>View version history of non-bot file dependencies</b> (Service Cloud case ID: 01615105)</p> <p>You can now view the version history of your non-bot file dependencies. This helps to identify relevant changes made to your file by other users during a specific date and time along with the check-in messages.</p> <p><a href="#">View version history of non-bot file dependencies</a> on page 1405</p>
<p><b>Edit non-empty folder names in private workspace</b> (Service Cloud case ID: 00535388, 00730075, 00786633, 00791528, 01615295, 01820406)</p> <p>You can now edit your non-empty folder names in the private workspace. With this feature, you can now manage folders more easily. Ensure the following when you rename a folder:</p> <ul style="list-style-type: none"> <li>• It does not contain checked-out or cloned bots even at subfolder levels.</li> <li>• It does not contain more than 100 items including subfolders and files.</li> </ul> <p><a href="#">Create and rename folders</a> on page 1377</p>
<p><b>View dependency maps for bots</b></p> <p>You can now view the dependency map for your bot in both the public and private workspaces. The dependency map shows the immediate parent and child bots for any selected bot. If you are an RPA developer, you can use the dependency map to better understand where a bot is invoked and which child bots are invoked by the bot. With this information, you can gauge the impact of the change in a bot, use the bot effectively, maintain better bot code and reusability, and prevent conflicts.</p> <p><a href="#">View bot dependency map</a> on page 1368</p>

## Automation Anywhere Robotic Interface (AARI)

What's new
<p><b>Create request in new tab</b></p> <p>You can now open and run your new requests in a separate tab when you select the <b>Open request in New Tab</b> option in the initial form. With this option, you can create requests concurrently without changing your current page navigation.</p> <p><a href="#">Create a request and complete a task</a> on page 1516</p>
<p><b>Duplicate rows for Table element</b></p> <p>In the web interface, when you are adding rows to your form by using the <b>Table</b> element, you can now save time by duplicating a row in the table with the new <b>Duplicate row</b> option. The duplicated row will now be placed under the highlighted row that you had selected.</p>

**What's new****Interface triggers support more technologies**

You can now use interface triggers with the following technologies:

- Windows native
- SAP Desktop
- Google Chrome and Edge Chromium browsers

[Add an interface trigger](#) on page 1563

**Enhancements to form rules**

- **Use custom formatting**

When you are adding a rule, if you use the **If** menu to set the rule conditions on certain elements such as **Text Box** or **Text Area**, you can now select **Is** from the drop-down menu to enable additional options. Select the **Custom** option and click **Add regular expression** to apply custom formatting requirements on the selected element.

Consider a scenario where the user IDs of all your employees have AV as prefix. For example, for an employee whose name is Adam, the user ID is AVAdam. Use the **Add regular expression** option to set the value in the **Regular expression** field as ^AV. If a user enters Adam in the user ID field, an alert is displayed.

- **Set custom value or append element value**

When you are adding a rule, use the **Then** menu to select a form element. For this form element, you can set one of the corresponding actions using **Set Value** or **Append value**:

- **Value:** Data entered in the **Enter value** field is applied to the selected element.
- **Form element:** Data from the form element selected in the **Select element** drop-down menu is appended.

Consider a scenario where a user registration form has 'First name' and 'Employee ID' fields. You can set one of the following rules for the value in the Employee ID field:

- Select **Value** and enter *Emp1013* as preset value.

This value is displayed in the 'Employee ID' field when the bot runs.

- Select **Form element** and set 'First name' element in the **Select element** drop-down menu.

The value from the 'First name' field is appended to the 'Employee ID' field when the bot runs.

You can use elements in the same way that variables are used in the Bot editor. You can enter **\$** to view a list of elements.

[Add rules to form elements](#) on page 1552

**Document Automation**

IQ Bot Extraction360 (Preview) is now Document Automation. Community Edition enables users to try features from Document Automation, including creating up to five learning instances, connecting to learning instances in Automation 360 IQ Bot, uploading documents for processing, and validating documents using AARI task manager.

*Community Edition* on page 1794

What's changed
The <b>Document Workspace</b> folder now holds learning instance assets (bots, process, and form). Previously, these assets were located in the <b>IQ Bot Processes</b> folder.
The actions which support document processing are now located in the Document Extraction package. Previously, these actions were located in the IQ Bot Extraction360 (Preview) package.
Learning instances from prior releases have been deleted to enable the upgrade to Build 14304.

Limitations
Document Automation supports a device username of 21 characters or fewer.
The value beside the <b>Validate documents</b> link, which indicates the number of documents awaiting validation for a learning instance, sometimes does not appear.
When you are validating a document, if you draw a box, zoom in, and then click <b>Fit to screen</b> , the box appears at a different location from where you clicked.
If you connect to a learning instance from Automation 360 IQ Bot with an optional field that has a set default value and some fields that are unmapped, when you process documents in that learning instance in Document Automation, the default value appears in the unmapped fields.
When a bot runs an action from the Document Extraction package, the <b>Activity &gt; In progress</b> page shows the item name as <code>IQBotAutoExtract</code> .
Although the Learning instances page states that users can not delete learning instances, a user can delete a learning instance by mousing over the actions menu to the right of the learning instance and clicking the <b>Delete</b> icon.

## Automation 360 v.24 Community Edition Release Notes

*Release date: 22 March 2022*

Review what's new in the Community Edition of the Automation 360 v.24 (Build 12350) release.

**Note:** For information about Automation 360 v.24R2 patch for Community Edition, see [Automation 360 v.24R2 Release Notes for Internet Explorer 11 EOL](#) on page 323.

### RPA Workspace

**Important:** This release includes an **optional** Bot Agent update. To use the new features in v.24 (including updates to Bot Migration, Browser, DLL, Process Discovery, and Recorder packages), update the Bot Agent available with this release. However, note that if you want to run your existing bots, you do not have to update your Bot Agent to this release.

For more information on updating to this release, see these resources:

- [Automatically update the Bot Agent](#) on page 1001 | [Manually update the Bot Agent](#) on page 1002
- [Compatibility with release builds](#) on page 985

<p><b>What's new</b></p>
<p><b>Do more with Microsoft Edge Chromium</b></p> <p>You can now use the Microsoft Edge Chromium browser extension for the following:</p> <ul style="list-style-type: none"> <li>• Bot Agent proxy configuration</li> <li>• Automatic population of device credentials</li> </ul> <p><i>Browser requirements for RPA Workspace</i> on page 829</p>
<p><b>Reduce turnaround time</b></p> <p>You can now reduce the turnaround time for collecting information on issues by capturing log files from the Bot Runner device. You can save the log files by using the new <code>-collectlogs</code> command with the Bot Agent diagnostic utility.</p> <p><i>Perform Bot Agent diagnostic checks</i> on page 1007</p>
<p><b>Enhancement to AISense Recorder</b></p> <p>You can now use AISense Recorder to automate applications that use Japanese and a combination of Japanese and English interfaces.</p> <p><i>AISense for recording tasks from remote applications</i> on page 1328</p>
<p><b>Support for copying metadata from one bot to another</b></p> <p>You can now copy image and metadata files from one bot to another by using the <b>Copy to shared clipboard</b> option.</p>
<p><b>Wait time option in SOAP Web Service and REST Web Service packages</b> (Service Cloud case ID: 00756730, 00792793, 01255869, 01753287)</p> <p>When you create a bot, you can now set a time-out value for actions in REST and SOAP requests. To indicate how long a bot should wait for a response from the server before timing out, you can set a wait time (in milliseconds) in the <b>Wait for actions to complete</b> field. You can enter a number or a variable or provide a global value.</p>
<p><b>Format text with new HTML editor in Email package</b></p> <p>In the Email package, when you use the <b>Send</b>, <b>Reply</b>, and <b>Forward</b> actions, you can now create and customize your email layout and body by using the new <b>HTML</b> design editor. Use the editor toolbar to make various changes to your text, such as applying bold, italic, and other formatting effects, inserting links, and changing the font and size of the text. You can copy the content from the design editor and paste it to other windows.</p>
<p><b>Task Bot package now supports passing Window variable to child bot</b> (Service Cloud case ID: 00691890, 00804359, 01258948, 01764292)</p> <p>In the <b>Run</b> action of the Task Bot package, when you select <b>Input values</b> fields and enter the values or variables to pass to the child bot, you can now choose the <code>window</code> type variable and pass it from parent bot to child bot.</p>
<p><b>New option in Content type field of REST Web Service package</b> (Service Cloud case ID: 00666852, 00789910, 00771194, 00785116, 00825945, 01762199)</p> <p>You can now use the <b>multipart/form-data</b> option to upload files and data through REST Web Service. The content type <code>multipart/form-data</code> can be used to submit form elements containing files, non-ASCII data, and binary data. This option is available for actions such as <b>POST</b>, <b>PUT</b>, and <b>PATCH</b>.</p>

What's new
<p><b>Custom delimiter option in SOAP Web Service package</b></p> <p>For responses specific to XPath, you can now use the custom delimiter option to delimit the return content from the SOAP response. In the <b>Custom Delimiter</b> field, you can provide a character or a variable, and the output of the delimited response will be a complete string.</p>
<p><b>New option in Run function action of DLL package</b> (Service Cloud case ID: 00830568, 01063654, 01259336, 01767965)</p> <p>In the <b>Run function</b> action of the DLL package, when the C# DLL interacts with the Windows API to perform system-related operations, such as keystroke, mouse click, or window switching, an intermediate window (AAZeroSizeForm) is displayed occasionally and interrupts the user's operation when the bot is running. In some cases, the DLL function does not interact with the Windows API to perform actions, such as keystroke, mouse click, or window switching, on the operating system UI through the DLL function. In such cases, you can now select the <b>Run function in background</b> check box to bypass the intermediate window (AAZeroSizeForm) and run the C# DLL in the console application without the form. This feature also helps to improve the performance of the DLL execution if the <b>Run function in background</b> check box is selected.</p>
<p><b>Autoscroll supported in Bot editor</b> (Service Cloud case ID: 00730747)</p> <p>When you are creating or editing bots with a large number of lines of code and when you drag actions up or down the page, the page now automatically scrolls up or down accordingly. This feature is supported in both <b>Flow</b> and <b>List</b> views.</p>
<p><b>New JSON package</b></p> <p>Use the JSON package to automate JSON data. You can now extract the required information from JSON text or file and directly use the values in the bot.</p> <p><i>Json</i></p>
<p><b>New option in Catch action of Error handler package</b> (Service Cloud case ID: 00766117)</p> <p>In the Error handler package, you can now ignore errors from actions inside the <b>Catch</b> block by using the <b>Catch &gt; On error, continue with next action</b> option. When you select the <b>On error, continue with next action</b> check box, even if there is an error from an action in the <b>Catch</b> block, no exception is thrown and the bot ignores the error and continues to the next action.</p> <hr/> <p><b>Note:</b> This enhancement applies to all nested actions in the <b>Catch</b> block. For example, if you have a <b>Try/Catch</b> action inside a main <b>Catch</b> action, if the check box is selected on the main <b>Catch</b> action, any error from actions within the nested block will also be ignored.</p> <hr/>
<p><b>Enhancement to String package</b></p> <p>In the <b>Extract text</b> action of the String package, when you use the <b>After</b> or <b>Before and/or after</b> option, you can now extract a substring from a specified source string that occurs in the range of 1 through 999999 times in a file.</p>

**What's new****Search for files by specific date**

You can now search for files created or modified on a specific date by using the new **On a date** option available in the **File Date** condition of various packages.

You can use this feature with the following packages and actions:

- File package
  - **Copy Desktop files** action
  - **Delete** action
  - **Print** action
  - **Print multiple files** action
  - **Rename** action
- Folder package
  - **Copy** action
  - **Delete** action
  - **Rename** action
- If > File date condition
- Loop > While > File date condition

**New action in Excel advanced package** (Service Cloud Case ID: 01263892, 01782290)

When you perform actions in a Microsoft Excel worksheet, you can now disable or enable real-time screen update by using the new **Disable or enable real-time screen update** action of the Excel advanced package. This action is useful to improve the performance of Excel-based automations at run time when dealing with large data sets.

[Worksheet operations in](#)

**Use Recorder conditions in Chromium-based Microsoft Edge with Internet Explorer (IE) mode**

You can now use the **Object exists** and **Object does not exist** Recorder conditions in Chromium-based Microsoft Edge with IE mode for the following packages:

- Loop > While condition
- Wait > Wait for condition
- If package

**Internet Explorer browser support for Browser package and window variables**

- The following actions of the Browser package now support the Internet Explorer browser:
  - Open
  - Close
  - Go back
  - Get source code
- In the **Browser** option, you can now select the Internet Explorer tabs from the list of active tabs.

[Browser package](#)

What's new
<p><b>Enhancement to Datetime package</b></p> <p>The <b>Variable</b> option in the <b>Datetime &gt; Assign</b> action is now enhanced and divided into two options:</p> <ul style="list-style-type: none"> <li>• <b>Datetime:</b> Enables you to select the date and time along with the time zone manually and assign it to a Datetime variable.</li> <li>• <b>Variable:</b> Enables you to select the Datetime variable or other variables that can have Datetime as a subtype, such as the Dictionary, Record, and list variables.</li> </ul> <p><i>Using the Assign action</i></p>
<p><b>Enhancement to Recorder package</b></p> <p>You can now capture and automate objects inside a cross-domain iFrame that has multiple iFrames with the same frame source and iFrames that are loaded at run time in Google Chrome and Microsoft Edge Chromium browsers. You can do this by using the <b>Recorder &gt; Capture</b> or the <b>Start recording</b> option. This support is also available for offline Google Chrome extensions.</p> <p><i>Recorder package</i></p>
<p><b>Support for pop-up windows and dialog boxes in Google Chrome, Microsoft Edge Chromium, and Mozilla Firefox browsers</b> (Service Cloud Case ID: 00762207, 00769773, 00781196, 00786646, 00777907, 00795677, 00785995, 00808600, 00811044, 00767486, 01282172, 01286665, 01256750, 01762040)</p> <p>When you are automating a web page on the supported browsers, you can now capture the pop-up windows, alert dialog boxes, confirmation dialog boxes, and prompt dialog boxes that appear. You can do this by using the <b>Recorder &gt; Capture</b> or <b>Start recording</b> option.</p> <p><i>Recorder package</i></p>
<p><b>Retrieve source code of an iFrame in Google Chrome browser</b></p> <p>You can now retrieve the source code of an iFrame in the Google Chrome browser by using the <b>Browser &gt; Get source code</b> action. You can use the new <b>Capture object</b> option to capture these iFrames.</p> <hr/> <p><b>Note:</b> The <b>Capture object</b> feature is optional and is only used to retrieve the source code of an iFrame.</p> <hr/>
<p><b>Run JavaScript inside an iFrame in Google Chrome browser</b></p> <p>You can now run JavaScript in a page that contains iFrames in the Google Chrome browser by using the <b>Browser &gt; Run JavaScript</b> action. You can use the new <b>Capture object</b> option to capture iFrames on which you want to run JavaScript.</p> <hr/> <p><b>Note:</b> The <b>Capture object</b> feature is optional and is only used to run JavaScript inside an iFrame.</p> <hr/>
<p><b>Global session support for Excel basic package</b></p> <ul style="list-style-type: none"> <li>• The Global session option is now supported for the Excel basic package. Use the Global session option to share a Microsoft Excel session across multiple bots so that you can use the same Excel worksheet across these bots.</li> <li>• The <b>Session name</b> field is now renamed <b>Create Excel session</b>.</li> </ul> <p><i>Using the Open for</i></p>

What's new
<p><b>Default variable to hold number type data</b></p> <p>When you are building or testing a bot, you can now use the default number variable <code>SampleNumber</code>, which is included in the Variables palette.</p> <hr/> <p><b>Note:</b> The default number variable is only available in new bots.</p>
<p><b>Export and import password-protected files</b></p> <p>To improve security by providing protection against unauthorized access and malicious editing and also to protect privacy, the export and import features are now enhanced to include the password option. With this feature you can now perform the following:</p> <ul style="list-style-type: none"> <li>• Set a password for the files that you want to export from your Control Room.</li> <li>• Import the password-protected exported file into your Control Room.</li> </ul> <p><a href="#">Export bots</a> on page 2143   <a href="#">Import bots</a> on page 2145</p>
<p><b>New options in Git configuration</b> (Service Cloud case ID: 00782957, 00837059, 00687394, 00783715, 00714059, 00659476, 00749755, 00786233, 00748166, 00776417)</p> <p>You can now perform the following actions for Git configuration:</p> <ul style="list-style-type: none"> <li>• Choose either the HTTPS or SSH authentication method to set up the Git configuration. The SSH authentication method is more secure as the authentication is based on a public and private key pair.</li> <li>• Specify the branch to which you want to push your Git commits. This helps with team coordination and workflow management.</li> <li>• Connect to your Git repository by using a proxy server.</li> </ul> <p><a href="#">Configure a remote Git repository in Control Room</a> on page 2067   <a href="#">Restore bots from Git repository</a> on page 2074</p>

## Automation Anywhere Robotic Interface (AARI)

What's new
<p><b>Microsoft Edge Chromium and Safari supported for AARI</b></p> <p>You can now create forms and processes in the RPA Workspace and run your requests, tasks, and bots in the web interface on Microsoft Edge Chromium and Safari browsers.</p> <p><a href="#">Browser requirements for RPA Workspace</a> on page 829</p>
<p><b>Create password fields and hide sensitive information</b> (Service Cloud case ID: 00714159, 01063512)</p> <p>In the RPA Workspace, you can now create password fields by using the <b>Password</b> element in your form builder. You can use the <b>Password</b> element in the web interface to add masked text to your password fields in the initial forms to hide sensitive information.</p> <p><a href="#">Configure processes</a> on page 1475   <a href="#">Password element properties</a> on page 1508</p>

What's new
<p><b>Reference ID enhancement to requests</b></p> <p>You can now view the reference ID associated with your process in the <b>Reference</b> column of the <b>Requests</b> page. The reference ID is a combination of a prefix and a number that is created from a <b>Process Key</b> that you can enter when you edit your process for the first time. This reference ID is incremented whenever a request is created from the corresponding process.</p> <p><a href="#">Reference ID properties</a> on page 1513   <a href="#">Configure an AARI process</a> on page 1528</p>
<p><b>Cancelled status for tasks</b></p> <p>You can now filter tasks by the <b>Cancelled</b> status in the <b>Tasks</b> page. This status will show a <b>Cancelled</b> label next to the filtered results to inform you of the tasks that were cancelled by a user. You can filter by this status from the drop-down menu in the status bar.</p> <p><a href="#">Filter and search for a task</a> on page 1523</p>
<p><b>Fill initial form elements by URL parameters</b></p> <p>When you create a request, you can now fill initial form elements by creating query scripts that enter specific parameters in the initial form URL. These parameters are applicable only for <b>Date</b>, <b>Number</b>, <b>Text Box</b>, and <b>Time</b> elements.</p> <p><a href="#">URL parameters</a> on page 1507</p>
<p><b>Customize text in forms using updates to Label element</b></p> <p>You can now customize the text in your forms in various ways, such as applying bold, italic, underline, and other formatting effects, changing the font size and color, and so on, by using the <b>Label</b> element. With these options, you can highlight specific messages or texts, such as next steps, warnings, or errors, when they are rendered in the initial form in the web interface.</p> <p>The <b>Label</b> element now provides the following formatting options:</p> <ul style="list-style-type: none"> <li>• <b>Emphasis</b></li> <li>• <b>Font color</b></li> <li>• <b>Font size</b></li> <li>• <b>Text alignment</b></li> </ul> <p><a href="#">Using the Label element</a> on page 1546</p>
<p><b>Search and filter columns in a table</b></p> <p>On the form builder screen, if you select the <b>Enable column filtering</b> check box for the <b>Table</b> element, users can search and filter the content for all the available columns when the bot is running.</p> <p>When you use the <b>Table</b> element to render a table in your initial forms, you now have the enhanced ability to search each column of your table by value.</p> <p><a href="#">Using the Table element</a> on page 1550</p>

## Discovery Bot

What's new	
<p><b>Save the recording with a name</b></p> <p>After recording a process, you can now save the recording with a name. The name of the recording is displayed on the <b>Recordings</b> page for that process.</p> <p><a href="#">Record a Discovery Bot business process</a> on page 1672</p>	
<p><b>Share a description of the recording</b></p> <p>You can now provide a description for a recording of a process by using the <b>Recordings</b> page for that process. In the <b>Recordings</b> page, use the <b>Description</b> field to share the context and the purpose of the recording with the analyst. The description provided is also displayed in the PDD.</p> <p><a href="#">Record a Discovery Bot business process</a> on page 1672</p>	
<p><b>Delete a recording</b></p> <p>After you record a process, if you do not want to submit the recording data to an analyst for review, you can delete the recording by using the <b>Recordings</b> page for that process. In the <b>Recordings</b> page, use the <b>Delete</b> option to delete the recording.</p> <p><a href="#">Record a Discovery Bot business process</a> on page 1672</p>	
<p><b>Record business processes using AARI Assistant</b></p> <p>You can now use AARI Assistant to record business processes without signing in to the Control Room. To record a business process, start AARI Assistant by double-clicking the AARI icon on your desktop.</p> <p><a href="#">Record a Discovery Bot process using AARI Assistant</a> on page 1677</p>	
<p><b>Enhancements to custom opportunities</b></p> <p>You can now update the potential cost and savings for custom opportunities and save your changes to the process diagram. The potential cost and potential savings can be updated at any time as you review the steps from various recordings and make changes within the process diagram.</p> <p><a href="#">Review opportunities, convert to bot, and generate PDD</a> on page 1679</p>	
<p><b>Enhancement to PDD</b></p> <p>You can now view the entire process diagram from within Discovery Bot by clicking the URL link provided in the PDD. The PDD does not display the process diagram if more than 100 steps are selected.</p> <p><a href="#">Review opportunities, convert to bot, and generate PDD</a> on page 1679</p>	

Fixes	
Service Cloud case ID	Description
--	In the Community Edition and Free Trial version, you can now create and delete five or more processes, and the autogeneration opportunity does not fail. You can create up to five opportunities.

# Automation 360 v.23 Community Edition Release Notes

*Release date: 30 December 2021*

Review what's new in the Community Edition of the Automation 360 v.23 (Build 11524) release. Build 11524 replaces Build 11513.

**Important:** Build 11524 includes a fix for the issue of frequent device disconnections caused by either high load or the database being locked.

## RPA Workspace

**Important:** This release includes a required update to your . Ensure that you complete the update to continue with your automation activities when upgrading from a previous release to this release.

[Automatically update the Bot Agent](#) on page 1001 | [Manually update the Bot Agent](#) on page 1002

To verify which version is compatible with this release, see [Compatibility with release builds](#) on page 985.

What's new
<p><b>Microsoft Edge (Chromium) supported for Control Room and Bot Agent</b></p> <p>You can now perform Control Room operations, and install and register your Bot Agent device using the Microsoft Edge based on Chromium browser.</p> <p><a href="#">Browser requirements for RPA Workspace</a> on page 829</p>
<p><b>Support to automate Microsoft Edge Chromium with Internet Explorer compatibility mode</b> (Service Cloud case ID: 00767502, 00787186)</p> <p>You can now automate web applications running on Microsoft Edge Chromium, by enabling the Internet Explorer compatibility mode, using the Universal Recorder where the objects are captured using HTML technology.</p> <p><a href="#">Record a task with the Universal Recorder</a> on page 1314</p>
<p><b>Support for cross-domain IFrames in Google Chrome and Microsoft Edge Chromium browsers</b> (Service Cloud case ID: 00825656)</p> <p>You can now capture and automate objects inside a cross-domain IFrame in Google Chrome and Microsoft Edge Chromium browsers by using <b>Recorder &gt; Capture</b> or the <b>Start recording</b> option. After you capture an object inside a cross-domain IFrame, the path to the frame is stored in the <b>FrameDOMXPath</b> property, by default.</p> <p>The new <b>FrameDOMXPath</b> property identifies the path to the frame in which the object is located. You must select this property to run the bot successfully to capture objects on a cross-domain IFrame.</p> <p><b>Note:</b> This feature is available for the bots you create using the 2.4.0-20211016-070100 version of the Recorder package starting from this release.</p> <p><a href="#">Recorder package</a></p>

What's new
<p><b>Support for Capture anchor in AISense Recorder</b></p> <p>The AISense Recorder now supports the <b>Capture Anchor</b> option. When you run a bot to search for an object in an application in which the anchor changes frequently, you can use <b>Capture anchor</b> to override the default anchor and manually select an anchor to detect the object.</p> <p><a href="#">Edit a task recorded using AISense</a> on page 1332</p>
<p><b>Enhanced support when selecting Object property in Recorder package</b></p> <p>After you capture an object using the <b>Recorder &gt; Capture</b> action, you can now select a particular object property name from the list of available properties in order to retrieve the value of the object property using the <b>Get property</b> action. The list includes suggested property names from the search criteria in the <b>Object Properties</b> table.</p> <p><a href="#">Recorder package</a></p>
<p><b>File ID supported in Check permission action of Google Drive package</b> (Service Cloud case ID: 00777716)</p> <p>The <b>Check permission</b> action of the Google Drive package now supports the <b>File ID</b> option to refer to files available in the <i>Shared with me</i> folder of Google Drive. By providing the <b>File ID</b>, you can now verify the <b>Read</b>, <b>Write</b>, or <b>Delete</b> access granted to you in the <i>Shared with me</i> folder of the Google Drive files.</p> <p><a href="#">Google Drive package</a></p>
<p><b>New Credential package</b></p> <p>You can now use the <b>Assign</b> action in the Credential package to assign an insecure string or a variable directly to the credential variable.</p> <p><a href="#">Credential</a></p>
<p><b>Web Services security supported in SOAP Web Service package</b> (Service Cloud case ID: 00481836)</p> <p>As a Bot Creator, you can now provide credential variables in the raw data of the <b>SOAP Web service</b> action. You can create a credential variable, map the credential with a reference name in the credential mapper, and use the reference name in the raw data. Because this ensures that all security-related data can be defined in the Credential Vault and the credentials can be used in bots, you can safely deploy tasks without compromising security.</p> <p><a href="#">Example of using the SOAP web service action</a> on page 1431</p>
<p><b>New option in SOAP Web Service package</b></p> <p>Use the <b>Build Xpath</b> option in the SOAP Web Service package to extract values from the SOAP response. You can now specify the Xpath expression or select the appropriate node from the response body and store the output in a variable.</p>
<p><b>Read email from shared mailbox in Microsoft Outlook</b> (Service Cloud case ID: 00728579, 00831622)</p> <p>To automate email-related tasks, you can now select a shared account in Microsoft Outlook so that email messages can be read from the shared mailbox.</p>

**What's new****New encoding types supported in the Write to file action of Data Table package** (Service Cloud case ID: 00767158)

When you use the **Write to file** action to write data from a Table type variable to a CSV or TXT file, you can now use the following encoding types from the encoding list:

- UTF-8: Works as UTF-8 without BOM
- UTF-8 with BOM (called UTF-8 previously)
- UTF-16LE
- Shift-JIS (Japanese encoding)

**Auto-save functionality in Bot editor**

In the Bot editor, when you use actions to build an automation, when a bot is not manually saved, an auto-save is performed and the bot now automatically saves the changes for specific events.

**Note:** The auto-save functionality is currently available only for specific events.

Some of the events that support auto-save functionality are as follows:

- Recorder: When you create a bot with certain actions and click **Recorder**, the event is saved, and when the recording is complete, the event is automatically saved.
- Variable manager: When you create or edit a variable to insert it in an action, the changes are saved.

**Note:** The auto-save functionality is not supported when you delete a variable or insert it by pressing F2 to open the variable list.

- Actions menu (vertical ellipsis): When you select any action from this menu, for example **Packages**, the event is saved automatically. When you make any change to the **Packages** page and return to the Bot editor, the event is saved.
- Find a file: When you click the **Find a file** icon, the bot is saved if it is not manually saved. Also, after you click the **Add** option, the bot is automatically saved.
- Dialog boxes: When a dialog box is opened, it is automatically saved if any changes are made.

**Note:** Auto-save is triggered only for top-level dialog boxes and not for nested dialog boxes.

- Deleting variables: When you delete unused variables, the event is saved.
- Bot name change: If you edit the name of a bot, the event is saved.

**New option in FTP / SFTP package** (Service Cloud case ID: 00792346)

Use the **Credential** option when you connect with the **Secure FTP** server type to automate a task. You can now use username and password for authentication.

[Connect](#)

**Enhancement to AISense Recorder**

AISense Recorder now supports automation of applications that use Brazilian-Portuguese and a combination of Brazilian-Portuguese and English interfaces.

[AISense for recording tasks from remote applications](#) on page 1328

What's new
<p><b>Enhancements to Number package</b></p> <ul style="list-style-type: none"> <li>In the <b>Random</b> action of the Number package, you can now specify and limit the number of decimal digits required in the random number generated in the output.</li> <li>The existing <b>Save the outcome to a number variable</b> field is now renamed as <b>Save the outcome to a variable</b>.</li> </ul> <p><i>Number package</i></p>
<p><b>Enhancements to Wait package</b></p> <p>Use the new <b>Capture region</b> feature in the <b>Wait for screen change</b> action of the Wait package to capture a specific region on an application by drawing a rectangle around it so that the bot automatically captures the coordinates of this region. You can perform the following actions:</p> <ul style="list-style-type: none"> <li>Capture a specific region on a Windows application.</li> <li>Preview the captured image in the <b>Preview</b> window.</li> <li>Recapture a region if the image in the <b>Preview</b> window is not per user requirement.</li> </ul> <p>The coordinates are renamed as follows:</p> <ul style="list-style-type: none"> <li><b>Left</b> is now <b>X</b></li> <li><b>Top</b> is now <b>Y</b></li> <li><b>Right</b> is now <b>Width</b></li> <li><b>Bottom</b> is now <b>Height</b></li> </ul> <p><i>Using Wait for screen change</i></p>
<p><b>Enhancement to String package</b></p> <p>In the <b>Extract text</b> action of the String package, you can now extract a substring from a specified source string that occurs more than 1000 times in a file and up to a maximum limit of 999999.</p>
<p><b>Enhancement to File conditions in If package</b></p> <p>You can now use the new <b>File extension</b> condition from the <b>Condition</b> list in the <b>If</b> package to check the extensions of files and then execute actions based on the results.</p>
<p><b>Enhancement to Excel advanced package</b> (Service Cloud case ID: 00799071)</p> <p>Use the <b>Open</b> action of the Excel advanced package to open files with <code>.ods</code>, <code>.htm</code>, <code>.html</code>, <code>.mht</code>, <code>.mhtml</code>, <code>.slk</code>, and <code>.pdf</code> extensions.</p> <p><i>Excel advanced package</i></p>
<p><b>Global session support for loop iterator based on Excel advanced</b></p> <p>You can now use the <b>Global session</b> option when you loop through each row in an Excel advanced worksheet. Use the <b>Global session</b> option to share a Microsoft Excel session across multiple bots so that you can use the same Excel worksheet across these bots.</p> <p><i>Using the Open for</i></p>

**What's new****New APIs for devices**

You can now allocate default devices by using the new APIs introduced in the `v1/Devices` section. Choose to set or not set a specific device as the default deployment device for a specified user by using the following APIs respectively:

- `/runasusers/default`
- `/runasusers/default/unset`

**Automation Anywhere Robotic Interface (AARI)****What's new****New query filter in Query Requests and Query Tasks actions**

Use the new filter now available in the **Query Requests** and **Query Tasks** actions of the **AARI Web** package to filter query requests and tasks by team name in the AARI web interface.

**Team name filter**

You can filter your tasks and requests by team name in the **Task** and **Request** pages in the web interface, respectively. Select the **Team** label from the filter and search by team name to view the teams assigned to a task or request.

[Filter and search for a request](#) on page 1522 | [Filter and search for a task](#) on page 1523

**Support for audit logs** (Service Cloud case ID: 00801166)

You can now view the audit logs and refer to events relating to requests, teams, scheduler, process setups, bot setups, human tasks, and bot tasks that you have created, deleted, updated, submitted, or recovered.

[Audit log](#) on page 1972

**Enhancement to user task assignment in Human Task**

In the process editor, the **Auto-assign this task** option in **Human Task** provides the following alternatives:

- **The user who created the request:** The task is automatically assigned to the user creating the request in the web interface.
- **The user who opens this task:** The task is automatically assigned to the user who opens the task in the web interface.

This feature helps to reduce conflicts in assigning a task to oneself, particularly in case of specialized users such as Validator for whom the action of opening a task is equivalent to assigning the task to oneself.

**What's new****Enhancement to team setup**

You can now simultaneously add multiple users with similar roles (custom role) to the AARI team in the web interface. The custom role in the Control Room is now aligned with a team in the AARI web interface, and the enhanced team setup works as follows:

- The users added with the role are assigned a **Member** role in the team. The role cannot be changed to **Owner** or **Admin**.
- You cannot view these users in the **Users** tab of the **Team** page.
- If a user is both part of a role and added manually to the team, their role in the team will be the same as the role assigned to them manually. For example, if a user is a member, they will continue to have the **Member** role whereas if the user is an owner, they will be assigned the **Owner** role in the team.
- If the user is no longer part of a role, the user will also not be a part of the team.

Also, the **Team** page is now enhanced with navigation options at the top so that you can navigate through the various tabs (**General**, **Users**, **Roles**, **Processes**, and **Bots**). Use the **General**, **Users**, and **Roles** tabs to create teams and add users to them. The **Processes** and **Bots** tabs display the processes and bots assigned to teams, respectively.

[Team management](#) on page 1511 | [Create an AARI team and assign team roles to members](#) on page 1518

**Bot setup support**

The AARI Admin can use the **Bot Setup** page to view the bots that are assigned to a team, assign teams to a bot, and edit bots to remove or reassign teams. Attended Bot Runners who can view all the bots that are checked in to the **Public** workspace can now view the bots that are assigned to teams in AARI Assistant.

[Bot setup](#) on page 1530

**Enhancement to the form logo**

You can now use the **Logos in footer** field to select up to two separate logos that are displayed in the footer of the form during bot runtime.

**What's new****Add rules to various form elements**

When you are creating or editing a form in the form builder, you can now add rules to the following form elements by using the **Form rules** tab:

- **Checkbox**
- **Date**
- **Document**
- **Dropdown**
- **Label**
- **Number**
- **Password**
- **Radio Button**
- **Rich Text Editor**
- **Text Area**
- **Text Box**
- **Time**

For the **Checkbox** and **Radio Button** elements, the rules are triggered only if the corresponding presets are selected. For example, if a form has two mutually exclusive options, such as **Yes** and **No**, the rules associated with these options are triggered only when you select one of the two options.

[Add rules to form elements](#) on page 1552

**What's new****Updates to triggers**

The following triggers are now available to run a bot:

- **Process trigger:** Starts a bot when the status of the specified process in Microsoft Windows meets one of the following preset conditions:

- **Starts**
- **Stops**

[Add a process trigger](#) on page 1564

- **Service trigger:** Starts a bot when the status of the specified service in Microsoft Windows meets one of the following preset conditions:

- **Starts**
- **Stops**
- **Resumes**
- **Pauses**
- **Is running**
- **Has stopped**
- **Is paused**

[Add a service trigger](#) on page 1564

- **Window trigger:** Starts a bot when the specified application window meets one of the following preset conditions:

- **Opens**
- **Closes**

[Add a window trigger](#) on page 1565

**Discovery Bot****What's new****Install Bot Agent seamlessly**

If you have not already installed the Bot Agent, you are now prompted to install the Bot Agent from the **Processes** tab. Follow the screen instructions to install the Bot Agent. After the installation, you are prompted to enable a Chrome plug-in in order to proceed with your recording tasks.

[Prerequisites for Discovery Bot](#) on page 1661

**Enhancement to auto-generated opportunities**

You can now begin reviewing an auto-generated opportunity from the **Opportunities** tab when at least one process recording is submitted for review. Review the auto-generated opportunity and choose to create a custom opportunity from an auto-generated opportunity, as required.

[Review opportunities, convert to bot, and generate PDD](#) on page 1679

**What's new****New recordings for review for custom opportunity**

You can now review new recordings submitted by a Discovery Bot user for a custom opportunity. You can choose to accept or dismiss the recording updates as part of the custom opportunity work flow. This option allows you to quickly and easily review new recordings in real time as the recordings are submitted by the user for that process.

[Review opportunities, convert to bot, and generate PDD](#) on page 1679

**Enhancements to Opportunities page**

The opportunities page is now updated to include an opportunities evolution map, along with other graphs, to help you review and analyze data for a potential opportunity for automation. Use the opportunities evolution map to help guide you on which opportunities to automate first.

[Analyzing opportunities for automation](#) on page 1678

**Download PDD document from the Recordings page**

You can now download and export a PDD document from the **Recordings** page. After you submit a recording for an analyst to review, the PDD begins processing in the background automatically. When the PDD is generated, the field changes from Processing PDD to **Download**. You can now choose to download the document in Word format, PDF, or both. An email notification to the business user is also sent to the email address on file. The Download PDD for Word or PDF document is also available for a custom opportunity from the Opportunities list table.

[Review opportunities, convert to bot, and generate PDD](#) on page 1679

**Limitations**

In the Community Edition and Free Trial version, if five processes are created by the user and then deleted, the auto-generated opportunity will fail when the recording is submitted for the sixth process.

**Workaround:** Create a new Community Edition and Free Trial user to create new processes and opportunities.

**IQ Bot****What's new****Document Automation released in Community Edition**

Community Edition now offers limited features from the Document Automation version. This version is integrated with the Community Control Room. When you create a learning instance, IQ Bot automatically creates RPA bots to extract and download the data and an AARI process to manage the end-to-end process. Validation now takes place in AARI tasks.

Use IQ Bot Community Edition to extract data from invoices in English.

[Community Edition](#) on page 1794

**What's new****Classifier enhancements**

You can now create custom document groups in a learning instance. This reduces the possibility of an OCR failing to detect fields in a document, which will cause the Classifier to create a document group unnecessarily or send the document to a wrong group.

[About the Classifier](#) on page 1810

## Automation 360 v.22 Community Edition Release Notes

*Release date: 15 September 2021*

Review the new features in the Community Edition of the Automation 360 v.22 (Build 10535) release.

### RPA Workspace

**What's new****Introducing Text file package**

A new Text file package is now available and includes the **Get text** action. Use this action to extract text from files that have Japanese characters with Shift-JIS encoding and then save the content in the files to a string variable.

[#unique\\_351](#)

**Share session across bots**

Share a DLL, Excel, and Terminal Emulator session across multiple bots using the **Global session** option. You can also share a session with specific child bots using the **Variable** option and share a session with only the current bot using the **Local session** option.

[Sharing sessions across](#)

**Enhancement to AISense Recorder**

AISense Recorder now enables automation of applications that use Russian and a combination of Russian and English interfaces.

[AISense for recording tasks from remote applications](#) on page 1328

**Enhancements to recorder conditions for packages**

- Use the new **Object does not exist** condition from the Condition list of any package to verify whether a specific object in a window exists and then execute actions based on the result.

This condition works with SAP technology as well.

- The existing **Object** condition is now renamed as **Object exists**.

[Loop package](#)

What's new
<p><b>Enhancements to Excel advanced package</b></p> <ul style="list-style-type: none"> <li>• Open files with <code>.xml</code> and <code>.txt</code> extensions using the <b>Open</b> action.</li> <li>• Use the wildcard character (*) in the <b>Open</b> action for file names to search based on the wildcard pattern.</li> <li>• When you use the <b>Run macro</b> action and specify an argument that has a blank value, this blank value can now be passed to the macro.</li> </ul>
<p><b>New option in Database: Disconnect action</b></p> <p>In the <b>Database: Disconnect</b> action, you can now use the <b>Keep database schema in cache until bot finishes running</b> option to enable the <b>Loop</b> action to iterate the dataset by using cached schema after disconnecting from the database.</p>
<p><b>Use regular expressions in File &gt; Open action</b> (Service Cloud case ID: 00737614)</p> <p>Use regular expressions (regex) in the <b>Open</b> action of the File package to support pattern-based search.</p>
<p><b>Specify timeout for bots</b> (Service Cloud case ID: 00667049, 00690892, 00699158, 00706491, 00739420, 00739415, 00741590, 00769795)</p> <p>You can now specify the amount of time by which the execution of a bot must be completed. The system stops the bot execution if it is not completed within the time you specified.</p> <p><a href="#">Configure timeout for bot execution</a> on page 1376</p>
<p><b>New Exchange version supported in Email package</b></p> <p>In the Email package, when you choose an <b>EWS</b> server to establish a connection, you can now use the <b>Exchange2013</b> option in the <b>Exchange Version</b> field.</p>
<p><b>New actions in Window package</b></p> <ul style="list-style-type: none"> <li>• Use the <b>Close all</b> action to close all windows or programs running on the system, except the windows added in the <b>Add window</b> field.</li> <li>• Use the <b>Restore</b> action to restore the size of a maximized or a minimized window or application running on the system.</li> </ul> <p><a href="#">#unique_352</a></p>
<p><b>New option to search text within bot content in Bot editor</b> (Service Cloud case ID: 00735685, 00736201, 00739122, 00740481, 00733885, 00748970, 00746459, 00738181, 00756441, 00759037, 00761453, 00764478)</p> <p>In the Bot editor, use the search box in the Flow, List, or Dual view to search for text, variables, or actions in the entire bot content such as package name, action name, string name, or variable name. This feature helps you to view or edit a bot with long code lines to determine where the searched text, such as variables, strings, or actions, is used and in which line.</p> <p><a href="#">Actions to build bots</a></p>
<p><b>Enhanced support for SOAP Web Service URI</b> (Service Cloud case ID: 00759811)</p> <p>In the SOAP Web Service package, if the input to the <b>Address location</b> field is empty, the bot now retrieves the address location from the WSDL file.</p>

What's new
<p><b>New option in SOAP Web Service package</b></p> <p>Use the <b>Build SOAP request</b> option in the SOAP Web Service package to retrieve SOAP request details from the SOAP URI or the WSDL file. You can now select any operations from the list of services and ports available in the SOAP Request to automatically populate data in the fields of the SOAP Web Service action.</p> <p><i>Example of using the SOAP web service action</i> on page 1431</p>
<p><b>TNS name supported for Oracle Database connection</b></p> <p>TNS (Transparent Network Substrate) name is now supported in the Oracle Database. You can connect to the Oracle Database by specifying the TNS name and path of the <code>tnsnames.ora</code> configuration file.</p>
<p><b>Wait time option in Google Sheets package</b> (Service Cloud case ID: 00738249, 00817449, 00814775)</p> <p>When you use the <b>Connect</b> in the action in the Google Sheets package to establish a connection with the Google server, you can now set a wait time in the <b>Wait for actions to complete</b> field when performing actions such as <b>Get</b>, <b>Set</b>, or <b>Delete</b>. For example, if you have a large file that takes a long time to open, you can now set the wait time for the file to open before the system executes the next set of actions.</p>
<p><b>New option for Put action in Dictionary package</b></p> <p>You can now assign a static value to a key for a dictionary variable by using the <b>Static value</b> option in the <b>Put</b> action in the Dictionary package.</p> <p><i>Dictionary package</i></p>
<p><b>Relative click and occurrence supported in packages</b> (Service Cloud case ID: 0055643,00754173)</p> <p>When you capture a target image using the Image Recognition package, you can now use the <b>Preview</b> option to select a specific captured occurrence and position your click location relative to the image.</p> <p>The feature is supported in the following packages and actions:</p> <ul style="list-style-type: none"> <li>• Image Recognition &gt; Find image in window</li> <li>• Image Recognition &gt; Find window in window</li> <li>• If &gt; Image Recognition condition</li> <li>• Loop &gt; While &gt; Image Recognition condition</li> <li>• Wait for condition action &gt; Image Recognition condition</li> </ul> <p><i>Using Find image in window</i>   <i>Using the Find window in window</i></p>
<p><b>Enhancements to execution type key in AATaskExecutor variable</b></p> <ul style="list-style-type: none"> <li>• When you schedule a bot to run, the <code>Execution_Type</code> key in the <code>AATaskExecutor</code> variable now returns information about the execution type with schedule type (frequency) such as <code>Run as schedule Daily</code>, <code>Run as schedule Weekly</code>, or <code>Run as schedule Monthly</code>.</li> <li>• When you use a trigger in a bot, the <code>Execution_Type</code> key can be accessed through the trigger data. The <code>Execution_Type</code> key returns the <code>Run through Trigger</code> as a string for triggers.</li> </ul>

What's new
<p><b>Language support for variable names</b></p> <p>Variable names now support Greek and Japanese languages. You can now create variable names using the following characters:</p> <ul style="list-style-type: none"> <li>• Greek uppercase and lowercase characters</li> <li>• Japanese Katakana full-width and half-width characters.</li> </ul>
<p><b>New option in REST Web Service</b> (Service Cloud case ID: 00764198, 00800287)</p> <p>In the REST Web Service package, you can now use the <b>Allow insecure connection when using https</b> option to skip SSL certificate validation and to allow non-secure connections.</p>
<p><b>Work item ID and time filters for workload automations</b></p> <p>Combine the work item ID and start time of a queue to search for specific work items and monitor the progress of these work items. The start time filters the list of all work items that start between specified start date and start time.</p> <p><i>Actions allowed on view queue page</i> on page 2126</p>
<p><b>Enhancements to the bot structure</b></p> <p>We have enhanced the overall readability of the bot structure and updated the node labels of the bot to show selected properties and parameters of each action in detail in the Flow, List, and Dual views. You no longer have to expand each action to view these details.</p> <p>The Flow, List, and Dual views display the following properties of actions:</p> <ul style="list-style-type: none"> <li>• The value you enter for actions such as <b>Set text</b> for all supported technologies</li> <li>• Names of objects on which actions such as <b>Set text</b>, <b>Click</b>, <b>Left click</b>, <b>Get property</b>, and <b>Select item by index</b> are performed</li> <li>• Name of the object property mentioned in the action</li> <li>• Name of the return variable if some value is assigned to a variable</li> <li>• List of properties for the <b>Get property</b> action</li> </ul>
<p><b>Java applications supported in App integration package</b></p> <p>The App integration package now supports Java applications that are based on the Standard Widget Toolkit and Abstract Window Toolkit, which can draw text using Windows text-drawing APIs.</p>
<p><b>Direct download support in Bot Store</b></p> <p>Users who cannot connect their Control Room to the internet can now directly download Automation 360 bots and packages locally from Bot Store and then import them to their Control Room.</p> <p><i>Download locally and import bots and packages from Bot Store to Control Room</i> on page 1783</p>

## AARI (Automation Anywhere Robotic Interface)

What's new
<p><b>Select File element input supported for Create a Request action</b></p> <p>The <b>Create a Request</b> action in the AARI Web package now supports passing input in the request creation forms for the <b>Select File</b> element. You can now use bots to create a request and upload or download files as input with the <b>Select File</b> element. These input files are uploaded to the storage service to be available for further processing in the request.</p>
<p><b>Output variables support in Process Editor</b></p> <p>The <b>Output variables</b> section in the process editor enables you to create a user-defined variable that can be set as an output to any process. This helps you pass the output from the child (sub) process, which was called in the <b>Process Task</b>, to the parent (main) process.</p> <p><a href="#">Use an Output variable</a> on page 1497</p>
<p><b>Detail view in Tasks page</b></p> <p>The new <b>Detail view</b> option in the <b>Tasks</b> page provides better insight into individual tasks for better task management. The detail view previews each task in its respective request view page without opening another page, which helps organize and correspond your tasks with the available requests. Users can interact with their tasks as well.</p>

## Discovery Bot

What's new
<p><b>View Groups of steps</b></p> <p>When reviewing a process view, you can now use the group option or icon to display groups of steps that belong to the primary level action and secondary level action (and subgroup level actions) used during the recording session.</p> <p>Use the group icon to help you decide what groups of steps to select for a task you want to automate. For example, a primary level action displays Microsoft Outlook, a secondary level action displays Outlook mail notification, and subgroup level actions display terms such as Email -Add To, Email – Add Subject.</p> <p><a href="#">Create a process view with branches and opportunities</a></p>
<p><b>Use Dynamic option for system-generated views</b></p> <p>You can now use the <b>Dynamic</b> option from the Model options to view recordings where groups of steps display a set of repeating patterns that belong to the same application or same primary level action used during the recording session.</p> <p>Use this option to decide the context of the process or the task you want to automate. Groups of steps that are labeled belong to supported applications such as Microsoft (Excel, Outlook, and Notepad), Notepad++, text editors, most windows use cases, and Chrome browser functionality.</p> <p><a href="#">Create a process view with branches and opportunities</a></p>

**What's new****Enhancements to PDD Word document**

The PDD Word document now includes a process recording flow chart and the time on each individual step in hours, minutes, and seconds.

Review the release notes for previous Community Edition releases.

## Automation 360 v.21 Community Edition Release Notes

*Release date: 02 June 2021*

Review the new features in the Community Edition of the Automation 360 v.21 (Build 9664) release.

- [RPA Workspace](#) on page 729
- [AARI](#)
- [Discovery Bot](#) on page 733

## RPA Workspace

**Important:** This release includes a required update to your . Ensure that you complete the update to continue with your automation activities when upgrading from a previous release to this release.

[Automatically update the Bot Agent](#) on page 1001 | [Manually update the Bot Agent](#) on page 1002

To verify which version is compatible with this release, see [Compatibility with release builds](#) on page 985.

**New features****Automation 360 navigation enhancements**

We have enhanced the overall readability and accessibility of the Automation 360 interface. To make navigation easier, menus and views are organized based on frequently used features and related tasks.

The interface includes the following updates:

- The Device, Profile, and Help icons are now located at the bottom of the navigation menu, consolidating all controls on the left for easy access.  
When you click these icons, flyout panels of content and actions are shown.
- The side navigation menu can be collapsed to a slim bar to maximize the main workspace area.  
You can continue to use the side navigation in collapsed mode, with flyouts for each section.

[Automation 360 navigation updates](#)

New features
<p><b>Deploy workload automation on a multi-user Windows terminal server</b></p> <p>To optimize workload automation and multi-user devices, you can deploy workload automations on a multi-user Windows terminal server so that a single device can process multiple work items concurrently.</p> <p><a href="#">About multi-user devices</a> on page 1952   <a href="#">About device pools</a> on page 1955</p>
<p><b>New actions in the SAP BAPI package</b></p> <p>Use the following new actions:</p> <ul style="list-style-type: none"> <li>• <b>Run standard workflow:</b> Runs a standard workflow in SAP BAPI.</li> <li>• <b>Run custom workflow:</b> Runs a custom workflow in SAP BAPI.</li> </ul> <p><a href="#">SAP BAPI</a></p>
<p><b>New actions in File package</b></p> <p>Use the following new actions:</p> <ul style="list-style-type: none"> <li>• <b>Get name:</b> Reads a file name and stores it to a string.</li> <li>• <b>Get path:</b> Reads the path of the file and stores it to a string.</li> </ul> <p><a href="#">File package</a></p>
<p><b>Common table expression supported in Database package</b></p> <p>You can now use common table expression (CTE) in the <b>Read from</b> action using the <code>WITH</code> keyword in SQL-compliant databases such as Oracle and MySQL. Use CTE statements within a SQL query to simplify complex joins and subqueries.</p> <p><a href="#">Using the Read from</a></p>
<p><b>Support for large numbers in Number package</b> (Service Cloud case ID:00557619)</p> <p>You can now perform mathematical operations for large numbers with more precision in the Number package.</p> <p><a href="#">Number package</a></p>
<p><b>Snowflake database support using ODBC driver</b> (Service Cloud case ID:00761695)</p> <p>Snowflake ODBC driver is now supported in the Database package. You can connect to the Snowflake database using ODBC-based client applications.</p> <p>The following actions support this feature:</p> <ul style="list-style-type: none"> <li>• Connect</li> <li>• Disconnect</li> <li>• Read from</li> <li>• Export to data table</li> <li>• Insert/Update/Delete</li> </ul>
<p><b>Variables: new features and enhancements</b> (Service Cloud Case ID:00740585)</p> <ul style="list-style-type: none"> <li>• Edit the variable name after the variable is created.</li> <li>• Delete all or a specific selection of unused variables from a bot.</li> </ul>

New features
<p><b>Universal Recorder new features and enhancements</b></p> <ul style="list-style-type: none"> <li>Record object interactions in applications built on the Electron framework.</li> <li>Perform double-click in all supported applications and browsers.</li> </ul>
<p><b>Limit credential attribute use to password fields only</b> (Service Cloud Case ID:00740585)</p> <p>When you create or edit a credential attribute, ensure that bots input the attribute value only in fields that are identified as password fields by selecting the <b>Set this attribute as a password</b> option.</p>
<p><b>Default names for output variables</b></p> <p>When you configure an output variable for the actions in the Error handler and Python Script packages, the Control Room automatically generates a descriptive default variable name. If you create more than one output variable for an action, the subsequent variable names are appended with a -1, -2, -3, and so on to avoid a variable name conflict.</p>
<p><b>New string action to support nested variables</b></p> <p>Use the <b>String &gt; Evaluate value</b> action to compare a user-specified string variable with the string variables in the bot. If a match is found, the action returns the value of the matching variable.</p> <p><a href="#">String package</a></p>
<p><b>Delete Global values</b></p> <p>A user with the <b>AAE_Admin</b> role can delete a global value from the <b>All global values</b> page.</p> <p><a href="#">Global values</a> on page 1400</p>
<p><b>ODBC driver support for all connection strings</b> (Service Cloud Case ID: 00748887, 00777676)</p> <p>An Open Database Connectivity (ODBC) driver is now available to support all the ODBC connection strings in the same way it was used in the Enterprise 11 version. Using SQL as a standard for accessing and managing data, you can connect to MySQL, Google BigQuery, Snowflake, and other databases using the ODBC driver.</p>
<p><b>Share a DLL session</b></p> <p>You can now share a DLL session between bots.</p>

## Automation Anywhere Robotic Interface (AARI)

New features
<p><b>Download, delete, or view files in browser in initial forms or tasks</b></p> <p>Users can now use the <b>Select File</b> element to download files that are uploaded to the initial forms or tasks, and they can also delete files or access the hyperlink file to view the file in within the browser. The uploaded file can be accessed as a hyperlink, and new icons are available for download and delete.</p>

New features
<p><b>Enhancement to team roles</b></p> <p>The AARI team consists of three roles:</p> <ul style="list-style-type: none"> <li>• Member: Can create, view, and delete their own requests. All the tasks are automatically assigned to the member when they create the request in a private team. In a shared team, the member can assign tasks to other members.</li> <li>• Owner: Can create, view, delete, and assign all the requests from the members in the team.</li> <li>• Admin: Can create, view delete, and assign all the requests from the members in the team. The admin can also modify the team.</li> </ul> <p>An AARI admin or manager can edit their teams and update their team members' roles. They also have the option to add or remove team members. The AARI manager is the team admin by default when they create a team.</p>
<p><b>Assign to me feature in tasks</b></p> <p>When a task is unassigned and users access the tasks, use the <b>Assign to me</b> option to allow the tasks to be assigned to the current user so that they can immediately access the form.</p> <p><a href="#">Assign or unassign a task</a> on page 1520</p>
<p><b>New Bot page</b></p> <p>When AARI team members with attended Bot Runner licenses access the web interface, they are automatically redirected to AARI Assistant. Users can view all the bots created by them on this page. They can also pin, search, and sort their assigned bots.</p>
<p><b>New team reference in Request and Process pages</b></p> <p>The user can now reference the team from which a request is created by referring to the new <b>Team</b> column in the <b>Request</b> page or the team name added in the process tile in the <b>Process</b> page, to help guide their team assignment.</p>
<p><b>New Request Visibility field</b> (Service Cloud case ID: 00718119)</p> <p>Request visibility enables users to allow or restrict access to a request they created to other team members. When the <b>Request Visibility</b> field is set to <b>Shared</b>, all the requests are accessible by all members, owners, and team admins. If the field is set to <b>Private</b>, the requests are available only to the user who has created the request, owner, and the team admin.</p>
<p><b>Enhancement to the Processes page</b></p> <p>The following enhancements are available on the <b>Processes</b> page:</p> <ul style="list-style-type: none"> <li>• Sort the processes by name, in ascending or descending order.</li> <li>• Toggle the pinning of a process.</li> <li>• Use the responsive view to adjust the display to the screen size.</li> </ul>
<p><b>AARI Assistant for attended Bot Runners</b></p> <p>The AARI Assistant application enables users with the attended Bot Runner license to access their bots without logging in to the Control Room. AARI web users can use the AARI Assistant when the attended Bot Runner license is enabled along with their AARI User license without impacting their existing functionality.</p> <p><a href="#">About AARI Assistant</a> on page 1532</p>

**New features****Add rows from header row context menu**

Only the header row is displayed when a form that has a table is launched during bot runtime. Use one of the following methods to add new rows to the table:

- Header row context menu of the table

[Using the Table element](#) on page 1550

- The **Set** action in a bot

[Set](#)

**Discovery Bot****New features****Sort for a process tile from the Processes page**

You can now use the sort field to help you locate a process tile quickly. From the **Processes** page, use the drop-down menu to sort on a process tile based on the process name in alphabetical order. Alternatively, you can sort in the order of the newest process created to the oldest process and vice versa.

[Create a Discovery Bot process](#) on page 1669

**Enhancements to opportunities**

You can now review and analyze automatically generated (or system-generated) opportunities immediately from the **Opportunities** page. Auto-generated opportunities are created when at least two recordings are approved by the user. You can create a custom opportunity from an auto-generated opportunity and apply the **Model** and **Filter** options to target a specific opportunity for automation.

You can now prioritize opportunities based on a simple formula for all recordings in a process. From the Opportunities table, you can view the cost without automation and savings for an opportunity. The system automatically calculates the cost and potential savings for each opportunity generated. You can customize these metrics based on your organization's model for cost and savings.

[Review opportunities and convert to](#)

**Generated PDD files are available on your local server**

The generated PDD file for an opportunity is now stored locally on your server for On-Premises deployments. The existing PDD files are automatically moved to the new location and are not deleted when a re-installation or upgrade is performed in the Control Room.

[Prerequisites for Discovery Bot](#) on page 1661

**Community Edition A2019.20 Release Notes**

## Community Edition

**Important:** This release includes a required update to your . Ensure that you complete the update to continue with your automation activities when upgrading from a previous release to this release.

[Automatically update the Bot Agent](#) on page 1001 | [Manually update the Bot Agent](#) on page 1002

To verify which version is compatible with this release, see [Compatibility with release builds](#) on page 985.

What's new
<p><b>Automate SAP-related tasks using SAP BAPI</b></p> <p>Use the actions available in the SAP BAPI package to automate SAP-related tasks using SAP BAPI.</p> <p><a href="#">SAP BAPI</a></p>
<p><b>Default names for output variables</b></p> <p>When you configure an output variable for the following packages, the Control Room shows a descriptive default variable name. If you create several output variables, subsequent variable names are appended with a -1, -2, -3, and so on to avoid duplication.</p> <ul style="list-style-type: none"> <li>• Browser</li> <li>• CSV/TXT</li> <li>• Email</li> <li>• Excel advanced</li> <li>• JavaScript</li> <li>• Loop</li> <li>• Recorder</li> <li>• VBScript</li> <li>• Window</li> </ul>
<p><b>PDF split with blank pages supports scanned image documents</b> (Service Cloud case ID: 00683923)</p> <p>Use the PDF <b>Split</b> action to separate a blank page from pages with scanned images. With pixel-based split, you can now use <b>Split document</b> to split a PDF with blank page separators for scanned (image-based) documents.</p>
<p><b>SMTP port range expanded to include ports 1 through 65535</b></p> <p>The Email package now supports ports in the range of 1 through 65535 for the SMTP server. You can use the <b>Send</b> email action by configuring the SMTP port in this range.</p>
<p><b>New actions in the Active Directory package</b></p> <ul style="list-style-type: none"> <li>• <b>Update account options:</b> Sets account attributes for the user.</li> <li>• <b>Change user password:</b> Use this option to change a user's password.</li> </ul> <p><a href="#">User account operations</a></p>

<b>What's new</b>
<p><b>Enhancement to Create user action in Active Directory package</b></p> <p>You can now use the <b>Create user</b> action to create an Active Directory user with password.</p> <p><a href="#">Using the Create user</a></p>
<p><b>Universal Recorder expanded support and new features</b></p> <p>Use the Universal Recorder to perform the following:</p> <ul style="list-style-type: none"> <li>Automate clicks and data retrieval in drop-down lists and combo boxes in Oracle EBS applications such as Compass.</li> <li>Link an object that the bot cannot reliably identify to a nearby object (such as a link or button) that is easier for the bot to find. Use this feature in MSAA, UI Automation, or Java applications.</li> </ul>
<p><b>Support for new languages in variable names</b></p> <p>You can now use Czech, Danish, Dutch, Finnish, French, German, Hungarian, Italian, Norwegian, Polish, Portuguese, Romanian, Spanish, and Swedish characters in variable names.</p> <p><a href="#">Unicode range supported in variables</a> on page 1392</p>
<p><b>Search and add child bot in the parent bot</b></p> <p>Search for a child bot in the public and private workspaces so that you can add it in the parent bot. You can search for the child bot from the Bot editor and the <b>Run</b> action of the Task Bot package.</p> <p><a href="#">Using the Run   Bot editor for creating bots</a> on page 1306</p>
<p><b>Obtain information about user that deployed the bot</b></p> <p>Use the <code>AATaskInvoker</code> system variable to return the username, first name, last name, and email of the user that ran or scheduled the bot. If the bot is deployed to an attended Bot Runner, this variable returns information about the logged-in user. If the bot is deployed by a trigger, this variable returns information about the user who set the trigger.</p> <p><a href="#">System settings and parameters</a> on page 1381</p>
<p><b>New condition in If package</b> (Service Cloud case ID: 00536088, 00690073,00717514, 00737243, 00702383)</p> <p>Use the new <b>Window with same title does not exist</b> or <b>Window with same title exist</b> condition available in the If package to verify whether a window with the same title exists or whether the window title has changed.</p> <p><a href="#">If package</a></p>
<p><b>Google packages are now generally available</b></p> <p>Google Calendar, Google Drive, and Google Sheets packages are now generally available in Automation 360, and contain these new actions:</p> <ul style="list-style-type: none"> <li><b>Write from data table</b> and <b>Insert row/column</b> actions in the Google Sheets package.</li> <li>Each Google package contains a <b>Connect</b> action to authenticate your account before adding other actions from that package to your automation. This action replaces the deprecated <b>OAuth</b> action from the G-Apps package.</li> <li>Each Google package contains a <b>Disconnect</b> action to terminate the connection.</li> </ul> <p><a href="#">Using the Connect action for Google packages</a></p>

## Automation Anywhere Robotic Interface (AARI)

<b>What's new</b>
<p><b>Get Storage file action</b></p> <p>The new <b>Get Storage file</b> action in the <b>AARI Web</b> package enables you to download storage files to a bot device.</p> <p><i>Web</i></p>
<p><b>Upload files in initial forms or tasks</b></p> <p>Add the <b>Select File</b> element to forms to enable users to select and upload files in the initial forms or tasks in the web interface. Users can browse to upload a new file or replace an existing file. The uploaded file is shown as a hyperlink and redirects users to a new tab when opened.</p> <p><i>Configure processes</i> on page 1475</p>
<p><b>Hyperlinks support for initial forms or tasks</b></p> <p>Use the new <b>Hyperlink</b> element to add links to forms and access them in initial forms and tasks.</p> <p><i>Configure processes</i> on page 1475</p>
<p><b>Configure a scheduler user for each process</b> (Service Cloud case ID: 00713786)</p> <p>As an AARI administrator, you can now configure a scheduler user for each process to allocate the Control Room resources (devices and unattended Bot Runners) on the web interface. By default, the <b>Global scheduler</b> user is selected if a scheduler user is not configured for individual processes.</p> <p><i>Configure scheduler user for AARI on the web</i> on page 1472</p>
<p><b>Update to properties panel for human task</b> (Service Cloud case ID: 00718109)</p> <p>As a Bot Creator, you can choose to not configure any actions in the human task by selecting the <b>Make the form read-only</b> check box in the <b>Properties</b> panel. The human task does not require any input and it is executed automatically to the next task.</p>
<p><b>Bookmark any page as landing page for AARI on the web</b></p> <p>The web interface is now enhanced to a new multiple page system so that you can directly bookmark any page (<b>Requests</b>, <b>Tasks</b>, or <b>Recycle Bin</b>) as your landing page. Also, the tabs in the web interface have been removed so that the requests are opened one at a time and not simultaneously. To perform multiple tasks, you can open the requests pages in different browser tabs.</p>
<p><b>Navigation enhancement in AARI on the web</b></p> <p>The web interface is now enhanced with a side navigation pane so that you can easily navigate to various pages (<b>Processes</b>, <b>Requests</b>, <b>Recycle Bin</b>, and <b>Tasks</b>).</p>
<p><b>New processes page</b> (Service Cloud case ID: 00694786)</p> <p>As an AARI user, navigate to your assigned processes and create new requests by using the new <b>Processes</b> page in the web interface. Use the navigation bar to quickly access the page.</p>

What's new
<p><b>Enhancements to the Button element</b></p> <ul style="list-style-type: none"> <li>• Use the <b>Disallow button click when this form is first loaded</b> option to disable the <b>Button</b> element in a form when it is displayed for the first time during bot runtime.</li> <li>• Use the <b>Subtle</b> option in the <b>Button type</b> drop-down menu if you want the button element to appear as a link during bot runtime.</li> </ul> <p><a href="#">Using the Button element</a> on page 1540</p>
<p><b>Enhancement to the form logo</b></p> <p>You can now use the <b>Logos in footer</b> field option to select up to two separate logos that are displayed in the footer of the form during bot runtime.</p> <p><a href="#">Create a form</a> on page 1536</p>

## Discovery Bot

What's new
<p><b>Search for a business process from the Processes page</b></p> <p>You can now use the search field to help you locate a specific process by name. The field is not case-sensitive. The search field is available from the <b>Processes</b> page.</p> <p><a href="#">Create a Discovery Bot process</a> on page 1669</p>
<p><b>View all captured images from the screenshot modal window</b></p> <p>You can now navigate across all captured screenshots when you click an image in full size from the modal window. Click the pagination located below the image to select a step number or use the right or left arrows to quickly display all captured images.</p> <p><a href="#">Record a Discovery Bot business process</a> on page 1672</p>
<p><b>Process Discovery package is included in default packages</b></p> <p>The Process Discovery package is now included in the default packages. You can preload the default package when you connect to your device. Preloading the package helps to speed the start time of the recorder the first time you begin recording a process</p> <p><a href="#">Prerequisites for Discovery Bot</a> on page 1661</p>
<p><b>Recorder enhancements</b></p> <p>You can now perform actions such as double-click, drag-drop, click and hold, and text select when recording a business process. Actions performed using keyboard strokes are displayed in the <b>Data</b> field. Double-click is captured by the recorder and displayed in the screenshot from the <b>Recordings</b> page.</p> <hr/> <p><b>Note:</b> The Discovery Bot recorder does not capture the drag-drop and click and hold actions from the <b>Recordings</b> page. To include these actions performed during the recording, you can document the individual steps in the <b>Step description</b> text field for the analyst.</p> <hr/> <p><a href="#">Record a Discovery Bot business process</a> on page 1672</p>

## IQ Bot

### Known limitations

IPv6 addresses are not supported for IQ Bot, so ensure that you use only IPv4 addresses.

## Bot Insight

### What's new

#### **AAE\_Admin role access to operations API from Power BI connector**

The Power BI connector now provides the **AAE\_Admin** user role access to the botrundata operational API. With this role, you can connect to the botrundata API and extract operational metrics to be analyzed and visualized within Power BI.

#### **Enhancements to the publish (production) dashboard**

Users with the **AAE\_Bot Insight Admin** and **AAE\_Bot Insight Expert** role can now edit the published dashboard. You can use the save as option to save the production dashboard as a custom production dashboard and add widgets to your custom dashboard. You can also delete a default production dashboard and a custom production dashboard.

[Save a published dashboard](#) on page 2269 | [Delete a published dashboard](#) on page 2269

## Community Edition A2019.19 Release Notes

*Release date: 05 February 2021*

Review the new features in the Community Edition A2019.19 release (Build 8145).

- [Community Edition](#) on page 738
- [AARI](#)
- [Discovery Bot](#) on page 741

## Community Edition

---

**Important:** This release includes a required update to your . Ensure that you complete the update to continue with your automation activities when upgrading from a previous release to this release.

[Automatically update the Bot Agent](#) on page 1001 | [Manually update the Bot Agent](#) on page 1002

---

To verify which version is compatible with this release, see [Compatibility with release builds](#) on page 985.

New features
<p><b>New features in Data Table package</b> (Service Cloud case ID: 00656843, 00707635)</p> <ul style="list-style-type: none"> <li>• Use the <b>Change column type</b> action in the Data Table package to perform operations on the column of a data table. Use this action to change the column data type to <b>Boolean</b>, <b>Datetime</b>, <b>Number</b>, or <b>String</b>.</li> <li>• Sort the data in the data table in <b>Number</b>, <b>Datetime</b>, <b>Boolean</b>, or <b>String</b> format.</li> </ul> <p><i>Data Table package</i></p>
<p><b>New action in App Integration package</b></p> <p>Use the <b>Capture scrollable text</b> action to extract text from the selected window or any control within the selected window and save it to a variable. If you click any control within the window, then text from that specific control is extracted. If you click outside the window, then all the text from that window is extracted.</p> <p><i>App Integration package</i></p>
<p><b>New encoding combo box option in Terminal Emulator for VT Series</b></p> <p>To send and receive Japanese text, you can now use the <b>Encoding</b> and <b>CodePage</b> combo boxes when you connect to the Terminal Emulator for the VT series terminal type.</p> <p><i>Using Connect for</i></p>
<p><b>New actions in Active Directory package</b></p> <p>Use the following actions in the Active Directory to automate a task:</p> <ul style="list-style-type: none"> <li>• Move a computer <i>Using the Move computer</i></li> <li>• Move an organizational unit <i>Using the Move organizational unit</i></li> <li>• Add users to a group <i>Using the Add users to group</i></li> <li>• Remove users from a group <i>Using the Remove users from group</i></li> </ul>
<p><b>New system variable for new line character</b> (Service Cloud case ID: 00669232, 00672775, 00673578)</p> <p>Use the <code>\$String:Newline\$</code> system variable to add a new line character. This variable adds a new line character in various applications regardless of the operating system of the device.</p>
<p><b>Zero-size form for Enterprise A2019</b> (Service Cloud case ID: 00677611)</p> <p>The <b>Run</b> action uses the zero-size form with name <code>AAZeroSizeForm</code> that can be used by DLLs to identify zero-size forms created by Enterprise A2019.</p>
<p><b>Enhancement to define parent path in Active Directory</b></p> <p>When you establish a connection with an LDAP server, you can now select the LDAP path by connecting to the server.</p> <p><i>Using Connect for</i></p>

New features
<p><b>Obtain information about Run-As user after bot deployment</b></p> <p>Use the <i>AATaskExecutor</i> system variable to return the username, first name, last name, and email of the user that ran the bot. If the bot is deployed on an attended Bot Runner, this variable returns information about the logged-in user. If the bot is deployed by a trigger, this variable returns information about the user associated with that Bot Runner license.</p> <p><a href="#">System settings and parameters</a> on page 1381</p>
<p><b>Enhancements to the Recorder</b></p> <ul style="list-style-type: none"> <li>• Universal Recorder now supports object capture in Mozilla Firefox. You must install the A2019 extension from Mozilla Firefox browser add-ons.</li> <li>• Capture table, grid view, and main window objects from SAP applications.</li> </ul> <p><a href="#">Universal Recorder supported applications and browsers</a> on page 1321   <a href="#">Actions performed on objects captured with Universal Recorder</a></p>

## Automation Anywhere Robotic Interface (AARI)

New features
<p><b>New filter task in the process editor</b></p> <p>In the process editor, the <b>Filter Task</b> enables users to filter variables such as human or bot task output with a specific filter criterion.</p> <p><a href="#">Create an AARI process</a> on page 1487</p>
<p><b>New process task in the process editor</b></p> <p>Use the new <b>Process Task</b> option in the process editor to call a subprocess within the main process. This feature enables you to separate tasks into different processes instead of including all the tasks in a single process. Multiple teams can now work at the same time on different tasks within the main process and remain segregated, without any conflicts.</p> <p><a href="#">Create an AARI process</a> on page 1487</p>
<p><b>Hide a task or view a hidden task</b></p> <p>With a Bot Creator license, you can now perform the following:</p> <ul style="list-style-type: none"> <li>• Hide the display of human and bot tasks by selecting the <b>Hide this task after completion</b> option in the process editor.</li> <li>• View a hidden human or bot tasks by selecting the <b>View hidden tasks</b> option in the tasks view page.</li> </ul> <p><a href="#">Create an AARI process</a> on page 1487</p>
<p><b>Edit title in process editor</b></p> <p>Users can now edit the title in the process editor.</p>
<p><b>Rich-text editor updates (web interface)</b></p> <p>In the web interface, you can use rich-text editor features such as bold text, italics, underline, alignment, formatting, color, and size in tasks.</p>

New features
<p><b>Table element updates (web interface)</b></p> <p>In the web interface, the <b>Table</b> element now supports the use of date, number, drop-down, and text values in tasks.</p>
<p><b>Updates to elements in form builder</b></p> <p>The form builder now includes the following new elements:</p> <ul style="list-style-type: none"> <li>• <b>Select Folder</b> element: Add an upload folder option in the form. <i>Using the Select Folder element</i> on page 1544</li> <li>• <b>Hyperlink</b> element: Assign a URL in the form. <i>Using the Hyperlink element</i> on page 1545</li> </ul>
<p><b>Enhancement to the Checkbox action trigger</b></p> <p>If a form with a <b>Checkbox</b> element is used within a trigger loop package, you can now use the <b>Value selected</b> and <b>Value unselected</b> trigger actions. <i>Trigger loop package</i></p>

## Discovery Bot

New features
<p><b>View the duration of each recorded step</b></p> <p>A recorded step is now displayed in minutes and seconds for the business user and analyst. Use this information to understand which steps are a bottleneck in the current process and will provide most benefit from automation. The step duration is displayed from the <b>Recordings</b> page (below the screenshot image), and from the <b>View process</b> and <b>View opportunities</b> page from the Preview pane window. <i>Record a Discovery Bot business process</i> on page 1672</p>

---

**Important:** The supported packages information is moved to this topic: [Packages available in Automation 360](#) on page 1369.

---

## Community Edition A2019.18 Release Notes

*Release date: 05 January 2021*

Review the new features and supported packages in the Community Edition A2019.18 release (Build 7560).

- [Community Edition A2019](#) on page 742
- [AARI](#)
- [Discovery Bot](#) on page 745
- [Bot Insight](#) on page 746
- [Supported packages](#)

## Community Edition A2019

**Important:** This release includes a required update to your . Ensure that you complete the update to continue with your automation activities when upgrading from a previous release to this release.

[Automatically update the Bot Agent](#) on page 1001 | [Manually update the Bot Agent](#) on page 1002

Build 7560 (Community Edition) is compatible with Bot Agent 16.19.8232.

New features
<p><b>Configure timeout in Bot Migration package</b></p> <p>When migrating bots, you can now set a timeout value in the range of 3 through 90 minutes (default value is 90 minutes). If the migration of any specific bot is not completed within the set time, a timeout message is displayed and the migration process moves to the next bot.</p>
<p><b>Use regular expressions in variables</b> (Service Cloud case ID: 00628227)</p> <p>Use regular expressions (regex) in value type variables to specify the entity on which you want to perform an operation. For example, actions in the File, Folder, String, and Window packages allow use of regular expression in variables.</p> <p>When Enterprise 11 or Enterprise 10 bots with commands that use regular expressions in variables are migrated, if their equivalent actions in Enterprise A2019 do not support regular expressions, the regular expression is converted to string in the migrated bots.</p>
<p><b>Recorder enhancements</b></p> <ul style="list-style-type: none"> <li>Use the AISense Recorder <b>Define</b> option to record an interaction, such as click active text, with an object that is only visible when you hover the mouse over the object.</li> <li>If you record a click and keystrokes in a text box with a <b>Control Type</b> of <code>PASSWORD_TEXT</code>, the <b>Recorder</b> does not capture the keystrokes entered into the field. Instead, the action selects the <b>Set text</b> option and offers users the option to select a credential from the Credential Vault, enter a credential variable, or enter an insecure string.</li> </ul>
<p><b>Efficiently map input and output variables between parent and child bots</b> (Service Cloud case ID: 00537090, 00698697)</p> <p>For input variables, use the <b>Quick map</b> option to select the variables and set the values for the parent bot to pass. For output variables, use the <b>Multiple variables</b> tab to associate each dictionary key with a variable. This feature eliminates the need to use actions to extract the output dictionary values.</p> <p><a href="#">Task Bot package</a>   <a href="#">Using the Run</a></p>
<p><b>Support for PowerBuilder application in App Integration package</b> (Service Cloud case ID: 00680703)</p> <p>The App Integration package now supports PowerBuilder to capture and extract text from a window application. The <b>Capture text of window</b> action enables you to open a PowerBuilder screen to capture all the data and verify the captured text.</p>
<p><b>New action in Terminal Emulator package</b></p> <p>Use the <b>Search Field</b> action in the Terminal Emulator package to search for a field based on the text it contains. This action returns the name or index of the field based on the option selected.</p> <p><a href="#">Terminal Emulator</a></p>

New features
<p><b>New action in PDF package</b></p> <p>Use the <b>Get Property</b> action in the PDF package to retrieve the properties of a PDF file and assigns the properties to a dictionary variable.</p> <p><i>Using the Get property</i></p>
<p><b>New actions in Browser package</b></p> <p>Use the following actions in the Browser package:</p> <ul style="list-style-type: none"><li>• <b>Close:</b> Closes a Google Chrome browser window or tab.</li><li>• <b>Get source code:</b> Retrieves the source code of a web page and saves it to a string variable.</li><li>• <b>Go back:</b> Returns to a web page that you previously visited in the current tab.</li><li>• <b>Open:</b> Opens the browser to a specific web page in an existing tab, new tab, or window.</li><li>• <b>Run JavaScript:</b> Executes JavaScript in a web page.</li></ul> <p><i>Browser package</i></p>
<p><b>Specify application window dimensions</b></p> <p>Use the <b>Resize windows</b> option to set the window height and width to specific dimensions or to the dimensions at which it was captured. This feature enhances the bot's ability to identify the target object.</p> <p>The following packages support this feature:</p> <ul style="list-style-type: none"><li>• App Integration</li><li>• If <b>Image recognition</b> condition</li><li>• If <b>Legacy Automation &gt; Window Control</b> condition</li><li>• Image Recognition</li><li>• Simulate keystrokes</li><li>• Legacy Automation <b>Desktop &gt; Manage windows controls</b> action</li><li>• Loop <b>While &gt; Image recognition</b> condition</li><li>• Loop <b>While &gt; Legacy Automation &gt; Window Control</b> condition</li><li>• Mouse</li><li>• OCR</li><li>• Screen</li></ul>
<p><b>Support for function keys in Terminal Emulator package</b></p> <p>Function keys (F1 through F24) are now supported to automate processes using ANSI and VT100 terminals in the Terminal Emulator package.</p>

**New features****Use regex case insensitive flag for Window title**

Enable the regex **Case insensitive** flag to identify a **Window title** field as not case-sensitive. This feature enables you to successfully run the bots even if the letter case does not match the captured window title.

The following packages and actions support this feature:

- Wait
- Image Recognition
- Simulate keystrokes
- Mouse > **Click** action
- Legacy Automation **Desktop** > **Manage windows controls**
- OCR > **Capture window, Capture area**
- Screen > **Capture window, Capture area**
- Recorder > **Capture**
- Window: **Activate, Close, Maximize, Minimize, Resize**

**Automation Anywhere Robotic Interface (AARI)****New features****New AARI on the web package**

Use the AARI on the web package to perform actions such as assign, query, and cancel tasks; create and query requests; and retrieve a list of team members.

[Web](#)

**Filter by time**

You can now filter your requests and tasks by time:

- **Requests** tab: Use the **Created** and **Updated** options in the **Filter** window to select any dates.
- **Tasks** tab: Use the **Task created** and **Task updated** options in the **Filter** window to select any dates.

[Filter and search for a request](#) on page 1522 | [Filter and search for a task](#) on page 1523

**View updated dates**

- Use the new **Updated** column in the **Requests** tab to view the dates and time of a request that was last updated.
- Use the new **Task Updated** column in the **Tasks** tab to view the date and time of a task that was last updated.

**Variable options**

In the **Insert a variable** window, the **Variable** field now shows child elements of available references, which include **Dictionary, List, Record,** and **Table** variable types.

New features
<p><b>Delete a request</b></p> <p>AARI administrators, managers, and users can now delete requests created by the AARI process. The AARI administrator can delete any requests. AARI managers can delete requests of the team for which they are the owner. AARI users can delete only the requests they have created.</p> <p><a href="#">Delete a request</a> on page 1517</p>
<p><b>Automatically assign managers and users</b></p> <p>Users can now select the <b>Auto assign this task</b> option in the <b>Human Task</b> to assign managers or users to the task. Users can also select the <b>Auto assign the target task to</b> option in the <b>Go to</b> element to assign managers to the task.</p> <p><a href="#">Create an AARI process</a> on page 1487</p>

## Discovery Bot

New features
<p><b>Access Discovery Bot capabilities in Community Edition</b></p> <p>Discovery Bot is now available in the Community Edition and the free trial version. Log in to the Control Room and click the Discovery Bot tab on the left panel to get started.</p> <p>The available limits to create processes, recordings, views, and opportunities are displayed on the respective page. Create any number of bots and download a PDD for your personal use as required.</p> <p>A single Community Edition user is a multi-role user with Admin plus Business user plus Analyst permissions.</p> <p><a href="#">Get started with Discovery Bot</a> on page 1655</p>
<p><b>Use Model option for system-generated views</b></p> <p>You can now use the <b>Model</b> option to compare and find the best aggregated view for your recordings. Use this option to save as many views with different combinations as required.</p> <p>You can also save the view as a manual view to further customize your view and compare side-by-side. Select either an <b>Easy</b> or <b>Strict</b> model so that you can view recordings where the steps are the same versus recordings with different results with more branches in the process path.</p> <p><a href="#">Create a process view with branches and opportunities</a></p>
<p><b>Use Filter option for system-generated views</b></p> <p>You can now use the <b>Filter</b> option to use a set of values to compare different sections of a process across various recordings by selecting a specific path and step filter. Used along with the <b>Model</b> option, the path and step filter options for a system-generated or manual view can help you to determine and decide on a good candidate for automation.</p> <p><a href="#">Create a process view with branches and opportunities</a></p>
<p><b>Use toggle frequency counter option for system-generated views</b></p> <p>You can now use the toggle frequency counter to display the number of recordings that a particular path takes in the flow in a system-generated view. Use this option to help you understand the frequency of the path compared to other recordings or views.</p> <p><a href="#">Create a process view with branches and opportunities</a></p>

New features
<p><b>Remove recording screenshot for data privacy</b></p> <p>Use the <b>Screen</b> option (icon) to display or hide the recording screenshot before submitting the recording for the analyst to review. Use this option when you do not want to share personal image details with the analyst.</p> <p><a href="#">Record a Discovery Bot business process</a> on page 1672</p>
<p><b>Download PDD from the Opportunities table</b></p> <p>You can now download a process definition document (PDD) for an opportunity directly from the Opportunities table listed on the <b>Opportunities</b> page. The PDD is automatically generated when the opportunity is created. After the PDD is generated, the field changes from generating PDD to <b>Download PDD</b>. You can then download and save the document.</p> <p><a href="#">Review opportunities and convert to</a></p>

## Bot Insight

New features
<p><b>Access Bot Insight data from Tableau</b></p> <p>Use the Tableau connector in Bot Insight to access business and operational information. The Tableau connector connects to the Bot Insight APIs to create various business and operational metrics that you can analyze and visualize within Tableau.</p> <p><a href="#">Configure Tableau web data connector in Bot Insight</a> on page 2281</p>

## Supported packages

Package	Version
Application	2.1.0-20201112-22332

## Community Edition A2019.17 Release Notes

*Release date: 13 November 2020*

Review the new features and supported packages in the Community Edition A2019.17 (Build 7103) release. IQ Bot is on Build 7082.

- [Community Edition A2019](#) on page 748
- [AARI](#)
- [IQ Bot](#) on page 752
- [Bot Insight](#) on page 752
- [Supported packages](#)

## Community Edition A2019

**Important:** This release includes a required update to your . Ensure that you complete the update to continue with your automation activities when upgrading from a previous release to this release.

[Automatically update the Bot Agent](#) on page 1001 | [Manually update the Bot Agent](#) on page 1002

New features
<p><b>Connect to EWS server with OAuth authentication</b></p> <p>A new authentication is available for the Exchange Web Services (EWS) protocol with OAuth. You can use the OAuth authentication and enable your EWS-managed API applications to access Exchange online in Office 365.</p> <p><a href="#">Using Connect for</a></p>
<p><b>VT220 terminal type supported in Terminal Emulator</b></p> <p>To establish a connection and communicate with another machine, you can now use the VT220 terminal for sending and receiving text.</p> <p><a href="#">Using Connect for</a></p>

New features
<p><b>Enhancements to the Recorder</b></p> <ul style="list-style-type: none"> <li>Record a task using the Universal Recorder or AISense Recorder from a single point of entry. Both recorders are now managed through a single package, which enables faster and more efficient updates.</li> <li>You can now record tasks in a Microsoft Edge browser that runs on Chromium (versions 79 and later).</li> <li>Use the AISense Recorder <b>Define</b> option to capture an object that is only visible when you hover the mouse over the object.</li> <li>Use the <b>Resize window</b> option in the <b>Recorder &gt; Capture</b> action to set the window width and height.</li> </ul> <p>This option delivers a more reliable bot. It resizes the window to the dimensions at which the task was recorded, thus increasing the likelihood that the bot identifies the target object.</p> <p><a href="#">Get started with recorders</a> on page 1312   <a href="#">Universal Recorder supported applications and browsers</a> on page 1321   <a href="#">Using the Capture</a></p>
<p><b>Use shared session in Terminal Emulator</b></p> <p>Use the new <b>Shared session</b> option to pass the exact state of an application to a concurrently occurring TaskBot or MetaBot logic. For example, instead of connecting to the same application multiple times for different tasks, you can use the option to connect to the application using a single task, thus optimizing your automation logic in the long run.</p> <p><a href="#">Share session between logic</a></p>
<p><b>Share an Excel session between bots</b></p> <p>Use the <b>Set session</b> action from the Excel basic or Excel advanced package to assign an Excel session to a variable, and then pass that variable from a parent to a child bot. This enables the child bot to access the worksheet opened in the parent bot.</p> <p><a href="#">#unique_462</a>   <a href="#">Excel advanced workbook operations</a>   <a href="#">Example of sharing an Excel session between bots</a></p>
<p><b>New option for Run Task</b></p> <p>In the Task Bot package, you can now use the <b>Run</b> action with an option to repeat the selected task until you choose to stop it.</p>
<p><b>New search for roles in User Management API</b></p> <p>Use the new <code>Search for roles</code> API in the User Management APIs in Swagger to obtain a list of all the roles or details for a specific role.</p>
<p><b>Capture response status of REST API</b></p> <p>In the REST Web Service package, you can capture the response status of the REST API in the dictionary variable. The dictionary variable now shows the response key with its value.</p>
<p><b>New option for REST Web Service</b> (Service Cloud case ID: 00489741, 00646436)</p> <p>Use the <b>Capture failure response</b> action in the REST Web Service package to capture response details in the response body.</p>

## New features

### Use regular expressions in packages

You can use regular expressions (regex) in certain actions to support pattern-based search in a file, folder, or Windows title. Regular expressions are supported in the actions of the File and File and Folder packages such as **Copy**, **Delete**, **Rename**, **Print Multiple files**, and **Zip**.

You can also use regular expressions in some packages that support the wildcard character in their window titles.

The following packages and actions support regular expressions:

- Wait
- Image Recognition
- Simulate keystrokes
- Mouse > **Click** action
- Legacy Automation > **Manage windows control**
- OCR
- Screen
- Recorder > **Capture**
- Run DLL > **Run function (Legacy)**, **Run function**
- Window: **Activate**, **Close**, **Maximize**, **Minimize**, **Resize**

[Using Copy Desktop file for file](#) | [Using the Capture](#)

### Support for overloaded functions in DLL package

The **DLL > Run function** action can now handle `.dll` files that contain multiple functions of the same name. The action calls the function based on the number of parameters passed.

[Using the Run function](#)

### New actions for SAP captured objects

Use new actions that are available for **Tree**, **Tab**, and **Label** controls to perform operations for the various objects captured from an SAP application.

[supported in various versions](#)

### Store multiple lines of text in a string variable

You can use a string variable containing multiple lines of text in the following actions:

- **String > Assign**
- **String > Extract text**
- **String > Compare**
- **String > Lowercase**
- **String > Replace**
- **String > Reverse**
- **Log to file**
- **Message box**
- The string condition in the **If**, **Wait**, and **While** actions

**New features****Arabic, Japanese, and Russian characters supported in variable names**

You can now create variables with names containing Arabic or Russian characters, or Japanese double-byte numbers.

[Unicode range supported in variables](#) on page 1392

**Automation Anywhere Robotic Interface (AARI)****New features****View previous selected tasks**

AARI users can now reference selected actions of their tasks. When they view a submitted task in request view, a check mark indicator is now displayed next to the buttons that are selected.

**Run a process in private workspace**

You can now run a process in your private workspace by using the **Run** option in the process editor. The bots in the process are then executed on the default device of the Bot Creator.

[Configure processes](#) on page 1475

**Use variables types**

You can now use new variables in the process editor such as **createdOn** and **updatedOn** (DateTime), **id** (Number), and **title** (String). These variables are part of a data flow (workflow engine) that moves data between each step of a process and requires variable input for the process to run properly.

[AARI variable types](#) on page 1495

**Use the Data Privacy tag field**

The **Data Privacy tag** enables users to generate hidden custom output in their process tasks (**Start** panel, **Human Task**, and **Bot Task**). Users can enter the variables for this field during runtime with values. In the web portal, the AARI admin can use this tag to check for requests or tasks by using personal user data. The admin can also filter using this field.

[Create an AARI process](#) on page 1487 | [Filter and search for a request](#) on page 1522 | [Filter and search for a task](#) on page 1523

## IQ Bot

New features
<p><b>Support for Arabic language</b></p> <p>When creating a learning instance, you can now choose the Arabic language from the <b>Primary language of documents</b> drop-down menu, with the following limitations:</p> <ul style="list-style-type: none"> <li>• Advance table extraction is not available.</li> <li>• Search field on the <i>Validator</i> is not supported.</li> <li>• Arabic numerals are not supported.</li> </ul> <p>For example, if the document has date or time in Arabic language, it is extracted as text and validations can fail.</p> <hr/> <p><b>Note:</b> You can still use string-based validation checks (such as regular expressions) for Arabic numerals.</p> <hr/> <ul style="list-style-type: none"> <li>• Arabic is only supported on ABBYY FineReader Engine 12.4.</li> </ul> <p><i>Creating a learning instance</i></p>
<p><b>Default validations for a group</b></p> <p>When editing a learning instance, you can now use the <b>Select the default validations group</b> drop-down menu to select an available group. This allows all the new group documents in production to be extracted based on the custom logic and validations defined in this selected group, before it goes to the Validator.</p> <p><i>Edit a learning instance</i></p>

Fixed features	
Service Cloud case ID	Description
-	You can now create and edit a bot even if a document associated with a deleted bot appears in production. Previously, if a bot was deleted and a document associated with it appeared in production, you could not create a new bot.

## Bot Insight

New features
<p><b>New AARI dashboard in Bot Insight</b></p> <p>Use the AARI dashboard to view various widgets that provide information about requests created from published processes in AARI. The dashboard also provides statistics on the status of created requests.</p> <p><i>AARI dashboard</i> on page 2262</p>

## Supported packages

Package	Version
Application	2.1.0-20200921-085720
App Integration	1.1.0-20201014-042506
Analyze	2.2.4-20200903-113949
Active Directory	2.1.0-20200921-085716
Boolean	2.1.0-20201014-042509
Bot Migration	2.5.0-20200902-045043
Browser	2.1.0-20201002-123733
Clipboard	2.1.0-20201014-042520

## Sandbox environment

The sandbox environment for Automation 360 Cloud enables you to test your production bots to ensure that these bots work seamlessly in your production environment. Use the sandbox environment to help plan and test new features for upcoming Automation 360 releases.

The sandbox environment is the same as any Automation 360 Cloud instance but includes updates from the upcoming new release at least 3 weeks before Automation Anywhere Cloud is updated.

**Note:** The sandbox environment should not be used as your production environment.

IQ Bot is not included in the sandbox environment.

The following image shows how a new build is tested in the sandbox environment before it is pushed to the production environment.

## Benefits

The environment provides the following benefits to the Automation 360 Cloud customers:

- Test new features and identify any changes that might be required in your current bots.
- Preview upcoming features and enhancements.
- Better plan and manage changes for the upcoming update to your environment.

The sandbox environment is available only for Automation 360 cloud and cloud-enabled deployments. The environment is not supported for a Control Room in a data center that is hosted by you or a third-party vendor. The environment includes upcoming updates for Automation 360, Discovery Bot, Document Automation, AARI, and Bot Insight.

## Prerequisites

- You must have a valid Automation 360 Cloud license to use the sandbox environment.
- You must purchase an orderable sandbox SKU.

Contact your Customer Success Manager (CSM) or Partner Enablement Manager (PEM) for more details.

## Configure the environment

Perform the following tasks before you start using the environment:

1. De-allocate some of the licenses from your existing Automation 360 instances and allocate these licenses to the sandbox environment.
2. *Switch Bot Agent to the sandbox environment.*
3. Create the required users, roles, and other Automation 360 Cloud entities in the environment:
  - *Create a user* on page 2004
  - *Create a role* on page 2012
  - *Credentials and lockers in the Credential Vault* on page 2147
4. *Export bots from your existing Automation 360 Cloud.*
5. *Import the exported bots to the sandbox environment using Bot Lifecycle Management.*

# Automation 360 Package SDK Release Notes

Review the new, changed, fixed, and deprecated features, and security fixes, known issues, and limitations for the Automation 360 (formerly Enterprise A2019) Package SDK.

## Enhancements to Automation 360 v.27

Feature	Description
Added new annotations	<p>Added <b>documentation_url</b> and <b>tutorial_url</b> in <b>CommandPkg</b>.</p> <ol style="list-style-type: none"> <li><b>documentation_url</b> - Use this to add a documentation link to an action.</li> <li><b>tutorial_url</b> - Use this to add a video tutorial link to an action.</li> </ol> <p>For example:</p> <pre>@CommandPkg (     node_label =     "[[CMtoINCH.node_label]]",     label =     "[[CMtoINCH.label]]",     description =     "[[CMtoINCH.description]]",     name = "CMtoInch",     icon =     "ruler_icon.svg",     documentation_url =     "https://example.com/doc/     CMtoINCH.html",     tutorial_url =     "https://example.com/     tutorial/CMtoINCH.html",      minimum_controlroom_version =     "13980",      minimum_botagent_version =     "21.210")</pre>

[A360-package-sdk-2.6.1.zip](#)

## Enhancements to Automation 360 v.25

Feature	Description
Added default session_value	Added <b>default_session_value</b> in <b>CommandPkg</b> to set up the default value for global session.

[A360-package-sdk-2.5.0.zip](#)

## Enhancements to Automation 360 v.23

Feature	Description
Log4j version	Log4j version upgrade to 2.17.1.

[A360-package-sdk-2.4.1.zip](#)

## Enhancements to Automation 360 v.22

Feature	Description
Rebranded the package name	The package name is rebranded from <b>A2019</b> to <b>A360</b> .
Added return settings	Added return settings for <b>CommandPkg</b> to decide the setting or configurations related to the return type of the command.
Added a new annotation	Added a new annotation for <b>SessionObject</b> to indicate that the session object is passed to the command.
Added a new annotation	Added a new annotation for <b>SessionAllowNonExistent</b> to indicate that a non-existing session can be passed to the command.
Added a new attribute type	Added a new attribute type <b>BAPIOBJECT</b> that works with the control type named <b>BAPIWORKFLOW</b> with the following three tables. <ul style="list-style-type: none"> <li>• Import</li> <li>• Export</li> <li>• Table</li> </ul>
Added multiple return settings	Added multiple return settings in <b>CommandPkg</b> to return multiple values from the command.
Runtime library updates	Bundled the latest bot runtime libraries.

[A360-package-sdk-2.3.0.zip](#)

## Enhancements to Automation 360 v.21

Feature	Description
Added a new annotation	Added the new annotation for the Control Room and the Bot Agent.

Feature	Description
Added a new annotation	Added the new annotation for the credential password (@CredentialAllowPassword).
Added a new example	Added the new example at: <code>botcommand/samples/commands/basic/types</code> , called <b>CredentialTypeDemo.java</b> file.
Added a new annotation	Added the new annotation to support the Trigger3 interface.
Updated trigger examples	Updated trigger examples to support the Trigger3 interface.
Runtime library updates	Bundled latest bot runtime libraries.

[A2019-package-sdk-2.1.0](#)

## Enhancements A2019.20

Feature	Description
Runtime library updates	Bundled latest bot runtime libraries.

[A2019-package-sdk-2.0.9](#)

## Enhancements to Enterprise A2019.19

Feature	Description
Runtime library updates	Bundled latest bot runtime libraries.
Added annotation rule	Added the <code>MultipleRecordPicker</code> annotation rule.
Added annotations	Added annotations for desktop operation stages.

[A2019-package-sdk-2.0.8](#)

## Enhancements to Enterprise A2019.18

Feature	Description
Runtime library updates	Bundled latest bot runtime libraries.
Added shared session	Added support for shared sessions.
Enhanced property creation	Now properties can accept one parameter.
Added rule for WindowResize and WindowBrowser	Added a new rule for WindowResize and WindowBrowser.

Feature	Description
Non-essential dependencies in the <code>build.gradle</code> are commented out	Non-essential dependencies in the <code>build.gradle</code> are now commented out. Enable it to compile the Package SDK samples.

[A2019-package-sdk-2.0.7](#)

## Enhancements to Enterprise A2019.17

Feature	Description
Runtime library updates	Bundled latest bot runtime libraries.
Added author name in custom packages	Added support to add the author name in the vendor column of custom packages.
Added File2 attribute	Added the new attribute type File2.
Added File Type rule	Added the new rule File Type.

[A2019-package-sdk-2.0.6](#)

## Enhancements to Enterprise A2019.16

Feature	Description
Runtime library updates	Bundled latest bot runtime libraries.
Added NoLogging	Added NoLogging support.

[A2019-package-sdk-2.0.5](#)

## Enhancements to Enterprise A2019.15

Feature	Description
Runtime library updates	Bundled latest bot runtime libraries.

[A2019-package-sdk-2.0.4](#)

## Enhancements to Enterprise A2019.14

Feature	Description
Desktop operations	Added desktop operations support.
Samples for actions in the download file	Added additional samples for actions in the Package SDK download file.

Feature	Description
Runtime library updates	Bundled latest bot run-time libraries.

[A2019-package-sdk-2.0.3](#)

## Enhancements to Enterprise A2019.13

Feature	Description
Time validation for locales	Added compile time validation for locales JSON file.
Entry list	Added support for ENTRYLIST
Runtime library updates	Bundled latest bot runtime libraries.

[A2019-package-sdk-2.0.2](#)

## Enhancements A2019.12.1

Feature	Description
Trigger samples	Added trigger samples in the Package SDK download file. Download the latest Package SDK to access the sample files.

[A2019-package-sdk-2.0.1.zip](#)

## Enhancements to Enterprise A2019.12

Feature	Description
Runtime libraries	Added the latest runtime libraries.
Custom trigger	Creating custom triggers is supported in this release.
Sample	We added more code samples.
<b>HierarchyDemo.java</b> code example added to package documentation. (Service Cloud case ID: 00469066)	Create a simple action with multiple choices. The UI differs based on the options selected.

[A2019-package-sdk-2.0.0.zip](#)

## Enhancements A2019.11

Feature	Description
Runtime libraries	This package contains the latest runtime libraries.

[A2019-package-sdk-1.0.11.zip](#)

## Enhancements to Enterprise A2019.10

Feature	Description
Updated annotation support	Added new attributes annotation support.
Improved bundling of SDK	Bundled java doc inside package SDK zip. You only need to download one zip file now.
Runtime libraries	Bundled latest bot runtime libraries.
More examples	Added new examples inside zip.
Datatypes	Added new datatypes.

[A2019.10-package-sdk-1.0.0.zip](#)

**Note:** All the components for the Package SDK are included in a single zip file starting with the A2019.10 release.

## Enhancements to Enterprise A2019.09

Feature	Description
Bot runtime libraries	Bundled latest bot runtime libraries for A2019.09 Package SDK.

- SDK Demo Package: [A2019.09-packageSDK-1.0.0.zip](#)
- Documentation: [A2019.09-package-annotations-javadoc.zip](#)

## Enhancements to Enterprise A2019.08

Feature	Description
Bot runtime libraries	Bundled latest bot runtime libraries for A2019.08 Package SDK.
Properties support	Extended support for properties.
Comments expanded and improved	Added more comments to sample commands to help use SDK.

Feature	Description
Comment field formatting	Added text color and background color to comment fields.

- SDK Demo Package: [A2019.08-packageSDK-1.0.0.zip](#)
- Documentation: [A2019.08-package-annotqations-javadoc.zip](#)

## Enhancements A2019.07

Feature	Description
Bot runtime libraries	The A2019.07 bot runtime libraries are bundled in the SDK package.
<b>CREDENTIAL</b> attribute	We provide support for credential attributes that require input from action screens.
Localized error messages and actions UI text	Enables developing packages with i18n error messages and localized (l10n) actions UI with localized text.
Java Development Kit 11	The A2019.07 Package Development Kit supports JDK 11.

- SDK Demo Package: [A2019.07-Package-Sdk-1.0.0.zip](#)
- Documentation: [A2019.07-package-annotations-javadoc.zip](#)

## Process Discovery Release Notes

Review the new features and improvements in each release.

Use the links to view the release notes updates for each release.

For information related to features and fixes in previous Process Discovery releases, see the PDFs for these releases: [Process Discovery documentation \(release versions\)](#).

## Process Discovery Version 1.65.0 Release Notes

Review the new fixes available in this release.

Release Date: 28-March-2023

For information related to features and fixes in previous Process Discovery releases, see the PDFs for these releases: [Process Discovery documentation \(release versions\)](#).

### Fixes

- The **Export PDD as .docx** option only appears for Process Specifications with an associated Process Definition Document (PDD).

**Service Cloud Case ID:** 01942432

- The link to the `Credits` page has been removed. The page was previously accessible, however it did not reliably show the correct data.

## Neo Sensor Version 2.4.1

Review the new feature and fixed issues available in this release.

Release Date: 18-November-2022

### Feature and Fixed issues

Contact your Customer Success Manager (CSM) or Partner Enablement Manager (PEM) for the latest version. For information related to features and fixes in the previous Neo Sensor release, see the PDFs for these releases: [Process Discovery documentation \(release versions\)](#). Neo Sensor Version 2.4.1 includes the following updates:

#### Feature

You can now adjust the Neo Sensor debug level, and the log will contain more details regarding the screenshots taken by the application. For example, the **Area of Interest** screenshot size and actions is detailed in the log. To adjust the debug level, set the debug value to one of the following in the NeoConfig json configuration file:

- Set DEBUG to 1 in the installer.
- Set Debug to 1 in the registry.
- Set debug to 1 in the NeoConfig json configuration file if running in portable mode.

#### Fixed issues

For Observer Users that have a multi-monitor setup and the **ScreenFullCapture** setting is disabled, you can now view the screenshot taken on the correct monitor. Previously, only the Primary monitor was used in making the comparison between the screenshot taken and the desktop size.

You can now use two different methods to determine where an application's screen is located. You can adjust the SCREEN\_FETCH\_METHOD in the installer, ScreenFetchMethod in the registry, or screenFetchMethod in the NeoConfig json configuration file if running in portable mode with one of these values:

- 1 (default value) will use the center of the active window to determine the position.
- 2 will use the active windows reported handle from Microsoft Windows.

## CoE Manager Release Notes

Review the CoE Manager feature available in Automation 360 v.26 release.

### Introduction

Use CoE Manager - powered by Shibumi to scale your automation programs more quickly and efficiently. CoE Manager provides visibility into your end-to-end automation lifecycle and accelerates pipeline generation. It provides a consistent way of assessing automation opportunities which helps in minimizing the variations and maximizing the ROI.

CoE Manager is available out of the box and requires minimal configuration for first-time use.

## Automation Anywhere Enterprise compatibility

Automation 360: The Control Room can be a Cloud or On-Premises deployment.

[CoE Manager](#) on page 2228.

## Browser extensions for Automation 360

Create automation from supported browsers by using browser extensions. Extensions are periodically updated to support feature enhancements and fixes. Therefore, ensure that you have the latest versions of extensions for the Google Chrome, Microsoft Edge, and Mozilla Firefox browsers.

Before you download the latest version of a browser extension, review the information in the following tables:

### Browser extension for Manifest V3

Extension name	Extension Fixes version		Link to extension
Google Chrome	3.0.8.0	During web automation, the web page maintains its position when the target object is already visible on the page. This improves the automation reliability when there is a fixed pane on the web page and physical actions (such as mouse click) do not work as expected.	<a href="#">Google Chrome extension for Automation 360</a>
Microsoft Edge based on Chromium	3.0.8.0	During web automation, the web page maintains its position when the target object is already visible on the page. This improves the automation reliability when there is a fixed pane on the web page and physical actions (such as mouse click) do not work as expected.	<a href="#">Microsoft Edge extension for Automation 360</a>

### Browser extensions for Manifest V2

**Impact to our customers:** Automations that use Google Chrome Manifest V2 based extensions will stop working sometime after June 2023. The deprecation timelines of Manifest V2 based extensions are currently under review and subject to change by Google.

- For Google Chrome Manifest V2 extensions timelines, see [Manifest V2 support timeline](#).
- For Microsoft Edge Manifest V2 extensions timelines, see [Overview and timelines for migrating to Manifest V3](#).

Extension name	Extension version	Link to extension
Google Chrome	1.7.0.0	<a href="#">Automation 360 extension for Chrome</a>
Microsoft Edge based on Chromium	1.7.0.0	<a href="#">Automation 360 extension for Microsoft Edge</a>

Extension name	Extension version	Link to extension
Mozilla Firefox	1.7.0.0	<a href="#">Automation 360 extension for Mozilla Firefox</a>

### Related concepts

[Automation 360 Release Notes](#) on page 139

Review the new capabilities, changes, fixes (resolved issues), security fixes, deprecated features, and limitations in each release.

### Related reference

[Browser requirements for RPA Workspace](#) on page 829

Access the RPA Workspace interface from a browser. After you have installed and enabled extensions in the browser, perform several tasks through the RPA Workspace interface based on your user role and automation requirements.

[Bot Agent compatibility](#) on page 984

Before you install the Bot Agent, ensure that it is compatible with the hardware and software in your environment.

## Browser extensions for web applications

You can create automations using the Google Chrome and Microsoft Edge browser extensions for web applications running on Google Chrome and Microsoft Edge, which enables you to automate with enhanced security and performance.

### Features using browser extensions for web applications

The following Automation 360 features use the browser extensions for web applications running on Google Chrome or Microsoft Edge browsers:

- Automation of web applications through Universal Recorder or Browser package
- User interface-based triggers
- Bot Agent device registration with the Control Room
- Packages that use window titles, for example, OCR and **Mouse > Click**.

### Use browser extensions to automate web applications

To automate web applications, the browser extensions capture the properties of the targeted UI elements, application window title, and URL that enables you to create or update the actions that are specific to the Recorder in the bots. Newly created or updated bots are then uploaded from the browser of the Bot Creator to the Control Room. All bots are stored in the Control Room along with the properties of the UI element. When a bot is running, browser extensions are used to automate actions on the targeted UI elements of the web-based business applications.

When a Bot Creator or a Bot Runner user connects to the Control Room for the first time over Google Chrome or Microsoft Edge browsers, the browser extensions enable you to register your device by automatically sharing the device name and windows username, with the Control Room.

---

**Note:** Firefox browser extension supports object-based automation of web applications running in Firefox browser. Registering your device over Firefox browser is not yet supported.

---

## Previous versions of browser extensions

Review the version history of browser extensions from past releases.

### Version 3.0.7.0

Extension name	Fixes
Google Chrome	<ul style="list-style-type: none"> <li>• Timeout issues no longer occur on websites that previously had high loading time because now the JavaScript with debugger is performed successfully on any page that has a CSP policy.</li> <li>• Fix provided for <code>document.evaluate</code> if the <code>document.querySelector</code> is blocked. Previously, user interaction functions on some websites were not available because the <code>document.querySelector</code> was blocked.</li> </ul>
Microsoft Edge based on Chromium	<ul style="list-style-type: none"> <li>• Timeout issues no longer occur on websites that previously had high loading time because now the JavaScript with debugger is performed successfully on any page that has a CSP policy.</li> <li>• Fix provided for <code>document.evaluate</code> if the <code>document.querySelector</code> is blocked. Previously, user interaction functions on some websites were not available because the <code>document.querySelector</code> was blocked.</li> </ul>

### Version 3.0.6.0

Extension name	Fixes
Google Chrome	<ul style="list-style-type: none"> <li>• Enhancement to add case sensitivity option for static window titles in Google Chrome and Microsoft Edge</li> <li>• Fixes to capture objects and perform selected actions in a migrated bot using Recorder in Google Chrome and Microsoft Edge</li> <li>• Fixes to run JavaScript after executing Recorder actions in a bot in Google Chrome and Microsoft Edge</li> <li>• Fixes to capture pop-up windows with Automation 360 plug-in enabled in Google Chrome and Microsoft Edge.</li> </ul>

Extension name	Fixes
Microsoft Edge based on Chromium	<ul style="list-style-type: none"> <li>In the Recorder package, you can now use the <b>Click</b> or <b>Left click</b> action on the JavaScript alert, prompt, and confirmation pop-up windows to automate web pages on Microsoft Edge browser.</li> <li>In the package, you can now use the <b>Click</b> for the Link and Form tag controls that have inline scripting with using Manifest V3 extensions.</li> </ul>

### Version 3.0.5.0

Extension name	Fixes
Google Chrome	<ul style="list-style-type: none"> <li>Fixes to run JavaScript inside an iFrame in Google Chrome</li> <li>Enhancement to exclude page load for default pages in Google Chrome and Microsoft Edge</li> </ul>
Microsoft Edge based on Chromium	

## Automation 360 feature comparison matrix

Use the feature comparison matrix to compare the Automation 360 features with the features in Automation Anywhere Enterprise 11.3.x and Enterprise 10 versions.

For details on latest features and enhancements, see Automation 360 release notes.

### Core components

	Automation 360	Enterprise 11.3.x	Enterprise 10.x
Target user	Citizen Developer Specialist/RPA Developer IT	RPA Developer IT	RPA Developer IT
Delivery model	On-Premises Cloud Cloud-enabled	On-Premises	On-Premises BotFarm (for Bot Runners)

[Package SDK](#) on page 1687

Package SDK enables you in creating and uploading action packages to your Control Room.

### Related reference

[Operating system, environment, and platform supported for Control Room](#) on page 814

Automation 360 can be hosted on AWS, Microsoft Azure, Google Cloud Platform, IBM, and any public, private, or hybrid cloud service that meets the Control Room and Bot Agent hardware and software requirements.

[Automation 360 FAQ](#) on page 17

For details and questions on the latest Automation Anywhere platform, Automation 360, review this FAQ.

[Variable mapping for migration](#) on page 1232

In migration, some variables map directly from previous product versions to Automation 360 while others behave differently or contain configuration changes.

[Global values](#) on page 1400

Global values enable users to reuse identical values between bots instead of creating new variables for each bot. A user with the `AAE_admin` role configures a global value with a default value and can enable non-admin users to overwrite the value to use in their bots.

[Recursive expressions](#) on page 1390

Use a recursive expression to insert a variable in the place of an index or key of a dictionary, list, record, or table variable.

## Automation 360 IQ Bot feature comparison matrix

Compare the key features of Automation 360 IQ Bot deployment models and review the feature parity with the latest IQ Bot 11.3.x release.

IQ Bot basic features	Automation 360 IQ Bot			IQ Bot 11.3.x
	On-Premises	Cloud	Community Edition	
Prebuilt domains	Yes	Yes	Yes Supported domains include: <ul style="list-style-type: none"> <li>• Invoices</li> <li>• Purchase orders</li> <li>• Bank statements</li> <li>• Credit memo</li> <li>• Utility bills</li> </ul>	Yes
User confidence threshold in Validator	Yes	No	No	Yes
Learning instance creation/editing/renaming	Yes	Yes	Yes	Yes
Document image preprocessing	Yes	Yes	Yes	Yes
Document image classification	Yes	Yes	Yes	Yes
Document image OCR	Yes	Yes	Yes	Yes
Google Vision OCR	Yes	Yes	Yes	Yes
Tegaki API OCR engine	Yes	No	No	Yes
MICR (magnetic ink character recognition) extraction	Yes	Yes	Yes	Yes
PDFBox Toggle	Yes	Yes	Yes	Yes
Caching (enhanced performance)	Yes	Yes	Yes	Yes
Bot limiting	Yes	Yes	No	Yes
Bot creation/editing/deletion	Yes	Yes	Yes	Yes
Designer/Preview/Test	Yes	Yes	Yes	Yes
Production toggle	Yes	Yes	Yes	Yes

IQ Bot basic features	Automation 360 IQ Bot			IQ Bot 11.3.x
	On-Premises	Cloud	Community Edition	
Validator	Yes	Yes	Yes	Yes
CSV output files	Yes	Yes	Yes	Yes
Learning instance import/export	Yes	Yes	No	Yes
Default validations for a group	Yes	Yes	No	Yes
Adding groups manually	Yes	Yes	No	No
CyberArk support	Yes	No	No	No
CyberArk support with key rotation	Yes	No	No	No

Domain/training features	Automation 360 IQ Bot			IQ Bot 11.3.x
	On-Premises	Cloud	Community Edition	
Web-based UI	Yes	Yes	Yes	Yes
Domain import/export	Yes	Yes	No	Yes
Hover over text segment to view OCR	Yes	Yes	Yes	Yes
Resize mapped box in Designer	Yes	Yes	Yes	Yes
Delete mapped box in Designer	Yes	Yes	Yes	Yes
Populate text in <b>End of table/section indicator</b>	Yes	Yes	Yes	Yes
Single click to extract text in the Validator	Yes	Yes	Yes	Yes
Document group description	Yes	Yes	Yes	Yes
<b>See extraction results</b> action displays list of all training documents in an alphanumeric sequence	Yes	Yes	Yes	Yes
InstallShield patch installer with simplified upgrade/downgrade for IQ Bot	Yes	No	No	Yes
OCR Pre-processing Settings configuration	Yes	No	No	No

Extraction/validation features	Automation 360 IQ Bot			IQ Bot 11.3.x
	On-Premises	Cloud	Community Edition	
Original IQ Bot text segmentation/document classifier from IQ Bot Version 5.3.0/6.0	Yes	No	No	Yes
New IQ Bot text segmentation/ document classifier from IQ Bot Version 5.3.1/6.5	Yes	Yes	Yes	Yes
Option to select classifier version of existing learning instances during IQ Bot upgrade: <ul style="list-style-type: none"> <li>Version 1 (IQ Bot 5.3.0 or before 6.0)</li> <li>Version 2 (IQ Bot 5.3.1/ Version 6.5 Beta)</li> </ul>	Yes	No	No	Yes
Enhanced compatibility with ABBYY FineReader Engine 12.2 Plugin	Yes	Yes	Yes	Yes
Automated installation of ABBYY FineReader Engine 12.2 Plugin	Yes	Yes	Yes	Yes
Validator auto-correction	Yes	Yes	Yes	Yes
Check box extraction	Yes	Yes	Yes	Yes
Check box auto-detection	Yes	Yes	Yes	Yes
Advanced extraction: Repeated tables/sections; linking tables/sections; map some header-less columns	Yes	Yes	Yes	Yes
Alternative to stop extraction at <b>End of table/section indicator</b>	Yes	Yes	Yes	Yes
Select text segments that enclose or are enclosed by other text segments	Yes	Yes	Yes	Yes
Option to select default training document	Yes	Yes	Yes	Yes
Formula validation	Yes	Yes	Yes	Yes
List validation in UI	Yes	Yes	Yes	Yes
List validation through external file	No	No	No	No

Extraction/validation features	Automation 360 IQ Bot			IQ Bot 11.3.x
	On-Premises	Cloud	Community Edition	
File/folder search validator	Yes	Yes	Yes	Yes
Microsoft Azure Computer Vision API (OCR)	Yes	Yes	Yes	Yes
Add user logic in the Designer	Yes	Yes	Yes	Yes
View and test all documents in the <b>Designer &gt; See extraction results</b>	Yes	Yes	Yes	Yes
IQ Bot extensions	Yes	No	No	Yes
Import standard form domains	Yes	Yes	No	Yes
(Beta) Enabled data capture and OCR using Google Vision API for Asian languages	Yes	Yes	Yes	Yes
Magnetic ink character recognition (MICR) extraction	Yes	Yes	Yes	Yes
Option to turn off PDFBox as OCR engine	Yes	Yes	Yes	Yes
Using variables in IQ Bot package	Yes	Yes	Yes	No
Extraction results opening in a new browser tab	Yes	Yes	Yes	No
IQ Bot standard forms	Yes	Yes	No	No

Enterprise features	Automation 360 IQ Bot			IQ Bot 11.3.x
	On-Premises	Cloud	Community Edition	
Access IQ Bot without device license (without Bot Creator or Bot Runner license)	Yes	Yes	Yes	Yes
Access IQ Bot as Validator users without Bot Creator or Bot Runner license	Yes	Yes	Yes	Yes
Database encryption	Yes	Yes	Yes	Yes
Roles-based access (RBAC) for new learning instances	Yes	Yes	No	Yes
Audit logs	Yes	Yes	No	Yes
Windows authentication	Yes	Yes	No	Yes
Azure PaaS Database Service	Yes	No	No	Yes
Counter for number of uploaded pages in production	Yes	Yes	No	Yes

## Automation 360 IQ Bot version compatibility

Review the version compatibility information before you upgrade from an earlier version of Automation 360 IQ Bot to the latest Automation 360 IQ Bot version, or from earlier versions of IQ Bot to Automation 360 IQ Bot.

### Compatibility with Automation 360 Control Room

Automation 360 IQ Bot On-Premises version compatibility with Automation 360 Control Room:

**Important:** The following table lists the latest build of each Control Room release that is compatible with the IQ Bot build. Note that, IQ Bot is compatible with all Automation 360 builds in a release. For example, Automation 360 v.21, IQ Bot build 9642 is compatible with Control Room build 9664 and builds released after that such as 9595, and 9642 **for the same release version**. We recommend that you update to the latest Control Room build for the latest fixes.

IQ Bot On-Premises	Control Room
Build 17506	Build 17506 (Automation 360 v.28)
Build 16685	Build 16685 (Automation 360 v.27)
Build 15450	Build 15459 (Automation 360 v.26)
Build 15112	Build 15112 (Automation 360 v.25)
Build 13343	Build 13343 (Automation 360 v.24R2)
Build 12350	Build 12350 (Automation 360 v.24)
Build 11513	Build 11513 (Automation 360 v.23)
Build 10520	Build 10526 (Automation 360 v.22)
Build 9642	Build 9664 (Automation 360 v.21)
Build 8815	Build 8815 (A2019.20)
Build 8098	Build 8147 (A2019.19)
Build 7554	Build 7560 (A2019.18)
Build 7082	Build 7103 (A2019.17)
Build 6443	Build 6463 (A2019.16)
Build 5931	Build 5933 (A2019.15)
Build 5322	Build 5322 (A2019.14)
Build 4695	Build 4705 (A2019.13)
Build 4088	Build 4105 (A2019.12)
Build 3337	Build 3337 (A2019.11)
Build 2545	Build 2545 (A2019.10)
Build 2079	Build 2079
Build 1610	Build 1610
Build 1089	Build 1089

IQ Bot On-Premises	Control Room
Build 550	Build 550

Automation 360 IQ Bot Cloud version compatibility with Automation 360 Control Room:

IQ Bot Cloud	Control Room
Build 16685	Build 16701 (Automation 360 v.27)
Build 15436	Build 15459 (Automation 360 v.26)
Build 14288	Build 14298 (Automation 360 v.25)
Build 12342	Build 12342 (Automation 360 v.24)

## Migration compatibility with earlier IQ Bot versions

Review the following version compatibility table to understand the available upgrade options for Automation 360 IQ Bot:

IQ Bot version	Automation 360 IQ Bot (On-Premises)
Version 11.3.5.x	Yes
Version 11.3.4.x	Yes

To migrate to Automation 360 IQ Bot On-Premises from a version earlier than 11.3.4.x, first upgrade to IQ Bot Version 11.3.4.x or later.

[Migrate to Automation 360 IQ Bot](#) on page 1288

Importing learning instances between different IQ Bot versions is not supported. If you want to retain the associated data for a learning instance, ensure you update or migrate to the correct IQ Bot version before importing the corresponding learning instance. For example, if you export a learning instance in IQ Bot On-Premises (Build 8815), you can only import it within an equivalent IQ Bot On-Premises or Cloud build.

[Migrate learning instances](#) on page 1295

# Install and update Automation 360

Automation 360 provides a web-based, cloud-native RPA platform for users of all types. Review the tasks involved in setting up Automation 360.

**Legal disclaimer:** The information provided in this workflow might vary depending on which offering you use. Administrator steps might not be applicable to Cloud or Community Edition.

**1.** Choose your Automation 360 deployment model.

[Deployment models](#) on page 14

**2.** Verify the system prerequisites based on your deployment model:

- **Cloud:** [Automation 360 Cloud prerequisites](#) on page 791
- **On-Premises:** [Automation 360 On-Premises prerequisites](#) on page 804
- **Community Edition:** [Get started with Community Edition](#) on page 980

**3. Administrators:** Set up bot users.

Bot users, skip this step and proceed to Step 4.

**a.** Receive your administrator credentials.

- **Cloud administrators:** Receive your login credentials with administrator privileges and your Automation 360 dedicated URL from Automation Anywhere.
- **On-Premises administrators:** Receive your licensing information from Automation Anywhere and install Automation 360.

The installation user is assigned administrator privileges.

Installation type	Go here
Windows	<a href="#">Installing Control Room On-Premises</a> on page 801  To view this installation task in an interactive visual format, see <a href="#">Install Control Room On-Premises (custom mode)</a> .
Linux	<a href="#">Installing Control Room on Linux</a> on page 909
Amazon Web Services	<a href="#">Installing Control Room on Amazon Web Services</a> on page 887
Microsoft Azure	<a href="#">Installing Control Room on Microsoft Azure</a> on page 893

Installation type	Go here
Google Cloud Platform	<a href="#">Installing Control Room on Google Cloud Platform on page 904</a>

- b. Log in to a supported device, open a supported web browser, and log in to your Control Room using the dedicated URL.
    - [Automation 360 Bot Runner device requirements](#) on page 792
    - [Log in to Automation Anywhere Control Room](#) on page 981
  - c. Create your bot users by assigning a role and device license.
    - [Create a user](#) on page 2004
    - [Create an Active Directory user](#) on page 2005
  - d. Set up email notifications to Control Room users when events affect them, such as changes to passwords or user information, and account activation or deactivation.
- 4. Bot users:** Perform these steps to get started with Automation 360.
- a. Receive your user login credentials and the Control Room dedicated URL.  
 Credentials are sent to you from your company's Automation Anywhere administrator or from Automation Anywhere.  
 Community Edition users: If you do not have an Automation 360 account, register for a free Community Edition account by visiting [Automation Anywhere Community Edition](#).
  - b. Log in to your Automation 360 account.  
 Log in to a supported device, open a supported web browser, and log in to your Control Room.
    - [Automation 360 Bot Runner device requirements](#) on page 792
    - [Log in to Automation Anywhere Control Room](#) on page 981
  - c. [Install Bot Agent and register device](#) on page 998.  

---

**Note:** The Bot Agent is installed only on devices running supported Windows operating systems. See [Automation 360 Bot Runner device requirements](#) on page 792. You can create bots using the Bot editor in the Control Room, but to run the bots you must install the Bot Agent on your device.  

---
  - d. Start creating bots:
    - [Create your first bot](#) on page 1018
    - [Build a Go be Great bot](#) on page 1406

---

**Update Automation 360:** See [Update to latest Automation 360 version](#) on page 1022.

Cloud and the Community Edition are updated automatically.

---

### Related tasks

[Log in to Automation Anywhere Control Room](#) on page 981

To log in to Automation 360, open the Control Room URL in your browser, enter your credentials in the login screen, and click **Log in**.

[Get started with Community Edition](#) on page 980

Use these tasks to register for, and start creating and using bots with the Community Edition of Automation 360.

#### Related reference

[Automation 360 Bot Runner device requirements](#) on page 792

Review the machine hardware specifications, operating system versions, and browser types supported for creating and running bots on a device. The same requirements are also valid for Automation 360 Community Edition.

[Browser requirements for RPA Workspace](#) on page 829

Access the RPA Workspace interface from a browser. After you have installed and enabled extensions in the browser, perform several tasks through the RPA Workspace interface based on your user role and automation requirements.

[Enterprise v11 Client installation](#)

## Get started with Automation 360 Cloud

Use these tasks to start creating and using bots with Automation 360 Cloud.

1. Complete the prerequisites for Cloud.

[Automation 360 Cloud prerequisites](#) on page 791

Use the checklist to determine whether your device fulfills the requirements for registering with Automation 360 Cloud.

2. [Provision Cloud Control Room instances](#) on page 973.

Use the Licenses and Cloud Services portal to provision Cloud Control Room and Cloud sandbox Control Room instances on demand.

3. Receive your Control Room URL and login credentials. The URL points to your Automation 360 instance.

If you are your company's principal administrator and ordered cloud-deployed Automation 360, you receive an email from Automation Anywhere with your URL and credentials.

4. [Log in to Automation Anywhere Control Room](#) on page 981.

To log in to Automation 360, open the Control Room URL in your browser, enter your credentials in the login screen, and click **Log in**.

5. Install Bot Agent, register your device, and set user device credentials.

[Install Bot Agent and register device](#) on page 998 | [Set user device credentials](#) on page 1011

The Bot Agent is a lightweight application that enables you to run bots on your device by connecting the device to the Control Room. To run bots on a local machine, install the Bot Agent and add the local device to the list of enabled host devices.

To enable a device for running bots, set the local device credentials.

If you are using an operating system other than Windows, you will not be able to install the Bot Agent at this time. See [system requirements](#). However, you can still build bots using the [Bot editor](#).

**6. [Create your first bot](#) on page 1018.**

Follow these steps to create your first bot that prints the message, `Go be great!`, the Automation Anywhere version of `Hello World!`

**7. [Run your first bot](#) on page 1021.**

Run a bot from the same device that you used to create the bot.

## Automation 360 Cloud prerequisites

Use the checklist to determine whether your device fulfills the requirements for registering with Automation 360 Cloud.

- Verify the device software and hardware requirements.  
[Automation 360 Bot Runner device requirements](#) on page 792
- Access the Control Room URL from your browser.  
[Log in to Automation Anywhere Control Room](#) on page 981
- Add the Automation Anywhere Domain Name System (DNS) to the safe recipients or allowed list to ensure secure access to Automation 360 cloud services.  
[Add Automation 360 Cloud URLs to trusted list](#) on page 794
- Allow Automation Anywhere communications ports and protocols.  
[Allow Automation Anywhere communications ports](#) on page 797
- Add devices to the allowed list within the corporate network for granular security.  
[Add access IP addresses](#) on page 2053
- Add or update the authenticating proxy credentials to connect your device.  
[Connect Bot Agent to a device with a proxy](#) on page 1005
- Set up SAML authentication identity provider if you are using single sign-on (SSO).  
[Set up SAML authentication](#) on page 954
- Configure your network firewall to add the outbound NAT Gateway IP addresses to the allowed list.  
[Automation 360 IP addresses for external integrations](#) on page 2070
- When configuring your domain and subdomain Control Room URLs, you must follow the Domain Name System (DNS) guidelines.  
[Naming guidelines for Control Room URLs](#) on page 936

- To ensure seamless connectivity of your IQ Bot cloud servers with the Cloud Control Room, specify a list or range of IP addresses that are allowed to access the Cloud Control Room URL.

*Add IQ Bot cloud server IP addresses to allowed list* on page 798

## Automation 360 Bot Runner device requirements

Review the machine hardware specifications, operating system versions, and browser types supported for creating and running bots on a device. The same requirements are also valid for Automation 360 Community Edition.

### Hardware requirements for registered devices

You communicate with the Control Room, through a registered local machine (device). Bot Creators and Bot Runners use the registered devices to create and run bots. Part of registering a device with Automation 360 is installing a Bot Agent.

The Bot Agent can be installed on devices that meet or are equivalent to the following hardware requirements:

Device	Processor	RAM	Storage (free disk space)	Network
Machine	Intel Core i3 2.6 GHz with 4 multi-cores or higher 64-bit	<ul style="list-style-type: none"> <li>4 GB (Minimum)</li> <li>8 GB (Recommended)</li> </ul>	32 GB Add 100 through 150 KB per Automation Anywhere script Add 40 through 50 GB per long-term project	<ul style="list-style-type: none"> <li>5Mbps (Minimum)</li> <li>20Mbps or higher (Recommended)</li> </ul>
Additional users on a multi-user device	2 CPU per additional user	4 GB per additional user	No additional storage required	No additional network needed

#### Additional RAM requirements for the registered devices

Add additional RAM to account for applications and services running on the registered devices, for example:

- Microsoft Office applications (example: Excel)
- Browsers (example: Google Chrome)
- Enterprise applications (example: CRM, Oracle EBS, and SAP)
- VDI infrastructure applications
- Anti-virus software
- AISense Recorder

#### Additional disk space on registered devices

- Automation 360 scripts average approximately 100-150 KB. Additional free disk space is required to develop automation projects because temporary files such as screenshots, server logs,

and audit files are created during the execution of the automation scripts.

- Free space required increases with the project size. Recommendation: Have at least 40-50 GB of free disk space for each long-term project.
- Increase storage space configuration after installation, as needed, depending on product usage. For example, depending upon the complexity of your bot, generating log files and logic creation require additional disk space later.

## Additional CPU or processor on registered devices

AISense Recorder: Additional CPU or processor is required on a device if the existing CPUs are utilized by customer applications. It is also required in case of a VDI infrastructure where CPU or processors are shared across the infrastructure.

## Platform compatibility for registered devices

A device used to connect to the Control Room and perform bot tasks must meet the platform requirements.

---

**Note:** Platform requirements are different for Control Room and Bot Agent.

---

### Registered devices

Physical machines that you want to use for creating bots or deploying bots and running any of the supported operating systems.

### Terminal servers

Using remote desktop (RDP), running any of the supported operating systems is supported on Automation 360 Version A2019.11 or later.

### Virtual machines

Bot Agent is supported on all VMs where the supported Windows OS has been hosted on Version A2019.09 or later. For example, Virtual Desktop Infrastructure (VDI) are supported on Amazon Web Services, Microsoft Azure, Google Cloud Platform, VMware virtual machines, and Oracle Virtual Box.

## Supported operating systems for registered devices

A device used to run the Bot Agent, connect to the Control Room, and perform bot tasks as a Bot Creator and Bot Runner must meet the operating system requirements.

---

**Note:**

- Only 64-bit operating system version supported.
  - Bot Creator tasks are supported with all the listed operating systems.
  - You cannot register a device that is running on a Linux system. The Bot Agent cannot be installed on Linux systems. However, you can use a registered device running on a Windows system to access a Control Room that is installed on a Linux system.
-

Windows version	Windows edition	Attended Bot Runner	Unattended Bot Runner	Bot Creator
Windows Server 2019	Datacenter and Standard	Supported	Supported <sup>1</sup>	Supported
Windows Server 2016	Datacenter and Standard	Supported	Supported <sup>1</sup>	Supported
Windows Server 2012	Datacenter and Standard	Supported	Supported <sup>1</sup>	Supported
Windows 11	Enterprise	Supported	Supported <sup>1</sup>	Supported
Windows 10	Professional and Enterprise	Supported	Supported <sup>1</sup>	Supported
Windows 8 <sup>2</sup>	Professional and Enterprise	Supported	Supported	Supported
Windows 7 <sup>2</sup>	Professional and Enterprise	Supported	Supported	Supported

### (1) Auto-login

- Auto-login is only supported on 64-bit systems.
- If the Auto-login fails, configure the **Local Security Policy** settings. For example, in Windows, select **Security Settings > Local Policies > Security Options**. **Enable** the **Interactive logon > Do not require CTRL +ALT+DEL** option.

### (2) Supported OS

Windows 11 (64-bit) supported on Automation 360 Build 15459 or later.

Windows 8 (64-bit) supported on Enterprise A2019 (Builds 1598 and 1610) or earlier.

Windows 7 (64-bit) supported on Enterprise A2019.12 or later.

## Add Automation 360 Cloud URLs to trusted list

To ensure secure access to Automation 360 cloud services, add the URL specific to the service to the safe recipients or trusted list.

### Automation 360 Cloud URLs list

Automation 360 cloud service hosting uses dynamic IP addresses and therefore we recommend that you add to the safe recipients list the complete URL instead of an IP address for the Automation Anywhere cloud services.

Service	URL	Port	Device
Automation Anywhere	www.automationanywhere.com	TCP 443 (HTTPS)	All devices

Service	URL	Port	Device
Automation Anywhere Cloud customer tenant  Includes Automation Anywhere Control Room and IQ Bot	crdomainname- X.my.automationanywhere.digital  <b>Note:</b>  <ul style="list-style-type: none"> <li>• crdomainname-X refers to your specific tenant name.</li> <li>• The tenant name does not support the underscore ( _ ) character. So an underscore is used in the tenant name, the specified URL will not be created.</li> </ul>	TCP 443 (HTTPS)	All devices that access Automation 360

## Files and folders

For information on files and folders to add to the safe list and to the antivirus exception list, see these articles:

- [Files and URLs to add to safe list for Automation 360 \(A-People login required\)](#)
- [List of files to add to antivirus exception list for Automation 360 \(A-People login required\)](#)

### Related tasks

[Add access IP addresses](#) on page 2053

Use this setting to limit user login access to the Control Room URL based on IP addresses or subnets that you specify in a list. You add IP address ranges using the Classless Inter-Domain Routing (CIDR) format, and you can add multiple CIDR ranges.

### Related reference

[Ports, protocols, and firewall requirements](#) on page 823

View the default and configurable firewall, port, and protocol requirements for Automation Anywhere deployment. View the default ports and protocols that are required to be allowed on customer's firewall for Automation Anywhere deployment. The default ports that are used for HTTP/HTTPS are configurable.

[Add Automation 360 On-Premises URLs to trusted list](#) on page 933

To ensure secure access to Automation 360 online services for On-Premises deployment, add the URL specific to the service to the safe recipients or trusted list.

[Add IQ Bot cloud server IP addresses to allowed list](#) on page 798

To ensure seamless connectivity of your IQ Bot cloud servers with the Cloud Control Room, specify a list or range of IP addresses that are allowed to access the Cloud Control Room URL.

[Automation 360 IP addresses for external integrations](#) on page 2070

To ensure seamless connectivity of your Git instance, On-Premises key vault, or SIEM with the Cloud Control Room, configure your network firewall to include Automation Anywhere outbound Automation 360 IP addresses to the allowed list.

## Allow Automation Anywhere communications ports

As part of the Automation 360 Cloud prerequisites, you must allow Automation Anywhere communications ports and protocols from the customer network.

### Cloud communications ports

You can set the following connection modes between the customer network and the Control Room:

- **Outbound:** The traffic flows from the customer network to the Control Room.
- **Inbound:** The traffic flows from the Control Room to the customer network.

---

#### Note:

- You do not need an inbound connection for a regular bot execution. The inbound connection is only required when you have configured any integrations to: Git repository, On-Premises external key vault, or SIEM server with your cloud-hosted Control Room.
- You must open the Cloud communications ports to unidirectional (outbound connection) to transmit traffic from the customer network to the cloud-hosted Control Room.

---

The following table describes the required Cloud communications ports:

Automation 360 Cloud communications ports				
From	To	Port	Protocol	Connection type
Bot Agent (customer hosted)	Control Room (Automation Anywhere hosted)	443	HTTPS	Outbound
Bot Agent (customer hosted)	Control Room (Automation Anywhere hosted)	443	WebSocket	Outbound
Access to Control Room through browser	Control Room (Automation Anywhere hosted)	443	HTTPS	Outbound

Automation 360 Cloud communications ports				
From	To	Port	Protocol	Connection type
Control Room (Automation Anywhere hosted) where Control Room connects from these <a href="#">Automation 360 IP addresses for external integrations</a> on page 2070	Third-party Keystore (customer hosted and optional)	443	HTTPS	Inbound
Control Room (Automation Anywhere hosted) where Control Room connects from these <a href="#">Automation 360 IP addresses for external integrations</a> on page 2070	Git Repository (customer hosted and optional)	443	HTTPS	Inbound
Control Room (Automation Anywhere hosted) where Control Room connects from these <a href="#">Automation 360 IP addresses for external integrations</a> on page 2070	SIEM server (customer hosted and optional)	443	HTTPS	Inbound

## Add IQ Bot cloud server IP addresses to allowed list

To ensure seamless connectivity of your IQ Bot cloud servers with the Cloud Control Room, specify a list or range of IP addresses that are allowed to access the Cloud Control Room URL.

Based on your region, add the following outbound NAT IP addresses to the allowed list in the Cloud Control Room network settings:

Region	IP addresses
- Africa	<ul style="list-style-type: none"> <li>• 13.244.57.44</li> <li>• 13.244.197.159</li> <li>• 13.244.185.72</li> <li>• 54.228.5.1</li> <li>• 54.228.48.30</li> <li>• 54.217.103.248</li> </ul>
- Australia	<ul style="list-style-type: none"> <li>• 54.153.153.175</li> <li>• 52.65.8.56</li> <li>• 3.106.147.142</li> </ul>
- Canada	<ul style="list-style-type: none"> <li>• 35.203.94.19</li> <li>• 34.152.28.44</li> </ul>

To ensure secure access to Automation 360 cloud services, add the URL specific to the service to the safe recipients or trusted list.

## Installing Control Room On-Premises

Review the installation core tasks and topics for installing the Automation 360 Control Room in a data center on an On-Premises server or a cloud service provider server instance.

The Control Room provides centralized management for a digital workforce and an interface for Bot Insight. It is deployed on a server in a data center.

---

**Linux users:** See [Installing Control Room on Linux](#) on page 909.

---

---

**Note:** Linux is not supported for Cloud-enabled On-Premises installations.

---

## Control Room installation core tasks

### Prerequisites

Before you begin, download the appropriate installer for your operating system and version from [A-People Downloads page \(Login required\)](#).

#### Step 1: Pre-installation

*Automation 360 On-Premises prerequisites* on **page 804**

Determine whether the system has the required hardware and software to install Control Room for On-Premises.

#### Step 2: Installation

The Control Room installer allows you to select installation modes (Express or Custom), and during the installation process, it also installs missing software dependencies.

Use Custom mode to install on a cloud-based platform such as Amazon Web Services.

*Installing Control Room using Express mode* on **page 884**

Log in to the servers as an Administrator and install Automation Anywhere Control Room in Express Mode using the default settings.

*Installing Control Room using Custom mode* on **page 863**

Log in to the server as an administrator and install Automation Anywhere Control Room in Custom mode to select installation and configuration options, including installing non-default requirements. Select this mode for a data center deployment.

To view this installation task in an interactive visual format, see [Install Control Room On-Premises \(custom mode\)](#).

*Installing Control Room on Microsoft Windows Server using scripts* on **page 921**

Silent Control Room installation, also known as unattended installation, uses a customized script for a full setup or the command line for a hot fix patch. Silent install runs the entire installation process in the background

**Step 3: Post-installation**

*Configuring post-installation settings* on **page 927**

without requiring user interaction or displaying messages.

The options for launching the Control Room for the first time and the authentication method depend on the installation mode and deployment type.

*Verifying Automation Anywhere services* on **page 929**

Automation Anywhere specific services are installed on the Control Room server.

**Step 4: Validation**

*Configure Control Room authentication options* on **page 938**

The options for launching the Control Room for the first time and the authentication method depend on the installation mode and deployment type.

**Step 5: License installation**

*Managing Cloud and file licenses* on **page 969**

Follow the instructions to install a valid license key or license file on your On-Premises Control Room.

- For the license key, install a license GUID from the Licenses and Cloud Services portal on your On-Premises Control Room.
- For file-based licensing, generate a license file from the Licenses and Cloud Services portal and install it on your On-Premises Control Room.

## Automation 360 On-Premises prerequisites

Determine whether the system has the required hardware and software to install Control Room for Automation 360 On-Premises.

### Hardware requirements

#### *Control Room server requirements* on page 808

The Control Room is deployed on servers in data centers. The minimum Automation Anywhere hardware requirements include: server type, machine type, processor, RAM, disk storage, and network requirements.

#### *Operating system, environment, and platform supported for Control Room* on page 814

Automation 360 can be hosted on AWS, Microsoft Azure, Google Cloud Platform, IBM, and any public, private, or hybrid cloud service that meets the Control Room and Bot Agent hardware and software requirements.

#### *Bot Agent compatibility* on page 984

Bot Agent is the Automation 360 plug-in that enables you to create and run bots. The agent is installed on devices used to access the Control Room. Installing the Bot Agent is part of registering a device.

#### *Credential requirements* on page 817

Login credentials are required at different stages of Automation Anywhere deployment and use. Credentials are required for installation and data center servers, access to Automation Anywhere components, and to run tools in bots.

#### *Supported cloud platforms* on page 817

Review the supported cloud platforms for various Automation 360 features.

### Data center requirements

#### *Database requirements* on page 809

*Working with SQL Servers* on page 813 Configure Microsoft SQL Servers before setting up the Control Room database.

*Working with Azure SQL PaaS* on page 814 Using PaaS SQL database with Azure requires configuration from the Azure instance.

#### *Load balancer requirements* on page 821

View the load balancer requirements for Automation Anywhere installation. This includes load balancer minimum requirements, and both TCP and HTTPS layer load balancing requirements.

#### *Ports, protocols, and firewall requirements* on page 823

View the default and configurable firewall, port, and protocol requirements for Automation Anywhere deployment.

[Browser requirements for RPA Workspace](#) **on page 829**

The user interface for Automation 360 (On-Premises or Cloud deployed) and for Community Edition is accessible through a browser.

[HA and DR deployment models](#) **on page 847**

[High availability deployment](#) **on page 852**

The high availability (HA) deployment model provides failure tolerance for the Control Room servers, services, and databases using a distributed load balancer.

[Disaster recovery deployment](#) **on page 853**

The disaster recovery (DR) deployment model uses high availability (HA) clusters distributed across separate geographic areas.

[Single-node deployment](#) **on page 848**

A single-node deployment hosts the Control Room only on one server or machine.

## Trusted URLs

To ensure secure access to Automation 360 online services for On-Premises deployments, add the service-specific URL to the safe recipients or trusted list.

[Add Automation 360 On-Premises URLs to trusted list](#) on page 933.

## Additional requirements

[Configure application Transport Layer Security](#) **on page 868**

Use the **Transport Layer Security (TLS) configuration** wizard page from the Automation 360 installer to generate a self-signed certificate or import a security certificate to set up a highly secure Control Room instance.

[Naming guidelines for Control Room URLs](#) **on page 936**

When configuring your domain and subdomain Control Room URLs, you must follow the Domain Name System (DNS) guidelines.

See also this article on the Automation Anywhere support site: [Automation 360 On-Premises prerequisites \(A-People login required\)](#).

### Related concepts

[Installing Control Room on Microsoft Azure](#) on page 893

Installing Control Room on Microsoft Azure begins in the Azure environment and ends with configurations in the Control Room.

[Installing Control Room on Amazon Web Services](#) on page 887

Log in to an Amazon Web Services (AWS) server instance as Administrator. Then, download and start the Control Room installer and select **Custom** mode.

[Installing Control Room using Custom mode](#) on page 863

Log in to the server as an administrator and install Automation Anywhere Control Room in Custom mode to select installation and configuration options, including installing non-default requirements. Select this mode for a data center deployment.

### Related tasks

[Installing Control Room using Express mode](#) on page 884

[Installing Control Room on Microsoft Windows Server using scripts](#) on page 921

Silent Control Room installation, also known as unattended installation, uses a customized script for a full setup or an update setup. Silent installation runs the entire installation process in the background, without requiring user interaction or displaying messages.

## Capacity and performance planning

To plan your deployment capacity and performance for Control Room On-Premises, understand the requirements, limits, and defaults that determine the number of simultaneous bots, user sessions, and processing rates.

The following topics provide information to help you calculate a deployment scenario that meets your requirements.

[Concurrent bot deployments and executions](#) on page **806**

To plan your deployment capacity and performance for Control Room On-Premises, understand the requirements, limits, and defaults that determine the number of simultaneous bots, user sessions, and processing rates.

## Concurrent bot deployments and executions

Review the information on the maximum number of concurrent bot deployments and executions for On-Premises deployment.

### Overview

---

**Note:** For information about attended automations, see [Attended automations](#) on page 808 at the end of this page. The rest of the information on this page is applicable only to unattended automations.

---

The entity count in the following list provides information only about the maximum number of entities that the Control Room can support irrespective of the machine resources. Deploying additional machine resources does not increase the entity count.

Control Room supports either of the following, for maximum number of concurrent bot deployments and executions:

- 1000 concurrent bot deployments and executions on Bot Runner sessions (typically in a production Control Room)
- 700 concurrent bot deployments and executions on Bot Creator sessions (typically in a development Control Room)

Entity Type	Count
Users	10,000*
Roles	5000*

Entity Type	Count
Schedules	1500
Audit entries	10,000,000*
Lockers	100
Credentials	5000
Repository files (Including all file types in the Control Room <b>Public</b> workspace)	25,000*
<hr/> <b>Note:</b> Repository files include dependent files that you check in to the <b>Public</b> workspace (visible on the UI) and related files from the database (not visible on the UI). For example, .png files generated after an automation is recorded are stored in the database and are included in the repository files.	
Repository folders	9000*
Queues	10
Device pools	10
Work Items	1,000,000

\* Applicable from Automation 360 v.21 and later.

## Concurrent deployment and executions

Control Room supports up to 1000 concurrent bot deployments and executions across the Control Room cluster. These 1000 bots can be a combination of the same or different bots.

**Note:** If you use different bots, because of the load, the compiler slows down the execution for the first-time deployment. For subsequent deployments, bot execution process might accelerate.

Control Room edition and configuration	Number of Run as users
One instance of On-Premises	Maximum 1000
Three instances of On-Premises with High Availability (HA) configuration	Maximum 1000

The bot deployment depends on the network quality and the size of data that needs to be transferred from Control Room to Bot Agent.

Therefore, in the above scenario when the network connectivity speed is increased for the three Control Room instances, the network throughput improves, so the completion time will become shorter but the maximum accepted concurrent bot deployments will remain the same.

## Bot concurrent schedules

Scheduling considerations when running bots repeatedly.

When configuring bots to run repeatedly on a schedule it is important to make sure that the time between runs does not drop below the total time for deployment and execution of the bot. Otherwise, sequential executions of the bot might overlap leading to unexpected behavior.

For example if it takes two (2) minutes to run a bot, do not schedule the bot to run every one (1) minute. The previous run cannot complete before the next run begins.

With the reference specification, it is possible to successfully configure concurrent schedules.

Activity	Schedule data
Concurrent schedules	100
<b>Run as</b> user per schedule	10
Total concurrent bots	1000

## Attended automations

Attended use-cases typically have bots that run for shorter periods of time (less than 10 minutes), are run frequently, and only run on one device at a time. Execution is also typically started from the Desktop Assistant.

These high frequency deployments require more resources on the Control Room and the database server.

- **Control Room resources required:**

Environment	Maximum concurrent users
Single-node environment 16 CPUs 32-GB RAM	100
Cluster 3 nodes 16 CPUs 32-GB RAM	750
Cluster 5 nodes 16 CPUs 32-GB RAM	1500

- **Database server resources required:** Minimum 8 CPUs and 16-GB RAM with an SSD hard drive, for example, AWS instance type m5d.24xlarge.

## Control Room server requirements

The Control Room is deployed on servers in data centers. The minimum Automation Anywhere hardware requirements include server type, machine type, processor, RAM, disk storage, and network requirements.

**Note:** Automation Anywhere does not provide any monitoring functions for repository, such disk space usage, memory, or other alert mechanisms related to repository. There are commercial tools available from other third-party independent software vendors (ISV) who provide such tools.

The installation wizard requires the following:

- **IP addresses:** Identify all the nodes (servers) IP addresses in the data center cluster before installation. You provide these IP addresses during Control Room installation.

- **Access hardware:** To enable viewing the Automation Anywhere interface, provide:
  - keyboard
  - mouse or other pointing device
  - monitor with 1366 x 768 or higher resolution

---

**Note:** For IQ Bot server requirements, see [IQ Bot hardware and software requirements](#) .

---

Control Room must be installed on a 64-bit, server-level machine, and there can only be one instance of it on the machine. All previous Control Room versions must first be removed from the server machine before you begin the installation.

The following are server requirements for Windows and Linux.

Component server	Processor	RAM	Storage (free disk space)	Network
Control Room Servers	8 core Intel Xeon Processor or equivalent 64-bit Processor with 2.5 GHz plus speed	16 GB	500 GB	1 GbE <ul style="list-style-type: none"> <li>• IPv4</li> <li>• IPv6</li> </ul>

**Memory utilization:** A Control Room configured with the recommended 16 GB RAM utilizes 80 to 90 percent memory in idle condition and up to 95 percent memory under load, for example, concurrent bot deployments.

---

**Tip:** We recommend that you configure the Control Room network bandwidth to be above 1 GbE for all inter-cluster communication between or among the following:

- Control Room and database
  - All Control Room nodes
  - Control Room and Elasticsearch nodes
  - Control Room and storage systems
  - Database nodes for high availability (HA) and disaster recovery (DR) configuration
- 

## Database requirements

View the list of supported databases, database server type, version, hardware, and operating system requirements, and database backup and recovery requirements.

Automation Anywhere installation creates a database to store bot data and metadata for the analytics dashboards.

---

**Note:** Automation Anywhere does not provide any monitoring functions for database activities, such as disk space usage, memory, or other alert mechanisms related to databases. There are commercial tools available from database vendors and other third-party independent software vendors (ISV) who provide such tools.

---

For latest updates, see [Microsoft SQL Server Hardware and Software requirements](#).

## Database server hardware requirements

Component server	Processor	RAM	Storage	Network
Database server	4-core Intel Xeon Processor with 2.5 GHz plus speed	8 GB	500 GB	1 GbE

---

**Note:** If you are hosting the Control Room databases along with other application databases, ensure that the hardware resources are increased proportionately.

---

## Database server version and operating system requirements

Database type	Database version	Database edition	Installed OS	Supported platforms	Configuration requirement
Microsoft SQL Server database	2019 2017 2016 2014	Enterprise Express Standard Developer (for 2019)	Windows Server 2008 R2 Standard or later Linux CentOS 7.7 and 7.9 Red Hat Enterprise Linux 7.7 and 7.9	Amazon Web Services Relational Database Service (RDS)	Installed and configured.  Only option for Express installations.  Enable protocols for Named Pipes and TCP/IP.
Oracle Server database	Oracle 19c	<ul style="list-style-type: none"> <li>Standard</li> <li>Enterprise</li> </ul>	Windows Server 2012 R2 or later Linux CentOS 7.7 and 7.9 Red Hat Enterprise Linux 7.7 and 7.9	Amazon Web Services Relational Database Service (RDS)	Installed and configured with <code>max_string_size</code> parameter set to EXTENDED. Supported only on non-container Database. Available only through an On-Premises custom installation.

- All database versions support all certified operating systems.

- We have certified Amazon RDS for SQL Server and Azure SQL single database for PaaS deployment.

Note that for Azure SQL, CPU or memory requirements are not applicable because it is a scalable and high performance Cloud database built on similar lines with SQL Server and certified for PaaS deployment in Automation 360.

- We recommend hosting the databases on separate hosts to take into account failover scenarios.
- We recommend Enterprise or Standard editions of Microsoft SQL Server database for production use and to ensure business continuity with HA and DR deployments.

You can configure the Express edition of Microsoft SQL Server for Automation 360 testing and proof of concept (POC) purposes based on considerations such as limit on data size, SQL agent unavailability, and DR capabilities.

For more information about scale limits, see [Microsoft SQL Server Express edition scale limits](#).

- Transparent Data Encryption (TDE) is a function of Microsoft SQL Server database. Additional configurations are not required on the Control Room as the TDE supportability is managed by Microsoft. For more information, see [Transparent data encryption \(TDE\)](#) and [Transparent data encryption for SQL Database](#).

## Required database information for Automation Anywhere installation

When you install Automation Anywhere, you are prompted to provide information specific to the database type you are using. The following table summarizes the required information.

Microsoft SQL Server database	
Required information	Description
Database (SQL Server) authentication	Provide credentials for a Microsoft SQL Server user who has permission to connect to the database.
<b>Note:</b> Linux installations use this authentication method	Use only supported characters for the authentication user name and password. See <a href="#">Supported special characters</a> on page 836. Do not use semicolons ( ; ) in the database password.
	<b>Linux example:</b> SQL Database server Login ID: sa SQL Database password: Automation123 sa user authentication is mandatory.
Database names	Database names cannot be blank, have spaces, or include a percent ( % ). Restrict the names to alphanumeric, period ( . ), hyphen ( - ), and underscore ( _ ). Default name: Automation360-Database
Database port	Default: 1433 Connection to this port is mandatory.

Microsoft SQL Server database	
Required information	Description
Secure connection (optional) and certificate	Provide a CA certificate. Ensure the certificate host name and database connection are the same.
Service credentials	Provide the user with <code>db_datareader</code> , <code>db_datawriter</code> , and <code>db_ddladmin</code> permissions to create databases during installation.  The preferred method is to use the Domain user account.
Windows authentication	The Windows credentials of the user logged in to the device to connect to the database server.
Database collation	Use the default database collation: <code>SQL_Latin1_General_CP1_CI_AS</code>

For Oracle Server database information, see [Installing Control Room using custom mode for Oracle installation](#) on page 862.

Before installing Automation 360, ensure that you have configured additional firewall settings, verified the connection to the default port and an SQL query with SA user works as expected.

#### Related concepts

[Installing Control Room on Amazon Web Services](#) on page 887

Log in to an Amazon Web Services (AWS) server instance as Administrator. Then, download and start the Control Room installer and select **Custom** mode.

[Installing Control Room on Microsoft Azure](#) on page 893

Installing Control Room on Microsoft Azure begins in the Azure environment and ends with configurations in the Control Room.

#### Related tasks

[Installing Control Room on Linux](#) on page 909

You start installing the Automation Anywhere Control Room in the Linux environment and complete the installation in the Control Room.

[Configure default database port](#) on page 875

Configure and enable the TCP/IP in the SQL database server to use the default port 1433 when you install the Control Room.

#### Related reference

[Ports, protocols, and firewall requirements](#) on page 823

View the default and configurable firewall, port, and protocol requirements for Automation Anywhere deployment. View the default ports and protocols that are required to be allowed on customer's firewall for Automation Anywhere deployment. The default ports that are used for HTTP/HTTPS are configurable.

## Working with SQL Servers

Configure Microsoft SQL Servers before setting up the Control Room database.

### Configuring SQL Server Settings

*SQL Server* settings can be configured in the SQL Server Configuration Manager.

1. Enable protocols for Named Pipes and TCP/IP in **SQL Server Network Configuration > Protocols for MSSQLSERVER**.
2. Double-click TCP/IP to open the properties window.
3. Input the default or custom port number for `IPAll` in the IP Addresses tab of the TCP/IP Properties window.  
The default port number is 1433.
4. Click **OK**.
5. Restart the `MSSQLSERVICE` for the updates to take effect.

---

**Note:** Ensure the Control Room database uses `SQL_Latin1_General_CP1_CI_AS` as the default database collation.

---

## Database and Services Matrix

See [Database requirements](#) on page 809 for a list of supported Microsoft SQL Server versions.

Service Credentials	Windows Authentication	SQL Authentication
Local System Account	<ul style="list-style-type: none"> <li>• Current logged in user account is used to create:               <ul style="list-style-type: none"> <li>• <i>Database</i></li> <li>• Tables</li> </ul> </li> <li>• Installer gives <code>db_owner</code> permission to NT AUTHORITY\SYSTEM account.</li> </ul>	SQL User account is used to create: <ul style="list-style-type: none"> <li>• Databases</li> <li>• Tables</li> </ul>
Domain User Account	<ul style="list-style-type: none"> <li>• Current logged in user account is used to create database.</li> <li>• Domain user account is used to create tables.</li> <li>• Installer gives <code>db_owner</code> permission to domain user account.</li> </ul>	SQL User account is used to create: <ul style="list-style-type: none"> <li>• Databases</li> <li>• Tables</li> </ul>

Service Credentials	Windows Authentication	SQL Authentication
Service User Account		For Microsoft Azure installations, the service account user needs to have read/write access to the remote Microsoft Azure repository share path.

### Related reference

[Ports, protocols, and firewall requirements](#) on page 823

View the default and configurable firewall, port, and protocol requirements for Automation Anywhere deployment. View the default ports and protocols that are required to be allowed on customer's firewall for Automation Anywhere deployment. The default ports that are used for HTTP/HTTPS are configurable.

## Working with Azure SQL PaaS

Using PaaS SQL database with Azure requires configuration from the Azure instance.

Configure the Azure instance before you install Automation 360.

1. Log in to your Azure account.
2. Navigate to the **Azure SQL** option.
3. Create a database based on your custom requirements.
4. Enable the firewall option.
5. Add the IP address to safe recipients list for accessing the database.

Install Automation 360 and point the database server to this instance of the SQL database. See [Customize Control Room installation on Microsoft Azure](#) on page 897.

## Operating system, environment, and platform supported for Control Room

Automation 360 can be hosted on AWS, Microsoft Azure, Google Cloud Platform, IBM, and any public, private, or hybrid cloud service that meets the Control Room and Bot Agent hardware and software requirements.

Automation 360 is currently certified on AWS, Google Cloud Platform, and Microsoft Azure. For Bot Agent operating system and platform compatibility, see the Bot Agent compatibility matrices in [Bot Agent compatibility](#) on page 984.

Automation 360 supports the 64-bit version of the Microsoft operating system.

---

**Recommendation:** Enable Desktop Experience when using the server or client operating system.

---

**Note:** When you install the Control Room on Microsoft Windows Server 2012 and 2012 R2 Datacenter, a warning message indicating installation prerequisites is displayed. However, you can still proceed with the installation without any issues.

---

**Note:** Before you install the Control Room for On-Premises, ensure that you have installed the Visual C++ + Redistributable for Visual Studio 2015 package on the Control Room host machine. For more information about the package, see [Visual C++ Redistributable for Visual Studio 2015](#).

---

The following sections list the environment and deployment types with the release or build number applicable to each supported operating system:

## Microsoft Windows Server 2012 and 2012 R2 Datacenter

Environment	Automation 360 build (version)
<ul style="list-style-type: none"> <li>Amazon Web Services Elastic Compute Cloud (EC2)</li> </ul>	<ul style="list-style-type: none"> <li>On-Premises: Build 4105 (A2019.12) or later</li> <li>Cloud: Build 4111 (A2019.12) or later</li> </ul>
<ul style="list-style-type: none"> <li>Microsoft Azure VM</li> </ul>	<ul style="list-style-type: none"> <li>On-Premises: Build 4105 (A2019.12) or later</li> <li>Cloud: Build 4111 (A2019.12) or later</li> </ul>
<ul style="list-style-type: none"> <li>Google Compute Engine</li> </ul>	<ul style="list-style-type: none"> <li>On-Premises: Build 7103 (A2019.17) or later</li> </ul>

## Microsoft Windows Server 2016 Standard and Datacenter

Microsoft Windows Server 2016 is the minimum recommended operating system.

Environment	Deployment type with release and build
<ul style="list-style-type: none"> <li>Microsoft Azure VM</li> </ul>	<ul style="list-style-type: none"> <li>On-Premises: Build 2079 or later</li> <li>Cloud: Build 2079 or later</li> </ul>
<ul style="list-style-type: none"> <li>Google Compute Engine</li> </ul>	<ul style="list-style-type: none"> <li>On-Premises: Build 7103 (A2019.17) or later</li> </ul>
<ul style="list-style-type: none"> <li>VMware VMs on ESXi 6.x</li> </ul>	<ul style="list-style-type: none"> <li>On-Premises: Build 7103 (A2019.17) or later</li> <li>Cloud: Build 2079 or later</li> </ul>

## Microsoft Windows Server 2019 Standard and Datacenter

Environment	Deployment type with release and build
<ul style="list-style-type: none"> <li>Amazon Web Services Elastic Compute Cloud (EC2)</li> </ul>	<ul style="list-style-type: none"> <li>On-Premises: Build 1089 or later</li> <li>Cloud: Build 1082 or later</li> </ul>
<ul style="list-style-type: none"> <li>Google Compute Engine</li> </ul>	<ul style="list-style-type: none"> <li>On-Premises: Build 7103 (A2019.17) or later</li> </ul>
<ul style="list-style-type: none"> <li>Microsoft Azure VM</li> </ul>	<ul style="list-style-type: none"> <li>On-Premises: Build 2079 or later</li> <li>Cloud: Build 2079 or later</li> </ul>

## Microsoft Windows 10

Environment	Deployment type with release and build
<ul style="list-style-type: none"> <li>VMware VMs on ESXi 6.x</li> </ul>	<ul style="list-style-type: none"> <li>On-Premises: Build 7103 (A2019.17) or later</li> <li>Cloud: Build 2079 or later</li> </ul>

## Linux CentOS

Environment	Deployment type with release and build
<ul style="list-style-type: none"> <li>Amazon Web Services Elastic Compute Cloud (EC2)</li> </ul>	<p>For Linux CentOS 7.7:</p> <ul style="list-style-type: none"> <li>On-Premises: From Build 2545 or later</li> <li>Cloud: From Build 2545 or later</li> </ul> <p>For Linux CentOS 7.9 and 8.3:</p> <ul style="list-style-type: none"> <li>On-Premises: From Build 9664 or later</li> <li>Cloud: From Build 9664 or later</li> </ul>

## Red Hat Enterprise Linux

Environment	Deployment type with release and build
<ul style="list-style-type: none"> <li>Amazon Web Services Elastic Compute Cloud (EC2)</li> </ul>	<p>For Red Hat Enterprise Linux 7.7:</p> <ul style="list-style-type: none"> <li>On-Premises: From Build 2545 or later</li> <li>Cloud: From Build 2545 or later</li> </ul> <p>For Red Hat Enterprise Linux 7.9:</p> <ul style="list-style-type: none"> <li>On-Premises: From Build 9664 or later</li> <li>Cloud: From Build 9664 or later</li> </ul>

## Amazon Linux 2

Environment	Deployment type with release and build
<ul style="list-style-type: none"> <li>Amazon Web Services Elastic Compute Cloud (EC2)</li> </ul>	Amazon Linux 2

### Related reference

[Bot Agent compatibility](#) on page 984

Before you install the Bot Agent, ensure that it is compatible with the hardware and software in your environment.

[Control Room server requirements](#) on page 808

The Control Room is deployed on servers in data centers. The minimum Automation Anywhere hardware requirements include server type, machine type, processor, RAM, disk storage, and network requirements.

## Supported cloud platforms

Review the supported cloud platforms for various Automation 360 features.

Automation 360 feature	Google Cloud Platform	AWS	Microsoft Azure
Control Room	Yes	Yes	Yes
Bot Agent	Yes	Yes	Yes
Bot Insight	Yes	Yes	Yes
IQ Bot	Yes	Yes	Yes
Discovery Bot	Yes	Yes	Yes
AISense Recorder	Yes	Yes	Yes

## Credential requirements

Login credentials are required at different stages of Automation 360 deployment and use. Credentials are required for installation and data center servers, access to Automation 360 components, and to run tools in bots.

Access point	Task	Type
Data center servers	Install Control Room.	User on the hosting server: <ul style="list-style-type: none"> <li>Windows - <code>system administrator</code></li> <li>Linux - <code>superuser sudo, root</code></li> </ul>
Data center servers	Manage (run, stop, restart) Control Room.	Administrator and <b>Logon as Service</b> permission for Windows services and the Domain or the VM technical user account.
Bot Agent devices	Install, setup, or update Bot Agent.	Administrator permission on the device.

Access point	Task	Type
Bot Agent devices	Start or stop Bot Agent service.	Administrator permission on the device. Write permission on Bot Agent device system paths: C:\ProgramData C:\Windows \System32\config \systemprofile C:\Users\ <loggedinuser&gt; </loggedinuser&gt;  \AppData\Local \AutomationAnywhere
Local devices	Register device.	Windows login to open a browser and login into the Control Room and register the local device. Administrator permission not required.
Local devices	Download bots to local device. Run new bots or existing (downloaded) bots.	Windows login. Administrator permission not required.
Automation 360 login	Perform specific tasks, such as create a bot or run a bot.	License and role based permissions. Bot Creator and Bot Runner users <b>do not</b> require administrator privileges.
Bot task	Used by bots to perform bot tasks.	Credential Vault stores securely created credentials. Read permission on bot machine system path: C:\Windows \System32\config \systemprofile \AppData\Local \AutomationAnywhere
Automation Anywhere Service	Run all Windows services created by Automation 360.	Local system account user or Domain user account The Interactive logon rights should be enabled for the service account.

Access point	Task	Type
Remote Desktop Protocol (RDP) to a Windows machine	Run bots on Bot Creators and unattended Bot Runners if RDP connection exists for the deployed user.	Administrator permission is not required. RDP access for the bot is not required. View the Control Room <b>Activity</b> page.
Remote Desktop Protocol (RDP) to a server OS or a hosted VM	Run bots on Bot Creators and unattended Bot Runners if RDP connection exists for the deployed user.	Administrator permission required. RDP access for the bot is required. For confirmation, view the Control Room <b>Activity</b> page.

### Data center server credentials

Data center server credentials for Automation Anywhere hosting servers and integrated product servers are required to deploy Automation 360.

To install and deploy Automation 360 requires that users log in to the hosting servers. These users must have permissions to install and run Automation 360 components on the servers. Permissions levels need to be assigned to the user on selected data center applications and servers.

### Automation 360 login

Log in to Automation 360 requires a username and password. These credentials are linked to the machine you use to access the Automation 360 components. Your credentials are assigned roles that give you permission to perform specific tasks, such as create a bot or run a bot.

### Bot task

As an automation expert, Credential Vault provisions you to securely create and store your credentials. This ensures that your credentials can be used in bots without compromising security with safe deployment of tasks. Any authorized user can create credentials.

### Windows services

The Windows service credentials include a user name and password. The user specified needs to be:

- A member of the local system administrator group.
- Have permission to manage services, including Automation Anywhere services.
- If you use Windows authentication to connect to the SQL database, ensure you grant the `db_owner` permission to the service credential user.

The service credentials are used to create database tables and allow the Control Room processes to access the database and repository.

The service credential choices are:

User role	Bot program folder	Bot data folder	Log folders or files	User type
Install user	<ul style="list-style-type: none"> <li>• Read</li> <li>• Write</li> <li>• Delete</li> </ul>	<ul style="list-style-type: none"> <li>• Read</li> <li>• Write</li> <li>• Delete</li> </ul>	<ul style="list-style-type: none"> <li>• Read</li> <li>• Write</li> <li>• Delete</li> </ul>	<ul style="list-style-type: none"> <li>• Admin</li> <li>• Non-Admin</li> </ul>
Service run user				<ul style="list-style-type: none"> <li>• Local system account</li> <li>• Domain user account</li> </ul>
Bot deployment user				<ul style="list-style-type: none"> <li>• Local system account</li> <li>• Domain user account</li> </ul>

The following are the different user types:

**Admin** A user who has administrator privileges.

**Non-Admin** A user who does not have administrator privileges.

**Local system account** The logged-on user performing the installation (default).

**Domain user account** A user that is not the local system account user.

Reasons and requirements for using a domain account user include:

- **Use the Windows domain credentials**

Enter credentials valid for running

Automation  
Anywhere services.

- **PowerShell script restrictions**

Specify a user with permissions to launch PowerShell scripts, who is not a Windows domain user, or database table creation can fail.

*Install Bot Agent and register device* on page 998

## Load balancer requirements

View the load balancer requirements for Automation 360 installation. This includes load balancer minimum requirements, and both TCP and HTTPS layer load balancing requirements.

### Load balancer minimum requirements

As a best practice, ensure the load balancer:

- (Required) Adheres to the Domain Name System (DNS) guidelines when configuring the domain and subdomain URLs in load balancer.

*Naming guidelines for Control Room URLs* on page 936

- (Required) Supports WebSocket protocol (RFC 6455)
- (Preferred) Uses round-robin host selection and is not configured to use persistent (sticky) sessions.
- (Preferred) Uses the appropriate TLS security layer:

- TCP (layer 4) load balancing
- HTTPS (layer 7) load balancing

With a Nginx load balancer, set HTTPS termination at nodes by changing `http://Backend` to `https://Backend`.

- (Preferred) Has idle timeout set to 120 seconds.

The timeout value depends on the process time of various actions in the Control Room such as the time required to check in and check out bots, import bots, and download bot dependencies.

If the idle timeout is less than the Control Room processing time, a browser request can time out. For example, if the configured idle timeout is not sufficient to complete a bot check-in action, you will have to refresh your browser to validate whether the bot check-in action is successful or not.

### Load balancer health check parameters

The load balancer health check parameters depend on various factors such as the type of load balancer used, network latency, and user interface responsiveness within and outside the load balancer.

## TCP (Layer 4) Load Balancing

When TCP is applied at layer 4 with the load balancer, the certificate is installed on every Control Room corresponding to the load balancer URL.

In the image, Control Room components are shown in orange and other components are shown in blue.

### Pros

End-to-end encryption without the possibility of intercept at the load balancer.

Single certificate required.

### Cons

If audit logging is required, the load balancer cannot report the requests from clients.

Does not use TLS hardware offloading, even if the load balancer supports it.

## HTTPS (Layer 7) Load balancing

When HTTPS is applied at layer 7 with the load balancer, the certificate corresponding to the load balancer URL is applied through the load balancer. The Control Room trusts the certificates received from the load balancer.

### Pros

Allows request logging, when supported by the load balancer.

Reduces load from TLS handshake through hardware offloading, when supported by the load balancer.

### Cons

Certificates must be managed both on the load balancer and on the control room nodes

Possible interception of data at the load balancer hardware level, because TLS session is not end-to-end.

For Automation 360 users on release Build 7560 and later, if SSL offloading is applied at load balancer level for communication between load balancer and application nodes, the `traefik.toml` file in application server needs to be re-configured.

See [SSL offloading for Automation 360 v.18 and later \(A-people login required\) | A360 | Device shows disconnected after registration with Load Balancer URL \(A-People login required\)](#)

## Ports, protocols, and firewall requirements

View the default and configurable firewall, port, and protocol requirements for Automation Anywhere deployment. View the default ports and protocols that are required to be allowed on customer's firewall for Automation Anywhere deployment. The default ports that are used for HTTP/HTTPS are configurable.

- Add Automation Anywhere to the Windows Firewall exception list. Follow the steps as directed by Microsoft for your Windows version.
- Allow communication from Automation Anywhere by adding it to the allowed list in firewall. Follow the steps in the firewall documentation of the operating system.
- Configure the firewall rules and add the Control Room URLs to safe recipients list.
- Configure the firewall rules to allow communication on the server or the firewall appliances that are configured in between, or add the Control Room URLs to the safe recipients list in firewall or end device browsers.

Refer to the following tables for lists of required ports and their use.

## Control Room

**Important:** It is critical that communication between the Control Room servers is properly protected. The communication between Control Room servers contain security sensitive information. Therefore, in addition to allowing all the required communication directly between the Control Room cluster servers, you should block all the inbound traffic from hosts except for HTTP/HTTPS ports to communicate with the Control Room servers.

Protocol	Port	Usage	Clients
HTTP	80	HTTP	Web browsers
HTTPS	443	HTTPS and Web Socket	Web browsers
TCP/UDP	1234	ActiveMQ	Automation 360 Services
TCP	5672	Cluster Messaging	Automation 360 Services
TCP	47100 - 47200	Cluster Messaging and Caching	Automation 360 Services
TCP	47500 - 47598	Cluster Messaging and Caching	Automation 360 Services
HTTP	47599	Elasticsearch	Automation 360 Services
TCP	47600	Elasticsearch	Automation 360 Services

Protocol	Port	Usage	Clients
HTTP	4567	Control Room	Automation 360 Services
HTTP	4569 - 4571	Automation Anywhere Robotic Interface	Automation 360 Services
TCP	5800 - 5900	Automation Anywhere Robotic Interface	Automation 360 Services

## Internal ports for localhost services

Note that the following internal ports are used for Automation 360 localhost services:

Port	Protocol
4567 - 4571	HTTPS REST
5678 - 5707	gRPC

## Data center ports and protocols for Automation 360

Configure each of the data center components that are required for Control Room integration. In the image below, Control Room components are shown in orange and data center components provided by your organization are shown in blue.

---

**Note:** The arrows in the image indicates the combination of communicating hosts and does not indicate the direction of the establishing the connection.

---

Default ports are listed for illustration purposes. Some ports can have alternative port numbers specified during Control Room installation. Some port numbers can be modified after Control Room installation. Active Directory ports are listed as an example of an enterprise identity management.

After the HTTP/HTTPS connection is established between the Control Room and Bot Agent, the communication will be bidirectional (inbound and outbound) using the WebSocket .

All three objects, the web browser, Bot Agent, and external applications communicate directly with the Control Room. A user logs into the Control Room through a browser, to do tasks, such as creating users,

or bot related tasks, such as creating, deploying, and scheduling bots. Bot Agent establishes a connection with the Control Room on registration and keeps it alive in order to receive bot deployments from the Control Room. External applications talk to the Control Room directly through the Control Room APIs to perform tasks such as creating users or running bots.

Connection from	Connection to	Protocol	Port	Usage
Bot Agent	Load balancer or firewall, or both	HTTP and WebSocket	80 (TCP) Default	HTTP and WebSocket
Bot Agent	Load balancer or firewall, or both	HTTP and WebSocket	443 (TCP)	HTTP and WebSocket
Web Browser	Load balancer or firewall, or both	HTTP and WebSocket	80 (TCP)	HTTP and WebSocket
Web Browser	Load balancer or firewall, or both	HTTP and WebSocket	443 (TCP)	HTTP and WebSocket
Control Room services	Enterprise identity management (for example, Active Directory)	LDAP	389 (TCP)	User authentication
		LDAP SSL	636 (TCP)	User authentication
		LDAP global controller	3268 (TCP)	User authentication
		LDAP global controller SSL	3269 (TCP)	User authentication
		Kerberos	88 (TCP and UDP)	User authentication
Control Room services	File share with Microsoft Server Message Block (SMB)	SMB 2.0 or SMB 3.0	445 (TCP)	Repository file share access
Control Room services	Microsoft SQL database server	SQL	1433 (TCP) Configurable	Database access

## Microsoft Azure supported data center elements

Data center object	Supported version	Configuration
Control Room operating system	<ul style="list-style-type: none"> <li>Microsoft Windows Server 2012 and 2012 R2 Datacenter</li> <li>Microsoft Windows Server 2016 Standard and Datacenter</li> <li>Microsoft Windows Server 2019 Standard and Datacenter</li> </ul>	IaaS

Data center object	Supported version	Configuration
Identity management: Azure <i>Active Directory</i>	Azure Active Directory	<ul style="list-style-type: none"> <li>IDaaS</li> <li>Windows 2016 for IaaS</li> </ul>
<i>SMB File Share</i>	Azure File Share with Server Message Block 2.0 and 3.0 (SMB) protocol	PaaS
<i>Load Balancer</i>	Azure Load Balancer (Not Application Gateway)	PaaS
<i>Microsoft SQL Server</i>	Azure SQL Database with single database (Microsoft SQL Azure (RTM) - 12.0.2000.8)	PaaS

### Microsoft Azure security policy recommended ports

Data center object	Port	Protocol
Control Room	<ul style="list-style-type: none"> <li>80</li> <li>443</li> </ul>	HTTP/HTTPS
LDAP	<ul style="list-style-type: none"> <li>3268</li> <li>3269</li> </ul>	TCP (LDAPS - Secure TCP)
email SMTP	587	SMTP
SSH	22	TCP
RDP	3389	TCP

### Google Cloud Platform security policy recommended ports

Data center object	Port	Protocol
Load balancer	<ul style="list-style-type: none"> <li>80</li> <li>443</li> </ul>	<ul style="list-style-type: none"> <li>HTTP</li> <li>HTTPS</li> </ul>
Firewall	<ul style="list-style-type: none"> <li>80</li> <li>443</li> <li>1433</li> </ul>	<ul style="list-style-type: none"> <li>HTTP</li> <li>HTTPS</li> <li>TCP</li> </ul>
Microsoft SQL Server database	1433	TCP

#### Related tasks

[Prepare for installation on Amazon Web Services](#) on page 888

Use these steps to prepare the Amazon Web Services (AWS) instances for the Control Room installation.

[Verify readiness for installation on Microsoft Azure](#) on page 894

Use these steps to configure third-party products for the Control Room installation.

### Related reference

[Automation 360 On-Premises prerequisites](#) on page 804

Determine whether the system has the required hardware and software to install Control Room for Automation 360 On-Premises.

[Add Automation 360 Cloud URLs to trusted list](#) on page 794

To ensure secure access to Automation 360 cloud services, add the URL specific to the service to the safe recipients or trusted list.

## Control Room repository requirements

The repository location is configured in the Control Room after installation. All your automations are stored in this repository.

Before you configure the Control Room server repository, review the repository requirements for deploying Automation 360 On-Premises.

- For a single node Control Room deployment, the repository can be a local folder.  
For example, `C:\Automation360\Automation Anywhere Server Files`.
- For a multiple-node Control Room deployment, the repository should be accessible from all Control Room nodes in the cluster over the network.

You can create a file share and access the repository from a local machine. For example, `\<fileserver>\<folder>\Automation Anywhere Server Files`.

The Control Room repository contains server files, such as packages and resource files.

---

**Note:** Deploying Distributed File System (DFS) as a Control Room repository is not supported.

---

## Microsoft Windows: Control Room repository requirements

Review the following requirements for configuring the repository location of cluster nodes:

- The Control Room uses its service account to connect to the repository, you must have read/write permission to the repository location.
- The repository path must meet the Universal Naming Convention (UNC) requirements.

For details, see [UNC Path](#).

- The repository size depends on the user data.

For details about storage requirements, see [Control Room server requirements](#) on page 808. For supported file and folder size, see [Concurrent bot deployments and executions](#) on page 806.

For repository migration requirements, contact your Automation Anywhere representative.

- You can configure the repository using Network File System (NFS) protocols, such as Microsoft Windows, Microsoft Azure Files, and Amazon Elastic File System (EFS).
- Network-attached storage (NAS) uses Server Message Block version 3 (SMBv3) for supported platforms: Microsoft Windows, Amazon Web Services, Microsoft Azure, Google Cloud Platform, and Linux.

## Linux: Control Room configuration using the default repository path

- Ensure that the default path exists in the system and use this default path during the Linux installation.

After the installation, you can modify the repository path or copy files from one directory to another. Verify that all copied files and folders have the same permissions as before the installation.

- Ensure that permission for the path is `crkernel:controlroom`.
- If there is no permission, add the following permission.

```
sudo chmod -R 775 /opt/automationanywhere/enterprise/appdata
```

- Run the following command to allow users access to the `crkernel:controlroom` path:

```
sudo chown -R crkernel:controlroom /opt/automationanywhere/enterprise/appdata
```

## Linux: Control Room configuration with a user-defined repository path

- Ensure that the default path exists in the system.
- Ensure that permission for the path is `crkernel:controlroom`.
- If there is no permission, add the following permission.

```
sudo chmod -R 775 /CRRepo/AutomationAnywhere
```

- Run the command to allow users access the `crkernel:controlroom` path:

```
sudo chown -R crkernel:controlroom /CRRepo/AutomationAnywhere
```

The `crkernel:controlroom` user is created after the Control Room installation, so set the user permission to a specified repository before performing the final Control Room configuration.

## Browser requirements for RPA Workspace

Access the RPA Workspace interface from a browser. After you have installed and enabled extensions in the browser, perform several tasks through the RPA Workspace interface based on your user role and automation requirements.

**Important:** As Microsoft Internet Explorer 11 is reaching end-of-life (EOL) in June 2022, Control Room will not be supported on Microsoft Internet Explorer 11 browser from the upcoming Automation 360 v.25 release planned for later this year (June 2022).

The impact on your automation depends on the operating system that is currently used for your bot deployments. See the following table for details.

Microsoft operating system	Automation 360
Windows 10 Semi-Annual Channel	Upgrade bots to use one of the other compatible browsers. <i>Supported browsers</i>
All other supported operating systems <i>Bot Agent compatibility</i> on page 984	No action required.

For more information, see [Microsoft Internet Explorer 11 EOL FAQ](#) on page 79.

## Supported browsers

You can use a browser to perform a range of tasks from automation creation to automation management, such as the following:

- Control Room activities, such as creating users and roles, managing devices, configuring settings, creating and deploying bots, and maintaining audit logs.
- User activities, such as Bot Agent installation and device registration.
- Automation Anywhere Robotic Interface activities, such as creating users and roles and creating a human and bot tasks in the process editor.

### Browser support for Control Room and Bot Agent and Automation Anywhere Robotic Interface

The following table shows supported browsers for Control Room activities, Bot Agent installation, Automation Anywhere Robotic Interface, and device registration:

Activity	Google Chrome (version 57 or later)	Internet Explorer (version 11)	Microsoft Edge (version 93.0.96 or later)	Mozilla Firefox (version 80 or later)	Safari (version 15.3 or later)
Control Room activities	Yes	No	Yes	No	No
Bot Agent installation and device registration <sup>1</sup>	Yes	No	Yes <sup>3</sup>	Yes	No
Automation Anywhere remote agent for Citrix <sup>2</sup>	Yes	Yes	No	No	No
Automation Anywhere Robotic Interface	Yes	No	Yes	No	Yes
Bot Insight	Yes	No	Yes	Yes	No

1. If you have trouble registering your device from a browser, run the Bot Agent diagnostic utility.

For details, see [Perform Bot Agent diagnostic checks](#) on page 1007

2. Automation Anywhere remote agent for Citrix supports Google Chrome (XenApp) automation with Automation Anywhere extension (version 11.2.0.0).

[Chrome web store](#)

3. If you are using Microsoft Edge based on Chromium to register your Bot Agent and your device is unable to connect to the Control Room due to proxy settings, add the authentication details.

### Browser support for recording automation

The following table shows supported browsers for recording automation:

Activity	Google Chrome (version 57 or later)	Internet Explorer (version 11)	Microsoft Edge based on Chromium (version 79 or later)	Mozilla Firefox (version 80 or later)	Microsoft Edge (Chromium) with Internet Explorer compatibility (version 93.0.961.52 or later)
Record automation <sup>1</sup>	Yes <sup>1</sup>	Yes	Yes	Yes	Yes <sup>2</sup>
	<ul style="list-style-type: none"> <li>• Extension must be enabled for recording.</li> <li>• Supported from A2019 v.10.</li> </ul>	<ul style="list-style-type: none"> <li>• No extension required for recording.</li> <li>• Supported from A2019.06.</li> </ul>	<ul style="list-style-type: none"> <li>• Extension must be enabled for recording.</li> <li>• Supported from A2019 v.17.</li> </ul>	<ul style="list-style-type: none"> <li>• Extension must be enabled for recording.</li> <li>• Supported from A2019 v.19.</li> </ul>	<ul style="list-style-type: none"> <li>• Internet Explorer with compatibility mode must be enabled for recording.</li> <li>• Supported from Automation 360 v.23.</li> </ul>

1. Record automation refers to opening a target application for recording in a supported browser, and recording actions or capturing

objects using the Automation Anywhere recorders.

- For details on automation using Universal Recorder and Recorder capture action, see [Universal Recorder for object-based automation on page 1313](#) | [Edit a task recorded with the Universal Recorder on page 1316](#)
- If you have trouble recording automation using Google Chrome, see [Google Chrome extension troubleshooting on page 1323](#)

2. Microsoft Edge (Chromium) with Internet Explorer compatibility mode is supported for capturing objects from web applications based on HTML technology.

## Extensions for automation

When you install the Bot Agent from a browser, extensions for Automation 360 are installed. Extensions are required to record automation using a supported browser.

You can enable extensions on a device from supported browsers. For example, after you install a Bot Agent from a Google Chrome browser, click the enable extension option from the browser task bar. The Google Chrome extension will allow you to record automation using the Google Chrome browser.

When you connect your Bot Agent device to the Control Room, you can enable the following extensions from your browser to record automation:

Extension name	Link to extension
Google Chrome	<a href="#">Automation 360 extension for Chrome</a>
Microsoft Edge based on Chromium	<a href="#">Automation 360 extension for Microsoft Edge</a>
Mozilla Firefox	<a href="#">Automation 360 extension for Mozilla Firefox</a>

For updates to latest extension version, see [Browser extensions for Automation 360 on page 765](#)

### Related tasks

[Perform Bot Agent diagnostic checks on page 1007](#)

Use the Bot Agent diagnostic utility for connectivity-related issues between the Bot Runner device and Control Room. The utility helps to diagnose issues either by providing solutions or suggestions to help resolve the issues.

### Related reference

[Universal Recorder supported applications and browsers on page 1321](#)

Use the Universal Recorder to record interactions with objects from the supported technologies.

[Bot Agent compatibility on page 984](#)

Before you install the Bot Agent, ensure that it is compatible with the hardware and software in your environment.

[Google Chrome extension troubleshooting on page 1323](#)

If you encounter an error when recording or running a bot that automates tasks in a Google Chrome browser and you have installed Google Chrome, you must perform additional steps to configure your system.

[Browser extensions for Automation 360](#) on page 765

Create automation from supported browsers by using browser extensions. Extensions are periodically updated to support feature enhancements and fixes. Therefore, ensure that you have the latest versions of extensions for the Google Chrome, Microsoft Edge, and Mozilla Firefox browsers.

## Internationalization, localization, and language support

Automation 360 provides internationalization and localization support for its user interface (UI), automation, and documentation.

Internationalization means that you can automate using supported languages. Localization means the user interfaces are translated to languages supported by Automation Anywhere. Also, these supported languages have been tested and certified to work in that language.

### **Internationalization**

Perform automation in various languages to work with localized operating systems and keyboards.

### **Encoding format**

UTF-8 is the default encoding format for Automation 360.

### **Product documentation**

View the Automation Anywhere documentation in the supported language at <https://docs.automationanywhere.com/>. To view information in one of the supported languages, select the language from the drop-down menu at the top-right of the website. The default language is English for any topic that is not available in another language.

### **Interface**

View the user interface for Automation 360 components, including Control Room and IQ Bot, in the supported language.

- Automate applications (web and desktop) with the language UI, text, and controls values (for example, push-button with a language name and combo-box items in language text).
- Provide the language name to a bot, workflow, and report in Control Room.
- Provide the language name to bot schedules, automation name and description, role name and description, a user's first and last names, workload pools, and queues.
- Deploy bots with the language name on Bot Runners.
- View the language entities (names, description, and so on) across all the pages in Control Room.

### **Select a language in the user interface**

From the Control Room interface, next to the user ID, click the language icon (globe icon) and select a language from the list.

Parts of the Control Room interfaces that are translated do not include the applications or tools that are used within the bots. For example, Microsoft Excel is not translated through the Control Room.

## Automation 360

**Note:** The language setting of the Control Room does not translate language in Bot Insight, due to the difference in applications. For alternative languages in Bot Insight, users should seek translation from either browser language options or an operating system, configured to their language of choice.

## Components for Control Room and bot actions

Control Room and bots have additional requirements depending upon the Automation 360 deployment model you choose. Some third party applications are installed with Automation 360.

### Control Room supported platforms

View the listed supported platforms and components for Control Room.

Component	Supported Control Room option
Amazon Web Services Elastic Compute Cloud (EC2)	Required to install Control Room platform.
HTML	Required for Microsoft Azure: Use Load Balancer, not Application Gateway.
Java Database Connectivity (JDBC) driver	Required for Oracle Database.
Linux CentOS or Red Hat Enterprise Linux	Python 3.6 required for Build 6463 and later. Install Control Room platform.
Microsoft Active Directory	Required to configure as either IDaaS or IaaS. For IaaS use Windows 2016.
Microsoft Azure	Required to install Control Room platform.

### Third-party components for bot actions

View the listed third party components for the bot actions.

Component	Automation 360 Plug-in	Supported Bot action
ABBYY FineReader Engine version 12.2.27.12		Required for capturing images in the OCR, AISense, and IQ Bot packages.

Component	Automation 360 Plug-in	Supported Bot action
Citrix Receiver Version 4.4 LTSR or later <hr/> <b>Note:</b> You can also use the Citrix Workspace app. All major releases of the Citrix Workspace app version .22 are certified.	Automation 360 Citrix remote agent	Prerequisite for bot actions on the Bot Agent installed on Citrix resident apps.
Citrix Virtual Apps version 6.5 or later	Automation 360 Citrix remote agent	Prerequisite for bot actions on business applications hosted on Citrix server resident apps. Supported with Universal Recorder.
IBM WebSEAL		For reverse proxy for Bot Runner.
Microsoft .NET Framework version 4.6.1 or later		For the Recorder package.

## Supported special characters

Use only supported special characters when creating user names and passwords. Supported characters vary depending upon where they are used.

In all of the below listed cases, the standard alphanumeric characters, **a-z**, **A-Z**, **0-9** are supported. The special characters allowed or specifically excluded from particular use are typical to standard English keyboards. See the table below to verify the special characters that can be used in names or passwords.

<b>TLS certificate</b>	Do not use at sign ( @ ) in passwords
<b>Wildcards</b>	The asterisk ( * ) is supported.
<b>Windows</b>	Do not use the pipe (   ) or semicolon ( ; ) in user names or passwords.
<b>Worksheet</b>	Do not use the asterisk ( * ), question mark ( ? ), or bracket left or right ( [ ] ) in the worksheet name.
<b>Database</b>	Do not use percent ( % ) or space ( ) in the database name. Do not use semicolon ( ; ) in the database username or password.

## Supported characters

Characters supported for authentication are acceptable for both user names and passwords. In the table:

- **Supported** means the character is explicitly supported for that use.
- **Do not use** means the character is explicitly not supported for that use.
- **Double dash (--)** means results with using the character for that use are unknown.

Character	Windows authentication	Control Room authentication	Database name, username, or password	JSON Web Token authentication
ampersand ( & )	Supported	Supported	--	Supported
angle bracket, left or right ( < > )	Supported	--	--	--
apostrophe, straight single ( ' )	Supported	--	--	--
asterisk ( * )	Supported	--	--	--
at sign ( @ )	Supported	Supported	--	Supported
braces left or right ( { } )	Supported	--	--	--
bracket left or right ( [ ] )	Supported	--	--	--

space	Supported	--	Do not use	--
underscore ( _ )	Supported	Supported	Supported	Supported

## Citrix integration on Cloud

Automation 360 integration with Citrix enables you to create bots that run tasks on remote Citrix Virtual Apps servers.

### Process overview

Ensure the following tasks are completed before you begin automating tasks in a Citrix environment:

#### Verify the Citrix component version

Following are the various Citrix components and its related versions that are supported for the Automation 360 integration with Citrix.

Citrix component version	Automation Anywhere Plug-in	Automation 360 client or Bot option
Citrix Receiver Version 4.4 LTSR or later	Automation Anywhere Citrix plug-in	For using Citrix server resident apps or installing Automation 360 client.
<b>Note:</b> You can also use the Citrix Workspace app. All major releases of the Citrix Workspace app version .22 are certified.	Automation Anywhere Citrix remote agent	
Citrix Virtual Apps version 6.5 or later		For using Citrix server resident apps.
Citrix XenDesktop Version 7.15 LTSR		For using Citrix server resident apps or installing Automation 360 client.

#### Verify credentials and licensing

- Ensure you have the credentials to access the Citrix server.

**Note:** We recommend you have different Citrix login credentials for each Bot Runner user.

- Ensure the appropriate Citrix license is available for the Automation Anywhere Enterprise system.

## Install components

Specific Citrix and Automation Anywhere components are required on both the local user machine and the Citrix Virtual Apps server.

### Local machine

1. Install Citrix Receiver.
2. Install the Bot Agent. This is automatically installed when you register the local machine with the Control Room.

The Bot Agent and Automation Anywhere plug-in for Citrix are installed at the same time if the Citrix Receiver is installed on the local machine.

3. Install the Automation Anywhere plug-in for Citrix.

If the Bot Agent is already installed, the Automation Anywhere plug-in for Citrix is automatically installed when the Universal Recorder is initiated.

### Citrix server

1. Install the Automation Anywhere remote agent for Citrix.
2. Register the Automation Anywhere remote agent for Citrix as a Virtual App in the Citrix StoreFront.

## Create a bot

1. From the Citrix StoreFront, run the **AARemoteAgent** and the target application.
2. From the Control Room, create the bot, start the **Recorder**, select the target application,

and record your actions on the Citrix server to build your bot.

## Using Citrix architecture with bots

To create and run bots using applications that reside on a Citrix server, see the following resources:

[Using the Recorder on Citrix Virtual Apps servers](#) on page 840

The **Record: Capture** cloning action requires specific configurations to capture objects from applications available through the Citrix StoreFront on a remote Citrix Virtual Apps server. Ensure the required components are installed on the local machine and the remote Citrix Virtual Apps server.

### Related concepts

[Installing Automation Anywhere remote agent on Citrix servers](#) on page 844

Install the Automation Anywhere remote agent on the Citrix Virtual Apps server where the virtualized applications are installed.

### Related tasks

[Using the Recorder on Citrix Virtual Apps servers](#) on page 840

The **Record: Capture** cloning action requires specific configurations to capture objects from applications available through the Citrix StoreFront on a remote Citrix Virtual Apps server. Ensure the required components are installed on the local machine and the remote Citrix Virtual Apps server.

[Installing the Citrix required components on local machines](#) on page 843

Install the Automation Anywhere components to enable you to use bots on Citrix Virtual Apps servers. Two components are installed: Bot Agent and Automation Anywhere plug-in for Citrix.

Access the RPA Workspace interface from a browser. After you have installed and enabled extensions in the browser, perform several tasks through the RPA Workspace interface based on your user role and automation requirements.

## Using the Recorder on Citrix Virtual Apps servers

The **Record: Capture** cloning action requires specific configurations to capture objects from applications available through the Citrix StoreFront on a remote Citrix Virtual Apps server. Ensure the required components are installed on the local machine and the remote Citrix Virtual Apps server.

Complete the steps listed in the following tasks:

- [Installing the Citrix required components on local machines](#) on page 843
- [Installing Automation Anywhere remote agent on Citrix servers](#) on page 844

If you are using Google Chrome for automation, ensure the Automation Anywhere extension (version 11.2.0.0) for Automation Anywhere remote agent for Citrix is installed and enabled. For Automation 360 remote agent, ensure that the Automation Anywhere extension (version 3.0.0.0 or later) is installed and enabled.

[Chrome web store](#)

Create bots with applications running on a remote Citrix Virtual Apps server using the Automation Anywhere remote agent for Citrix.

1. Log in to the Citrix Virtual Apps server StoreFront.

---

**Note:** You can also use the Citrix Workspace app. All major releases of the Citrix Workspace app version .22 are certified.

---

2. Depending on the Automation 360 release, select and run one of the following remote agents from the **Citrix StoreFront**.

- Select **Citrix server > Citrix StoreFront > AARemoteAgent**.

---

**Note:** **AARemoteAgent** is the Citrix name for the Automation Anywhere remote agent for Citrix.

---

- Select **Citrix server > Citrix StoreFront > A360 Remote agent**.

---

**Note:** **A360 Remote agent** is the Citrix name for the Automation 360 remote agent.

---

3. Run the target application from the Citrix StoreFront.
4. Log in to your registered local machine with the Bot Agent and Citrix Receiver installed.
5. Log in to the Control Room from your registered local machine.
6. Create a new bot or edit an existing bot.
7. Select the auto login feature to log in to a Citrix environment when it is locked or logged off.

---

**Note:** To ensure the auto login works, always log off the Citrix Receiver associated with the Citrix Virtual Apps server before you disconnect.

---

8. Start the **Recorder**.
9. From the **Automation Anywhere Record Application** selection window, select the target application from the drop-down list in the **Window or URL** field, and click **Start recording**.

---

**Note:** The remote application has `\\Remote` label at the end of the application name.

---

10. When the steps to record are completed, click **End recording**.

Access the RPA Workspace interface from a browser. After you have installed and enabled extensions in the browser, perform several tasks through the RPA Workspace interface based on your user role and automation requirements.

## Using Citrix XenDesktop on Cloud

Install the Bot Agent on a Citrix XenDesktop virtual machine to create or run bots using applications that reside on that Citrix XenDesktop virtual machine.

Ensure the required components are installed on the local Bot Agent machine and the remote Citrix server. The required components are:

### On the local machine

**Citrix Receiver:** Install this on every machine you use to connect to a Citrix server.

**Note:** You can also use the Citrix Workspace app. All major releases of the Citrix Workspace app version .22 are certified.

### On the Citrix XenDesktop

**Bot Agent:** Install this on the Citrix XenDesktop virtual desktop.

Log in to the Control Room and launch the recorder. This triggers the Bot Agent installer.

The Citrix XenDesktop is a virtual machine sitting on a remote Citrix server. It contains the applications to be used for the bots.

The following figure shows the process flow when the Bot Agent is installed on a Citrix XenDesktop with the applications on the virtual desktop.

The Bot Agent can be installed on multiple platforms, which includes a Citrix XenDesktop virtual machine. Ensure the virtual desktop meets the requirements for any Bot Agent installation.

Create bots with Citrix XenDesktop.

1. Prepare for bot activities.
  - a) Install the Citrix Receiver on your local machine.
  - b) Install the Bot Agent on Citrix XenDesktop.
2. From your local machine with Citrix Receiver installed, log in and open **Citrix server > Citrix StoreFront**.
3. Select the Citrix XenDesktop virtual desktop with the Bot Agent.  
The whole Citrix XenDesktop is presented as a local virtual desktop on your local machine. This is automatic when you start the Citrix XenDesktop.
4. From the virtual desktop, launch the Enterprise Client that is installed on the Citrix XenDesktop, or launch a browser and log in to the Control Room.
5. From your Control Room, create the bot.

## Installing the Citrix required components on local machines

Install the Automation Anywhere components to enable you to use bots on Citrix Virtual Apps servers. Two components are installed: Bot Agent and Automation Anywhere plug-in for Citrix.

1. Log in to your local machine.
2. Install Citrix Receiver.

---

**Note:** You can also use the Citrix Workspace app. All major releases of the Citrix Workspace app version .22 are certified.

---

This Citrix component is required to communicate from a local machine to a Citrix virtual application server.

To install the Citrix Receiver, see the Citrix documentation.

3. Register your local machine with the Control Room. This installs the Bot Agent.  
The Bot Agent enables local machine communication with the Control Room.

To install the Bot Agent:

- a) Log in to the Control Room through your Automation Anywhere URL.
  - b) Navigate to **Devices** in the **Manage** tab.
  - c) From the action icons, click **Add local bot agent**.
  - d) Click **Connect to my computer**.
  - e) Follow the steps outlined in the wizard.
  - f) Refresh the **Devices** page and verify that the local device is added.
4. Install Automation Anywhere plug-in for Citrix on your local machine.  
The Automation Anywhere plug-in for Citrix provides the Citrix driver. This driver communicates with the Citrix server.  
To install the Automation Anywhere plug-in for Citrix:
    - a) Log in to the Control Room.
    - b) Launch one of the designated events.  
Designated events include: launch **Recorder**, use the **Devices** tab or **Device Status** tab, or run a bot from **Editor**.

- c) Optional: Verify that the Automation Anywhere plug-in for Citrix is installed.

Check for the file `C:\Program Files (x86)\Citrix\ICA Client  
\Automation.CitrixDriver.dll`.

Install the Automation Anywhere components to enable you to use bots on Citrix Virtual Apps servers. Two components are installed: Bot Agent and Automation Anywhere plug-in for Citrix.

### Related reference

[Components for Control Room and bot actions](#) on page 835

Control Room and bots have additional requirements depending upon the Automation 360 deployment model you choose. Some third party applications are installed with Automation 360.

*Install Automation Anywhere remote agent for Citrix 2.0: Recorder package version 2.8.6*

Install the Automation Anywhere remote agent for Citrix 2.0 available with Build v 2.0.0.7 on the Citrix Virtual Apps server where the virtual applications are installed.

Keep the following considerations in mind when automating a task in the Citrix environment using the new Automation Anywhere remote agent for Citrix 2.0:

- If you are using Google Chrome for automation, ensure that the Automation Anywhere extension (version 3.0.0.0 or later) for Automation 360 remote agent is installed and enabled.

*Google Chrome extension for Automation 360*

- Both Automation Anywhere remote agent for Citrix 1.0 and 2.0 can run on Citrix environment at the same time.
- When you use the 2.8.6-20220823-160834 or later version of the Recorder package in your bots, we strongly recommend that you use the Automation Anywhere remote agent for Citrix 2.0. If you have not installed the Automation Anywhere remote agent for Citrix 2.0, then we have support for an automatic fallback where the existing Automation Anywhere remote agent for Citrix 1.0 will be used.

---

**Note:** During fallback, the Automation Anywhere remote agent for Citrix 1.0 will work only with technologies and browsers that it supports.

---

- For Citrix automation, bots created using Recorder package (versions earlier than 2.8.6) will not work with Automation Anywhere remote agent for Citrix 2.0. Ensure that you connect to Automation Anywhere remote agent for Citrix 1.0 instead.
- If you are using Automation Anywhere remote agent for Citrix 2.0 and the Bot Agent over the same Citrix environment, ensure that you do not uninstall the Automation Anywhere remote agent for Citrix or Bot Agent without reinstalling the updated version of either of these. For example, if you uninstall Automation Anywhere remote agent for Citrix, then ensure that you either install the new version of Automation Anywhere remote agent for Citrix or you reinstall the Bot Agent so that the registry entries remain updated.
- If you have bots that use 2.7.3-20220527-004608 or earlier version of the Recorder package, then the bots will use the existing Automation Anywhere remote agent for Citrix 1.0.
- Automation Anywhere remote agent for Citrix 2.0 will not work if Citrix XenDesktop is also connected from the same Bot Creator or Bot Runner device.
- Technology selection drop-down option for Recorder is not supported.
- Microsoft UI automation (COM) is not supported.
- SAP automation is not supported.

The following technologies and browsers are supported with Automation 360 remote agent for Citrix:

- Google Chrome
- Internet Explorer
- Microsoft Edge
- Microsoft Edge with IE mode
- Mozilla Firefox
- Java
- Electron apps
- Microsoft Active Accessibility (MSAA)
- Microsoft UI automation

1. Log in to the Citrix Virtual Apps server.

2. Download the latest version of the Automation Anywhere remote agent for Citrix 2.0 installer file to the Citrix Virtual Apps server. The Automation 360 remote agent running on the Citrix server interprets data received from Automation 360 and responds appropriately.
  - a. Go to [A-People Downloads page \(Login required\)](#).
  - b. Select and download the Automation Anywhere remote agent for Citrix 2.0.
3. Run the Automation Anywhere remote agent for Citrix 2.0 installer.
  - a. Extract the `AARemoteAgent_2.0.zip` file and double-click the `A360RemoteAgent.exe` file.
  - b. On the **Automation 360 Remote agent Setup** screen, click **Next**.
  - c. On the **Select Destination Folder** screen, click **Browse** to specify a non-default location for installing the remote agent. Click **Next**.  
The default location for installation is set to `C:\Program Files (x86)\Automation Anywhere\A360 Remote Agent`.
  - d. On the **Setup Status** screen, track the status of the installation process.
  - e. On the **Setup Wizard Complete** screen, click **Finish** to complete the setup.
4. From the Citrix interface, add the Automation Anywhere remote agent for Citrix 2.0 application to the Citrix **Delivery Controller**.  
This registers the Automation Anywhere remote agent for Citrix 2.0 as a Virtual App in the Citrix StoreFront.
5. Verify that the Automation Anywhere remote agent for Citrix 2.0 is available from the Citrix StoreFront. The Citrix StoreFront name for the Automation Anywhere remote agent for Citrix 2.0 remote agent is **A360 Remote agent**.

*Install Automation Anywhere remote agent for Citrix 1.0: Recorder package version 2.7.3 and earlier*

Install the Automation Anywhere remote agent for Citrix 1.0 available with Build v 1.0.0.0 on the Citrix Virtual Apps server where the virtualized applications are installed.

Keep the following considerations in mind when automating a task in the Citrix environment using the Automation Anywhere remote agent for Citrix:

- If an application hosted on the Citrix environment runs in elevated mode, the Automation Anywhere remote agent for Citrix must also run in elevated mode.
- If some applications hosted on the Citrix environment run in elevated mode and some on non-elevated mode, you can install two instances of the Automation Anywhere remote agent for Citrix: One instance of the agent will run in elevated mode and the other instance in non-elevated mode.
- If you are using Google Chrome for automation, ensure the Automation Anywhere extension (version 11.2.0.0) for Automation Anywhere remote agent for Citrix is installed and enabled.

*Chrome web store*

1. Log in to the Citrix Virtual Apps server.
2. Download the latest version of the Automation Anywhere remote agent for Citrix installer file to the Citrix Virtual Apps server. The Automation Anywhere remote agent for Citrix running on the Citrix server interprets data received from Automation 360 and responds appropriately.
  - a. Go to [A-People Downloads page \(Login required\)](#).
  - b. Select and download the Automation Anywhere remote agent for Citrix.

3. Run the Automation Anywhere remote agent for Citrix installer.
  - a. Extract the `AARemoteAgent_1.0.zip` file and double-click the `AAE_Remote_Agent_1.0.0.exe` file.
  - b. On the **Automation Anywhere Remote Agent Setup** screen, click **Next**.
  - c. On the **License Agreement** screen, accept the license agreement, and click **Next**.
  - d. On the **Select Destination Folder** screen, click **Browse** to specify a non-default location for installing the remote agent. Click **Next**.  
 The default location for installation is set to: `C:\Program Files (X86)\Automation Anywhere\AARemoteAgent`
  - e. On the **Setup Status** screen, track the status of the installation process.
  - f. On the **Setup Wizard Complete** screen, click **Finish** to complete the setup.
4. From the Citrix interface, add the Automation Anywhere remote agent for Citrix application to the Citrix **Delivery Controller**.  
 This registers the Automation Anywhere remote agent for Citrix as a Virtual App in the Citrix StoreFront.
5. Verify that the Automation Anywhere remote agent for Citrix is available from the Citrix StoreFront.  
 The Citrix StoreFront name for the Automation Anywhere remote agent for Citrix is **AARemoteAgent**.

## HA and DR deployment models

Automation 360 provides several deployment options to meet various levels of enterprise cost/price performance and resiliency requirements. The options include installation on single nodes and on multiple nodes. Multi-node deployments can be configured for highly available (HA) clusters and disaster recovery (DR) sites.

The deployment services are set up using the Automation 360 installer. A typical Automation 360 server node runs the following services:

- Automation Anywhere Automation Services
- Automation Anywhere Messaging Services
- Automation Anywhere Caching Services
- Automation Anywhere Search Services
- Repository storage
- (Optional) IQ Bot VM

The Automation 360 installer also supports the multi-node deployment configuration.

## Planning

Identify your requirements before selecting a deployment model. For best results, deploy the same operating systems across the RPA Workspace development, testing, and production environments. At minimum, have the same OS on both test and production environments.

## Deployment models

At a high level, there are two ways to deploy or install Automation 360 - single-node and multi-node. Choose the option that meets your business continuity requirements.

## Single-node deployment

As the name suggests, there is a single physical server node, on which all the services related to Automation 360 are run. By design, this configuration does not provide any redundancy and hence the availability depends on the services on this single node.

### Database

In single-node deployment, the database can be anywhere if the Control Room server is able to connect to the database server. This can involve network configurations.

---

**Note:** You cannot host the database server on the same server as the Control Room server as it requires higher processing/memory configuration on the server.

---

### Characteristics

- No disaster recovery (single point of failure): If the single node fails, RPA operation will be adversely affected.
- No high availability: If the server is taken offline for upgrade or maintenance, RPA operations will be affected.
- No RPA up-scaling: When RPA deployments scale up and users increase, the single node will have to manage the increased load. This might adversely affect the RPA performance.

### Usage Recommendations

Single-node deployments are typically recommended for small-scale usage in proof of concepts, demos, testing, and trials, to name a few.

Single-node deployments are NOT RECOMMENDED for production usage because any downtime will impair RPA operation and business continuity.

### Advantages

- Quick and easy installation and setup
- Additional servers not required
- Load balancers and clustering configuration not required

The following image shows the Automation Anywhere and data center components for a single node. The Automation Anywhere components are shown in orange and components provided by your organization are shown in blue. Components that are centrally hosted on cloud and managed by Automation Anywhere such as license server are shown in light orange.

## Multi-node deployment

To achieve higher processing scale, higher availability in production setups, Automation 360 services are deployed across multiple server nodes. Installer enables you to setup multi-mode configuration. This involves additional configuration steps such as linking services to same database and so on.

### Distributed approach

The Control Room provides the flexibility to process large number of requests in given time window.

Deploy multiple instances of Control Room on multiple physical or virtual servers as required. This also means configuring the cluster setup for the caching, search, and messaging services.

### Load balancing

Performed by a load balancer, this is the process of distributing application or network traffic across multiple servers to protect service activities, allowing workloads to be distributed among multiple servers. This ensures automation activity is continued on clustered servers.

[Load balancer requirements](#) on page 821

### Databases

In multi-node deployments, databases use their own built-in failover to protect the data. This ensures database data recovery.

If you use cloud-based database services likes of AWS-RDS, the High Availability and Disaster

Recovery as part of their service offerings, in which case no further database configurations are necessary.

For pure on-premises database scenarios, configure synchronous replication between the primary (active) and secondary (passive) clustered Microsoft SQL Server in the data center. This ensures consistency in the event of a database node failure.

For synchronous replication, configure the database using publisher and subscriber model in Microsoft SQL Server from the primary disaster recovery site to the secondary disaster recovery site that is at a geographically separated location from the primary site.

[Replicate data between primary and secondary sites](#) on page 860

The following image shows the Automation Anywhere and data center components for three nodes in a data center cluster. The Automation Anywhere components are shown in orange and components provided by your organization are shown in blue. Components that are centrally hosted on cloud and managed by Automation Anywhere such as license server are shown in light orange.

**Important:** Stretch clusters are not supported.

- Ensure that all the HA cluster nodes are configured in the same location. Do not configure the nodes in a single HA cluster that is located across various sites. Ensure that you configure one HA cluster at the primary site and the other HA cluster at the secondary site.
- The Control Room and IQ Bot must be configured in the same data center to ensure communication between both the applications.

---

## Related concepts

[High availability deployment](#) on page 852

To support Automation 360 in your data center, configure an high availability (HA) cluster. Follow your company methods and procedures for implementing your data center cluster.

## Convert single-node deployment to multi-node deployment

You can convert your single-node deployment into a multi-node deployment by editing the configuration files and restoring the data in the repository for the single-node setup.

The single-node deployment can run on one of several infrastructures, local machines, private data centers, and cloud providers.

To convert a single-node deployment running on AWS or other supported environment into a multi node-deployment, perform the following steps.

1. In the Task Manager, stop all Automation Anywhere services.
2. Stop the Control Room instance.
3. Create an Amazon Machine Images (AMI) instance using the Control Room instance.  
For information about how to create AMI in AWS, see [Create an AMI from an Amazon EC2 Instance](#).
4. Create a new instance using the AMI created in the previous step.
5. Edit the configuration files related to the database server, Ignite cluster, and Elasticsearch to form the clusters in the configuration directory on a standard installation.

The files are located in `C:\Program Files\Automation Anywhere\Enterprise\config`

- a) Edit the database server URL to point to the intended database server in

`boot.db.properties`.

Do not change the URL if the original server already refers to a non-localhost address.

- b) Edit the following property in the `cluster.properties` file:

Append the list with a new server IP in `ignite.discovery.static.ips=<existing list of ips>, <current server ip>`

- c) Edit the following properties in the `elasticsearch.yaml` file:

- Add the current server address in `node.name: "<local-ip>"`
- Add the current server address in `network.host: "local-ip"`
- Leave the existing values intact and append the IP of the current server in `discovery.zen.ping.unicast.hosts: ["ipl", "<local-ip>"]`
- Leave the existing values intact in `cluster.initial_master_nodes: ["<master-ip>"]`

6. Restore and mount the repository to the respective path from the same timed snapshot as the selected Control Room snapshot.
7. Update the configuration tables to ensure TCP visibility between the nodes.
8. Start the services on the replicated node and wait for a couple of minutes for the clustering to establish.
9. Log in to the Control Room to verify whether the bots are available and the repository structure is intact.

**10. Check Git integration for standard installations.**

If the installation has external Git configured, check the validity by exercising test check-in and confirm audit logs.

## High availability deployment

To support Automation 360 in your data center, configure an high availability (HA) cluster. Follow your company methods and procedures for implementing your data center cluster.

**Why only odd number of nodes are supported** A cluster comprising even number of nodes can merge inconsistencies but can result in a split-brain condition where the cluster has no majority and cannot resolve transactions, which might result in data inconsistencies. Split-brain condition is a known limitation of clustering systems that can be caused by network issues including latency.

Deployment configurations with odd numbered nodes can help avoid split-brain issues and are recommended for Automation 360 deployments.

### Quorum

The nodes determine which transaction can be processed through voting on each transaction. The number of votes constituting a majority of the nodes in the cluster is referred to as a quorum and determines how many nodes have to vote for or confirm a transaction before it can be processed.

### Fault Tolerance

Fault tolerance in terms of node failure is determined by how many nodes can fail before a quorum or majority of nodes is not available to vote on the validity of any transaction. Fault tolerance is optimized with an odd number of nodes in the cluster because a majority in odd-numbered clusters is a lower number than in even-numbered clusters

### Supported Configurations

A cluster with three or higher odd number of nodes prevents the split-brain condition or inconsistencies due to network issues, while giving the higher scale and availability.

Number of nodes in cluster	Majority (quorum)	Fault tolerance (node failures)	Support
3	2	1	Certified
5	3	2	Contact Automation Anywhere support
7 and so on	4 and so on	3 and so on	Contact Automation Anywhere support

## Multi-availability Zone/Multi-datacenter Configurations

When going for a multi-zone deployment in further enhance the availability, say with 3 nodes deployment, we recommend that you have each Control Room in separate availability zones. Deployments with more than 3 nodes, spread these deployments across at least 3 availability zones. One thing we need to be concerned about in these setups is the latency between the zones/providers. The nodes in a high availability cluster must be deployed in the same region.

In terms of the cloud providers, we currently support 3 major cloud providers - Amazon Web Services, Google Cloud Platform, and Microsoft Azure.

---

**Note:** In a multi-node environment, if a node goes down, operations such as bot deployments and schedules, triggers, and work items in queues on that node will be adversely affected.

---

**Tip:** For information on how to backup and restore files to recover a Control Room High Availability cluster in case of failure, see [Backing up and restoring a Control Room High Availability Cluster \(A-People login required\)](#).

---

### Related concepts

[Disaster recovery deployment](#) on page 853

The disaster recovery (DR) deployment model uses high availability (HA) clusters distributed across separate geographic areas.

### Related tasks

[Configure IP cluster](#) on page 878

Use the **Cluster Configuration** wizard page under **Custom installation type** in Control Room installer to configure resiliency requirements. Select the **Enable Cluster setup** option and for high availability cluster, provide multiple (three or more) IP addresses from your cluster setup.

[Configure disaster recovery site for Elasticsearch IP addresses](#) on page 930

If you have configured the Control Room for high availability (HA) and disaster recovery (DR) and installed the Control Room on both the primary and secondary sites, configure Elasticsearch IP addresses for the secondary site.

### Related information

[Cluster coordination in ElasticSearch](#)

## Disaster recovery deployment

The disaster recovery (DR) deployment model uses high availability (HA) clusters distributed across separate geographic areas.

Disaster recovery (DR) is a method where the two high availability (HA) data center configurations are separated geographically. In the event of a localized disaster at the primary site, the physically removed data center on the secondary site can resume functions with minimum downtime.

If there were external systems used in the setup, it is essential to restore the network level connectivity. Some examples for these external systems include any external key vaults, Git, and so on. All the firewall rules, IP white-listings, host-names referred in configurations are still intact and available to the restored services.

---

**Note:** The Control Room clusters in the primary and secondary disaster recovery sites are recommended to use a minimum of three nodes each because a three-node configuration can help avoid split-brain issues

with two-node clusters and increase security by using node authentication and transport layer security (TLS) features.

---

The following image shows the Automation Anywhere and data center cluster components for three nodes in primary and secondary sites configured for disaster recovery. The Automation Anywhere components are shown in orange and components provided by your organization are shown in blue. Components that are centrally hosted on cloud and managed by Automation Anywhere such as license server are shown in white.

## Disaster recovery methods

There are two ways to perform disaster recovery - Image based replication and Warm standby. Choose the option that meets your business continuity requirements.

### Related tasks

[Image based replication](#) on page 856

The replication process is similar across environments and cloud providers. A scheduled way is used for creating and storing the snapshots. The snapshot interval is based on the tolerance of the customer for potential data loss.

[Replicate data between primary and secondary sites](#) on page 860

The process of replicating the data between the primary and the secondary site involves database replication using publisher and subscriber models in Microsoft SQL Server Management Studio, server repository replication using Windows Distributed File System (DFS), and backing up Elasticsearch (audit log) data.

### Related information

[Cluster coordination in ElasticSearch](#)

#### *Image based replication*

The replication process is similar across environments and cloud providers. A scheduled way is used for creating and storing the snapshots. The snapshot interval is based on the tolerance of the customer for potential data loss.

We recommend that the replication schedule should be at least 1 day (one snapshot daily).

The following describes the procedure for AWS as an example cloud provider.

As a first step in any image-based DR setup, create snapshots at fixed intervals. In case of the disaster, the setup would revert to the latest good image/snapshot and system would be back, up and fully functional in a short time, however with a data loss and short down time.

1. Decide on the snapshot interval based on potential data loss.
2. Stop the Automation Anywhere services on the server being imaged.
3. If on AWS, create AMI using standard image creation steps.

[Create an AMI from an Amazon EC2 Instance](#)

4. After the image is created, start the Automation Anywhere services.
5. Run the repository backup mechanism on the same schedule.

The subsequent steps describe restoring data from an image.

6. Spin a new instance using the previously created AMI.

Depending on the original setup, if the setup is spread across availability zones, you must do the same in all relevant availability zones.

The following steps are applicable to each instance being recovered.

7. Edit the configuration files related to the database server, Ignite cluster, and Elasticsearch to form the clusters in the configuration directory.  
On a standard installation, the files are located in: `C:\Program Files\Automation Anywhere\Enterprise\config`
  - a) Edit the database server URL to point to the intended database server in: `boot.db.properties`.  
Do not change the URL if the original server already refers to a non-localhost address.
  - b) Edit the following property in the `cluster.properties` file:  
Append the list with a new server IP in: `ignite.discovery.static.ips=<existing list of ips>, <current server ip>`
  - c) Edit the following properties in the `elasticsearch.yaml` file:
    - Add the current server address in: `node.name: "<local-ip>"`
    - Add the current server address in: `network.host: "local-ip"`
    - Leave the existing values intact and append the IP of the current server in: `discovery.zen.ping.unicast.hosts: ["ip1", "<local-ip>"]`
    - Leave the existing values intact in: `cluster.initial_master_nodes: ["<master-ip>"]`
8. Optional: If mounted, restore the repository from the same timed snapshot as the selected Control Room snapshot and mount to the respective path.
9. Update configuration tables.
10. Ensure Transmission Control Protocol (TCP) visibility between the nodes.
11. Start the services on the replicated node and wait for couple of minutes the clustering to establish.
12. Verify the following:
  - Login and check the bots are listed and visible.
  - If the installation has external Git configured, check the validity using functions such as check-in.
  - Verify the audit logs.
13. Update the load balancer tier or DNS as needed if any host names/IPs change with corresponding current values.

### Related tasks

[Replicate data between primary and secondary sites](#) on page 860

The process of replicating the data between the primary and the secondary site involves database replication using publisher and subscriber models in Microsoft SQL Server Management Studio, server repository replication using Windows Distributed File System (DFS), and backing up Elasticsearch (audit log) data.

[Warm stand-by](#) on page 857

Host two setups or sites - primary and backup for the warm stand-by DR procedure.

*Warm stand-by*

Host two setups or sites - primary and backup for the warm stand-by DR procedure.

Each setup would have following recommended configurations:

1. Automation 360 hosted in clustered mode (three nodes)
2. SQL instance
3. Repository storage (shared network drive)
4. Git repository

Synchronous replication of the data onto the backup node should be configured. The backup node should have the exact same configuration as Primary node; except for Control Room.

- To sync Git repository, back up Git repository path from primary to backup path.
- To sync SQL database, setup replication from primary to backup database.

*Replicate data between primary and secondary sites* on page 860

Once configured the setup scheme would look like this:

Complete the disaster recovery deployment on the two geographically separated sites, where one site is the primary (active) site and the other is the secondary (passive) site used for backup. If the primary site cluster fails, perform recovery on the secondary site.

---

**Note:** The secondary site should be set up as a passive configuration so that the failover procedure can be performed without delay.

---

The procedure is identical regardless of whether you are switching over from primary to secondary, or from the secondary to primary sites. Connect the Control Room to the replicated database and shared the repository on the secondary site.

These steps apply to all the servers in the Automation 360 cluster, including the Control Room servers, SQL server, and Elasticsearch server.

1. Install Automation 360 on the secondary site.  
Follow the steps for installation up to the database configuration.  
*Installing Control Room using Custom mode* on page 863
2. In the **Database Configuration** window, add database details for the secondary site such as the database server IP address and default port number.  
*Configure Microsoft database type and server* on page 872
3. Verify the Elasticsearch details in the **Provide Elasticsearch Credentials** window.  
Because the Elasticsearch data is already replicated from the primary database, you do not have to provide the Elasticsearch password.
4. After the installation is complete, verify that the Control Room URL and repository path is available in the Control Room **Welcome** page.  
You can change the Control Room URL and repository path after you log in to the Control Room as the next step.
5. Log in to the Control Room using your administrator credentials to change the **Configuration Settings** in **Administration > Settings**:
  - a) To allow users to access the Control Room using a public IP address, change the **Control Room Access URL** settings to point to the secondary site access URL in **General Settings > General**.
  - b) Change the **Repository path** to the secondary site repository path in **Control Room database and software > Control Room repository**.
6. Verify the data for the following:
  - Users, roles, schedule, triggers, credential information, and workload settings
  - Elasticsearch certificate and connectivity
  - Automation Anywhere Robotic Interface, Bot Insight, Discovery Bot, and IQ Bot

---

**Note:** Perform a byte-by-byte measurement of the recovered data and compare the primary and secondary site data. If you see any difference, verify the subscriber logs for any intermittent failure due to any network issue.

---

After the recovery site is operating as the primary site, configure a replacement secondary site. Using the database tools, set up replication from the recovery primary site to the replacement secondary site.

## Replicate data between primary and secondary sites

The process of replicating the data between the primary and the secondary site involves database replication using publisher and subscriber models in Microsoft SQL Server Management Studio, server

repository replication using Windows Distributed File System (DFS), and backing up Elasticsearch (audit log) data.

Before installing Automation 360, ensure that you have set up your secondary site.

Configure the database and shared repository in the secondary site that is used for disaster recovery. Back up your Elasticsearch data by setting up the backup cluster.

1. **Replicate the database** from the primary site to the secondary site using the publisher and subscriber models in Microsoft SQL Server Management Studio.

---

**Recommendations:**

- Use the Microsoft SQL Server Developer or Enterprise edition for database replication.  
The publisher and subscriber versions must be the same, or the gap between the two versions must not be more than two releases. For example, do not use Microsoft SQL Server 2012 publisher with Microsoft SQL Server 2019 subscriber.
- Configure the publisher and distributor on the same system to avoid latency in data sharing.  
Use different systems only for load distribution, for example, for data larger than 200 GB.

- 
- a) Connect to the primary database to create a snapshot publication for your local publications.
  - b) Add the tables and views as articles.
  - c) Use the snapshot agent option to create a snapshot and keep the snapshot available to initialize subscriptions.
  - d) Schedule the snapshot agent to back up the data at regular intervals (for example, every 10 seconds from 12 AM to 11:59:59 PM).
  - e) To select the account to run the snapshot agent, configure the security and agent settings.
  - f) Add a publication option.
  - g) Run all agent and distributors after ensuring that the publisher and database names are correct.
  - h) To add subscribers to the local subscriptions, connect to the database server and provide connection details for the database at the secondary site.

For detailed steps, see [Database Mirroring and Replication \(SQL Server\)](#).

2. **Replicate the repository** (bots and data files) using the Windows DFS from the primary site to the secondary site.
  - a) Open the DFS on the machine where the shared repository is saved.
  - b) Create a new multipurpose replication group to add replication group members.  
The group members include the source machine in the primary site and the destination machine in the secondary site to store the shared repository.
  - c) Use the full mesh option for DFS replication groups composed of less than 10 servers.
  - d) Use the full bandwidth option to replicate the data continuously.
  - e) Add the machine where you are configuring the repository as a primary member.
  - f) Add a backup folder for the shared repository from the destination machine.
  - g) Verify that the data is replicated in the backup folder on the destination machine.

For detailed steps, see [Distributed File System Replication](#).

3. **Back up the Elasticsearch (audit log) data** by adding the secondary site cluster IP address in the Control Room on the primary site.

For detailed steps, see [Configure disaster recovery site for Elasticsearch IP addresses](#) on page 930.

### Related tasks

[Warm stand-by](#) on page 857

Host two setups or sites - primary and backup for the warm stand-by DR procedure.

## Installing Control Room using custom mode for Oracle installation

Install the Automation Anywhere Control Room using Oracle Database for On-Premises and complete the installation in the Control Room.

Ensure the following:

- Oracle Database is preconfigured in your environment before you complete the Control Room installation.
- Oracle 19c On-Premises or over AWS RDS Oracle is supported. Ensure that the following settings are enabled with version 19c:
  - The value of the Oracle instance `max_string_size` parameter is set to EXTENDED.
  - If you want to use the SSL/TLS connection for the database, it is required that you configure TLS on the Oracle Server.
  - Oracle credentials are created. Database credentials must be created and the following grants must be provided: CONNECT, RESOURCE, CREATE TABLE, CREATE VIEW.

---

**Note:** The QUOTA on tablespace USERS is UNLIMITED.

---

---

**Note: External vault integration** is not supported on Oracle-based Windows Control Room installation.

---

## Procedure

1. Prepare for installation

- Verify [Automation 360 On-Premises prerequisites](#) on page 804.
- Ensure that you have the following:
  - Automation Anywhere Control Room installation file
  - TLS certificate
  - License file

2. [Run Control Room installer](#) on page 865.

Run the installer to verify the operating system and hardware requirements, select the deployment option, accept the licensing agreement, and select the installation file path.

---

**Note:** Ensure that you select Oracle for **Database type**.

---

3. [Configure application Transport Layer Security](#) on page 868.

Use the **Transport Layer Security (TLS) configuration** page to generate a self-signed certificate or import a security certificate to set up a highly secure Control Room instance.

**4.** *Configure service credentials* on page 871.

Use the **Service Credentials** page to specify the account that will be used to run all Windows services that are created by the installer.

**5.** *Configure Oracle database type and server* on page 875

Use the **Database type** page to configure the Oracle Database for use with the Control Room.

**6.** *Add Elasticsearch credentials* on page 877.

Add Elasticsearch credentials for enhanced monitoring and alerting in the Control Room.

**7.** *Configure IP cluster* on page 878.

Use the **Cluster Configuration** page to configure resiliency requirements. Provide only one IP address to configure the Control Room on a single node. Provide multiple (three or more) IP addresses to configure the Control Room for high availability cluster.

**8.** *Review the installation summary.*

Use the **Ready to Install the Program** page to complete the installation wizard and monitor the installation progress.

**9.** Complete Control Room configuration and validation.

*Complete Control Room post-installation configuration* **on page 926**

After installing the Control Room, complete the configuration settings to ensure that timely Automation Anywhere communications are specified and confirm that Automation Anywhere services are running.

*Post-installation user management* **on page 937**

After completing the post-installation tasks, validate the setup by logging in to the Control Room and installing a license. First-time access to the Control Room walks you through the configuration for your authentication method.

**10.** *Prepare for users.*

As an administrator, you can create, view, edit, delete, and enable or disable a user. The steps for creating users can vary depending on whether the user is a non-Active Directory, Active Directory, or single sign-on (SSO) user from an IdP server.

## Installing Control Room using Custom mode

Log in to the server as an administrator and install Automation Anywhere Control Room in Custom mode to select installation and configuration options, including installing non-default requirements. Select this mode for a data center deployment.

---

**Linux users:** See *Installing Control Room on Linux* on page 909.

---

## Procedure

### 1. Prepare for installation

- Verify [Automation 360 On-Premises prerequisites](#) on page 804.
- Ensure that you have the following:
  - Automation Anywhere Control Room installation file
  - TLS certificate
  - License file

### 2. [Run Control Room installer](#) on page 865

Run the installer to verify the operating system and hardware requirements, select the deployment option, accept the licensing agreement, and select the installation file path.

### 3. Select the database type that you want to use

- Microsoft SQL Server
- Oracle

### 4. Use the **External key vault integration** page to configure a connection to an external key vault such as CyberArk or AWS Secrets Manager, that is optionally used for retrieving credentials for either installation or runtime purposes. Configuring the key vault connection enables retrieval options for credentials during installation. Ensure that you have the follow information:

- All necessary database and user credentials.
- Any necessary credential requirements for the external key vault such as secret keys, application IDs. See the specific requirements for your external key vault on the External Key Vault integration configure page.

### 5. [Configure application Transport Layer Security](#) on page 868

Use the **Transport Layer Security (TLS) configuration** page to generate a self-signed certificate or import a security certificate to set up a highly secure Control Room instance.

### 6. [Configure service credentials](#) on page 871

Use the **Service Credentials** page to specify the account that will be used to run all Windows services that are created by the installer.

### 7. Configure database type and server

Use the **Database type** page to configure the Microsoft SQL Server database, or Oracle Database for use with the Control Room.

- [Configure Microsoft database type and server](#) on page 872
- [Configure Oracle database type and server](#) on page 875

### 8. [Add Elasticsearch credentials](#) on page 877

Add Elasticsearch credentials for enhanced monitoring and alerting in the Control Room.

### 9. [Configure IP cluster](#) on page 878

Use the **Cluster Configuration** page to configure resiliency requirements. Provide only one IP address to configure the Control Room on a single node. Provide multiple (three or more) IP addresses to configure the Control Room for high availability cluster.

**10.** *Review the installation summary*

Use the **Ready to Install the Program** page to complete the installation wizard and monitor the installation progress.

**11.** Complete Control Room configuration and validation

*Complete Control Room post-installation configuration* **on page 926**

After installing the Control Room, complete the configuration settings to ensure timely Automation Anywhere communications are specified and confirm Automation Anywhere services are running.

*Post-installation user management* **on page 937**

After completing the post-installation tasks, validate the setup by logging in to the Control Room and installing a license. First-time access to the Control Room walks you through the configuration for your authentication method.

**12.** *Prepare for users*

As an administrator, you can create, view, edit, delete, and enable or disable a user. Creating users steps vary depending on whether the user is a non-Active Directory, Active Directory, or single sign-on (SSO) user from an IdP server.

**Related concepts**

[Migrate to Automation 360](#) on page 1084

## Run Control Room installer

Run the installer to verify the operating system and hardware requirements, select the deployment option, accept the licensing agreement, and select the installation file path.

To install Automation Anywhere Control Room in Custom Mode, follow these steps:

1. Start the installer wizard.
  - a) Extract all files from the Automation360\_Build\_<build-number>.zip file.
  - b) Right-click the Automation360.exe file and select **Run as administrator**.

The installation process will create a Control Room database with the name Automation360-Database on your SQL database server instance.

However, if you are migrating from Enterprise 11 to Automation 360, the restored Enterprise 11 database will be used instead of the Automation 360 database.

---

**Note:** Ensure the SQL database server is installed on a different server than that of the Control Room.

---

The installation process checks for supported operating system and recommended hardware requirements. The following message appears if the requirements are not met:

This system does not meet all the installation prerequisites for Automation Anywhere Enterprise.  
Some features might not work as expected after installation. For details, verify the Control Room Installation Prerequisite.

For more information, see [Automation 360 On-Premises prerequisites](#) on page 804.

2. Select the **On-Premises** deployment type and click **Next**.

In On-Premises deployment type, the Control Room, Bots and files are installed on your servers.

In **Cloud-enabled** deployment type, all data such as bots and files are installed on your servers. The management functions of the Control Room are delivered through Cloud.

3. Accept the licensing agreement and click **Next**.
4. Select the **Custom** option and click **Next**.

The **Destination Folder** page appears. By default, the destination folder is C:\Program Files

\Automation Anywhere\.

5. If you are upgrading from one Automation 360 version to another, confirm the upgrade and choose whether to use the existing installation parameters.

Existing installation parameters include, for example: the installation path, HTTPS ports, database names, IP addresses, and TLS configuration. The username and password have to be manually entered.

- **Yes**—all the installation parameters are pre-filled and disabled. You cannot change pre-filled fields.
- **No**—enter the same or different installation parameters through the installation prompts.

---

**Note:** Choose **No** if the previous installation did not use the default installation path `C:\Program Files`.

---

6. To make changes to the destination folder, click **Change**, enter a new destination folder name, and click **OK**.

---

**Note:** **Do not** install the application directly in the root directory (`C:\`). You should create a folder, for example, `C:\Program Files\Automation Anywhere\Automation360\`.

---

7. Click **Next**.

## Integrate external key vaults

You can integrate external key vaults to the Automation 360 On-Premises Control Room.

As part of your external key vault integration planning strategy, if you determined that you are using an Automation 360 On-Premises Control Room deployment (where the Control Room and external key vault are hosted at the customer's site and environment), then select from the following list of external key vaults to configure:

- CyberArk Password Vault – Customer On-Premises environment  
*On-Premises integration using CyberArk Password Vault* on page 2171
- Azure Key Vault – Customer Azure environment  
*On-Premises integration using Azure Key Vault* on page 2185
- AWS Secrets Manager – Customer AWS environment  
*On-Premises integration using AWS Secrets Manager*

## Configure application Transport Layer Security

Use the **Transport Layer Security (TLS) configuration** wizard page from the Automation 360 installer to generate a self-signed certificate or import a security certificate to set up a highly secure Control Room instance.

Automation Anywhere leverages TLS 1.2 and TLS 1.3 encryptions for HTTPS and TCP communications between our components. The TLS certificates are installed on the Automation Anywhere Control Room and IQ Bot servers. The certificates are installed in .PFX format and leveraged for communications.

---

**Note:** If your load balancer uses HTTP to forward traffic to the Control Room, do not use the **Enable Force HTTP traffic to HTTPS** option. We recommend that you use HTTPS to forward the load balancer traffic for enhanced security instead.

---

1. In the **TLS Configuration** page, configure the following:

- **Generate a Self-Signed Certificate**

Enabling the **Self-Signed Certificate** option allows the installer to generate a unique private key and a self-signed certificate for the Control Room.

- **Import a Certificate**

To import a custom certificate, clear the **Self Signed Certificate** check box. This setting allows you to import a certificate using the **Certificate Path** field.

---

**Note:** The certificate file must be a PKCS12 format.

---

Provide the following information:

- **Certificate Path:** Click **Browse** to import the certificate.
  - **Private Key Password:** Enter the password for the private key.
- 

**Password limitation:** Do not use the at sign (@) in passwords. Using the special character @ in the password causes the certificate file import to fail.

---

- **Webserver Port:** Enter the web server port – either HTTP or HTTPS. If the port is already assigned, an error message is displayed.
- 

**Important:** The port validation message is also displayed when you add 8080 for the web server and if that port is already in use for a Control Room license service. Use a different unassigned port in these cases.

---

- **Enable Force HTTP traffic to HTTPS:** This option redirects all HTTP port requests to HTTPS. To access to the Control Room through HTTPS using the generated self-signed certificate, ensure the port numbers are different for HTTP and HTTPS.

To generate a custom certificate for HTTPS, ensure your custom certificate meets the following:

- Create a `.pfx` certificate with a pass code from a CA trusted authority.
- Combine Root, Intermediate, and Machine level certificates into a single certificate.
- Use the format `[WS Machine Host Name].[DomainName].com` for the private key.
- Include the host name as a fully qualified domain name (FQDN) in the certificate.

You provide the host name during Control Room installation.

- In multi-node HA clusters, issue certificates to the load balancer DNS name.
- Add individual URLs, which require access to all nodes, to the `Subject Alternative Name` field in the certificate.

For more information, see Automation Anywhere support site: [Automation 360 On-Premises prerequisites \(A-People login required\)](#).

The following sample illustration shows options for importing a custom certificate:

The screenshot shows the 'Automation 360 - [blurred]' window with the 'TLS Configuration' section. The title is 'Configuring the control room transport layer security configuration'. There are several input fields and checkboxes:

- Self-Signed Certificate
- Certificate Path: [text input field]
- Private Key Password: [password input field]
- Intermediate Certificate(s) .zip File (Optional): [text input field]
- HTTP Port: [text input field with value 80]
- HTTPS Port: [text input field with value 443]
- Force HTTP Traffic To HTTPS

At the bottom, there is an 'InstallShield' label and three navigation buttons: '< Back', 'Next >', and a partially visible 'C' button.

2. Click **Next** to configure service credentials.

[Configure service credentials](#) on page 871

#### Related tasks

[Configure Control Room for HTTPS certificate](#) on page 950

Configure Control Room for HTTPS mode using a self-signed or CA certificate either before or after performing a custom Control Room configuration.

[Import HTTPS, and CA certificates](#) on page 951

After you install the Control Room for an On-Premises deployments, you can use the Windows or Linux command prompt to import all or some of these certificate:

## Configure service credentials

Continue from the Control Room installer to the **Service Credentials** wizard page. Use this page to specify the account that will be used to run all Windows services that are created by the Automation Anywhere installer.

1. In the **Service Credentials** screen, choose from the listed options.

The Windows Service credentials include a user name and password. The user specified must meet these requirements:

- Have permission to manage services, including Automation Anywhere services.
- If you use Windows authentication to connect to the SQL database, ensure you grant the `db_owner` permission to the service credential user.

These service credentials allow the Control Room processes to run the required services.

- **Local System Account**—(default) The logged-on user performing the installation.
  - **Use a Group Managed Service Account**—Specify to manage Automation 360 services.
    - a. Clear the **Local System Account** check box.
    - b. Select the **Use a Group Managed Service Account** option.
    - c. Enter the user name only. No password is required to use this option.

### *Group Managed Service Accounts Overview*

- **Domain Account**—Specify a user that is not the local system account user
  - a. Clear the **Local System Account** check box.
  - b. Enter the user name and password for the domain account.
 

Use only supported characters for the user name and password. See *Supported special characters* on page 836.
  - **Do not use the Windows domain credentials**

Enter credentials valid for running Automation Anywhere services. Without the valid credentials, the Control Room will fail to launch.
  - **PowerShell script restrictions**

Specify a user with permissions to launch PowerShell scripts who is not a Windows domain user. Without the relevant permissions, database table creation can fail.
- **Service Account (manually enter credential)**
  - a. Enter username.
  - b. Enter password.
- **Service Account (optionally retrieve service account credential from the previously configured external key vault )**
  - a. If using CyberArk, enter the safe name and object name for the credential.
  - b. If using AWS Secrets Manager, enter the secret name.

- c. If using Azure, enter the vault URL.

The following example shows selection of a domain account:

2. Click **Next**.

## Configure Microsoft database type and server

Continue from the Control Room installer to the **Database type** wizard page. Use this page to configure the Microsoft SQL Server database for use with the Control Room.

This procedure applies only to Microsoft Windows Server based installations.

---

**Linux users:** See [Installing Enterprise Control Room on Linux - Database configuration](#).

---

If you are installing Automation 360 as part of migration, this task includes the step to select the Enterprise 11 (cloned) database.

1. Select the **Microsoft SQL Server** database.  
An instance of the SQL Server should be already configured.
2. Click **Next**.  
The **Database Server** page is displayed (if you selected **SQL Server** for configuring your database).

### 3. Set the connection and authentication for the database server.

To configure the **Database Server** for the Control Room instance, use the default **Database Server** port 1433. If multiple instances are running on the same database host on different ports, you can use the corresponding custom port for that instance (for example, 1435 or 1437).

---

**Note:** The instance name is not supported in the **Database Server** field.

---

**Note:**

- If possible, do not set the value for **Database Server** as **localhost**. If you must use **localhost**, note that the **Secure Connection** to the database will not work.
- 
- Click **Browse** to select the SQL Server instance where the Control Room database will be created. Alternatively, enter a database server name or select one from the list.

---

**Migration task:** If you are migrating from Enterprise 11 to Automation 360, browse to the restored Enterprise 11 database.

Provide the following details:

- a) **Database Port:** Use the default port (1433) or specify a custom value.  
*Configure default database port* on page 875
- b) **Use Secure Connection:** Select to use a CA certificate as specified.

---

**Note:** Use the same host name for certificate and database connections.

---

- c) **Certificate:** This option is enabled when you select **Use Secure Connection**. Browse to select a CA certificate.  
*Import HTTPS, and CA certificates* on page 951
- d) Select one of the following for database authentication:

- **Windows authentication:** This option is selected by default and allows connection to the SQL Server using Windows authentication.

---

**Note:** If you select Windows authentication, then the user running the installer is used to test that the database exists, create it if required, and grant `db_owner` to the service account user (NT Authority/System).

---

- **SQL Server authentication: (manually enter credential)** Select this option to use SQL Server authentication to connect to the database. Provide the correct user name and password for SQL authentication.
  1. Enter username.
  2. Enter password.
- **SQL Server authentication: (retrieve credential from external key vault)** Select this option to use SQL Server authentication to connect to the database.

---

**Note:** SQL Server Authentication is required if you will retrieve the credentials for the database from an external key vault.

---

1. If using CyberArk, enter the safe name and object name.
2. If using AWS Secrets Manager, enter the secret name.

- **AD Azure authentication:** Select this option to use Microsoft Azure Active Directory credentials to connect to the database when you install the Control Room on Microsoft Azure.

Use only supported characters for the user name and password. See [Supported special characters](#) on page 836. Do not use semicolons ( ; ) in the database password.

- e) **Name of Control Room database:** Enter the name of the Control Room database.

**Migration task:** If you are migrating from Enterprise 11 to Automation 360, enter the name of the restored database in the database field as shown in the following image:

The screenshot shows the 'Database Server' configuration window. The title is 'Database Server' and the subtitle is 'Select authentication method and provide database names'. The window contains the following fields and options:

- Database Server:** A dropdown menu showing '(local)\SQLEXPRESS' with a 'Browse...' button next to it.
- Database Port:** A text box containing '1433'.
- Use Secure Connection**
- Certificate (Optional):** A text box with a 'Browse...' button.
- Windows authentication** (selected)
- Sql Server authentication**
- AD Azure authentication**
- Login ID:** A text box.
- Password:** A text box.
- Name of Control Room database:** A text box containing 'Restored-11.x-Database', which is highlighted with a red rectangle.

At the bottom, there are three buttons: '< Back', 'Next >', and 'Cancel'. The 'Next >' button is highlighted with a blue border.

The following sample illustration shows SQL Server authentication for database

The screenshot shows the 'Database Server' configuration window. The title is 'Database Server' and the subtitle is 'Select authentication method and provide database names'. The window contains the following fields and options:

- Database Server:** A dropdown menu showing '(local)\SQLEXPRESS' with a 'Browse...' button next to it.
- Database Port:** A text box containing '1433'.
- Use Secure Connection**
- Certificate (Optional):** A text box with a 'Browse...' button.
- Windows authentication**
- Sql Server authentication** (selected)
- AD Azure authentication**
- Login ID:** A text box containing 'sa'.
- Password:** A text box containing a series of dots.
- Name of Control Room database:** A text box containing 'Automation360-Database'.

At the bottom, there are three buttons: '< Back', 'Next >', and 'Cancel'. The 'Next >' button is highlighted with a blue border.

connection:

4. Click **Next** to provide the Elasticsearch credentials.  
[Add Elasticsearch credentials](#) on page 877

## Configure default database port

Configure and enable the TCP/IP in the SQL database server to use the default port 1433 when you install the Control Room.

Enable TCP/IP from the Microsoft SQL Server Configuration Manager.

Transparent Data Encryption (TDE) is a function of Microsoft SQL Server database. Additional configurations are not required on the Control Room as the TDE supportability is managed by Microsoft. For more information, see [Transparent data encryption \(TDE\)](#) and [Transparent data encryption for SQL Database](#).

1. Ensure the SQL Server Browser service is running in the Task Manager.
2. To set the default port for the SQL database server, launch the Microsoft SQL Server Configuration Manager.
3. Select **SQL Server Network Configuration > Protocols for <SQL server instance>**.
4. Right-click **Protocols for <SQL server instance>** and select **Open** to show the available protocols.
5. Ensure **TCP/IP** is enabled.
6. Right-click **TCP/IP** and select **Properties**.  
You can configure the default port for the SQL database from the **TCP/IP Properties** window that is displayed.
7. Select the **IP Addresses** tab to update the default **TCP Port** to **1433** in the **IPAll** node.  
If provided, clear the value shown in the **TCP Dynamic Ports** field.
8. Click **OK** to confirm and exit the window.
9. Select the **SQL Server Services** option to **Restart** the **SQL Server <instance name>**.  
The SQL database server is now configured and enabled to use the default port in the Control Room.

## Configure Oracle database type and server

Configure the Oracle Database Server for use with the Control Room by using the Database type wizard page.

This procedure applies only to installations based on Microsoft Windows Server.

Oracle must be installed on a machine that is accessible from the Automation 360 Control Room.

Create users for Automation Anywhere to access the Database.

This is supported only on non-container Database. Oracle installation is supported only for first-time setup of Automation Anywhere. Oracle installation does not support updates.

---

**Note:** Oracle database for Control Room installation is supported only in Custom mode and not in Express mode.

---

1. Select **Oracle** database.  
An instance of the Oracle Server must be configured already. For more information, see [Installing Control Room using custom mode for Oracle installation](#) on page 862.

2. Click **Next**.

The Oracle Database server page is displayed (if you selected Oracle for configuring your database). The following sample illustration shows Oracle Database Server authentication for database connection:

3. Set the connection and authentication for the database server. Provide the following details:
- Database Server:** Enter the server name or IP address of the Oracle Database server. The **localhost** IP address can be used.
  - Database Port:** Enter your database server port number. The default port is 1521.
  - For the connection, select one of the following options and enter the name of your Oracle instance in the text field:

Option	Action in text field (example)
<b>SID</b>	ORCL
<b>Service name</b>	ORCLPDB

**Note:** The SID and service name entered in the text field provided is unique to your Oracle database. The Oracle instance name entered in the text field is not case-sensitive.

- In the **Username** field, enter your Oracle database user or schema name.
- In the **Password** field, enter the password for the user or schema name.
- Use Secure Connection:** Select to use a CA certificate as specified.

**Note:** Use the same host name for certificate and database connections.

- Certificate:** This option is enabled when you select **Use Secure Connection**. Browse to select a CA certificate.

[Import HTTPS, and CA certificates](#) on page 951

**8. Click **Next**.**

The database connection begins validating for the database server and the elastic search.

**9. Enter the Elasticsearch credentials in the fields provided.**

[Add Elasticsearch credentials](#) on page 877

## Add Elasticsearch credentials

When installing Automation 360, add Elasticsearch credentials for enhanced security.

Based on whether you are performing a new installation, running the setup for the first time to upgrade to a later version, or a subsequent re-installation, the options to add the Elasticsearch credentials or select a backup Elasticsearch server are enabled.

**1. In the **Provide Elasticsearch Credentials** window, enter the credentials for Elasticsearch in the **Elasticsearch password** field.**

**Important:** Ensure the following for your Elasticsearch authentication password:

- The password cannot include a space, semicolon (;), percent (%), or backslash (\).
- The first character cannot be a minus sign (-) or forward slash (/).
- Include at least one alphabetical character.

This option is enabled only for the primary node of the cluster when you run the setup for the first time for an upgrade or a new installation of the Control Room. When you enter the password, self-signed certificates are generated for encrypting the data traffic for inter-node and client communication.

The option is disabled for subsequent installations because the password and certificates are retrieved and reused from the second node onwards.

**2. Repeat the credentials in the **Confirm Elasticsearch password** field.**

3. Select the **Check only if installing on the first node of the backup Elasticsearch cluster** check box when you want to install the Control Room on the primary node that will be used as a backup for the Elasticsearch cluster.

This option is available only if you have provided the Elasticsearch credentials for the primary node during a previous installation. The option enables you to use the database backup that is created from the Elasticsearch settings table after the primary node of the cluster is installed.

The option is disabled for subsequent installations.

4. Click **Next** to configure the IP cluster.

If you encounter errors when performing this task, see these resources:

- Error on storing Elasticsearch certificate to database, see [Installation error storing Elasticsearch certificate to database \(A-People login required\)](#).
- Error restarting the Automation Anywhere Elastic Search Service, see [Automation 360 v.16 upgrade error: Elasticsearch Service fail to start during certificate retrieval process \(A-People login required\)](#).

[Configure IP cluster](#) on page 878.

## Configure IP cluster

Use the **Cluster Configuration** wizard page under **Custom installation type** in Control Room installer to configure resiliency requirements. Select the **Enable Cluster setup** option and for high availability cluster, provide multiple (three or more) IP addresses from your cluster setup.

Before you install Control Room in cluster mode:

- Ensure that the default/custom and configurable firewall, port, and protocol requirements for Automation 360 deployment are configured. For more information, see [Ports, protocols, and firewall requirements](#) on page 823.
- Ensure that the network location (UNC) path is configured to access the repository files from all Control Room nodes in the cluster.

Ensure that the Network Attached Storage (NAS) file sharing can be configured using Server Message Block (SMB) protocol.

- Ensure that all nodes that will be configured for the IP cluster are available for configuration before the installation. Also, while installing on each of the node, ensure that the list of IP addresses of all nodes are provided in the same order when configuring the **Cluster IP addresses** field in **Cluster Configuration** wizard page.

- Ensure to sign all the PowerShell files if the machine on which you are installing Automation 360 has MachinePolicy as AllSigned or UnRestricted. For example on how signing in a Windows PowerShell script, see [Signing in Windows PowerShell scripts](#).

To view the MachinePolicy on your machine, run the following command in PowerShell:

```
Get-ExecutionPolicy -List
```

You can find the following PowerShell files in the temp folder:

- servicecredsvalidate
- getsysip
- getfileprodversion
- ecertprocess
- createstorageables
- createpddtables
- createiqbottables
- createcrdbtables
- createaaridbtables

Example of a temp folder path: C:\Users\ADMINI~1.FD\AppData\Local\Temp\<GUID>.

**Note:** GUID is generated dynamically for each installer session.

A sample URL for reviewing the health of the cluster is:

```
https://<cr ip>:47599/_cat/health?pretty
```

You are prompted to enter the following credentials:

- **Username:** es\_client (default)
- **Password:** <your set\_elastic\_search\_password>

A green or yellow color icon is displayed for a healthy cluster.

1. Select the **Enable Cluster Setup** check box.
2. If the nodes in your network use IPv6 address, select the **IPv6** check box.
3. Enter the IP addresses of the nodes in the cluster.  
Use a comma (,) to specify more than one IP address. For example, to specify three IP addresses in the cluster, enter: 192.0.2.1,192.0.2.2,192.0.2.3

**Note:** The first IP address in the list is used as the initial master node. Ensure that you enter the IP addresses in the same order on all node configurations in subsequent installations.

You can install multiple nodes at the same time after the master node is installed. After installation, you can add a new IP address to the cluster at the end of the list. However, you cannot change the IP address version (such as IPv4 to IPv6).

4. Select an IP address from the **Local IP Address** drop-down list.

If multiple local IP addresses are configured on the machine, ensure that you select an IP address (private IP address recommended) on which the Control Room is installed, as it will be used by other nodes internally to communicate with each other.

5. Click **Next** to complete the Control Room installation process.

6. Optional: To review or monitor the installation progress, see [Setup installation summary](#) on page 884.

## Add nodes to a cluster setup

As an RPA platform administrator, you can add nodes to a cluster for better performance and better load distribution.

Ensure the following:

- Verify whether the prerequisites for on-premises installation are met.

[Automation 360 On-Premises prerequisites](#) on page 804

- Verify that all the primary nodes and databases have backups.

- You must have the IP addresses of all the cluster members for the Control Room server network interfaces used for Elasticsearch communications.

---

**Note:** The Control Room servers can have multiple network interfaces. The server IP addresses must be statically assigned and cannot use the Dynamic Host Configuration Protocol (DHCP).

---

- If any external load balancers are used in the environment, update them with IP addresses from the new server nodes.
- Ensure that you have administrator or root privileges on the Control Room servers. You must be familiar with installing Control Room in custom mode and also with the related configuration settings.

Adding nodes to a cluster helps you to upgrade the configuration of the nodes in a cluster. You can add nodes to a Control Room cluster setup, change the IP addresses of nodes in the cluster, and monitor the health of the underlying cluster services.

---

**Note:** The minimal number of nodes supported within a Control Room cluster is three. The nodes in a cluster synchronize with each other over a local network. All the nodes in a cluster connect to the same database.

---

Perform the following steps to add three nodes (N4, N5, and N6) to a cluster that has three nodes (N1, N2, and N3).

1. On node N4, log in to the operating system as an administrator and run the Control Room installer.
2. Proceed through the installer to the cluster configuration.
  - a) Select **Enable Cluster Setup**.
  - b) In the **Cluster IP addresses** box, enter the IP addresses of all the nodes that you need to configure in the cluster.  
172.31.30.120, 172.31.21.216, 172.31.17.110, 172.31.20.242,  
172.31.17.149, 172.31.18.37
  - c) Select or add your Local IP address.

---

**Note:** The IP addresses must be entered in the same sequence on every node.

---

3. Restart the nodes, one at a time.  
After you restart the nodes, each node will have six IP addresses.
4. Complete the remaining steps to install Control Room.  
[Installing Control Room On-Premises](#) on page 801
5. Repeat the steps 1 on page 881 through 4 on page 881 for nodes N5 and N6.
6. Ensure that all the Control Room services have started for all the nodes.

7. To verify the health of the cluster, use the Elasticsearch API through a browser or API tool.
  - a) From a browser, navigate to the IP address of any node in the cluster by using the Elasticsearch port 47599 and use the `_cat/nodes` API.  
`https://172.31.30.120:47599/_cat/nodes`  
 The master node is indicated by an asterisk character (\*).
  - b) Verify that the IP address of the master node is the same as the one mentioned in the `elasticsearch.yml` file for all the nodes.
  - c) From a browser, navigate to the IP address of any node in the cluster by using the Elasticsearch port 47599 and use the `_cat/health?pretty` API.  
`https://172.31.30.120:47599/_cat/health?pretty`

You must wait until the replication status turns **green**. The replication time varies depending on the data load in the clusters. The replication status turns green when the cluster is fully synchronized.

## Upgrade nodes in a cluster setup

If you have a mutinode cluster setup that contains both Elasticsearch and OpenSeach nodes, and you are upgrading to Automation 360 v.28, the Automation 360 installation might fail.

To fix the installation issue, you must perform the following workaround:

This example describes how to upgrade a three-node cluster:

1. Start with the master node (in this example, node 1) and complete the installation.
2. Stop the Elasticsearch service on node 1.
3. In a browser window, enter the localhost URL ([https://localhost:47599/\\_cat/nodes](https://localhost:47599/_cat/nodes)) to identify the master node.

---

**Note:** The master node should not be node 1.

---

4. Start with node 2 and complete the installation.
5. Start the Elasticsearch service on node 1.
6. Stop the Elasticsearch service on node 3.
7. In a browser window, enter the localhost URL ([https://localhost:47599/\\_cat/nodes](https://localhost:47599/_cat/nodes)) to identify the master node.

---

**Note:** The master node should not be node 3.

---

8. Start the Elasticsearch service on node 3.
9. Start with node 3 and complete the installation.

## Remove nodes from a cluster setup

As an RPA platform administrator, you can remove nodes from a Control Room cluster setup to replace them or upgrade them for enhanced performance.

Ensure the following:

- Verify that all the primary nodes and databases have backups.
- Ensure that you have administrator or root privileges on the Control Room servers.

Perform the following steps to remove three nodes (N1, N2, and N3) from a cluster that has six nodes (N1, N2, N3, N4, N5, and N6).

1. Verify the master node. Use the following Elasticsearch API through a browser or API tool to identify the master node:

`https://172.31.18.37/_cat/nodes`

2. Log in to the server as an administrator and stop all the Control Room services by running the following command:

```
services.msc
```

Log in to any of the original nodes N2 or N3 and not the master node N1.

3. Similarly, stop all the Control Room services for the master node N1.
4. Before removing the nodes, verify the health of the cluster by using the following Elasticsearch API through a browser or API tool:

From a browser, navigate to the IP address of any node in the cluster by using the Elasticsearch port 47599 and use the `_cat/nodes` API.

`https://172.31.18.37/_cat/nodes`

---

**Note:** The master node is indicated by an asterisk character (\*).

---

5. Edit the `cluster.properties` file located at `C:\Program Files\Automation Anywhere\Automation 360\config`.
6. Remove the IP addresses for the original three nodes from the **cluster.properties** attribute.

---

**Note:** Perform this action for all the nodes in the cluster. When you remove the IP addresses of the original three nodes, do not change their sequence.

---

7. Edit the `elasticsearch.yml` file at `C:\Program Files\Automation Anywhere\Automation 360\elasticsearch\config`.
8. Remove the IP addresses for the original three nodes from the **discovery.zen.ping.unicast.hosts** attribute.

---

**Note:** The `discovery.zen.ping.unicast.hosts` attribute must contain the IP addresses only for the new nodes and in the same sequence within the file on each node.

---

9. To verify the new master node, use the following Elasticsearch API through a browser or API tool:

`https://172.31.18.37/_cat/nodes`

10. Update the IP address of the new master node in the **cluster.initial\_master\_nodes** attribute.
11. Run the following command to start the services on each node:

```
services.msc
```

You must start the services on the master node at the end.

12. To verify the health of the cluster, use the Elasticsearch API through a browser or API tool.
  - a) From a browser, navigate to the IP address of any node in the cluster by using the Elasticsearch port 47599 and use the `_cat/nodes` API.

`https://172.31.30.120:47599/_cat/nodes`

---

**Note:** The master node is indicated by the asterisk character (\*).

---

- b) From a browser, navigate to the IP address of any node in the cluster by using the Elasticsearch port 47599 and use the `_cat/health?pretty` API.

`https://172.31.30.120:47599/_cat/health?pretty`

You must wait until the replication status turns **green**. The replication time varies depending on the amount of data in the clusters. The replication status turns green when the cluster is fully synchronized.

## Setup installation summary

Continue from the Control Room installer to the **Ready to Install the Program** wizard page. From this stage of the installation wizard, you finish the installation wizard and monitor the installation progress.

**1. Click Next.**

The **Ready to Install the Program** screen appears.

**2. Click Install** and allow the installation process to complete.

The **InstallShield Wizard Completed** screen appears.

**3. Click Finish.**

Launch Automation Anywhere is enabled by default.

Enable **Show installer settings** to open the `aae-installsummary.html` file. By default, this is located at `C:\Program Files\Automation Anywhere\Enterprise\`. Use this file to view a summary of the installation.

Complete the Control Room configuration and validation.

- [Complete Control Room post-installation configuration](#) on page 926

After installing the Control Room, complete the configuration settings to ensure timely Automation Anywhere communications are specified and confirm Automation Anywhere services are running.

- [Post-installation user management](#) on page 937

After completing the post-installation tasks, validate the setup by logging in to the Control Room and installing a license. First time access to the Control Room walks you through the configuration for your authentication method.

- [Users](#) on page 2002

As a Cloud user with administrator permissions, you can create, view, edit, delete, and enable or disable a user. Creating users steps vary depending on whether the user is a non-Active Directory, Active Directory, or single sign-on (SSO) user from an IdP server.

### Related tasks

[Installing Control Room using Express mode](#) on page 884

## Installing Control Room using Express mode

Log in to the servers as an Administrator and install Automation Anywhere Control Room in Express Mode using the default settings.

---

**Note:** Linux users, see [Installing Control Room on Linux](#) on page 909.

---

- Verify [Automation 360 On-Premises prerequisites](#) on page 804.
- Ensure that you have the following:
  - Automation Anywhere Control Room installation file
  - TLS certificate
  - License file

---

**Important:** This installation mode is ideal for demo and training purposes. This installation mode is **not recommended** for the production environment.

---

The Express Mode installation quickly sets up the Control Room with default parameters for the various components.

### Default parameters

Microsoft SQL Server is the default database for Control Room.

The following parameters are installed by default:

Parameter	Default value
SQL database instance	SQLEXPRESS
Authentication type	Windows authentication
Control Room database	Automation360-Database
Port	1433

To install Automation Anywhere Control Room in Express Mode, follow these steps:

1. Log in to the installation server.
2. Start the installer wizard.
  - a) Extract all files from the `Automation360_Build_<build-number>.zip` file.
  - b) Right-click the `Automation360.exe` file and select **Run as administrator**.

The installation process creates the Control Room database with the name Automation360-Database on your SQL database server instance.

---

**Note:** Ensure the SQL database server is installed on a different server than that of the Control Room.

---

The installation process checks for supported operating system and recommended hardware requirements. The following message appears if the requirements are not met:

```
This system does not meet all the installation prerequisites for Automation
Anywhere Enterprise.
Some features might not work as expected after installation. For details,
verify the Control Room Installation Prerequisite.
```

For more information, see [Automation 360 On-Premises prerequisites](#) on page 804.

3. Click **Next** on the **Welcome to the Setup Wizard** page.
4. Select one of the following deployment types and click **Next**:

Deployment type	Description
<b>On-Premises</b>	The Control Room, Bots and files are installed on your servers.
<b>Cloud-enabled</b>	All data such as bots and files are installed on your servers. The management functions of the Control Room are delivered through Cloud.

5. Accept the licensing agreement and click **Next**.

6. On the **Installation Type** page, select the **Express** option and click **Next**.

The **Database Server** configuration page appears.

- a) Enter the port you want to use to connect to the database server in the **Port** field.  
The default port is 1433. The installer uses the first available port and checks the availability of each consecutive port.
- b) Select any one of the following options to connect to the database server.

Option	Action
<b>Use Windows Authentication</b>	The system uses your Windows credentials. The <b>Login ID</b> and <b>Password</b> fields are disabled in the installer.
<b>Sql Server authentication</b>	Enter the <b>Login ID</b> and <b>Password</b> used for connecting to the database server.
<b>AD Azure authentication</b>	Enter the <b>Login ID</b> and <b>Password</b> used for connecting to the database server.  Select this option to use Microsoft Azure Active Directory credentials to connect to the database when you install the Control Room on Microsoft Azure.

---

**Note:** The user who connects to the database server must have database creator privileges.

---

- c) Enter the name of the database that you want to use for Control Room in the **Name of Control Room** database field.

7. Click **Next** on **Provide Elasticsearch credentials** page to configure Elasticsearch for enhanced monitoring and alerting in the Control Room.

---

**Important:** Ensure the following for your Elasticsearch authentication password:

- The password cannot include a space, semicolon (;), percent (%), or backslash (\).
- The first character cannot be a minus sign (-) or forward slash (/).
- Include at least one alphabetical character.

---

This option is enabled only for the primary node of the cluster when you run the setup for the first time for a new installation or an upgrade of the Control Room. When you enter the password, self-signed certificates are generated for encrypting the data traffic for inter-node and client communication.

The option is disabled for subsequent installations because the password and certificates are retrieved and reused from the second node onwards.

8. Optional: When you want to install the Control Room on the primary node that will be used as a backup for the Elasticsearch cluster, select the **Check only if installing on the first node of the backup Elasticsearch cluster** check box.  
This option is available only if you have provided the Elasticsearch credentials for the primary node during a previous installation. The option enables you to use the database backup that is created from the Elasticsearch settings table after the primary node of the cluster is installed.  
The option is disabled for subsequent installations.
9. Click **Next**.
10. On the **Ready to Install the Program**, click **Install** and allow the installation process to complete.  
During this process, the Automation 360 services are started automatically.
11. On the **InstallShield Wizard Completed** page, click **Finish**.  
Launch Automation 360 is enabled by default.  
Enable **Show installer settings** to open the `aae-installsummary.html` file. By default, this is located at `C:\Program Files\Automation Anywhere`. Use this file to view a summary of the installation.

The Control Room launches in your default browser with the **Configure Control Room settings** page displayed. Proceed to [Complete Control Room post-installation configuration](#) on page 926.

### Related concepts

[Installing Control Room using Custom mode](#) on page 863

Log in to the server as an administrator and install Automation Anywhere Control Room in Custom mode to select installation and configuration options, including installing non-default requirements. Select this mode for a data center deployment.

## Installing Control Room on Amazon Web Services

Log in to an Amazon Web Services (AWS) server instance as Administrator. Then, download and start the Control Room installer and select **Custom** mode.

---

### Note:

- Many possible system configurations and requirements exist. These installation steps do not account for all those possibilities, so your specific setup and installation steps will vary, and Automation Anywhere does not make any warranties that these steps conform to your specific configurations.
  - For Automation 360 to work properly on Amazon Workspace, update the registry on all Workspace machines. For details, see [Device compatibility](#) on page 991.
- 

### Step 1: Prepare for installation

- Verify [Automation 360 On-Premises prerequisites](#) on page 804.
- Ensure that you have the following:
  - Automation Anywhere Control Room installation file
  - TLS certificate
  - License file

### Step 2: [Prepare for installation on Amazon Web Services](#) on page 888

Use these steps to prepare the Amazon Web Services (AWS) instances for the Control Room installation.

**Step 3:** *Customize Control Room installation on Amazon Web Services* **on page 890**

Install and apply the customized configuration required for the Control Room cluster on Amazon Web Services (AWS) after completing initial preparations.

**Step 4: Complete Control Room configuration and validation.**

*Complete Control Room post-installation configuration* **on page 926**

After installing the Control Room, complete the configuration settings to ensure timely Automation Anywhere communications are specified and confirm Automation Anywhere services are running.

*Post-installation user management* **on page 937**

After completing the post-installation tasks, validate the setup by logging in to the Control Room and installing a license. First time access to the Control Room walks you through the configuration for your authentication method.

**Step 5: Prepare for users.**

*Users* **on page 2002**

As a Cloud user with administrator permissions, you can create, view, edit, delete, and enable or disable a user. Creating users steps vary depending on whether the user is a non-Active Directory, Active Directory, or single sign-on (SSO) user from an IdP server.

## Prepare for installation on Amazon Web Services

Use these steps to prepare the Amazon Web Services (AWS) instances for the Control Room installation.

If you have not done so already, prepare your AWS Identity and Access Management (IAM) user account to login to the AWS Console.

Do the following:

1. Create AWS Elastic Compute Cloud (EC2) Instances for the Control Room Servers.
2. If you use RDS, create Relational Database Service (RDS) Instances for the SQL Server Enterprise 2014 Database server.
3. Configure the AWS Load Balancer.

---

**Note:** There are many possible system configurations and requirements. These installation steps do not account for all those possibilities so your specific setup and installation steps will vary and Automation Anywhere does not make any warranties that these steps conform with your specific configurations.

---

To prepare AWS instances, do the following:

1. Set up the *Microsoft SQL Server* on Amazon Web Services Elastic Compute Cloud (AWS EC2) or Relational Database Service (RDS).  
AAE supports both. For a comparison of the two, see *Microsoft SQL Server on AWS*.
2. Test the database connection with the Microsoft SQL Server.
  - a) Install Microsoft SQL Management Studio on one of the AWS EC2 instances inside the Virtual Private Cloud (VPC).  
For more information, see *Download SQL Server Management Studio*.
  - b) Connect to the Microsoft SQL Server.  
For configuration information, see *Working with SQL Servers* on page 813.
  - c) (Skip this step if the master database user installs the Control Room). Create the following empty database and assign `db_owner` privileges to the master database user for the Automation360-Database.
3. Set up the shared repository.
  - a) Create an AWS EC2 instance as a Windows File Server with an additional volume of 100 GB.
  - b) Join the Active Directory domain.
  - c) Create a folder and set up the permissions for the repository.  
Assign the Control Room admin full access to this folder.

---

**Important:** Only the Control Room admin is to have full access to this folder because this is the account from which all Control Room services run.

---

4. Launch three AWS instances, one for each Control Room server.
  - a) Establish three AWS instances, each with the following configuration:
    - Type: c5.2xlarge or similar instance type (8 CPU, 16 GB RAM)
    - Storage: Root Device: 100 GB
    - Storage: Additional Device: D:\ 200 GB (For Automation Anywhere Install files)
    - Accidental Deletion Prevention: Enabled
  - b) Access the three instances through Remote Desktop Protocol.
  - c) Add the instances to the Active Directory domain.
  - d) For each instance, add the Control Room system admin as a local administrator on the computer and reboot the system.
5. Configure the firewall and port.  
See *Ports, protocols, and firewall requirements* on page 823.
6. Set up the AWS Application Load Balancer.  
See *Details for Elastic Load Balancing Products*.
  - Disable the stickiness attribute.
  - Set the idle time-out to 120 seconds.

## 7. Upload the SSL certificate to the Load Balancer.

Continue with [Customize Control Room installation on Amazon Web Services](#) on page 890.

## Customize Control Room installation on Amazon Web Services

Install and apply the customized configuration required for the Control Room cluster on Amazon Web Services (AWS) after completing initial preparations.

If you have not done so already, complete the initial installation steps in [Prepare for installation on Amazon Web Services](#) on page 888.

---

**Note:** There are many possible system configurations and requirements. These installation steps do not account for all those possibilities so your specific setup and installation steps will vary and Automation Anywhere does not make any warranties that these steps conform with your specific configurations.

---

To install the Control Room in a cluster setup, do the following steps:

1. Login to the first AWS instance as an Administrator.
2. Download `Automation Anywhere_<version>.exe`.
3. Click **Next** on the **Welcome to the Setup Wizard** page.
4. Accept the licensing agreement and click **Next**.
5. Select the **Custom** option and click **Next**.

The **Destination Folder** page appears. By default, the destination folder is `C:\Program Files\Automation Anywhere\Enterprise\`.

6. To make changes to the destination folder, click **Change**, enter a new destination folder name, and click **OK**.

---

**Note: Do not** install the application directly in the root directory (`C:\`). You should create a folder, for example, `C:\Program Files\Automation Anywhere\Enterprise\`.

---

7. Click **Next** to configure the IP cluster.
8. Select the **Enable Cluster Setup** check box.

The check box is enabled by default if the machine on which the setup is being run has local IP addresses configured.

To install the Control Room on a single node and not a cluster, clear the **Enable Cluster Setup** check box.

9. Enter the IP addresses of the nodes in the cluster.
  - Enter IPv6 addresses if all the nodes in the network are using IPv6.
  - Enter IPv4 addresses if some nodes in the network are using a combination of IPv4 and IPv6 addresses.

- a) Use a comma (,) to specify more than one IP address.  
For example, to specify three IP addresses in the cluster, enter:

```
192.0.2.1,192.0.2.2,192.0.2.3
```

---

**Important:** The first IP address in the list is used as the master node. Ensure that you enter the IP addresses in the same order on all node configurations in subsequent installations. An incorrect

order causes the application to configure the IP addresses as separate clusters, which will result in data loss when the issue is fixed after installation.

You can install multiple nodes at the same time after the master node is initially installed.

After installation, you can add a new IP address to the cluster at the end of the list.

- b) After you enter the cluster IP addresses correctly, select a valid address IP at the message prompt to provide network access to the machine.

**10.** Click **Next** to configure the application Transport Layer Security (TLS).

**11.** In the **TLS Configuration** page, configure the following:

- **Generate a Self-Signed Certificate**

Enabling the **Self-Signed Certificate** option allows the installer to generate a unique private key and a self-signed certificate for the Control Room.

- **Import a Certificate**

To import a custom certificate, clear the **Self Signed Certificate** check box. This setting allows you to import a certificate using the **Certificate Path** field.

---

**Note:** The certificate file must be a PKCS12 format.

---

Provide the following information:

- **Certificate Path:** Click **Browse** to import the certificate.
- **Private Key Password:** Enter the password for the private key.

---

**Password limitation:** Do not use the at sign (@) in passwords. Using the special character @ in the password causes the certificate file import to fail.

---

- **Webserver Port:** Enter the web server port – either HTTP or HTTPS. If the port is already assigned, an error message is displayed.

---

**Important:** The port validation message is also displayed when you add 8080 for the web server and if that port is already in use for a Control Room license service. Use a different unassigned port in these cases.

---

- **Enable Force HTTP traffic to HTTPS:** This option redirects all HTTP port requests to HTTPS. To access to the Control Room through HTTPS using the generated self-signed certificate, ensure the port numbers are different for HTTP and HTTPS.

To generate a custom certificate for HTTPS, ensure your custom certificate meets the following:

- Create a `.pfx` certificate with a pass code from a CA trusted authority.
- Combine Root, Intermediate, and Machine level certificates into a single certificate.
- Use the format `[WS Machine Host Name].[DomainName].com` for the private key.
- Include the host name as a fully qualified domain name (FQDN) in the certificate.

You provide the host name during Control Room installation.

- In multi-node HA clusters, issue certificates to the load balancer DNS name.
- Add individual URLs, which require access to all nodes, to the `Subject Alternative Name` field in the certificate.

For more information, see Automation Anywhere support site: [Automation 360 On-Premises prerequisites \(A-People login required\)](#).

**12.** Click **Next** to configure the service credentials.

**13.** In the **Service Credentials** screen, choose from the listed options.

The Windows Service credentials include a user name and password. The user specified must meet these requirements:

- A member of the local system administrator group.
- Have permission to manage services, including Automation Anywhere services.
- If you use Windows authentication to connect to the SQL database, ensure you grant the `db_owner` permission to the service credential user.

These service credentials allow the Control Room processes to run the required services.

- **Local System Account**—(default) The logged-on user performing the installation
- **Domain Account**—Specify a user that is not the local system account user
  - a. Clear the **Local System Account** check box.
  - b. Enter the user name and password for the domain account.
 

Use only supported characters for the user name and password. See [Supported special characters](#) on page 836.
- **Do not use the Windows domain credentials**

Enter credentials valid for running Automation Anywhere services. Without the valid credentials, the Control Room will fail to launch.
- **PowerShell script restrictions**

Specify a user with permissions to launch PowerShell scripts who is not a Windows domain user. Without the relevant permissions, database table creation can fail.

**14.** Add the SQL Server and click **Next**.

Select **Microsoft SQL Server**, type the **Name**, and click **Next**.

**15.** On the **InstallShield Wizard Completed** page, click **Finish**.

Launch Automation Anywhere is enabled by default.

Enable **Show installer settings** to open the `aae-installsummary.html` file. By default, this is located at `C:\Program Files\Automation Anywhere\Enterprise\`. Use this file to view a summary of the installation.

The Control Room launches in your default browser with the Configure Control Room settings page shown. Continue with [Configure settings post-installation on Amazon Web Services](#) on page 892.

## Configure settings post-installation on Amazon Web Services

After installation is complete, configure Control Room settings on Amazon Web Services.

If you have not done so already, complete the installation steps in [Customize Control Room installation on Amazon Web Services](#) on page 890.

---

**Note:** There are many possible system configurations and requirements. These installation steps do not account for all those possibilities so your specific setup and installation steps will vary and Automation Anywhere does not make any warranties that these steps conform with your specific configurations.

---

To install Automation Anywhere on Amazon Web Services (AWS), do the following steps:

1. Configure the following Control Room settings:
  - a) Specify the host name URL by providing the AWS Load Balancer URL.  
This is the URL that users use to access your installation of Control Room.
  - b) Select the Active Directory authentication type. For more information, see [Configure Control Room for Active Directory: manual mode](#) on page 940.
2. After you configure the Control Room, install product licenses.
3. Test Control Room access using the AWS Load Balancer URL.  
This completes the Control Room installation on AWS.

Complete the Control Room configuration and validation.

- [Complete Control Room post-installation configuration](#) on page 926

After installing the Control Room, complete the configuration settings to ensure timely Automation Anywhere communications are specified and confirm Automation Anywhere services are running.

- [Post-installation user management](#) on page 937

After completing the post-installation tasks, validate the setup by logging in to the Control Room and installing a license. First time access to the Control Room walks you through the configuration for your authentication method.

- [Users](#) on page 2002

As a Cloud user with administrator permissions, you can create, view, edit, delete, and enable or disable a user. Creating users steps vary depending on whether the user is a non-Active Directory, Active Directory, or single sign-on (SSO) user from an IdP server.

## Installing Control Room on Microsoft Azure

Installing Control Room on Microsoft Azure begins in the Azure environment and ends with configurations in the Control Room.

---

**Note:** There are many possible system configurations and requirements. These installation steps do not account for all those possibilities so your specific setup and installation steps will vary and Automation Anywhere does not make any warranties that these steps conform with your specific configurations.

---

### Step 1: Prepare for installation.

- Verify [Automation 360 On-Premises prerequisites](#) on page 804.
- Ensure that you have the following:
  - Automation Anywhere Control Room installation file
  - TLS certificate
  - License file

### Step 2: [Verify readiness for installation on Microsoft Azure](#) on page 894

Use these steps to configure third-party products for the Control Room installation.

### Step 3: [Begin Control Room installation on Microsoft Azure](#) on page 897

Initial steps for Control Room installation on Microsoft Azure.

**Step 4:** *Customize Control Room installation on Microsoft Azure on page 897*

Install and apply the customized configuration required for the Control Room cluster on Microsoft Azure.

**Step 5: Complete Control Room configuration and validation.**

*Complete Control Room post-installation configuration on page 926*

After installing the Control Room, complete the configuration settings to ensure timely Automation Anywhere communications are specified and confirm Automation Anywhere services are running.

*Post-installation user management on page 937*

After completing the post-installation tasks, validate the setup by logging in to the Control Room and installing a license. First time access to the Control Room walks you through the configuration for your authentication method.

**Step 6: Prepare for users.**

*Users on page 2002*

As a Cloud user with administrator permissions, you can create, view, edit, delete, and enable or disable a user. Creating users steps vary depending on whether the user is a non-Active Directory, Active Directory, or single sign-on (SSO) user from an IdP server.

## Verify readiness for installation on Microsoft Azure

Use these steps to configure third-party products for the Control Room installation.

---

**Note:** There are many possible system configurations and requirements. These installation steps do not account for all those possibilities so your specific setup and installation steps will vary and Automation Anywhere does not make any warranties that these steps conform with your specific configurations.

---

To configure third-party products prior to installation, do the following steps:

1. Ensure the installation environment meets the data center requirements and collect the necessary information about the following components:

- Load balancer - IP address
- Microsoft SQL Server - port credentials
- Azure SMB file share - address credentials
- Enterprise identity management system (optional)

If you have Active Directory (AD) - AD server domain credentials

- SMTP - host port HTTP/S ports for TLS (optional)
- Control Room servers - Have Windows credential manager installed

Refer to [Supported data center component versions on Microsoft Azure](#) on page 896 for configuration and version information.

2. Configure the Network Security Group as per the recommended security policies for Inbound Port rules:

Data center object	Port	Protocol
Control Room	<ul style="list-style-type: none"> <li>• 80</li> <li>• 443</li> </ul>	Any
LDAP	<ul style="list-style-type: none"> <li>• 3268</li> <li>• 3269</li> </ul>	Any
email SMTP	587	Any
SSH	22	Any
RDP	3389	TCP

3. Configure the AD server.

Ensure all users are part of the AD domain and the AD server is setup in IaaS mode for Azure cluster environment installations. To add user, navigate to **Active Directory Users and Computers > <domain> > Users** and add the necessary user.

To configure the AD server on Azure with IDaaS, refer to the [Microsoft Azure documentation](#).

#### 4. Ensure the Control Room servers in the cluster can ping each other.

If the ping is not successful:

- a) In **Windows Defender Firewall with Advanced Security>Inbound rules**, set the following values for the file and printer sharing firewall rule:
  - **Name:** File and Printer Sharing (Echo Request - ICMPv4-In)
  - **Group:** File and Printer Sharing
  - **Profile:**All
  - **Enabled:** Yes
  - **Action:** Allow
  - **Override:** No
  - **Program:** Any
  - **Local address:** Any
  - **Remote address:** Any
  - **Protocol:** ICMPv4
- b) Ping the Control Room after enabling the firewall rule change.

When you have completed the pre-installation configurations, [Begin Control Room installation on Microsoft Azure](#) on page 897.

### Supported data center component versions on Microsoft Azure

For installing Automation Anywhere on the Microsoft Azure cluster environment, the versions of data center components that are supported are identified for each component.

Data center object	Supported version	Configuration
Control Room operating system	<ul style="list-style-type: none"> <li>• Microsoft Windows Server 2012 and 2012 R2 Datacenter</li> <li>• Microsoft Windows Server 2016 Standard and Datacenter</li> <li>• Microsoft Windows Server 2019 Standard and Datacenter</li> </ul>	IaaS
Identity management: Azure <a href="#">Active Directory</a>	Azure Active Directory	<ul style="list-style-type: none"> <li>• IDaaS</li> <li>• Windows 2016 for IaaS</li> </ul>
<a href="#">SMB File Share</a>	Azure File Share with Server Message Block 2.0 and 3.0 (SMB) protocol	PaaS
<a href="#">Load Balancer</a>	Azure Load Balancer	PaaS
	Azure Application Gateway	
<a href="#">Microsoft SQL Server</a>	Azure SQL Database with single database (Microsoft SQL Azure (RTM) - 12.0.2000.8)	PaaS

## Begin Control Room installation on Microsoft Azure

Initial steps for Control Room installation on Microsoft Azure.

If you have not done so already, complete the pre-installation configuration in [Verify readiness for installation on Microsoft Azure](#) on page 894.

---

**Note:** There are many possible system configurations and requirements. These installation steps do not account for all those possibilities so your specific setup and installation steps will vary and Automation Anywhere does not make any warranties that these steps conform with your specific configurations.

---

To begin the installation:

1. Use Remote Desktop Connection (RDC) to connect to the Control Room server, as an Administrator, and run the Control Room installer.
2. Click **Yes** to start the installer.
3. Click **Next** on the **Welcome to the Setup Wizard** page.
4. Accept the licensing agreement and click **Next**.
5. Select the **Custom** option and click **Next**.
6. Click **Next** to setup the system IPs.  
The **Cluster Configuration** window displays.

Continue with [Customize Control Room installation on Microsoft Azure](#) on page 897.

## Customize Control Room installation on Microsoft Azure

Install and apply the customized configuration required for the Control Room cluster on Microsoft Azure.

If you have not done so already, complete the initial installation steps in [Begin Control Room installation on Microsoft Azure](#) on page 897. This task requires the configuration information you gathered in the prerequisites stage. This includes IP addresses, certificates, and credentials for the the Control Room servers, datacenter servers, and databases.

---

**Note:** There are many possible system configurations and requirements. These installation steps do not account for all those possibilities so your specific setup and installation steps will vary and Automation Anywhere does not make any warranties that these steps conform with your specific configurations.

---

**Important:** Automation 360 software components are not compatible with Distributed Resource Scheduling (DRS) and Virtual Migration of Dynamic Processes across hosts. Ensure that you do not enable the corresponding properties of the host virtual machines.

---

To install the Control Room in a cluster setup, do the following steps:

1. Select the **Enable Cluster Setup** check box.  
The check box is enabled by default if the machine on which the setup is being run has local IP addresses configured.  
To install the Control Room on a single node and not a cluster, clear the **Enable Cluster Setup** check box.

**2.** Enter the IP addresses of the nodes in the cluster.

- a) Use a comma (,) to specify more than one IP address.  
For example, to specify three IP addresses in the cluster, enter:  
192.0.2.1,192.0.2.2,192.0.2.3

---

**Important:** The first IP address in the list is used as the master node. Ensure that you enter the IP addresses in the same order on all node configurations in subsequent installations. An incorrect order causes the application to configure the IP addresses as separate clusters, which will result in data loss when the issue is fixed after installation.

---

You can install multiple nodes at the same time after the master node is initially installed.

After installation, you can add a new IP address to the cluster at the end of the list.

- b) After you enter the cluster IP addresses correctly, select a valid address IP at the message prompt to provide network access to the machine.

**3.** Click **Next** to configure the application Transport Layer Security (TLS).

4. In the **TLS Configuration** page, configure the following:

- **Generate a Self-Signed Certificate**

Enabling the **Self-Signed Certificate** option allows the installer to generate a unique private key and a self-signed certificate for the Control Room.

- **Import a Certificate**

To import a custom certificate, clear the **Self Signed Certificate** check box. This setting allows you to import a certificate using the **Certificate Path** field.

---

**Note:** The certificate file must be a PKCS12 format.

---

Provide the following information:

- **Certificate Path:** Click **Browse** to import the certificate.
- **Private Key Password:** Enter the password for the private key.

---

**Password limitation:** Do not use the at sign (@) in passwords. Using the special character @ in the password causes the certificate file import to fail.

---

- **Webserver Port:** Enter the web server port – either HTTP or HTTPS. If the port is already assigned, an error message is displayed.

---

**Important:** The port validation message is also displayed when you add 8080 for the web server and if that port is already in use for a Control Room license service. Use a different unassigned port in these cases.

---

- **Enable Force HTTP traffic to HTTPS:** This option redirects all HTTP port requests to HTTPS. To access to the Control Room through HTTPS using the generated self-signed certificate, ensure the port numbers are different for HTTP and HTTPS.

To generate a custom certificate for HTTPS, ensure your custom certificate meets the following:

- Create a `.pfx` certificate with a pass code from a CA trusted authority.
- Combine Root, Intermediate, and Machine level certificates into a single certificate.
- Use the format `[WS Machine Host Name].[DomainName].com` for the private key.
- Include the host name as a fully qualified domain name (FQDN) in the certificate.

You provide the host name during Control Room installation.

- In multi-node HA clusters, issue certificates to the load balancer DNS name.
- Add individual URLs, which require access to all nodes, to the `Subject Alternative Name` field in the certificate.

For more information, see Automation Anywhere support site: [Automation 360 On-Premises prerequisites \(A-People login required\)](#).

5. Click **Next** to configure the service credentials.

**6.** In the **Service Credentials** screen, choose from the listed options.

The Windows Service credentials include a user name and password. The user specified must meet these requirements:

- A member of the local system administrator group.
- Have permission to manage services, including Automation Anywhere services.
- If you use Windows authentication to connect to the SQL database, ensure you grant the `db_owner` permission to the service credential user.

These service credentials allow the Control Room processes to run the required services.

- **Local System Account**—(default) The logged-on user performing the installation
- **Domain Account**—Specify a user that is not the local system account user

- a. Clear the **Local System Account** check box.
- b. Enter the user name and password for the domain account.

Use only supported characters for the user name and password. See [Supported special characters](#) on page 836.

- **Do not use the Windows domain credentials**

Enter credentials valid for running Automation Anywhere services. Without the valid credentials, the Control Room will fail to launch.

- **PowerShell script restrictions**

Specify a user with permissions to launch PowerShell scripts who is not a Windows domain user. Without the relevant permissions, database table creation can fail.

**7.** Click **Next** to configure database type and server.

---

**8.** Set the connection and authentication for the database server.

---

**Note:**

- If possible, do not set the value for **Database Server** as **localhost**. If you must use **localhost**, note that the **Secure Connection** to the database will not work.
  - Click **Browse** to select the SQL Server instance where the Control Room database will be created. Alternatively, enter a database server name or select one from the list.
- 

**Migration task:** If you are migrating from Enterprise 11 to Automation 360, browse to the restored Enterprise 11 database.

Provide the following details:

- a) **Database Port:** Use the default port (1433) or specify a custom value.

*Configure default database port* on page 875

- b) **Use Secure Connection:** Select to use a CA certificate as specified.
- 

**Note:** Use the same host name for certificate and database connections.

---

- c) **Certificate:** This option is enabled when you select **Use Secure Connection**. Browse to select a CA certificate.

*Import HTTPS, and CA certificates* on page 951

- d) **Windows authentication:** This option is selected by default and allows connection to the SQL Server using Windows authentication.
- 

**Note:** If you select Windows authentication, then the user running the installer is used to test that the database exists, create it if required, and grant `db_owner` to the service account user (NT Authority/System).

---

- e) **SQL Server authentication:** Select this option to use SQL Server authentication to connect to the database. Provide the correct user name and password for SQL authentication.

Use only supported characters for the user name and password. See *Supported special characters* on page 836. Do not use semicolons ( ; ) in the database password.

- f) **AD Azure authentication:** Select this option to use Microsoft Azure Active Directory credentials to connect to the database when you install the Control Room on Microsoft Azure

- g) **Name of Control Room database:** Enter the name of the Control Room database.

**Migration task:** If you are migrating from Enterprise 11 to Automation 360, enter the name of the restored database in the database field as shown in the following image:

9. Click **Next**.

10. On the **Ready to Install the Program**, click **Install** and allow the installation process to complete.

11. On the **InstallShield Wizard Completed** page, click **Finish**.

Launch Automation Anywhere is enabled by default.

Enable **Show installer settings** to open the `aae-installsummary.html` file. By default, this is located at `C:\Program Files\Automation Anywhere\Enterprise\`. Use this file to view a summary of the installation.

The Control Room launches in your default browser with the Configure Control Room settings page shown. Continue with [Configure settings post-installation on Microsoft Azure](#) on page 902.

## Configure settings post-installation on Microsoft Azure

After Control Room installation is complete, use the Microsoft Azure Portal to configure the clusters. Use the Azure Portal to configure Windows credentials, Control Room settings for repository and URL, master key for Credential Vault, Active Directory authentication, and optionally SMTP settings.

- If you have not done so already, complete the installation steps in [Customize Control Room installation on Microsoft Azure](#) on page 897.
- The service account user must have read and write access for the Azure data drive (SMB).

---

**Note:** There are many possible system configurations and requirements. These installation steps do not account for all those possibilities so your specific setup and installation steps will vary and Automation Anywhere does not make any warranties that these steps conform with your specific configurations.

---

1. From the Azure Portal where [SMB File Share](#) is setup, get the Connection String to retrieve following parameters:
  - Internet or network address
  - User name
  - Password
2. Locate the Window Credential Manager on the control room server and click **Add a Windows Credential**.

---

**3.** Enter the credential information.

---

**Note:** Adding a user under Windows Credential Manager needs to be repeated on all the servers used for testing in the cluster environment (Control Room, Clients/Devices).

---

**4.** Enter information and click **Save and Continue**.

Repository path is extracted from SMB File Share and Control Room access URL in is a load balancer Public IP.

**5.** **Copy** the Master Key and save it (it will be needed to restart the services).

**6.** Select Express mode and click **Save and Continue**.

**7.** Enter the Active Directory authentication configuration information, including URL, Domain username, and password, then click **Check Connection**. If settings are correct, click **Next**.

**8.** Enter the AD user created previously and click **Check name in Active Directory**. Upon validation, click **Save and Log in**.

Create additional users as needed and create corresponding users in the Control Room.

**9.** Optional: Continue with installing other control room nodes in the cluster.

**10.** Perform the SMTP registration.

---

**Note:** A real SSL certificate is recommended for use with deployments.

---

This completes the Control Room installation on Microsoft Azure.

If you see a `Bad Gateway` error message after you install the Control Room in a three-node cluster setup with S0 Azure SQL Database, see the following article for troubleshooting steps.

[Automation A360 - Bad Gateway error in a three node cluster setup \(A-people login required\)](#)

Complete the Control Room configuration and validation.

- [Complete Control Room post-installation configuration](#) on page 926

After installing the Control Room, complete the configuration settings to ensure timely Automation Anywhere communications are specified and confirm Automation Anywhere services are running.

- [Post-installation user management](#) on page 937

After completing the post-installation tasks, validate the setup by logging in to the Control Room and installing a license. First time access to the Control Room walks you through the configuration for your authentication method.

- [Users](#) on page 2002

As a Cloud user with administrator permissions, you can create, view, edit, delete, and enable or disable a user. Creating users steps vary depending on whether the user is a non-Active Directory, Active Directory, or single sign-on (SSO) user from an IdP server.

# Installing Control Room on Google Cloud Platform

Log in to a Google Cloud Platform (GCP) server instance as administrator. Then download and start the Control Room installer and install in Custom mode.

---

**Note:** There are many possible system configurations and requirements. These installation steps do not account for all those possibilities so your specific setup and installation steps will vary and Automation Anywhere does not make any warranties that these steps conform with your specific configurations.

---

**1.** Complete the prerequisites for installation:

- Verify [Automation 360 On-Premises prerequisites](#) on page 804.
- Ensure that you have the following:
  - Automation Anywhere Control Room installation file
  - TLS certificate
  - License file

**2.** [Prepare to install Control Room on Google Cloud Platform](#) on page 905

Ensure that you complete the required steps to prepare the Google Cloud Platform instances for installing the Control Room.

**3.** [Perform custom installation of Control Room on Google Cloud Platform](#) on page 906

Install and apply the customized configuration required for the Control Room cluster on Google Cloud Platform after completing initial preparations.

**4.** [Configure Google Cloud Platform settings after installation](#) on page 908

After installing the Control Room, configure the required settings on Google Cloud Platform.

**5.** Complete the Control Room configuration and validation.

a) [Complete Control Room post-installation configuration](#) on page 926

After installing the Control Room, complete the configuration settings to ensure timely Automation Anywhere communications are specified and confirm Automation Anywhere services are running.

b) [Post-installation user management](#) on page 937

After completing the post-installation tasks, validate the setup by logging in to the Control Room and installing a license. First time access to the Control Room walks you through the configuration for your authentication method.

**6.** [Manage your users](#)

As a Cloud user with administrator permissions, you can create, view, edit, delete, and enable or disable a user. Creating users steps vary depending on whether the user is a non-Active Directory, Active Directory, or single sign-on (SSO) user from an IdP server.

---

**Tip:** To ensure that the bots run properly in GCP, we recommend that you create a whitelist for the following APIs:

- `/v2/repository/files/:id/content`
  - `/v2/repository/files/public/:id/content`
  - `/v2/blm/import`
-

## Prepare to install Control Room on Google Cloud Platform

Ensure that you complete the required steps to prepare the Google Cloud Platform instances for installing the Control Room.

**1.** Configure the Network Security Group of all the servers as specified in the following list:

- Name: aarestrictedsecuritygroup
- Type: Ingress
- Targets: aarestrictedsecuritygroup
- Filters: IP ranges: List of IP addresses provided by the IT security team
- Protocols and ports: all
- Action: Allow
- Priority: 1000
- Network: default

---

**Note:** In the IP address ranges field, enter all the IP addresses of all the virtual machines (VMs) in the cluster environment.

---

**2.** Set up the F5 load balancer with the following configurations:

- Select standard as the type option.
- Enter `0.0.0.0/0` as the Source address in Host.
- Enter `F5-LB-Private IP` as the Destination Address/Mask in Host.
- Enter `80` as the Port and select **HTTP** as the Service Port.
- Select the **Notify Status to Virtual Address** check box.
- Enable the load balancer state.

To use SSL offload with the F5 load balancer, provide the SSL certificate at the load balancer level, and configure your Control Room application servers to use HTTP mode only.

---

**Note:** Your IT team should configure the F5 load balancer with the Control Room.

---

**3.** Set up pools and nodes with the following configurations:

- a) Update the pool properties:
  - Choose a basic configuration.
  - Select ICMP as your gateway to monitor health.
- b) Update the pool member options:
  - Choose the round-robin method for load balancing.
  - Disable the priority group activation.
- c) Update the node properties:
  - Change the state to enabled.
  - Select node-specific health monitors.
  - Select ICMP as your gateway to monitor health.

**4.** Configure the Active Directory server.

Verify that all the VMs in the cluster can ping each other using private IP addresses.

5. Connect using RDP to one of the Control Room nodes or servers and run the Control Room installer. The Installation Prerequisite Check verifies that your system has the basic configurations required for Automation Anywhere. See [Automation 360 On-Premises prerequisites](#) on page 804.

[Perform custom installation of Control Room on Google Cloud Platform](#) on page 906

## Perform custom installation of Control Room on Google Cloud Platform

Install and apply the customized configuration required for the Control Room cluster on Google Cloud Platform after completing initial preparations.

If you have not done so already, complete the initial installation steps: [Prepare to install Control Room on Google Cloud Platform](#) on page 905.

1. Log in to the first Google Cloud Platform instance as an administrator.
2. Download the `Automation Anywhere__<version>.exe` file.

[A-People Downloads page \(Login required\)](#)

3. Run the installer file.
4. Click **Next** on the **Welcome to the Setup Wizard** page.
5. Accept the licensing agreement and click **Next**.
6. Select the **Custom** option and click **Next**.

The **Destination Folder** page appears. By default, the destination folder is `C:\Program Files\Automation Anywhere\Enterprise\`.

7. To make changes to the destination folder, click **Change**, enter a new destination folder name, and click **OK**.

---

**Note:** Do not install the application directly in the root directory (`C:\`). You should create a folder, for example, `C:\Program Files\Automation Anywhere\Enterprise\`.

---

8. Click **Next** to configure the IP cluster.
9. Select the **Enable Cluster Setup** check box.

The check box is enabled by default if the machine on which the setup is being run has local IP addresses configured.

To install the Control Room on a single node and not a cluster, clear the **Enable Cluster Setup** check box.

10. Enter the IP addresses of the nodes in the cluster.

- Enter IPv6 addresses if all the nodes in the network are using IPv6.
- Enter IPv4 addresses if some nodes in the network are using a combination of IPv4 and IPv6 addresses.

- a) Use a comma (,) to specify more than one IP address. For example, to specify three IP addresses in the cluster, enter:

```
192.0.2.1,192.0.2.2,192.0.2.3
```

---

**Important:** The first IP address in the list is used as the master node. Ensure that you enter the IP addresses in the same order on all node configurations in subsequent installations. An incorrect

order causes the application to configure the IP addresses as separate clusters, which will result in data loss when the issue is fixed after installation.

You can install multiple nodes at the same time after the master node is initially installed.

After installation, you can add a new IP address to the cluster at the end of the list.

- b) After you enter the cluster IP addresses correctly, select a valid address IP at the message prompt to provide network access to the machine.

**11.** Click **Next** to configure the application Transport Layer Security (TLS).

**12.** In the **TLS Configuration** page, configure the following:

- **Generate a Self-Signed Certificate**

Enabling the **Self-Signed Certificate** option allows the installer to generate a unique private key and a self-signed certificate for the Control Room.

- **Import a Certificate**

To import a custom certificate, clear the **Self Signed Certificate** check box. This setting allows you to import a certificate using the **Certificate Path** field.

---

**Note:** The certificate file must be a PKCS12 format.

---

Provide the following information:

- **Certificate Path:** Click **Browse** to import the certificate.
- **Private Key Password:** Enter the password for the private key.

---

**Password limitation:** Do not use the at sign (@) in passwords. Using the special character @ in the password causes the certificate file import to fail.

---

- **Webserver Port:** Enter the web server port – either HTTP or HTTPS. If the port is already assigned, an error message is displayed.

---

**Important:** The port validation message is also displayed when you add 8080 for the web server and if that port is already in use for a Control Room license service. Use a different unassigned port in these cases.

---

- **Enable Force HTTP traffic to HTTPS:** This option redirects all HTTP port requests to HTTPS. To access to the Control Room through HTTPS using the generated self-signed certificate, ensure the port numbers are different for HTTP and HTTPS.

To generate a custom certificate for HTTPS, ensure your custom certificate meets the following:

- Create a `.pfx` certificate with a pass code from a CA trusted authority.
- Combine Root, Intermediate, and Machine level certificates into a single certificate.
- Use the format `[WS Machine Host Name].[DomainName].com` for the private key.
- Include the host name as a fully qualified domain name (FQDN) in the certificate.

You provide the host name during Control Room installation.

- In multi-node HA clusters, issue certificates to the load balancer DNS name.
- Add individual URLs, which require access to all nodes, to the `Subject Alternative Name` field in the certificate.

For more information, see Automation Anywhere support site: [Automation 360 On-Premises prerequisites \(A-People login required\)](#).

**13.** Click **Next** to configure the service credentials.

**14.** In the **Service Credentials** screen, choose from the listed options.

The Windows Service credentials include a user name and password. The user specified must meet these requirements:

- A member of the local system administrator group.
- Have permission to manage services, including Automation Anywhere services.
- If you use Windows authentication to connect to the SQL database, ensure you grant the `db_owner` permission to the service credential user.

These service credentials allow the Control Room processes to run the required services.

- **Local System Account**—(default) The logged-on user performing the installation
- **Domain Account**—Specify a user that is not the local system account user
  - a. Clear the **Local System Account** check box.
  - b. Enter the user name and password for the domain account.
 

Use only supported characters for the user name and password. See [Supported special characters](#) on page 836.
- **Do not use the Windows domain credentials**

Enter credentials valid for running Automation Anywhere services. Without the valid credentials, the Control Room will fail to launch.
- **PowerShell script restrictions**

Specify a user with permissions to launch PowerShell scripts who is not a Windows domain user. Without the relevant permissions, database table creation can fail.

**15.** Add the SQL Server and click **Next**.

Select **Microsoft SQL Server**, enter the name, and click **Next**.

**16.** On the **InstallShield Wizard Completed** page, click **Finish**.

Launch Automation Anywhere is enabled by default.

Enable **Show installer settings** to open the `aae-installsummary.html` file. By default, this is located at `C:\Program Files\Automation Anywhere\Enterprise\`. Use this file to view a summary of the installation.

The Control Room is opened in your default browser and displays the Configure Control Room settings page.

[Configure Google Cloud Platform settings after installation](#) on page 908

## Configure Google Cloud Platform settings after installation

After installing the Control Room, configure the required settings on Google Cloud Platform.

If you have not done so already, complete the installation steps: [Perform custom installation of Control Room on Google Cloud Platform](#) on page 906.

1. Configure the following Control Room settings:
  - a) Specify the host name URL by providing the Google Cloud Platform load balancer URL. This is the URL that users use to access the Control Room.
  - b) Select the Active Directory authentication type.
 

See [Configure Control Room for Active Directory: manual mode](#) on page 940.

2. After you configure the Control Room, install product licenses.
3. Test access to the Control Room using the Google Cloud Platform load balancer URL.

Complete the Control Room configuration and validation.

- [Complete Control Room post-installation configuration](#) on page 926

After installing the Control Room, complete the configuration settings to ensure timely Automation Anywhere communications are specified and confirm Automation Anywhere services are running.

- [Post-installation user management](#) on page 937

After completing the post-installation tasks, validate the setup by logging in to the Control Room and installing a license. First time access to the Control Room walks you through the configuration for your authentication method.

- [Users](#) on page 2002

As a Cloud user with administrator permissions, you can create, view, edit, delete, and enable or disable a user. Creating users steps vary depending on whether the user is a non-Active Directory, Active Directory, or single sign-on (SSO) user from an IdP server.

## Installing Control Room on Linux

You start installing the Automation Anywhere Control Room in the Linux environment and complete the installation in the Control Room.

---

**Note:** The installation steps do not list any specific configurations or requirements and therefore your setup might be different. Automation Anywhere does not provide any warranties that the installation steps conform with your system configurations or requirements.

---

This task applies to first-time installation and updates of Automation 360 On-Premises.

Ensure the following:

- The Microsoft SQL Server or Oracle Server database is installed and running.
- The Automation 360 installation server is connected to the Microsoft SQL Server or Oracle Server database.
- For Oracle Server, ensure that you have installed the appropriate JDBC driver for the Oracle version that is connected to the Control Room.
- From Automation 360 Build 6463, ensure that Python 3.6 is installed.

- For Oracle Server, only non-container database is supported.

**1.** Verify the installation prerequisites.

- a) Verify the [Automation 360 On-Premises prerequisites](#) on page 804.
- b) Depending on the server you want to use, verify that the Microsoft SQL Server or Oracle Server is running, and execute the command:

```
$ sudo systemctl status mssql-server
```

If Microsoft SQL Server is not running, install it.

---

**Note:** The Microsoft SQL Server or Oracle Server installation instructions refer to Red Hat Enterprise Linux version 8. For version 7, change the paths to `/rhel/7` instead of `/rhel/8`.

---

See [Quickstart: Install SQL Server](#).

- c) Ensure the following files are available:

- SSL certificate
- License file

- d) Download the `Automation360_e17_Build_<build_number>.bin` installation file to the Linux server from [A-People Downloads page \(Login required\)](#)

---

**Note:** We do not support the patch upgrades (upgrading between builds in the same release) in Linux. When you are performing a patch upgrade, we recommended that you always uninstall and do a fresh install for the patch upgrades.

---

- e) Verify that the installation server has internet access in order to update Linux kernel files and OS libraries using Yum updates.

Alternatively, configure `/etc/yum.conf` on the installation server to use a Yum repository local to its network. The Yum repository should be up to date before starting the installation.

- f) Starting in Automation 360 Build 6463, Python 3.6 is required.

**2.** Log in to the installation server.

**3.** Run the installer command as a superuser from the Linux shell:

- a) 

```
$ sudo chmod +x Automation360_e17_Build_<build_number>.bin
```

- b) 

```
$ sudo ./Automation360_e17_Build_<build_number>.bin
```

The installation wizard verifies the installation requirements and proceeds with the installation.

---

**Tip:**

- Enter the `back` command to return to a previous command step.
  - Press the **return key** to accept default values, or enter an alternate value and then press the **return key**.
- 

**4.** To accept the license agreement, enter `Y`.

**5.** In the **Transport Layer Security (TLS)** screen, configure the following:

- a) Control Room HTTP Port (Default: 80)
- b) Control Room HTTPS Port (Default: 443)
- c) To enable the Self Signed Certificate, enter 1 or enter 2 to disable it.
- d) To Force HTTP Traffic to HTTPS, enter 1 to disable it or enter 2 to enable it.

*Configure application Transport Layer Security* on page 868

**6.** In the **Cluster Configuration** screen, enter 1 to disable it or enter 2 to enable it.

- If you choose to enable cluster configuration, enter the IP addresses of the cluster nodes. Use a comma (,) to specify more than one IP address. Do not add space between IP addresses. For example: 192.168.0.1,192.168.0.2,192.168.0.3
- The repository location should be a shared location accessible from all Control Room nodes in the cluster.
- Ensure that you select the IP address that is used to communicate with other nodes of the Control Room.

*Configure IP cluster* on page 878

**7.** In the **Database Type** screen, select one of the following servers:

- Microsoft SQL Server
- Oracle

**8.** Depending on the database server you chose, configure the following settings the server:

Microsoft Database Configuration	Oracle Database Configuration
Database Server address (default: localhost)	Database Server (default: localhost)
Database port (default: 1433)	Database port (default: 1521)
Control Room Database (default: Automation360-Database) or enter a name.	Connect with SID or Service Name  <b>Note:</b> The SID and Service Name entered in the text field provided is unique to your Oracle database.
SQL Server Login credentials: provide the login ID and SQL Server password.	Database User/Schema Password: provide the password.
Password prompt for elasticsearch: Enter or define any password.	(Optional) Use Secure Connection: Enable to use a CA certificate as specified and select a CA certificate.  <b>Note:</b> Use the same host name for certificate and database connections.  <i>Import HTTPS and CA certificates</i>

9. In the **Database Configuration** screen, configure the following:
  - a) Database Server address (default: localhost)
  - b) Database port (default: 1433)
  - c) Control Room Database (default: Automation360-Database) or enter a name.
  - d) SQL Server Login credentials: provide the login ID and SQL Server password.
  - e) Password prompt for elasticsearch: Enter or define any password.
10. Review the pre-installation summary.
11. Press Enter to install Automation 360 in the default directory.

Linux installer	Version	Default directory path
Installation file path	Version .22 and earlier versions	/opt/ automationanywhere/ enterprise
	Updating from earlier versions to version .22	
	New installation of version .22 and later	/opt/ automationanywhere/ automation360

A message appears stating the installation is successfully completed. See [Installed Control Room directories and files](#) on page 961 for the location of control room assets.

12. Configure the post-installation settings.

[Configuring post-installation settings](#) on page 927

Post-installation, a Control Room group `controlroom` is automatically created. Following users are a part of this group which run the respective Control Room services:

```
crkernel, traefik, ignite, activemq, crelasticsearch, criqbot, crbotinsight, craari, crdiscoverybot, crstorage, crdiscoverybotml.
```

13. Verify Automation 360 services started successfully.

[Stop and start Control Room services on Linux](#) on page 2105

14. Set up Control Room access.

[Configure Control Room database](#) on page 948

15. Set up licenses.

[Installing additional licenses](#) on page 2104

16. The log files for the Control Room installation are available at:

Linux installer	Version	Log file path
Log path	Version .22 and earlier versions	/var/log/ automationanywhere/ enterprise
	Updating from earlier versions to version .22	
	New installation of version .22 and later	/var/log/ automationanywhere/ automation360

After the Control Room installation and configuration is complete, users can register their devices to create and run bots.

[Install Bot Agent and register device](#) on page 998

For more information on Out of Memory Management (OOM Killer), see [Linux Automation 360 Control Room service stopped \(A-People login required\)](#).

[Control Room repository requirements](#) on page 828

The repository location is configured in the Control Room after installation. All your automations are stored in this repository.

## Performing silent installation of Control Room on Linux

Silent Control Room installation, also known as unattended installation, uses a customized script with parameters specific to your business requirements. The entire installation process runs in the background without requiring user interaction or displaying messages.

- Verify you have completed the [Automation 360 On-Premises prerequisites](#) on page 804.
- Ensure that you have the following:
  - Automation Anywhere Control Room installation file
  - SSL certificate
  - License file
- Verify the installation server has internet access in order to update Linux kernel files and OS libraries using Yum updates. Alternatively, configure `/etc/yum.conf` on the installation server to use a repository local to its network. The repository should be up to date before starting the installation.

Two scripts run the Linux silent installation:

- `LinuxInstaller.sh`: This script contains the installation parameters you want to apply during installation.
- `CallLinuxScript.sh`: This script executes the first script.

See the installation parameters and sample scripts.

Run the script in Linux shell.

1. Review the parameters and identify the settings you require.

Control Room installation parameters		
Installation parameter	Description	Script response options
Proceed with Installation	The installer analyzes your system and notifies you if it does not meet the prerequisites. In silent mode, set the value to 1.	1 = Continue 2 = Cancel

Control Room installation parameters		
Installation parameter	Description	Script response options
Continue setup wizard	The installer displays an introduction and offers options of <code>back</code> to return to a previous step and <code>quit</code> to cancel the installation.  Default is <code>Enter</code> .	<code>\n</code>
Advance to end of License Agreement	In console mode, you have the option to page through the license agreement. In silent mode, you advance to the end by selecting 0.	0
Accept License Agreement	Accept the license agreement to continue with the installation. In silent mode, set the value to Y.	Y = Yes N = No
Control Room HTTP Port	The web server port you will use to access the Control Room with HTTP. The default value is 80.  Replace the number 80 in the sample script to use a different port.	80 = Default port yy = your port number yy
Control Room HTTPS Port	The web server port you will use to access the Control Room with HTTPS. The default value is 443.  Replace the number 443 in the sample script to use a different port.	443 = Default port zzz = your port number zzz
TLS configuration: Self-Signed Certificate	Choose to enable or disable the self-signed certificate. The default is Enable, or 1.	1 = Default (Enable) 2 = Disable
TLS Configuration: Force HTTP traffic to HTTPS	Choose to disable or enable forcing traffic from HTTP to HTTPS. The default is Disable.	1 = Default (Disable) 2 = Enable
Cluster setup	Choose to disable or enable clustering. The default is Disable.	1 = Default (Disable) 2 = Enable
Database server URL	server1.yourcompany.com	Enter the URL of the server where the database resides.
Database server port	Default is 1433	1433

Control Room installation parameters		
Installation parameter	Description	Script response options
Database name	Default is localhost	Default is localhost. If database is on a separate server, enter the host name.
Database SA user name	Database system administrator login ID	Default is sa.
Database SA user password	Database system administrator login ID	The password to log in to your database as system administrator user.
Database Secure Connection	Choose to disable or enable the connection. Default is Disable (1).	1 = Default (Disable) 2 = Enable
Pre-Installation summary	If the output is directed to a console, the installer will show a summary of features selected and whether the prerequisites are met. Default is <code>Enter</code>	<code>\n</code>
Proceed	Confirm to proceed with the installation. Default is <code>Enter</code> .	<code>\n</code>

2. Create the script `LinuxInstaller.sh`, substituting values for your own environment.

---

**Important:** Be sure to test the connection to the SQL Server and enter verified values for database name, database administrator login ID, database administrator password. Invalid values cause the script to stall and fail.

---

Example script:

```
echo "Starting Installation"
#Change the next two lines to match the install filename you downloaded
sudo chmod a+x AutomationAnywhereEnterprise_A2019_el7_4799.bin
sudo ./AutomationAnywhereEnterprise_A2019_el7_4799.bin << EOF
1
\n
0
Y
80
443
1
1
1
#Change the next line to your Automation Anywhere install server
mybotserver.mycompany.com
1433
#Replace next line with your database name
AAE-Database
#Change the next two lines to your SQL Server admin ID and password
admin
youradminpasswordhere
1
\n
```

```
\n
\n
EOF
```

3. Create the script `CallLinuxscript.sh` to execute `Linuxinstaller.sh`.

This script writes the installation results to `/home/Installlog`. Change the path to the install log file, if required.

```
echo "Starting Linux installation"
sudo ./LinuxInstaller.sh >> /home/Installlog
echo "Installation Completed Successfully"
```

4. On the installation server, logged in as an Administrator, execute the scripts.

- a) `$ sudo chmod a+x LinuxInstaller.sh`
- b) `$ sudo chmod a+x CallLinuxscript.sh`
- c) `$ sudo ./CallLinuxscript.sh`

5. Review the installation log to confirm there were no errors.

---

**Note:** The Control Room installation folder on Linux is located by default at `/opt/automationanywhere/enterprise`.

---

Continue from the step **Configure the post-installation settings** in

[Installing Control Room on Linux](#) on page 909.

## Uninstall Automation 360 On-Premises from Linux server

Uninstall the On-Premises Control Room from your Linux server.

Ensure that the Automation 360 installation server is disconnected from the Microsoft SQL Server database.

1. Log in to the installation server.
2. Run the uninstaller command as a superuser:

```
