For reference of the user interface enhancements, see [Automation Co-Pilot Desktop Assistant automation activities](#) on page 3208.

Platform alerts and notifications

Notifications from the Automation Workspace can work in a widget to notify users of specific task completions and bot status.

You will be notified with real-time message alerts based on recent automation events that occurred in Automation Co-Pilot. Notifications are alerts that notifies and updates you based on

statuses of your automations. When you view notifications in your embedded widget, you will only see relevant updates for your automations.

Enhancements

- The **Notifications** tab in your widget will alert you of your automation outcomes such as the successful or failed status of your bots. You no longer need to check each individual bot to view its current status.
- When you are assigned a task, the **New task assigned** message will notify you, and you can click to be redirected to the newly assigned task and confirm your details.
- You can filter your list of notifications with the **Attention needed** toggle to identify high-priority tasks that requires your attention

Benefits

As you run your automations in your embedded widget, the notification system helps enhance your automation experience as you are updated in real time for any successful or failed bots and newly assigned tasks.

For reference, see [Notifications](#) on page 2118.

Tags

These tag improvements provide a more accurate search and save you time when searching for available tags. You can select and manage up to 500 tags at a time in the tag selector, when you configure your process. The tag selector can display up to 500 tags at a time. You can fully or partially type keywords that makes up the tag and use the search all function for the tag selector to view the database for the tag.

Note: A minimum of two characters are required to use the search all function.

For reference of adding tags, see [Configure a process](#) on page 3278.

URL Parameters

These process level URL improvements make it easier for you to pass URL data to your requests:

- You can pass custom data from applications to requests.
- Supported data types include: dates, time, number, text box, check box, radio button, text area, and drop-down.
- Hidden variable types in a form are supported to receive URL data.

See [Construct URL parameters for supported elements](#) on page 3303.

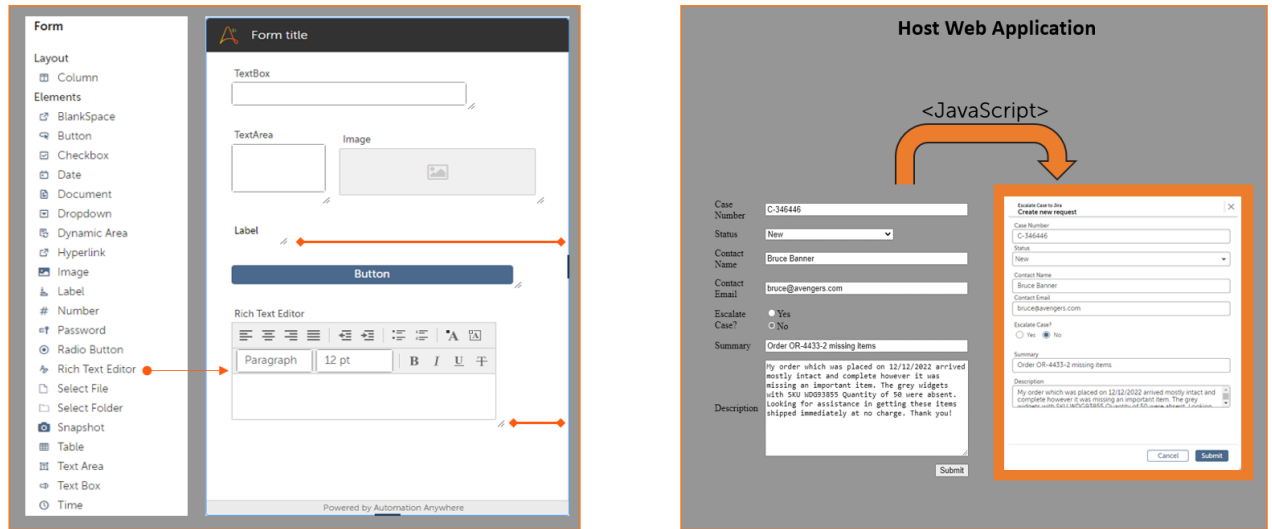

You can use supported languages from Control Room to change the localized language for your embedded widget or web page. You use the XX_XX format to structure the language format, such as for English (**en_US**) and French (**fr_FR**), that you can add to the end of a URL such as

www.sampleaddress.com/en_US or www.sampleaddress.com/fr_FR. This language format is based on the JavaScript language tags.

Smart embedded forms and dynamic data mapping

As a developer, you can design smart forms to embed in a widget of a host web application where you can run a script to populate data dynamically.

This enhanced form builder experience enables you to quickly design smart forms with more concise controls. The smart forms are embedded as a widget (using iFrame widgets) in a web application where you can populate data dynamically and run your automations.

Design forms that can embed in any web application via an embedded widget

- Form canvas dynamically adjusts to fit form size
- Drag and drop elements directly into canvas
- Mouse draggable resizing of elements

Populate data for smart forms in embedded widgets to save time and eliminate data re-entry

- Script template available for developers
- Host data mapped to source code in web application
- Data dynamically populates embedded widget
- Fast and secure to run automations

See the following video for an overview of smart forms and dynamic data mapping:

What a developer can do

Design smart forms with the enhanced form builder:

- Drag form elements directly to the form builder to add new elements.
- Resize individual form elements to a precise length.
- Design forms to use in an embedded widget.

Populate data dynamically in an embedded widget:

- Utilize a Javascript for a host web application to read and use as inputs in processes.

- Run a script (postMessage API JavaScript) to populate the data of the process based on the process ID, element ID, and its value.

Benefits

Smart embedded forms provides the following benefits:

- Dragging and resizing form elements are a seamless and consistent experience.
- Developers can quickly add new elements to their forms.
- Forms created in the form builder is rendered the same way in an embedded widget.
- Form builder supports up to 25 form elements.
- Behaviors of the older forms are maintained.

Dynamic data mapping provides the following benefits:

- Data is populated dynamically to avoid repetitive data re-entry.
- Only specified data are dynamically populated, which provides a secure way to run automations.

Related concepts

[Embed automations in your application using Automation Co-Pilot for Business Users](#) on page 3147

Access automated processes and bots from any platform with an embedded interface. Automation Co-Pilot for Business Users delivers automation everywhere you want, either integrated with your web application or delivered through a browser extension.

[Automation Co-Pilot using embedded widget overview](#) on page 3151

You can use a widget that embeds automation built on the Automation 360 platform that can be applied natively on any supported web application.

Map host data to Automation Co-Pilot forms

Configure your widget settings for a host application to populate data in the initial form of your iFrame widget. Eliminate repetitive data entry and ensure control over data during automation runtime.

The iFrame widget in host applications

When leveraging Automation Co-Pilot capabilities, like passing data into forms, it is important to consider the setup and development of web components in your host application, like the iFrame widget. Development parameters vary across applications when integrating new components like the Automation Co-Pilot widget. Familiarize yourself with your host application parameters when developing the iFrame widget to customize the components to your specific requirements.

Example synopsis

The following example uses ServiceNow as the host application to demonstrate using HTML and JavaScript to enable the transfer of data from host to Automation Co-Pilot (iFrame widget). The

referenced code maps existing values from the host page (ServiceNow) to theAutomation Co-Pilot process initial form elements.

1. From ServiceNow, click **Start Building**. This will redirect you to your corresponding developer account. [ServiceNow developer account](#)
2. Navigate through the following: **All > Service Portal > Service Portal Configuration > Service Portal Configuration > Widget Editor > Create a New Widget**.
3. Enable **Create test page** while creating the widget to view the html template and client script during development.
4. Click **Enable Preview** and click the **eye** icon to show the preview tab for testing the code changes.
5. Use the following sample code to model the code you will use for your business requirement. [Sample HTML and JavaScript for iFrame widget](#) on page 3168

Note: The code in this example is generic and can be used in similar applications as a model. Development and setup of the iFrame widget is specific to ServiceNow parameters. See : [Map host data to process](#) on page 3169.

- a) Add the corresponding JavaScript to Client script.
 - b) Add the Automation Co-Pilot iFrame element to the HTML template.
 - c) Ensure the parameter `referrerpolicy="origin"` is in your HTML template to avoid cross origin issues.
6. **Save** your widget.
The preview will be loaded.
 7. Review the preview and make necessary edits to the HTML template and client script.
 8. **Save** your changes.

Sample HTML and JavaScript for iFrame widget

The following script can be used to model code when developing the iFrame widget to transfer and consume host data in ServiceNow.

Sample of HTML

This reference should be used with the linked process. [Map host data to Automation Co-Pilot forms](#) on page 3167

```
<div>
<!-- your widget template -->
<label for="fname">First name:</label>
<input type="text" id="fname" name="fname" value="sikha"><br><br>
<label for="lname">Last name:</label>
<input type="text" id="lname" name="lname" value="poyyil"><br><br>

<iframe
src='https://aa-pet-us-17.my.automationanywhere.digital/aari/#/
embedded?tags=%5B%5D'
name="aari-embedded-app"
width="100%"
height="500px"
style="border: none;"
referrerpolicy="origin">
```

```
</iframe>
</div>
```

Sample of Client script

```
api.controller=function() {
  /* widget controller */
  var c = this;
  console.log(c)
  console.log(window)
  var getLatestData = function() {
    return {
      167 : {
        TextBox0: document.getElementById("fname").value,
        TextBox1: document.getElementById("lname").value
      }
    };
  }
  console.log("Data" + JSON.stringify(getLatestData()));
  console.log(event)
  setTimeout(function() {
    window.addEventListener('message', function(event) {
      if(event.data.aariDataRequest === 'aari-data-request') {
        var mappedHostData = getLatestData();
        var id = event.data.processId || event.data.botId;
        console.log("Event data: " + JSON.stringify(event.data));
        console.log("Data passed: " + JSON.stringify(mappedHostData[id]));
        var iframeElement = document.getElementsByName("aari-embedded-
app")[0];
        iframeElement.contentWindow.postMessage({data: mappedHostData[id]
        },
        iframeElement.getAttribute("src"));
      }
    });
  }, 100);
};
```

Map host data to process

You can configure your widget settings from a host application and populate data in the initial form of your iFrame widget. This ensures that you have control over your data without the need for repetitive data entry.

Ensure you have completed the following:

- Provided a system-created **AAE_Robotic_Interface User** role for the AARI User.
- Have access to the Automation Co-Pilot for Business Users on the web interface.
- Have access to the host web application of your choice that supports the iFrame technology.
- You already set up the iFrame widget. For more details, see [Configure an iFrame widget in a web application](#) on page 3158.

1. Log in to the host web application.
This is your target application with the iFrame widget.
2. Navigate to widget settings page or source code of your host web application (where you added the iFrame widget code).
This page contains the embedded code for your widget source.

3. Enter the host data and send data in the script.

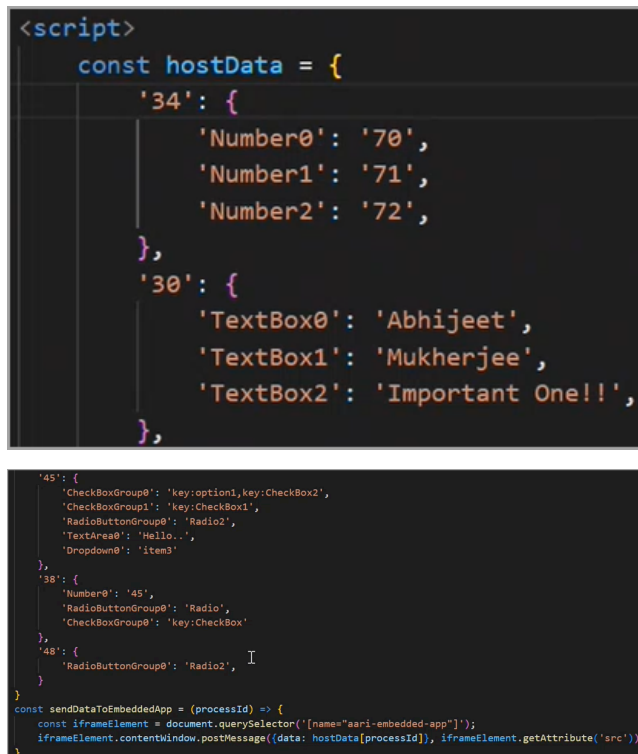

Important: To map data, you must load a process on the host web application with a process ID, element ID, and values of the element ID which correlate with each another.

Example structure of host data:

```
hostData =
{
  process ID
  {
    elementID1: value1
    elementID2: value2
    elementID3: value3
  }
}
sendDataToEmbeddedApp = (processID) =>
{
  iframeElement = document.querySelector();
  iframeElement.contentWindow.postMessage({data:
hostData[processID]},
    iframeElement.getAttribute());
}
```

Note: The element ID uses form element data types, such as: Check Box, Number, Radio Button, and Text Box.

An additional sample structure:

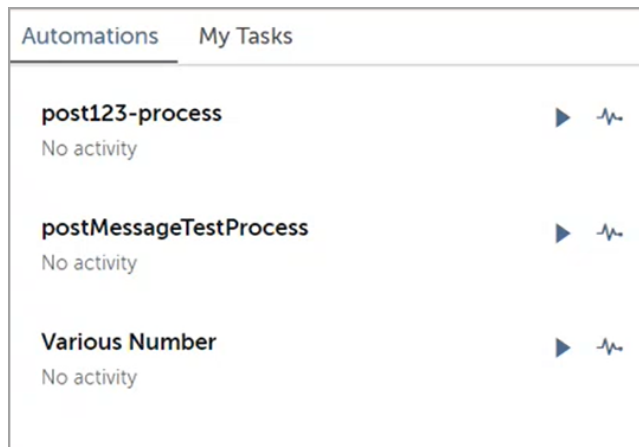

```
<script>
const hostData = {
  '34': {
    'Number0': '70',
    'Number1': '71',
    'Number2': '72',
  },
  '30': {
    'TextBox0': 'Abhijeet',
    'TextBox1': 'Mukherjee',
    'TextBox2': 'Important One!!',
  },
}

'45': {
  'CheckBoxGroup0': 'key:option1_key:CheckBox2',
  'CheckBoxGroup1': 'key:CheckBox1',
  'RadioButtonGroup0': 'Radio2',
  'TextArea0': 'Hello.',
  'Dropdown0': 'item3'
},
'38': {
  'Number0': '45',
  'RadioButtonGroup0': 'Radio',
  'CheckBoxGroup0': 'key:CheckBox'
},
'48': {
  'RadioButtonGroup0': 'Radio2',
}
}

const sendDataToEmbeddedApp = (processId) => {
const iframeElement = document.querySelector('[name="aari-embedded-app"]');
iframeElement.contentWindow.postMessage({data: hostData[processID]}, iframeElement.getAttribute('src'));
}
```

In this example: 45 is the process ID, Number0 is the element ID, and 45 is the value of the element ID.

- Click **Save** or press **Ctrl + S** to save your session.
You have now configured the host data, and mapped the data to your processes.
- Navigate to the iFrame widget.
The iFrame widget should show a list of automations.

- Click a process to open an initial form with data already mapped and filled in.

The screenshot shows a form titled 'postMessageTestProcess' with the subtitle 'Create new request'. The form contains the following fields:

- TextArea**: Contains the text 'Hello..'.
- CheckBoxGroup**: Contains three options: 'option1' (checked), 'option2' (unchecked), and 'option3' (unchecked).
- Dropdown**: Contains the selected item 'item3'.

At the bottom of the form are two buttons: 'Cancel' and 'Submit'.

The initial form shows the mapped data.

- Click **Submit** to run your automations.

Map host data using bot inputs

In a host application, you can pass supported input variable data to your attended bots in the iFrame widget.

Ensure that you have completed the following:

- Provided a system-created **AAE_Robotic_Interface User** role for the AARI User.

- You have access to Automation Co-Pilot.
- You have already set up your host data in a web application that supports the iFrame technology, such as Salesforce or ServiceNow, see [Map host data to process](#) on page 3169.
- You have created a bot that contains variables with an input type, and checked in. Therefore this bot is available for you to access in the iFrame widget.

Note: **String**, **Number**, **Boolean**, and **DateTime** variable types are supported to pass data to an attended bot. In addition, there are new IDs for **event.processId** and **event.botId**, where **pID** is for process and **botID** is for bots.

Sample of a bot with input variables:

This form uses the Set action from the Interactive Forms package to set input variable values in each form fields. See [Interactive forms package](#) on page 2633.

1. Log in to Salesforce (host application).
2. Configure your code in the Salesforce console.
This code can be found in the code controller option.

```

Copilot Copilot.cmp CopilotController.js
22     Date1: component.get("v.accountRecord")["CreatedDate"],
23     TextArea0: component.get("v.accountRecord")["BillingStreet"],
24     Password0: component.get("v.accountRecord")["Sic"]
25   },
26   102 : {
27     account_name: component.get("v.accountRecord")["Name"],
28     type: component.get("v.accountRecord")["Type"],
29     industry: component.get("v.accountRecord")["Industry"],
30     employee: component.get("v.accountRecord")["NumberOfEmployees"],
31     phone: component.get("v.accountRecord")["Phone"],
32     account_number: component.get("v.accountRecord")["AccountNumber"],
33     Created_at: component.get("v.accountRecord")["CreatedDate"],
34     created_date: component.get("v.accountRecord")["CreatedDate"],
35     billing_address: component.get("v.accountRecord")["BillingStreet"],
36     boolVar: component.get("v.accountRecord")["Active__c"] == 'Yes',
37     sic_code: component.get("v.accountRecord")["Sic"]
38   },
39   101 : {
40     var1: component.get("v.accountRecord")["Name"],
41     var2: component.get("v.accountRecord")["Name"],
42     var3: component.get("v.accountRecord")["Name"],
43     var4: component.get("v.accountRecord")["Name"],
44     var5: component.get("v.accountRecord")["Name"],

```

Sample of a full code that includes host data:

```

({
  handleRecordChanged : function(component, event, helper) {
    console.log("Hi from controller");
    if(event.getParams().changeType === 'LOADED') {
      const userLang = $A.get('$Locale.language');
      console.log('User language setting: ' + userLang);
      console.log("Account record: " + JSON.stringify(component.get("v.accountRecord")));
    } else {
      console.log('Not loaded')
    }

    const mappedHostData = {
      102 : {
        account_name: component.get("v.accountRecord")["Name"],
        type: component.get("v.accountRecord")["Type"],
        industry: component.get("v.accountRecord")["Industry"],
        employee: component.get("v.accountRecord")["NumberOfEmployees"],
        phone: component.get("v.accountRecord")["Phone"],
        account_number: component.get("v.accountRecord")["AccountNumber"],
        Created_at: component.get("v.accountRecord")["CreatedDate"],
        created_date: component.get("v.accountRecord")["CreatedDate"],
        billing_address: component.get("v.accountRecord")["BillingStreet"],
        boolVar: component.get("v.accountRecord")["Active__c"] == 'Yes',
        sic_code: component.get("v.accountRecord")["Sic"]
      },
    };
    console.log("Data" + JSON.stringify(mappedHostData));
    console.log(event)
    setTimeout(function() {
      window.addEventListener('message', function(event) {
        if(event.data.aariDataRequest === 'aari-data-request') {
          const id = event.data.processId || event.data.botId;
          console.log("Event data: " + JSON.stringify(event.data));
          console.log("Data passed: " + JSON.stringify(mappedHostData[id]));
          const iframeElement = component.find("aari-embedded-app").getElement();
          iframeElement.contentWindow.postMessage({data: mappedHostData[id]}, iframeElement.getAttribute("src"));
        }
      });
    }, 100);
  }
})

```

Note: This code shows an number (ex: **102**) that matches with the **Bot ID** from the Control Room. You can view the Bot ID when you access your public bots in the **public repository**. The ID will be shown in the URL similar to the following:

<https://.../bots/repository/public/taskbots/102/view>

- View the bot in the embedded widget.

In this case, **Account_Details_Validation** bot is available for you to select.

- Deploy your bot.
The bot will begin the automation process.

Simultaneously, the data fields in the form will populate based on the input variables.

The screenshot shows the Automation Anywhere interface. The main window displays the account details for 'Burlington Textiles Corp of America'. The 'Details' tab is selected, showing a list of account information. A modal window titled 'Account Details' is open, displaying a form with the following fields and values:

Field	Value
Name	Burlington Textiles Corp of America
Type	Customer - Direct
Industry	Apparel
Employees	9000
Phone	3362227000
Account Number	656092
Created time	09:30 AM
SLA Exp Date	6/30/2023
Created date	4/12/2023
Boolean value	false
Billing Address	525 S. Lexington Ave
SIC Code	*****
Active	<input type="radio"/> Yes <input checked="" type="radio"/> No

Buttons for 'Validate' and 'Find Category' are visible at the bottom of the modal. The footer of the modal reads 'Powered by Automation Anywhere'.

5. Close the automation session.
You have successfully ran a bot with input variables.

Automation Co-Pilot using Chrome extension

Use Automation Co-Pilot using Chrome extension to embed an interface for the Automation Anywhere platform in your Google Chrome browser.

Benefits and capabilities of Automation Co-Pilot (extensions)

Broader access to automations brought to your familiar environment

With Automation Co-Pilot using Chrome extension, you can develop custom actions and workflows. The OAuth 2.0 connection offers a seamless connection from the Automation Anywhere Control Room to your web browser. This connection extends automated features into your preferred environment through embedded web components. Develop these components in any web scenario through the use of Automation Co-Pilot using Chrome extension. Users with these components can launch automated processes and bots directly from existing environments, where most time is spent. With this access, business data can be retrieved and processed without ever changing applications.

Secure connection with admin control for organizing team and user workloads

Automation Co-Pilot using Chrome extension is fully integrated with Automation Anywhere for security and authorization of content. This means that the administrator has complete control over which content is made public through Automation Co-Pilot by assigning Automation Co-Pilot using Chrome extension

content to teams. Content assigned to a team will become visible to the members of the team when the target pages are opened. With this control and organization, administrators can develop specialized components for specific team functions by empowering users with streamlined automation.

Requisites:

- OAuth 2.0 Automation Workspace configuration: using secure credentials, configure a security token to validate your identity as a licensed user. Servers will recognize this token and approve your access, eliminating the need to log in multiple times to your accounts. [Use AuthConfig App to enable OAuth2 services](#) on page 1783
- Automation 360 v.26 or later
- Google Chrome browser
- Automation Co-Pilot licenses: Automation Co-Pilot using Chrome extension uses teams and members to securely authorize and deploy content to the right users.
- Automation Co-Pilot fluency: administrators should be familiar with the environment in order to identify key elements used to map custom content to teams.

Additional considerations:

- Roles: Ensure that you have the proper role and permissions for your activity. [Users and team roles for Automation Co-Pilot](#) on page 3288
- Ensure that your browser is not blocking Automation Co-Pilot using Chrome extension access and windows.

Process flow

The end-to-end workflow is illustrated in the following diagram.

1. To begin accessing features, set up and connect your Control Room to Automation Co-Pilot using Chrome extension. [Set up and connect Automation Co-Pilot using Chrome extension](#) on page 3177
2. Develop and embed content in your preferred application for Automation Co-Pilot using Chrome extension. [Develop a widget for Automation Co-Pilot using Chrome extension](#) on page 3180
3. Administer your developed content to teams for users to access through Automation Co-Pilot using Chrome extension. [Provisioning Automation Co-Pilot using Chrome extension to users](#) on page 3186

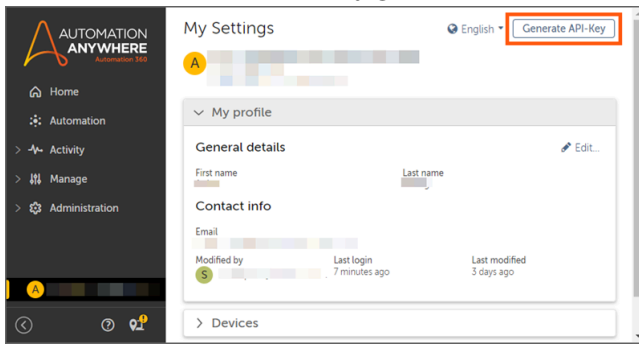

4. Get started using the embedded content through Automation Co-Pilot using Chrome extension. [Deploy automations in web application](#) on page 3161

Set up and connect Automation Co-Pilot using Chrome extension

Set up and connect to Automation Co-Pilot using Chrome extension.

- Ensure that you meet all the prerequisites. [Automation Co-Pilot using Chrome extension](#) on page 3175
- Have your Service Account Token accessible to enter in setup. [Create a service account for Automation Co-Pilot using Chrome extension](#) on page 3178

Note: This token is an API key generated in the Control Room, from **Settings**.

Automation Co-Pilot using Chrome extension requires setup and connection of your system. Perform the following steps to complete the setup illustrated in the following diagram.

The following video shows the setup process.

1. To open the extensions setup in a new tab with context about the AAI tenant click **Connect Accounts**.

Note: Your Control Room URL and Partner ID will be automatically filled as part of the setup.

2. Select your Google or Microsoft account to begin the process of deploying and connecting Automation Co-Pilot using Chrome extension to your Control Room.
3. Enter a **Name** for the new Automation Co-Pilot using Chrome extension Tenant that will be connected to your Control Room, for example, Production.
4. In the Control Room settings:
 - a) Enter the Username of the Service Account that you created previously.
 - b) Enter the **Service Account API Key** to use for server-to-server communication.
5. Select **Connect**.

You are now connected to Automation Co-Pilot using Chrome extension, and you can assign developed content.

[Develop a widget for Automation Co-Pilot using Chrome extension](#) on page 3180

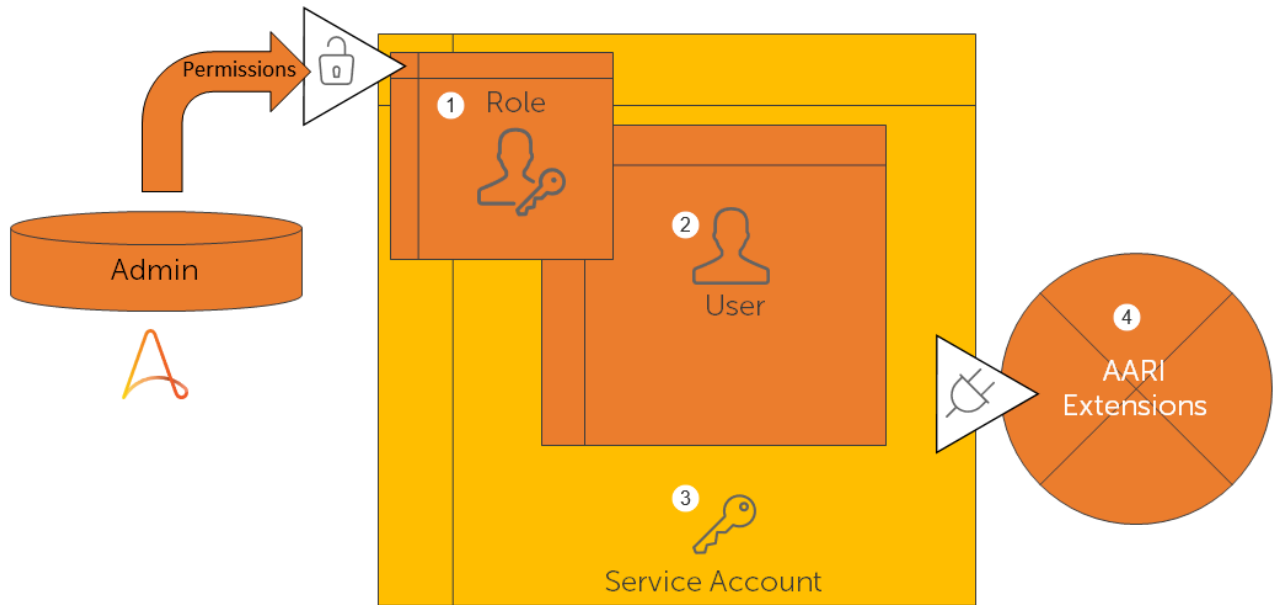

Create a service account for Automation Co-Pilot using Chrome extension

Create the service account and assign permissions to customize the Automation Co-Pilot using Chrome extension experience in your embedded widget.

Use your AARI Admin account (AAE_Robotic Interface Admin) to create a new user with the proper role and permissions to configure the Automation Co-Pilot using Chrome extension experience.

Overview

1. **Role:** Create a new role, with specific permission, to operate in Automation Co-Pilot as the service account. The permission you assign will structure the Automation Co-Pilot using Chrome extension experience.
2. **User:** After you set up the role, create a new user and assign the role to administer permissions.
3. **Key:** Generate the API-Key of the user account that Automation Co-Pilot using Chrome extension will identify as the service account. During setup of Automation Co-Pilot using Chrome extension, enter the API-Key.
4. **Connect:** Name the account to complete the Automation Co-Pilot using Chrome extension connection.

To grant permissions to the role:

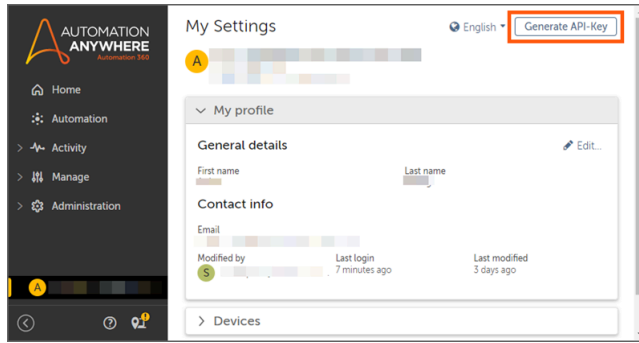

1. Log in to your Control Room as an Admin user.
2. Navigate to **Administration** > **Roles** in the left-hand menu.
3. Click **Create Role** at the top right of the page.
4. Enter the name for your new role and select the following permissions on the Features page. These permissions enable the Automation Co-Pilot using Chrome extension server to query information to verify user access and save meta data to Automation Co-Pilot.
 - View users
 - View roles
 - View users and roles basic information
 - View licenses
 - Generate API-Key
 - Extension API for service account
5. **Save** your new role.

To create a new user for your service account and assign the role:

6. Navigate to **Administration** > **Users** in the left-hand menu.
7. Click **Create User** located at the top right toolbar to define a new service account user.
8. Enter information in the required fields and select the role you previously created and assign it to this user.
9. Select **Allow** for Allow Multiple Sessions on the user creation page.
10. Click **Save**.

To generate the API key:

11. Log in to the Control Room with the user you previously created.
12. Click your user name in the left-hand menu and then click **My Settings** in the profile card that displays.
13. Select **Generate API key** at the top right of the My Settings page.

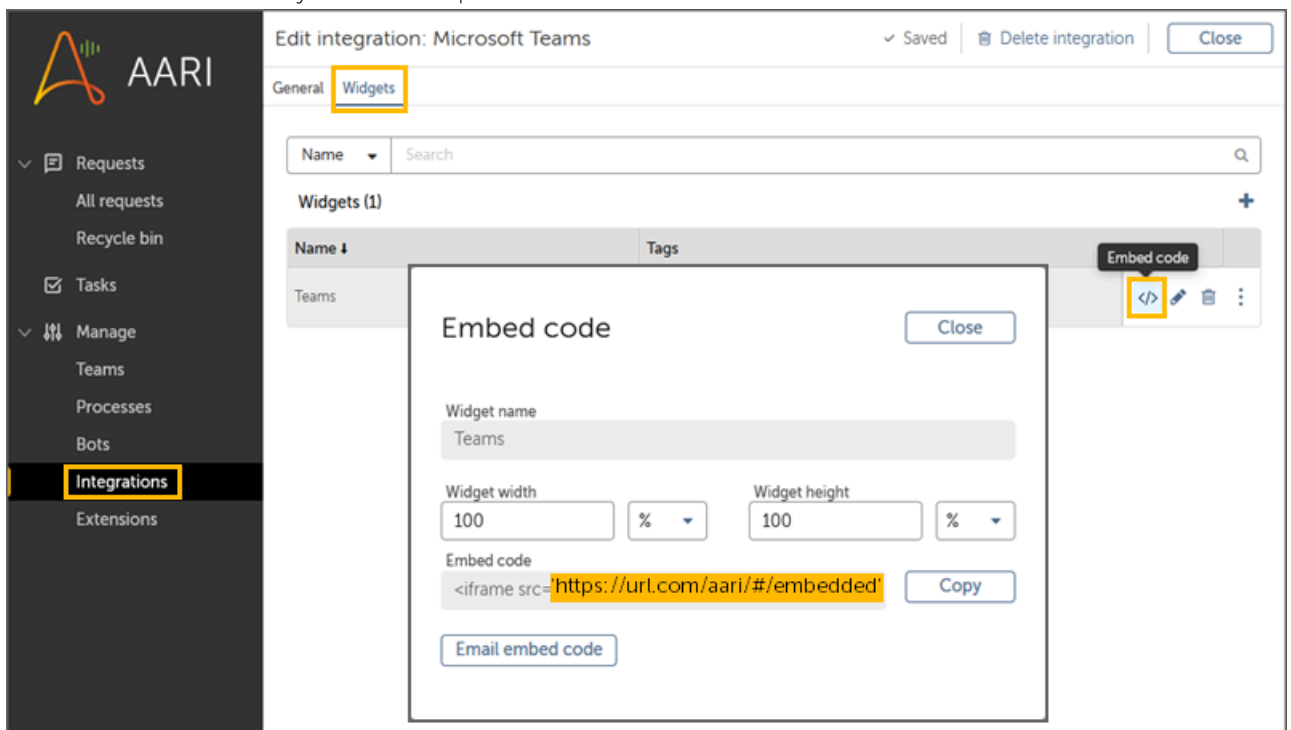

14. Save the API key to use when connecting Automation Co-Pilot using Chrome extension.

[Set up and connect Automation Co-Pilot using Chrome extension](#) on page 3177

Develop a widget for Automation Co-Pilot using Chrome extension

Develop the iFrame widget in Automation Co-Pilot using Chrome extension to deploy in your web application.

- You must be logged in to the Control Room with **AAE_Basic** permissions.
- Ensure that Automation Co-Pilot using Chrome extension is installed in your browser by completing setup. [Set up and connect Automation Co-Pilot using Chrome extension](#) on page 3177
- Set up the widget in Automation Co-Pilot that will map automations into Automation Co-Pilot using Chrome extension. [Setup iFrame widget using Automation Co-Pilot](#) on page 3153
- Have the widget **embed code** accessible to enter into Automation Co-Pilot using Chrome extension. You need only the URL in quotes after `src=`.

With Automation Co-Pilot using Chrome extension, your Chrome browser will act as the vessel to embed the widget. Using the following steps, develop an iFrame widget for your web application and deploy the widget to Automation Co-Pilot to map your complete embedded automation experience. While you can develop many web components, the following steps streamline a simple process to bring automations directly into your web application.

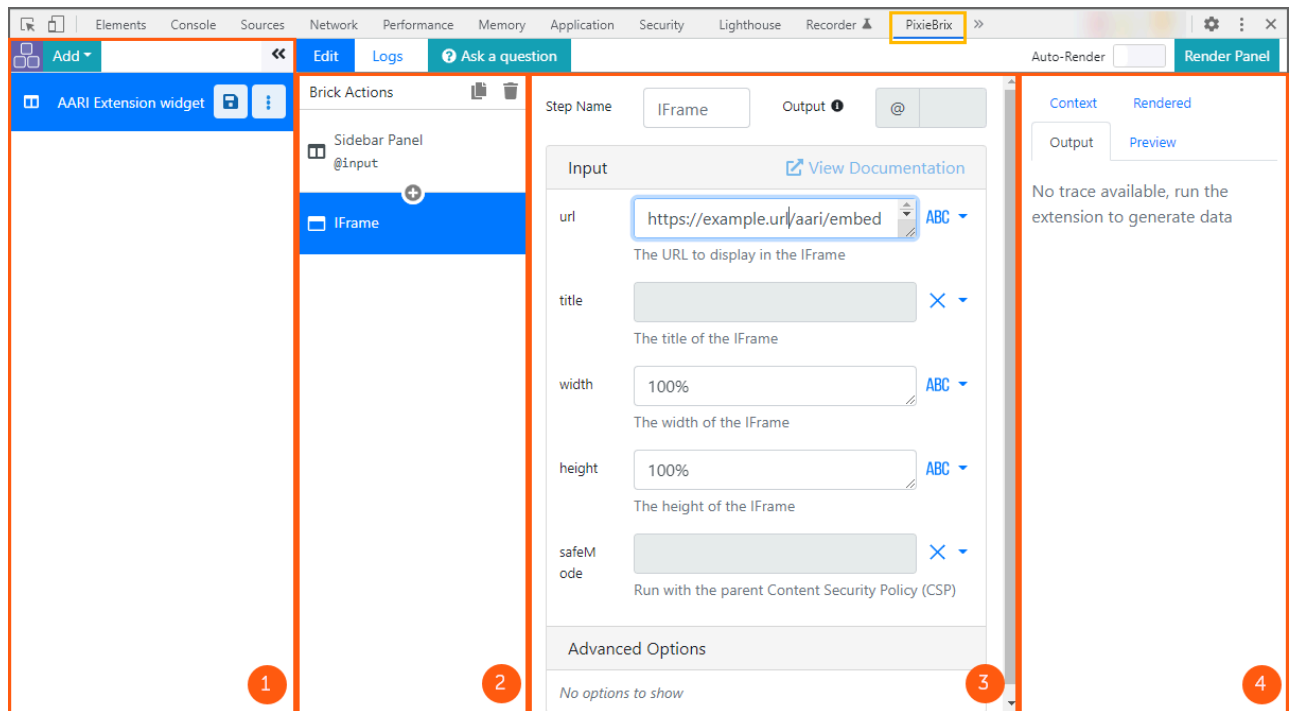

The PixieBrix Page Editor environment is used to map and configure automations from Automation Co-Pilot to your web application and select the component for embedding the widget. This environment uses your OAuth connection to access saved processes and automations from your Control Room and map them to the selected component. For complete details on developing in the Editor, see the following link: [Guide to PixieBrix Page Editor](#)

The following video demonstrates the process of developing the widget in Automation Co-Pilot using Chrome extension.

1. To begin, navigate to the web application where the iFrame widget will be embedded.
2. Select the **Render Panel** action and delete it by clicking the trash icon on the top of the pane.
3. To open the page editor, from the desired web application, right-click and select **Inspect**.

The following table and image details the development environment.

	Panel	Description
1	Extensions List	Create and select an extension for development.
2	Extension Overview	Add, view, and edit the components of the extension.
3	Configurations panel	Map and configure how components interact with the web page.
4	Data panel	Test and debug your extension.

4. From Extensions List, click **Add** and select **Sidebar panel**.

5. From the Overview panel, click the **plus icon** to open the component menu.
6. Select the **iFrame** component and click **Add brick**.
7. In the Configuration panel, complete the necessary fields.
 - a) Enter the **Name** of the widget. This name will appear in Automation Co-Pilot when you begin provisioning to users.
 - b) Enter the widget **URL** to access your Control Room.

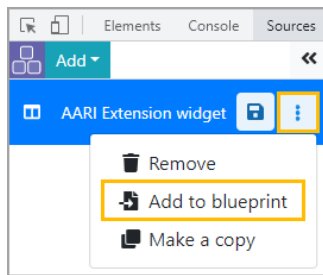

This is the URL taken from the **embed code** found in Automation Co-Pilot using embedded widget. You need only the URL in quotes after `src=`.

8. **Save** your Extension.
9. Test and debug your extension by using the data panel.

The final output is detailed in the data panel and alerts you to any action that might be mapped or configured incorrectly.

Important: If an alert for invalid connection or invalid credential appears, check that you have set up and connected Automation Co-Pilot correctly to Automation Co-Pilot using Chrome extension.

10. After successful verification, click the vertical ellipses in the Extensions List panel to add your extension to a blueprint.

11. Select **create new blueprint**.
12. Select **move** or **copy** into the new blueprint.
13. Enter your **unique id**.
14. Enter the **name** to identify the extension in the next step.
15. Enter the **version** for developers to identify the progressive customizations made over the life of the extension.
16. Enter a **description**.
17. Click **Create** to save your changes.

After developing the extensions for your team, deploy the blueprint to Automation Co-Pilot using Chrome extension. [Deploy an extension version to Automation Co-Pilot using Chrome extension](#) on page 3182

Deploy an extension version to Automation Co-Pilot using Chrome extension

Select and deploy the version of a verified extension for Teams to access in Automation Co-Pilot using Chrome extension.

Select and deploy an extension version (called a mod) for teams to access in Automation Co-Pilot using Chrome extension. Mods package all customizations and return them to the web application as a single version. This provides developers access to make improvements on one version while users simultaneously run a verified version.

Use the management console in the Automation Co-Pilot using Chrome extension to deploy a mod and control the version of developed artifacts.

Automation Co-Pilot using Chrome extension offers a management console for development artifacts to provide version control. Select the version of an extension by choosing a mod from the console. Mods package all customizations and return them to the web application as a single version. This allows developers access to make improvements, while users run a verified version.

This task describes how to deploy a mod from the Automation Co-Pilot using Chrome extension management console to populate your widget and make it accessible.

Prerequisites

- Use a Google Chrome browser with a profile setup with Automation Co-Pilot using Chrome extension.
- Ensure you have access to two Automation Co-Pilot users, one with the Automation Co-Pilot admin profile for set up and one with the Automation Co-Pilot user profile for testing.

1. You can either:

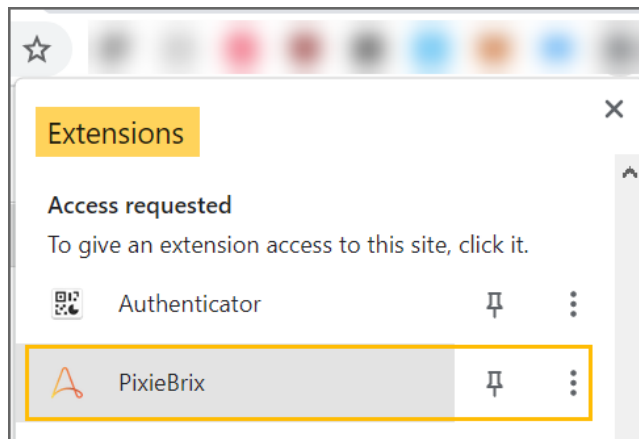

- Open a new browser window on your machine and log in to Automation Co-Pilot using Chrome extension as an AARI Admin; or
- Open a new browser window on a different machine to easier manage active sessions.

Tip: Use Chrome Profiles to manage multiple user profiles on the same machine. For each user profile created, the user must log into Automation Co-Pilot and install the Chrome extension into that Chrome profile. Then, each user must log in to the Chrome extension using their respective Automation Co-Pilot credentials. This management method:

- Organizes profiles for Administrator, Developer, and end users for testing.
- Optimizes managing multiple sessions when tasks are completed on the same device.

To learn more about Chrome Profiles, see [Google Chrome help](#)

2. Open the Console page by selecting **Chrome > Extensions > PixieBrix**.

3. Click the **Options** button in the slide out panel that appears.

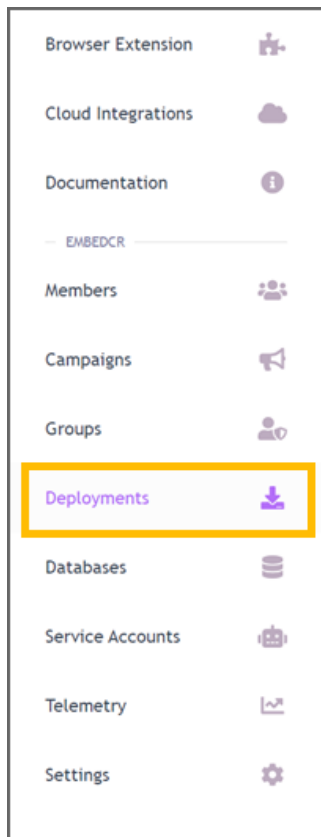

4. If prompted to log in enter your Control Room URL and log in using the AARI Admin account.

Note: To switch to a different user in the existing session, click **Open Admin Console** at the top right of the page. In the new tab, click the **username** and select **Logout**.

5. When logged in as the AARI Admin, click **Open Admin Console** at the top right of the page.
6. Select **Deployments** from the left navigation menu.

7. Click **+ Create Deployment** at the top right of the Deployments page.
8. Enter the name of your deployment.

- Select the mod of the extension you previously created using the Develop an widget for Automation Co-Pilot using Chrome extension procedure. [Develop a widget for Automation Co-Pilot using Chrome extension](#) on page 3180

Create Deployment

Name

Blueprint

Blueprint Version

- @embedcr/automations-sidebar - 1.0.0
- @embedcr/demo_workday_sidebar - 1.0.0**
- @embedcr/my-ondemandcom-trigger - 3.0.0

Integration

- @embedcr/my-ondemandcom-trigger - 2.0.0
- @embedcr/my-ondemandcom-trigger - 1.0.0

Blueprint has n

- @embedcr/ptab-sap-trigger - 1.0.0
- @embedcr/workday-hr-automation - 1.0.0

Configure Blueprint

Blueprint has no options to configure

- Click **Create Deployment** to save your settings to Automation Co-Pilot.
- In a new tab or window, navigate to Automation Co-Pilot and log in as an AARI Admin.
- Open the Extensions page by selecting **Manage > Extensions** from the left-hand navigation menu.
- Click **+ Add Extension** on the top right of the page.

Your newly deployed extension displays in the table.

- Select the check box next to your deployed extension and then click **Add & Save**.

Add Extensions

Name Search

Extensions (6) (4 selected)

<input checked="" type="checkbox"/>	Name	Package	Version	Last Modified

25

You return to the Extension Setup page.

- From the Extension Setup page, select the deployment you added. Automation Co-Pilot navigates to the Properties page.
- To assign one or more teams, select the **Teams** tab at the top of the page.
- Click the **+** button on the bottom right to open the Teams dialog.

18. Select the Teams for which to assign the extension.

19. Click **Add & Save** to activate and deploy teams customization.

Test the customization.

Note: If using Chrome Profiles, switch to a user profile dedicated to an AARI User profile that belongs to this respective Team. Otherwise, follow the steps to log the user out of the Chrome extension and then log in with a user that already has an AARI user license assigned and has been added to this respective Team.

As the user, navigate to your configured application, (similar to how Workday was configured in the previous task). After you access the page configured on the Trigger, the Sidebar panel should automatically display with the list of available automations for the user.

Provisioning Automation Co-Pilot using Chrome extension to users

Organize and assign developed extensions to users for business roles and functions.

Ensure that you have completed development of the Automation Co-Pilot using Chrome extension content. [Develop a widget for Automation Co-Pilot using Chrome extension](#) on page 3180

After developing an extension, make sure to **refresh** Automation Co-Pilot to load recently developed content.

1. In Automation Co-Pilot using Chrome extension, click **Add Extension**.
2. Select the extension.
Recognize the extension by the **Name** you entered in development.
3. Click **Add and Save**
4. To edit properties, select the newly added extension on the **Extension Setup** page .
5. Click the **Teams** tab.
6. Select **Teams** to assign them the extension.
7. To commit your changes, click **Add and Save**.

The ellipsis on the far right of each team offers an option to send the extension link to users. Users will now be able to access the widget from their web applications.

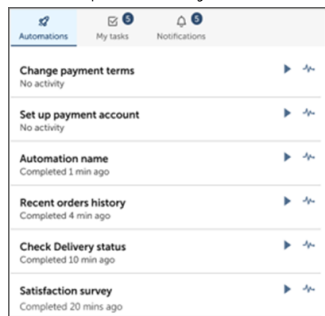

Check out what users can do with the extension. [Deploy automations in web application](#) on page 3161

Use Automation Co-Pilot as embedded widget in Genesys

Invoke Automation Co-Pilot as an interaction widget inside Genesys Cloud. The agent uses the widget to correct a pricing error without leaving Genesys.

Automation Co-Pilot

Business users can directly access authorized automation from within their favorite business applications, without having to open a new interface or learn a new app. Automation Co-Pilot delivers automation everywhere you want, through a widget, either integrated with your web application or delivered through a browser extension. To make the widget accessible, create and configure the widget in your preferred application. Then populate the widget by assigning pre-built automation to teams or roles in Automation Co-Pilot. Assigned users can access Automation Co-Pilot to complete daily tasks.

Setup

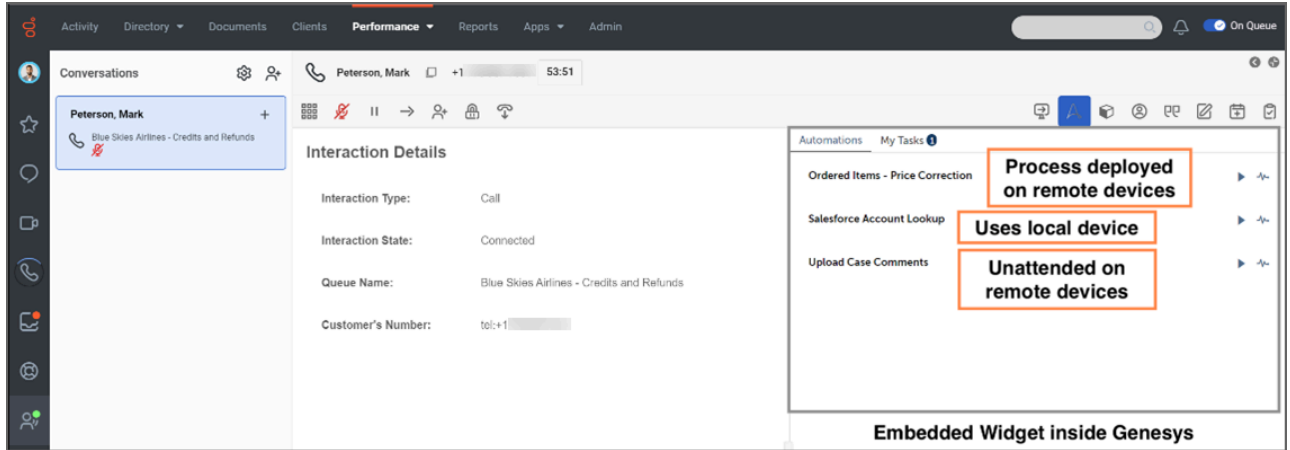

1. Complete the setup process flow [Automation Co-Pilot using embedded widget overview](#) on page 3151
2. Assign automation [Assign automations to teams](#) on page 3156
3. Automation assigned should include the following.
 - Attended bot (that can be deployed on the local device) [Attended and unattended automation](#) on page 3143
 - Automation Co-Pilot Process invocation (with two human step forms) [Deploy processes](#) on page 3256
 - Unattended bot (triggered via Automation Co-Pilot process with no human inputs) [Create a process automation in Process Composer](#) on page 3312

Tip: Usable sample code

You can download the following sample code to test this example in your own environment. [GitHub: Embedded Use Case 1](#)

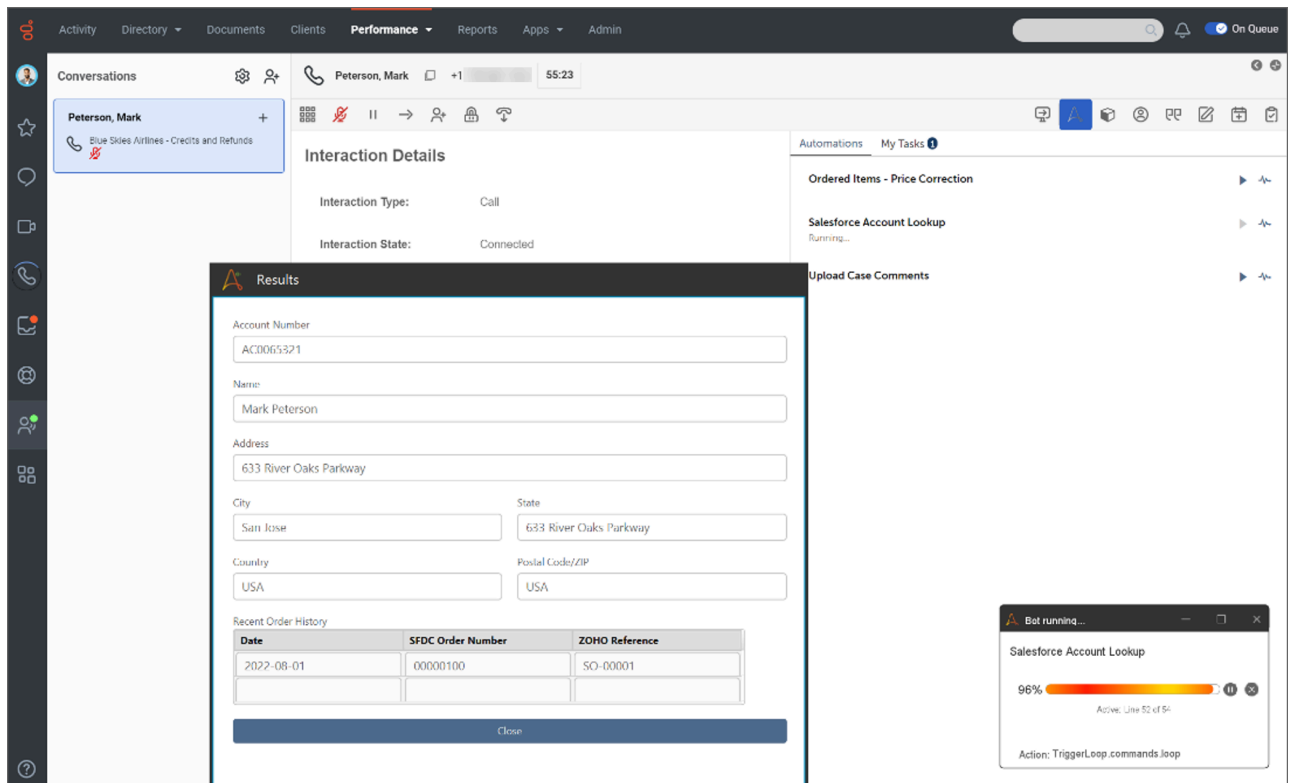

Example Summary

In this example, a contact center agent receives a call about an order with an incorrect charge. The agent, operating in Genesys, responds using the embedded widget by launching automated processes and bots, and handles the order correction without leaving Genesys. Deployed automation touch Salesforce and Zoho Sales Order Management to correct the error in respective systems. Assigned automation are detailed in the following image.

This example describes steps the agent takes to correct a pricing error while in Genesys, by using the Embedded Automation widget.

1. Deploy the **Salesforce Account Lookup** bot and enter the phone number to pull up the account record.

Copy the **SFDC Order Number** to enter in the next step.

2. Launch the **Order Items Price Correction** process from within the widget and enter the order number you have retrieved.
A Bot retrieves order details from Zoho and renders the **Display Order Details** in a form, including products and prices paid.

Optional Additional Discount (Compensatory)
 Apply 3% discount on order

Cancel Submit

Task Sequence

4. Optionally, select the 3% discount for courtesy.
5. Click **Submit**.
The bot calculates the amount to be reimbursed.
6. The bot creates a billing update for refund in Zoho.
7. A reference number is generated, and the system indicates it will take 5-7 business days for refund to appear on card.

After the case is resolved, upload case notes from all cases handled through the day into a compliance application for audit.

	A	B
1	Case Number	Comment
2	00001002	Guided customer to refer to KB Aricle AB3434HH for directions on installation
3	00001016	Customer inquiring about maintenance guidelines, specifically what to maintian and at what interval. Guidance provided as per generator documentation.
4	00001024	Escalated issue to engineering as issue is mechanical and requires expert assistance from SME
5		

Enter the **file location**, for the automation to sends notes to the appropriate contacts.

Use Automation Co-Pilot as Chrome extension in Workday

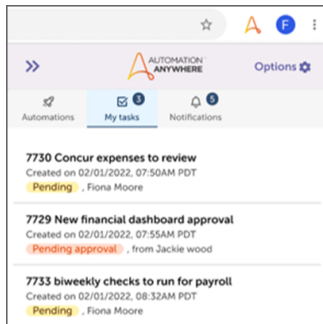

Automation Co-Pilot makes automation accessible for end users operating inside Workday. For example, a Human Resource admin enters an employee address and can order business assets to ship without leaving Workday.

Automation Co-Pilot

Business users can directly access authorized automation from within their favorite business applications without having to open a new interface, or learn a new app. You can invoke the widget in Workday. To make the widget accessible:

1. Create and configure the widget in your preferred application.
2. Assign any pre-built automation in Automation Co-Pilot required for teams to complete their daily tasks.

The widget (shown in the following image) populates assigned automation for specific roles.

Setup

1. Complete the following setup process.
 - a) [Set up and connect Automation Co-Pilot using Chrome extension](#) on page 3177
 - b) [Setup iFrame widget using Automation Co-Pilot](#) on page 3153
 - c) [Develop a widget for Automation Co-Pilot using Chrome extension](#) on page 3180

Note: For this example, configure the widget to trigger as a Page Load event.

 - d) [Provisioning Automation Co-Pilot using Chrome extension to users](#) on page 3186
2. Two types of automation are assigned in this example and include the following details:
 - Attended bot (that you can deploy on the local device). See [Attended and unattended automation](#) on page 3143.
 - Automation Co-Pilot Process invocation (with two human step forms). See [Deploy processes](#) on page 3256

Tip: Sample code

You can download sample code to test this example in your own environment. See [GitHub: Embedded Use Case 2](#)

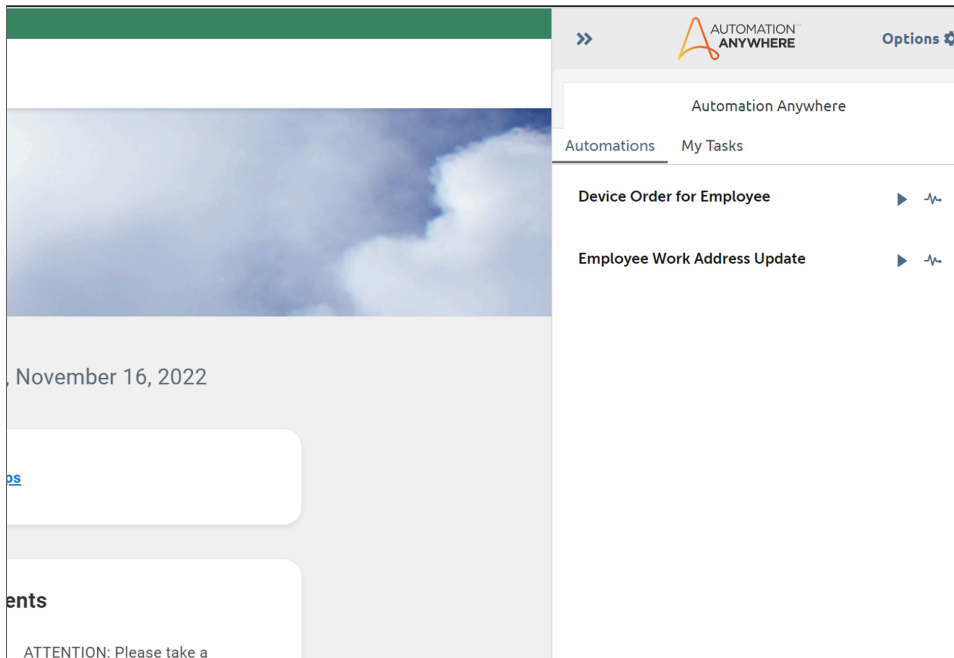

Example Summary

An HR Admin logs into the Workday application and views the new widget sidebar on the home page that has been deployed by the RPA Center of Excellence (CoE). The sidebar opens has been designed to open automatically when the user accesses the Workday application and the page has completed loading.

The HR Admin can use Embedded Automation to access and update an employee address, and then order hardware assets to deliver to that employee.

The deployed automations used in this example touch Workday and Zoho Sales Order Management (used to complete the transaction):

- An attended bot (**Employee Work Address Update**) built for an HR Admin to quickly locate and update home office address details of employees, using interactive forms and local desktop automation.
- An Automation Co-Pilot process invocation (**Device Order for Employee**) built for an HR Admin to order hardware assets (such as laptops and keyboards) for employees directly in Workday.

1. Start the **Employee Work Address Update** automation used to enter the Employee ID of the person you want to update.

2. Enter the **Employee ID** to search Workday for the employee.

Employee Data

Employee ID: 21507 User ID: tstaff

Person Data

Position: System Administrator Hire Date: 2020-03-11

First Name: Tim Last Name: Staff

Email Address: timstaff@getnada.com

Address: 545 Tremont Street

City: Boston State/Province: MA

ZIP: 02116 Country: USA

Position Data

Pay Type: Salaried

Management Level: 8_Individual_Contributor

Base Pay: 100000

Bonus Plan Amount: 0 Bonus Plan Percentage: 0

Total Compensation: 100000

Update Work Address

3. Enter the employee's address details using the provided form to update the employee data.

This example shows a simple address update. However, you can update other employee details based on the available APIs in your Workday instance, or by using the Automation Anywhere Universal Recorder.

4. Click **Save Changes**.

The screenshot displays the 'Employee Details' form in Workday. The form is divided into several sections: 'Employee Data', 'Person Data', 'Address', and 'Position Data'. The 'Employee Data' section includes fields for Employee ID (21507) and User ID (tstaff). The 'Person Data' section includes Position (System Administrator), Hire Date (2020-03-11), First Name (Tim), and Last Name (Staff). The 'Address' section includes Email Address (timstaff@getnada.com), Address (715 SW MORRISON ST), City (PORTLAND), State/Province (OR), ZIP (97205), and Country (USA). The 'Position Data' section includes Pay Type (Salaried), Management Level (8_Individual_Contributor), Base Pay (100000), Bonus Plan Amount (0), and Bonus Plan Percentage (0). The Total Compensation is also shown as 100000. At the bottom of the form, there are two buttons: 'Save Changes' and 'Cancel'. The 'Save Changes' button is highlighted with a yellow border. A blue button labeled 'Update Work Address' is also visible above the 'Position Data' section. The footer of the form reads 'Powered by Automation Anywhere'.

The automation updates the employee data in Workday.

The second automation (Device Order for Employee) simplifies daily tasks of the HR Admin. This adds an automated process for device ordering that is embedded directly in the Workday application using the same sidebar. Typically, this task would require navigating procurement applications to locate and order devices, and while navigating the Workday application to capture shipping address details of the employee.

By bringing the ordering process into the primary application where daily tasks are performed, the task is simplified. Similar to the previous task, when the HR admin logs into Workday, the sidebar appears with the list of available automations their CoE has deployed.

5. Locate the **New Device Order for Employee** automation displayed in the sidebar and click **Start**.

A new instance is created.

6. Enter the **Employee ID** for a new order.

After submitting a valid Employee ID, the automation locates and returns the employee details within Workday.

7. Confirm the employee details and select the hardware items to order.

The screenshot displays the 'Automation Anywhere' interface for a task named '53-25 Ship New Device Device Selection'. The user is identified as Charlie Harrison. The form is divided into sections: 'Employee Data' with fields for Employee ID (21507) and ZIP (97205); and 'Available Assets to Order'. Three assets are listed, each with a checkbox, price, and quantity field (set to 0): Jabra Evolve 65 UC Headset (\$199.99), Microsoft Ergonomic Desktop Keyboard (\$121.99), and Microsoft Bluetooth® Ergonomic Mouse (\$69.99). At the bottom, there are 'Submit' and 'Cancel' buttons, and a 'Task Sequence' button.

8. After the automation has created a new order in the company's order management system (Zoho Order Management), the automation returns the Sales Order number (SO-00012) for reference.

Access Automation Co-Pilot in SAP and ServiceNow

Automation Co-Pilot makes a shared automation accessible for end users in SAP (via Chrome extension) and ServiceNow (via embedded widget). An employee submits an order request and a manager approves the request.

Automation Co-Pilot

Business users can directly access authorized automations from their favorite business applications without having to open a new interface, or learn a new app. You can invoke Automation Co-Pilot as a widget in ServiceNow and as a sidebar in SAP. To make the widget accessible:

1. Create and configure the widget in your preferred application.
2. Assign any pre-built automations in Automation Co-Pilot required for teams to complete their daily tasks.

The widget populates assigned automations for specific roles.

The diagram illustrates three ways to integrate Automation Anywhere into a web application:

- iFrame Widget**: For web apps supporting customization. It shows a sidebar with automation tasks like 'Change payment terms', 'Set up payment account', 'Automation name', 'Recent orders history', 'Check Delivery status', 'Satisfaction survey', and 'Look up competitor pricing'.
- Embed automation in any web application**: For attended, unattended, and process automations. It features a lightning bolt icon and is described as having a 'Lightweight and responsive interface'. It also notes 'Seamless authentication with OAuth 2.0 or SAML SSO'.
- Chrome Extension Widget**: For web apps not supporting customization. It shows a mobile-style interface with a list of tasks such as '7730 Concur expenses to review', '7729 New financial dashboard approval', and '7733 biweekly checks to run for payroll'.

Example Summary

A company employee (Jane) submits a request to order replacement hardware. Jane (operating in ServiceNow) uses the embedded widget to launch an automated bot to process the order, and submit for approval to a Cost Center Manager (Gerald). Gerald (operating in SAP) uses the embedded widget to launch automations that approve and complete the hardware shipment order.

The widget is visible in ServiceNow as a custom ServiceNow component that is placed into the Employee Service Portal page. The widget is invoked as a sidebar through the web browser. For users operating in SAP S/4HANA, the sidebar appears on a page load trigger.

Setup

1. Complete the setup process flow for ServiceNow. See [Automation Co-Pilot using embedded widget overview](#) on page 3151.
2. Complete the setup process flow for SAP . [Automation Co-Pilot using Chrome extension](#) on page 3175.
3. Assign automations. See [Assign automations to teams](#) on page 3156.
4. The embedded widget can contain combinations of three types of automations:
 - Automation Co-Pilot Process invocation (with two human step forms). See [Deploy processes](#) on page 3256.
 - Attended bot (that can be deployed on the local device). See [Attended and unattended automation](#) on page 3143.
 - Unattended bot (triggered through Automation Co-Pilot process without human input). See [Create a process automation in Process Composer](#) on page 3312.

Tip: Sample code

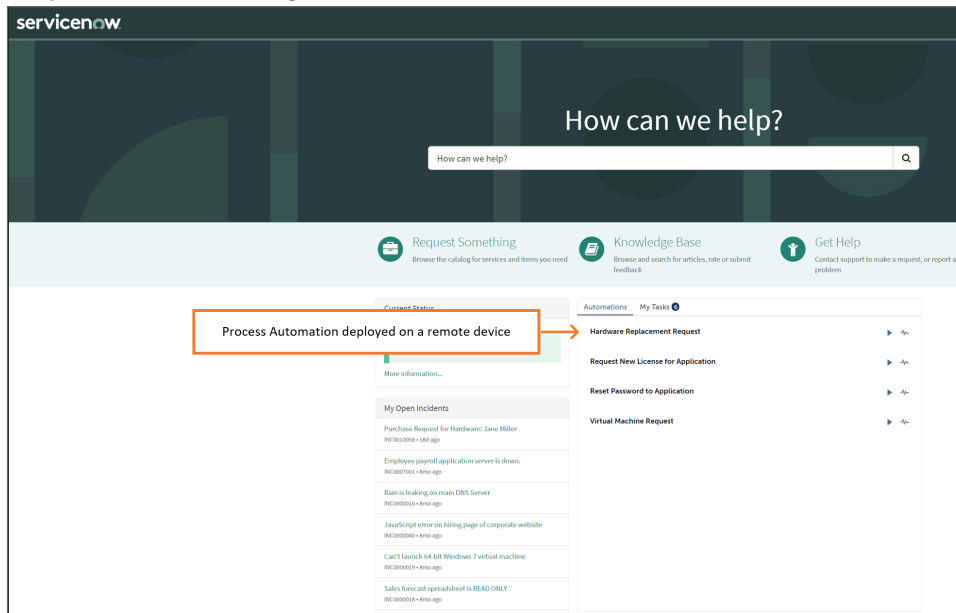

You can download the following sample code to test this example in your own environment. See [GitHub: ServiceNow](#) .

Procedure

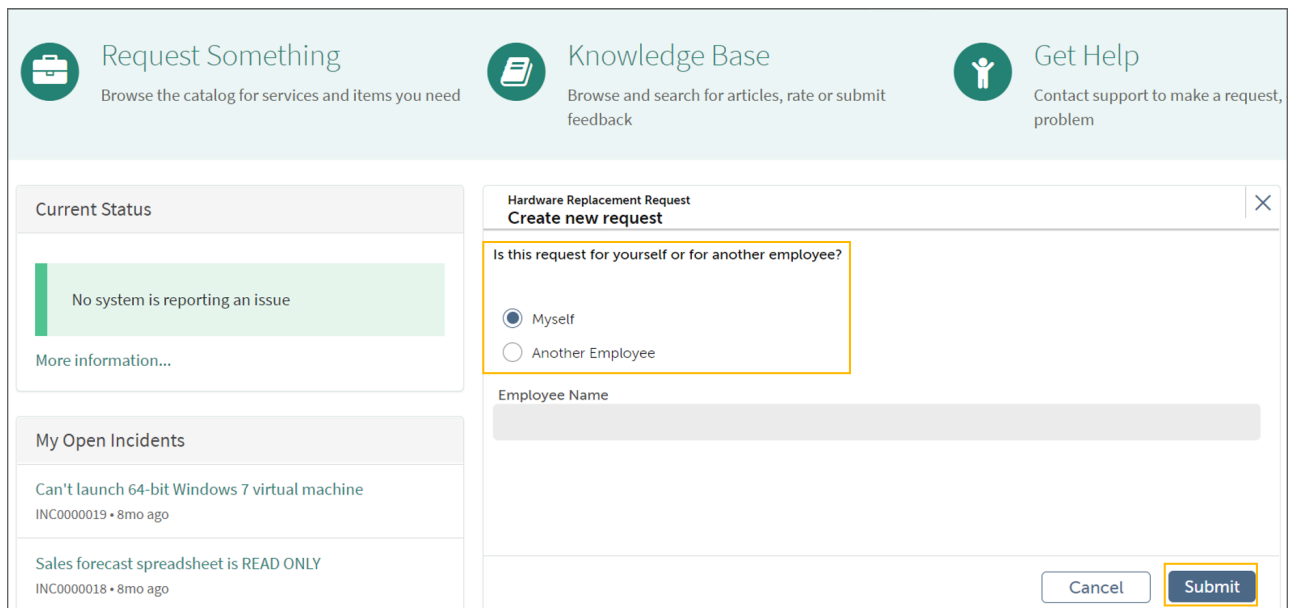

This embedded widget example includes the AARI Process automation type.

The **Hardware Replacement Request** Automation Co-Pilot process allows an employee access to the business ServiceNow Service Portal for IT requests. An employee can use the embedded widget to automate requests. Jane's order request includes replacement hardware such as: keyboards, mice, or laptops.

When Jane opens ServiceNow, they can see the automated process for **Hardware Replacement Request** within the widget.

1. Jane initiates the **Hardware Replacement Request** and is taken to an input page in the widget where they enter the information required to execute the automation.
2. Jane can select the request for self, or as another employee, and click **Submit**.

3. After submitting her request, the next automation connects Jane to the business HR system where Jane gathers employee details, such as shipping address. The system connects to the procurement system to retrieve the available items to order.

Note: This example includes these steps in the automation to reduce reliance on additional systems.

Task Sequence

- This business rule was created in this automation example to check the total order value:
If the total order value exceeds the company threshold of \$3000, then an approval is required from the cost center owner. This generates a request to Gerald.
- Gerald focuses on different tasks in the cost management application (SAP). The list of automations in the sidebar is focused on orders, inventory, and other sales related processes. When the widget generates Jane's request for Gerald, a toast message displays in the inbox for the new task in the widget.

Gerald selects **My Tasks** to view the request and continue with the Automation Co-Pilot approval process.

- Gerald approves the request and adds any comments, remaining in the SAP environment.

Integrate Automation Co-Pilot with Microsoft Teams

Set up the Automation Anywhere app to access Automation Co-Pilot in the Microsoft Teams platform.

Integrating Automation Co-Pilot in Microsoft Teams

Use the Automation Co-Pilot experience with Microsoft Teams (desktop or web app) directly from your workspace and access authorized automations from within Microsoft Teams without having to open a new interface or learn a new app.

Task summary

1. Download all files and edit the manifest.json file using your own URL for the Automation Workspace.
2. Create one zip file for all of the files.
3. Using the zip file, upload the Automation Anywhere app to your organization's app catalog in Microsoft Teams to make it available to end users for download.

Note: The Automation Anywhere app is not supported on mobile devices.

Prerequisites

- Create a copy of the URL for your organization's Control Room from the **Embed code** field in Automation Co-Pilot using embedded widget. You will replace the example in the manifest.json file with your URL. See, [Setup iFrame widget using Automation Co-Pilot](#) on page 3153.

Note: You must use the following parameter in your URL to force the use of the Teams SDK and auth code.

- If the embed code was generated with Tags, then add

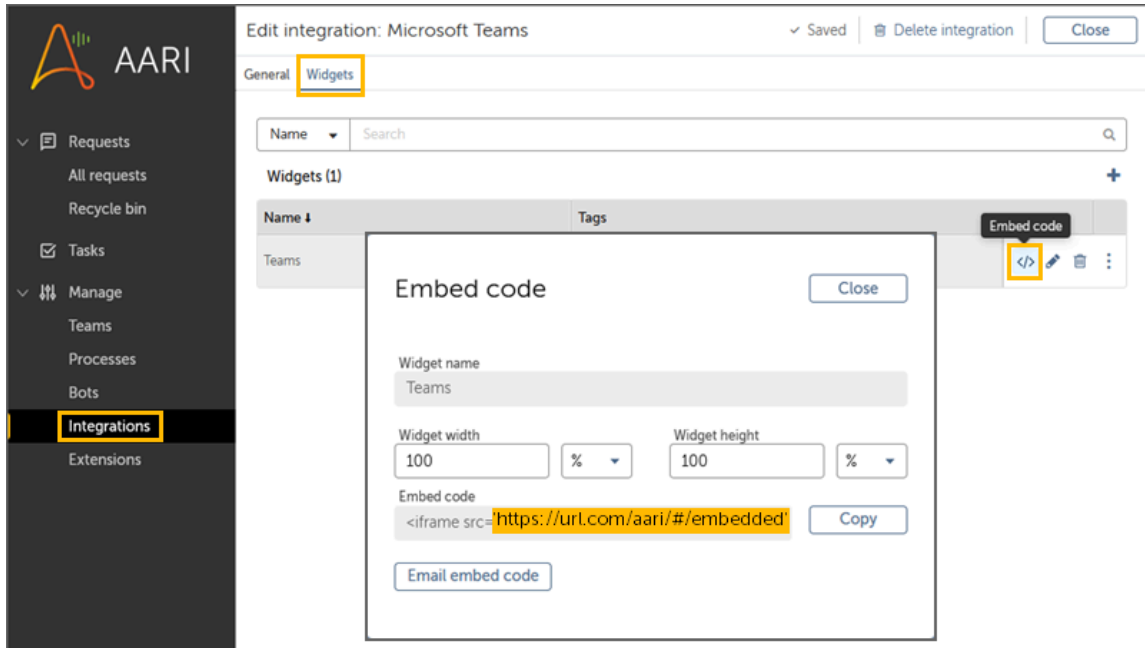

```
&App=Teams
```

to the end of the URL.

- If the embed code was generated without Tags, then add

```
?App=Teams
```

to the end of the URL.

- Download all files from the [MS-Teams-Integration/Automation Anywhere/](#) GitHub folder to use in this setup process.
- Use admin roles and permissions to access your Microsoft Teams platform during the setup process.

1. Edit the manifest.json file by replacing all instances of `your-a360-domain` with the URL of your Control Room.

```

16  "description": {
17    "short": "AARI",
18    "full": "Use the AARI web interface from within MS Teams"
19  },
20  "icons": {
21    "outline": "outline.png",
22    "color": "color.png"
23  },
24  "accentColor": "#FFFFFF",
25  "staticTabs": [
26    {
27      "entityId": "ecad9d6d-55c8-4bd9-820c-aall580b9e41",
28      "name": "AARI",
29      "contentUrl": "https://your-a360-domain/aari/#/embedded",
30      "scopes": [ "personal" ]
31    },
32    {
33      "entityId": "about",
34      "scopes": [
35        "personal"
36      ]
37    }
38  ]
39  "validDomains": [
40    "your-a360-domain" ]

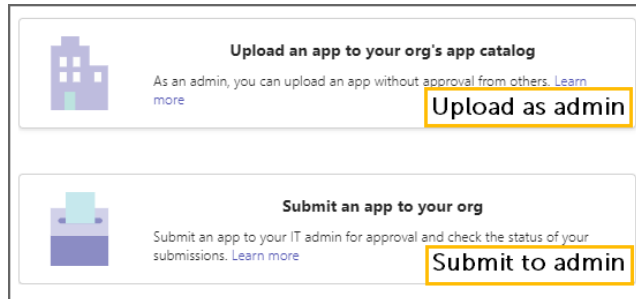

```

2. Create a zip file containing the contents of the **Automation Anywhere** folder and label it for uploading to Microsoft Teams.
3. Using the admin role and permissions in Microsoft Teams, upload the zip file.
 - a) From the **Apps** tab, click **Manage your apps** in the lower left corner.

b) Click **Upload an app**.

c) **Note:** You must have admin privileges to upload directly. Users without admin privileges should work with their IT department to upload the package with proper authorization.

Select **Upload an app to your org's app catalog** to use the app immediately without review. Optionally, you can select **Submit an app to your org** to submit the app for review by your IT admin.

d) Select the zip file you created in step 2.

4. Click **Add**.

5. When the App loads, you will be prompted to log in to the Automation Anywhere Control Room. Click **Log in** to continue.

The login window closes and the Automation Co-Pilot interface is displayed.

The end user installs the Automation Anywhere app:

1. In Microsoft Teams, click the ellipsis button in the left sidebar and search for the Automation Anywhere app.
2. When prompted, log in to the Automation Anywhere Control Room and the Automation Co-Pilot interface is displayed.

Using Automation Co-Pilot for Business Users on desktop

Use Automation Co-Pilot for Business Users through your desktop to manage routine tasks such as validating data, retrieving approvals, and managing escalations through bots.

Note: Roles, permissions, and licenses may continue to reference Automation Anywhere Robotic Interface (AARI)] within the product.

The following workflow describes how to use Automation Co-Pilot to automate and manage your tasks:

1. Create a user:
 - The Control Room administrator creates a user with a Bot Creator license.
 - [Create a user](#) on page 1678 | [Automation 360 licenses](#) on page 1347
 - The user logs in to the Control Room to start building bots.

[Install Bot Agent and register device](#) on page 1288 | [Get started building bots](#) on page 3067

2. Create forms using the Interactive forms package:

- Interactive forms enable you to design forms for submitting and regrouping data from various applications.

[Create a form](#)

- Link the form to a newly created bot or an existing bot using the Bot editor interface.

[Add a form to bot](#) on page 3231

3. Add triggers to the bot:

Trigger loop enables you to add triggers that can run a task automatically when certain predefined events occur.

[Adding a trigger to run a bot](#) on page 3233

Automation Co-Pilot Desktop Assistant

Attended Bot Runner users can use the Automation Co-Pilot Desktop Assistant application to access bots without logging into Control Room.

Note: Roles, permissions, and licenses may continue to reference Automation Anywhere Robotic Interface (AARI) within the product.

Control Room administrator adds Active Directory (AD) users by selecting AD domain, providing environment details, and assigning a role and device license. Administrator can further deploy the Control Room RBAC by specifying role-based privileges and permissions at the bots and Bot Runner level.

Control Room RBAC on Bot Runner users facilitate a complete isolation based on pre-defined criteria such as users across various business units or departments. This also includes the privileges that is applied at a folder level to completely and seamlessly isolate bots of one department from the other.

In a typical scenario, triggering some specific bots to complete important tasks can be one of the daily routines for attended Bot Runner users. Entire process of signing into Control Room can be time consuming. Automation Co-Pilot Desktop Assistant reduces this effort considerably. When Bot Agent is installed on a device, an application shortcut on the desktop for Automation Co-Pilot Desktop Assistant is also created along with a **Start** menu icon.

Users with attended Bot Runner license can launch this application, use their AD credentials to sign in and review the list of available bots, and run the specific bot.

Important: Automation Co-Pilot Desktop Assistant application is not available for the Citizen Developer license.

Sign in to Automation Co-Pilot Desktop Assistant

Use the Automation Co-Pilot Desktop Assistant application to directly run bots without signing into Control Room.

- Automation Co-Pilot service must be running in Control Room to use Automation Co-Pilot Desktop Assistant .
- This application is designed only for user with attended Bot Runner license. A sign in error is displayed if users with any other license tries to sign in.
- This application is designed for users with either an attended license, an AARI license, or both. Attended Bot Runners can use their license to run bots, while users with an AARI license can run processes. Users with both licenses can run both bots and processes.

1. Click the **AARI** icon to open Automation Co-Pilot Desktop Assistant .
2. Use Automation 360 credentials to sign into the application.

All the bots that you have access to are listed.

3. Optional: Use the **Search** bar at the top to find a bot.
4. Optional: Click **Show pinned only** check box to list your pinned bots.

Ensure you pin (similar to favorites) the most used bots for a quick access.

5. Click **Launch** to run the bot.

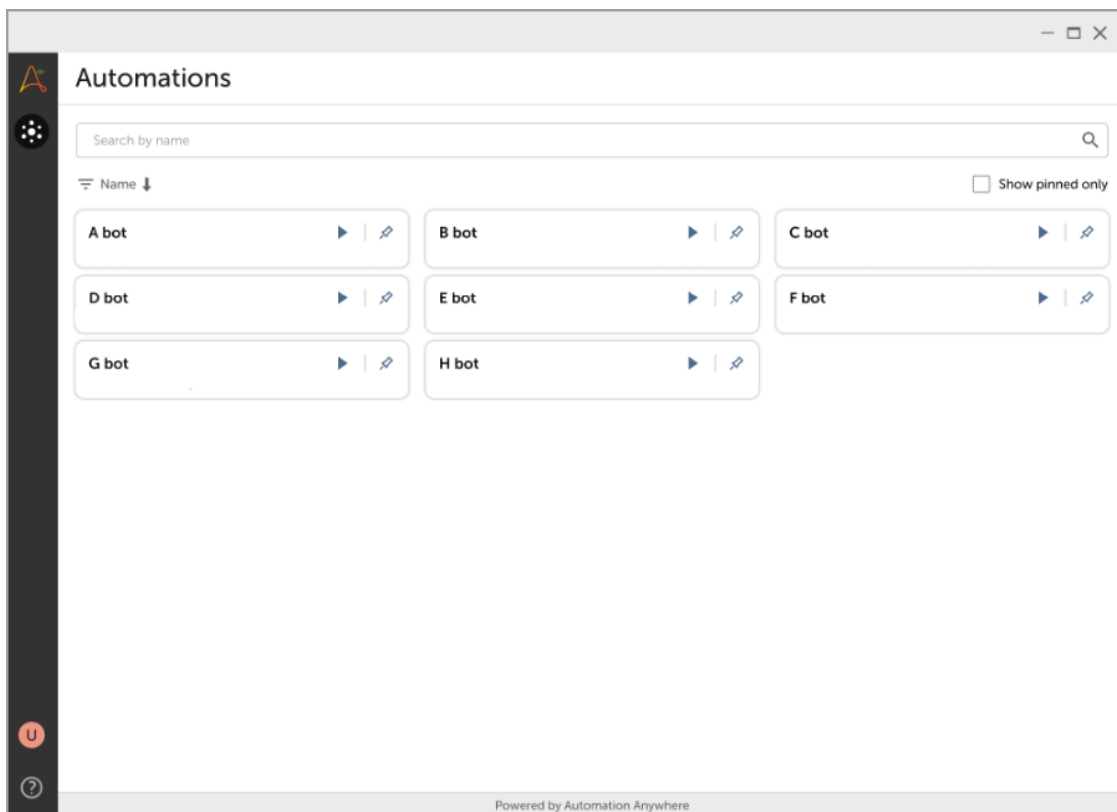

After the bot run is successful, a **Completed** message is displayed. You cannot launch another bot until this activity completes.

Automation Co-Pilot Desktop Assistant automation activities

As an attended user who runs attended bots, you can perform several automation activities using Automation Co-Pilot Desktop Assistant .

Automations page overview

In Automation Co-Pilot Desktop Assistant , you can view a list of available bots for you to run in the **Automations** page.

You can re-size the page to fit your screen and have its contents automatically adjust.

From the **Automations** page, you can also pin, sort, or search for bots.

Key features

Continue pending automation

You can continue any pending automation that you started from different Automation Co-Pilot Desktop Assistant instances. If you start an automation from one instance and then reconnect to continue the automation on another instance, the automation will process.

This provides a consistent automation experience no matter which instance you use to access Automation Co-Pilot Desktop Assistant.

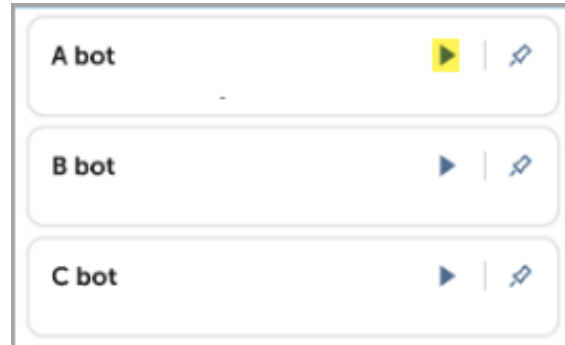

Consistent state

Automation Co-Pilot Desktop Assistant will remain in a consistent state regardless of how

View and run any available bots

many Automation Co-Pilot Desktop Assistant instances you use. The state will be updated to the latest state across all Automation Co-Pilot Desktop Assistant instances.

To view and run any available bots, simply click **Start** to start the automation.

View status or control bot progress in one page

After you run a bot, you can view its progress in real time.

The progress details of a bot run contains information such as:

- The name of the bot.
- The action that is currently being performed.
- The line number that is being executed.
- The total number of lines in the bot.
- Status of the bot run (% completed).

The progress details are displayed only when a bot is run on a local device by a user with Attended Bot Runner license.

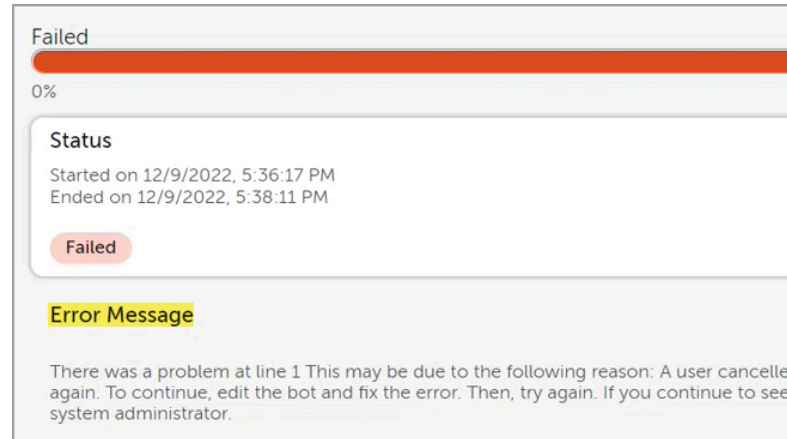

You can also pause, start (resume), or stop the bot progress.

By presenting the status and bot controls on one unified page, this ensures consistency for each bot run.

Note: To use the bot controls, you must have the **Managed my activity** permission. Otherwise, you can view the controls only.

View detailed status

You can view the details of a bot status . For example, you can use the details to troubleshoot the automation if an error occurs.

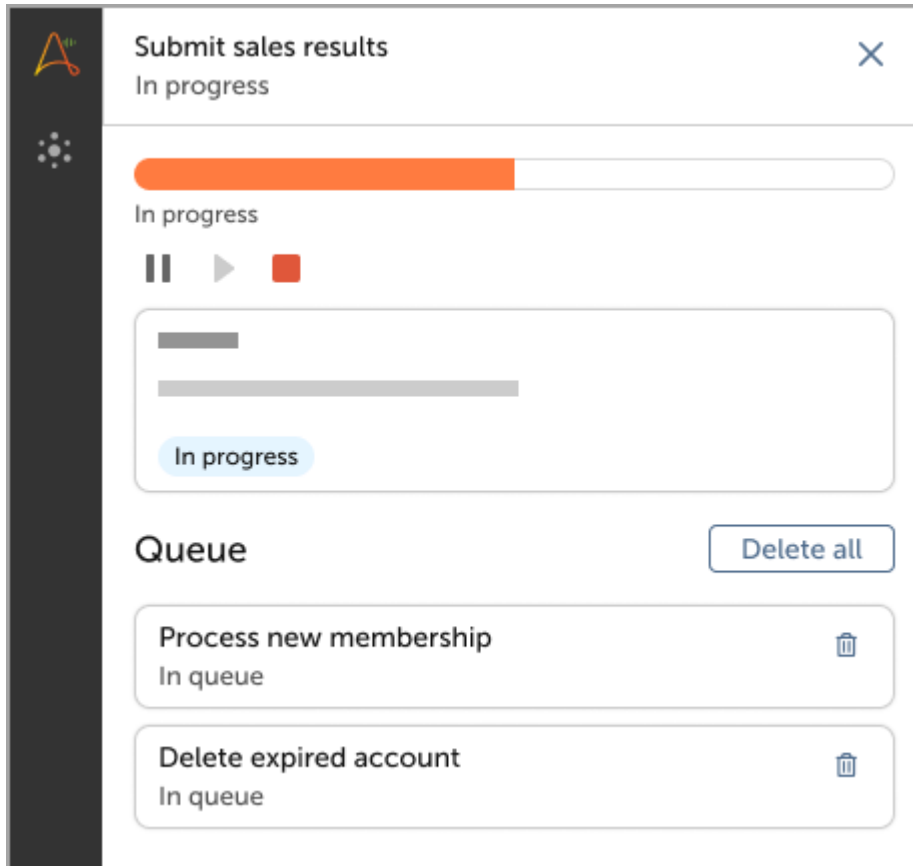

Queue automations

You can queue attended bots and manage multiple bot deployments.

Queue page

In Automation Co-Pilot Desktop Assistant, the **Queue** page allows for you, an attended user, to view and manage your attended bots that are in multiple deployments. This helps keep track when you are deploying more than one bot at the same time.

The goal of this page is to help you manage on your pending queues at a quick glance.

Benefits

Deploy more than one bot instance	You are able to deploy multiple bot instance and not limit yourself to just one bot deployment.
Identify when triggers are initiated	When you add triggers to your bots, the bots will automatically be placed in the queue.
Grants user direct control over queues	When your bots are in a queue, you have the ability to start and stop your queue at any time. You can also delete all bots from queue list using the Delete all function, or delete individual bots.
Continue queues where you left off	When you move devices or you accidentally disconnect your device while the queue has not been cleared up. You can always continue your deployment or progress when you log back.
Search for specific queues	You can search for specific queues using keywords and quickly identify queues that are on your list.

Using interactive forms

Interactive forms enable you to build forms for submitting and regrouping data that is used to send and receive information from various applications within your attended automation process.

Interactive forms provide a list of actions that you can drag into a bot as a task logic. Specific function of each action is displayed when you hover over them. The actions within the interactive forms can be broadly classified into the following types:

Form level actions	Represented by  and used within a task logic to manage the linked form.
Element level actions	Represented by  and used to manage elements of a form.

Watch the following video to understand how to use Interactive forms in Automation 360:

Create a form

As a Bot Creator, you can create a form to provide interaction between humans and bots. You enter required data using any of the supported form elements that can be rendered in the web interface. Additionally, you can add or remove form actions when creating a process.

Note: As a user, you can interact with the form only when it is assigned to you. If the form is unassigned, it is not enabled and is read-only. To edit the form, you can assign the form to yourself or to any team member who has access to the process. After editing the form, the assignee can submit the form or use any other action options. After the form is submitted or an action option is used, the request view displays the next step or task.

- You must have a Bot Creator license.
- You must be assigned a custom role with the create folder permission.

Forms in Automation Co-Pilot can be displayed in two scenarios:

- Case creation: This is the initial form that is displayed when you want to create a new case and enter the required business data.
- Form step: This form is displayed to show information and prompt for additional inputs.

1. On the left pane, click **Automation**.
A list of available and forms is displayed.
2. Click **Create new > Form**.
3. In the **Create form** page, enter a name for the new form.
Forms are saved in the \Bots\ folder by default. Click **Browse** to change the default folder.
4. Click **Create & edit**.
The form builder page appears with a single row **Column** layout.
5. Drag any of the supported elements (for example: Checkbox, Document, Table, and so on) into the form from the **Elements** panel on the left.
6. If you want to delete a row, click the vertical ellipsis in the form layout and click **Delete row**.
7. Confirm the delete action in the confirmation message.
8. Use the **Properties** panel on the right to update or change the form properties.
9. Click **Save**.

10. Click Close.

[Create a process automation in Process Composer](#) on page 3312

Related tasks

[Example: Use Select File element to upload and download files](#) on page 3330

This example describes how to use the **Select File** element to upload or download files that are passed in the initial forms in the web interface.

Using the Button element

Use the **Button** element in the form builder to validate or cancel a form during bot runtime.

1. On the left pane, click **Automation**.
A list of available and forms is displayed.
2. Click an existing form or click **Create new > Form**.
The form builder page appears.
3. Drag **Button** into the form.
4. Enter the name of the element in the **Button-text** field.
5. Optional: Enter the hint text and tooltip.
6. Use the **Button types** drop-down menu to set the type of the button element.
For example, consider you have two buttons, Save and Cancel. Use **Primary** for Save and **Secondary** for Cancel. Or, if you want the button element to appear as a link during bot runtime, select **Subtle**.
7. Optional: Use the following **Advance behavior** option:
 - **Disallow button click when this form is first loaded**: Enable this option to disable the button element when the form is displayed for the first time during bot runtime.
 - **Validate all form fields when this button is clicked**: Enable this option to validate all available fields of the form when a user clicks this button element during bot runtime.
8. Optional: Click one of the following options:
 - **Reset**: Clears all the element customization and sets the default.
 - **Delete**: Deletes the selected element.
9. Click **Save**.

Using the Checkbox element

Use the **Checkbox** element in the form builder to enable users to select multiple options in a form during bot runtime.

When working with check box outputs, the process builder should apply the following format when mapping keys to options.

A check box output will be a dictionary variable(var) that pairs key:value

The option ID is set by the system as:
CheckBoxGroupX_Y

Key is the option ID.

Value is a boolean (false = not selected).

CheckBoxGroupX is defined by the check box group ID (see in Form Builder).

Y is the order of the option.

Example: `CheckBoxGroup0_0` The first option of the `CheckBoxGroup0` element.

This check box output variable can be set to direct the flow of bots in the process Ex. key1:true then bot1, key1:false then bot2

1. On the left pane, click **Automation**.
A list of available and forms is displayed.
2. Click an existing form or click **Create new > Form**.
The form builder page appears.
3. Drag **Checkbox** into the form.
4. Enter the name of the element in the **Element label** field.
5. Optional: Enter the hint text and tooltip for the check box element.
6. Use the **Checkbox content** fields to add multiple check boxes and enter a name for each one of them.
For example, if you are creating a sales chart form, use this field to add three check boxes and enter `Product 1`, `Product 2`, and `Product 3`.
7. Optional: Enable any of the following **Advance behavior** options:
 - Select the **Make field required** check box to ensure users select this element during bot runtime.
 - Select the **Make field uneditable** check box to make the element a read-only option.
 - If you have multiple check boxes in the form and want a default selection during bot runtime, select the **Make default selections** check box, and select the necessary option.
8. Use the **Formatting** field to set the vertical or horizontal layout of the check boxes.
9. Optional: Click one of the following options:
 - **Reset**: Clears all the element customization and sets the default.
 - **Delete**: Deletes the selected element.
10. Click **Save**.

Using the Date element

Use the **Date** element in the form builder if the user must schedule a date in the form during bot runtime.

1. On the left pane, click **Automation**.
A list of available and forms is displayed.
2. Click an existing form or click **Create new > Form**.
The form builder page appears.
3. Drag **Date** into the form.
4. Enter the name of the element in the **Element label** field.
5. Select a default date using the **Default value** field.
6. Optional: Select the **Use the local system date when form is loaded** check box to set your system date as the default value.
7. Select one of the following formatting options:
 - **Use locale date format setting**: The date is displayed in the format set on the user's machine.
 - **Manual input**: Select the date format to be displayed from the drop-down menu.
8. Enter the hint text and tooltip for the formatting option.

9. Optional: Enable any of the following **Advance behavior** options:
 - Select the **Make field required** check box to ensure users select this element during bot runtime.
 - Select the **Make field uneditable** check box to make the element a read-only option.
10. Optional: Click one of the following options:
 - **Reset**: Clears all the element customization and sets the default.
 - **Delete**: Deletes the selected element.
11. Click **Save**.

Using the Document element

Use the **Document** element in the form builder to render a document, such as an image (.jpg) or PDF, that you want to preview along with the form.

Note: Only one **Document** element can be used in a form.

1. On the left pane, click **Automation**.
A list of available and forms is displayed.
2. Click an existing form or click **Create new > Form**.
The form builder page appears.
3. Drag **Document** into the form.
4. Enter the correct URL or the document location address in the **Default file** field.
5. Use the **Formatting** drop-down menu to set the position of the document element in the form.
6. Optional: Enter a specific width for the element in the **Dimensions** field.
7. Optional: Click one of the following options:
 - **Reset**: Clears all the element customization and sets the default.
 - **Delete**: Deletes the selected element.
8. Click **Save**.

Using the Dropdown element

Use the **Dropdown** element in the form builder to provide multiple options in the form during bot runtime.

1. On the left pane, click **Automation**.
A list of available and forms is displayed.
2. Click an existing form or click **Create new > Form**.
The form builder page appears.
3. Drag **Dropdown** into the form.
4. Enter the name of the element in the **Element label** field.
5. Optional: Enter the hint text and tooltip for the check box element.
6. Use the **Add dropdown content** field to enter the items that must appear in the drop-down menu during bot runtime.
7. Optional: Enable any of the following **Advance behavior** options:

- Select the **Make field required** check box to ensure users select this element during bot runtime.
 - Select the **Make field uneditable** check box to make the element a read-only option.
 - If you have multiple items in the drop-down element and want a default selection during bot runtime, select the **Select default list item** check box, and select the necessary option.
8. Optional: Click one of the following options:
- **Reset**: Clears all the element customization and sets the default.
 - **Delete**: Deletes the selected element.
9. Click **Save**.

Using the Dropdown Multi-Select element

You can use the Dropdown Multi-Select element to add a dropdown menu in your form for multiple selection.

1. Drag the Dropdown Multi-Select element to your form.
The properties view will appear to allow for you to configure your element.
2. Specify the name of the label in the **Element label** field.
By default this is named to **Multi select dropdown**.
3. Optional: Specify the hint in the **Hint below field**.
The maximum limit is 30 characters.
4. Optional: Specify the hint in the **Tool tip**.
The maximum limit is 200 characters.
5. Specify a list of items that you want to include for the dropdown menu in the **Add dropdown content** section.
You can specify as much as you need, as long as the items ends with a comma.

Note: Duplicates will be automatically deleted.

6. Select any of the following in the **Advanced behavior** section.
 - **Make field required**
 - **Make field uneditable**
 - **Select default list item**
7. Click **Save** to save your configuration.
8. Optional: Click **Reset** to clear all fields.
9. Optional: Click **Delete** to remove this element from the form.

Using the Dynamic Area element

Use the **Dynamic Area** element in the form builder to display content that is not part of the form itself during bot runtime.

1. On the left pane, click **Automation**.
A list of available and forms is displayed.
2. Click an existing form or click **Create new > Form**.
The form builder page appears.
3. Drag **Dynamic Area** into the form.

4. Enter the name of the element in the **Element label** field.
5. Use the **Placeholder text** field to enter the text that must appear if this element is empty during bot runtime.
6. Enter a specific height of the element in the **Height** field.
The default dimension value is set to 120 and enables a scroll bar if the additional content exceeds this value.
7. Optional: Click one of the following options:
 - **Reset**: Clears all the element customization and sets the default.
 - **Delete**: Deletes the selected element.
8. Click **Save**.
The **Dynamic Area** action is available during bot runtime to render this field.
See [Interactive forms package](#) on page 2633.

Using the Hyperlink element

Use the **Hyperlink** element in the form builder if you want to assign a URL during bot runtime.

1. On the left pane, click **Automation**.
A list of available and forms is displayed.
2. Click an existing form or click **Create new > Form**.
The form builder page appears.
3. Drag **Hyperlink** into the form.
4. Enter the text to be displayed for the URL in the **Display text** field.
5. Enter the link in the **URL** field.
6. Use the **Open in browser** drop-down menu to select a browser to open the URL.
If you select Google Chrome, the URL opens in Google Chrome during bot runtime.
7. Optional: Enter the hint text and tooltip for the check box element.
8. Click **Save**.

Using the Image element

Use the **Image** element in the form builder to enable users to attach an image file to the form. For example, you can use this element to add a company logo to the form during bot runtime.

1. On the left pane, click **Automation**.
A list of available and forms is displayed.
2. Click an existing form or click **Create new > Form**.
The form builder page appears.
3. Drag **Image** element into the form.
4. Enter the id in the **Element ID** field.
5. Enter the name of the element in the **Element label** field.
6. Optional: Enter a value in the **Height** field to adjust the height.
7. Optional: Add a help text.
 - Enter a text in **Hint below** field.
 - Enter a text in the **Tool tip** field.
8. Use the **Desktop or network path to retrieve image** field to specify the image filepath
9. Upload an image in the **Select image file to upload** field.

Note: In Automation 360 v.26, where you must specify a local image for the **Image** element (**Desktop or network path to retrieve image** field), you must use the browse feature in the image property to upload the image.

Using the Label element

Use the **Label** element in the form builder to add a read-only field in the form at bot run time.

1. On the left pane, click **Automation**.
A list of available and forms is displayed.
2. Click an existing form or click **Create new > Form**.
The form builder page appears.
3. Drag **Label** into the form.
4. Enter the name of the element in the **Element label** field.
5. In the formatting section, select your formatting options:
 - **Font size:** Set the size of the font.

- **Emphasis:** Set the font emphasis such as bold, italics, and so on.
- **Font color:** Set the display colour of the font.
- **Text alignment:** Set the text alignment within the element.

6. Optional: Enter a tooltip that appears when the user points to the element.
7. Click **Save**.

Using the Number element

Use the **Number** element in the form builder if the form must have a field that allows the user to enter only numeric values during bot runtime.

1. On the left pane, click **Automation**.
A list of available and forms is displayed.
2. Click an existing form or click **Create new > Form**.
The form builder page appears.
3. Drag **Number** into the form.
4. Enter the name of the element in the **Element label** field.
5. Set the default value for the element.

6. Enter the minimum and maximum number of characters that users can enter in this field during bot runtime.
7. Optional: Enter the hint text and tooltip for the check box element.
8. Optional: Enable any of the following **Advance behavior** options:
 - Select the **Make field required** check box to ensure users select this element during bot runtime.
 - Select the **Make field uneditable** check box to make the element a read-only option.
9. Use the **Formatting** options to enable users to enter negative values, trailing zeroes, and comma during bot runtime.
10. Use the **Decimals** drop-down menu to set the number of decimal places.
11. Use the **Special characters** field to enter the prefix and suffix labels for the element.
12. Optional: Click one of the following options:
 - **Reset**: Clears all the element customization and sets the default.
 - **Delete**: Deletes the selected element.
13. Click **Save**.

Using the Password element

Use the **Password** element in the form builder if the form must have a confidential or masked field. This element uses the masking feature by default and Credential Vault encryption to transfer data during bot runtime.

1. On the left pane, click **Automation**.
A list of available and forms is displayed.
2. Click an existing form or click **Create new > Form**.
The form builder page appears.
3. Drag **Password** to the form.
4. Enter the name of the element in the **Element label** field.
5. Use the **Formatting** field for additional options:
 - **Standard**
 - Set the character limit for password using the **Min** and **Max** fields.
 - Enable additional security options for the password.
 - **Custom**
 - Click the **Add regular expression** option and enter a custom password in the **Regular expression** field.
 - Optional: Enter the same custom password in the **Test Content** field, and click **Test regular expression** to verify it works correctly.
6. Optional: Enter the hint text and tooltip.
7. Optional: Enable any of the following **Advance behavior** options:
 - Select the **Make field required** check box to ensure users select this element during bot runtime.
 - Select the **Make field uneditable** check box to make the element a read-only option.
8. Optional: Click one of the following options:

- **Reset:** Clears all the element customization and sets the default.
- **Delete:** Deletes the selected element.

9. Click **Save**.

Note: Use the view icon  in the **Password** field to hide or reveal the password during runtime.

Using the Radio Button element

Use the **Radio Button** element in the form builder if you want to enable users to select only one of the available options from a field during bot runtime.

1. On the left pane, click **Automation**.
A list of available and forms is displayed.
2. Click an existing form or click **Create new > Form**.
The form builder page appears.
3. Drag **Radio Button** into the form.
4. Enter the name of the element in the **Element label** field.
5. Optional: Enter the hint text and tooltip for the check box element.
6. Enter the names of the radio buttons that will be displayed during bot runtime.
For example, if you are creating a client information form, use this field to add two radio buttons and enter `Male` and `Female`.
7. Enable any of the following **Advance behavior** options:
 - Select the **Make field required** check box to ensure users select this element during bot runtime.
 - Select the **Make field uneditable** check box to make the element a read-only option.
 - If you have multiple radio buttons in the form and want a default selection during bot runtime, select the **Make default selections** check box, and select the necessary option.
8. Use the **Formatting** field to set the vertical or horizontal layout of the radio buttons.
9. Optional: Click one of the following options:
 - **Reset:** Clears all the element customization and sets the default.
 - **Delete:** Deletes the selected element.
10. Click **Save**.

Using the Rich Text Editor element

Use the **Rich Text Editor** element in the form builder to insert a text editor in the form that provides various options to edit the content during bot runtime.

1. On the left pane, click **Automation**.
A list of available and forms is displayed.
2. Click an existing form or click **Create new > Form**.
The form builder page appears.
3. Drag **Rich Text Editor** into the form.
4. Enter the name of the element in the **Element label** field.
5. Set the default value for the element that must appear in the element during bot runtime.

6. Enter the minimum and maximum number of characters that users can enter in this field during bot runtime.
7. Optional: Enter the height for the input area of the field and tooltip for the element.
8. Optional: Enable any of the following **Advance behavior** options:
 - Select the **Make field required** check box to ensure users select this element during bot runtime.
 - Select the **Make field uneditable** check box to make the element a read-only option.
9. Optional: Click one of the following options:
 - **Reset**: Clears all the element customization and sets the default.
 - **Delete**: Deletes the selected element.
10. Click **Save**.

Using the Select File element

Use the **Select File** element in the form builder to enable users to attach a file to the form. For example, if the registration form requires a new user to attach a photograph, you can use this element in the form.

1. On the left pane, click **Automation**.
A list of available and forms is displayed.
2. Click an existing form or click **Create new > Form**.
The form builder page appears.
3. Drag **Select File** into the form.
4. Enter the name of the element in the **Element label** field.
5. Use the **Select the format type** field to set one of the following options for upload file format:
 - **Supported Type**: If you select this option, in the **Enter file formats separated by commas** field, ensure that you enter the file types that the user can upload when the bot runs. For example, if you want to allow only `.png` and `.jpeg` file types, enter them in the **Enter file formats separated by commas** field.
 - **Unsupported Type**: If you select this option, in the **Enter file formats separated by commas** field, ensure that you enter the file types that will not be supported during upload when the bot runs. For example, if you want to restrict users from uploading `.txt` and `.ppt` file types, enter them in the **Enter file formats separated by commas** field.
6. Optional: Select **Enable file download** if you want the users to be able to download the file.
7. Optional: Enter the hint text and tooltip for the element.
8. Optional: Choose one of the following **Advance behavior** options:
 - Select the **Make field required** check box to ensure users must select this element during bot runtime.
 - Select the **Make field uneditable** check box to set the element as a read-only option.
9. Optional: Choose one of the following options:
 - **Reset**: Clears all the element customization and sets the default.
 - **Delete**: Deletes the selected element.
10. Click **Save**.
When you click **Preview** during bot runtime, the system default application is used to display the selected file.

For example, if Microsoft Excel is set as the default application and you use **Select file** to upload a `.xls` spreadsheet, the selected document is displayed in Microsoft Excel when you click **Preview** during bot runtime.

Users can click **Browse** to select a file or drag a file into the **Select File** element during bot runtime.

Using the Select Folder element

Use the **Select Folder** element in the form builder to enable users to upload a folder that contains a specified file type during bot runtime.

1. On the left pane, click **Automation**.
A list of available and forms is displayed.
2. Click an existing form or click **Create new > Form**.
The form builder page appears.
3. Drag **Select Folder** into the form.
4. Enter the name of the element in the **Element label** field.
5. Optional: Select the **Show list of supported files in the folder** check box.
If you select this option, the supported file types are displayed below the **Select folder** form element during bot runtime.
6. Enter the supported file types for this element during bot runtime.
For example, if you want to allow users to only upload folders that contain documents or text files, enter `doc` and `txt`.
7. Optional: Enter the hint text and tooltip for the element.
8. Optional: Choose one of the following **Advance behavior** options:
 - Select the **Make field required** check box to ensure users must select this element during bot runtime.
 - Select the **Make field uneditable** check box to set the element as a read-only option.
9. Click **Save**.
Users can click **Browse** to select a folder or drag one into the **Select Folder** element during bot runtime.

Using the Snapshot element

Use the **Snapshot** element in the form builder to provide the users a screen capture option on the form during bot runtime. The file is saved in the `.jpg` format.

1. On the left pane, click **Automation**.
A list of available and forms is displayed.
2. Click an existing form or click **Create new > Form**.
The form builder page appears.
3. Drag **Snapshot** into the form.
4. Enter the name of the element in the **Element label** field.
5. Optional: Enter the hint text and tooltip for the check box element.
6. Optional: Choose one of the following **Advance behavior** options:
 - Select the **Make field required** check box to ensure users must select this element during bot runtime.
 - Select the **Make field uneditable** check box to set the element as a read-only option.

7. Enter a filepath in the **Desktop path to save snapshot** field where the snapshot file must be saved during bot runtime.
Optionally, you can either allow the user to create a folder if the filepath is not available or change the destination folder of the snapshot file.
8. Enter the suffix text for the snapshot file.
For example, if this element is used to capture sales information, enter `sales`. The snapshot file is then saved with the text `sales` added at the end.
9. Optional: Choose one of the following options:
 - **Reset**: Clears all the element customization and sets the default.
 - **Delete**: Deletes the selected element.
10. Click **Save**.
When you click **Preview** during bot runtime, the system default application is used to display the snapshot file.
For example, if Microsoft Photos is set as the default application to open `.jpg` files, the snapshot file is displayed in Microsoft Photos when you click **Preview**.

Using the Table element

Use the **Table** element in the form builder to insert a customizable table in the form that can be used to populate data during bot runtime.

1. On the left pane, click **Automation**.
A list of available and forms is displayed.
2. Click an existing form or click **Create new > Form**.
The form builder page appears.
3. Drag **Table** to the form.
4. Enter the name of the element in the **Element label** field.
5. Optional: Enter hint text for the element in the **Hint below field**.
For example, enter `View outpatients details` if the table is used to capture a list of outpatients.
6. Optional: Specify your tooltip in **Tool tip** field.
When you add a tooltip and hover, your specified text is displayed.
7. Use the **Rows before scrolling** field to enter the minimum number of rows the table element must have before a scroll bar is added during bot runtime.
8. Optional: Select the **Enable row selection (Column 0)**.
This will add a check box column in the first column of the table. This also provides a better user experience when multiple rows are needed to be highlighted or picked by the user (instead of asking the user to select from a drop-down).

Note: The column is a boolean type where true = row selected. This provides a true/false boolean whether a row is selected or not, thus giving a form or bot to access this data.

9. Add or remove the total number of columns.
10. Click **Column settings** for additional options.
11. In the **Column settings** page, click the **Form element type** drop-down menu to set the element type.
For example, if you select **Dropdown**, use the **Add dropdown content** field to enter the items that must appear in the drop-down menu during bot runtime.
12. Optional: Click **Make columns width equal**.

13. Optional: Select any of the following **Advance behavior** options to enable them:

- **Make table uneditable:** Enables a read-only view during bot runtime.
- **Include table actions:** Enables users to add, remove or edit table rows during bot runtime.

If you use the table actions to delete all the rows from a table and then add a new row, the columns and rows of the table appear misaligned. Drag and resize any column to reset the alignment.

- **Enable column filtering:** Enables users to search and filter the content for all the available columns during bot runtime. This enhances the search for content that is referenced by the column values.

14. Click **Save**.

Using the Text Area element

Use the **Text Area** element in the form builder to insert a text field in the form for users to enter alphanumeric characters during bot runtime.

1. On the left pane, click **Automation**.

A list of available and forms is displayed.

2. Click an existing form or click **Create new > Form**.

The form builder page appears.

3. Drag **Text Area** into the form.

4. Enter the name of the element in the **Element label** field.

5. Use the **Default value** field to enter the default text to be displayed in the element.

6. Optionally, enter the parameters for minimum and maximum number of characters you want to allow in this field during bot runtime (ex. 1 to 100).

7. Enter the height for the input area of the field.

8. Optional: Enter the hint text and tooltip for the check box element.

9. Optional: Enable any of the following **Advance behavior** options:

- Select the **Make field required** check box to ensure users select this element during bot runtime.
- Select the **Make field uneditable** check box to make the element a read-only option.

10. Optional: Click one of the following options:

- **Reset:** Clears all the element customization and sets the default.
- **Delete:** Deletes the selected element.

11. Click **Save**.

Using the Text Box element

Use the **Text Box** element in the form builder to insert a text box in the form.

1. On the left pane, click **Automation**.

A list of available and forms is displayed.

2. Click an existing form or click **Create new > Form**.

The form builder page appears.

3. Drag **Text Box** into the form.

4. Enter the name of the element in the **Element label** field.

5. Enter the default text that must appear in the element.

For example, if this field is used in a registration form, enter `First name`, which is displayed during bot runtime.

6. Use the **Formatting** field for additional options:
 - **Standard**
Set the character limit using the **Min** and **Max** fields.
 - **Custom**
 - Click the **Add regular expression** option and enter a custom text in the **Regular expression** field.
 - Optional: Enter the same custom text in the **Test Content** field, and click **Test regular expression** to verify it works correctly.
7. Optional: Enter the hint text and tooltip for the element.
8. Enable any of the following **Advance behavior** options:
 - Select the **Make field required** check box to ensure users select this element during bot runtime.
 - Select the **Make field uneditable** check box to make the element a read-only option.
 - Select the **Mask data** check box if you want the field to be masked by special characters when the user enters data during bot runtime.
9. Optional: Click one of the following options:
 - **Reset**: Clears all the element customization and sets the default.
 - **Delete**: Deletes the selected element.
10. Click **Save**.

Using the Time element

Use the **Time** element in the form builder to set the time in the form during bot runtime.

1. On the left pane, click **Automation**.
A list of available and forms is displayed.
2. Click an existing form or click **Create new > Form**.
The form builder page appears.
3. Drag **Time** into the form.
4. Enter the name of the element in the **Element label** field.
5. Select a default time using the **Default value** field.
6. Optional: Select the **Use the local system time when form is first displayed** check box to set your system time as the default value.
7. Use one of the following formatting options:
 - Set the time to **12 Hours** or **24 Hours** format.
 - Enter the hint text and tooltip.
8. Optional: Enable any of the following **Advance behavior** options:
 - Select the **Make field required** check box to ensure users select this element during bot runtime.
 - Select the **Make field uneditable** check box to make the element a read-only option.
9. Optional: Click one of the following options:

- **Reset:** Clears all the element customization and sets the default.
- **Delete:** Deletes the selected element.

10. Click **Save**.

Add rules to form elements

Add conditional actions, such as **If**, **And/Or**, and **Then**, to various elements in a form by using rules.

For the **Checkbox** and **Radio Button** elements, the rules are triggered only if the corresponding presets are selected. For example, if a form has two mutually exclusive options, such as **Yes** and **No**, the rules associated with these options are triggered only if you select one of the two options.

Attention: Rules are not supported for the following elements:

- Dynamic Area
- Hyperlink
- Image
- Select file
- Select folder
- Snapshot
- Table

Note: The change label action in the form rules now applies to the **Button** element. This form rules will automatically apply to the button where you set the rules. The rules editor is now applicable to the **Table** element. The rules editor and conditions applies for each individual columns while any actions you set are applied for each row in the row level.

Consider a scenario where you are creating a user sign in/registration form. You can add a rule to one of the form elements to enable an option to sign in as an existing user or register a first time user.

1. On the left pane, click **Automation**.
A list of available and forms is displayed.
2. Click **Create new > Form**.
3. In the **Create form** page, enter a name for the new form.
Forms are saved in the `\Bot.s\` folder by default. (Optional) Click **Choose** to change the default folder.
4. Click **Create & edit**.
5. Drag the following elements into the form:
 - **Dropdown:** In the **Element label** field, enter 'Select user type' and in the **Add dropdown content** field, add 'Existing user' and 'New user'.
 - **Text Box:** Add two elements and name them 'User name' and 'Register'.
 - **Password:** Add one element.
 - **Button:** Add two elements and name them 'Save' and 'Cancel'.
6. On the right pane, click **Form rules > Add rule**.
You can use this option to add rules to the form elements. In this scenario, add two rules.

7. For **Rule1**, update the following fields:

Rule 1 is applied when an existing user tries to sign in. If the user clicks **Select user type > Existing user**, the **Register** text box is made unavailable. Use the **If** menu to set the following conditions:

- a) **Select user type** as the element condition in the first drop-down menu
- b) **Choice is** in the second drop-down menu
- c) **Existing user** in the third drop-down menu

Note: The **If** conditions are supported on the following elements:

- **Dropdown**
- **Checkbox**
- **Radio Button**
- **Date**
- **Time**
- **Hyperlink**

Use the **Then** menu to set the corresponding actions:

- a) The **Register** text box in the first drop-down menu

All the available elements in the form on which the rules are supported are listed in this field. For the **Dropdown** element in the **Then** menu, you can use the **Assign** option to append or overwrite values at bot runtime.

- b) **Disable** in the second drop-down menu

8.

On **Rule1**, click the vertical ellipsis (⋮) for the following options:

- **Add rule below:** Add a new rule below **Rule1**.
- **Duplicate rule:** Add a duplicate of **Rule1**.
- **Delete rule:** Delete **Rule1**.

If you added more than one rule, the following additional options are enabled to toggle the rules:

- **Move up**
- **Move down**
- **Move to top**
- **Move to bottom**

9. For **Rule2**, update the following fields:

Rule 2 is applied for a first-time user. If a user clicks **Select user type > New user**, the **User name** and **Password** text boxes are made unavailable. Use the **If** menu to set the following conditions:

- a) **Select user type** as the element condition in the first drop-down menu
- b) **Choice is** in the second drop-down menu
- c) **New user** in the third drop-down menu

Use the **Then** menu to set the corresponding actions:

- a) The **User name** text box in the first drop-down menu
- b) **Disable** in the second drop-down menu
- c) The **Password** text box in the third drop-down menu
- d) **Disable** in the fourth drop-down menu

10. Optional: If you want to interchange the sequence of these two rules, drag **Rule1** below **Rule2** or **Rule2** above **Rule1**.

You can also click the ellipsis (...) next to **Add rules** to select one of the following options:

- **Collapse all**: Collapses the rules. Is enabled only if you have expanded any of the available rules.
- **Expand all**: Expands the rules.

11. Click **Save**.

The new registration form is created and is ready to be linked to a bot.

Add a form to bot

Adding an existing form to a bot enables users to collaborate with bots. Use the necessary action items to create a bot and build a task logic.

This task describes a scenario where you want to design a bot that triggers an existing New User Registration form. A **Hot key** preset trigger starts the bot. An existing form that is linked to the bot is displayed where the user enters the information.

- If the user clicks **Submit**, a User Agreement form is displayed.
 - If the user clicks **Cancel**, User registration is canceled message is displayed and the bot is terminated.
1. On the left pane, click **Automation**.
A list of available and forms is displayed.
 2. Click **Create new > Bot**.
 3. Enter a name for the bot.
All the bots are stored in the \Bots folder. Click **Browse** to change the folder.
 4. Click **Create & edit**.
The bot builder pane is displayed that has **Flow** (default view), **List** and **Dual** view. You can drag the required actions from the left pane to create a task.
 5. In **Triggers > Hot key**, drag **Hot key trigger** into **Drag a trigger here** in the bot logic.
 6. Set **Ctrl** and **L** as the hot key combination.
 7. Use the **Search actions** field to find **Interactive forms**.
 8. Drag **Display** into the task logic.
You can use the display action to show the form when the bot is triggered. The display action properties appear on the right.
 9. Click the create variable icon () to create a variable.
You have to create a form variable by linking an existing form. This enables you to use the form variable and the associated form across multiple instances.

Note: The form variable can be linked only to forms created using the Control Room form builder.

10. On the **Create variable** screen, enter a name for the form variable you are creating.
11. Click **Browse** and select the New User Registration form.
This links the New User Registration form to the form variable that you are creating.
12. Click **Create & select**.
A new form variable is created. For any existing form variable, use the **Form name** drop-down menu to select it.
13. Use the **Search actions** field to find **Trigger loop** and drag it to add event monitoring.
Event monitoring enables you to simultaneously set multiple events within the task logic of a bot.
14. Drag **Handle** into the **Trigger loop**.
Handle enables you to run an action by configuring a trigger in the **Trigger loop: Handle** for the bot. You can set a trigger when an event occurs on the selected interface (selected application) or when a user clicks the selected form element.
15. For this scenario, use the **Trigger on** drop-down menu to select **INTERACTIVE FORMS > Form trigger**.
16. Click the **Form name** drop-down menu and select the New User Registration form.
This enables you to set a trigger for the **Submit** option of the New User Registration form.
17. Click the **Form element** drop-down menu and select **Submit**.
For the **Button** element of a form, the **Select action trigger** is set to **Clicked** by default. When the user clicks **Submit** on the New User Registration form, it triggers the User Agreement form.
18. (Optional) Use **Assigned to** to create a variable.
You can use this variable to fetch various details for the element you have selected in the **Form element** drop-down menu. This return value is either a string or number based on the element type selected. For example, if you have selected the **Date** element, the return value is a string.
19. Search for **Interactive forms** and drag **Display** into **Trigger loop: Handle**.
20. Click the **Form name** drop-down menu and select User Agreement form.
The User Agreement form appears.
21. Search for **Message** and drag it into **Trigger loop: Handle**, after **Interactive forms**.
A successful registration message appears when the user clicks **Submit**.
22. Terminate the trigger by dragging **Break** into the **Trigger loop**.
Use **Break** to exit the current event loop and for actions where finishing a process is required.
23. Drag another **Handle** next to the **Trigger loop: Handle**.
This enables you to set a trigger for the **Cancel** option of the New User Registration form.
24. Click the **Form element** drop-down menu and select **Cancel**.
25. Search for **Message** and drag it into **Trigger loop: Handle**. Update the **Enter the message to display** field as User registration is canceled.
When the user clicks **Cancel** on the New User Registration form, it triggers a `User registration is canceled` message and terminates the bot.
26. Drag **Trigger Loop > Break** to terminate the loop.
27. Click **Save**.

28. Click Run with triggers.

The **Run with triggers** sets the **Hot key** trigger to start the bot, which is Ctrl plus L combination from the keyboard in this scenario.

[Interactive forms package](#) on page 2633

The interactive forms package contains actions that handle exceptions encountered by a bot. All the actions performed by users on the interactive forms can be monitored to execute logic using subtasks.

Adding a trigger to run a bot

Add triggers that can automatically run the selected bot whenever a specific event occurs. For example, clicking a specific button or using a combination of keystrokes.

Triggers integrate predefined events into your workflow and reduce the number of repetitive tasks that users must perform. Attended automation in Automation 360 enables you to create unique triggers for various applications. You can then use these triggers to start a bot.

Use one of the following types of triggers to start a bot:

Important: Trigger are not supported for private workspace, the trigger functionality will not work.

Email	Starts a bot when a new email message is received in the specified email service such as Microsoft Outlook, Email server, or EWS server.
Files and folders	Starts a bot when a predefined file or folder event occurs. You can set one of the following options as the trigger: <ul style="list-style-type: none">• When a new file or folder is created.• When an existing file or folder is deleted.• When a file or folder is renamed.• When a file or folder is modified.
Hot key	Starts a bot when a predefined combination of keystroke is performed on the keyboard. You can set a combination of the following keys as the trigger: <ul style="list-style-type: none">• Control keys such as Ctrl, Alt, Windows logo key, and Esc.• Keys with regular alphabetical (English) characters.
Interface	Starts a bot when a predefined event occurs on the selected user interface element. Some examples of the predefined events are: <ul style="list-style-type: none">• User clicks a button.• User opens or closes an application.• User selects or clears a checkbox.

Note: When capturing an interface trigger in a SAP application, ensure that both the Recorder and Interface trigger packages are from Build 5933 or from a prior release.

Process	Starts a bot when a predefined event occurs on the selected Microsoft Windows process. Some examples of the predefined events are: <ul style="list-style-type: none">• User starts a process.• User stops or closes a process.
Service	Starts a bot when a predefined event occurs on the selected service in Microsoft Windows. Some examples of the predefined events are: <ul style="list-style-type: none">• Service starts or stops.• User pauses the service.• User resumes the service that was paused\.
Window	Starts a bot when a predefined event occurs on the selected application window. An example for a predefined event is when a user opens or closes an application.

Related reference

[Trigger loop package](#) on page 3007

The **Trigger loop** package enables you to run a series of actions when a trigger event occurs. You can insert multiple trigger loops within a bot or nest one trigger loop within another trigger loop.

[Email trigger package updates](#) on page 841

Review the updates in released versions of the Email trigger package such as new and enhanced features as well as fixes and limitations. The page also lists the release dates of each version, and the compatible Control Room and Bot Agent versions.

Add an email trigger

Starts a bot when a new email message is received from the predefined email service.

Connect the Control Room to one of the email services on your system and trigger the bot when you receive a new email.

For email automation, you can use OAuth 2.0 to authenticate with the email server. To register your application with the Microsoft identity platform, see [Using Connect action for Email](#) on page 2437

1. On the left pane, click **Automation**.
A list of available and forms is displayed.
2. Click **Create new > Bot**.
3. Enter a name for the bot.
All the bots are stored under the \Bots folder. (Optional) Click **Browse** to change the folder.
4. Click **Create & edit**.
5. In the bot builder page, click **Triggers > Email trigger**.
6. Drag **Email** into **Drag a trigger here**.

7. Use the **Email trigger** pane on the right to choose one of the following server types as the trigger for your incoming emails:

Server type	Steps
Microsoft Outlook	Click Outlook . Microsoft Outlook is set as the email service and the bot is triggered when you receive a new email.

Server type	Steps
Email server	<p>Click Email server.</p> <p>a) Enter the email service Host information.</p> <p>For example, if you are using Office365 as your email service, enter <code>Outlook.office365.com</code>.</p> <p>b) Select IMAP or POP3.</p> <p>IMAP and POP3 are protocols used to connect to the mail server that enables you to read your emails through an email client.</p> <hr/> <p>Note: The POP3 protocol has a known limitation where any new calendar invite can also trigger the bot.</p> <hr/> <p>c) Use secure connection (SSL/TLS): Select this option if you want to use a secure connection with the mail server.</p> <p>d) Enter the configured port number for your email server.</p> <p>e) Select one of the following user authentication methods to sign in to the email server:</p> <ul style="list-style-type: none"> • Basic <ul style="list-style-type: none"> • Credential: Click Pick to select the stored Username and Password. • Credentials and credential variables in the Bot editor on page 2254 • Insecure string: Enter the username and password. • Client credentials <ul style="list-style-type: none"> • Specify the unique client and tenant IDs generated when you registered the application in the Microsoft Azure portal. • Specify the username you want to use to access the mail server. • Specify the client secret that you generated for your app in the app registration portal. <p>For Client ID, Tenant ID, Username and Client Secret fields, choose from Credential or Insecure string tab:</p> <ul style="list-style-type: none"> • Credential: Use a value available in the credential vault. • Insecure string: Manually enter a value. <hr/> <p>Note: Client Credentials flow does not support Gmail.</p> <hr/> <p>Note: The Email in folder does not support sub-folders when you set the protocol as POP3 for Email Server,</p> <hr/>

Server type	Steps
EWS server	<p>Click EWS server.</p> <p>a) From the Microsoft Exchange Version drop-down menu, select your current version.</p> <p>For example, if you are using Microsoft Exchange Service Pack 2, select Exchange2010_SP2 as your email service.</p> <p>b) Enter the domain name, for example, <code>smtp.office365.com</code></p> <p>c) Select one of the following user authentication methods to sign in to the email server:</p> <ul style="list-style-type: none"> • Basic <ul style="list-style-type: none"> • Credential: Click Pick to select the stored Username and Password. Credentials and credential variables in the Bot editor on page 2254 • Insecure string: Enter the username and password. • OAuth 2.0 - Client credentials <ul style="list-style-type: none"> • Specify the unique client and tenant IDs generated when you registered the application in the Microsoft Azure portal. • Specify the username you want to use to access the mail server. • Specify the client secret that you generated for your app in the app registration portal. <p>For Client ID, Tenant ID, Username and Client Secret fields, choose from Credential or Insecure string tab:</p> <ul style="list-style-type: none"> • Credential: Use a value available in the credential vault. • Insecure string: Manually enter a value. <hr/> <p>Note: There is no shared mailbox support for Microsoft Outlook but as a workaround, you can use the EWS server credentials flow with a shared email as a username string.</p> <hr/>

8. Optional: Use the **Check every** drop-down menu available under all the server types to set the trigger interval.

The trigger interval for the bot is set to 120 seconds by default.

Note: The trigger interval that you have configured using the **Check every** drop-down menu does not depend on the number of emails received during the scheduled interval.

For example, if you have configured **Check every** to **1** second, the task is triggered only one time even if you receive three different emails at same time. The run time filter of polling is updated to the sent date time of the email for which the last trigger was run.

-
- 9.** Optional: Use **Select Conditions** to specify an email event for the selected server type.

Consider a scenario where you select **Outlook** and want to trigger a bot when you receive an email from a specific sender. In **Select Conditions**, select the **Email from** check box and specify the sender's email address.

When you select the **Email subject contains** check box, the email trigger is executed depending on the following subject conditions:

- When the subject line is provided within double quotation marks (""), for example, "ABC spreadsheet", the trigger is executed only when the email subject has an exact match for the string provided within quotation marks.
- When multiple subject lines are separated by semicolons, for example, ABC spreadsheet; ABC project logs, the trigger is executed when the email subject matches any of the subject lines mentioned.

- 10.** Optional: To create a variable, in the **Assigned to > Record** tab, click .

You can use this variable to retrieve various details about the email that triggered the bot, such as sender, recipient, subject, email content, date, action information, email server host, and port data.

- 11.** Click **Apply**.

- 12.** Click **Run > Run with triggers**.

Microsoft Outlook, Email server, or EWS server is set as the trigger to start the bot for new emails.

Note: When you run an email trigger, the **emailTo** key returns a list of To addresses. To convert the list of To addresses into a string, use the **Assign** action from the List package and then use the **Join items** action from the List package, with the comma as a delimiter to separate the addresses.

Add a file and folder trigger

Starts a bot when a predefined action such as create, delete, rename, or modify is performed on a file or a folder.

This procedure is for a scenario where you want to trigger a bot when a user modifies a document called `Product info.docx`.

Note: This scenario is for a user with Bot Creator role.

For information about how a user with a Bot Runner role can link event triggers, see [Linking event triggers to a Bot Runner](#) on page 2067.

- 1.** On the left pane, click **Automation**.
A list of available and forms is displayed.
- 2.** Click **Create new > Bot**.
- 3.** Enter a name for the bot.
All the bots are stored under the `\Bots` folder. (Optional) Click **Browse** to change the folder.
- 4.** Click **Create & edit**.

5. In the bot builder page, click **Triggers > Files & folders**.
6. Drag **File trigger** into **Drag a trigger here**.
7. Click **Browse** and select the `Product info.docx` file.
8. From the **Start the bot when the file is** drop-down menu, select **modified**.
This sets the trigger for the bot.
9. Optional: Use the **Assigned to** drop-down menu to assign a variable.
If you want use the **Variables** tab to create a variable, ensure you select the **Use as input** check box for it to appear in the **Assigned to (optional)** drop-down menu.

Note: If you use the  in the **Assigned to (optional)** drop-down menu to create a variable, ensure that you do not select the **Constant (read only)** check box.

The following set of data can be retrieved by defining a variable as the input type, which you can assign to get output from the trigger:

- **triggerType:** File or folder trigger
- **eventType:** The type of trigger event

The following set of data cannot be used if the **Set Schema** check box is selected as it returns a non-string variable type:

- **timeStamp:** The time when the trigger occurred

Ensure you link the **timeStamp** value to a string variable to obtain the trigger data. For example, consider you want to extract the date and time for the trigger event when a user modifies the `Sales update.xls` file. Use the **Message** action within the task logic, and enter `Date Time- $recordVar[2]$` in the **Enter the message to display** field.

- **fromFolder:** Details of the parent folder path
- **folder:** Details of the file or folder path on which the event occurred

10. Click **Save**.
11. Click **Run > Run with triggers**.
Whenever a user modifies the `Product info.docx`, the bot is triggered.

Related reference

[Event triggers](#) on page 2064

An event trigger is a predefined action that runs an associated bot. All the bots with event triggers are listed under the **Event triggers** tab.

Add a hot key trigger

Starts a bot when a predefined combination of keys is used on the keyboard.

This procedure is for a scenario where the bot is triggered when a user presses Ctrl (plus) L keys from the keyboard.

Note: Hot key triggers are supported on both attended and unattended Bot Runner licenses. However, the hot key trigger will work for unattended Bot Runner users only if they have access to the associated default device and they use the predefined keys.

1. On the left pane, click **Automation**.
A list of available and forms is displayed.
2. Click **Create new > Bot**.

3. Enter a name for the bot.
All the bots are stored under the \Bots folder. (Optional) Click **Browse** to change the folder.
4. Click **Create & edit**.
5. In the bot builder page, click **Triggers > Hot key**.
6. Drag **Hot key trigger** into **Drag a trigger here**.
7. Click **Ctrl** to set it as the **Hot key** from the available key modifiers.
8. Use the drop-down menu to select **L** from the keyboard.
The **Hot key** field displays the key combination that will trigger the bot.
9. Click **Apply**.
10. Click **Run > Run with triggers**.
When the Ctrl and L keys are used on the keyboard, the bot is triggered.

Add an interface trigger

Starts a bot when a predefined action occurs on a specific interface element, such as clicking a button or closing an application.

The following procedure is for a scenario where you want to configure a trigger to start a bot when the user clicks **New** option in Microsoft Word. Before you configure the trigger, ensure that you have the Microsoft Word application open on your system.

Note: Interface triggers for objects are available only for native Windows applications.

Note: Interface triggers are supported on both attended and unattended Bot Runner licenses. However, the interface trigger will work for unattended Bot Runner users only if they have access to the associated default device and perform the predefined action on the specified interface element.

1. On the left pane, click **Automation**.
A list of available and forms is displayed.
2. Click **Create new > Bot**.
3. Enter a name for the bot.
All the bots are stored in the \Bots folder. (Optional) Click **Browse** to change the folder.
4. Click **Create & edit**.
5. In the bot builder page, click **Triggers > Interface trigger**.
6. Drag **Object** into **Drag a trigger here**.
The **Interface trigger: Object** editing panel appears.
7. In **Window detail** tab, click **Application**.

Note: For browser-based events, click **Browser** and select the correct browser tab. Interface triggers are supported on only Google Chrome and Edge Chromium browsers.

8. Click the drop-down menu and select **Taskbar** under **Preset**.
If Microsoft Word is not displayed in the list, you can use the Refresh option to reload the list of applications.
9. Click **Capture object**.
This initiates a built-in web recorder that captures the action. In this scenario, Microsoft Word is displayed. Click **New**, which is then set as the trigger to start the bot.

10. Click the **Select main event** drop-down menu to choose a specific event.
In this scenario, **New** in Microsoft Word is considered a button and the following events are available:
 - **Click**: Triggers the bot when the user clicks the selected main event object.
 - **Click with hotkey**: Use one of the available key modifiers and select a key (alphabetical letters) from the drop-down menu. This combination is set as the hot key to trigger the bot.
11. Optional: Select one of the available Control keys (Shift, Alt, Ctrl, Windows and AltGr) as an additional combination for the hot key to trigger the bot.
12. Click **Save**.
13. Click **Run > Run with triggers**.
The preset trigger is created, and the bot is triggered when the user clicks **New** in Microsoft Word.

Add Microsoft 365 Outlook trigger

Use email as a trigger to start a bot when you receive an email in Microsoft 365 Outlook that is using the OAuth2 authentication.

Ensure that the following per-requisites are completed:

- OAuth 2.0 to use client credentials is set up.
For more information on setting up OAuth 2.0 to use client credentials, see [Set up OAuth 2.0 using client credentials](#) on page 2746
- Credentials are assigned to lockers that can be accessed during bot development.
For more information, see [Set up lockers and credentials in Credential Vault](#) on page 1797.

This procedure is for a sample scenario where you want to trigger a bot when you receive a Microsoft 365 Outlook email that meets one the following conditions:

- Email is from sales@example.com.
 - The subject line contains the phrase `Monthly sales report`.
 - The email contains an attachment.
1. Log in to the Control Room as a Bot Creator.
 2. On the left pane, click **Automation**.
A list of available bots and forms are displayed.
 3. Click **Create new > Task Bot**.
 4. In the **Create a bot** page, enter `Sales Report` in the **Name** field.
All the bots are stored in the `\Bots` folder location.
 5. Optional: Click **Browse** to change the default location.
 6. Click **Create & edit**.
 7. In the bot editor page, click **Triggers > Microsoft 365 Outlook** and double-click or drag **Email**.
 8. Click the **Azure Cloud** drop-down menu and select **Azure Global**.
Azure Global is used for the Microsoft 365 Commercial version (login.microsoftonline.com) while **Azure GCC High** is used for the Microsoft 365 Government version (login.microsoftonline.us).

9. Use the **Check every** field to change the trigger interval time to 40 minutes.
The trigger interval for the bot is set to **120** minutes by default.
10. Verify **Client Credentials** is selected under the **Authentication mode** drop-down menu.
11. For the **Client ID**, **Tenant ID**, **Username** and **Client Secret** fields, select the **Credential** tab and click **Pick** to select a value from the Credential Vault.
Use the **Insecure String** tab to provide an existing variable.
12. In the **Select Conditions** field, select the following options for the email events:
 - **Email from**: Enter sales@example.com.
 - **Email subject contains**: Enter Monthly sales report.
 - **Email attachment**: Select **With attachment**.
13. Optional: Use the **Assigned to (optional)** drop-down menu to either select an existing record variable, or click the **Create variable** icon to create a record variable that you want to assign.
You can use this variable to retrieve various details about the email that triggered the bot, such as sender, recipient, subject, email content, date, action information, email server host, and port data.
14. Click **Save** to save your configuration.
Microsoft 365 Outlook is now configured to trigger the associated bot when the specified email events under the **Select Conditions** field occur.

Add a process trigger

Starts a bot when a predefined action occurs on the selected Microsoft Windows process.

This procedure is for a scenario where you want to configure a trigger to start a bot when users launch or close Microsoft Outlook. Before you configure the process trigger, ensure that you have the Microsoft Outlook application open on your system so that you can select this process.

1. On the left pane, click **Automation**.
A list of available and forms is displayed.
2. Click **Create new > Bot**.
3. Enter a name for the bot.
All the bots are stored in the \Bots folder. (Optional) Click **Browse** to change the folder.
4. Click **Create & edit**.
5. In the bot builder page, click **Triggers > Process trigger**.
6. Drag **Process** into **Drag a trigger here**.
The **Process trigger: Process** editing panel appears.
7. Click the **Process name** drop-down menu and select **Outlook.exe**.
Refresh the **Process name** drop-down menu if none of the processes are listed.
8. Select the following check boxes to set the trigger condition:
 - **Starts**: Triggers the bot when users launch or start Microsoft Outlook.
 - **Stops**: Triggers the bot when users close or stop Microsoft Outlook.
9. Optional: Use the **Assigned to** drop-down menu to assign a variable.
If you want to use the **Variables** tab to create a variable, ensure that you select the **Use as input** check box for it to appear in the **Assigned to (optional)** drop-down menu.
10. Click **Save**.
11. Click **Run > Run with triggers**.

The preset trigger is created, and the bot is triggered when the user launches or closes the Microsoft Outlook application.

Add a service trigger

Starts a bot when any of the predefined actions occur on the selected service in Microsoft Windows.

This procedure is for a scenario where you want to configure a trigger to start a bot when the **Windows Update** service is started, stopped or is paused by a user.

1. On the left pane, click **Automation**.
A list of available and forms is displayed.
2. Click **Create new > Bot**.
3. Enter a name for the bot.
All the bots are stored in the \Bots folder. (Optional) Click **Browse** to change the folder.
4. Click **Create & edit**.
5. In the bot builder page, click **Triggers > Service trigger**.
6. Drag **Service** into **Drag a trigger here**.
The **Service trigger: Service** editing panel appears.
7. Click drop-down menu and select **Windows Update**.
Refresh the drop-down menu if none of the services are listed.
8. Select the following checkboxes to set the trigger condition for the **Windows Update** service:
 - **Starts**
 - **Stops**
 - **Pauses**
9. Optional: Use the **Assigned to** drop-down menu to assign a variable.
If you want use the **Variables** tab to create a variable, ensure you select the **Use as input** check box for it to appear in the **Assigned to (optional)** drop-down menu.
10. Click **Save**.
11. Click **Run > Run with triggers**.
The preset trigger is created, and the bot is triggered when any user starts, stops or pauses the **Windows Update** service.

Add a window trigger

Starts a bot when the predefined application window is opened or closed by the user.

This procedure is for a scenario where you want to configure a trigger to start a bot when any user opens a Microsoft Excel document called **Customer_database.xls**. Before you configure this window trigger, ensure that you have opened the **Customer_database.xls** document on your system so that you can select this window.

1. On the left pane, click **Automation**.
A list of available and forms is displayed.
2. Click **Create new > Bot**.
3. Enter a name for the bot.
All the bots are stored in the \Bots folder. (Optional) Click **Browse** to change the folder.

4. Click **Create & edit**.
5. In the bot builder page, click **Triggers > Window trigger**.
6. Drag **Window** into **Drag a trigger here**.
The **Window trigger: Window** editing panel appears.
7. Click the **Window** drop-down menu and select **Customer_database.xls**.
Refresh the **Window** drop-down menu if none of the available windows are listed.
8. Under the **Window title** field, click the **String** tab to set the entire title of the selected window.

The **Regex** tab can be used to select a pattern that matches the selected window title. For example, if you select the **Regex** option in this scenario, the bot is triggered if the user opens any `.xls` file.
9. Select **Open** from the **Window action that start the bot** drop-down menu.
10. Optional: Use the **Assigned to** drop-down menu to assign a variable.
If you want use the **Variables** tab to create a variable, ensure you select the **Use as input** check box for it to appear in the **Assigned to (optional)** drop-down menu.
11. Click **Save**.
12. Click **Run > Run with triggers**.
The preset trigger is created, and the bot is triggered when any user opens the **Customer_database.xls** document.

ServiceNow New Record trigger

Create a trigger to monitor a ServiceNow table for new records and begin succeeding RPA actions in your bot flow.

- The bot creator must have access to a ServiceNow account with required permissions to perform tasks enabled by this package. See [Roles](#).
- Follow ServiceNow guidelines for authenticating to an external client with OAuth 2.0. See [Set up OAuth](#).
- Create a Developer account and Developer instance in ServiceNow. See [Personal Developer Instances](#).
- Ensure that you are authenticated before initiating any ServiceNow action. See [Authentication](#) on page 2892

The new record trigger monitors the creation event of any record within a time period. Upon record creation, the trigger invokes and returns data. If multiple records are created within the entered time period, then the trigger returns data of multiple records.

Map your trigger to a ServiceNow table, and then enter the time period to send a query for that table data. When a new record is found, this trigger is invoked and begins succeeding bot actions.

1. Enter the **URL** for your ServiceNow instance.
2. (Optional) Enter the API version.
3. Select how ServiceNow credentials will be entered for the following fields.

Option	Description
Credential	Select a credential saved in a secure locker that you have mapped to your Control Room.
Insecure string	Enter the credential.

- a) Enter the **Client ID**.
 - b) Enter the **Client secret**.
 - c) Enter the **Username**.
 - d) Enter the **Password**.
4. Enter the **Table name** in ServiceNow to monitor for new records.
A query is sent, and ServiceNow returns data for this table. When a new record is returned in the data, then this trigger is invoked.
 5. (Optional) To store a response from ServiceNow, select and enter a **List** or **Variable** input where the response is stored.
 6. (Optional) Apply filters to specify the type of ServiceNow record to monitor.
 7. Enter how frequent the trigger searches for new records in the **Check every (seconds)** field.
 8. (Optional) Select a variable to save returned data by the trigger.

ServiceNow Updated Record trigger

Create a trigger that monitors a ServiceNow table for updated records and begins succeeding RPA actions in your bot flow.

- The bot creator must have access to a ServiceNow account with required permissions to perform tasks enabled by this package. See [Roles](#).
- Follow ServiceNow guidelines for authenticating to external client with OAuth 2.0. See [Setup OAuth](#).
- Create a Developer account and Developer instance in ServiceNow. See [Personal Developer Instances](#).
- Ensure that you are authenticated before initiating any ServiceNow action. See [Authentication](#) on page 2892

The updated record trigger monitors the record within a time period. When updates occur, the trigger invokes and returns data. If multiple records are updated within the entered period, then data of multiple records is returned.

Map your trigger to a ServiceNow table. Enter the time period to send a query for that table data. When an updated record is found, this trigger is invoked and can begin succeeding bot actions.

1. Enter the **URL** for your ServiceNow instance.
2. Enter the API version.
3. Select how ServiceNow credentials will be entered for the following fields.

Option	Description
Credential	Select a credential saved in a secure locker that you have mapped to your Control Room.
Insecure string	Simply enter the credential. This data will remain visible.

- a) Enter the **Client ID**.
- b) Enter the **Client secret**.
- c) Enter the **Username**.

d) Enter the **Password**.

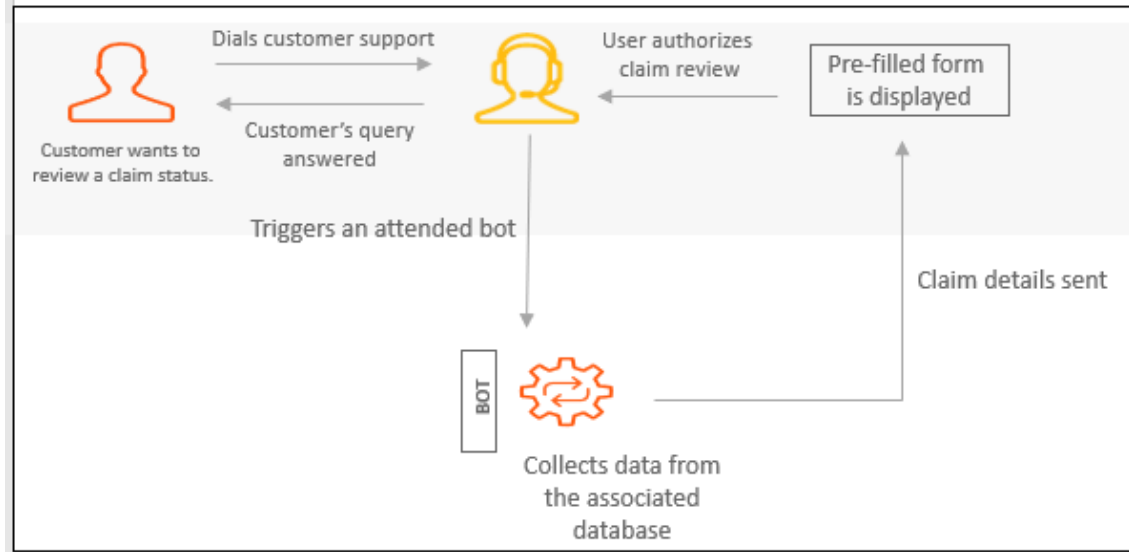

- 4.** Enter the **Table name** where the record is located in ServiceNow.
This data is what the trigger monitors. A query is sent, and ServiceNow returns data for this table. When a record update is returned in the data, then this trigger is invoked.
- 5.** (Optional) To store a response from ServiceNow, select and enter a **List** or **Variable** input where the response is stored.
- 6.** (Optional) Apply filters to specify the type of ServiceNow record to monitor.
- 7.** Enter how frequent the trigger searches for updated records in the **Check every (seconds)** field.
- 8.** (Optional) Select a variable where returned data is saved by the trigger.

Example for using hot key to trigger a bot

In this example, a front desk executive of an insurance company responds to a call from an existing customer who wants to understand the policy details and its validity. The executive uses a hot key to trigger a bot that retrieves the customer's information.

Information about all the existing customers and the insurance company's various policies is distributed across two different databases. An existing bot maps the data between the two databases and provides consolidated information in a user readable format to the executive. Ctrl +L is set as the hot key to trigger this bot.

- 1.** The executive collects caller's information to verify if it is an existing customer.
The executive confirms the caller is an existing customer who wants to know the policy details.
- 2.** The executive uses Ctrl+L to trigger a bot.
The bot retrieves the customer information and the corresponding policy details. An authorization message is displayed.
- 3.** The executive reviews the information that is consolidated in a form, and answers the customer queries without any delay or hold time.
The following image illustrates this attended automation scenario:

Add Automation Co-Pilot URLs to trusted list

To ensure secure access to Automation Co-Pilot services, add URLs specific to the service to your safe recipients or trusted list.

Automation Co-Pilot URLs list

Because Automation Co-Pilot service hosting uses dynamic IP addresses add the following service URLs to the safe recipients. The complete URL instead of an IP address for Automation Anywhere services.

Service	Description	URL	Device
Telemetry	Allows performance and usage information to be gathered anonymously in order to improve product quality.	<ul style="list-style-type: none"> cdn.pendo.io app.pendo.io/ data.pendo.io/ https://pendo-static-5673999629942784.storage.googleapis.com/ https://pendo-io-static.storage.googleapis.com/ 	Bot Creator and AARI User devices

Service	Description	URL	Device
Documentation	Allows documentation content to be displayed to the creator while building automations.	<ul style="list-style-type: none"> • https://iph.zoominsoftware.io/ • https://automationanywhere-be-dev.zoominsoftware.io/ • https://automationanywhere-staging.zoominsoftware.io • https://docs.automationanywhere.com/ • https://automationanywhere-be-prod.automationanywhere.com • https://*.youtube.com/ • https://*.wistia.net/ • https://*.wistia.com 	Bot Creator devices
Storage	Allows files to be stored and exchanged between AARI User and automations.	<ul style="list-style-type: none"> • https://*.amazonaws.com/ • https://*.googleapis.com/ 	Bot Creator and AARI User devices
Assets	Allows assets like fonts and icons to be correctly displayed in the user interfaces.	<ul style="list-style-type: none"> • https://fonts.googleapis.com/ • https://fonts.gstatic.com/ 	Bot Creator and AARI User devices

Using virtual window for picture in picture

You can set up and configure attended bots to run in a virtual window [picture in picture (PIP) mode] in Automation Co-Pilot.

What is virtual window?

Virtual window is a feature in Automation Co-Pilot where you can configure your bots to run in a virtual window. This feature uses the Microsoft child sessions feature to render a second window (picture-in-picture mode) on your desktop. When you use this feature with Automation Co-Pilot,

you can view a small window of your automations on your desktop, enabling you to interact or reference it as you work on other important tasks.

Note: Child sessions is a feature built by Microsoft to enable the picture-in-picture mode in Windows. Automation Co-Pilot uses the virtual window option to access this Microsoft child sessions feature. The automation experience remains the same and is maintained by Automation Co-Pilot for Business Users. To learn more about Microsoft child sessions, see [Microsoft Child Sessions](#).

Why is virtual window important?

An AARI Admin can select virtual window to configure their bots and assign their teams to use. Team members can simply run their bots and the virtual window will automatically start the automation process. As an AARI Admin, you can automate while maintaining control and the ability to multitask without having to remain on a bot page or application, and waiting for the automation progress to complete.

While you automate with virtual window, your computing devices (such as your mouse and keyboard) remains available to use without blockers.

Virtual window scenario

A small but busy customer success team at a large service company wants to address and automate hundreds of support tickets that are submitted each day.

With the proper configuration, Jake (an AARI Admin for the customer success team) can configure bots for each customer agent of his team to automate tasks and manage their multitasking duties to resolve other issues.

Jake is an AARI Admin

- He is an admin of a team and can manage bots and team assignments for members of his team.
- He plays the vital role of bots and teams configuration in Automation Co-Pilot for Business Users.
- He can select the virtual window option when configures bots for his team.

When Zoe (an AARI User and customer success agent) automates a customer request, would typically need to verify a lot of time-consuming customer information on one automation page. However, if Zoe could automate using a virtual window in Automation Co-Pilot, she would be able to multitask while the bot runs in her desktop background.

Zoe is an AARI User.

- She is a member of a team.
- She can run bots in a virtual window to automate her tasks.
- Her goal is to run bots and ensure her tasks are completed.

Zoe would be able to automate these daily operations:

- Customer requests
- Refund policy
- Updating customer information.

For details on each user roles and function, see [Users and team roles for Automation Co-Pilot](#) on page 3288.

For details on teams and functions, see [Team management](#) on page 3258.

How to use virtual window

The following video provides a sample walk through of configuring bots and running in a virtual window, showing two personas (AARI User and AARI Admin) and their key tasks.

For a detailed procedure, follow these steps:

1. [Create a bot](#) on page 3250.
2. [Configure a bot to use virtual window](#) on page 3250.
3. [Run your bot with virtual window](#) on page 3251.

Important: In some cases when you deploy your bot using virtual window, the user credential window will prompt you to log in every time. As a workaround, you must log in to the user credential window and authenticate only one time, then log out or restart your system. When you log in again and run your bot, the window does not prompt again. This is a known behavior for the Microsoft child sessions feature.

Triggers is not supported

The virtual window does not support triggers and does not work if bots contain triggers.

Solution to server manager error

When you encounter a server manager error when you run bots in virtual window, see [Solution for server manager error](#) on page 3251.

Create a bot

Zoe is an AARI User who can access the Automation 360 Control Room to create and check in bots.

- Zoe has the Bot Creator license to create bots in the Control Room.
- Zoe has the Bot Creator license to check in bots in the Control Room.
- Zoe has access to the Control Room.

1. Log in to the Control Room.
2. Create a bot.

Zoe can create any bot without triggers. She, like any developer, can run the bot without checking in.

To access this bot, Zoe and her customer success team will need to be assigned to this bot. As an AARI Admin, Jake can view and manage the bot that Zoe checked in, in Automation Co-Pilot for Business Users.

Configure a bot to use virtual window

As the AARI Admin, Jake can configure bots for his team. Since Zoe has checked in a bot, Jake will be able to configure this bot to enable the virtual window option in Automation Co-Pilot.

- Jake has the system-created **AAE_Robotic_Interface Admin** role for the AARI Admin.
- Jake has access to Automation Co-Pilot for Business Users.

1. Log in to Automation Co-Pilot.
2. [Configure a bot](#) on page 3277.

Jake can configure the bot that Zoe has checked in and set the option to run a bot in a virtual window. Additionally, Jake can assign Zoe and her team to this bot for them to access it in Automation Co-Pilot.

After Jake has configured the bot and assigned it to Zoe, Zoe can then deploy this bot .

Run your bot with virtual window

Zoe can run her assigned bots which have been configured to use virtual window. She can use Automation Co-Pilot Desktop Assistant to run these bots from her desktop.

Zoe has access to Automation Co-Pilot Desktop Assistant.

1. Log in to Automation Co-Pilot Desktop Assistant.
2. Run the configured bot.
Zoe selects the bot that Jake had configured. When Zoe deploys the bot, a virtual window appears on her desktop.
3. Optional: Click the edit icon to edit the virtual window.
By selecting the **edit** icon, Zoe can interact in real-time with her bot deployment through the virtual window.

Solution for server manager error

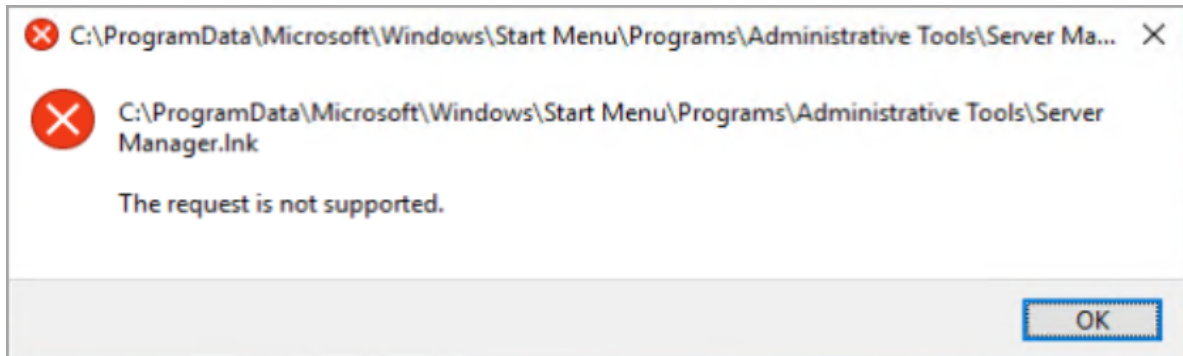

You might encounter a server manager error when you launch bots using the virtual window. This topic will help troubleshoot if you counter that problem.

You have successfully created a bot to deploy with virtual window. See [Using virtual window for picture in picture](#) on page 3248.

Note: Child sessions (picture-in-picture mode) is a Microsoft Windows feature. Virtual window is an Automation Co-Pilot feature that uses Microsoft child sessions.

When you deploy a bot with virtual window, you might encounter an error message that relates to the server manager. This does not occur for every instance but when it does occur, you can follow these steps to resolve this issue.

Example of the error message:

1. Modify the settings for the individual server as follows:
 - a) Open the server manager.
 - b) Navigate to **Sever Manager > Properties**.
This page allows you to modify the setting at the individual server level.
 - c) Select the **Do not start Server Manager automatically at logon** setting.
2. Modify the settings at the central level by using group policy as follows:
 - a) Log in to domain controller.
 - b) Launch Group Policy Management console.
You can start the Group Policy Management console when you navigate to **Server Manager > Tools > Group Policy Management**.

Note: If the Group Policy Management is not visible, then you can add this as a feature in **Server Manager > Add Roles and Features**.

- c) Create GPO in domain where all server machines belong.
- d) Navigate to **Computer Configuration > Policies > Administrative Templates > System > Server Manager** in the Group Policy Management editor.
- e) Right click the **Do not display Server Manager automatically at logon** setting.
- f) Click **Edit**.
- g) Select **Enabled** to enable the setting.
- h) Click **OK** to close the Group Policy Management console.
When the policy is applied, the server manager will not launch when you run your bot with virtual window.

Note: The policy will be applied based on the Group Policy refresh interval for your device. If the policy is not applied then run the **gpupdate /force** command.

Automation Co-Pilot for Business Users on the web interface

The Automation Co-Pilot for Business Users on the web interface is an intuitive portal and dedicated workspace for the AARI User to create requests, run tasks, and for an AARI Manager to create manage team roles and deployment.

Note: Roles, permissions, and licenses may continue to reference Automation Anywhere Robotic Interface (AARI) within the product.

Automation Co-Pilot for Business Users on the web interface provides an engaging experience with attended and unattended bots. It gives you a one-stop place to view and organize your documents and tasks, perform actions, and hand over the work to bots. In addition, it provides a process-centric approach to deliver automation.

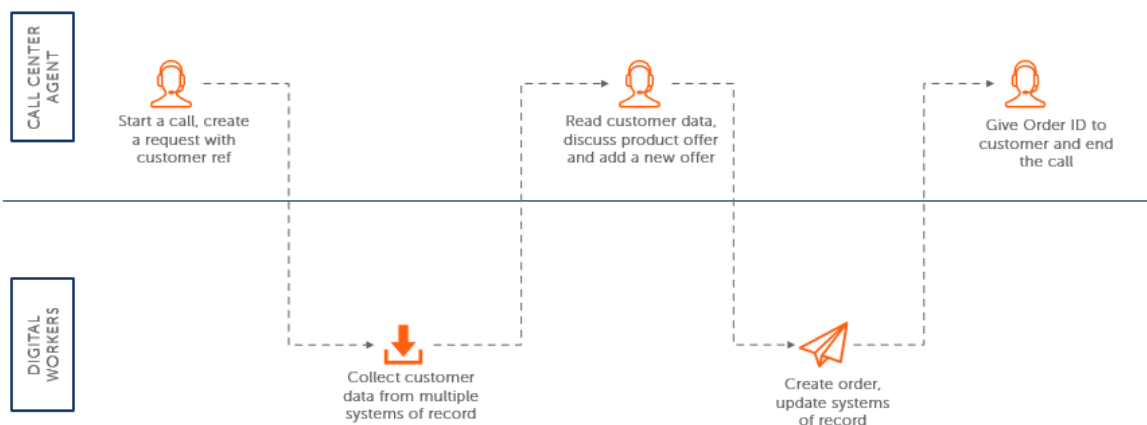

Capabilities

Automation Co-Pilot for Business Users on the web interface helps you in the following ways:

- Start automation from an easy-to-use process catalog.
- Automate long-running workflows across multiple users and bots.
- Handle bot exceptions.
- Train users and reduce errors with guided automation.
- Multitask with humans and bots.
- Monitor and audit attended automation.

Automation Co-Pilot for Business Users on the web helps multiple users to collaborate with bots without disruption and without accessing your personally identifiable information (PII) data and confidential systems.

The following image illustrates the front-office automation capability:

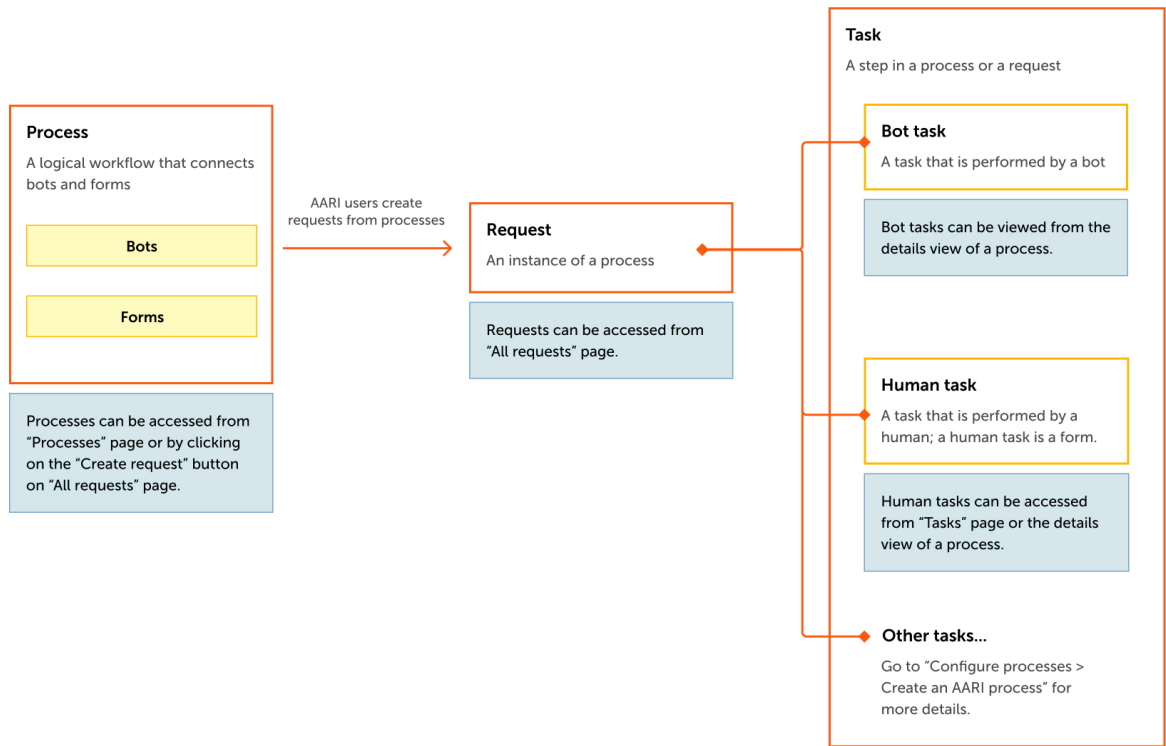

Components

Automation Co-Pilot for Business Users on the web interface includes the following components:

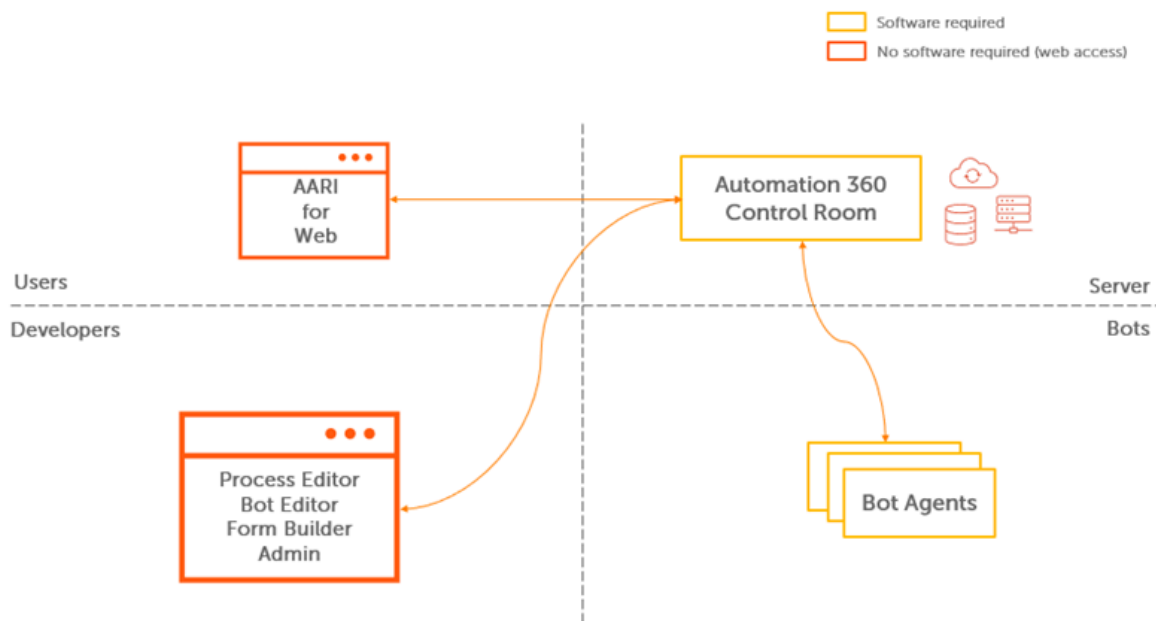

Bots	The bots automate specific, repetitive, rule-based tasks.
Form	The form enables humans to invoke and interact with the bots through the customizable web interface.
Process	The process connects the bots and the forms together. The process contains the logic for triggering the bots and the forms and coordinating the flow of data between them.
Request	The request is an instance of a process. If the process defines a template of how bots and forms interact, a request is a specific instance of that template.
Task	Tasks are the steps that must be performed within a process. Processes can have two types of tasks: <ul style="list-style-type: none">• Bot task: A task that is performed by a bot.• Human task: A task that is performed by a human; a human task is a form.

Review the following image to gain a better understanding of the relationship between these components.

Architecture

The following images illustrate the architecture of Automation Co-Pilot for Business Users on the web interface:

Setting up

The following workflow lists how to use Automation Co-Pilot for Business Users on the web interface to automate and manage your tasks:

1. [Configure and set up roles](#)
2. [Configure processes](#)
3. [Deploy processes](#)

Note: To view the Automation Co-Pilot for Business Users on the web interface tasks in an interactive visual format, see [Get started with AARI](#).

Deploy processes

Automation Co-Pilot for Business Users on the web interface provides a dedicated workspace to organize processes, create requests, and run and view tasks. An AARI Manager can create new teams and manage team roles and deployment of tasks.

You can access Automation Co-Pilot from the Automation 360 home page by clicking the **Explore AARI** link which provides a shortcut to Automation Co-Pilot for Business Users on the web interface.

AARI

AARI helps you scale automation across your workforce by providing all employees easy access to RPA across platforms, applications, and devices

[Explore AARI](#)

The checked-in processes are available in Automation Co-Pilot for Business Users on the web interface and can be assigned to the teams so that the team members can create requests and complete tasks.

The three main components involved in deploying a process are as follows:

- [Team management](#) on page 3258
- [Manage a process in Automation Co-Pilot](#) on page 3259
- [Request management](#) on page 3260

Deployment workflow

The following workflow describes the steps involved in deploying a process:

1. [Create a team and assign roles to team members](#) on page 3267.
2. [Assign a team to a process](#) on page 3269.
3. [Create a request and complete a task](#) on page 3264.

Other tasks

Depending on the requirement, you can also perform the following tasks:

- As an AARI Manager, you can either assign or unassign tasks to your team members.
[Assign or unassign a task](#) on page 3270.
- To clear the memory space, as an AARI User, AARI Manager, or AARI Admin, you can delete the requests that are no longer required.
[Delete a request](#) on page 3265.
- To make process selection easier at the time of request creation, as an AARI User or AARI Manager, you can view, pin, or search for your assigned processes.
[View and search for a process](#) on page 3271.
- As an AARI User, to quickly search for a specific request created, you can filter and search for that request.
[Filter and search for a request](#) on page 3271.
- As an AARI User, when you have many tasks created from multiple requests, you can filter and search for a specific task.
[Filter and search for a task](#) on page 3273.
- You can edit your process in the **Process** page of the web interface.
[Configure a process](#) on page 3278
- As an AARI Admin, you can edit bots to set parameters, enable virtual window, and assign teams to bots.
[Configure a bot](#) on page 3277

Related concepts

[Users and team roles for Automation Co-Pilot](#) on page 3288

Users with specific roles and permissions can use different features in Automation Co-Pilot to automate business processes as per requirement.

[Reference ID properties](#) on page 3260

The reference ID is a unique key reference that help you identify your related processes and requests. The reference ID is also different for teams, process, and bots.

Team management

Team management is an essential function of Automation Co-Pilot for Business Users on the web interface. The basis of request and process assignment is dependent on the team setup.

Overview

The team configurable in Automation Co-Pilot helps business managers to define the following aspects:

- How a request can be created
- How a request is visible to the other users
- Who can read, update, or delete requests

Team structure

A team contains users with specific team roles—**Admin**, **Owner**, and **Member**. The admin has the ability to modify their team. By default, the AARI Manager is the **Admin** of their team. They can create new teams, manage existing teams, assign team roles to their team. As an admin, an AARI Manager can add other admins to their teams. A team can have more than one admin but must have at least one admin. To access a process and create new requests, the AARI Manager must request the AARI Admin to assign the AARI Manager team to a process.

An AARI Admin can also simultaneously add multiple users with similar roles (custom role) to the team. The custom role in the Control Room is aligned with a team in Automation Co-Pilot, and the behavior of the enhanced team setup is as follows:

- The users added with the custom role are assigned a **Member** role within the team. This role cannot be changed to **Owner** or **Admin**.
- You cannot view these users added with the custom role in the **Users** tab of the **Manage > Team** page.
- If a user is added through the custom role and also added manually to the team, their role in the team will be the same as the role assigned to them manually. For example, if the user is a **Member**, they will continue to have the **Member** role whereas if the user is an **Owner**, they will be assigned the **Owner** role in the team.
- If the user is no longer part of a custom role, the user will also not be a part of the team.

For example, create a custom role (aari_role_finance) in the Control Room and add the required users (aari_user1, aari_user2, aari_mngr1) to this role. You can now add this custom role, aari_role_finance, to a team in Automation Co-Pilot, and the users associated with this role are automatically added to the team. The team role of the users (aari_user1, aari_user2, aari_mngr1) is **Member**. The team role of these users cannot be changed from **Member** to either **Admin** or **Owner**. If aari_user2 is added as a part of aari_role_finance and also added manually through the **Users** tab and the role is **Owner**, then the team role of this user is retained as **Owner**.

Team types

Each team is configured to a team type (shared or private) and depending on that type, requests that can be viewed and accessed by members of that team might change.

- **Shared:** All the requests can be viewed by admins, owners, and members of that team.
- **Private:** Requests can be viewed only by the users creating those requests and the owner and admin of the team.

The team roles are based on the Control Room role assigned to the user. Each team role has a subset of permissions and actions that can be performed by that role. These sets of permissions vary between the shared and private team types.

Related concepts

[Users and team roles for Automation Co-Pilot](#) on page 3288

Users with specific roles and permissions can use different features in Automation Co-Pilot to automate business processes as per requirement.

Manage a process in Automation Co-Pilot

A process contains bot and human tasks. An AARI Admin can manage and assign processes to teams to deploy processes or automate tasks.

The AARI Admin performs global process management tasks. Such tasks include, but are not limited to:

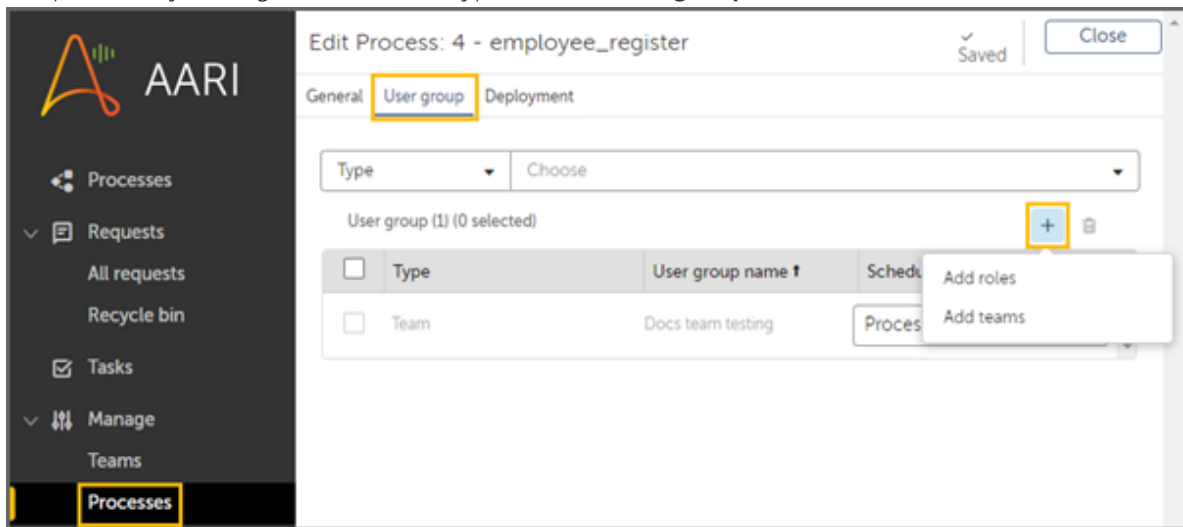

- View the checked-in processes from the Control Room.
- Assign teams to a process for request creation.
- View and resolve pending requests and tasks.

Reference #	Key	Name	Description	Tags	User groups
4	--	employee_register	checkbox example		1

You can view your requests on the **Processes** page. For easy access to a specific process, you can sort the processes by name in ascending or descending order and toggle the pinning of a process. The responsive view of the **Processes** page adjusts the display to your screen size. To guide with your team assignment, you can also reference the team from which a request is created by referring to the team name added in the process tile on the **Processes** page.

Select a process to begin editing and select who and how the process can be run. Find initial settings on the General tab. Enable users to run

the process by adding role and team types on the **User group** tab.

Request management

A request must be created to automate processes to complete assigned tasks. Members of a team create requests and complete the corresponding tasks.

Requests must always be created within a team. This ensures that the teams assigned to the same process cannot see each other data. By default, an AARI User, selected as an owner or member of their team, can create requests because their role has the **AARI license**, which enables them to access Automation Co-Pilot and create requests.

The structure of request creation is as follows:

- An AARI User (team owner or member) can access and view all the processes that are assigned to a team on the **Processes** page.
- The AARI User must provide all the required information in an **initial form**.
- The bots and human tasks run in the **request view** page, which contains high-level details of the tasks.
- The task information is displayed in the **Requests** page, for the AARI User to verify.
- The AARI User can view their requests on the **Requests** page. They can manage or sort their existing requests by using a filter.
- A request can be created by either a user or a bot on the **Edit Process** page. If the request is created by a user, the process is displayed on the **Processes** page. If the request is created through a bot, the user cannot create a request or view the process.

Reference ID properties

The reference ID is a unique key reference that help you identify your related processes and requests. The reference ID is also different for teams, process, and bots.

Overview

The main objective of the reference ID is to help the user quickly identify all associated processes and the number of requests created from a process.

Requests

A reference ID is created from a **Process key**, a unique text input, that a user can enter when they edit their process. When the user configures their process key, it creates a prefix that corresponds to their process.

Key enhancements:

- The **Reference** column in the **Requests** page shows the numbers of reference ID (e.g. **2-42, 98-10, MAIN-5**).
- The **Process key** and number of request iterations helps the user identify the sequential consistency among the number of requests for a given process (e.g. A **Finance** process with the **FIN** process key and number of new requests shows **FIN-1, FIN-2, FIN-3, FIN-10**).

URL enhancements:

- The **Requests** URL is now changed to `entity/ref/:ref` from `entity/:id`.
- You can access requests directly when you enter the **reference ID** (ex: `/aari/#/requests/all#/requests/ref/2-34`)
- If the user opens any request using **Request ID**, the URL now redirects using **Reference**. For example, consider the **Request ID** as 896 and **Reference** as 2-34 for a request. If the user views the request using the **Request ID** (`/aari/#/requests/all#/requests/896`), the URL will redirect using the **Reference** (`/aari/#/requests/all#/requests/2-34`).

Scenario - Create a process key to view reference ID

1. You edit a **Beta** process to create a **Process key** called **ALPHA**.
2. You create multiple requests from **Beta** process.
3. For each requests created from the **Beta** process, the **ALPHA** process key will iterate one time.
4. You access the **Requests** page and view the **Reference** column.
5. The **Reference** column shows **ALPHA-1, ALPHA-2, ALPHA-3**, this is the **reference ID**.
6. You can now view the **reference ID** for all related processes.

Bot/Process/Team

For **Bot, Process, and Team**, the function is different compared to **Request**. The **request ID** from a previous environment is now replaced by the **reference ID**, this is to improve the single tenant experience by making a logical sequence to a referential number.

URL enhancements:

- The **Edit Process** page now shows an updated URL (ex: `/aari/#/manage/process/ref/96`) where the user can directly access a process when they enter the **reference ID**.
- The **Edit Team** page now shows an updated URL (ex: `/aari/#/manage/team/ref/123`) where the user can directly access a team when they enter the **reference ID**.

Update changes in Automation Co-Pilot for Business Users from Automation 360 v.21 or later versions

From version Automation 360 v.21 or later, there is a change in how the teams work in Automation Co-Pilot for Business Users on the web interface. Advanced team management now

helps business managers define how a request can be created. They can also specify who can view or delete requests.

To ensure that there is no discontinuity in the existing behavior for users who had any access to a process or created requests from a process (regardless of existing team assignment), the following conditions should be maintained:

- The user access to create a request for a specific process is retained.
- The user access to view the requests from a process regardless of the team they were part of is also retained.

How existing teams are changed

To maintain the current access to processes and the current teams, the existing teams remain with the following:

- Existing process assigned to them.
- Same members assigned to the team.
- The team type is configured to shared. This ensures that all the members of the team can view the migrated processes and requests.
- Members of the team have one of the following team roles:
 - AARI Manager or AARI Admin has the admin role
 - AARI User has the member role

To maintain the current access to requests, new teams are created for each process and the new team has the following:

- Existing processes assigned to the team are named "Teams Migrated for Process X" where X is the process ID. This helps reference the migrated processes. Teams are created for existing processes with this name.
- Users who had access to the process previously are assigned to this team regardless of their existing team assignment, and the team is assigned to the process.
- The team type is configured to shared.
- Members of the team have one of the following team roles:
 - AARI Admin
 - AARI Manager
 - AARI User

Previously, the AARI Manager could create requests without assigning the processes to teams. After the update, they must create teams and ask the AARI Admin to assign their team to a process in order to create new requests.

Important: After the migration process and the creation of the migrated team, in the request creation, there will be two processes (one for each team) for you to select. The two processes will have different behaviors for the request visibility.

Example

The following scenario helps illustrate how the update works.

Consider a process named **Loan Closing** with process ID **47**. Georges has an AARI Admin role in the Control Room.

Before Update

Two teams HR and IT have access to the **Loan Closing** process and the team structure is as mentioned in the table below.

HR		IT	
User Name	Control Room Role	User Name	Control Room Role
Bob	AARI Manager	Grace	AARI Manager
Carol	AARI User	Steve	AARI User
Debby	AARI User	Debby	AARI User

The behavior before the update is as given below:

- Users from the HR team can see requests created in the IT team and vice versa.
- Bob and Grace can assign the processes that have been previously assigned to them by Georges to the HR and IT team respectively.
- Bob can manage the HR team and similarly, Grace can manage the IT team such as add members, assign processes, rename the team, so on.

After update

The two initial teams (HR and IT) still remain and additionally one new team (named **Team Migrated** for Process **47**) is created during the update. The team structure of all the three teams are mentioned in the table below:

HR			IT			Team Migrated for Process 47		
User Name	Team Role	Control Room Role	User Name	Team Role	Control Room Role	User Name	Team Role	Control Room Role
Bob	Admin	AARI Manager	Grace	Admin	AARI Manager	Bob	Admin	Automation Co-Pilot manager
Carol	Member	AARI User	Steve	Member	AARI User	Carol	Member	Automation Co-Pilot user
Debby	Member	AARI User	Debby	Member	AARI User	Debby	Member	Automation Co-Pilot user
					AARI User	Grace	Admin	Automation Co-Pilot manager

HR			IT			Team Migrated for Process 47		
User Name	Team Role	Control Room Role	User Name	Team Role	Control Room Role	User Name	Team Role	Control Room Role
						Steve	Member	Automation Co-Pilot user

The behavior of the teams after the update is as given below:

- Members from the HR team cannot see the requests created in the IT team and vice versa anymore.
- As Debby is a part of both HR and IT team, this user can create requests in both the teams. Two different process cards are displayed to the user during request creation.
- Old requests created inside the HR and IT teams are treated like they were created inside the common team named Team Migrated for Process 47 which has only the Loan Closing process (47) assigned to it.
- Members from both HR and IT teams are all part of Team Migrated for Process 47 and so they can access the old requests. Deleting the team Team Migrated for Process 47 deletes the requests associated with it, so old requests access is removed and cannot be restored.
- Members from HR or IT team can create requests inside the team Migrated for Process 47 and those requests are visible to all the members of the HR and IT team.
- Bob and Grace can manage the HR and IT team respectively as well as jointly manage the Team Migrated for Process 47. This means they can add members to the team, rename the team, remove members from the team, so on.
- Bob and Grace can now only view the processes assigned to their teams by Georges.

Important: During the update, issues with team admin assignment might occur intermittently, whereby either the creator of the team is incorrectly assigned the member role instead of the team admin role or other team members are assigned the team admin role instead of the member role. After the update, the AARI Admin must always verify the team admin assignment.

The following example explains the team admin assignment issue:

Before update: Bob creates the HR team and has the AARI Manager role, with Carol, Debby, Grace, and Steve as team members and having AARI User roles.

After update: Bob is assigned the team admin role along with Carol. Debby, Grace, and Steve are assigned the team member roles. In this case, Carol is incorrectly assigned the admin role instead of the member role. The AARI Admin must verify the team admin assignment and change Carol's role to team member.

Create a request and complete a task

An AARI User can create a new request from processes that is their team is assigned to, enter required information in an initial form, and complete tasks.

Ensure you have completed the following:

- Provided a system-created **AAE_Robotic_Interface User** role for the AARI User.
- Assigned the AARI license.

- Have access to Automation Co-Pilot.
- 1. Log in to Automation Co-Pilot as an AARI User.
As an AARI User, you are now assigned to a team with an owner or member team role, created by the AARI Manager or AARI Admin.
- 2. Navigate to the **Processes** page.
This page shows all available processes that your team was assigned to by the AARI Admin.
- 3. Select an assigned process.
The initial form appears and shows the required fields for you to complete. These fields are from supported interactive form elements.

Important: Processes now includes team names associated to the process that the team is assigned to. The **Team Migrated For Process** team name indicates that the process is available to team members who had previous access to that process, regardless of team assignment, before the Automation 360 upgrade.

4. Complete the required information to the initial form.
You can also fill your initial forms via the URL parameters that is for your **Date**, **Number**, **Text Box**, and **Time** elements.
5. Optional: To view the request in a different tab, select the **Open request in New Tab** option.
6. Click **Submit** to confirm the information and progress.
Optionally, you can click **Cancel** to discard your changes.
7. View the request view page.
Your process is now running, and you might be prompted to complete pending tasks in the request tabs.
8. Complete the required task information in the request tab.
As the bot completes its task, it might prompt you to take over and complete the remaining steps.
9. View your request status.
Your request is now completed.
10. Navigate to **Requests > All requests** to view all requests created in the team.
11. Optional: Click **Create request** button to create a new request from the **Request** page.

Delete a request

An AARI User, AARI Manager, or AARI Admin can delete requests that are no longer required. Deleting requests helps clear the memory space. You can also recover a deleted request if necessary.

Ensure you have completed the following:

- Assigned a system-created **AAE_Robotic_Interface User** role for the AARI User.
 - OR **AAE_Robotic_Interface Manager** for the AARI Manager.
 - OR **AAE_Robotic_Interface Admin** role for the AARI Admin.
- For the AARI User, AARI Manager, or AARI Admin:
 - You are assigned the AARI license.

- You have access to Automation Co-Pilot.

Only requests that are in **Cancelled**, **Failed**, or **Completed** status can be deleted.

Open requests can be deleted if they are part of a public process by changing the process settings.

The screenshot displays the AARI interface for editing a process. The left sidebar contains a navigation menu with 'Processes' highlighted. The main panel is titled 'Edit Process: 4 - employee_register' and has three tabs: 'General', 'User group', and 'Deployment'. Under the 'General' tab, there are several configuration sections:

- Select tags:** A dropdown menu with a note 'Maximum number of tags: 500'.
- Default assigned group:** A dropdown menu set to 'Docs team testing - Team' with a note 'The selected user group will be the default responder of the Request.'
- Request creation:** Two radio buttons, with 'by user' selected.
- Request retention:** A section with two sub-headers:
 - 'Number of days before a completed request is moved from Request List to Recycle Bin' with a dropdown set to 'Disabled'.
 - 'Number of days before request is deleted from Recycle Bin' with a dropdown set to 'Custom' and a text input field containing '30'. Below the input is the text 'Min=1 Max=60'.
- Allow Open Requests to be moved to the Recycle Bin:** A checkbox that is currently unchecked and highlighted in yellow.

- An AARI Admin can delete any request.

Note: The AARI Admin is the only user who can permanently delete requests.

- The AARI Manager can delete requests of the team for which they are the owner.
 - The AARI User can delete only the requests they have created.
-

Important: Files that are associated with a process are deleted when the request is deleted or are automatically deleted after 90 days.

1. Log in to Automation Co-Pilot.
2. Navigate to the **Request** tab.

3. From the list of requests, select the request or requests you want to delete and click the delete icon.
A confirmation message appears to confirm the deletion.
4. Click **Yes, delete** to delete the selected requests.
5. Optional: To recover a deleted request or requests, perform these steps:
 - a) Navigate to the **Recycle Bin** tab.
 - b) Select the requests you want to recover and click the recover icon.
A confirmation message appears to confirm recovery of the request.
 - c) Click **Yes, recover**.
The requests are recovered and appear in the **Requests** tab.

Create a team and assign roles to team members

An AARI Manager is a team admin who can create new teams, add members to their team, and assign new team roles. AARI Admin can also configure a team but does not have a team role.

Ensure you have completed the following:

- Provided a system-created **AAE_Robotic_Interface Manager** role for the AARI Manager.

Note: In addition, the AARI Manager requires the AARI license.

- Provided a system-created **AAE_Robotic_Interface Admin** role for the AARI Admin.
 - Have access to Automation Co-Pilot.
1. Log in to Automation Co-Pilot as an AARI Manager or AARI Admin.
 2. Navigate to **Manage > Team**.
The **Team** page enables you to view all of your teams and provides the option to create a new team.
 3. Click **Create new team**.
A **Create new team** window prompts to enter the team details.
 4. Enter a team name in the **Team Name** field.
 5. Optional: Enter a description in the **Description** field.
 6. Select a user from the drop-down in the **Team admin** field.
 7. In the **Request Visibility** field in the **General** tab, select **Shared** or **Private**.
If you select the **Shared** option, then all the requests that are created are accessible to members of the team. If you select the **Private** option, then a request will be available only to the member who created that request and the owners and admins of the team.
 8. Add members to the team by choosing one of the following options:

Option	Steps
Users	<p>a) Click the + (plus) icon. The Add members window appears. Use it to search for members to add.</p> <p>b) Search by using name, email, username, or role in the search bar.</p> <p>c) Select the member from the displayed list.</p> <p>d) Click Add & save. Members are now successfully added to the team.</p> <hr/> <p>e) Optional: To remove a team member, select the member and click the trash icon.</p> <hr/> <p>f) Navigate to Roles next to each member name. Each member's team role is set to Member, by default.</p> <p>g) Click Member to change the team role when applicable.</p> <p>h) Select Member, Owner, or Admin to designate the team role.</p> <hr/> <p>Important: A team must have at least one Admin as a member. Only the Automation Co-Pilot manager can be assigned the Admin team role because the roles are based on the Control Room roles assigned to the user. A team, however, can have more than one admin.</p> <hr/>
Roles	<p>a) Click the + (plus) icon. The Add roles window appears. Use it to search for roles to add.</p> <p>b) Search for a role in the search bar.</p> <p>c) Select the role from the displayed list.</p> <p>d) Click Add & save. Roles are now successfully added to the team.</p> <hr/> <p>e) Optional: To remove a role, select the role and click the trash icon.</p> <hr/>

9. Optional: Click the **Processes** or **Bots** tabs respectively to view the assigned processes or bots.
10. Click **Close**.
11. Optional: To edit an existing team, click the team's name in **Team** column within **Team Setup** page.
The AARI Manager or AARI Admin can edit a team to update their team setup or click **Delete** to erase the team entirely.

See, [Users and team roles for Automation Co-Pilot](#) on page 3288

Assign a team to a process

An AARI Admin can configure processes in the web interface and assign teams to a process for request creation. They access the web interface to view and manage processes in the **Process Setup** page.

Ensure you have completed the following:

- Provided a system-created **AAE_Robotic_Interface Admin** role for the AARI Admin.
- Have access to Automation Co-Pilot.

As an Automation Co-Pilot admin, their key function is to assign teams to a process.

1. Log in to Automation Co-Pilot as an AARI Admin.
2. Navigate to **Manage > Process setup**
The **Process Setup** page enables the AARI Admin to view all of the check-in processes from the Control Room and assign teams to a process.
3. Click on a process.
An **Edit Process** window appears and shows related information about the process such as the process name, description, tags, and teams.
4. Edit the **Process name** field if necessary.
5. Optional: Enter a description in the **Description** field.
6. If no tags exist, input any tag name in the **Tags** field to attribute tags to the process.
Follow steps 7 and 8 to add existing tags, or you can skip to step 9.
7. Search for a tag description in the search bar.
8. Click **Add** as a new tag.
A new tag will be added.
9. Select the scheduler user from the drop-down menu in the **Scheduler** field.

Note: The **Global scheduler** option is selected by default if a scheduler is not set for any process.

10. Select the **by user** (default) or **by bot** options in the **Request creation** field.

Important: If the **by user** option is selected, then processes are visible in the **Processes** page for all AARI Users (owners or members of team). If the **by bot** option is selected, then the request is created by a bot or another process using the **Process Task** in the **Process Composer**. A team must be selected in the **Default team to take the bot created request** field, for requests to be created by that team.

11. Click the **+** (plus) icon to add teams to the process.
The **Add teams** window appears to search for teams to add.
12. Search for a team in the search bar.
13. Click on their name to confirm the team.
14. Click **Add**.
Team are now successfully added to the process.
15. Optional: To remove a team, click the **trash** icon next to the team name.
16. Click **Save**.

Bot setup for Bot Runner users

The AARI Admin can manage and assign bots to a team of attended Bot Runner users, for them to view bots in the Automation Co-Pilot Desktop Assistant.

The main purpose of this feature is to improve the bot assignment for attended Bot Runner users, to enable them to access only the bots that are assigned to their team by an AARI Admin.

This helps control which users can view or use a bot. However, if an attended Bot Runner user is not part of any team, they will be able to view and access all bots in Automation Co-Pilot Desktop Assistant.

For the AARI Admin to assign a team of attended Bot Runner users to a bot, they must have view permissions on folders containing the bot.

- The AARI Admin can access the **Bot Setup** page in the web interface to view all bots and assign them to a team. They can also assign multiple teams to a bot or remove teams from bots entirely.
- When new bots are added to this page, the bots can be assigned to a team of attended Bot Runner users.
- The attended Bot Runner users can view their assigned bots in Automation Co-Pilot Desktop Assistant.
- The attended Bot Runner user must have a role with access to the public folder where the bot resides.

Assign or unassign a task

The AARI Manager and AARI User can assign specific tasks to their team. They can also unassign tasks.

Ensure you have completed the following:

- Provided a system-created **AAE_Robotic_Interface Manager** role for the AARI Manager.
- Provided a system-created **AAE_Robotic_Interface User** role for the AARI User.
- Have access to Automation Co-Pilot.

AARI Manager can assign tasks to all members who have access to a process. AARI User can assign tasks to other users in the same team. Both can unassign tasks.

1. Log in to the Automation Co-Pilot as an AARI Manager.
2. Navigate to the **Tasks** tab.
3. Select a task from the list.
4. Navigate to
 - **Unassigned**
Tasks are unassigned by default.
 - **Assign to me**
This option assigns the task to the current user.
5. Select the user.
The task is now assigned.
6. Optional: Select **Unassigned**.

The task is now unassigned.

View and search for a process

AARI User can view, pin, or search their assigned processes.

Ensure you have completed the following:

- Provided a system-created **AAE_Robotic_Interface User** role for the AARI User.
- You are assigned the AARI license.
- You have access to Automation Co-Pilot.

1. Log in to Automation Co-Pilot as an AARI User.
2. Click **Create request** from the home page and choose from these options:

Option	Steps
View a process	View your assigned process in the Select a process window. Important: A list of processes is available in the All tab by default and are assigned to your team by the manager.
View a pinned process	<ol style="list-style-type: none"> a) Click the pin icon. b) Navigate to the Pinned tab. c) View your pinned process.
Search for a process	<ol style="list-style-type: none"> a) Click Create request from the home page. b) Navigate to the search bar. c) Enter your keyword. The search bar dynamically searches your processes for common keywords. You can also search for tags. d) View the searched process.

Filter and search for a request

When an AARI User has created many requests, they can quickly search for a specific request in the **Requests** page.

Ensure you have completed the following:

- Provided a system-created **AAE_Robotic_Interface User** role for the AARI User.
- You are assigned the AARI license.
- You have access to Automation Co-Pilot.

Follow these steps to quickly search or filter your requests:

1. Log in to the web interface as an AARI User.

You are now in your home page, where you can view your requests.

2. Navigate to the **Requests** page and choose from these options:

Option	Steps
Sort	<p>a) Click on a column.</p> <p>You can choose from: Status, Reference, Process, Team, Request title Created , Updated or Tags.</p> <p>The column is sorted to ascending order by default.</p> <p>b) Optional: Click the same column again.</p> <p>The column is now sorted to descending order.</p> <p>c) View your sorted requests.</p>
Search	<p>a) Click Status (set by default).</p> <p>You can search by Request title, Reference, Process, Tags, Data Privacy Tags (Automation Co-Pilot Admin only), and Team .</p> <p>b) Search for your request.</p> <p>The search bar dynamically searches for common keywords.</p> <ul style="list-style-type: none"> • Enter the title in the Request title field. • Enter the reference key in the Reference field. • Enter a process name in the Process field. • Enter a tag name in the Tags field. • Enter a team name in the Team field. • Optional: Enter the query in the Data Privacy tag field. <hr/> <p>Note: This option is available only for the Automation Co-Pilot admin. The admin can update the field and manage any information about data privacy.</p> <hr/> <p>c) Optional: Click x to clear searched keywords.</p> <p>d) View the searched requests.</p>

Option	Steps
Filter	<p>a) Click Status (set by default). You can filter by selecting from the drop-down menu.</p> <p>b) Select from the drop-down menu. You can choose from Completed, Failed, Cancelled, and Open.</p> <p>c) Optional: Click x to clear filtered keywords.</p> <p>d) View your filtered requests.</p>
Date	<p>a) Select Created date or Updated date field. The date range window appears.</p> <p>b) Select the current date or specify any dates in the From and To fields.</p> <p>c) Click Submit.</p> <p>d) View your requests by the creation or modified dates.</p>

Filter and search for a task

When an AARI User has created many tasks, they can quickly search for a specific task in the **Tasks** page.

Ensure you have completed the following:

- Provided a system-created **AAE_Robotic_Interface User** role for the AARI User .
- Assigned the AARI license.
- Have access to Automation Co-Pilot.

Follow these steps to quickly search or filter your tasks:

- 1.** Log in to Automation Co-Pilot as an AARI User.
You are now in your home page, where you can view your tasks.
- 2.** Navigate to the **Tasks** page and choose from these options:

Option	Steps
Sort	<p>a) Click on a column.</p> <p>You can choose from: Status, Task Name, Assignee, Team, Request title, Reference, Task Created , Task Updated .</p> <p>The column is sorted to ascending order by default.</p> <p>b) Optional: Click the same column again.</p> <p>The column is now sorted to descending order by default.</p> <p>c) View your sorted tasks.</p>
Search	<p>a) Click Status (set by default).</p> <p>You can search by Task Name, Request title, Reference, Data Privacy Tags (AARI Admin only), Assignee , and Team .</p> <p>b) Search for your task.</p> <p>The search bar dynamically searches for common keywords.</p> <ul style="list-style-type: none"> • Enter a task name in the Task Name field • Enter the title in the Request title field. • Enter the reference key in the Reference field. • Enter an assignee name in the Assignee field. • Enter the team name in the Team field. • Optional: Enter the query in the Data Privacy tag field. <hr/> <p>Note: This option is available only for the AARI Admin. The admin can update the field and manage any information about data privacy.</p> <hr/> <p>c) Optional: Click x to clear searched keywords.</p> <p>d) View the searched tasks.</p>

Option	Steps
Date	<p>a) Select Created date or Updated date field. The date range window appears.</p> <p>b) Select the current date or specify any dates in the From and To fields.</p> <p>c) Click Submit.</p> <p>d) View your tasks by the creation or modified dates.</p>
Preset filters in Table view	<p>a) Navigate to the Table view tab (set by default)</p> <p>b) Click My Completed tasks, My Pending tasks, or Unassigned tasks.</p> <p>c) View your filtered tasks.</p>
Filter in Table view	<p>a) Click Status (set by default) or Type.</p> <p>b) Select from the drop-down menu. For Status, you can choose from Pending, Cancelled, and Completed. For Type, you can choose from Form and Validation.</p> <p>c) View your filtered tasks.</p>

Option	Steps
Filter in Detail view	<p>a) Navigate to the Detail view tab.</p> <p>b) Click Filter.</p> <p>c) In the dedicated filter window that appears, configure your contents from these filter options:</p> <ul style="list-style-type: none"> • Choose a preset filter from My Completed tasks, My Pending tasks, and Unassigned tasks. • Select a date in the Created date or Updated date fields. You can select the current date or specify any dates in the From and To fields. • Select a status in the Status option. You can choose Pending , Cancelled, and Completed. • Enter a task name in the Task Name field. • Enter a name in the Request title field. • Enter a name in the Created by field. • Enter the reference key in the Reference field. • Select a type in the Type option. You can choose Form and Validation. • Enter a name in the Assignee field. • Optional: Enter the query in the Data Privacy tag field. <hr/> <p>Note: This option is available only for the AARI Admin. They can update the field and manage any information about data privacy.</p> <hr/> <p>d) In the task list, you can filter your task with more sort options:</p> <ol style="list-style-type: none"> 1. Click Task Created (set by default). 2. Select in the Sort By field from Status, Task Name, Reference, Title, and Task Created options. 3. Select in the Order field from Ascending (set by default) and Descending orders. <p>e) Optional: Click x to clear any custom filter keywords or tags.</p> <p>f) View your filtered tasks.</p>

Configure a bot

This task shows you how to edit a bot to set parameters as well as to manage team members.

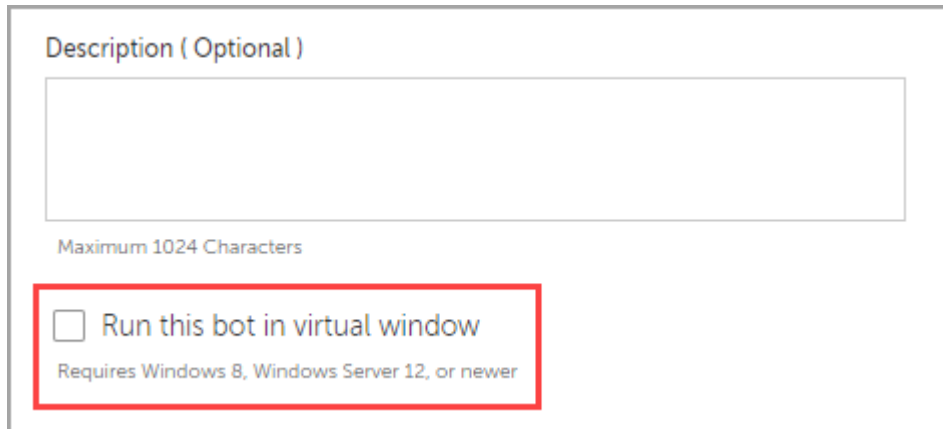

1. Log in to Automation Co-Pilot.
2. Navigate to **Manage > Bot**.
3. Click on an available bot.
This opens the **Edit Bot** page in the **General** tab.
4. Specify a name in the **Bot display name** field.
5. Reference the file name in the **Bot file name** field

Note: The field is grayed out and cannot be modified as this field is to help you reference the name of this bot file.

6. Reference the URI in the **Uri** field

Note: The field is grayed out and cannot be modified as this field is to help you reference the URI of this bot.

7. Optional: Enter a description for your bot.
8. Optional: Select the **Run this bot in virtual window** check box.

The screenshot shows a configuration form for a bot. It features a text input field labeled "Description (Optional)" with a "Maximum 1024 Characters" limit. Below this field is a checkbox labeled "Run this bot in virtual window" with a red border around it. Underneath the checkbox, it states "Requires Windows 8, Windows Server 12, or newer".

This option enables the Microsoft Windows child sessions [Picture-in-Picture (PIP)] feature. This feature enables attended users to run bots in Automation Co-Pilot Desktop Assistant on a virtual desktop window, while they continue to work on other applications. For more information on Automation Co-Pilot Desktop Assistant, see [Automation Co-Pilot Desktop Assistant](#) on page 3207.

Attended users can also use the PIP feature to run attended bots from the iFrame widget in their web applications, see [Embed automations in your application using Automation Co-Pilot for Business Users](#) on page 3147.

Important: Microsoft Windows 8, Microsoft Windows Server 12, or any of the later versions are required for virtual window. Here are some of the existing limitations of using the PIP feature:

- Another instance of your current browser cannot be used on Windows Desktop and the virtual window at the same time.

For example, if you are using an instance of Google Chrome on your Windows Desktop, the same cannot be used in the virtual window. In order to use Google Chrome in the virtual window, ensure you close this browser on your Desktop.

- When a virtual window is initiated, you might be logged out of your connected Global Protect software. However, the Task Bot will continue to run in the virtual window.
- Applications that allow single log in are restricted to the corresponding main or virtual windows.
- After a bot starts, it runs in the virtual window and is completely independent of the main instance.

-
9. Optional: Select **Delete bot** to delete this bot.

Important: This option will permanently delete your bot.

10. Click on the **Teams** tab.
This page allows you to manage your team members.
11. Click the **Add (+)** button.
This **Add Teams** page appears.
12. Select an available team.
13. Click **Add & save** to confirm your choice.
A team has now been assigned to this bot.
14. Optional: Select a team and click **Delete** (recycle) button to remove a team.
15. Optional: Select the search bar and filter by **Team**, **Description**, and **Request visibility** from **Private** or **Shared**.
16. Click **Close**.
Your settings are saved automatically.

Configure a process

This task shows you how to edit a process to create a process key, set a default team, as well as enable the option to delete a process.

1. Log in to Automation Co-Pilot.
2. Navigate to **Manage > Process**.
3. Click on an available process.
This opens the **Edit Process** page in the **General** tab.
4. Specify a name in the **Process name** field.
5. Specify the description in the **Description** field.
6. Enter a customer key (if applicable) in the **Process key** field.

Important: The process key must be one to five characters long and in alphabetical order. The process key can only be defined once, and after when the process key is defined, it cannot be modified later by the user.

7. Add tags to your process in the **Tags** field.

Tags allow you to filter out automations and display only a subset of automations from the entire list. This will let you call and access only the tagged automations in your embedded widget.

8. In the **Tags** field:

a) Click the **Tags** field.

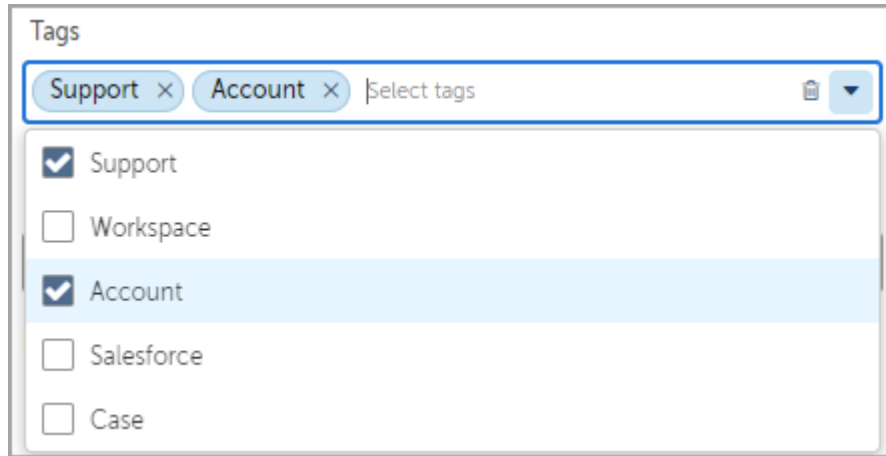

b) Specify your tags with unique keywords, such as **Cases** or **Reports**.

c) Select the **Add as new option** from the drop-down to add a new tag.

The keyword will automatically generate a new tag if it does not exist. The search result is displayed in real time.

The screenshot shows the 'Edit Process: 34 - Order Status' form. The 'General' tab is selected. The 'Process name' field contains 'Order Status' with a maximum of 255 characters. The 'Description (Optional)' field is empty with a maximum of 1024 characters. The 'Process key' field is empty with a note: 'Enter 1-5 alphabetical characters. Once saved, the Process Key cannot be changed.' The 'Tags' field is highlighted with a red box. Below it, a search bar contains 'Cases' and a dropdown arrow. Below the search bar, a message says 'No result found.' and a button labeled 'Add as new tag 5/500' is highlighted with a red box.

d) Select an existing tag from the drop-down.

- e) Select the trash bin icon to delete your tags in the field.
- f) If your tags are not listed, you can use the **Search All** option to search for the related keywords.

Note: Only the AARI Admin can view and create tags.

9. Specify the team in the **Default team** field.

By default the first team that is added to the process is automatically set as the default team. You can change the team by selecting from the drop-down menu.

Important: A default team cannot be deleted from a process. For the admin to remove a default team (e.g. Team 1), they would need to set another team (e.g. Team 2) as the default team, then remove the original team (e.g. Team 1) from the process.

Ex: You can select **Recruitment Director** in the drop-down menu.

10. Choose between the **by user** and **by bot** in the **Request creation** field.

11. In the **Request retention** field:

- Select **Disabled**, **Immediate**, or **Custom** from the first drop-down menu to specify whether the completed request is moved from the **Request** page to the **Recycle bin**.

For example, you can select **Disabled** to prevent your requests from being moved to the **Recycle bin** or select **Immediate** for all current completed requests to be moved without delay.

Note: When you select the **Immediate** option, it can take a maximum time of one hour before the request is moved to the **Recycle bin**.

- Select **Immediate** or **Custom** from the second drop-down menu to specify the number of days when the requests is permanently deleted in the **Recycle bin**.

Ex: You can select the **Custom** option and specify **30** to represents thirty days when the request is deleted in the **Recycle bin**.

- Select the check box option to allow open request to be moved to the **Recycle bin**.

12. Click **Close**.

Your settings are saved automatically.

Business user

A business user is typically a non-technical employee who learns to build intelligent automation software bots to handle their workflows. Automation 360 provides business users with accessible, no/low-code, automation tools they can use on their own, every day.

Overview

Business users help organizations improve business KPIs by automating manual processes across multiple use cases and transforming institutional knowledge into automations. AARI enables these business users to automate and streamline processes with no-code drag-and-drop RPA. With AARI, organizations can:

- Eliminate application switching: Search through multiple systems to find the required information and present all data on a single screen
- Eliminate data and departmental silos: Connect across back and front office systems and users with no/low-code automation
- Scale automation to new use cases Process owners can automate on their own and design how employees should interact with the AARI workflow.

Source: [Automation Anywhere Corporate site \(Business user solution\)](#)

Using AARI, a business user leverages automation built by bot developers (bots, forms, processes) and interact with applications (for example, web, Microsoft Excel, SFDC) that transfer data between group of users and bots, providing an automation service catalog and acting as a request management tool.

Business users can be:

- AARI Admin: act like a Process Owner from business side
- AARI Manager: act like a Team Owner from business side
- AARI User: act like an simple operator from business side

Approvals in Automation Co-Pilot

The approvals task is a designated process flow that routes notifications and process data to specific users that can quickly address complex and urgent hand-offs.

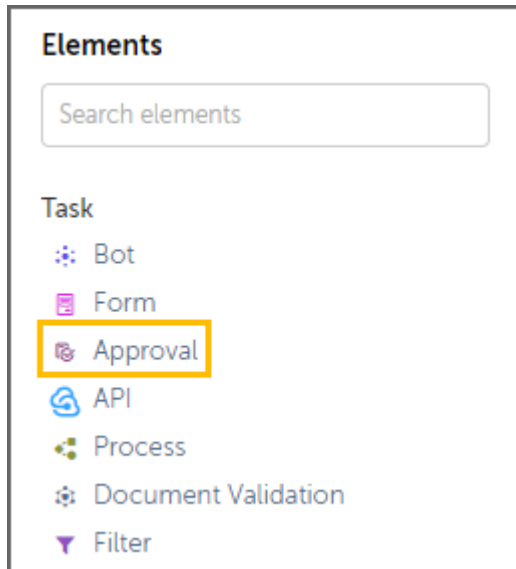

The approval task offers many advantages.

Automation Co-Pilot offers a feature that makes approving tasks simple and direct. The need for approvals applies to many business tasks and with the approval task users can submit and receive approvals, while staying notified of progress, without breaking concentration from streamlined work flow. Likewise, decision making becomes simplified when managers can quickly review the information of a task requested for approval, and they can directly respond with attachments and

comments. This human interaction now has a designated space within Automation Co-Pilot and the Process Composer for configuring and automating across applications and roles.

Find the approval task in Process Composer.

The approval task is a process element that can be added and configured in the Process Composer. This enables functionality in Automation Co-Pilot for business users and decision makers to share information within the automation, improving response time that can otherwise take longer to resolve due to the complex nature of cross-functional decision making.

By running an approval task each team member can leverage their unique role and responsibilities in a single streamlined automated task. This means the experience for approving contributors is tailored to the function of their role, while business users continue their familiar automated experience with the added benefit of immediate updates and details when requests are approved. Consider the relationships for the following personas.

Table 5: Relationships of personas and the approval task

Persona	Experience
 <p data-bbox="506 1549 695 1579">Automation Admin</p> <p data-bbox="581 1600 630 1621">Jake</p>	<p data-bbox="883 1360 938 1390">Plan</p> <p data-bbox="883 1411 1399 1507">Assign users to roles/teams. Workflow

The following steps describe the basic workflow to configure an approval task.

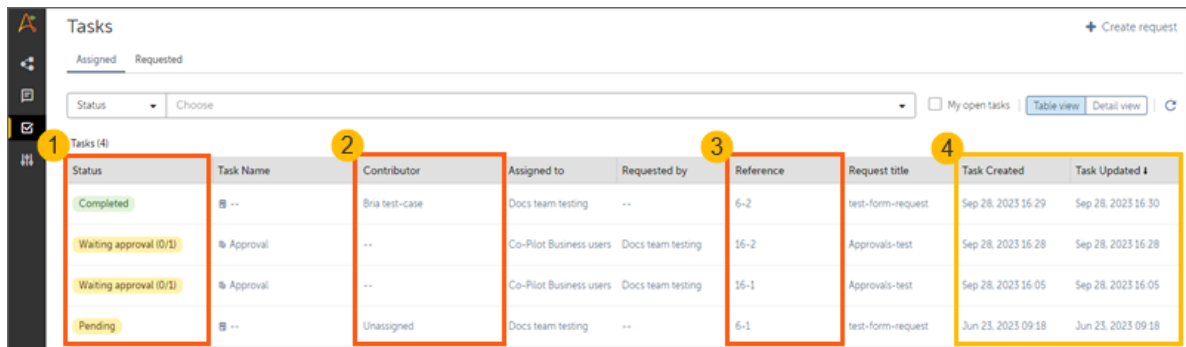

1. Create your teams for business tasks. [Create a team and assign roles to team members](#) on page 3267
2. Optionally, add the relevant team to a single Global Value, of variable type user group. [Create a global value](#) on page 2261
3. In Process Composer, configure the approval task in your process using the pre-built user group. [Add Approval Task to a process automation](#) on page 3321
4. Save your changes to the process.

5. Run the approval task in Automation Co-Pilot.

Using and sorting the Tasks view

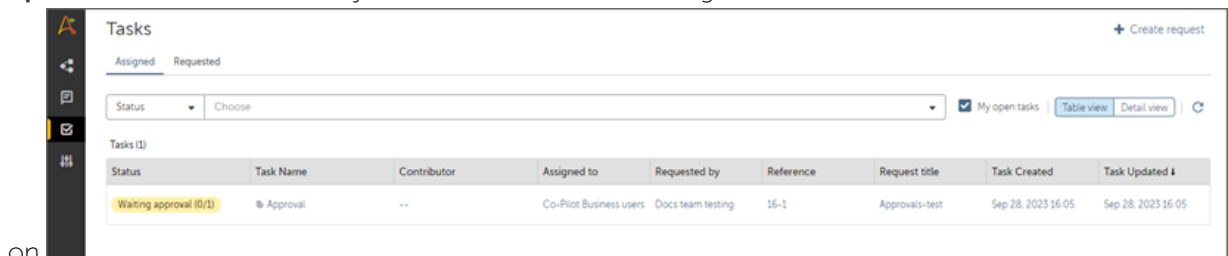

Use the task view to filter by status and contributors and find an approval task or reference ID for quick response in Automation Co-Pilot.

The **Tasks view** offers quick reference of the status and contributors for tasks run in Automation Co-Pilot, including the individual reference ID of the process. At a glance, you can check the responses of an approval task, relevant dates and times, and who is contributing or assigned to a task. Click any of the column headers to sort tasks in ascending or descending order based on the data type of the column.

Column	Data	Details
1	Status	View what status the task is in to gauge your response.
2	Contributor	View the user that contributed to the task for further details or follow up.
3	Reference	View the reference ID for identifying specific requests.
4	Create, Updated	View dates and times of tasks

To quickly view your tasks that are open, simply select **My open tasks** and find the task you want to continue working

Further details on status and notifications can be found in the following topic. [Automation Co-Pilot status and notifications](#) on page 3286

Automation Co-Pilot status and notifications

With process event notifications enabled, users are alerted to changes in tasks and requests.

Ensure notifications for process events are turned on to receive the following alerts. [Getting started with Notifications](#) on page 2120

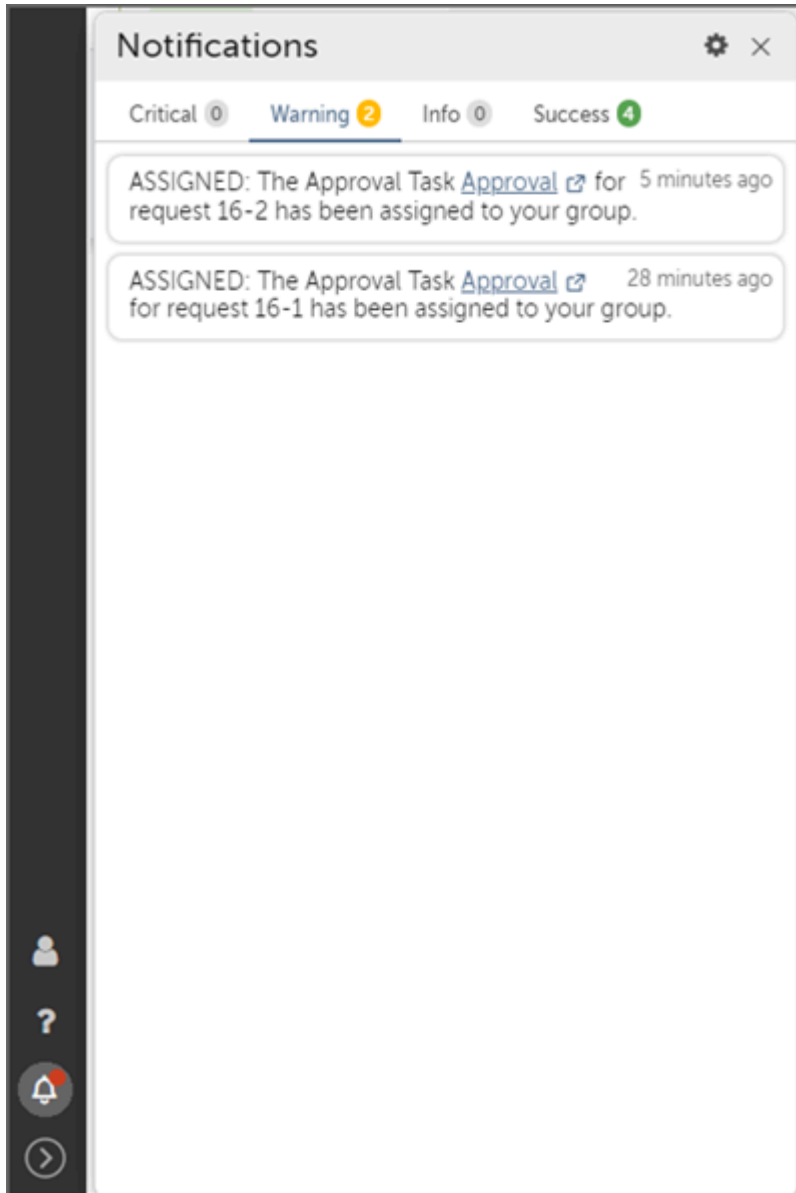

While in Automation Co-Pilot, notifications prompt users to respond to priority events and streamline time-sensitive tasks. These notifications are consumed by Automation Co-Pilot for ease of use. Notifications include a link to the relevant task and display information on the latest event of that task.

The following are examples of the status a task can have in Automation Co-

In-progress task status		In-progress task status	
Pending	Pending Task is pending response by the user (me).	Completed	Completed Task is successfully completed.
In progress	In progress Bot/API task is on going.	Failed	Failed Task is not successfully completed due to Bot/Process error.
Queued	Queued Task is queued up for Bot execution.	Cancelled	Cancelled Task is cancelled by user.
Waiting approval (0/2)	Waiting approval Approval Task is pending response.	Expired	Expired Task is expired due to response timeout.
		Approved	Approved Approval task is approved.
		Declined	Declined Approval task is declined.

Pilot.

The notifications panel groups the alerts by severity. The following are some examples of events and their corresponding severity.

Event	Severity
Queued	Info
Waiting approval	Info
Completed	Success
Assigned	Warning
Failed	Critical

Users and team roles for Automation Co-Pilot

Users with specific roles and permissions can use different features in Automation Co-Pilot to automate business processes as per requirement.

Note: Roles, permissions, and licenses may continue to reference Automation Anywhere Robotic Interface (AARI)] within the product.

There are two main types of users that run Automation Co-Pilot. They can be broadly categorized into users who access the Control Room to build processes in the Process Composer, and end users that run automations using Automation Co-Pilot from the cloud or desktop.

Users and their roles

Configure users with the proper roles and permissions and assign them the AARI license to start using Automation Co-Pilot. The primary users involved in the configuration stage are as follows:

- Control Room Admin: They can create users and assigns Automation Co-Pilot roles (AARI Admin, AARI Manager, and AARI User) with the AARI licenses.
[Create users for Automation Co-Pilot](#) on page 3291
- AARI Admin: They can create scheduler users and allocates Control Room resources required to run a process.
[Configure scheduler user for Automation Co-Pilot](#) on page 3293

The following table illustrates the relationship between users, roles, and the permissions they have while using Automation Co-Pilot.

User	Role	Permissions
Control Room Admin	AAE_Admin	Create users with AARI license and assign roles.
Bot Creator	AAE_Basic	<ul style="list-style-type: none"> Create a process. Check in a process. Check out a process. Run a private process. Delete a process. Import a process. Export a process.

User	Role	Permissions
AARI Admin	AAE_Robotic Interface Admin	<ul style="list-style-type: none"> • Configure scheduler user and allocate Control Room resources (device pool and unattended Bot Runners) to a process in the configuration setup stage. • Perform the following global team and process management tasks in the process deployment stage: <ul style="list-style-type: none"> • Create, view, and modify all teams. • Assign teams to processes.
AARI Manager	AAE_Robotic Interface Manager	<ul style="list-style-type: none"> • Create and view teams. <hr/> <p>Note: Requires the AARI license.</p> <hr/> <ul style="list-style-type: none"> • Add members to or remove members from the teams. • Assign owners to the teams. • Function as default admin for the teams they create. • Request AARI admin to assign their team to processes.
AARI User	AAE_Robotic Interface User	<ul style="list-style-type: none"> • Create and access requests. • Submit and access tasks.

Team roles and permissions

The following table lists the users, and their roles and permissions in a team.

Note: These roles require the AARI license.

Team role	Control Room role	Team type	Permissions
<p>Note: The AAE_Robotic Interface Manager role sets the AARI Manager to automatically have an Admin team role. A license is required.</p>	<p>AAE_Robotic Interface Manager</p>	<p>Shared</p>	<ul style="list-style-type: none"> • Create • View all • Delete all • Assign all • Modify team
		<p>Private</p>	<ul style="list-style-type: none"> • Create • View all • Delete all • Assign all • Modify team
<p>Owner</p>	<p>AAE_Robotic Interface User</p>	<p>Shared</p>	<ul style="list-style-type: none"> • Create • View all • Delete all • Assign all
		<p>Private</p>	<ul style="list-style-type: none"> • Create • View all • Delete all • Assign all
<p>Member</p>	<p>AAE_Robotic Interface User</p>	<p>Shared</p>	<ul style="list-style-type: none"> • Create • View all • Delete • Assign all
		<p>Private</p>	<ul style="list-style-type: none"> • Create • View • Delete • Auto-assign

Example

Consider two teams, Finance and HR, and their team roles as listed in the following table:

Finance (private)		HR (shared)	
User	Role	User	Role
User A	Owner	User X	Member
User B	Member	User Y	Member

Finance (private)		HR (shared)	
User	Role	User	Role
User C	Member	User Z	Owner

For any process, keep in mind the following:

- User A can view and delete all the requests created inside the team Finance.
- Users B and C can view and delete only their requests inside the team Finance.
- Users X, Y, and Z can view all the requests but can delete only their request inside the team HR.
- User Z can view and delete all the requests created inside the team HR.

Automation Co-Pilot workflow

Workflow map: Click the following schematic image to view the Automation Co-Pilot workflow in an interactive visual format:

1. [Get started with AARI](#)

See also, [Create a team and assign roles to team members](#) on page 3267

Create users for Automation Co-Pilot

Control Room Admin can create users and assigns the required system roles for AARI Admin, AARI Manager, and AARI User to use Automation Co-Pilot for business processes.

Ensure that you have purchased the AARI license for your business users.

Note: These roles are only applicable for Automation Co-Pilot.

1. From your local machine, log in to your Control Room as administrator.
2. Go to **Administration > Users**.
3. Click **Create user**.
The icon is located at the top-right of the **Users** table.
The **Create user** page is displayed.

4. In the **General Details** section, enter the following user details:

Enable User	Select the check box so that the user can log in immediately.
Username	Enter a unique user name.
Description	Optional: Enter a description for the user.
First name	Optional: Enter the first name of the user.
Last name	Optional: Enter the last name of the user.
Password	Type and confirm a password for the user. Ensure the password follows any necessary password policy.
Email	Enter and confirm the email address for the user. If SMTP is enabled, the user is sent an email to this address to confirm the account. Click the URL in the email to log in to the Control Room and set up your credentials. All important Control Room notifications will be sent to this email address.

5. In the **Select Roles** section, select one of the following roles from the **Available roles** column:

Role	Select this role
AARI Admin	AAE_Robotic Interface Admin
AARI Manager	AAE_Robotic Interface Manager
AARI User	AAE_Robotic Interface User

6. Click the right arrow to move the role to the **Selected** column.

7. In the **Allocate a device license** section, select the following:

Role	Action
Admin	Retain the default None . The user with administrator role has access to the Control Room and Automation Co-Pilot.
Manager	Retain the default None for administrative tasks only. Optionally, assign the Automation Co-Pilot user license for this user to create a request, submit tasks, and create and view teams. The user with manager role has access to Automation Co-Pilot.
User	Assign the AARI license. You can also optionally assign the attended Bot Runner license to run local bots or use the desktop interface. The user has access to Automation Co-Pilot.

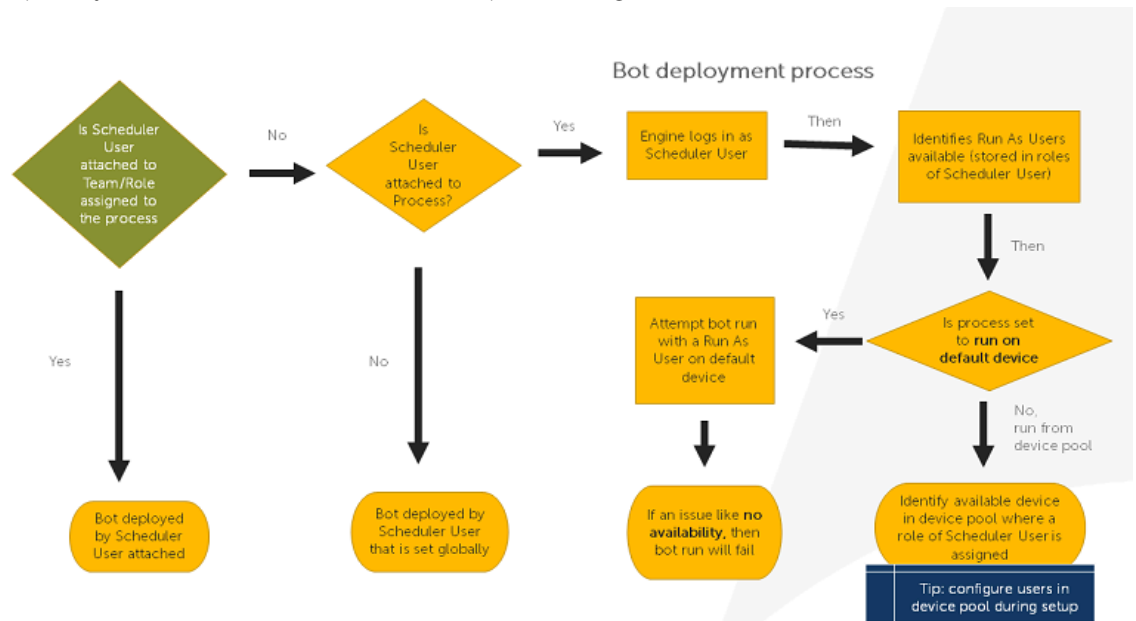

8. In the AARI licenses section, select the **AARI User** check box.
9. Click **Create user**.
The new user is displayed in the User table. If SMTP is enabled, an email will be sent to the new user inviting them to log in.

Configure scheduler user for Automation Co-Pilot

You can configure a scheduler user (**global scheduler** or **per-process scheduler**) to allocate the Control Room resources (devices and unattended Bot Runners) for Automation Co-Pilot for Business Users on the web interface. This scheduler user is a dedicated user who helps the process deployment.

The role assigned to the scheduler user cannot be a shared role with any other user such as Bot Runner or an admin user. To perform this task, you will use both the Control Room and Automation Co-Pilot.

There are multiple considerations when a bot is deployed. The following process flow illustrates the priority of a scheduler user and device pool during bot

deployment.

1. [Create a scheduler user with a role in the Control Room](#) .
2. [Create device pools in the Control Room](#) .

Note: AARI Admin is the device pool owner and can select a custom role (**AARI-pool-scheduler**) in **Device Pool Consumers**.

3. [Assign a scheduler user to a process in the web interface](#).

Assign custom roles to a new scheduler user

You can assign custom roles to a new scheduler user in order to run processes in Automation Co-Pilot.

You must be an AARI Admin to perform this task.

1. Log in to Control Room as an AARI Admin.
2. Navigate to **Administration > Roles**.
3. Create a custom role.
AARI-pool-scheduler
[Create a role](#) on page 1687.
 - a) Set the permissions to **View my bots**, **View packages**, **Run my bots**, and **AARI Scheduler**.
 - b) In the **Bots** tab, select the folders that contain the bots to be run by the scheduler user, that you want to give access to with run and view permissions. Set the required bot permissions for the role at the folder level.
 - c) Select the unattended users in the **Run As** section.
 - d) Save your changes.
4. Create a user.
AARI-scheduler-user

Note: This user does not require any license.

5. Assign the custom role you created to this user.
AARI-pool-scheduler

Assign a scheduler user to a process

You can configure a scheduler user (team scheduler, per-process scheduler, or global scheduler) to allocate the Control Room resources (devices and unattended Bot Runners) to Automation Co-Pilot. This scheduler user is a dedicated user who helps in process deployment.

Ensure that you have created the scheduler user and the device pool.

1. Log in to Automation Co-Pilot as an AARI Admin.
Alternatively, you can navigate to Automation Co-Pilot through the Control Room by clicking the **settings page** link in the **Manage > Device pools** screen. This will automatically navigate you to the Automation Co-Pilot screen, with you logged in as an AARI Admin.
2. Select a scheduler user by choosing one of the following options:
The process uses the device pool and unattended Bot Runners configured with this user for each bot deployment.
By default, **Global scheduler** is selected if you have not set a **Scheduler** for any process.
By default:
 - a) **Team** scheduler user is selected.
 - b) **Process** scheduler user is selected if **Team** scheduler user is not defined.

- c) **Global scheduler** user is selected if the **Team** and **Process** scheduler users are not defined

Scheduler Type	Steps
<p>Team</p>	<ul style="list-style-type: none"> a) Navigate to Manage > Process. b) Select the process to configure the scheduler user. The Edit Process page will open. c) Navigate to the Team tab. d) Select a scheduler user from the drop-down menu in the Scheduler field. The Process scheduler is selected by default. e) Click Save.
<p>Scheduler (per-process scheduler)</p>	<ul style="list-style-type: none"> a) Navigate to Manage > Process. b) Select the process to configure the scheduler user. The Edit Process page will open. c) Navigate to the Deployment tab. d) Select a scheduler user from the drop-down menu in the Process scheduler field. The Global scheduler is selected by default. e) Select the Deployment type. f) Click Close. The setting saves automatically.

Scheduler Type	Steps
Global scheduler	<p>a) Navigate to Manage > Process.</p> <p>b) Select the process to configure the scheduler user. The Edit Process page will open.</p> <p>c) Navigate to the Deployment tab.</p> <p>d) Select the Global scheduler user from the drop-down menu in the Process scheduler field. The Global scheduler is selected by default.</p> <p>e) Select the Deployment type.</p> <p>f) Click Close. The setting saves automatically.</p>

Important: If scheduler users had their role removed or do not have sufficient permissions to access a file:

- a)** The Control Room Admin will see an audit log of the change.
- b)** The AARI Admin will see an error message for an invalid scheduler then must reassign a new scheduler user.
- c)** The AARI User will see an error message for the process.

Configure deployment type for bots

You can configure the deployment type for your bot tasks. This determines how the bots in the process will be deployed. You can also define the mapping between run-as user and the device.

This mapping will help take care of constraints if any in your organizational set up such as credential constraints requiring one to one mapping between devices and run-as user.

- 1.** Navigate to **Manage > Process**.
- 2.** Select the process.
- 3.** Select the **Deployment** tab.
- 4.** In the **Deployment type** field, select one of the following options:
 - **Prefer default device** - The bot deploys on the default device of the unattended Bot Runner user. If default device is unavailable, the bot deploys on the available device in the device pool. All the unattended Bot Runner users in the scheduler user should either have the same device credentials (user name and password) or the different user name and password credentials that are set in all the devices. If the password is different for each device credential, the user name also differs.

- **Run on pool of device** - The bot deploys on the available device in the device pool. It overrides the default device of the user.
- **Run only on default device** - The bot deploys only on the default device of the user. In this option, the unattended Bot Runner user should own the default device. If the device is jointly owned by the unattended Bot Runner user along with another licensed user, the device is not used as the unattended Bot Runner user is considered to have no default device. If the scheduler user has multiple unattended Bot Runner users and one of those users do not have a default device, the bot deployment fails.

5. Click **Close**.

About Process Composer

Process Composer is an environment that leverages multiple products across the Automation 360 platform to deliver an Intelligent Automation experience.

Pro and Citizen Developers can use the Process Composer's low-code features to collaborate and build end-to-end process automations. Process Composer displays correct data to the appropriate users and exchanges that data across multiple teams. Using a single, drag-and-drop visual interface, developers can quickly build long-running process automations that combine bots, forms, document processing, integrations, and API Tasks.

Benefits of Process Composer

Pro and Citizen Developers can:

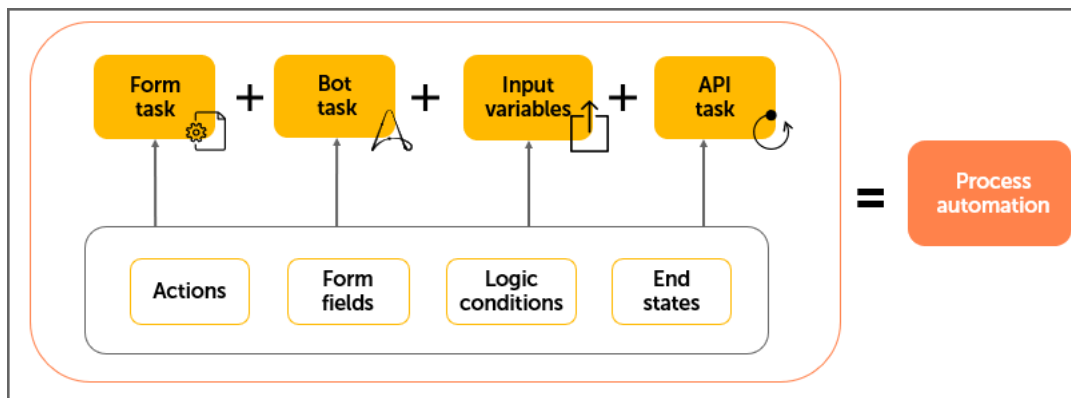

- **Optimize complex workflows:** Simplify business operations across departments by automating multi-user, multi-step tasks and approvals.
- **Empower employee experience:** By transforming end-to-end processes, combine robotic tasks with connecting APIs and can insert humans-in-the-loop where needed.
- **Boost operational productivity for the organization:** Time between tasks decreases, service level agreements (SLAs) are enforced, and teams are promptly alerted within their application of choice.

Process Composer components and elements

Process Composer is comprised of three components:

- **Process discovery component:** You use Process Composer to discover processes, and then learn (reference) from them. An asset generated from [Process Discovery](#) can be a process workflow that gets translated into a process automation in Process Composer.
- **Process automation design component:** You create and design process automations which link bots and forms together. Additionally, the process automation contains the logic that triggers the bots and forms, and coordinates the flow of data between them. A process automation contains the following elements:
 - **Request:** A specific instance of a process automation that defines a template of how bots and forms interact.
 - **Initial data:** Fed into the process typically entered by a user and consumed through a [form](#) as the first step.

- Sequence of steps in a process automation: Which can contain any of the following process automation elements:
 - Form Task: Completed by users which enable them to invoke and interact with the bots through the customizable web interface.
 - Bot Task: Previously built in the Bot builder and available to select in Process Composer. The bots automate specific, repetitive, and rule-based tasks.
 - API Task: Task that connects to a specified API and retrieves data for the process automation to consume. When invoked from a process automation, API Tasks provide a faster response than a Bot Task when called in the same process automation.
 - Approval Task: Task that alerts a responder to approve shared data.
 - Document Validation: Task that requires document approval.
 - Input, output, and meta variables: Includes shared data in the process automation.
- Logic conditions: Such as the `IF/ELSE` pair or `ELSE if` to include internal and conditional branching of the process automation.
- End states: Closes each request (specific instance of a process automation) with a status such as: completed, failed, or canceled.
- Process automation management component: After you have created a process automation, you can check it in to deploy and make available to other users in the web interface. Additionally, you can import, export, run, delete, and check out process automations.

[Users and team roles for Automation Co-Pilot](#) on page 3288

Users with specific roles and permissions can use different features in Automation Co-Pilot to automate business processes as per requirement.

Supported behaviors for tasks and elements in Process Composer

Process Composer tasks, logic conditions, and end points support copy, paste, and cut behaviors from the Bot editor. This also includes the ability to double-click and replace items on the canvas.

Supported behaviors

Note: The functionality of these behaviors are the same for both Process Composer and Bot editor with the exception of some specific task types.

Copy	Use CTRL + C to copy data from the task.
Paste	Use CTRL + V to paste copied data in your task.
Cut	Use CTRL + X to copy and remove data from your task.
Double-click to add	Double-click a task to add data to it.

Copy behavior

When you copy a task or element in the canvas, these behaviors will occur:

Task types	Behavior
<ul style="list-style-type: none"> • Bot Task • Form Task • Filter Task • Document Validation Task • If • Else if • End process • Go to 	Properties are retained in the clipboard.
Else	Task is not retained in the clipboard.

Paste behavior

When you paste a task or element in the canvas, these behaviors will occur:

Task types	Node selected	Behavior
<ul style="list-style-type: none"> • Bot Task • Form Task • Filter Task • Document Validation Task • If/Else pair 	None	Task is attached to the last node located before the end point (End process or Go to).
<ul style="list-style-type: none"> • Bot Task • Form Task • Filter Task • Document Validation Task • If/Else pair 	<ul style="list-style-type: none"> • End process • Go to 	Task is attached to the last node placed before the end point (End process or Go to).
<ul style="list-style-type: none"> • Bot Task • Form Task • Filter Task • Document Validation Task • If/Else pair 	<ul style="list-style-type: none"> • Bot Task • Form Task • Filter Task • Document Validation • If • Else if • Else 	Task is attached to the node.
<ul style="list-style-type: none"> • End process • Go to 	<ul style="list-style-type: none"> • Bot Task • Form Task • Filter Task • Document Validation • If • Else if • Else • None 	Paste is not allowed or disabled.
<ul style="list-style-type: none"> • End process • Go to 	<ul style="list-style-type: none"> • End process • Go to 	Task replaces the selected node.
Else if	<ul style="list-style-type: none"> • If • Else if 	Task is added as a new Else if node in the same line as the If or Else if , and located in the last position before the Else .

Task types	Node selected	Behavior
Else if	<ul style="list-style-type: none"> • Bot Task • Form Task • Filter Task • Document Validation • End Process • None 	Task is not added to the canvas because this action is invalid.

Cut behavior

When you cut (remove) a task or element in the canvas, these behaviors will occur:

Task types	Behavior
<ul style="list-style-type: none"> • Bot Task • Form Task • Filter Task • Document Validation Task 	Task is removed from the canvas by deletion but the clipboard retains the task with all the properties .
<ul style="list-style-type: none"> • If • Else if 	Task is removed from the canvas by deletion but the clipboard retains the task with all the properties. All child nodes are deleted from the canvas.
Else	Task is not removed or retained in the clipboard.
<ul style="list-style-type: none"> • End process • Go to 	Task is removed from the canvas by deletion but the clipboard contains the task with all the properties.

Double-click to add behaviors

When you double-click a task or element in the canvas to add data to it, these behaviors will occur:

Task types	Node selected	Behavior
<ul style="list-style-type: none"> • Bot Task • Form Task • Filter Task • Document Validation Task • If/Else pair 	None	Task is attached to the last node located before the end point (End process or Go to) of the main branch (farthest left).

Task types	Node selected	Behavior
<ul style="list-style-type: none"> • Bot Task • Form Task • Filter Task • Document Validation Task • If/Else pair 	<ul style="list-style-type: none"> • End process • Go to 	Task is attached to the last node located before the end point (End process or Go to).
<ul style="list-style-type: none"> • Bot Task • Form Task • Filter Task • Document Validation Task • If/Else pair 	<ul style="list-style-type: none"> • Bot Task • Form Task • Filter Task • Document Validation • If • Else if • Else 	Task is attached to the selected node.
<ul style="list-style-type: none"> • End process • Go to 	<ul style="list-style-type: none"> • Bot Task • Form Task • Filter Task • Document Validation • If • Else if • Else • None 	Double-click is not allowed or disabled.
<ul style="list-style-type: none"> • End process • Go to 	<ul style="list-style-type: none"> • End process • Go to 	Task replaces the selected node.
Else if	If	Task is added as a new Else if node in the same line as the If or Else if and in the last position before the Else .
Else if	<ul style="list-style-type: none"> • Bot Task • Form Task • Filter Task • Document Validation • Else if • End Process • Go to • None 	Task is not added to the canvas because this action is invalid.

Construct URL parameters for supported elements

You can construct URL parameters for the following supported elements: **Date**, **Number**, **Text Box**, and **Time**.

Supported elements to construct URL parameters

You can call a specific process using its ID and pass parameters through the URL to populate the initial forms based on the form field ID. This population method is also supported for initial forms in the iFrame widget for Automation Co-Pilot for Business Users using the embedded widget.

Note: The URL value will always overwrite the default value of the form fields.

Data format: The following data format is accepted for certain elements:

- The **Text Box**, **Text Area**, and **Rich Text Editor** elements accept the **String** type data.
- The **Number** element accepts the **Double** type data.
- The **Date** and **Time** elements accept the **RFC 8601** date (local time) type data (for example, 2021-06-10T00:00:00.000).
- The **Radio Button** and **Dropdown** elements accept the **String** type data.
- The **Check Box** element accepts the **String** type data.

Parameter Mapping: The following parameter mappings differ for certain elements:

- For the **Text Box**, **Text Area**, and **Rich Text Editor** elements, the **Element ID** shows the value after the element ID becomes the default element or input value. For example:
 - `TextBox1=MyValue`
 - `TextArea2=MyLoooooooooooooongValue`
 - `RichTextEditor3=AnUnformattedString`
- For the **Number** element, the **Element ID** shows the value after the element ID becomes the default element or input value. For example: `Number2=123.99`.
- For the **Date** and **Time** elements, the **Element ID** shows the value after the element ID becomes the default element or input value. For example:
 - `Date1=2021-06-10T00:00:00.000`
 - `Time0=2021-06-10T23:59:17.000`
- For the **Radio Button** and **Dropdown** elements, the **Element ID** shows the value after the element ID becomes the default element or input value. For example:
 - `RadioButtonGroup3=TheDefaultOption`
 - `Dropdown0=TheDefaultOption`
- For the **Check Box** element, the **Element ID** shows the value after the element ID becomes the default element or input value. For example: `CheckBoxGroup1_1=TheOption2`.

Delimiter: You can use the **&** symbol as a delimiter between parameters.

Password element behavior

You can use the **Password** element to add password fields to your forms to process in the web interface.

Element behavior

To use in the web interface, the **Password** element has the following specific behaviors:

- The value of the password field is encrypted when a user submits a form (initial form or as part of a **Form Task**).
- When another user accesses the same form after submission (read-only view of initial form or **Form Task**), they cannot view the password field because it is encrypted.
- Since the password field values are encrypted, you cannot use them in the **If/Else** condition of a process automation.
- Only the encrypted password field values are stored in the database; the decrypted values are not stored.
- When you pass the encrypted password field value through a credential variable input to a bot inside the process automation, the encrypted password field value is decrypted by the bot during deployment by using an instantaneous key from the credential vault. No other configuration is required.

When you create a form and use this password element, the element is similar to the **Text Box** element except that your text inputs in these fields are now masked.

The **Password** element contains these key form properties:

- **Element ID**
 - This field can be edited or overwritten by the user who created the form.
 - The field takes a unique default value (for example, the default value could be **password1**).

Note: The Bot Creator can reference this field for internal use.

- **Element label**
 - This field can be edited or overwritten by the user who created the form.
 - You can set a default label (for example, **Password**).
- You have the option to make password fields required or read only.

Example: Use Checkbox element in a form dynamically

You can use the **Checkbox** element in the form to select multiple options in a form during bot runtime.

You must:

- Have a Bot Creator license.
- Be assigned a custom role with create folder permission.

In this example, you create a process to register new employee details in the company database. The initial form contains basic information such as:

- Name
- ID
- Date of birth
- gender
- location

Additionally, the initial form has only two options (San Jose and Tokyo) for the location field. You will make the location field dynamic during the request creation to be able to add a new location (India) for those employees whose ID falls within the 100 to 200 range.

1. Log in to the Control Room as a Bot Creator user.
2. Create the initial form.

[Create a form](#) on page 3214.

 - a) On the left plane, select **Automation**.
 - b) Select **Create new > Form**.
 - c) Enter the form name as `employee_register_initial_form`.
 - d) Enter the folder location as `Bots\Employee Registration`.
To change where your form is stored, select **Choose** and follow the prompts.
 - e) Select **Create & edit**.
 - f) Add the following **Elements** and corresponding **Element label** in the form.

Element	Element label
TextBox	Full Name
Number	ID
Date	Date of Joining
Dropdown	Gender

For the **Dropdown** element, enter `Male, Female` in the **Enter list items separated by commas** field.

- g) Select **Save**.
 - h) Select **Close**.
3. Create a second form.
 - a) In the same folder location, select **Create new > Form**.
 - b) Enter the form name as `employee_location`.
 - c) Select **Create & edit**.
 - d) Drag the **Checkbox** element into the form.
 - e) Enter the name in the **Element label** field as `Employee location`.
 - f) Click the **plus** icon in the **Checkbox content** field and add the locations `San Jose` and `Tokyo`.
 - g) Select **Save**.
 - h) Select **Close**.

4. Create a new bot.
 - a) In the same folder location, select **Create new > Bot**.
 - b) Enter the bot name as `dynamic_checkbox`.
 - c) Select **Create & edit**.

5. Create the following variables:
 - `emp_id`: Number type; use as input
 - `emp_location`: List type, String subtype; use as output; click the **plus** and add two values `San Jose` and `Tokyo`
 - `emp_dyn_location`: String type, add the default value `India`

The default values are San Jose and Tokyo however if the employee ID falls between 100 and 200, then location India is selected.

6. Use the **If** action to configure the conditional statement.
 - a) Double-click or drag the **If** action.
 - b) Select **Number** from the **Condition** drop-down list.
 - c) In the **Source value** field, insert the variable `emp_id`.
 - d) Select **Greater Than (>)** as the **Operator**.
 - e) Enter 100 in the **Target value** field.
 - f) Click **Add condition** and select **And**.
 - g) Select **Number** from the **Condition** drop-down list.
 - h) In the **Source value** field, insert the variable `emp_id`.
 - i) Select **Less Than (<)** as the **Operator**.
 - j) Enter 200 in the **Target value** field.
 - k) Click **Save**.

7. Add the **List** package into the **If** container to insert the new location as per the defined condition.
 - a) Drag the **List > Add item** action.
 - b) In the **List variable** field, select the variable in which to add the list item `emp_location`.
 - c) In the **Item to be added** field, select the variable that contains the value to add `emp_dyn_location`.
 - d) Select **Save**.
 - e) Select **Close**.

8. Create a new process automation.
 - a) In the same folder location, select **Create new > Process**. See [Create a process automation in Process Composer](#) on page 3312.
 - b) Enter the process automation name as `employee_register`.
 - c) Select **Create & edit**.
 - d) Select **Start** to add an initial form to the process automation.

- e) In the **Select initial data form** field, browse and select the initial form: `employee_register_initial_form`.
 - f) Provide **Request title** as `Employee Registration`.
 - g) Drag the **Bot Task** into the `Process Composer` from the **Task** field.
 - h) In the **Bot Task** panel and **Element name** field, enter a name `Location`.
 - i) Enter the **Task name** as `Generate location`.
 - j) In the **Select Task Bot** field, browse and select the bot you created `dynamic_checkbox`.
 - k) In the **Input values** field, select the input variable `emp_id`.
 - l) Drag the **Form Task** into the `Process Composer` from the **Task** field.
 - m) In the **Form Task** panel and **Element name** field, enter a name `location_form`.
 - n) Enter the **Task name** `Employee location form`.
 - o) In the **Select form** field, browse and select the form you created `employee_location`.
 - p) Select **Add button**.
 - q) Specify `OK` for the **Button label** and `Primary` for the **Button style**.
 - r) Select the **Feed data into form** check box as `Employee Location[CheckBoxGroup0]`.
Set the two variables from the bot as output variables.
 - s) In the **List of options** field, select the output variable `Location.output[emp_location]`.
 - t) In the **Default value** field, select the output variable `Location.output[emp_dyn_location]`.
 - u) Select **Save**.
 - v) Select **Close**.
9. Deploy the process automation.
- a) Select **Run** to create a request for the process automation.
 - b) Enter the values for the initial form.
 - c) Select **Submit**.

The process automation deploys and if the employee ID falls between the values 100 to 200, then Employee location field will have a new option of India making this option dynamic. If the employee ID is not between the values 100 to 200, the Employee location field will have only two options, San Jose and Tokyo.

Supported variable types in Process Composer

The core part of any process automation in Process Composer is how data moves (flows) between each task. To run properly, tasks require variables.

Variable types

These variable types are supported in a process automation in Process Composer:

Input	Use this variable type to return values that went "in" a task.
Output	Use this variable type to return values that came "out" of a task.
Meta	Use this variable type to return high-level details about the request of a task.

Note: You can use hidden variables to conceal data. For details on how to configure hidden variables, see [Create hidden variables in a form](#) on page 3311.

Variable entities

The following entities can hold variables:

Global	Global values span across the tenant and all variable types, and use this form: <code>`\${variableName}`</code> .
Request	Requests hold meta-type variables only and use this form: <code>`\${meta variable name}`</code> . This meta-type variable value is from the request.
Task	Tasks can hold three types of variables (input, output, meta) and use these forms: <ul style="list-style-type: none"><code>`\${task}.<input output>[<variable name>]`</code>: This input or output variable value is read from the task.<code>`\${task}.<meta variable name>`</code>: This meta-type variable value is read from the task.

Date time variables

Name	Entity	Description
createdOn	Request, Task	Shows the date when the request or task was created. Example: \$createdOn\$ or \$Approval_Task.createdOn\$
updatedOn	Request, Task	Shows the date when the request or task was last updated. Example: \$updatedOn\$ or \$Approval_Task.updatedOn\$

Dictionary variables

Name	Entity	Description
assignedTo	Task	Shows information about the user who is assigned to the task. Dictionary key: {id}, {username}, {email} Example: \$Approval_Task.assignedTo\$
createdBy	Request	Shows information about the user who created the request. Dictionary key: {id}, {username}, {email} Example: \$createdBy\$

Number variables

Name	Entity	Description
executionCount	Task	Shows the number of times the task was run. Example: \$Name_Bot.executionCount\$
id	Request, Task	Shows the numerical ID of a request or task. Example: \$id\$ or \$Approval_Task.id\$
assignedTo{id}	Task	Shows the numerical ID of the user who is assigned to the task. Example: \$Approval_Task.assignedTo{id}\$

Name	Entity	Description
createdBy{id}	Request	Shows the numerical ID of the user who created the request. Example: %createdBy{id}\$

String variables

Name	Entity	Description
status	Task	Shows the label of the button clicked (action) for a form task or the bot return code for a bot task (equal to failed when the bot fails). Example: %Approval_Task.status\$ or \$Name_Bot.status\$
title	Request, Task	Shows the title of the request or task. Example: %title\$ or %Approval_Task.title\$
type	Request	Shows the task type (equal to BOT for bot tasks and FORM for form tasks). Example: %Task.type\$
assignedTo{username}	Task	Shows the username of the user who is assigned to the task. Example: \$Approval_Task.assignedTo{username}\$
createdBy{username}	Request	Shows the username of the user who created the request. Example: \$createdBy{username}\$
assignedTo{email}	Task	Shows the email of the user who is assigned to the task. Example: \$Approval_Task.assignedTo{email}\$
createdBy{email}	Request	Shows the email of the user who created the request. Example: \$createdBy{email}\$

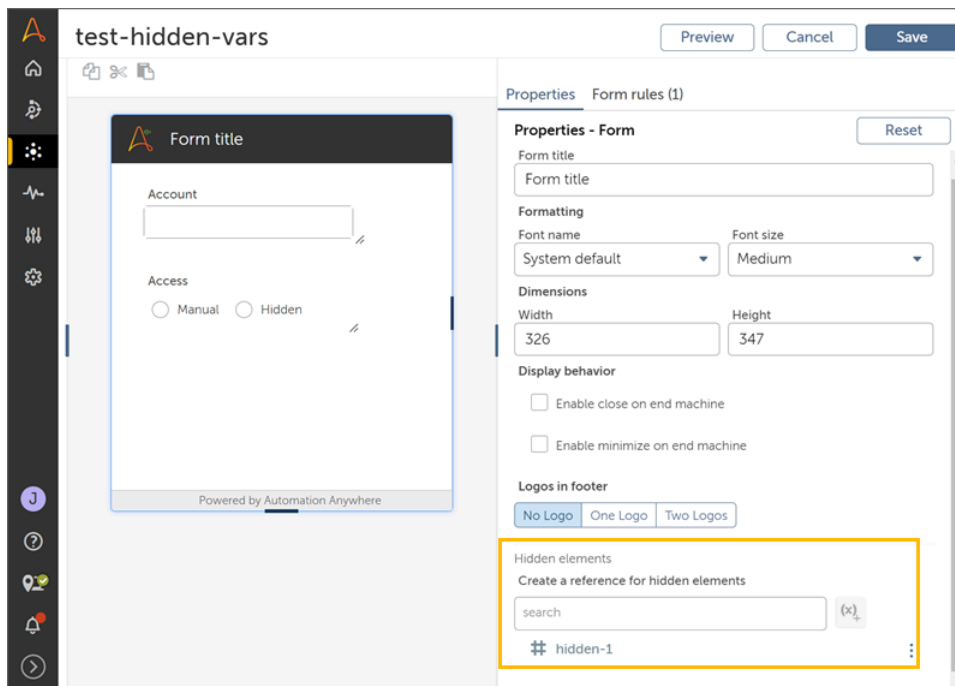

User-defined variable

Name	Entity	Description
Any	Task	Stores Boolean, Data table, Date time, File, Number, Record, String, or Window data types. Use this variable type when you are uncertain of the action data type.

Create hidden variables in a form

You can create hidden elements in a form to access hidden variables in a process automation in Process Composer.

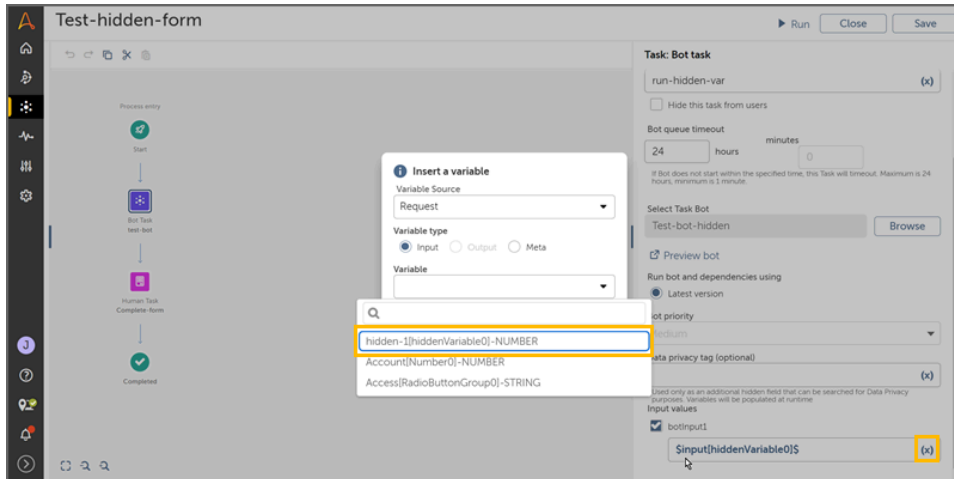

Hidden variables are supported in rules, all variable types, and If/Else conditions. To create a new hidden element (variable), select the **Properties - Form**. You define hidden elements (variables) in a form by selecting **Create a reference for hidden elements**. Enter data for the new hidden variable.

After you create the reference, you can access the hidden variables using the variable picker in the Process Composer.

Note: For URL inputs, use the label ID of the hidden variable name as the key for the URL input.

To enable task bots to use hidden variables, create an input variable when building the bot and assign the hidden element as the input for the variable in Process Composer.

Create a process automation in Process Composer

As a Bot Creator, you create and design process automations which consist of human and botbot tasks listed as elements in the Process Composer.

- You must have a Bot Creator license.
- You must be assigned a custom role with the create folder permission.

Note: Each task, logic condition, and end point supports the copy, paste, and cut elements from the Bot editor. Additionally, you can double-click to add and replace items on the canvas. See [Supported behaviors for tasks and elements in Process Composer](#) on page 3299.

1. Create a process automation:
 - a) From your local machine, log in to your Control Room as a Bot Creator.
 - b) From the left pane, click **Automation**, and then click **Create new > Process**.
 - c) In the **Create process** page, enter a name for the new process automation. By default, process automations are saved in the \Bots\ folder. Click **Browse** to change the default folder.
 - d) Click **Create & edit**.
 - e) Click the process automation name to rename it.
2. To add initial form and data to the process automation, click **Start**.
3. From the **Start** panel:
 - a) Browse and **Select initial data form**.
 - b) In the **Request title** field, enter text or insert a variable as an input variable. A dynamic title is created for this request that will display in the web interface and serve as a reference.

Note: You can use a Reference ID such as `ref ID = $RefId$`. Reference ID is a **Meta** variable type.

- c) In the **Task name** field, enter the name of the task.
You can use a Reference ID such as `task ref ID = $RefId$`.
 - d) In the **Data privacy tag** field (same as a PII [Personally Identifiable Information] tag), enter a text or variable to generate hidden custom output.
 - e) Click **Apply**.
4. [Add Bot Task to a process automation](#) on page 3314.
The Bot Task runs a bot with inputs and outputs.
 5. [Add Form Task to a process automation](#) on page 3315.
The Form Task displays a form that requires interactions by a user.
 6. You can add these optional elements to the process automation:
 - [Add API Task to a process automation](#) - Use the API Task to enable API calls for inputs and outputs.
 - [Add input variables to a process automation](#) on page 3318 - Use input variables to start a process without having to build a form as the point of entry for a process automation.
 - [Add Filter Task to a process automation](#) on page 3320 - Use the Filter Task to filter a variable based on your specific criteria.
 - [Add Process Task to a process automation](#) on page 3320 - Use the Process Task to run a process automation.
 - [Add Document Validation to a process automation](#) on page 3326 - Use the Document Validation Task to display a validator for a document that requires validations.
 - [Add Approval Task to a process automation](#) on page 3321 - Use the Approval Task to share requests with decision makers before the process is completed.
 7. You can add logical conditions to include internal and conditional branching of the process automation. Drag the condition from the **Elements** panel. You can select an **If/Else** pair or **Else if**.
 8. From the **Condition** panel, you can add these optional fields:
 - a) Add a description in the **Description** field.
 - b) Add a message in the **Display message** field. As a result, the display message you enter is shown in the request view page in the web interface.
 - c) Click **Add Condition** to add a condition.

You can select a condition from these available types: **Boolean**, **Datetime**, **Number**, or **String**.

d) Click **Apply**.

9. [Add End Point to a process automation](#) on page 3327.

You can add End Point to end a process automation with a selected status (such as: completed, failed, or canceled) or add Go to to navigate to other tasks in the process automation.

You have now configured your process automation!

10. To preview your bot or forms information in the Process Composer (**Edit process** page) in both your public and private workspace:

a) Click the vertical ellipsis next to the **Bot Task** or the **Form Task**.

b) Select either the **Preview bot** or **Preview form** option.

In the public workspace, these options display the **Bot name preview** or **Form name preview** page where you can quickly view a bot or form.

In the private workspace, these options display the **Edit Task Bot** or **Edit form** page where you can make changes to your Bot Task or form.

Related tasks

[Create your first bot](#) on page 1429

Perform the following steps to create your first bot that prints the message, `Go be great!`, the Automation Anywhere version of `Hello World!`

[Create a form](#) on page 3214

As a Bot Creator, you can create a form to provide interaction between humans and bots. You enter required data using any of the supported form elements that can be rendered in the web interface. Additionally, you can add or remove form actions when creating a process.

Related reference

[About the Automation Co-Pilot process in Document Automation](#) on page 3479

Document Automation uses Automation Co-Pilot for Business Users technology to manage the end-to-end document extraction process. When you create a learning instance in Document Automation, the system also creates an Automation Co-Pilot process. Review the following guide to understand the logic.

Add Bot Task to a process automation

As a Bot Creator, you can create a Bot Task to execute inside a process automation.

1. Add a **Bot Task** to the process automation by dragging the element from the **Element** panel.

2. From the **Bot Task** panel:

a) Enter a name in the **Element name** field.

b) Enter the task name in the **Task name** field.

The task display name appears in the web interface as a reference. You can use a Reference ID such as `ref ID = $RefId$`.

c) Optional: Select the **Hide this task after completion** check box.

After task completion, the user does not see the **Bot Task** in the web interface.

To display the hidden task, select the **View hidden tasks** check box in the tasks view page of the web interface.

- d) Browse and select the Task Bot in the **Select Task Bot** field.
- e) In the **Run bot and dependencies using** section, select a label version.

You can select **Latest version** (default) or **Production label**.

The bot deploys the version that you select.

- f) In the **Bot priority** section, you can review your bot priority level.

Note: The bot priority level is a read-only label that shows **Low**, **Medium**, or **High** depending on the priority level that was set for the bot.

Important: If the priority of a task bot was changed, you need to browse for the task bot again to reflect the correct priority status for an existing Process Composer process automation.

- g) Optional: In the **Data privacy tag** field, enter a text or variable to generate hidden custom output.

Select the **Input values** check box and specify a variable.

The variable input expected by the bot is mapped with the variable that will be populated when creating the request.

1. Select a task in the **Process task** field.
2. Select a type in the **Variable type** field. You can select **Input**, **Output**, or **Meta**. When you select the Use as input check box, the process automation passes data into the input variables, and when you select the Use as output check box, the process automation retrieves data from the output variables after the bot execution. See [Supported variable types in Process Composer](#) on page 3308.
3. Specify your variable in the **Variable** field.

Note: Reference ID is a **Meta** variable type.

4. Click **Apply**.

3. Click **Save**.

You have now configured the Bot Task in your process automation.

Add Form Task to a process automation

You can add a Form Task to configure the settings of a process automation.

1. Add the **Form Task** to the process automation by dragging the element from the **Element** panel.
2. From the **Form Task** panel, perform these steps:
 - a) Enter a name in the **Element name** field.
 - b) Enter the task name in the **Task name** field.

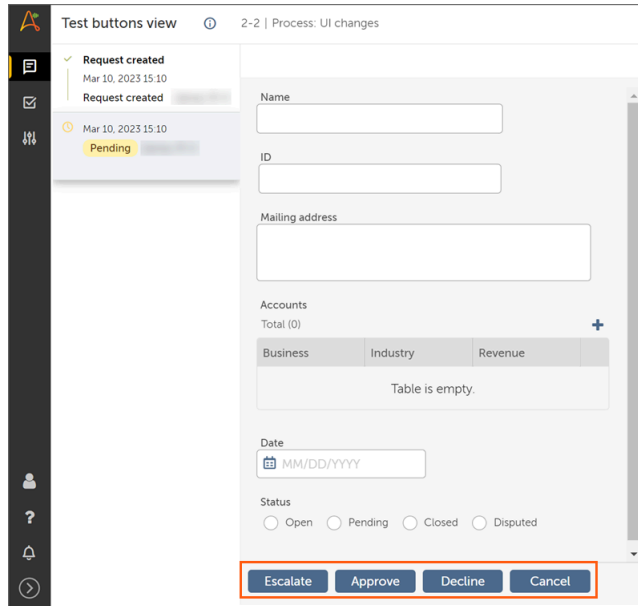

The task display name is displayed in the web interface as a reference. You can use a Reference ID such as `ref ID = $RefId$`.

- c)** Select the **Hide this task after completion** check box.
After task completion, the **Form Task** is not displayed to the user in the web interface.
To display the hidden task, select the **View hidden tasks** check box in the tasks view page of the web interface.
- d)** Select the **Make the form read-only** check box.
The **Form Task** does not require any input and moves automatically to the next task.
- e)** Select the **Assign this task to the user who created this request** check box.
The task is automatically assigned to the user creating this request in the web interface.
- f)** Select the **Auto-assign this task to** check box. You can select the following options from the drop-down:
 - **The user who created the request:** The task is automatically assigned to the user creating the request in the web interface.
 - **The user who opens this task:** The task is automatically assigned to the user who opens the task in the web interface.
- g)** In the **Task expiration time** field, select the time option.
You can select the following options: **No expiration** (default), **1 hour, 1 day, 1 week, 2 week, 30 days**, and **Custom**.

Note: If you choose the **Custom** option, you must specify the time by the number of days, hours, and minutes. The maximum is **45 days**, and the minimum is **1 minute**. Days range from 0 to 45 days, and hours range from 0 to 23 hours. For minutes, if the hours and days are set to **0**, minute range is 1 to 59 minutes. However, if the hours and days are not set to **0**, then the minute range is 0 to 59 minutes.

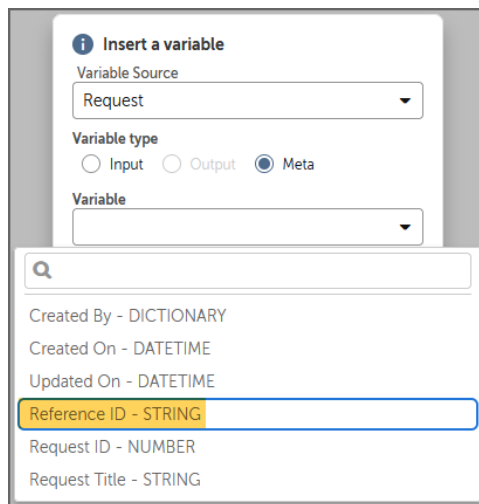

- h)** In the **Select form** field, browse and select the second form created.
This form displays the result.
- i)** In the **Data privacy tag** field, enter a text or variable to generate hidden custom output.
- j)** In the **Add form button** field, specify your button details.
 - Specify a name in the **Button label** field.
 - Select a style in the **Button style** field.
You can choose between **Primary, Secondary, or Cancel**.
 - Click **Add button** to add any additional buttons.

For example, these buttons display in the fixed footer of the form during the form task:

- k) Select the check box in the **Feed data into form** field.
1. Select a task in the **Process task** field.
 2. Select a type in the **Variable type** field.
You can choose **Input**, **Output**, or **Meta**.
 3. Specify your variable in the **Variable** field.

Note: Reference ID is a **Meta** variable type.

4. Click **Apply**.
3. Click **Save**.
You have now configured the Form Task in your Process Composer process automation.

Add input variables to a process automation

As a Pro developer, you can use input variables to start a new process automation without using a form.

Using input variables, you can start a process automation without having to build a form as the point of entry for a process. You define input variables directly within the process automation itself which is particularly useful if your process automation requires complex variable types such as a dictionary, table, or a list. For example, without any human intervention, you can easily and efficiently:

- Schedule a process automation to run overnight.
- Trigger a process automation by email.
- Launch a process automation from another system such as Salesforce or SAP.

Additionally, you can use input variables with the Create Request API and Create Request command package.

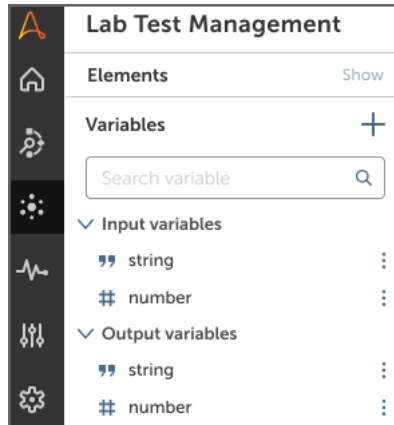

Create and add input variables to a new process automation

To create and add input variables to a new process automation:

1. From the panel on the left, click Show at the bottom to open the Variables panel.
2. From the Variables panel, click the plus (+) icon. The Create Variable dialog displays for you to create a new input variable.

Note: You cannot select an existing variable as an input variable; you must create a new one.

3. Enter the name of the new variable in the Name field.
4. Select your variable type from the Type drop-down. Click [Supported variable types in Process Composer](#) on page 3308 for more details.
5. Optional: Enter the variable description in the Description field.
6. Click Use as input.
7. Based on the variable type you selected, you might need to enter additional information to define the input variable.
8. Click Create. The input variable that you created displays in the Variables panel under the Input variables section. You can expand or collapse the lists of input and output variables.

Repeat steps 2 through 8 to create any additional input variables for your process automation.

Start a new process automation using input variables

After you have created the input variables, you can start a new process automation using the initial data provided by the input variables:

Note: You cannot add input variables when you start a process automation using initial data from a form. To create input variables, you must click Input variables as the Initial data selection.

1. From the Start panel on the right, click Input variables.
2. Click Run to run the process automation.

Note: If you start a process automation using initial data from an existing form and then change the form, all existing input variables will be overridden. This might cause validation errors due to invalid variables.

Edit or delete input variables

To edit or delete input variables after you create them:

1. From the Variables panel, click the action menu (vertical ellipsis) next to the variable you want to edit or delete.
2. Click Edit variable or Delete variable.
 - If you edit the variable, you can change the Description or Default value fields only. Click Apply to save the changes.
 - If you delete the variable, it is automatically removed from the Input variables list.
3. You can rerun or close the process automation with the updated variables.

Note: If you have attached a form, input variables are auto-generated based on the form fields. You cannot delete these variables, however you can edit the variable description only.

Add Filter Task to a process automation

You can add a Filter Task to apply a filter to a process automation variable in Process Composer.

1. Add the **Filter Task** option to the process automation by dragging the element from the **Task** panel. The filter task applies a filter to the process automation variable.
For example, you have a table as an output of a form, and your output has an **Approved** column that contains **Yes** or **No** data in the rows, the filter task will be able to retrieve only rows with **Yes** as an output of the filter task.
2. From the **Filter Task** panel:
 - a) Enter a name in the **Element name** field.
 - b) Enter the task name in the **Task display name** field.
The task display name displays in the web interface as a reference.
 - c) Optional: Select the **Hide this task** check box.
After task completion, the user does not see the **Filter Task** in the web interface.

To display the hidden task, select the **View hidden tasks** check box in the tasks view page of the web interface.
 - d) Enter a variable in the **Variable to be filtered** field.
 - e) In the **Filtered type** field, select an option.
For example, for a dictionary variable, the **Check each key/value pair in the dictionary** or **Check entire dictionary** options are available for you to select.
 - f) In the **Filter criterion** field, select a condition.
After you select a condition, specify the **Source variable**, **Operator**, and **Target value** fields.
3. Click **Save**.
You have now configured the Filter Task in your Process Composer process automation.

Add Process Task to a process automation

You can add a Process Task to configure the settings for a process automation.

1. Add the **Process Task** option to the process automation by dragging the element from the **Task** panel.
2. From the **Process Task** panel:
 - a) Enter a name in the **Element name** field.
 - b) Enter the task name in the **Task name** field.
The task display name appears in the web interface as a reference.
 - c) Optional: Select the **Hide this task from users** check box.
After task completion, the user does not see the **Process Task** in the web interface.

To display the hidden task, select the **View hidden tasks** check box in the tasks view page of the web interface.
 - d) Select either the **Public folder** or **Private folder** and browse and select the process.
 - e) In the **Data privacy tag** field, enter a text or variable to generate hidden custom output.

- f) Select the **Input values** check box and specify a variable.
 1. Select a task in the **Process task** field.
 2. Select a type in the **Variable type** field.

You can select **Input**, **Output**, or **Meta**.
 3. Specify your variable in the **Variable** field.

3. Click **Save**.

You have now configured the Process Task in your Process Composer process automation.

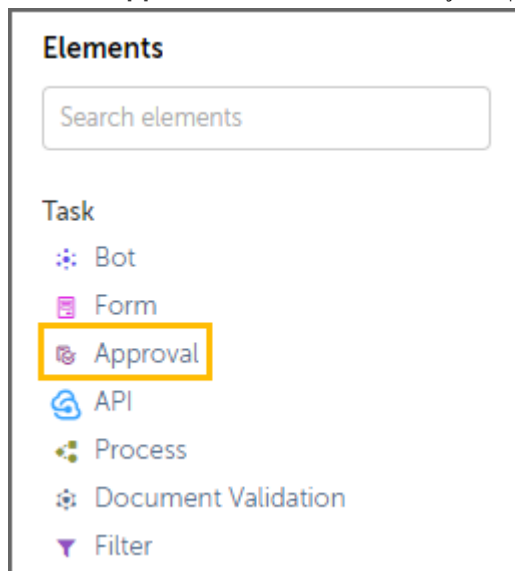

Add Approval Task to a process automation

You can configure an approval task to share requests with decision makers before the process automation is completed.

The need for approvals applies to many business tasks, like time-off and purchasing requests. The approval task can be used by developers to automate a process where users can submit and receive approvals, while staying notified of progress, without breaking concentration from streamlined work flow.

The developer will need a pre-built form for the approval task that can receive data from the process. This is labeled the **Approval content form** and is used to pass data to the responder approving the task.

1. From the Control Room, open an existing process automation or create a new process automation to launch the Process Composer.
2. Add the **Approval** task to the end of your process automation.

3. Select the **Approval** task element in your flow to open the configurations panel and enter the **Element name**.
4. Enter the **Task name**.
5. Select the users for the Task requester and assignment.

Task requester and assignment

Default Custom

Task requester Send

Task requester(s) will be able to see this task and its status from their "Requested" task list.

Request creator

The assigned group of the request
Assigned group is the user group responsible for a request. It is specified either by admin during process setup (default group) or by users or bots when initiating a request.

Specify user group

Role Team Variable

Docs team testing X Choose

Assign this task to Receive

Request creator

The assigned group of the request
Assigned group is the user group responsible for a request. It is specified either by admin during process setup (default group) or by users or bots when initiating a request.

Specify user group

Role Team Variable

Co-Pilot Business users X Choose

Note: The **task requester** represents the user group (role, team, individual user) that sends the task for response. **Assign** the task to the user group that receives the request and responds. See, [Route users to an approval task](#) on page 3323.

Default will send approval requests to default users set by the admin. When you select **Custom**, you can enable these options to the **Specify user group** for the approval.

- **Role:** Select a pre-built Custom role to add users that have the selected role assigned. [Create a role](#) on page 1687
- **Team:** Select the pre-built Team to add users in the selected Team. [Assign members to a team](#) on page 3156
- **Variable:** Select a pre-built Global value to add users from that user group to the configuration. [Create a global value](#) on page 2261

6. Enter the **Number of approvals** you want required for this task to complete.
7. Select your pre-built **Approval content form**.
8. Select the **Action buttons** for the responder to approve and decline the task.
9. Select each box and enter the inputs to **Feed data into form**.
10. **Save** the process automation.

Route users to an approval task

For appropriate users to run, approve, and contribute to an approval task, it is important to use the labels recognized by the Process Composer.

In the **Process Composer > Approval task**, configurations for users are recognized as assigned, requested, and contributors of the task during run time for multiple-user collaboration.

The following table of information can be used to configure and assist decisions when routing the approval to roles and teams. The User column displays the label recognized in the process configuration. The Details column describes the parameters for that configuration.

User	Details
Request Creator	<p>When the request is created using the interface (AARI Web or Automation Co-Pilot) the user who created the request.</p> <ul style="list-style-type: none"> Request Creator is required to be part of the Assigned Group. <p>When request is created by other means (API, Create Request command, CoE approval use case, etc.)</p> <ul style="list-style-type: none"> Request Creator is not required to be part of the Assigned Group and only needs the execute permission.
Request Assigned Group	<p>The role or team where the request is created.</p> <p>= <code>createdByTeam</code></p> <p>Example: Request POC-2 from Process (POC) created under Team 202.</p> <ul style="list-style-type: none"> Team 202 is the Request Assigned Group. This group has read access to the request created in their workspace.
Task Assigner	<p>The role or team that needs to respond to the task (Received).</p> <p>Example: Form Task from a request is assigned to Role 301.</p> <ul style="list-style-type: none"> Role 301 is the Task Assigner. Users from Role 301 can see the task in the Assigned tab.
Task Requester	<p>The role, team or user (request creator) that requests the task to response (Sent).</p> <p>Example: Form Task from a request is requested by Team 403.</p> <ul style="list-style-type: none"> Team 403 is the Task Requestor. Users from Team 403 can see the task in the Requested tab.

User	Details
Contributor	<p>Users who contributed (or are contributing) to the Task.</p> <ul style="list-style-type: none"> Form and Document Validation Task (Contributor is populated before submit) <ul style="list-style-type: none"> When status is <code>Pending</code>, Contributor is the user assigned or locked to the task. <div style="background-color: #f0f0f0; padding: 2px; margin: 5px 0;"><code>=assigneeID</code></div> or <div style="background-color: #f0f0f0; padding: 2px; margin: 5px 0;"><code>lockedBy</code></div> When is <code>Completed</code>, Contributor is the user who submitted the task <div style="background-color: #f0f0f0; padding: 2px; margin: 5px 0;"><code>=submittedBy</code></div> Approval Task (Contributor is populated after submit) <ul style="list-style-type: none"> When status is <code>Waiting Approval (0/2)</code>, Contributor is empty When status is <code>Waiting Approval (1/2)</code>, Contributor is the userID of user that approved the task. When status is <code>Approved</code>, Contributor is the array of all users who approved the request. <div style="background-color: #f0f0f0; padding: 2px; margin: 5px 0;"><code>=approvedBy</code></div> When status is <code>Declined</code>, Contributor is the user who declined the request. <div style="background-color: #f0f0f0; padding: 2px; margin: 5px 0;"><code>=declinedBy</code></div>

Visibility and actions of an Approval task

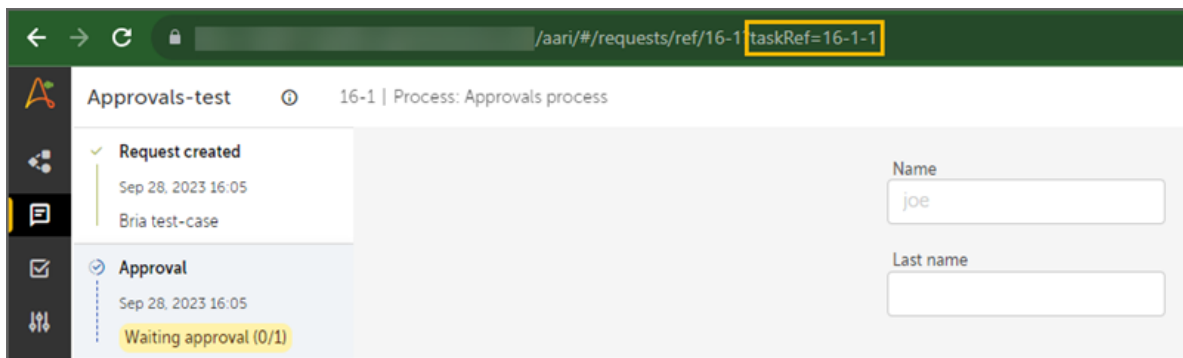

Task sequence:

- Any user who is part of the Responder Group can see the task as it progresses through the sequence.
- Tasks, other than the current Approval Task, are not visible to the Responder Group.

Possible actions for the task:

- Comments history
 - Displays a history of the Approval or Reject comments
- Approve
 - Submits the task with an **Approve** status
 - Adds a comment when submitting an approval
- Reject
 - Submits the task with a **Reject** status
 - Adds a comment when submitting a rejection notice

In cases where users want to notify someone of a specific task, the task reference ID can be found in the URL of an active task.

Add Document Validation to a process automation

You can add a Document Validation Task to configure the settings of a process automation.

1. Add the **Document Validation Task** option to the process automation by dragging the element from the **Task** panel.
2. From the **Document Validation Task** panel:
 - a) Enter a name in the **Element name** field.
 - b) Enter the task name in the **Task name** field.
The task name appears in the web interface as a reference.
 - c) Optional: Select the **Hide this task from users** check box.
After task completion, the user does not see the **Document Validation Task** in the web interface.

To display the hidden task, select the **View hidden tasks** check box in the tasks view page of the web interface.
 - d) Optional: Select the **Auto-assign this task to** check box. You can select the following options from the drop-down:
 - **The user who created the request:** The task is automatically assigned to the user creating the request in the web interface.
 - **The user who opens this task:** The task is automatically assigned to the user who opens the task in the web interface.

- e) Specify the ID in the **Document ID** field.
- f) Optional: In the **Data privacy tag** field, enter a text or variable to generate hidden custom output.
Select the **Input values** check box and specify a variable.
 1. Select a task in the **Process task** field.
 2. Select a type in the **Variable type** field.
You can select **Input**, **Output**, or **Meta**.
 3. Specify your variable in the **Variable** field.

3. Click **Save**.

You have now configured the Document Validation Task in your Process Composer process automation.

Add End Point to a process automation

You can add End Point to close your Process Composer process automation or add Go to to navigate to other tasks in the process automation.

You can add the **End point** by dragging the **End process** or **Go to** from the **End point** panel to your process automation.

- From the **End point: End process** panel:
 - a) Select the type in the **End process status** field.
You can select between **Completed**, **Failed**, or **Cancelled**.
 - b) Optional: Specify a name in the **Update request title** field.
 - c) Optional: Add a message in the **Display message** field.
The display message you enter is shown in the last step of your task in the request view.
 - d) Click **Apply**.
 - e) Click **Save** to save the process automation.
- From the **End point: Go to** panel:
 - a) In the **Select target task** option, specify the task by choosing **Bot Task** or **Form Task**.
 - b) Select the **Override the task assignment setting** check box and from the drop-down, and then select either **Unassign the task** or **Assign the task to the user who created the request**.
Depending on your choice, the task is unassigned or the user creating the request can automatically view the task assigned to them in the web interface.
 - c) Click **Save** to save the process automation.

Example: Upload and view PDF file

This example describes how to use forms to upload and view a PDF file.

You must have the following:

- A Bot Creator license assigned with a custom role that has the create folder permission.
- Access to the Automation Workspace.
- A system-created **AAE_Robotic_Interface User** role with the AARI user license for the AARI User.
- Access to the web interface.

Create two forms and a process automation.

1. Log in to the Automation Workspace as a Bot Creator.
2. Create your first form. See [Create a form with the Select File element](#) on page 3328.
3. Create your second form. See [Create a form with the Document element](#) on page 3329.
4. Create a process automation with data from the two forms. See [Create a process automation to view files](#) on page 3329.
5. Run your process automation. Click **Run** in Process Composer.
6. The initial form opens in a separate tab for you to interact. Click **browse** to select a file.
7. Navigate to the file path in your local machine and select a PDF file.

Important: File size is limited to 50 MB.

8. Click **Open** to open the PDF file in your form.
9. Click **Submit**.
10. Click **Done** to confirm the file upload.

The PDF file is successfully uploaded.

Create a form with the Select File element

You can create a form by using the **Select File** element to select files.

1. Continuing with this example, create the first of two new forms and name it **Select File Form**.
2. Drag and drop the **Select File** element into your form designer from the **Elements** column. The **Properties - Select File** dialog displays with relevant fields.
3. Enter **Upload a file** as the label in the **Element label** field.
4. Specify **PDF** as the file format in the **Enter supported file formats separated by commas** field.
5. Click **Save** to save your form session.
6. Click **Close** to close the current form dialog.
7. Click [Create a form with the Document element](#) on page 3329 to continue the example.

Create a form with the Document element

You can create a form using the **Document** element to select files.

1. Continuing with the example, create the second of two forms and name it **Document Viewer Form**.
2. Drag and drop the **Document** element into your form designer from the **Elements** column. The **Properties - Form** dialog displays with relevant fields.
3. Optional: Modify your document dimensions or keep the system default settings.
4. Click **Save** to save your form session.
5. Click **Close** to close the current form dialog.
6. To continue the example, click [Create a process automation to view files](#) on page 3329.

Create a process automation to view files

Create a new process automation to the files.

1. Create a new process automation and name it **View a File Process**. Use Process Composer to design the new process automation.
2. Click the **Start** node (green icon) to add the first node as the entry to your process automation. The **Start** dialog displays with relevant fields.
3. Click the **Browse** option in the **Select initial data** field to search for a form.
4. Click the **Browse** tab in the **Find a form** dialog.
5. Select the **Select File Form** form that you previously created as the first form.
6. Click **Choose** to confirm.
7. Enter **Select File** as the title in **Request title** field. Leave the rest of the entries as is.
8. Click **Save**.
9. Drag and drop the **Form Task** from the **Task** column to your process automation. The **Task: Form Task** dialog displays.
10. Enter **File** as the element name in the **Element name** field.
11. Click the **Browse** option in the **Select form** field to search for a form.
12. Click the **Browse** tab in the **Find a form** dialog.
13. Select the **Document Viewer Form** form that you had previously created as the second form.
14. Click **Choose** to confirm.
15. Specify your button details in the **Add form button** field.
You can specify **Upload** as the **Button label** and keep the **Primary** setting as the **Button style**.
16. Select the **Document[Document0]** option in the **Feed data into form** field. This displays as a check mark your selected option.
17. Click **Insert a variable** in the blank field.
 - a) Select **Request** as your variable source.
 - b) Select **Input** as your variable type.
 - c) Select **Upload a file[File0]-File** as your variable type. This option should automatically be defined for you to select.
 - d) Click **Add** to add and confirm your variable.

18. Click **Save** to save your session.

Example: Use Select File element to upload and download files

This example describes how to use the **Select File** element to upload or download files that are passed in the initial forms in the web interface.

You must have:

- A Bot Creator license with a custom role assigned that has the create folder permission.
- Access to the Automation Workspace.
- A system-created **AAE_Robotic_Interface User** role with the AARI user license for the AARI User.
- Access to the web interface.

1. Log in to the Automation Workspace as a Bot Creator.
2. Create a form where the file can be accessed. See [Create a form to view documents](#) on page 3330.
3. Create a bot that can call and store the input file. See [Create a bot with Get Storage file action](#) on page 3331.
4. Create a process that allows users to run the bot and access the file. See [Create a process automation to select a file input](#) on page 3331.
5. Run the process and access the file. See [View uploaded file](#) on page 3332.

Create a form to view documents

Create a form to upload files and view documents.

1. Create the first of two new forms and name it **File Form**. The new form dialog displays for you to design your form.
2. Drag and drop the **Select File** element into your form designer from the **Elements** column. The **Properties - Select File** dialog displays with relevant fields.
3. Enter **Select a file (PDF)** as the label in the **Element label** field.
4. Specify **PDF** as the supported file format in the **Enter supported file formats separated by commas** field.
5. Click **Save** and close the current dialog.
6. Create the second form and name it **View Document Form**.
7. Drag and drop the **Document** element into your form designer from the **Elements** column. Optionally, you can use the **Image** element instead of the **Document** element to add an image to your form.

Note: The **Document** and **Image** elements provide the same functionality but use different file formats. The file size should not exceed 150 kb (similar to a logo image) and the supported file types are: PNG, JPG, JPEG, and GIF.

8. Optional: You can specify the window formatting and dimensions in the **Properties - Document** window.
9. Click **Save** and close the current window.

You have now successfully created a form with the **Select File** and **Document** elements.

To continue this example and create a bot, see [Create a bot with Get Storage file action](#) on page 3331.

Create a bot with Get Storage file action

This procedure describes how to build a bot using the **Get Storage file** action in Process Composer.

1. Create a new bot and name it **Bot File**. The new botwindow displays for you to create a bot.
2. Select the plus (+) icon in the **Variables** field. The **Create variable** window displays.
3. Select **File** in the drop-down menu in the **Type** field.
4. Enter **FileVar** as the variable name in the **Name** field.
5. Select **Use as input** only.
6. Click **Create**.
7. Drag the **Get Storage file** action from the **Process Composer** package. The **Process Composer: Get Storage file** window displays.
8. Select **Variable**.
9. Select the **FileVar** that you had previously created.
10. Specify the path in the **Full path of file in local device to be saved to** field.

Important: The full path of the file includes the name of the file, for example: `C:\aari\output\filename.pdf`.

11. Click **Save**.

You have successfully created a bot with the **Get Storage file** action.

To continue the example and create a process, see [Create a process automation to select a file input](#) on page 3331.

Create a process automation to select a file input

This procedure describes how to create a process automaton to select a file input.

This process automation uses the elements that you previously created in the example:

- [Create a form to view documents](#) on page 3330
- [Create a bot with Get Storage file action](#) on page 3331

1. Create a new process automation and name it **Process To Download File** in Process Composer.
2. Click **Process entry**. The **Start** window displays.
3. Click **Browse** in the **Select initial data form** field.
4. Set the initial form as **File Form** that you had created.
5. Enter the request title and task name.
6. Click **Save** and close the current window.
7. Drag and drop the **Bot Task** into your process automation from the **Elements** panel. The **Task: Bot Task** window displays.
8. Enter your element and task name in the **Element name** and **Task name** fields.

9. Click **Browse** in the **Select bot** field and set this as the **Bot File** that you previously created.
10. Set your input value as **Download**.
11. Select the **FileVar** that you had previously created, and set the variable as the document you uploaded as the variable.
12. Click **Save** and close the current window.
13. Drag and drop the **Form Task** into your process automation from the **Element** panel. The **Task: Form Task** window displays.
14. Enter your element and task name in the **Element name** and **Task name** fields.
15. In the **Select Form** field, select the **View Document Form** that you previously created.
16. Click the **Add button** option.
17. Specify your button labels and style using the **Button label** and **Button style** fields.
18. Select **Document** in the **Feed data into form** field. Alternatively, you can select **Image** if you had used the **Image** element instead.
19. Enter the file variable to feed into the form.
20. Click **Save** and close the current window.

You have successfully created a process automation to view files.
To continue the example and upload a file, see [View uploaded file](#) on page 3332.

View uploaded file

Run your process automation and upload a file to view.

The following video shows a sample process automaton:

1. Click **Run** to run your process automation from Process Composer.

The initial form window for the **Process To Download File** process automation displays with the **Select a file (PDF)** option for you to upload a file.
 2. Click **browse** to select a PDF file in the initial form. You have uploaded your file to the initial form.
-
- Important:** File size is limited to 50 MB.
-
3. Click **Submit**. The request view page displays and the tasks are running. One of the process automation steps will display a preview of the file that was uploaded.
 4. Click **Done** to confirm. The PDF file is downloaded to the local machine at the file path you set.
 5. Navigate to folder on your local machine (for example: C:\aari\output) where you had specified the file path. The downloaded file should now display in the folder location.
 6. Click the PDF file to view your file. You have successfully uploaded and viewed the file.

Cloud storage usage

This topic describes the cloud storage usage details based on the file size that you upload.

Cloud storage usage details

You can use the **Select File** element to upload files that are stored on the cloud. However to store these files on the cloud, the files must meet the following specific requirements:

Cloud storage quota

The files uploaded by users are based on the maximum file and storage sizes. The cloud storage quota consists of the following:

- The file size for when a user uploads a file using the **Select File** element cannot be greater than 50 MB.

Important: The file limit is attached to a **Select File** element only; not to a request. Additionally, you can upload only one file for each **Select File** element. However, there is no limit to the number of **Select File** elements that you can add to a form.

- The cloud storage can store a maximum of 250 MB of data per tenant.

Note: This is set by default. The storage limit is per tenant and not per user.

- The storage for each tenant is extended to an additional 1 GB for every AARI user license that is allocated in the tenant.

Important: These storage restrictions are applied only to the process automation when used in Automation Co-Pilot use cases. However, there are no storage capacity restrictions for Automation Co-Pilot Desktop Assistant storage and use cases.

Retention Policy

The retention policy for files that are uploaded to the cloud storage is as follows:

File will be deleted 90 days after the time of the file upload.

When a request is deleted, the request and the associated file are permanently deleted and not just sent to the recycle bin.

Note: This is supported for requests which have only one associated file, not multiple files.

Manage process automations in Process Composer

Depending on the business requirements, a Bot Creator can perform other tasks to manage a process automation in Process Composer.

After a process automation has been created in Process Composer, a Bot Creator can perform the following tasks:

- Test and [Run a process automation](#) on page 3335: Before you check in a process automation, you can test the process automation by running it in a private or public workspace using the Run option in the Process Composer. The bots in the process automation running in a private

workspace execute from the default device of the Bot Creator. When a Bot Creator executes the process automation, they can create a request, enter data in the initial form, and then run their request from the private workspace.

- Requests created from the process automation executed in a private workspace can be viewed only by the Bot Creator user who created the request.
- Requests created from the process automation executed in a public workspace can be viewed by the Automation Co-Pilot Admin. Managers and users can view the requests only if they have access to the process automation.
- [Check in a process automation](#) on page 3334: To make a process automation available to other users, you can check in a process automation from a private workspace to a public workspace.
- [Check out a process automation](#) on page 3335: If there is a change in a business requirement, you can check out the process automation from a public workspace to your own private workspace and make changes to the process automation.
- Access a process automation from one Control Room to another by either importing or exporting the process automation:
 - For example, if you developed a process automation and tested it in the staging area and it is now ready for production, you can [Export a process automation](#) on page 3339 from the staging area.
 - Similarly, you can import the exported process automation into the production area. See [Import a process automation](#) on page 3336.
- [Delete a process automation](#) on page 3340: If a business requirement becomes redundant, you can delete the process automation.
- After creating a process automation, you can create an output variable to [Display child process automation output](#) on page 3340 in the parent process automation. The end process can then call the output variable.

Check in a process automation

Bot Creators can check in a process automation from the private workspace to the public workspace to make it available for other users.

- You must have a Bot Creator license.
- You must be assigned a custom role with the following permissions:
 - Required: Check-in and check-out permission
 - Optional: Create folder permission
 - Optional: View packages permission
- To check in a process automation with dependent folders and files, ensure you have the following:
 - Create folder permission.

If you are checking in a process automation from your private workspace and if the folder containing the process automation does not yet exist in the public workspace, then you must have the create folder permission to successfully check in the process automation.
 - Check-in permission on the dependency folder.

Important: If a bot is checked out, edited, and then checked in again, the changes to the bot are reflected immediately. Whereas, if you follow the same procedure for forms, the

changes to forms are only reflected when the entire process automation is checked in again.

1. Log in to the Control Room as a Bot Creator user.
2. On the left pane, click **Automation**.
A list of available and forms is displayed.
3. Select the process automation you want to check in, open the actions menu (vertical ellipsis), and click **Check in process**.
4. In the **Check in Process** dialog, add your comment and click **Check in**.
The process automation displays in the same folder structure in the public workspace.

Check out a process automation

Bot Creators can check out a process automation from the public workspace to create an editable copy of the process automation.

- Ensure you have the Bot Creator license to check out a process automation to your private workspace.
- To check out a process automation with dependent folders and files, you must have the following:
 - Create folder permission
 - Check-out permission on the dependency folder

1. Log in to the Control Room as a Bot Creator user.
2. In the public workspace, click **Bots > My bots**.
The **My bots** page is displayed with the list of folders or files containing the process automations.
3. Select the process automation, open the actions menu (vertical ellipsis), and click **Check out process**.
The process automation appears in the same folder structure in the private workspace.

Run a process automation

In the Control Room, as a Bot Creator, you can run a process automation from the **Process Composer** in the private workspace.

Best practices:

- When the process automation is executed in the private workspace, the Bot Creator can create a request and enter data in the initial form.

In the private workspace, the bots are executed on the default device of the Bot Creator.
- Requests created from the private workspace can be viewed only by the user creating the request.

The AARI Admin cannot view the process automations executed from the private workspace in the process management page.

- When process automation 1 (parent) calls process automation 2 (child), two requests are generated:
 - Request started by the parent process automation to the child process automation shows the status as pending.
 - Second request started by the child process automation requires the user to complete the first request to proceed.

User must first complete the 2nd request (child process automation) so the callback goes to process automation 1 (parent). The user can then continue with process automation 1 to complete the task.

1. Log in to the Control Room as a Bot Creator user.
2. On the left pane, click **Automation**.
A list of available and forms is displayed.
3. Click the process automation name.
4. When the process automation opens in the Process Composer, click **Run**.
A dialog opens prompting you with the initial form.

Import a process automation

As a Bot Creator, you can import a process automation from one Control Room to another.

- To import process automations, ensure that you have the following permissions:
 - Import process permission
 - Create folder permission (if required)
 - Check-in permission
 - Manage package permission
- The process automation directory path is case-sensitive. As a result, ensure that the export and import paths use the same case in the Control Room to avoid any process automation execution failure.

In this task, the required process automation is already exported and an email is received with a link to the zip file containing the package to import.

Any previously exported process automation is located in the public repository. It must be imported and checked in so that it can be deployed from the new Control Room.

The imported process automation will be available in the public repository.

1. On the left pane, click **Automation**.
A list of available and forms is displayed.
2. Click **Import bot**, browse, and then select the process automation to import.

Note: This option applies to both bots and processes.

3. Select the option to import a process automation into the private or public workspace.
4. Set the option for importing the process automation based on whether a previous version of the process automation resides in the destination location.

During the import, if a file already exists, you can skip the process during import or overwrite the existing process and file.

5. Click the **Import bot** icon.
6. Click **Check in**.
On completion, the imported process automation is placed in the public repository and is ready to deploy from the new Control Room.

Import process automation dependencies

When you import a process automation, you might encounter some issues where the import might not work as intended. This topic describes scenarios on how to successfully import a process automation.

Import process automation scenarios

For these scenarios, a **Parent** process automation has dependencies with a **Child** process automation and a **Test** form, and needs to import from **Environment A** to **Environment B**. The goal is to successfully import from **Environment A** to **Environment B**.

Scenario parameters

- **Parent** process automation uses the **Child** process automation and both use the **Test** form in **Environment A**.
- The export **Child-only** zip file contains the **Child** process automation and the **Test** form.

Note: You have to manually export the proper files.

- The export **Parent-only** zip file contains the **Parent** process automation and the **Test** form.
- The export **Parent-and-Child** zip file contains the **Parent** process automation, the **Child** process automation, and the **Test** form.

Scenario A (Best case)

1. **Environment B** has no files.
2. Import **Child-only** zip file into **Environment B**. The files of **Child** process automation and **Test** form will now exist in the repository.

Automation Co-Pilot receives a bulk import event of **Child** process automation and **Test** form files, and a new process automation called **Child Process** is successfully created.

3. Import **Parent-only** zip file into **Environment B**. The files of **Parent** process automation and **Test** form will now exist in the repository.

Automation Co-Pilot receives a bulk import event of **Parent** process automation and **Test** form files. Because **Child Process** exists in Automation Co-Pilot, the **Parent Process** is successfully created.

4. Your import is successful because the **Child Process** and **Parent Process** are created in Automation Co-Pilot.

In this scenario, the import from **Environment A** to **Environment B** was successful because the **Child-only** zip file was imported before the **Parent-only** zip file, therefore the **Child Process** and **Parent Process** were successfully created in Automation Co-Pilot.

This is the best case scenario for a successful import.

Scenario B (Conditional case)

1. **Environment B** has no files.
2. Import **Parent-only** zip file into **Environment B**. The files of **Parent** process automation and **Test** form will now exist in the repository.

Automation Co-Pilot receives a bulk import event of **Parent** process automation and **Test** form files. Because **Child Process** does not exist, this failed to create a **Parent Process**.

3. Import **Child-only** zip file into **Environment B**. The files of **Child** process automation and **Test** form will now exist in the repository.

Automation Co-Pilot receives a bulk import event of **Child** process automation and **Test** form files. A new process called **Child Process** is successfully created.

4. Import **Parent-only** zip file again with **Overwrite existing files into** option selected to **Environment B**. The files of **Parent** process automation and **Test** form will be overwritten in the repository.

Automation Co-Pilot receives a bulk import event of **Parent** process automation and **Test** form files. Because **Child Process** now exists in Automation Co-Pilot, **Parent Process** is now successfully created.

Important: If the **Overwrite existing files into** is not selected, then no bulk import event is generated because files of **Parent** process automation and **Test** form already exist in repository. Therefore, **Parent Process** cannot be created in Automation Co-Pilot.

5. Your import is successful because the **Child Process** and **Parent Process** are created in Automation Co-Pilot.

In this scenario, the import from **Environment A** to **Environment B** can fail if the **Parent-only** zip file was imported before the **Child-only** zip file. Since the **Parent Process** can only be created if the required dependencies from the **Child Process** exist, and the **Child Process** did not exist in the repository, then the **Parent Process** could not be created.

As a workaround to successfully create the **Parent Process**, you can import the **Parent-only** zip file again by selecting the **Overwrite existing files into** option to overwrite the existing repository (only after the **Child Process** was created). This workaround succeeds conditionally only if you selected the **Overwrite existing files into** option. If you did not select this option, then the **Parent Process** cannot be created.

To avoid this issue, you should use Scenario A for a successful import experience.

Scenario C (Worst case)

1. **Environment B** has no files.
2. Import **Parent-and-Child** zip file into **Environment B**. The files that contain the **Parent** process automation, **Child** process automation, and **Test** form will now exist in the repository.

Automation Co-Pilot receives a bulk import event of the **Parent** process automation, **Child** process automation, and **Test** form files. However, because the **Parent** process automation and **Child** process automation relations are not known from the bulk import event, the **Parent** process automation might be processed first. Since the **Child Process** does not exist, then this failed to create a **Parent Process**.

3. Your import failed because the **Child Process** and **Parent Process** were not created in Automation Co-Pilot.

In this scenario, the import from **Environment A** to **Environment B** failed because the **Parent-and-Child** zip file was imported. The bulk import event does not understand the relation between the **Parent** process automation and the **Child** process automation, and might process the **Parent** process automation before the **Child** process automation. As a result, the **Parent Process** cannot be created because the **Child Process** does not exist; therefore, no new process automation is created in Automation Co-Pilot.

To avoid this issue, you should use Scenario A for a successful import experience.

Export a process automation

As a Bot Creator, you can export a process automation from one Control Room to another.

- Only process automations within the public workspace can be exported. To export a process automation, check the process automation into the public workspace.
- Ensure that you have the correct role and permissions to export the process automation, including the **View package** permission.
- To receive the link to the exported package through email, enable SMTP. See [Email server settings](#) on page 2442.
- To export the process automation from one Control Room to another, both Control Rooms must be the same version.

The Control Room maintains a maximum of 10 GB of historical export files in the download directory. To maintain this threshold, files are deleted on a first-in/first-out basis.

1. On the left pane, click **Automation**.
A list of available and forms is displayed.
2. Click the **Export bot**, browse the public directory, and then select the process automation to export.

Note: This option applies to both bots and process automations.

The selected process automation and the required dependencies are displayed.

3. Click **Next**.
The process automation and its dependencies are ready for export and displayed in the **Review Dependencies** window.
4. Click **Next**.
All related packages are displayed.
5. Select the necessary packages associated with the process automation to export.
You can select **Exclude process packages** to remove all packages from the export.
6. Click **Export bots and files**.
If you have configured SMTP, an email is sent containing a link to the zip file of the exported package.
If you have not configured SMTP, perform the following steps to access the link to the zip file of the exported package:
 - a) Navigate to **Activity > Historical**.
 - b) Search and view the historical activity of the exported package.
 - c) Click **Download exported zip file**.

A link to download the zip file is displayed.

7. Use the link to download the zip file and save it to a location for importing it to another Control Room.

Import the process automation to another Control Room.

Delete a process automation

As an AARI Admin or a user with **Delete from Public** permission, you can delete a process automation from the public workspace.

When deleting a process automation, consider the following:

- You can delete process automations that have open requests.

After a process automation is deleted, you cannot access the process automation even if the requests still exist. The scheduled bots can still be executed, but the forms cannot be submitted. If you republish the same process automation, the old requests can be restored and team permissions can be created again.

- You cannot delete checked-out process automations.

1. Log in to the Control Room as an AARI Admin or a Bot Creator user.

2. On the left pane, click **Automation**.
A list of available and forms is displayed.

3. Select the process automation you want to delete, open the actions menu (vertical ellipsis), and click **Delete process**.

You must first delete the process automation before you can delete the bots or forms within the process automation.

4. Select **Yes, delete** to confirm.

When the process automation is deleted from the public workspace, it is removed from the process management page in the web interface. Additionally, if the process automation is already assigned to any AARI User or team, access is removed after the process automation is deleted from the public workspace.

Display child process automation output

Bot Creators can create an output variable to display the output of a child process automation in the parent process automation.

After a Bot Creator has created a process automation in Process Composer, they can create an output variable that can be used in the end process.

- To create an output variable:
 - a) Navigate to the **Output variables** section.
 - b) Click **Show**.
 - c) Click the plus (+) icon.
The **Create variable** dialog displays.
 - d) Enter the name of the variable in the **Name** field (for example, **output**).

- e) Select your variable type in the **Type** field (for example, **String**).
 - f) Optional: Enter the variable information in the **Description** field.
 - g) Optional: Enter a default variable in the **Default value** field.
You need to insert a variable:
 - a) Select a source in the **Variable source** field (for example, **botTask**).
 - b) Select **Output** as a **Variable type** option.
 - c) Select a variable in the **Variable** field (for example, **output**).
 - d) Click **Yes, insert** to confirm your changes.
 - h) Click **Create**.
You have now created a new output variable! This output variable is now included in the **User-defined** variables in the **Output variables** section.
- To edit or delete an existing output variable:
 - a) Navigate to the **Output variables** section.
 - b) Select the three dots icon next the user-defined output variable (for example, **output**).
 - c) Optional: Select the **Delete variable** to delete the current variable.
 - d) Select the **Edit variable** to edit the current variable.
The **Edit variable** window prompts you to add any new changes to your current variable.
 - e) Click **Apply** to save your changes.

Process Composer and Co-Pilot for Business Users

As a Bot Creator user, you can create a process automation in Process Composer and then run the process automation in Automation Co-Pilot as an automated task.

[Automation Co-Pilot for Business Users](#) on page 3144 is a user-interface that enables real-time communication between users and bots. Using Automation Co-Pilot for Business Users, you can automate repetitive and time-consuming tasks, navigate controls, and input data when interacting with a customer.

As a Bot Creator user, you can configure a process automation in the **Process Composer** in the **Control Room**. Using the **Process Composer** drag-and-drop interface, users can create process automations and configure when a bot should be executed. It also displays correct data to users and exchanges that data across multiple teams.

The following video shows how to create a process automation in **Process Composer** and then launch it in **Automation Co-Pilot** as an automated task:

Preprocessing error messages

If you encounter any preprocessing errors, review the cause and perform the required action to resolve the error.

If you build a bot that has more than 2,000 lines of code, and if the bot uses descendant actions such as **Loop > Continue** or **Break** actions, pre-processing errors can occur. To prevent pre-processing errors, we recommend that you break the larger bot into smaller bots, and run the **Task Bot > Run** action from any other bot.

Note:

- From Automation 360 v.23, if an error occurs when you run a bot, a preprocessing or runtime error is shown. Note that preprocessing of child bots does not occur in sequence because these bots are referred in the parent bot and are sometimes in complex nested workflows. Therefore, the errors might be displayed in any sequence for these child bots. The parent bot cannot proceed further until all the errors in the child bots are resolved.
- The following scenarios are applicable only to Automation 360 v.21 or earlier releases. For v.22, Only the Catch action scenario is applicable, so review the probable cause.

Cause	Action required
A mismatch occurred and we did not find the expected variable data type.	Use an inline expression or a separate action to convert to the correct variable data type. Variables overview on page 2235
A "\$" is being read as a variable but no such variable exists.	Use "\$\$" to escape the dollar sign and try again.
The bot is calling another bot, but we did not find the child bot at the specified location.	Check the path and try again.
We found a Catch action that is not contained by a Try action.	Ensure that each Catch action is contained by a Try action.
We found a Try action that does not contain a Catch action. Each Try action requires at least one Catch action inside it.	Ensure that each Try action contains a Catch action.

Build advanced bots and packages

Package SDK

Package SDK enables you in creating and uploading action packages to your Control Room.

The Automation Anywhere Package Development Kit provides detailed instructions for users to independently develop custom actions and upload the packages in their Control Room. The custom action are build in an IDE and are compiled to generate Java Archive (JAR) files. The JAR files are then uploaded to the Control Room which becomes available as actions under the **Action Panel**.

The Package SDK section includes sample codes and supporting files for Java developers to create and validate custom actions.

Set up the Java project

Set up an integrated development environment (IDE) for Java, including Automation Anywhere custom annotations to develop an action package that you can upload to your Control Room.

A working knowledge of Java and Gradle is required in order to successfully build an action package. You require the following software and file:

- Java Developer Kit (JDK) 11
- Java IDE
 - [Eclipse](#)
 - [Community edition of IntelliJ](#)
- Gradle plug-in v.7.*.* in the IDE
- Automation Anywhere Bot Agent installed and connected to your Control Room **Download and extract a zip file**

Download and extract the zip file for the release you want:

Package SDK v.30 release on page 48	SDK download link: A360-package-sdk-2.9.0.zip Docs download link: A360-package-sdk-2.9.0-javadoc.zip
Package SDK v.29 release on page 93	SDK download link: A360-package-sdk-2.8.0.zip
April 2023, Release (Automation 360 v.28)	SDK: A360-package-sdk-2.7.0.zip Docs: A360-package-sdk-2.7.0-javadoc.zip
November 2022, Release (Automation 360 v.27)	A360-package-sdk-2.6.1.zip

Configure the build files, compile the JAR file, add the package to your Control Room, and then build a bot to test your package. [Build and test a demo package and bot](#) on page 3402.

Develop your own package and upload it to an Control Room to provide custom actions for bots.

Standard coding practices and guidelines for developing packages

This topic covers standard coding practices and guidelines that help to ensure the development of high quality packages.

Testing

Ensure high quality code. Write sufficient unit tests and integration tests for your package.

Icons

Set proper icon for your package.

Setting the version manually

The SDK package build version gets updated automatically every time a build happens. However, you can set it manually in the command project of a common **build.gradle** file.

- Update the **build.gradle** file before a build.
- Enter up to four digits numbers, separated by a period, as shown below:

```
...
ext {
    version '2.0.8'
}
dependencies {...}
```

Dependencies

Embed all the dependencies in your package JAR. Load the dependencies at run time by extracting them to a temporary location. Be sure to clean the temporary location after the dependencies are loaded.

Dependent JAR files

Add dependent JAR files under dependencies in the **build.gradle** file as implementation so that the dependant JAR files are packaged.

```
. . .
dependencies {
    compileOnly name: 'command-
annotations'
    compileOnly name: 'bot-runtime'
    compileOnly name: 'bot-api'
    implementation name: 'i18n-api'
        implementation
name: 'mydependentjavafile.jar'
    apt name: 'command-processor'
    compileOnly group:
'org.apache.logging.log4j',
name: 'log4j-core', version:
"$loggerVersion"
    testImplementation
"org.testng:testng:
$testNgVersion"
    testImplementation name: 'bot-
runtime'
    testImplementation name: 'bot-
api'
}
. . .
```

Add new actions to the exiting package

When adding new actions to an existing package, make sure to do clean before packaging. It is always a good practice to do clean build - gradlew.bat clean build shadowJar.

Error messages

Provide meaningful error messages.

- Do throw meaningful error messages. For example, in local language using i18n APIs with `BotCommandException`, throw a new exception
`BotCommandException(MESSAGES.getString("Run.E`
- Do not throw generic error messages, such as `ex.message`.

Basic validation

Use the validation annotation rules, such as `@NotEmpty` included with this development kit. Do not add basic validations for your code. See [Validation annotations](#) on page 3400.

Loops

Avoid long running loops in your code. Long running loops can cause high CPU usage, leading to errors such as, "Bot is unresponsive."

Add logging

Use the default **log4J** logger provided in the bot run time framework. Do not add your own logger. See the sample code for details.

Logging levels

- **ERROR/FATAL:** Severe error event that the user is affected and there is no workaround.
- **WARN :** Unexpected error occurred but the system has recovered from it.
- **INFO:** Informational messages about state change, for example, an accepted request.
- **DEBUG:** Detailed diagnostic information that will be required to debug when something goes wrong.
- **TRACE:** All information is captured about an application behavior.

If you are not sure of the log level, set it to **TRACE**.

Loading resources

All resources should be loaded using current thread context class loader, as shown in the following example:

```
Thread.currentThread().getContextClassLoader().getResources("resources")
```

[Develop a sample package](#) on page 3347

Develop your own package and upload it to an Control Room to provide custom actions for bots.

Develop a sample package

Develop your own package and upload it to an Control Room to provide custom actions for bots.

Download and extract the contents from the latest Automation 360 Package SDK release. The newest package contains the necessary sample source code to build your package.

You need to have a project created in a Java IDE. For details about setting up a project, read [Set up the Java project](#) on page 3344.

The following high-level tasks provide the basic workflow for creating a package.

1. Create a java class.

This class is the action you plan to publish in your package.

Important: It is required that the class supports the default constructor.

2. Add required business logic to the class.
The following are the supported return types:
 - **Void**: Use this return type if your action does not return any value.
 - **Value**: Use this return type if your action returns any type of value.
3. Annotate the class with **BotCommand** and **CommandPkg** Annotations to make the class eligible to be converted to an action.
4. Annotate the variable that accepts values with **Idx** and **Pkg**.
5. Annotate the entry method with the **Execute** annotation.
6. From the action prompt, run `gradlew.bat clean build shadowJar`.
The JAR file created from the build is located in **build/lib**.

From the Control Room on the **Bots > Package** page, click the **Add package** icon to upload the JAR file.

Tip: To upload a package to a Control Room, you need **Upload package** permission. Review how to add a package to an Control Room: [Add packages to the Control Room](#) on page 1842.

Using the package SDK

These example topics provide a basic understanding of how to use the Package SDK with Automation 360. Each SDK package includes a collection of configurable files that you can use to build a custom package, and then use the package to create Task Bots.

Use the following steps to create, configure, and build an IntelliJ project to compile a new package, and then create a bot to test the package you created.

1. Download, extract, and review the Package SDK files:
 - Download the latest Automation Anywhere A2019 Package SDK.
[Enterprise Automation360 Package Development Kit Release Notes](#)
 - Go to your `Downloads` folder, right-click your downloaded Package SDK, and select **Extract All**.
 - Review all the files included in the package. You can drop any java file in your IntelliJ project to view or edit the content.

2. Install the latest Automation 360 version:
 - a) After the installation, log in to the Control Room with an admin privilege and create a new user with permissions to upload a package and create bots.
[Create a user](#) on page 1678
 - b) Connect your local device to the Control Room. If required, download and install the latest Bot Agent.
[Install Bot Agent and register device](#) on page 1288
3. Install Java SE Development Kit 11 or IntelliJ IDE Community Edition and Gradle plug-in.
 - Java SE Development Kit 11 (<https://www.oracle.com/java/technologies/javase/jdk11-archive-downloads.html>)
 - Java IDE (<https://www.jetbrains.com/idea/download/#section=windows>)
4. Configure the sample build files in the IntelliJ project.
[Configuring build files](#) on page 3349
5. Create a new directory, package, and class.
[Creating new Java class](#) on page 3350
6. Use the compiled JAR file as a package and upload it to your Control Room in Automation 360.
[Upload custom package to your Control Room](#) on page 3352
7. Create a Task Bot to test the new package.
[Create a bot to test the new package](#) on page 3353
8. Optional: Verify the results, and if required, add additional actions to your bot flow, and configure parameters and values.
9. View additional resources.
To learn more, search for the [Package SDK: How to examples](#).

[Configuring build files](#) on page 3349

Configuring build files

Use IntelliJ to configure and compile a JAR file, and then upload it as a package to your Control Room in Automation 360.

A basic understanding of JDK and Java IntelliJ is required in order to build an action package. Ensure you have the following software and files:

- Java SE Development Kit 11 (<https://www.oracle.com/java/technologies/javase/jdk11-archive-downloads.html>)
 - Java IDE (<https://www.jetbrains.com/idea/download/#section=windows>)
 - Automation Anywhere A2019 SDK. Download and extract the zip file for the release you require: [Enterprise A2019 Package Development Kit Release Notes](#)
1. Unzip the contents of the SDK package to your `IdeaProjects` directory and rename the folder from `<latest package sdk zip file>` to `A2019FileDetails`.
 2. In IntelliJ IDEA, go to **File > Open** and open the project located at `C:\Users\<User>\IdeaProjects\A2019FileDetails`.
 3. Open the `settings.gradle` file in the project root, and set the `rootProject.name = 'A2019FileDetails'`

4. Update the `package.template` file located at **src > main > resources > package.template**.
5. Change the package name from `A2019DemoPackage` to `A2019FileDetails`.
6. Update the package name in **locales json**: go to **src > main > resources > locales > en_US.json**.
 - a) Open the `en_US.json` file and update the required `label` field. Update the optional description.
 - b) Delete all other remaining lines in the `en_US.json` file.
7. Open the `build.gradle` in the project root. After the dependencies section, remove other dependencies, if they are not required.
8. Save all files.

[Creating new Java class](#) on page 3350

Creating new Java class

Use IntelliJ to create a new java class and a new directory, and configure other build files.

Complete the steps in the following task: [Configuring build files](#) on page 3349.

1. Create a new **Java Class**, right-click the `com.automationanywhere.botcommand` package, and select **New > Java Class**. Enter the name for the new class `GetFileDetails`.
 - a) Copy `@BotCommand` from the `Concatenate.java` and paste it into the new `GetFileDetails.java` file.

```
import static
    com.automationanywhere.commandsdk.model.DataType.STRING;
//BotCommand makes a class eligible for being considered as an
action.

@BotCommand
//CommandPks adds required information to be disalable on GUI.
@CommandPkg(
    //Unique name inside a package and label to display.
    name = "concatenate", label = "[[Concatenate.label]]",
    node_label = "[[Concatenate.node_label]]", description =
    "[[Concatenate.description]]", icon = "pkg.svg",

    //Return type information. return_type ensures only the right
kind of variable is provided on the UI.
    return_label = "[[Concatenate.return_label]]", return_type =
    STRING, return_required = true)
public class Concatenate {

    //Messages read from full qualified property file name and
provide i18n capability.
    private static final Messages MESSAGES = MessagesFactory

    .getMessages("com.automationanywhere.botcommand.samples.messages");

    //Identify the entry point for the action. Returns a
Value<String> because the return type is String.
    @Execute
    public Value<String> action(
        //Idx 1 would be displayed first, with a text box for entering
the value.
```

```

    @Idx(index = "1", type = TEXT)
    //UI labels.
    @Pkg(label = "[Concatenate.firstString.label]")
    //Ensure that a validation error is thrown when the value is
    null.
    @NotEmpty
    String firstString,

    @Idx(index = "2", type = TEXT)
    @Pkg(label = "[Concatenate.secondString.label]")
    @NotEmpty
    String secondString) {

    //Internal validation, to disallow empty strings. No null check
    needed as we have NotEmpty on firstString.
    if ("".equals(firstString.trim()))
        throw new
    BotCommandException(MESSAGES.getString("emptyInputString",
    "firstString"));

    if ("".equals(secondString.trim()))
        throw new
    BotCommandException(MESSAGES.getString("emptyInputString",
    "secondString"));

    //Business logic
    String result = firstString + secondString;

    //Return StringValue.
    return new StringValue(result);
}

```

- b) Update the @CommandPkg parameters such as: name, label, node_label, description, and icon.
 - c) Update the return_label and the return_type.
 - d) Add the NumberValue action, internal validation, business logic, and the return value.
 - e) Delete the Concatenated. java file and samples.commands. basic directory, and the sample.commands directory.
2. Configure the en_US.json file: go to **src > main > resources > locales > en_US.json** and add the following fields after the label and description values, and delete other parameters from the file.

```

{
  "label": "File Details",
  "description": "Returns basic file details",
  "GetFileDetails.label": "File Size",
  "GetFileDetails.description": "Return the size of the selected file
  in bytes",
  "GetFileDetails.node_label": "File Size in Bytes",
  "GetFileDetails.return_label": "File Size",
  "GetFileDetails.return_label_description": "Return in bytes",
  "GetFileDetails.filePath.label": "Select a File for analysis"
}

```

3. Delete packages: go to **src > main > java > com.automationanywhere.botcommand**, and delete the samples.commands and delete the samples packages.
4. Import new icons from Github and update the CommandPkg annotation.

- a) Download any icons you want to use in your bot flow and save them as `.svg` files.
 - b) Copy your image files into the `src > main > resources > icons` folder.
5. Create a new directory: go to `src`, right-click, and select **New > Directory**.
 - a) In the **Name** field, enter `test\java`. Alternatively, select the `test\java`, and enter the name `TestFileSize`.
 - b) Configure test annotations in the `TestFileSize` java class.
 - c) Create a `@test` public class, create a `GetFileDetails` object, and invoke the action.
 - d) Optional: Run the `TestGetFileDetails` in IntelliJ to test it.
 6. Configure the `TestFileSize` file, and open `TestFileSize` and copy and paste the following code:

```

{
    @Test
    public void TestGetFileDetails() {
        String filePath = "src\\main\\resources\\icons\\sample.svg";
        //Create GetFileDetails Object
        GetFileDetails getFileDetails = new GetFileDetails();
        //invoke action
        NumberValue output = getFileDetails.action(filePath);
        Assert.assertEquals(output.getAsDouble(), 5027.0);
    }
}

```

7. Save the project: **File > Save All**.
8. Click **Reload All Gradle Projects**, and then click **Execute Gradle Task**, and verify that the **A2019FileDetails** project is selected.
9. In the **Run Anything** window, enter `gradle clean build shadowJar`. After it runs, the following message is displayed: `BUILD SUCCESSFUL in 8s <number of seconds>`

[Upload custom package to your Control Room](#) on page 3352

Upload custom package to your Control Room

Use the compiled JAR file and upload it as a package to your Control Room in Automation 360.

- Complete the steps in the following task: [Creating new Java class](#) on page 3350.
 - Ensure you have the following:
 - Access to the Control Room.
 - Credentials with **AAE_Basic** permission or a custom role with the capability to upload packages to the Control Room.
1. From Windows Explorer, go to `C:\Users\<Username>\IdeaProjects\A2019-FileDetails\build\libs` and locate `A2019FileDetails-2.0.9.jar`.
 2. Log in to your Control Room as a user with permissions to add a new package.
 3. Click **BOTS > Packages**.
 4. In the **All packages** page, move your mouse over the plus sign and click **Add package**.
 5. In the **Add package** page, click **Browse** and locate the `A2019FileDetails-2.0.9.jar` file.

By default, the file is located at: C:\Users\\IdeaProjects\A2019-FileDetails\build\libs.

6. Select the A2019FileDetails-2.0.9.jar file and click **Open**.
7. Click **Upload Package**.

When you upload a custom package to the Control Room, a notification is also sent to the Control Room users to notify about package updates. This notification is sent to the users who have the **View package** permission. For more information, see [#unique_258/unique_258_Connect_42_package-event](#) event notification.

[Create a bot to test the new package](#) on page 3353

Create a bot to test the new package

Use the actions in Automation 360 to create a bot and test the new package you have added to your Control Room.

Ensure you have the following to build the bot:

- Access to the Control Room.
 - Credentials with **AAE_Basic** permission or a custom role to create bots.
 - Your workstation is a registered device in the Control Room.
 - Your package A2019FileDetails-2.0.9.jar is available in the Control Room.
1. Log in to the Control Room.
 2. On the left pane, click **Automation**.
A list of available and forms is displayed.
 3. Click the **Create a bot** icon.
 4. In the **Name** field, enter `TestingFileSize` or any other name you want.
 5. Click **Create & Edit**.
 6. In the Actions pane, find **File Details** and drag **File Size** into the bot flow.
 - a) In the **Select a File for analysis** field, select **Desktop file**, click **Browse**, and select any file from your desktop.
 - b) Click **Create variable** to create a new number variable.
 - c) In **Create Variable**, enter `nFileSize` and click **Create & Select**.
 - d) Click **Apply**.
 7. In the Actions pane, find the **Number** package and drag the **To String** command.
 - a) In the **Enter a number** field, enter **F2**, and select **nFileSize**.
 - b) In the **Assign the output to variable** field, select **prompt-assignment - String** from the drop-down list.
 - c) Click **Apply**.
 8. From the Actions pane, drag **Message box**.
 9. In the **Enter the message to display** field, click **F2** and select the **prompt-assignment variable**.
 10. Click **Apply** and **Save**.
 11. Click **Run**.

The bot displays the `<The value of the file size>`, which is a successful build.

If you were not able to run your bot, go back and modify your configuration steps in your Control Room.

Package SDK examples

This section contains code examples and explanations about how to code some basic bot capabilities.

Return a value from an action on page 3355	Set the following properties on <code>CommandPkg</code> to store the action output in a variable.
Expose property attributes of action on page 3357	The property values of an action can be exposed by setting the following properties on CommandPkg .
Organize and group actions when developing packages on page 3358	Review the provided examples on how to add and group actions during the package SDK development process.
Input types - UI elements on page 3359	The user interface (UI) elements are the input controls used to receive inputs in an action while building a bot.
Create custom variables using Package SDK on page 3361	When using Automation 360, you can create custom variables using the SDK package.
Create a condition using Package SDK on page 3367	When using Automation 360, you can create a condition with the SDK package.
Add a condition in a custom package for If condition on page 3369	Add conditions in a custom package.
Create an iterator using Package SDK on page 3370	In Automation 360, you can create an iterator with the SDK package. An iterator is used to loop through multiple objects of similar type and is used with the Loop package. It consists of two methods, <code>next</code> and <code>hasNext</code> , which return the actual object and a boolean value.
Create a custom trigger (Example 2) on page 3378	The example shows how to create a trigger in Automation 360 that allows you to create tasks that will be executed at specified intervals.
Create a custom trigger (Example 3) on page 3382	The example shows how to create an event-based trigger (<code>SimpleMessageListenerContainer</code>) using the Package SDK.
Add debug logs of custom packages to bot_launcher.log file on page 3384	You can add logs using <code>log4j</code> . The dependency is already added in the package SDK sample <code>build.gradle</code> file.
Handle sessions in a custom package on page 3386	You can extract a session using a session name from the <code>SessionsMap</code> . In the same package, you can use sessions to pass information between actions, but not to other packages.

[Configure shared session using Package SDK](#) on page 3389

Package SDK provides configuration for the SDK users to create and use shared sessions. Sessions are seamlessly shared between different bots to share resources between them. This means that if a session has been created, the other Task Bots can read and update the session and vice versa.

[Create a bot to test the custom package](#) on page 3416

A shared session enables you to reuse actions between Task Bots that run concurrently, for example, using the same Excel file to pass values.

Actions

Any action class supports only one method as an entry point. Annotate all parameters of the entry point method with `Idx`. There are three types of actions:

- `CommandAction` (default choice)
- `Iterator`
- `Condition`

Important: If you do not provide a public setter to member variables with `Inject`, compilation errors occur.

Related concepts

[Standard coding practices and guidelines for developing packages](#) on page 3345

This topic covers standard coding practices and guidelines that help to ensure the development of high quality packages.

[Annotations](#) on page 3396

This section provides reference information about the annotations used to create Automation Anywhere packages.

Related tasks

[Set up the Java project](#) on page 3344

Set up an integrated development environment (IDE) for Java, including Automation Anywhere custom annotations to develop an action package that you can upload to your Control Room.

[Develop a sample package](#) on page 3347

Develop your own package and upload it to an Control Room to provide custom actions for bots.

Return a value from an action

Set the following properties on `CommandPkg` to store the action output in a variable.

Action return values

- **return_type**
Defines the return type of the action. It usually matches the entry method return type.
- **return_required**
When the value is set to `true` the return value is required.
- **return_label**

A description of the UI label for the variable value.

Example: Convert a sourceString to uppercase and assign the result to returnTo

```
//BotCommand makes a class eligible for being considered as an action.
@BotCommand

//CommandPks adds required information to be displayable on the UI.
@CommandPkg(
    //Unique name inside a package and label to display.
    name = "uppercase", label = "[[Uppercase.label]]",
    node_label = "[[Uppercase.node_label]]", description =
    "[[Uppercase.description]]", icon = "pkg.svg",

    //Return type information. return_type ensures only the right kind of
    variable is provided on the UI.
    return_label = "[[Uppercase.return_label]]", return_type =
    STRING, return_required = true)
public class Uppercase {

    //Messages read from a fully qualified property file name and provides
    i18n capability.
    private static final Messages MESSAGES = MessagesFactory
        .getMessages("com.automationanywhere.botcommand.samples.messages");

    //Identify the entry point for the action. Returns a Value <String>
    because the return type is String.
    @Execute
    public Value<String> action(
        //Idx 1 would be displayed first, with a text box for entering the
        value.
        @Idx(index = "1", type = TEXT)
        //UI labels.
        @Pkg(label = "[[Uppercase.sourceString.label]]")
        //Ensure that a validation error is thrown when the value is null.
        @NotEmpty
        String sourceString,
```

Related concepts

[Package SDK examples](#) on page 3354

This section contains code examples and explanations about how to code some basic bot capabilities.

Expose property attributes of action

The property values of an action can be exposed by setting the following properties on **CommandPkg**.

Action property values

	Property Attributes	Description
1	name	The name of the property, unique at action level, in auto-complete box this name would appear.
2	description	A description of the property.
3	type	The data type on which property operates, only if the type matches, the property will be appear in the auto-complete box.
4	return_type	The return data type of the property. If this type does not match the field type where it is used, there will be a validation error.

```
@BotCommand
@CommandPkg(label = "Uppercase", name = "uppercase",
  description="Converts the string to upper case",
  icon = "uppercase.svg", node_label="Convert {{sourceString}} to upper
  case| and assign the result to {{returnTo}}",
  return_type=DataType.STRING, return_required = true,
  return_label="Assign the output to variable") public class UpperCase {

  @Execute
  public Value<String> convert(
    @Idx(index = "1", type=TEXT)
    @Pkg(label="Source string")
    @NotEmpty
    String sourceString){
    return new StringValue(sourceString.toUpperCase());
  }
}
```

Tip: The character | acts as a separator node label. The content before and after the | character appears only when there is an input for the variables declared in each part. For example, in the above sample, when the {{sourceString}} variable has a value, the content before the | appears, and when {{returnTo}} has a value, the content after the | appears.

For example, the above class in the UI will look like:

Message box

Displays a message box

Required bot agent version: 20.11 or above

Enter the message box window title

Converts the string to upper case

String:uppercase - String

Enter the message to display

\$Test123{Body}.u|

Scrollbar after lines

30

Close message box after

Seconds

#

[Package SDK examples](#) on page 3354

This section contains code examples and explanations about how to code some basic bot capabilities.

Organize and group actions when developing packages

Review the provided examples on how to add and group actions during the package SDK development process.

Example: Add actions

```
@BotCommand
//CommandPks adds required information to be dispalable on the UI.
@CommandPkg(
  //Unique name inside a package and a label to display.
  name = "concatenate", label = "[[Concatenate.label]]",
  node_label = "[[Concatenate.node_label]]", description =
  "[[Concatenate.description]]", icon = "pkg.svg",

  //Return type information. return_type ensures only the right kind of
  variable is provided on the UI.
  return_label = "[[Concatenate.return_label]]", return_type = STRING,
  return_required = true)
```

Example: Group actions

Use the `group_label` to `ConcatenateGroup` which it is displayed in the UI also as **ConcatenateGroup**. When the `group_label` is not used, you will get all the actions in the respective package.

```
@BotCommand

//CommandPks adds required information to be dispalable on the UI.
@CommandPkg(
    //Provide a unique name inside a package and a label to display.
    group_label = "ConcatenateGroup", name = "concatenateWithGroup",
    label = "concatenateWithGroup",
    node_label = "[[Concatenate.node_label]]", description =
    "[[Concatenate.description]]", icon = "pkg.svg",

    //Return type information. return_type ensures only the right kind of
    variable is provided on the UI.
    return_label = "[[Concatenate.return_label]]", return_type = STRING,
    return_required = true)
public class ConcatenateWithGroup {
```

Input types - UI elements

The user interface (UI) elements are the input controls used to receive inputs in an action while building a bot.

The following examples show the supported input types. Use the UI elements to create user interface (UI) designs to build the Control Room interfaces. For instance, if you need an input as text then, use `TEXT`, if you need a radio button, select `RADIO`, and so on. This topic is based on the `SampleUI` sample available within the Package SDK in the following location: `<PackageSDK>\src\main\java\com\automationanywhere\botcommand\samples\commands\ui\SampleUI.java`.

1. Make sure you have imported the following packages to ensure all the functionalities works as described in the sample.

```
import com.automationanywhere.commandsdk.annotations.Idx;
import com.automationanywhere.commandsdk.annotations.Pkg;
import com.automationanywhere.commandsdk.annotations.rules.CodeType;
import
    com.automationanywhere.commandsdk.annotations.rules.VariableType;
```

2. Add the `@BotCommand` annotation to make a class as an Action in the Control Room. For more information on annotations, see [Annotations](#) on page 3396.

```
@BotCommand
```

3. Add the `@CommandPkg` annotation to define all the UI related components - labels, description, and name.

```
@CommandPkg(label = "UI Demo", description = "Demonstrates the
    provided UI elements", name = "uiDemo")
```

4. Create a class and define the fields as described below.
 - a) Annotate the method with `@Execute` to execute the method during compilation.
 - b) In this sample, `@Idx` and `@Pkg` are used as a member of the class, so you should use `set` and `get` methods to define them.

1. @Idx - Defines the index of an action.
2. @Pkg - Defines all the parameters and member variables shown in the interface. Must be accompanied by the @Idx, if not this annotation is ignored.
3. @Inject - To receive value from the UI using the member class, @Inject is required at field levels.

```

@BotCommand
@CommandPkg(label = "UI Demo", description = "Demonstrates
the provided UI elements", name = "uiDemo")
public class SampleUI {
    @Idx(index = "1", type = TEXT)
    @Pkg(label = "Text type")
    @Inject
    String text;

    @Execute
    public String getText() {
        return text;
    }
    public void setText(String text) {
        this.text = text;
    }
}

```

5. Drag the action into canvas and you will be able to input a string in the text field. You will see an input box similar to this image.

DemoPackageSDK: UI Demo

Demonstrates the provided UI elements

Required bot agent version: 20.11 or above

Text type (optional)

UI element - Number field

Use the Number type to create an UI element that will accept a number. Using the below sample you will be able to create a field that will accept only numbers.

```

@BotCommand
@CommandPkg(label = "UI Demo", description = "Demonstrates the provided
UI elements", name = "uiDemo")
public class SampleUI {
    @Idx(index = "2", type = NUMBER)
    @Pkg(label = "Number type")
    @Inject
    String num;

    @Execute
    public String getNum() {

```

```

        return num;
    }
    public void setNum(String num) {
        this.num = num;
    }
}

```

Other UI elements

It is possible to create other UI components like: Boolean, Radiobutton, Number, Variable, Code, Dictionary, List, Date/Time, and so on. To get a complete list of UI elements supported, see <PackageSDK>\src\main\java\com\automationanywhere\botcommand\samples\commands\ui\SampleUI.java.

UI validations supported

The following UI validations are also supported:

- @NotEmpty means that the UI field needs an input at the bot design time.
- @LocalFile refers to a local file from a user machine.
- @NumberIntegers refers to a number value that you can provide, such as, a float or a double input kind.

Create custom variables using Package SDK

When using Automation 360, you can create custom variables using the SDK package.

Using custom variables

Use Automation 360 to create a custom variable. This is a system variable and is used as other bot variables, except it is read-only and the value is calculated instead of being assigned.

Required annotations

For creating a variable, the following annotations are required:

Annotation	Usage
BotCommand	Use the BotCommand annotation with the <code>variable</code> as <code>commandType</code> . This ensures that the plain old Java object (POJO) is suitable for creating an Automation 360 variable.
CommandPkg	These values are used when creating a package. Provide a name, label, and description to the annotation.
Idx	Annotate all the parameters and member variables that are required and help with the validation check. Alternatively they might be displayed in the interface for the input. Provide the index (<code>Idx</code>) and the type.

Annotation	Usage
Pkg	Annotate all the parameters and member variables that will be shown in the interface. This annotation will be ignored if it is not accompanied by the Idx.
VariableExecute	The method that has to be called for returning the variable value. This method does not accept any input parameters. Sessions and GlobalSessionContext are available through setter injection.

Use case example

The following use case shows how to return the current time for the system default zone.

1. Create the POJO class with the business logic:

```
public class Now {

    public DateTimeValue now() {
        Instant instant = Instant.now();
        ZonedDateTime now = instant.atZone(ZoneId.systemDefault());
        return new DateTimeValue(now);
    }

}
```

2. Annotate the POJO class to enable it for the Automation 360 variable and to create the package:

```
@BotCommand(commandType = BotCommand.CommandType.Variable)
@CommandPkg(description = "The current datetime at system
default zone.", name = "Now", label = "", variable_return_type =
DataType.DATETIME)
public class Now {

    public DateTimeValue now() {
        Instant instant = Instant.now();
        ZonedDateTime now = instant.atZone(ZoneId.systemDefault());
        return new DateTimeValue(now);
    }

}
```

3. Annotate the now method to denote it to be the execute method.

```
@VariableExecute
public DateTimeValue now() {
    Instant instant = Instant.now();
    ZonedDateTime now = instant.atZone(ZoneId.systemDefault());
    return new DateTimeValue(now);
}
```

Every variable must have one test `VariableExecute` method.

This section contains code examples and explanations about how to code some basic bot capabilities.

Using EntryList

EntryList enables you to accept any number of parameters through the bot designer. The parameter structure is defined in the Automation 360 actions.

Example: EntryList

The following example shows how to create a parameter with the name of `village` pair.

```
@BotCommand
@CommandPkg(label = "EntryList example", description = "EntryList
example", icon = "sample.svg", name = "entryListExample")
public class EntryListExample {
// UI display for ENTRYLIST 1.1, the linking is done based on the
ENTRYLIST title.
// This should be added as a child of the ENTRYLIST, however it should
not be part of options.
// The EntryList does not need a setter or Inject as the value is
provided inside the ENTRYLIST.
@Idx(index = "1.3", type = TEXT, name = "NAME")
@Pkg(label = "Name", default_value_type = DataType.STRING)
@NotEmpty
private String name;
//Linked to 1.2 through title.
@Idx(index = "1.4", type = TEXT, name = "VILLAGE")
@Pkg(label = "village", default_value_type = STRING)
private String city;
@Execute
public void setParameter(
// Add the entryList, the values are accepted as a list of values.
// Provide the column header for the tabular display of accepted
entries.
// In Pkg, provide a unique title.
// Provide Idx for each option separately, this is needed to
// have the correct UI type when the entry form is presented.
// Add only columns to options, you cannot add their definitions.
@Idx(index = "1", type = ENTRYLIST, options = {
@Idx.Option(index = "1.1", pkg = @Pkg(title = "NAME", label =
"Name")),
@Idx.Option(index = "1.2", pkg = @Pkg(title = "VILLAGE", label =
"village")),
})
//Label that is displayed in the UI
@Pkg(label = "Provide name value entries")
//Header of the entry form
@EntryListLabel(value = "Provide entry")
//Button label which displays the entry form
@EntryListAddButtonLabel(value = "Add entry")
//Unique rule for the column, this value is the column TITLE.
```

```

@EntryListEntryUnique(value = "NAME")
//Message to dispaly in the table when no entries are present.
@EntryListEmptyLabel(value = "No parameters added")
    List<Value> entryList) {

}

```

Here is another example of the EntryList, define the values of the EntryList usage.

```

//Entry list//
@Idx(index = "1", type = ENTRYLIST, options = {
    @Idx.Option(index = "1.1", pkg = @Pkg(title = HEADER_ENABLED,
    label = "[[HEADER1]]")),
    @Idx.Option(index = "1.2", pkg = @Pkg(title = HEADER_NAME, label
    = "[[HEADER1]]")),
    @Idx.Option(index = "1.3", pkg = @Pkg(title = HEADER_VALUE, label
    = "[[HEARER3]]"))
})
@Pkg(label = "customHeaderslabel")
@EntryListLabel(value = "customHeaderlabel")
@EntryListAddButtonLabel(value = "add.header")
@EntryListEmptyLabel(value = "no.header")
@Inject
List<Value> customHeaders;

```

This section contains code examples and explanations about how to code some basic bot capabilities.

Using regular expression

Use regular expressions (regex) to create string patterns that help match, locate, or manage text in Java. Together, the literals and special characters define a logical pattern. Use the pattern to compare strings of text to check if the strings match the defined pattern.

Note: Regular expression (regex) does not recognize `\b` as a Backspace command. Use `\\b` to use Backspace instead.

Example: MatchesRegex

Use `MatchesRegex` to test the string pattern.

In the following example, the input pattern starts from the English alphabet, uppercase and lowercase, (A-Z/a-z) and ends with a numeric value.

```

@Idx(index = "1", type = TEXT)
@Pkg(label = "Field label", description = "Field description")
@MatchesRegex("[A-Za-z]\w*")
@NotEmpty
String cell

```

If the pattern does not match, the following message is displayed: `Must match pattern.`

This section contains code examples and explanations about how to code some basic bot capabilities.

FILE2 (Regex) attribute

A regular expressions (RegEx) are patterns of string defined to search for a file in a specified path. Use the FILE2 attribute when using regular expressions (regex) to create string patterns.

For instance: If you want to search a folder path for a file (For example Hello.txt) which contains a certain string. . You will use File2 attribute type to enter the following regex pattern: He11 or e11 which will find the file that matches the search criteria. This topic is based on the File2TypeDemo sample available within the Package SDK in the following location <PackageSDK>\src\main\java\com\automationanywhere\botcommand\samples\commands\basic\types\File2TypeDemo.java.

Using the FILE2

1. Make sure you have imported the following packages to ensure all the functionalities works as described in the sample.

```
import com.automationanywhere.commandsdk.annotations.*;
import com.automationanywhere.commandsdk.model.AttributeType;
import org.apache.logging.log4j.LogManager;
import org.apache.logging.log4j.Logger;
```

2. Add the @BotCommand annotation to make a class as an Action in the Control Room. For more information on annotations, see [Annotations](#) on page 3396.

```
@BotCommand
```

3. Add the @CommandPkg annotation to define all the UI related components - labels, description, icon, return type, and name.

```
@CommandPkg(label = "[[File2TypeDemo.label]]", description =
  "[[File2TypeDemo.description]]", icon = "sample.svg", name =
  "file2TypeDemo")
```

4. Create a method (For example: regexFile) within your class and define the fields as described below.

- a) Annotate the method with @Execute to execute the method during compilation.
- b) In the below sample, @Idx, @Pkg, and @NotEmpty are defined as a parameters of the method. If they are used as a member of the class, then you should use set and get methods to define them.

1. @Idx - Defines the index of an action. (@Idx(index = "1", type = AttributeType.FILE2))
2. @Pkg - Defines all the parameters and member variables shown in the interface (@Pkg(label = "[[File2TypeDemo.localFile.label]]")). Must be accompanied by the @Idx, if not this annotation is ignored.

3. `@NotEmpty` - Defines that this parameter cannot be empty (`@NotEmpty @LocalFile FileValue fileValue`).

```
@BotCommand
@CommandPkg(label = "[[File2TypeDemo.label]]",
description = "[[File2TypeDemo.description]]", icon =
"sample.svg", name = "file2TypeDemo")
public class File2TypeDemo {
private static Logger logger =
LoggerManager.getLogger(File2TypeDemo.class);

@Execute
public void regexFile(
@Idx(index = "1", type = AttributeType.FILE2)
@Pkg(label = "[[File2TypeDemo.localFile.label]]")
@NotEmpty @LocalFile FileValue fileValue)
```

5. Build and upload the custom package to the Control Room. For more information on uploading the package, see [Using the package SDK](#) on page 3348.
6. Create a bot.
7. Drag the action into canvas and you will be able to input the regex to find a file. You will see an input box similar to this image.

DemoPackageSDK: File2 Demo

Sample action showing how to use regex with file name

Required bot agent version: 20.11 or above

Please enter a local file

Specific path
Regex

Folder path

C:\log\
(x)
Browse...

File name

ell
(x)
⚙️

Type	Value
Pattern ▼	C:\log\ell (x)

Add regex

Print the Regex - Folder name and the File location

Use the [Logger](#) interface obtained from Log4j package to provide information of the objects being manipulated. In the below sample you will be able to log the folder name and the local file location by using the debug method.

```
@BotCommand
@CommandPkg(label = "[[File2TypeDemo.label]]",
  description = "[[File2TypeDemo.description]]", icon = "sample.svg",
  name = "file2TypeDemo")
public class File2TypeDemo {
  private static Logger logger =
  LogManager.getLogger(File2TypeDemo.class);

  @Execute
  public void regexFile(
    @Idx(index = "1", type = AttributeType.FILE2) @Pkg(label =
    "[[File2TypeDemo.localFile.label]]") @NotEmpty @LocalFile FileValue
    fileValue) {
    if (fileValue.isRegex()) {

      RegexFile regexFile = fileValue.getRegex();
      logger.debug("folder name {}", regexFile.getFolder());
      logger.debug("local file location {}",
      regexFile.getFileNamePattern().toString());
    } else {
      logger.debug("Regex option is not selected");
    }
  }
}
```

Create a condition using Package SDK

When using Automation 360, you can create a condition with the SDK package.

Using a condition

If and Loop are branching constructs in Automation 360. They are used to run a sequence of actions when a condition is set to `true`. A condition is used along with the If and Loop packages. A condition takes a set of inputs and returns a Boolean value.

Required annotations

For creating a condition, the following annotations are required:

Annotation	Usage
BotCommand	Use the BotCommand annotation with the condition as <code>commandType</code> . This ensures that the plain old Java object (POJO) is suitable for the creation of an Automation 360 condition.
CommandPkg	These values are used when creating a package. Provide a name, label, and description to the annotation.

Annotation	Usage
<code>Idx</code>	Annotate all the parameters and member variables that are required and help with the validation check, or they might be displayed in the interface for the input. Provide the index (<code>Idx</code>) and the type.
<code>Pkg</code>	Annotate all the parameters and member variables that will be shown in the interface. This annotation will be ignored if it is not accompanied by the <code>Idx</code> .
<code>ConditionTest</code>	The method that has to be called for testing the condition. It must return a Boolean value. If the method accepts parameters, then annotate them with <code>Idx</code> .

Use case example

The following use case verifies whether the given number is greater than the other number.

1. Create the POJO class with the business logic:

```
public class IsGreater {
    public Boolean checkGreater(Double first, Double checkAgainst) {
        return first > checkAgainst;
    }
}
```

2. Annotate the POJO class to enable it for the Automation 360 condition and to create the package:

```
@BotCommand(commandType = Condition)
@CommandPkg(label = "Is greater condition", name = "IsGreater",
    description = "Checks if the given number is greater than the
    other.", node_label = "{{first}} > {{checkAgainst}} ")
public class IsGreater {
    public Boolean checkGreater(Double first, Double checkAgainst) {
        return first > checkAgainst;
    }
}
```

3. Annotate the `checkGreater` method to indicate that this method should be used as a comparison method.

```
@ConditionTest
public Boolean checkGreater(Double first, Double checkAgainst) {
    return first > checkAgainst;
}
```

Every condition must have exactly one test condition method.

4. Annotate the parameters of the `checkGreater` method with `Idx` and `Pkg`.

Add `@NotEmpty` to ensure the value is not null.

```
@ConditionTest
public Boolean checkGreater(
    @Idx(index = "1", type = AttributeType.NUMBER) @Pkg(label = "Number
to check") @NotEmpty Double first,

    @Idx(index = "2", type = AttributeType.NUMBER) @Pkg(label = "Number
to compare against") @NotEmpty Double checkAgainst) {

    return first > checkAgainst;
}
```

The attribute type number returns a Double.

This section contains code examples and explanations about how to code some basic bot capabilities.

Add a condition in a custom package for `If` condition

Add conditions in a custom package.

Create condition values in an Action

- To create a condition, set `commandType` property of `BotCommand` annotation with value as `Condition`.
- To define the entry method of the condition, use the annotation `ConditionTest`.

```
@BotCommand(commandType = Condition)
@CommandPkg(label = "File exists", name = "fileExists",
    description = "Checks if the file exists.",
    node_label = "file exists at {{sourceFilePath}}", icon = "")
public class Exist extends AbstractCondition {
    @ConditionTest
    public boolean test(@Idx(index = "1", type = FILE) @LocalFile
@Pkg(label = "File path") @NotEmpty String sourceFilePath,
        @Idx(index = "2", type = NUMBER) @Pkg(label =
"How long you would like to wait for this condition
to be true?(Seconds)",
            default_value = "0", default_value_type
= DataType.NUMBER)
            @GreaterThanOrEqualTo("0")
@LessThanOrEqualTo("99999") @NotEmpty @NumberInteger Double waitTimeout)
    {
        // Add the logic to check for the condition
    }
}
```

The following example verifies if the provided boolean value is false.

Set `commandType` to `Condition`.

```
@BotCommand(commandType = Condition)
@CommandPkg(label = "False condition example", name =
  "conditionalTypeExample",
  description = "Checks if the boolean value is false.")
public class ConditionalTypeExample {

  @ConditionTest
  public Boolean validate(
    @Idx(index = "1", type = AttributeType.BOOLEAN)
    @VariableType(BOOLEAN)
    @Pkg(label = "Boolean variable", default_value_type =
  BOOLEAN) @NotEmpty Boolean variable
  ) {
    return variable == null ? false : !variable ;
  }
}
```

Related concepts

[Package SDK examples](#) on page 3354

This section contains code examples and explanations about how to code some basic bot capabilities.

Create an iterator using Package SDK

In Automation 360, you can create an iterator with the SDK package. An iterator is used to loop through multiple objects of similar type and is used with the Loop package. It consists of two methods, `next` and `hasNext`, which return the actual object and a boolean value.

Required annotations

When iterator is used, the `next` method returns the next available value. If no more values are available, an exception is shown. The `hasNext` method checks for other values and returns `false` if no more values are available. In Automation 360, when the loop is executed, `hasNext ()` is called first, and `next ()` is called only if `hasNext ()` returned a `true` value.

For creating an iterator, the following annotations are required.

Annotation	Usage
<code>BotCommand</code>	Use the <code>BotCommand</code> annotation with an <code>iterator</code> as the <code>commandType</code> . This ensures that the plain old Java object (POJO) is eligible for creating an Automation 360 iterator.
<code>CommandPkg</code>	When creating a package, provide a name, label, and description to the annotation.
<code>Idx</code>	Annotate all parameters and member variables that are required and help with the validation check, or they can be displayed in the interface for the input. Provide the <code>Idx</code> and the type.
<code>Pkg</code>	Annotate all parameters and member variables that will be displayed in the interface. This annotation will be ignored if it is not accompanied by the <code>Idx</code> .

Annotation	Usage
HasNext	<p>The method that has to be called for testing if the iteration has more elements (returns <code>true</code> if <code>next ()</code> returns an element rather than throwing an exception). It must return a Boolean value.</p> <p>If the method accepts parameters, then they must be annotated with the <code>Idx</code>. The <code>hasNext</code> method verifies it and returns <code>false</code> if no more values are available. In Automation 360, when Loop is executed, <code>hasNext ()</code> is called first. <code>next ()</code> is called only if <code>hasNext ()</code> returns a <code>true</code> value.</p>
Next	The method returns the next available value in the iteration. The return type is a value. If no more value is available, an exception is shown.

Use case example

The example use case loops through number of times, for example, `for (int i=0; I<n; i++)` Java construct. It accepts the value of `n` from the Bot Creator when the bot is created.

1. Make sure you have imported the following packages to ensure all the functionalities works as described in the sample.

```
import com.automationanywhere.botcommand.data.Value;
import com.automationanywhere.botcommand.data.impl.NumberValue;
import com.automationanywhere.commandsdk.annotations.BotCommand;
import com.automationanywhere.commandsdk.annotations.CommandPkg;
import com.automationanywhere.commandsdk.annotations.HasNext;
import com.automationanywhere.commandsdk.annotations.Idx;
import com.automationanywhere.commandsdk.annotations.Inject;
import com.automationanywhere.commandsdk.annotations.Next;
import com.automationanywhere.commandsdk.annotations.Pkg;
import
    com.automationanywhere.commandsdk.annotations.BotCommand.CommandType;
import
    com.automationanywhere.commandsdk.annotations.rules.GreaterThanEqualTo;
import com.automationanywhere.commandsdk.annotations.rules.NotEmpty;
import
    com.automationanywhere.commandsdk.annotations.rules.NumberInteger;
import com.automationanywhere.commandsdk.model.AttributeType;
import com.automationanywhere.commandsdk.model.DataType;
```

2. Create the POJO class with the business logic.

Ensure that the POJO has a method and returns a boolean value. This will act as the comparison method.

```
@BotCommand(commandType=CommandType.Iterator)
@CommandPkg(return_label = "Return the value in variable",
    node_label = ": {{times}} times",
    label = "Iterator demo", description = "Iterate number of times",
    name = "iteratorTypeDemo", return_type = DataType.NUMBER)
public class IteratorTypeDemo {
    @Idx(index = "1", type = AttributeType.NUMBER)
    @Pkg(label = "times", default_value = "10", default_value_type =
        DataType.NUMBER)
    @GreaterThanEqualTo("0")
    @NumberInteger
    @NotEmpty
```

```

    @Inject
    private Double times = 10d;

    private Double counter = 0d;

    @HasNext
    public boolean hasNext() {
        return counter < times;
    }

    @Next
    public Value<Double> next() throws Exception{
        if (counter >= times)
            throw new Exception("Counter '" + counter + "' is exceed the times
            limit '" + times + "'");

        counter++;
        NumberValue result = new NumberValue();
        result.set(counter);
        return result;
    }

    public void setTimes(Double times) {
        this.times = times;
    }
}

```

3. Annotate the POJO class to enable it for the Automation 360 iterator and to create a package.

```

@BotCommand(commandType = CommandType.Iterator)
@CommandPkg(return_label = "Return the value in variable",
node_label = ": {{times}} times",
label = "Iterator demo", description = "Iterate number of times",
name = "iteratorTypeDemo", return_type = DataType.NUMBER)
public class IteratorTypeDemo {

    private Double times = 10 d;
    private Double counter = 0 d;

    public boolean hasNext() {
        return counter < times;
    }
}

```

4. Annotate the hasNext () and next () method appropriately.

```

@HasNext
public boolean hasNext() {
    return counter < times;
}

@Next
public Value < Double > next() throws Exception {
    if (counter >= times)
        throw new Exception("Counter '" + counter + "' is exceed the times
        limit '" + times + "'");

    counter++;
    NumberValue result = new NumberValue();
    result.set(counter);
    return result;
}

```

```
}

```

The methods are named in easy-to-use way and are in parallel with the Java iterator interface. There is no restriction from the SDK side when naming methods.

In an iterator, do not use parameter methods, but use `setter injection`.

5. Annotate the variables with `Idx` and `Pkg`.

Add `@NotEmpty` to ensure the value is not null, and add `@GreaterThanEqualTo` to ensure the value is always greater than 0.

```
@Idx(index = "1", type = AttributeType.NUMBER)
@Pkg(label = "times", default_value = "10", default_value_type =
    DataType.NUMBER)
@GreaterThanEqualTo("0")
@NotEmpty
@Inject
private Double times = 10 d;
```

The attribute type number returns a `Double`.

This section contains code examples and explanations about how to code some basic bot capabilities.

Create a custom trigger (Example 1)

Package SDK provides tools to build your custom trigger that automate actions based on predefined conditions.

In this section, you will learn how to create an interval trigger using Automation Anywhere's Package SDK. A sample class called `TriggerDemo` is used to explain its functionality step by step. By the end, you will have a solid understanding of how to build your own custom triggers using Package SDK:

1. Dependencies and Package: The code sample utilizes various imports and is organized within the package `com.automationanywhere.botcommand.samples.trigger`.
2. Annotations: The code utilizes several annotations provided by Package SDK to define and configure the trigger. These annotations include:
 - a) `@BotCommand`: Specifies that this class represents a trigger. You specify this using the line `@BotCommand(commandType = BotCommand.CommandType.Trigger)`. When you specify that it is a command type `Trigger`, then it will be visible in the Trigger section within the Bot editor.
 - b) `@CommandPkg`: Provides metadata about the trigger, such as label, description, icon, and return type. The return type is always set to `RECORD` as shown in the following sample.
 - c) `@TriggerId`: Indicates the unique identifier assigned to each trigger instance.
 - d) `@TriggerConsumer`: Specifies the consumer function to be invoked when the trigger condition is met.
 - e) `@StartListen`: Marks the method responsible for starting the trigger.

Tip: `@StartListen` is used to execute a trigger and is analogous to `@Execute` in the case of a bot.

- f) `@StopAllTriggers`: Identifies the method used to cancel all triggers.
 - g) `@StopListen`: Identifies the method responsible for canceling a specific trigger.
3. **Trigger Execution**: The trigger execution logic is implemented in the `startTrigger` method using the `@StartListen` annotation. In this example, a `TimerTask` is scheduled to run at regular intervals defined by the user. When the scheduled time is reached, the `run` method of the `TimerTask` is executed, triggering the `consumer.accept`. The consumer accepts the `RecordValue` returned by the `getRecordValue` method.

Tip: `RecordValue` is also available to use within your bot logic.

4. **`getRecordValue` Method**: The `getRecordValue` method creates a `RecordValue` object and populates it with a list of schemas and values. In this example, the schema `triggerType` is added with the corresponding value `Interval Trigger`.
5. **`StopListen` and `StopAllTriggers` Methods**: These methods are annotated with `@StopListen` and `@StopAllTriggers`, respectively. They are responsible for canceling the trigger task(s) and removing them from the task map.
6. **Additional Helper Methods**: The code also includes getter and setter methods for the `triggerUid` and `consumer` variables.

```
package com.automationanywhere.botcommand.samples.trigger;

    ds.setPassword(password.getInsecureString());
    return ds;
}

    public static boolean checkRecordsExist(Connection con, String
query)
        throws SQLException {
        Statement stmt = null;
        try {
            stmt = con.createStatement();
            ResultSet rs = stmt.executeQuery(query);
            rs.last();
            if(rs.getRow() > 0)
                return true;
        } catch (SQLException e ) {
            throw new DemoException("Problem running statemnt", e);
        } finally {
            if (stmt != null) { stmt.close(); }
        }
        return false;
    }

public String getTriggerUid() {
    return triggerUid;
}

public void setTriggerUid(String triggerUid) {
    this.triggerUid = triggerUid;
}

public Consumer getConsumer() {
    return consumer;
}

public void setConsumer(Consumer consumer) {
    this.consumer = consumer;
}
}
```

In the above code sample describes the various methods and annotations used to create and manage the trigger. By understanding the code and its functionality, you are now equipped to create your own interval triggers using Package SDK. Experiment with different intervals and trigger actions to automate your business processes effectively.

The above article is a just a sample, and you need to refine and customize it further based on your specific requirements and target audience.

Create a custom trigger (Example 2)

The example shows how to create a trigger in Automation 360 that allows you to create tasks that will be executed at specified intervals.

A trigger launches a bot when certain conditions are met and waits until conditions have changed or stopped. When the conditions of the trigger are matched, the run method is called to signal the trigger.

Required annotations

For creating a trigger, the following annotations are required:

Annotation	Usage
BotCommand	Use the BotCommand annotation with the trigger as <code>commandType</code> . This ensures that the plain old Java object (POJO) is suitable for creating the trigger with Automation 360.
CommandPkg	These values are used when creating a package. Provide a name, label, and description to the annotation.
TriggerId	A trigger ID, which is required for stopping the trigger.
TriggerConsumer	Specifies the consumer function to be invoked when the trigger condition is met.
StartListen	Starts the trigger listener.
StopAllTriggers	Identifies the method used to cancel all triggers.
StopListen	Identifies the method responsible for canceling a specific trigger..

Use case - Timer Trigger

The following use case shows how to create a timer trigger that triggers a bot at regular intervals. The `Demo Trigger` command sample explained here is a trigger command that allows you to create and manage triggers based on user-specified intervals. This trigger can be used to execute tasks at regular intervals.

Command Information

```
@BotCommand(commandType = BotCommand.CommandType.Trigger)
@CommandPkg(label = "Demo Trigger", description = "Demo Trigger", icon
= "email.svg", name = "demoTrigger",
    return_type = RECORD, return_name = "TriggerData",
    return_description = "Available keys: triggerType")
```

- Command Type: Trigger
- Label: Demo Trigger
- Description: Demo Trigger
- Icon: email.svg
- Name: demoTrigger
- Return Type: RECORD
- Return Name: TriggerData
- Return Description: Available keys: triggerType

Class Structure

The `TriggerDemo` class is a singleton class that manages the trigger tasks. It stores the tasks in a map using the `triggerId` as the key. Once the trigger condition is met, the `run` method of the associated `Runnable` is called to signal the trigger.

Class Variables

- `taskMap`: A static `ConcurrentHashMap` that stores multiple trigger tasks.
- `TIMER`: A static `Timer` used for scheduling the trigger tasks.
- `triggerUid`: Annotated with `@TriggerId`, it represents the unique identifier for the trigger.
- `consumer`: Annotated with `@TriggerConsumer`, it is the consumer that will accept the trigger data.

Methods

- `startTrigger`: Annotated with `@StartListen`, this method starts the trigger. It takes an interval parameter (in seconds) to specify the trigger activation interval. It creates a new `TimerTask` that calls the `run` method of the associated `Runnable` when executed. The `TimerTask` is added to the `taskMap` with the `triggerUid` as the key, and it is scheduled to run at the specified interval.
- `getRecordValue`: A private method that creates and returns a `RecordValue` containing the trigger data. The trigger data includes a schema with a single key "triggerType" and its corresponding value "Interval Trigger".
- `stopAllTriggers`: Annotated with `@StopAllTriggers`, this method cancels all trigger tasks and clears the `taskMap`.
- `stopListen`: Annotated with `@StopListen`, this method cancels a specific trigger task identified by the `triggerUid` parameter and removes it from the `taskMap`.
- Setter methods: `setTriggerUid` and `setConsumer` are setter methods for the `triggerUid` and `consumer` variables, respectively.

 * user
 * specified intervals.
 *
 */
@BotCommand(commandType = BotCommand.CommandType.Trigger)
@CommandPkg(label = "Demo Trigger", description = "Demo Trigger", icon
    = "email.svg", name = "demoTrigger",
    return_type = RECORD, return_name = "TriggerData", return_description
    = "Available keys: triggerType")
public class TriggerDemo {

    // Map storing multiple tasks
    private static final Map<String, TimerTask> taskMap = new
    ConcurrentHashMap<>();
    private static final Timer TIMER = new Timer(true);

    @TriggerId
    private String triggerUid;
    @TriggerConsumer
    private Consumer consumer;
```

```

/*
 * Starts the trigger.
 */
@StartListen
public void startTrigger(@Idx(index = "1", type =
AttributeType.NUMBER)
@Pkg(label = "Please provide the interval to trigger in seconds",
default_value = "120", default_value_type = DataType.NUMBER)
@GreaterThan("0")
@NumberInteger
@NotEmpty
Double interval) {
    TimerTask timerTask = new TimerTask() {

        @Override
        public void run() {
            consumer.accept(getRecordValue());
        }
    };

    taskMap.put(this.triggerUid, timerTask);
    TIMER.schedule(timerTask, interval.longValue());
}

private RecordValue getRecordValue() {
    List<Schema> schemas = new LinkedList<>();
    List<Value> values = new LinkedList<>();
    schemas.add(new Schema("triggerType"));
    values.add(new StringValue("Interval Trigger"));

    RecordValue recordValue = new RecordValue();
    recordValue.set(new Record(schemas, values));
    return recordValue;
}

/*
 * Cancel all the task and clear the map.
 */
@stopAllTriggers
public void stopAllTriggers() {
    taskMap.forEach((k, v) -> {
        if (v.cancel()) {
            taskMap.remove(k);
        }
    });
}

/*
 * Cancel the task and remove from map
 *
 * @param triggerUid
 */
@stopListen
public void stopListen(String triggerUid) {
    if (taskMap.get(triggerUid).cancel()) {
        taskMap.remove(triggerUid);
    }
}

public void setTriggerUid(String triggerUid) {
    this.triggerUid = triggerUid;
}

```

```

}

public void setConsumer(Consumer consumer) {
    this.consumer = consumer;
}

}

```

Example

Here's an example of using the Demo Trigger

```
demoTrigger.startTrigger(60.0);
```

This will start a trigger that runs every 60 seconds and calls the associated consumer with the trigger data.

To stop the trigger, you can use the following methods:

- `demoTrigger.stopAllTriggers()`: This method will stop all active triggers.
- `demoTrigger.stopListen(triggerUid)`: This method will stop a specific trigger identified by the `triggerUid`.

Note: The `triggerUid` is a unique identifier for each trigger and is assigned automatically when a trigger is created.

This section contains code examples and explanations about how to code some basic bot capabilities.

Create a custom trigger (Example 3)

The example shows how to create an event-based trigger (`SimpleMessageListenerContainer`) using the Package SDK.

Event-based triggers - Push mechanism

The trigger waits for an event to occur, for example, a message listener to start listening.

- An event details are stored in the memory and a message listener waits for a message.
- When the event occurs, it runs the `consumer.accept(<RecordValue Instance>)` method and triggers an associated bot..

The following example shows how to create a simple `ActiveMQ` message listener (`SimpleMessageListenerContainer`) to demonstrate the trigger push mechanism.

```

@BotCommand(commandType = BotCommand.CommandType.Trigger)
@CommandPkg(label = "JMS Trigger", description = "JMS Trigger", icon =
    "jms.svg", name = "jmsTrigger",
    return_type = RECORD, return_name = "TriggerData", return_description
    = "Available keys: triggerType")
public class JMSQueue implements SessionAwareMessageListener {

    // Map storing multiple MessageListenerContainer

```

```
private static final Map<String, MessageListenerContainer> taskMap =
new ConcurrentHashMap<>();

@TriggerId
private String triggerUid;
@TriggerConsumer
private Consumer consumer;

//This method is called by MessageListenerContainer when a message
arrives.
// At this point, the trigger get enabled
@Override
public void onMessage(javax.jms.Message message, Session session)
throws JMSEException {
    consumer.accept(getRecordValue());
}

private RecordValue getRecordValue() {
    List<Schema> schemas = new LinkedList<>();
    List<Value> values = new LinkedList<>();
    schemas.add(new Schema("triggerType"));
    values.add(new StringValue("JMSQueue"));

    RecordValue recordValue = new RecordValue();
    recordValue.set(new Record(schemas, values));
    return recordValue;
}
/*
 * Starts the trigger.
 *
 * Use this method to setup the trigger, such as, setup the
MessageListenerContainer and start it.
 */
@StartListen
public void startTrigger(@Idx(index = "1", type = AttributeType.TEXT)
@Pkg(label = "Provide the broker URL")
@NotEmpty
String brokerURL, @Idx(index = "2", type = AttributeType.TEXT)
@Pkg(label = "Provide the queue name")
@NotEmpty
String queueName) {

    if (taskMap.get(triggerUid) == null) {
        synchronized (this) {
            if (taskMap.get(triggerUid) == null) {
                SimpleMessageListenerContainer messageListenerContainer = new
SimpleMessageListenerContainer();
                messageListenerContainer.setConnectionFactory(new
PooledConnectionFactory(brokerURL));
                messageListenerContainer.setDestinationName(queueName);
                messageListenerContainer.setMessageListener(this);
                messageListenerContainer.start();
                taskMap.put(triggerUid, messageListenerContainer);
            }
        }
    }
}
}
```

```

/*
 * Cancel all the tasks and clear the map.
 */
@stopAllTriggers
public void stopAllTriggers() {
    taskMap.forEach((k, v) -> {
        v.stop();
        taskMap.remove(k);
    });
}

/*
 * Cancel the tasks and remove from the map
 *
 * @param triggerUid
 */
@stopListen
public void stopListen(String triggerUid) {
    taskMap.get(triggerUid).stop();
    taskMap.remove(triggerUid);
}

public String getTriggerUid() {
    return triggerUid;
}

public void setTriggerUid(String triggerUid) {
    this.triggerUid = triggerUid;
}

This section contains code examples and explanations about how to code some basic bot capabilities.

Add debug logs of custom packages to bot_launcher.log file

You can add logs using `log4j`. The dependency is already added in the package SDK sample `build.gradle` file. Review the logging info using `RadioTypeDemo.java` file.

Example 1: Logger info - Get region value using `RadioTypeDemo` class

1. Review the code example where the logger is added in the code, open the `RadioTypeDemo.java` file located at `<your latest package-sdk-2.0.9>\src\main\java\com\automationanywhere\botcommand\samples\commands\basic\types`

```

@BotCommand
@CommandPkg(label = "[[RadioTypeDemo.label]]",

```

```

description = "[[RadioTypeDemo.description]]", icon = "sample.svg",
name = "radioTypeDemo")
public class RadioTypeDemo {

    private static Logger logger =
    LogManager.getLogger(RadioTypeDemo.class);

    @Execute
    public void getRegionValue(@Idx(index = "1", type =
    AttributeType.RADIO, options = {
        @Idx.Option(index = "1.1", pkg = @Pkg(label =
        "[[RadioTypeDemo.region.1.1.label]]", value = "us_east")),
        @Idx.Option(index = "1.2", pkg = @Pkg(label =
        "[[RadioTypeDemo.region.1.2.label]]", value = "us_west")),
        @Idx.Option(index = "1.3", pkg = @Pkg(label =
        "[[RadioTypeDemo.region.1.3.label]]", value = "us_central"))
    })
    @Pkg(label = "[[RadioTypeDemo.region.label]]")
    @NotEmpty
    String region) {
        logger.info("Selected region is {}", region);
    }
}

```

2. Build a simple bot from the Automation 360 Demo package and select a radio group: **Radio Demo**.
3. Select an appropriate region, such as, US East.
4. Save and run the bot.
5. Access the folder where the logs were generated, the default log location: C:\ProgramData\AutomationAnywhere\BotRunner\Logs\Bot_Launcher.log.
If the logs get roll back from the Bot_Launcher.log file, then logs will create a folder based on the month when they were created, for example, 2021-May. Inside this folder, the logs will continue to generate.
6. Open the Bot_Launcher.log file and review the log info for the **RadioTypeDemo** and **selected region is us_east**.

Example 2: Assigning a value to clipboard

The following example accepts a user input or a variable and assigns it to clipboard.

```

@BotCommand
@CommandPkg(label = "Copy to", icon="assigntoclipboard.svg", name =
"assignToClipboard", description
= "Accepts user input or a variable and assigns it to Clipboard",
node_label="{{value}}")
public class AssignToClipboard {

    private static Logger logger =
    LogManager.getLogger(AssignToClipboard.class);

    @Execute
    public static void assign(@Idx(index = "1", type = TEXT) @Pkg(label =
    "Value") @NotEmpty String
        value) {

        logger.trace("Assigning '{}' value to clipboard.", value);
    }
}

```

```
}

```

Handle sessions in a custom package

You can extract a session using a session name from the SessionsMap. In the same package, you can use sessions to pass information between actions, but not to other packages.

Configure the following attributes

- Apply an annotation to the class field and add a corresponding public setter.
- Retrieve the SessionsMap using the Sessions attribute.
- Set the variable type as Map<String, Object>.
- Set the attributeType: TEXT or SESSION. If type = TEXT, it is a regular session; if type = SESSION, it is a sharedSession.

Start a new session

```
@BotCommand
@CommandPkg(label = "Start session", name = "startSession", description
= "Start new session",
icon = "pkg.svg", node_label = "start session {{sessionName}}|") public
class Start {

    @Sessions
    private Map<String, Object> sessions;

    @Execute
    public void start(@Idx(index = "1", type = TEXT) @Pkg(label =
"Session name",
    default_value_type = STRING, default_value = "Default") @NotEmpty
String sessionName) {

        // Check for existing session
        if (sessions.containsKey(sessionName))
            throw new
BotCommandException(MESSAGES.getString("xml.SessionNameInUse",
sessionName));

        // Do some operation

        // Create new session
        sessions.put(sessionName, new Session(operation));
    }
    public void setSessions(Map<String, Object> sessions) {
        this.sessions = sessions;
    }
}
```

```
}

```

End a session

```
@BotCommand
@CommandPkg(label = "End session", name = "endSession", description =
  "End session", icon =
  "pkg.svg", node_label = "End session {{sessionName}}|")
public class EndSession {
    @Sessions
    private Map<String, Object> sessions;
    @Execute
    public void end(
        @Idx(index = "1", type = TEXT) @Pkg(label = "Session name",
        default_value_type = STRING,
        default_value = "Default") @NotEmpty String sessionName) {

        sessions.remove(sessionName);
    }
    public void setSessions(Map<String, Object> sessions) {
        this.sessions = sessions;
    }
}

```

Add a session

In the below example, string objects are used (although in real actions, you can use complex objects).

```
@BotCommand
@CommandPkg(label = "[[SessionDemo.label]]", description =
  "[[SessionDemo.description]]", icon = "sample.svg", name =
  "sessionDemo")
public class SessionDemo {

    // Sessions are provided as a Map. Actions can add or remove entries
    // in this
    // Map.
    // The choice to reuse/overwrite/delete/add any Object in this Map
    // belongs to
    // the actions, and the framework makes no assumption regarding it.
    @Sessions
    private Map<String, Object> sessionMap;

    @Execute
    public void execute(@Idx(index = "1", type = TEXT)
    @Pkg(label = "[[SessionDemo.name.label]]")
    @NotEmpty
    String name) {
        if (!sessionMap.containsKey(name))
            sessionMap.put(name, "Some Value");
    }
}

```

```

}

// Ensure that a public setter exists.
public void setSessionMap(Map<String, Object> sessionMap) {
    this.sessionMap = sessionMap;
}
}

```

Set a session variable

The below example shows how to develop an action (for example, Set session variable). In the action, the session details are retrieved and stored as a session variable so that the information can be used within a specific package.

```

@BotCommand
@CommandPkg(label = "[[SessionDemo2.label]]", description =
    "[[SessionDemo2.description]]", icon = "sample.svg", name =
    "SessionDemo2",
return_type = DataType.STRING)
public class SessionDemo2 {

    // Sessions are provided as a Map. Actions can add or remove entries
    in this
    // Map.
    // The choice to reuse/overwrite/delete/add any Object in this Map
    belongs to
    // the actions, and the framework makes no assumption regarding it.
    @Sessions
    private Map<String, Object> sessionMap;

    @Execute
    public Value<?> execute(@Idx(index = "1", type = TEXT)
    @Pkg(label = "[[SessionDemo2.name.label]]")
    @NotEmpty
    String name) {
        if (sessionMap.containsKey(name)) {
            return new StringValue(sessionMap.get(name));
        }
        return new StringValue("session does not exist");
    }
    // Ensure that a public setter exists.
    public void setSessionMap(Map<String, Object> sessionMap) {
        this.sessionMap = sessionMap;
    }
}

```

Related concepts

[Package SDK examples](#) on page 3354

This section contains code examples and explanations about how to code some basic bot capabilities.

Configure shared session using Package SDK

Package SDK provides configuration for the SDK users to create and use shared sessions. Sessions are seamlessly shared between different bots to share resources between them. This means that if a session has been created, the other Task Bots can read and update the session and vice versa.

Share session between parent and child

The following section describes creating a shared session. The parent GlobalSessionDemoUpperCaseParent returns a Session value to the global session and is used by the child bot GlobalSessionDemoUpperCaseChild.

Note: Place the three classes below in the following location: <PackageSDK>\src\main\java\com\automationanywhere\botcommand\samples\commands\basic

1. Create the following POJO class DemoForSession that implements CloseableSessionObject.

```
package
  com.automationanywhere.botcommand.samples.commands.basic.GlobalSessionSampleProj

import
  com.automationanywhere.toolchain.runtime.session.CloseableSessionObject;

import java.io.IOException;

public class DemoForSession implements CloseableSessionObject
{
    public void setClose(boolean close) {
        this.close = close;
    }

    boolean close=false;
    public String getDemo() {
        return demo;
    }

    public void setDemo(String demo) {
        this.demo = demo;
    }
    public DemoForSession(String demo){
        this.demo=demo;
    }
    String demo;

    @Override
    public boolean isClosed() {
        return close;
    }

    @Override
    public void close() throws IOException {

    }
}
```

2. Add the `@BotCommand` annotation to make a class as an Action in the Control Room. For more information on annotations, see [Annotations](#) on page 3396.

```
@BotCommand
```

3. Add the `@CommandPkg` annotation to define all the UI related components - labels, description, icon, return_type, and name. The elements `return_label`, `return_settings`, `return_type`, and `return_required` belonging to the `@CommandPkg` ensures that the `SESSION` is returned by the parent bot.

```
@CommandPkg (
    //Unique name inside a package and label to display.
    name = "GlobalSession", label = "Global session uppercase parent",
    node_label = "Shared session parent node label", description =
    "Shared session parent description", icon = "pkg.svg",

    //Return type information. return_type ensures only the right kind
    of variable is provided on the UI.
    return_label = "Return the parent session",
    return_settings = {ReturnSettingsType.SESSION_TARGET},
    return_type = SESSION,
    return_required = true)
```

4. Create the `GlobalSessionDemoUpperCaseParent` object. The `GlobalSessionDemoUpperCaseParent` gets a lower case string input from the action's input, converts it to an upper case string and store the result in the `SessionValue`.
 - Annotate the method with `@Execute` to execute the method during compilation.

```
package
    com.automationanywhere.botcommand.samples.commands.basic.GlobalSessionSamplePr

import com.automationanywhere.botcommand.data.impl.SessionValue;
import com.automationanywhere.commandsdk.annotations.*;
import
    com.automationanywhere.commandsdk.annotations.rules.NotEmpty;
import com.automationanywhere.commandsdk.model.ReturnSettingsType;
import org.apache.logging.log4j.LogManager;
import org.apache.logging.log4j.Logger;

import java.util.Map;

import static
    com.automationanywhere.commandsdk.model.AttributeType.TEXT;
import static
    com.automationanywhere.commandsdk.model.DataType.SESSION;

//BotCommand makes a class eligible for being considered as an
action.
@BotCommand

//CommandPks adds required information to be disalable on GUI.
@CommandPkg (
    //Unique name inside a package and label to display.
    name = "GlobalSession", label = "Global session uppercase
parent",
    node_label = "Shared session parent node label", description =
    "Shared session parent description", icon = "pkg.svg",
```

```

//Return type information. return_type ensures only the right
kind of variable is provided on the UI.
return_label = "Return the parent session",
return_settings = {ReturnSettingsType.SESSION_TARGET},
return_type = SESSION,
return_required = true)
public class GlobalSessionDemoForStringUpperCaseParent {
private static Logger logger =
LogManager.getLogger(GlobalSessionDemoForStringUpperCaseParent.class);

//Identify the entry point for the action. Returns a SessionValue
because the return_type is SESSION.
@Execute
public SessionValue action(
//Idx 1 would be displayed first, with a text box for entering
the value.
@Idx(index = "1", type = TEXT)
//UI labels.
@Pkg(label = "Enter string in lower case")
//Ensure that a validation error is thrown when the value is
null.
@NotEmpty
String firstString) {
String result = firstString.toUpperCase();
DemoForSession demoForSession= new DemoForSession(result);
return SessionValue
.builder()
.withSessionObject(demoForSession)
.build();
}
}

```

5. Create the GlobalSessionDemoUpperCaseChild object. The GlobalSessionDemoUpperCaseChild gets a lower case string input from the action's input, converts it to upper case and concatenates it with the SessionValue received from the parent bot.

```

package
com.automationanywhere.botcommand.samples.commands.basic.GlobalSessionSampleProject;

import com.automationanywhere.botcommand.data.Value;
import com.automationanywhere.botcommand.data.impl.StringValue;
import
com.automationanywhere.botcommand.samples.commands.basic.Uppercase;
import com.automationanywhere.commandsdk.annotations.*;
import com.automationanywhere.commandsdk.annotations.rules.NotEmpty;
import
com.automationanywhere.commandsdk.annotations.rules.SessionObject;
import com.automationanywhere.commandsdk.model.AttributeType;
import com.automationanywhere.commandsdk.model.DataType;
import org.apache.logging.log4j.LogManager;
import org.apache.logging.log4j.Logger;

import static
com.automationanywhere.commandsdk.model.AttributeType.TEXT;
import static
com.automationanywhere.commandsdk.model.DataType.STRING;

```

```

//BotCommand makes a class eligible for being considered as an
action.
@BotCommand

//CommandPks adds required information to be dispalable on GUI.
@CommandPkg(
    //Unique name inside a package and label to display.
    name = "GlobalSessionChild", label = "Global session upper case
child",
    node_label = "Global session child node label",
    description = "Global session child description", icon =
"pkg.svg",

    //Return type information. return_type ensures only the right kind
of variable is provided on the UI.
    return_label = "Return the concatenated string to", return_type =
STRING, return_required = true)
public class GlobalSessionDemoUpperCaseChild {
    private static Logger logger =
    LogManager.getLogger(Uppercase.class);

    @Execute
    public Value<String> action(
        //Idx 1 would be displayed first, with a text box for entering
the value.
        @Idx(index = "1", type = TEXT)
        //UI labels.
        @Pkg(label = "Enter a sting in lower case to concatenate")
        //Ensure that a validation error is thrown when the value is
null.
        @NotEmpty
        String sourceString,
        @Idx(index = "2", type = AttributeType.SESSION)
        @Pkg(label = "sharedSession", description = "sharedSession",
        default_value = "Default", default_value_type =
DataType.SESSION)
        //Using the sessionObject annotation here as its a consumer class
        @SessionObject
        DemoForSession session) {

        //Business logic
        String result = sourceString.toUpperCase();
        logger.info("session: {}", session);
        return new StringValue(result+session.getDemo().toUpperCase());
    }
}

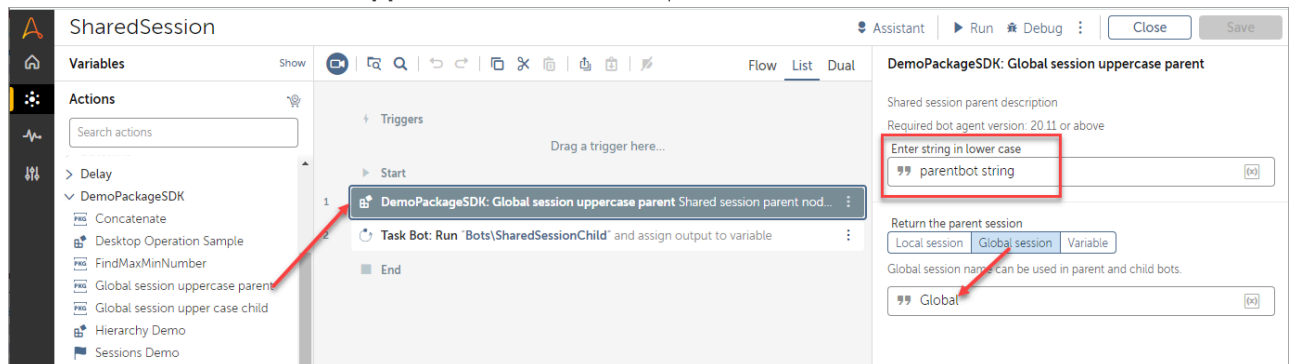

```

6. Build and upload the custom package to the Control Room. For more information on uploading the package, see [Using the package SDK](#) on page 3348.
7. Create a bot by using the Global session uppercase parent action.
 - a) Enter a lower case string (For example: parentbot string)
 - b) Enter a name for the session. The parent bot returns the value to the Global session (For example: Global)

8. Create a Task Bots by using the **Global session upper case child** action. You will be able to input a lower case string and also get the string from the shared parent session. Concatenate the parent and child strings.
9. Use a **Message box** to show the output.

10. Now call the **Global session upper case child** into the parent.

11. Run the parent bot and you will see the message box showing the value from the Child bot which it derived using the Shared global session.

Build bots to share session details using Package SDK

A shared session enables you to reuse actions between Task Bots that run concurrently, for example, using the same Excel file to pass values.

Ensure you have the following to build a Task Bot:

- Access to the Control Room
- Credentials with **AAE_Basic** permissions
- A development license, which enables you to create and run Task Bots
- Your workstation is a registered device in the Control Room
- An Excel file that you want to use in the shared session actions

1. Log in to the Control Room.
2. Create three Task Bots that will share the shared session actions.

3. Create a new childSession2 variable of **Type > Session** and **Session type > MS Excel session**, select **Use as input**, and then click **Apply**.
4. On the left pane, click **Automation**.
A list of available and forms is displayed.
5. Click the **Create a bot** icon.
6. Create a new bot called childBot2.
 - a) In the **Name** field, enter childBot2.
 - b) In the Actions pane, find **Excel Advanced**, and drag **Get current worksheet name** to the Bot editor.
 - c) In **Session name > Shared session**, enter **F2 > childSession2**, and in **Assign the output to variable**, select **prompt-assignment**.

7. Create a new parentSession variable of **Type > Session** and **Session type > MS Excel session**, and then click **Apply**.
8. Create a new bot called parentSession, and click **Create & Edit**.
9. In the Actions pane, find **Excel Advanced**, and drag **Open** to the Bot editor.
 - a) In **File path**, select **Desktop file**, click **Browse**, and navigate to the Excel file that you want to use.
 - b) In **Session name**, retain **Default**.
 - c) Click **Save**.

10. Create a new childSession1 variable of **Type > Session** and **Session type > MS Excel session**, select **Use as input**, and then click **Apply**.
11. Create a new bot called childBot1.
 - a) In the **Name** field, enter childBot1.
 - b) In the Actions pane, find **Excel Advanced**, and drag **Get single cell** to the Bot editor.
 - c) Select **Active cell** in **Session name**, and select **Local name**, enter **F2**, and then in **Store cell content to**, select **prompt-assignment**.

12. In the Actions pane, find **Excel Advanced**, and drag **Set session variable** to the Bot editor.
 - a) In **Session name**, retain **Default**.
 - b) In **Save session to a variable**, select **parentSession**.

13. From the Actions pane, find **Task Bot**, and drag **Run** to the Bot editor.
 - a) In **Task Bot to run**, select **Control Room file**, click **Choose**, and then **Browse**, and select **childBot1**.
 - b) In **Input values**, select **Set childSession1**, enter **F2**, and select **parentSession**.

14. In the Actions pane, find **Excel Advanced**, and drag **Close**, select **Session name** as **Local name**, and retain **Default**.
15. In the Actions pane, find **Message box**. In **Enter the message to display**, enter **F2**, and then select **prompt-assignment**.
16. From the Actions pane, select **Task Bot**, and drag **Run** to the Bot editor.
 - a) In **Task Bot to run**, select **Control Room file**, click **Choose**, and then **Browse**, and then select **childBot2**.

b) In **Input values**, select **Set childSession2**, enter **F2**, and select **childSession1**.

17. In the Actions pane, find **Message box**. In **Enter the message to display**, enter **F2**, and select **prompt-assignment**.

18. Save all three bots and run the **parentSession** Task Bot.

The following three messages are displayed:

Single cell value from parent bot:1

Current worksheet name of excel opened in parent bot: Sheet1 <name of the sheet>

Your bot has run successfully!

[Package SDK examples](#) on page 3354

This section contains code examples and explanations about how to code some basic bot capabilities.

Create a custom bot command exceptions

You can use the `BotCommandException` class to create a custom Bot Command Exceptions for error reporting. You can throw and catch them in your methods. With custom exceptions, you can specify detailed error messages and have more custom error handling in your catch blocks.

Example: Define a custom `BotCommandException`

This example defines a custom exception called `DemoException`. This class extends `BotCommandException` and implements several constructors by invoking the equivalent amount of constructors in the super-class. You only need to implement the constructors that you want to use, and you can ignore the rest of the constructors in the super-class (Java classes do not inherit constructors, so you must re-implement them).

```
package com.automationanywhere.botcommand.samples.exceptions;

import com.automationanywhere.botcommand.data.Value;
import com.automationanywhere.botcommand.exception.BotCommandException;

import java.util.Optional;

public class DemoException extends BotCommandException {
    public DemoException(String message, Throwable cause) {
        super(message, cause);
    }

    public DemoException(String message) {
        super(message);
    }

    public DemoException(Throwable cause) {
        super(cause);
    }

    public DemoException(String message, Throwable cause,
        Optional<Value> outputVariables) {
```

```

        super(message, cause, outputVariables);
    }
}

```

Many constructors of the `BotCommandException` class accept a `java.lang.Throwable` object as an argument. You can implement similar constructors and pass `Throwable` objects (usually other exception objects) to your custom exceptions when you want your custom exception to include the exception that caused it.

The following example shows how to use the exception that you defined in the previous example.

```

public static boolean checkRecordsExist(Connection con, String
query)
    throws SQLException {

    Statement stmt = null;
    try {
        stmt = con.createStatement();
        ResultSet rs = stmt.executeQuery(query);
        rs.last();
        if(rs.getRow() > 0)
            return true;
    } catch (SQLException e) {
        throw new DemoException("Problem running statement", e);
    } finally {
        if (stmt != null) { stmt.close(); }
    }

    return false;
}

```

If an exception is found, then this would catch the exception and through an error statement as defined in the example.

Annotations

This section provides reference information about the annotations used to create Automation Anywhere packages.

- [Creation and function annotations](#) on page 3397
List of the available creation and function annotations.
- [Validation annotations](#) on page 3400
Validates annotated strings and values used in the Java code.
- [Configure and use credential allow password annotation](#) on page 3401
Use the provided **CredentialTypeDemo.java** package SDK file and configure the **CredentialAllowPassword** annotation for the password field in Automation 360 locker actions.

Related tasks

[Set up the Java project](#) on page 3344

Set up an integrated development environment (IDE) for Java, including Automation Anywhere custom annotations to develop an action package that you can upload to your Control Room.

[Develop a sample package](#) on page 3347

Develop your own package and upload it to an Control Room to provide custom actions for bots.

Creation and function annotations

List of the available creation and function annotations.

Annotation: BotCommand

Makes the type eligible to be treated as an action. You can define three types of actions **commandType** property.

- CommandAction
- Condition
- Iterator

Examples:

- `@BotCommand(commandType = BotCommand.CommandType.Iterator)`
- `@BotCommand(commandType = Condition)`
- `@BotCommand(commandType = Variable)`
- `@BotCommand(commandType = Trigger)`

Annotation: CommandPkg

Makes the type eligible for creation of action **package.json**. This annotation must be used with **BotCommand** to take effect. **Pkg** participates in the activity only when this annotation is present.

Example:

```
@CommandPkg(label = "Create", name = "createFile",
description = "Creates a file", node_label = "{{filePath}}",
icon = "file.svg")
```

Annotation: ConditionTest

Participates in the **Condition** execution. This annotation can only be used when the **BotCommand** has **commandType** set as **Condition**. Only one method needs to be annotated when **BotCommand** annotation is present on the type. Failure to do so will result in the compilation error.

Annotation: Execute

Participates in the execution of **BotCommand**. Exactly one method needs to be annotated when **BotCommand** annotation is present on the type. Failure to do so will result in the compilation error.

Example:

```
@Execute public void create( @Idx(index = "1", type = FILE) @LocalFile
    @Pkg(label =
    "File", description = "e.g. C:\\MyDoc\\MyFile.doc") @NotEmpty String
    filePath,
    @Idx(index = "2", type = CHECKBOX) @Pkg(label = "Overwrite an existing
    file")
    @NotEmpty Boolean isOverwrite) { createFile(filePath, isOverwrite); }
```

Annotation: GlobalSessionContext

Can only be applied to member variables and fetches the GlobalSessionContext through a setter.

Example:

```
@com.automationanywhere.commandsdk.annotations.GlobalSessionContext
private GlobalSessionContext globalSessionContext;

public void setSessionMap(Map < String, Object > sessionMap) {
    this.sessionMap = sessionMap;
}
public void
setGlobalSessionContext (com.automationanywhere.bot.service.GlobalSessionContext
globalSessionContext) {
    this.globalSessionContext = globalSessionContext;
}
```

Annotation: HasNext

Participates in the execution of **Iterator**. This annotation can only be used when the **BotCommand** has commandType set as **Iterator**. Requires the **Next** annotation to be present. One method needs to be annotated when **BotCommand** annotation is present on the type. Failure to do so will result in the compilation error.

Annotation: Index

Makes the annotated element part of hierarchy utilized for the code and resource generation. Without this annotation no **BotCommand** related element annotations would be processed.

Annotation: Idx.Option

An option represents the elements that would play in the hierarchy, but lend the values to the parents.

Examples:

- RADIO

```
@Idx(index = "1", type = RADIO, options = {
    @Idx.Option(index = "1.1", pkg = @Pkg(node_label
    = "[[Delay.delayType.1.1.node_label]]", label =
    "[[Delay.delayType.1.1.label]]", value = REGULAR)),
    @Idx.Option(index = "1.2", pkg = @Pkg(node_label
    = "[[Delay.delayType.1.2.node_label]]", label =
    "[[Delay.delayType.1.2.label]]", value = RANDOM))
})
@Pkg(label = "[[Delay.delayType.label]]", default_value = "REGULAR",
    default_value_type = DataType.STRING)
@Inject
private String delayType;
```

- SELECT

```
@Idx(index = "2", type = SELECT, options = {
    @Idx.Option(index = "2.1", pkg = @Pkg(label =
    "[[LaunchWebsite.browser.2.1.label]]", value = "DEFAULT")),
    @Idx.Option(index = "2.2", pkg = @Pkg(label =
    "[[LaunchWebsite.browser.2.2.label]]", value =
    "INTERNET_EXPLORER")),
    @Idx.Option(index = "2.3", pkg = @Pkg(label =
    "[[LaunchWebsite.browser.2.3.label]]", value = "FIREFOX")),
    @Idx.Option(index = "2.4", pkg = @Pkg(label =
    "[[LaunchWebsite.browser.2.4.label]]", value = "CHROME"))
}) @Pkg(label = "[[LaunchWebsite.browser.label]]", default_value
    = "DEFAULT", default_value_type = DataType.STRING)
@NotEmptyString(browser)
```

Annotation: Inject

Makes an element eligible for injection into the annotated type object. The injection is setter-based so a corresponding setter in the type is **mandatory**. The injected values would form the **BotCommand** parameter map using the name provided in **Idx**.

Annotation: Next

Participates in the **Iterator** execution. This annotation can only be used when the **BotCommand** has `commandType` set as **Iterator**. Requires the `HasNext` annotation to be present. One method needs to be annotated when **BotCommand** annotation is present on the type. Failure to do so will result in compilation error.

Annotation: Pkg

Makes an element to participate in the `package.json` creation. This annotation is ignored when **Idx** is not present.

Related concepts

[Annotations](#) on page 3396

This section provides reference information about the annotations used to create Automation Anywhere packages.

Validation annotations

Validates annotated strings and values used in the Java code.

Annotation	Description
CodeType	The MIME-type of the code to format.
CredentialOnly	Can only accept a credential value, no string allowed.
Equals	Validates that the given string is equal to the annotated string variable.
FileExtension	Validates the annotated string value that ends with the supported extension type.
GreaterThan	Validates that the annotated number variable value is always greater than the given numeric value.
GreaterThanEqualTo	Validates that the annotated number variable value is always greater than or equal to the given numeric value.
LessThan	Validates that the annotated number variable value is always less than the given numeric value.
LessThanEqualTo	Validates that the annotated number variable value is always less than or equal to the given numeric value.
LocalFile	Can only accept local paths and no file expression.
MatchesRegex	Validates that the annotated string value matches the given regular expression.

Annotation	Description
NotEmpty	Validates and throws an exception when the annotated variable value is null. <pre>@Execute public Value<Double>length (@Idx (index="1", type=TEXT) @Pkg (label="Source string") @NotEmpty String sourceString) {}</pre>
NotEquals	Validates that the given string is not be equal to the annotated string variable.
NotMatchesRegex	Validates that the annotated string value does not match the given regular expression.
NumberInteger	Ensures the UI accepts only integers and not double for the annotated variable value.
RepositoryFile	Can only accept repository paths and no file expression.
VariableNotPackage	Cannot choose a variable from this package.
VariablePackage	Can only choose a variable from this package.
VariableSubType	The variable subtype must match.
VariableType	The variable type must match.
VariableUserDefined	Can only choose a user-defined variable.

Related concepts

[Annotations](#) on page 3396

This section provides reference information about the annotations used to create Automation Anywhere packages.

Configure and use credential allow password annotation

Use the provided **CredentialTypeDemo.java** package SDK file and configure the **CredentialAllowPassword** annotation for the password field in Automation 360 locker actions.

Example: Review the CredentialTypeDemo.java

Use the following **CredentialTypeDemo.java** file located at: <latest package-sdk>2.0.9\src\main\java\com\automationanywhere\botcommand\samples\commands\basic\types as an example on how to configure the credential attribute.

```
@BotCommand
@CommandPkg (label = "[[CredentialTypeDemo.label]]",
description = "[[CredentialTypeDemo.description]]", icon =
"sample.svg", name = "credentialTypeDemo")
public class CredentialTypeDemo {
```

```

private static Logger logger =
LogManager.getLogger(CredentialTypeDemo.class);

/**
 * To accept credentials the {@link AttributeType} in index should be
 * {@link AttributeType.CREDENTIAL CREDENTIAL}. A {@link SecureString}
is
 * provided for any credentials type.
 */
@Execute
public void printCredentials(@Idx(index = "1", type =
AttributeType.CREDENTIAL)
@Pkg(label = "[[CredentialTypeDemo.credentials.label]]")
SecureString credentials) {
    // SecureString provides multiple way to access the data inside.
    // Let's try to get the user name and print it in logs.

    // To get the username as String
    String userName = credentials.getInsecureString();
    logger.trace("User name from getInsecureString : {}", userName);
}

```

Example: Configure the credential attributes @Execute

Configure the index, type, label, optional description, and the credentialAllowPasswordAttribute. When creating a new or updating an existing package, use the **CredentialAllowPassword** annotation to allow the credential picker to pick a credential attribute marked as a password field.

```

@Execute
public void printCredentials(@Idx(index = "2", type =
AttributeType.CREDENTIAL)
@Pkg(label =
"[[CredentialTypeDemo.credentialsAllowPasswordAttribute.label]]")
@CredentialAllowPassword
SecureString credentialAllowPasswordAttribute) {
}

```

Configure the attributes in the Control Room

In the **Attribute name** field, enter **password** and an optional **description**, in **Input** field, select **Standard**, and enter the **value**. In the **Security** field, select **Use attribute only on Password or Masked fields**.

Use the credential attribute in Control Room

- In the **Pick a credential** field, select **credential**. In the **Attribute** field, select **username**. In the **Provide the credential for the user (optional)** field, select **Credential**, and then **Pick**.
- In the **Attribute** field, select **password**. In the **Provide the credential for the password (optional)** field, select **Credential**, and then **Pick**.

Build and test a demo package and bot

This practical how to section demonstrates that creating, changing, and managing packages allow you to customize actions and efficiently manage packages for all Control Room users.

Here is a list of all the necessary tasks to create a package, add the package to your Control Room, and verify your work in a bot. Complete the listed tasks in order.

Tip: Click the title of each step to go the detailed task.

Step 1 Update related workflow and build files on page 3403	Follow the detailed steps for updating workflow and build files for this project using your integrated development environment (IDE).
Step 2 Choose your favorite IDE	You can compile a package from the IDE of your choice. Here are two possible ways you can compile a package:
Compile a demo JAR file from the Eclipse UI on page 3404	Use Eclipse to compile a demo JAR file that you can add as a package to your Control Room.
Compile a demo JAR file from the command line on page 3404	Compile the demo Java code provided with this software development kit.
Step 3 Add your demo package to the Control Room on page 3405	Users with Upload package permission can add packages to the Control Room for use by all Bot Creators.
Step 4 Create a demo bot with the demo package on page 3406	Create a bot using the demo package to verify the actions that were created.
Step 5 Change the Java file used to create the package JAR file on page 3407	Modify and compile the Java code used to create a package to fix issues and create new functionality.
Step 6 Upload new demo package on page 3407	Package management allows you to upload package updates. The new package has the same name, but a different version number.
Step 7 Update the demo bot with the updated package on page 3408	Update bots to use specific package versions.

Update related workflow and build files

Follow the detailed steps for updating workflow and build files for this project using your integrated development environment (IDE).

Complete all the steps for project setup detailed in [Set up the Java project](#) on page 3344.

This task shows you how to update the appropriate build and workflow files.

1. Open the project "A2019DemoPackage" that you created in [Set up the Java project](#) on page 3344.
You can find the project file in the directory where you extract the zip files to, for example `c:\A2019DemoPackage`.
2. From inside the project, Open the **settings.gradle** file.
3. Replace the project name with `A2019DemoPackageFirstnameLastname`.
If your name is John Developer it would look like this, `A2019DemoPackageJohnDeveloper`.
4. Open **src > main > resources > package.template**.

5. Update the **name**, **label**, and **description** values.

Original package.template	Updated package.template
<pre>{ "name": "A2019DemoPackage", "label": "A2019DemoPackage", "description": "Provides actions for A2019DemoPackage operations.", "group": "", "artifactName": "", "packageVersion": "", "codeVersion": "", "commands": [] }</pre>	<pre>{ "name": "A2019DemoPackageFirstnameLastname", "label": "A2019DemoPackageFirstnameLastname", "description": "A2019DemoPackageFirstnameLastname", "group": "", "artifactName": "", "packageVersion": "", "codeVersion": "", "commands": [] }</pre>

6. Save the changes.

After you have setup the build files, you need to compile the demo Java code, [Compile a demo JAR file from the command line](#) on page 3404.

Compile a demo JAR file from the Eclipse UI

Use Eclipse to compile a demo JAR file that you can add as a package to your Control Room.

Before starting this task complete the steps in [Update related workflow and build files](#) on page 3403.

Build a package file using a Gradle project in the Eclipse IDE.

1. Import the A2019DemoPackage as a Gradle project, **File > Import > Gradle > Existing Gradle Project** and click **Finish**.
2. From the **Gradle Tasks** tab, go to **<your project> > build** and run the following tasks in order.
 - a) **<your project> > build > clean**
 - b) **<your project> > build > build**
3. From the **Gradle Tasks** tab, go to **<your project. > shadow** and run the **shadowJar** task.

Your compiled package file is located in file:\A2019DemoPackage\build\libs\. The package file has named after your project name (<your project>-1.0.0.jar).

To add your custom package to your Control Room follow the instructions in [Add packages to the Control Room](#) on page 1842.

[Build and test a demo package and bot](#) on page 3402

This practical how to section demonstrates that creating, changing, and managing packages allow you to customize actions and efficiently manage packages for all Control Room users.

Compile a demo JAR file from the command line

Compile the demo Java code provided with this software development kit.

Before starting this task complete the steps in [Update related workflow and build files](#) on page 3403.

1. Open a terminal window and go to where the **gradlew.bat** file is located.
...\A2019DemoPackage > gradlew.bat
2. In the terminal window, type `gradlew.bat clean build shadowJar`, and press Enter. Here is an example of what you see:

```
> . . .\A2019DemoPackage>gradlew.bat clean build shadowJar

> Task :compileJava
Note: Starting hierarchy discovery for
'com.automationanywhere.botcommand.demo.Concatenate'
Note: Starting non-hierarchical element discovery for

Note: Starting non-hierarchical element discovery for
'com.automationanywhere.botcommand.demo.Uppercase'
Note: Starting Command Java generator...
Note: Starting Json generator...
Note: Generating command json for Concatenate
Note: Generating command json for Uppercase

> Task :commandCodeGen
mergeJsonFiles: updatePackage: group com.automationanywhere ,
artifactName A2019DemoPackageFirstnameLastname ,
packageVersion 1.0.0-20190816-101906
```

The compiled file is located in `file:\ \A2019DemoPackage\build\libs\`.

To add your custom package to your Control Room follow the instructions in [Add packages to the Control Room](#) on page 1842.

Related concepts

[Build and test a demo package and bot](#) on page 3402

This practical how to section demonstrates that creating, changing, and managing packages allow you to customize actions and efficiently manage packages for all Control Room users.

Add your demo package to the Control Room

Users with **Upload package** permission can add packages to the Control Room for use by all Bot Creators.

Before you can upload a package, you need valid user login credentials with **Upload package** permission for the Control Room you are adding the package to.

To add a package from a source other than Bot Store, follow these steps:

1. Navigate to **Manage > Packages**.
2. Click **Add package**.
3. Click **Browse**.
4. Locate and select the package to add to the Control Room.
Packages are Java Archive (JAR) files that contain actions used to create bots.
5. Click **Upload package**.
6. On the **Bots > Packages > Confirm package** page, choose any of the following options:

- **Accept, enable and set as default:** Uploads and enables the selected package, and sets it to the default package for the Control Room.
- **Accept and enable:** Uploads and enables the package, but the package is not set as the default package. Bot Creators have to specifically select non-default packages to use them for creating bots.
- **Accept but disable:** Uploads and disables the new package.

Choosing **Reject** stops the upload process.

To add a package from Bot Store, see the following video:

7. After installation, click **Administration > Packages** to verify that the package is added.
When you add or update a package in the Control Room, a notification is also sent through the **Notifications** icon. This notification is sent to the Control Room users who have the **View package** permission. For more information, see [Capabilities supporting notifications](#) on page 2132.

After successfully uploading your demo package, create a bot to test the actions you just created. For detailed step about how to create a bot, read [Create a demo bot with the demo package](#) on page 3406

Create a demo bot with the demo package

Create a bot using the demo package to verify the actions that were created.

Here are the minimum prerequisites for building this demo bot:

- Access to a Control Room
- User credentials with **AAE_Basic** permission
- Your local host (workstation) is a registered device in the Control Room
- Ensure that the demo package A2019DemoPackageFirstnameLastname is available in the Control Room

This task uses the following actions and components:

- Uppercase (demo package)
 - [Message box](#)
 - [Variables overview](#) on page 2235
1. On the left pane, click **Automation**.
A list of available and forms is displayed.
 2. Click the **My Task Bot** icon.
 3. Type MyDemoBot1 in the **Name** field.
 4. Click **Create & Edit**.
 5. Expand **A2019DemoPackageFirstnameLastname** and double **Uppercase**.
 6. Type `hello world, go be great!` in all lower case letters.
 7. Create the variable `vMyDemoVar1`.
 8. Click **Apply**.
 9. Add a **Message box** and insert the variable `vMyDemoVar1` in the **Enter the message to display** field.
 10. Click **Apply** and **Save**.
 11. Click the **Run** icon.

A message box with "HELLO WORLD, GO BE GREAT!" in all upper case letters is displayed. The custom action **Uppercase** converted all the letters from lower case letters to upper case letters.

The task, [Change the Java file used to create the package JAR file](#) on page 3407, gives instruction on how to modify the **Uppercase** action to convert all upper case letters to lower case letters.

Change the Java file used to create the package JAR file

Modify and compile the Java code used to create a package to fix issues and create new functionality.

1. Open the project "A2019DemoPackage."
2. From inside the project, open **src/main/java/com.automationanywhere.botcommand.samples.commands/basic/Uppercase**.
3. Change the function from upper case to lower case.

Original function	Updated function
<pre>String result = "ALL".equals(caseType) ? sourceString.toUpperCase() : (sourceString .substring(0, 1).toUpperCase() + sourceString .substring(1));</pre>	<pre>String result = "ALL".equals(caseType) ? sourceString.toLowerCase() : (sourceString .substring(0, 1).toUpperCase() + sourceString .substring(1));</pre>

4. Save the changes and re-compile the package.

You can now upload the changed package to the Control Room. [Upload new demo package](#) on page 3407

Related tasks

[Upload new demo package](#) on page 3407

Package management allows you to upload package updates. The new package has the same name, but a different version number.

Upload new demo package

Package management allows you to upload package updates. The new package has the same name, but a different version number.

You need **AAE_Basic** permissions to create and edit bots.

1. From the **Bots > Packages** page, click the **Add package** icon.
2. **Browse** to the location of the package to add.
Packages are Java Archive (JAR) files that contain actions used to create bots.
3. Select the package to add, and click **Upload package**.
4. On the **Bots > Packages > Confirm package** page, click **Accept, enable and set as default**.

You can select specific packages to be used from within a bot. Read detailed steps about managing packages for specific bots in [Update the demo bot with the updated package](#) on page 3408 task.

Update the demo bot with the updated package

Update bots to use specific package versions.

- Access to the bot created in the task [Create a demo bot with the demo package](#) on page 3406.
 - **AAE_Basic** permission.
1. On the left pane, click **Automation**.
A list of available and forms is displayed.
 2. Double-click **MyDemoBot1**, the demo bot you created in an earlier task.
 3. Click the **vertical eclipses** in the upper right corner and click **Packages**.
 4. Expand the row for the package **A2019DemoPackageFirstnameLastname**.
 5. From the drop-down list of package versions, select the **Default** version.
Because you added the updated package as the default version, you are selecting the new version of the package you created.
 6. Click **Change Version** and **Save**.
 7. On the left pane, click **Automation**.
A list of available and forms is displayed.
 8. Double-click **MyDemoBot1**.
 9. Click **A2019DemoPackageFirstnameLastname** and type `HELLO WORLD, GO BE GREAT!` in the **Source string** field.
 10. Click **Apply** and **Save**.
 11. Click the **Run** icon.
The message box displayed by the bot displays "hello world, go be great!" This verifies that the action from the updated package is being used.

Build and test a custom package

Use IntelliJ to build a custom package and use Automation 360 actions to test the package.

Complete the following tasks to create a custom package, upload the package to your Control Room, and build a bot to test it. After you update the IntelliJ files, create directories, and create and update java classes, you can build the custom package.

1. [Build a custom package in IntelliJ](#) on page 3409
Use IntelliJ to import the Automation Anywhere SDK, create a new package, and compile a JAR file that you can upload to your Control Room.
2. [Add custom package to your Control Room](#) on page 3415
Use the compiled JAR file and upload it to the Control Room.
3. [Create a bot to test the custom package](#) on page 3416
Use Automation 360 actions to create a bot to test the custom package.

Note: The customer support team does not provide guidance for the code written by customers.

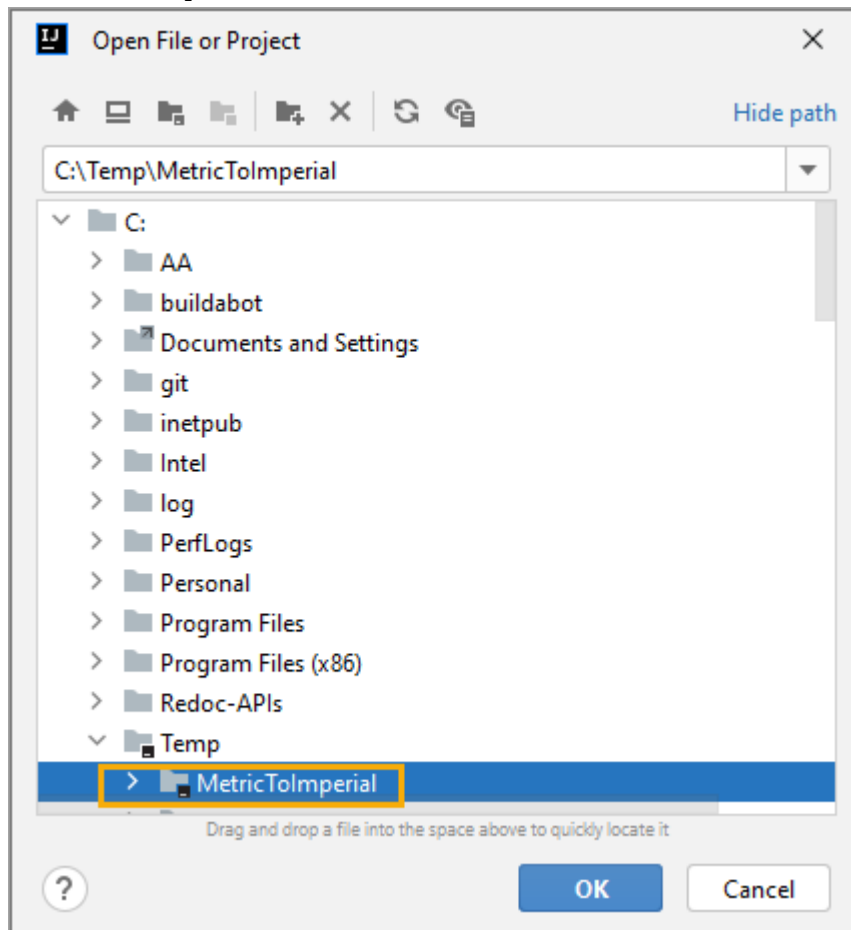

Note: [Create custom packages](#)

Build a custom package in IntelliJ

Use Java IntelliJ to create and compile a JAR file that you can upload as a package to your Control Room in Automation 360.

A basic understanding of JDK and Java IntelliJ is required in order to build an action package. Ensure you have installed the following software and files:

- [Java SE Development Kit 11 Downloads](#)
 - Java IDE [Community edition of IntelliJ](#)
1. Download the latest release of the Automation Anywhere Package SDK. For the latest release of the Package SDK, see - [Previous Package SDK Release Notes](#) on page 922.
 2. Unzip the contents of the SDK package to any of your local directory.
 3. Rename the folder from `A360-package-sdk-<version number>` to `MetricToImperial`.
 4. In IntelliJ IDEA, go to **File > Open** and open the project at `C:\<SavedLocation>\MetricToImperial`.

5. Open the `settings.gradle` file in the project root. Set the `rootProject.name = 'MetricToImperial'`

6. Open the package.template file located at **src > main > resources > package.template**.
7. Change the package name from A360DemoPackage to MetricToImperial.

Click the **Sync** button in IntelliJ to update the project.

8. Update the package name in **locales json**: go to **src > main > resources > locales > en_US.json**.
 - a) Open the **en_US.json** file and update the **required** label field from A360DemoPackage to MetricToImperial. Update the optional description.
 - b) Delete all other remaining lines in the **en_US.json** file.
9. Delete the sample packages, go to **src > main > java > com.automationanywhere.botcommand**, and delete the **samples.commands** and delete the **samples** packages.

10. Create a new package, right-click on java folder and select **New > Package**. Enter the new package name as `metrictoimperial.commands`.
11. Create a new **Java Class**, right-click on the `metrictoimperial.commands` package, and select **New > Java Class**. Enter the name for the new class `CMtoINCH`:
 - a) Open the **CMtoINCH** class. Copy and paste the following code above the class definition statement:

```
import static
    com.automationanywhere.commandsdk.model.DataType.NUMBER;
//BotCommand makes a class eligible for being considered as an
action.
@BotCommand
//CommandPks adds required information to be disalable on GUI.
@CommandPkg(
    //Unique name inside a package and label to display.
    name = "CMtoInch", label = "[[CMtoINCH.label]]",
    node_label = "[[CMtoINCH.node_label]]", description =
    "[[CMtoINCH.description]]", icon = "ruler_icon.svg",
    //Return type information. return_type ensures only the
right kind of variable is provided on the UI.
    return_label = "[[CMtoINCH.return_label]]", return_type =
NUMBER, return_required = true)
```

- b) Inside the **CMtoINCH** class, copy and paste the following code:

```
//Identify the entry point for the action. Returns a Value<String>
because the return type is String.
@Execute
public NumberValue action(
    //Idx 1 would be displayed first, with a text box for
entering the value.
    @Idx(index = "1", type = AttributeType.NUMBER)
    //UI labels.
    @Pkg(label = "[[CMtoINCH.CMInput.label]]")
    //Ensure that a validation error is thrown when the value is
null.
    @NotEmpty
    Double CMInput) {
    //Internal validation, to disallow empty inputs. No null check
needed as we have NotEmpty on CMInput.
    if (!"".equals(CMInput.toString().trim()))
        throw new BotCommandException("Input of CM is required");
    Number result;
    try {
        //Conversion logic
        result = CMInput * 0.393701;
    } catch (Exception e) {
        //Throw custom error message
        throw new BotCommandException("Unable to convert " +
CMInput.toString() + "cm to inches");
    }
    //Return NumberValue.
    return new NumberValue(result);
}
```

To import the namespaces, click the highlighted red notations and press ALT+ENTER key and select **Import** which automatically imports namespaces based on the annotations and datatypes.

```

4 import com.automationanywhere.commandsdk.annotations.*;
5 import com.automationanywhere.commandsdk.annotations.rules.NotEmpty;
6 import com.automationanywhere.commandsdk.model.AttributeType;
7
8 import static com.automationanywhere.commandsdk.model.DataType.NUMBER;
9 //BotCommand makes a class eligible for being considered as an action.
10 3 usages
11 @BotCommand
12 //CommandPks adds required information to be dispalable on GUI.
13 @CommandPkg(
14     //Unique name inside a package and label to display.
15     name = "CMtoInch", label = "[[CMtoINCH.label]]",
16     node_label = "[[CMtoINCH.node_label]]", description = "[[CMtoINCH.description]]", icon = "ruler_icon.svg",
17     //Return type information. return_type ensures only the right kind of variable is provided on the UI.
18     return_label = "[[CMtoINCH.return_label]]", return_type = NUMBER, return_required = true)
19 public class CMtoINCH {
20     //Identify the entry point for the action. Returns a Value<String> because the return type is String.
21     //usage
22     @Execute
23     public NumberValue action(
24         //Idx 1 would be displayed first, with a text box for entering the value.
25         @Idx(index = "1", type = AttributeType.NUMBER)
26         //UI labels.
27         @Pkg(label = "[[CMtoINCH.CMInput.label]]")
28         //Ensure that a validation error is thrown when the value is null.
29         @NotEmpty
30         Double CMInput) {
31         //Internal validation, to disallow empty inputs. No null check needed as we have NotEmpty on CMInput.
32         if (!"".equals(CMInput.toString().trim()))
33             throw new BotCommandException("Input of CM is required");
34         Number result;
35         try {
36             //Conversion logic
37             result = CMInput * 0.393701;
38         } catch (Exception e) {
39             //Throw custom error message
40             throw new BotCommandException("Unable to convert " + CMInput.toString() + " cm to inches");
41         }
42         //Return NumberValue.
43         return new NumberValue(result);
44     }
45 }

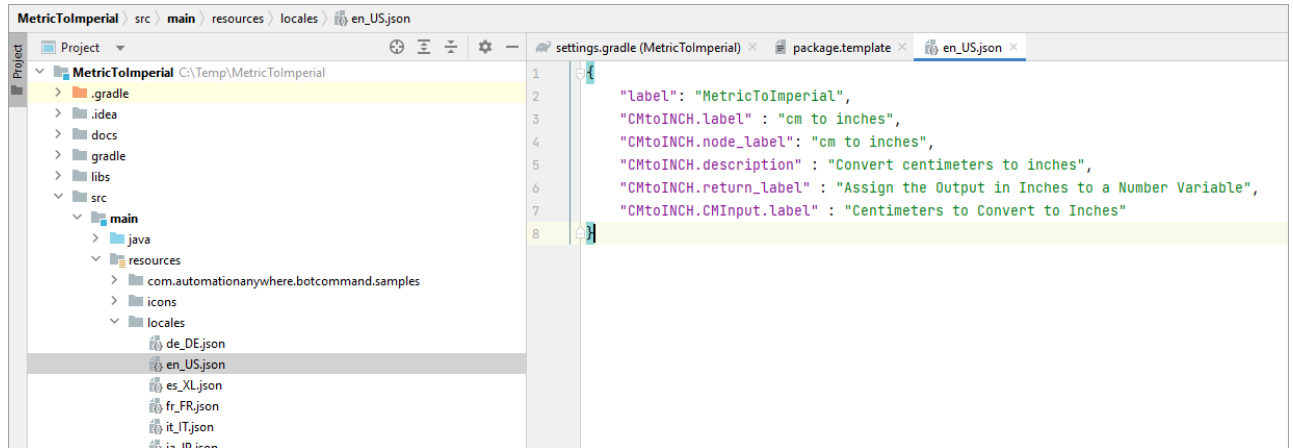

```

- Configure **en_US.json** file, go to **src > main > resources > locales > en_US.json** and add the following fields after the label and description values:

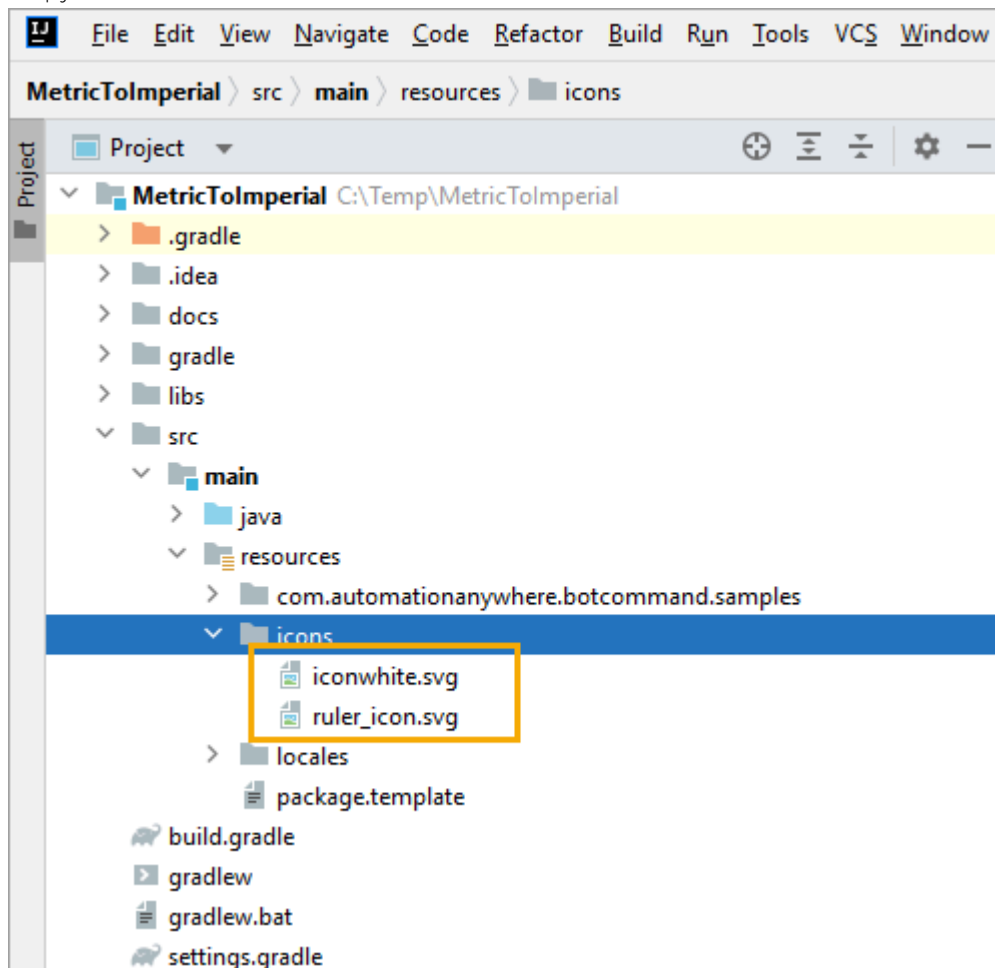

```

"CMtoINCH.label" : "cm to inches",
"CMtoINCH.node_label": "cm to inches",
"CMtoINCH.description" : "Convert centimeters to inches",
"CMtoINCH.return_label" : "Assign the Output in Inches to a Number Variable",
"CMtoINCH.CMInput.label" : "Centimeters to Convert to Inches"

```

13. Update the CommandPkg annotation. Download icons from Github.
- Download ruler_icon.svg from [github](#) and right-click the image and save the image as ruler_icon.svg.
 - Download iconwhite.svg from [github](#), right-click the image and save the image iconwhite.svg.
 - Copy both files into the **src > main > resources > icons** folder.

14. Open the `build.gradle` in the project root. After the dependencies section, but before the last closing tag, copy and paste the following code:

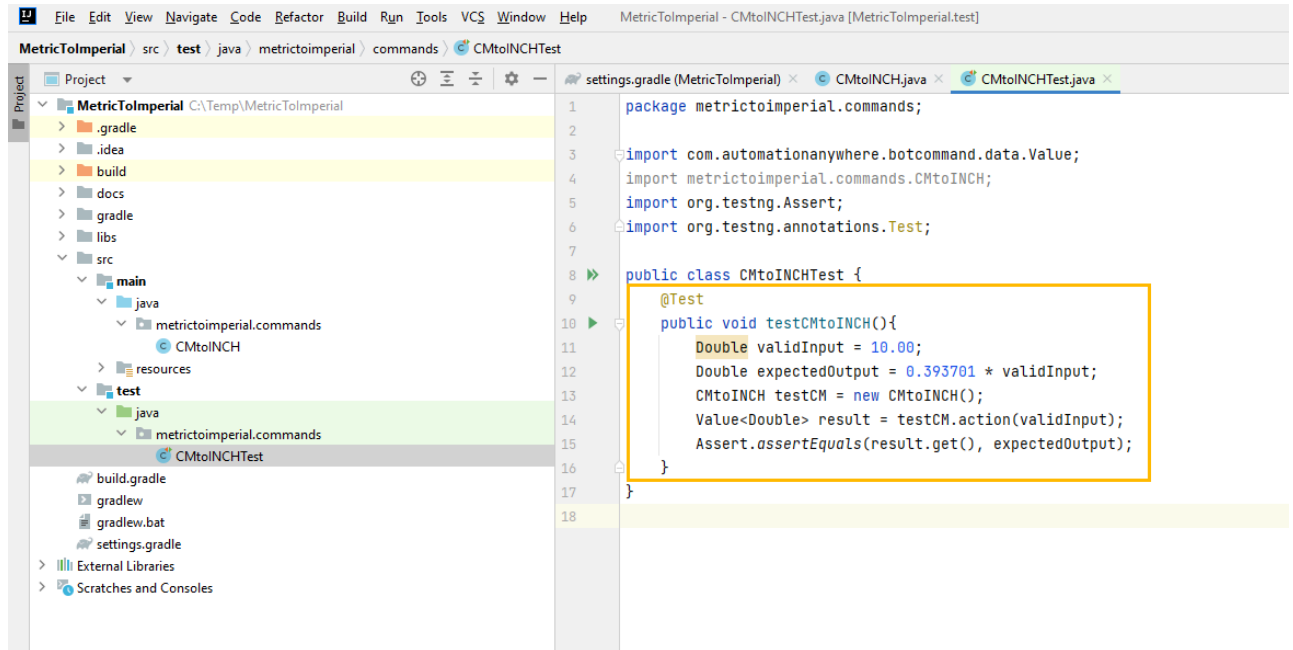

```
test {
    testLogging {
        exceptionFormat = 'full'
    }
    useTestNG() {}

    afterSuite { desc, result ->
        if (!desc.parent)
            println("${result.resultType} " +
                "${result.testCount} tests, " +
                "${result.successfulTestCount} successes, " +
                "${result.failedTestCount} failures, " +
                "${result.skippedTestCount} skipped")
    }
    maxHeapSize "3g"
}
```

15. Update the version number and remove dependencies that is not required for your project from `build.gradle`.
16. Create a new directory, right-click **src** and select **New > Directory**.
 - a) In the **Name** field, enter `test\java`, or select the **test\java** suggestion from the **Gradle Source Sets**.
 - b) Create a new package, right-click the `java` directory and select **New > Package**.
 - c) Enter the name for the newly created package: `metrictoimperial.commands`.
17. Create new Java class, right-click and select **New > Java Class**. Enter the name for the new class `CMtoINCHTest`.

Inside the `CMtoINCHTest` class, copy and paste the following code:

```
@Test
public void testCMtoINCH(){
    Double validInput = 10.00;
    Double expectedOutput = 0.393701 * validInput;
    CMtoINCH testCM = new CMtoINCH();
    Value<Double> result = testCM.action(validInput);
    Assert.assertEquals(result.get(), expectedOutput);
}
```

18. Save the project **File > Save All**.

19. Build the package.

You can use the IntelliJ UI or the command line. If you are using the command line:

- a) Open a terminal window and navigate to the `MetricToImperial` directory.
- b) To build the project, enter the following command: `gradlew.bat clean build shadowJar`

A `BUILD SUCCESSFUL` message appears.

Sometimes a build might fail because existing files could not be automatically deleted and a system message appears indicating the execution failed for the task: `clean`. If this occurs, close the explorer windows and run the build again.

[Add custom package to your Control Room](#) on page 3415

Add custom package to your Control Room

Use the compiled JAR file and upload it as a package to your Control Room in Automation 360.

- Complete the steps in [Build a custom package in IntelliJ](#) on page 3409.
 - Ensure you have the following:
 - Access to the Control Room.
 - Credentials with **AAE_Basic** permission or a custom role with permissions to add packages to the Control Room.
1. From Windows Explorer, go to `C:\Users\<<Username>\IdeaProjects\MetricToImperial\build\libs` and locate `MetricToImperial-1.0.0.jar`.
 2. Log in to your Control Room as a user with permissions to add a new package.
 3. Click **BOTS > Packages**.
 4. In the **All packages** page, move your mouse over the plus sign and click **Add package**.

5. In the **Add package** page, click **Browse** and locate the `MetricToImperial-1.0.0.jar` file. By default, the file is located at: `C:\Users\<<Username>\IdeaProjects\MetricToImperial\build\libs`.
6. Select the `MetricToImperial-1.0.0.jar` file and click **Open**.
7. Click **Upload Package**.
When you add a custom package to the Control Room, a notification is also sent to the Control Room users to notify about package updates. This notification is sent to the users who have the **View package** permission. For more information, see [#unique_258/unique_258_Connect_42_package-event](#) event notification.

Create a bot to test the custom package

Use the actions in Automation 360 to create a bot and test the custom package.

Ensure you have the following to build the bot:

- Access to the Control Room.
 - Credentials with **AAE_Basic** permission or with a custom role to build a bot.
 - Your workstation is a registered device in the Control Room.
 - Your package **MetricToImperial-1.0.0.jar** is available in the Control Room.
1. Log in to the Control Room.
 2. On the left pane, click **Automation**.
A list of available and forms is displayed.
 3. Click the **Create a bot** icon.
 4. In the **Name** field, enter `MetricToImperialTest`.
 5. Click **Create & Edit**.
 6. In the Actions pane, find **Metric to Imperial** and drag **Convert centimeters to inches** into the bot flow.
 - a) In the **CM to Convert** field, enter 1.
 - b) Click **Create variable** (next to the **Output** field) to create a new number variable.
 - c) In **Create Variable**, enter `nInchesOutput` and click **Create & Select**.
 - d) Click **Apply**.
 7. In the Actions pane, find the **Number** package and drag the **To String** command below **Convert centimeters to inches**.
 - a) In the **Enter a number** field, enter **F2** and select `nInchesOutput`.
 - b) In the **Enter number of digits after decimal** field, enter 5.

- c) In the **Assign the output to variable** field, select **prompt-assignment - String** from the drop-down list.
 - d) Click **Apply**.
8. From the Actions pane, drag **Message box**, click **F2** and insert the **prompt-assignment variable**.
 9. In the **Enter the message to display** field, click **F2** and select the **prompt-assignment variable**.
 10. Click **Apply** and **Save**.
 11. Click **Run**.
The bot displays the 0.39370 message, which is a successful build.

Using Python to parse JSON response

Use the Automation 360 Python script to execute Python functions to build a bot. Use the Python functions to parse the JSON response from a REST Web Services GET request.

Ensure you have the following to build the bot:

- Basic understanding of Python programming language.
- Basic experience with creating Automation Anywhere bots.
- Download and install Python 3.

[download Python](#)

Do one of the following:

- While installing the Python, make sure to select **Add Python x.xx to PATH** during the Python installation.

- Add a path to the Environment variable.

1. Log in to the Control Room.
2. On the left pane, click **Automation**.
A list of available and forms is displayed.
3. Click **Create a bot** icon.

4. In the **Name** field, enter `PythonTutorial`.
5. Click **Create & Edit**.
6. In the Actions pane, click **Variables** to create the following new variables:
 - a) Name `dResponse`, **Type** > **Dictionary** and **Subtype** > **String**.
 - b) Name `dRetrieveValue`, **Type** > **Dictionary** and **Subtype** > **Any**.
 - c) Name `dResponseBody`, **Type** > **String**.
 - d) Name `sFullName`, **Type** > **String**.
 - e) Name `sLocation`, **Type** > **String**.
 - f) Name `sTotalUserCount`, **Type** > **String**.
 - g) Name `nTotalUserCount`, **Type** > **Number**.
 - h) Name `nCurrentUser`, **Type** > **Number**.
 - i) Name `sCurrentUser`, **Type** > **String**.

- j) Name prompt-assignment, **Type > String**.
7. From the Actions pane, select **REST Web Services > Get method** and place it under the **Start** of the bot flow.
- a) In the **URI** field, enter <https://randomuser.me/api/?results=5&inc=name,email,location&nat=us>.
This is a sample API that returns random user details to the calling application.
- b) In the **Authentication Mode** drop-down list, select **No Authentication**.

The screenshot displays the Automation Anywhere interface. On the left, a bot flow is visible with six steps: 1. REST Web Services: Get meth... (highlighted with a red box), 2. String: Assign, 3. Python script: Open, 4. Python script: Execute function, 5. Dictionary: Put, and 6. String: To number. On the right, the configuration for the 'REST Web Services: Get method' action is shown. The 'URI' field is set to 'https://randomuser.me/api/?results=5&inc=na...', and the 'Authentication Mode' is set to 'No Authentication'. The 'Wait for action to complete' field is set to '60000'. The 'Assign the output to a variable' field is set to 'dResponse'.

REST Web Services: Get method

The GET method gets (reads) the information (in the form of an entity) that is identified by the Request URI.

Required bot agent version: 20.11 or above

URI

Enter the URI

a)

e.g https://domainname.com/resource/search?param1=value1¶m2=value2

Select credential as URI

Credential Variable

Pick...

Authentication Mode

b)

Header

Custom headers (optional)

Enabled	Name	Value
No headers		

Add header

Advanced options

Capture failure response

Allow insecure connection when using https

Warning: Transferred data may be visible to attackers

Wait for action to complete (in milliseconds)

60000

Increase this value if GET action times out

Assign the output to a variable

Multiple variables Dictionary

c)

Use response header name as key to fetch header value and 'Body' as key to fetch body of response

- c) In the **Assign the output to a variable** drop-down list, select **dResponse -Dictionary of Strings**.
8. From the Actions pane, click **String > Assign** action and drag it into the canvas below the **REST Web Services** action.
 - a) In the **Select the source string variable value** field, enter `$dResponse{Body}$`.

The screenshot displays the Automation Anywhere interface. On the left, the canvas shows a sequence of actions: a REST Web Services action (request for URI "https://rando..."), a "String: Assign" action (labeled "2.") which is highlighted with a red box, and a "Python script: Open" action (labeled "3."). On the right, the configuration pane for the "String: Assign" action is shown. It includes a description: "Assigns or concatenates the given strings" and "Required bot agent version: 20.11 or above". The "Select the source string variable(s)/ value (optional)" field contains the text "\$dResponse{Body}\$" with a purple callout 'a' pointing to it. The "Select the destination string variable" field contains a dropdown menu with "dResponseBody" selected and a purple callout 'b' pointing to it.

- b) In the **Select the destination string variable** drop-down list, select **dResponseBody - String**.
9. From the Actions pane, click **Python script > Open** and drag it into the canvas below the **String > Assign** action.
 - a) In the **Python** field, select **Manual input**.

The screenshot displays the Automation Anywhere interface. On the left, a workflow is visible with steps: 1. request for URI "https://rando...", 2. String: Assign, 3. Python script: Open (highlighted with a red box and callout 'a'), 4. Python script: Execute function "get_node_count" with param..., 5. Dictionary: Put, 6. String: To number, and 7. Loop. On the right, the "Python script: Open" configuration panel is shown. It includes a "New Python session" dropdown set to "Default", a "Python" section with "Manual input" selected, and a "Enter script here" text area containing Python code. Callout 'b' points to the code area, and callout 'c' points to the "Python runtime version" dropdown set to "3".

response_body[itemCount]['location']['state']

```

- c) In the **Python runtime version** field, retain the default value as **3**.
10. From the Actions pane, click **Python script > Execute function** and drag it into the canvas below the **Python script > Open** action.
- a) In the **Python session** field, retain **Default**.
- b) In the **Enter the name of function to be executed** field, enter `get_node_count`.
- c) In the **Arguments to the function** drop-down list, select **dResponseBody - String**.

- d) In the **Assign the output to a variable** drop-down list, select **sTotalUserCount - String**.
11. From the Actions pane, click **Dictionary > Put** and drag it into the canvas below the **Python script > Open** action.
- a) In the **Dictionary variable** field, select **dRetrieveValue -Dictionary**.
- b) In the **Associate to this key** field, enter `response`.

- c) In the **New value** drop-down list, select **dResponseBody - String**.
- d) In the **Assign previous value to a variable** drop-down list, select **prompt-assignment - String**.

The screenshot shows the configuration for the **Dictionary: Put** action. The canvas on the left displays a flow with the following steps:

1. Python script: Open (Python script of 28 lines from ...)
2. Python script: Execute function "get_node_count" with param...
3. **Dictionary: Put** (Variable value at key "respons...") - This step is highlighted with a red box.
4. Loop (Loop: \$nTotalUserCount\$ times)

The right pane shows the configuration for the **Dictionary: Put** action:

- a**: Dictionary variable dropdown set to `dRetrieveValue`.
- b**: Key text field set to `response`.
- c**: Value dropdown set to `dResponseBody`.
- d**: Assign previous value to variable (optional) dropdown set to `prompt-assignment`.

12. From the Actions pane, click **String** > **To number** and drag it into the canvas below the **Dictionary** > **Put** action.
 - a) In the **Enter the string** field, enter `$sTotalUserCount$`.
 - b) In the **Assign the output to a variable** drop-down list, select **nTotalUserCount - Number**.

The screenshot shows the configuration for the **String: To number** action. The canvas on the left displays a flow with the following steps:

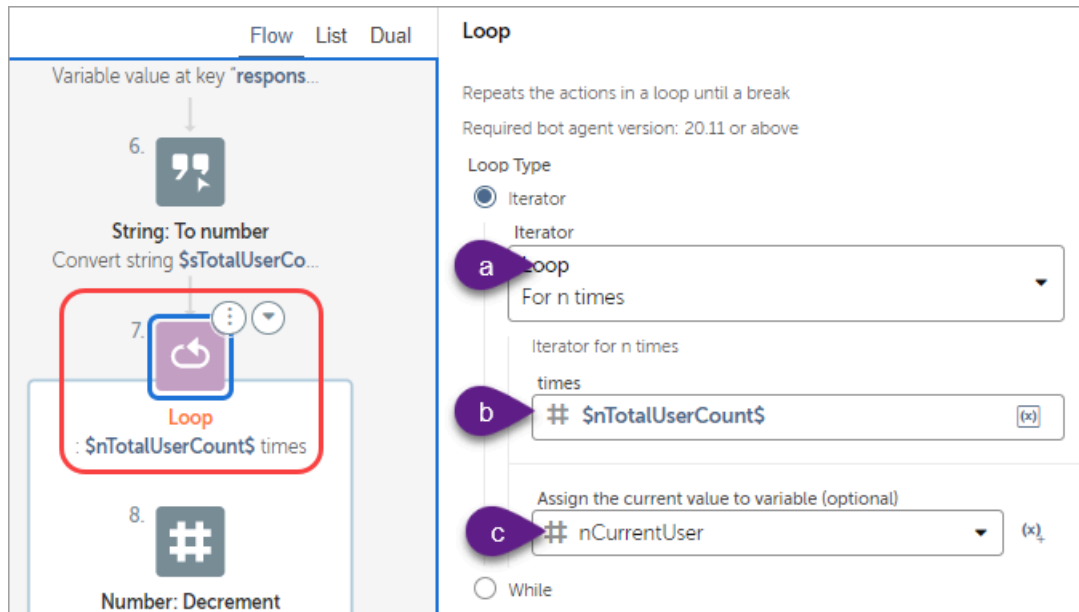

1. Dictionary: Put (Variable value at key "respons...")
2. **String: To number** (Convert string \$sTotalUserCo...) - This step is highlighted with a red box.
3. Loop (Loop: \$nTotalUserCount\$ times)

The right pane shows the configuration for the **String: To number** action:

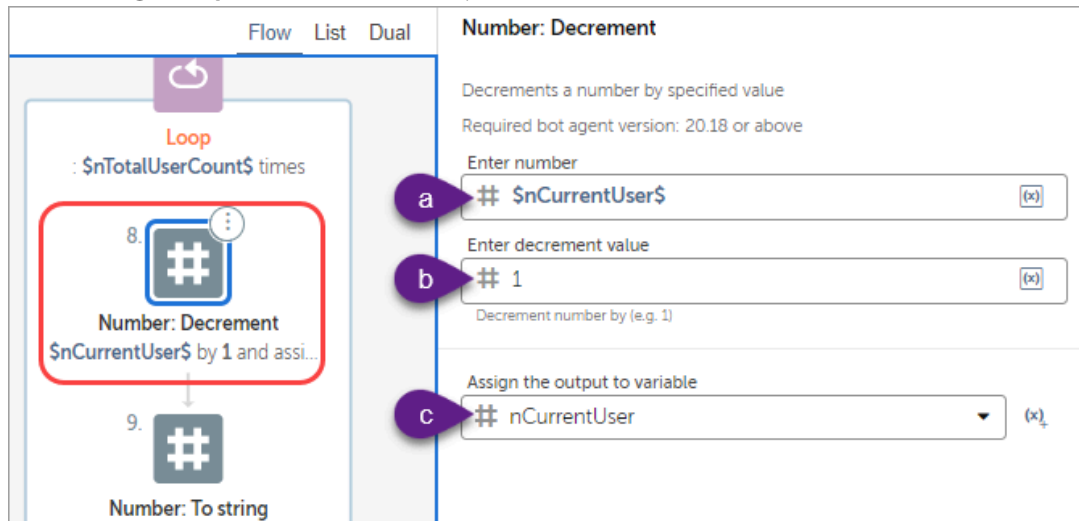

- a**: Enter the string text field set to `$sTotalUserCount$`.
- b**: Assign the output to variable dropdown set to `nTotalUserCount`.

13. From the Actions pane, click **Loop** > **Loop**.

- a) In the **Loop Type** > **Iterator**, select **For n times** from the drop-down list.
- b) In the **times** field, enter `$nTotalUserCount$`.
- c) In the **Assign the current value to a variable** drop-down list, select **nCurrentUser - Number**.

14. From the Actions pane, click **Number**, select **Decrement** and place it inside the **Loop** action.
 - a) In the **Enter number** field, enter `$nCurrentUser$`.
 - b) In the **Enter decrement value** field, enter 1.
 - c) In the **Assign output to a variable** drop-down list, select **nCurrentUser - Number**.

15. From the Actions pane, click **Number**, select **To string** and place it inside of the **Loop** action, below **Number** > **Decrement**.
 - a) In the **Enter a number** field, enter `$nCurrentUser$`.
 - b) In the **Enter number of digits after decimal** field, enter 0.

- c) In the **Assign output to a variable** drop-down list, select **sCurrentUser - String**.

16. From the Action pane, click **Dictionary > Put** and place it inside of the **Loop** action.

- In the **Dictionary variable** field, select **dRetrieveValue -Dictionary**.
- In the **Associate to this key** field, enter **count**.
- In the **New value** drop-down list, select **sCurrentUser - String**.
- In the **Assign previous value to a variable** drop-down list, select **prompt-assignment - String**.

17. From the Actions pane, click **Python script > Execute function** and place it inside of the **Loop** action.

- In the **Python session** field, retain **Default**.
- In the **Enter the name of function to be executed** field, enter **get_full_name**.
- In the **Arguments to the function** drop-down list, select **dRetrieveValue - Dictionary**.

- d) In the **Assign the output to a variable** drop-down list, select **sFullName - String**.

The screenshot displays the configuration for a Python script action. The left pane shows a flowchart with three steps: 11. Python script: Execute function "get_full_name" with parameter... (highlighted in a red box), 12. Python script: Execute function "get_location" with parameter..., and 13. Python script: Execute function "get_location" with parameter... The right pane shows the configuration for the selected Python script action. It includes fields for Python session (Default), function name (get_full_name), arguments (dRetrieveValue), and output variable (sFullName).

18. From the Actions pane, click **Python script > Execute function** and place it inside of the **Loop** action.

- In the **Python session** field, retain **Default**.
- In the **Enter the name of function to be executed** field, enter `get_location`.
- In the **Arguments to the function** drop-down list, select **dRetrieveValue - Dictionary**.
- In the **Assign the output to a variable** drop-down list, select **sLocation - String**.

The screenshot displays the configuration for a Python script action. The left pane shows a flowchart with three steps: 11. Python script: Execute function "get_full_name" with parameter..., 12. Python script: Execute function "get_location" with parameter... (highlighted in a red box), and 13. Message box "Full Name: \$sFullName\$ Loc...". The right pane shows the configuration for the selected Python script action. It includes fields for Python session (Default), function name (get_location), arguments (dRetrieveValue), and output variable (sLocation).

19. From the Actions pane, click **Message box** and place it inside of the **Loop** action.

- a) In the **Enter the message to display** field, enter the following:

```
Full Name: $sFullName$ Location: $sLocation$
```

- b) Select **Close message box after** > **Seconds**, enter 5.

The screenshot shows the configuration for a 'Message box' action. The left pane displays a flow with a Python script action followed by a 'Message box' action (step 13). The right pane shows the configuration for the 'Message box' action, including the window title, the message to display, and the scrollbar settings. Callouts 'a', 'b', and 'c' point to the window title, message to display, and scrollbar settings respectively.

20. From the Actions pane, click **Python script** > **Close** and place it outside of the **Loop** action.

- a) In the **Python session** field, retain **Default**.

The screenshot shows the configuration for a 'Python script: Close' action. The left pane displays a flow with a 'Python script: Close' action (step 14) followed by an 'End' action. The right pane shows the configuration for the 'Python script: Close' action, including the Python session name. Callout 'a' points to the Python session field.

21. Click **Save** to save your bot, and then click **Run**.

The bot runs, displaying five full user names with locations for approximately 5 seconds each before completing its successful execution.

If you get a Bot **Error** message, see the following sections for a solution: [Getting Bot Error while executing Python Script/Function \(A-People login required\)](#), [Getting Bot Error or True value in message box while executing Python Script \(A-People login required\)](#), or [An unexpected error occurred while executing Python Script command; Error code: bot.execution.error \(A-People login required\)](#).

Use JavaScript to build a bot to take user input

Use the JavaScript actions Automation 360 to execute JavaScript functions to build a bot. Use the actions to create a bot that takes user input and provides the appropriate output.

Ensure you have the following to build the bot:

- Basic understanding of JavaScript programming language.
 - Basic experience with creating Automation Anywhere bots.
1. Log in to the Control Room.
 2. On the left pane, click **Automation**.
A list of available and forms is displayed.
 3. Click **Create a bot** icon.
 4. In the **Name** field, enter `Hello User`.
 5. Click **Create & Edit**.
 6. In the Actions pane, click **Variables** to create the following new variables:
 - a) Name `lInputList`, **Type** > **List** and **Subtype** > **String**.
 - b) Name `sInputName`, **Type** > **String**.
 - c) Name `sOutput`, **Type** > **String**.
 7. From the Actions pane, click **Prompt** > **For value**:
 - a) In the **Prompt window capture** field, enter `Enter your name here`.
 - b) In the **Prompt message** field, enter `Please enter your name here`.
 - c) In the **Assign the output to a variable** drop-down list, select **sInputName - String**.
 8. From the Actions pane, click **List** > **Add item**:
 - a) In the **List variable** drop-down list, select **lInputList - List**.
 - b) In the **Item to be added** drop-down list, select **sInputName - String**.
 - c) In the **Add item** field, select **To end of list**.
 9. Create a new JavaScript file.
 - a) Open a notepad, and copy and paste the following code:

```
function response(str) {
  return "Hello "+ str
}
```
 - b) Save the file in your desktop as `Salutation.js`, and select **Save as type:** as **All Files**.
 10. From the Actions pane, click **JavaScript** > **Open**:
 - a) In the **JavaScript session** field, leave as **Default**.
 - b) In **JavaScript** > **Import existing file**, for the **JavaScript file** field, select **Desktop file**.
 - c) Click **Browse** and select the `Salutation.js` file from your desktop or where you saved the file.

- d) In the **Assign the output to a variable** drop-down list, select **sOutput - String**.
11. From the Actions pane, click **JavaScript > Run JavaScript**:
 - a) In the **Enter name of the function to be executed** field, enter `response`.
 - b) In the **Parameters** drop-down list, select **InputList - List**.
12. From the Actions pane, click **Message box**:
 - a) In the **Enter the message to display** field, enter `$sOutput$`.
13. Click **Save** to save your bot, and then click **Run**.
14. When the bot prompts to enter a name, enter the name and click **OK**.
A message from the bot appears: `Hello <User>`.

Bot developer recommendations

Automation Anywhere provides a flexible platform for bot and package development. The information in this topic provide guidelines and recommendations on how to structure and develop robust and reusable bots and packages.

Bot Store submissions checklist

Use the checklist to ensure that your Automation 360 Bot Store submission is correctly created, processed, and accepted. If you do not follow requirements listed in the checklist, your submission will be rejected and will not be published on the Bot Store page.

Use this checklist from the developer portal: [Automation 360 bot submission checklist](#).

Building reusable bots

Review the guidelines to gain a better understanding of how to develop bots or subtasks for reusability, from designing and creating through reusing.

Define prerequisites, input, output, and variables

When you build bots for reusability, define the following:

- Document all necessary prerequisites on how to use your bot either on its own or as a subtask.
- When creating your bots, define values as input, output, or local. Input and output variables are used when your bot is designed to be used as a subtask, allowing it to receive and pass back values to or from another calling bot.
- Provide meaningful variable descriptions when defining input and output variables so that other developers know how to interact with your subtask.

- Adhere to an established standard for variable naming guidelines. Review the Automation Anywhere user-defined variables for variable naming guidelines. [Your variables \(user-defined\)](#) on page 2241

Follow single-responsibility principle

Bots developed for reusability should follow the single - responsibility principle which states that each subtask or component should have responsibility over a single part of the functionality of the overall bot and that responsibility should be entirely encapsulated by that subtask or component.

Other examples of single-responsibility:

- A subtask that processes a single transaction, but can be called multiple times for each transaction on a list.
- A subtask that collects screen display data on a single page of a website, but can be called multiple times as a bot goes through pagination.

Bot design considerations

Consider the following patterns based on which templates must be developed for use:

1. Master, Main, and Sub bots

- Master bot: This bot is called directly to begin the process, through mechanisms including scheduling through the Control Room or API call. Include the following major process steps in the **TRY** section:
 - a) Initial setup for the process.
 - b) Validation that the setup was successful. For example, check whether all required files and folders exist or initial variable values are populated as required.
 - c) Run the desktop **PRE-PROCESS CLEANUP**.
 - d) Call the main bot to run the business logic of the process.

In the **FINALLY** section, run the desktop **POST-PROCESS CLEANUP**.

- Main bot: This bot calls the sub bots as required to run the business logic of the process. Include the following major process steps in the **TRY** section:

- a) Validation of any input. For example, input variable values from the master bot.
- b) Execution of sub bots.
- c) Validation of any output.
- d) Ensure population of any output variable values based on the execution of main bot, to return to the master bot.

In the **CATCH** section, log the error, and ensure population of any output variable values, for example, **oStrResult** to pass back to the master bot.

- Sub bots
 - A sub bot is called by the master bot or main bot to run the actual business logic required for the automation. They are also referred to as helper tasks or utility tasks because their only purpose is to assist the calling task.
 - Use output variables to return a result indicator to the calling bot either main, or another sub bot. For example, **outStrResult**. The value contains an error message if the processing was not successful due to an error or exception that had occurred.

2. Main and Sub bots: This pattern includes the master and the main bot in a single main bot. The design pattern of the Sub bot is similar to the design pattern explained above.

Opening and closing applications

Any applications, files, or windows that a bot or subtask opens must be closed by the same bot or subtask.

- For example, when a bot opens Microsoft Excel to perform a spreadsheet operation, verify that the spreadsheet and Excel are closed when the bot finishes processing.
- Close applications when the bot execution is successful or unsuccessful.
- Use the **Finally** block of the **Try/Catch/Finally** operation to ensure applications

are closed regardless of success of the task processing.

- In the case that applications do not respond during testing, consider using the command prompt to forcefully close (kill) the applications. For example, to forcefully close power point, the command-line operation would be:

```
Taskkill /IM powerpnt.exe /F
```

Error handling

After completing the task, verify that the bot successfully handles any failure or exceptions.

- Each task or subtask must handle its own errors.
- An unhandled exception in a subtask can cause issues in a parent task.
- Use **Try/Catch/Finally** blocks at the root level of every bot.
- Use **Try/Catch** blocks inside of a loop if you want to try an operation multiple times before reporting a failure.

Event or exception handling

Other than action errors that are captured by **Try/Catch**, you must perform code checks for other processes such as events or exceptions. If a certain process condition occurs, notify or log these conditions for additional analysis.

- Develop a configurable event handler Task Bot that minimizes the requirement for code changes if the actions change. For example, maintain an XML file that contains a definition of all the possible events or exceptions and any notification requirements when those events or exceptions occur.
- In the code, when such events or exceptions occur, write the information to an event log. You can also add memory usages and capture a screenshot.
- Run the event handler Task Bot to process the event or exception. For example, issue a notification using parameters such as email recipient, CC recipient, or subject from the XML file.
- If the notification requirements vary for each environment, or change over time, the configuration file can be updated without having to change the code.

Running bots on other computers

When designing a bot, enable it so it runs on computers other than the computer on which a bot was created.

- Use variables for local file paths, network shares, or window titles so that your bot can successfully run from other machines.
- Consider using global values for environment markers or network shares that multiple bots need access to.
- Use wildcard characters for window titles where appropriate to enable bots to run regardless of specific environment or version of the target application. For example, instead of using

```
Salesforce - Professional  
Edition - Internet Explorer
```

use the following:

```
Salesforce - * - Internet  
Explorer
```

Using prompts, message boxes, and infinite loops

Prompts and message box actions stop the bots from running when waiting for a user input. Unless a user input is required, design the bots without using prompt statements.

- When using loops, ensure all loops have a definite end by clearly defining their number of iterations or specifying where break loop actions need to exist.
- If your bot is intended to run as an unattended bot, remove or disable any prompts or message box actions.
- If you are building bots for an attended automation scenario, message boxes and prompts are often reasonable or required for bots to run as expected. Use message boxes to display different variables, such as, responses, outputs, or values.

Storing sensitive data in the Credential Vault

The Control Room includes the Credential Vault that can be used to store sensitive information, such as user names, passwords, API keys, and tokens.

- When building a bot, create a locker in the Control Room using the Credential Vault to store credentials and retrieve them as required by referencing the credential and the attribute. This allows users to create

bots that consume APIs or perform logins without the need for bot builders to directly hard-code the required credentials within a bot.

- Do not hard-code sensitive credentials into a bot, or a subtask, because hard-coded storage in a bot introduces a security risk.
- When Credential Vault values are required to be used in a bot, verify that all locker names and credentials are clearly defined in the bot documentation. If required, include details on how to obtain credentials, for example, an API key or a token.

Testing independent tasks

When creating bots for reusability, design them in a way that they can be tested independently of other subtasks.

- Practice the test-driven development (TDD) approach: When adding a new bot, or a new feature in an application, write a test case for it.
- In a test case, define the specific function that validates that feature or functionality.
- For single-responsibility principle and reusability, create many smaller tasks that can be tested independently.

Using comments and steps

Comments enable developers to provide descriptions within their bots so that bot other bot developers can better understand what each section, block of code, or subtask is designed for. Include clear comments to allow developers to understand the purpose of the function of a given code block.

- When bots are submitted to the Bot Store, commenting demonstrates how to customize the bot.
- Using comments makes code maintenance easier because section descriptions help identify where changes might be required to enable developers to work towards quicker issue resolution
- Comments on bots that are a work in progress can be helpful when creating placeholders for future work. Consider using a TODO command as a reminder to add logic to the bot, but update the comments when the work is completed.
- Automation 360 includes the Step action, which provides the capability to organize

the code into logical groupings to improve readability and the flow.

- Create an outline of the major objectives of your bot by using empty, labeled step actions. When that is completed, go back to each step and complete the logic for the step.

Creating logging files

Identifying problems without logs can be difficult when bots are running unattended on any number of Bot Runners. Software developers, support teams, and bot owners rely on logs to understand where their automations have issues and how to diagnose problems. Bots must log errors to get error details.

- Use error handling and screen captures to better understand when a bot or subtask encounters an error.
- Use the A2019 Bot Store template that contains basic error handling, logging, and snapshot capabilities with the customizable root logging location for maintaining older log files.

[Bot Store bot template](#)

- If required, create additional logging files and include a full audit history of everything a bot or subtask has done. The additional log files can include audit, debug, and performance information about the bot, as well as the following:
 - Main bot start and end time.
 - Subtask start and end time.
 - The completion time of specific milestones defined within the bot.
 - Number of transactions received in an input file.
 - Number of successfully processed or failed transactions.

See also: [Best practices: Building reusable and secure Automation 360 bots and packages](#)

Related tasks

[Using Loop action](#) on page 2689

Use the Loop action to repeatedly run a sequence of actions for a specific number of times or until a condition is met.

Related reference

[Your variables \(user-defined\)](#) on page 2241

Users and some actions create user-defined variables to temporarily hold values. Use this kind of variable to input values into an action (window title, login credential, or file path) or to accept the output of an action (values read from a file or a Boolean return).

[Application package](#) on page 2326

Use the `Open Program/File` action in the `Application` package to launch an application or a file. This action supports `.exe`, `.bat`, script files, or shortcut paths.

[Error handler package](#) on page 2466

If a bot encounters an error due to an abnormal condition or exceptions during execution, the normal execution of the bot is hindered, and the bot fails to complete the task. The Error handler package contains actions that enable you to easily handle exceptions a bot encounters and transfers control to the other actions within that bot.

[Step package](#) on page 2956

The `Step` package groups various actions together and runs them in a specific order. You can provide a relevant name for a step to identify the operation performed by the actions included in that step.

[Prompt package](#) on page 2787

Use the `Prompt` package to accept an input value, a yes/no response, or to open a file or folder.

[Message box package](#) on page 2691

Use the **Message box** action from the **Message box** package to insert a message box that shows a message when the task runs. For example, you can insert a **Message Box** action to follow a web form so that the action displays the message: `Web Form Filled and Complete`.

Building reusable packages

Review the guidelines to understand how to build packages for reusability.

Know your incoming data

When setting fields that your action package requires from the user, provide specifics in setting the attribute type to limit the kinds of data that your package receives.

- Limit the input to reduce the burden of checks that have to be done when the package is received.
- Javadoc includes 34 defined attribute types, so review those when you build your package to select the appropriate field types.
- Set your package so that it takes a stored value. For example, on behalf of the bot, your package is making API calls, verify that the `AttributeType` of the action input field for the API key or a token is set to `credential`. This way users are encouraged to use a value stored in the Credential Vault for sensitive input data that the package requires.

Use labels appropriately

In the `CommandPkg` annotation, use different labels, `node_labels`, and descriptions appropriately.

- Use these labels as short descriptions of your action and use only a few words to describe an action.
- Replicate the same naming style as it is presented in the default Action packages.
- Each action is a child element of a package, and the action label is displayed along with the package icon in the Actions pane. Use short names to describe each action.
- Document an expected input format for certain fields. Use the parameter description for the @Pkg annotation. This allows package developers to review the format, requirement, or data that must be used for a specific input field. For example:

```
@Pkg(label = "Start Date",  
      description="Date Format as  
      MM/DD/YYYY")
```

Unit test your components

During the package development, create unit tests to validate that each component and the action of the package is working as expected.

- Validate the behavior of the individual test unit, a single class, or a single action, to ensure that it is functioning as expected.
- Review and document any feature or functionality defects at early stages of the development process.

Handling errors

Include the error handling in the bot logic to ensure that all errors are handled gracefully. If an error is not handled, it could prevent a bot runner from executing other tasks.

- Create meaningful error messages that can help bot consumers with error resolutions.
- As a package developer, keep in mind these recommendations:
 - Use **Try/Catch** block to accommodate for an error.
 - Use a multi-catch block to find specific errors, and use the **BotCommandException** to return customized error messages. For example:

```
//create array of 3 items  
int[] myIntArray = new int[]  
{1, 0, 7};  
try {  
    //print 4th item in array
```

```
System.out.println(myIntArray[3]);
//Perform operation on
first and second items in
array
    int result =
myIntArray[0] /
myIntArray[1];
} catch
(ArrayIndexOutOfBoundsException
e) {
    //Throw custom message
for IndexOutOfBounds
    throw new
BotCommandException("The
array does have the number
of expected items.");
} catch (ArithmeticException
e) {
    //Throw custom message on
Atithmetic Exception
    throw new
BotCommandException("Math
Operation Error with " +
Integer.toString(myIntArray[0])
+ " and " +
Integer.toString(myIntArray[1]));
}
```

Follow single-responsibility principle

A package is a collection of actions. Each action within a package must have a single responsibility and that responsibility must be encapsulated by that action.

- Following the single-responsibility principle helps your package consumers to implement it easily, simplifies testing, and avoids unnecessary modifications.
- The actions that you offer allow package consumers to customize the way they use your package within their bots, and can help their bots be as efficient as possible.

Provide examples

When submitting packages to the Bot Store include a demo bot that demonstrates the use of the package.

- Use the Automation 360 actions and allow package consumers to use these actions to expend their bot capabilities.
- Always provide sample bots with descriptions to help your package consumers with the knowledge they require to understand its proper use.

Review the guidelines to gain a better understanding of how to develop bots or subtasks for reusability, from designing and creating through reusing.

Troubleshooting and debugging

Troubleshooting and debugging information.

Troubleshoot bot run issue

Issue: I'm unable to deploy a bot because I get the following – Unexpected error setting up a new user session.

Cause:

Most often, this error is caused by invalid device credentials.

Solution:

Confirm the device is registered and connected.

1. Select **Devices > My devices** from the Automation Anywhere web interface.
2. Confirm that the Status column shows **Connected** for the relevant device.

Confirm that the device username and password are correct.

1. Select the profile icon on the Automation Anywhere web interface and select **Edit profile**.
2. Verify the device username.

Depending on how the device is configured within the network, you might need to prepend it with the domain name. For example, domainname \firstname.lastname.

3. Verify the device password.

Other resources

- [Could not deploy due to one of the following issues-User is already running a bot on device \(A-People login required\)](#)

- [Automation 360 Device error while running a bot \(A-People login required\)](#)

Bot Agent log files

Various types of information about the Bot Agent are captured in different log files. You can analyze these log files when the Bot Agent or a bot encounters an error and identify the root cause for that error.

Overview

The Bot Agent log files enable you to perform these actions:

- Determine whether a bot ran successfully
- Identify issues that resulted in a bot failure
- Determine if the device is properly connected with the Control Room

Log file locations

The Bot Agent log files are available at `C:\ProgramData\AutomationAnywhere\BotRunner\Logs` on your device. The following files are available at this location:

Bot_Launcher	Captures information about the execution of a bot such as the operations performed, events triggered, and errors encountered by the bot. The filename now includes the name of the user running the bot on the Bot Runner. For a multi-user session machine, there will be a bot launcher log per user.
Node_Manager	Captures information about when a bot is run from the Control Room and communication details between a Bot Runner and the Control Room.

Log file configuration

To configure the different types of log files that can be collected from the devices connected to the Control Room, see [Configure log collection](#) on page 1738.

Bot Store

You can access Bot Store from the Control Room. From Bot Store, you can download bots or packages to your Control Room repository.

There are two ways for you to get bots and packages from Bot Store into your Control Room:

- You can load items directly from Bot Store to your Control Room, without needing to download the items locally. For details, see [Directly import bots and packages from Bot Store to Control Room](#) on page 3443.
- You can download items from Bot Store locally, then import them to your Control Room, even if your Control Room is not connected to the internet. For details, see [Download locally and import bots and packages from Bot Store to Control Room](#) on page 3444.

Access Bot Store from the Control Room

As a Bot Store registered user, you can log in to Bot Store from the Control Room.

You must have valid Bot Store credentials to access Bot Store from the Control Room. If you do not have valid Bot Store credentials, you must register with Bot Store.

1. Log in to the Control Room.
2. Click the **Bot Store** tab.
Bot Store opens in a separate window (<https://botstore.automationanywhere.com>).
3. Log in using your Bot Store credentials.

In the Control Room, you can see **My downloads** under the **Bot Store** tab.

Watch the following video on how to find bots on Bot Store.

Related concepts

Related tasks

[Submit bots or packages to Bot Store](#) on page 3442

You can submit bots or packages from the Control Room to Bot Store. If your bot includes dependencies, submit all dependencies. Submit a demo bot that demonstrates the use of the package.

[Directly import bots and packages from Bot Store to Control Room](#) on page 3443

You can load items directly from Bot Store to your Control Room without the need to download the items locally.

Submit bots or packages to Bot Store

You can submit bots or packages from the Control Room to Bot Store. If your bot includes dependencies, submit all dependencies. Submit a demo bot that demonstrates the use of the package.

You must have a system-created **AAE_Bot Store Publisher** role in order to submit bots or packages to Bot Store. See [System roles](#) on page 1706.

1. Download the A2019 Bot Store Bot template from GitHub: [A2019 Bot Store Bot Template](#).
2. Log in to the Control Room.
3. Log in to Bot Store using the Bot Store credentials.
4. On the left pane, click **Automation**.
A list of available and forms is displayed.
5. Click **Public** workspace and select the **Bot Store** folder.
6. In the **Automation** page, move your mouse over the **Action** toolbar and click **Submit to Bot Store**.
 - a) In the **Submit to Bot Store** page, review the dependencies that will be bundled with your bot (including a parent bot) and make changes as required. In addition, ensure that the bot and all dependent bots and files are in the same folder to submit to Bot Store.
 - b) Click **Next** to review the **Bundled packages** to ensure all packages are included with your submission.
 - c) If the bot you want to submit and the bundled package look complete, click **Submit**.
When choosing a name for your bot or package, ensure it is unique and descriptive so it is easily searchable on Bot Store.
Alternatively, click **Back** to go back.
When you submit your files, the system displays the following message: <bot/package name> submission is in progress. Go to Bot Store > My Submissions to complete your submission form. You will receive a confirmation email when the submission is completed.
 - d) Click **Take me to Bot Store** to complete your submission form in Bot Store.

When you resubmit files to Bot Store, it overwrites the previously submitted files, which are in a **Draft** status.

- It can takes three to five business days for review and approval of your bot or package.
- For any questions on bot and package submissions, contact [Contact Bot Store Support](#) or select the **Have questions about submitting a bot** option on Bot Store pages.

Directly import bots and packages from Bot Store to Control Room

You can load items directly from Bot Store to your Control Room without the need to download the items locally.

You must have a system-created **AAE_Bot Developer** role in order to download bots or packages to your Control Room repository. See [System roles](#) on page 1706.

1. Navigate to Bot Store site.
2. Log in with your A-People credentials to download from Bot Store.
3. Select a bot or package.
Once you have selected your bot, you are redirected to a detailed bot page.
4. Click the **Get Bot** button.
A confirmation window prompts you to confirm the request.
5. Click **Ok, Get Bot** to confirm the request.
You can choose from the **Add to Control Room** or **Download as a zip file** options.
 - The **Add to Control Room** option requires you to specify your Control Room URL.
 - The **Download as a zip file** option requires you to save the bot locally on your device and confirm the location path for your download to begin.
6. Select the **Add to Control Room** option to load the bot directly to your Control Room.
7. Enter your Control Room URL.
8. Log in to the Control Room.
9. Navigate to the **Automation** page.
10. Open your **Bot Store** tab.
11. Click **Add to RPA Workspace** in the **Action** toolbar.
The following message appears: `If you have any files already installed in private workspace, they will be overwritten.`
12. Select **Yes, continue** to overwrite an existing file and continue with the installation, or select **No, cancel** to cancel your download.
The installation status of the selected file changes to **Installed**.
13. Verify the downloaded bots in your Bot Store folder of the private workspace.
The custom packages downloaded from Bot Store are available in the **Packages** repository. You can navigate **Bot Editor > Action Palette**.
14. Verify that the downloaded packages have been enabled in the **Packages** repository. If the packages are not enabled, then go to individual packages and enable them.

You must have a system-created **AAE_Bot Developer** role in order to download bots or packages to your Control Room repository. See [System roles](#) on page 1706.

1. Navigate to Bot Store site.
2. Log in with your A-People credentials to download from Bot Store.
3. Select a bot or package.
Once you have selected your bot, you are redirected to a detailed bot page.
4. Click the **Get Bot** button.
A confirmation window prompts you to confirm the request.
5. Click **Ok, Get Bot** to confirm the request.
You can choose from the **Add to Control Room** or **Download as a zip file** options.
 - The **Add to Control Room** option requires you to specify your Control Room URL.
 - The **Download as a zip file** option requires you to save the bot locally on your device and confirm the location path for your download to begin.
6. Select the **Download as a zip file** option
You can save the bot locally on your device and when you confirmed the location path, your download begins.
7. Log in to the Control Room.
8. Navigate to the **Automation** page.
9. Click **Import bots**.
10. Click **Browse**.
11. Select your downloaded zip file at the location path you saved.
12. Specify the option to have your bot in the **Public** or **Private** tab.
13. Click **Import** to import the downloaded bot.
14. Navigate to the **Public** or **Private** tab that you specified.
15. Open your **Bot Store** folder.
16. Access the bot.
You can now use the bot from Bot Store to start your automation experience.

To use a Bot Store package, open the bot you want to edit and access package from the Actions panel.

Note: For users who want proxy access to Bot Store, you can reference this knowledge base [article](#) for a workaround.

Private Bot Store

Private Bot Store is a secure internal bot marketplace for a company to post and share details and documentation for all internally developed bots. Employees can easily discover internal bots and commands to reuse in addition to all of the bots from the Automation Anywhere Bot Store vendors.

Use Private Bot Store to perform the following tasks:

- View, access, and reuse bots to automate processes:
 - Find and reuse bots built by your team
 - Use filters to search for bots by applications, business processes, or a keyword
 - Use bots from the Automation Anywhere Bot Store vendors
 - Review detailed documentation provided with each bot to decide whether to use the bot
- Submit details and documentation about your own bots
- Use the **Suggested bot idea** page to submit a bot idea

Use bots within your company:

- If required, email a bot developer for bot installation assistance
- Review and access bots in your Control Room

Use admin tools to help you with the following tasks:

- Review, approve, and publish bots
- Review your team's bot use case ideas
- Add or remove users and assign permissions

Watch the following video on how to get started with Private Bot Store:

Related concepts

[Getting started with Private Bot Store](#) on page 3445

Use Private Bot Store to view and submit bots and bot use cases within your company. Use admin tools to review and publish bots and manage users.

Getting started with Private Bot Store

Use Private Bot Store to view and submit bots and bot use cases within your company. Use admin tools to review and publish bots and manage users.

The following is a high-level overview of how to get started with Private Bot Store:

1. The Private Bot Store support team creates admin users for your company.

2. Optionally, the support team helps you set up SAML-based SSO or Active Directory Federation Services (ADFS) integration.
3. Admin users grant other users Private Bot Store access and permissions. (It is automated if you use SAML-based SSO or ADFS).
4. Users create bot listings and submit them for approval.
5. Admin users can approve or reject the submitted bots.
 - If approved, the bot listing is published and is available on Private Bot Store for other users within the organization to view.
 - If rejected, the bot author receives feedback on what has to be updated. The bot author updates the bot and resubmits it.
6. Other employees within the company access the published bot listings and use them in their automation tasks.

Related concepts

[Private Bot Store](#) on page 3445

Private Bot Store is a secure internal bot marketplace for a company to post and share details and documentation for all internally developed bots. Employees can easily discover internal bots and commands to reuse in addition to all of the bots from the Automation Anywhere Bot Store vendors.

Set up A-People user access to Private Bot Store

A-People user access and management is included out-of-the-box with Private Bot Store. Within Private Bot Store, your company admin can manage users. Other users with granted permissions can access Private Bot Store with the same credentials they use for public Bot Store and other Automation Anywhere sites.

- Set up A-People user access

After your first admin users get access to Private Bot Store, they can add additional users. Any Private Bot Store user with admin access can manage users from the **Private Bot Store - User Access Settings** page.
- Add new users individually or in bulk
 - a) Navigate to **User Access Settings**.
 - b) Click **Add Users**.
 - c) Enter the email addresses for the users you want to add.

Invited users will receive an invitation email with instructions to set up their account.
- Change user permission level

Only admin users can modify permission levels by selecting the correct level in the **Access** panel.
- Delete users

Select **Delete** in the **Actions** panel.

Related tasks

[Submit and approve bots using Private Bot Store](#) on page 3447

Use Private Bot Store to submit, review, and approve detailed bot listings for all of the bots your team has built.

Set up SAML user access to Private Bot Store

Use SAML-based single sign-on (SSO) or Active Directory access to ensure that your Private Bot Store user access is updated automatically when users join or leave your company. Users can log in to Private Bot Store using the same credentials they use for other applications.

- Set up SSO or Active Directory Federation Services (ADFS) user access
The Private Bot Store support team will help you set up **SSO** or **Active Directory** user access.
 - Provide details about Private Bot Store in your identity provider (IdP) settings.
 - Provide the Private Bot Store support team some information about your system.
The Private Bot Store support team will verify the information and complete the integration.
After the integration is completed, your Private Bot Store user access will be managed automatically by your SSO or ADFS user access.
- Change user permission level
Admin users can change a user's permission level by navigating to the Private Bot Store **Settings** page and updating user permissions.
Admins can only modify a user permission level if a user is an active Private Bot Store user.

Related tasks

[Submit and approve bots using Private Bot Store](#) on page 3447

Use Private Bot Store to submit, review, and approve detailed bot listings for all of the bots your team has built.

Submit and approve bots using Private Bot Store

Use Private Bot Store to submit, review, and approve detailed bot listings for all of the bots your team has built.

- Submit internal bots :
To submit a new bot:
 - a) From Private Bot Store, click **My Submissions**.
 - b) Click **Add New Bot**.
 - c) Enter all the required fields, such as bot description, benefits, and requirements.
 - d) Review the documentation examples for each field and follow the suggested guidelines.
 - e) Click **Submit** or click **Save** to save the bot before submitting it.
After you submit your bot, your Private Bot Store admin team receives an email to review the bot.
Your bot will be published or it might be send back for an update and resubmission.
- Review internal bot submissions
Private Bot Store admin users approve or reject bot submissions before they can be published.
 - a) As an admin user, navigate to Private Bot Store and click **All Submissions**.
 - b) Click **Review Bot** to review each submitted bot.

- c) Approve or reject the submitted bot:
 - Approve and publish a bot: On the **Review Bot** page, click **Approve** to publish the bot.
 - Reject the bot and request updates: On the **Review Bot** page, click **Reject** to reject the bot and send feedback to the bot submitter with instructions for updates.

Submit and manage bot ideas using Private Bot Store

Use Private Bot Store to submit, manage, and prioritize bot ideas for your development requirements.

- Submit bot ideas
 - a) From Private Bot Store, click **Suggest Bot Idea**.
 - b) Fill in all the fields about your bot idea, with as much detail as possible.
 - c) Click **Submit**.
After you submit the bot idea, your admin team will review and prioritize it. The admin team might contact you for more information about your bot idea.
- Manage bot ideas
Private Bot Store admin users can manage and prioritize bot ideas.
 - a) As an admin user, navigate to Private Bot Store and click **Manage Bot Ideas**.
 - b) Click **Review** to review each submitted bot idea.
 - c) Edit any of the fields as required.
 - d) Select a **Bot Priority** level for the bot idea.
 - e) Click **Save**.
 - f) Click the **Mail** icon to contact the bot idea submitter to request additional details.
Watch the following video on how to submit a bot idea to Bot Store.

Custom filter management in Private Bot Store

Create your own filters and tags to organize your automations in Private Bot Store using the custom filter management page.

Custom filter management enables you to perform the following activities:

- Rename any of the default filters such as **Applications** and **Departments**, and tags (specific categories) such as **Excel** and **Finance**.
- Add up to six of your own custom filters.
- Add your own custom tags, with up to three nested layers of tags, for example, 2021 > Q1 > January.
- Select which filters you want to appear first in your Private Bot Store navigation.
- Select up to five top tags to appear first under their filter.

The custom filters are displayed throughout Private Bot Store, including:

- In the top navigation, filters on the left, and search results.

- On the listing submission form, where bot builders can select custom tags for their bots.
- On bot detail pages, where users can see how each bots is categorized.

Edit filters

1. You must have an admin user permission to access the **Manage Filters** page in Private Bot Store.
2. Navigate to **Private Bot Store > Manage Filters > Admin Tools > Manage Filters**.
3. Edit the default filters to match your company terminology.
Whenever possible, use default filter names, such as **Departments**, rather than creating your own filters. As a result, all the existing bots are already tagged and you do not have to tag them again.
4. Under **Actions**, click the **Rename Filter** action (pencil icon) to rename the filter.
5. Click **Add Filter** to add a new filter. Enter the name for the new filter.
You can add up to six custom filters.
6. Select a filter and click **Reorder entry** on the left and place the filter into your desired order.
The filter order is reflected in the Private Bot Store navigation and the filter panel.
7. Click the delete (X) action in the right column to delete any custom filter.
You cannot delete default filters.

Edit tags

1. Navigate **Admin Tools > Manage Filters > Actions** select a filter and click the tree icon **Add and Edit Tags** action.
2. Select a tag and click the tree icon to **Add Child Tag** within a tag. Enter a new child tag name.
You can add up to three layers of nested tags.
3. Click the **Rename Tag** action to rename any tag.
For the default tags, the original **Tag Name** continues to appear in the **Default Name** column for your reference.
4. Select up to five **Top Tag** in the left column to display those tags at the top of the list within each filter.
Use this for your company most-used applications or other important bot categories. Other than the selected **Top Tag**, tags are displayed in alphabetical order.
5. Click the delete (X) action to delete any custom tag.
You cannot delete the default tags.

Automation Scenarios

This page lists the available automation scenarios for various Automation 360 products.

Scenario: Generating insurance quote with Automation Co-Pilot and Process Composer

This scenario details how Zoe (as an insurance agent) generates an insurance quote for a customer using Automation Co-Pilot for Business Users and Process Composer.

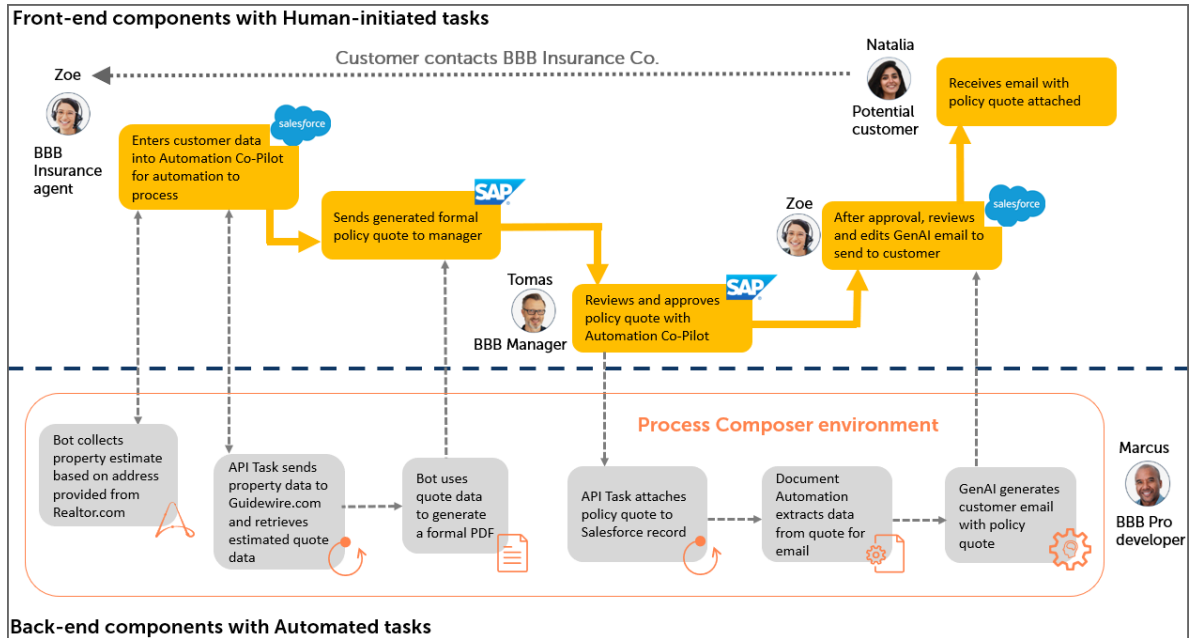

About this scenario

The scenario describes the actions and data flow for the following four people:

- Zoe is an insurance agent at BBB Insurance Co. where she serves as the primary contact for customers. She is responsible for supporting new and existing customers as she creates insurance quotes based on customer data she's gathered.
- Natalia is a potential customer who has contacted Zoe requesting an insurance quote for a new home purchase.
- Tomas is Zoe's Manager at BBB Insurance Co. He is responsible for drafting budgets, managing resources, and for reviewing and approving any insurance quotes Zoe or any other agent on his team generates.
- Marcus is a software engineer working at BBB Insurance Co. He is responsible for designing, developing, and implementing automations that increase process efficiencies for the insurance company. He is familiar with development tools, processes, and best practices.

Architecture and tasks flow

The following architecture overview shows the front-end and back-end components, and their related human-initiated tasks and automated tasks for the BBB Insurance Co:

Front-end components

- [Automation Co-Pilot for Business Users](#) on page 3144 is a user-interface that enables real-time communication between users and bots. Using Automation Co-Pilot for Business Users, you can automate repetitive and time-consuming tasks, navigate controls, and input data when interacting with a customer.
- [Salesforce](#)
- [SAP](#)

Back-end components

- [Process Composer](#) is an environment that leverages multiple products across the Automation 360 platform to deliver an Intelligent Automation experience. It provides a drag-and-drop interface that Pro developers can use to create process flows and configure when to execute a bot. Additionally, it displays correct data to users and exchanges data across multiple teams.
- [Realtor.com](#)
- [#unique_60](#) builder and [RPA workspace](#)
- [Guidewire.com](#) (a property and casualty insurance data platform) through an [Apigee connector](#)
- Bot builder
- [Document Automation](#) on page 3455

Scenario walkthrough

The BBB Insurance Co. needed a system that could handle complex workflows that met and delivered on high service level agreements (SLAs).

1. Marcus used Process Composer to create this business process automation and automate the task of generating customer quotes for the BBB Insurance Co.
2. Natalia is in the middle of purchasing a new home and has been shopping online to compare policy quotes provided by several home insurance companies. As a result of her research, she accessed the BBB Insurance Co's website and dialed their toll-free number to speak with an agent about getting a homeowner's policy quote. Natalia contacts Zoe.
3. As part of her job responsibilities, Zoe is first line support for customers looking for insurance policy quotes. She has just engaged with a potential new customer, Natalia. Zoe accesses Automation Co-Pilot for Business Users through an [embedded widget](#) in her Salesforce instance. The widget automates tasks that embed automations built on the Automation 360 platform and connects and authorizes the flow of data between applications and Automation Co-Pilot for Business Users.
4. Zoe explains the process to Natalia as she asks her questions and collects data to generate a new homeowner policy quote. A bot runs in the background gathering property value data based on Natalia's location from Realtor.com.
5. Working in Salesforce (with Automation Co-Pilot for Business Users embedded through the widget), Zoe enters data. API Tasks and the automated process run in the background gathering industry-wide data from Guidewire.com to add to the quote.
6. In the background, Process Composer uses an RPA bot to generate a PDF file for the quote.
7. Zoe sends the generated quote (formatted as a PDF file) electronically to her manager Tomas to review and hopefully approve.
8. Tomas is manager of a team of customer agents and is responsible for drafting budgets, managing resources, and for reviewing and approving any insurance quotes generated by his team. Working in SAP (with Automation Co-Pilot for Business Users embedded in the application), Tomas was just notified of a new policy quote that was submitted by Zoe for review.
9. Tomas carefully reviews Zoe's quote and agrees that it would be a good risk for his company to accept. He approves the policy quote. Zoe receives an immediate notification that the policy quote for Natalia has been approved. Simultaneously in the background:
 - a) An API Task is used to attach the policy quote to a record in Salesforce.
 - b) Document Automation extracts data from the quote for an email.
 - c) Generative AI generates a customer-specific email that contains the policy quote information.
10. After receiving Tomas' approval for the policy quote, Zoe reviews and edits the Generative AI email in Salesforce.
11. Zoe attaches the policy quote PDF file to the email and sends it to Natalia.
12. During the phone call with Zoe (within five to six minutes), Natalia receives the completed policy quote as an attachment to an email. She considers using the BBB Insurance Co. to insure her new home.

Scenario summary and benefits

The BBB Insurance Co. will be looking to automate future business processes.

Summary

With access to the Automation Co-Pilot embedded widget, employees (Zoe and Tomas) can run remote or local automations on-demand from any web application. With in-app (Automation Co-Pilot for Business Users) notifications, Zoe and Tomas are alerted to tasks requiring their immediate attention. As a result, the BBB Insurance Co. can automatically generate and deliver on-demand insurance quotes to their customers (Natalia) with real-time and embedded approvals.

Benefits

By implementing Automation Co-Pilot for Business Users and Process Composer on the Automation 360 platform, the BBB Insurance Co. realized the following benefits:

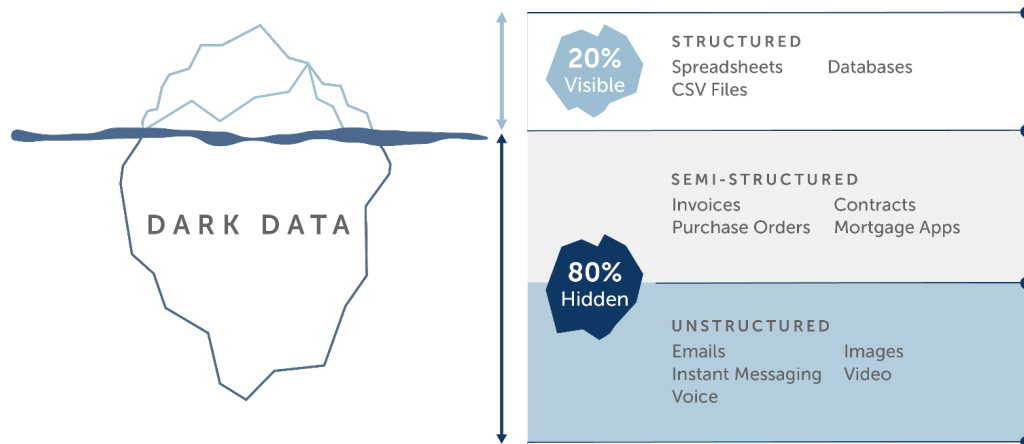

- Time to generate each policy quote decreased by 90% (from 60 mins to 6 mins).
- Zoe can spend her valuable time and effort processing the quote request (including approval) instead of spending a lot of time logging in and out of various applications, trying to contact her manager, writing emails, looking up various industry data points, and so on. By having prompt results and actionable deliverables, Zoe felt empowered with her interaction with Natalia and derived immediate job satisfaction.
- Whether it's Salesforce, SAP, or other applications, BBB employees never need to leave their home application of choice for their daily activities or for when an immediate action is required leading to greater employee productivity and efficiencies.
- Customer satisfaction has increased for both new and existing customers. Natalia ended her call with Zoe satisfied and confident with the service the BBB Insurance Co. can provide having experienced their competency and customer care first-hand.

Document Processing

Automation Anywhere offers several web-based intelligent document processing solutions that extract semi-structured data from documents and convert it into structured data, which can be used by Robotic Process Automation (RPA) bots for automation of business processes.

Overview

Typically, RPA bots can automate only those tasks that involve processing structured data. As a result, about 80% of a business's data remains inaccessible to RPA bots as "dark data." This dark data is made accessible to RPA bots by cognitive automation, which combines the technologies of intelligent document processing and RPA. With cognitive automation, semi-structured data is extracted from documents such as invoices, and converted into structured data, so RPA bots can subsequently use this structured data for automating business processes.

Learn more about the Automation Anywhere intelligent document processing solutions:

Document Automation

Document Automation is the new Cloud-native intelligent document processing solution that business users can set up to automatically read and process documents quickly using pretrained models and validation feedback.

[Document Automation](#) on page 3455

Automation 360 IQ Bot

In Automation 360 IQ Bot, users configure templates and train bots to extract data from a variety of documents. Automation 360 IQ Bot is available for on-premises and cloud installations, and offers users a wide range of tools to customize and optimize document processing, including the following:

- Packages to create models for classifying documents by category and to enhance the quality of documents or images for better extraction

- Standard form models for extracting data from documents that have minimal or no variation in their layout
- Support for Optical Character Recognition (OCR) engines to improve the accuracy of the extracted data

[Automation 360 IQ Bot](#) on page 3538

IQ Bot 11.3.x

This early version of IQ Bot supports Enterprise 11 customers. It is available for on-premise installations only.

[IQ Bot 11.3.x](#)

Community Edition

The Community Edition version offers users limited features from the document processing solutions Document Automation and Automation 360 IQ Bot. This version is available to users for free.

[Community Edition](#) on page 3533

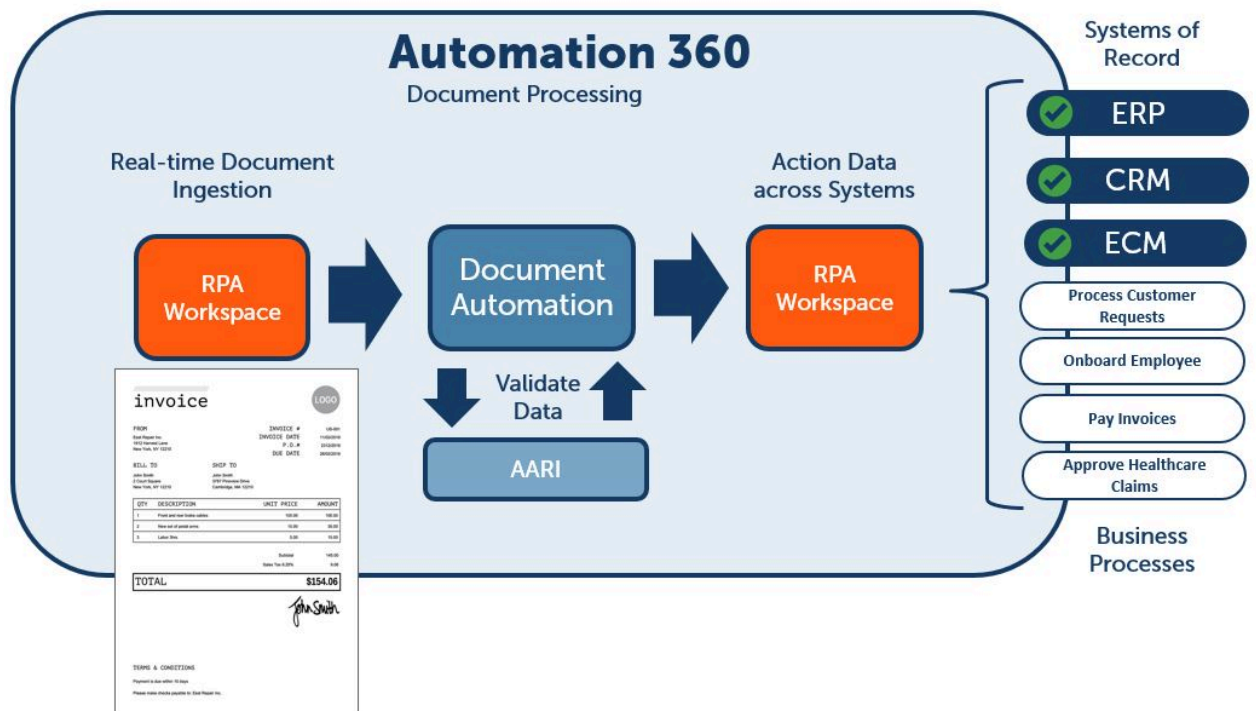

Document Automation

Document Automation is the new Cloud-native intelligent document processing solution that business users can set up to automatically read and process documents quickly using pretrained models and validation feedback.

Document Automation is fully integrated into Automation 360: Document Automation is installed as part of the Control Room. RPA bots are used to extract semi-structured or unstructured data to automate document-centric business processes, and Automation Co-Pilot for Business Users manages the end-to-end extraction process and validation tasks.

With Document Automation you can:

- Process more document types: Configure and process structured and semi-structured documents within a single, intuitive interface that is integrated with the Automation Success Platform with no additional software to install.
- Leverage a seamless user experience: Enjoy a unified experience for all document validations using Automation Co-Pilot for Business Users. The default document processing flow can be changed as needed enabling users to streamline their document workflows with ease.

The Document Automation workflow enables users to scale their document processing operation. Users create learning instances that use Automation Anywhere or Google Document AI pre-trained models to process invoices, utility bills, and receipts. Once a learning instance is running in production, it automatically improves extraction accuracy based on feedback from manual validation.

Watch this video to understand how you can use Document Automation to extract and embed data quickly and easily with an automated work-flow.

To compare Document Automation features side by side with Automation 360 IQ Bot, see [Intelligent Document Processing solutions feature comparison matrix](#) on page 3464.

Set up the Document Automation environment

Document Automation is installed simultaneously with the Control Room and shares the Control Room database. There are no additional installation tasks for Control Room Cloud customers.

To get started using Document Automation, you must first configure users, roles, and devices, and connect the Control Room with Automation Co-Pilot for Business Users:

[Set up your Document Automation environment](#) on page 3466

Note: To install Document Automation in an On-Premises server, note the following:

- The Control Room stores Document Automation output data.
- You must install the Control Room in a configuration that points to the location where Document Automation data is stored. Ensure there is sufficient storage space.

- The minimum necessary storage space depends on the processing volume, document size, and use case. As a guide: an environment that processes 100,000 pages per month, with a 30-day data lifespan, requires 500 GB of storage space.

Using Document Automation

Workflow map: Click the following schematic image to view the workflow in an interactive visual

format:

1.

The following is an overview of the end-to-end process to create, configure, and publish a learning instance in Document Automation:

Step 1: [Create a learning instance](#)

Log in to the Control Room as the learning instance creator user, and create a learning instance to extract values from documents.

Step 2: [Process documents](#)

Upload documents to the learning instance to test the model, fix validation errors, and verify the extracted data.

Step 3: [Build a bot to upload documents to Document Automation](#) on page 3504

Build a bot that uploads documents from a source folder to Document Automation.

Step 4: [Publish the learning instance to production](#) on page 3503

Check-in the learning instance assets (process, form, and bots) to the public repository. Then, deploy the process and bots to unattended Bot Runner devices to begin processing documents in real time.

After the process is deployed, incoming documents are processed, and Document Automation either extracts data from the documents or sends the documents for validation.

Step 5: [Validate the uploaded documents](#)

Log in as the Validator user, open the validation queue, and use the Validator to fix errors.

Related concepts

[Document Automation users](#) on page 3469

With the required roles, permissions, and licenses, Document Automation users can perform various tasks. Users and roles are defined in the **Administration** tab.

Related tasks

[Set up your Document Automation environment](#) on page 3466

Document Automation is installed simultaneously with the Control Room. Configure the users, roles, and devices, and connect the Control Room with Automation Co-Pilot for Business Users.

Document Automation architecture

Document Automation uses features from the Control Room and Automation Co-Pilot for Business Users, as well as some third-party products.

The following architecture graphic demonstrates the flow of data in the intelligent document processing workflow for the two possible deployment scenarios:

- The Learning instance creator uploads documents to the Document Automation interface, for example to test the extraction capabilities of the learning instance.
- An Unattended Bot Runner deploys the Scheduler Bot to upload and process the documents.

The graphic also shows the scenarios where data is sent to third-party products, such as for Google Document AI or Standard Forms extraction.

Control Room to regions mapping

Document Automation is supported on AWS and Google Cloud Platform.

For customers who configured Document Automation with Google Document AI licenses purchased from Google: Documents uploaded to Document Automation for processing in Google Document AI are sent to the Apigee gateway that you configured when you created the processor in Google Document AI.

For customers who purchased Google Document AI product licenses from Automation Anywhere: Google Document AI uses the Apigee API gateway to manage the document processing APIs. When a document uploaded to Document Automation is sent to Google Document AI, data is sent to the Apigee gateway that corresponds with your AWS or Google Cloud Platform region.

Apigee gateway	AWS/Google Cloud Platform regions
US	<ul style="list-style-type: none"> • US-East • US-Central • US-West • CAN • LATAM
Europe	<ul style="list-style-type: none"> • EU-West1 • EU-West4 • ME • S-Africa • AP-Aus • AP-Singapore • AP-JP • India

[About the Automation Co-Pilot process in Document Automation](#) on page 3479

Document Automation uses Automation Co-Pilot for Business Users technology to manage the end-to-end document extraction process. When you create a learning instance in Document Automation, the system also creates an Automation Co-Pilot process. Review the following guide to understand the logic.

Document Automation FAQ

Answers to frequently asked questions (FAQs) on the latest Automation Anywhere intelligent document processing solution, Document Automation.

Product FAQ

What pre-trained models are included?

Automation Anywhere offers invoices and Google Document AI offers invoices, utility bills, and receipts.

Does Document Automation have feature parity with Automation 360 IQ Bot?

Document Automation supports the following features from Automation 360 IQ Bot:

- Data extraction from text, number, date time, and check box fields
- Validation rules based on patterns, formulas, lists, and statements

Note: Document Automation does not support check box fields. The check box fields are available only for Automation 360 IQ Bot.

Which browsers are supported?

Document Automation is supported on the same browsers as the Automation Anywhere Control Room: Google Chrome, and Microsoft Edge.

Note: If you use Document Automation in Firefox, the user interface might not behave as expected.

What languages are supported?

Based on the providers, Document Automation supports various languages. Following table lists the languages supported by each provider:

Languages	Providers	
	Automation Anywhere (Pre-trained)	Google Document AI
English	Yes	Yes
Dutch	No	Yes
Estonian	No	Yes
French	Yes	Yes
German	Yes	Yes
Italian	No	Yes
Latvian	No	Yes
Lithuanian	No	Yes
Portuguese	No	Yes
Romanian	No	Yes
Spanish	Yes	Yes
Swedish	No	Yes

You can process documents in other languages by creating and training a learning instance in Automation 360 IQ Bot and connecting it with Document Automation to process documents using Document Automation technology and

What file formats are supported?

workflow. For more information, see [Connect learning instance](#) on page 3492.

Document Automation can process documents in the following file types:

- PDF
- JPG
- JPEG
- PNG
- TIF
- TIFF

What are the hardware requirements for Document Automation?

The hardware requirements for Document Automation are the same as the Bot Agent. For detailed information such as hardware components, compatible devices, supported operating systems and browser extensions, see [Bot Agent device requirements](#) on page 1282.

Which licenses are necessary?

The IQ Bot Pages product licenses is necessary for processing documents. The Automation Co-Pilot for Business Users license is necessary for processing documents in learning instances in production.

To send documents to Google Document AI for extraction, you must also have the Doc AI Document product license.

Note: To configure the Control Room with your Google Document AI license key, you must do these steps: [Configure key for Google Document AI](#) on page 3471. These steps are not necessary if you purchased Doc AI Document licenses through Automation Anywhere.

We provide a recommendation on configuring users with the minimum necessary roles and device licenses to perform specific tasks in [Document Automation users](#) on page 3469.

Can learning instances be migrated from Automation 360 IQ Bot to Document Automation?

Users can connect their learning instances from Automation 360 IQ Bot to their Document Automation environment, which allows them to process documents using the Document Automation technology without having to rebuild the learning instances. For more information, see [Connect learning instance](#) on page 3492.

Are customers required to maintain their Automation 360 IQ Bot environments?

If you have connected a learning instance from Automation 360 IQ Bot to Document Automation, do not delete the learning instance

	from Automation 360 IQ Bot since it stores the training data. We recommend you maintain Automation 360 IQ Bot in a version compatible with the associated Control Room.
What learning instance fields are supported out of the box?	Document Automation offers over 35 of the most common invoice fields, with the option to configure custom fields. To see all the possible fields when you are creating a learning instance, click Show unused fields .
What are the available deployment models for Document Automation?	Document Automation solutions can be deployed in On-premise edition as well as Cloud.

Processing and extraction FAQ

Which OCRs are supported?	The Automation Anywhere pre-trained model uses the ABBYY FineReader Engine or the Google Vision OCR .
I uploaded documents for processing, but nothing is happening.	The first time you process documents, the Document Extraction package downloads to the local device. This might cause a delay in document processing.
What should I do if a folder contains documents in multiple languages?	Use the Document Classifier package to sort the documents by language, then create a learning instance for each language.
What should I do if a language is not supported for the provided document?	If a document language is not currently supported, a recommended solution is to extract documents using languages available by other Providers such as, Standard Forms and Google Custom Data Extraction (CDE).
Is it possible to define custom document types such as bank statements or commerce registrations?	You can use the user-defined document type to process documents that are visually similar to invoices. Additionally, you can also use Standard Forms and Google Custom Document Extractor.
How do I process documents using Google Document AI?	Document Extraction enables users to send their documents to Google Document AI for processing. To use this feature, users must have Document AI licenses that they either purchased from Automation Anywhere or provided their Google Document AI account credentials to the Control Room. The process of creating, testing, and publishing is the same for learning instances using a Google Document AI model as for learning instances using a pre-trained model from Automation Anywhere.

Are multi-page tables supported?	Yes, Document Extraction supports extracting tables that span across multiple pages.
Is it possible to extract multiple tables from a document?	At this time, Document Automation can extract one table per document.
Where can I see the reason why data was not extracted from an uploaded document?	The Automation Co-Pilot Requests tab holds the history for each uploaded document. Here, you can see the step at which extraction failed or if a Validator user marked the document as invalid.
Is currency extraction supported?	Yes, except for the rupee (#).

Intelligent Document Processing solutions feature comparison matrix

Review the differences between Automation 360 IQ Bot and Document Automation by comparing the features in them.

	Automation 360 IQ Bot	Document Automation
Administration and setup		
Installation	Separate installer	Installed as part of the Control Room
Database administration	Separate database; requires additional effort for backups and maintenance	Uses the Control Room database; no additional backup or maintenance needed
Server configuration	Requires additional SSL configuration, RabbitMQ administration, HA and DR	Works out of the box
Learning instance configuration		
Alias management (keywords)	Yes, parity	Users can view, add, or remove field aliases for the learning instance
Confidence threshold	Does not work out of the box; server-level configuration	Helps to catch false positive outcomes; field-level configuration
Field order and field name customization	Not supported	Helps to improve validation efficiency
Field configuration	Must be done for every group	Needs to be done only one time for a learning instance
Ability to add and remove fields from the learning instance	No	Yes

	Automation 360 IQ Bot	Document Automation
Search for form or table fields	No	In create/edit learning instance search by field name, label, or data type.
Extraction capabilities		
Pre-trained models	Pre-configured domains that require additional training	Yes, out-of-the-box
Handling document variations	Classifier relies on document layout and training. Documents uploaded with a new layout are sent to a new document group, which requires training. Some docs could not be classified.	Layouts are identified using an object detection model to find key-value pairs. It is not necessary to configure all the fields in a learning instance before uploading documents.
Training process	Each group needs to be manually trained before it can process documents	Learning instance extraction improves based on changes users make in the Validator
Output format	CSV only	CSV or JSON
Process invoice-like documents with user-defined document type	Custom domains can be created exclusively through APIs for processing custom document types	Supported out-of-the-box
Regular expression-based extraction	Not supported	Use regex pattern extraction for values that follow a specific pattern, such as a VAT number or a PO number
Standardize the format of extracted numbers and dates	No	Configure your learning instances to convert extracted dates and numbers to standard formats
Unstructured document support	No	Yes, available with GenAI integration
Extraction from Fixed Forms	No	Yes, supported via MS Standard Forms
Google Document AI		
Google Document AI support	No	<ul style="list-style-type: none"> • Pre-trained models for invoices, Utility bills, Receipts • Google CDE support • Available through BYOL and OEM licenses
Human review and Validation		

	Automation 360 IQ Bot	Document Automation
Validation queue management	No	Use filters and search to find specific learning instances or documents
Auto-fill for tables	No	Use the Auto fill button in the validation interface to expedite the extraction of values from tables
Document-level Validation rules	No	Document Automation lets you create complex validation rules with different fields, multiple conditions and actions
End-to-end automation		
Task bots	Must be manually created	Document Automation automatically creates task bots for a learning instance
See status and history of uploaded documents	No	Yes
Customizable document processing workflow	No	Yes
Ability to split documents	No	Supported by the Advanced Classifier package
Monitoring and reporting		
Custom dashboards	No	Available with Bot Insight integration
Licensing	No	License consumption is tracked properly
Security		
Retention policy	No	Supported for 90 days by default
Secret management	No	Can use credential vault
Audit log	No.	Yes

Set up your Document Automation environment

Document Automation is installed simultaneously with the Control Room. Configure the users, roles, and devices, and connect the Control Room with Automation Co-Pilot for Business Users.

1. Log in to Document Automation through the Control Room.

You will receive an email from Automation Anywhere with your URL and credentials. Open the Control Room URL in your browser, enter your credentials in the login screen, and click **Log in**.

2. Upload the Document Extraction package to the Control Room: [Upload the IQ Bot packages to the Control Room](#)
 3. Create a custom role that allows users to check in and check out bots, manage packages, and validate documents.: [Create a custom role for Document Automation](#) on page 3468
 4. Create the users necessary to complete the end-to-end process of creating and publishing a learning instance: [Document Automation users](#) on page 3469
-

Note: When creating the `Unattended Bot Runner` user, provide the device credentials. You will connect the `Unattended Bot Runner` to the device in the next step.

5. Configure the unattended Bot Runner user device and device pool to allow the learning instance to function in public mode:
 - a) Using Remote Desktop Protocol (RDP), open the virtual machine where the unattended Bot Runner will run.
 - b) Log in to the Control Room as the `Document Automation Admin` user you created previously.
 - c) Navigate to **Manage > Devices** and click **Connect local device**. Follow the steps in the wizard to connect the Control Room to your device.
 - d) Click **Refresh** to verify that your device is connected.
 - e) Click **Create device pool** and perform the following steps:
 1. Enter a name for the device pool.
 2. Click **Devices** and then the arrow to move the device to the **Selected** column.
 3. Click **Consumers** and then the arrow to move `aari-document-processor` to the **Selected** column.
 4. Click **Create device pool**.

You can perform the following steps in the virtual machine or you can return to your device. If you perform the following steps on your device, ensure that you log in to the Control Room as the `Document Automation Admin` user.

6. Open Automation Co-Pilot for Business Users to connect it with the Control Room.
 - a) Navigate to the Automation Co-Pilot interface by adding `/aari` after your assigned Control Room URL.
 - b) Navigate to **Manage > Process > Global scheduler** and click **Edit**.
 - c) Select the `Scheduler` user that you created previously and click **Save**.
The following message is displayed: `Secure connection between AARI Web and Enterprise Control Room established successfully`
7. Create a team in Automation Co-Pilot to grant the `validator` user access to the documents awaiting validation.
 - a) Navigate to **Manage > Team > Create new team**.
 - b) Enter a team name.
 - c) Select the **Shared** request visibility.

- d) In the **Users** field, add the `validator` user that you created previously and click **Save**.

If users will create learning instances that use the Google Document AI model and you did not purchase Google Document AI licenses through Automation Anywhere, follow the steps to [Configure key for Google Document AI](#) on page 3471.

Log in to the Control Room as the `Learning instance creator` user and begin creating learning instances: [Using Document Automation](#) on page 3457

Related tasks

[Installing additional licenses](#) on page 1725

Upload new licenses to the Automation Anywhere Control Room to be distributed to users as required.

Related reference

[Automation 360 licenses](#) on page 1347

The **All Licenses** page displays detailed information about current product and device licenses.

Create a custom role for Document Automation

With a custom role, Document Automation users can check in and check out bots, manage packages, and validate documents.

1. Navigate to **Administration > Roles > Create role**.
2. Provide a name for the role, such as `aari-document-processor`.
3. In the Feature permissions page, select the following:
 - Set automation priority to high
 - View my bots
 - Run my bots
 - Export bots
 - Import bots
 - Create folders
 - Rename folders
 - Cancel checkout

Package Manager

- View packages
- Manage packages

Automation Co-Pilot for Business Users

- Cross Team Read
- AARI Scheduler

4. In the Bots permissions page, select all the check boxes in the **Bots** row.
5. Click **Save** to create the role.

Create users and assign this custom role to them. For more information about the required users, refer to [Document Automation users](#) on page 3469.

Document Automation users

With the required roles, permissions, and licenses, Document Automation users can perform various tasks. Users and roles are defined in the **Administration** tab.

The following table contains information about each type of user that interacts with Document Automation. It includes a description of the tasks that each user performs, the required roles, permissions, and licenses, and links to the pages most relevant to that user. Use this page to guide you in creating the users in the table below: [Create a user](#) on page 1678

Note: Some users require a custom role in Document Automation. This role grants users permissions to check in and check out bots, manage packages, and validate documents. For instructions on how to create a custom role, see [Create a custom role for Document Automation](#) on page 3468.

User	Description	Roles	License	Related links
Learning instance creator	Can create, edit, and delete learning instances, upload documents for processing, and check in or check out learning instances. The **All Licenses** page displays detailed information about current product and device licenses.

Configure key for Google Document AI

If the learning instance uses a Google Document AI model and you did not purchase Google Document AI licenses through Automation Anywhere , follow these configuration steps.

- If you have not done so already, complete the steps to [Set up your Document Automation environment](#) on page 3466.
- Log in as the `Admin` user type. For more information about the user types, refer to [Document Automation users](#) on page 3469.

For detailed information, see [BYOK | Google Doc AI Integration](#).

You will assign this role to a Credential Vault locker, which will allow the `Learning instance creator` user to securely provide the Google Document AI key to the **Extraction bot**, allowing the learning instance to send documents to Google Document AI for extraction.

Create a custom role to access the Credential Vault locker that holds the Google Document AI key:

1. Navigate to **Administration > Roles > Create role**.
2. Provide a name for the role, such as `doc-ai-credential-role`.
The `Manage my credentials and lockers` permission is automatically selected.
3. Click **Create role**.

Assign the role to the `Learning instance creator` and `Unattended Bot Runner` user types.

4. Navigate to **Administration > Users** and locate the users.
5. For each user, click **Edit user** and add the `doc-ai-credential-role`.

Create a credential to store the Google Document AI key:

6. Navigate to **Manage > Credentials > Create credential**.
7. Provide a name for the credential, such as `doc-ai-credential`.
8. Provide a name for the attribute, such as `ServiceAccount`.
9. Select the **Standard** input option and enter the Google Document AI API key in the **Value** field.
10. Click **Create credential**.

Create a locker to store the key and provide access to other users.

11. Navigate to the **Lockers** tab and click **Create locker**.
12. Provide a name for the locker, such as `doc-ai-locker`.
13. Select the `doc-ai-credential` and click the right arrow to move the credential to the **Selected column**.
14. In the **Consumers** tab and select the `doc-ai-credential-role` and click the right arrow to move the credential to the **Selected column**.
15. Click **Create locker**.

Log in as the `Learning instance creator` user type to do the following:

- Create a learning instance: [Create a learning instance in Document Automation](#) on page 3472
- Provide the credential to the **Extraction bot**: [Configure Extract action to process documents in Google Document AI](#) on page 2430

Related tasks

[Installing additional licenses](#) on page 1725

Upload new licenses to the Automation Anywhere Control Room to be distributed to users as required.

Create a learning instance in Document Automation

Begin processing documents by creating a learning instance to extract data from invoices, utility bills, or receipts. A learning instance is a structure that holds information such as document type, language, and the fields to be extracted.

- To create a learning instance, you must be a `Learning instance creator` user. See [Document Automation users](#) on page 3469.
- To create a learning instance that uses a Google Document AI model, you must create a credential and locker to hold your security token. See [Create credential](#) on page 1798 and [Create locker](#) on page 1801.

Note: When configuring the locker, you must add the `aari-document-processor` custom role as a locker consumer.

- The default OCR is ABBYY FineReader Engine. Alternatively, Cloud Control Room users can create a learning instance to process documents in Google Vision OCR.

Watch this video for the complete end-to-end process of creating a learning instance:

1. From the Control Room home page, navigate to **Manage > Learning Instances > Create Learning Instance**.
2. Enter a name and description for the learning instance.
Document Automation does not allow duplicate learning instance names, so the name you provide must be unique.
3. Select the document type: **Invoice**, **User-defined**, **Utility Bill**, or **Receipt**
Use the user-defined document type to process documents that are visually similar to invoices, such as purchase orders and sales orders, which contain key-value pairs and a table structure. In this document type, you create and configure all of the form and table fields.
4. Select the language.
Document Automation supports English, Dutch, French, German, Italian, Portuguese (Brazilian), and Spanish.

Note: Extraction for French, German, and Spanish language documents is currently in preview. Extraction results will improve in future releases.

If you select a document type that is used while configuring the parser in step 3, the language selected during parser configuration is auto-selected. In addition, the locale list displays language options based on the auto-selected language.

5. If you selected Invoice: Select the provider.

If you selected the English language in step 4, Automation Anywhere (Pre-trained) is auto-selected.

If you select a document type that is used while configuring the parser in step 3, the configured (third-party) parser is auto-selected as the provider.

6. Optional: You can use the **Send validation feedback** option to send feedback to the system to improve extraction results. For more information, see [Improving extraction accuracy through validation](#) on page 3477**7.** Optional: Select the OCR provider. By default, Document Automation processes documents in ABBYY FineReader Engine.

Users with a Cloud Control Room can select to process documents in Google Vision OCR.

8. Click **Next**.

We recommend that you open a sample document side by side with the Control Room window as you configure the form and table fields.

Note:

- A form field is a type of field that occurs only one time in a document.
 - A table field is a type of field that reoccurs throughout a document, typically in the form of a table.
-

9. Configure the form and table fields for extraction.

Document Automation offers a standard set of form and table fields, many of which are not initially visible. You can search for a field by field name, field label, or data type.

To see the full list of fields, click **Show unused fields**. See the following video for a demonstration:

Click a field to open the fields editor. You can edit most attributes of a field. You cannot edit the name and default aliases. Document Automation assigns default aliases, which are hardcoded keywords, to standard fields to help with extraction. You cannot modify or delete default aliases, but you can add aliases in the **Custom aliases** field. See the following video for a demonstration of creating a custom alias:

You can add custom form and table fields for Google Document AI learning instances. When you want to extract data from fields that Google does not support, you can create custom fields. With this enhancement, you can use pre-trained models from Google along with custom fields for document extraction.

Consider the following points when you add custom fields for Google Document AI learning instances:

- You can add custom form and table fields for document types such as invoices and utility bills.
-

Note: You cannot add custom fields for the receipts document.

- You can edit and save the custom fields.
- A regular expressions (RegEx) is available for the custom fields.
- You can add custom fields for existing learning instances that are attached to the old package.

In this scenario, when you save the learning instance, a notification displays to update the package version.

- Based on the aliases, you can extract the custom fields by using the V8 engine.
- When a package is not compatible with multiple features, a message displays corresponding to the highest package version.
- You can import or export the custom fields to or from the .dw file along with defined aliases and settings.
- When you extract the custom fields, these fields are backward compatible with the older package version.
 - When a learning instance uses the custom fields, the old package (v.29 and earlier) does not throw an error and contains empty values for custom fields.
 - Similar to the standard fields, the old package (v.29) applies normalization and rules for custom fields, if applicable.

Mouse over the menu icon to the right of a field to access the up/down arrows. Use the arrows to rearrange the order of the fields for a more efficient manual validation. The order of the fields does not impact extraction.

To learn more about the other field attributes, review the table in the next step.

10. To add a field, click **Add a field** and complete the following fields:

Option	Description
Field name	Enter a field name that begins with an alphabetical character (A-Z or a-z). In standard fields, the field name is hardcoded and cannot be changed.
Field label	Enter a user-friendly name to help validators. For example, you can rename <code>Organization tax number</code> to a localized name, such as <code>VAT number</code> . The field label does not affect extraction.
Confidence	Set a threshold to reduce potential false positives. At the time of processing, the Document Automation engine assigns a score to each field in a document to indicate the certainty that the data was correctly extracted. If the document contains fields with a score that is lower than the confidence threshold, the document is sent to the validation queue. If you enter a high confidence threshold, more documents will be sent to the validation queue. If you enter a low confidence threshold, fewer documents will be sent to the validation queue. Supports values from zero to 100.
Data type	Choose from Address* , Text , Number , and Date . If the data in the field does not match the data type, the document is sent to the validation queue. Document Automation supports date and number format variations. * If you are configuring a learning instance with a user-defined document type, the form fields include the address data type, which extracts the entire structure of an address.

Option	Description
Format Date/ Number	<p>Set a standard appearance to convert extracted dates and numbers to a specific format. This ensures consistency and accuracy in your databases and other systems of record.</p> <p>For example, if you select to standardize dates to MM/DD/YYYY and a processed document contains a date that appears as 12 Feb 2023, the learning instance will reformat the date to 02/12/2023.</p> <p>If you select to standardize numbers to the English (United States) locale and a processed document contains a number that appears as 100,00, the learning instance will reformat the number to 100.00.</p>
Required	<p>Select one of the following:</p> <ul style="list-style-type: none"> • Required: Field cannot be empty. • Optional: Field can be empty or not exist in the document.
Default aliases	No action is necessary for this field. Document Automation assigns default aliases, which are hardcoded keywords, to standard fields to help with extraction.
Custom aliases	<p>Additional keywords to help Document Automation locate the field. For example, add country or region-specific names for fields such as VAT number as an alias to an Organization tax number custom field.</p> <hr/> <p>Note: Custom aliases must be unique. They cannot duplicate the default alias of another field. Exception: Form fields can have duplicate custom aliases as the table fields and vice versa.</p> <hr/>
Validation rules	<p>Depending on data type, create rules using patterns, formulas, lists, and statements such as starts or ends with.</p> <p>Formula validation on page 3486 Pattern validation on page 3491</p>

11. Click **Create**.

When a new learning instance is created, the Control Room creates a folder with the same name as the learning instance in the **Automation > Document Workspace** folder. The folder contains two bots (extraction and download), a process, and a

form.

Files and folders (4)			
<input type="checkbox"/>	Type #1	Name #2	Status
<input type="checkbox"/>	Process	Invoice_processing	Public
<input type="checkbox"/>	Task Bot	Invoice_processing_downloadbot	Public
<input type="checkbox"/>	Task Bot	Invoice_processing_extractionbot	Public
<input type="checkbox"/>	Form	Invoice_processing_initform	Public

- **Process:** Manages the process using if/else scenarios through which Document Automation extracts data from uploaded documents, assigns documents to users for validation, and downloads the extracted data. To learn more, see [About the Automation Co-Pilot process in Document Automation](#) on page 3479
- **Extraction bot:** Extracts data from defined fields in the uploaded documents.
- **Download bot:** Downloads the extracted data to a specific folder on the device or shared network.
- **Form:** Defines the input parameters that are sent to the process. Input parameters include the learning instance name, uploaded file, and output file path.

Copy a learning instance in Document Automation

You can copy an existing learning instance (Public and Private) to reuse the learning instance fields, parser, document type, and language. When you copy a public learning instance, the copied learning instance remains in the private mode. After copying a learning instance, you can edit the existing parameter (except parser and heuristic feedback) as required.

To copy a learning instance,

1. Go to **Manage > Learning Instances.**

A list of all the learning instances display.

2. Click the three dots icon next to the learning instance that you want to copy and click the **Copy option.**

3. In the **Copy Learning Instance window, enter the name for the instance.**

Note: When you copy a learning instance, the default name starts with the prefix **Copy of <<instance name>>**. You can change the name, if required.

4. Select the required copy options and click **Copy.**

You can select the existing form and table field attributes, validation rules of existing form and table fields, and heuristic feedback.

A success message indicates that the copy process is started and a Control Room notification is triggered to indicate success or failure of the copy process.

Consider the following points when you copy a learning instance:

- You cannot copy the dashboard metrics for the learning instance.
- You cannot copy the connected learning instance.
- You cannot copy the Doc AI learning instance credentials.
- If the underlying package of the learning instance is deleted before copying an instance, an error might occur during the copy process.
- Each copied learning instance is separate one.
- You can delete the original or copied learning instance when required.
- An audit entry is logged.

Upload documents to the learning instance, fix validation errors, and verify the extracted data: [Process documents in Document Automation](#) on page 3481

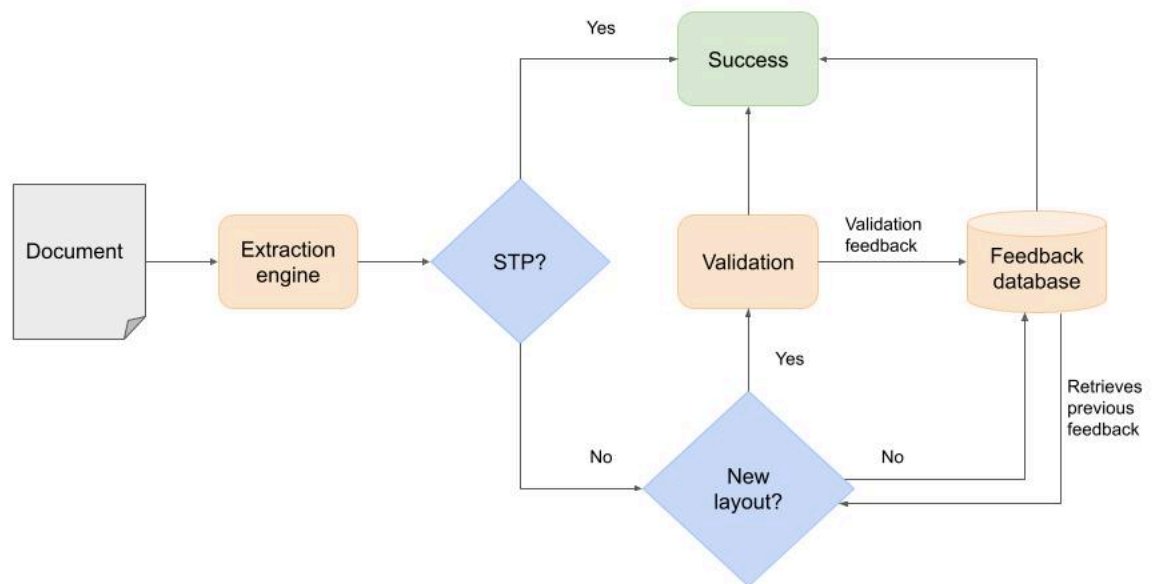

Data extraction in Document Automation

Understand how the system improves extraction accuracy through user-provided changes in the Validator.

Improving extraction accuracy through validation

When a learning instance is created, the user has the option to enable this feature to send feedback to the learning instance based on user-provided changes in the Validator. In Document Automation, learning instances running in production mode can continuously "learn" whenever a user resizes or relocates the extraction region in the Validator.

The following graphic provides a visual overview of the process by which learning instances continuously receive feedback from validation:

1. An uploaded document passes through the extraction engine.
2. If the learning instance successfully extracts the data, the document is added to the straight-through processing (STP) count and the extracted values are downloaded to a file in the Success folder.
If the learning instance can not extract the data, the system evaluates whether the document contains an unfamiliar layout.
3. If the learning instance does not recognize the document layout (new layout), the document is sent for manual validation where the user "teaches" the learning instance how to extract the data by setting the extraction region.
4. The extracted values are downloaded to a file in the Success folder and the changes are collected in a feedback file, which is sent to the feedback database.

Note:

- Feedback is only collected when the user changes the extraction region. If the user manually inputs text, the system does not collect feedback.
- The feedback file only contains data on the field location to improve extraction accuracy for subsequent documents.

If the learning instance recognizes the cluster, it retrieves previous feedback from the feedback database and uses it to extract data.

Using validation feedback to extract specific values in a table

As of Automation 360v.27, you can train a learning instance to extract data from a cell that contains more than one field.

For example, if a product description column also includes item number, you can outline the item number in the Validation interface. When the learning instance processes subsequent documents, it will extract the item number and ignore the product description.

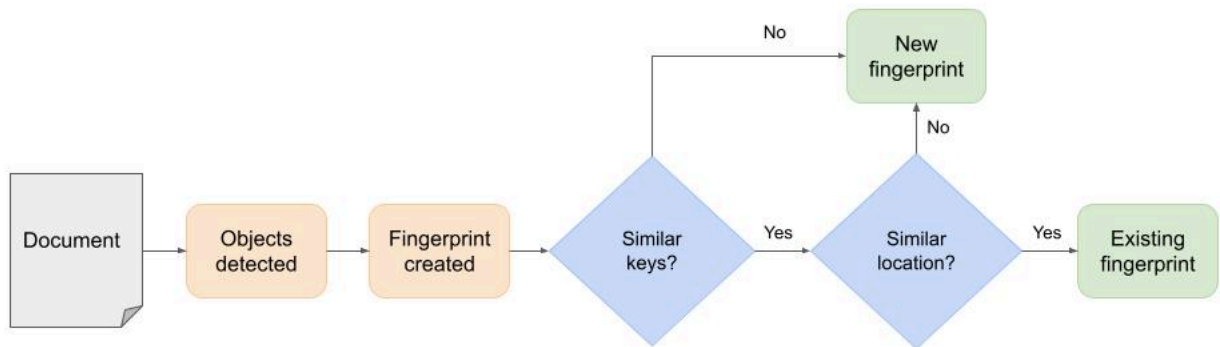

Follow this process to configure a learning instance to extract specific values from a cell:

1. Create a learning instance using an Automation Anywhere pretrained model and select the option to send validation feedback: [Create a learning instance in Document Automation](#) on page 3472
2. Upload a sample document: [Process documents in Document Automation](#) on page 3481
3. In the Validator, locate the field and redraw the box to only surround the values that you want to extract.
4. After you click **Submit**, the information on the new extraction region is sent to the feedback database.
5. Upload more documents to test the accuracy of extraction. When you are satisfied with the results, proceed to preparing the learning instance to run in production: [Publish the learning instance to production](#) on page 3503

How Document Automation identifies new layouts

Document Automation extraction is based on object detection. During document processing, the extraction engine identifies objects, or key-value pairs of the field and associated value. The engine creates a "fingerprint" of the document, which stores the sequence of the objects and each object's location in the document.

When a document is processed, if the engine recognizes the keys and their locations, the document is classified and extracted based on that existing fingerprint. Otherwise, the engine saves a new fingerprint of the keys and their locations.

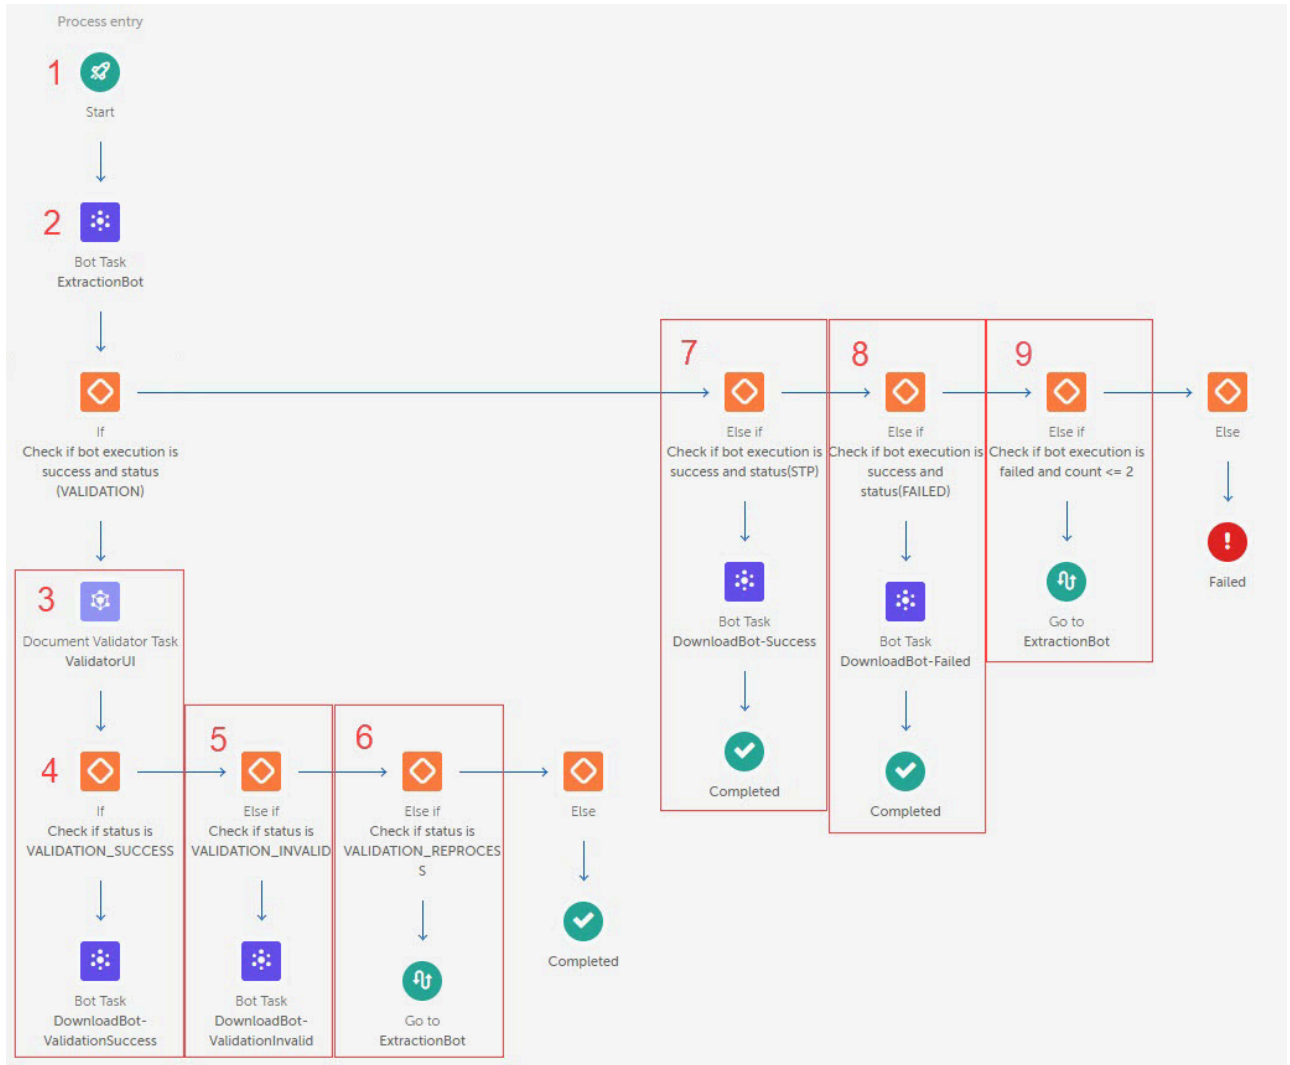

About the Automation Co-Pilot process in Document Automation

Document Automation uses Automation Co-Pilot for Business Users technology to manage the end-to-end document extraction process. When you create a learning instance in Document Automation, the system also creates an Automation Co-Pilot process. Review the following guide to understand the logic.

When a learning instance is in production, each incoming document creates a new request, which triggers the extraction process. If a document requires manual validation, Automation Co-Pilot creates a validation task and assigns it to a validation team.

After the documents are processed, the Download bot downloads the extracted data to a file in the Success folder.

1. Start: The Automation Co-Pilot form that defines the inputs, such as the learning instance name, uploaded documents, and output folder.
2. Bot Task ExtractionBot: Executes the RPA bot that processes incoming documents to extract data from them.
3. Document Validator Task: Opens the Validation user interface where the user can manually validate the fields in the document.
4. Documents require validation: The ExtractionBot tried to process the documents then sent the documents for validation, the documents were successfully validated, and the DownloadBot downloaded the extracted data to the `Success` subfolder.

Request status = `VALIDATION_SUCCESS`

5. Invalid documents: The previous process was interrupted at validation, where a user marked certain documents as **invalid**. These documents were downloaded to the `Invalid` subfolder.

Request status = `VALIDATION_INVALID`

6. Reprocessed documents: The previous process was interrupted at validation because the user clicked **Reprocess**. Documents were sent back to the ExtractionBot for reprocessing.

Request status = `VALIDATION_REPROCESSING`

7. Documents are successfully processed: The ExtractionBot successfully processed the documents, no documents required validation, and the DownloadBot downloaded the exacted data.

Request status = `success` and `STP`

8. Processing failed: The ExtractionBot failed to process the documents (for example: invalid format or could not read the file) and the file is saved to the `Failed` subfolder

Request status = `FAILED`

9. Deployment failed: The Control Room failed to deploy the ExtractionBot (for example: lost server connection). The Control Room makes three attempts.

Important: We do not recommend deleting the process. If you unintentionally delete a process associated with a learning instance, do the following steps to recover the process:

1. Navigate to **Manage > Learning Instances** and mouse over the actions menu to the right of the learning instance.
2. Click **Export**.
3. Mouse over the actions menu to the right of the learning instance and click **Delete**.
4. Click **Import** at the top of the page.
5. Click **Browse** and select the `.dw` file you exported.
6. When prompted, click **Overwrite** to generate a new process for the learning instance.

Process documents in Document Automation

Upload sample invoices to test the learning instance, verify the extracted data, and fix validation errors.

- If you have not done so already, [Create a learning instance in Document Automation](#) on page 3472.
- Verify that your device is connected to the Control Room: [Install Bot Agent and register device](#) on page 1288
- If the learning instance uses a Google Document AI model and you did not purchase Google Document AI licenses through Automation Anywhere , you must provide your Google Document AI credentials to the Extraction bot. See [Configure key for Google Document AI](#) on page 3471
- If the learning instance uses an Automation Anywhere model, ensure that each file is 50 MB or less.

If the learning instance uses a Google Document AI model, ensure that each file is 20 MB or less, with a maximum of 5 pages.

- Ensure that the sample documents are in one of the following supported document types:
 - PDF
 - JPG
 - JPEG
 - PNG

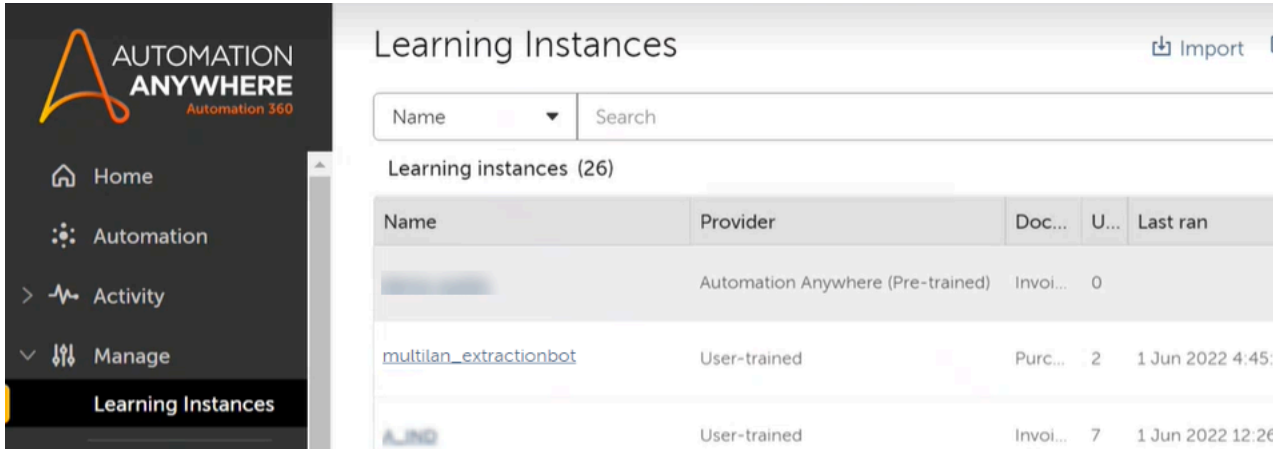

- TIF
- TIFF
- The default output format for the extracted data is CSV file. To change the output to JSON, see [Change output format from CSV to JSON](#) on page 3484.

Perform the following steps to upload sample invoices to the learning instance to test the data extraction capabilities of the learning instance.

1. Upload documents to test the learning instance:

See these steps in a video:

a) Click **Process documents**.

The screenshot shows the Automation Anywhere interface. On the left is a navigation menu with options: Home, Automation, Activity, Manage, and Learning Instances. The main area displays the 'Learning Instances' table. The table has columns: Name, Provider, Doc..., U..., and Last ran. There are 26 learning instances listed. One instance, 'multilan_extractionbot', is highlighted in blue. It is a 'User-trained' instance with 2 documents and a last run time of 1 Jun 2022 4:45. Another instance, 'A...ND', is also visible with 7 documents and a last run time of 1 Jun 2022 12:26.

b) In the **Process Documents** window, click **Browse** to select the files to upload.

c) In the **Download data to** field, enter the file path that will hold extracted data.

When the process runs, it creates the following three folders in the provided file path:

- **Success:** Contains the extracted data in the specified format (CSV or JSON).
- **Invalid:** Holds documents marked invalid.
- **Failed:** Holds documents that could not be processed.

You can provide an output folder path based on one of the following options:

- Option 1: The local device path if you have set up document processing and validation on the same device.

This option is typically used when you are testing the learning instance.

- Option 2: The shared folder path if you have set up distributed validation on separate devices.

This option is typically used for published learning instances. For example, \10.239.192.60\Sharepath\Output.

d) Click **Process documents**.

The Bot Runner window appears. The window disappears when the documents are done processing. Refresh the **Learning instances** table to see the updated metrics.

If there is a value next to the **Validate documents** link, you must manually validate the document fields. Otherwise, proceed to step 3.

2. Fix the validation errors**a)** Click **Validate documents**.

The Automation Co-Pilot Task Manager opens in a new tab, with the first failed document in queue. For an introduction to the Validator user interface, see [Using the Automation Co-Pilot Task Manager Validator for Document Automation](#) on page 3511.

b) Review each field to verify the data type and extracted value.

Document Automation supports the following data types: text, number, date, address, and check box

Alternatively, from the drop-down list on the right panel, you can select **Show fields that need validation**.

Note: When documents are awaiting validation, if you edit the learning instance, click **Reprocess** to reattempt extraction.

Reprocessing documents does not affect the uploaded documents metric.

c) Update the fields with errors.

Click the field or draw a box around the values that you want to extract.

For Automation Anywhere pre-trained models, you can configure the learning instance to extract specific values in a field and ignore others. For more information, see [Using validation feedback to extract specific values in a table](#) on page 3478.

- To skip a document without correcting errors, click **Skip** to proceed to the next document in the validation queue.
- To remove a document that cannot be processed, click **Mark as Invalid**.

d) After you make the necessary corrections, click **Submit** so that the document can finish processing.

The next document in queue appears. When all the documents are corrected, the system displays a message stating that no more tasks are available.

e) Close the tab to return to the **Learning Instances** page.**3.** Verify the output results:**a)** Open the file in the **Success** folder that contains the extracted data and review the results to ensure that it matches your use case.**b)** Optional: Review the **Learning Instance** dashboard.

The dashboard displays the total number of uploaded documents and the number of documents pending validation.

If the learning instance repeatedly cannot find a field or if characters are not correctly recognized (such as the letter "l" extracted as the number "1"), you can try changing the OCR to Google Vision OCR.

Build a bot that uploads documents from a source folder to the learning instance. Then, publish the learning instance assets (process, form, and bots) to the public repository so that the learning instance can be used in public mode to extract data from real documents, and validators can manually validate documents: [Publish the learning instance to production](#) on page 3503

Related concepts

[Extracting data from check boxes](#) on page 3494

Document Automation supports check box extraction for connected learning instances. The output varies depending on the selected data format.

Change output format from CSV to JSON

Data from successfully processed documents is available as a CSV file, by default. Change the output format by editing the download data action before you begin uploading documents.

If you have not done so already, [Create a learning instance in Document Automation](#) on page 3472.

To change the output format to JSON, perform the following steps:

1. Navigate to **Automation > Private tab > Document Workspace** and click the folder with the same name as the learning instance to configure the assets.

2. Open the process.

You must update the output format for `DownloadBot-ValidationSuccess` and `DownloadBot-Success`:

3. Click `DownloadBot-ValidationSuccess` and locate the **DocumentType** field.

4. Change `OUTPUT_CSV` to `OUTPUT_JSON`.

5. Repeat steps 3 and 4 to change the output format for `DownloadBot-Success`.

6. Click **Save**.

Upload documents to the learning instance: [Process documents in Document Automation](#) on page 3481

Validation rules in Document Automation

With validation rules, you can ensure the accuracy of extracted data across multiple fields in your documents.

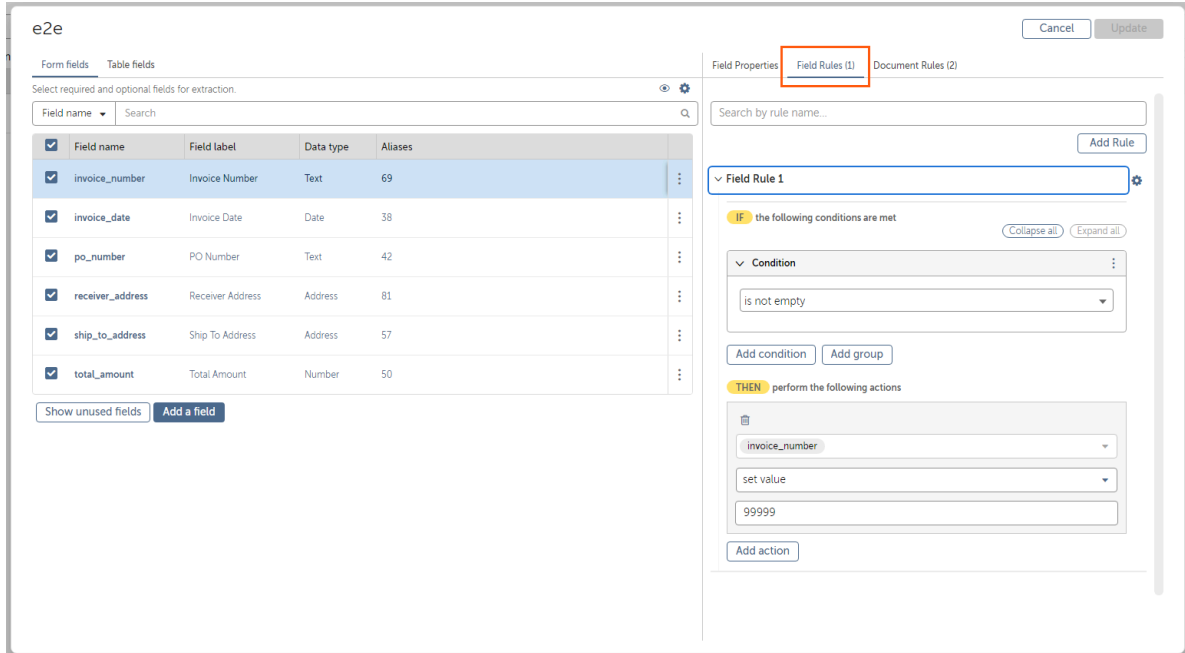

You can define various conditions, such as pattern matching or equality checks. When those conditions are met, you can effortlessly take action to flag errors or warnings, clean up or replace values, or set new values.

Enhanced validation rules can be applied on two levels:

- Field Rules
- Document Rules

Field rules

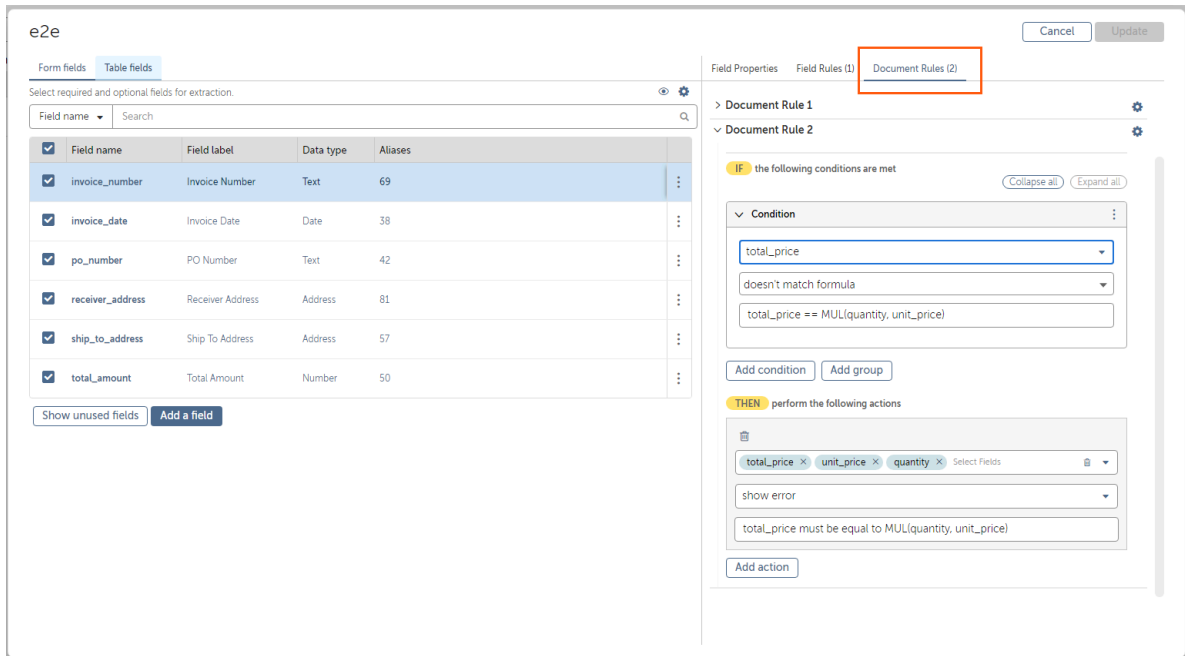

Field-level rules are designed to create rules specifically for individual fields. These rules contain a condition that is followed by a set of actions to be performed if the condition is met and is implicitly associated with the highlighted field.

These rules are processed before document-level validation rules.

Document Rules

A document level rule is associated with a field but can have conditions and actions that are dependent on values of other fields. With these rules, you can build complex structure of conditions that can include several fields and encompass extensive actions.

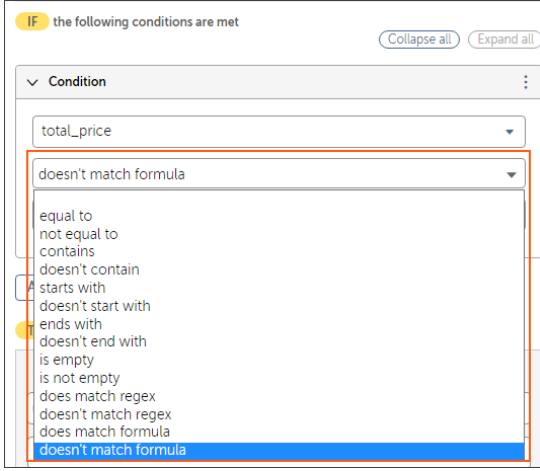

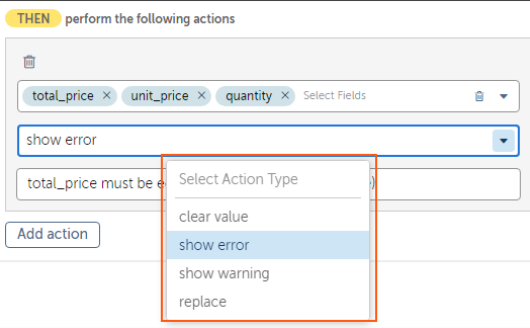

Note:

- You can select one or more fields where these actions can be applied.

- The document rules can be structured with dependencies between fields, and their execution order is crucial. It is important to maintain the sequence.

In the following video, you can observe how validation rules are utilized within documents to enhance the process of data extraction.

Available conditions and actions

Condition	Action
<p>A condition is expressed as a logical rule that evaluates the state or values of certain fields that must be met for an action to occur.</p> <p>Below is the list of all the available conditions:</p> 	<p>An action is associated with an operation that is performed when certain conditions are met.</p> <p>Below is the list of all the available actions:</p> 

Formula validation

Use basic arithmetic, comparative, logical, and functional operations.

Tip: We recommended using functional operators instead of mathematical operators when validating fields and tables for better accuracy.

When formulating an expression remember the following:

- All function names must be in capital letters.
- All formulas must result in either a true or false validation.
- Field and column names are case sensitive when used within formulas. If field is defined as Qty in design, using qty or QTY in formula results in an invalid formula.
- For variable declaration or manipulation, ensure not to use certain keywords that are reserved for formulating an expression, including SUM, SUB, DIV, MUL, COLSUM, IF.

Mathematical Operators

Operations	Description	Syntax
+	Addition	Field/Column_Name1 + Field/Column_Name2
-	Subtraction	Field/Column_Name1 - Field/Column_Name2
*	Multiplication	Field/Column_Name1 * Field/Column_Name2
/	Division	Field/Column_Name1 / Field/Column_Name2

Comparative Operators

Operations	Description	Syntax
==	Equal To	[Current Field/Column Name] == [expression comprised of one or more field/column name or fixed numeric values] For example, AMOUNT == MUL(QUANTITY, UNIT_PRICE)
>=	Greater than or Equal To	[Current Field/Column Name] >= [expression comprised of one or more field/column name or fixed numeric values] For example, TOTAL_BILL_AMOUNT >= AMOUNT_PAID
<=	Less than or Equal To	[Current Field/Column Name] <= [expression comprised of one or more field/column name or fixed numeric values] For example, AMOUNT_PAID <= TOTAL_BILL_AMOUNT

Operations	Description	Syntax
>	Greater Than	[Current Field/Column Name] > [expression comprised of one or more field/column name or fixed numeric values] For example, BILL_AMOUNT > 0
<	Less Than	[Current Field/Column Name] > [expression comprised of one or more field/column name or fixed numeric values] For example, DISCOUNT_PERCENTAGE < 100
!=	Not Equal To	[Current Field/Column Name] != [expression comprised of one or more field/column name or fixed numeric values] For example, DEBIT_AMOUNT != 0

Logical Operators

Operations	Description	Syntax
&&	And: Field/Column is valid if all conditions are true	<Current Field/Column Name> <operator 1> <expression 1> && <Current Field/Column Name> <operator 2> <expression 2> For example, DISCOUNT_PERCENTAGE >= 0 && DISCOUNT_PERCENTAGE <=100

Operations	Description	Syntax
	Or: Field/Column is valid if any one of the given conditions is true	<p><Current Field/Column Name> <operator 1> <expression 1> <Current Field/Column Name> <operator 2> <expression 2></p> <p>For example, DISCOUNT_PERCENTAGE >= 0 DISCOUNT_PERCENTAGE == 'Net'</p>
!	Not: Converts a true expression to false and also the other way round	<p>!<expression></p> <p>For example, !(AGE < 18) ==> valid when AGE is not less than 18</p>

Functional Operators

Operations	Description	Syntax
SUM	Summation: gives result of addition of one or more field/column/fixed-number values	<p>SUM(n1,n2,...,nN)</p> <p>For example, SUM(SUB_TOTAL, SERVICE_TAX, EDUCATION_CESS) ==> equivalent to SUB_TOTAL plus SERVICE_TAX plus EDUCATION_CESS</p>
SUB	Subtraction: gives result of subtraction of one or more field/column/fixed-number values from the first specified value	<p>SUB(n1,n2,...,nN)</p> <p>For example, SUB(SUB_TOTAL, TOTAL_DISCOUNT, ADJUSTMENTS) ==> equivalent to SUB_TOTAL minus TOTAL_DISCOUNT minus ADJUSTMENTS</p>

Operations	Description	Syntax
MUL	Multiplication: gives result of multiplication of one or more field/column/fixe-number values	<p>MUL(n1,n2,...,nN)</p> <p>For example, MUL(QTY_IN_BOX, UNIT_PRICE, SHIPPED_BOXES) ==> equivalent to QTY_IN_BOX multiply-with UNIT_PRICE multiply-with SHIPPED_BOXES</p>
DIV	Division: gives result of division of one or more field/column/fixe-number values from the first specified value	<p>DIV(n1,n2,...,nN)</p> <p>For example, DIV(AMOUNT, SHIPPED_BOXES, UNIT_PRICE) ==> equivalent to AMOUNT divide-by SHIPPED_BOXES divide-by UNIT_PRICE</p>
COLSUM	Sum of a given Column in a table: gives result after evaluating given expression for each row of specified table and adding them all together	<p>COLSUM("<table-name>", "<expression to evaluate for each row of specified table- name>")</p> <p>For example, FINAL_TOTAL == COLSUM("LINE_ITEMS", "MUL(QTY, UNIT_PRICE)")</p> <p>Say there are 3 rows for table LINE_ITEMS, then FINAL_TOTAL should be equal to MUL(QTY1, UNIT_PRICE1) + MUL(QTY2, UNIT_PRICE2) + MUL(QTY3, UNIT_PRICE3)</p> <p>where, QTY1 is QTY value in row 1, similarly UNIT_PRICE1 is UNIT_PRICE value in row 2, and so on for other rows as well.</p>

Pattern validation

A pattern defines an acceptable format for date, number, or text fields. Reference the tables below for common examples:

Text

Field	Pattern	Notes	Description
Email	<code>^([a-z0-9_\.-]+)@([\da-z0-9_\.-]+)\.([a-z\.-]{2,6})\$</code>	This regular expression validates emails like john@ado.com.	The Email field supports regular expressions.
Phone Number	<code>^(\(?\+?[0-9]* \)?)?[0-9_\-\(\)]*\$</code>	This regular expression validates phone numbers like (+64) 38 3235393.	The Phone Number field supports regular expressions.
Website	<code>^([a-zA-Z0-9]+(\.[a-zA-Z0-9]+)+.*)\$</code>	This regular expression validates websites like www.domain.com.	The Website field supports regular expressions.
Number string	<code>^[0-9]{1,45}\$</code>	This regular expression validates a string with numbers 0 - 9 and limit length to 45.	The Number string field supports regular expressions.
Alpha-numeric	<code>^[A-Za-z0-9_@./#&+]*\$</code>	This regular expression validates a string containing alphanumeric values like INV-001.	The Alpha-numeric field supports regular expressions.

Number

Field	Pattern	Notes	Description
Number string	<code>^[0-9]{1,45}\$</code>	This regular expression validates a string with numbers 0 - 9 and limit length to 45.	The Number string field supports regular expressions.

Connect learning instance

Connect to a learning instance in Automation 360 IQ Bot to process documents in that learning instance using the Document Automation workflow.

To perform this task, you must have one of the following roles:

- **AAE_IQ Bot Admin**
- **AAE_IQ Bot Services**
- A custom role with the **Connect learning instance** permission

Open the Document Automation and Automation 360 IQ Bot environments on the same device.

When you connect a learning instance that was created in Automation 360 IQ Bot, the system creates learning instance assets (RPA bots, Automation Co-Pilot process, and form) to enable the learning instance to start processing documents in Document Automation.

Note:

- This feature is accessible only within Document Automation (not available in Community Edition). If you are an IQ Bot customer, you can use this feature within Document Automation.
- The Automation 360 IQ Bot environment must be associated with the Control Room where Document Automation is installed. In addition, Automation 360 IQ Bot must be in a version that is compatible with the Control Room.
- You can connect one learning instance at a time.

A connected learning instance can extract data from check boxes if your device is configured with the Microsoft Visual C++ 2019 Redistributable package: [Extracting data from check boxes](#) on page 3494

1. Login to the Control Room as the **Admin** user. Navigate to **Manage > Learning Instances**. Click **Connect learning instance**. This takes you to **Connect Learning Instances from IQ Bot classic page** which contains a list of Automation 360 IQ Bot learning instances.

- Select the learning instance from version Automation 360 IQ Bot to connect with. Move it from left to right. Click **Connect**.

Connect Learning Instances from IQ Bot classic

You can edit the Learning Instance only in IQ Bot

Select learning instance

Click learn left

The newly-connected learning instance appears in the Learning instances table in private mode.

Note: The value in the Provider column indicates whether a learning instance was connected from Automation 360 IQ Bot or created in Document Automation.

- For a connected learning instance, the Provider column value is User-trained.
- For a learning instance created in Document Automation, the Provider column value is Automation Anywhere (Pre-trained).

Note: You must maintain the Automation 360 IQ Bot server because it stores the configuration and training data for the connected learning instance.

- A connected learning instance can only be edited in Automation 360 IQ Bot. To edit the learning instance after connecting it, click the name in the Learning instances table and you will be redirected to open the learning instance in Automation 360 IQ Bot in a new window.
- To upload documents for processing, click **Process Documents**. [Process documents in Document Automation](#) on page 3481

Extracting data from check boxes

Document Automation supports check box extraction for connected learning instances. The output varies depending on the selected data format.

A check box is a user interface object that allows you to make a binary choice - select or leave unselected. Document Automation supports extracting data from check boxes or radio buttons marked with a tick, cross, or dot. In addition to square check boxes and round radio buttons, Document Automation supports triangle and rhombus outlines.

Document Automation supports the extraction of group check boxes from connected learning instances. For more information on group check boxes, see [Extract data from check box groups in Automation 360 IQ Bot](#).

Note: To enable check box detection, you must install the Microsoft Visual C++ 2019 Redistributable package on the Bot Runner device where the documents are processed. [Download Microsoft Visual C++ Redistributable](#)

How the data is output

The possible output values are `Yes`, `No`, or `No Checkbox Found`. The output format depends on the format you selected [Change output format from CSV to JSON](#) on page 3484.

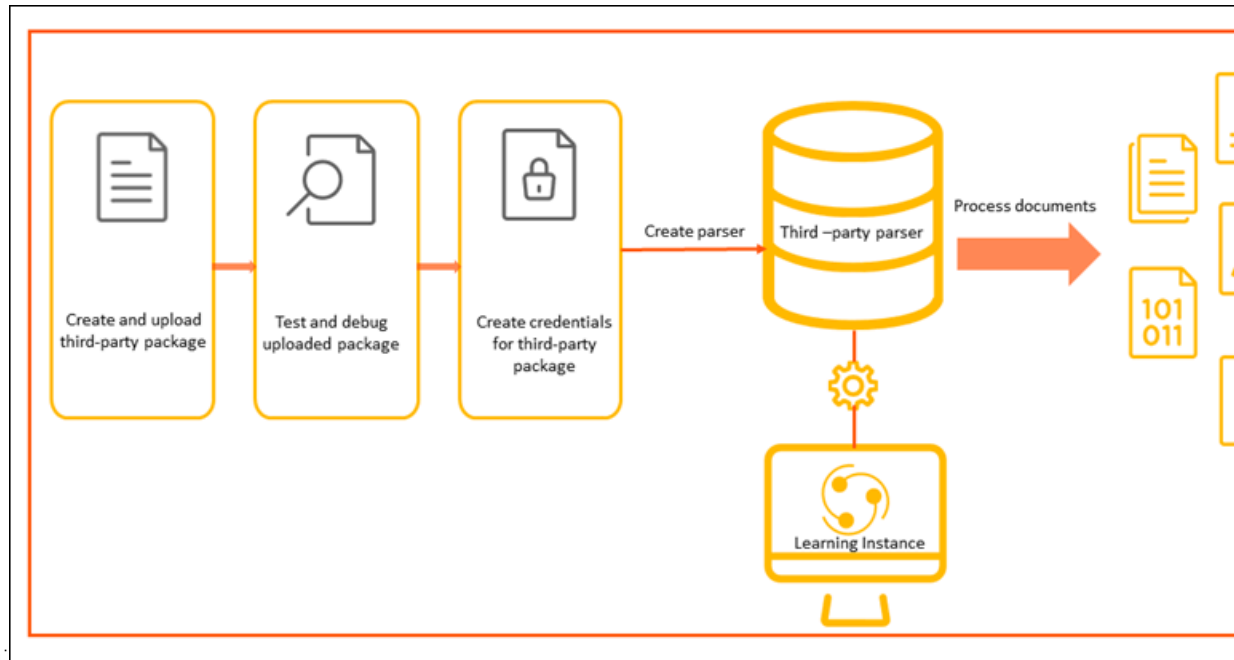

Note: Regardless of the document language, the output values are always in English.

Integrate third-party parser in Document Automation

Document Automation enables you to connect to an external extraction engine using a custom Automation 360 package. You can create, customize, and connect this custom package as a parser and use it to extract documents.

Using the third-party parser integration feature in Document Automation, you can create a custom Automation 360 package, connect it to Document Automation, and use it as a parser to process your documents. Create your own parser based on your specific use case and integrate it with the learning instance to process the documents. With the third-party parser integration in the learning instance, the associated package converts the document data into an authorized engine data format, which is sent to Document Automation for processing the documents. You can customize the fields when creating or updating the parser, viewing the added fields in the learning instance, and selecting or clearing the fields while the creating learning instance.

The following image illustrates the flow of third-party parser integration in Document

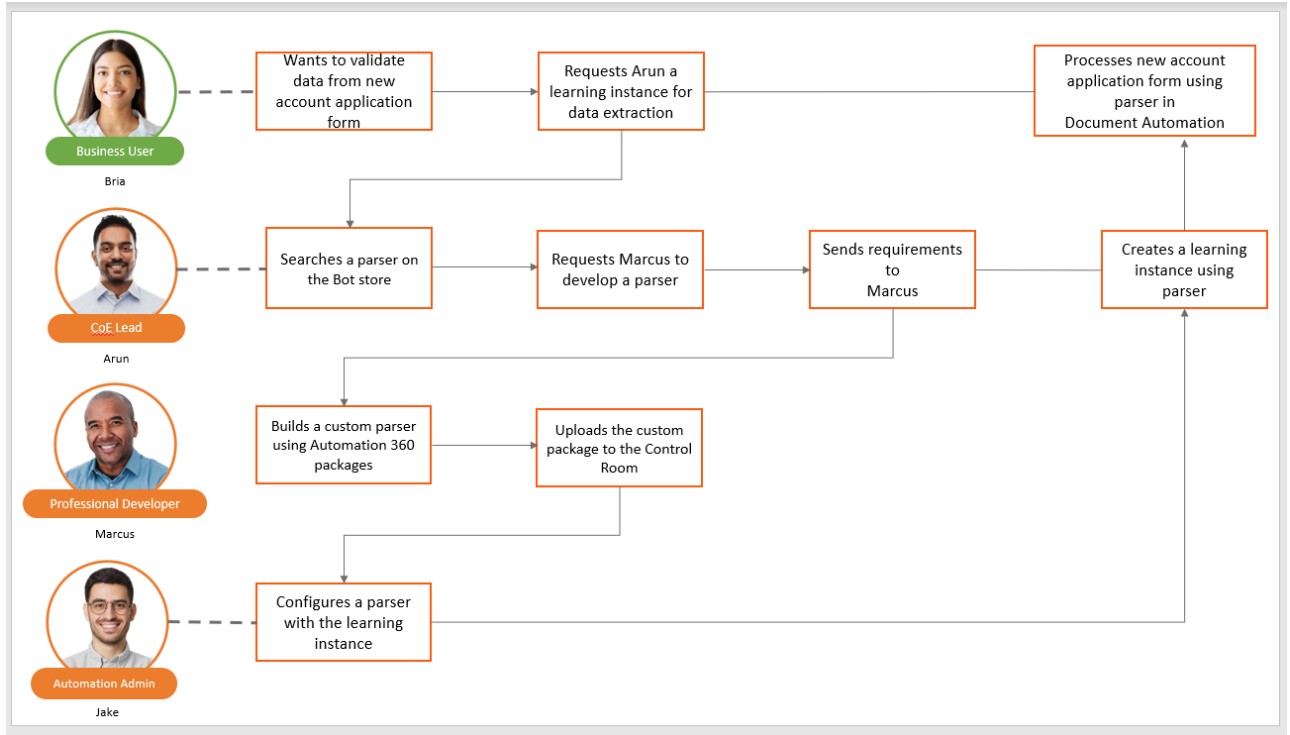

Automation:

With a third-party parser integration in Document Automation, you can:

- Leverage Automation 360 packages for enhanced document extraction
- Speed up your processing time with custom and package-driven document extraction
- Improve document parsing quality and reliability
- Improve learning instance efficiency to process more unstructured documents
- Extract documents more efficiently in less time and cost

For example, a bank employee wants to validate data in an application form for opening a new account. The existing system parser does not support a new application document type. As a result, an automation developer (Pro developer or CoE Lead) needs a third-party parser to extract document data from the new account application form. By integrating this third-party parser with the learning instance, the bank employee can use Document Automation SDK (software development kit) to extract data from the new account application form.

The following graphic illustrates the parser integration workflow) for a Business User, Pro Developer, CoE Lead, and the Control Room administrators.

Follow these steps to integrate a third-party parser:

1. Create a custom package, upload it to the Control Room, and test the uploaded package. See [Build and test a custom package](#) on page 3408.
2. Create credential and locker in the Credential Vault. See
 - [Create credential](#) on page 1798
 - [Create locker](#) on page 1801
3. Create a parser and configure it with a learning instance in Document Automation. [Create a parser and configure in Document Automation](#) on page 3496
4. Process documents with the third-party parser. [Process documents in Document Automation](#) on page 3481

Create a parser and configure in Document Automation

After creating a credential and locker for the custom package and uploading it to the Control Room, create a parser using the custom SDK and configure it with a learning instance in Document Automation.

Ensure that your custom Package you want to integrate with in Document Automation, fulfills these requirements:

- The Automation Anywhere IQ Bot Administrator role to configure the parser in Document Automation.
- A Document Workspace license to configure the parser and integrate with a learning instance.

- When you create a Package, a defined command variable with `inputFilePath` must contain the input file path.
- If the package requires credentials to connect to the external service, the variable name must be same as the attribute defined in the Credential Vault.

For example, if there is a credential in the Credential Vault with the `serviceAccount` attribute, then the variable name defined in the command must be `serviceAccount` to capture the Credential Vault key value .

Configure a third-party parser with a learning instance and use it to process documents in Document Automation.

1. Create a parser.

To create a parser, provide an input and output contract for the parser package that you want to integrate with Document Automation. For more details, see [Sample codes for parser contracts](#) on page 3498.

2. Next, configure a parser with a learning instance.

After creating a parser, configure it with a learning instance in Document Automation. To configure a parser,

a) Navigate to **Manage > Learning Instances** and click **Configure Parser**.

b) On the **Parser Configuration** page, click **Create Parser Configuration**.

c) Enter the following details for parser configuration and click **Next**.

- **Name:** Provide a parser name. The allowed limit of characters for a parser name is 50.

Note: The special characters such as ", [, \, ?, <, >, :, \$, |, *, /,] are not supported for a parser name.

- **Description:** This is an optional field. Enter a description.
- **Package and Version:** Select the relevant package and version from the list.
- **Provider:** Select the provider you want to use with the learning instance for document extraction.
- **Document type:** Select the document type.
- **Language:** Select language and click **Add**.
- **Credentials:** This is an optional field. For the **Credentials** field, select the **Pick a credential** option and select the locker, credential, and attribute.

d) Click **Browse** to upload a JSON file that contains form and table fields for the parser and click **Create**.

Following is the sample schema for a JSON file which contains fields for a parser:

```
{
  "parserFields": [
    {
      "fieldName": "invoice_number",
      "dataType": "TEXT",
      "fieldType": "KEY_VALUE"
    },
    {
      "fieldName": "invoice_date",
      "dataType": "DATE",
      "fieldType": "KEY_VALUE"
    }
  ]
}
```

```
{
  "fieldName": "total_amount",
  "dataType": "NUMBER",
  "fieldType": "KEY_VALUE"
},
{
  "fieldName": "total_price",
  "dataType": "TEXT",
  "fieldType": "TABLE_HEADER"
}
]
```

The required parser with the associated package SDK is created and displays in the **Parser Configuration** list.

3. Create a learning instance and integrate the configured parser with the learning instance. See [Create a learning instance in Document Automation](#) on page 3472.

The following micro-animation demonstrates how to configure a parser and integrate it with a learning instance:

Consider the following points when working with a parser (such as: create, edit, or delete a parser):

- You can edit the parser details such as parser name, parser description, and version.
- You can change the parser details such as document type, language, package name, and field names only when the parser is not used in a learning instance. However, you can add new languages and field names.
- While editing a parser, when you change the package version in the parser, it might impact the existing document extraction capability of the associated learning instance.
- If a parser is used in a learning instance, you cannot delete it until the associated learning instance is deleted.
- While integrating a parser with a learning instance, you are required to create form and table fields that map to the parser fields.
- When you migrate the learning instances, you also need to migrate the associated third-party parser configuration. If multiple learning instances with the same parser configuration are migrated, then the corresponding parser configuration is migrated only once. If a target configuration exists for the parser, the same is updated with that of the source parser configuration.

Sample codes for parser contracts

As a CoE Lead, you must provide input and output contract for the parser package to integrate it with Document Automation.

Following are the sample codes for input and output contracts:

Input contract

```
package aws;
```

```
import com.automationanywhere.botcommand.data.impl.StringValue;
import com.automationanywhere.commandsdk.annotations.*;
import com.automationanywhere.commandsdk.annotations.rules.LocalFile;
import com.automationanywhere.commandsdk.annotations.rules.NotEmpty;
import com.automationanywhere.commandsdk.model.AttributeType;
import com.automationanywhere.core.security.SecureString;
import static com.automationanywhere.commandsdk.model.DataType.STRING;

@BotCommand
@CommandPkg(
    name = "ExtractionCommand",
    label = "Extraction Command",
    description = "Extraction Command",
    node_label = "Extraction Command",
    return_type = STRING,
    return_label = "Extraction Command Response",
    minimum_botagent_version = "21.98",
    minimum_controlroom_version = "10520")
public class ExtractionCommand {

    @Execute
    public StringValue compute(
        @Idx(index = "1", type = AttributeType.FILE)
        @LocalFile
        @Pkg(label = "Image File Path")
        @NotEmpty
        final String inputFilePath,
        @Idx(index = "2", type = AttributeType.CREDENTIAL) @Pkg(label =
            "Service Account")
        final SecureString serviceAccount) {

        String secureString = serviceAccount.getInsecureString();

        return new StringValue("");
    }
}
```

Output contract

The response from the command must be in JSON format with appropriate schema with which Document Automation can work. Following is the schema for JSON output generated out of the command:

```
{
  "metadata": {
    "documentId": "unique Id used to Identify document in DA",
    "filepath": "Input File Path that refers to the Path used by Bot runner
    during execution",
    "executionStatus": {
      "statusCode": "Status code which indicates the response post
      extraction",
```

```
"statusMessage": "status message which indicates the response post
extraction ",
"message": "Message that details the result"

```

Publish the learning instance to production

Check-in the process associated with the learning instance. Then, build a bot that uploads documents from a source folder to the learning instance and check it in to the public repository. Finally, deploy the process and bots to unattended Bot Runner devices to begin processing documents in real time.

For Bot Runner devices with a Windows 2012 server-based operating system:

1. Download and install the Windows Essential Media Pack from Microsoft.
 2. Install the Media Foundation feature from the Windows Server Manager.
1. Publish the process.
 - a) Navigate to **Automation > Private tab > Bots > Document Workspace processes** and select the folder with the same name as the learning instance.

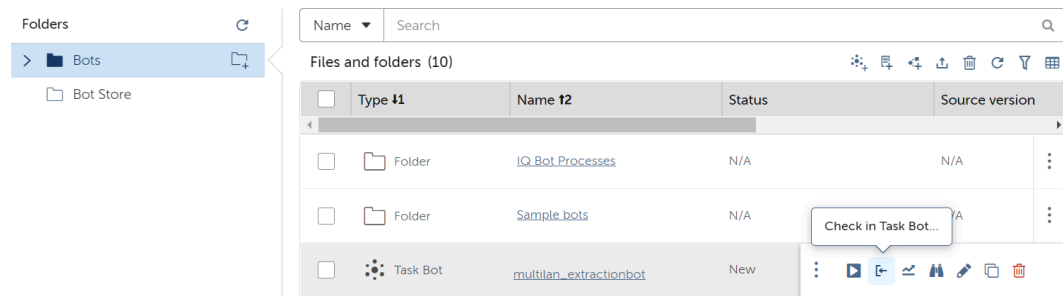

- b) Mouse over the vertical ellipses to the right of the process to open the actions menu and click **Check in process**.
The **Check in Process** window opens with the bots and form auto-selected to also be checked in.
- c) In the **Check in Process** window, add your comment and click **Check in**.
The process appears in the same folder structure in the public workspace.

See these steps in a video:

Note: The **Private** mode is used for testing in a controlled environment and cannot be viewed by other users. The **Public** mode is used when the bot is production-ready, allowing it to be viewed and accessed by others based on permissions set by the administrator.

2. Build the **Extraction-Scheduler** bot to automate uploading documents to the learning instance: [Build a bot to upload documents to Document Automation](#) on page 3504
3. Publish the **Extraction-Scheduler** bot.
 - a) Locate the **Extraction-Scheduler** bot in the private tab.
 - b) Mouse over the triple ellipses to the right of the bot to open the menu and click **Check in Task**

Private bots and files cannot be viewed by other people. If a bot or file has been checked out from the Public tab, it can be viewed and run by other people, but cannot be edited.

bot.

The **Check in Task bot** page opens with the bot auto-selected.

- c) Add a comment and click **Check in**.

4. Login as the **Document Automation Admin** user to deploy the process and bots to unattended Bot Runner devices: [Deploy the learning instance assets](#) on page 3510

Once the process and **Extraction-Scheduler** bot are deployed, documents in the specified folder are uploaded to Document Automation, and Document Automation either extracts data from the documents or sends the documents for validation.

Navigate to **Activity > In progress** to see the status of the running bots.

Build a bot to upload documents to Document Automation

Build a bot to upload documents to a specific learning instance for processing and extraction.

- Ensure you have the name of the destination learning instance.
- If you have an adequate amount of Bot Runners connected. For instructions on connecting a Bot Runner, see step 5 of [Set up your Document Automation environment](#) on page 3466.

Note: You need a dedicated Bot Runner for this bot and additional Bot Runners for the extraction and download bots, depending on the average number of pages in the documents. Review the explanation below for more guidance on how many Bot Runners are needed.

- Decide on the scheduling interval for deploying this bot with a maximum interval of every thirty minutes.
- Determine the average number of pages in the documents awaiting upload.

This bot is necessary for end-to-end automation of the document extraction process. When deployed, the bot checks if there are enough Bot Runners to handle the documents, by comparing the number of files already uploaded against a calculated value. The calculation considers the number of Bot Runners, scheduling interval, and average number of pages in the documents.

Note: This step is important as it controls the number of documents being uploaded to ensure smooth processing and avoid overloading the Bot Runners, which might cause a time-out error.

To determine the number of Bot Runners needed, consider the following:

- One Bot Runner can process a single-page document in one minute.
- One Bot Runner can process a two-page documents in two minutes.
- One Bot Runner can process 1440 single-page documents in one day.
- Two Bot Runners can process two single-page documents in one minute.

Use this equation to determine how many Bot Runners are needed:

$$\text{Number of Documents to Process per day} * \text{Average Number of Pages per document} / 1440 = \text{Number of Bot Runners}$$

Note: If the equation result is not an integer, you must round up to the next whole number to obtain an adequate number of Bot Runners. For example, if the equation result is 4.2, you will need 5 Bot Runners.

As an example, if you want to process 10,000 documents each day with an average of one page per document, you need seven Bot Runners:

$$10,000 \text{ documents} * 1 \text{ page per document} / 1440 = 7 \text{ Bot Runners}$$

To build the bot, follow these steps:

1. Navigate to **Automation > Private tab** and click **Create a bot**.
Ensure you do not place the bot in the **Document Workspace** folder.
2. Provide a name for the bot, such as `Extraction-Scheduler`.
3. Create the following variables: [Create a variable](#) on page 2246

Variable name	Description	Data type	Value
File_Count	Increments with each loop iteration to count the number of files uploaded for processing.	Number	0
Extraction_Device_Count	Number of Bot Runner devices connected to the Control Room	Number	Enter the number of connected Bot Runner devices
Scheduler_Interval	Scheduling interval in minutes	Number	Enter the interval for which you will schedule this bot to run when you deploy it (minimum 2 min,maximum 30 min)
Average_Pages	Average number of pages per document		Enter the approximate average number of pages in the documents
FilesInFolder	Holds file name and extension	Dictionary	--
SourcePath	File path to the folder containing documents awaiting upload to Document Automation	String	Enter the file path
OutputPath	File path to the folder containing the extracted data and invalid or failed documents	String	Enter the file path where you want the extraction output

4. Insert a **Loop** action to iterate through all the documents in a specific file path.
 - a) Double-click or drag the **Loop** action.
 - b) Select the **For each file in folder** iterator.
 - c) Insert the `SourcePath` variable into the **Folder path** field.
 - d) Insert the `FilesInFolder` variable into the **Assign file name and extension to this variable** field.

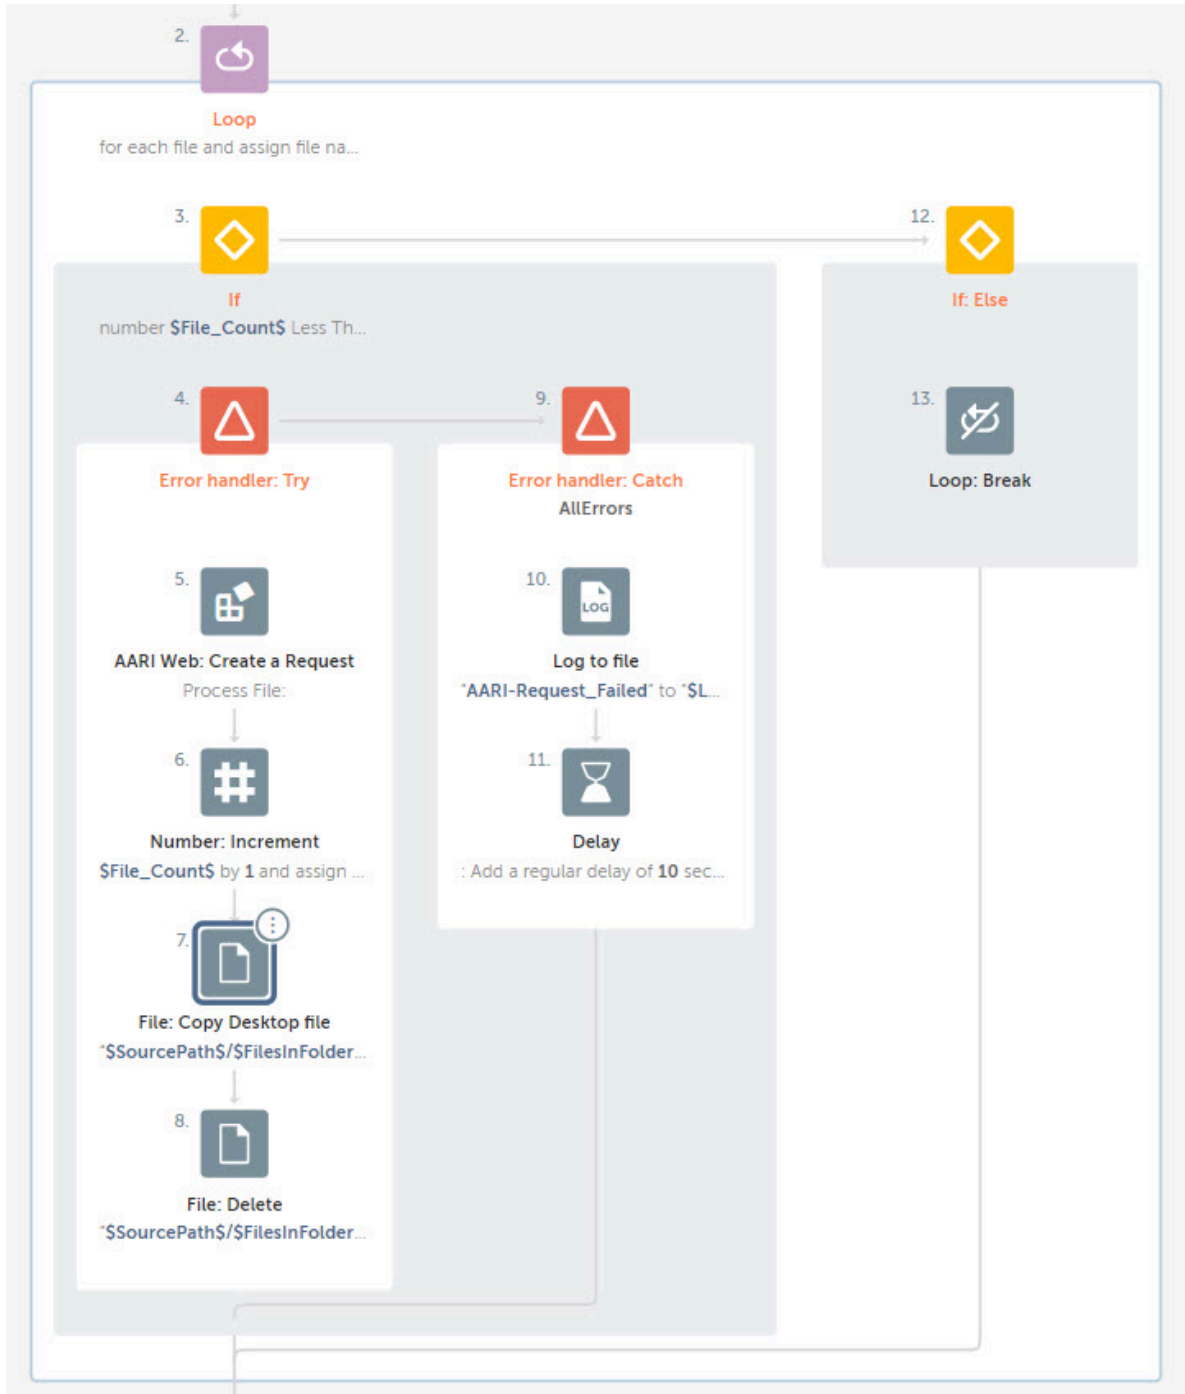

5. Insert an **If** action to compare the number of documents uploaded for processing to the number of Bot Runner devices multiplied by a scheduling interval and divided by the average number of pages.

Note: You must include this equation to limit the number of files uploaded for processing at one time to ensure that the Bot Runners are able to process the documents.

- a) Drag the **If** action into the **Loop** container.
 - b) Select the **Number** condition.
 - c) Insert the `File_Count` variable into the **Source value** field.
 - d) Select the **Less than** operator.
 - e) Enter the following into the **Target value** field: `$Extraction_DeviceCount$*
$Scheduler_Interval$/$Average_Pages$`
6. Insert **If: Else** and **Loop: Break** actions to end the loop if the condition is not met:
- a) Drag the **If: Else** action beside the **If** action in the **Loop** container.
 - b) Drag the **Loop: Break** action into the **If: Else** container.
7. Insert an error handling mechanism to log any possible errors:
- a) Drag the **Error handler: Try** action into the **If** container.
 - b) Drag the **Error handler: Catch** action beside the **Error handler: Try** action.
 - c) Drag a **Delay** action below the **Error handler: Catch** action.
 - d) Set a delay of 10 seconds.
8. Configure actions to upload documents to the process associated with a specific learning instance.
- a) Drag the **Process Composer: Create a request** action below the **Error handler: Try** action.
 - b) Mark the **Set LearningInstanceName** option and provide the name of the learning instance where to send the documents.
 - c) Mark the **Set InputFile** option and enter `$SourcePath$/$FilesInFolder{name}$.
$FilesInFolder{extension}$`.
 - d) Mark the **Set InputFileName** option and enter `$FilesInFolder{name}$.
$FilesInFolder{extension}$`.
 - e) Mark the **Set OutputFolder** option and enter `$OutputPath$`.
 - f) Drag the **Number: Increment** action below the **Process Composer: Create a request** action.
 - g) Insert the `File_Count` variable into the **Number** and **Assign output to variable** fields. The **Number** action increases the value of `File_Count` by one each time a file is uploaded to the learning instance. As long as the value in `File_Count` is less than the total in the equation you entered in step 5, the bot can run another loop iteration to upload another document to the learning instance.
9. Make a copy of the uploaded file to a different location on your desktop to keep track of which documents were successfully uploaded:
- a) Drag the **File: Copy Desktop file** action below the **Number: Increment** action.
 - b) Enter `$SourcePath$/$FilesInFolder{name}$.
$FilesInFolder{extension}$` in the **Source file** field.

- c) Provide the folder path where to copy the files.
- 10. Remove documents after they are uploaded to Document Automation so they do not get re-uploaded in the next iteration:
 - a) Drag the **File: Delete** action.
 - b) Enter `$(SourcePath)/$(FilesInFolder{name})$. $(FilesInFolder{extension})$` in the **File** field.
- 11. Click **Save**.

The completed bot should resemble the one in the image below:

Publish the process and bot. See step 3 of [Publish the learning instance to production](#) on page 3503

Deploy the learning instance assets

Deploy the process and RPA bots to the unattended Bot Runner devices, and assign the learning instance to a validation team. Here, you configure the learning instance assets to process documents in real time.

- The user who created the learning instance assets must check-in the process, form, and bots to the public repository. If you have not done so already, complete steps 1 and 2 of [Publish the learning instance to production](#) on page 3503.
- To deploy the learning instance assets, you must be an Admin user. See [Document Automation users](#) on page 3469.

1. Assign the a team of Validators to the process:.

- a) Open Automation Co-Pilot by appending `/aari` to the Control Room URL.
- b) Navigate to **Manage > Process** and locate the process with the same name as the learning instance.
- c) Click the process to assign it to a team.
- d) Navigate to the **Request Creation** section and select the **by Bot** option.
- e) Navigate to the **Teams** tab and click the **Add** icon on the left side.
- f) Select the team and click **Add and save**.

2. Deploy the `Extraction-Scheduler` bot

See these steps in a video:

- a) Return to the Control Room by removing `/aari` from the Control Room URL.
- b) Navigate to **Automation > Public tab** and locate the `Extraction-Scheduler` bot.
- c) Follow the steps to [Schedule a bot](#) on page 2056.
 - At the scheduling details section, select **Run repeatedly**.
 - Select the **Repeat every** option to schedule the bot on a recurring basis.

When you provide the desired interval and frequency, ensure that the interval matches the value in the `Scheduler_Interval` variable in the `Extraction-Scheduler` bot.

Note: If you are scheduling the bot to run starting today, you must repeat the steps two times to schedule the bot as follows:

- Schedule the bot with the desired start time for today, with an end time of 11:59pm on the same day.
- Schedule the bot to start tomorrow at 12:00am, with an end time of 11:59 on a future date.

Important: If you do not follow this guidance, the bot will start running each day at the time you provided in the **Start time** field, instead of being scheduled to run for 24 hours of each day.

- When selecting a Bot Runner, deploy the `Extraction-Scheduler` bot to a different Bot Runner than the one running the process.

Note: A Bot Runner can run only one bot at a time. Ensure that you use separate Bot Runners for the process and the `Extraction-Scheduler` bot, so that the `Extraction-Scheduler` bot does not interfere with the `Extraction` and `Download` bots.

Once the process and `Extraction-Scheduler` bot are deployed, documents in the specified folder are uploaded to Document Automation, and Document Automation either extracts data from the documents or sends the documents for validation.

Navigate to **Activity > In progress** to see the status of the running bots.

Using the Automation Co-Pilot Task Manager Validator for Document Automation

Document Automation uses Automation Co-Pilot for Business Users technology to manage the end-to-end document extraction process. Each incoming document creates a new request, which triggers the extraction process. If a document requires manual validation, Automation Co-Pilot creates a validation task and assigns it to a validation team.

When you click the **Validate documents** link in the Learning instances page, the Automation Co-Pilot Task Manager opens in a new tab, with the first failed document in queue.

Note: An empty page with a notification message appears in the following scenarios:

- If you are not assigned to any validation teams, and thus do not have access to learning instances.
 - If there are no files that require validation in the learning instances to which you have access.
 - If another user is working on the remaining file in the validation queue.
-

1. You can toggle between the Table and Detail views

Detail view: We recommend that you perform validation tasks in the **Detail** view because this view shows all the documents in the validation queue side by side with the document that you are currently validating. Additionally, when you finish validating a document, the next document in the queue automatically opens.

Note: You can search for specific documents (tasks) in **Detail** view only.

2. Filter the documents in your queue

Table view: Use the **Table** view see learning instance history. When you open a document from this view, the history for the learning instance that is processing this document appears in a pane on the left. Click the empty text field, then select the blue-bounded box in the document that contains the data to extract. After you select a box, the data is highlighted in yellow and a green outline appears, which you can resize or reposition to include all the data that you want to extract.

3. Your documents queue

The Validator opens with certain filters enabled by default to show only the documents from a specific learning instance that need validation.

The documents that match the parameters you specified in the filters pane appear here.

You can switch between documents in the queue without completing validation for the current document.

- | | |
|---|---|
| 4. Customize your view | Use the icons in the taskbar to hide the blue-bounded system identified regions, stack the document pane above the fields pane, or change the zoom levels. |
| 5. Toggle between the fields views | Use the drop-down list to select between Show all fields to see all the document fields or Show fields that need validation to only show the fields that need your manual validation. |
| 6. Fields awaiting validation are outlined in red | In the example above, the table fields Item total and Quantity require manual entry. |
| 7. Add or delete a row | To insert or delete a row, hover over the ellipses to show the icons for adding or deleting table rows. |
| 8. Skip to next file | Skip a file without correcting the errors in the current document. |
| 9. Reprocess | If the learning instance is edited while documents are awaiting validation, you must Reprocess the documents. |
| 10. Mark document as invalid | Removes the document from the validation queue and saves a copy of the document to the Invalid folder. Click here to mark a document as invalid, then select from the following reasons: <ul style="list-style-type: none">• Fields missing• Tables missing• Wrong values |

For documents processed in a connected learning instance:

The Validator shows the group number for the document. If you are unsatisfied with the extraction results, you can retrain the learning instance in Automation 360 IQ Bot.

Validate documents in Document Automation

If a learning instance cannot extract data from a document (for example, blurry text, data does not match data type, or data is missing for a required field), it sends that document to the validation queue, where the `validator` user manually provides the data.

The learning instance assets must be checked-in to the public repository.

The Validator is comprised of two panels with the document on the left side and the fields with extracted data on the right side.

In a window that is 1280 pixels or more, the panels are positioned side-by-side. Otherwise, the panel containing the fields and extracted data shifts below the panel containing the document, as demonstrated in this video:

Note: If a document contains tables with large number of rows or data fields (>1000), there might be a delay in the initial validation and the corresponding response time.

1. Log in as the `Validator` user.
2. From the Control Room home page, navigate to **Manage > Learning Instances**.
The Learning instances table displays details for each instance. The value in the **Validate documents** link indicates the number of documents awaiting manual validation.
3. Click **Validate documents**.
The Automation Co-Pilot Task Manager opens in a new tab, with the first failed document in queue. For an introduction to the Validator user interface, see [Using the Automation Co-Pilot Task Manager Validator for Document Automation](#) on page 3511.
4. Provide correct values to the fields that need validation.
See these steps in a video:
 - a) Select **Show fields that need validation** from the drop-down list in the right panel.
 - b) Click the field to extract.
 - c) In the document image, click the blue-bounded box containing the correct data or draw a box around the data you want to extract.
 - To skip a document without correcting its errors, click **Skip** to proceed to the next document in the validation queue.
 - To remove a document that cannot be processed, click **Mark as Invalid**.
5. After you make the necessary corrections, click **Submit** so the document can be processed and the extracted data downloaded.
The extracted values are saved to a file in the Success folder. The Validator shows the next document in queue. When all documents are corrected, the system displays a message stating that there are no more tasks available.

Export/Import learning instances

A user with the `IQ Bot Admin` role or with the `View and manage migration` permission can use the **Export** and **Import** buttons to move learning instances between Document Automation environments.

Export a learning instance

When you export a learning instance, a `.dw` file is downloaded to your desktop with the learning instance configurations, including the language, provider, and fields.

To export a learning instance, navigate to **Manage > Learning Instances** and mouse over the vertical ellipses to the right of the learning instance you want to export. Then, click **Export**.

Note: The process and bots associated with the learning instance are exported separately: [Export a process automation](#) on page 3339 | [Export bots](#) on page 1967

Import a learning instance

First, import the process and bots associated with the learning instance: [Import a process automation](#) on page 3336. If you do not import the process, Document Automation will create a new process when you import the learning instance.

Note:

- Verify that the destination environment has the necessary licenses. See [Automation 360 licenses](#) on page 1347
- If a previous version of the learning instance already exists in the Control Room, only the user who imported that learning instance can import a new version.

To import a learning instance:

1. Navigate to **Manage > Learning Instances** and click **Import** at the top of the page.
2. Click **Browse** to select the learning instance.

Note: If there is already a learning instance in this environment with the same ID number, the imported learning instance overwrites the existing one.

3. Select whether to pair the learning instance with an existing process or to create a new process.

Incorporating validation feedback in export/import of learning instances

You can use Export and Import with enhanced feature that enables you to export and import learning instances while retaining the pre-training information. This enhancement empowers users to leverage pre-trained learning instances across different environments

Validation feedback during export

To export a learning instance, navigate to **Manage > Learning Instances** and mouse over the vertical ellipses to the right of the learning instance you want to export. Then, click **Export**

1. When you **Export** the learning instance, a pop-up window appears **Do you want to include validation feedback**).

2. If you select **Yes**, the validation feedback will be saved as part of the learning instance with a notification displaying **Export process successfully started**.

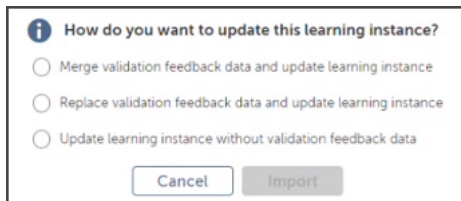

Note: Once the export process is initiated, you can track the progress in the **Notifications** window. Notifications are available to keep you informed about the successful export.

3. If the learning instance `test` file is exported successfully, click the file to download it in `.dw` format .

The information saved in these learning instances can contain various training sessions along with their corresponding feedback files. This enables you to transfer it to another instance and perform an **Import**.

Validation feedback during import

When you **Import** the file, a pop-up window appears **How do you want to update this learning instance?** which has three options to select from:

i How do you want to update this learning instance?

Merge validation feedback data and update learning instance

Replace validation feedback data and update learning instance

Update learning instance without validation feedback data

Cancel Import

- **Merge validation feedback**
- **Replace validation feedback**
- **Update learning instance without validation feedback data**

Once the import process is initiated, you can track the progress in the **Notifications** window.

Create custom models in Document Automation using Standard Forms

Standard Forms are fixed format document types that have a defined template, with little or no variation in the overall layout, and are typically official or legal forms, such as a W-4 (Employee Withholding Certificate) form, income tax form, or a sale deed.

See the following video on how Microsoft Standard Forms integrates with Document Automation and its enhanced processing capabilities.

With enhanced accuracy, this feature enables you to extract data from densely structured forms including those with handwritten input in the following languages: English, Dutch, French, German, Italian, Portuguese, and Spanish.

The following overview provides an end-to-end process you can use to create the Standard Forms data model, configure the learning instance, and publish the learning instance to process documents autonomously, all within the Document Automation interface.

Note: Set up your Document Automation environment, which includes configuring users, roles, and devices, and connecting the Control Room with the Automation Co-Pilot for Business Users: [Set up your Document Automation environment](#) on page 3466.

1. Evaluate your use case for Standard Forms.
[Evaluate your use case](#) on page 3517
2. Review extraction service.
[Review extraction service](#)
3. Set up and configure an extraction service.
[Set up extraction service](#) on page 3520
4. Configure Document Automation for the selected extraction service.
[Configure Document Automation with Microsoft Azure Form Recognizer](#) on page 3520
5. Build a data extraction model.
[Create standard form in Document Automation](#) on page 3522
6. Create a learning instance with the Standard Forms data model.
[Create a learning instance for standard forms](#) on page 3524
7. Upload documents to the learning instance to test the model, fix validation errors, and verify the extracted data.
[Process documents](#)
8. Build a bot that uploads documents from a source folder to Document Automation.
[Build a bot to upload documents to Document Automation](#) on page 3504
9. Transfer the Standard Forms learning instance across different Document Automation environments.
[Transfer standard forms learning instance](#) on page 3526
10. Check the learning instance assets (process, form, and bots) into the public repository. Then, deploy the process and bots to unattended Bot Runner devices to begin processing documents in real time.
[Publish the learning instance to production](#) on page 3503
11. Validate the processed documents for the Standard Forms learning instance.
[Validate the uploaded documents](#)

Evaluate your use case

Before processing documents in Document Automation, you must ensure that your documents are Standard Forms. After you confirm that your document meets the prescribed Standard Forms criteria, you can proceed with the type of extraction service required.

To determine if your use case meets the Standard Forms criteria, review the following parameters:

- The layout of your document remains the same across vendors.
- The positions of various data elements such as checkboxes, tables, and so on, is fixed in your documents.
- You have documents where the values are independent of other data elements.
- Your document is available in a supported language. For more information, see [Azure Form Recognizer Supported Languages](#).
- Your document must have un-repetitive sections. In other cases, there must be a fixed number of such repetitive sections that do not vary between documents.

- Your documents contain tables that have the same number of rows and columns.
- The document layout remains the same within the same year, across different organizations.

Review extraction service

After you have confirmed that the documents are Standard Forms, you can then plan the type of standard forms extraction service that fits your requirement. You can use the Microsoft Form Recognizer service to process Standard Forms in Document Automation. Before processing, ensure the following:

- Input documents can contain:
 - Information with many details and have a reasonable quality resolution (>200 dpi)
 - Check-boxes and radio buttons
 - Handwritten content
 - Signatures
 - Tables

Note: Input documents can also contain tables that span over a single page. However, if the Standard Forms contain table that spans across multiple pages, the content extraction can fail.

- No section of the input document is repeated.
- Documents that contain transpose tables.

Benefits of Microsoft Azure Forms Recognizer service

- Ability to process diverse standard form type documents.
- Auto detection feature can identify different types of tables, such as header-less tables, inverted tables, and so on.
- Provides good support for handwritten forms.

Data Flow for Standard Forms in Document Automation

The following data flow diagram shows how to configure Standard Forms in Document Automation using various components that facilitate the flow of data between Document Automation and the third-party extraction service.

- Labeling and model creation tool

You use the model creation tool to label and create models. In this diagram, the training documents are uploaded in the tool and stored in the blob storage of the third-party service. To obtain the best results, we recommend that you upload and label a minimum of five training documents to create a model.

- Blob storage

Blob storage is a storage unit that contains training documents and its related information.

- Extraction model

The trained models stored in the blob storage of the third-party service are fetched through APIs. The Model ID, which can be a GUI ID or a standard name, is used to create the learning instance.

- Learning instance creation

You can browse and select the model to create a Learning instance. After you select the model, you can upload a document for extraction to this Learning instance. The Learning instance accesses the third-party extraction service to retrieve extraction results. The results either move to the output folder, or the document moves to the validator.

- Extraction engine

The extraction engine performs extraction based on the model ID and returns the results to the Learning instance.

- Output results

Once the extraction is completed, the output results will include three components:

- `extraction .csv`
- `auto detected table .csv`

- `response.json`

Set up extraction service

To extract content from Standard Forms, you must setup and configure Microsoft Azure Form Recognizer service.

Document Automation provides you with the option to get your own license key or purchase license from Automation Anywhere. For more information on licenses, see [Automation 360 licenses](#) on page 1347.

1. Subscribe to Microsoft Azure service

Microsoft provides the Azure Form Recognizer service. This service enables you to build automated data processing software that can identify and extract specific content from documents. You must have Microsoft Azure subscription in order to access Azure resources (OCR, Form Recognizer), Automation Anywhere provides access to these resources through its subscription. Contact your Customer Success Manager (CSM) or Partner Enablement Manager (PEM) who will help you setup the services.

[Request access for Microsoft Azure resources \(OCR and Form Recognizer\) \(A-People login required\)](#)

2. Setup Microsoft Azure Form Recognizer service

For Cloud deployment

- If you purchase the license from Automation Anywhere, no additional configurations or changes are required.
- If you purchase the license from Microsoft Azure, review the following article to setup and configure your Microsoft Azure Form Recognizer for extracting content from standard forms.

[Setup Azure Form Recognizer and Storage \(Cloud\) \(A-People login required\)](#)

Next steps

Connect Document Automation with the extraction service. See, [Configure Document Automation with Microsoft Azure Form Recognizer](#) on page 3520.

Configure Document Automation with Microsoft Azure Form Recognizer

Send an API request to connect Document Automation with the extraction service.

Note: You will need the following information:

- Authorization token. See [Authentication API](#)
 - Microsoft Azure Form Recognizer endpoint
 - Microsoft Azure Form Recognizer API key
 - Microsoft Azure Blob storage URI
-

For Document Automation Cloud:

Request

```
PUT <Cloud Host Url>/cognitive/v3/formrecognizer/config
```

```
Headers: X-Authorization - <IQBot Admin User Auth token >
```

Request body:

```
{
  "formRecognizerApi": "https://<Cognitive Service Endpoint>",
  "formRecognizerKey": "<Cognitive Service apiKey>",
  "blobStorageSas": "https://<storage URL>"
}
```

Note: To obtain a Microsoft Azure API Key, reach out to your CSM. If not, raise a support case with the tenant name and region for standard forms in description through [APeople](#) page.

For supported regions, see Microsoft Azure AI Document Intelligence product at [Azure Products by Region](#).

For Document Automation on-prem:

Request

```
PUT <On-Prem Machine ip>/localhost/cognitive/v3/formrecognizer/config
```

```
Headers: X-Authorization - <IQBot Admin User Auth token >

Next steps

Log in as the Learning instance creator user to [Create standard form in Document Automation](#) on page 3522.

Create standard form in Document Automation

Create a Standard Forms extraction model in the Control Room.

- Ensure your Control Room has the Document Automation Standard Forms (Number of pages) product license
- You must have the **AAE_IQ Bot Admin** or **AAE_IQ Bot Services** roles to complete this task
- Identify between five and fifteen training documents

1. In the Control Room, navigate to **Manage > Learning Instances** and click **Create model**. The **Projects** window opens in a new tab.

2. Click **Create project**.

3. Enter a name for the project, click **Browse** to upload documents to train the extraction model, and click **Create**.

4. Define the field tags:

a) Click **Add new tag**.

b) Enter a name for the tag. For example, `Invoice no.` or `Invoice Date`.

5. Define the table tags:

a) Click **Configure table tag**.

b) Enter a name for the table.

c) For each column in the table, enter the name of the column under the **Column fields** section.

Column fields

Name	Type	Format
<input type="radio"/> Quantity	string	not-sp...
<input checked="" type="radio"/> Description	string	not-sp...

+ Add column

- d) When you are done entering the columns names, click **Save**.
6. Define the location of the data for each field:
 - a) For the form fields, highlight the location of the data to extract, then click the respective field in the right panel.
 - b) For each row in the table, highlight the location of the data to extract, then click the respective table field on the right.
 - c) Click **Done**, then open the next document and repeat the steps to define the locations of the form and table fields.
 7. Click the **Train model** icon, enter a name for the model, and click **Train**.

8. Click the **Analyze** icon, click **Browse for file**, and select a document to test the extraction model.

Note: As of Automation 360 v.29, you can create and train new models in Microsoft Form Recognizer v.3.0 only. If you are in Microsoft Form Recognizer v.2.1, then you must upgrade to Microsoft Form Recognizer v.3.0 by following the below steps:

- a) Open **Project**.
- b) Go to **Train** tab.
- c) Click **Train**. The model is created in the Microsoft Form Recognizer v.3.0.

Next, [Create a learning instance for standard forms](#) on page 3524

Note: You cannot edit an extraction model after associating it with a learning instance.

Create a learning instance for standard forms

A learning instance is a structure that holds information such as document type, language, and the fields to be extracted. After creating Standard Forms, you must create learning instance to extract data from the documents.

- Ensure your Standard Forms configuration is complete.
 - Ensure your Control Room has the Document Automation Standard Forms (Number of pages) product license
1. From the Control Room home page, navigate to **Manage > Learning Instances > Create Learning Instance**.

The **Create Learning Instance** window opens in a new tab.  Connect learning instance Create model Create Learning Instance

2. Add a name for the new learning instance to be created.
3. From the **Document Type** drop-down menu, select **Standard Forms**.

Document Type

Standard Forms

Note: The provider name is selected as **Microsoft Form Recognizer** by default.

4. For model selection, click **Browse** and search for a model using name or description filter.
5. Select your model and click **Next**.
6. To proceed further, you must select atleast one field:
 - Table
 - Forms

Select required and optional fields for extraction.

Form fields Table fields

Note: Standard forms support multiple tables. However, Document Automation does not allow displaying multiple tables. Hence, the tables are displayed as **tablename:field name** under **Tables** tab.

7. Some other field attributes are as follows:

Option	Description
Field name	Enter a field name that begins with an alphabetical character (A-Z or a-z). In standard fields, the field name is hardcoded and cannot be changed.
Field label	Enter a user-friendly name to help validators. For example, you can rename <code>Organization tax number</code> to a localized name, such as <code>VAT number</code> . The field label does not affect extraction.

Option	Description
Confidence	<p>Set a threshold to reduce potential false positives.</p> <p>At the time of processing, the Document Automation engine assigns a score to each field in a document to indicate the certainty that the data was correctly extracted. If the document contains fields with a score that is lower than the confidence threshold, the document is sent to the validation queue.</p> <p>If you enter a high confidence threshold, more documents will be sent to the validation queue. If you enter a low confidence threshold, fewer documents will be sent to the validation queue.</p> <p>Supports values from zero to 100.</p>
Data type	<p>Choose from Address*, Text, Number, and Date.</p> <p>If the data in the field does not match the data type, the document is sent to the validation queue.</p> <p>Document Automation supports variations of the date format.</p> <hr/> <p>Note: If you are configuring a learning instance with a user-defined document type, the form fields include the address data type, which extracts the entire structure of an address.</p> <hr/>
Required	<p>Select one of the following:</p> <ul style="list-style-type: none"> • Required: Field cannot be empty. • Optional: Field can be empty or not exist in the document.
Validation rules	<p>Depending on data type, create rules using patterns, formulas, lists, and statements such as starts or ends with.</p> <p>Starts With and Ends With on page 3580 Pattern on page 3580 Lists on page 3585 Formulas on page 3585</p>

8. Click **Create**.

When a new learning instance is created, the Control Room creates a folder with the same name as the learning instance in the **Automation > Document Workspace**

folder. The folder contains two bots (extraction and download), a process, and a

form.

- Process: Manages the process using if/else scenarios through which Document Automation extracts data from uploaded documents, assigns documents to users for validation, and downloads the extracted data. To learn more, see [About the Automation Co-Pilot process in Document Automation](#) on page 3479
- Extraction bot: Extracts data from defined fields in the uploaded documents.
- Download bot: Downloads the extracted data to a specific folder on the device or shared network.
- Form: Defines the input parameters that are sent to the process. Input parameters include the learning instance name, uploaded file, and output file path.

Upload documents to the learning instance, fix validation errors, and verify the extracted data:
[Process documents in Document Automation](#)

Transfer standard forms learning instance

Standard forms learning instance can be used across similar Document Automation environments. Export/Import an existing learning instance to avoid creating another one with the same configurations.

- Ensure that the source and destination systems are running the same Document Automation version. Learning instances from different Document Automation versions cannot be imported because their database schema will not match.
- Back up your database before importing learning instances.
- Export the .dw file from the source Document Automation environment.
- Import the .dw file into the destination Document Automation environment.
-

Note: The incoming model of the source system must be available in the configuration of the target system.

For detailed information on exporting/importing learning instances, see [Export/Import learning instances](#) on page 3514.

Document Automation support for Google Custom Document Extractor (CDE)

In Document Automation, you can create a user-trained learning instance and extract using a Google Custom Document Extractor (CDE) processor.

The new capability can be used to train a model using Google Custom Document Extractor (CDE) for any document type covering 50 languages. Once a model is deployed, the processor URL can be embedded within Document Automation extraction process.

To use Google CDE, you must have a:

- Google subscription to Google Document AI workbench.
- License for **Document Automation Platform** > **Document Workspace pages**.

Usage of Google CDE

The effort involved in creating and maintaining models with Google CDE is justified by various scenarios, including:

- Extended language support: When working with documents that require support for additional languages, and existing pre-trained models do not offer that capability, Google CDE becomes essential.
- Unsupported document formats: Google CDE is beneficial when dealing with document types that lack compatible parsers. For example, documents like bill of lading, KYC documents, and others where existing parsers cannot be utilized.
- Addressing accuracy and performance challenges: In specific document formats, even with the use of pre-trained models, achieving the desired accuracy can be difficult. Google CDE with specific training on documents can provide better accuracy.
- Custom or non-standard field extraction: Google CDE can be used in scenarios where specific fields need to be extracted from documents that have custom or non-standard formats.
- Extraction based on specific training when labels do not exist: Google CDE is beneficial when there is a need to extract information from fields where pre-defined labels do not exist.

Create a Custom Document Extractor (CDE)

The Google Custom Document Extractor (CDE) enables you to extract structured data and specific information from unstructured documents, such as invoices, receipts, and contracts.

With CDEs, you can train and evaluate processors using your own data, enabling accurate identification and extraction of entities from your documents. By applying these trained processors to additional documents, you can streamline the extraction of information from similar document types.

For detailed instructions on setting up Document AI Workbench and accessing the dataset, see [Build Custom Processor](#).

Train multi-row tables

This quick feature allows the model to accurately extract information from tables spanning across multiple rows.

1. Train the first row of the table.

4. Review the identified text values to verify that they accurately represent the content of the document.

For detailed information, see the **Label a document** section in [Create a Custom Document Extractor](#).

- You can manually correct any discrepancies in the table fields after the training on multiple rows.
- [Create a learning instance using Google CDE](#) on page 3529.

Create a learning instance using Google CDE

A learning instance is a structure that holds information such as document type, language, and the fields to be extracted. After creating a custom extraction processor, you must create learning instance to extract data from the documents.

- Ensure you have successfully created and trained a Google Custom Document Extractor (CDE) processor.
- Ensure your Control Room has the Document Workspace (Number of pages) product license.

To integrate a new processor with Google Document AI, the crucial step is the creation of a learning instance. This involves utilizing the provider as **Google Document AI (User-defined)** option. By creating a learning instance using this option, users can define form and table fields with matching names as present in the processor.

Note: Currently, Google Document AI supports single table extraction.

1. From the Control Room home page, navigate to **Manage > Learning Instances > Create Learning Instance**.

The **Create Learning Instance** window opens in a new tab.

2. Add a name for the new learning instance to be created.
3. From the **Document Type** drop-down menu, select **User-defined**.
4. From the **Provider** menu, select **Google Document AI (User-defined)**.
5. Select **Table** or **Forms** field.
6. Create new fields with identical names as those utilized in the Google CDE processor.

Note: When creating new fields, ensure that their names match the schema labels used in the Google processor. This applies to both form fields and table fields.

7. Click **Create**.

When a new learning instance is created, the Control Room creates a folder with the same name as the learning instance in the **Automation > Document Workspace** folder.

8. Update the extraction bot of learning instance with Service Account and Processor Endpoint URL.
 - a) Open the bot for the learning instance from **Bots > IQ Bot Processes > {LI name} > {LI name}_extractionbot**.
 - b) Pick a credential vault locker and key. For more information, see [Configure bring your own key BYOK for Google CDE](#) on page 3531.
 - c) Copy the prediction endpoint URL from Google CDE processor.

The screenshot shows the Document AI interface for a processor named 'FreeDomALL'. The processor is currently disabled. The 'Prediction endpoint' is highlighted with a red box and contains the URL: `https://eu-documentai.googleapis.com/v1/projects/1018049478570/locations/eu/processors/c6384ae2227adb95:process`.

Processor Details	Value
Name	FreeDomALL
ID	c6384ae2227adb95
Status	Disabled
Processor Type	Custom Document Extractor
Encryption Type	Google-managed

d) Paste the copied URL in the **Document AI endpoint URL for document processor**.

The screenshot shows the 'Document Extraction: Extract data' configuration window. The 'Document AI endpoint URL for document processor (optional)' field is highlighted with a red box and contains the URL: `tions/eu/processors/c6384ae2227adb95:process`. Below this field, there is a note: 'URL to Document AI endpoint. Format should be "https://(host)/(apiVersion)/projects/(projectId)/locations/(location)/processors/(processorId):process". Optional parameter for using your own Google service account to access Doc AI.'

Upload documents to the learning instance, fix validation errors, and verify the extracted data. For more information, see [Process documents in Document Automation](#) on page 3481.

Configure bring your own key BYOK for Google CDE

To leverage BYOK (bring your own key) license for Google Custom Document Extractor (CDE) processor, follow these configuration steps.

Log in as the `AAE_Locker_Admin` user type.

1. Create a custom role for Credential Vault locker.
 - a) Provide a name for the role, such as `google-cde-credential-role`. The `Manage my credentials` and `lockers` permission is automatically selected.
 - b) Click **Create** role.
Assign the role to the `Bot creator` and `Unattended Bot Runner` user types.
2. Create a credential in Credential Vault for Google service account.
 - a) Navigate to **Manage > Credentials > Create credential**.
 - b) Provide a name for the credential, such as `google-cde-credential`.
 - c) Provide a name for the attribute, such as `ServiceAccount`.
 - d) Select the **Standard** input option and enter the Google Document AI API key in the **Value** field.
 - e) Click **Create credential**.
3. Create a locker to store the key.
 - a) Navigate to the **Lockers** tab and click **Create locker**.
 - b) Provide a name for the locker, such as `google-cde-locker`.
 - c) Select the `google-cde-credential` and click the right arrow to move the credential to the **Selected** column.
 - d) In the **Consumers** tab, select the `google-cde-credential-role` and click the right arrow to move the credential to the **Selected** column.
 - e) Click **Create locker**.

Document Automation data extraction using Generative AI

Document Automation for Cloud provides Generative AI capability to extract data seamlessly from unstructured and semi-structured documents. Create learning instance with generative AI capability to process documents in English, using a Large Language Model (LLM). Note: This capability is available only in Cloud deployments with the Automation 360 v.30 release.

Note: This feature will be available with the Cloud rollout for Automation 360 v.30 release.

Benefits

Enhance extraction accuracy in a learning instance by using the **Search query for Generative AI model** feature when defining form fields. Document Automation offers a default customizable query based on your selected field. Transmitting your query to generative AI enhances and enables data extraction from different document types without prior training. Leverage this innovation to enhance your document processing capability.

How Generative AI improves extraction

When you create a learning instance for unstructured documents (such as: Contracts, Agreements, Reports, Letters, and Emails), the generative AI-driven data extraction capability is automatically selected. While defining the **Form fields** for your learning instance, you can leverage the **Search query for Generative AI model** option to customize your data extraction request.

For an address field, the generative AI query provides a default query such as: 'What is the Property Address?'. You can customize this query for more focused extraction to say: 'What is the full Property Address with city, state and zip code?' See image below for reference.

The screenshot shows the configuration interface for 'Fire Risk Reports'. On the left, under 'Form fields', a table lists selected fields:

Field name	Field label	Data type
Report Date	Report Date	Text
Property Address	Property Address	Text
Overall risk	Overall risk	Text

On the right, the 'Field Properties' for 'Property Address' are shown. The 'Search query for Generative AI model' checkbox is checked, and the text input field contains the query: 'What is the full Property Address with state, city and zip code?'.

On processing a document, using this learning instance, the generative AI capability will extract the complete address, instead of just the street name and number. All you need to do is define the search query in the model just once, and then for every document processed using this model, the data gets extracted with high accuracy with no additional configuration.

When creating a learning instance for semi-structured or supply-chain documents (such as: Waybill, Bill of Lading, Arrival Notice, and Packing Lists), you can leverage the generative AI-driven data extraction capability in addition to the native extraction capability based on user-provided updates in the Validator.

These are available use cases for this feature:

- Create learning instance models for unstructured documents such as: Contracts, Agreements, Reports, Letters, and Emails.
 - Google Vision OCR support only
 - PDF and image extraction capability
 - English language availability only
 - Form field capability only
 - Document Automation Cloud version support only

- Create learning instance models for semi-structured documents such as: Waybill, Bill of Lading, Arrival Notice, and Packing Lists.
 - ABBYY FineReader Engine (default), and Google Vision OCR support
 - PDF and image extraction capability
 - English language availability only
 - Form field creation capability only
 - Document Automation Cloud version support only

Important: Privacy Notice: When the generative AI capability is selected, the query is sent to a third-party service. Currently, the data is sent to Microsoft Azure OpenAI service, which is located in the US and EU regions. If you do not want your data sent to a third-party service, we recommend not using the generative AI feature.

Community Edition

The Community Edition version offers users limited features from the document processing solutions Document Automation and Automation 360 IQ Bot. This version is available to users for free.

Users are not required to purchase a license and there are no time limitations. However, there are some functionality constraints as follows:

- You can create a maximum of five learning instances per user.
- You cannot delete a learning instance.
- In the learning instance list, you can view and access only the learning instances and data that you created.
- You cannot integrate a Community Edition version of Document Automation with an Automation 360 IQ Bot environment.
- Google Document AI and Standard forms are not supported.

Get started with Community Edition

To begin using Community Edition:

1. Register and log in to Community Edition:
Complete steps one and two of [Get started with Community Edition](#) on page 1269.
2. Install the Bot Agent and set user device credentials.
 - a) Navigate to **Manage > Devices** and click **Connect local device**. Follow the steps in the wizard to connect the Control Room to your device.
 - b) Click **Refresh** to verify that your device is connected.
 - c) Click your username. Navigate to **My settings > Devices > Credentials**. Click **Edit** to provide your device username and password.
3. Navigate to **Manage > Learning instances** and select a version of IQ Bot to begin creating learning instances:

- Option 1: Click the **Create learning Instance** option.
Create learning instances to extract data from invoices in Document Automation: [Create a learning instance in Community Edition](#) on page 3534
- Option 2: Click the **Train other documents** option.
Create learning instances to extract data from other document types using Automation 360 IQ Bot: [IQ Bot Community Edition quick start guide](#)

Create a learning instance in Community Edition

Create a learning instance to begin processing documents. In Community Edition, you can extract data from invoices in English using the ABBYY OCR provider.

1. From the Control Room home page, navigate to **Manage > Learning Instances > Create Learning Instance**.
2. Enter a name and description for the learning instance.
Document Automation does not allow duplicate learning instance names, so the name you provide must be unique.
3. Click **Next**.

We recommend that you open a sample document side by side with the Control Room window as you configure the form and table fields.

Note:

- A form field is a type of field that occurs only one time in a document.
- A table field is a type of field that reoccurs throughout a document, typically in the form of a table.

-
4. Configure the form and table fields for extraction.

Document Automation offers a standard set of form and table fields, many of which are not initially visible. You can search for a field by field name, field label, or data type.

To see the full list of fields, click **Show unused fields**. See the following video for a demonstration:

Click a field to open the fields editor. You can edit most attributes of a field. You cannot edit the name and default aliases. Document Automation assigns default aliases, which are hardcoded keywords, to standard fields to help with extraction. You cannot modify or delete default aliases, but you can add aliases in the **Custom aliases** field. See the following video for a demonstration of creating a custom alias:

You can add custom form and table fields for Google Document AI learning instances. When you want to extract data from fields that Google does not support, you can create custom fields. With this enhancement, you can use pre-trained models from Google along with custom fields for document extraction.

Consider the following points when you add custom fields for Google Document AI learning instances:

- You can add custom form and table fields for document types such as invoices and utility bills.

Note: You cannot add custom fields for the receipts document.

- You can edit and save the custom fields.
- A regular expressions (RegEx) is available for the custom fields.
- You can add custom fields for existing learning instances that are attached to the old package.

In this scenario, when you save the learning instance, a notification displays to update the package version.

- Based on the aliases, you can extract the custom fields by using the V8 engine.
- When a package is not compatible with multiple features, a message displays corresponding to the highest package version.
- You can import or export the custom fields to or from the .dw file along with defined aliases and settings.
- When you extract the custom fields, these fields are backward compatible with the older package version.
 - When a learning instance uses the custom fields, the old package (v.29 and earlier) does not throw an error and contains empty values for custom fields.
 - Similar to the standard fields, the old package (v.29) applies normalization and rules for custom fields, if applicable.

Mouse over the menu icon to the right of a field to access the up/down arrows. Use the arrows to rearrange the order of the fields for a more efficient manual validation. The order of the fields does not impact extraction.

To learn more about the other field attributes, review the table in the next step.

5. To add a field, click **Add a field** and complete the following fields:

Option	Description
Field name	Enter a field name that begins with an alphabetical character (A-Z or a-z). In standard fields, the field name is hardcoded and cannot be changed.
Field label	Enter a user-friendly name to help validators. For example, you can rename <code>Organization tax number</code> to a localized name, such as <code>VAT number</code> . The field label does not affect extraction.
Confidence	Set a threshold to reduce potential false positives. At the time of processing, the Document Automation engine assigns a score to each field in a document to indicate the certainty that the data was correctly extracted. If the document contains fields with a score that is lower than the confidence threshold, the document is sent to the validation queue. If you enter a high confidence threshold, more documents will be sent to the validation queue. If you enter a low confidence threshold, fewer documents will be sent to the validation queue. Supports values from zero to 100.

Option	Description
Data type	<p>Choose from Address*, Text, Number, and Date.</p> <p>If the data in the field does not match the data type, the document is sent to the validation queue.</p> <p>Document Automation supports date and number format variations.</p> <p>* If you are configuring a learning instance with a user-defined document type, the form fields include the address data type, which extracts the entire structure of an address.</p>
Format Date/Number	<p>Set a standard appearance to convert extracted dates and numbers to a specific format. This ensures consistency and accuracy in your databases and other systems of record.</p> <p>For example, if you select to standardize dates to MM/DD/YYYY and a processed document contains a date that appears as 12 Feb 2023, the learning instance will reformat the date to 02/12/2023.</p> <p>If you select to standardize numbers to the English (United States) locale and a processed document contains a number that appears as 100,00, the learning instance will reformat the number to 100.00.</p>
Required	<p>Select one of the following:</p> <ul style="list-style-type: none"> • Required: Field cannot be empty. • Optional: Field can be empty or not exist in the document.
Default aliases	<p>No action is necessary for this field. Document Automation assigns default aliases, which are hardcoded keywords, to standard fields to help with extraction.</p>
Custom aliases	<p>Additional keywords to help Document Automation locate the field. For example, add country or region-specific names for fields such as VAT number as an alias to an Organization tax number custom field.</p> <hr/> <p>Note: Custom aliases must be unique. They cannot duplicate the default alias of another field. Exception: Form fields can have duplicate custom aliases as the table fields and vice versa.</p> <hr/>
Validation rules	<p>Depending on data type, create rules using patterns, formulas, lists, and statements such as starts or ends with.</p> <p>Formula validation on page 3486 Pattern validation on page 3491</p>

6. Click **Create**.

Upload documents to the learning instance, fix validation errors, and verify the extracted data:
[Process documents in Community Edition](#) on page 3537

Process documents in Community Edition

Upload sample invoices to train the learning instance, verify the extracted data, and fix validation errors.

- If you have not done so already, [Create a learning instance in Community Edition](#) on page 3534
- Ensure that each file is 2 MB or less.
- Ensure that the sample invoices are in the following supported document types:
 - PDF
 - JPG
 - JPEG
 - PNG
 - TIF
 - TIFF

Upload sample invoices to a learning instance to test the learning instance's data extraction capabilities. If a document requires manual validation, the system sends it to the Validator, where you must manually enter the correct data.

1. Upload documents to the learning instance:

Note: Community Edition can process a maximum of five documents at a time. You must wait for a document to successfully complete processing (and validation if necessary) to upload another document.

- a) Click **Process documents**.
- b) In the **Process Documents** window, click **Browse** to select the files to upload.
- c) In the **Download data to** field, enter the file path where the extracted data is output to a CSV file.
- d) Click **Process documents**.
The Bot Runner window appears. The window disappears when the documents are done processing. Refresh the **Learning instances** table to see the updated metrics.

If there is a value next to the **Validate documents** link, you must manually validate the fields with errors. Otherwise, proceed to step 2b to review the extracted data.

2. Fix the validation errors

- a) Click **Validate documents**.
The Automation Co-Pilot Task Manager opens in a new tab, with the first failed document in queue. For an introduction to the Validator user interface, see [Using the Automation Co-Pilot Task Manager Validator for Document Automation](#) on page 3511.
- b) Review each field to verify the data type and extracted value.
Document Automation supports the following data types: text, number, date, address, and check box
Alternatively, from the drop-down list on the right panel, you can select **Show fields that need validation**.

Note: When documents are awaiting validation, if you edit the learning instance, click **Reprocess** to reattempt extraction.

Reprocessing documents does not affect the uploaded documents metric.

c) Update the fields with errors.

Click the field or draw a box around the values that you want to extract.

For Automation Anywhere pre-trained models, you can configure the learning instance to extract specific values in a field and ignore others. For more information, see [Using validation feedback to extract specific values in a table](#) on page 3478.

- To skip a document without correcting errors, click **Skip** to proceed to the next document in the validation queue.
- To remove a document that cannot be processed, click **Mark as Invalid**.

d) After you make the necessary corrections, click **Submit** so that the document can finish processing.

The next document in queue appears. When all the documents are corrected, the system displays a message stating that no more tasks are available.

e) Close the tab to return to the **Learning Instances** page.

3. Verify the output results:

a) Open the file in the **Success** folder that contains the extracted data and review the results to ensure that it matches your use case.

b) Optional: Review the **Learning Instance** dashboard.

The dashboard displays the total number of uploaded documents and the number of documents pending validation.

Congrats! You have now successfully processed your first documents in the Community Edition version of Document Automation.

Automation 360 IQ Bot

Automate document-centric business processes, end to end, by using IQ Bot, a web-based, Cloud-native intelligent document processing solution that can read and process complex documents and email. This solution combines RPA with AI techniques to extract and classify semi-structured and unstructured data.

Automation 360 IQ Bot is a hybrid solution for On-Premises and Cloud deployments.

Note: From Build 4695 (A2019.13), Automation 360 IQ Bot has feature parity with IQ Bot Version 11.3.4.2 and some features from Version 11.3.5. For feature parity information between Automation 360 IQ Bot and the corresponding IQ Bot 11.x versions, see [Automation 360 IQ Bot feature comparison matrix](#) on page 952.

Overview

The technologies of IQ Bot and RPA together constitute cognitive automation. With cognitive automation, IQ Bot extracts semi-structured and unstructured data and converts it into structured data, and RPA bots subsequently use this structured data for automating business processes.

IQ Bot works by using learning instances. A learning instance is a structure that holds information such as document type, language, and fields to be extracted from tables and forms. A learning instance also includes bots that are trained to extract data from documents.

IQ Bot is also supported by RPA bots that are built for functions such as training the Classifier, sharpening document resolution, and downloading the extracted data.

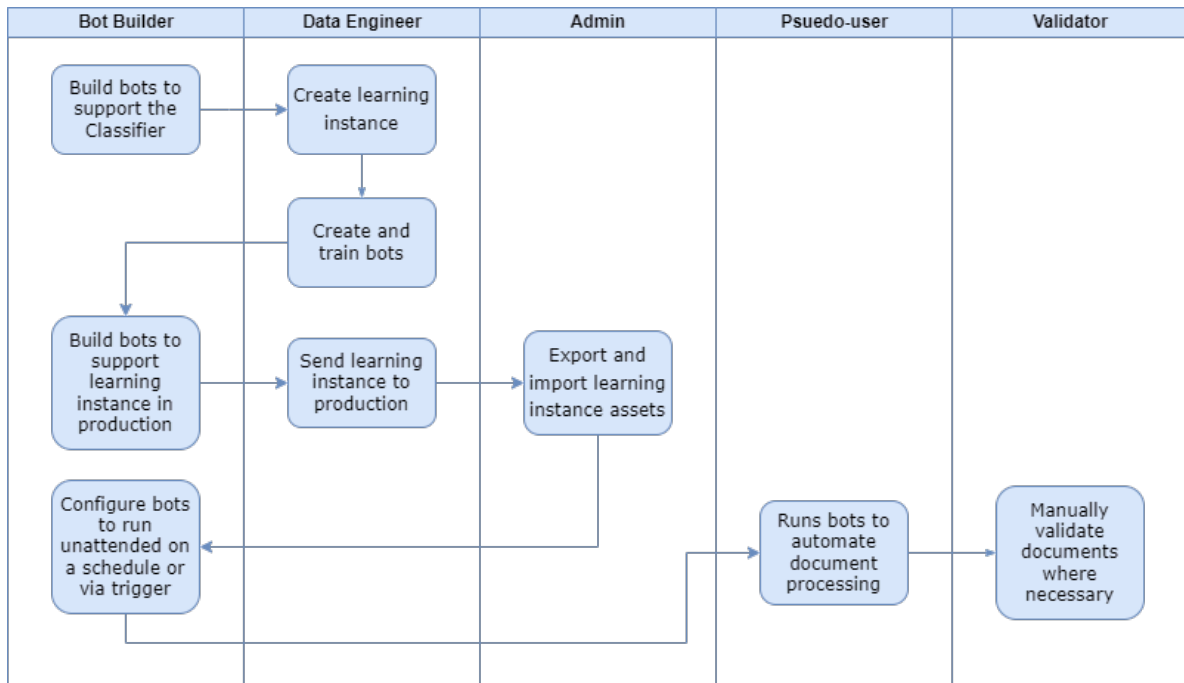

After the bots in a learning instance are trained and the necessary RPA bots are built, a learning instance is set to production mode. After that, IQ Bot can start processing documents automatically, through the following steps:

1. Retrieves documents from a source, such as attachments in incoming email
2. Improves document quality
3. Classifies documents into groups
4. Extracts data
5. Either downloads the extracted data or first sends the document for manual validation and then downloads the data

Types of IQ Bot users

In many organizations, different types of users perform specific tasks within their product area to create, configure, and publish a learning instance and the supporting assets. To learn more about the user types, required licenses, roles, and permissions, and the assigned product areas, see [IQ Bot user personas](#) on page 3543.

The following diagram demonstrates the sequence of how a learning instance and supporting assets are built, as well as which user performs which task.

Get started with learning instances

Perform the following these steps to create a learning instance, train bots, and set the bots to production:

- [Using Automation 360 IQ Bot On-Premises](#) on page 3541
- [Using Automation 360 IQ Bot Cloud](#) on page 3542

Build RPA bots for IQ Bot

The following links guide you in configuring RPA bots to support IQ Bot functions.

- Use the Document Classifier package to improve classification and prevent invalid documents from being uploaded to a learning instance.

[Train the classifier](#) | [Classify documents](#)

- Use the IQ Bot Pre-processor package to prepare documents and extract data before processing.

[Using Enhance Image action](#) on page 2640 | [Using Convert Image To PDF action](#) on page 2638

- After sending a learning instance to production, configure a bot with the **Process documents** action from the IQ Bot Extraction package: [IQ Bot Extraction package](#) on page 2644
- [Download extracted data](#)

Resources

For more information, review the courses in the IQ Bot Developer learning trail: [IQ Bot Developer Training \(A-People login required\)](#).

You can also search for the following courses in [Automation Anywhere University: RPA Training and Certification \(A-People login required\)](#):

- Intelligent Document Processing with IQ Bot
- Unleash Your Intelligent Bots: Develop Cognitive Bots Driven by AI & Machine Learning (IQ Bot)

Related concepts

[Install and update Automation 360 IQ Bot](#) on page 1366

This collection of topics guide you through the process of installing or setting up Automation 360 IQ Bot On-Premises and Cloud.

[Languages supported in Automation 360 IQ Bot](#) on page 3547

Up to 31 languages are supported in IQ Bot. You can also access up to 190 languages in IQ Bot by using an OCR engine.

IQ Bot architecture diagram

This diagram shows the different components of IQ Bot architecture.

Use the IQ Bot, components, Designer and Validator for designing and validating bots, respectively. In a typical scenario, IQ Bot portal and IQ Bot platform communicate through a network firewall and a load balancer.

Various protocols are used to communicate between the different components. A database server, a file storage server, and servers for IQ Bot are used. An organization has the flexibility of using a separate server for the database or using the Control Room clusterdatabase. A firewall is between the external components, web browser and Bot Runner, and the data center load balancer. Chrome is the supported browser.

Using Automation 360 IQ Bot On-Premises

Create a learning instance, train the bots to extract data from documents, and push the learning instance to the production environment.

Complete the steps to [install IQ Bot](#).

You must be assigned either the IQ Bot Admin or IQ Bot services roles.

As you configure a learning instance, a Bot builder creates RPA bots to support the learning instance functions. For more information, see [IQ Bot process overview](#).

1. In Automation 360 IQ Bot, click the **LEARNING INSTANCES** tab to create a new learning instance, upload sample documents to train, and select the OCR engine for document processing.

[Create a learning instance](#) on page 3554

[Select an OCR engine](#) on page 3557

2. Train the uploaded sample documents in the IQ Bot Designer.

[Train a learning instance](#) on page 3564

3. As you finish training each bot, set it to Production mode. When all the bots are in Production mode, set the learning instance to Production mode so it can start processing real documents.

[Tasks performed from Bot page](#) on page 3568

[Set learning instance to Production](#) on page 3595

Using Automation 360 IQ Bot Cloud

Create a learning instance, train the bots to extract data from documents, and push the learning instance to the production environment.

Complete the steps to [install IQ Bot](#).

You must be assigned either the IQ Bot Admin or IQ Bot services roles.

As you configure a learning instance, a Bot builder creates RPA bots to support the learning instance functions. For more information, see [IQ Bot process overview](#).

1. In Automation 360 IQ Bot, click the **Learning Instance** tab to create a new learning instance and upload sample documents to train.

[Create a learning instance](#) on page 3554

Note: As Tegaki API OCR requires a separate On-Premises set up that is not supported in Automation 360 IQ Bot Cloud, all other OCR engines except the Tegaki API OCR are available.

- You will always have the latest version of the OCR engines supported by Automation 360 IQ Bot Cloud, but cannot select a specific OCR version.
- You cannot configure OCR settings from the Control Room. Starting with Automation 360 IQ Bot.19 version, we have provided an internal API that can be used to configure OCR settings in the database.

-
2. Train the uploaded sample documents in the IQ Bot Designer.

[Train a learning instance](#) on page 3564

3. As you finish training each bot, set it to Production mode. When all the bots are in Production mode, set the learning instance to Production mode so it can start processing real documents.

[Tasks performed from Bot page](#) on page 3568

[Set learning instance to Production](#) on page 3595

IQ Bot user personas and roles

Learn about the users that contribute to IQ Bot and the associated roles and licenses. IQ Bot users and roles are defined in the Control Room.

IQ Bot user personas

A persona refers to the type of tasks that a user performs and the product areas with which a user interacts. To learn more about how each user contributes to IQ Bot, see [IQ Bot process overview](#).

User type	Description	Roles, permissions, and licenses	Access to product areas	Related links
Bot builder	Builds RPA bots to support IQ Bot functions such as training the Classifier and pre-processing documents	Bot developer role + Bot creator license	Automation 360	Build RPA bots for IQ Bot on page 3540
Data engineer	Creates learning instances, trains bots, and sends bots to production	IQ Bot Admin or IQ Bot services roles	Following tabs in Automation 360 IQ Bot <ul style="list-style-type: none"> • Dashboard • Learning Instances • Bots • Domains • Administration (IQ Bot Admin only) 	Using Automation 360 IQ Bot On-Premises on page 3541 Using Automation 360 IQ Bot Cloud on page 3542
Admin	Uploads custom domains and migrates learning instances between IQ Bot environments	IQ Bot Admin role or a custom role with the migration utility permission	Following tabs in Automation 360 IQ Bot <ul style="list-style-type: none"> • Dashboard • Learning Instances • Bots • Domains • Administration 	Custom domains in IQ Bot on page 3604 Migrate learning instances on page 1664

User type	Description	Roles, permissions, and licenses	Access to product areas	Related links
Pseudo-user	Runs the RPA bots to upload, pre-process, classify, and extract data from documents in IQ Bot	Unattended Bot Runner license + view learning instance permission	Automation 360 and IQ Bot	
Validator	Manually corrects fields in documents that IQ Bot could not process	Validator role	Only the learning instances to which permission is granted	Use the IQ Bot Validator on page 3597

IQ Bot roles

A role determines the areas in IQ Bot to which you have access. Roles are assigned in the Control Room and are of two types, predefined system roles and custom roles. If your user type is Admin, you can create custom roles.

- System roles: These roles are built in and have a predefined set of permissions that cannot be customized.
- Custom roles: These roles can be customized and modified to grant granular permissions to an IQ Bot user. An admin can configure the scope of a role with organization-wide permissions to manage all organizational resources or more narrowly to be limited to department-level resources. For more information, see [Defining a custom role for IQ Bot](#) on page 3545.

The following table describes the permissions and access areas applicable to each system role:

System role	IQ Bot permissions	Access to tabs
AAE_IQ Bot Admin	Access to all IQ Bot features and can migrate learning instances between environments	<ul style="list-style-type: none"> • Dashboard • Learning Instances • Bots • Domains • Administration Migration utility
AAE_IQ Bot Services	All permissions related to learning instances	<ul style="list-style-type: none"> • Dashboard • Learning instances • Bots
AAE_IQ Bot Validator	Can launch the Validator for granted learning instances	Learning instances

Related concepts

[Defining a custom role for IQ Bot](#) on page 3545

For various roles within IQ Bot, you can use role-based access control (RBAC) to enable or restrict user access to learning instances, related features, and functionality by defining granular permissions. You can also use RBAC to define custom roles in IQ Bot.

Related tasks

[Creating a user with an IQ Bot specific role](#) on page 3546

Create users in the Control Room to access IQ Bot.

Related reference

[Automation 360 licenses](#) on page 1347

The **All Licenses** page displays detailed information about current product and device licenses.

Defining a custom role for IQ Bot

For various roles within IQ Bot, you can use role-based access control (RBAC) to enable or restrict user access to learning instances, related features, and functionality by defining granular permissions. You can also use RBAC to define custom roles in IQ Bot.

IQ Bot supports two types of role definitions:

- System roles in Control Room: These roles are built-in and have a pre-defined set of permissions that cannot be customized. To learn more, see [IQ Bot roles](#) on page 3544.
- Custom roles in Control Room: These roles can be customized and modified to grant granular permissions to an IQ Bot user. If you are an admin, by creating a custom role, you can grant users access to specific learning instances.

If you are a user with the **View and Manage Roles** permission, you can use the Control Room to create and assign custom roles.

Permission	Description
View my learning instances	Allows a user to access their own learning instances.
View learning instances from the same role	Allows a user to view only learning instances created by the same role. Note: If multiple users are assigned the same role, then all these users will have access to the same learning instances.
View all learning instances	Allows users to view all learning instances created by any user across all roles.
Edit learning instance	Allows users to edit learning instances.
Delete learning instance	Allows users to delete learning instances.
Send learning instance to production	Allows users to move learning instances from staging to production.
Import domain	Allows users to import domains into IQ Bot.

Things to remember:

- Ensure that users with **View learning instance from the same role** do not have non-IQ Bot roles. Example: When you create a learning instance, all the roles that you have under your name gets assigned to the learning instance. So, if you have AA_Basic role in combination with View learning instance from the same role, then all the users with AA_Basic role have access to IQ Bot. Therefore, users who create learning instances must not be assigned non-IQ Bot roles.
- It is required that creators of learning instances for a specific department must be assigned a minimum of two roles:
 - A role that allows them to create learning instances
 - A department-specific role with the **View learning instance from the same role** permission
- When new learning instances are migrated, existing roles will not be migrated. After the roles are assigned in the target system, they cannot be changed. IQ Bot A360 does not support changing role assignments of learning instances.

Related tasks

[Create a role](#) on page 1687

As an administrator, you can configure roles with permissions to access features and perform operations such as create, edit, or delete a bot in the Control Room, and assign the role to a user.

[Creating a user with an IQ Bot specific role](#) on page 3546

Create users in the Control Room to access IQ Bot.

Creating a user with an IQ Bot specific role

Create users in the Control Room to access IQ Bot.

Create administrator, services, and Validator IQ Bot users with Microsoft Windows credentials using the following roles in the Control Room:

- **AAE_IQ Bot Admin**
- **AAE_IQ Bot Services**
- **AAE_IQ Bot Validator**

Tip: The Active Directory users are authenticated with their Active Directory credentials, and the non-Active Directory users are authenticated with the credentials stored in the Control Room database.

Users in Control Room are created depending on the type of user configured during installation.

Note: IQ Bot supports 50 concurrent users. However, Document Extraction if all users are active at the same time, then you cannot run Document Extraction in parallel. Additionally, if the number of concurrent users exceeds 50, system performance might degrade.

-
1. Log in to Control Room as a user with the **AAE_Admin** role.
 2. Go to **Administrator > Users**.
 3. Click the **Create User** icon.
The **Create User** page appears.
 4. Enter the required information on the Create User page.

Note:

- The **First name**, **Last name**, and **Description** fields are optional. For a first name and last name, use numbers, spaces (), period (.), hyphen (-), and underscore (_).
- For a Non-Active Directory user, provide information in each field.

-
5. To create a user with the administrator role, select **AAE_IQBotAdmin**. To create a user with the services role, select **AAE_IQBotServices**. To create a Validator role, select the **AAE_IQBotValidator** role.
 6. Select a license to be allocated to the user from the **Allocate a device license to user** section. If no license slots are available for a role, an alert message appears.
 7. Click **Save** to create the user.

To switch a user type from Development to Run-time or vice versa, depending on the automation requirements of your organization, update the license type from the License Management section in Control Room.

After a Validator or a services user is created, an email is sent to the user. The user is asked to do the following:

- Verify the email ID and set the Control Room access password, if the Control Room is configured for the Non-Active Directory users.
- Verify the email ID, if the Control Room is configured for the Active Directory users.

Related concepts

[Defining a custom role for IQ Bot](#) on page 3545

For various roles within IQ Bot, you can use role-based access control (RBAC) to enable or restrict user access to learning instances, related features, and functionality by defining granular permissions. You can also use RBAC to define custom roles in IQ Bot.

Languages supported in Automation 360 IQ Bot

Up to 31 languages are supported in IQ Bot. You can also access up to 190 languages in IQ Bot by using an OCR engine.

When you review the list of languages in IQ Bot, you will observe the following:

- Some languages are listed multiple times as variants, for example, Norwegian, Norwegian (Bokmal), Norwegian (Nynorsk).
- Among languages that are written from right to left, only Arabic is currently supported on IQ Bot.
- For languages not in the IQ Bot UI by default:
 - These rely on ABBYY FineReader Engine 12.2 for text segmentation and OCR, then IQ Bot for classification, extraction, and auto-correction.
 - Contact your Cognitive Services or Sales Engineering representative to create IQ Bot custom domains to access these languages.
 - In the SQL database and `.json` file, IQ Bot requires language codes for 160 of the additional languages to appear in the UI, and culture codes to allow numeric and date validation.

Note:

- For ABBYY FineReader Engine and Microsoft Azure Computer Vision OCR engine, IQ Bot uses its text segmentation + OCR.
- For Microsoft Azure Computer Vision OCR engine, user can select any language from IQ Bot's drop-down, but the API aims to auto-detect the language during processing, and override user selection.

The following table provides a list of supported languages in IQ Bot for various document types:

Language	Document types such as invoice, contracts, health insurance, purchase order, and so on	Document typ
English	X	X
German	X	X
French	X	X
Spanish	X	X
Italian	X	X
Afrikaans		X

Fijian	Macedonian	Russian (old spelling)	
Finnish	Malagasy	Russian (with accents marking stress position)	
Frisian	Malinke	Samoan	
Friulian	Maltese	Selkup	
Scottish Gaelic	Mansi	Serbian (Cyrillic)	
Gagauz	Maori	Shona	

The following table provides you with links to supported languages for all IQ Bot supported OCR engines:

IQ Bot supported OCR engines	List of supported languages
ABBYY FineReader Engine	ABBYY FineReader Engine OCR supported languages
Microsoft Azure Computer Vision OCR engine	https://docs.microsoft.com/en-us/azure/cognitive-services/computer-vision/language-support
Google Vision API	https://cloud.google.com/vision/docs/languages
Tesseract4 OCR 4.0.0	https://tesseract-ocr.github.io/tessdoc/Data-Files-in-different-versions.html

IQ Bot supported OCR engines	List of supported languages
Tegaki API	<ul style="list-style-type: none">• Japanese• Korean• Japanese - English• Korean - English

Note: The supported languages in IQ Bot must be considered in concurrence with the OCR supported languages.

Tip: If you are unable to see all languages in the IQ Bot UI or if IQ Bot is unable to extract data from multiple languages in a document, troubleshoot the issue:

[Unable to extract data from Multiple languages in a document \(A-People login required\)](#)

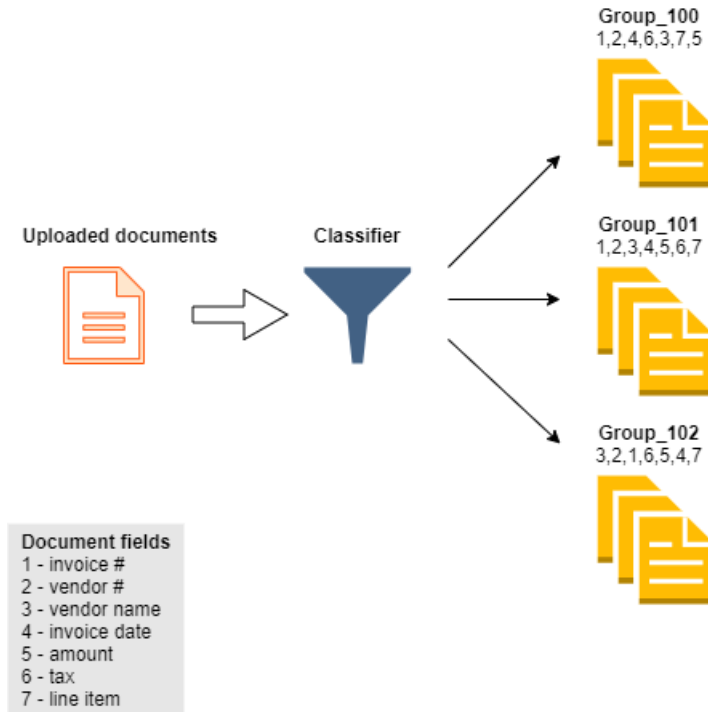

Note: If you are adding custom language to a custom domain, then you must retain the language ID across all installations from where IQ Bot learning instances will be exported and imported.

About the Classifier

Learn about how documents are classified and the factors that affect classification.

When documents are uploaded to a learning instance, the Classifier sorts the documents into document groups based on the layout, which is the order in which the fields appear on the page. If a document is uploaded to a learning instance in production and the document does not match the layout of any of the document groups, the Classifier creates a new group for that document.

The following graphic illustrates how uploaded invoices that contain specific fields are sorted into one of three groups, depending on the order in which the fields appear in the invoice.

Alternatively, you can manually define a document group to process all the documents with an identical layout. In this case, IQ Bot bypasses the Classifier and sends the document to the group you created that has the same layout as the uploaded document. This option is useful when the OCR fails to detect one or more fields in a document, causing the Classifier to unnecessarily create a new document group or send the document to the wrong group. See [Create a new document group](#) on page 3553.

Note: User-created document groups cannot be deleted.

The Classifier is supported by RPA bots and the Document Classifier package. It contains actions that automate identifying and sorting the different document types. See [Document Classifier package](#) on page 2420.

Resources

Watch the following videos to learn more about how the Classifier works and how to use it:

Learning instances created with out-of-box or custom domains

IQ Bot checks for a minimum number of fields that you selected to successfully classify the document. In all other cases, the document will be marked as unclassified.

For example:

- If you create a new learning instance with one to four fields selected, IQ Bot checks for at least four fields from the total number of fields presented for that specific learning instance. Similarly, if you create a learning instance with five fields selected, IQ Bot checks for at least five fields.

- If you create a learning instance with six or more fields selected in the learning instance, IQ Bot checks for at least six fields. For example, if you selected eight fields in an invoice domain, IQ Bot checks for at least six fields out of the total fields available.

Learning instances created with other domains

If you create a learning instance with multiple fields, IQ Bot checks for at least one field and classifies the document. If IQ Bot does not find any field, the document will be marked as unclassified.

Factors that impact classification

Factor	Notes
Page layout	If the page layout is different from the original document with respect to document content position, IQ Bot sends the document to a different group.
Label orientation	All the labels in a document must be oriented in the same direction. If some of the labels are vertical and some horizontal, the document is sent to a different group.
Label position	Labels can be positioned anywhere on the page. However, the label sequence from left to right and top to bottom must be the same as in the training documents.
Match percentage	IQ Bot uses a 70% match for labels.
Fields added after the learning instance is created	Fields added after a learning instance is created are excluded from the classification process.

Related tasks

[Limit the creation of document groups](#) on page 3561

Limit the number of new document groups that the Classifier can create when a learning instance is in production.

Create a new document group

Manually define a user-created document group to process documents with an identical layout. For example, invoices from a specific supplier.

- If you have not done so already, [Create a learning instance](#) on page 3554. After you create a learning instance, you are redirected to the document groups page, where you create a new document group.
- Identify the group label. This is the name of the folder in the `documents\classify\train` directory where documents with an identical layout are sent. You will provide the group label in the steps below.
- Identify sample documents (maximum 150) that have an identical layout. You can upload more documents to train the group after the group is created.

1. Navigate to the learning instance details page and click **Create group**.
 2. In the **Group label** field, provide the folder name that contains the sorted documents in the `documents\classify\train` directory.
 3. Click **Browse** to upload sample documents to define the layout.
 4. Click **Save**.
1. Configure the mechanism to sort incoming documents to the correct group:
 - To use the Classifier, run the bot with the **Train Classifier** action to create the classification model and sub-folders to hold the sorted documents in the `documents\classify\train` directory. See [Using Train Classifier action](#) on page 2424.
 - Alternatively, create RPA bots identify and sort incoming documents using conditional statements, such as string-matching the file name or sender. See the String condition in the [Loop package](#) on page 2679 or [If package](#) on page 2619.
 2. Update the following actions:
 - Optional: Update the **Classify Document** action to use **Express mode**. See step 6 in [Using the Classify document action](#) on page 2423.
 - Update the **Upload document** action to provide the group label. See step 4 in [Upload document action](#) on page 2654.
 3. Upload more documents to train the group. When you are done with training, set the group to production.
 4. After you set the group to production: If you have a bot with the **Process Documents** action, you must update the action with the group label. See step 7 in [Using IQ Bot Process documents action](#) on page 2652.

Note: During the production process, you must not move the learning instances or bots from Staging to Production or vice-versa.

Create a learning instance

Create a learning instance and upload sample documents for training. In this step, you define the data elements for a single document type, such as an invoice or a purchase order, and the fields which you want to extract.

Ensure the sample documents meet the following requirements:

- Each document is a separate file. For example, if you have downloaded an email and its attachments into a single PDF, you must separate the email body from the attachments. See [Using the Split document action](#) on page 2771.
- The documents are in one of the following supported file types:
 - PDF
 - JPG
 - JPEG
 - PNG
 - TIFF
- Use documents with a resolution value of at least 300 dots per inch (dpi).

- In staging, you can upload a maximum of 150 documents of 10 MB file size per learning instance.
- In production, you can upload a maximum of 50 MB file size per document. However, the maximum number of documents allowed per learning instance depends on the license.
- There are no limitations on the number of pages per document in a pdfbox OCR.
- You can upload 60 pages per document in an image-based OCR.
- You can upload up to a file size of 12 MB. You can upload additional documents after creating the learning instance.
- The file names of the documents that you upload should not start with special characters, such as the hyphen (-).

Note:

- With the Tesseract4 OCR, currently there is a known limitation which restricts the number of pages per document to less than 60 pages.
- Azure confidential computing enables organizations to upload encrypted data to secured storage, such as private folders on a virtual machine. If you upload documents from such secured folders to IQ Bot, these are moved to **Unclassified** status as data extraction is not supported for such documents.

When you start with a collection of documents to insert into a digital process, you will probably have a mix of documents types, formats, and orientations. An invoice, for example, has a consistent set of data elements, whereas a purchase order contains a different set of data elements. You must create a different learning instance for each of these document types, using the following steps:

1. Navigate to **LEARNING INSTANCES** and click the **New instance** option.
2. In the **Create new learning instance** screen, enter the following information:

- a) **Instance name:** Enter a unique name.

IQ Bot version A360.21 and below does not allow duplicate learning instance names. Even if you delete a learning instance, the name cannot be reused. From IQ Bot version A360.22, it is possible to create duplicate learning instance names, as well as reuse the name of a deleted learning instance.

- b) Optional: **Description:** Enter a description.

- c) **Document type:** Select the document type from the drop-down list.

Do not choose standard forms as **Document type** while creating learning instance. Based on the option you select, a predefined set of form and table fields for the domain type appears. For example, when you select **Invoices**, the common forms and tables of an invoice appear.

Note: If you want to create a domain to use specifically for this learning instance, select **Document type > Other** and enter a domain name. In the upcoming steps, you will customize the domain.

For more information on creating a custom domain, watch the following video:

If you want to create a domain to use in more than one learning instance and you have the required access permissions, you can work with Automation Anywhere support to create a custom domain. See [Custom domains in IQ Bot](#) on page 3604 for more information.

- d) **Primary language of documents:** Use the drop-down menu to select a language for the learning instance.

[Languages supported in Automation 360 IQ Bot](#) on page 3547

To create custom domains in other languages and access up to 190 languages that IQ Bot supports, contact Automation Anywhere support.

Important: If you are unable to see all languages in the IQ Bot interface, troubleshoot the issue: [Unable to extract data from Multiple languages in a document \(A-People login required\)](#)

- e) **Upload your documents:** Click the **Browse** option to upload sample documents.

3. Select or de-select fields in the **Common form fields** and **Common table/repeated sections fields** sections.

Form fields appear one time in a document, such as the invoice date or number. Table fields are fields that reoccur throughout the document, such as the item total or quantity.

To see all the possible fields, click **Additional form fields** or **Additional table/repeated section fields**.

4. Optional: Add additional fields by entering the field name in the **Additional form fields** or **Additional table/repeated section fields** section.

Follow the naming conventions when you enter a name in the **Add fields (Optional)** field:

- Field names can only begin with alphabetical characters (A-Z and a-z).
- Field names can only include alphanumeric characters and spaces.
- Field name cannot end with a space.

5. **Optical Character Recognition:** Select the required OCR engine.

[Select an OCR engine](#) on page 3557

6. Optional: De-select the **My PDF documents do not have images** check box. To learn more, see [Disable PDFBox option](#) on page 3564

When this check box is selected, IQ Bot uses PDFBox OCR to process PDF documents; non-PDF documents are processed by the OCR you selected in the previous step.

7. **Checkbox auto-detection:** Select the **Detect checkboxes** check box to enable this feature.

Selecting this option allows IQ Bot to automatically detect check boxes in a document. However, it might increase the processing time of documents.

8. Click the **Create instance and analyze** option to create the learning instance.

The system analyzes and sorts the training documents into logical groups based on field identification and shows the details in the **Learning Instance > Summary** tab.

When a new learning instance is created, the sample documents you uploaded are analyzed and sorted into groups based on the document characteristics. To learn more, see [About the Classifier](#) on page 3551.

After the Classifier finishes sorting the documents, you are redirected to the Designer, where you will train bots to extract data from each sample document. [Train a learning instance](#) on page 3564.

Related tasks

[Select an OCR engine](#) on page 3557

You can select an OCR engines that suits your requirement for data extraction based on your document types. Restarting IQ Bot services is not necessary for implementing an engine change.

Related reference

[Create a learning instance for standard forms](#) on page 3617

Learning instance is used in IQ Bot to extract, train, validate content from standard forms. Use the following instructions to create a learning instance for processing standard forms in IQ Bot

Select an OCR engine

You can select an OCR engines that suits your requirement for data extraction based on your document types. Restarting IQ Bot services is not necessary for implementing an engine change.

During IQ Bot installation, the system sets the latest version of Tesseract Optical Character Reader as the default OCR engine. This is also the default setting for the product. However, you can manually set the OCR engine in the `Settings.txt` file, which becomes the default engine. Similar to the prior releases of IQ Bot, you can continue to manually update the `Settings.txt` file with the OCR engine name you want to set as default.

When creating a learning instance, you can select an OCR engine from the **Optical Character Recognition** drop-down menu. See [Create a learning instance](#) on page 3554

Note: Selecting an OCR engine in the interface overrides the settings in the `Settings.txt` file.

The following table lists the various OCR engines supported in IQ Bot and the corresponding options:

Table 6: List of OCR engines and their specifications

Qualifiers	OCR Version	Supported installation	Handwritten	Languages Supported	Document Quality	Document Type
Tesseract OCR	4	Cloud and On-Premises	N/A	English German Spanish Italian French	No noise No dark background No stamps/watermarks 200+ dpi	Invoices, POs, etc. Semi-structured formats
ABBYY FineReader Engine	12.3, or 12.4	Cloud and On-Premises	N/A	English All Latin+ Chinese Japanese Korean	Less noise Dark background with white fonts Has stamps/watermarks 96+ dpi	Invoices, POs, etc. Semi-structured formats Mortgage Forms, Tax Forms Unstructured Formats

Qualifiers	OCR Version	Supported installation	Handwritten	Languages Supported	Document Quality	Document Type
Microsoft Azure Computer Vision OCR engine	2.0 or 3.2	Cloud and On-Premises	English only	English All Latin+ Chinese Japanese Korean	Less noise Dark background Has stamps/ watermarks 96+ dpi	Invoices, POs, etc. Semi-structured formats Passports, Driving license, etc. KYC documents
Google Vision API	Version is updated automatically to match current release	Cloud and On-Premises	N/A	English All Latin+ Asian	Less noise Dark background Has stamps/ watermarks 96+ dpi	Invoices, POs, etc. Semi-structured formats Mortgage Forms, Tax Forms Unstructured Formats
Tegaki API	Check with your Cogent Labs sales representative	On-Premises only	Japanese and Korean	Japanese and Korean	No noise No dark background No stamps/ watermarks 200+ dpi	Invoices, POs, etc. Semi-structured formats

1. On the **Create a new learning instance** page, select the domain and language of the documents.
In the **My learning instance** list page, a new **OCR Engine** column is available that shows the OCR engine used for creating each learning instance. This information is useful to the user when deciding on document processing.
2. The **Fields to extract** and **Advanced Settings** sections are displayed when you select the domain.
Each domain is available with a predefined list of primary supported languages. Language selection is enabled and available from the **Primary language of documents** drop-down list based on supported languages for a specific domain.

Note: If you select a language from the **Primary language of documents** drop-down list and then select an engine that does not support that language, the system displays an error message in the **Optical character recognition** drop-down list.

3. Click **Advanced Settings > Optical character recognition** to display the OCR engine options drop-down list.

If the OCR engine selection is invalid, the **Create instance and analyze** option is not enabled.

Note: IQ Bot automatically installs all OCR engines during the installation process, except for ABBYY FineReader Engine.

Important: You can only configure the selected OCR engine in Automation 360 IQ Bot On-Premises. OCR settings in Automation 360 IQ Bot Cloud cannot be edited as they are not accessible except for ABBYY FineReader Engine. You can edit the configuration settings for ABBYY FineReader Engine using the `appConfigurations` REST API.

You can select from the following:

Option	Description
Tesseract OCR 4	This is the default engine, unless changed in the <code>Settings.txt</code> file.
ABBYY FineReader Engine	To verify if ABBYY FineReader Engine is installed and available for use on your machine, check the <code>Settings.txt</code> file, the OCR Plug-ins folder for the SDK files, and the Optical character recognition drop-down list. Note: Also supported in IQ Bot [Local Device] package and IQ Bot Extraction package. Use ABBYY FineReader Engine OCR engine in IQ Bot on page 1402
Microsoft Azure Computer Vision OCR engine	IQ Bot supports all languages supported by this OCR engine. Use Microsoft Azure Computer Vision OCR engine on page 1399
Google Vision API	IQ Bot supports Google Vision API as an OCR engine and supports all languages supported by this engine. Use Google Vision API OCR engine on page 1405
Tegaki API	IQ Bot supports his OCR engine to extract data specific to Japanese and Korean language documents. You need to download and use your private license to use Tegaki API. Note: Tegaki API OCR engine is not supported in Automation 360 IQ Bot Cloud. Use Tegaki API OCR engine on page 1409

Option	Description
My PDF documents do not have images	<p>All the PDF documents that you upload are processed using the PDFBox OCR by default, regardless of the OCR engine you have specified or selected.</p> <p>If you are uploading non-PDF documents or PDF documents that contain images, clear the My PDF documents do not have images check box to ensure that the OCR engine that you have specified or selected is used to process the documents.</p> <p>The My PDF documents do not have images check box is enabled by default. To disable this feature, see Disable PDFBox option on page 3564.</p>

Tip: If IQ Bot is unable to extract data from low quality or handwritten documents, troubleshoot the issue:

[IQ Bot unable to extract data from low quality and Handwritten documents \(A-People login required\)](#)

Note: Use the following files to change the OCR settings:

- AbbyyImagePreProcessingSettings.json
- LanguageCodeToAbbyyLanguageCode.json
- TegakiOCREngineSettings.json
- Azure3OCREngineSettings.json
- GoogleOCREngineSettings.json
- AzureOCREngineSettings.json

[How to change OCR Settings in IQ Bot \(A-People login required\)](#)

Edit a learning instance

Edit a learning instance to change its name, description, add additional training documents, or include additional fields for extraction.

You can only edit a learning instance on Staging. So ensure you move any learning instance in Production environment to Staging to edit it.

1. On the **Learning Instances** page, click a learning instance.
2. Click the **Edit** icon to edit the learning instance.
3. Optional: Update the description field.
4. Optional: Change or update the learning instance name.

When you change the name of a learning instance, the following changes occur:

- A separate folder with the new learning instance name is created in the configured output directory to store the .csv files of processed documents.

The previous folder containing the .csv files before the learning instance name was changed remains as is in the output folder.

- When you migrate a learning instance with an updated name using overwrite or remove options, it is updated in the source environment after the `.iqba` file is imported.
- An entry in the audit logs is created for this activity.

5. Optional: Click **Browse** to select additional training documents.

The file names of the documents that you upload should not start with special characters, such as the hyphen (-).

6. Optional: Select additional fields and table columns to add to the learning instance for data extraction.
7. Use the **New groups creation setting** field to restrict creation of new groups or set the threshold for the number of groups.

Note: The **New groups creation setting** field only applies to the documents in Production. However, this field option is not applicable for IQ Bot [Local Device] and IQ Bot Extraction packages.

For more information, see [Limit the creation of document groups](#) on page 3561.

8. Optional: Use the **Default validations group** option to select a default group for document validations.

All new documents use the custom logic and validations defined in the default group. Validation rules from this default group are applied when a document does not belong to any of the existing group. If you delete the selected default group, the validation rules are not applied to any of the new documents that were supposed to use this group.

Note: If you select a default group, you can only change it to another group. However, you cannot select **Select default validation**, which is the default setting.

9. Click **Save** to view a confirmation message.
10. Click **Yes, proceed with field addition** to upload, analyze, and classify the selected training documents (if any) that were added to the learning instance.

The classification of documents remain unaffected by the newly added fields.

All additional fields become available in all the bots and appear as optional fields in the selected learning instance. The bots must be retrained for these fields.

See [Errors generated while editing learning instances](#) on page 3563.

Limit the creation of document groups

Limit the number of new document groups that the Classifier can create when a learning instance is in production.

You can only edit a learning instance that is in staging. If the learning instance is in production, you must revert it to staging.

When documents are uploaded to a learning instance, the Classifier sorts the documents into document groups based on the layout, which is the order in which the fields appear on the page. If a document is uploaded to a learning instance in production and the document does not match the layout of any of the document groups, the Classifier creates a new group for that document.

Use the following steps to either configure a limit for the number of total document groups in the learning instance, or opt to disallow the Classifier from creating new document groups.

1. Navigate to **LEARNING INSTANCES**, select a learning instance, and click **Edit**.

2. Select from the following options:

Option	Description
Select the Never create new groups check box	<p>No new groups are created, irrespective of the number of document uploads. The uploaded documents are sent directly to the Validator.</p> <ul style="list-style-type: none"> • This check box is deselected by default. • When this option is selected, the Threshold to create new groups field is disabled. • You can create new groups manually by uploading them to the learning instance in staging.
Set a value for the Threshold to create new groups field	<p>When you set a threshold value, IQ Bot does not create a group for the uploaded documents till it reaches the defined value. Till the set threshold value is reached, all documents are sent to the Validator.</p> <ul style="list-style-type: none"> • By default, the value is set to 10 for all new learning instances. • You can set a value of up to 10 digits. • IQ Bot does not allow you to enter non-numerical characters, zero, or floating points.

3. Save your updates, which are then reflected in the **Summary** tab.

The **Summary** tab displays all the staging and production details. The information is updated based on any applied setting in the **New groups creation setting** section.

For new learning instances, unless you set the minimum threshold in the **New groups creation setting** section, IQ Bot applies the default set value of 10 and does not create groups for the first 9 uploaded documents.

4. For existing learning instances, you can set the minimum threshold in the **Learning Instance > Edit** page. The new threshold is applied to all documents from then onward.

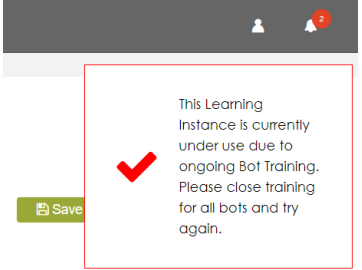

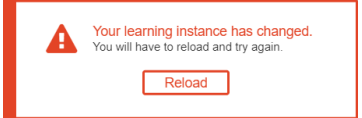

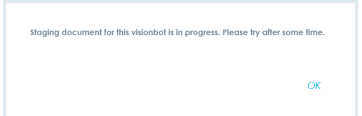

All existing learning instances, even after upgrade, will continue with a threshold as 1.

All changes take effect only on the documents uploaded in production after the setting is edited. If you change the setting to a new threshold or never create new groups with an existing learning instance, this check will be performed only on the next document uploaded in production.

In the production environment, all classified documents that do not belong to any group and do not meet the minimum threshold requirement are sent to the Validator. You can update the values and make necessary corrections. However, all fields are optional and are text data type. The user can **Save current document** without making any corrections, or choose the **Mark as Invalid** option.

Errors generated while editing learning instances

Use case scenarios and error messages generated while editing a learning instance are explained in this topic.

Case	Details	Message
Bot in training	<p>Learning instance is in use because of ongoing bot training and you edit the same instance</p> <p>A) User 2 is editing the same learning instance</p>	
Case 1: Simultaneous editing of same learning instance	<p>Example for case 1:</p> <p>User 1 uploads a document to the same learning instance.</p> <p>User 2 adds a field when editing the same learning instance.</p>	
Run and edit the same bot	<p>Run the bot and then edit the same bot using the same user login or two different user logins.</p>	

Delete a learning Instance

Use the Learning Instances page to delete a learning instance from the **View Details** page.

You cannot delete a learning instance that is in the production environment. To edit a learning instance, do the following:

1. On the **Learning Instances** page, click the learning instance or **View Instance Details** icon to show the **Summary** tab.
2. On the details page, : click the **Edit** icon. The learning instance becomes available for editing.
3. To delete the learning instance, click the **Delete Instance** button. A confirmation message appears.
4. Enter the learning instance name in the field and delete the learning instance.

Important:

Unless you have already exported the learning instance as a backup, the following occurs after you delete a learning instance:

- It is permanently deleted and cannot be restored.

- All the associated bots are deleted and cannot be reused.
 - You cannot reuse a deleted name for a learning instance to create a new one.
-

Disable PDFBox option

The PDFBox option is enabled by default. Disable the option when you are training hybrid PDF documents containing images and text.

The PDFBox option works best with completely digital documents only. When using hybrid documents containing images and text, our recommendation is to disable the PDFBox option for better document classification.

Note: The PDFBox option is enabled in the system by default. Ensure that the PDFBox is kept enabled only if you plan to process digital documents, otherwise processing will fail.

If PDFBox is enabled, you can process the following PDF types:

- Vector and Hybrid PDF can be processed using PDFBox
- Raster PDF can be first processed using PDFBox, and if no segment is found then the PDF is processed again using Document Image OCR

There are two ways in which you can disable/enable the PDFBox option in IQ Bot:

- Directly in the UI during the creation of a learning instance. In the **Create new learning instance** page go to **Advanced Settings > Optical character recognition** and disable/enable the **My PDF documents do not have images** check-box.
- In the `Setting.txt` file described as follows:

1. Navigate to `C:\Program Files (x86)\Automation Anywhere IQ Bot\Configurations`.

2. Open the `Setting.txt` file, and change `PDFBoxOCREnabled=true` to `PDFBoxOCREnabled=false`

This turns off the processing of uploaded documents by PDFBox for new learning instances (after applying this change), and does not apply to the existing learning instances. IQ Bot will use your selected OCR engine for PDF documents as well.

Note: When PDFBox is disabled, ensure that your PDF document is less than 60 pages.

3. After updating the `Setting.txt` file, execution of `stoppedanduninstalled` and `installedandstartedstart` of IQ Bot services is not required.

Train a learning instance

Use the staging environment to train a learning instance and extract data from sample documents. Review each field to verify whether the correct value is extracted and where necessary, map the correct field.

When you upload sample documents while creating a learning instance, the Classifier analyzes and categorizes these documents into logical groups. The system creates a bot for each document group, which you must train to extract data from specific fields in the sample documents.

The following steps provide an overview of the training process:

Step 1: Open the Designer

From the **My Learning Instances** page, open a learning instance and click **Edit bot** or **Create bot** to start training the learning instance.

For an introduction to the components, see [Introduction to the Designer](#) on page 3567.

Step 2: Map the document fields

In the **Fields** section, click each form field to verify whether the correct value is extracted. If the value is incorrect or if the field was not found (indicated by a grayed-out check icon next to the field), you must remap the field.

- [Map a field](#) on page 3571
- [Delete mapping in the Designer](#) on page 3578

Step 3: Map the check boxes (if applicable)

If you configured the learning instance and uploaded sample documents containing check boxes or option buttons, see [Extract data from check boxes or check box groups](#) on page 3576

Note:

- Check boxes and check box groups can be extracted as either a form or table field depending on whether the check box appears one time or on a recurring basis in the document.
- We do not support classification of encrypted or password-protected documents.

Step 4: Map the table fields

Review each table field to ensure that the correct column name is identified in the **Column Value** field. If IQ Bot did not find the correct Column Name, remap the column name by using the same approach as you did for the form fields. Then, configure the table settings. [Map a table](#) on page 3572

If the document contains more than one table, define the additional tables:

1. Add all the table fields to the **Additional table/repeated fields** section of a learning instance. [Edit a learning instance](#) on page 3560.
2. Map the additional table fields. [Add multiple tables in Designer](#) on page 3575.

To establish a relationship between the fields of the different tables, see [Define one or more linked fields in a child table](#) on page 3575.

Step 5: Review the training results

Click **See extraction results** to check the extracted data from the document group. [Preview extracted data](#) on page 3577

If not all of the fields are extracted, try resizing the mapping areas for those fields.

Alternatively, train the bot by using a different document. [Change the training document for a group](#) on page 3568

Step 6: Save the bot

Click **Save and go to next group** to train the bot for the next document group.

A menu appears, with the option to **Cancel**, **Save**, or **Save and send to Production**.

Note: We recommend that you test the bot (see next step) before sending it to production.

Step 7: Test bot extraction capabilities

You can view the status of all the bots in all your learning instances from the **BOTS** tab. [Manage IQ bots](#)

Navigate to the **BOTS** tab and click **Test bot**.

The bot processes the remaining documents in the document group based on the trained document. To see the bot performance, review the values in the **Learning instance summary** page, particularly the straight-through processing (STP) metric. [Review the learning instance details](#) on page 3578

If the STP number is low, you can either retrain the bot, such as by resizing the mapping areas or train the bot on a different document. [Change the training document for a group](#) on page 3568

Step 8: Send the bot to production

When you are satisfied with the extraction accuracy of the bot, switch it to production mode. Then, switch the learning instance to production mode. Once a learning instance is in production mode, IQ Bot is ready to begin processing documents in real time: classifying the uploaded documents to the document groups with bots in production and either extracting data or sending the document for manual validation.

From the **Learning Instance Details** page, click the switch at the top right to move the learning

instance into production mode. [Set learning instance to Production](#) on page 3595

Note: If you want to retrain a bot, both the learning instance and the bot must be in staging mode.

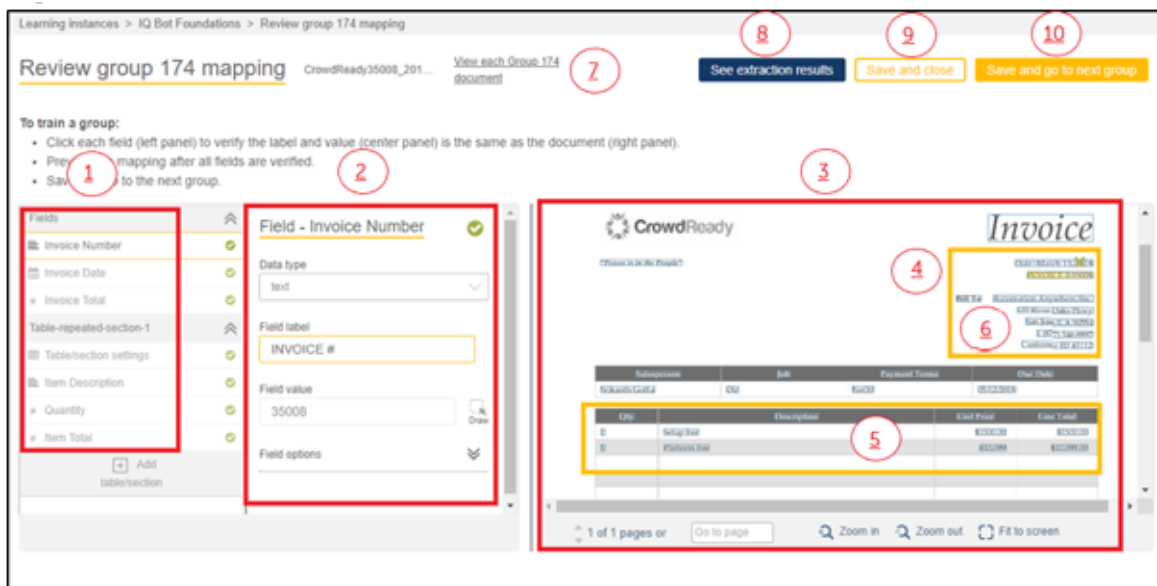

Related concepts

[About the Classifier](#) on page 3551

Learn about how documents are classified and the factors that affect classification.

Introduction to the Designer

The Designer is the user interface where you train bots to extract data from uploaded sample documents. The Designer contains auto-mapped fields and table columns, where you can edit the existing mapping or add new fields and tables.

Highlighted areas are:

1. Fields panel: List of fields selected for extraction during Learning Instance creation. Fields successfully found are indicated with a green check mark.
2. Field Details panel: Details for the highlighted field in the Fields Panel, including data type and extracted value.
3. Document Image panel: Rendered image of the document with image view controls
4. Form fields: A field that has a single value in the document, such as the invoice number or invoice date.
5. Table fields: A field with values that appear more than one time in a document, such as the item description or quantity.
6. The blue boxes indicate System Identified Regions (SIRs) where IQ Bot found extractable data.
7. The training document can be changed by clicking **View each Group (#) document**.
8. The extraction can be tested using **See extraction** results.

9. Save and close: Saves the changes and returns to the Learning Instance details page.
10. Save and go to the next group: Saves changes, allows the Group to be set to Production mode, and moves to the next available Group.

Note: If you have multiple files in a group and one of the document is deleted, then you will see an error message **Unable to load document** and you will not be able to change the document for training in the Designer. When the entire multi-page document is deleted or corrupted, you will not be able to navigate between the pages. If you click the next page button, then the **Loading document** screen is displayed.

Change the training document for a group

During document training, look at unique document layouts available in a group, and choose a different document than the default one chosen by IQ Bot Designer, that is more representative of documents across that group. That helps maximize straight-through processing (STP).

Follow the steps to choose a different document from a document group.

1. User can see the **View each Group 'x' document** button in the Designer training page next to the document name.
The **View each Group 'x' document** button is disabled if there is a single document in the group.
2. Click the **View each Group 'x' document** button to display the previous and next arrows that will let you move to another document. You can also cancel out of the task.
Choosing a different document as the group's training document will clear all mapping from the previous document. IQ Bot displays a warning message stating the same.
3. Select a new document and click the **Change the training document** button to see a message confirmation stating: *If you change the training document for this group, any mapping from the previously trained document will be lost. Do you want to change the training document for <group name> to <document name>?*
4. Choosing **No, cancel** takes you back to the Designer, whereas confirming the message **Yes, change** loads and launches the new document with auto-mapped fields.
5. Click **See extraction results** to view extracted data from the new document.

Tasks performed from Bot page

This page lists all the available bots for a learning instance, and enables you to perform tasks such as run, change the status, or launch the IQ Bot Designer.

Create a bot to extract text from a document. Define the field labels and values in a document so that the system can learn from it and automatically process other documents in the document group..

Monitor the progress and status of all bots created for a learning instance and set the status from Staging to the Production environment.

Testing a bot verifies that the bot can reach the required accuracy based on the training. It also runs it against all the sample documents associated with that category or group and benchmarks document and field accuracy. Test a bot only in the Staging environment.

Note:

- To view the updated document and field accuracy, refresh the **Bots** page and click the bot name. The updated document and field accuracy appear in the details area.
- You cannot edit a bot that another user is already editing.

Various bot states

The status of a bot is dependent on the state of the learning instance as well as the bot. The table below shows the relationship between learning instance state, bot state, and bot status.

Learning Instance State	Bot State	Bot Status
Staging	Staging	Training
Staging	Production	Ready
Production	Staging	Training
Production	Production	Active
Created	Not created	No listing

Delete a bot

The following are some key points:

- Clicking the **Delete bot** button displays a message asking if you want to delete the Bot. Selecting yes displays a success message in the Learning Instance details page. The **Summary** tab shows the updated information in the **Staging** and **Production** results sections for the **Groups found** and **Bots created** fields.
- You can delete a Bot in Staging only. Once deleted, the Bot does not display in the Learning Instance details page or the Bot listing page.
 - All associated staging documents are removed from the system.
 - All associated unprocessed production documents get moved to the Validator for processing.

Note: A new Bot is created when the same documents are uploaded again to Staging or Production.

- On re-uploading the deleted documents from the learning instance, the system classifies the documents and displays the groups again with the **Create Bot** option for each group. Clicking the **Create Bot** option creates the Bot and you can see it in the **Create Bot** details page.
- In case of backend exceptions, such as disruption of Services, the system does not let you delete the Bot. Instead, it displays an error message saying that an unexpected error has occurred.

Related tasks

[Create your first bot](#) on page 1429

Perform the following steps to create your first bot that prints the message, `Go be great!`, the Automation Anywhere version of `Hello World!`

Improve output quality using OCR confidence

Improve the output quality of the IQ Bot platform using the system-identified region (SIR) and optical character recognition (OCR) confidence by comparing it to a predefined threshold.

Confidence-based validation is useful for a text type field and for Date or Number fields because it helps route a document, with contentious values, for a human to view despite the fields satisfying the set validation criteria.

Enable OCR confidence-based validation

Note: This option is applicable only if you selected Tesseract OCR when creating the learning instance.

This feature is disabled by default. To enable this feature, open the `Settings.txt` configuration file available in `<IQ Bot Installation Folder>\Configurations\`, and set the desired threshold value in the `ConfidenceThreshold` property. For this example, set the character-level confidence threshold value to 99, that is `ConfidenceThreshold=99`. When this feature is disabled, the default value is set to 0, signifying that the feature is disabled.

Note: The confidence threshold value is uniformly applicable across all the learning instances.

How OCR confidence-based validation works

In a document if a field's SIR character level confidence is lower than that of the set confidence threshold, the validation for that field fails, resulting in the failure of that document.

Note: If a field value fails due to a validation rule (for example, `Invalid Number Format`) other than an OCR confidence validation failure, you see that tooltip, and not the tooltip for Low confidence.

While training a document, a confidence-based validation failure against a field appears in an orange box during preview if no other validation errors exist for that field. Other validation errors take precedence over OCR character-level confidence validation.

Troubleshoot: If the OCR engine is not able to identify SIRs for Chinese language PDF documents, troubleshoot the issue:

- [Data objects \(SIRs\) are not identified by OCR for Chinese PDF documents \(A-People login required\)](#)
 - [How to convert PDF files to TIFF files \(A-People login required\)](#)
-

Map a field

When you are training a learning instance, if a field value was extracted incorrectly or if the field was not found, you must remap the field.

If you have not done so already, first create a learning instance with sample documents. [Create a learning instance](#) on page 3554

For an introduction to the components, see [Introduction to the Designer](#) on page 3567.

The Designer image display panel contains blue boxes that surround text, date, or number type data. Each of these blue boxes is a system identified region (SIR) that indicates that IQ Bot has identified that region as containing extractable data. Perform the following steps to map a field to teach IQ Bot to extract data from that field (for example, the invoice number) from a specific region (for example, the top-right side of SIR).

Note: These steps apply only to text, number, and date data types. IQ Bot also supports check boxes. For more information, see [Extract data from check boxes or check box groups](#) on page 3576.

1. Select a field and specify the data type from the **Data type** list.

Note: If a field value contains a mix of letters and numbers, such as invoice number, select the **Text** option.

2. In the image display panel, click the field from where you want to extract data.
IQ Bot tries to identify and autopopulate the corresponding field value in the field details panel.

Tip: Use the pipe symbol (|) to add field aliases, which represents alternative text that might be present in an SIR. For example, if the recipient's information is in a field labeled `Sold to` in some of the documents and in `Ship to` in other documents, enter `Sold to | Ship to` as the field label.

3. Optional: Drag the corners of the green-bounded box to resize the mapping area.
Alternatively, draw a new mapping area by holding and dragging the cursor.
When you resize any value region or create your own value region using select, its position is fixed relative to the field label. The value for that field is always searched in that relative region.
Reset a fixed field region defined by the user in the autodetected mode by clicking the close button at the top-right corner of the field.
For additional information, see [What are the different ways to map form fields in IQ Bot \(A- People login required\)](#).
4. Optional: If the column value is not consistently available in the training documents, expand the **Field options** section and select **Optional**.
5. Optional: Add validation patterns or custom logic.
[Designer validation patterns](#) on page 3579|[Adding custom logic to improve automatic extraction in production](#) on page 3590

Review each field to verify whether the correct value is extracted. Then, proceed to mapping table fields. See [Map a table](#) on page 3572.

Use list validation to improve accuracy of a text field

Setting validations while defining any field or table column while mapping the document class helps validate a field or table column against predefined parameters so that you can be warned if any mismatch is found during the data digitization process.

Enter each text value in a separate line.

- The bot validates extracted value of field/table column against this predefined list and checks for any mismatch found during the **See Extraction Results** phase.
- Besides validating, the process also helps auto correct the extracted values.
- Errors in validation are marked with a red border and can be seen in the **See Extraction Results** phase. Move your cursor over the error to know the error type.

If list validation value is Adam, and the extracted value is Adem; the extracted value will be auto corrected to Adam. In this example, there is a 75% match of characters; and threshold for match is at least 66%.

Use validation patterns/lists to flag discrepancy in extracted data

Use validation patterns/lists to flag discrepancies in extracted data and prevent incorrect data from going through.

When a date/number format pattern is explicitly specified, the date/number is auto corrected.

See the following examples:

Table 7: Example of date format pattern

Incorrect OCR Data	Pattern	Auto-Correction
15 10-2015	dd-mm-yyyy	15-10-2015

Table 8: Example of number format pattern

Incorrect OCR Data	Pattern	Auto-Correction
123 4567	9999999	1234567

Map a table

IQ Bot uses column names as reference points when extracting values from tables. As part of training a learning instance in the Designer, you must map the column names and configure the table settings.

Create a learning instance and map all the form fields in the Designer. [Map a field](#) on page 3571

1. Skipping the **Table settings** section, click the first table column in the **Table fields** section.
2. Click the name of the column from where you want to extract data in the image display panel.

There are two ways to map the column values:

- Option 1: For a basic table that is contained within one page, map the column name to the **Column value** field.
- Option 2: If the table spans multiple pages, we recommend mapping the **Column value** field to an entry in that column that has the greatest height and width among the entries in that column.

Depending on which mapping option you choose, IQ Bot autopopulates the **Column value** field in the field details panel with either the name of the selected column or the value of the selected table entry. In addition, the selected SIR in the document is highlighted with yellow color for easy identification.

3. Optional: Drag the corners of the green-bounded box to resize the mapping area.

Alternatively, draw a new mapping area by holding and dragging the cursor.

When you resize any value region or create your own value region using select, its position is fixed relative to the field label. The value for that field is always searched in that relative region.

Reset a fixed-field region defined by the user in the autodetected mode by clicking the close button at the top-right corner of the field.

Tip: For additional information, see [How to map tables in IQ Bot \(A-People login required\)](#)

4. Expand the **Field options** section and select **Required** or **Optional**. Use the optional value if the column value is not consistently available in the training documents.

5. Optional: Provide validation patterns.

[Designer validation patterns](#) on page 3579

Configure the **Table settings** section. Ensure that you map all the other fields in the document before populating this section.

6. Review the selected option in the **Best field for table/repeated section** field. IQ Bot autodetects the table field that best defines the height of the rows in the table. You can select a different column from the list.

Other columns are extracted in reference to this column. For example, if the **Best field for table/repeated section** has five rows, then a maximum of five rows will be extracted from the other columns.

Note: Ensure that this field does not contain multiple lines or is empty.

7. Optional: Map a field label for the **End of table indicator** field to specify where to stop extracting data from that table.

For example, an invoice might contain the subtotal, sales tax, and total in the table, but because each of these fields has only one value per document, they should not be extracted as part of the table.

Provide the name of the first field that appears where the table ends, for example, `Total` or `Grand Total`.

Provide the value for the **End of table/section indicator** field in any of the following ways:

- In the Image display panel, select an SIR to populate that text value as the **End of table/section indicator**.
- Alternatively, type a value directly into the **End of table indicator/section** field, in the middle panel.

Tip: Use the pipe symbol (|) to add field aliases, which represent alternative text that might be in an SIR. For example, `Subtotal | Subtotal Amounts` refers to Subtotal OR Subtotal Amounts.

For an example of how to map one table for extraction in a document that contains multiple tables, see [Mapping a table in a page with many tables](#) on page 3574.

8. If you mapped a table value for the Column value field (option 2 in step 2): Expand the **Advanced table options** section and select **Stop extraction at "end of table indicator"**.
9. Optional: Enter custom logic.
[Adding custom logic to improve automatic extraction in production](#) on page 3590

Click **See extraction results** to check the training results for table data and remap the fields if required. [Preview extracted data](#) on page 3577

Mapping a table in a page with many tables

This example guides you in using the **Extract Table Summary Rows** and **End of table indicator** fields to extract one table in a page that contains many tables.

If you have not already done so, create a learning instance and map all the form fields in the Designer. [Map a field](#) on page 3571

In this example, a page in a document contains more than one table, but the objective is to extract only one of the tables. User is in the Designer training a bot, with at least one table having duplicate or similar regions matching those of another table. **Extract Table Summary Rows** functionality does not impact data extraction irrespective of whether user specifies the **End of table indicator** value.

1. Create two tables with similar or duplicate areas. For example, one table with claims total and other with record details related to line number.
2. Map all table columns related to line number.
3. Map all value columns without table label, but related to claims total.
Claim totals table has duplicate or similar areas like another table related to line number. So the billed amount column is a duplicate area for both tables.
4. Map one column of claims total table with the claims total label, as at least one column label is required for data extraction for a table.
5. Click on **See extraction results** to see duplicate rows that have duplicate or similar areas on claims total table. For example, When single page has multiple claim totals records.
6. Click **Back to training** to return to the training page.
7. Navigate to **Claim totals table > table settings**, and check the box for **Extract Table Summary Rows** label under **Advance Table Options**.
8. Enter value for **End of table indicator** and click on **See extraction results**.
9. User can see rows in claims total table related to claims total only.
10. Click on **Export to CSV** to open the file.
11. User can see table related to claims total extraction, as seen in preview.
12. Next, set the learning instance, and bot to production and upload some files related to the bot.
 - If the bot does not have any validation errors, the user can see claims total table as per mapping in production CSV file.

- If the bot has some validation errors, the user can see claims total table as per mapping in the Validator.

Add multiple tables in Designer

If the sample documents contain more than one table, you must map the columns and configure the table settings for each table.

Create a learning instance and map all the fields in the Designer. [Map a field](#) on page 3571

Map the columns for the first table. [Map a table](#) on page 3572

Add multiple tables in the Designer to extract their value and validate them. Move one or more table fields from one table to another to train extraction. To add tables do the following:

1. In the **Table fields** panel, click Add Table.
2. Select the columns to add from the **Available columns** list and click the arrow to add to the new table column list.
3. Map the column names and values as you did for the first table, then configure the **Table settings** section.

Resources

Click **See extraction results** to check the training results for table data and re-map the fields if needed. [Preview extracted data](#) on page 3577

Define one or more linked fields in a child table

In the Designer, define one or more linked fields/sections in a child table, to link parent and child tables in a flexible way.

Use the linked fields in a child table feature in Designer to create table links, and a hierarchy of table links among parent and child tables. This helps efficient data extraction of the linked fields besides easy linking among tables. Foreign key data extraction allows the following relationships only:

- Link single parent row to a single child row (one-to-one linking).
- Link single parent row to multiple child rows (one-to-many linking).

Note: IQ Bot does not support linking of check boxes.

Use the feature for documents with a list of names or IDs with specific information on each. For example, documents from an electric company with a list of customers and their billing/usage information. Or a document with a list of student names displaying their test scores. Create multiple tables and link the common fields thus allowing efficient and accurate data extraction. IQ Bot supports linking of up to 50 columns and unlimited rows. However, data extraction from rows spanning across multiple pages is not supported.

- Single parent-child table field/section linking:

In the **Table/Repeated Section** of the Designer, choose one or more fields/sections from a parent table to link to a child table.

1. Click **Table Settings** in the child table and click on **Link Table Fields** and select the parent table from the drop-down list of table names. This displays the available column options in the parent table you can choose to link to.
 2. Select the columns you want linked and click the downward arrow to link the columns to the child table.
 3. The linked columns display under **child table > Table Settings > Linked to (table name)**.
 4. When previewing the extracted data (click **See extraction results**), the linked fields from the parent table show up in the extreme left columns of the child table.
- Multiple hierarchical table field/section linking:

When linking table 1, 2, and 3 in a hierarchy, link in a way so that table 1 is the parent of table 2, and table 2 is parent of table 3. All three tables would be linked. Child table 3 would display linked fields from table 2 and 1. IQ Bot supports hierarchy linking up to six tables at a time.

Note: For table 3, you can only choose fields from table 2 that are not from table 1.

When previewing the extracted data for child table 3 (click **See extraction results**), the extreme left columns show linked fields from table 1. The next columns show linked fields from table 2.

Important: For successful linking, the child table must be at the same or lower level than the parent.

Extract data from check boxes or check box groups

Train a bot to extract data from a single check box or a group of check boxes.

A check box is a user interface object that allows you to make a binary choice - select or leave unselected. IQ Bot supports extracting data from check boxes or radio buttons marked with a tick, cross, or dot. In addition to square check boxes and round radio buttons, IQ Bot supports triangle and rhombus outlines.

When IQ Bot processes documents with a check box, it extracts either a **Yes** (check box selected) or **No** (check box not selected) value.

You can also combine multiple check boxes into a single group, for example a payment methods group that contains check boxes for cash, credit card, and check. When IQ Bot processes documents with a check box group, it includes the group name in the extraction results.

Recurring check boxes or groups

By default, IQ Bot extracts check box values as a form field. However, if a check box or group appears on a recurring basis in the uploaded documents, you manually select the **Column** option so that IQ Bot extracts the values as table fields. This enables IQ Bot to extract values from the subsequent occurrences. Otherwise, IQ Bot will only extract the check box value the first time it appears.

1. Click the field you want to map from the left panel.
2. In the center panel, in the **Data type** drop-down field, select value as **check box** or **checkbox group**.

- To extract data from single check box or check box groups, click the **Field label** field and then click the corresponding value in the document in the right pane.
 - Extract data from recurring check box or check box groups, click the **Column name** field and then click the corresponding value in the document in the right pane.
3. To extract the check box value, draw an outline around the check box excluding the value.
 - For a single check box, use the **Draw** tool to draw over the check box or select the auto-mapped check box segment.
 - For a check box group, use the **Draw** tool to draw over the region covering all the check boxes in that group.
 4. For single check boxes or check box groups: Verify the extracted data either in the **Field value** field in the Designer or click **See Extraction Results** to see the extracted data.
For recurring check boxes or check box groups: You can only view the extracted data by clicking **See Extraction Results**; the extracted data is not shown in the Designer.
 5. Optional: To add an individual check box to a check box group, select the desired value from the **Checkbox group** drop-down menu.
 6. When you are done configuring the check boxes, click **Save and close** or **Save and go to next group**.

Preview extracted data

Click **See Extraction Results** to review the extraction accuracy of the bot. This is the only way to see extraction results for table data, since the Designer does not show extracted table data during training. Alternatively, click **Export to CSV** to review the data in a CSV file.

The extraction result window displays the following information:

- Successfully mapped fields and the extracted values.
- Table headers and the values for each row.
- Extraction errors, which are highlighted within a red box. Hover on the error to learn more, such as if there was a validation error or lack of OCR confidence.

Note:

- The time required to display the extraction results can vary based on the complexity of the Python logic that you have created.
- To ensure successful previewing of a training document, its entire end-to-end processing, including value extraction, execution of any Python logic (if applicable), and validation of all fields, must be completed within a 2-minute time frame.

Training documents must be limited to a maximum of 20 to 30 pages. This ensures efficient processing and successful previewing within a 2-minute time frame.

Important: A training document can pass in spite of an error flagged by the validation pattern. Sometimes we want a validation pattern to flag an error, so it would not pass specific documents at a later stage in production; instead enter them in the manual validation queue.

Close the window to return to the Designer.

Important: If you upload 30 documents and all documents are classified into one group, you can see only one document for each unique layout.

Export data to a CSV file

You can export the extracted data to a CSV file for ease of review. When you click **Export to CSV**, the current document is downloaded to your device. To download other documents you must navigate to them using the < and > buttons.

The data in the downloaded CSV file is displayed exactly how it will appear when IQ Bot downloads data from a successfully processed document from a learning instance in production mode.

Review the learning instance details

Review various details of a learning instance such as associated groups, environment status, staging and productions results, total number of tested documents, modified date and so on.

On the **My learning instances** page, select a learning instance and use the following tabs to review the details:

- **Document Groups**- Contains a list of the document classification groups for the learning instance.

When you create a learning instance and upload documents to train, documents are automatically categorized in the same document group based on their content and classified accordingly. These are termed as classification groups. A bot is more likely to succeed extracting text across documents in a group with similar content.
- **Summary**- Contains various details about the learning instance such as Staging and Production results, current environment that the selected learning instance is in, total number of associated groups and bots, and so on.

Note: The system does not automatically refresh (auto-refresh) the **My learning instances** unless the user loads a screen or clicks the **Refresh** button, thereby manually refreshing data on a page. This feature helps reduce the response time for loading new data or performing any action in IQ Bot.

Related concepts

[Review the dashboard](#) on page 3601

The dashboard summarizes the performance report and provides document processing information in a graphic format.

Delete mapping in the Designer

Delete mapping of field labels and field values, selecting the **X** delete symbol next to the mapped label or value.

The following use cases explain the delete field labels and value mapping options in the Designer.

- | | |
|--|---|
| Delete a field label and its mapped value: | Select a field label in the middle panel and click the X delete symbol of the bound box in the document view to delete both, label and value |
|--|---|

	mapping . The label and the value from the middle panel gets deleted as well. The mapping check mark in the left and middle panels turns from green to gray indicating incomplete mapping.
Delete field value:	Select the field value and click the X delete symbol of the mapped box in the document view, to delete the mapped value. The value from the middle panel gets deleted as well. The check mark in the left and middle panels turns from green to gray indicating incomplete mapping.
Delete auto mapped value fields:	<p>The X delete symbol of the mapped box in document view is not visible till user resizes or manually maps it.</p> <p>For a form field, when a user deletes a resized or manually mapped box around a the field value, IQ Bot repopulates the original auto mapped value.</p> <p>For a table/section field, that same behavior does not apply, as a user has the option to map a table/section field name but not a field value, and vice versa.</p>
Delete a field label/value with or without auto mapped value:	Select a field label/value with or without auto mapped value. The field label bound box displays in the document with an X delete symbol allowing users to delete the label.
Delete field label mapping with validation pattern:	In spite of deleting a field label, the validation pattern that was assigned to the field remains in place.
Delete option ('X') when bounded box reaches space limit:	If the label/field value bounded box in the document view covers a bigger area, extending to the edge of or beyond the document view, the 'X' delete symbol appears in the nearest corner of the box.

Note: The field value box in the middle panel is disabled and users cannot enter text manually.

Designer validation patterns

IQ Bot Designer allows you to validate a field and table column against a set of predefined parameters so that you can be warned if any mismatch is found during data digitization process.

Validate a field or table

Validate a field or table column against the following predefined parameters of validation options:

- Start With / End With
- Pattern

- Lists
- Formulas

IQ Bot classifies documents into groups based on similar content, structure, and layout, which is easily identifiable. The sample documents for training are chosen based on these criteria as well. When you launch the Designer to train your learning instance, IQ Bot loads and displays a sample document from each classified group in the document pane.

Tip: In the Designer set the validation parameters by defining any field and or table column during document training.

Starts With and Ends With

While all validations can be set at the time of Design definition, you can set **Starts with/Ends with** and **Pattern** validations during training.

To validate whether data in a field starts or ends with a certain value, use the **Starts With** and **Ends With** validation option fields. While defining the design of a field or table column, you can specify whether the data is part of the selected field.

- Start with a certain value using a Starts With field
- End with a certain value using an Ends with field

If the Start With value is "IN" and extracted value is "1N7646464", then validation fails. While if End With value is 2017 and the extracted date value is 10-Aug-2017, the validation passes.

Pattern

A pattern helps define an acceptable format for data.

Validate data in the field or table column against a specific pattern. While defining the field or column in the Design view, specify a pattern of the data in the selected field.

Specify a pattern for date, number, or text fields based on the different available patterns. Reference the tables below for common examples:

Text

Field	Pattern	Notes	Description
Email	<code>^ ([a-z0-9_ \.-]+)@ ([\da-z \.-]+) \. ([a-z\.] {2,6})\$</code>	This regular expression validates emails like john@ado.com.	The Email field supports regular expressions.
Phone Number	<code>^ (\ (? \+? [0-9]* \) ?) ? [0-9_ \- \ (\)] *\$</code>	This regular expression validates phone numbers like (+64) 38 3235393.	The Phone Number field supports regular expressions.
Website	<code>^ ([a-zA-Z0-9]+ (\.[a-zA-Z0-9]+)+) \. *\$</code>	This regular expression validates websites like www.domain.com.	The Website field supports regular expressions.

Field	Pattern	Notes	Description
Number string	<code>^[0-9]{1,45}\$</code>	This regular expression validates a string with numbers 0 - 9 and limit length to 45.	The Number string field supports regular expressions.
Alpha-numeric	<code>^[A-Za-z0-9_@.#&+]*\$</code>	This regular expression validates a string containing alphanumeric values like INV-001.	The Alpha-numeric field supports regular expressions.

Number

Field	Pattern	Notes	Description
Number string	<code>^[0-9]{1,45}\$</code>	This regular expression validates a string with numbers 0 - 9 and limit length to 45.	The Number string field supports regular expressions.

Auto Correction for date and number fields

This is one of the built-in features of IQ Bot for date and number format types. It performs automatic validation and correction based on the defined pattern, even when the date/number in the scanned document is incorrect.

Note: Auto correction is only supported for special patterns.

The following table illustrates the auto-correction of an incorrect date and numbers by IQ Bot.

	Incorrect OCR value	Pattern	Auto-Correction	Description
DATE	12 F3B 2 0 1 5	<code>dd mmm yyyy</code>	12 FEB 2015	In the first example, IQ Bot auto corrects incorrect OCR "F3B" to "FEB".
	15 10-2015	<code>dd-mm-yyyy</code>	15-10-2015	

NUMBER	123 4567	9999999	1234567	In the first example, the extra space between "3" and "4" is deleted after validation against the pattern.
	12.34,S67.12	99,99,999.00	1234567.12	
				In the second example, the alphabet "S" is corrected as "5".

Note: English language numeric value with at least one digit to the left and two consecutive digits to the right (for example, 1.23) gets auto corrected if there is a space found between the decimal and the digits. For example, values 1 . 23 or 1. 23 or 1 .23 get auto corrected to 1.23.

To use this feature, add Pattern (in validation options) to the selected date and number format fields.

Special number patterns

A special pattern consists of a Prefix, a Number Pattern, and a Suffix. Use for each is explained as follows:

- Prefix: Any symbol or a text string that is appended before the Number Pattern.
- Suffix: Any symbol or a text string that is appended after the Number Pattern.
- Number Pattern: Number pattern has two parts:

- Integer-part:

They are represented by nines (9s).

The 9s in the integer part represents integer pattern and separators such as commas, spaces, and so on.

- Fractional part

They are represented by zeros.

If you need two fractional number, then it will be represented by two zeros.

Specifying fractional part is optional.

Format of numbers defined for validating numeric data.

IQ Bot supports prefixes and suffixes to make processing and validation of data easier. Specifying a suffix and prefix in the pattern and in the numeric fields is optional. Even if you do not specify the suffix or prefix, IQ Bot auto corrects and includes the required currency symbols and units of measure for the numeric fields as prefix or suffix. If you specify the currency symbols and units of measurements in the pattern and in the numeric data, IQ Bot deletes the currency symbol and unit of measure from the data.

Note: IQ Bot automatically recognizes these currency symbols: \$, ¥, £, #, €, Rs, USD, EUR, CAD, AUD, GBP, and INR. We recommend specifying valid currency symbols in the data.

IQ Bot supports prefixes and suffixes to make processing and validation of data easier. Specifying a suffix and prefix in the pattern and in the numeric fields is optional. Even if you do not specify the suffix or prefix, IQ Bot auto corrects and includes the required currency symbols and units of measure for the numeric fields as prefix or suffix. If you specify the currency symbols and units of measurements in the pattern and in the numeric data, IQ Bot deletes the currency symbol and unit of measure from the data.

Note: IQ Bot automatically recognizes these currency symbols: \$, ¥, £, #, €, Rs, USD, EUR, CAD, AUD, GBP, and INR. We recommend specifying valid currency symbols in the data.

Examples of special number patterns

Pattern	Example
Supported patterns	Supported format for numeric patterns: <ul style="list-style-type: none"> • Decimal (India) • Decimal (US, UK, Australia and others) • Number (India) • Number (US, UK, Australia and others) • Normal Decimal • Normal Number
9,999,999.00	2,597.23
9.999.999,00	7.562.597,23
9 999 999.00	2 597.23
9 999 999,00	7 562 597,23
9999999,00	2597,23
9999999.00	7562597.23
99,99,999.00	75,26,569.56
\$ 9.999.999,00	\$ 7.562.597,23
\$9 999 999.00	\$7 562 597.23
9 999 999,00 \$	2 597,23 \$
€ 9999999,00	€ 7562597,23
€9999999.00	€7562597.23
99,99,999.00 €	75,62,597.23€

Pattern	Example
EUR 9,999,999.00	EUR 7,562,597.23
EUR9 999 999.00	EUR7 562 597.23
9999999,00 EUR	62597,23 EUR
9.999.999.00	62.986.51
9, 999, 999. 00	232, 510. 68

Special date patterns

Supported date separators include /(forward slash), -(dash), space, .(dot), and ,(comma).

- d - Numeric day of the month, from 1 through 31 (eg. 5, 15 etc.)
- dd - Numeric day of the month, from 01 through 31 (eg. 05, 15 etc.)
- m - Numeric month (eg. 1 for January)
- mm - Numeric month (eg. 01 for January)
- mmm - First 3 letters of the month (eg. NOV for November)
- mmmm - Full name of the month (eg. June)

Examples of special date patterns

Pattern	Example
mm-dd-yy	01-31-18
mmm-dd-yyyy	Jan-31-2018
mmmm dd, yyyy	January 31, 2018
Mmmm d, yyyy	January 9, 2018
D M YY	9 5 15
D MM YY	9 11 15
D MMM YY	7 MAR 15
D MMMM YY	7 MARCH 15
M DD YYYY	5 05 2018
D/MM/YY	5/05/18
M/D/YY	9/5/15
DD / M / YYYY	05 / 9 / 2018
MMM / DD / YY	MAR / 05 / 18
D-MMMM-YY	09-APRIL-18
M-D-YY	5-5-18

Pattern	Example
MM-D-YY	11-5-18
MMM-DD-YYYY	NOV-13-2018
DD - M - YYYY	13 - 5 - 2019
MMMM - DD - YY	OCTOBER - 05 - 18
D.MMMM.YYYY	05.APRIL.2018
MMMM.DD.YYYY	APRIL.05.2018
D . M . YY	5 . 5 . 18
D . MM . YY	5 . 05 . 18
DD . MMM . YY	05 . JUL . 18
M . DD . YYYY	5 . 11 . 2018
MMMM . DD . YY	MAY . 13 . 13
YYYY-MM-DD	2018-01-27
YYYY/MM/DD	2017/07/27

Lists

While defining a field or table column in the Design view, you can specify a list as part of validation option for a selected field or table column. The extracted value of the field is validated against this predefined list during Preview and Test Run.

You can only specify list validation when format of field or table column is "Text". If the lookup returns multiple values for a word, the value is not auto corrected and the validation fails.

To specify list validation, do the following:

1. Select the validation type as **List** from the **Validate** drop-down menu.
2. Type a predefined list and click **Define** to save.

Each value in the list should be in a separate line.

If the extracted value does not match any value in the predefined list, the field is considered to have failed validation.

Formulas

Specify a formula as part of validation options for a selected field or table column. Use basic arithmetic, comparative, logical, and functional operations.

Tip: We recommended using functional operators instead of mathematical operators when validating fields and tables for better accuracy.

When formulating an expression remember the following:

- All function names must be in capital letters.
- All formulas must result in either a true or false validation.
- Field and column names are case sensitive when used within formulas. If field is defined as Qty in design, using qty or QTY in formula results in an invalid formula.

- For variable declaration or manipulation, ensure not to use certain keywords that are reserved for formulating an expression, including SUM, SUB, DIV, MUL, COLSUM, IF.

Mathematical Operators

Operations	Description	Syntax
+	Addition	Field/Column_Name1 + Field/Column_Name2
-	Subtraction	Field/Column_Name1 - Field/Column_Name2
*	Multiplication	Field/Column_Name1 * Field/Column_Name2
/	Division	Field/Column_Name1 / Field/Column_Name2

Comparative Operators

Operations	Description	Syntax
==	Equal To	[Current Field/Column Name] == [expression comprised of one or more field/column name or fixed numeric values] For example, AMOUNT == MUL(QUANTITY, UNIT_PRICE)
>=	Greater than or Equal To	[Current Field/Column Name] >= [expression comprised of one or more field/column name or fixed numeric values] For example, TOTAL_BILL_AMOUNT >= AMOUNT_PAID
<=	Less than or Equal To	[Current Field/Column Name] <= [expression comprised of one or more field/column name or fixed numeric values] For example, AMOUNT_PAID <= TOTAL_BILL_AMOUNT

Operations	Description	Syntax
>	Greater Than	[Current Field/Column Name] > [expression comprised of one or more field/column name or fixed numeric values] For example, BILL_AMOUNT > 0
<	Less Than	[Current Field/Column Name] > [expression comprised of one or more field/column name or fixed numeric values] For example, DISCOUNT_PERCENTAGE < 100
!=	Not Equal To	[Current Field/Column Name] != [expression comprised of one or more field/column name or fixed numeric values] For example, DEBIT_AMOUNT != 0

Logical Operators

Operations	Description	Syntax
&&	And: Field/Column is valid if all conditions are true	<Current Field/Column Name> <operator 1> <expression 1> && <Current Field/Column Name> <operator 2> <expression 2> For example, DISCOUNT_PERCENTAGE >= 0 && DISCOUNT_PERCENTAGE <=100

Operations	Description	Syntax
	Or: Field/Column is valid if any one of the given conditions is true	<p><Current Field/Column Name> <operator 1> <expression 1> <Current Field/Column Name> <operator 2> <expression 2></p> <p>For example, DISCOUNT_PERCENTAGE >= 0 DISCOUNT_PERCENTAGE == 'Net'</p>
!	Not: Converts a true expression to false and also the other way round	<p>!<expression></p> <p>For example, !(AGE < 18) ==> valid when AGE is not less than 18</p>

Functional Operators

Operations	Description	Syntax
SUM	Summation: gives result of addition of one or more field/column/fixed-number values	<p>SUM(n1,n2,...,nN)</p> <p>For example, SUM(SUB_TOTAL, SERVICE_TAX, EDUCATION_CESS) ==> equivalent to SUB_TOTAL plus SERVICE_TAX plus EDUCATION_CESS</p>
SUB	Subtraction: gives result of subtraction of one or more field/column/fixed-number values from the first specified value	<p>SUB(n1,n2,...,nN)</p> <p>For example, SUB(SUB_TOTAL, TOTAL_DISCOUNT, ADJUSTMENTS) ==> equivalent to SUB_TOTAL minus TOTAL_DISCOUNT minus ADJUSTMENTS</p>

Operations	Description	Syntax
MUL	Multiplication: gives result of multiplication of one or more field/column/fixe-number values	<p>MUL(n1,n2,...,nN)</p> <p>For example, MUL(QTY_IN_BOX, UNIT_PRICE, SHIPPED_BOXES) ==> equivalent to QTY_IN_BOX multiply-with UNIT_PRICE multiply-with SHIPPED_BOXES</p>
DIV	Division: gives result of division of one or more field/column/fixe-number values from the first specified value	<p>DIV(n1,n2,...,nN)</p> <p>For example, DIV(AMOUNT, SHIPPED_BOXES, UNIT_PRICE) ==> equivalent to AMOUNT divide-by SHIPPED_BOXES divide-by UNIT_PRICE</p>
COLSUM	Sum of a given Column in a table: gives result after evaluating given expression for each row of specified table and adding them all together	<p>COLSUM("<table-name>", "<expression to evaluate for each row of specified table- name>")</p> <p>For example, FINAL_TOTAL == COLSUM("LINE_ITEMS", "MUL(QTY, UNIT_PRICE)")</p> <p>Say there are 3 rows for table LINE_ITEMS, then FINAL_TOTAL should be equal to MUL(QTY1, UNIT_PRICE1) + MUL(QTY2, UNIT_PRICE2) + MUL(QTY3, UNIT_PRICE3)</p> <p>where, QTY1 is QTY value in row 1, similarly UNIT_PRICE1 is UNIT_PRICE value in row 2, and so on for other rows as well.</p>

Adding custom logic to improve automatic extraction in production

Enter the logic in the IQ Bot Designer to improve text extraction and validation, and to reduce the number of documents entering the Validator that requires RPA post processing.

Overview

For Automation 360 IQ Bot Cloud, there is an identified list of Python libraries and packages that are safe to use for the Custom Logic feature. Use only these packages to ensure security for your cloud infrastructure, file systems, databases, and network resources: [List of supported Pandas Libraries in Automation 360 IQ Bot \(A-People login required\)](#)

Keep in mind the following:

- Custom logic executes in a sequential order across all tables and fields.
- Applying custom logic might increase the extraction time per document.
- Automation 360 IQ Bot validation rules apply over the extracted values processed by the custom script.
- Custom script only works on the extracted data and does not influence the OCR extraction quality.
- Always test your Python script before processing documents in a learning instance in production

The custom logic feature helps clean up extracted values ahead of the validation step but does not replace all the post-processing currently done using the Task Bot. In addition to adding inline scripts, users can use the Python scripts in a central location, import those as modules, and call functions to reduce the amount of Python code at the field or table level.

Restriction: If the number of characters in the Python code along with other information exceeds 32000, and when this code is sent to the back-end as a Windows runtime argument for the process, the execution fails, and does not display any error message.

Resources

To learn more, search for Using Custom Logic in IQ Bot course in [Automation Anywhere University: RPA Training and Certification \(A-People login required\)](#).

Next step

Using scripts, in the IQ Bot Designer add the **Form fields** and **Table fields**.

Form fields

Add scripts in Designer for form fields.

The List validation via external file can be implemented as a part of the field custom logic using python scripts directly in the Designer.

1. In the IQ Bot Designer, left-hand panel, highlight a form field whose extraction/validation you aim to improve further.

2. In the middle panel, scroll down to **Field options** > **Logic**.
3. In that **Logic** section, toggle between **fullscreen** and **smallscreen** for ease of use.
4. Add code to modify IQ Bot's extracted text value. See example below:

```
# variable that stores the value: field_value

# import the Python regular expression library, re
import re

# call the regular expression library's method, findall, to extract
the date value only
field_value = re.findall(r'\d{2}-\d{2}-\d{4}', field_value)[0]
```

5. Select **Test Run** to test your script and see the results before vs. after.

```
value_before: 2018/11/09 B210
value_after: 2018/11/09
```

Table fields

Add scripts in Designer for table fields.

1. In IQ Bot Designer, left-hand panel, highlight **Table/section settings** for the table whose extraction/validation you aim to improve further.
2. In the middle panel, scroll down to **Logic**.
3. In the **Logic** section, toggle between **fullscreen** and **smallscreen** for ease of use.
4. Add code to modify the extracted table values, which are stored as a Python dictionary in a user variable called table_values. See example below.

Each row has a Guid (Global unique identifier), which allows IQ Bot to auto track rows that are added and deleted. If you add a row, you need not enter a Guid. IQ Bot will handle this automatically.

```
# variable that stores the value: table_values

# convert from dictionary to dataframe
df = pd.DataFrame.from_dict(table_values)

# print dataframe before update
print(df)

# Item Description: drop rows with a missing value
df = df[(df["Item_Description"] != "")]

# Quantity: extract first part of the string, the numeric part only
df['Quantity'] = df['Quantity'].str.split(' ', 1).str[0].str.strip()

# print dataframe after update
print(df)

# convert back from dataframe to dict to override what IQ Bot stores
table_values = df.to_dict()
```

5. Select **Test Run** to test your script and see the results before vs. after.

```

Item_Description                               Guid
product_id  Quantity Item_Total
0 wafer, NO172 43ea78f4-7b9b-413a-83ce-89d671478d6c 2
COMS5A-18090220 4.00 PCS 5,840.00
1 Visual Iaspection + cc774f5f-2507-4a15-8e45-7b2abf84fabe
1.00 EA 65.00
2 6bddfed1-2359-4305-a0ac-a1769c113bfb 5%
VAT : Total - 4.00PCS GR: 5,905.00
3 2dc642a7-8e6e-4bc6-9672-85afff8c21db
Total - KGD: 0.00

Item_Description                               Guid
product_id  Quantity Item_Total
0 wafer, NO172 43ea78f4-7b9b-413a-83ce-89d671478d6c 2
COMS5A-18090220 4.00 5,840.00
1 Visual Iaspection + cc774f5f-2507-4a15-8e45-7b2abf84fabe
1.00 65.00

```

6. If you select **See extraction results** or save the bot, your script is saved.

Use cases and examples

These are some use cases the Designer script feature supports.

For examples of user scripts and use cases, see: [IQ Bot custom logic use cases and examples](#)

Following are some use cases:

- Query an extracted value vs. a database in an ERP system to validate values.
- Extract "0123456" from "PO 0123456".
- Remove table rows that contain "Page x of y".
- Extract the currency from one table field (for example: Item Total) and save in an empty table field.
- Extract the product number from a table field (for example: Item Description).
- Extract the zip code from an address.
- Query a REST service (for example: add NLP, retrieve data from an outside system, and so on).
- Return a Boolean yes/no value on whether handwriting exists for a field.

Pre-installed Python packages

To facilitate ease of use and consistent behavior across servers, IQ Bot auto installs Python v3.11.0 and some popular Python packages mentioned as follows.

Table 9: Pre-installed Python packages

Main package	Version	URL
difflib	In-built Python with installer	https://docs.python.org/3/library/text.html

Main package	Version	URL
io	In-built Python with installer	https://docs.python.org/3/library/io.html
re	In-built Python with installer	https://docs.python.org/3/library/text.html
sqlite3	In-built Python with installer	https://docs.python.org/2/library/sqlite3.html
string	In-built Python with installer	https://docs.python.org/3/library/text.html
stringprep	In-built Python with installer	https://docs.python.org/3/library/text.html
sys	In-built Python with installer	https://docs.python.org/3/library/sys.html
textwrap	In-built Python with installer	https://docs.python.org/3/library/text.html
unicodedata	In-built Python with installer	https://docs.python.org/3/library/text.html
DateTime	4.3	https://pypi.org/project/DateTime/
pandas	0.24.2	https://pypi.org/project/pandas/
inflection	0.3.1	https://github.com/jpvanhal/inflection
dateutils	0.6.6	https://pypi.org/project/dateutils/
tabulate	0.8.3	https://pypi.org/project/tabulate/
numby	1.16.4	https://pypi.org/project/numpy/
json	2.0.9	https://docs.python.org/3/library/json.html
requests	2.22.0	https://github.com/kennethreitz/requests
psycopg2	2.8.3	https://pypi.org/project/psycopg2/
pymongo	3.8.0	https://pypi.org/project/pymongo/
pyodbc	4.0.26	https://github.com/mkleehammer/pyodbc
opencv-python	4.1.0.25	https://pypi.org/project/opencv-python/

Main package	Version	URL
Pillow	6.0.0	https://github.com/python-pillow/Pillow
cx_Oracle Note: As of Build 16685, this module is replaced by oracledb. See Upgrading from cx_Oracle 8.3 to python-oracledb	7.1.3	https://github.com/oracle/python-cx_Oracle
oracledb	1.2.1	https://github.com/oracle/python-oracledb
Python Arabic Reshaper	2.0.15	https://github.com/mpcabd/python-arabic-reshaper

Additional Python packages

To allow further empowerment, you can add more Python libraries for use in IQ Bot.

1. Open the Command Prompt.
2. In the Command Prompt, change directory to IQ Bot's Python dictionary. For example: `C:\Python354-x86-IQBot`.
3. Install your Python package there. For example: `pip install PyArabic`.
4. In **IQ Bot Designer > Logic**, you can import and use that Python package.
5. If step 4 does not work, then stop/uninstall and then install/start services.

Extract data using magnetic ink character recognition

Use the magnetic ink character recognition (MICR) OCR feature with ABBYY FineReader Engine version 12.2 support to extract MICR data from financial checks.

Note: Documents in Non-Latin based languages cannot be processed if MICR is enabled on ABBYY FineReader Engine OCR version 12.3 and 12.4.

- Ensure that ABBYY FineReader Engine is installed in the plug-ins folder: `\OCR Plugins\ABBY SDK\12\ . . .`
- From the `C:\Program Files (x86)\Automation Anywhere IQ Bot (version)\Configurations` folder, open the `Settings.txt` file, change `OCREngine=Tesseract4` to `OCREngine=Abbyy`, and save the file.

Note: A system restart is not required.

The MICR feature is supported with ABBYY FineReader Engine versions 12.2 .

1. Set ABBYY FineReader Engine in your `settings.txt` file as the primary OCR engine.

2. Navigate to the IQ Bot\Configurations\AbbyyImagePreProcessingSettings.json file.
3. Update these parameters:
 - TextTypes = 129
 - DetectTextTypesIndependently =true

The MICR feature is activated in the system.

- Create a learning instance and add form fields to extract MICR data from financial checks such as **MICR** and **Pay to** fields.
- Scan and upload a check to IQ Bot for training. In production, upload the financial checks for accurate MICR data extraction.
- In the Designer, map the MICR data in the financial check for extraction.
- In production, upload the financial checks for accurate MICR data extraction.

Set learning instance to Production

After you have trained a learning instance on Staging to extract data from documents with high accuracy, you can move the learning instance to Production. This enables you to deploy the learning instance on production documents for real time data extraction.

Use the **Set instance to production** button to move a learning instance to Production. When you move a learning instance to the Production environment, a confirmation message appears. To confirm, click **Yes, send to production**. Learning instances in the Production environment are identified by the **Production** label next to their name.

Tip: You can also use the **My Learning Instances** page to move a learning instance to Production.

Note: During the production process, you must not move the learning instances or bots from Staging to Production or vice-versa.

Manage learning instances

A learning instance is an IQ Bot structure that describes the data in a single document type, for example an invoice. It contains information such as the language used in the document and the fields to extract.

A learning instance can be either in staging or production mode. These modes determine whether the learning instance is a draft or live version.

Staging

In the staging mode, you can create and edit learning instances, upload sample documents, and train bots to extract data from the sample documents you uploaded. You can test and improve the accuracy of a learning instance and its bots before deploying it to production mode.

Note: Because the data generated by learning instances in the staging mode is based on sample documents, it is kept separate from data pertaining to learning instances in production mode. For example, sample documents are not counted against your organization's purchased pages. For more information, see [Review the dashboard](#) on page 3601.

Production

In the production mode, a learning instance can automatically process real business documents, extract data, and send documents requiring manual validation to the validation queue.

To find out which mode a learning instance is in, navigate to the **LEARNING INSTANCES** tab, where the **My learning instances** page displays the learning instances in the environment. Each learning instance has a toggle in the **Actions** column, which indicates whether it is in staging (toggle to the left and is colored gray) or production (toggle to the right and colored orange).

Instance name	Provider	# of IQ Bots	# of Files	Training %	Actions
IQBotDemo	Tesseract4 OCR	1	1	0%	
IQBotDemoDLCA	MicrosoftAzureAPI OCR	1	2	100%	

Based on the mode that a learning instance is in, different user types contribute to IQ Bot. For example, in the staging mode, the Data engineer creates learning instances and the Bot builder builds supporting RPA bots, and in the production mode, the Validator manually corrects the fields in the documents that IQ Bot could not process. To learn more about how each user contributes to IQ Bot, see [IQ Bot process overview](#).

Note: The following are the file size restrictions in each stage:

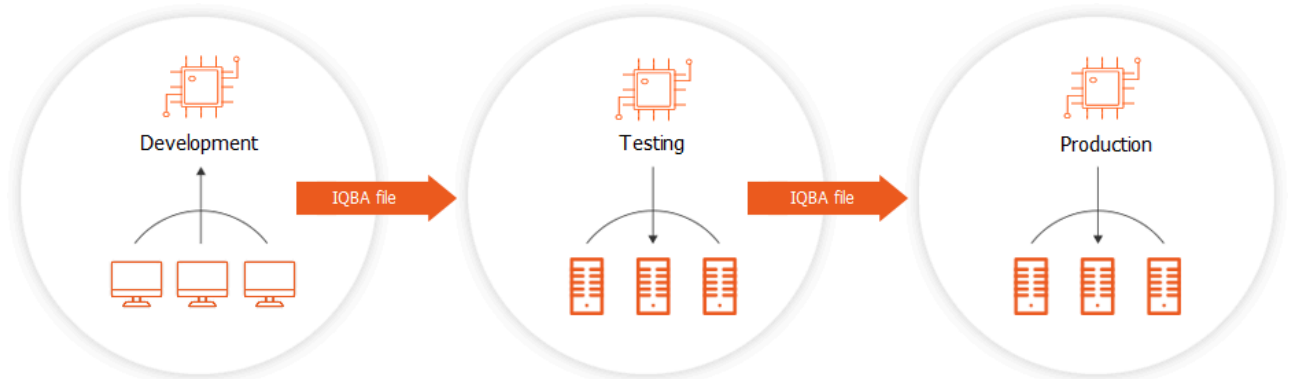

- In staging, you can upload a maximum of 150 documents of 10 MB file size per learning instance.
- In production, you can upload a maximum of 50 MB file size per document. However, the maximum number of documents allowed per learning instance depends on the license.
- There are no limitations on the number of pages per document in a pdfbox OCR.
- You can upload 60 pages per document in an image-based OCR.
- With the Tesseract4 OCR, there is a known limitation that restricts the number of pages per document to fewer than 60 pages.

The learning instance lifecycle

The staging and production modes are independent from the IQ Bot environment when it comes to the traditional DevOps workflow of separate development, testing, and production environments. A learning instance can be in either mode in any of the environments in the development life cycle.

Note: When you transfer a learning instance, it remains in the mode in which it was exported. For example, if you export a learning instance in staging mode from the development environment and import it to the testing environment, the learning instance will still be in staging mode and it will not perform document processing automatically.

The following image shows the typical lifecycle of a learning instance:

You can transfer learning instances across environments by using the Migration Utility. This helps you to avoid having to recreate similar learning instances and better manage the lifecycle of the associated bots. To learn more, see [Migrate learning instances](#) on page 1664.

Rotate the external key

The Control Room supports using CyberArk to store keys for encrypting and decrypting IQ Bot data. A user with the **AAE_IQ Bot Admin** role can change the object name in IQ Bot to start the key rotation process.

- The IQ Bot must have been connected with CyberArk during installation. See [Installing IQ Bot in Custom mode](#) on page 1380.
- Update the password in the CyberArk vault to generate the new key. Note the new key name because you will provide it in IQ Bot.

1. Navigate to **Administration > Key rotation**.

Most of the fields in the **Key rotation** page are auto-filled with the connection details you provided during installation.

2. In the **Object name** field, provide the new key name from CyberArk.

3. Click **Rotate key**.

The IQ Bot retrieves the new key from the CyberArk vault and encrypts data with this new key. When the encryption process completes, a success message appears.

If the encryption process is not successful, use the key rotation synchronizer to recover from the error.

Use the IQ Bot Validator

Use the Validator to manually validate documents from which IQ Bot could not extract data.

When IQ Bot processes documents in a learning instance that is in production mode and encounters one of the following scenarios, IQ Bot sends that document to the Validation queue.

- Data is not readable, such as blurry text or dark background.
- Data is missing from a required field.
- Document failed an automated processing rule.
- Fields did not meet the set optical character recognition (OCR) confidence threshold.

Note: To learn more about how field-level OCR confidence can be used to improve the quality of STP output, see [Improve output quality using OCR confidence](#) on page 3570.

A user with the **AAE_IQ Bot Validator** role opens the Validator window, where they correct the flagged fields.

Once all the fields in the document are corrected, IQ Bot finishes processing the document and exports the data to a .CSV file in the Learning Instance success folder.

Note: If a document required manual validation, it is excluded from the straight-through processing (STP) metric. For more information on the dashboard metrics, see [Review the dashboard](#) on page 3601.

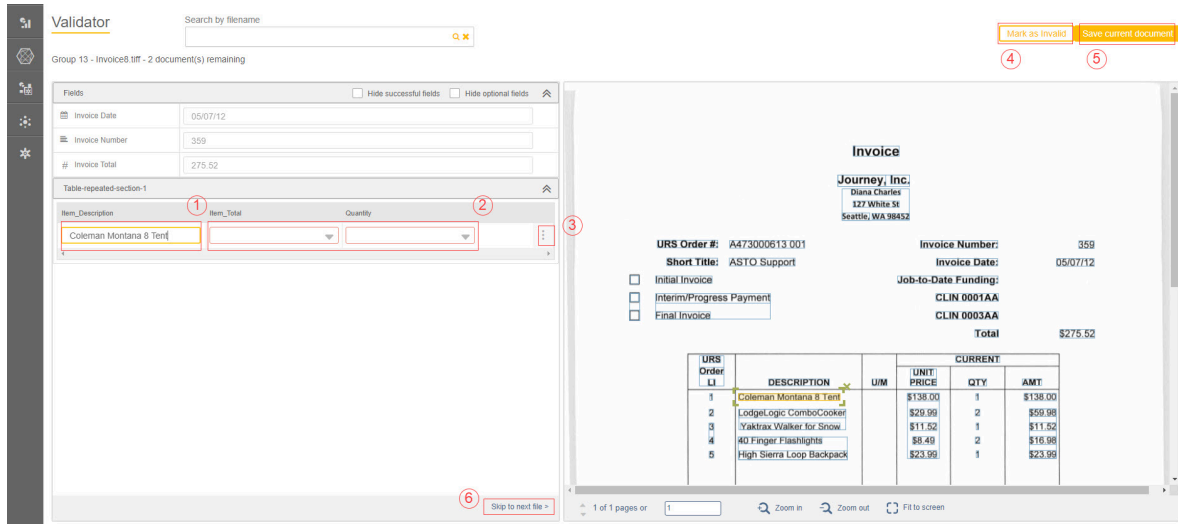

As you work on a document in the Validator queue, if you leave the Validator queue or log out of IQ Bot, the lock on the document is released, allowing other users to access or validate the document.

Validator interface overview

The Validator interface opens with the first document from the validation queue. The data requiring validation distinguished with red text or outlined in red boxes.

Note: An empty page with a notification message appears in the following scenarios:

- If no files are available in the validation queue.
 - If a file does not exist in the validation queue.
 - If another user is working on the remaining file in the validation queue.
-

1. Provide the values for fields IQ Bot could not extract

Click the empty text field, then select the blue-bordered box in the document that contains the data to extract. After you select a box, the data is highlighted in yellow and a green outline appears, which you can resize or reposition to include all the data that you want to extract.

2. Fields awaiting validation are outlined in red

In the example above, the table fields **Item total** and **Quantity** require manual entry.

3. Add or delete a row

To insert or delete a row, hover over the ellipses to show the icons for adding or deleting table rows.

4. Mark document as invalid

Removes the document from the validation queue and saves a copy of the document to the Invalid folder. Click here to mark a document as invalid, then select from the following reasons:

- Fields missing
- Tables missing
- Wrong values

5. Save current document

After you have validated all the fields, click here so IQ Bot can finish processing this document.

6. Skip to next file

Skip a file without correcting the errors in the current document.

Linked tables in the Validator

Some pages in a document might contain more than one table. When there is a relationship between the tables, such as in the example page below, where a parent table contains patient information and child tables contain additional information related to that patient, these are called linked tables.

In the example page below, the red box outlines the parent table and each of the blue boxes outline a child table.

Patient Name: Irrfan Khan Member ID: IQ_Bot0001 Date of Birth: 07 Jan 1967 Provider Name: Cognitive		Patient Account No: AASPL_3100 Claim ID: Cognitive_123XXX Claim Status: PAID					
Gender: <input checked="" type="radio"/> Male <input type="radio"/> Female <input type="radio"/> Other		Type of payment: <input type="checkbox"/> Cash <input type="checkbox"/> Cheque <input checked="" type="checkbox"/> Bank Account					
Line	Date of service	Rev Code	Units	Billed Amount	Allowed Amount	Discount /Penalty	N
1	02/02/18	0211	1	100.00	100.00	0.00	10
2	03/02/18	0221	5	500.00	500.00	0.00	50
3	03/02/18	0200	3	300.00	300.00	0.00	30
Claim Totals			9	900.00	900.00	0.00	90

Payment Mode (If Bank Account):

Net Banking

Debit Card

Credit Card

Type of Card (Only for Debit or Credit card) Payment:

Master Card

Visa Card

◆ Paid

To successfully validate a page with linked tables, add the fields from the child tables to same **table-repeated** section as the parent table.

If shared fields between the linked tables do not match values, the Validator does not let you complete validation and save your changes. This functionality helps avoid manual validation errors that can occur when there is a mismatch of field values between the parent and child tables. The Validator shows an error message and prevents the save.

Note: In Validator, if you mark an already corrupted document as invalid then that document is lost in the IQ Bot system. Instead, you will see a placeholder image and you must refresh the page to go to the next document. This applies to single page as well as multi-page documents. When the entire multi-page document is deleted or corrupted, you will not be able to navigate between the pages. If you click the next page button, then the Loading document screen is displayed.

Using the Validator

Open the Validator user interface from the **LEARNING INSTANCES** tab. If a learning instance contains documents that require validation, there will be a document icon with a red exclamation mark in the Actions column. Click the document icon to launch the Validator.

Note: Only users with an assigned Validator role can view the Validation page. For more information, see [IQ Bot user personas and roles](#) on page 3543.

Review the dashboard

The dashboard summarizes the performance report and provides document processing information in a graphic format.

The report appears when you log in to the IQ Bot. The information shown consists of: document classification, straight-through processing (STP), accuracy, and human validation for information on actions for a specific learning instance so you can focus on areas that require attention.

The IQ Bot dashboard is divided into two primary areas:

- **My Totals**
- **My Learning Instances**

My Totals area

My totals is a display area of the Dashboard that provides a quick overall view of the status of all learning instances in the Production environment.

View the following information in the **My Totals** area:

- Documents Processed: The total number of files processed in the production environment.

Note: If a file is corrupt and cannot be opened, it is not included in this count.

- Pages purchased: The number of pages purchased in the current license period.

For example, if 4000 pages were purchased before Dec 31, 2020 and another 20,000 pages were purchased between January 1, 2021 and February 28, 2021, the pages purchased metric shows a count of 20,000 pages, not 24,000. This is because 4000 of the pages were purchased before the license validity period.

Note: This metric is visible only to users with the **AAE_IQ Bot Admin** role or a custom role with the **View administration** permission.

- Pages uploaded: The number of pages uploaded to a learning instance in the production environment in the current license period. When the license is renewed, the value reverts to zero.

This metric is different from the documents processed metric because one document can contain multiple pages. Additionally, the metric count includes pages that were uploaded but have not completed processing.

The number of pages uploaded is refreshed every time the Control Room license is renewed. So, the Pages uploaded shows the pages uploaded or processed in the current license period. The Documents Processed count remains unaffected.

Note: In releases prior to Automation 360 v.23, this metric reflected the number of pages uploaded to learning instances in the production environment from the time of IQ Bot installation.

- Straight-through processing (STP): The percentage of total number of uploaded files that were successfully processed without manual intervention.
- Accuracy: The field accuracy, which is a percentage value of fields that have been accurately identified. This includes fields whose Optical Character Recognition (OCR) confidence levels exceed the confidence threshold that were set.

My Learning Instances area

View details of learning instances you have created that are in the Staging and Production environments.

View information for learning instances in the staging environment:

- Name of the learning instance
- The domain or type of documents. For example, invoices and receipts.
- Number of documents in the learning instance
- A graphical representation of trained documents showing the details in percentages

View information for learning instances in the production environment:

- Number of files processed
- Straight-Through Processing (STP) percentage of files that were successfully processed without manual intervention
- Field accuracy in percentages

Important: Sometimes, the number of documents in the Dashboard and in the Learning Instance summary page do not match the number of documents submitted for processing. This can occur when documents are classified into groups that are not in production. Documents in this category are not processed (by design), leading to a mismatch between the number of processed documents and the number of total documents. In such a case, if these groups are moved to production, the total numbers of documents will match.

Performance report page

The performance report page displays the details of a learning instance in the production environment.

Navigate to **My learning instances > Production** button to view the **Performance report** page showing details of all learning instances in the production environment.

Note: The **Performance report** page is not available for learning instances that are in the staging environment.

The top right corner of the performance report page displays the percentage of bots trained for the learning instance. The following is an example of how to interpret the percentage information.

Cathy has uploaded 10 documents and has created three bots for the learning instance:

- Bot1
- Bot2
- Bot3

Of these, three documents are a part of Bot1, four documents of Bot2, and three documents of Bot 3. When Cathy sets Bot1 into the production environment, the label displays 33% as the percentage of bots trained for the learning instance, which means that 3 out the 10 (33%) uploaded documents (for Bot1) have been trained.

Performance report details

In the **My learning instances** area, click any displayed information to bring up the **Performance report** page. The following sections describe the information for each displayed section of the performance report.

Instance totals and Processing results

The instance totals and processing results area shows the following information for a learning instance:

- Number of files uploaded for the learning instance – total number of files uploaded that need to be processed.
- Number of files processed for the learning instance - number of files that was processed by a bot.
- Number of files successfully processed for the learning instance – includes files that were successfully processed by a bot without human intervention.
- Number of files sent to validation for the learning instance – files flagged with one or more errors that need human intervention for review.
- Number of files validated for the learning instance – number of files that were reviewed by an individual and the results were saved.
- Number of files marked as invalid for the learning instance – number of files that were reviewed by an individual and marked as invalid.

Classification results

The Classification area provides a statistical display of the field representation graphically.

Accuracy results

The Accuracy area provides a graphical representation of the field types.

Validation

The Validation area provides the following information:

- A statistical representation of the corrections made to individual fields during the process of validating a document.
- A statistical representation of the average time spent to validate a group.

Custom domains in IQ Bot

A domain contains information about the language of the documents and the data fields that the system extracts from the documents. The IQ Bot environment includes seven domains; users with the **AAE_IQ Bot Admin** role can also create and import custom domains to the **Domains** tab.

If your documents contain specialized fields, you can create a custom domain with these fields to make learning instance creation quicker. Otherwise, the learning instance creator must manually define each specialized field, every time they create a new learning instance.

For example, for documents from the pharmaceutical industry, you might add fields like prescription name, dose, or delivery format to the custom domain. Likewise for financial industry documents, you might add fields for margin, call price, or limit order.

The **Domains** tab displays all available domains for use in the system and their associated languages. Besides out-of-box domains offered by IQ Bot, you can also create a custom domain and import it into IQ Bot.

[Create a custom domain \(A-people login required\)](#)

For information on creating a custom domain, see: [How to create a Custom Domain](#)

When creating a learning instance using a custom domain:

- The languages assigned to the domain when creating the domain is displayed and is available for selection from the **Primary language of documents** drop-down list.
- The fields that were selected when creating the custom domain are displayed in the **Fields to extract** section of the create **New instance** page.

You can import or export a domain using the **Import** or **Export** option in the **Domains** tab.

Note: Domains are created and saved with the `.dom` extension in the system.

Tip: Troubleshoot classification issue with Chinese language documents:

[Classification issue with Chinese Invoices \(A-People login required\)](#)

Import a domain

You import a domain for the following scenarios:

- Import a new domain.
- Import an existing domain from another system to your current system.

When you are ready to import a domain into your system:

1. Go to the system where you want the domain to be imported.
2. Click **Import new domain** in the **Domains** tab and select the `.dom` domain file in your local machine that you want to import.

The domain import success message is displayed in the **Domains** tab.

The imported domain appears for the selection in the **Document type** drop-down list of the create **New instance** page and is displayed in the domains list in the **Domains** page.

Export a domain

When you click the **Export** option next to a domain, it is exported to an output folder on your local drive. The exported domain is encrypted and is created with a `.dom` filename extension.

You export an existing domain from one IQ Bot system to import to another.

To export a domain from your IQ Bot system, do this: In the **Domains** list page, click the **Export** option next to the domain you want to export.

The system displays a success message for the exported domain.

The file is exported to a local output folder on your machine with a `.dom` filename extension.

Note: The domain files are encrypted for security.

Current limitations to the domain import and export actions

Important: Import or export of domains is independent of the migration action in the Migration Utility feature.

When you migrate learning instances that were created using a custom domain from one system to another, the field names and IDs must be the same in the target machine as well. Otherwise, even though the learning instances are imported, the custom domain will not be imported and the associated field names and IDs for the custom domain will not work in the imported learning instance. If you run the imported learning instance on documents, the documents will not be classified.

Even if you import the custom domain to your new system, the field names and IDs will still not match as these are automatically generated by the system. Hence classification will fail. This is the current limitation of the Migration Utility feature using a custom domain.

Workaround: First import the `.dom` file to the target machine, then migrate the learning instances. Move all learning instances to the staging environment, and test them before moving the learning instance to the production environment.

Custom domain enhancements

Import custom domains in any order

When you migrate learning instances (created using a custom domain) from the staging server to the production server, migration fails unless you import the different versions of the custom domain in the same order as they were created.

As the capability to edit a custom domain to add additional fields and aliases was not available, the user had to create a new domain and add the additional fields and aliases to it. Then the user had to assign that new domain to the learning instance. So when the user wanted to use the new domain, they had to re-import the original and the new domain to the production server in the order they were created in.

[Importing custom domain to IQ Bot production \(A-People login required\)](#)

From release Automation 360 Build 5322, this restriction does not exist.

- You can edit and update an existing custom domain multiple times, and import them to the production server multiple times as well.
- You can import the custom domains in any order. The system successfully migrates the updated fields (form or table), and field aliases (variations of field values found in the training documents, associated with a field) to the production server.

Important: Perform all edits or updates to a custom domain in the staging server before importing it to the production server to avoid errors.

IQ Bot performs document classification based on the defined fields and aliases of the version of custom domain used when the learning instance was created.

Editing the same custom domain (with additional fields) changes the version of the custom domain. For new learning instances created using the new version of the custom domain, classification occurs on the updated fields as well. The edited fields (whether form or table fields) are displayed in the learning instance with a double asterisk next to them to help identify them.

Using IQ Bot for standard forms

Standard forms are fixed format type documents that usually contain a large number of fields with very little or no variation in the overall layout, which can include both hand-written and digital content. IQ Bot enables you to extract data from standard forms.

Some examples of standard forms are W-4 (Employee Withholding Certificate), income tax form, sale deed and partnership agreement. You can extract data from standard forms by customizing and building a model before setting it up in IQ Bot. A machine learning model is a file that can be trained to recognize certain types of patterns from documents. You can use a sample document with a set of data to train a model to recognize patterns.

Based on the associated role or permission defined by the Control Room administrator, you can then create a learning instance using a model for extracting data from standard forms.

Note: Users must have the Standard forms pages product license to upload documents for processing. For more information, see [Automation 360 licenses](#) on page 1347.

The following workflow describes the various stages and procedures for setting up data extraction from standard forms:

1. Evaluate your use case for standard forms.

[Evaluate your use case](#) on page 3608

- 2.** Review the type of standard forms extraction service that fits your requirement.
[Review extraction service](#) on page 3610
- 3.** Review the service implementation prerequisites.

Evaluate your use case

Content extraction models can be integrated into IQ Bot for extracting data from specific type of documents.

Before you proceed further with standard forms, evaluate your use case to determine if the content extraction from standard forms suits your requirement. Use the following questions as a guide to determine whether your use case needs Standard forms processing

What are standard forms?

Fixed format type documents that have a defined template, with very little or no variation in the overall layout. Standard forms are also known as structured documents, are generally characterised by high density of information, and are typically official or legal forms. The following table illustrates some examples of standard forms:

Does the layout of your documents vary across vendor?

If yes, then this use case for content extraction using standard forms is not the best option.

Are the positions of the various data elements (checkboxes, tables, and so on) fixed in your documents?

If no, then these are not standard forms and this type of content extraction is not suitable.

Is the document a dynamic form? For example, you have documents where the values depend on other data elements.

If yes, then content from such documents cannot be processed using standard forms content extraction.

Is the document in a supported language?

See [Azure Form Recognizer Supported Languages](#). If no, then the document cannot be processed as a standard form.

Does the documents have repetitive sections?

If yes, then this is not a standard forms use case. However, if there are a fixed number of such repetitive sections that do not vary between documents, then it can be processed as a standard forms.

Does your documents contain tables that have a different number rows and columns?

If yes, then these documents cannot be considered as standard form. The number of rows and columns have to be fixed for standard forms.

Can document layouts that vary per year be considered as standard forms? For example, a

If the document layout does not vary within the same year or vary across organizations, then it can be considered as standard forms. If there

W-4 document in 2020 and W-4 document in 2021? are layout variations across years, then different standard form models must be used to process these documents.

Review extraction service

After you have confirmed that the documents you want to extract content from are standard forms, you can then plan the type of standard forms extraction service that fits your requirement.

The following technologies are available for processing standard forms:

IQ Bot extraction service

This is a template based extraction service that uses OCR and heuristics to extract content from standard forms. You have to train one template per standard form.

Guidelines for using IQ Bot extraction service

- Documents are of good quality (300 dpi)
- Document content is not very dense
- Input documents do not have any handwritten copies (limited support)
- Signatures are currently not supported
- Contains simple table layout (span within a page) with clear header, table boundaries, and so on
- Does not contain any tables or content that have checkboxes (limited support)
- Does not have any repeated sections (limited support)

Benefits of IQ Bot extraction service

- An integrated and simple out-of-the-box setup
- Various OCR engines to increase accuracy of extraction
- Complex layouts (repeated sections, continuous tables etc) can be extracted for specific cases (needs testing)
- Only requires IQ Bot license

Microsoft Azure Form Recognizer service

Third party technology, that provides custom built Artificial Intelligence (AI) models to extract content from standard forms. You can create custom models where documents can be labelled and trained.

Guidelines for using Microsoft Azure Forms Recognizer service

- Input documents:
 - can be dense (contain lot of details and information) and have a reasonable quality (>200 dpi)
 - can contain checkboxes and radio buttons
 - can have handwritten content
 - can contain signatures
 - can contain tables

The input documents can also contain tables that span over a single page. However, if the standard forms contain table that span across multiple pages, the content extraction can fail.

- None of the sections in the input documents are not repeated
- Documents that contain transpose tables

Benefits of Microsoft Azure Forms Recognizer service

- Diverse standard form type documents can be processed
- Auto detection feature can identify different types of tables such as header-less table, inverted tables, and so on
- Good support for handwritten forms

Review implementation prerequisites

After you have finalized the type of extraction service that suits your requirement, ensure that you review the prerequisites before proceeding with the implementation of the service.

IQ Bot extraction service

Review the operating system and database compatibility, database information, and various hardware and software requirements as part of prerequisites for using IQ Bot extraction service.

See [IQ Bot system requirements](#) on page 1370.

Microsoft Azure Form Recognizer service

Review the prerequisites of Microsoft Azure Form Recognizer service installation for standard forms.

- Cloud setup and installation
No additional configurations are required. However, based on the page processing volumes, the Transactions Per Second (TPS) must be increased for the Microsoft region where your service is running. Contact your Customer Success Manager (CSM) or Partner Enablement Manager (PEM) with the expected page volume and Microsoft region where the service is running to update the TPS.
- On-Premises setup and installation

[Pre-requisite for Azure Container on-prem installation for Standard Forms \(A-People login required\)](#)

Considerations for optimum performance

Review the considerations to capture the performance metrics of IQ Bot standard forms with a new Model containing more number of forms or table fields.

Test summary

- Performance test was run for 10000 COVID Form documents (two pages per document = 20000 pages) on a single node IQ Bot server using a single Bot Agent (using IQ Bot Extraction package). This test was conducted to benchmark the performance metrics such as processing time, Straight Through Processing (STP), validation, and documents processed (#successful processed pages/documents and #failed pages/documents).
- New Model (WalgreenComplete 3260b299-68b5-4118-87df-b313bd5c30f6) with 26 Form Fields & 8 Tables fields are trained and used for extraction.
- With new Model (WalgreenComplete 3260b299-68b5-4118-87df-b313bd5c30f6), all the documents were moving to validation during extraction. To get STP we marked below 5 fields as optional for this test: A2PatientSign, B2Date, B2Sign, Phone, InsuranceCard(Table)->Card Details.
- Total time take to process 20000 pages using single Bot Agent was 25 hours, 21 minutes, & 42 seconds. This was based on IQ Bot On-Premises Build 12350.
- Average time take to process single page using IQ Bot Extraction package on single Bot Agent is approximate 4.56 seconds.
- Achieved STP: 100% and Accuracy: 100%.
- During our test execution, the requests were served by Microsoft standard forms services hosted in us-west2 region.
- As confirmed, Microsoft team TPS (Transactions Per Second) supported by us-west2 region was 100 TPS

Note: KPI (Key Performance Indicators) like processing time, STP, accuracy might vary based on the regions where Microsoft standard forms service is hosted and its transactions per second (TPS) rate.

Infrastructure configurations

The following table lists the infrastructure configurations:

Server	Parameters	Values
Server 1 [Web Server]	Control Room	Windows Server 2019 → 8vCPU, 16 GB RAM, 512 GB Disk [Rackspace Platform]-uee
Server 2 [Database]	Database	Windows Server 2019 → 8vCPU, 16 GB RAM, 512 GB Disk [Rackspace Platform]
Server 3 [Application Server]	IQ Bot	Windows Server 2019 → 8vCPU, 16 GB RAM, 512 GB Disk [Rackspace Platform]

Server	Parameters	Values
Server 4 [Client]	Bot Agent	Windows Server 2019 → 4vCPU, 8 GB RAM, 256 GB Disk [Rackspace Platform]

Product configurations

The following table lists the product configurations:

Parameters	Values
Automation Anywhere Enterprise	Automation 360 Build 12313
Bot Agent	21.80.10273
IQ Bot	A360.24.28441-20220311
IQ Bot Extraction package	1.0.0-20220307-024320
Database	Microsoft SQL Server Developer (64-bit)
Protocol	HTTPS
Network services	Non-Active Directory

Data configurations

The following table lists the data configurations:

Parameters	Values
Domain	Standard forms
Provider	Forms Extractor Type 1
Model	WalgreenComplete 3260b299-68b5-4118-87df-b313bd5c30f6
Document Type	Multi page PDF document
Pages	Two pages per document
Form Fields	26 [A2Date, A2PatientSign, Address, Age, B2Date, B2Sign, City, DOB, Email, FirstName, LTCFName, LastName, Phone, PrintName, Race-American, Race-Asian, Race-Black, Race-Native, Race-Other, Race-UnableToReport, Race-Unknown, Race-White, RefusedInformation, State, VaccinationType, Zipcode]

Parameters	Values
Table Fields	8 tables, 23 table fields Table1: DriversLicense[Issuance, LicenseNo]Table2: Ethnicity[Hispanic, NotHispanic, UnableToReport, Unknown]Table3: Gender[Female, Male]Table4: InsuranceCard[Card Details, Medical Card, Pharmacy Card]Table5: MedicareDetails[Medicare, Medicare PartB]Table6: PatientCardHolder[DontKnow, No, Question, Yes]Table7: PatientType[Resident, StaffMember]Table8: ScreeningQuestions[DontKnow, No, Question, Yes]
Configuration	COVID forms
# of Documents	10000
# of Pages	20000
Language	English

Test results

The following table lists the test results:

Parameters	Values
Total Documents Uploaded	10000
Total Pages Uploaded	20000
Total Processed documents	10000
Total Processed pages	20000
Success	10000 documents
Pending Review (Validation)	0
STP	100%
Accuracy	100%
Processing Time	25 hours, 21 minutes, and 42 seconds

Resource consumption data

The following table provides the resource consumption data:

Parameters	CPU Utilization in %	Memory Utilization in %
IQ Bot	Average: 3.4 Maximum: 26.8	Average: 70.9 Maximum: 78.9

Parameters	CPU Utilization in %	Memory Utilization in %
Control Room	Average: 1.4 Maximum: 14.5	Average: 83.3 Maximum: 84.8
Database	Average: 3.3 Maximum: 20.6	Average: 91.5 Maximum: 94.1
Bot Agent (Extraction)	Average: 4.8 Maximum: 48.9	Average: 52.4 Maximum: 58.7

Set up extraction service

To extract content from standard forms, you must setup and configure an extraction service. Review this topic to understand how to setup each of the extraction service.

IQ Bot extraction service

No specific setup is required for content extraction through IQ Bot service. Ensure that you have access to an active IQ Bot environment so that you can create a learning instance.

See [Create a learning instance](#) on page 3554.

Microsoft Azure Form Recognizer service

1. Subscribe to Microsoft Azure service

Microsoft provides the Azure Form Recognizer service. This service enables you to build automated data processing software that can identify and extract specific content from documents. You must have Microsoft Azure subscription in order to access Azure resources (OCR, Form Recognizer), Automation Anywhere provides access to these resources through its subscription. Contact your Customer Success Manager (CSM) or Partner Enablement Manager (PEM) who will help you setup the services.

[Request access for Microsoft Azure resources \(OCR and Form Recognizer\) \(A-People login required\)](#)

2. Setup Microsoft Azure Form Recognizer service

a) For Cloud deployment

- If you have Automation Anywhere subscription, no additional configurations or changes are required.
- If you have Microsoft Azure subscription, review the following article to setup and configure your Microsoft Azure Form Recognizer for extracting content from standard forms.

[Setup Azure Form Recognizer and Storage \(Cloud\) \(A-People login required\)](#)

b) For On-Premises deployment

Configure IQ Bot for extraction service

IQ Bot must be connected to the extraction service for processing standard forms. The following section provides details on how to configure IQ Bot for the selected extraction service. However, your IT Service team can help you setup and configure the extraction service in IQ Bot.

IQ Bot extraction service

If you choose IQ Bot extraction service, no additional configurations are required.

Microsoft Azure Form Recognizer service

If you choose the Microsoft Azure Form Recognizer service, you must add Microsoft Form API and the corresponding configurations in IQ Bot.

[How to Setup and configure standard forms in IQ Bot \(A-People login required\)](#)

Create the model in Document Automation

In Automation 360 v.26, you can configure the extraction model in the Control Room:

[Create standard form in Document Automation](#) on page 3522

Build extraction model

Data extraction model typically leverages Artificial Intelligence (AI) and Machine Learning (ML) technologies to accurately extract text, key-value pairs, and tables from documents.

IQ Bot extraction service

Requires no separate AI model as this will be done as part of creating and training a learning instance in IQ Bot.

See [Create a learning instance](#) on page 3554.

Microsoft Azure Form Recognizer service

During your use case evaluation, Microsoft Azure Form Recognizer models can be created by Sales Engineering. But for any production deployment, contact Professional Services, or Partner Enablement Manager (PEM) at Automation Anywhere.

[How to Create and train Azure Form Recognizer model \(A-People login required\)](#)

The benchmarks for the time taken for labeling fields in the Microsoft Azure Form Recognizer service are as follows:

- Up to 30 fields: 1 hour
- 30 to 100 fields: 2 hours
- 100 to 400 fields: 4 hours

Note: While creating a model, ensure there are no duplicate model names. And while creating a table, ensure that the table name does not contain a space. For example, `Sales chart.xls`.

Transfer third-party extraction service models

Third party extraction models can be transferred from one subscription to another. Contact your Automation Anywhere Customer Success Manager (CSM) for assistance.

IQ Bot extraction service

If you are using IQ Bot extraction service, no changes required.

Microsoft Azure Form Recognizer service

- Transfer models from one On-Premises to another On-Premises environment.
[Transfer models from one environment to another \(On-Prem\) \(A-People login required\)](#)
- Transfer models from one Cloud to another Cloud environment.
[Transfer models from one environment to another \(Cloud\) \(A-People login required\)](#)

Note: You can transfer standard forms learning instance along with an associated model between your IQ Bot instances using API configurations. For more information, see [Transfer standard forms learning instance and associated model \(A-People login required\)](#)

Create a learning instance for standard forms

Learning instance is used in IQ Bot to extract, train, validate content from standard forms. Use the following instructions to create a learning instance for processing standard forms in IQ Bot

Using IQ Bot extraction service

Ensure that you have access to an active IQ Bot environment so that you can create a learning instance.

See [Create a learning instance](#) on page 3554.

Using Microsoft Azure Form Recognizer service

1. From the **Document type** drop-down menu select **Standard Forms**.
2. In the **Standard form settings** tab, from the **Provider name** drop-down menu, select a provider for processing the form.

3. From the **Configuration type** drop-down menu, select the supported configuration.
This enables you to connect to one of the provider services configured during installation.
4. From the **Select Model** drop-down menu, select a pre-trained model for the selected configuration.
5. Click **Browse** to upload a reference document.
For example, if you have selected the configuration type and model as invoice, you can upload an invoice file that must be analyzed.

Note: The reference document is only a representation of the document type you want to extract data from.

6. From the **Fields to extract** tab, select the fields from where the values must be extracted.
The fields are displayed based on the selected Form set in the pre-trained model, and no additional fields can be added.
7. Click **Create instance and analyze**.
The system analyzes and sorts the document into logical group.

Note: Only one default group is created. The system-identified region (SIR) are not visible and all the training related fields are greyed out. As the standard forms learning instance contains pre-trained model, no additional training of the group is available. You can only add validation patterns and custom logic.

After you have created a learning instance, you must add a group specific to standard forms.

8. On the **Learning Instance details** page, click **Add group**.
9. Create group label as <Standard Forms layout name>.
For example, if you have W-4 documents for the year 2021, enter W4_2021.
10. Click **Save**.
11. Open the system generated group
12. Click **Delete Bot**.
System generated group is removed from the **Learning instance details** page

Edit a standard forms learning instance

As the learning instances created by using standard forms have pre-set configurations, you can edit only the name and the description. Also, you cannot edit instances in the production environment without moving them to staging.

Note: If you want to change the model associated with a learning instance, you must create a new model and follow these instructions:

1. Create another learning instance similar to the previous one.
2. Associate the new model with this learning instance.
3. Select all the fields you had selected in the previous learning instance.
4. Update the validation rules.

5. Move the learning instance to production and associate a bot with this learning instance.

-
1. On the **My learning instances** page, select the learning instance you want to edit.

You can also use the **Search** bar to locate the learning instance.

2. Click **Edit**.

3. Edit the name of the learning instance in the **Instance name** field.

The document classification options are not available as the standard forms use a pre-trained model and configurations.

4. Optional: Use the **Document Groups** tab to review the groups associated with the learning instance.

Note: The **Add group** button is not available as adding groups is not supported for a standard forms learning instance.

5. Optional: Click the **Summary** tab to review the learning instance.

Standard Forms details such as **Provider**, **Configuration**, and **Model** are available under this tab.

6. Click **Save**.

Changes made to the learning instance are updated on staging.

Define validation rules for standard forms learning instance

To prevent wrong or invalid data extraction, you can edit the bot associated with any standard forms learning instance and customize the validation rules.

You can only edit a bot on staging. So ensure that you move any bot that you want to edit to staging if it is in production.

Using IQ Bot extraction service

Use IQ Bot Designer to train a learning instance and extract content from sample documents. Review each field to ensure the correct value is extracted and where necessary, map the correct field.

For more information, see [Train a learning instance](#) on page 3564.

Using Microsoft Azure Form Recognizer service

1. On the **Bot** page, select the bot you want to edit.

You can also use the **Search** bar to locate the bot.

2. Click the **Edit Bot** icon.

3. In the **Field** column, click **Field options**.

4. Enter any custom validation rules in the fields under the **Validate Pattern** tab.

Documents that are not processed are moved to the **Validator**, and fields with errors are flagged. You can review the flagged fields in the Validator.

[Use the IQ Bot Validator](#) on page 3597

5. Enter post processing logic under the **Logic** tab, and click **Save**.
6. Click **Save**.
The updated bot is saved on staging and you can move it to production.

Upload documents for standard forms learning instance

Upload your documents to IQ Bot for an existing standard forms learning instance for content extraction.

For extracting content from a single document, use the **Upload Document** action from IQ Bot package in Automation Workspace.

See [Upload document action](#) on page 2654

For content extraction from multiple or large number of documents, you can use the **Process documents** action from IQ Bot Extraction package in Control Room. Use the following instructions to upload multiple or large number of documents:

1. Drag the **Process documents** action into the workflow.
2. Click the **Learning instance name** drop-down menu and select a standard forms learning instance.
3. In the **Desktop folder** tab, enter the file path for the input folder or click **Browse** to select it.
4. Select the output folder from the **Output folder path** field.
5. Select the **Send documents to IQ Bot Validator for validation** check box.

Although the documents are processed using Bot Runners on your local machine, you must use this option if you want to validate the documents in the Validator

6. Click **Save**.

Download extracted content

After you have trained learning instance, use the **Download all documents** action from the IQ Bot package to download extracted content from standard forms.

1. Drag the **Download all documents** action from the **IQ Bot** package.
2. Click the **Learning instance name** drop-down menu and select a standard forms learning instance.
3. In the **Local output folder** field, provide a path to your local folder where you want to extract the content.
4. In the **IQ Bot Document status**, select the appropriate status for the documents:
5. Select **Delete files from the server after downloading** check box if you want to remove the files from IQ Bot server.
6. In the **Save the response to a variable** field, add a variable.

A variable value in this field provides information if the download was successful or the reason for a failure.

7. Click **Save**, and run the bot.
8. Navigate to the local output folder to review the downloaded files.
The output folder can have up to three subfolders:

- **Retrain:** Contains documents that were sent for validation.
These documents are stored in their original input format and you can train them by uploading them to your existing learning instance.
- **Success:** Standard form documents that have been processed successfully.
The output is a `.json` file. Tables in the input documents are auto extracted and saved as separate `.xls` file with the table name.
- **Validate:** Contains documents that require validation.
These documents will be available in the IQ Bot Validator and you can download the output separately.

Note: Depending on the content in the uploaded documents, you can also get the following additional subfolders:

- **Failed:** Documents that failed the validation process.
 - **Unprocessed:** Documents that could not be classified.
-

Transfer standard forms learning instance

A standard forms learning instance is similar to the regular IQ Bot learning instance that describes the data in a single document type, for example an invoice. It contains information such as the language used in the documents and the fields to extract.

- Ensure that the source and destination systems are running the same IQ Bot version. Learning instances from different IQ Bot versions cannot be imported because their database schema will not match.
- Back up your database before importing learning instances.
- Export the `.iqba` file from the source IQ Bot environment.
- Import the `.iqba` file into the destination IQ Bot environment

Related concepts

[Manage learning instances](#) on page 3595

A learning instance is an IQ Bot structure that describes the data in a single document type, for example an invoice. It contains information such as the language used in the document and the fields to extract.

Export a standard forms learning instance

Standard forms learning instance can be used across similar IQ Bot environments. Export an existing learning instance to avoid creating another one with the same configurations.

IQ Bot administrator can use the following instructions to edit a standard forms learning instance:

1. Click **Administration > Migration**.
2. Click **Create Backup**.

Backing up your existing learning instance enables you to save and restore the configuration if required.

3. Select the learning instances that you want to back up and then click **Backup**.
4. Enter a name for the IQ Bot archive (IQBA) file.

The name of the archive file is appended with a time stamp to make it unique. You can download this file and export it to the target environment.

5. Click **Backup** to begin the export process.

The exported data file with the `.iqba` extension is available in the `BackupData` folder in your IQ Bot output directory.

Import a standard forms learning instance

Import an existing learning instance from a similar environment to avoid creating learning instances and associated bots multiple times. Use the Automation 360 IQ Bot Migration Utility feature to import any standard forms learning instances.

Ensure that you have migrated the associated configuration to the target server before importing a learning instance.

When you export an `.iqba` file, only a single document associated with every available bot (Group) training is exported.

1. Log in to IQ Bot as an administrator.

2. Click **Administration > Migration**.

A list of backed-up learning instances is displayed.

3. Click the **Import** icon under the **Actions** tab for the selected learning instance.

4. Select the import method, and click **Accept**.

The selected standard forms learning instance is imported and is displayed under in **My learning instances** page.

Process Discovery

Process Discovery is a data-driven approach to analyze, monitor, and improve business processes by extracting insights and knowledge from the user interactions with various systems. It uncovers the actual flow of activities, decisions, and interactions that occur within an organization's processes.

Process Discovery drives organizational efficiency, cost reduction, and enhanced quality control. This approach fosters insights into process operations, pinpointing areas for enhancement like automation, workflow streamlining, and step elimination. Leveraged in process improvement, compliance, and risk management endeavors, Process Discovery proves invaluable.

Components

The Process Discovery platform is used in combination with the Process Discovery Sensor and Privacy Enhanced Gateway (PEG) applications to streamline data capture, analysis, and process modeling.

Process Discovery Platform

The Process Discovery platform is used in combination with the Process Discovery Sensor and Privacy Enhanced Gateway (PEG) applications to streamline data capture, analysis, and process modeling. The Process Discovery interface enables users to perform the following tasks:

- Capture, parse, and analyze user interactions with various systems.
- Identify and map all relevant pathways (including variations) and automatically documents the most common workflow.
- Compare the potential ROI from automating these processes and enables Business Analysts to accelerate automation and maximize RPA ROI.
- Convert automation opportunities into bot prototypes using the Process Definition Document (PDD) for further development and deployment by the Automation Developer.

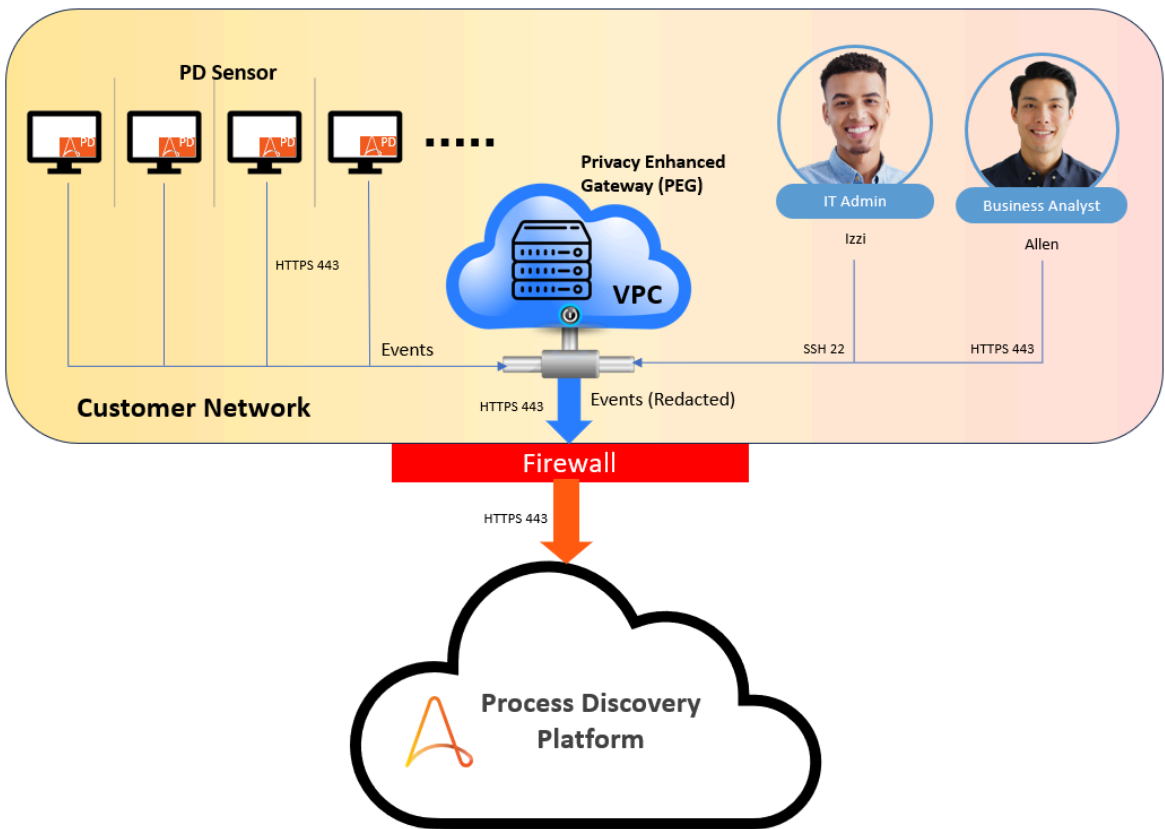

Process Discovery is part of the Automation 360 platform. To learn more, see [Automation 360](#)

Process Discovery Sensor application

The Process Discovery Sensor is installed on end-users' machines to capture data on user activities. This data is sent to Process Discovery for analysis to determine what business processes are candidates for automation.

Privacy Enhanced Gateway

The Privacy Enhanced Gateway (PEG) redacts sensitive data collected by the Process Discovery Sensor application, which prevents Personally Identifiable Information (PII) from being included in the data sent to Process Discovery for analysis.

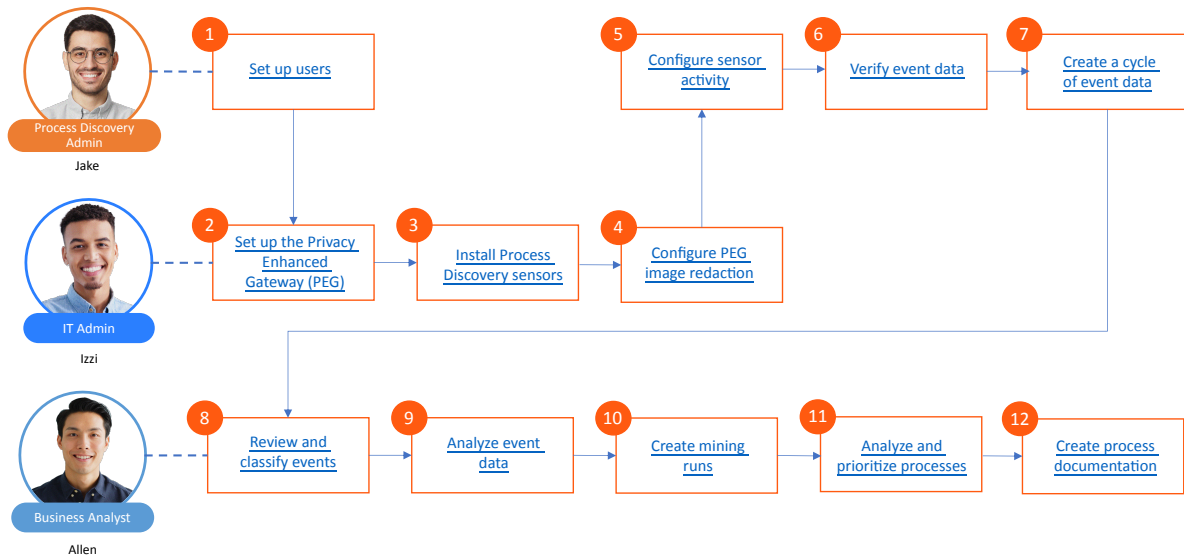

Companies often start automation projects by manually observing and documenting processes. This involves interviewing users, mapping workflows, and can be time-consuming and prone to inaccuracies. Process Discovery uses visualization tools to identify automation opportunities and compare processes across regions or teams.

Workflow

The following diagram shows the Process Discovery workflow for Process Discovery Admin, IT Infrastructure Admin, and Business Analyst users:

Process Discovery workflow

(Click the links to navigate to the sections.)

The Process Discovery helps Power/Discovery users find automation candidates by:

- Capturing and analyzing user interactions with systems.
- Documents common Workflows and provides visualizations (Flow and Path graphs)
- Comparing the ROI for potential automation.

Overview of Process Discovery

Process Discovery enables organizations to accelerate the automation of business processes and discover the fastest path to process optimization and business ROI (return on investment). You can use Process Discovery in various industries such as: healthcare, life sciences, and finance.

Why use Process Discovery

Many companies begin their automation projects with manual observation and documentation. Manual production and review of process documentation requires interviewing business users and mapping work flows while they are performing daily operations. This involves additional resources which can be time-consuming for all involved. This additional effort is also subject to inaccuracies due to users behaving differently while being monitored. As a result, many of the automation opportunities remain undiscovered. Process Discovery uses visualization tools to view process details and metadata, and review identical processes that differ across regions, teams, or apps.

Process Discovery Platform capabilities

The Process Discovery application enables Power or Discovery users to identify the business processes that are candidates for automation. Use Process Discovery to do the following:

- Capture, parse, and analyze user interactions with various systems.

- Identify and map all relevant pathways (including variations) and automatically documents the most common workflow.
- Compare the potential ROI from automating these processes and enables Business Analysts to accelerate automation and maximize RPA ROI.
- Convert automation opportunities into bot prototypes using the Process Definition Document (PDD) for further development and deployment by the Automation Developer.

Process Discovery user roles

Learn about the various users in the Process Discovery platform and their privileges from creating mining runs and exploring processes, to creating web applications and creating a Process Definition Document (PDD).

The Process Discovery platform includes the following user types:

Limited user

A Limited user has access to only the Client Dashboard by default, and view-only access to select assets attached to that tenant's Client Dashboard by a higher-privileged user.

Data Review user

Selects and reviews data for all observers in the Process Discovery platform. The data reviewer user has access only to the **Review** tab and **Data Review** page.

The Data Review role grants a user access to only the Virtual Interviewer flow.

Note: Discovery and Power Users can access Virtual Interviewer via the URL, but there is no direct link from the main navigation. While a Virtual Interviewer user has access to only the Virtual Interviewer interface, they can currently select and see the data for any and all observer names on the tenant.

Discovery user

The Discovery user is designed for anyone who wants to create Mining Runs and Processes or explore the work of others. Restricts access to features around signature creation that could have impacts on other users data and processes if misused. They do not have access to the Cycle page but can be given access to specific cycles by a higher-privileged user. They can look through the events, mining runs, or processes generated for those specific cycles. For instance, a Discovery user from a IT team has access to only IT team cycles and cannot view Accounts team cycles.

Power user

The Power user is an expansion of the Discovery user, granting access to those non-

admin interfaces that the discovery user lacks. They can do everything in the application, from creating Mining Runs and exploring processes to managing application signatures and creating Web Applications. The power user does not have administrator privileges.

Administrator

The Administrator role is the same as previous - it can do everything a power user can, plus all the additional administration screens related to management of the tenant, cycles, users, observers, and integration/plugins.

Create Process Discovery users and assign roles

As an Administrator user, you can create users and assign roles in the Process Discovery platform.

1. Log in to your Process Discovery platform as an administrator.
2. Click your account initials in the upper-right corner and select **Manage Users**.
3. Click **Create User**.
The **Create New User** window appears.
4. Enter the first name of the user in the **FIRST NAME** field.
5. Enter the last name of the user in the **LAST NAME** field.
6. Enter the email address of the user in the **EMAIL** field.
This is also the unique user ID for the user.
7. In the **ROLE** field, click the drop-down to select a Process Discovery role for the user. For more information on Process Discovery role, see [Process Discovery user roles](#) on page 3626.
8. To select an avatar for the user, click **Choose Image file**.
9. Navigate to an image on your computer and click **Open** to select the image.
10. Click **Create User**.
Process Discovery automatically generates and sends an email inviting the user to log in and use the platform.

Note: If the user does not activate the account within 24 hours of receiving the email invitation, click the **Didn't receive confirmation instructions** link on the login page to resend the confirmation email. Enter the email address in the field provided and click **resend confirmation instructions**.

-
11. To reset a user password for a fully registered user, click **Actions** > **Force Password Reset**.
 12. Click **Yes** to reset the user password.
A message appears notifying you that the user will have to change their password on the next login attempt.

Create your event reporting password

As an Administrator user, you can create your own password for the Event Reporting interface.

The Event Reporting interface uses Kibana which provides you reports about how people interact with applications and screens. Using the reports, you can determine where to focus your process discovery.

1. To create your Event reporting password, log in to your Process Discovery platform tenant.
2. Click your account initials in the upper-right corner and select **Manage Users**
3. Locate your account details in the users list.

Tip: To quickly locate your account, click **Filter**. Enter your email address, select a role, and click **Apply**.

4. In the Actions column, click the drop-down arrow and select **Set Event Reporting Password**. The Set Event Reporting Password window displays.
5. Enter your password and click **Set Password**.
The password is ready to use the next time you log in.

Create a URL and application list

Learn how to create a domain list (containing the URL) and application list for data that you want to capture or exclude on an Observers machine.

This task is performed by an Administrator. Before you configure Observer activity for data collection, you create domain list and application list.

To create a domain list, perform the following steps:

1. Log in to your Process Discovery platform as an administrator.
2. Click your account initials in the upper-right corner and select **Domain List**.
3. Click **Create List**.
4. In the **Name** field, enter a name for the list.
For example, enter Business applications.
5. In the **Type** field, select **Allow** to capture URLs or **Block** to exclude the URLs.

Note: The blocked URLs will not be displayed in the screen shots from the Events page.

6. In the **Domain** field, enter the full URL address.
For example, enter www.servicenow.com, www.sap.com, or www.oraclefinancials.com.

Note: When specifying domains, you must explicitly indicate what domains to include or exclude. For example, if chase.com is blocked, the secure05c.chase.com would not be blocked. You must include secure05c.chase.com on the list.

7. Click **Add** to add the specified domain to the list.
8. Click **Create List**.

You can now select this Block or Allow URL list from the **Observers** page for data you want to capture or exclude, for an individual observer or group observers, based on your requirements.

To create an application list, perform the following steps:

1. Click your account initials in the upper-right corner and select **Application List**.
2. Log in to your Process Discovery platform as an administrator.
3. Click **Create List**.
4. In the **Name** field, enter a name for the list.
For example, enter Business applications.
5. In the **Type** field, select **Allow** or **Block** from the drop-down.
6. In the **Application** field, select an application from the drop-down or enter an application in the text field.
7. Click **Add** to add the application to the list.
8. Click **Create List**.

You can now select this Block or Allow Application list from the **Observers** page for data you want to capture or exclude, for an individual observer or group observers, based on your requirements.

Note: To create a default Block and Allow URL or Application list for all new observers in a tenant, click your account initials in the upper-right corner and select **Manage Account**. In the Observer Settings section, update the URL or Application Block and Allow List.

Configure Observer activity

As an administrator, you can configure an individual Observer or a group of Observers to capture or exclude specific sets of data from collection on an Observers machine. This topic describes how to enable or disable the capture settings (screenshots, keystrokes, title, and keyboard) and apply this to specific applications.

After the Process Discovery Sensor is installed on the Observers' machines, ensure that you:

- Enable the sensor recording. For more information on enabling or disabling the recording, refer to [Enable and disable the users recording](#) on page 3684.
- Create your domain and application list. For more information, see [Create a URL and application list](#) on page 3628.

Note: To enable or disable the recordings for new observers in a tenant, click your account initials in the upper-right corner and select **Manage Account**. In the New Observer Recording section, select **Enable** or **Disable** to set the recording configuration for all new observers. Click **Save** to save your changes.

To configure an individual observer or group configure observers for data collection with capture settings, perform the following steps:

1. Log in to your Process Discovery platform as an administrator.

2. Navigate to **Data > Observers**.
3. To configure all observers, select **Configure <number> Observers**.
This configuration is for all observers using the current filter. You can create filters for specific departments in your organization (for example, HR or Finance) to filter data collection for a subset of Observers. Click **Filters** to create filters.
4. To configure an individual observer, navigate to the **Actions** column for the Observer and select **Configure** from the drop-down arrow.
5. In the Capture section, use the individual toggles to capture or exclude screenshots, keystrokes, title, or clipboard globally for all applications.
6. In the URL Block and Allow List section, select one of the these options:

Option	Action
None	No action to select. All URLs are captured by the Process Discovery Sensor.
Allow	Select the Allow URL list you created from the Domain List page from the drop-down field.
Block	Select the Block URL list you created from the Domain List page from the drop-down field.

7. In the Application Block and Allow List section, select one of the these options:

Option	Action
None	No action to select. All URLs are captured by the Process Discovery Sensor.
Allow	Select the Allow Application list you created from the Application List page from the drop-down field.
Block	Select the Block URL list you created from the Application List page from the drop-down field.

8. In the **Configure Applications** window, enter specific applications in the text field you want to capture and click **Add**.
Based on your business needs and the applications you set to capture or exclude, you might need to capture Screenshots and Titles for data processing of screen signatures.
The application is listed in the Application Name column.
9. To disable capture settings for the application, select the icon for Screenshots, Keystrokes, or Titles.
An X mark appears on the icon.
10. To configure observers by a single user, or group of observers with the same user name, select **Use configuration for observers owned by this user (<user name>)**.
This option is available for an individual observer only.

Note: When you use this option, the allow and block list that is created for new observers is used for users with the same user name.

11. Click **Configure**.
The capture settings are now set for Observers.

12. To enable the capture settings for all observers by default, click your account initials in the upper-right corner and select **Manage Account**.
13. In the Observer Settings section, perform steps 5 through 7.
14. Click **Save** to save your changes.

Create a cycle

Learn how to create a cycle for each data collection and add permitted users to the cycle so they can access the associated events for data analysis. Cycles are defined as a collection of events based on a set of Observers during a given time range.

Administrators have access to all event data, and can define which Permitted Users (Data Review, Discovery, or Power user roles) can access the cycle data in the Process Discovery platform. The Administrator informs users when the cycle is ready for them to review. Power users and all other non-admin users do not have access to create their own cycles and cannot review data until the Administrator creates the cycle for them. Creating a cycle for Power and all other non-admin users allows the users to access the data to review events and mine for processes.

To create a cycle, perform the following steps:

1. Log in to your Process Discovery platform as an administrator.
2. Navigate to **Data > Cycle**.
3. Click **New Cycle**.
4. In the **CYCLE NAME** field, enter a name for the cycle.
For example: Cycle 1: Order Entry and Processing.
5. In the **PERMITTED USERS** field, select the users that you want to give access to.
Permitted users include only the Data Review, Discovery, or Power user roles. You do not need to add Admins as permitted users because Admins can access all event data.
6. In the **OBSERVED AT** field, select the time data range from the Start date to the End date for the set of Observers.
7. In the **OBSERVERS** section, you can multi-select Observers or Observer Users from the drop-down lists. Alternatively, you can select a tag from the Observer tag drop-down list to populate the Observers.
You can create Observer tags from the Observers page and can use them to identify a team for a cycle. For example, the team is payroll or recruiting in HR where you can select as many Observers as required. In a VDI environment, we recommend that you select Observers from the OBSERVER USER section. This option enables you to easily select from hundreds of Observers and customize based on the cycle you want to create.
8. (Optional) APPLICATION NAMES, click the drop-down list to select applications.
9. (Optional) In the START SIGNATURES, click the drop-down list to select a start signature.
10. (Optional) In the END SIGNATURES, click the drop-down list to select an end signature.
11. (Optional) In NOTES, enter any notes you want to share with the permitted users.
12. Click **Create Cycle**.

Classify application screens and create web applications

You can review unclaimed browser events such as Google Chrome, Internet Explorer, and so on, to assign them to a specific web application.

When using web applications from the Process Discovery platform, the browser name is captured but the web application or software as a service (SaaS) is not. Web application events (where the application name is not captured) are stored in the Unclaimed Browser Events section of the Web Applications page. To classify web application events that are related to the task or process, you must create specific web applications for the events to be claimed in the application. From the Web Applications page, you can:

- Review events in the Unclaimed Browser Events section to locate and filter related process events from their native browser applications. Typically, Google Search, personal searches, or web mail events are not relevant to a task or process.
- Create specific web applications that are used in the task or overall process flow, for example: Amazon Web Services, Slack, Zendesk, and so on.

To review events in the Unclaimed Browser Events section and create web applications, perform the following steps:

1. Log in to your Process Discovery platform as a power user.
2. Navigate to **Data > Web Applications**.
In the Existing Rules section, you will see previously created web applications. In the Unclaimed Browser Events column, you will see various browser application events.
3. In the Unclaimed Browser Events column, click:
 - **Grouped by: Title** to organize the browser events listed in the column by window title.
 - **Grouped by: URL** to organize the events by URL.
4. To filter events in the column, use the data range option under the Unclaimed Browser Events header. Select the start date (Month/Date/Year) and end date (Month/Date/Year). The events column will update and display your results.
To filter events by specific event tiles, use the search icon. Enter the title in the search field. The events column will update to display your results.
5. To view a browser event, click the link to view the set of events from the Events page.
The browser events with the highest frequency titles or URLs are displayed at the top of the column. These are the most important events for processes that users are recording.

Unclaimed Browser Events	
2022-10-24	2023-01-24
Grouped by: Title	
Groups: 3	Events Count: 97
WINDOW TITLE	EVENTS
New Tab - Google Chrome	82
Prostate cancer icd10 - Google Search - Google Chrome	9
university radiology npi number - Google Search - Google Chrome	6

Showing 1 - 3 of 3 results

6. From the Events page, verify what web application the events belongs to.

Tip: We recommend that you note the web titles or URLs as you review the events because you will create a web rule pattern (regular expression or regex) for each of the targeted web applications. Additionally, you can use the Filter option to locate specific web applications by

Observer Name (for example) and click through the events in their workflow. Based on your situation, you might filter on URLs because URLs are unique, whereas titles are not necessarily unique. For example, if you have two applications with HOME as the title, you should use a URL web based rule instead of the title.

7. From the Unclaimed Browser Events column, continue to review the set of browser events from the Events page and determine if the events need to be claimed as web application events.
8. After you have located the titles or URL that you need to create web applications, navigate back to the Web Applications page.
9. Click **Create Web Application**.
10. In the **APPLICATION NAME** field, enter the name of the application.
For example, enter Google Search ICD 10 Lookup.
11. In the APPLIED RULE TYPE section, select the rule type (Title or URL) to use.
For example, select Title.
12. In the RULE PATTERN (REGEX) section, enter a pattern that matches the title or URL of your target application in the text box.

For example, enter icd10 lookup in the text box. We recommend that you remove "Google Search" from the application name because there may be similar events (icd10 lookup) in other browsers that you can also include in the rule pattern.

You can also click the copy icon to copy the title of the web application and paste into the text box.

For example, you only need the title, KTBSonline and there are two KTBSonline titles listed in the browser events column. The two titles are:

- Verify Login Information | KTBSonline - Google Chrome
- Enroll in Open Enrollment Benefits | KTBSonline - Google Chrome

To capture the events from both titles, you can enter the rule pattern as: Verify Login Information \| KTBSonline - Google Chrome|Enroll in Open Enrollment Benefits \| KTBSonline - Google Chrome, or you can just enter KTBSonline and keep the rule pattern simple.

Continuing with the example for KTBSonline, the backslash (\) character precedes the vertical (|) character to indicate that this is not an OR function in the rule.

To include more than one title in the rule pattern, use the vertical bar (|) character to indicate the OR function. For example, to include results for PDFfiller OR pdfFiller, enter the rule pattern as: PDFfiller|pdfFiller.

The caret (^) character is another commonly used character for creating web rules. Use the caret character at the beginning of the rule pattern when you want to match the exact event title at beginning of the text. For example, you want events only where KTBSonline is at the beginning of the text in the application. In the text box, enter the rule pattern as: ^KTBSonline.

13. Click **Create**.

The system takes a few minutes to create the web application. To verify that the rule is updated, click the magnifying glass icon in the Actions column. After the web application has completed, a pop-up notification appears in the bottom left corner.

Applications with auto-assigned screen signatures

Process Discovery automatically assigns a screen signature to the following productivity tools. A screen signature is a descriptive name that identifies a page within an application, such as a spreadsheet in a workbook.

- Adobe Acrobat Reader
- Calculator
- Foxit PDF Reader
- Google Chrome
- Microsoft Access
- Microsoft Excel
- Microsoft InfoPath
- Microsoft Internet Explorer
- Microsoft OneNote
- Microsoft Outlook
- Microsoft Power BI
- Microsoft PowerPoint
- Microsoft SharePoint
- Microsoft Teams
- Microsoft Terminal Services Client
- Notepad
- SAP Logon
- Snipping Tool
- 1cv8

Review Events and filter data

You can review and filter Events collected from the Observers machine to develop mining insights.

We recommend that you collect Observer events for at least two to five weeks to ensure that all processes assigned to Observers are completed before data analysis begins. After a few weeks of collecting Events, you can review the Events. From the Events pages, Power users can:

- Review events to ensure that data is collected from Observers.
- Use the **Filter** option to sort and display events by single or multiple Observers, application, Observed at (date range), and so on.
- Enlarge individual screens to view Observer events (mouse clicks and keystrokes) in detail.

To review and filter Events, perform the following steps:

1. Log in to your Process Discovery platform as a power user.
2. Navigate to **Data > Events**.
3. In the upper left side, click the drop-down to select an Observer.

By default, all Observers events are displayed on the Events page.

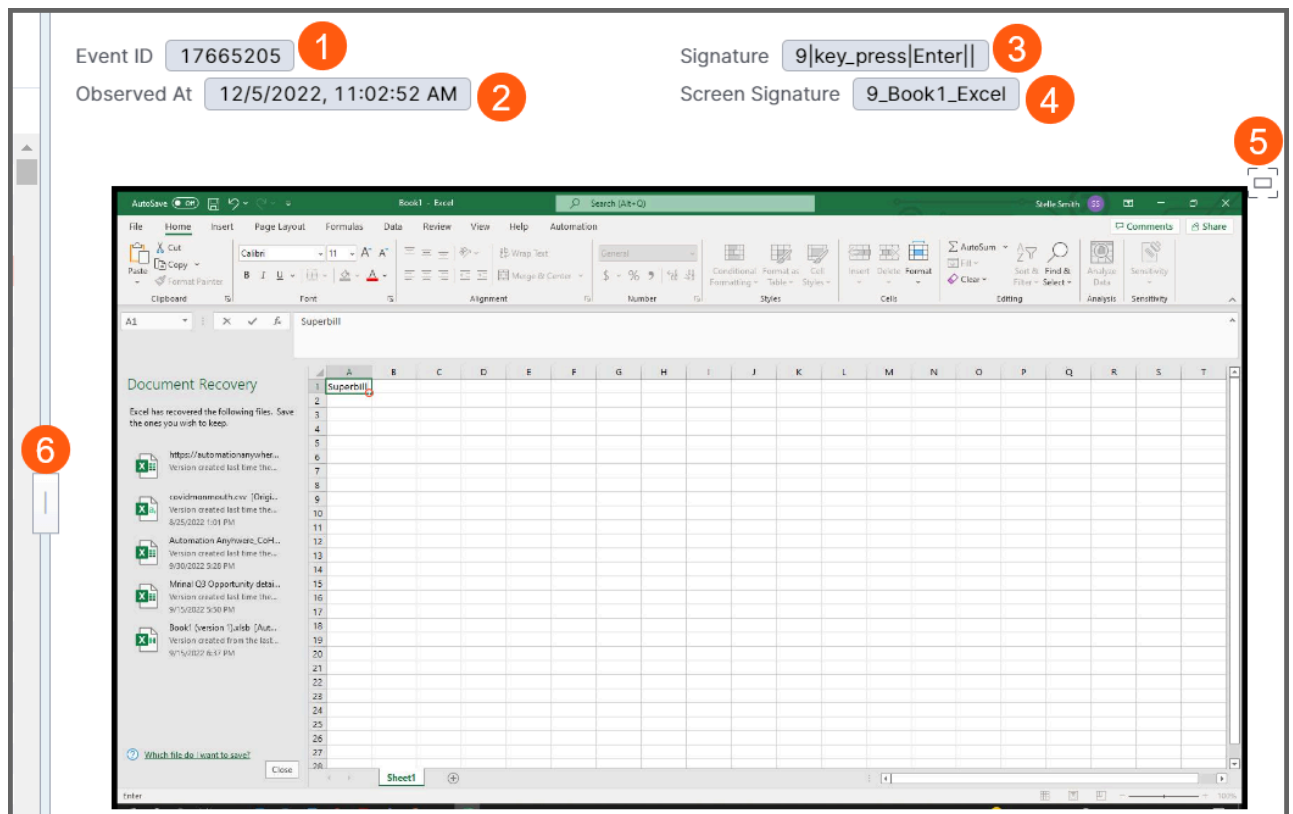

The events collected by the Observer are displayed in the Events table. The total number of Events collected by the Observer is displayed in the Events text box above the table.

4. Click through the event IDs to view the date range (Observed At), Application, Title, and Field columns.

Click the gear icon to select additional data to view. The selected data displays a green checkmark. For example, you can select Screen signatures, Application, Field, and so on. The data displays in another column within the Events table.

Note: In the Events table, the Observed At date and time range is the time that a user is looking at the events in the application. The Observed At date range is not related to the Observers location. For example, if the Observer is in India and the user is looking at the events in the application in California, the Observed At date and time is in California time.

For each Event ID, the associated Event screen appears to the right. The following image and table describe the metadata (1-4) details associated with the screen and the icons (5 and 6) used to enlarge the image.

	Metadata	Description
1	Event ID	The ID number associated with the event.
2	Observed At	The exact date (Month/Day/Year) and recording time of the event captured by the Observer.
3	Signature	The application screen associated with that event. Each application has a unique ID.

	Metadata	Description
4	Screen Signature	<p>A unique label pattern applied to an application screen to enable process mining.</p> <hr/> <p>Note: Although, Screen signatures are partially automatic, modifications are required for data mining. As long as the Screen Signature is logical, multiple Events may share the same Screen Signature. It is important that Screen Signatures describe the screen appropriately because they enable further process mining.</p> <hr/> <p>When you are ready to modify your Screen Signatures work, we recommend that you work with your Customer Success Manager (CSM).</p>
5	Image Viewer icon	Enlarges the image to full screen mode.
6	Slider	Expands the width of the image.

- Click **Filter** to customize the events you want to view.
Filtering events allows you to better understand the individual steps as part of the overall process you might optimize. For example, you might refer to the Field column for potential start and end tasks of process.
- To filter events for a cycle, select a cycle from the **Cycles** drop-down and click **Apply**. The Events table is updated and updates events for that cycle.
- To filter events using a set of rules with conditions (AND, OR) or create a group (combination of rules), select from the following options or a combination of options:

Option	Action
Add Rule	A Rule is single condition. Use this to add additional conditions, such as AND, OR. Refer to the AND,OR examples for more information.
AND	<p>Filter events only which satisfy BOTH conditions will be included.</p> <hr/> <p>For example, the AND operator is selected and you select Application Name = Acrobat and Application Type = web. The filter rules include events from both Acrobat and web.</p> <div style="border: 1px solid #ccc; padding: 5px; width: fit-content;"> </div>

Option	Action
<p>OR</p>	<p>Filter events only which satisfy EITHER condition will be included. For example, the OR operator is selected and you select Application Name = Chrome and Application Type = windows. The filter rules will include only events EITHER in Chrome or in windows.</p> 
<p>Add group</p>	<p>Use this to filter for a combination of rules. A Group can also be a collection of Groups, or a mix of both.</p> <p>For example, there is a combination of Groups, each with their own group of Rules, collected by an OR operator. The filter rules will include events that are either (on machine AAIComputer_7 AND in Chrome) OR (on machine AAIComputer_4 AND in Excel).</p> 

Option	Action								
Operators	<p>Select from one of the following operators:</p> <table border="1"> <thead> <tr> <th>Option</th> <th>Result</th> </tr> </thead> <tbody> <tr> <td>=</td> <td>The condition is equal to the input. For example: Application Name=Google. This filter rule will include events where the application is Google only.</td> </tr> <tr> <td>>, <</td> <td>The condition is greater than, or less than those in the input. For example: ID > 1000. This filter rule will include events where the ID is greater than 1000. Note: This applies only for Observed At and ID conditions. The Observed At filter is the quantity of any event that is recorded in that exact time.</td> </tr> <tr> <td>>=, <=</td> <td>The condition is greater than or equal to, or less than or equal to those in the input. Note: This applies only for Observed At and ID conditions.</td> </tr> </tbody> </table> <p>Note: The examples provided include some of the more commonly used operators. The full list of operators include:</p> <ul style="list-style-type: none"> • In • != • Not In • Is Null • Is Not Null • Matches 	Option	Result	=	The condition is equal to the input. For example: Application Name=Google. This filter rule will include events where the application is Google only.	>, <	The condition is greater than, or less than those in the input. For example: ID > 1000. This filter rule will include events where the ID is greater than 1000. Note: This applies only for Observed At and ID conditions. The Observed At filter is the quantity of any event that is recorded in that exact time.	>=, <=	The condition is greater than or equal to, or less than or equal to those in the input. Note: This applies only for Observed At and ID conditions.
Option	Result								
=	The condition is equal to the input. For example: Application Name=Google. This filter rule will include events where the application is Google only.								
>, <	The condition is greater than, or less than those in the input. For example: ID > 1000. This filter rule will include events where the ID is greater than 1000. Note: This applies only for Observed At and ID conditions. The Observed At filter is the quantity of any event that is recorded in that exact time.								
>=, <=	The condition is greater than or equal to, or less than or equal to those in the input. Note: This applies only for Observed At and ID conditions.								

8. Click **Apply** to apply your filter settings and view events.

Mining for processes

A mining run identifies and analyzes variations in how a business process is performed.

Determine your mining strategy

Before you create your first mining run, decide on a mining strategy. We suggest the following strategies, however, you should use the strategy that is appropriate for your use case.

- Find the most popular screen in your event reporting interface. You can use the most popular screen as the Center screen. Create a Butterfly Mining Run first using the Center screen Screen

Signature to identify the Start and End Screen Signatures. Next, create a Path-Based Mining Run using the start and end Screen Signatures to identify processes.

For more information, see [Create a Butterfly mining run](#) on page 3646 and [Create a Path-based mining run](#) on page 3644

- Select a single Observer first and delve into their data. Also known as a "day in the life" view, with this strategy, you review the Events for the Observer and identify their processes through mining. Then, mine all Observers together to see which processes they have in common.

For more information, see [Create a Mining Run](#) on page 3639

- Select all Observers and mine all data for processes without using Screen Signatures or parameters. The number of processes generated by the Mining Run might be too many to analyze. This strategy is more appropriate with smaller data sets and a small number of Observers.

For more information, see [Create a Mining Run](#) on page 3639

Create a Mining Run

Perform exploratory mining to discover processes across an open dataset. You can narrow the results by observer, application, or screen signature. This approach might yield multiple processes, each with different start and end points.

Create a mining run where you can specify time frame, observer, application, and screen signatures.

Note: When you run a basic mining run the **Mining Type** (visual output) is a [Flow Graph](#) on page 3640. For Advanced mining runs, the **Mining Type** by default is Flow Graph, but you can select **Path** or **Butterfly**.

1. Navigate to **Data > Mining Runs**.
2. Click **New** and provide the following information:

Field	Description
Observed at	The start and end dates and times for the recorded steps to include in this mining run.
Observers	<p>Select All, Include, or Exclude.</p> <p>If you select Include or Exclude, use the Observers from tag menu to select observers by tag or the Select observers to select observers by device name.</p> <hr/> <p>Note: Observer tags are created by an admin and are used to identify a team, such as payroll or recruiting.</p>

Field	Description
Applications	<p>Select All, Include, or Exclude.</p> <p>If you select Include or Exclude, use the Applications from tag menu to select applications by tag or the Select applications to select applications by name.</p> <hr/> <p>Note: Application tags are created by an admin and are used to identify a grouping, such as payroll or recruiting.</p> <hr/>
Start screen signature	<p>The screen signature is a descriptive name assigned to each recorded screen. You can view and search for screen signatures from the Data > Events tab.</p>
Stop screen signature	

3. Click **Create & Run**.

Process Discovery performs the mining run. The length of time necessary to complete the mining run depends on the size of the data set. When the mining run is complete, it appears in the **Data > Mining Runs** page.

Review the processes identified by the mining run. See [Analyze and prioritize processes](#) on page 3649.

Flow Graph

The Flow-based mining run produces the visual output for the Flow Graph, which shows each screen signature only once, resulting in a simplified visual. Additionally, the Flow Graph shows loops and common steps in the process.

Create a Flow-based mining run

Create a flow graph to visualize the flow-based mining run resulting in a simplified visual.

[Create a cycle](#) on page 3631

1. Navigate to **Data > Mining Runs**.
2. Click **New**, navigate to the **Advanced** tab, and select the cycle from the drop-down list.
3. Select the **Flow** mining type.
4. Optional: Provide the following information:

Field	Description
Min path length	Set the minimum length for a path to be included in the output.
Max path length	Set the maximum length for a path to be included in the output.

Field	Description
Number of processes	Sets a maximum number of unique starting screens
Number of paths	Sets a maximum number of total paths
Start strategy	<p>If you do not provide a start screen, Process Discovery uses one of the following algorithms to determine potential start screens:</p> <ul style="list-style-type: none"> • Dependency: Uses a statistical model based on the frequency that certain events lead to one-another or to many others • Frequency: Returns the screen signatures appearing most frequently in the event logs for the given filter rules • Interactivity: Uses a ratio of unique appearances of screens to the amount those screens are interacted with to determine good start candidates • Copy Paste: Looks at controls to determine which screens are copied from most frequently
Path filter	<ul style="list-style-type: none"> • Frequency: Ranks paths by total frequency of occurrence • Levenshtein: Ranks paths based on frequency and similarity to other frequently appearing paths • Dedup: Includes only the first occurrence of a screen in a unique path, then runs the default filtering on the results. For example, if a process flows through these screens [A -> B -> A -> C], it is converted to [A -> B-> C]
Merge starts (optional)	If there are multiple start screens, Process Discovery combines all those start screens into a single process, instead of creating a process for each start screen

Field	Description
Shortest path (optional)	If the mining run has a defined start and end screen, Process Discovery finds the longest path between a start and an end screen, which might generate a path with repetitions of the start screen. If you select Shortest path , Process Discovery looks for the shortest path between the start and end screens

5. Click Create & Run.

Process Discovery performs the mining run. The length of time necessary to complete the mining run depends on the size of the data set. When the mining run is complete, it appears in the **Data > Mining Runs** page with the discovered processes below it.

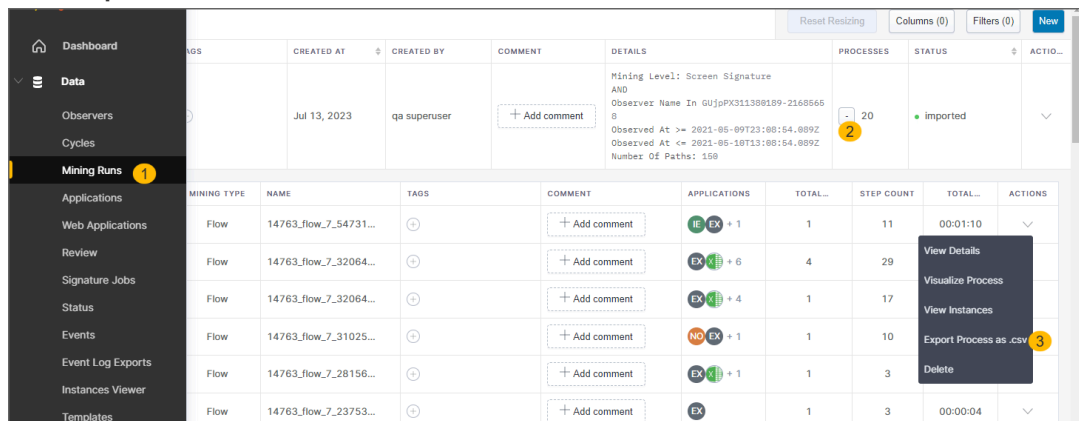

[Using the Flow Graph to find common steps and loops on page 3643](#)

Export Process as CSV

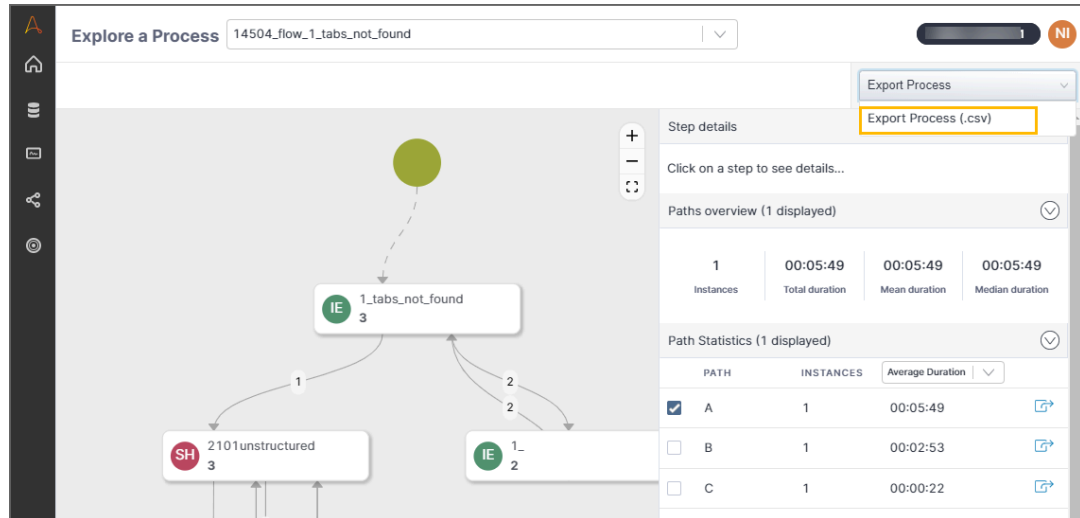

You can export a process to a CSV file for offline data analysis

To export the process as a CSV:

1. Click **Mining Runs**.
2. Expand the process that contains the Flow Graph you want to export.
3. Do one of the following:
 - a) Click **Export Process as .csv**.

- b) Click **Visualize Process > Export process**.

4. Open the CSV file to see the exported data.

Using the Flow Graph to find common steps and loops

Identify the most common steps in a path or the paths which contain that step, as well as any process loops, where a user returns to a previous screen or application.

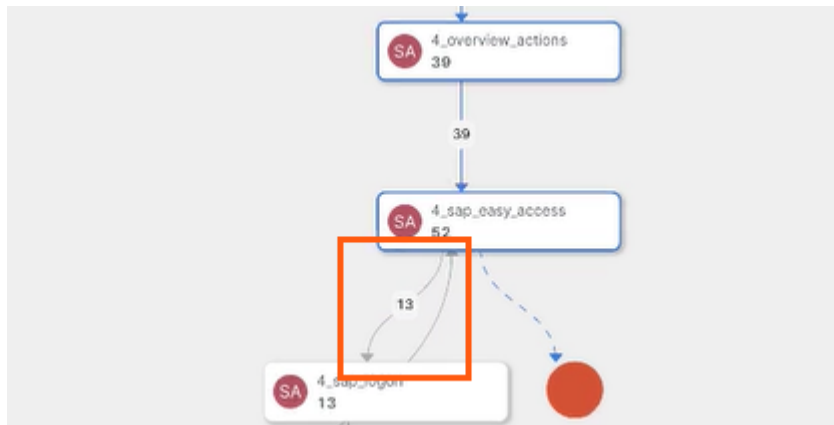

Create a flow-based mining run. See [Create a Flow-based mining run](#) on page 3640

After the mining run is completed, the Mining Runs page displays the flow-based mining run with the identified processes.

1. Expand the list of processes for the completed mining run.
2. Under the Actions column, click the downward-pointing arrow then **Visualize Process**.
3. Use the following flow graph visualization features to identify automation or optimization opportunities:
 - Most popular path: The first path in the right-side panel is the path that contains the most commonly-occurring steps. The subsequent paths are organized in descending order of how often the steps occur in the variations of that path.
 - Most common steps: A pink line highlights the most common connection between steps. Click on a step that is intersected by a pink line to see all the paths that contain the connection.

- Process loops: In a process loop, a user returns to a previous application or screen. Look for arrows that point to a previous step, such as in the graphic below.

[Analyze and prioritize processes](#) on page 3649

Create a Path-based mining run

The Path-based mining run type finds patterns in the data and generates processes based on the set parameters.

[Create a cycle](#) on page 3631

1. Navigate to **Data > Mining Runs**.
2. Click **New**, navigate to the **Advanced** tab, and select the cycle from the drop-down list.
3. Select the **Path** mining type.
4. Optional: Provide the following information:

Field	Description
Min path length	Set the minimum length for a path to be included in the output.
Max path length	Set the maximum length for a path to be included in the output.

Field	Description
Number of processes	Sets a maximum number of unique starting screens
Number of paths	Sets a maximum number of total paths
Start strategy	<p>If you do not provide a start screen, Process Discovery uses one of the following algorithms to determine potential start screens:</p> <ul style="list-style-type: none"> • Dependency: Uses a statistical model based on the frequency that certain events lead to one-another or to many others • Frequency: Returns the screen signatures appearing most frequently in the event logs for the given filter rules • Interactivity: Uses a ratio of unique appearances of screens to the amount those screens are interacted with to determine good start candidates • Copy Paste: Looks at controls to determine which screens are copied from most frequently
Path filter	<ul style="list-style-type: none"> • Frequency: Ranks paths by total frequency of occurrence • Levenshtein: Ranks paths based on frequency and similarity to other frequently appearing paths • Dedup: Includes only the first occurrence of a screen in a unique path, then runs the default filtering on the results. For example, if a process flows through these screens [A -> B -> A -> C], it is converted to [A -> B-> C]
Merge starts (optional)	If there are multiple start screens, Process Discovery combines all those start screens into a single process, instead of creating a process for each start screen

Field	Description
Shortest path (optional)	If the mining run has a defined start and end screen, Process Discovery finds the longest path between a start and an end screen, which might generate a path with repetitions of the start screen. If you select Shortest path , Process Discovery looks for the shortest path between the start and end screens

5. Click **Create & Run**.

Process Discovery performs the mining run. The length of time necessary to complete the mining run depends on the size of the data set. When the mining run is complete, it appears in the **Data > Mining Runs** page with the discovered processes below it.

Review the processes identified by the mining run. See [Analyze and prioritize processes](#) on page 3649.

Create a Butterfly mining run

The Butterfly Mining run type shows the flow in and out of a screen. Use this type to identify all the paths that include this screen, as well as the steps before and after that screen.

1. Navigate to **Data > Mining Runs**.
2. Click **New**, navigate to the **Advanced** tab, and provide the following information:

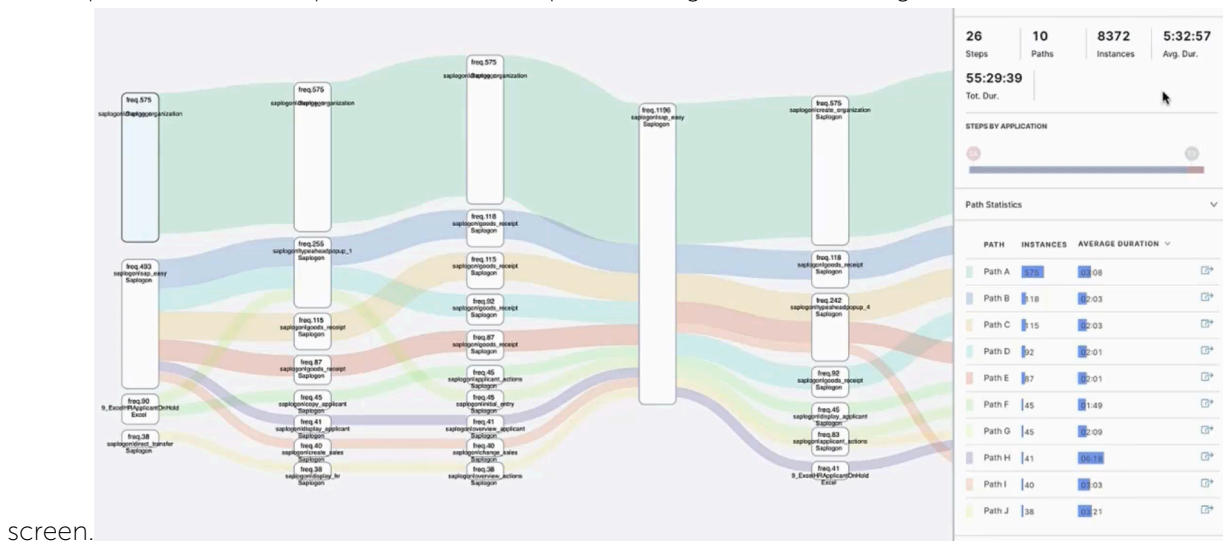

Field	Description
Mining level	Ensure Screen Signature is selected
Mining type	Ensure Butterfly is selected
Filters	Create rules to filter which of the recorded screens to include in this mining run.

Field	Description
Center Screen Signature: Screen signature	Specify a screen that all the paths must include. The screen signature is a descriptive name assigned to each recorded screen. You can view and search for screen signatures from the Data > Events tab.
Center Screen Signature: Signature label	Field: The name of the field the user interacted with Control key: The keyboard or mouse control key the user pressed, such as a left click or "Enter" You can find field and control key data in the Data > Events page.
Must Include Screen Signature (optional)	Include additional screen signatures that the paths must contain
Number of events before center	The number of steps before the center screen to include in the paths
Number of events after center	The number of steps after the center screen to include in the paths
Number of processes	Sets a maximum number of unique starting screens
Number of paths	Sets a maximum number of total paths
Start strategy	If you do not provide a start screen, Process Discovery uses one of the following algorithms to determine potential start screens: <ul style="list-style-type: none"> • Dependency: Uses a statistical model based on the frequency that certain events lead to one-another or to many others • Frequency: Returns the screen signatures appearing most frequently in the event logs for the given filter rules • Interactivity: Uses a ratio of unique appearances of screens to the amount those screens are interacted with to determine good start candidates • Copy Paste: Looks at controls to determine which screens are copied from most frequently

Field	Description
Path filter	<ul style="list-style-type: none"> • Frequency: Ranks paths by total frequency of occurrence • Levenshtein: Ranks paths based on frequency and similarity to other frequently appearing paths • Dedup: Includes only the first occurrence of a screen in a unique path, then runs the default filtering on the results. For example, if a process flows through these screens [A -> B -> A -> C], it is converted to [A -> B-> C]

3. Click Create & Run.

Process Discovery performs the mining run. The length of time necessary to complete the mining run depends on the size of the data set. The output is a sankey chart, which provides a visual representation of the paths through the selected signature

screen.

Review the processes identified by the mining run. See [Analyze and prioritize processes](#) on page 3649.

Export Mining Runs

You can export a mining run to a CSV file for offline data analysis.

To export a mining run as a CSV:

1. Click **Mining**

The screenshot shows a table with the following columns: CREATED AT, CREATED BY, COMMENT, DETAILS, PROCESSES, STATUS, and ACTIONS. The table contains three rows of mining runs. The first row is highlighted, and a dropdown menu is open over its ACTIONS column, showing options: Clone, Delete, Export Mining Run as .csv (highlighted), and Explore Events. The second row is also highlighted, and the third row is partially visible.

2. Click the drop-down in the **ACTIONS** column corresponding to the mining run you want to download.
3. Click **Export Mining Run as .csv**.
4. Open the CSV file to see the exported data.

Analyze and prioritize processes

Map and compare workflows using data visualization tools. Prioritize processes based on ROI and select a process for automation opportunities.

- Create a mining run from the Mining Runs page: [Mining for processes](#) on page 3638
- From the Process Explorer page, review the various paths taken by the observers, where the thickest path is the most frequent path taken.
- Identify the path you want to view from an event-level.
- Click the **View in Instances Viewer** icon to navigate to the Instances Viewer page where you can select and annotate events to include in a PDD. You can also select a process to annotate directly from the Instances Viewer page.

1. Log in to your Process Discovery platform as a power or discovery user.
2. Navigate to **Data > Instances Viewer**.
3. In the upper-left side next to **View Instances**, click the drop-down to select a process to visualize.

The screenshot shows the 'View Instances' page in IQ. At the top, there is a search bar with the text '2401_path_2433_Patient' and a dropdown arrow. Below this, there are filters for 'Observers: 7 AAIComputer_3-U...' and 'Paths: 5'. A dropdown menu is open on the right, showing a list of instances from 1 to 12. The table below has columns for Order, Title, App, Action, Value, and Observer Name. The first row is highlighted in red.

Order	Title	App	Action	Value	Observer Name
1	Patient...	billrMD	MOUSE_C...		AAIComputer_3-User_3
2	New Pat...	billrMD	MOUSE_C...		AAIComputer_3-User_3
3	New Pat...	billrMD	KEY_PRE...	Teresa	AAIComputer_3-User_3
4	New Pat...	billrMD	KEY_PRE...		AAIComputer_3-User_3
5	New Pat...	billrMD	KEY_PRE...	Tester	AAIComputer_3-User_3
6	New Pat...	billrMD	KEY_PRE...		AAIComputer_3-User_3

- After the process displays on the page, click the drop-down to select the instance to include in the PDD.
- Click the gear icon to add the **Include in Process** column.
The **Include in Process** column provides you a check box for each line order (refer to the Order column) used to specify which steps to include in the PDD.
- Click **Annotate** to update field labels for the selected steps. For all steps that you want to include in the PDD, leave the box checked and update the action and label from the screen on the right.
Two fields will appear above the screen image.
- From the drop-down, select a **Control Type**.
The **Control Type** refers to the selection performed in the application.
- In the text field, enter a control label description for the **Control Type** and click **Update**.
We recommend that you enter a label description that corresponds with the label in the screenshot so that when users review the PDD, the output makes sense to them.
For example, select Button from the **Control Type** drop-down and enter Click New Ticket in the description field.
The **Ann** column will display user and the **Field** column will display the description entered in the text field.
- Repeat steps 6 through 8 for all steps that you want to annotate.
The **Save Instance to Process** button is enabled for all checked items that include both a label and description. You must annotate all instances you want included in the process for the **Save Instance to Process** button to appear.
- Click **Save Instance to Process**.
The **View Process Details** button appears.
- Click **View Process Details** to name the process.
- In the **Name** field, enter a name for the process using this suggested format: 5577-21245E Instance 1 for <Mining Run><Process><Path><Instance>.
- Click **Save Process** to save the process with a name.
A message appears at the bottom left side notifying you that the process is saved successfully. Click the hyperlink to return to the **Process Explorer** page. You can now create groups for the events and generate a PDD.

[Creating groups for the process and generate a PDD on page 3651](#)

Creating groups for the process and generate a PDD

Learn how to create different groups with start and stop events, and use the groups to design a Process Definition Document (PDD).

After you selected your instances, you can create groups for the events and build your PDD.

1. Click **Create Group** to place the steps in different groups for the PDD.

You can create groups for tasks that are part of the process.

2. In the **Create Group** window, drag a step from the process workflow and move it into the **Start Node**.

The Start Node is the beginning of the task. For help building the group of steps as tasks in the overall process, refer to the **View Instances** page for the selected screens. For example, to create tasks related to completing fields on a checkout page, you can

- Group all steps in one group and name the group Checkout; or
- Create multiple groups for individual tasks like Add Payment in one group or add Shipping address in another group.

3. Select the last step in the group and place the screen in the **End Node(s)**.

The End Node(s) is the end of the task.

4. Enter a name in the **Group Name** text box.

5. Select a color for the group from the drop-down next to the **Group Name** text box.

6. Click **Save** to save the group.

7. Repeat steps 2 through 6 for all steps you want to group.

8. Open a new browser tab and navigate to the Process Discovery platform.

9. From the left pane, navigate to **Models > Diagram Composer**.

In the **Browser Processes and Groups** section, the instances and groups are displayed.

10. Click the + sign to add a flow box for each group.

Each flow box appears on top of the previous box. Move these boxes into a row or column. The groups are listed in reverse order from when they were created.

11. To connect one flow box to another flow box, click the > on the side of the flow box and drag the arrow to connect the boxes.

12. To document a process with branches, click the **Decision Point**.

A diamond shape flow box appears in the composer.

13. In the **Details** window, click the pencil symbol to enter a name for the decision point.

14. Repeat steps 10 through 13 until you have completed adding flow boxes for all groups in the PDD.

15. Click **Auto Layout** to display any missed connections.

16. Update the flow boxes as needed.

17. To save your PDD, specify a name in the text field and click **Save**.

The **Generate PDD** button appears.

18. Click **Generate PDD** to start generating a PDD.

19. Select **Yes** or **No** to include an image appendix.

The image appendix includes full-sized screen shots of the steps.

Note: The default images for each step is a zoomed-in snippet of the events interaction point.

The events interaction point is the area on the screen where the user is focused which is typically denoted by a red circle on the screen shot.

The Process Specifications page appears and the message Generating PDD displays in the bottom left corner.

20. Click **Download PDD** to open the PDD document.
The generated Word document is available from your Downloads folder on your machine. The zip file contains all the images.
21. Review and modify the document, (if needed) and then save your PDD.

Getting started with Privacy Enhanced Gateway

Control the data that the Process Discovery cloud platform receives by using the Process Discovery Privacy Enhanced Gateway (PEG). PEG redacts sensitive data that is included in video frames collected by the Process Discovery desktop sensor. This redaction occurs within your own Virtual Private Cloud (VPC) before the data is forwarded to the Process Discovery cloud for analysis.

Install Privacy Enhanced Gateway (PEG) to limit Personally Identifiable Information (PII) and sensitive data capture: [Install PEG](#) on page 3652

After performing the installation steps, configure PEG to mask words and send the redacted images to the Process Discovery platform: [Configure PEG image redaction](#) on page 3666

Install PEG

Review the prerequisites and installation process.

Before you start installation

- PEG runs as a virtual machine (VM) in your Virtual Private Cloud (VPC). PEG deployments are supported on AWS, Microsoft Azure, and Google Cloud Platform. Automation Anywhere will provide cloud images for you to deploy. To obtain the PEG image, see [Obtain the PEG image \(A-People login required\)](#) .
- Review the information on [Deployment and networking requirements](#) on page 3653

Installation steps

1. [Create certificates](#) on page 3655
2. [Create DNS entries and deploy PEG VM](#) on page 3657
3. If you require a proxy: [Configure PEG to work with a proxy](#) on page 3657
4. [Set up and configure PEG](#) on page 3658
5. [Validate PEG is running](#) on page 3661

Note: Through the installation process, replace the values within angle brackets with your actual values and remove the angle brackets. For example:

- <apex domain> might be replaced by example.com.
- <UID> might be replaced by 123456ab-789c-12de.

After installation

[Create image viewer user in analytics portal](#) on page 3663

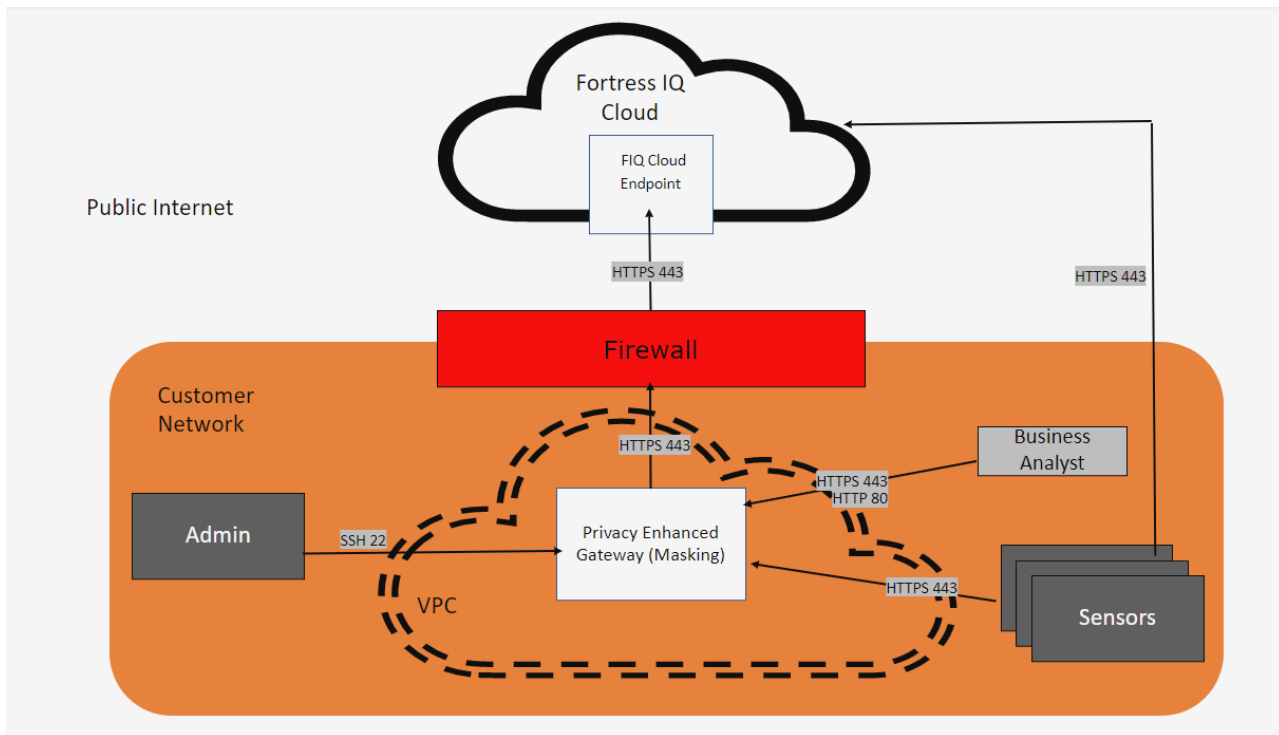

Deployment and networking requirements

Learn about the deployment architecture based on certificates for HTTPS connections and the associated port, storage, VM and DNS requirements.

Deployment

With this deployment model, all connections to PEG remain within networks that you control.

Architecture

Port requirements

The following table lists the port requirements for ingress and egress IP addresses.

Port	Protocol	Purpose	Ingress private IP	Ingress public IP	Egress to public internet
22	TCP	ssh connectivity for Admin	#		
443	TCP	Ingress Desktop sensor and business analyst connectivity over HTTPS (TLS 1.2) Egress PEG sends redacted data to Process Discovery. Also used to pull down PEG installer, updates, and so on from our repositories Sensor connects directly to Process Discovery cloud to get configuration information only. No collected data is sent directly from the sensor to the Process Discovery cloud.	#		#
80	TCP	Used for redirection from http to HTTPS (443)	#		

VM size requirements

The following VM sizes are supported for PEG installation:

- Microsoft Azure: NC8as T4 v3
- AWS: g4dn.4xlarge
- Google Cloud Platform: N1-highmem-8 with 1 nvidia-tesla-t4 GPU

Note: Each PEG VM can handle 10 sensors per calendar week, with each sensor sending data for approximately eight hours each day for five days a week.

Storage requirements

Ensure that your OS or root disk has 2 TB of nearline SSD storage or more. Encrypt the disk using your platform's storage encryption mechanisms.

DNS requirements

You will provide PEG with an apex domain name that you want to use (for example, example.com). Based on that, PEG will inform you about the DNS sub domain records that you must create.

Create certificates

Create certificates as part of installing PEG.

You can create certificates by using one of two options.

- Option 1: [PEG generates keys and CSRs](#).
- Option 2: Create your own keys and certificates.

In both cases, you will need the following:

- Unique ID (UID): Each PEG VM you run must have a unique id. You can define the UID to be anything you want as long as it meets the following criteria:
 - Less than or equal to 18 characters in length
 - Contains only letters from a to z, numbers from 0 to 9 and/or hyphens
 - Must not begin or end with a hyphen
 - Must not contain consecutive hyphens
-
- **Tip:** To easily create a UID, take the last 18 characters of a GUID generated from an online GUID generator.
-
- The apex domain that you want to use for the PEG DNS names (for example, example.com)

Option 2 - Create your own keys and certificates

Learn how to create keys and certificates before you deploy PEG.

Keys and certificates must be in Base64 PEM format (called openssl or PKCS #8 for the key format in some systems). Create certificates according to [Common Tasks - Creating the certificates](#) on page 3655. Keys must not be password protected. Also, ensure that your keys match the file names in the Key File Name column of, [Common Tasks - Creating the certificates](#) on page 3655.

Common Tasks - Creating the certificates

Learn how to create Base64 PEM certificates.

When you create the certificates, create six server Base64 PEM certificates (called openssl format in some systems), with domain names and file names mapped as follows, where the UID is provided to you by Process Discovery and the apex domain is your apex domain that you will use for PEG. Each certificate you create must just contain the leaf certificate and not the full chain.

Table 10: Mapping of domain names to certificate file names

Domain	Cert file name	Key file name (Required only if you created your own keys)
analytics-fiq-<UID>.<apex domain>	analytics-cert.pem	analytics-key.pem
proxy-fiq-<UID>.<apex domain>	proxy-cert.pem	proxy-key.pem
storage-fiq-<UID>.<apex domain>	storage-cert.pem	storage-key.pem
st-fiq-<UID>.<apex domain>	st-cert.pem	st-key.pem

Domain	Cert file name	Key file name (Required only if you created your own keys)
dlp-fiq-<UID>.<apex domain>	dlp-cert.pem	dlp-key.pem
es-fiq-<UID>.<apex domain>	es-cert.pem	es-key.pem
klite-fiq-<UID>.<apex domain>	klite-cert.pem	klite-key.pem

Note: You can create one certificate with all of the SANs. You can also create just one key if you create keys if you want. However, you will still need to make sure there are seven copies of that certificate and seven copies of that key (if you created keys) named as indicated previously. Do not create a wildcard certificate.

Create certificates option 1: PEG generates keys and CSRs

Learn how to use PEG to generate the keys and CSRs for you.

1. Log in to PEG through ssh.
If you do not log in as user named `peguser`, then ensure that you switch to the `peguser` per this command before performing these steps.

```
sudo su - peguser
```
2. If you already have a unique ID (UID) by Process Discovery, run the following command:
`echo "<UID>" > ~/.kudzu/appliance.txt`, where UID is the unique ID that you were provided. If you do not have a UID, the next few steps will generate one for you.
3. Run `cd peg && ./peg_start.sh`.
4. Select **Cluster management**.

```
No Products Found
[~] Initializing Installer ... Initialized!
Which function would you like (Use ↑/↓ and ←)
▶ Cluster Management
  Redaction Management
  Vault Management
```

5. Select **Generate Certificate Requests**.

```
Which function would you like
  Install Cluster - Cloud Managed
  Install Cluster - On Premise
▶ Generate Certificate Requests
```

6. Fill out the options that follow.
7. Exit the menu.
8. Please record the UID value that you see in the output of this command: `cat ~/.kudzu/appliance.txt`
The CSRs are located in `~/peg/csr`.
9. Create certificates from those CSRs per [Create certificates](#) on page 3655.

Create DNS entries and deploy PEG VM

Create DNS entries and deploy PEG VM as part of installing PEG.

Create DNS entries where each domain mentioned in [Table 1](#), points to the PEG VM (PEG must have a static IP or a static domain name).

Configure PEG to work with a proxy

Configure PEG to use a proxy for outbound traffic if required.

Deploy PEG VM

Note: When you deploy the PEG VM, ensure that it has a static IP or at least a static domain name. To configure the VM static IP address, use the mechanism provided by your VPC provider.

1. Log in to the PEG VM through ssh.
2. Copy your proxy certificate, if one is required, to the following locations:

Note: The proxy file name must have a .crt extension and must be in the Base64 PEM format (called openssl format in some systems).

- ```
sudo cp <your proxy certificate.crt> /usr/local/share/ca-certificates/
```
- ```
sudo cp <your proxy certificate.crt> /peg_v/certs/
```

3. For the OS to load the certificate, run the following command: `sudo update-ca-certificates`
4. Add the following to the `/etc/environment` file (including the username and password if required) using the `http_proxy` and `https_proxy` values for your environment.

Note: Although this is not a requirement, the `https_proxy` value is often the same as the `http_proxy`, with the protocol being HTTP for both.

Enter the URL in the following format: `<your http/https proxy url>`

Enter the username and password if required: `http://username:password@host:port/`

```
---
```

```
http_proxy=<your http proxy url> https_proxy=<your https proxy url>
```

```
no_proxy="localhost,::1,127.0.0.0/8,0.0.0.0,10.0.0.0/8,192.168.0.0/16,172.16.0.0/16"
```

5. Log out of your ssh session and then log back in.
This allows the proxy settings to be picked up by the operating system.
6. Edit the following values as follows in `~/peg/text_pipeline/values-gpu.yaml`. (These values are at the bottom of the file).
Enter the URL in the following format: `<your https proxy url>`. Enter the username and password if required. `http://username:password@host:port/`

If you do not use a certificate for the proxy, `fluentd_cert_path` should be left as follows: ""

```
---
```

```
has_fluentd_proxy: "true"
```

```
fluentd_cert_path: "/peg_v/certs/<your proxy.crt>"
```

```
https_proxy: "<your https proxy url>"
```

```
---
```

7. If you performed the steps in before performing the proxy steps outlined in the previous steps, perform the following steps:
 - a) Run `cd peg && ./peg_start.sh`.
 - b) Select Cluster Management and press Enter, and then select Load Certificates and press Enter again.

```
No Products Found
[~] Initializing Installer ... Initialized!
Which function would you like (Use ↑/↓ and
▶ Cluster Management
```

```
Which function would you like
Install Cluster - Cloud Managed
Install Cluster - On Premise
Generate Certificate Requests
▶ Load Certificates
```

Set up and configure PEG

Configure PEG for your environment.

If you require a proxy configuration, first perform the steps outlined in [Configure PEG to work with a proxy](#) on page 3657.

Ensure the following:

- Unique ID (UID) provided by Process Discovery
- Platform endpoint provided by Process Discovery
- PEG-managed certificates: the apex domain that you want to use for the PEG DNS names (for example, example.com)

1. Log in to PEG through ssh.

Note: If you do not log in as user named peguser, then ensure that you switch to the peguser before performing these steps: `sudo su peguser`.

2. Run the following commands:

```
echo "<apex domain>" > ~/.kudzu/apex_domain.txt
```

```
echo "<UID>" > ~/.kudzu/appliance.txt
```

```
echo "127.0.0.1" > ~/.kudzu/external_ip.txt
```

```
echo "CSRs Generated" > ~/.kudzu/csr_log.txt
```

3. Modify the existing values in `~/peg/text_pipeline/values-gpu.yaml` as seen here. Do not include a slash at the end of the URL.

```
external_fluentd_url: "https://<FortressIQ provided platform endpoint>"
```

```
external_fluentd_port: "443"
```

4. Confirm that the PEG VM can reach the Process Discovery platform by running the following:
`curl https://<FortressIQ provided platform endpoint>`
 Use the platform endpoint based on where your cloud tenant is located:

Region	Process Discovery provided platform endpoint
United States	https://tr-na-000-fluentd-web.fortressiq.com
United Kingdom	https://tr-uk-00-fluentd-web.fortressiq.com
Australia	https://tr-au-00-fluentd-web.fortressiq.com
Canada	https://prod-ca-001-fluentd-web.fiq-process-intelligence.com

The following message is displayed:

400 Bad Request

'json' or 'msgpack' parameter is required.

Although that result is an error response, it is expected as the curl is not sending a well-formed message. The response confirms that the server received the request and responded.

5. Copy the PEG certificates that you created to `/peg_v/certs/` directory. Ensure that they are named according to the certificate file names in [Create certificates](#) on page 3655.
6. If you also created your own keys, copy the PEG keys that you created to the `/peg_v/keys/` directory. Ensure that the keys are not password protected. Also, ensure that they are named according to the certificate file names in Table 1.
 If you did not create your own keys, the PEG-generated keys are automatically included by PEG.
7. Run `~/peg/scripts/validatecerts.sh`.
 To confirm that the certificates are valid, continue only if the script passes with "All checks passed!"
8. Reboot to ensure that any updated drivers are applied correctly: `sudo reboot now`

- Run `cd ~/peg && ./peg_start.sh`.
- Select Redaction Management and press Enter, and then select Install module and press Enter again.

- Change the analytics page password. Run the following and enter your password. `cd ~/peg/scripts/ && ./change_elastic_password.rb`

Note: The username for logging in to `https://analytics-fiq-<UID>.<apex domain>` is admin.

15. Add storage users as needed . You will need at least one user with at least read access to confirm that PEG works. These are the users that can review the redaction of the images. `~/peg/scripts/add-storage-user.rb` .

This script also gives you the option to create users that can edit the pass-and-block (allow/deny) list.

Note: The username that you create corresponds to the **Access Key** in the login page for `https://storage-fiq-<UID>.<apex domain>`. The password corresponds to the **Secret Key**.

Configuration is now complete.

Validate PEG is running

Verify whether your PEG configuration is operating correctly in review mode.

Review the following table for the format and purpose of various URLs in PEG:

URL format	Purpose
<code>analytics-fiq-<UID>.<apex domain></code>	Provides access to Kibana dashboards where we can monitor the number of logs, number of users, what is being forwarded, and so on.
<code>dlp-fiq-<UID>.<apex domain></code>	Is a critical URL as this is where the sensor sends all its logs to. This URL must be used as an input while setting up the sensor.
<code>es-fiq-<UID>.<apex domain></code>	Used for accessing database directly. This is very important as the key light application accesses database to align meta data with the images.
<code>klite-fiq-<UID>.<apex domain></code>	Provides access to the Klite application where the raw data and the corresponding screen shots can be visualized.
<code>proxy-fiq-<UID>.<apex domain></code>	Monitors the health of Kubernetes services. Note: This is only required for debugging.
<code>st-fiq-<UID>.<apex domain></code>	Provides a direct link to the OCR service. Note: This is only required for debugging.
<code>storage-fiq-<UID>.<apex domain></code>	Provides Direct Access to the image storing application. Note: Images are in raw S3 bucket format that can be accessed through Klite.

To confirm that PEG is running as expected, perform the following steps:

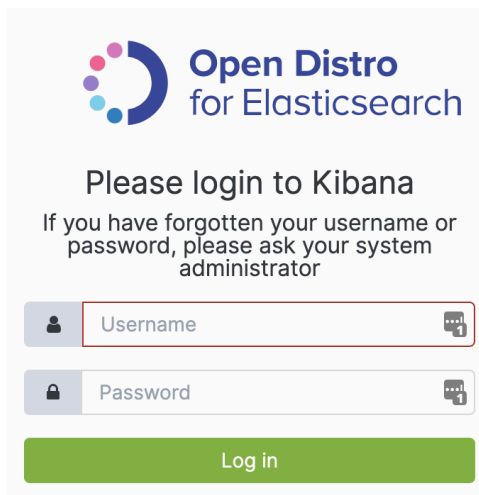

1. In a browser, go to `https://storage-fiq-<UID>.<apex domain>`. You will see a screen like this: ("Access Key" = "your username" and secret key = "your password")

2. Log in to `https://storage-fiq-<UID>.<apex domain>` using a user you created in the configuration steps previously (by running `~/peg/scripts/add-storage-user.rb` on the VM).
3. After you log in, you will see these folders on the left. If you do not, run the "Storage Management" "initialize storage" steps in the configuration steps. If you still do not see them after that, contact Process Discovery.

4. In a browser, go to the analytics URL: `https://analytics-fiq-<UID>.<apex domain>`. You will see a screen similar to the following:

If you do, go to the next step.

5. In a browser, go to `https://dlp-fiq-<UID>.<apex domain>`. You will just see a blank page. If you encounter an error or it times out, then there is something wrong.
6. Install the Process Discovery Sensor on a Windows machine. Open a web page, such as <https://www.fortressiq.com>, and then click the page several times.
7. After 10 minutes (which is the approximate duration for review images to be generated), log in to `https://storage-fiq-<UID>.<apex domain>`. Log in with one of the storage users that you created previously in the configuration steps. Note on the folders on the left side:
 - `fiq-screenshots`: Shows the screenshot that PEG received
 - `forwarded`: Shows what the screenshot looks like if it is forwarded. This is populated regardless of whether it was actually forwarded or not.
 - `review`: PEG adds annotation to the images here to show more clearly what will be redacted. PEG includes a blue rectangle around where the redacted word previously existed and includes the text it found above the rectangle.
8. Click the **fiq-screenshots** folder on the left.
9. Download some of the images from this folder and confirm that they look like the results of your test.
10. Click on the **review** folder.
11. Download some of the images from this folder and confirm that they appear to be from your test. If PEG finds words that must be redacted, PEG includes a blue rectangle around where the redacted word existed and it includes the text it found above the rectangle, as follows.

If this looks as expected, you have validated that PEG is working in review mode.

Create image viewer user in analytics portal

Learn how to create an image viewer user and add the user to the analytics portal. Use the image viewer to find, view, and compare images in PEG.

To create a user in image viewer user and add a user to the **klite_read_only** role in the analytics portal, perform the following steps:

Note: The image viewer uses the same logins as those used in the PEG analytics portal.

1. In a browser, go to the analytics portal: `https://analytics-fiq-<UID>.<apex domain>`
2. Enter your admin username and password.
Your admin password is the same password as the elastic password you set when you configured PEG.
3. Go to **Security > Internal users**.
4. Click **Create internal users**.

5. In the **Create internal user** form, enter your username and password.
6. Click **Create**.
7. Go to **Security > Roles**.
8. In the search field, enter **klite_read_only**.
9. Click **klite_read_only**.
10. Select the **Mapped Users** tab, and click **Map Users**.
11. Select the users you want to map.
12. Click **Map**.

Users can now log in to the image viewer.

Update PEG

Use the following instructions to update PEG to the latest version.

Review the following considerations before updating the PEG version:

- The current version of the PEG installation.
- The Operating System (OS) version that the PEG is currently using.

Run `ssh` in the PEG to retrieve the OS version.

Note: If you see 18.04 as the Ubuntu OS version, then it is recommended that you get the latest PEG image and start a new configuration rather than updating the PEG version. The most recent PEG image is based on Ubuntu 20.04.

- The Keys and Certificates that must be deployed for updating the PEG version.
1. Use the following instructions to test if PEG can access the required update files from the cloud storage:
 - a) SSH into your PEG Virtual Machine (VM).
 - b) Create a directory that will contain the update files.
For example, `mkdir update`.
 - c) Use the following command to navigate into the `update` directory:
`cd update`
 - d) Download the `update_peg.rb` script using the following command:

```
curl "https://fiqpeg.blob.core.windows.net/updates/update_peg.rb?si=get_updates&sv=2020-08-04&sr=c&sig=vVI3fmLfJyu2zsCC9nxhxUKBhsgkp5K5DnrFCDQJ%3D" -o update_peg.rb
```

- If the above command was successful, PEG VM must be able to download all of the required files for the update. Review step 2 for instructions.
 - If the command times out or fails in any way, the PEG VM cannot download the update files directly. Review step 3 for instructions.
2. If the above command was successful, use the following instructions to download the PEG update file directly to the PEG VM:
 - a) Ensure that you are in the directory of PEG that you had previously created.

Use the `cd update` command to get to the directory.

- b)** Use the following command in order to make the update script executable:

```
chmod ugo+x update_peg.rb
```

- c)** Run the following update script:

```
./update_peg.rb
```

This script will not update the PEG but will only download all the dependent files for the update.

Note:

By default, `update_peg.rb` downloads the update files from United States server. However, If the download times out or you encounter an error, you can download it from the Australia server by using the following command to switch the country:

```
./update_peg.rb --country au
```

If the download was successful, **You have all files needed for the upgrade** message is displayed.

- d)** Run the following update script:

```
./update_peg.rb --upgrade-peg
```

This can take a while (about an hour or less).

Note: If the script fails before the update completes, do not run it again. Contact Automation Anywhere support for assistance.

If the update was successful, an **Update done** message appears.

- 3.** If the PEG is unable to access the required update files from the cloud storage, use the following instructions to download the file outside the PEG VM:

- a)** Run the following command on a Windows machine with curl (for example, Windows 10) or a Linux machine that has access to a public internet:

```
curl "https://fiqpeg.blob.core.windows.net/updates/update_peg.rb?si=get_updates&sv=2020-08-04&sr=c&sig=vVI3fmLfJyu2zsCC9nxhxUKBhsgkp5K5DnrFCDQJ%3D" -o update_peg.rb
```

Note: If the above command fails or times out, you need not access the PEG update files. Try another machine that has outbound `https port 443` access to `fiqpeg.blob.core.windows.net`.

- b)** If the above command was successful, copy the downloaded `update_peg.rb` to the update folder in your PEG VM.
- c)** Sign in to PEG.
- d)** Use the following command to navigate to the update folder:
`cd update`
- e)** Use the following command in order to make the update script executable:
`chmod ugo+x update_peg.rb`
-

- f) Use the following command to run the update script:
- ```
./update_peg.rb
```
- The update script will create a `./download_peg_updates.sh` file. Run this script on a machine that can access the public internet you used earlier. If it is a windows machine, you can copy the contents of the `./download_peg_updates.sh` file and run those curl commands.
- g) Copy all the files that were downloaded into the update folder in your PEG VM.
- h) Repeat the step c and g until `./update_peg.rb` completes with a message **You have all files needed for the upgrade**.

---

**Note:** You might have to repeat these steps multiple times as with each file you add to the update directory, the `update_script.rb` learns new info about what other update files are required. Typically, you have to run through this cycle of steps three times before the update script has the necessary files for the update.

---

- i) When the above step is successful, run the following update script:
- ```
./update_peg.rb --upgrade-peg
```
- This can take a while (about an hour or less).
- If the update was successful, an **Update done** message appears.

Configure PEG image redaction

After performing the installation steps, configure PEG to mask words and send the redacted images to the Process Discovery platform.

Configuration steps

Step 1: [Manage redaction list configurations](#) on page 3667

PEG redacts words based on the pass and block lists for forwarding.

The pass list: PEG will not redact the built-in pass list of words. Only words in the pass list will be included in images and other data sent to the Process Discovery platform. Words that are not on the pass list are redacted.

The block list: The block list is a list of words that PEG will redact. PEG redacts words based on this list before processing the pass list.

The block list is useful in situations where you know words exist on the pass list that you want redacted, but you do not want to have to modify the pass list. One common use case is that some people's names are also everyday words that appear on the default pass list. You can create a block list of all of the names of your employees or common names in various

countries, which can be obtained from the Internet.

Note: The redaction of all information is subject to the OCR accuracy. Please note that 100% redaction accuracy of all information can be difficult to achieve and might require a high degree of manual review.

Step 2: [Review redaction results](#) on page 3670

The image viewer enables users to review incoming images and redaction results.

Step 3: [Manage forwarding configurations](#) on page 3673

Redacted images are processed in one of two modes, the review mode and the forwarding mode.

The review mode: This is the default mode for PEG when it runs for the first time. In this mode, you can review the redacted images, make changes to the pass-and-block lists, without PEG forwarding data to the Process Discovery platform.

The forwarding mode: When you are comfortable with the results of your review of the images, you can enable the forwarding mode. In this mode, PEG will redact sensitive data from newly incoming images and send the redacted data to the Process Discovery platform. (Existing images from review mode will not be forwarded.)

Manage redaction list configurations

Learn how to manage your redaction configurations from the Privacy Enhanced Gateway (PEG) UI and export logs, instead of running commands on the Command Line Interface (CLI).

To update your redaction settings from the UI, perform the following steps:

1. Log in to your PEG klite URL platform as an administrator: `https://klite-fiq-
<UID>.<apex domain>`.
2. In the upper right-corner, navigate to **Admin > PEG configuration**.
3. In General Settings, select **Redaction List**.
4. In the **Pass List** section, select from the following options:

Option	Action
Upload new list document	<p>Click to upload a new list of words. The words on this list are not redacted and are sent to the platform. Words on this list typically do not contain sensitive, private information (such as credit cards numbers, phone numbers, names, and so on).</p> <hr/> <p>Note: Any word that is not on the pass list is redacted.</p> <hr/>
<pass-list>.txt	<p>a) Click to edit the existing pass list. The list is saved in the Downloads folder.</p> <p>b) Open the file, add your changes, and save the file.</p> <p>c) Click Upload new list document to upload the document.</p> <p>A pop-up message appears notifying you that the pass list is updated successfully.</p> <p>Each line can only contain one word. A word can contain letters, numbers, and symbols, but no spaces. For words with numbers and symbols, those words will only be used for comparison if the Cleaning field is set to false. The words are case-insensitive. For more details about cleaning, see step 11.</p>
Text field	<p>Enter the words in the text field to update the existing pass list followed by the Enter key. For example, to update the pass list to include a category (such as Support), enter Support in the text box followed by the Enter key.</p>

5. Click **UPDATE** to save your changes for the pass list in the text field.
6. Click **CLEAR ALL** to clear your changes in the text field and start over.
7. In the **Block List** section, select from the following options:

Option	Action
Upload new list document	<p>Click to upload a new list of words. The words on this list are redacted and not sent to the platform.</p>

Option	Action
<block-list>.txt	<p>a) Click to edit the existing block list. The list is saved in the Downloads folder.</p> <p>b) Open the file, add your changes, and save the file.</p> <p>c) Click Upload new list document to upload the document.</p> <p>A pop-up message appears notifying you that the block list is updated successfully.</p> <p>Each line can only contain one word. A word can contain letters, numbers, and symbols, but no spaces. For words with numbers and symbols, those words will only be used for comparison if the Cleaning field is set to false. The words are case-insensitive. For more details about cleaning, see step 11.</p>
Text field	Enter the words in the text field to update the existing block list followed by the Enter key.

8. Click **UPDATE** to save your changes for the block list in the text field.
9. Click **CLEAR ALL** to clear your changes in the text field and start over.
10. In the **Redaction Word Filter Setting** section for **Fuzzy Matching**, select **true** to allow Optical Character Recognition (OCR) some level of variation (fuzzy matching) to consider a word a match. By default, **Fuzzy Matching** is set to true and PEG does not require an exact match when comparing a word with a word on the pass for the block list. Select **false** to disable fuzzy matching.

Note: When reviewing the redaction levels, you might find some sensitive text (that is not on the allow list) displaying unexpectedly in the applications screenshots. In that case, select **false** to disable fuzzy matching to provide a preferable result.

For example, if OCR reads a word as kello. There is a chance that OCR might be right or wrong in how it reads the word kello. Kello is not in the pass or block list. Kello might be considered a close enough match to hello (with the idea that kello was just OCR misreading hello). So, if the word hello is in the pass list, then the word kello would also be allowed and not redacted.

11. In the **Cleaning** field, click the drop-down to select **true** to remove all non-alphabetic (anything not a letter in the alphabet) from a detected word before comparing it to the words in the dictionaries. Select **false** to allow numbers for cleaning. By default, cleaning is set to true.

Note: Cleaning defines whether non-alphabetic characters should be ignored when comparing a word with the dictionaries.

For example, there are category types (PURCH2A, PURCH2B, and PURCH2C) that are a mix of numbers and letters that appear in your application screens that should not be redacted. To ensure that PURCH2A, PURCH2B, and PURCH2C are not redacted, add the words to the allow list and disable cleaning. PEG will not remove the numbers from these words when comparing with the words on the allow list. Another example is if you have an account ID,

such as SA31LE. If cleaning is set to true, then PEG removes the number 31 from SA31LE and compares the word, SALE with the words in the allow list. If SALE is in the allow list, then it is not redacted. However, if you set cleaning to false, cleaning compares SA31LE with the words on the allow list. Since SA31LE is not in the allow list, SA31LE is redacted.

12. Click **UPDATE** to save your changes.

A pop-up message appears notifying you that your changes are successfully deployed.

13. Click one of the following buttons to export the logs from the UI:

- **Export Logs**

The logs begin generating. After the logs have generated, click **Download Logs** to download the `logs.zip`. The log files contain information about the system (including logs for the last 24 hours).

- **Export PEG metrics**

After the metrics are generated, click **Download PEG Metrics** to download the `pegMetrics.zip`. The file contains operational and performance metrics about the system.

Review redaction results

Use the image viewer to see the incoming images and review the redaction results to determine what changes to make to the redaction configurations.

You can use the image viewer to see images in the following buckets:

- `fiq-screenshots`: This contains the screenshots that PEG received.
- `forwarded`: This is what the screenshot looks like when it is forwarded to the Process Discovery platform. This is populated regardless of whether it is forwarded or not.
- `review`: This includes annotated images. PEG adds annotation to the images to clearly show what will be redacted. PEG puts a rectangle around where the redacted word previously existed and includes the text it found above the rectangle.

To review the images, perform the following steps:

Note: These instructions show you the filters that are used frequently, but you can change the selection as needed.

1. Log in to the image viewer.

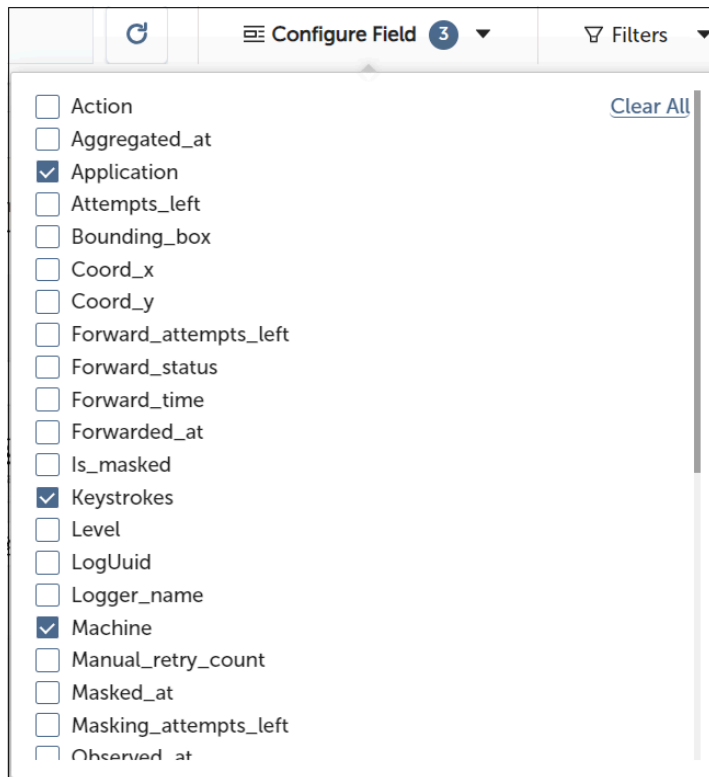

To open the image viewer application, enter the following address in a web browser:

```
https://klite-fiq-<UID>.<apex domain>
```

2. Click the **Bucket 1 (Mandatory)** field and select **fiq-screenshots**.
3. Click the **Bucket 2 (Optional)** field and select **forwarded**.
4. Use the calendar to select a date range for reviewing the data.

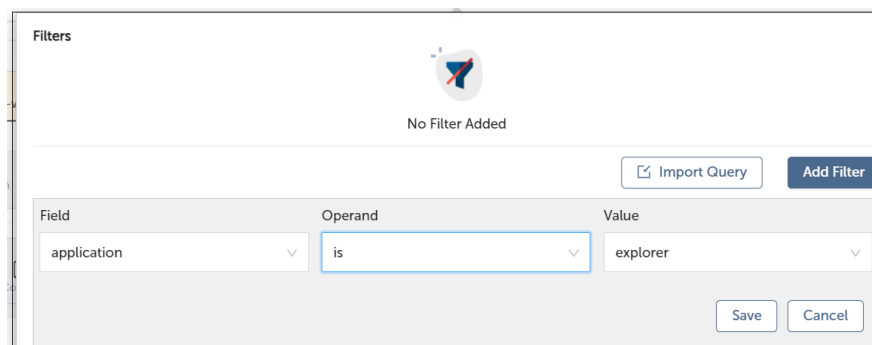

5. Click the **Configure Field** drop-down menu and select fields that you want to apply the filter on.
For example, select the **Application**, **Keystrokes**, and **Machine** fields.

The image viewer displays the selected fields above the screenshot.

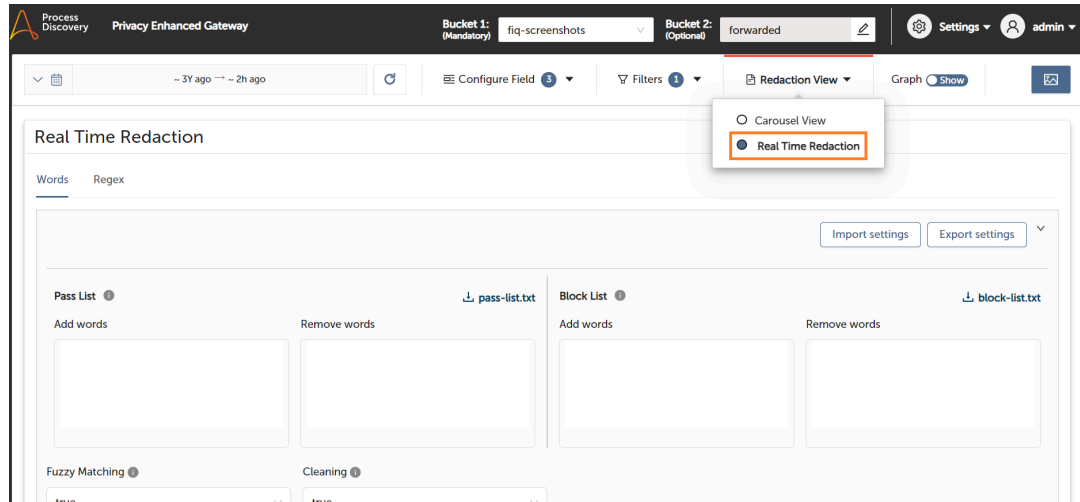

6. Click **Filters** to specify a value for the fields that you have selected in the **Configure Field**.
For example, select the **Field** as **application**, **Operand** as **is**, and the **Value** as **explorer** to see the images that contain explorer.

7. Optional: The **Carousel View** is default display option. Click the drop-down menu and select **Real Time Redaction**.

You can use real-time redaction as a **sandbox** environment, where you can edit the pass and block lists and immediately see the impact of those edits. When you are ready, you can commit your edits to the system redaction configurations.

- a) From the toolbar at the top, click **Carousel View > Real Time Redaction**.

- b) Use the slider to review the image before and after redaction.
- c) Use one of the following filters for the images:
- **Words**
Use the following two fields to add or remove the words:
 - **Pass List:** The words on this list are not redacted and are sent to the platform. Words are on this list typically do not contain sensitive, private information (such as credit cards numbers, phone numbers, names, and so on).
 - **Block List:** The words are on this list are redacted and not sent to the platform.
 - **Regex**
Use regular expressions (regex) to create string patterns that help match, locate, or manage text:
 1. Click the **Create regex** icon for new regex expression.
 2. Enter a regex pattern in the **Regex expression** field.
 3. In the **Description** field, add a description for the new regex expression.
 4. Use the **Action** field to select one of the following redaction conditions:
 - **Allow**
 - **Block**
 5. Click **Commit** to save the regex filter.
- d) Click **Preview** to see the redaction results of your edited Pass and Block lists. Continue making changes to the lists and reviewing the image until you are satisfied with the redaction results.
- e) Click **Commit** to apply your changes to the system redaction configurations.
8. Optional: Export images for further review. To export images, do the following steps:
- a) Click the **Export image** icon located in the top-right corner of the page.
 - b) Select the range of images to export using the modal bar.

- c) Select the slot from which to export the images.
A slot is a container for up to 100 images.
 - d) Alternatively, select the **Random** export option.
 - e) Click **Download**.
9. Review the images to ensure the correct content is being redacted.
10. To change the redaction configurations, do the following steps:
 - a) Return to the Redaction list page to update the pass and block lists.
For more information on editing the pass and block lists, see [Manage redaction list configurations](#) on page 3667.
 - b) From the upper right corner, navigate to **Admin > PEG configuration > Forwarding**.
 - c) Click **Run re-redaction sync job** to apply the new redaction configurations on images that were not forwarded to the Process Discovery platform.
 - d) Return to the Image viewer to review the newly-redacted images.

When you are satisfied with the redaction results, turn on image forwarding. See [Manage forwarding configurations](#) on page 3673

Manage forwarding configurations

Learn how to manage your forwarding configurations from the Privacy Enhanced Gateway (PEG) UI instead of running commands on the Command Line Interface (CLI).

To update your forwarding settings from the UI, perform the following steps:

1. Log in to your PEG klite URL platform as an administrator: `https://klite-fiq-
<UID>.<apex domain>`.
2. In the upper right-corner, navigate to **Admin > PEG configuration**.
3. In General Settings, select **Forwarding**.
4. In the **Forward to platform** field, select **true** to forward redacted data platform, or select **false** to prevent sending forward redacted data to the platform.
By default, the **Forward to platform** field is set to false.
5. In the **Port for forwarding** field, the default port number is 443.
We recommend that you leave the default port number as 443 unless you need to change it.
6. In the **Forward live records** field, select **true** to forward the live events to the platform, or select **false** to prevent sending any events to the platform.
You can use this setting to forward new incoming events. It will not forward existing events that are masked. If you select **false**, the incoming events are redacted, but not sent to the platform.
7. In the **Forward existing masked records** field, select **true** to forward existing events that were already recorded but have not been sent to the platform. Select **false** to prevent sending any existing events collected on your machine to the platform.
You use this field only to forward data that was previously collected. For example, you might have collected events for two weeks and forgot to send the events to the platform.

8. In the **UTC start date for forwarding** field, enter the start date for the observed at date range. The observed at date range is when the Process Discovery Sensor recorded the event on the machine. You must specify the range in the UTC time zone.
Based on the date range you enter, PEG forwards previously redacted events that were not already forwarded to the platform.
9. In the **UTC end date for forwarding** field, enter the end date for the observed at date range.
10. To use a proxy, click the **Use Proxy** checkbox.
11. In the **https proxy** field, enter the proxy URL address to use.
If required, include the username and password in the URL: http://username:password@host:port/
12. Click **Deploy**.

Switch between modes

Change PEG to the forwarding mode and then back to the review mode.

By default, PEG initially starts in the review mode.

1. To switch to the forwarding mode:
 - a) Edit the `~/peg/text_pipeline/values-gpu.yaml` file. At the end of the file, change the `forward_to_fluentd` value to true and save the changes.
`forward_to_fluentd: "true"`
 - b) Push the change to PEG by running the following from any folder:

```
source ~/peg/scripts/vars.sh
```

```
kubectl delete cronjob.batch/text-pipeline-masking-masking-cron -n text-pipeline
```

```
kubectl get pods --output=jsonpath={.items..metadata.name} -n text-pipeline -o=name | grep cron | xargs -n1 kubectl delete --grace-period=0 --force -n text-pipeline
```

```
helm upgrade text-pipeline ${text_pipeline_dir} -f ${values_file_t} --namespace text-pipeline --set ocr.name=st-fiq-$new_gen_uuid.$apex_domain --set masking.name=dlp-fiq-$new_gen_uuid.$apex_domain
```

2. To switch back to the review mode:
 - a) Edit the `~/peg/text_pipeline/values-gpu.yaml` file. At the end of the file, change the `forward_to_fluentd` value to false and save the changes.
`forward_to_fluentd: "false"`

- b) Push the change to PEG by running the following from any folder:

```
source ~/peg/scripts/vars.sh
```

```
kubectl delete cronjob.batch/text-pipeline-masking-masking-cron -n text-pipeline
```

```
kubectl get pods --output=jsonpath={.items..metadata.name} -n text-pipeline -o=name | grep cron | xargs -n1 kubectl delete --grace-period=0 --force -n text-pipeline
```

```
helm upgrade text-pipeline ${text_pipeline_dir} -f ${values_file_t} --namespace text-pipeline --set ocr.name=st-fiq-$new_gen_uuid.$apex_domain --set masking.name=dlp-fiq-$new_gen_uuid.$apex_domain
```

Manage disk space

Manage disk space by managing the duration for which images are kept in the review folder.

When the disk usage is over 80 percent, PEG stops processing new messages. To manage the setting in the review folder, perform the following steps:

1. Add the following block of code to the end of the `~/peg/text_pipeline/values-gpu.yaml` file. (Alternatively, if an entry already exists, modify it.)

```
#Archive Info
review_retention_days: 365
```

The value that you include here will be the number of days for which PEG will keep an image in the review folder. Replace the number 365 with the number of days for which you want to retain review images. This will affect only the review images. The original images and the images in the forwarded folder will not be affected.

2. Push the change to PEG by running the following from any folder:

```
source ~/peg/scripts/vars.sh
```

```
kubectl delete cronjob.batch/text-pipeline-masking-masking-cron -n text-pipeline
```

```
kubectl get pods --output=jsonpath={.items..metadata.name} -n text-pipeline -o=name | grep cron | xargs -n1 kubectl delete --grace-period=0 --force -n text-pipeline
```

```
helm upgrade text-pipeline ${text_pipeline_dir} -f ${values_file_t} --namespace text-pipeline --set ocr.name=st-fiq-$new_gen_uuid.$apex_domain --set masking.name=dlp-fiq-$new_gen_uuid.$apex_domain
```

Manage PEG events

An event consists of a screenshot and logs (meta data of actions performed while the screenshot was captured). Events can be used to review any data reliability shortcomings that might occur between PEG and Process Discovery platform when data is not in sync.

The **Events Console** screen enables you to review the status of the events, search any failed or pending events, or use a start and end date to filter all the events. However, the **Date Filter** can be used only for the events with **Completed** and **Failed** status. The status can be used to reduce errors caused while forwarding events from PEG to Process Discovery.

Consider a scenario where you want to review the list of events that must be forwarded to the Process Discovery platform. After filtering these event, you want to forward them together (bulk).

1. Log in to your PEG klite URL platform as an administrator: `https://klite-fiq-<UID>.<apex domain>`.
2. In the upper right-corner, navigate to **Settings > Events Console**.
Events Console screen is displayed that contains the status for all the events, a search and filter fields.
3. Click the **Status** drop-down menu and select **Forward Pending**.
The **Total events** field is refreshed and the number of events that are pending to be forwarded is displayed.

Note: You can click any of the events to review the event details such as the transmission timestamps, the reason why the forwarding of the event failed, number of times the forwarding was attempted and so on. PEG attempts to forward an event to Process Discovery for a maximum of five times before moving it to the **Failed** status.

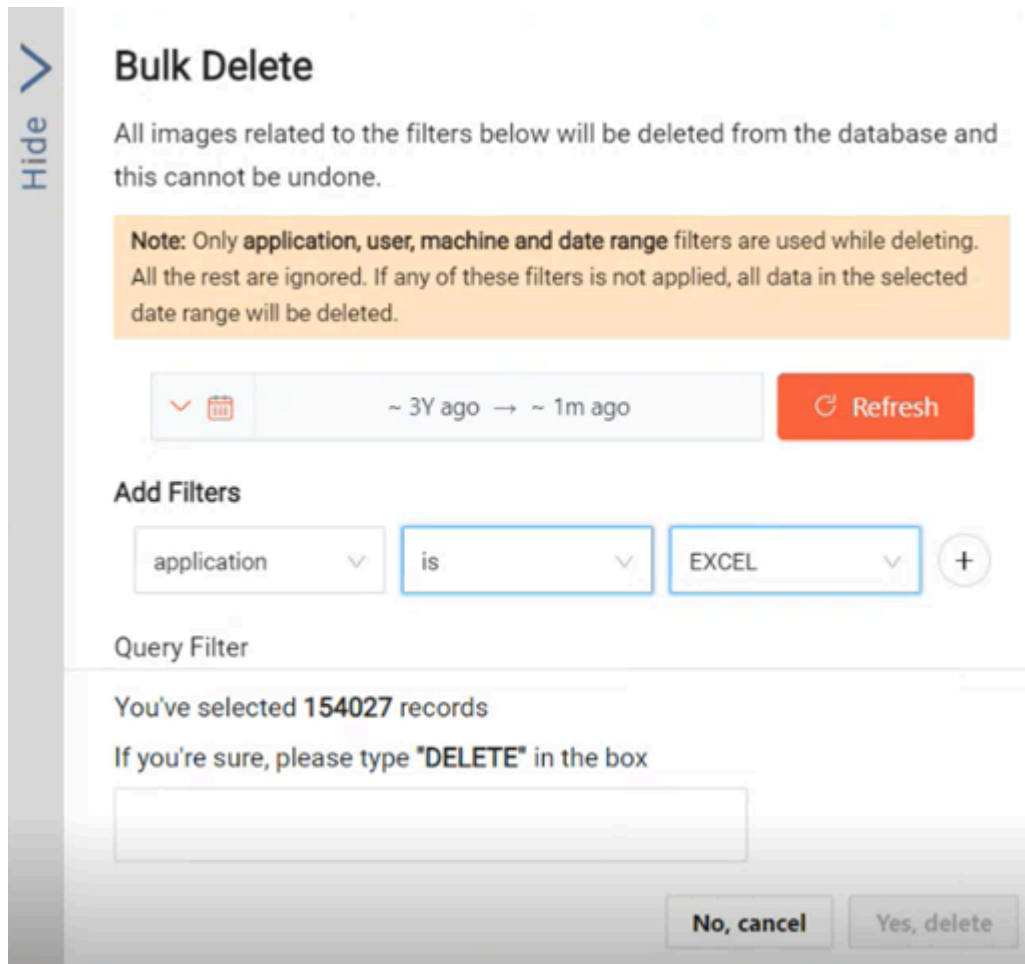

4. Select all the events and click the **Bulk retry** icon at the top of the table.
An alert is displayed that an attempt to forward the events in bulk is initiated and would take sometime. You can click **Status > Forward Pending** and review the total number of events.

Using Bulk delete

Free up storage space by generating a list of images that meet a specific criteria, then selecting the images for deletion.

You must be an admin user to perform bulk deletion.

1. To access Bulk delete for the first time, navigate to **Settings > Enable bulk delete**.
The Bulk Delete modal opens.
In the future, access the Bulk Delete modal from the right side of the window.
2. Specify the time range for when the images were collected.
3. Optional: Select from the following filters and provide the acceptable values: **application**, **user**, or **machine**.
PEG displays the number of images that match your search criteria.

4. Enter DELETE in the text box.
5. Click **Yes, delete**.

Renew and replace certificates and keys using PEG

In the customer-managed certificates deployment model, certificates and keys that are set to expire are not renewed and replaced automatically.

When your certificates are set to expire, you must perform the following tasks to renew them:

1. Create a new certificate. You can create a new certificate with two options:
 - You can choose to have PEG create the new certificate signing request and the keys, or
 - You can create your own certificates and keys. To create your own certificates and keys, see [Create certificates](#) on page 3655.
2. Upload the new certificate. To upload the new certificate, see [Upload the new certificates](#) on page 3678.

If you choose to have PEG generate new keys and the certificate signing requests, perform the following steps:

1. Run `cd peg && ./peg_start.sh`.
2. Select **Cluster Management**.

```
No Products Found
[^] Initializing Installer ... Initialized!
Which function would you like (Use ↑/↓ and ←)
▶ Cluster Management
  Redaction Management
  Vault Management
```

3. Select **Generate Certificate Requests**.

```
Which function would you like
  Install Cluster - Cloud Managed
  Install Cluster - On Premise
▶ Generate Certificate Requests
```

4. Enter information for the options that follow.
5. Exit the menu.
The certificate signing requests are located in `~/peg/csr`.
6. Create certificates from the CSRs that PEG generated. For more information, see [Create certificates](#) on page 3655.

Upload the new certificates

Learn how to upload the new certificates and keys after they are created.

1. Copy the PEG certificates that you created to the `/peg_v/certs/` directory.
Ensure that you name them according to the certificate file names in [Table 1](#).
2. If you also created your own keys, then copy the PEG keys that you created to the `/peg_v/keys/` directory.
Ensure that the keys are:
 - Not password protected
 - Named according to the certificate file names in [Table 1](#)

Note: If you choose to have PEG generate the keys, then you do not need to perform this step. The PEG-generated keys are placed into a folder for you.

3. To confirm that the certificates are valid run `~/peg/scripts/validatecerts.sh`.
Continue to Step 4 only if the script displays: All checks passed!
4. To load the latest certificates, run the following command on PEG:

```
kubectl rollout restart deployment.apps/traefik -n kube-system
```

Process Discovery Sensor application

Use the Process Discovery Sensor to record activity on a user's machine to determine what business processes are candidates for automation.

The Automation Anywhere Process Discovery Sensor is a lightweight application that integrates to the machines' video card to record user activities. The sensor operates in both thick and thin client applications, and across multiple monitors. You can configure which applications and domains can be used to capture activity.

System requirements

The following system requirements are supported for installing the Process Discovery Sensor:

- Operating Systems
 - Desktop: Windows 10, Windows 11
 - Citrix VDI: Windows Server 2016
- Memory: 4 GB RAM
- Required software packages: .NET 4.7 or later

Installing Process Discovery Sensor

Learn how to install Process Discovery Sensor on your machine.

Ensure that you install Process Discovery Sensor as a user on your machine, and not on a system level. Any user with privileges to run an MSI installer, and write permissions to their own user folder, can perform the installation. If you are using Microsoft SCCM or other software deployment solutions to deploy the MSI, make sure it is deployed as the user you are deploying it to.

1. Contact your Automation Anywhere Customer Success Manager (CSM) to obtain the msi package.
2. Unzip the msi file if you have received it as a zip file.
3. Double-click the msi file to launch the Installation Wizard.
4. Click **Next**.
5. Click **Next** to continue with your organization, endpoint, and port information.
Your customer information is already populated in the fields provided.
6. Click **Install** on the Ready to Install Process Discovery window to begin the installation.
7. Click **Finish** to exit the Setup Wizard.
The installation is complete and the Process Discovery Sensor is now running. A shortcut displays on your desktop and a pop-up message displays informing you that Process Discovery Sensor has started recording. The Process Discovery icon is displays in your system tray.
8. To quit the recording, right-click the Process Discovery icon in the system tray and click **Quit**.
A message displays that the recording has stopped. To restart the recording, double-click the Process Discovery icon shortcut on your desktop.

Note: Depending on how the Sensor is configured, the quit option might not be available.

Note: After you enable the Observer and install the Process Discovery Sensor, the recording will automatically start even after a system reboot. To prevent the Process Discovery Sensor from automatically recording, click the caret symbol on the taskbar to access the system tray. Right-click the Process Discovery icon in the system tray and select **Quit**.

Uninstalling Process Discovery Sensor

Learn how to uninstall Process Discovery Sensor on your machine.

In a centralized deployment, IT will uninstall Process Discovery Sensor. If you choose to manually uninstall Process Discovery Sensor from your system, perform the following steps:

Note: Before you begin uninstalling Process Discovery Sensor, ensure that you close the Process Discovery Sensor application on your system.

Note: Uninstalling Process Discovery Sensor from the Observers machine will not delete the previous recordings from the Process Discovery Cloud.

1. Navigate to **Windows > Control Panel > Programs and Features**.
 2. Right-click the Process Discovery (IQ) icon and click **Uninstall**.
 3. Click **Yes** to uninstall.
-

Note: If you receive a pop-up message informing you that the following applications should be closed before continuing the install, select, **Automatically close applications and attempt to restart them after setup is complete** and click **OK**.

Installing Process Discovery Sensor in a VDI environment

Learn how to install the Process Discovery Sensor in a Virtual Desktop Infrastructure (VDI) environment and create a portable package.

Many VDI environments do not allow msi installs that install as the user, especially if they are non-persistent desktops. If the msi installer does not work in your environment, you must create a portable installer on a machine with access to the Automation Anywhere Process Discovery platform.

1. Install the Process Discovery Sensor using the MSI installer. For more details, see [Installing Process Discovery Sensor](#) on page 3679.

Ensure that Process Discovery Sensor is running. The Process Discovery Sensor icon displays in the bottom right corner of the system tray.

2. Navigate to `C:\Users\\AppData\Local\Programs\Neo2` and copy the files that the Process Discovery Sensor installer created in that folder to a different folder. For example, you can name the folder Process Discovery Sensor files.
3. In Windows Explorer, search in **Add or remove programs**.
4. Locate the Process Discovery Sensor app and remove the program.

This removes the existing install folder and the registry settings.

5. Copy the Process Discovery Sensor files that you put in a folder to any folder on the VDI server.
6. Create a startup script to start the Neo2.exe on login for users that will run the Process Discovery Sensor.

By default, the Process Discovery Sensor needs write access to the folder it is running from because that is where the Process Discovery Sensor writes the logs and downloads the configuration from the platform. Since the Process Discovery Sensor runs in the user space, users need write access to that folder. If you do not want users to have write access to that folder, you can specify a different writable folder to store the logs and the Process Discovery Sensor configuration. For more details on storing the logs and sensor configuration to a writable folder, see [Modifying the log and configuration storage location](#) on page 3681.

Modifying the log and configuration storage location

Learn how to change the location of the logs and the Process Discovery Sensor configuration storage folder to a folder that is writable to all users who have the Process Discovery Sensor running on their machine.

1. Copy the `NeoRemoteConfig.json` file to the folder where you want to store it.
The `NeoRemoteConfig.json` file is one of the Process Discovery Sensor files you should see in your portable installer folder. The folder you copy it to must be the same writable folder where you want to store the logs.
2. Set the log and config file location by specifying the absolute path to the new folder in the `Path.config` file. In the folder with the `Neo2.exe`, there should be a `Path.config` file. For example, your `Path.config` file might contain: `z:\user_shared_storage\neo2_logs_and_config`.

You can assign it to an absolute path or can use one special reserved variable `{MyDocuments}`.

If you use the `{MyDocuments}` variable in the `Path.config` file, the logs will be stored in a folder named `Neo2` in the user's Documents folder.

Note: The Process Discovery Sensor expects to see the `NeoRemoteConfig.json` in that folder.

Verify Process Discovery Sensor Installation

Use the log files to verify that the Process Discovery Sensor is installed correctly on your machine.

1. While the Process Discovery Sensor is running and in recording mode, click a few times anywhere on your machine.
Clicking a few times on your machine triggers the Process Discovery Sensor to collect and send a screenshot to the Platform which results in entries in the Process Discovery Sensor logs that you can use for validation.
For more details on enabling the Process Discovery Sensor in recording mode, see [Enable and disable the users recording](#) on page 3684.

2. From Windows Explorer, open the C:\Users\\AppData\Local\Programs\Neo2 folder. If you changed the default location for the logs, then open the folder you have changed it to.
3. Locate this log file: Neo_<machine name>_<userid>.log
4. Double-click to open the log file.

If the Process Discovery Sensor is working as expected, the following lines display as an example towards the bottom of the log file. If everything is correct, a job number displays, followed by OK.

```
2022-11-08 22:03:39.3775 TEST\testuser
com.FIQ.Neo2.Utility.Network.RawLogForwardingPostConsumer [INFO]
Worker id: 5b1bd418-2e19-4097-8ba7-31af6f22bd0a, queue size: 0,
current job 152 OK, time elapsed: 0ms, type: fiq.win.keylog
```

```
2022-11-08 22:03:39.3775 TEST\testuser
com.FIQ.Neo2.Utility.Network.RawLogForwardingPostConsumer [INFO]
Worker id: 61849714-b916-43b7-8878-eced56dd1d65, queue size: 0,
current job 151 OK, time elapsed: 5ms, type: fiq.win.screenshot
```

If the Process Discovery Sensor is not working, you will see words such as error and failed in the log files output.

Note: If you experience issues, please contact Automation Anywhere for assistance.

```
2022-11-08 14:13:32.5720 TEST\testuser
com.FIQ.Neo2.Utility.Network.RawLogForwardingPostConsumer [ERROR]
Worker id: bbe8547d-3c67-473d-a328-e949a7c25a03, queue
size: 13, current job 2 failed, type: fiq.win.screenshot,
time elapsed: 10ms, System.AggregateException: One or
more errors occurred. ---> Flurl.Http.FlurlHttpException:
Call failed. An error occurred while sending the request.
POST https://test.example.com:443/fiq.win.screenshot --->
System.Net.Http.HttpRequestException: An error occurred while
sending the request. ---> System.Net.WebException: The remote name
could not be resolved: 'test.example.com'
```

Event Recording

This topic describes the event recording using the Process Discovery (PD) Sensor application. This application seamlessly integrates with the users' desktop environments and captures on-screen activities.

The mouse movement and keystrokes, are observed and captured as screenshots by the PD Sensor. These screenshots are sent to the Process Discovery Cloud platform. The essence of this process lies in the aggregation of these recorded events within the Process Discovery Cloud platform. Here, the events combine, enabling the platform to find patterns. These patterns, representative of sequences of events, subsequently serve as the foundation for the development of recommended processes.

Note: Check the **Data > Events** page to ensure the Process Discovery platform is receiving data from sensors.

The following lists the scenarios when an event is recorded:

1. Keystrokes: The Process Discovery sensor take screenshots when any key outside alphanumeric keys are pressed.

Note: Alphanumeric keys are all letters and numbers and some different symbols. These keys include all letters starting from A leading to Z and numbers from 0 to 9.

When Screenshot is taken	When Screenshot is not taken
Pressing a combinations of keys such as Control-C, Control-V or set of keystrokes followed by enter key.	Pressing all number keys (both on the top row of a keyboard but also specific number pads as well)
Pressing Enter and editing keys	Pressing all character keys such as QWERTY.
Pressing Function keys	Pressing modifier keys that change case – either Shift or Caps Lock Pressing single key strokes: a) Control key b) Shift key c) Alt key

Legend for keyboard key categories:

- Character keys
- Modifier keys
- Enter and editing keys
- System and GUI keys
- Navigation keys
- Function keys
- Numeric keypad
- Lock keys

2. Mouse Clicks: When a mouse click is made the PD Sensor captures a screenshot as an event. The captured events are sent to the Process Discovery Cloud platform through two pathways: direct transmission or through Privacy Enhanced Gateway (PEG). This gateway serves as an enabler of security and privacy, effectively redacting sensitive visual information before dispatching screenshots to the PD cloud.

Capturing these events is similar to creating a digital tapestry of user interaction. Each time an end-user performs a predefined keystroke, clicks the mouse, or even presses the enter key, an event is generated, and in conjunction, a screenshot is taken. This combination of mouse actions, keystrokes, and screenshots forms a complete event.

For instance, if you type "Wikipedia login" into a search box and then press the enter key constitutes an event. This single interaction, a combination of keystrokes and mouse clicks or enter key presses, creates an event. At this instant a screenshot is taken.

In short, a Process Discovery Event consists of metadata from keystrokes and mouse actions combined with the screenshots.

Enable and disable the users recording

Learn how to enable or disable the Observers recording in the Process Discovery platform.

1. Log in to into the Process Discovery platform.
2. Navigate to **Data > Observers**.
3. Identify the Observer you want to enable or disable the recording.
4. From the **Actions** column, click the drop-down arrow to enable **Start Recording** for that Observer. To disable, select **Stop Recording** for that Observer.

Process Discovery FAQ

Answers to frequently asked questions (FAQs) on the Process Discovery, Process Discovery Sensor, and Privacy Enhanced Gateway (PEG) applications.

This document describes Process Discovery and Privacy Enhanced Gateway security features: [Process Discovery Security Brief](#)

Do the Automation Anywhere security risk assessment reports apply to the Process Discovery platform? What Audits are performed?

Automation Anywhere has the following reports with Process Discovery as a component: ISO 27001

Process Discover is audited to the following frameworks and has the following reports:

- SOC 2 Type 2
- HIPAA
- PCI

In addition, the product is GDPR and CCPA compliant.

Can users export their Security Information and Event Management (SIEM)?

Users can export process data and event data into a .csv file. Process Discovery cannot be connected directly to a SIEM. The audit logs track all changes, who made the change, and when the changes are made to the following elements:

- Allow/block list
- Event logs

- Process Discovery configuration policy
- Observers
- Tenants
- Processes
- Windows
- Username

Is Multi-Factor Authentication (MFA) supported?	Yes, Single sign-on and SAML 2.0 are supported.
Does the Process Discovery platform use vulnerability management?	We have internal and external security testing programs. Internal testing spans planning, development, and testing phases, with each test building on previous work. We have an established approach to static and dynamic code analysis at both the development and testing phases. External testing is done on production and is built around the concept of ongoing assurance.
What is the Process Discovery Security Incident Management process?	<p>Incident Response: Automation Anywhere maintains an incident response program designed to analyze, contain, eradicate, and recover from security and safety incidents impacting Automation Anywhere managed networks and/or systems or customer data.</p> <p>Incident Notification: If Automation Anywhere determines that customer data within its control has been subject to a security incident, the customer will be notified under and according to applicable law.</p> <p>Incident Post-Mortem: Automation Anywhere runs a post-mortem after an incident has occurred to analyze and improve tools and processes to mitigate future occurrences.</p>
How does Process Discovery handle security configurations and changes?	<p>Automation Anywhere takes care of the following items:</p> <ul style="list-style-type: none">• Secure multi-tenant environment on Google Cloud Platform• Boundary security (FW, IDS)• Source code scanning• Pen testing Threat & vulnerability scanning• Container security management
Does Process Discovery have a disaster and recovery plan?	<p>We perform daily backups.</p> <p>As per our current disaster recovery policy of 2021, our recovery point objective (RPO) is 6 hours and recovery time objective (RTO) is 24 hours.</p>

Does the PEG redaction process allow users to set anonymized values instead of clearing out redacted values?	No.
Where are Support Teams located?	Our support teams are based around the world to provide follow-the-sun support with personnel located in the US, Europe, Japan, India, and Poland. Our support plans are designed to help you get the answers you need, when you need them, maximizing your investment in Automation Anywhere.
Can Automation Anywhere customer support see masked customer data?	No, the support teams do not have specialized access.
Is there any consent management platform to register client/consumer consent regarding data collection?	Since the customer organization owns their data, it is the responsibility of that customer to collect and maintain consent.
Is there a mechanism to delete stored data?	Yes, we can delete all of the data collected for various different criteria, including all of the data for specific times for a specific observer. If you want to delete data from storage, please notify Automation Anywhere customer support. The data will be permanently removed during the next backup process.
Is there a backup data retention policy in place?	Yes.
How do I increase the storage capacity of my Process Discovery cloud instance?	This is done automatically through the cloud service provider.
What is the total time required to get the PEG VM Image working on the Cloud Provider Environment (AWS, GCP, Azure)?	The time required to perform this task is highly dependent on skill set of the person completing the steps. For more information on the process, see Install PEG on page 3652.
Does using PEG delay the transfer of data from the customer's instance to the Process Discovery cloud instance?	Yes. Data collected within an 8 hour period should transfer to the platform within 24 hours. The platform then can take up to 24 hours to process.
What will happen with PEG VM if the cloud service is down temporarily?	If forwarding mode is enabled, PEG will not forward events. After multiple attempts per event (about 5 attempts), PEG will mark the event as not forwarded and will not try it again.
How is Advanced Redaction implemented?	The latest PEG versions have all redaction settings now available in the user interface.
What is the PEG Analytics Portal?	It is the web interface to the Elastic database. It uses Open Distro (a Kibana-like tool) to enable customers to see the data, including a dashboard that shows which data is masked or in forwarding mode.
What encryption methods or key pairs are recommended for storage options specific to Azure, AWS and GCP?	We recommend you use the standard hard drive encryption methods available in those

	respective clouds using whatever mechanisms they provide.
How often does the Process Discovery Sensor upload data?	Every 5 minutes.
What is the CPU (VDI) Performance impact?	Typically 2 - 5 %
Are there any bandwidth metrics for typical usage?	Process Discovery Sensor typically sends about 10kpbs outbound. For PEG, it is typically 10kpbs outbound multiplied by the number of concurrent sensors.
Will there be an admin who has access by default to the platform? What other users will have access to the instance and data?	See Process Discovery user roles on page 3626.
Which versions of Microsoft Edge does Process Discovery support?	Any of the Chromium-based versions released after January 15, 2020.
Does the customer organization determine the apex domain for PEG DNS names, such as example.com?	Yes
Are events and PEG events stored off-site in case of a disaster recovery incident?	PEG events are not stored off-site. Process Discovery data is backed-up on a regular basis.
What are the storage requirements?	We require 2TB of storage and recommend SSD standard. Customers might need to delete data to free up space for each cycle.

Process discovery by using Discovery Bot

You can use Discovery Bot to identify the processes in your business that can be automated. Discovery Bot identifies such processes by recording and analyzing user interactions with various systems for processes, comparing the potential ROI from automating these processes, and creating bots to automate the processes.

What is process discovery

Process discovery is the first step in automation, in which the processes that can be automated in a business are identified. Process discovery is a method used to uncover business processes by recording user interactions with various systems and analyzing the recorded interactions to identify patterns. User interactions with any of the following types of systems can be recorded and analyzed:

- Enterprise solutions, such as ERP, CRM, business process management (BPM), and ECM
- Personal productivity applications, such as Microsoft Excel and Outlook
- Terminal and virtual environments, such as Citrix XenApp and Remote Desktop

Why use Discovery Bot

Many companies begin their automation projects with manual process discovery and documentation. Manual review of process documentation requires interviewing business users and mapping work flows while performing daily operations involving additional resources, which can be time-consuming for businesses. This additional effort prevents or delays businesses from reaching the decision to automate their processes and reaping the benefits of automation. As a result, many of the automation opportunities are left undiscovered. Discovery Bot allows businesses to assess ROI from potential opportunities that can help with deciding and implementing automation for their processes.

Capabilities

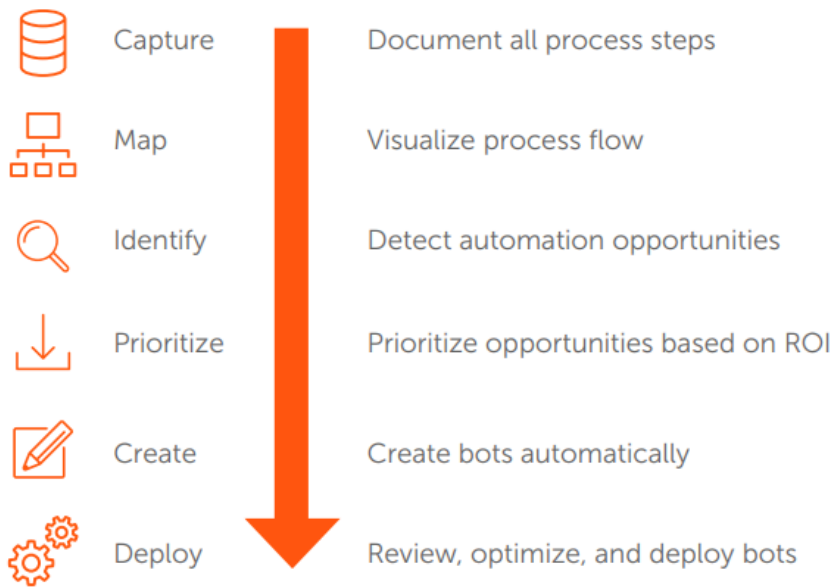

Discovery Bot helps in the following ways:

- Enables automatic process documentation and analysis, thereby saving time and resources
- Identifies the correct processes for automation for business users and citizen developers
- Enables business analysts and RPA developers to accelerate automation and maximize RPA ROI
- Converts automation opportunities into bot prototypes for further development and deployment by the automation developer

How Discovery Bot is used

The Discovery Bot administrator creates processes and invites business users through an email invitation to participate in the recording of these processes. Business users record the steps they perform for various business processes. Discovery Bot aggregates the recordings and generates a proposed work flow. The business analyst can adjust the work flow to select and merge steps into branches from different recordings. From the work flow, the analyst identifies and prioritizes potential automation opportunities based on ROI. Opportunities are approved by the analyst, and Discovery Bot converts the opportunities to Task Bots for deployment.

The following image illustrates how Discovery Bot supports your automation journey from process discovery to bot creation.

To view Discovery Bot tasks in an interactive visual format, see [Get started with Discovery Bot](#).

For an overview of how to get started with Discovery Bot, watch the following video:

See [Get started with Discovery Bot](#).

Get started with Discovery Bot

Discovery Bot enables organizations to accelerate the automation of business processes from process discovery to bot creation.

- Ensure the system requirements are met.
[Prerequisites for Discovery Bot](#) on page 3695
- Install and configure Discovery Bot for users in your organization.

[Installing Control Room On-Premises](#) on page 1121

1. Set up users and assign Discovery Bot roles.
Assign Automation 360 users with the relevant Discovery Bot permissions and associated licenses.
 - [Discovery Bot users](#) on page 3690
 - [Supported licenses for Discovery Bot](#) on page 3692
 - [Create users for Discovery Bot](#) on page 3697
 - [Create multi-role users for Discovery Bot](#) on page 3699
 - [Create a custom role for Discovery Bot](#) on page 3701
 - [Assign the Discovery Bot custom role to a user](#) on page 3702
2. Set up the business process within your organization.

Create a placeholder for collecting all of the recordings associated for a given process. Invite one or more users through email notification to a Discovery Bot process recording session.

[Create a Discovery Bot process](#) on page 3704

3. Record the process.

Business users record their work for the associated processes, annotate their steps, and submit for review a proposed automation work flow.

- [Supported applications and browsers for Discovery Bot](#) on page 3707
- [Record a Discovery Bot business process](#) on page 3709
- [Record a Discovery Bot process using Automation Co-Pilot Desktop Assistant](#) on page 3713

4. Analyze the process.

The relevant business users (subject matter experts (SMEs), RPM or business analysts (BA)) review the recording data and opportunities associated with the process for specific usage patterns.

[Analyzing opportunities for automation](#) on page 3714

5. Create opportunities. Merge specific recordings or steps as required. Prioritize opportunities and generate bots automatically.

- [Review opportunities, convert to bot, and generate PDD](#) on page 3715
- [Using the Filter and Toggle frequency counter options](#) on page 3722

Discovery Bot users

Various users are involved in the discovery process, and each user's role and responsibility helps in identifying potential automation opportunities for a business process. The streamlined workflow in Discovery Bot enables various users to collaborate without changing their operations in a major way.

Discovering processes for automation involves the following users:

Control Room administrator	Creates other users, assigns roles to users, and assigns Discovery Bot licenses for users
Discovery Bot administrator	Creates, edits, and deletes processes; also, associates Discovery Bot roles to and disassociates Discovery Bot roles from processes Users with the Discovery Bot administrator privilege cannot view the recorded data of any process, participate in the recording analysis, or create new opportunities for automation.
Discovery Bot business user	Represents the task force in an organization that will benefit from process automations. The business user performs the following associated tasks for business processes: <ul style="list-style-type: none"> • Performs the steps in the assigned process and records the steps

The business user is responsible for recording the steps in the process that are being reviewed and evaluated for potential automation candidates. The business user is invited to participate in recording session by the Discovery Bot administrator.

- Edits the **Step description** (annotated user text) field for recordings.

For each recording, the business user can review the recorded screen captures and provide annotations to capture the business context for the analyst to review. The business user can update the **Data** (keyboard entered) text field if the information should not be shared with the analyst, for example, user ID and password. If the captured steps are not relevant to the process, the business user can delete the steps before submitting the recording for review.

Note: After a recording has been submitted, it cannot be edited.

- Controls the recording of processes using the media control symbols on the Discovery Bot recorder.

Users can start, pause, resume, and stop the recording on demand by using the Discovery Bot recorder to capture the relevant steps for each process.

Note: After the recorder has been stopped, additional steps cannot be inserted into that recording.

Discovery Bot analyst

This user can also be known by other names in an organization, such as process owner, process analyst, business analyst, or subject matter expert. The Discovery Bot analyst is responsible for reviewing the associated recordings and identifying potential candidates for automation. The analyst can perform the following steps:

- View all approved recordings from assigned users for a given process.

The analyst cannot edit the recordings; however, they can merge the necessary variations from multiple recordings and create an aggregate view of the process.

- Create opportunities from individual recordings and the aggregated view created from multiple recordings, and convert the opportunities into bots.
- Export a potential opportunity to a Word document for reference.

While it is not a prerequisite for the analyst to be knowledgeable about the processes they are reviewing, it is beneficial because this knowledge helps in easily selecting and analyzing the recordings.

Supported licenses for Discovery Bot

Learn about the supported Discovery Bot licenses to ensure business workers are ready to begin using Discovery Bot.

Process Discovery licenses must be purchased for use for business analysts and business users using Discovery Bot. Discovery Bot supports two licenses:

- Process analyzer license for the Discovery Bot analyst

This license allows a user to view and manage the metadata from all recordings within the process and create, view, and manage opportunities created from the recordings.

- Process recorder license for the Discovery Bot user

The process recorder license allows a user to view, record, and submit a process using the Discovery Bot recorder.

The following table displays detailed information for supported licenses and permissions for Discovery Bot business workers:

Discovery Bot user	System-provided Discovery Bot role	Discovery Bot features	Discovery Bot license required
Discovery Bot admin	AAE_Discovery Bot Admin	<ul style="list-style-type: none"> • Create, view, update, and delete processes. • Assign Discovery Bot analyst and business user to processes. 	None
Discovery Bot analyst	AAE_Discovery Bot Analyst	<p>View assigned processes.</p> <hr/> <p>Note: Assigned processes are only displayed after the processes are created by the Discovery Bot admin.</p> <hr/>	Process analyzer

Discovery Bot user	System-provided Discovery Bot role	Discovery Bot features	Discovery Bot license required
		View only recordings (including annotated steps and metadata) that they have created or been assigned to. If a user is no longer assigned to a process, the user will lose access to the recordings.	Process analyzer
		View recordings, including metadata and annotated steps, for a given process.	Process analyzer
		<ul style="list-style-type: none"> • Create, view, update, and delete manual generated aggregation • View all manually generated aggregations 	Process analyzer
		Create and view own opportunities for a given process.	Process analyzer
		Convert an opportunity to a bot.	Process analyzer for opportunity creation. Bot Creator license is required to convert an opportunity to a bot.
		Export opportunity to Word.	Process analyzer

Discovery Bot user	System-provided Discovery Bot role	Discovery Bot features	Discovery Bot license required
Discovery Bot user	AAE_Discovery Bot User	<ul style="list-style-type: none"> • Using the Discovery Bot recorder, create or more recordings for an assigned business process. • Update own recording to include annotations for the steps. • Delete one or more steps from own recording before submission. • View only recordings (including annotated steps, keyboard entered text, and application type) that they have created or been assigned to. The user can update the keyboard entered text field if the information should not be shared with the analyst (e.g. user ID and password). <hr/> <p>Note: Assigned processes are only displayed after the processes are created by the Discovery Bot admin.</p> <hr/> <p>If a user is no longer assigned to a process recording, the user will lose access to the recording data.</p>	Process recorder

Prerequisites for Discovery Bot

To use Discovery Bot for your enterprise business processes, you must have an Automation 360 working environment and the associated dependencies installed: Bot Agent, browser extension, and so on.

Supported versions and server requirements

Verify that you have the correct Control Room version installed. The Control Room deployment can be cloud or on-premises.

Ensure your Control Room server requirements are set up before installation. See [Control Room server requirements](#) on page 1131.

System requirements

For Discovery Bot users' recording processes or assigned bot creation privileges, verify that your device meets the following system requirements:

- Windows machine is only supported for recording sessions.
- Oracle database is not supported on Discovery Bot.
- Set your local device credentials for any device that is connected to the Control Room. This is a one-time setup for each device. Ensure each device that you use accepts the credentials in your profile.
- [Set user device credentials](#) on page 1295
- Register your device and install the latest Bot Agent version on your machine. If you have not already installed the Bot Agent, when you log in initially, you will be prompted to install the Bot Agent from the **Processes** tab. Follow the prompts to install the Bot Agent. This will automatically add your user credentials.

[Install Bot Agent and register device](#) on page 1288

- To record processes using Google Chrome, the Chrome plug-in must be installed.

[Browser requirements for Automation Workspace](#) on page 1154

- Ensure your environment is ready to begin recording and analyzing processes using the Discovery Bot recorder. The prerequisites are similar to the Universal Recorder.

[Record a task with the Universal Recorder](#) on page 2164

- Verify the Discovery Bot recorder requirements are completed.

[Supported applications and browsers for Discovery Bot](#) on page 3707

Update proxy settings

You must update your proxy settings to add the Automation Anywhere URL domain to the trusted list. The added URL domain is specific to your region of Automation Anywhere cloud. If you are using your proxy to access our cloud, you must avoid a redirect to your proxy. Remove any authentication type settings and policy acceptance.

Installation requirements

The Discovery Bot installer is integrated with the Automation 360 installer. No separate installation is required for Discovery Bot On-Premises users. The IT administrator in your organization performs this task. See [Installing Control Room On-Premises](#) on page 1121.

Note: Ensure your database server requirements are met before using SQL authentication mode to connect to the Control Room: [Installing Control Room using Custom mode](#) on page 1189.

For custom installation, you can now change the default repository path location to a new location on your server after installation. The default path is: `C:\ProgramData\AutomationAnywhere\ServerFiles`. The Process Discovery files now reside in the ServerFiles folder.

Note: For Control Room admin. You must manually copy and paste the existing data into the new location if you change the default path to the new location.

The generated PDD file for an opportunity is now stored locally on your server by Automation 360 On-Premises. The path to the file storage is: `C:\ProgramData\AutomationAnywhere\ServerFiles\ProcessDiscovery\opportunity`. The existing PDD files will automatically be moved to the new location and will not be deleted when a reinstall or upgrade occurs in the Control Room.

Verify installation

After the installation is complete, log in to your Control Room as an administrator. The Discovery Bot tab is available for use from the left panel.

Process Discovery package

The Process Discovery package contains actions that record various object operations such as click (right or left), recording, and window resizing that are used during process recording sessions. View information about the Process Discovery package from the **View package** page (**Bots > Packages > Process Discovery**).

The package is included in the default packages. You can preload the default package when you connect to your device. Preloading the package helps to speed the start time of the recorder the first time you begin recording a process.

The actions in the package are not available for use from the Bot editor.

Related concepts

[Preload packages](#) on page 2219

You can preload packages on your local device to shorten the bot runtime.

Upgrade Discovery Bot from Enterprise A2019.15 to later versions

Upgrade Discovery Bot from Enterprise A2019.15 (On-Premises) to a later version for the latest features and enhancements.

Enterprise A2019.15 provides a separate installer (executable file) for Discovery Bot On-Premises users to install and use Discovery Bot from the Control Room. Starting from A2019.16, the Discovery Bot installer is integrated with the Enterprise A2019 installer. To upgrade from Enterprise A2019.15 to a later version, you must first uninstall Discovery Bot from your machine and install the Control Room.

1. In your Windows device, go to **Apps & features**.
2. Search for Discovery Bot.
3. Click **Uninstall**.
4. Install the latest version of the Control Room.
[Installing Control Room On-Premises](#) on page 1121
5. From your local machine, log in to your Control Room as an administrator.
The **Discovery Bot** tab is available for use from the left panel.

Create users for Discovery Bot

Create the Discovery Bot admin, analyst, and users to begin using the Discovery Bot functionality for front-office and back-office business processes. The Control Room admin creates these users and assigns the required system roles.

Ensure that you have purchased the necessary Discovery Bot licenses for your business users before you begin creating users: [Prerequisites for Discovery Bot](#) on page 3695.

To use the Discovery Bot features, the user must be assigned the appropriate role and licenses. See [Supported licenses for Discovery Bot](#) on page 3692.

Note: The Discovery Bot Admin role and permissions are distinct from the Control Room Admin role. See [Discovery Bot users](#) on page 3690.

1. From your local machine, log in to your Control Room as administrator.
2. Go to **Administration > Users**.
3. Click **Create user**.

The icon is located at the top-right of the **Users** table.

The **Create user** page is displayed.

4. In the **General Details** section, enter the following user details:

Enable User	Select the check box so that the user can log in immediately.
Username	Enter a unique user name.
Description	Optional: Enter a description for the user.

First name Optional: Enter the first name of the user.

Last name Optional: Enter the last name of the user.

Email Enter and confirm the email address for the user. If SMTP is enabled, the user is sent an email to this address to confirm the account. Click the URL in the email to log in to the Control Room and set up your credentials. All important Control Room notifications will be sent to this email address.

5. In the **Select Roles** section, select one of the following roles from the **Available roles** column:

Discovery Bot user	Select this role
Admin	AAE_Discovery Bot Admin
Analyst	AAE_Basic and AAE_Discovery Bot Analyst Note: The AAE_Basic role is required to view or add actions to the bots.
Business user	AAE_Basic and AAE_Discovery Bot User Note: The AAE_Basic role is required to view or add actions to the bots created by the analyst.

6. Click the right arrow to move the role to the **Selected** column.
7. In the **Allocate a device license to this user** section, select the following:

Discovery Bot user	Action
Admin	Retain the default None for the user. This user only has access to the Control Room.
Analyst	Assign the Bot Creator - Development license to this user. Note: This license is required to convert an opportunity to a bot.
Business user	Retain the default None for the user. This user only has access to the Control Room.

8. Under **Allocate other types of licenses for this user? > Discovery Bot licenses**, select the following:

Discovery Bot user	Action
Admin	No license is required.
Analyst	Select the Process analyzer license.

Discovery Bot user	Action
Business user	Select the Process recorder license.

9. Click **Create user**.

The new user is displayed in the User table. If SMTP is enabled, an email will be sent to the new user inviting them to log in.

[Create a Discovery Bot process](#) on page 3704

You can begin capturing business processes using Discovery Bot. Create a process and assign users to record and capture the process using the Discovery Bot recorder.

Create multi-role users for Discovery Bot

Create multi-role users when you want to combine system-generated Discovery Bot roles and licenses to provide additional functionality for your users. Depending on your business requirements, you can combine up to three Discovery Bot system-generated roles and two process discovery licenses.

Ensure that you have purchased the necessary Discovery Bot licenses for your business users: [Prerequisites for Discovery Bot](#) on page 3695.

To use the Discovery Bot features, the user must be assigned the appropriate role and licenses.

Note: The Discovery Bot Admin role and permissions are distinct from the Control Room Admin role. See [Discovery Bot users](#) on page 3690.

Multi-role users will see a different set of menu actions (vertical ellipsis icon) available on a tile for a process. These actions are different from the standard Discovery Bot user actions that are available on a tile for a process.

The following actions are available for multi-role users (Admin + Business user + Analyst) on a tile for a process:

Admin actions

- View process details
- Edit process details
- Delete process
- View/edit process details

Business user actions

- Start recording
- The **Start Recording** icon is displayed on a tile for a process, or you can select start recording from the vertical ellipsis icon.
- Edit my recording

Analyst action

Analyze processes
View process opportunities

1. From your local machine, log in to your Control Room as administrator.

2. Go to **Administration > Users**.

3. Click **Create user**.

The icon is located at the top-right of the **Users** table.

The **Create user** page is displayed.

4. In the **General Details** section, enter the following user details:

Enable User	Select the check box so that the user can log in immediately.
Username	Enter a unique user name.
Description	Optional: Enter a description for the user.
First name	Optional: Enter the first name of the user.
Last name	Optional: Enter the last name of the user.
Password	Optional: Enter your password and confirm the password.
Email	Enter and confirm the email address for the user. If SMTP is enabled, the user is sent an email to this address to confirm the account. Click the URL in the email to log in to the Control Room and set up your credentials. All important Control Room notifications will be sent to this email address.

5. In the **Select Roles** section, select the following roles from the **Available roles** column to create multi-role users:

Discovery Bot user	Select this role
Admin + Business user	AAE_Discovery Bot Admin and AAE_Discovery Bot User
Admin + Analyst	AAE_Basic , AAE_Discovery Bot Admin , and AAE_Discovery Bot Analyst
Business user + Analyst	AAE_Basic , AAE_Discovery Bot User , and AAE_Discovery Bot Analyst
Admin + Business user + Analyst	AAE_Basic , AAE_Discovery Bot Admin , AAE_Discovery Bot User , and AAE_Discovery Bot Analyst

6. Click the right arrow to move the roles to the **Selected** column.

7. In the **Allocate a device license to this user** section, select the following:

Discovery Bot user	Action
Admin + Business user	Retain the default None for the user. This user only has access to the Control Room.
Admin + Analyst	Assign the Bot Creator - Development license to this user. Note: This license is required to convert an opportunity to a bot.

Discovery Bot user	Action
Business user + Analyst	Assign the Bot Creator - Development license to this user. Note: This license is required to convert an opportunity to a bot.
Admin + Business user + Analyst	Assign the Bot Creator - Development license to this user. Note: This license is required to convert an opportunity to a bot.

8. In the **Allocate other types of licenses for this user** section, select the following:

Discovery Bot user	Action
Admin + Business user	Select the Process recorder license.
Admin + Analyst	Select the Process analyzer license.
Business user + Analyst	Select the Process analyzer and Process recorder licenses.
Admin + Business user + Analyst	Select the Process analyzer and Process recorder licenses.

9. Click **Create user**.

The new user is displayed in the User table. If SMTP is enabled, an email will be sent to the new user inviting them to log in.

[Create a Discovery Bot process](#) on page 3704

Log in with your multi-role credentials and create a process. Assign users to record and capture the process using the Discovery Bot recorder. Review and analyze business processes.

Create a custom role for Discovery Bot

Learn how to create a Discovery Bot custom role that allows users to select Discovery Bot feature permissions from standard business user roles (Admin, Business user, or Analyst roles), and a single Control Room admin feature permission for viewing users.

Ensure that you have purchased the necessary Discovery Bot licenses for your business users: [Prerequisites for Discovery Bot](#) on page 3695.

To use the Discovery Bot features, the user must be assigned the appropriate role and licenses.

Note: The Discovery Bot Admin role and permissions are distinct from the Control Room Admin role. See [Discovery Bot users](#) on page 3690.

Use case

The Discovery Bot custom role user is enabled with Control Room Admin feature permissions for viewing users, but does not have edit permissions. The role allows the user to view and manage all Discovery Bot feature permissions for processes, recordings,

aggregations, and opportunities. However, the role does not allow the user to view opportunities or the associated metadata created by other analysts in the **Opportunities** tab. The permission to view all opportunities is not enabled for the user.

1. From your local machine, log in to your Control Room as administrator.
2. Go to **Administration > Roles**.
3. Click **Create role**.
The icon is located at the top-right of the **All roles** table.
The **Create role** page is displayed.
4. Enter a **Role** name, and optionally enter a **Role** description.
5. Scroll to the **Administration** section.
6. Select **View users**.
7. Select **View roles**.
8. Scroll to the **Discovery Bot** section.
9. Select **View assigned process** at the parent level.
The child-level permissions are enabled.
10. Select all the following feature permissions: .
 - a) **Discovery Bot** process feature permissions at the child level
 - b) **Discovery Bot** recording feature permissions at the parent and child levels
 - c) **Discovery Bot** aggregation feature permissions at parent and child levels
 - d) **Discovery Bot** opportunity feature permissions at the parent and child levels

Note: Do not select **View all opportunities**.

11. Click **Create role**.
The **Discovery Bot** custom role is created.

[Assign the Discovery Bot custom role to a user](#) on page 3702

Assign the Discovery Bot custom role to a user

Create a new user and assign the **Discovery Bot** custom role you created to the user.

Ensure that you have purchased the necessary Discovery Bot licenses for your business users: [Prerequisites for Discovery Bot](#) on page 3695.

To use the Discovery Bot features, the user must be assigned the appropriate role and licenses.

Note: The Discovery Bot Admin role and permissions are distinct from the Control Room Admin role. See [Discovery Bot users](#) on page 3690.

Custom role users will see a different set of menu actions (vertical ellipsis icon) available on a tile for a process, depending on the permissions given to users. These actions are different from the standard Discovery Bot user actions that are available on a tile for a process.

For this custom role use case, the following actions are available on a tile for a process:

Admin actions

- View process details
- Edit process details
- Delete process

Business user actions

- Start recording
The **Start Recording** icon is displayed on a tile for a process, or you can select start recording from the vertical ellipsis icon.
- Edit my recording

Analyst action

Analyze processes

1. From your local machine, log in to your Control Room as administrator.
2. Go to **Administration > Users**.
3. Click **Create user**.

The icon is located at the top-right of the **Users** table.

The **Create user** page is displayed.

4. In the **General Details** section, enter the following user details:

Enable User	Select the check box so that the user can log in immediately.
Username	Enter a unique user name.
Description	Optional: Enter a description for the user.
First name	Optional: Enter the first name of the user.
Last name	Optional: Enter the last name of the user.
Password	Optional: Enter your password and confirm the password.
Email	Enter and confirm the email address for the user. If SMTP is enabled, the user is sent an email to this address to confirm the account. Click the URL in the email to log in to the Control Room and set up your credentials. All important Control Room notifications will be sent to this email address.

5. In the **Select Roles** section, select the **AAE_Basic** role and the Discovery Bot custom role you created from the **Available roles** column.
6. Click the right arrow to move the roles to the **Selected** column.
7. In the **Allocate a device license to this user** section, select the **Bot Creator - Development license**.
8. In the **Allocate other types of licenses for this user** section, select the **Process analyzer** and **Process recorder** licenses.
9. Click **Create user**.
The new user is displayed in the User table. If SMTP is enabled, an email will be sent to the new user inviting them to log in.

[Create a Discovery Bot process](#) on page 3704

Log in with your custom role credentials and create a process. Assign users to record and capture the process using the Discovery Bot recorder. Review and analyze business processes.

Create a Discovery Bot process

Create a Discovery Bot process and assign users to record and analyze a process for your automation requirements.

- This task is performed by the Discovery Bot admin who manages the creation, deletion, and editing of Discovery Bot processes.

Note: Multi-role and custom role user can also perform this task depending on the roles or the permissions given to users. You will see a different set of menu actions (vertical ellipsis icon) available on a tile for a process.

- Ensure the **Process recorder** license is allocated to Discovery Bot users assigned to recording a process.
- Ensure the **Process analyzer** license is allocated to the Discovery Bot analyst assigned to analyzing a process.
- Create a process and assign users:
 - a) From your local machine, log in to your Control Room as a Discovery Bot administrator.
 - b) Go to **Discovery Bot > Processes**.
 - c) Click **Create Process**.
The **Create process** page is displayed.
 - d) In the **General Details** tab, enter a **Process Name**.
Special characters are not supported. Creating a process with a duplicate name is not supported.
 - e) Optional: Enter a **Process Description**.
 - f) Click **Next** to assign users to a process.
 - g) Optional: In the **Users** tab, select the Discovery Bot business user or analyst from the list of **Available** users.
 - h) Click the right arrow to move the roles to the list in the **Selected** column.
 - i) Click **Next** to view the invitation that is sent to users to begin recording processes.
 - j) Click **Create Process**.
 - k) Click **Close** to exit the page and return to the **Processes** page.

Note: An email invitation is sent to assigned users (new users or users added at a later time) to begin a Discovery Bot process recording session.

The newly created process is displayed in the **Processes** page on a tile.

For users, all of their assigned processes are available for viewing from the **Processes** page. Use the search field to help you locate a specific process by name. The field is not case-sensitive. For users, use the field to search on a process you are assigned to. For admin users, use the field to search on all processes. Use the sort field to help you locate a process tile quickly. Click the drop-down to sort for a process tile based on the process

name in alphabetical order or you can sort in the order of newest process created to oldest process and vice versa. The tile for a process displays the following information for an admin user:

Process tile	Description
Recordings	The number of the recordings captured and stored for a process by users.
Process Cycle	The average time, in minutes and seconds, across all recordings captured for a process.

Process tile	Description
<p data-bbox="509 243 893 275">Vertical ellipsis icon (three dots)</p> <hr/> <p data-bbox="509 310 925 464">Note: You might see a different set of menu actions available from the tile if you are a Discovery Bot standard user, multi-role user, or custom role user.</p> <hr/>	<p data-bbox="974 243 1417 306">View, edit, or delete information for a process.</p> <ul style="list-style-type: none"> <li data-bbox="974 327 1386 449">• Click View process details to view more information about a process, edit and update information, and save changes. <li data-bbox="974 459 1406 613">• Click Edit process details to edit a process. Enter your changes and click Save changes. Click Close to return to the Processes page. <hr/> <p data-bbox="1011 648 1398 711">Note: The name of the process cannot be changed.</p> <hr/> <ul style="list-style-type: none"> <li data-bbox="974 732 1377 825">• Click Delete process to delete a process. A message window appears. <li data-bbox="974 835 1349 898">• Click Yes, delete to delete a process. <p data-bbox="1011 909 1422 1001">All recordings and associated data are permanently deleted. This cannot be undone.</p> <p data-bbox="1011 1022 1403 1085">Click No, cancel to return to the Processes page.</p> <ul style="list-style-type: none"> <li data-bbox="974 1096 1422 1346">• Click View/edit process details to view more information about a process, edit and update information, and save changes. To edit a process, click Edit. Enter your changes and click Save changes. Click Close to return to the Processes page. <hr/> <p data-bbox="1011 1377 1398 1440">Note: The name of the process cannot be changed.</p> <hr/> <ul style="list-style-type: none"> <li data-bbox="974 1461 1386 1524">• Click Edit my recording to edit and review recordings. <li data-bbox="974 1535 1422 1656">• Click View process opportunities to view auto-generated or custom opportunities created from the Opportunities tab.

- Create a process and add users at a later time:
 - a) From your local machine, log in to your Control Room as a Discovery Bot administrator.
 - b) Go to **Discovery Bot > Processes**.

- c) Click **Create Process**.
The **Create process** page is displayed.
 - d) In the **General Details** tab, enter a **Process Name**.
Special characters are not supported. Creating a process with a name previously used for another process is not supported.
 - e) Optional: Enter a **Process Description**.
 - f) Click **Create Process** to create a process without assigning users.
 - g) Click **Close** to exit the page and return to the **Processes** page.
- Update an existing process and add users.
 - a) From your local machine, log in to your Control Room as a Discovery Bot administrator.
 - b) Go to **Discovery Bot > Processes**.
 - c) Go to the process you want to edit.
 - d) Click **Edit** from the **Options** icon.
 - e) In the **Edit process** page, click **Next** to assign users to a process.
 - f) In the **Users** tab, select the Discovery Bot business user or analyst from the list of **Available** users.
 - g) Click the right arrow to move the roles to the list in the **Selected** column.
 - h) Click **Save changes**.
 - i) Click **Next** to view the invitation that is sent to users to begin recording processes.
 - j) Click **Close** to exit the page and return to the **Processes** page.

Note: An email invitation is sent to assigned users (new users or users added at a later time) to begin a Discovery Bot process recording session.

The newly created process is displayed in the **Processes** page on a tile.

[Record a Discovery Bot business process](#) on page 3709

Log in to your Control Room as a Discovery Bot user and record a business process assigned to you.

Supported applications and browsers for Discovery Bot

Learn about supported applications and browsers to ensure your environment is ready before you begin using the Discovery Bot recorder.

About the Discovery Bot recorder

The Discovery Bot recorder is similar in function to the Automation 360 Universal Recorder with one significant difference: pre-selection of the application to be used for recording is not required.

The Discovery Bot recorder captures data across many user interface (UI) objects such as Windows applications, native applications, executable file, or browser window on PC devices and

machines or virtual machines running Windows OS. Use the Discovery Bot recorder to capture, read (data extraction), write (data entry), and click (left or right) operations when working across various operations. A single recording per user can capture up to 8 hours of user actions.

The Discovery Bot recorder displays the performed action by using highlighter. Click the object control, for example, a button, form field, or a table. A red outline highlights the control when you move the mouse over it to capture the action.

You can perform actions like double-click, drag-drop, click and hold, and text select while recording. Actions performed using keyboard strokes are displayed in the **Data** field.

Supported applications and browsers

The recorder supports system, web, and virtual applications including the following:

Applications

- Microsoft applications: Edge, PowerPoint, Excel, Word, Outlook, Calculator, Notepad, Notepad++, Teams
- Zoom
- Snagit
- Java applet, web start, and desktop applications that run using Java Runtime Environment (JRE) 6, 7, 8, 9, 10, and 11 (32-bit and 64-bit versions)
- Microsoft Active Accessibility and UI automation based applications
- Oracle EBS and Forms
- SAP 730, 740, 750 and 760 versions.
- Citrix Virtual Apps

Browsers

- Internet Explorer version 11
- Google Chrome

Note: Chrome plug-in must be installed to record processes. If the Chrome plug-in is removed, you must manually add and re-enable the plug-in. [Google Chrome browser extension requirements](#) on page 2174

Desktop

The desktop refers to the device screen when all application and browser windows are minimized.

Taskbar

The taskbar is the horizontal or vertical bar containing icons of open applications and browsers, as well as the notification area. You can capture application, browser, system, and other icons, for example such as the clock and calendar, volume, and Wi-Fi.

Record a Discovery Bot business process

Record, capture, and annotate steps for a business process using the Discovery Bot recorder. The process recording allows the Discovery Bot analyst to view all recorded steps for a quantitative and comparative analysis. The steps along with the captured metadata and user actions help the analyst make the decision to create opportunities and bots.

- This task is performed by the Discovery Bot user who records assigned business processes and submits the same for review and analysis.

Note: Multi-role and custom role user can also perform this task depending on the roles or the permissions given to users. You will see a different set of menu actions (vertical ellipsis icon) available on a tile for a process.

- Ensure that you have set your device credentials and installed the latest Bot Agent version on your machine before using the Discovery Bot recorder.
- Ensure that the machine on which you will be performing the recordings is also duly registered.

[Prerequisites for Discovery Bot](#) on page 3695

1. Record a business process:

- a) From your local machine, log in to your Control Room as Discovery Bot business user.
- b) Go to **Discovery Bot > Processes**.
The **Processes** page appears, displaying all processes assigned to the user for recording.
- c) Click the **Start Recording** icon from the tile associated with the process you want to begin recording a process.

Note: You can also select, **Start Recording** from the from the vertical ellipse icon to begin recording a process.

A message window appears notifying you that you are now recording and sharing your screen. The **Discovery Bot Recorder** window is displayed with **Pause** and **Stop** options. Pause and resume the recording as required. Allow for a few minutes for the recorder to start the very first time you begin recording a process.

- d) Perform the actions to record.

For example, open an application and fill in a form or open a browser and search a website. Click the object control, for example, a button, form field, or a table. A red outline highlights the control when you move the mouse over it to capture the action. The red outline indicates that the recorder is ready for you to take the next action in recording the process.

You can perform actions like double-click, drag-drop, click and hold, and text select while recording. Actions performed using keyboard strokes are displayed in the **Data** field.

- e) Click **Stop** to end the recording.

You can click **Cancel recording** to cancel a recording at any time.

Wait for a few seconds for the recorder to end. The details in the tile for the process is incremented to include the new recording in the **Recordings** section.

Note: Once the recording has been stopped, additional steps cannot be added to the recording.

Note: A maximum of 8 hours worth of user actions can be captured in a single recording.

- f) Enter a name for the recording in the field provided.
The character limit is 50. Special characters are supported.
- g) Click **Save** to save your changes.
- h) Click **Cancel** to discard the recording.

Note: If you discard the recording, you cannot recover it.

2. Review the captured steps, annotate them, and submit a process recording for review to the Discovery Bot analyst:

- a) From **Processes**, select a process by clicking the process name or anywhere within the process tile body. From **Processes**, click the vertical ellipsis icon and select **Edit my recording** to edit and review recordings.

If you click the process tile body or the process name, the **Opportunities** page appears. Only approved recordings from the **Opportunities** tab are displayed for the analyst.

For Discovery Bot multi-role and custom role users, click the vertical ellipsis icon and select **Edit my recording** to edit and review recordings. If you click the process tile body or the process name, the **View process** page appears. Only approved recordings are displayed for the analyst on the **View process** page.

The **Recordings** page appears with the **Recordings** table on the left and single recording details on the right. The table displays the following information:

Recordings	Description
Recordings (#) (# selected)	The number of recordings logged in by users.
Customize columns	Click the table icon to display or hide columns (ID, Status, Process Cycle, and Recorder), or edit the layout of the header rows to display right or left as required.
ID	The ID number of the recording in the database. The system collects and sequentially increments the index for each recording captured by the users. Note: To search for a specific recording, select ID and enter the ID number in the search bar.
Name	The recording name.

Recordings	Description
Status	<p>The status of the recording:</p> <ul style="list-style-type: none"> • Pending: Initial state. • Approved: All user-required edits have been completed and recording is ready for review by an analyst. • Error: There is an error when storing the recording in the system. • Declined: Currently not being used. <hr/> <p>Note: To search on a process status, select Status and choose a status from the drop-down list.</p>
Process Cycle	<p>The recording duration, in minutes and seconds, excluding the time that the recorder was paused.</p>
Recorder	<p>The name of the user that created the recording.</p> <hr/> <p>Note: To search on users assigned to a recording, select Recorder from the drop-down list and enter the user name in the search bar. The search is case-sensitive.</p>

- From the **Recordings** table, select a recording to view all captured steps. In the right pane, the header displays the recording ID details, including the total steps captured during the recording session, recording name, process time, and current recording status.
Each recorded step includes: screenshot image with the **Screen** option (icon), application type, data (keyboard entered text), and step description (annotated user text) fields.
- Optional: To provide a description for the recording, click in the **Description** area. Using the **Description** field that appears, share the context and the purpose of the recording with the analyst.
The character limit is 255. The description entered is displayed in the PDD.
- Click **Save** to save the description you entered in the **Description** field.
- Optional: Click the **Screen** icon to display or hide the screenshot image.
Use the **Screen** option icon when you do not want to share personal image details with the Discovery Bot analyst, multi-role, or custom role users. To remove personal information, for example username and password credentials from the image, edit the **Data** field prior to submission for analyst review.

Note: If you hide an image and Click **Submit**, you cannot display the image again.

7. Click the screenshot to display the image in full size.

The **Screenshot** shows the state of the application at the time of performing the associated action. The red outline highlights where you have performed actions like click and hold and text select. You cannot edit the screenshot. Click the image when you want to display a larger view of the screenshot. Review the step action in more detail from the modal window. Click the pagination located below the image to select a step number or use the right or left arrows to quickly display all captured images. For actions not captured by the recorder such as double-click, drag-drop, and click and hold, you can document the individual steps in the **Step description** field for the analyst.

The duration of the recorded step is displayed in minutes and seconds below the screenshot. Use this information to help prioritize what step or sequence of steps are a better candidate for automation. For example, if a sequence of steps takes longer to perform, you can automate this first for a process to save manual effort.

- Click the **Hide image** icon to hide the image.

The image will not be submitted to the analyst for review. Click **X** to close the frame. Click **Save** to save your selection.

- Click **Show image** to display the image.

The image will be submitted to the analyst for review. Click **X** to close the frame. Click **Save** to save your selection.

8. Optional: Update the application name used in the process recording in the **Application** text field.

The **Application** field represents the name of the application on which the action was performed. If required, the user that made the recording can change this.

9. Optional: Update the keyboard entered text used in the process recording in the **Data** text field.

The **Data** field represents any data entered by the user at that step during the recording.

Note: You must follow the keyboard data entry with a left or right mouse click. For any step in which the data was entered, you can make changes to the data in the **Data** field. You cannot enter any data for steps which do not have any data entered during the actual recording of the process.

10. Optional: Update the context associated with the step in the **Step description** text field.

The **Step description** text field represents any additional description that you would like to provide regarding the operation being performed. The maximum character limit is 2000.

11. Optional: Delete any step that is not required to be included in the process recording.

12. Repeat the above steps for each step as required.

13. Optional: Click **Save** to save your changes.

Use the **Save** option when you want to edit and compare the recording data (including application, keyboard entered text, and annotation text fields) across multiple recordings captured in the **Recordings** table.

14. Optional: Click **Delete** to delete the recording for that process.

Use the **Delete** option when you do not want to submit the recording data to the analyst for review.

The recording and associated data is deleted from the **Recordings** page for that process.

15. Click **Submit**.

The recording is submitted to the analyst for review and approval.

Note: After a recording is submitted, it cannot be edited to make additional changes.

16. Click the **Download** option to export the opportunity data into a Process Definition Document (PDD) with the same name as the opportunity. Select the type of PDD (Word or PDF) that you want to export. The PDD includes the process recording flow chart and the time on each individual step in hours, minutes, and seconds.

When an opportunity is created, the PDD begins processing in the background automatically. When the PDD is generated, the field changes from Processing PDD to **Download**. You can now download the document. An email notification to the business user is also sent to the email address on file. If an error occurs when you download the PDD, click **Download** again to generate the PDD again.

Note: If you are a multi-role user, you will receive two email notifications for the exported data, one for the recording data and one for the opportunity data.

Note: You must be the owner of the opportunity to be able to download it; otherwise, the download option is not available.

On your machine, the document is saved in the folder that is configured for downloads in your browser.

[Analyzing opportunities for automation](#) on page 3714

Log in to your Control Room as a Discovery Bot analyst to review and analyze the recordings to create opportunities or bots as required.

Record a Discovery Bot process using Automation Co-Pilot Desktop Assistant

Use Automation Co-Pilot Desktop Assistant to record Discovery Bot business processes without signing in to the Control Room.

- Before using the Discovery Bot recorder, ensure that you have set your device credentials and installed the latest version of the Bot Agent on your machine.
-

Note: The Bot Agent installation will load the Automation Co-Pilot icon on your desktop.

- Ensure that the machine on which you will be performing the recordings is also duly registered.

[Prerequisites for Discovery Bot](#) on page 3695

- Ensure that your browser settings allow redirects and pop-ups from your browser to access the Control Room.

1. Double-click the Automation Co-Pilot icon to open the Automation Co-Pilot Desktop Assistant.
2. Use Automation 360 credentials to sign in to the application.
3. Click **Processes**.
The **Recording Processes** page appears, displaying all the processes assigned and available to the user.
4. When you want to start recording a process, click **Start recording**.

A message window appears, notifying you that you are now recording and sharing your screen. The **Discovery Bot Recorder** window is displayed with **Pause** and **Stop** options. Pause and resume the recording as required. The first time you begin recording a process, the recorder might take a few minutes to start recording.

5. Perform the actions to record.
6. To end the recording, click **Stop**.
You will be redirected to the Control Room to review and edit your recording before you submit it. [Record a Discovery Bot business process](#) on page 3709
7. To review the steps of previous recordings and submit them, click **Previous recordings**.
You will be redirected to the Control Room to review the recordings.

Analyzing opportunities for automation

Review opportunities and process recording data by using graphs and charts that help you to analyze and understand the benefits and savings from a potential opportunity with or without automation.

Opportunities

The Opportunities header provides a snapshot of the recording and opportunity data captured by all users for assigned processes. The following data is displayed in the **Opportunities** header:

Field	Description
Savings	The potential savings (yearly savings or savings per run) associated with the opportunity
Number of opportunities	The number of opportunities that include the selected recordings
Number of process variants	The number of branches included in the opportunity
Average process cycle	The average duration of the recordings provided for the process
Participants	Number of users who submitted recordings for the process

Opportunities evolution

Use the opportunities evolution map as a guide to decide which opportunities to automate first. Each quadrant displays the following:

- **Proceed now:** These opportunities yield the maximum benefit and ease of implementation.
- **Long term:** These opportunities yield good ROI but will take time to implement. They also require a higher implementation effort to automate.
- **Hold:** The automation benefit is low and the implementation time is high. The recommendation is not to automate.

- **Quick wins:** Always do this first to build momentum.

Application usage

The donut chart displays the number of applications used across selected recordings. The application usage details are displayed in the table to the right of the chart in the following format: Application | minutes seconds | percentage. The percentage represents the percent of the application used over a total of all applications used.

Use case

Use this information to quickly understand user participation and process complexity and variability; the higher the application count, the higher the complexity and variability of the process that is being analyzed. The average process cycle time will provide a quick insight into the duration of the process within the expected processing time. If the actual process cycle is higher across application count, this might be an indicator that the process is a more suitable candidate for automation and assists with improving efficiency.

Process cycle time by process

This graph displays the time associated with the average process cycle (in minutes) for each process and by user.

Use case

Use this information to help you understand which processes take the most time and therefore, will potentially give you more savings if automated. For example, an analyst can learn why a process recording took longer or was completed in a shorter period for one particular participant and compare this information with other participants. This information is instrumental in narrowing down on a smaller subset of the process recordings to study them for inefficiencies that might result in better or more opportunities for automation.

Number of steps by a process

This graph displays the average number of manual steps in each process and by user. Use this information to compare the number of steps across processes. Processes with greater number of manual steps are more likely candidates for automation.

Review opportunities, convert to bot, and generate PDD

Review potential, system-generated opportunities, create custom opportunities from a system-generated opportunity, and convert them to bots. You can also export the opportunity data to a Microsoft Word or PDF document for your reference.

Automation opportunities are of two types, system-generated and manual. System-generated opportunities, also known as auto-generated opportunities, are created when at least one

recording is approved by the user for a process. The auto-generated opportunities are available immediately for you to begin analyzing from the **Opportunities** page for the recording. The **Download** option to generate a Microsoft Word or PDF document is not available for auto-generated opportunities. Creating a branch and merging steps into the branch for auto-generated opportunities is not available from the process diagram.

Manual opportunities, also known as custom opportunities, are created from auto-generated opportunities. A custom opportunity allows you the flexibility to review current and newly added recordings from users and decide to accept or reject the new recording changes to the existing process diagram. You can also create a branch as you add steps from another recording to the process diagram. The **Download** option is available for you to use if you want to download a Microsoft Word or PDF document of the custom opportunity data for your reference.

- This task is performed by the Discovery Bot analyst who is in charge of reviewing and analyzing the associated recordings of business processes.
- Ensure the analyst is assigned a Process analyzer license and the **AAE_Discovery Bot Analyst** role before processes are analyzed.

[Supported licenses for Discovery Bot on page 3692](#)

- Ensure the analyst is assigned a Bot Creator license to convert opportunities to bots.

[Supported licenses for Discovery Bot on page 3692](#)

1. Review the data in the **Opportunities** tab:
 - a) From your local machine, log in to your Control Room as Discovery Bot analyst.
 - b) Go to **Discovery Bot > Opportunities**.

The **Opportunities** page displays all the opportunities you have created. You can configure the menu option to display as you want using the **Customize columns** icon. The table lists the following information:

Field	Description
Opportunity name	The name created for the opportunity. To identify an auto-generated opportunity from a custom opportunity, the auto-generated opportunity begins with the name of the process hyphen OPPORTUNITY.
Process name	The name created for the process.
Type	The type of opportunity created for a process. The type can be Auto or Custom.
Path	The type of path specified based on the Filter option applied to the opportunity. Auto-generated opportunities use filter default value of Most common path.
Date created	When the opportunity was created.

Field	Description
Date modified	The date the opportunity is modified by the analyst. The modified date can occur when a opportunity is updated or when a custom opportunity is created.
Owner	The name of the process owner. The process owner can be system or analyst.
# of recordings	The number of recordings for a process associated with the opportunity.
# of applications	The number of applications used in a recording session associated with the opportunity.
Process cycle	The duration of the recording session associated with the opportunity.
# of users	The number of users who participated in the recording session for that process.
Cost without automation	The formula used to calculate the cost of the opportunity without automation. Use the formula to help you decide which opportunities to prioritize for your business development based on ROI, applications used, number of users, and so on. The formula is calculated by taking the number of users multiplied by the total hourly pay of number of users multiplied by the average process cycle.
Savings	The potential savings associated with the opportunity (this could have been specified as a yearly savings or savings per run).
Priority	The priority level assigned to the opportunity. The priority can be one of the following: <ul style="list-style-type: none"> • Low • Medium • High

Field	Description
Bot created	The bot created for an opportunity. This can be Yes or No. The Convert to bot option is not available for auto-generated opportunities. The Convert to bot option is available for custom opportunities only.

- c) Select the required opportunity by sorting, searching, or both from the table using the **Search** field.
 - d) Click the vertical ellipsis icon (three dots) from the table to view an opportunity or download a Word or PDF PDD document.
The PDD download option for Word or PDF is only available for custom opportunities.
 - e) Select an opportunity from the table for display.
2. Optional: Create a custom opportunity from the autogenerated opportunity.
- a) Expand the **Recordings** section from the left side of the main canvas.
By default, all selected recordings are displayed in the process diagram.
 - b) Select a single recording from the **Recordings** section for review, as needed.
The selected recording is colored in blue from the **Recordings** section and displayed in the new feeder canvas to the left of the main canvas. All recordings are displayed in the process diagram to the right of the main canvas. Toggle off the selected recording to select another recording for display.
 - c) Select either the screenshot icon or the application icon to decide how you want to display the steps.
Use the **Zoom in** or **Zoom out** options as required. Use the **Reset** zoom to bring the view back to the default level and recenter the process in the canvas.
Contiguous steps performed in the same application are combined together. This is displayed as a single group to allow better readability of the process. The number of steps collated together is indicated in the bottom-right corner of the group.
-
- Note:** If the screenshot view is the last active view, then the image of the last step in the group is the one that is displayed for the collapsed group. You can drag the process within the canvas by holding down the mouse left button and moving the process to the desired location.
-
- d) Click a step to expand a group of steps to preview the step in more detail. Alternatively, click the arrow near the top-right corner of the group icon.
Use the group icon to display groups of steps that belong to the primary and secondary level actions (and subgroup level actions) used during the recording session. As required, expand a group of steps to drill down from the primary to subgroup-level actions to help you decide what group of steps to use when creating a potential opportunity for a task that you want to automate. For example, a primary-level action displays Microsoft Outlook, a secondary-level action displays Outlook mail notification, and subgroup-level actions can display compose email, body email, and send email.
 - e) Select the **Select all steps** check box from the **Overview** pane to select all the steps in the process diagram.

Based on your requirements, use the Shift key to customize the number of steps within a path from the main canvas. If you select a nested branch or loop, the parent branch or loop displays a partial selection.

- f) Optional: Use the **Filter** option to customize a specific opportunity. [Using the Filter and Toggle frequency counter options](#) on page 3722.
- g) Optional: Use the **Toggle frequency counter** option to display the frequency of path as compared to other recordings. For more information, see [Using the Filter and Toggle frequency counter options](#) on page 3722.
- h) Click **Save as** to save the opportunity as a custom opportunity.
- i) Enter a name and description for the opportunity in the fields provided.
- j) Click **Save as** to save your changes.
A message window appears notifying you that the opportunity is created. Click the hyperlink to view the custom opportunity. The PDD is generated and available for download from the **Opportunities** table. Click the vertical ellipsis to download the PDD in Word format or PDF.

Note: The filter option you selected for a custom opportunity will not be reflected in the new custom opportunity process diagram.

3. Optional: Create another custom opportunity from a custom opportunity. Add steps from another recording to the process diagram, create a branch, and merge steps from one or more recordings into the branch.
 - a) Select a single recording from the **Recordings** section.
 - b) Click the branch icon from the right main canvas to add a condition step.
Moving the subsequent step into a branch on the left and adding a new branch to the right in the empty branch are to receive steps from another recording. In the top-right corner of the yellow box, click the three dots to create a new branch or delete a branch. The branch endpoint is displayed with a small circle.
By default, you can move the branch endpoint lower in the path flow to include more than one step. To move the branch endpoint, press down with the cursor on the endpoint until you see the dotted lines appear around the branches. Drag the endpoint downward in the path flow. Place the endpoint when you see the dotted lines appear between the arrow. The endpoint is shifted downward in the path flow and includes more steps. To select a custom selection of steps, use the Shift key to select a certain number of steps within a path from the main canvas. Cross-path selection is not available.
The loop icon is displayed as an orange circle with an arrow. A loop is a sequence of steps that occurs for a specific number of times for a single recording. The loop icon has a **for** condition displayed under this along with **Count**, which describes the number of times the sequence of steps in this loop is repeated in the process. You can change the loop condition (**for** and **while**) by saving the process diagram.
 - c) Click the **Condition** field at the node level.
 - d) In the **Condition** field, enter a name for the condition. Example, `credit score`.
 - e) Click the check mark to save the name for the condition.
 - f) Open the corresponding branches on the right and left and set a value for the condition. For example, enter less than 200 on the right and greater than 700 on the left.

- g)** Drag and drop steps from the recording in the feeder canvas into the receiver step that reads **Drag items here** of the branch in the main canvas.
Use the Shift key to select one or more steps to drag into the receiver step. To clear a condition in the branch, click the three dots. Select **Clear branch**.
 - h)** Click **Save** to save your changes to the process diagram.
The PDD begins processing in the background automatically. When the PDD is generated, the field changes from Processing PDD to **Download**.
 - i)** Repeat steps a through h to review additional recordings and create branches and merge steps into the branch.
 - j)** From the **Overview** pane, click the **Edit** icon to update the potential savings associated with the custom opportunity.
The potential savings and potential cost can be updated at any time as you review the steps from various recordings and make changes within the process diagram.
 - k)** Enter the estimated cost of the process without automation.
 - l)** Enter the potential savings associated with the process when automation is used.
This is your best assessment of the expected savings on an annual basis if a bot is used to perform all the steps in the opportunity.
 - m)** Select the priority from the drop-down list.
 - n)** Click **Update**.
 - o)** Click **Save** to save your changes to the process diagram.
 - p)** Repeat steps j through o to update the potential cost for the custom opportunity from the **Overview** pane.
 - q)** Click **Save as** to save the opportunity as a custom opportunity.
 - r)** Enter a name and description for the opportunity in the fields provided.
 - s)** Click **Save as** to save your changes.
A message window appears notifying you that the opportunity is created. Click the hyperlink to view the custom opportunity.
 - t)** Optional: Repeat steps 4a through s to create another custom opportunity from this custom opportunity, as needed.
All opportunities (autogenerated and custom) can be viewed from the **Opportunities** page.
- 4.** Optional: For custom opportunities, review new recordings submitted by the Discovery Bot user. Accept or dismiss the new changes for the process diagram.
- a)** Click **Review** to accept the updates and review the new recordings.
 - b)** Select the new recording from the **Recordings** section.
The selected recording is highlighted in blue. The recording opens for display to the left of the canvas. Refer to the dotted lines around the steps. The placement of the steps is displayed in the process diagram to the right of the canvas with a bold border around the steps. The shaded green refers to the placement of the groups of steps from the new recording as they will appear in the process diagram if you update with these changes.
 - c)** Click **Update with changes** to accept the updates to the process diagram.
A pop-up message is displayed, indicating that your changes are successfully updated.

- d) Click **Back to edit** to return to the current process diagram without the changes.
- e) Click **Dismiss** to dismiss the changes.
Continue reviewing the current process diagram for the custom opportunity. Add steps from another recording to the process diagram, create a branch, and merge steps from one or more recordings into the branch, as needed.

5. Convert to bot:

- a) Click the **Convert to bot** option.
- b) Enter a bot name.
- c) Optional: Enter a description.
- d) Click **Browse** and accept the default folder location `\Bots\`.
To change the location where your bot is stored, drill down to the folder in which you want to save the bot.
- e) Click **Confirm**.
- f) Click **Convert**.
A message window appears notifying you that the bot has started to convert. You will receive an email when the bot is converted successfully. Click the hyperlink in the email to take you to your folder in which the bot was generated.

Note: In the **My bots** tab, the converted bot displays an error, with 0 byte size while the bot creation is in process. Avoid opening the bot until the bot conversion is complete.

The **Convert to bot** option is only available if you have the Bot Creator license. To review the created bot you must have the **AAE_Basic** role assigned.

6. Click the **Download** option to export the opportunity data into a Process Definition Document (PDD) with the same name as the opportunity. Select the type of PDD (Word or PDF) that you want to export. The PDD includes the process recording flow chart with a URL link to the process diagram inside Discovery Bot , and the time on each individual step in hours, minutes, and seconds. The PDD does not display the process diagram if there are more than 100 steps selected.

When an opportunity is created, the PDD begins processing in the background automatically. When the PDD is generated, the field changes from Processing PDD to **Download**. You can now download the document. An email notification to the business user is also sent to the email address on file. If an error occurs when you download the PDD, click **Download** again to generate the PDD again.

Note: If you are a multi-role user, you will receive two email notifications for the exported data, one for the recording data and one for the opportunity data.

Note: You must be the owner of the opportunity to be able to download it; otherwise, the download option is not available.

On your machine, the document is saved in the folder that is configured for downloads in your browser.

Using the Filter and Toggle frequency counter options

Use the Filter and Toggle frequency counter options from the toolbar to help you review, analyze, and compare the various recordings in the process work flow as you look to create a potential opportunity.

Filter option

Use the **Filter** option when you want to use a set of values to compare the different sections of a process across various recordings by selecting a specific path and step filter. The **Filter** window displays the following:

Option	Action
Path: With the most common flow	Select this option when you want to see what paths have the most common variance of a process that is being used. If you choose to automate this type of path, you will have a higher return on your investment.
Path: With the most deviations	Select this option when you want to see certain sections of the process that have a different deviation in the path. The automation priority for such paths are usually low.
Path: With the most repetitive flow	Select this option when you want to display sections of the process that are more repetitive and cost more. The automation priority for such paths are usually high.
Step: Application	Select the Application option when you want to see the application type used during the recording. Use this option to see which applications are more frequently used, and to decide on which applications should be a priority.
Step: Action Type	Select the Action type option to filter the process steps to display only particular actions that will help you get an idea how the steps are used.
Clear	Select Clear to clear all selected options.
Reset	Select Reset to reset to the previous saved state of the filters in a view.
Apply	Select Apply to apply the selected options for display for the system generated or manual opportunity.

Toggle frequency counter

Use the toggle frequency counter option to display the number of recordings that a particular path takes in the flow for a system generated or manual opportunity. Use this option to help you understand the frequency of the path as compared to other recordings. From the **Recordings** table, select two or more recordings and the **Toggle frequency counter** displays two at the start of the process flow to indicate the number of recordings selected. If each recording takes a different path, the process flow is divided between the total number of recordings selected and displays accordingly. For example, if there are ten recordings in a view and three paths displayed. Two recordings follow one path, two recordings follow the second path, and six recordings follow the third path. Along the path flow, you will see two, two, and six. If a step is merged, the number gets added between the two paths. Use the thick or thinness of the path to help you prioritize processes for automation. The most commonly used path is the thickest path and this can be useful for prioritizing a process when reviewing many recordings. For example, if there are 5 paths for 20 recordings, you will quickly see which is the thickest and consider automating this path. If you have additional bandwidth to automate another path, you can drill down in the flow and look at the numbers to see what path is next as a possible candidate for automation.

Bot Insight

Bot Insight is an analytics platform that provides real-time, interactive, and smart insights about business processes and operational intelligence. Bot Insight is available with out-of-the-box dashboards that you can start using instantly. These dashboards provide analyzes to measure the performance of your digital workforce and predict and solve preventable business problems.

Business analytics through Bot Insight

Automation Anywhere Bot Insight processes real-time and interactive insights about business processes, and provides operational intelligence. Access the bots, and manage and instrument them to gather business analytics and insights, and publish dashboards.

1. [Create and edit bots](#)

The cloud-based bot editor provides tools, packages, and actions to create bots to automate processes.

2. [Instrument the bot for analytics](#)

Business analytics provides information about the transactional analytics for the data that is logged by the variables that are tagged in a task. The information provided can be about the total sales in a month, invoicing and payment trends, insight about new customers, and quote-to-order ratio.

3. [Access Bot Insight](#)

Access Bot Insight to perform the business analytics.

4. [Customize dashboards and widgets](#)

Dashboards represent the RPA infrastructure in the form of meaningful visuals and charts, so that you can analyze, interpret, and take action on the updates that are important to you. The dashboards display dynamically updated information of active users, registered clients, failed tasks, apps, bots, bot schedules, workflows, queues, and the overall status of devices.

5. [Publish a business analytics dashboard](#)

Publish a dashboard to display the production data generated by the task. The analytics consumers who primarily analyze and interpret data can access the published dashboard.

To learn more, search for the [Managing RPA Reports Using Automation 360](#) course in [Automation Anywhere University: RPA Training and Certification \(A-People login required\)](#).

Related concepts

[Bot Insight dashboards](#) on page 3728

The Bot Insight dashboards provide dedicated graphical insight to help you view your bot information.

Related tasks

[Run your first bot](#) on page 1433

Run a bot from the same device that you used to create the bot.

Related reference

[Analyze package](#) on page 2310

Use the actions in the **Analyze** package to specify the actions and variables to use in the Bot Insight dashboard and widgets. The **Analyze** package enables you to perform transactional analytics for the data that is logged by the variables when the bot runs.

Accessing Bot Insight

This section provides information about how to access Bot Insight.

To use Bot Insight business dashboard, the Control Room must have the Bot Insight license applied, and you must be logged in as a user with one of the following roles:

1. `AAE_Bot Insight Expert`
2. `AAE_Bot Insight Consumer`
3. `AAE_Bot Insight Admin`

Note: To view the published business dashboards, you must have a custom role defined with the **View my bots** and **Check in** permissions to the folder that contains the corresponding tasks.

To use Bot Insight external APIs, you must be logged in as a user with `AAE_Bot Insight Admin` role.

Access Bot Insight from the Control Room

Access Bot Insight to interactively analyze bot data and enhance bot widgets.

Access Bot Insight from the Control Room in one of the following ways:

- From the Control Room, select **Dashboard**.
 - a) Locate the **Insights** tab.
 - b) In the **Insights** tab, click **Explore Bot Insight**.
The Bot Insight window appears.
- On the left panel, click **Automation**. A list of available bots and forms is displayed.
 - a) In the **Automation** page, click **PUBLIC** to view the public bots that can be viewed, run, and checked out by other people, based on the permissions set by the administrator.
 - b) Click **PRIVATE** to view your bots and files.

Note: Private bots and files cannot be viewed by other users. If a bot or file is checked out from the **PUBLIC** tab, it can be viewed and run by other users. However, the bots and files cannot be edited by other users.

- c) Select your bot from the **Files and Folders** menu.
Alternatively, enter the search parameters in the **Search Name** field and search for your bot.
- d) Open the bot and click **Analyze**.
The Bot Insight window appears.

Roles to access Bot Insight

The Control Room restricts Bot Insight access to users with certain roles.

Access to the dashboard depends on the user roles assigned to a user and the access permission granted to those user roles. See [Role-Based Access Control](#).

System-generated access is provided to all user types for Bot Insight. Administrators can customize the Bot Insight experience by assigning a user-generated role to users. Each role includes a permission set, designed to specialize Bot Insight features to make analytics more simple or comprehensive. Admins should evaluate user tasks and functions to assign the role most appropriate to fulfill user responsibilities, based on the following details.

Note: Various types of dashboards can be accessed for quick insights. Common types are listed below. For more details on dashboards, see [Bot Insight dashboards](#) on page 3728

- The system-generated dashboard is also known as a Default type.
- The user-generated dashboard is also known as a Custom type.
- The Published dashboard is also known as the Production type.
- When a published dashboard is saved by a user, the dashboard copy is known as a custom production type.

Apart from Bot Creators, users with the following roles have access to business analytics dashboards:

Bot Insight Admin

Use this role to perform the following operations in Bot Insight:

- Access Bot Insight API
- Analyze the Data Profile of the task data for which the dashboard report is generated.
- Analyze and save the system-generated dashboards.
- Analyze, save, publish, and delete the user-generated dashboards and publish dashboards.
- Bookmark, compare, and share the dashboards.

Bot Insight Expert

Use this role to perform the following operations in Bot Insight:

- Analyze the data in the dashboards that are deployed in the production environment.
- Save the system-generated dashboards.
- Analyze, save, publish, and delete the user-generated dashboards and publish dashboards.
- Bookmark, compare, and share the dashboards.

Bot Insight Consumer

Use this role to perform the following operations in Bot Insight:

- Analyze the data in the dashboards that are deployed in the production environment.
- Bookmark, compare, and share the published dashboards.

Note: To view the published business dashboards, you must have a custom role defined with the **View my bots** and **Check in** permissions to the folder that contains the corresponding tasks.

Role-based access control in Bot Insight

Role-based access control (RBAC) enables a Control Room administrator to restrict access to the various components of Bot Insight.

The Control Room administrator can grant access to various user roles based on your requirements. When adding a user, you assign appropriate roles to that user. A user will have access to the components and folders based on the roles assigned to them.

Requirements

Before you publish the dashboard, ensure that the following requirements are met:

- The bot resides in the Public workspace for which you want to publish the dashboard.
- You must have a custom role defined with the **View my bots** and **Check in** permissions to the folder that contains the corresponding tasks to:
 - View the published business dashboards.
 - Move your bots from **Private** to **Public** workspace.

the folder that contains the corresponding tasks to

RBAC for business analytics

Dashboards for business analytics are available for the tasks that are enabled for analytics. The Control Room administrator and users who have access to a task can view the dashboards for those tasks. You can access the dashboard for a task from the **Insight** tab in the **DASHBOARD** section of the Control Room and from the **ANALYZE** tab in the Workbench.

To view the Bot Insight dashboards, you must be granted access to the folder containing the corresponding tasks.

For example, you have created various tasks related to sales and accounting and stored them in the Sales and Accounts folder. If you want to grant access to the sales-related tasks to members of your sales department, you need to provide them access to the Sales folder. The same applies to grant access to the accounts-related tasks in the Accounts folder.

The following table illustrates the access the various members of the Sales and Accounts team will have:

	Sales_Dep			Accounts_Team	
	John	Mark	Dave	Smith	Micheal
Access to the Sales folder	Yes	Yes	Yes	No	No
Sales1	Yes	Yes	Yes	No	No
Sales2	Yes	Yes	Yes	No	No
Access to the Accounts folder	No	No	No	Yes	Yes
Accounts1	No	No	No	Yes	Yes
Accounts2	No	No	No	Yes	Yes
Accounts3	No	No	No	Yes	Yes

Bot Insight dashboards

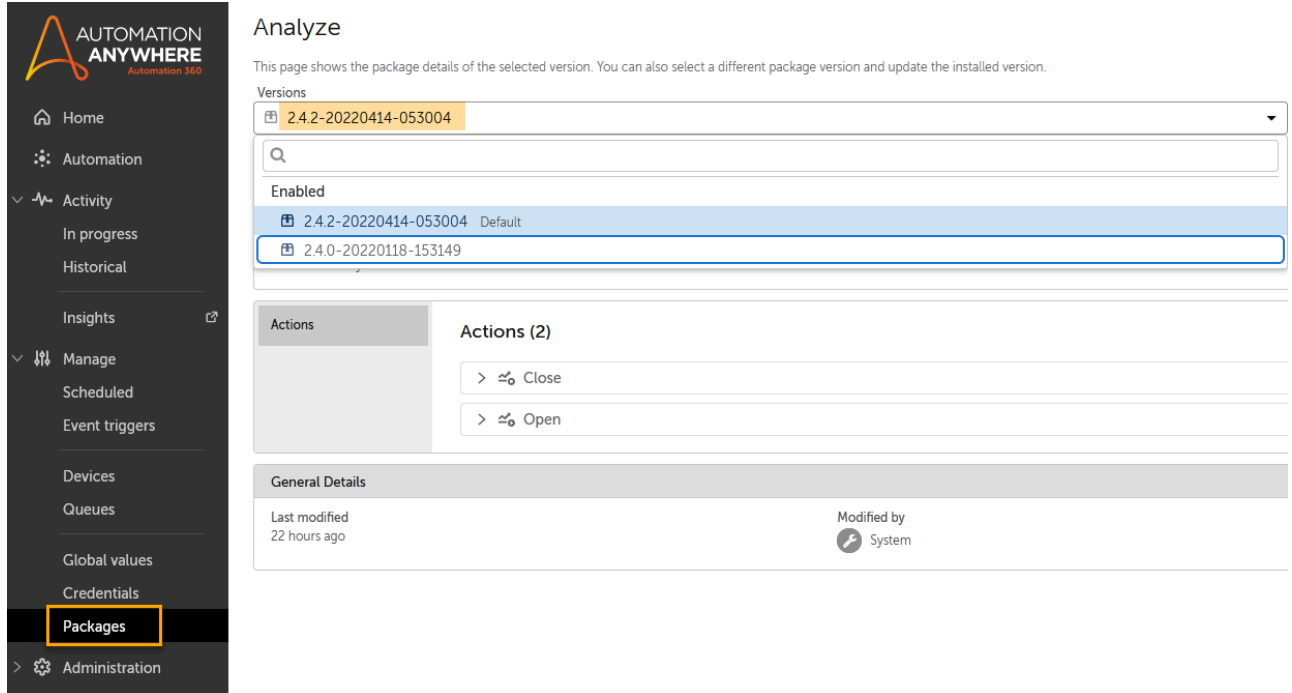

The Bot Insight dashboards provide dedicated graphical insight to help you view your bot information.

Dashboards display meaningful visuals and charts so that you can analyze, interpret, and take action on the updates that are important to you. You can use dynamically updated information about active users, failed tasks, apps, bots, bot schedules, workflows, queues, and the overall status of devices to create custom dashboards and widgets.

Note: You must use the Analyze package version 2.3.0-20210922-121532 or later to generate the dashboard when running analysis. This package version is available from Automation 360 v.23.

Perform the following steps to apply the package.

1. From the Control Room, select **Manage > Packages > Analyze**.

Analyze

This page shows the package details of the selected version. You can also select a different package version and update the installed version.

General Details

Last modified 22 hours ago

Modified by System

2. Change the Analyze package version to 2.3.0-20210922-121532 or later.
3. Save your changes.
4. Run the bot and ensure the change to dashboard generation.

Note: For changes to be applied to the public workspace, **checkIn** your bot before running analysis.

When you create and run a bot, Bot Insight automatically creates a default dashboard in the collection: My dashboards. If you have a parent bot and a child bot, Bot Insight creates a separate dashboard for each of the bots.

Note: The system does not automatically refresh (auto-refresh) the Bot Insight dashboards unless the user loads a screen or clicks the **Refresh** button, thereby manually refreshing data on a page.

When you deploy and run a bot on the Bot Runner machine, Bot Insight aggregates all the information related to that bot. The published dashboard for that bot displays the aggregated bot information.

Note: Some data might not populate in a widget if bots were created in Automation 360 v.12 or earlier versions. See the following article for troubleshooting: [Bot Insight dashboard not populating data in specific widgets \(A-People login required\)](#).

My dashboards displays the following dashboards:

- [Operations dashboard](#) on page 3731
- [Business dashboard](#) on page 3734

Note:

- You must have either the `AAE_Bot Insight Admin` or the `AAE_Bot Insight Consumer` role assigned to you to view the published dashboard.
 - The data visible on the dashboards is in the **UTC** time zone.
-

Viewing Bot Insight dashboards

The Bot Insight dashboards provide customizable widgets for you to gain insights in specific scenarios. You can view information about your bots on the Bot Insight dashboards from the Control Room.

To view the published business dashboards, you must have a custom role defined with the **View my bots** and **Check in** permissions to the folder that contains the corresponding tasks.

When you tag variables for analytics in a task and then run the task, Bot Insight generates the analytics dashboard. By default, the system-generated dashboard has the same name as that of the task. You can customize this dashboard to your requirements.

Business analytics provide information on the transactional analytics for data that is logged by the variable tagged in a task. The information provided can be about total sales in a month, invoice, payment trends, new customer insights, or quote-to-order ratio. You can select your dashboard from the **Select a Dashboard** drop-down menu to view the analytics.

Bot Insight provides the following dashboards:

- **Configure**

The system-generated dashboards are available in the **Configure** tab in the Bot Insight window.

- **Analyze**

The customized dashboards can be published and are available in the **Analyze** tab in the Bot Insight window.

- **Operation**

The **Operation** dashboard provides information about bots that are created, deployed, or scheduled to run across different Bot Runner machines. You can use the information to enhance productivity and take measures based on real-time information for RPA deployments.

1. Log in to the Control Room with one of the following roles:

- `AAE_Bot Insight Admin`
- `AAE_Bot Insight Expert`
- `AAE_Bot Insight Consumer`

2. Click **Explore Bot Insight** from the **Insights** tab.

The Bot Insight dashboard appears in a new window.

Viewing Insights

You can view information about business data in Bot Insight.

Click **Insights** from the **Analyze** tab to view information about interesting facts on business data.

The Insight dashboard provides information about business data that is logged through Bot Insight without the need to analyze the dashboards. It provides a snapshot of data that you can use to

enhance your bot productivity. This feature highlights important facts that are inferred from within the business process data logged by the bots.

A bot created to process orders displays the following information:

- Total processing cost
- Process time
- Monthly payment
- Total payment

The dashboard provides information about the difference between the calculated metric values for a specific time interval:

- Yesterday
- Last 7 days
- Last 30 days

The Insight dashboard enables you to configure the variance thresholds for indicating metric-level health.

Perform the following steps to configure the variance thresholds:

1. Click **Settings**.
2. In the **Variance Threshold** window, move the slider to the left or the right to adjust the variance threshold.
 - Move the slider to the left for a **Poor** metric health level.
The poor metric level health is represented in red.
 - Move the slider to the right for a **Good** metric health level.
The good metric level health is represented in green.
3. Enter the values in the **Fair** field to set the **Fair** metric health level.
4. Select the **Switch poor and good** check box to switch between the **Poor** and **Good** metric health levels.
5. Click **Save**.

Operations dashboard

The Bot Insight Operations dashboard provides information about bots that are deployed on different Bot Runner machines and bot statistics based on performance. You can use this information to enhance productivity and take measures based on real-time information for RPA deployments.

The Operations dashboard provides visual insight into various operational aspects of bots and displays hyperlinks to the following dashboards:

- Bots Dashboard
- Audit Dashboard
- Device dashboard

Note: Ensure that you have the **AAE_Admin** role to view all bots information in the operations dashboards.

These dashboards appear as the Default dashboards and are automatically created by Bot Insight based on the variables that are used in the bot. You can use the **Save As** function to save the Default dashboard as a Custom dashboard. You can also add widgets from the Visualizations menu to your custom dashboards.

[Using widgets](#) on page 3749

Bots Dashboard

You can view information about the bots that are created, deployed, scheduled, and running across various Bot Runner machines.

The dashboard displays the following bot information:

- **Total Bot Runs:** Displays the total number of times the checked-in bots executed from the Bot Runner machines. (The number displays the total number of bots that have run successfully and failed to run).
- **Total Completed (Success):** Displays the number of bots that have ran successfully.
- **Total In Progress:** Displays the number of in-progress bots.
- **Total Failed:** Displays the number of bots that had failed to deploy or run.
- **Weekly Bot Status:** Displays the weekly status of bots that are scheduled to run.

Tip: You can hover over the widget to view the number of bots that have run successfully, failed to deploy, and failed to run. It also displays the weekly bots statistics percentage.

- **Failure Reasons:** Displays reasoning information on bots that had failed.
-

Note: The **Error Message** field displays a snapshot of the original error message and extensive details on why the bot failed. You can export the error messages and logs to a CSV file, which you can later use to troubleshoot.

Additionally, the Bots dashboard displays the Bot duration (such as minimum, maximum, average, and summation) of each bot. You can create your own dashboard, add any widget, and calculate the minimum, maximum, average, and summation of bot run time.

Audit Dashboard

This dashboard displays various widgets that provide information about Control Room events. Users with the `View everyone's audit log actions` permission have access to view the audit information captured in the Control Room.

[System roles](#) on page 1706.

The dashboard displays the following information:

- **Event Distribution by Activity Type**
- **Event Distribution by User Name**
- **Event Distribution by Source**
- **Event Distribution by Control Room Source**
- **Event Distribution by Workbench Source**

You can perform the following actions in the Operations dashboard:

- Enter the name of the dashboard in the **Search** text box to access a dashboard.
- Click the **Favorite** tab to bookmark your dashboard.
- Double-click the **Favorite** menu to remove bookmarks.

You can view information in the following tabs:

- **Total Views:** Displays the number of users who viewed a particular dashboard.
- **Last Refreshed:** Displays the time and date of when a particular dashboard was last refreshed.

You can click the arrow next to the Operations dashboard tabs to organize the dashboards to your requirements.

You can customize the widgets in the Operations dashboard. You can perform the following functions:

- [Working with Bot Insight dashboards](#) on page 3743
- [Comparing dashboards](#) on page 3743
- [Sharing a dashboard](#) on page 3746
- [Taking a screenshot of a dashboard](#) on page 3747
- [Downloading a PDF file from a dashboard](#) on page 3747

Device Dashboard

The Device dashboard displays various widgets that provide information about resource utilization of the machines on which bots are executed.

The dashboard provides key metrics to analyze the status and utilization of devices. It also displays the activity history of the bots that are deployed on the machines.

The dashboard displays the following information:

- **Online Devices:** Displays the number of Bot Runner machines that are active or online at a point in time.
- **Offline Devices:** Displays the number of Bot Runner machines that are inactive or offline at a point in time. Devices can be online even though no bots are deployed on them.
- **Bot Schedules on Devices:** Displays the number of bots that are scheduled to run on all the Bot Runner machines.
- **Device Utilization%:** Provides the overall time used by bots that are executed across all the Bot Runner machines. You can view and analyze the utilization information by date using the following criteria:
 - Bot duration
 - Unit: %
 - Group 1: Start date time of a bot (interval: day)
 - Group 2: device name

There is no limit on the number of devices that can be displayed on the dashboard.

- **Device Activity History:** Provides information about the execution history of bots deployed on each Bot Runner machine. The Device Activity History table provides the following information:
 - Device name
 - Bot name
 - Bot duration (milliseconds)

- Start date time of a bot
- End date time of a bot
- Status

When the Group1 and Group 2 fields have date type variables and you select **Bot Duration** as a metric, the **Percentage (%)** option appears as an additional option for **Bot Duration Unit**. Based on the selected group interval, the percentage is calculated for the bot duration.

Example: When you select the parameters in the following fields as:

- Group By or Sub By: Date
- Interval: Year
- Metric: Bot Duration
- Bot Duration Unit: Percentage (%)
- The percentage calculated for bot duration is:
 $(10000/1000ms * 60s * 60m * 24h * 365days) * 100 = \%$

Note: The percentage calculation of the bot duration is available in all the widgets, except datatable and maps.

- **Top Error Messages:** Provides information about the error messages for any bot failure and the frequency of occurrence.

Business dashboard

The Bot Insight Business dashboard provides information about the Bot Insight data and statistics based on bot performance. You can use this information to enhance your productivity and take measures based on real-time information for RPA deployments.

The Business dashboard provides visual insight into the various business aspects of the bots. From this dashboard, you can access both the Default and Custom dashboards.

Bot Insight automatically creates the Default dashboard based on the variables that are used in the bot. You can use the **Save As** function to save the Default dashboard as a Custom dashboard. You can also add widgets from the **Visualizations** menu to your custom dashboards.

[Using widgets](#) on page 3749

In the Custom dashboard, Bot Insight enables you to export data from a dashboard widget to CSV files.

[Exporting data from a dashboard widget](#) on page 3755

You can perform the following actions in the Business dashboard:

- Enter the name of the dashboard in the **Search** text box to access a dashboard.
- Click the **Favorite** tab to bookmark your dashboard.
- Double-click the **Favorite** menu to remove bookmarks.

The dashboard displays the following bot information:

- **Bot Name:** Displays the name of bots that are associated with the business dashboards.
- **Total Views:** Displays the number of users who viewed a dashboard.
- **Last Refreshed:** Displays the time and date on which a particular dashboard was last refreshed.

- **Modified By:** Displays the name of the user who had last modified the dashboard.

You can click the arrow next to the Business dashboard tabs to organize the dashboards to your requirements.

In the **Dashboard Name** tab, select the dashboard that you want to access to view the dashboard. You can also enter the name of the dashboard in the **Search** text box to access the dashboard directly.

Click **Rank** in the **Distinct Count** row to view the rank of each variable. You can view the string data type values that are logged by a variable for the maximum or minimum number of times. This further enhances your ability to verify that the data is logged correctly in the bot.

[Viewing ranks of string datatype values](#) on page 3744

The Business dashboard widgets displays the following information:

- The total number of variables
- The comparison between number variables and transaction status
- The comparison between number variable distribution and transaction status
- A bar chart representing the distribution between the number variables and string variables
- A pie chart representing the relationship between variables in numbers and strings

The Profile dashboard displays bot variables and the transaction data. The Task Name table displays the variable name, display name, data type, inclusion details, maximum, minimum, average, sum, distinct count for the date, string, and number variables.

The Transaction Data table displays the variable name, display name, data type, inclusion details, minimum, maximum, average, sum, and distinct count metrics for the following parameters:

- **Machine Name**
- **Transaction Name**
- **Transaction Start Time**
- **Transaction End Time**
- **Total Transaction Duration** (Start Time - End Time)
- **Transaction Status** (In Progress or Completed)
- **User Name** (User who runs the bot)

You can use the **Preview Data** option to view the total number of records maintained for each variable. When you create and run a bot with multiple **Transaction Blocks** with **Analyze**, **Open**, or **Close** commands, all the tagged business variables are displayed in the **Transaction Names** menu.

You can customize the widgets in the Business dashboard. You can perform the following functions:

- [Working with Bot Insight dashboards](#) on page 3743
- [Comparing dashboards](#) on page 3743
- [Sharing a dashboard](#) on page 3746
- [Taking a screenshot of a dashboard](#) on page 3747
- [Downloading a PDF file from a dashboard](#) on page 3747

Document Workspace dashboard

The Document Workspace dashboards provide visualizations of learning instance performance and quality metrics as well as validation operations metrics.

Users with access to Document Automation can view and customize the Document Workspace dashboard without additional permissions.

The Document Workspace dashboard contains eight widgets, which contain visualizations of learning instance data. The widgets are customizable:

- You can reposition a widget by dragging and dropping it into a new location.
- You can apply filters, such as by specific learning instance or time frame. [Adding a dashboard filter](#) on page 3742
- You can click a data point in a widget to "drill down" or filter the metrics in that widget. See the following video:

Document Workspace widgets

Widget	Description
Accuracy % by field	A horizontal stacked bar chart that shows the straight-through processing percentage for each field in the learning instances
Extraction time per documents	A horizontal stacked bar chart that shows the average extraction time per learning instance in milliseconds
Number of uploaded documents	A line chart that tracks the total number of files uploaded each day
Number of uploaded pages	A line chart that tracks the total number of pages uploaded each day
STP% by learning instance	A horizontal bar chart that shows the straight-through processing percentage for each learning instance
STP% over time	A line chart that tracks the straight-through processing percentage for all the leaning instances by day
Validator performance by weighted average validation time	A horizontal bar chart that shows the weighted average time each Validator user spent performing manual validation per document.
Validator performance by # of documents validated	A horizontal stacked bar chart that shows the number of documents each Validator user validated per day

Dashboard filters

You can use the following dashboard filters to customize the metrics included in the dashboard:

- Learning Instance Name

Note: By default, both public and private learning instances are included in the dashboard.

- Document Type
- Page Count
- Created On

Note: When you set a filter, it is applied to the entire dashboard. To apply a filter to a specific widget, open the **Widgets** menu and select which widgets to apply the filter:

The screenshot displays the 'Dashboard Filter' interface. On the left, a sidebar lists filter categories: 'Attributes' (with 'Learning Instance Name' and 'Document Type' selected), 'Numeric' (with 'Page Count'), and 'Time' (with 'Created On'). A 'Clear All' button is located at the top right of the filter sidebar. The main area, titled 'Dashboard', shows a widget 'Extraction time per documents'. Below it, the 'Document Type' filter is expanded, showing radio buttons for 'Include' (selected) and 'Exclude'. A search box labeled 'Search Document Type' is present. Below the search box, there are two tabs: 'All' and 'Selected'. Under the 'All' tab, a list of document types is shown with checkboxes: 'Document Type', 'Invoices', 'Receipts', 'User-defined', and 'Utility Bill'. At the bottom of the filter panel, there is a 'Widgets' section with a 'Show' button and a large blue 'APPLY' button.

Custom dashboard filters

You can use the following custom filters to build the custom widgets in a **Document Workspace** dashboard:

- **User Name**
- **Status**
- **OCR Engine**
- **Processing Phase**
- **Processing Time**
- **Start time**
- **End time**

Related tasks

[Sharing a dashboard](#) on page 3746

You can share the link to view a dashboard through email using the **Share via email** option.

[Downloading a PDF file from a dashboard](#) on page 3747

You can download the data available in the dashboard as a PDF file.

[Taking a screenshot of a dashboard](#) on page 3747

You can take a screenshot of the data available in the dashboard.

Edit widget settings

You can edit widget settings to customize the general and advanced settings (such as chart title, chart type, metric, limit, and so on). You can build custom widgets with a custom filter, thereby increasing the data visualization effectiveness in the **Document Workspace** dashboard.

Users with access to Document Automation can view and customize the **Document Workspace** dashboard without additional permissions.

1. Open the Document Workspace dashboard.
2. Click the three dots icon in the required widget and click **Settings**.

Note: You can edit these widgets only: **Number of uploaded pages**, **Number of uploaded documents**, **Extraction time per documents**, **Validator performance by # of documents validated**, and **Validator performance by weighted average validation time**.

3. In the **Edit Chart** window, define the settings.
 - **General Settings**
 - **Chart Title:** Title of the chart (for example, `Number of uploaded documents`).
 - **Chart Type:** Type of the chart. See [Bot Insight visualizations](#) on page 3751.
 - **Group By:** Groups the data by **Learning Instance Name**, **Document Type**, **Created On**, **OCR Engine**, **User Name**, **Processing Phase**, **Status**, **Start Time**, and **End Time**.
 - **Date Interval:** The unit of interval (such as Hour, Day, Week, Month, and Year) in which data is presented.
 - **Metric:** Compares or assesses data by **Page Count**, **Processing Time Ms**, and **Volume**.
 - **Advanced Settings**
 - **Limit:** Limit for the X-axis and Y-axis values.

- **Sort By:** Sorts the data by **Volume** and **Start Time**.
- **Sort Order:** Order in which data is sorted (for example, **Descending** or **Ascending**).

4. Click **Next**.
5. Confirm the settings and click **Finish**.

Automation Co-Pilot dashboard

Use the Automation Co-Pilot dashboard in Bot Insight to view various widgets that provide information about requests created from published processes in Automation Co-Pilot for Business Users (Automation Co-Pilot).

Overview

The dashboard provides statistics and shows information about created requests for each process, which can vary from a simple summary to a complex cross-departmental view. You can use this real-time information to make process-related operational decisions. For example, consider a scenario where a manager can get a high-level activity overview of completed and pending tasks in the payroll process, which can then help the manager take necessary actions about the process.

From the Automation Co-Pilot dashboard, you can access both the Default and Custom dashboards. Bot Insight automatically creates the Default dashboard from the variables used in the process. You can use save the Default dashboard as a Custom dashboard if required. You can also add widgets from the visualizations menu to your custom dashboards.

Based on RBAC, the following users have access to view the data on the dashboard:

- **AAE_Robotic_Interface_Admin** can view all data inside Automation Co-Pilot on the web interface across all teams.
- **AAE_Robotic_Interface_Manager** can view all data inside Automation Co-Pilot on the web interface for their own teams.

What you can view in Automation Co-Pilot dashboard

The dashboard helps you to visualize and track the number of requests that are open, completed, canceled, or failed.

The dashboard also provides the following capabilities:

- Heat map chart: Visualize data about the percentage of request created for each process for a day. You can specify the dates by function (day) to get specific information using the following criteria:
 - Group1: created date (interval: day)
 - Group 2: process name
 - Metric: request created in percentage (%) for each process
- Request activity history: This table provides the execution history of the processes deployed on each Bot Runner machine. It includes information such as the following:
 - Process name

- Username
 - Request details such as the status, ID, end time and start time, duration
 - Total human and bot duration
 - Total human and bot tasks
- Stacked bar chart: Analyze the average duration taken by each process for human and bot tasks. For example, consider that there are two processes named API Test-Form 1 and API Test-Form 2 in the bot task type. For each process, the chart shows the average time (in seconds) taken for its execution. You can view and analyze this information using the following criteria:
 - Group 1: task type (human and bot)
 - Group 2: process name
 - Metric: duration (average)

Editing a data profile

You can modify the data profile of Default dashboards without modifying the bots.

You must have the **AAE_Bot Insight Admin** role.

You can edit the data profile and regenerate the dashboard based on the new data profile. You can edit the display name of a variable, change its data type, and exclude it from the dashboard.

Bot Insight provides smart data profiling for information about countries, states, and zip or postal codes. Bot Insight analyzes the information provided in the variables and automatically identifies the information as:

- Country (country code or country name)
- State (state code or state name)
- Zip code (five-digit zip code)

You can edit the data profile to convert the above parameters from numeric format to string format (country and state) based on your requirements. You can convert the zip code to either string or numeric format, and use the information to create widgets (world and US map widgets) in the Bot Insight dashboard.

1. Open the Bot Insight dashboard.
2. Click **Profile**.
The **Profile** window appears, displaying all the variables that you have tagged during the bot creation.
3. Click **EDIT**.
4. Specify a new name for a variable in the **Display Name** field.
5. Select an option from the **Datatype** drop-down list to specify a new data type for a variable.
You can change the datatype of a numeric variable to string, string to country, state, and zip code.

Note: Changes to the **Data Type** parameter cannot be reverted.

6. Clear the **Inclusion** check box to exclude the variable from the dashboard. Select **Inclusion** to include a variable from the dashboard and configure how the initial SMART dashboard is generated.

You can view the minimum, maximum, average, sum, and last value for the numeric values, but not for the string and timestamp variable types.

7. Click **Save and Generate Dashboard** to save the changes and generate the dashboard with the updated value.

Bot Insight dashboard filter

The Bot Insight dashboard filter enables you to apply filters across your dashboards to display the filtered data. You can save and publish the custom dashboards with preset filters.

Filters in the Bot Insight dashboard enables you to choose different views of the data. You can apply and save filters in a dashboard to preserve the filtered view. The filtered view displays the same view the next time you view the dashboard.

Dashboard filters enables different combinations of data in a single dashboard. The filter eliminates the need for separate dashboards for different users. A single-filtered dashboard allows you to serve data requirements for a wide range of users.

You can access the dashboard filter from both the Operations and Business dashboards. You can click each item in the filter list to view the parameters. You can search for a specific parameter in the **Search Automation Name** field in the **All** tab. You can select parameters based on whether to include or exclude them in the filter. The selected parameters appear in the **Selected** tab.

When you apply a specific filter, the visual indicator in the dashboard displays the name of the applied active filter. You can delete a dashboard filter by clicking the delete icon. When you publish a custom dashboard with the applied the dashboard-level filters, the published dashboard contains the same filters. You can click **Widgets** in the widget window to apply dashboard widgets.

The Bot Insight dashboard provides the following filters:

- **Attributes:** This filter enables you to include or exclude specific parameters of a given attribute. This can be the bot name, device name, or user name.

For example, you can use the parameters:

- **Model Version** to differentiate the payload and to determine if an upgrade is required in the dashboard. You can also use it as a filter so that the dashboard works correctly even with different job execution pay loads.
- **Job type** to identify the type of task such as TASK(Bot Run), WORKFLOW, WORKORDER, WLM_TASK
- **Automation Name** to provide a name when running or scheduling the bot
- **Object Name** to identify the name of the entity for which the audit action is recorded. For example, to identify the username when the user is edited or created or the bot name when the bot is edited or created.
- **Numeric:** This filter enables you to select a specific duration for which you can get the numerical statistics of the bot. For example, this can be the **totalLines** that is processed by the bot, or the duration during which the bot was active.
- **Time:** This filter enables you to select a single date, or a range of dates to analyze the variables that are categorized under time and date. This can be the bot start time or end time.

Related concepts

[Operations dashboard](#) on page 3731

The Bot Insight Operations dashboard provides information about bots that are deployed on different Bot Runner machines and bot statistics based on performance. You can use this information to enhance productivity and take measures based on real-time information for RPA deployments.

Adding a dashboard filter

To create a dashboard filter, select a field containing the information type you want to filter and define the return of the data. The filtered view is preserved so that the same view is displayed the next time you view the dashboard.

1. Open the dashboard to which you want to add a filter.
2. Select the parameter based on your requirements in the **Attributes** tab, .
The parameter window appears.
 - a) Enter the name of the variable in the **Search** field.
The variable appears in the **All** tab. Select the variable that you want to add in the filter.
The selected variable appears in the **Selected** tab.
 - b) Choose one of the following options:
 - Click **Include** to include the variable in the dashboard filter.
 - Click **Exclude** to exclude the variable in the dashboard filter.
 - c) Click **Apply**.

The **Attributes** filter is added to the dashboard.

3. Select the parameter in the **Numeric** tab.
4. Perform these steps in the selected parameter window:
 - a) Select the condition that you want to specify in the filter.
 - b) Enter the minimum and the maximum values.
 - c) Click **Apply**.

The **Numeric** filter is added to the dashboard.

5. Select the parameter based on your requirement in the **Time** tab.
6. Perform these steps in the selected parameter window:
 - a) Select a specific date, or a range of dates.
 - b) Click **Apply**.
The **Time** filter is added to the dashboard.

Related reference

[Customizing a dashboard](#) on page 3744

Log in to Bot Insight with the `AAE_Bot_Insight_Expert` role to customize the information displayed in the system-generated dashboard to make it more relevant for an analytics consumer.

Working with Bot Insight dashboards

You can save or delete a Bot Insight dashboard when required. You can also delete a user-created dashboard.

When you delete a dashboard, it does not impact the data associated with that dashboard. You can delete dashboards that are available in the **Analyze** and **Configure** tabs of the Bot Insight window. The dashboards available in the **Analyze** tab are the published dashboards. Therefore, if you delete a dashboard from the **Analyze** tab, it will no longer be available for other users.

- Save a dashboard:
 - a) Open the dashboard that you want to save.
 - b) From the **Actions** menu, select **Save as**.
The **Save Dashboard** window appears.
 - c) In the **Dashboard Name** field, enter the name for the dashboard.
 - d) In the **Dashboard Description** field, enter the description of the dashboard.
 - e) Click **Save**.
Click **Save As** to save a default dashboard as a customized dashboard.
- Open the dashboard you want to delete.
 - a) Click **Delete** on the toolbar.
 - b) Click **Okay**.

Comparing dashboards

You can compare dashboards that belong to two separate processes, or the same process with different filters. The dashboards selected for comparison appears as a side-by-side view to enable you to obtain better insights.

- Compare dashboards:
 - a) Open the dashboard that you want to compare.
 - b) Navigate to **Actions > Compare** in the **Bots Dashboard**.
Your dashboard is now in compare mode. The dashboard you have opened appears in both the **Left View** and **Right View**. You can apply widget filters to your dashboard at any time.
- Apply widgets to your dashboards:
 - a) Click the **Filter** option from your dashboards, represented by the three dots in the corner.
The **Filter** window now appears and shows the available widgets.

Note: The **Filter** option next to the **Close** option accesses the same **Filter** window. You can also expand or minimize the **Filter** window.

 - b) Select the **Left View** or **Right View**.

- c) Select the **Attributes**, **Numeric**, or **Time** widgets that you want to apply.
- d) Optional: Click **Clear All** to reset all your widget selections.
- e) Click **Apply** to confirm.
You can now compare your dashboard with widgets.

Customizing a dashboard

Log in to Bot Insight with the `AAE_Bot Insight Expert` role to customize the information displayed in the system-generated dashboard to make it more relevant for an analytics consumer.

To make changes in a Bot Insight dashboard, create a copy of the dashboard, and then update the copy.

After you create customized dashboards for a bot, you can make changes to the tagged variables. You can delete and add variables based on your requirements. By default, the standard dashboard always displays the latest data profile. We recommend you use the system-generated standard dashboard, and then create customized dashboards from it. Data profile updates are highlighted with a red dot in the following scenarios:

- When there are data profile updates.
 - The variables that are newly added display the message `NEW`.
 - The variables that are deleted display the message `DELETED`.
- When the customized dashboard data profile does not match that of the standard dashboard.

Related tasks

[Editing a data profile](#) on page 3740

You can modify the data profile of Default dashboards without modifying the bots.

Viewing ranks of string datatype values

Among string datatype values, you can view the ranking based on the maximum and minimum number of times each string datatype value has been used, as logged by a variable. With this information, you can better verify whether the data logged in the bot is correct.

1. Open the dashboard for which you want to edit the data profile.
2. Click the **Profile** tab.
3. Click **Rank** within the **Distinct Count** column.

The **Distinct Count** column displays the number of unique values logged by a variable.

Note: The **Rank** option is only available for the variables that log values of string datatype. A message appears displaying the top five values that are logged for the maximum number of times in the variable.

4. Select **Bottom** from the list to display the five values that are logged the least number of times in the variable.
5. Select an option from the list to display five or ten values in the message box.

Previewing data

You can view all the variable data associated with a task using the **Preview Data** option.

1. Open the dashboard for which you want to preview the data.
2. Click the **Data Profile** tab.
3. Click the **Preview data** option.
A new window appears displaying all the variable data associated with that task.

Verifying data populated in a custom dashboard

After you create a custom dashboard that contains new widgets or customized widgets from the system-generated dashboards, you can verify the data that is populated in the dashboard.

1. Open the task for which you want to verify the data in Bot Insight.
2. Click **Run** on the toolbar.
3. Click the **ANALYZE** tab.
The system-generated dashboard for the task appears.
4. Click the **Analyze** tab in the Bot Insight window and search for the customized dashboard for which you want to verify the data.
5. Select the dashboard from the search results.
The dashboard appears.
6. Click the **Data Profile** tab and verify the data for the dashboard.

Publishing a business analytics dashboard

Bot Insight enables you to publish a business analytics dashboard that is generated for a task. You can publish both the Custom and Default Business dashboards.

Before you publish a dashboard, ensure that the particular bot resides in the Public folder in the Control Room.

1. Open the dashboard that you want to publish.
2. Customize the dashboard based on your requirements and verify the content and presentation formats.
3. Click **Publish** on the toolbar.
4. Specify a name for the dashboard, and then click **Okay**.
The dashboard is now published and available to display the production data generated by the task. The dashboard updates the data each time a task runs in the production environment from the Control Room on a regular basis.
In the Control Room, ensure that you deploy the bot in the Bot Runner device so that the published dashboards are populated with data.

Related tasks

[Import bots](#) on page 1969

You can import bots with their dependencies from one Control Room to another. The source environment can be Automation 360 Control Room, Enterprise 11 , or Enterprise 10 Control Room instance.

Save a published dashboard

You can publish a Bot Insight business analytics dashboard that is generated for a task. You can also save a copy of the published dashboard when required.

Ensure you have the **AAE_Bot Insight Admin** or **AAE_Bot Insight Expert** roles assigned to you.

1. Open the Bot Insight Window.
2. Click the **Business** tab and search for the dashboard for which you want to save a copy of custom production dashboard.
3. Select the dashboard from the search results.
The selected dashboard appears
4. Select the **SaveAs** from the **Action** menu to save the default **Production** dashboard as a **Custom Production** dashboard.
5. In the **Save Dashboard** window, specify a name for the dashboard and click **Okay**.
You can add widgets from the **Visualizations** menu to your custom production dashboard.
You can add, delete, change visualization, apply filters, and so on to customize the dashboard.

Delete a published dashboard

You can publish a Bot Insight business analytics dashboard that is generated for a task. You can also delete a published dashboard when it is not longer required.

Ensure you have the **AAE_Bot Insight Admin** or **AAE_Bot Insight Expert** roles assigned to you.

You cannot delete a default **Production** dashboard if child (custom production dashboards) are associated with it. You must first delete the custom production dashboard and then delete the default **Production** dashboard. However, you can delete a **Custom Production** dashboard.

1. Open the Bot Insight Window
2. Click the **Business** tab and search for the dashboard you want to delete.
3. Click **Delete** from the **Action** menu.
4. Click **Okay** to confirm the deletion.

Reviewing data in a published dashboard

You can review the data available in a published dashboard.

1. Open the Bot Insight window.
2. Search for the dashboard for which you want to view the data.
3. Select the dashboard from the search results.
The selected dashboard appears.
4. Review the data available in the dashboard.
The dashboard reflects the data processed by the task in the production environment.
5. Export the entire dashboard in PDF or PNG format for offline consumption and review.

Sharing a dashboard

You can share the link to view a dashboard through email using the **Share via email** option.

1. Open the dashboard that you want to share.

2. Click **Share via email** on the toolbar.
The email client configured on your system appears. The email client contains a link to access the dashboard.
3. Specify the email address of the recipients and send the email.

Downloading a PDF file from a dashboard

You can download the data available in the dashboard as a PDF file.

1. Open the Bot Insight window.
2. Search for the specific dashboard.
3. Select the dashboard from the search results.
The selected dashboard appears.
4. Review the data available in the dashboard.
5. In the **Actions** menu, click **Download PDF**.

Note: For all dashboards, the **Download PDF** function does not work in Safari browser. You can use other browsers such as Chrome, Firefox, or Edge to download the PDF reports.

6. In the **Download PDF** window, navigate to the location on your local disk drive.
7. Click **Save**.

Note: Due to a limitation within the third-party recharts library, you might observe labels overlapping issue with data in downloaded PDF.

Taking a screenshot of a dashboard

You can take a screenshot of the data available in the dashboard.

1. Open the Bot Insight window.
2. Search for the dashboard for which you want to view the data.
3. Select the dashboard from the search results.
The selected dashboard appears.
4. Review the data available in the dashboard.
5. In the **Actions** menu, click **Screenshot**.
6. In the **Download PDF** window, navigate to your local disk drive location.
7. Click **Save**.

Using Bot Insight

Use Automation Anywhere Bot Insight to track bot data for analytics.

Automation Anywhere bots are built, run, and monitored in the Control Room. Bot Insight accesses real-time business insights and digital workforce performance data to leverage content-level productivity data from the bots that are deployed. Data is logged for business analytics who has Attended and Unattended Bot Runner license .

Log in to Automation Anywhere Control Room as an `AAE_Bot_Insight_Expert` or `AAE_Bot_Insight_Consumer` to interactively analyze bot data and enhance bot widgets.

In the Control Room, select the Bot Insight tab, to do the following tasks:

- Interactively analyze the bot data in the dashboards.
- Refine and enhance widgets in the Bot Insight dashboards before they are published for wider consumption and deployed to production.

Note: To view the published business dashboards, you must have a custom role defined with the **View my bots** and **Check in** permissions to the folder that contains the corresponding tasks.

Business analytics

Business analytics provide information about the transactional analytics for the data that is logged by the variable tagged in a task. The information provided can be about the total sales in a month, invoicing and payment trends, insight about new customers, or quote to order ratio.

When you tag variables for analytics in a task, and run the task, Bot Insight generates the analytics dashboard. By default, the generated dashboard has the same name as that of the task. You can customize the system generated dashboards based on your requirement.

Configuring a task for business analytics

To configure a business analytics automation task, enable analytics (using the **Analyze: Open** and **Analyze: Close** actions) and tag the variables that are of interest for data analysis.

To configure a task for business analytics in an existing bot:

1. Log in to the Control Room.

Note: Ensure that you have the Bot Creator license assigned to you.

2. In the **Automation** pane, select the folder that contains the task for which you want to enable analytics.

The **Actions** palette appears in the left-hand side. See [Actions to build bots](#) on page 2272.

3. Build a bot.

For more information about building and editing a bot, see [Get started building bots](#) on page 3067.

4. Insert the **Analyze: Open** action at the beginning of the transaction.
5. Insert the **Analyze: Close** action at the end of the transaction.

The **Analyze: Close** menu lists all the variables in the transaction. Select the variables that are tagged in the transaction to process business analytics.

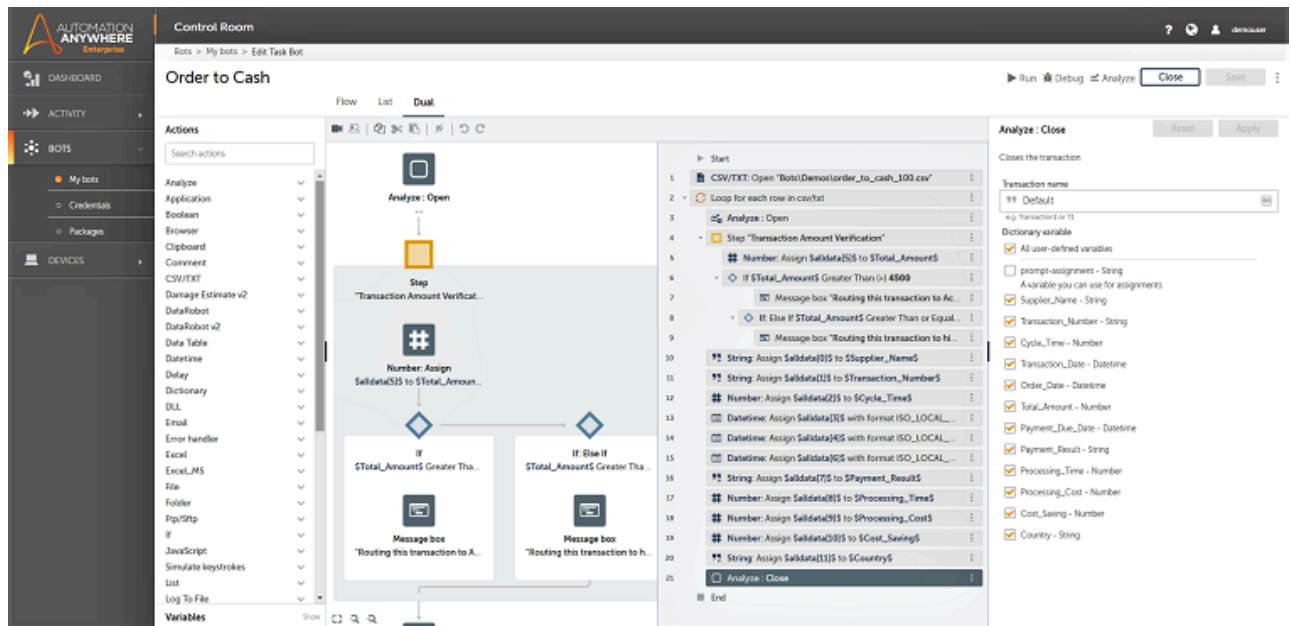

Note: This feature enables you to deselect variables that might raise potential privacy concerns, such as social security numbers or bank account details.

6. Click **Apply**.

Click **Reset** to reset the variable selection.

7. Click **Save**.
8. Click **Run**.

The **Bot Run Successfully** message appears.

9. Click **Analyze**.
The Bot Insight window appears.
10. Select a bot from the **Select a Dashboard** drop-down list.
Click the arrow to view the list of bots.

Using widgets

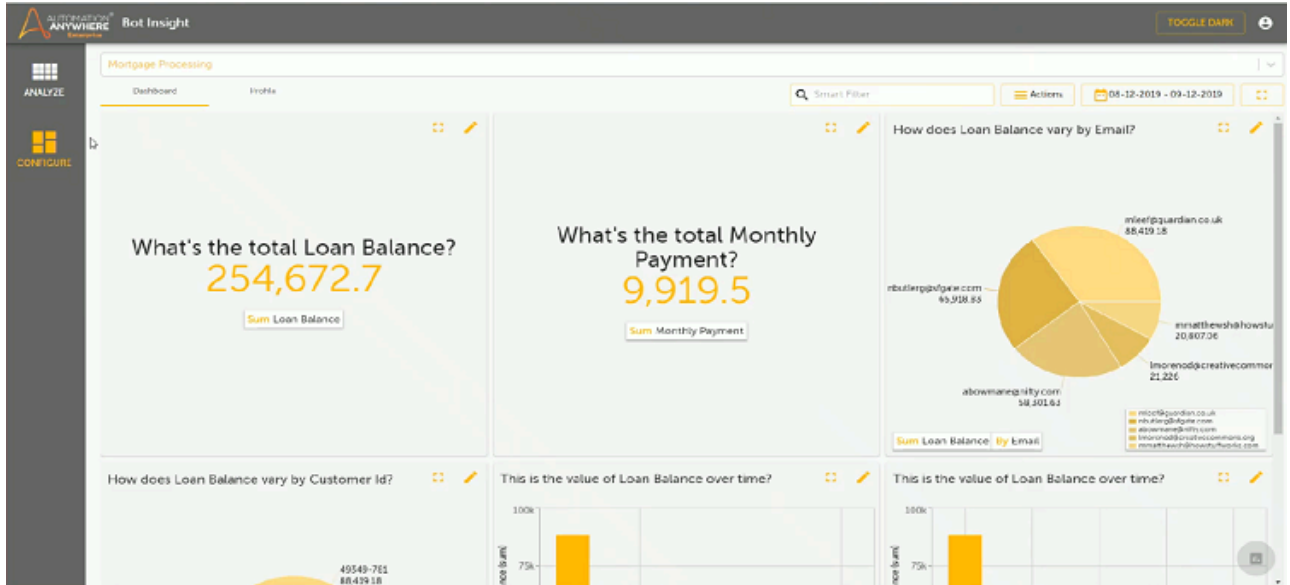

The Bot Insight dashboard provides a host of highly customizable widgets that you can use to gain insights for specific scenarios.

When you select a particular bot, the default widgets automatically appear in the **Dashboard** window. You can select the widgets and reposition them in the dashboard. To search for specific information, use the **Smart Filter** function. You can enter the search parameters in the **Smart Filter** field.

You can also use multiple filters to search for data the widgets should display. Enter the filters, search parameters, separated by a comma in the **Smart Filter** field. You can create, move, rename, and edit the widget properties in a dashboard, based on your requirements.

The available options are:

- Chart filters
- Chart style
- Metric-based filters
- Comparison metrics

You can group information by dates and use the **Date Interval** to view when a particular bot was active.

The following **Date** type options are available:

- **Hour**
- **Day**
- **Week**
- **Month**

Adding a dashboard widget

You can add custom widgets to the Bot Insight dashboard based on your requirements.

You can add a widget to the custom dashboards and not to the default dashboard.

1. Open the dashboard.
- 2.

Click the icon.

The **Add Visualization** window appears.

3. Select a widget that you want to add in the dashboard. See [Bot Insight visualizations](#) on page 3751.

The **Selected Chart** window appears.

4. Optional: Click the **Switch Widget** button to change widgets.
5. Click **Next**.

The **Construct Your Query** window appears.

6. Enter the query information to construct your dashboard. For reference to create a widget query, see [Configuring a Line Bar Chart query](#) on page 3752.

7. Click **Next**.

The **Ready to build** window appears.

8. Click Confirm.

The widget appears in the dashboard.

Bot Insight visualizations

The Bot Insight dashboards provide customizable widgets that you can use to gain insights for specific scenarios.

Bot Insight offers the following visualization widgets:

- **Gauge Chart**
- **KPI**
- **Vertical Bar Chart**
- **Line Bar Chart**
- **Clustered Line Bar Chart**
- **Horizontal Bar Chart**
- **Vertical Stacked Bar Chart**
- **Horizontal Stacked Bar Chart**
- **Vertical Clustered Bar Chart**
- **Horizontal Clustered Bar Chart**
- **Heat Map**
- **Pie Chart**
- **Donut Chart**
- **Line Chart**
- **Scatter Chart**
- **Bubble Chart**
- **Datatable Chart**
- **World Map**
- **US Map**

The **Pie Chart** widget enables you to visualize data in a circular statistical graphics that is divided into slices.

Note: Due to a limitation within the third-party recharts library, the data labels in a pie chart are overlapping if it contains many slices. As a result, the labels in a pie chart are not clear and are shown only when you hover over the slices.

The **Heat Map** widget enables you to visualize data as a heat map chart. You can specify the dates by function (day, week, month, or year) to drill down to specific information. This map displays all the possible available combinations of variable values in the X and Y axes. Blank heat map blocks appear if there the value attached to the variable is 0. The color of the heat map block depends on the value of the information displayed. A new window with all the relevant information appears when you hover your mouse over a particular heat map block.

The **Datatable Chart** widget enables you to view and analyze information about all the logged data in a tabular chart. You can select the attributes and metrics based on your requirement. All the available attributes and metrics are selected by default.

The **World Map** widget provides information about the data variables and enables you to drill down to specific information:

1. Country

2. State
3. Zip Code
4. Latitude
5. Longitude

The **US Map** widget provides the following information about the data variables and enables you to drill down to specific information:

1. Country
2. State
3. City
4. Zip Code

The **Line Bar Chart** and the **Clustered Line Bar Chart** widgets enable you to view and analyze information about your metrics and attributes. You can input two metrics and one attribute in **Line Bar Chart** widget, while in the **Clustered Line Bar Chart** widget, a **Sub group** option enables you to add one more attributes if necessary.

The widget displays a line bar graph aggregated by group values when only one attribute is selected or a clustered line bar graph aggregated by subgroup values when two attributes are selected. It displays group sectioning which forms multi-axes labels . You can use **Date** types as interval options, grouped by **Day, Week, Month, Quarter, and Year**, with the **Day** set as default.

[Configuring a Line Bar Chart query](#) on page 3752

Related tasks

[Adding a dashboard widget](#) on page 3750

You can add custom widgets to the Bot Insight dashboard based on your requirements.

Configuring a Line Bar Chart query

You can construct a custom query based on specific parameters to apply to your widget for line bar and clustered line bar charts.

After you are in the **Construct Your Query** window, follow these steps to select parameters to apply to your widget:

- Construct your query settings.
 - The query settings vary from widget to widget, but the selection process remains the same.
 - a)** Enter the title of your widget in the **Chart Title** field.
 - b)** Select a metric option in the **Metric** or **Select Metrics** field.
For **Line Bar Chart** and **Clustered Line Bar Chart**, the **Metric** field is renamed to **Y1 Axis** and **Y2 Axis**.
 - c)** Select an aggregated value in the **Aggregated By** field.
For **Line Bar Chart** and **Clustered Line Bar Chart**, the **Aggregated By** field is renamed to **Y1 Aggregated By** and **Y2 Aggregated By** with the same options.
 - d)** Select a value from the **Group By** or **Group 1** field.
 - e)** Select a secondary value from the **Sub Group By** or **Group 2** field.

Note: The **Sub Group By** or **Group 2** field is not available in the **Line Bar Chart**. For the **Metric**, **Group By** and **Sub Group By** fields, the first value is shown as the default value.

- f) Select a date value in the **Date Interval** field.
-

Note: This field appears when you select the Date Type variable in the **Group By** and **Sub Group By** fields.

- Construct your advanced query settings.

You can enable more options to any widgets that support advanced settings.

- a) Click **Advanced Settings**.

The settings display the default values. You can change the value of the fields if required.

- b) Select a limit value in the **Limit** or **Group Limit** field.
- c) Select a sort value in the **Sort By** or **Group Sort By** field.
- d) Select a sort order value in the **Sort Order** or **Group Sort Order** field.
- e) Select a secondary limit value in the **Sub Group Limit** or **Group 2 Limit** field.
- f) Select a secondary sort value in the **Sub Group Sort By** or **Group 2 Sort By** field.
- g) Select a secondary sort order value in the **Sub Group Sort Order** or **Group 2 Sort Order** field.
-

Note: The **Sub Group Limit**, **Sub Group Sort By** and **Sub Group Sort Order** fields are not available in the Line Bar Chart.

Editing a dashboard widget

You can edit the dashboard widget properties based on your requirements.

You can resize and save the widgets in the Bot Insight dashboard based on your requirements. When you resize a dashboard widget, other widgets in the dashboard are automatically adjusted to fill in the available layout.

Note: Bot Insight allows you to resize widgets in the standard and the customized dashboards. However, it does not allow you to save the widgets after resizing in the standard dashboard.

1. Open the dashboard widget.
2. Click the **Edit** button.

The **Edit** window appears.

The **Edit** menu offers the following options:

Chart Title	Renames the chart
Metric	Changes the units
Aggregate By	Displays the run time (such as minimum, maximum, average, and summation) of each bot

Group By

Changes the parameters based on which the widgets are grouped together

3. Click the bottom of a widget to change the attribute of the chart displayed within the widget.
4. Click **Save As** to save the widget.

Drilling down information in dashboard widget

You can drill down information from a dashboard widget based on your requirement. Select the options available in the drop-down list to view specific information in the dashboard widgets.

To use the drill down function feature in the Bot Insight dashboard widget, do the following:

1. Open the dashboard and select the widget.
2. Right-click to view the **Drill Down** menu.

Drill Down menu sample for a mortgage analytics processing bot :

- **Gender**
- **Mortgage Type**
- **Customer ID**
- **Company Name**
- **Email**
- **Loan Due Date**
- **Loan Origin Date**

Note: Bot Insight dynamically generates the **Drill Down** menu options based on the variables you tag when creating the bot.

Renaming a dashboard widget

You can rename a dashboard widget based on your requirement. The default name of a dashboard widget is based on the type of information that the widget displays.

To rename a widget in the Bot Insight dashboard, do the following:

1. Open the dashboard for the widget to edit.
2. Rollover and click the **Edit** button.
The **Edit Chart** window appears.
3. In the **Chart Title** field, enter the name of the widget.
4. Click **Next**.
The **Ready to build! Click Finish** window appears.
5. Click **Finish**.
The **Widget Updated** message appears.

Exporting data from a dashboard widget

You can export data from the Bot Insight **Custom Business** dashboard widgets to CSV files based on the requirement.

1. Open the dashboard.
2. Identify the widget.
3. Click the **Actions** icon.
4. Click **Export**.

The CSV file is automatically saved in your local drive as Chart name_summary_dd_mm_yyyy.

Data connector for Power BI

The data connector for Power BI enables you to establish a secure connection to Power BI, and generate and visualize data analytics. You can connect to the Bot Insight APIs in Power BI and apply specific parameters for each of the APIs.

The connector transforms the Bot Insight API responses to data visualizations in Power BI. The data connector for Power BI enables you to perform the following functions in Power BI:

- Authenticate and connect to the Control Room.
- Connect to APIs.
- Generate API responses.
- Transform the API responses to create a data model.
- Create visuals, charts or graphs, to represent the data.
- Create reports.
- Share reports with other users on Power BI.

You can access the following APIs from Power BI:

- `getaudittrialdata`
- `getbotrundata`
- `gettaskvariableprofile`
- `gettasklogdata`

Note: Automation Anywhere Power BI connector is certified and available as part of the Microsoft Power BI Desktop August release. The connector is available in the **Other** section of the **Get Data** dialog box in Power BI.

To update your Power BI to the latest certified release version and use the connector plug-in, manually deploy the data connector in Power BI. This enables you to retrieve information from the Bot Insight API for data analytics.

Trouble: When you attempt to refresh the data in a Microsoft Excel worksheet, an authentication error can occur from multiple simultaneous attempts through open windows and tabs. To avoid this error, perform the following steps:

1. In the Power BI desktop application, navigate to **File > Options and settings > Options**.

2. From the Current File section, select **Data Load**.

Note: Do not select **Data Load** from the Global section.

3. Disable the check box for **Enable parallel loading of tables**.
-

Related information

[Microsoft Power BI](#)

Deploy Power BI connector

Deploy the data connector in Power BI to retrieve information from the Bot Insight API to enable data analytics.

The connector can now be accessed directly from the Power BI desktop application. Ensure you meet the following prerequisites.

- You should be using Power BI desktop version 2.92.943.0 or above.
- You know your Automation Anywhere Control Room version.
- You have your Control Room credentials.
- You have your Control Room URL.

The following steps describe how to deploy the connector.

1. From your Power BI desktop application, select **Get data**.
2. In the search field, type and select `Automation Anywhere`.
3. Click **Connect**.
4. From the Login dialog box, enter your Control Room version and URL.
5. Enter your Control Room credentials.
6. Click **Connect**.

[Configure Power BI connector](#) on page 3756

Configure Power BI connector

Configure the data connector in Power BI to retrieve information from the Bot Insight API to enable data analytics.

Ensure that you have the `Bot Insight Admin`, or `AAE_Admin` role assigned to you in the Control Room.

Note: A `Bot Creator` license is required to generate a default dashboard with `tasklogdata` for Power BI.

Note: The Power BI Connector is supported with Database Authenticated Control Room and Active Directory authentication.

1. Log in to the Power BI.
2. Click **Get Data**.

The list of all the Power BI certified connectors appears.

- For information about how to access non-certified custom connectors, see [Connector extensibility in Power BI](#).
 - When you update the dataset of two or more datasets, you might observe the **Authentication 500 Internal server error**. For resolving this error, see [Automation 360 | Authentication 500 Internal server error while refreshing in power BI \(A-People login required\)](#).
3. Select Automation Anywhere and click **Connect**.
 4. In the **Automation Anywhere - Login** window, enter the following information:
 - a) In the **Control Room Version** drop-down menu, select the version of the Control Room.
 - b) In the **Control Room Host** field, enter the IP address or the host name of the Control Room server.
 - c) In the **Bot Insight Host** field, enter the IP address or host name of the Bot Insight server.
 5. Click **OK**.
 6. In the **Automation Anywhere Login** window, enter your Bot Insight user name and password.

To provide the credentials for Active Directory authentication, you must enter the domain name delimited by a double backslash (\\) along with the user name in the **User name** field. For example: domain name\\user name.
 7. Click **Connect**.

The Bot Insight APIs are authenticated and the authorization tokens are generated. The Bot Insight APIs are loaded dynamically from Swagger, along with the applicable request parameters.
 8. Select the required Bot Insight API from the **Navigator** menu and enter the information in the respective fields.
 9. Click **Load**.

The API retrieves specific information from the server.

To learn how to retrieve information from Bot Insight APIs in Power BI, see [Bot Insight API](#).
 10. Click **Transform Data** to convert the structured JSON response to a visual data model.

[Collaborate, share, and integrate across products with Power BI](#)

Example: Retrieve information in Power BI using business information API

The Power BI connector enables you to access the Bot Insight API from Power BI. This example task shows you how to retrieve information from the Bot Insight API and build data visualizations in Power BI.

1. Open Power BI.
2. Open the **Navigator** window, and log in to the Control Room by entering the credentials.
3. In the **Display Options** menu, select **fx Business Information**.

The **API** window appears.

4. In the **botName** field, enter the name of the bot, or the task for which you want to visualize the analytical data.

To enter multiple bot names, separate each name with a comma.

For example, `SalesAPAC,SalesEMEA,SalesUS`.

5. In the **pageNo** field, enter the offset value for the rows or records that you want to retrieve.
 - If page = 0, and limit =1000, then rows 0 -1000 will be retrieved.
 - If page = 1, and limit =1000, then rows 1001 -2000 will be retrieved.

6. Optional: In the **fromDate** field, enter the date from when you want to retrieve the information.

Format: `yyyy-mm-dd`, or `yyyy-mm-ddTh:m:s.msZ` (2020-02-20T12:45:23.000z)

Note: If you do not enter a date, the API will return all available data.

7. Optional: In the **toDate** field, enter the date till when you want to retrieve the information.

Format: `yyyy-mm-dd`, or `yyyy-mm-ddTh:m:s.msZ` (2020-03-21T15:45:32.000z)

Note: If you do not enter a date, the API defaults to the current date.

8. In the **limit** field, enter the number of rows or records you want to retrieve.
9. Click **Apply** and then click **Transform Data** to convert the structured JSON response to a visual data model.
10. Click **Record** and then click each list item until you drill down to the last element in business information.
Power BI displays the data visualization.

Configure Tableau web data connector in Bot Insight

The web data connector in Tableau enables you to establish a secure connection with Automation 360 and to extract, visualize, and analyze data from Bot Insight.

- Ensure that your user name is registered in the Control Room and that you have **Bot Insight Admin** or the **AAE_Admin** role assigned to you.
- Ensure you have access to the desktop or public version of Tableau software.

Note: Single sign-on is not currently supported for Bot Insight. Connectors only work with the following authentication mechanisms.

- Control Room database based authentication
 - Active directory based authentication
-

The Web data connector in Tableau enables you to perform the following functions in Tableau:

- Authenticate and connect to the Control Room.
- Connect to Bot Insight APIs for business and operational information.
- Use business and operational information to create a data model.
- Create charts or graphs to represent the data.

- Create reports and share them with other users on Tableau.
1. Open Tableau.
 2. Select **Web Data connector** from the **Connect** option in **Data** tab.
 3. In the **Web Data Connector** window, enter your Automation Anywhere URL in web data connector field: <control room url>/tableau/Login.html
 4. In the **Automation Anywhere - Login** window, enter the following information:
 - a) In the **Control Room Version** drop-down menu, select the version of the Control Room.
 - b) In the **Control Room URL** field, enter the URL or the host name of the Control Room.
 - c) In **User Name** and **Password** field, enter your Bot Insight user name and password.
 5. Click **Submit** to connect to Bot Insight APIs.
 6. Select either **Business Information** or **Operational Information** in the Bot Insight window. If you are an **AAE_Admin**, you can choose between Audit APIs and Operations APIs.
 7. Click **Get Data**.
Bot Insight API retrieves information from the server.
 8. Click **Update Now** to gather all the data from Bot Insight in Tableau.
You can use the retrieved data from Bot Insight for data visualizations and analysis in Tableau.

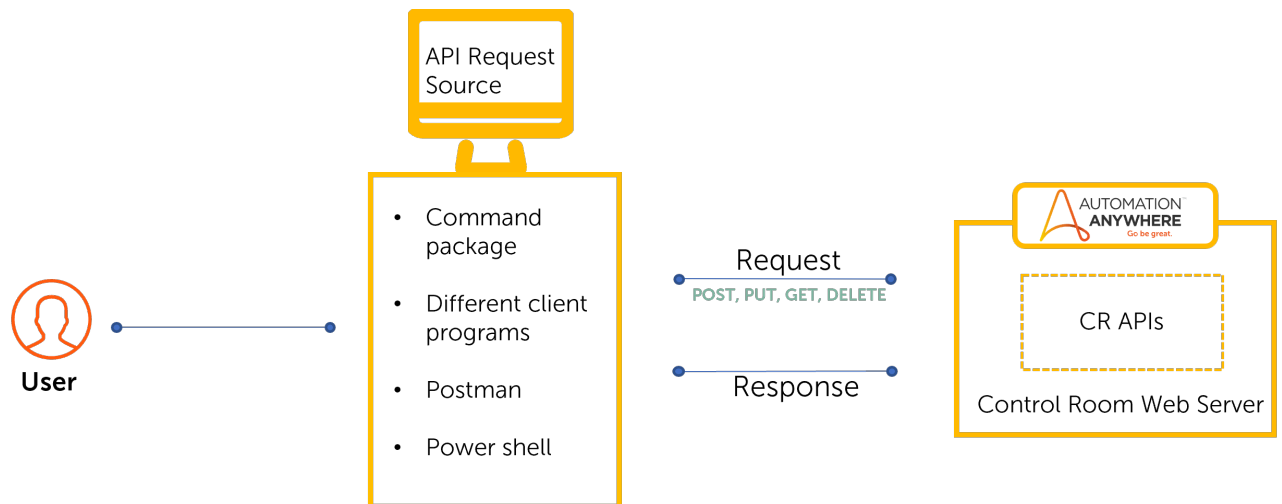

API References

The Automation 360 platform provides a comprehensive suite of API capabilities that enable customers, partners, and community developers to automate end-to-end processes using API.

Automation Anywhere APIs are Representational State Transfer (RESTful) APIs. REST APIs allow you to manage, administer, and run automations programmatically from your own application. By incorporating Automation Anywhere APIs into various software programs, you can simplify application integration across different platforms and reduce development effort. Automation Anywhere APIs provide a secure communication gateway to interact and exchange data.

You can use the Automation Anywhere APIs to:

- Register your device using the Bot Agent API.
- Perform various functionalities in the Control Room using the Control Room APIs.

Control Room APIs

The Automation Anywhere Control Room provides APIs that enable you to customize how you (and your automations) interact with Automation Anywhere.

You use Control Room APIs to:

- Manage bot deployments
- Create and manage credentials in the Credential Vault
- Create and manage user accounts and roles
- Create and manage queues

Getting started with Control Room APIs

All requests must include an X-Authorization header with the JSON authentication token, or an Authorization header with a Bearer token for requests to the Control Room. The following sections provide details about the Control Room APIs available endpoints, methods, resources,

authentication protocols, parameters, and headers, as well as examples of common requests and responses.

Note: The Bearer token is supported as of the Automation 360 v.27 release and later. It is unsupported and ignored in any previous releases. You must obtain the Bearer token from our OAuth services. To authorize your access, use either X-Authorization (using Authentication API) or Authorization (using OAuth). You cannot use both in the same API.

The Control Room supports several API clients. To explore the Control Room APIs, download and install [Postman](#), then click [Postman collection](#) to download the Control Room APIs collection. The following sections provide useful information about how to write a Control Room API request:

- Some APIs require you to filter, paginate, and sort the results to get the desired output. For more information on filtering, pagination, and sorting, see [Filtering, pagination, and sorting](#) on page 3761.
- API response codes in the responses are described in the [API response codes](#) on page 3767.
- The [Comparing Automation 360 and Enterprise 11 APIs](#) on page 3768 compares the Enterprise 11 and Automation 360 APIs.

To learn how to test Control Room APIs in Swagger and Postman, watch the following video:

Redoc view for API modules

You can now view the API modules in a redoc view. This view provides an intuitive interface where you can easily find information on using the Control Room APIs with comprehensive description and relevant code samples that you can reuse.

The layout is updated to a three-panel view which categorizes the API information into the following panes:

- Table of contents in the left pane.
- Introduction and descriptions in the center pane.
- Reusable code samples in the right pane.

This view includes details of each endpoint and examples on how to use them.

Related information

[API Reference \(Archived\)](#)

Filtering, pagination, and sorting

The Control Room API supports filtering, pagination, and sorting for endpoints that return arrays of resources.

The filtering mechanism filters the required resources, the sorting mechanism places the resources in order; and the pagination mechanism then returns a specific range of those ordered resources. This topic provides you the details to filter and sort the results of an API requests and also guides to handle the pagination of large result sets returned from an API request.

Note:

- Sorting and filtering are supported for substrings. For example, if you want to search for bots or files that have `fin` in their names, enter `fin` as the search criterion. All the bots and files that

contain `fin` in the names will be displayed, for example, Finance, Finder, DeltaFinance, and Dolfin.

- Wildcards are not supported for searching and filtering bots or files.

Filtering

Filtering allows you to apply Boolean condition against a collection of returned resources in order to subset the collection to only those resources for which the condition is `true`. The most basic operation in an Control Room API filters is to compare a field to a given value. It is possible to use equality comparison, range comparison, or logical . Use the following operators to compare a field to a constant value.

Operation	Description	Example
Equality comparison		
<code>eq</code>	Equals	UserEmailAddress, eq first.last@aa.com
<code>ne</code>	Not Equals	UserEmailAddress, ne first.last@aa.com
Range comparison		
<code>lt</code>	Less than	Quantity lt 1500
<code>le</code>	Less Than or Equal	Quantity le 1500
<code>ge</code>	Greater Than or Equal	CreatedDateUtc ge 2021-03-15
<code>gt</code>	Greater Than	CreatedDateUtc gt 2021-03-15
Logical		
<code>and</code>	And	Field1 eq 'abc' and Field2 eq 'def'
<code>or</code>	Or	Field1 eq 'abc' or Field2 eq 'def'

The `filter` query parameter allows you to apply basic, multiple, and convention oriented filters to a request. The filters in the Control Room APIs are applied with single parameter or with multiple parameters.

Single parameter filter

Single parameter filter allows the API request to select the responses by matching one or more members of the response to the value passed in the query. The single parameter filter is represented in the following image:

The JSON equivalent of the above image (single parameter filter) looks like:

```

{
  "filter": {
    "operator": "<NONE, lt, le, eq, ne, ge, gt, substring, and, or, not>",
    "field": "string",
    "value": "string"
  }
}

```

For example, to list all the device pools that has a substring `finance`, use the following single parameter filter:

```
POST http://{{ControlRoomURL}}/v2/devices/pools/list
```

```

{
  "filter":{
    "operator":"substring",
    "field":"name",
    "value":"finance"
  }
}

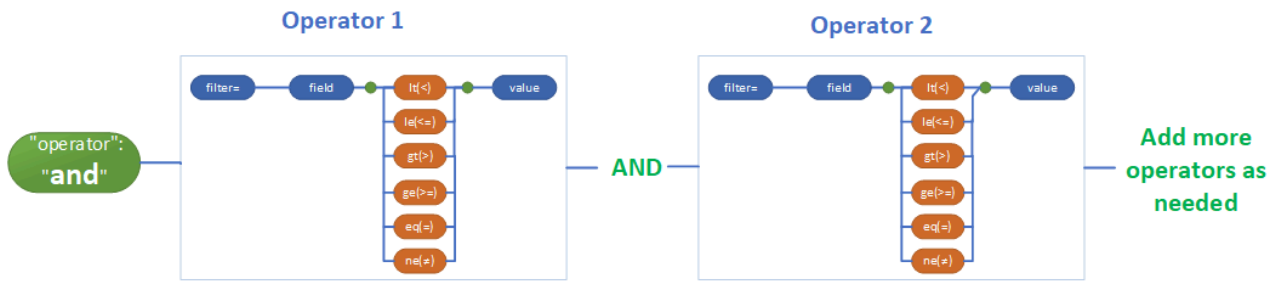

```

For more detailed sample on a single parameter filter, see [Device Pools API](#) .

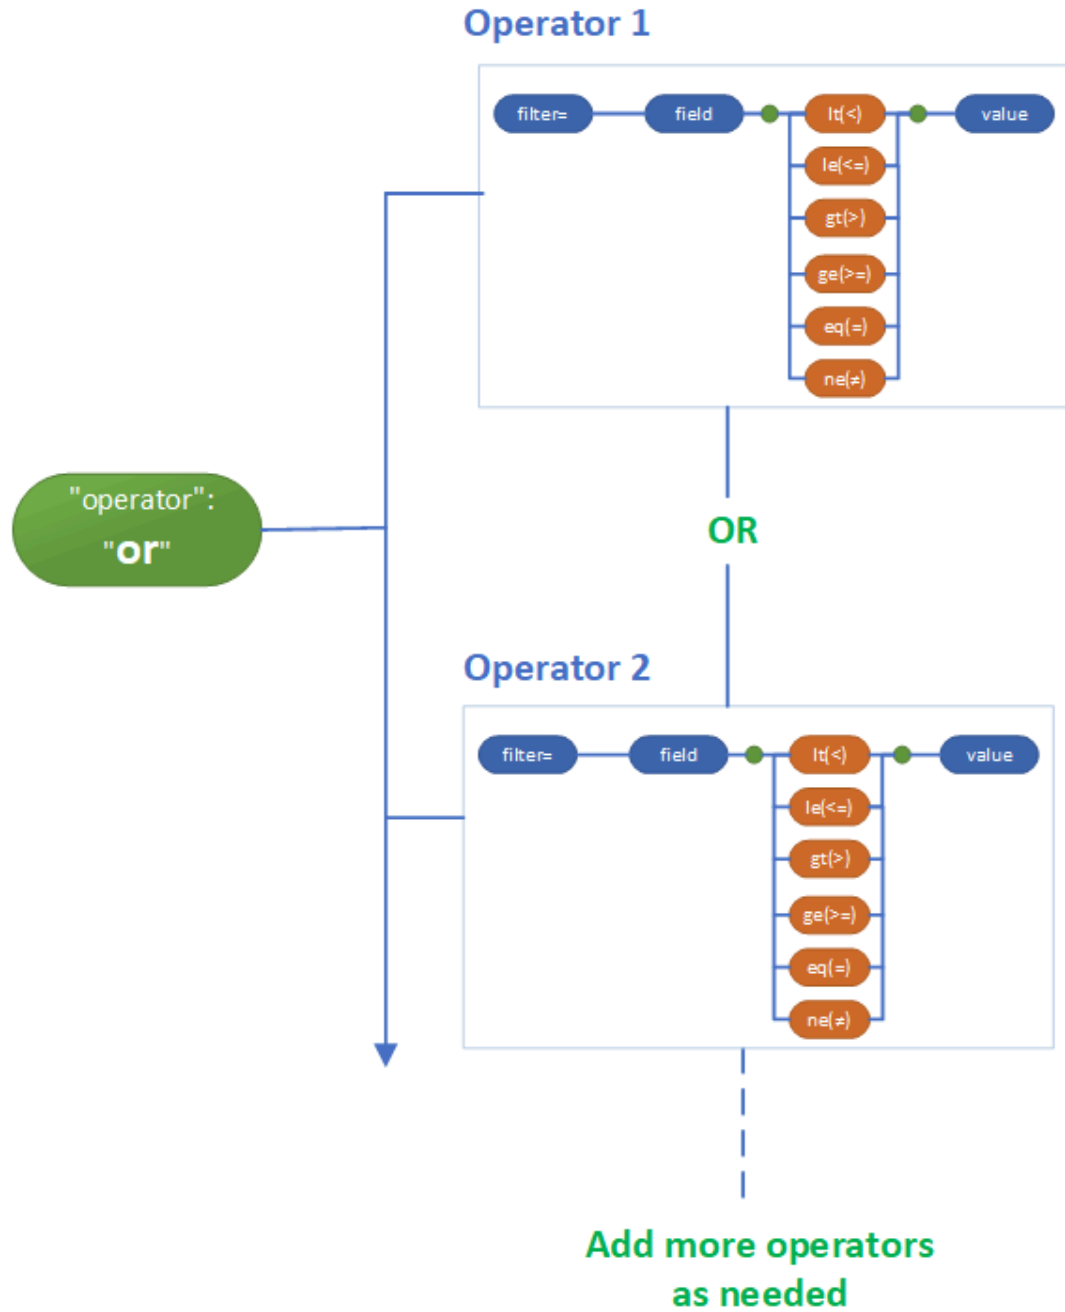

Multiple parameter filter

Multiple parameter filter allows you to filter the results based on combining multiple conditions wrapped in logical operands `and` or `or`.

- `and`: A binary operator that evaluates to `true` if all the conditions in the operands evaluate to `true`.

- `or`: A binary operator that evaluates to `true` if atleast one of the conditions in the operands evaluate to `true`.

The JSON equivalent of the above image (multiple parameter filter) looks like:

```

{
  "filter": {
    "operator": "<and, or>",
    "operands": [
      {
        "operator": "<NONE, lt, le, eq, ne, ge, gt, substring, and, or, not>",
        "field": "string",
        "value": "string"
      }
    ]
  }
}

```

```

    },
    {
      "operator": "<NONE, lt, le, eq, ne, ge, gt, substring, and, or,
not>",
      "field": "string",
      "value": "string"
    }
  ]
}
}

```

For example, to list all the roles that has a substring Device, createdOn is after 2022-04-01, and createdOn is before 2022-05-31, use the multiple parameter filtering with logical add operator as follows:

```
POST http://{{ControlRoomURL}}/v1/usermanagement/roles/list
```

```

{
  "filter":{
    "operator":"and",
    "operands":[
      {
        "operator":"substring",
        "field":"name",
        "value":"Device"
      },
      {
        "operator":"gt",
        "field":"createdOn",
        "value":"2022-04-01T00:00:00.989Z"
      },
      {
        "operator":"lt",
        "field":"createdOn",
        "value":"2022-05-31T23:00:00.123Z"
      }
    ]
  }
}

```

For more detailed sample on a single parameter filter, see [User Management API](#) .

Pagination

Pagination allows you to:

- Retrieve a limited collection of results.
- Offset a collection of results.

All Control Room APIs that returns a collection of records are paginated. API methods that support pagination takes two (optional) parameters:

Operation	Description
offset	The offset parameter controls the starting point within the collection of response results. Default value is 0.

Operation	Description
length	The length parameter is the maximum number of records to retrieve starting from the offset. Default value is 200.

The JSON snippet for pagination looks like:

```
"page":{
  "offset":5,
  "length":10
}
```

For more detailed sample on a single parameter filter, see [User Management API](#) .

Sorting

Sorting allows you to order the results by any field, in ascending or descending order. For example, if you are returning the roles, you can sort the roles by last modified date.

```
"sort": [
  {
    "field": "string",
    "direction": "<asc, desc>"
  }
]
```

Direction

Type: Enum [desc, asc]

- asc = ascending (smallest to largest, 0 to 9, A to Z)
- desc = descending (largest to smallest, 9 to 0, Z to A)

For more detailed sample on a single parameter filter, see [User Management API](#) .

API response codes

Review the HTTP status codes of responses for Automation 360 APIs.

Status code	HTTP name	Description
200	OK	Success
201	Created	Success, for POST, PATCH or PUT requests.
202	Accepted	Indicates that the request has been accepted for processing, but the processing has not been completed.
204	No content	Success, for DELETE requests and some PATCH requests.
400	Bad request	Request URL or request parameters are incorrect.

Status code	HTTP name	Description
401	Authentication required	Provide authentication details.
403	Unauthorized access	The operation is not authorized.
404	Not found	Control Room server did not find the requested URL.
409	Conflict	The request could not be completed because the code conflicts with the current state of the resource, for example, a duplicate entry.
500	Internal server error	Indicates that the server encountered a problem. Clear the cookies and cache, and then reload the page.

Comparing Automation 360 and Enterprise 11 APIs

Compare Automation 360 and Enterprise 11 APIs to understand the contract changes when you migrate from Enterprise 11 to Automation 360.

API details	Enterprise 11	Automation 360
Authentication API: Use this API to obtain the authentication token. The token is then used for all subsequent API calls.		
Method	POST	POST
Endpoint	v1/authentication	v1/authentication
Request body changes	Not applicable	No change
Response body changes	Not applicable	<ul style="list-style-type: none"> Multi-factor authentication is not supported Automation 360 response returns the tenantUUID
Auto login credentials API: Use this API to set the Windows credentials for a Bot Runner. These credentials are used for automatically login (auto-login).		
Method	POST	PUT
Endpoint	v1/credentialvault/external/credentials/loginsetting	v2/credentialvault/loginsetting
Request body changes	Not applicable	Endpoint version change

API details	Enterprise 11	Automation 360
Response body changes	Not applicable	Message displayed after successfully updating the credentials: Credentials updated for <username>. Enterprise 11 displays this message: Credentials were successfully updated.
Automation management API: Use this API to create automations (schedule bots), and edit and delete automations.		
Method	POST, PUT, and DELETE	POST, PUT, GET, and DELETE
Endpoint	v1/schedule	v1/schedule
Request body changes	Not applicable	Minor change in request body to pass bot input variables
Response body changes	Not applicable	Detailed response with bot input variable details
User Management API: Use this API to create, edit, and delete users and roles.		
Method	POST, PUT, GET, and DELETE	POST, PUT, GET, and DELETE
Endpoint	v1/usermanagement	v1/usermanagement
Request body changes	Not applicable	No change
Response body changes	Not applicable	No change
Migration API: Use this API to migrate bots from Enterprise 11 or Enterprise 10 to Automation 360		
Method	GET and POST	GET and POST
Endpoint	<ul style="list-style-type: none"> v1/migration v2/migration 	v2/migration
Response body changes	Not applicable	<ul style="list-style-type: none"> Endpoint version change APIs used to connect to the Enterprise 10 database to migrate users, roles, schedules, and bots
Request body changes	Not applicable	Because the endpoints and request body are different, the response body is also different.

API details	Enterprise 11	Automation 360
Manual Dependency API: Use this API to add or remove a dependency (data files and such) to or from a bot.		
Method	POST and DELETE	Not available
Endpoint	v1/files/manualdependencies/	Not available
Request body changes	Not applicable	Not available
Response body changes	Not applicable	Not available
Repository Management API: Use this API to get bots and files from the Control Room repository.		
Method	POST, DELETE, and GET	POST, DELETE, and GET
Endpoint	v1/repository	v1/repository
Request body changes	Not applicable	Additional APIs added to get folder permissions
Response body changes	Not applicable	No change
File Dependency API: Use this API to get the file dependency metadata to run and schedule bots.		
Method	GET	Not available
Endpoint	v1/files/manualdependencies/	Not available
Request body changes	Not applicable	Not available
Response body changes	Not applicable	Not available
Bot Lifecycle Management (BLM) API: Use this API to move (export or import) bots and dependent files across different Control Room environments.		
Method	POST	POST
Endpoint	v1/blm	v2/blm
Request body changes	Not applicable	<ul style="list-style-type: none"> Endpoint version change You cannot choose dependencies when exporting and importing
Response body changes	Not applicable	No change
Audit API: Use this API to get audit information about the product.		
Method	POST	POST
Endpoint	v1/audit	v1/audit
Request body changes	Not applicable	No change
Response body changes	Not applicable	No change
Two-factor Authentication (2FA) API: Use this API to generate a 2FA token		

API details	Enterprise 11	Automation 360
Method	GET and POST	Not available
Endpoint	v1/mfa	Not available
Request body changes	Not applicable	Not available
Response body changes	Not applicable	Not available
Credential Vault API: Use this API to create, edit, and delete credentials and lockers.		
Method	POST, PUT, GET, and DELETE	POST, PUT, GET, and DELETE
Endpoint	v2/credentialvault	v2/credentialvault
Request body changes	Not applicable	No change
Response body changes	Not applicable	No change
Bot Execution Orchestration API: Use this API to get the repository, automations, and devices list.		
Method	POST	POST, PUT, GET, and DELETE
Endpoint	v2/automations/deploy	v3/automations/deploy
Request body changes	Not applicable	Bot deployment includes run-as users
Response body changes	Not applicable	Returns deploymentID. Enterprise 11 API response returns automationID.
License API: Use this API to get product license information.		
Method	GET	GET
Endpoint	v2/license	v2/license
Request body changes	Not applicable	No change
Response body changes	Not applicable	Additional APIs added to update with license server and additional details
Workload Management (WLM) API: Use this API to create, edit, and delete workload queues, templates, and work items.		
Method	POST, PUT, GET, and DELETE	POST, PUT, GET, and DELETE
Endpoint	v2/wlm	v3/wlm
Request body changes	Not applicable	No change
Response body changes	Not applicable	More APIs to manage WLM entities
Bot Insight API: Use this API to get Bot Insight data for an automation.		

API details	Enterprise 11	Automation 360
Method	POST, GET, and DELETE	POST, GET, and DELETE
Endpoint	v2/botinsight/data/api	v2/botinsight/data/api
Request body changes	Not applicable	No change
Response body changes	Not applicable	No change
Bot Insight JSON API: Use to get business insights for an automation.		
Method	GET	Not applicable
Endpoint	v2/botinsight/data/api	Not applicable
Request body changes	Not applicable	Not applicable
Response body changes	Not applicable	Merged with Bot Insight API

[Control Room APIs](#) on page 3760

The Automation Anywhere Control Room provides APIs that enable you to customize how you (and your automations) interact with Automation Anywhere.

Configure the Control Room

Before you start creating workflows for bot deployment and workload management using Control Room APIs, ensure you complete specific prerequisites and steps in the Control Room.

Ensure you have following licenses and permissions:

- One or more Bot Creator and unattended Bot Runner licenses.
- Control Room admin credentials to view, create, and configure users, roles, and device pools.
- The **Create device pools** feature permission or the **AAE_Pool Admin** role must be assigned to you.

Follow these steps to configure your Control Room with users, roles, and bots.

1. Log in to the Control Room as an admin.
2. Create a Control Room user.
Ensure that the user is assigned the **AAE_BASIC** role.
[Create a user](#) on page 1678
3. Create a custom role to map the users you created to Bot Runners and Bot folders.
 - a) In the **Features** tab, ensure you select these permissions: **View my Scheduled Bots**, **Schedule my bots to run**, **Run my Bots**, **View my Bots**, and **Generate my API Key**.
 - b) In the **Automation** tab, expand the **Bots** folder and select the root folder or subfolders you want to provide access for use. Ensure you select these permissions: **Run and schedule** and **View content**.
 - c) In the **Run as** tab, select one or more Bot Runners from the list of **Available bot runners**.
 - d) In the **Users** tab, select the new user created in Step 1 to assign the custom role to this new user.

4. Create a new device pool.
In the **Consumers** tab, ensure you select the custom role you created in Step 3.
[Create device pools](#) on page 1818
5. Log in to the Control Room as a Bot Creator and create bots to automate routine business tasks.
[Build a Go be Great bot](#) on page 3068
Ensure you check in the bots in the `Bot` folder or folders selected when creating the custom role (Step 3). [Check in a bot](#) on page 2210

Roles and permissions

Assign roles from the Automation 360 Administration user interface or through the User Management API to enable users to access features. You can assign a system-created role or create a custom role with specific permissions.

Roles are a logical container for permissions and have interdependencies with bots, users, and licenses. Users with the `AAE_Admin` role can create custom roles and assign roles to users.

Related concepts

[Code analysis](#) on page 2103

Code analysis (code review) enables you to evaluate a program without running the code. When you review the code, a list of violations based on a set rules are displayed. You can review and fix any coding or stylistic errors for your automation.

Related reference

[Feature permissions for a role](#) on page 1688

A user with the **Manage roles** permission can create and assign roles to users to provide them with access to features and operations.

System-created roles

Automation 360 includes predefined roles that cannot be edited or deleted. Each role has the standard permissions, plus the permissions necessary to perform the tasks within the scope of that role.

Standard permissions

All system-created roles include the following permissions:

- View dashboards
- View my in progress activity
- Manage my credentials and lockers
- Create standard attributes for a credential (except for Discovery Bot roles)
- View and manage my Bot runners, Bot creators, and devices
- View and manage my queues
- View users and roles basic information

Administration permissions

Enable users to create and manage users and roles, to manage and update migrations, and to install Control Room licenses.

You will be able to use the Retrieve role by ID. See [User Management API](#) endpoint with the role ID to retrieve the permissions assigned to any system or user defined roles.

Users and roles permissions

Action	Resource Type	Description
usermanagement	usermanagement	Allows you to only view all other users in the system. You cannot create, edit, or delete users. Note: You must assign this permission before assigning the <code>createuser</code> , <code>updateuser</code> , or <code>deleteuser</code> permission.
deleteuser	usermanagement	Allows you to delete other users the Control Room.
createuser	usermanagement	Allows you to create new users in the Control Room.
updateuser	usermanagement	Allows you to edit all users in the system.
rolesview	rolesmanagement	Users with this permission are able to view the roles in the Control Room. Note: You must assign this permission before assigning the <code>rolesmanagement</code> permission.
rolesmanagement	rolesmanagement	Allows you to view and manage all roles in the Control Room.
viewuserrolebasicinfo	usermanagement	Allows you to view basic information on users and roles.

Migration permissions

Action	Resource Type	Description
view	migration	Allows you to view new migrations, but not run them Note: You must assign this permission before assigning the <code>manage migration</code> permission
manage	migration	Allows you to view and run new migrations

Action	Resource Type	Description
updatestatus	migration	Allows Bot Runner Run-as user to update the bot conversion status in the Control Room

Licenses permissions

Action	Resource Type	Description
licensemanagement	licensemanagement	Allows you to view the license details for the Control Room.
licenseinstall	licensemanagement	Allows you to install Automation 360 licenses for the Control Room.
licenseuserallocation	licensemanagement	Allows you to assign device licenses to other users.

Note: Only a user with the `AAE_Admin` role has the ability to view and manage settings in the Control Room. See [System-created roles](#) on page 3773.

Runtime Client Management permissions

Action	Resource Type	Description
runtimeclientsmanagement	runtimeclientsmanagement	Allows you to use the device mentioned in the resourceId for deployment. This permission is assigned when you are assigned a default device.
accessresourceany	runtimeclientsmanagement	Allows you to use any device for deployment. This permission is currently granted for all users with <code>AAE_ADMIN</code> role.

Global Values Permissions

Action	Resource Type	Description
manageuserscopevalues	globalvalues	Manage tenant level global values, given to <code>AAE_Admin</code> only. This cannot be given to any custom role at the moment.
managetenantscopevalues	globalvalues	Not used, created for future purpose.

¹ Not available in the UI and is seen only in the API response.

other permissions

Action	Resource Type	Description
systemadmin	system	This permission is given to AAE_Admin only. It is a system call and cannot be called manually. This permission is used to count the number of pages consumed against the entitled pages for the IQ bot application. It fetches a list of all the users with basic details and license information.
view	settings	View settings. Note: You will be allowed to view settings only with the system-created Admin role to view Settings.
all	botrunners	Allows you to use any runAsUser for deployment. This permission is currently granted for all users with <u>AAE_ADMIN</u> role.
operationroom	operationroom	Legacy, not used and will be removed from the future releases.
manage	mfa	Legacy, not used and will be removed from the future releases.

API permissions

Enables access to Bot Insight APIs and the ability to generate an API key.

Action	Resource Type	Description
botinsightapi	api	Allows access to Bot Insight RESTful APIs to the data logged by the Control Room and by a task during production runs.
generateapikey	api	Generate an apiKey that can be used in the Authentication API. Note: Without the <code>generateapikey</code> permission, use APIs by authenticating using their username and password.
coadmin	botinsightapi	Reserved. Not used for now and will be used when COE dashboard is available in A360. Allows you to access the COE dashboard when it is made available in A360.
accessreportingapi	iqbotapi	Allows you to access reporting details via an API.

Action	Resource Type	Description
accessuploadanddownloadapi	uploadapi	Allows you to upload a document and download the digitized result via an API.
accessnlpapi	iqbotapi	Allows you to access natural language processing capabilities of the IQ Bot portal via an API.

Audit log permissions

View audit logs and details to record user activities. Enable users to view logs from the Control Room.

Action	Resource Type	Description
recentactivities	recentactivities	Allows you to view all audit log activity for the Control Room
archiveaudit	recentactivities	Allows you to archive all audit log activity for the Control Room

Automation Co-Pilot (Previously named AARI) permissions

Assign Automation Co-Pilot permissions to a custom role.

Action	Resource Type	Description
aaricrosssteamread	aari	View all teams and see the team members
aaricrossprocessread	aari	View all processes and see team members and managers
aariteammanagement	aari	Create and view teams, edit team names, descriptions, and process tags. Add new teams, team members, and assigned processes
aaritaskmanagement	aari	Submit and view tasks from processes that are assigned to the team
aaricasemanagement	aari	Create and view requests from processes that are assigned to the team
aariglobalcasemanagement	aari	View process requests and tasks. Note: This permission does not grant the ability to create a request or submit a task
aariglobalprocessmanagement	aari	View checked-in public processes and assigned managers and teams, edit process tags, and assign managers and teams Note: This permission does not grant the ability to create a process.

Action	Resource Type	Description
aariglobalteammanagement	aari	View teams and assigned users, edit team names and descriptions. Add new processes, managers and users to a team Note: This permission does not grant the ability to create a team.
aarischeduler	aari	Allows users to be used as Automation Co-Pilot scheduler

Bot and bot credential permissions

Enables users to access features for managing bots and the credentials used by bots.

Bots permissions

Action	Resource Type	Description
view	repositorymanager	Allows you to view the bots they created and bots that were assigned to them. Note: You must assign this permission before assigning any other bots permissions.
run	repositorymanager	Allows you to run the bots they created and bots that were assigned to them.
export	repositorymanager	Allows you to export bots and related bot dependencies for which they have download permission.
import	repositorymanager	Allows you to import bots and bot dependencies for which they have upload permission.
createfolders	repositorymanager	Allows users to create folders within the folders that they have access to.
renamefolders	repositorymanager	Allows you to rename the folders they have access to. Note: Only empty folders can be renamed.
cancelcheckout	repositorymanager	Allows you to cancel bot checkout and unlock the file from the public repository.
forceunlock	repositorymanager	Allows you to unlock locked bots.

Action	Resource Type	Description
accessresourceany	repositorymanager	Allows you to get permissions to the resources. For example, runtimeclientsmanagement, pool, queue and so on.
setproductionversion	repositorymanager	Allows you to set the production version of bots.
all	repositorymanager	Allows you to get all the repository permissions.
gitrestore	repositorymanager	Allows you to get git restore permissions.

Credentials and lockers permissions

Action	Resource Type	Description
managecredentials	credentials	Allows you to create, edit, and delete their own credentials. In addition, the user can interact with credentials from their assigned lockers. Note: All roles have this permission by default.
create	locker	Allows you to create and manage their own lockers.
consume	locker	Allows you to consume a locker locker
createstandard	credentialattribute	Allows you to create a standard attribute for a credential that is shared across all users of that credential .
updateany	credentialattribute	Allows you to view and edit their own masked attributes.
botautologinapi	credentialattribute	Allows you to automate the login process to run bots remotely.
addcredential	credentialmanager	Legacy, not used and will be removed from the future releases.
updatecredential	credentialmanager	
deletecredential	credentialmanager	

Note: A user with the `AAE_Locker_Admin` role can view all credentials and lockers in the Control Room. See [System-created roles](#) on page 3773.

Bot Store permissions

Enables users to view and manage Bot Store packages.

Action	Resource Type	Description
view	botstore	Allows you to view Bot Store.
addfrom	botstore	Allows you to add bot packages from Bot Store to their Control Room private workspace.
submit	botstore	Allows you to submit bot packages to Bot Store.

Dashboard and activity permissions

Enables all users to view dashboards. Activity permissions enable users to view, manage, and schedule bot activities.

Dashboard and Activity Permissions

Action	Resource Type	Description
view	dashboard	View dashboard. Note: All roles have this permission by default.
myschedule	taskscheduling	All users can view their own activity. Note: All roles have this permission by default.
managemyschedule	taskscheduling	All users can pause, resume, or cancel their own activity and move their finished activities to history.
manageeveryone	taskscheduling	A user can monitor ongoing automations where a user has either run or schedule access on the respective bot. The user can monitor and manage ongoing automations.
view	taskscheduling	Users can see their scheduled bots regardless of which user scheduled the bot.
addschedule	taskscheduling	It requires permission to view and manage Bot Runners.
updateschedule	taskscheduling	Users can edit their scheduled bots, even if the bots are scheduled by a different user.
deleteschedule	taskscheduling	Users can delete schedules for any of their bots regardless of which users scheduled the bot.
manageallmyfolders	taskscheduling	Users can view, edit, and delete all the schedules on the bot folders that the user has access to. This includes the schedules that the user created or schedules created by other users.

Action	Resource Type	Description
manageallschedules	taskscheduling	Users can view, edit, and delete all the schedules in the system. This includes the schedules that the user created or schedules created by other users.
setautomationpriority	taskscheduling	Users can set the automation priority to high from the default medium. Automations with high priority are deployed ahead of automations with medium and low priority.
everyoneschedules	taskscheduling	Users can monitor those ongoing automations where they have either run or schedule access on the respective Task Bot.

Devices permissions

Enable you to register, view, and manage devices used to run bots.

Action	Resource Type	Description
register	devices	Allows you to register a localhost device.
all	devices	Allows you to view and manage all devices in the Control Room.
delete	devices	Allows you to delete devices that they registered.
edit	devices	<p>Allows you to edit the devices that they have permission to see.</p> <p>Allows you to view and manage all (registered and non-registered) devices from a specific accessible group.</p> <hr/> <p>Note: To view and manage registered and non-registered devices,</p> <ul style="list-style-type: none"> The Control Room administrator must grant access to manage a specific set of devices. You must select Devices from my device pool(s) to edit devices from device pools and Run as user(s) default device to edit Run as user(s) default device options in the Edit devices permission. <hr/>
view	devices	<p>Allows you to view and manage Bot Creators, Bot Runners, and device pools.</p> <hr/> <p>Note: All roles have this permission by default.</p> <hr/>
attestcredentials	devices	Allows you to deploy the bot during a session on the user's device without system password.

Action	Resource Type	Description
create	pool	Allows you to create and manage their own device pools.

Note: A user with the `AAE_Pool Admin` role is able to manage all device pools in the Control Room. See [System-created roles](#) on page 3773.

Discovery Bot permissions

Enable users to view or manage Discovery Bot processes, recordings, aggregations, and opportunities.

Process permissions

Action	Resource Type	Description
viewprocess	processdiscovery	Allows users to view assigned processes. Note: This is the standard permission. You must assign this permission before assigning any process discovery permissions.
viewallprocess	processdiscovery	Allows users to view all the defined processes.
editprocess	processdiscovery	Allows users to create and edit processes.

Recording permissions

Action	Resource Type	Description
viewrecording	processdiscovery	Allows users to view their own recording. Note: You must assign this permission before assigning any of the permissions below.
createrecording	processdiscovery	Allows users to run recorder and create recording.
editrecording	processdiscovery	Allows users to edit their own recording.
deleterecording	processdiscovery	Allows users to delete their own recording.
viewallrecording	processdiscovery	Allows users to view all recordings.
editallrecording	processdiscovery	Allows users to edit all recordings.

Aggregation permissions

Action	Resource Type	Description
viewmanualaggregation	processdiscovery	Allows users to view their own aggregations.
viewallaggregations	processdiscovery	Allows users to view all aggregations.
createdeletemanualaggregation	processdiscovery	Allows users to create and delete aggregations.
updatemanualaggregation	processdiscovery	Allows users to update aggregations.
viewsystemaggregation	processdiscovery	Allows users to view system aggregations.

Opportunity permissions

Action	Resource Type	Description
viewopportunity	processdiscovery	Allows users to view opportunities within an assigned process. Note: You must assign this permission before assigning any of the opportunity permissions.
editopportunity	processdiscovery	Allows users to edit opportunities within an assigned process.
viewalloppportunity	processdiscovery	Allows users to view all the opportunities.
createdeleteopportunity	processdiscovery	Allows users to create and delete opportunities within the assigned process.
converttobot	processdiscovery	Allows users to convert an opportunity to a bot.
exportopportunity	processdiscovery	Allows users to export an opportunity.

Event triggers permissions

Enable users to run bots automatically depending on a specific event, such as a new window opening. You can limit users ability to only view or to view and manage triggers.

Action	Resource type	Description
view	eventtriggers	Allows users to view event triggers.
manage	eventtriggers	Allows users to view and manage event triggers.
managemytriggers	eventtriggers	Allows users to view and manage event triggers from their private repository, on their local devices.

Additionally, you must enable the view packages permission as well:

Action	Resource type	Description
view	packagemanager	Allows users to view packages

IQ Bot permissions

Enable users to view IQ Bot permissions, create and manage learning instances, import and export domains, and manage IQ Bot configuration settings and migration.

IQ Bot permissions

Action	Resource Type	Description
viewiqbot	iqbot	Allows you to view the default dashboards in the IQ Bot portal. Note: You must assign this permission before assigning any of the permissions below.
view	iqbotpages	Allows to view the iqbot pages licensed
utilize	iqbotpages	Allows to utilize the iqbot pages licensed

Learning instance permissions

Action	Resource Type	Description
viewlearninginstance	viewiqbot	Allows you to view their learning instances in the IQ Bot portal. Note: You must assign this permission before assigning any other learning instance permission.
viewlearninginstancefromlearninginstance	viewlearninginstance	Allows you to view learning instances created by other you with the same role in the IQ Bot portal.
assignroletolearninginstance	viewlearninginstance	Allows you to assign some custom roles to a learning instance.
viewalllearninginstances	viewlearninginstance	Allows you to view all learning instances in the IQ Bot portal.
launchvalidator	viewlearninginstance	Allows you to access the IQ Bot Validator to review and update documents with exceptions.
createlearninginstance	viewlearninginstance	Allows you to create learning instances in the IQ Bot portal.
editlearninginstances	viewlearninginstance	Allows you to edit learning instances in the IQ Bot portal.

Action	Resource Type	Description
delelearninginstances	viewlearninginstance	Allows you to delete their learning instances in the IQ Bot portal.
sendlearninginstances	viewlearninginstance	Allows you to send their learning instances to production in the IQ Bot portal.
trainlearninginstances	viewlearninginstance	Allows you to train their learning instance groups in the IQ Bot portal.

Domains permissions

Action	Resource Type	Description
viewdomain	viewiqbot	Allows you to view all domains in the IQ Bot portal. Note: You must assign this permission before assigning any other domain permissions.
createdomains	viewdomain	Allows you to create domains in the IQ Bot portal.
editdomains	viewdomain	Allows you to edit domains in the IQ Bot portal.
importdomains	viewdomain	Allows you to import domains in the IQ Bot portal.
exportdomains	viewdomain	Allows you to export domains in the IQ Bot portal.
deletedomains	viewdomain	Allows you to delete domains in the IQ Bot portal.

Administration permissions

Action	Resource Type	Description
viewadministration	viewiqbot	Allows you to access the Administration tab in the IQ Bot portal. Note: You must assign this permission before assigning any other administration permissions.
viewandmanagesettings	viewadministration	Allows you to manage the IQ Bot portal advanced configuration settings.
viewandmanagemigration	viewadministration	Allows you to access the migration utility to import and export learning instances in the IQ Bot portal.

MetaBot permission

MetaBots are obsolete in Automation 360. However, this permission is valid to ensure that all functionality previously available is supported in Automation 360.

Access to MetaBot Designer

Permission/feature ID is not available.

Bot Creator users can access MetaBot Designer to view, create, and update MetaBots.

Note: This feature is available for internal use only.

Package manager permissions

Enable users to view and manage packages.

Action	Resource Type	Description
view	packagemanager	Allows you to view packages.
manage	packagemanager	Allows you to view and manage packages.

Workload permissions

Enable you to create and manage workitems, workitem models, queues, and automations in the Control Room.

Action	Resource Type	Description
myschedule	taskscheduling	Allows you to view and manage their own schedules.
create	queue	Allows you to create and manage their own queues.

Note: A user with the `AAE_Queue Admin` role has all the above permissions. In addition, the `AAE_Queue Admin` is able to manage all the queues in the Control Room. See [System-created roles](#) on page 3773.

How to find a migration journalid

Migrations can have more than one journalid. You can find the journalid in the response of a results list for a specific migration id.

In this request, we searched for results for the migration with the id 16.

```
<your_control_room_url>/v3/migration/16/results/list
```

The request returned the id in each object list as the journalid. In this example, there are two journal identifiers, 30 and 31, for the migration id 16.

```
{
  "page": {
    "offset": 0,
    "total": 2,
    "totalFilter": 2
  },
  "list": [
    {
      "sourceId": 12,
      "sourceName": "Dependency of IGN-23437.mbot",
      "sourcePath": "Automation Anywhere\\Bots\\My MetaBots\\
      \Dependency of IGN-23437.mbot",
      "sourceType": "application/vnd.aa.mbot",
      "targetId": 0,
      "status": "FAILED",
      "reason": "The logic IGN-23437 has some commands or actions
      which are not yet supported for migration.",
      "selectedByUser": true,
      "userId": 9,
      "id": 30,
      "targetName": "",
      "targetPath": "",
      "targetType": ""
    },
    {
      "sourceId": 12,
      "sourceName": "Dependency of IGN-23437.mbot",
      "sourcePath": "Automation Anywhere\\Bots\\My MetaBots\\
      \Dependency of IGN-23437.mbot",
      "sourceType": "application/vnd.aa.mbot",
      "targetId": 0,
      "status": "FAILED",
      "reason": "Migration of MetaBot failed.",
      "selectedByUser": false,
      "userId": 9,
      "id": 31,
      "targetName": "",
      "targetPath": "",
      "targetType": ""
    }
  ]
}
```

You can use the migration id and journal id in an action mapping request.

```
<your_control_room_url>/v3/migration/16/journal/31/actionmappings/list
```

Bot Agent API: Auto registration

Automatically register and connect your device to a Control Room by using the Auto registration API.

This API uses the generic registration token from the `autoregistration.properties` file to register the device in the specified Control Room URL. You cannot autoregister the device

if the Control Room URL is not available in the `autoregistration.properties` file. The `autoregistration.properties` file must be available on your local system, and you must not delete the file after the registration is complete.

Note: To register the device from the command line or API, you must set the `AA_DELAY_REGISTRATION_UNTIL_LOGIN` MSI parameter. You can enable this parameter in the Bot Agent MSI file or in the `autoregistration.properties` file. For more information, see [Bulk install Bot Agent on devices](#) on page 1296. You can also view a sample `autoregistration.properties` file in the bulk install topic.

Request

```
POST http://127.0.0.1:22113/v1/registration/auto
```

Request body:

```
{
  "url": "https://{controlroom url}",
  "userName": "dpcreator"
}
```

Request parameters

Parameter	Type	Required	Description
url	String	Yes	Specify the Control Room URL to autoregister the device.
userName	String	No	Specify the Control Room user to associate the device as the default device.

Response

```
{
  "result": "REGISTERED",
  "deviceId": "11",
  "crUrl": "control_room_url",
  "userName": "dpcreator",
  "installationType": "SYSTEM_WIDE",
  "crSwitchAllowed": "false",
}
```

Response parameters

Parameter	Type	Description
result	String	Status of the device registration.

Parameter	Type	Description
deviceId	Number	Unique ID of the device the Bot Agent is installed on.
crUrl	String	The Control Room URL where the device is autoregistered.
userName	String	The username for which the device is associated as default device.
installationType	String	The type of installation that is performed.
crSwitchAllowed	String	Indicates whether the device can be registered on a different Control Room.

The REST API responds to each request with an HTTP response code. For response codes, see [API response codes](#) on page 3767.
