Scan Automation 360 bots for Internet Explorer usage

Microsoft Internet Explorer end of life (EOL) is in June 2022, and Microsoft recommends that you to move your legacy applications and websites running on Internet Explorer to Microsoft Edge with IE mode. Use the Automation 360 Bot Scanner for IE utility to scan your Automation 360 bots for Internet Explorer usage.

- Ensure that your Control Room user has the **View content** permission on the **Bots** folder.
- Ensure that you meet the following system requirements for using the Bot Scanner:
 - Hardware requirements

Processor	2.66 GHz or higher (64-bit)
RAM	2 GB or higher
Disc space	200 MB

- Software requirements

Operating systems: Windows 7 or later (32-bit or 64-bit)

1. Navigate to [A-People Downloads page \(Login required\)](#).
2. Download `automation-360-bot-scanner-for-ie-1.0.zip` from **Automation 360 v.24 R2 (13343) > Installation Setup**.
3. Extract the files from the zip file you have downloaded and double-click the executable file to run the utility.
4. Click **Get started**.
5. Enter the Control Room URL of Automation 360 (On-Premises or Cloud) that you want to connect to, and access the **Bots** repository that contains the Internet Explorer bots that you want to scan.

Note: The Bot Scanner for IE utility does not support a proxy server. If you use a proxy to provide the Control Room URL, you will not be able to establish the connection.

6. Based on the authentication type configured in your Control Room, choose one of the following authentication methods in the **Authentication Type** field:

Authentication type	Steps
Database	<ol style="list-style-type: none"> a) Enter the Username (Control Room database username). b) Enter the Password (Control Room database user password).
Active Directory (default)	<ol style="list-style-type: none"> a) Enter the Username (Domain\username). b) Enter the Password (domain user password).

Authentication type	Steps
Single Sign-On	<p>a) Enter the Username.</p> <p>b) Enter the API Key.</p>

7. Click **Test connection**.
A connection success or failure message is displayed. Recheck your credentials if the connection fails.
8. In the **Select destination path** field, enter the location where you want to save the generated report.
9. Click **Scan bots**.
The scanner scans all the bots in the Control Room repository for Internet Explorer usage. After the scan is complete, a report is generated (.CSV file) containing all the details. If a .CSV file already exists in the output folder, you are prompted with a message indicating that the old .CSV file will be deleted, and after you click **Continue**, a new .CSV file is generated. If the old .CSV file is in use, a message is displayed indicating that the file cannot be deleted. Close the file and try again.
10. Click **Open report** to analyze the report generated by the scanner to get usage statistics about Internet Explorer in your bots.
The report contains the following details:
 - Task Bot name: Name of the Task Bot
 - Line number: The line number of the bot where the Internet Explorer browser is used
 - Package and action name: The package and action name where the Internet Explorer browser is used
 - Searched text: Provides the window or browser title
 - Action and review message: Contains the reviews or action required by the user after conversion
 - Task Bot path: The path to the repository where the bot resides

Note: Based on the report generated by the scanner, you can plan and implement a strategy to convert bots that use Internet Explorer to Microsoft Edge with IE mode. Using the report you can identify the following:

- Unique Task Bot names that use Internet Explorer
 - The action in each bot that uses Internet Explorer
 - Whether an action can be converted or not
 - Whether an action needs review after conversion
-

See the following video on how to scan Automation 360 bots for Internet Explorer usage:

The Bot Scanner does not convert your bots from Internet Explorer to Microsoft Edge with IE mode. For conversion, you must use the Update Bot wizard. See [Update Bot wizard for converting IE bots](#) on page 1061.

Analyze report for Internet Explorer bots

You can analyze the report generated by the Bot Scanner to get usage statistics about Internet Explorer used in your bots.

Based on the report that Bot Scanner generates, you can plan and implement a strategy to convert bots that use Internet Explorer to Microsoft Edge with IE mode.

Bot Scanner provides the following information about these bots:

- Number of bots analyzed
- Number of bots scanned for Internet Explorer usage and those that were not scanned
- Internet Explorer usage statistics on the percentage and number of bots using Internet Explorer
- Reasons for bots that were not scanned
- Reviews required by users after conversion

The Bot Scanner is designed to scan bots (Task Bots and MetaBots) created using both Enterprise 10 and Enterprise 11 versions of Enterprise Client. The total file count includes the number of files that were skipped and not scanned.

Folder location and reports

The reports are available at the output location you specified in the **Select destination folder** field in the **Automation Anywhere Bot Scanner** dialog box. The Bot Scanner generates a summary report and a separate report for each bot that it scanned. It creates a separate report for each logic available in a MetaBot.

A `raw-data` folder is created that contains the reports (in XML format) for each bot scanned. It helps our developers to further analyze the scanning process and take corrective actions, if required. No personally identifiable information (PII) is included in the summary report or the individual reports of the scanned bots.

If you choose to share the reports with us to help improve the product, compress the files in the `rawdata` folder and coordinate with your Customer Success Manager (CSM) or Partner Enablement Manager (PEM). No data is automatically shared with Automation Anywhere.

The system creates three folders within the `raw-data` folder that contain various reports:

- `Migratable_Bots`: Contains reports of bots that are possibly using Internet Explorer.
- `Failed_to_Analyze`: Contains reports of bots that Bot Scanner failed to analyze.
- `MetaBots`: Contains reports of MetaBots that can and cannot be migrated to Automation 360 and the ones that the Bot Scanner failed to analyze.

Summary report for all bots

The summary report provides information about the total number of bots scanned, the number of bots scanned for Internet Explorer usage, the number bots that could not be scanned. It also provides Internet Explorer usage statistics about the percentage and number of bots using Internet Explorer.

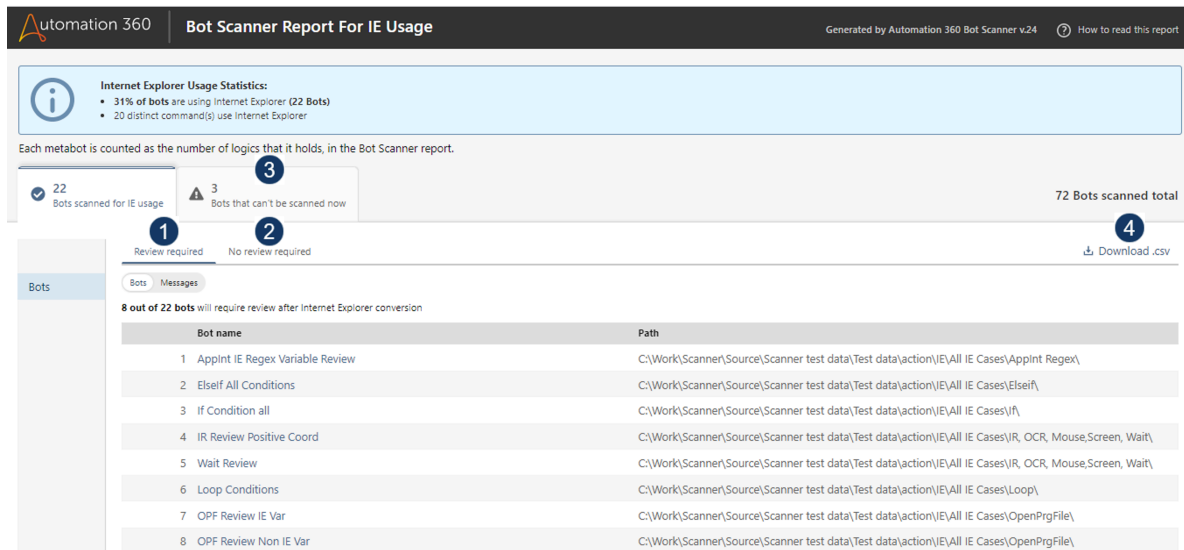

For example, consider the Bot Scanner has scanned 31 bots. Of the 31 bots, consider 26 bots are scanned for Internet Explorer usage, and 0 bots could not be scanned. The percentage of bots using Internet Explorer is 84%.

Reviewing the Bot Scanner report

Consider a scenario where you have scanned a total of 72 bots, of which 22 bots are scanned for Internet Explorer usage and 3 bots could not be scanned. In such a scenario, the report enables you to perform the following actions:

- Identify bots (8) that require review after conversion and take action if required.
- Identify bots (14) that do not require any review after conversion.
- Identify the reason why the bots (3) cannot be currently scanned for Internet Explorer usage. The reason might be that the bot is built using a version earlier to Enterprise 10 such as Enterprise 8.

The following image is a sample report from the Bot Scanner:

The following table describes the various fields in the sample Bot Scanner report (as numbered in the previous image):

Field/option	Description
1	<ul style="list-style-type: none"> • Bots scanned for IE usage > Review required > Bots: Go to this view for a list of bots (8 in this scenario) that should be reviewed after conversion. • To view the review required message for a specific bot, click the bot name. The message provides information about changes if any are required in the bot after conversion.
2	<p>Bots scanned for IE usage > No review required > Bots: Go to this view for a list of bots (14 in this scenario) that do not require any review after conversion. Click any bot name in this list to view the XML report offline.</p>
3	<ul style="list-style-type: none"> • Bots that can't be scanned now > Bots: Go to this view for a list of bots (3 in this scenario) that cannot be currently scanned. • To view the error message for a specific bot, click the bot name. An XML report opens in a new tab where you can view the error due to which the bot cannot be scanned.

Field/option	Description
4	Download (as a CSV file) the list of bots or commands that can or cannot be scanned so that you can review the file offline or share the file with others.

Report validity

The report is valid until the next version of Bot Scanner is available. When the next version is available, a report expiry message is displayed. You must download the latest version of Bot Scanner and use that version to scan the bots again.

Update Bot wizard for converting IE bots

Use the Update Bot wizard to convert Internet Explorer bots created in Automation 360 to Microsoft Edge with IE mode.

- Ensure you are logged in as an administrator or have given the following permissions to the user performing the bot update and to the Bot Runners you have selected:
 - Users performing the bot update:
 - **View bot update**
 - **Manage bot update**
 - **View Users and Roles basic information**
 - **View everyone's audit log actions**
 - **View packages**
 - **View my bots**
 - **Run my bots**
 - You must have the below-mentioned permissions for Bots, Sample bots, and the folders containing the bots you want to update:
 - **Run**
 - **Check in**
 - **Check out**
 - **View content**
 - A role that has access to Bot Runners that you want to select for running the update (on the **Administration > Bot update > Bot Runners** page)
- Bot Runners:
 - An unattended Bot Runner license
 - **Autologin Set** status
 - **Allow a bot-runner user to update bots**
 - **Create folders**
 - **View packages**
 - **Register device**
 - **View my bots**
 - **Run my bots**
 - Below permissions for the folders containing the bots you want to update,

- **Check in**
- **Check out**

- **Default device** settings

For more information on creating users and roles, see [Create a user](#) on page 1678 and [Create a role](#) on page 1687.

- The Internet Explorer bots should already be identified for conversion.
- The bots must be **Checked in** and available in the **Public** workspace.

Note: You cannot use the Update Bot wizard to convert Enterprise 10 and Enterprise 11 bots created using Internet Explorer. For details, see [Bot Migration Wizard](#) on page 1526.

See the following video for an overview of the Bot update wizard:

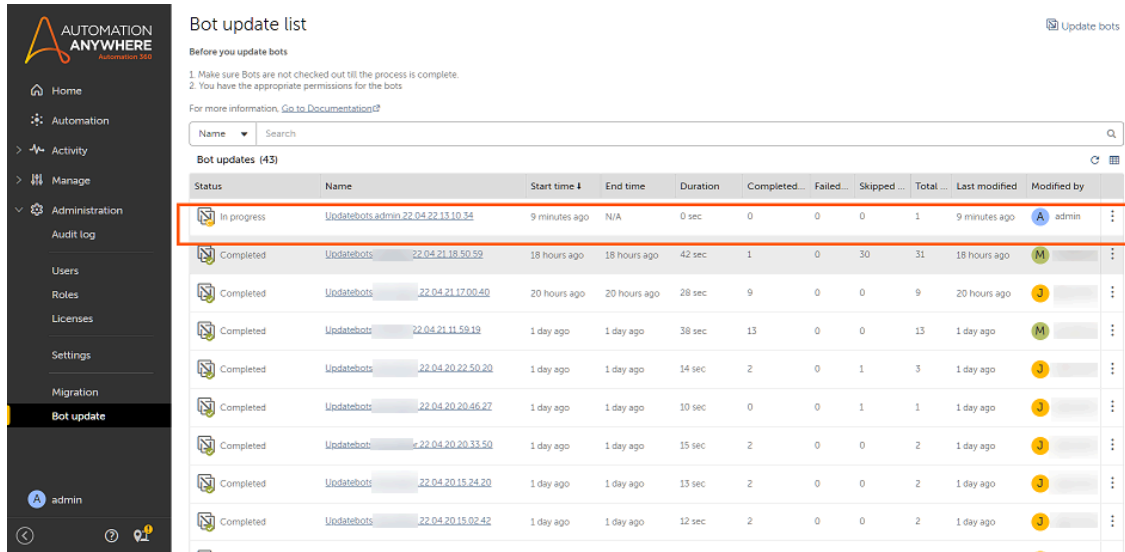

1. Navigate to **Administration > Bot update** in the Control Room.
If you have not performed any bot updates previously, the **Bot update list** on the **Bot update** page will not display bot updates.
2. Click **Update bots** to open the Update Bot wizard.
3. In the **Settings** tab, add details such as the name and description to update bots.
4. Click **Next**.
5. On the **Bots** tab, navigate to the Bots folder that contains the Internet Explorer bots.
6. Select bots from the list of available files and add the bots to the list of selected files.
You can choose from the latest or production version bots.

Note: You do not have to select the dependent bots because the dependent bots are selected automatically.

7. Click **Next**.
8. Select Bot Runner devices from the list of Bot Runners to run the bot update.
9. Click **Next**.
10. Verify details such as the bot type, name, version, and folder path on the Bot and Dependent Bots tab.
11. Click **Update bots**.

The selected bots and dependent bots are deployed on the selected Bot Runners for conversion from IE to Microsoft Edge with IE mode. The bots are converted one at a time and a new version of the bots is uploaded to the Control Room public repository. A new entry for updated bots is created during the bot conversion process on the **Bot update list** page.

The page shows the status and summary of the bots updated for conversion. You can refresh the page to view the current bot conversion status.

A list of the different bot conversion status during the conversion process is as follows:

- **In progress:** Indicates that the bot conversion has started.
- **Completed:** Indicates that the bot conversion process is completed.
- **Failed:** Indicates that the conversion of one or more bots has failed.

12. Select **View update bots details** from the actions menu (⋮) to view the bot conversion details of each bot.

See [Conversion report for IE bots](#).

See the following video on how to run the Bot update wizard:

A user with the **Manage roles** permission can create and assign roles to users to provide them with access to features and operations.

Viewing conversion details for Internet Explorer bots

For each update bot action, you can view details about the overall summary and status of individual bot conversion that is converted from Internet Explorer to Microsoft Edge with IE mode.

Viewing bot details

1. In the Control Room, go to **Administration > Bot update**.
2. Select an instance of the bot conversion from the list and click **View update bot details** action from the action menu for that instance.

The **Update details** page opens with detailed information about the name of the instance and the overall status of the bot conversion (at the top of the page). For more information, you can navigate to different tabs on this page: Summary, Settings, Bot Runners, and Results.

Summary details

You can view the following details in the **Summary** tab:

- Start time: Indicates the time when the bot conversion started
- End time: Indicates the time when the bot conversion completed
- Duration: Total duration taken for bot conversion to complete
- Completed items: Total list of items that are converted with completed status
- Failed items: Total list of items that failed to convert
- Skipped items: Total list of skipped items during conversion based on appropriate reasons
- Details of the selected bots and dependencies, listed in a table

The data is listed by file name by default. You can search for specific bots and dependencies by file name.

Settings

The **Settings** tab displays the following fields:

- Description: Displays any description you might have added before running the Update Bot wizard
- Update the bots built using Internet Explorer to Microsoft Edge Internet Explorer mode. By default, this field is set to **Yes**

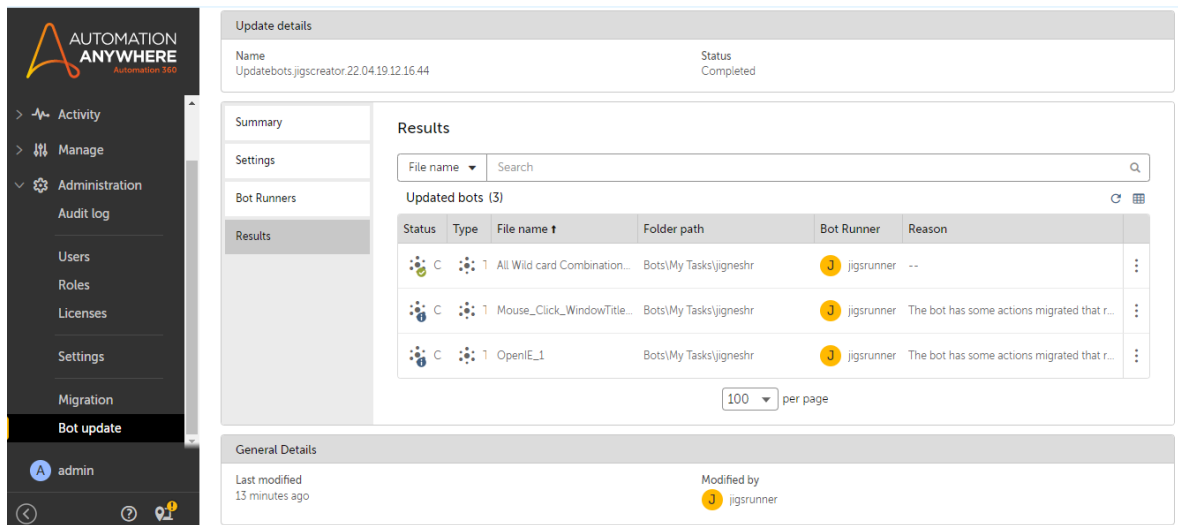

Bot Runners

This tab displays the list of Bot Runners on which the bot conversion is done.

Results

View the status of individual bot conversion on this tab:

- Status: Status of the individual bot conversion (completed, skipped, failed)
- Type: Type of the bot, for example Task Bot
- File name: Name of the bot
- Folder path: Path where the bot resides in the public workspace
- Bot Runner: The Bot Runner machine used to perform the bot conversion
- Reason: Reason why the bot conversion is in either failed, skipped, completed with review required, or completed with action required status

When you click the **View Bot update** for an individual bot status entry in this tab, the following reason and action values for the bots are shown.

Status	Reason	Action
Pending	-	-
Completed	-	-
Skipped	The bot is not updated as it does not use actions based on Internet Explorer	-
Completed with Review Required	The bot has some actions updated that requires your review	View bot update issues
Completed with Action Required	The bot has some actions updated that requires your action	View bot update issues
Failed	The bot uses some actions that are not supported for update to Microsoft Edge with IE mode	View bot update issues

The view bot update page displays the following columns:

- Line number
- Action name
- Reason for Recommendation

You can view the information listed in the reason column for the line number and open the corresponding bot, go to the line number and review based on the information provided in the window or take action as required.

The screenshot shows the Automation Anywhere interface. A modal window titled "Mouse_Click_WindowTitle_1" is open, displaying a notification: "Your bot update needs review. The bot has some actions migrated that require review." Below the notification is a table with 4 issues:

Line number	Action name	Reason / Recommendation
Line 20	Mouse: mouseClick	Browser components such as Menu bar, Status bar, Favorites bar, Comman... more >>
Line 21	Mouse: mouseClick	Browser components such as Menu bar, Status bar, Favorites bar, Comman... more >>
Line 22	Mouse: mouseClick	Browser components such as Menu bar, Status bar, Favorites bar, Comman... more >>
Line 23	Mouse: mouseClick	Browser components such as Menu bar, Status bar, Favorites bar, Comman... more >>

The background shows the "Update details" page for a bot named "Updatebots.iiscreator" with a status of "Completed". The "General Details" section shows it was last modified 14 minutes ago and modified by "jigsrunner".

Deprecation of Basic authentication in Exchange Online

Microsoft will permanently disable Basic authentication for specific protocols in Exchange Online starting from October 1, 2022. This impacts customers running bot for email automation that connect to Exchange Online using IMAP, POP3, or EWS protocols with Basic authentication.

Important: We have updated the Email package and Email trigger with newer versions as mentioned below:

Package or trigger	New version	Old version
Email package	<ul style="list-style-type: none"> • Version: 3.14.3-20220923-220748 • Filename: bot-command-email-3.14.3.jar 	<ul style="list-style-type: none"> • Version: 3.14.1-20220831-084727 • Filename: bot-command-email-3.14.1.jar
Email trigger	<ul style="list-style-type: none"> • Version: 2.8.3-20220923-171042 • Filename: bot-trigger-email-2.8.3.jar 	<ul style="list-style-type: none"> • Version: 2.8.1-20220831-123116 • Filename: bot-trigger-email-2.8.1.jar

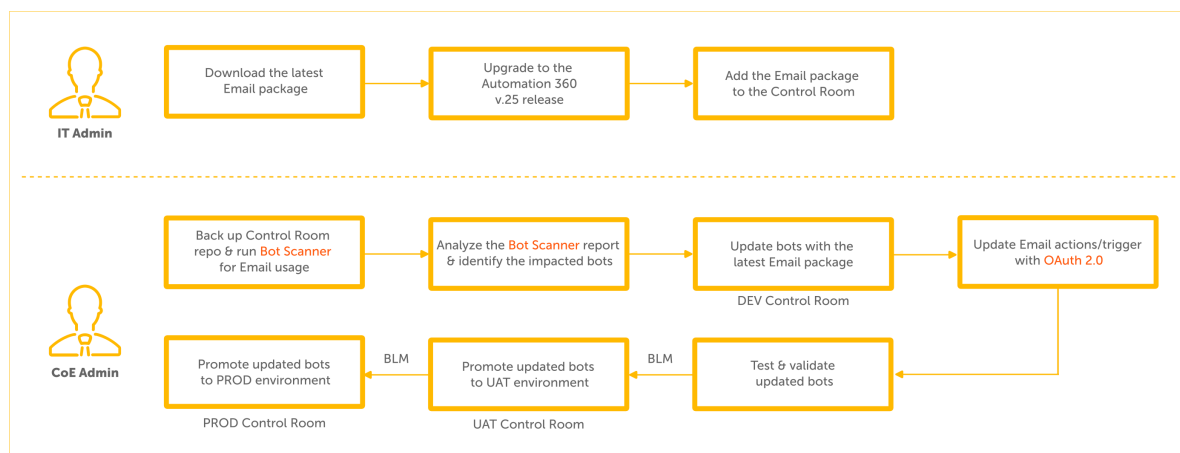

We recommend that you update your impacted bots with the new versions as they are compatible with the upcoming Automation 360 v.27 release. If you continue to use the old versions and update to Automation 360 v.27 release, you might encounter issues when importing or exporting of bots or when uploading the old versions of the Email package or trigger to Automation 360 v.27. To resolve this issue, see the workaround provided in [Everything about Basic Authentication deprecation in Microsoft Exchange online \(A-People login required\)](#).

We will provide a new version of the Email package with OAuth 2.0 support in an upcoming Automation 360 package-only release by the week of August 29, 2022.

To ensure that your existing bots that are using Basic authentication in Exchange Online are supported after Basic authentication is deprecated, we recommend that you update the bots to use OAuth 2.0. To identify the Automation 360 bots that are using Basic authentication in the Email package or Email trigger, use the Bot Scanner to scan bots. This helps you to plan your efforts to update your existing bots to OAuth 2.0 in Automation 360.

- [Bot Scanner for migration](#) on page 1469
- [Running Bot Scanner to scan bots for EOL features](#) on page 1077

Update Automation 360 bots to use OAuth 2.0

1. Update to the latest Automation 360 release.
[Update Automation 360 to latest version](#) on page 1363
2. Back up the Control Room repository.
[Integrating Control Room with Git repositories](#) on page 1762
3. Identify bots that are using Basic authentication using the Bot Scanner.
[Running Bot Scanner to scan bots for EOL features](#) on page 1077
4. Download the latest version of the Email package and add it to your Control Room.
[Add packages to the Control Room](#) on page 1842
5. Update the bots that are using Basic authentication in the **Connect, Send, Forward, or Reply** actions or Email trigger to use OAuth 2.0.
[Update bots using Basic authentication to OAuth 2.0](#) on page 1068
6. Verify that the updated bots can be deployed.

[Run a bot](#) on page 2206

Note: You can update your bots to use OAuth 2.0 in one environment (for example, development or DEV) and then move these bots to another environment (for example, UAT and production or PROD) without updating the bots in each environment.

Protocols impacted for Basic authentication deprecation

Microsoft is removing the capability to use basic authentication in Exchange Online for these specific protocols: MAPI, RPC, Offline Address Book (OAB), Exchange Web Services (EWS), POP, IMAP, Exchange ActiveSync (EAS), and Remote PowerShell.

Note: SMTP AUTH is excluded from this deprecation.

Any client (for example, user app, script, or integration) using Basic authentication for one of the affected protocols will not be able to connect to Exchange server starting October 1, 2022. An HTTP 401 error (`bad username or password`) will be displayed.

Note: Any app using OAuth 2.0 for these same protocols will not be impacted.

For more information, see [Basic authentication deprecation in Exchange Online – Updates](#).

Update bots using Basic authentication to OAuth 2.0

You should update your bots that are using Basic authentication to OAuth 2.0 in the **Connect**, **Forward**, **Reply**, and **Send** actions of the Email package and Email trigger before Basic authentication is deprecated.

Note: This procedure is applicable to both Automation 360 Cloud and On-Premises customers.

Prerequisites

- The Installation Setup folder in the Automation 360 v.25 Basic Authentication MS Online - Deprecation downloads folder contains the following JAR files:
 - Email package (`bot-command-email-3.14.1.jar`)
Ensure that you download this package and add it to your Control Room in Automation 360.
 - Email trigger (`bot-trigger-email-2.8.1.jar`)
Ensure that you download this package and add it to your Control Room in Automation 360
 - Trigger listener (`triggerlistener.jar`)
If you are on Automation 360 v.25 release, ensure that you download and install the trigger listener file. See [Install the trigger listener file](#) on page 1071.

For information on adding packages to the Control Room, see [Add packages to the Control Room](#) on page 1842.

To download these JAR files, see [Everything about Basic Authentication deprecation in Microsoft Exchange online \(A-People login required\)](#).

- Ensure that you have run the Bot Scanner utility for the deprecated features to identify the bots that are using Basic authentication in your Control Room repository.

See [Running Bot Scanner to scan bots for EOL features](#) on page 1077.

- Ensure that you have registered your application on the [Azure portal](#) and performed the following configurations for Client credentials flow:
 - IMAP/POP3
 1. [Register an application](#)
 2. [Authenticate an IMAP, POP or SMTP connection using OAuth](#)
 - EWS
 1. [Register an application](#)
 2. [EWS OAuth authentication](#)
 3. [Configure application access policy](#)

Procedure

1. Log in to your Control Room as Bot Creator.
2. Select the bot that was identified in the Bot Scanner report for updating.
3. Check out the bot to edit it.
4. In the Bot editor, click the vertical ellipsis in the top right-corner and click **Packages**.
5. Expand the row for the Email package.
6. From the drop-down list of package versions, select the **Default** version.

Note: For Email package, ensure that the package version is **3.14.1-20220831-084727** or later. For Email trigger, ensure that the package version is **2.8.1-20220831-123116** or later.

7. Click **Change Version** and **Save**.
8. Click **Return to editor**.
9. Click the Email action or Email trigger that is using the **Basic** authentication mode.
10. Click the **Email server** or **EWS server** option.
11. In the **Authentication mode** drop-down list, choose the required OAuth 2.0 mode.

Note: For unattended Email automation, use Client credentials or ROPC flows, and for attended Email automation, use Implicit or PKCE flows. Microsoft does not recommend the use of ROPC and Implicit legacy flows. Therefore, we recommend that you either use the Client credentials or PKCE flow.

The following table provides information about the OAuth 2.0 authentication modes that are available for Email action in the Email server and EWS server options:

Email actions	Email server	EWS server
Connect	<ul style="list-style-type: none"> OAuth2 – Authorization code with PKCE OAuth2 – Client credentials 	<ul style="list-style-type: none"> OAuth2 – ROPC OAuth2 – Implicit OAuth2 – Authorization code with PKCE OAuth2 – Client credentials
Send	OAuth2 – Authorization code with PKCE	<ul style="list-style-type: none"> OAuth2 – ROPC OAuth2 – Implicit OAuth2 – Authorization code with PKCE OAuth2 – Client credentials
Forward	OAuth2 – Authorization code with PKCE	--
Reply	OAuth2 – Authorization code with PKCE	--

The following table provides information about the OAuth 2.0 authentication modes that are available for Email trigger in the Email server and EWS server options:

Triggers	Email server	EWS server
Email trigger	OAuth2 – Client credentials	OAuth2 – Client credentials

- **OAuth2 – ROPC:** Uses Resource Owner Password flow ([Microsoft identity platform and OAuth 2.0 Resource Owner Password Credentials](#))

Note: The existing Silent flow has been renamed to ROPC.

- **OAuth2 – Implicit:** Uses implicit grant flow ([Microsoft identity platform and implicit grant flow](#))

Note: The existing Interactive flow has been renamed to Implicit.

- **OAuth2 – Authorization code with PKCE:** Uses authorization code with PKCE grant flow ([Microsoft identity platform and OAuth 2.0 authorization code flow](#))
- **OAuth2 – Client credentials:** Uses client credentials flow ([Microsoft identity platform and the OAuth 2.0 client credentials flow](#))

- 12.** Depending on the authentication mode that you selected, you might have to update some of the following fields:

- **Username:** Enter the username that you want to use to access the mail server.

For example, john.smith@myCompanyName.com

- **Password:** Enter the password for the username you provided.
- **Email provider:** Select the email provider from the drop-down list.

Note: For **Client ID**, **Tenant ID**, **Redirect URI**, and **Client secret** options, use the information that is provided for your account on your [Azure portal](#).

See [Email package](#) on page 2431 and [Add an email trigger](#) on page 3234.

13. For **EWS server**, click **Test connection** to sign in to your account, accept the permissions requested to authenticate, and establish a connection with the server.

Note: In the Microsoft Azure app registrations portal, in **Manage > Authentication**, ensure that the URI you have added is either <https://outlook.office365.com> or <https://outlook.office365.us> for the connection to work properly.

14. Click **Save**.

Repeat these steps for all the impacted bots and run the bots to ensure that they can connect to Exchange Online using OAuth 2.0 successfully.

Install the trigger listener file

To use the Email trigger with OAuth 2.0, you have to update the `triggerlistener.jar` in the Bot Agent.

1. In the Windows Task Manager, stop the **Automation Anywhere Bot Agent** service.
2. Go to the folder where the Bot Agent is installed (C:\Program Files\Automation Anywhere\Bot Agent).
3. Locate the `triggerlistener.jar` file and rename the file to `triggerlistener.jar_old`.
4. Copy the downloaded `triggerlistener.jar`.
5. In the Windows Task Manager, start the **Automation Anywhere Bot Agent** service.

- [Automation 360 and Basic authentication deprecation FAQ](#) on page 1072
- [Running Bot Scanner to scan bots for EOL features](#) on page 1077
- [Everything about Basic Authentication deprecation in Microsoft Exchange online \(A-People login required\)](#)

Automation 360 and Basic authentication deprecation FAQ

Microsoft has announced EOL for Basic authentication that is used to connect to Exchange Online. This will impact automations (bots) using Email package or Email trigger that uses Basic authentication. Review the FAQ for details about the deprecation of Basic authentication.

What is Basic authentication deprecation?

Microsoft has announced that starting October 1, 2022, Basic authentication will be permanently turned off (disabled) for specific protocols in Exchange Online for MAPI, RPC, Offline Address Book (OAB), Exchange Web Services (EWS), POP, IMAP, Exchange ActiveSync (EAS), and Remote PowerShell.

Exclusion: SMTP AUTH is excluded from this deprecation for tenants which are already using it

Any client (user app, script, integration, and so on) using Basic authentication for one of the affected protocols will be unable to connect after that specified date. The app will display an HTTP 401 error: `bad username or password`. Any app using OAuth 2.0 for these protocols will be unaffected.

[Basic authentication in Exchange Online](#)

What is Microsoft's recommendation to mitigate Basic authentication deprecation?

Per Microsoft's recommendation, you are requested to switch from Basic authentication to OAuth 2.0 if your clients or apps are using Basic authentication with any of the affected protocols to connect to Exchange server via Exchange Online.

Note: The Basic authentication deprecation applies to Exchange Online only and not to Exchange on-premises version.

Why this change?

Basic authentication is an outdated industry standard, less secure, and poses high risks to accessing customers' sensitive data. The latest industry standard is OAuth 2.0 which is more secure and less vulnerable to cyber attacks.

What if I am not ready for this change?

If you are not ready to switch to OAuth 2.0 by October 1, 2022, Microsoft has provided a one-time re-enablement option that will allow you to continue to use Basic authentication for specific protocols until end of December 2022. Per the Microsoft announcement, customers will be able to use the self-service diagnostic to re-enable Basic authentication for any protocols they need, once per protocol. After the diagnostic is run, Basic authentication will

be re-enabled for the specified protocols and will stay enabled until the end of December 2022.

Note: During the first week of calendar year 2023, the specified protocols will be disabled for Basic authentication use permanently.

[Basic Authentication Deprecation in Exchange Online – September 2022 Update](#)

Where is Basic authentication used in Automation 360 product?

In Automation 360, the Basic authentication feature is available in the **Connect**, **Send**, **Forward**, and **Reply** actions of the Email package and in Email trigger where you configure connection parameters using any of the IMAP, POP3, SMTP, or EWS protocols.

How do I know if I am going to be impacted by Basic authentication deprecation?

Basic authentication deprecation will impact you for the following cases:

- If you are automating email using Email package or Email trigger
- If you are using Basic authentication to connect to Exchange Online
- If you are using the IMAP, POP3, or EWS protocol

When Basic authentication will be disabled by Microsoft starting October 1, 2022, then all the Automation 360 bots for Email automation that meets the previously mentioned criteria will fail because the bot cannot connect to the Email server.

When will the support end?

Basic authentication will be disabled by Microsoft starting October 1, 2022.

How can I identify Automation 360 bots in my repository that are using Basic authentication with Email package or Email trigger?

For Automation 360 bots, you can run the Bot Scanner utility for EOL features.

[Running Bot Scanner to scan bots for EOL features](#) on page 1077

- The scanner will scan all the bots that are using Basic authentication with Email package or Email trigger and having IMAP, POP3, or EWS protocols.
- The scanner will then generate a CSV output listing all the impacted bots, including the specific line numbers and the specific actions to be performed.

Which feature will be provided in Automation 360 to mitigate the risk of Basic authentication deprecation?

The OAuth 2.0 feature will be available in Automation 360 in the Email package for the **Connect**, **Send**, **Forward**, and **Reply** actions and Email trigger for IMAP, POP3, and EWS protocols so that you can use this feature to switch from Basic authentication to OAuth 2.0.

What is the schedule and release version for introducing the OAuth 2.0 feature in Automation 360?

The OAuth 2.0 feature will be delivered as a package only release in the week of August 29, 2022. This release will include the following:

- Bot Scanner utility
- Updated versions of Email package, Email trigger, and trigger listener

Where can I download the Email package?

You can download the Email package from the link in the following article: [Everything about Basic Authentication deprecation in Microsoft Exchange online \(A-People login required\)](#).

Is the OAuth 2.0 feature backward-compatible with any of the previous releases of Automation 360?

No. The OAuth 2.0 feature is not backward-compatible with previous Automation 360 releases. Therefore, you are requested to manually update the package released with Automation 360 v.25.

What are the steps involved to update my impacted bots to switch to OAuth 2.0?

See to the following documentation page for the steps to update your impacted bots and switching from Basic authentication to OAuth 2.0: [Deprecation of Basic authentication in Exchange Online](#) on page 1066.

What are the different grant types or flows supported for OAuth 2.0 in Automation 360?

In Automation 360, there are two primary grant types that are supported for OAuth 2.0 across Email package and Email trigger:

- Client credentials: Email package and Email trigger
- Authorization code with PKCE: Email package

Within Email package, the individual **Connect**, **Send**, **Forward**, and **Reply** actions support each of these grant types as listed in the following table:

Action name	Email Server option	EWS option
Email > Connect	Client credentials	Client credentials
	Authorization code with PKCE	Authorization code with PKCE

Action name	Email Server option	EWS option
	—	ROPC or Silent
	—	Implicit or Interactive
Email > Send	—	Client credentials
	Authorization code with PKCE	Authorization code with PKCE
	—	ROPC or Silent
	—	Implicit or Interactive
Email > Forward	Authorization code with PKCE	—
Email > Reply	Authorization code with PKCE	—
Email Trigger	Client credentials	Client credentials

Note:

- The existing Silent flow has been renamed as ROPC (Resource Owner Password Credentials) and the existing Interactive flow has been renamed to Implicit.
- Both ROPC and Implicit grant flows are legacy flows, less secure, and are not recommended by Microsoft.
- The Client credentials flow for SMTP protocol is currently not supported by Microsoft to access Exchange Online.

- [OAuth grant types](#)
- [Authentication flow support in MSAL](#)
- [OAuth 2.0 Client Credentials Flow support for POP and IMAP protocols in Exchange Online](#)

What will happen to my existing bots that use email automation when I update to the

When you update to the latest version of the Email package or Email trigger, the existing

Automation 360 v.25 to update the default version of the Email package or Email trigger to the latest version?

bots that use email automation will include the following changes:

- If your bots are using the **Email server** option with IMAP or POP3 protocol, the **Authentication mode** option will be set to **Basic** by default to indicate that the action uses Basic authentication.

If the **Host** field in the **Email server** option uses a variable, the **Authentication mode** option will be set to **Basic**.

- If your bots are using the **EWS server** option with the **Authentication mode** option set to **Basic**, there is no change in the bots.

Note: This is the default scenario when you update the Email package.

- If your bots are using the **EWS server** option with the **Authentication mode** option set to **OAuth2-Silent**, the **Authentication mode** option will be set to **OAuth2 - ROPC** to indicate that the action uses the ROPC grant flow.
- If your bots are using the **EWS server** option with the **Authentication mode** option set to **OAuth2-Interactive**, the **Authentication mode** option will be set to **OAuth2 - Implicit** to indicate that the action uses the implicit grant flow.

Why is the Send Email action marked as **Deprecated** in my existing bots?

When you update your bots with the latest version of the Email package, you will notice that the Send Email action used in your bots are marked as **Deprecated** due to the following reasons:

- We have created a new version of the Send Email action which provides support for OAuth 2.0 mode of authentication.
- The new Send Email action is available in the Email package version 3.14.1-20220831-084727 or later.
- The **Deprecated** message will help you differentiate the old Send Email action from the new Send Email action.

Note: The Send Email action that is marked as **Deprecated** will continue to work the same way as earlier without any changes. However, if you want to switch from Basic authentication to OAuth 2.0, you must replace the deprecated Send Email action with the new Send Email

action and configure the required OAuth 2.0 parameters.

Will Automation Anywhere provide any tool for Automation 360 customers to update their bots from Basic authentication to OAuth 2.0?

No. You will have to manually update your impacted bots to switch to OAuth 2.0.

What is the guidance for Enterprise 11 customers if their bots are impacted by Basic authentication deprecation?

Enterprise 11 customers are recommended to migrate their Email automation bots to Automation 360 and leverage the OAuth 2.0 support. After migration, you can perform the following:

- Upload the new version of the Email package or Email trigger to Automation 360.
- Edit the impacted bots and set the latest version of Email package or Email trigger as default.
- Manually update your bots by switching from Basic authentication to OAuth 2.0.

Note: This guidance is applicable to both Cloud and On-Premises customers who are migrating to Automation 360.

Are there any limitations when you update the Email package?

We recommend that you do not perform a bulk update of bots to change Basic authentication to OAuth 2.0. You must manually edit the bots and update to OAuth 2.0.

[Deprecation of Basic authentication in Exchange Online](#) on page 1066

Running Bot Scanner to scan bots for EOL features

Automatically identify Automation 360 bots that are using Basic authentication mode in the Connect, Send, Forward, and Reply actions in the Email package and Email trigger, which are using IMAP, POP3, or EWS protocols.

- Ensure that the user credentials used to connect to the Control Room has the **View content** permission on the `Bots` folder.

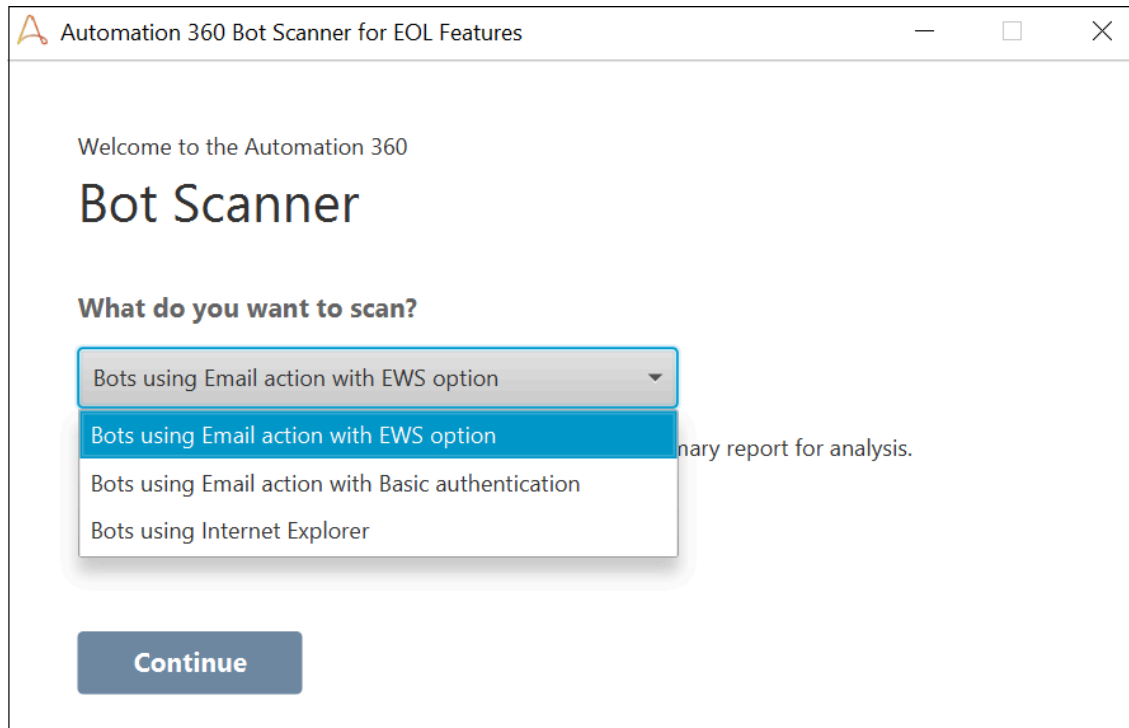

The Bot Scanner utility connects to your Control Room using these credentials.

- Ensure that you meet the software and hardware requirements for using the Bot Scanner.

See [Scan Enterprise 11 or 10 bots using Bot Scanner](#) on page 1471.

1. Download the Bot Scanner utility using the link provided in the following article: [Everything about Basic Authentication deprecation in Microsoft Exchange online \(A-People login required\)](#).
2. Extract the files from the zip file that you have downloaded and double-click the `Automation_360_Bot_Scanner_For_EOL_Features.exe` executable file to run the utility.

3. In the **Bot Scanner** page, click the drop-down and select one of the following:
- **Bots using Email action with EWS option:** To select the bots that have used the EWS protocols.
 - **Bots using Email action with Basic authentication:** To select the bots that have used the **Authentication type** as **Basic** for both IMAP and POP3 protocols.
 - **Bots using Internet Explorer:** To get the bots that have used Internet Explorer.

Note: Microsoft has deprecated EWS API for Exchange Online and has recommended that users move to Graph API. See [Upcoming API Deprecations in Exchange Web Services for Exchange Online](#).

We recommend that you replace each email-related action with the equivalent new action in the Microsoft 365 Outlook package (based on Graph API) if your bots are impacted by the deprecation.

4. Click **Continue**.
5. In the **Automation 360 Bot Scanner EOL features page**, perform these steps:
- a) Enter the Control Room URL that you want to connect to
 - b) Based on the authentication type configured in your Control Room, choose one of the following authentication methods in the **Authentication Type** field:

Authentication type	Steps
Active Directory	<ol style="list-style-type: none"> 1. Enter the Username (Domain\\username). 2. Enter the Password (domain user password).

Authentication type	Steps
Database	<ol style="list-style-type: none">1. Enter the Username (Control Room database username).2. Enter the Password (Control Room database user password).
Single Sign-On	<ol style="list-style-type: none">1. Enter the Username.2. Enter the API Key.

- c) Click **Test connection**.**
A connection success or failure message is displayed. Validate your credentials if the connection fails.
- d) In the **Select destination path** field, enter the location where you want to save the generated report.**
- e) Click **Scan bots**.**

Automation 360 Bot Scanner for EOL Features

e.g. `https:\\Automation Anywhere\\acmehealth.com\\CR23CN`

Authentication Type

Database

Username

Password

[Test connection](#)

Select destination path

Browse...

Choose where to save report

Scan bots **Cancel**

The scanner scans all the bots in your Control Room repository for Basic authentication mode usage in the **Connect**, **Send**, **Forward**, and **Reply** actions in the Email package and Email trigger. After the scan is complete, a report (.CSV file) is available in the destination path you selected for your review.

- If a .CSV file already exists in the output folder, a message is displayed that the previous .CSV file will be deleted. When you click **Continue**, a new .CSV file is generated.
- If the previous .CSV file is in use, a message is displayed that the file cannot be deleted. Close the file and click **Scan bots**.

6. Click **Open report** to analyze the report.
The report contains the following details:

- Task Bot name: Name of the Task Bot.
- Line number: The line number of the **Connect**, **Send**, **Forward**, or **Reply** actions that are using Basic authentication.

For **Email trigger**, the line number will be empty.

- Package and action name: The Email package and action that is using Basic authentication.

- Searched text: The hostname of the Email server or the domain name of the EWS server for the respective action.
- Action and review message: Use this information to understand the action that you have to perform or the information that you have to review for the corresponding action containing Basic authentication.
See [Basic authentication scanning messages](#) on page 1081.
- Task Bot path: The path to the repository where the bot resides.

After you identify the bots that are impacted due to Basic authentication, you can plan to update these bots in the Control Room repository to switch to OAuth 2.0 authentication. For more information on how to switch to OAuth 2.0, see [Deprecation of Basic authentication in Exchange Online](#) on page 1066.

Basic authentication scanning messages

The Bot Scanner report might display some messages for your review or action for updating bots that are using Basic authentication to OAuth 2.0 in the Email package or Email trigger. Messages provide detailed information about the action, error, or review required to update the bots.

Code	A1001
Message	<p>The Basic authentication mode that is used to connect to the email server is deprecated by Microsoft.</p> <p>For the bot to run, update the authentication mode by selecting OAuth 2.0 and configuring the required parameters. Otherwise, a connection error will occur.</p>

Code	A1002
Message	<p>The Basic authentication mode that is used to connect to the EWS server is deprecated by Microsoft.</p> <p>For the bot to run, update the authentication mode by selecting OAuth 2.0 and configuring the required parameters. Otherwise, a connection error will occur.</p>

Code	R1004
Message	<p>A variable is used in the 'Host' property of this bot. If the variable is pointing to 'office365.com', this can potentially have an impact on the action since the Basic authentication mode that is used to connect to the email server is deprecated by Microsoft.</p> <p>You are advised to review the variable and update the authentication mode by selecting OAuth 2.0 and configuring the required parameters.</p>

Chrome and Edge Manifest V3 extensions

As Google will deprecate Manifest V2 extensions, this might impact your existing automations that use the current Manifest V2 extensions for Google Chrome and Microsoft Edge browsers. We have published Manifest V3 extensions with the Automation 360 v.26 release to help you start switching to Manifest V3 extensions.

Manifest V2 based deprecation

A manifest is a specification that is used to build browser extensions. As Google is deprecating Manifest V2 based extensions, we recommend that you update to Manifest V3 based extensions, which provides an enhanced security, privacy, and performance.

Impact to our customers: Automations that use Google Chrome Manifest V2 based extensions will stop working sometime after June 2023. The deprecation timelines of Manifest V2 based extensions are currently under review and subject to change by Google.

- For Google Chrome Manifest V2 extensions timelines, see [Manifest V2 support timeline](#).
- For Microsoft Edge Manifest V2 extensions timelines, see [Overview and timelines for migrating to Manifest V3](#).

Post the given date, you must switch to Manifest V3 extensions for your automations to work. You can choose to use the enterprise group policy for both Google Chrome and Microsoft Edge to continue to use Manifest V2 based extensions. For more information on Manifest extensions support and timelines, see, [Manifest V3 transition timeline](#).

Manifest V2 deprecation for Automation 360 v.26 and later releases

From Automation 360 v.26 and later releases, we have published new Google Chrome and Microsoft Edge Manifest V3 extensions. Starting on October 23, 2023, we will deprecate support for Manifest V2 extensions on Automation 360 v.26 and later releases. After this date, we will not address any issues relating to Manifest v2 extensions. If you are on Automation 360 v.26 or a later release and still using Manifest V2 extensions for Google Chrome and Microsoft Edge, we recommend that you upgrade your Google Chrome and Microsoft Edge browser extensions to Manifest V3 extensions before October 23, 2023.

Automation 360 features that use browser extensions

The following Automation 360 features use the Google Chrome or Microsoft Edge browser extension for web applications running on Google Chrome or Microsoft Edge:

- Bot Agent device registration with the Control Room (uses Chrome extension only)
- Automation of web applications through Universal Recorder or Browser package
- User interface based triggers
- Packages that use window titles, for example, OCR and Mouse Click

Plan the switch to Manifest V3 extensions

Note: Manifest V3 extension is supported on Google Chrome and Microsoft Edge browsers version 91 and later only.

Automation 360 customers:

We have published new Google Chrome and Microsoft Edge Manifest V3 extensions with the Automation 360 v.26 release. We will also continue to support Manifest V2 extensions until June 2023 to provide you time to switch to Manifest V3 extensions before Jan 2024 for Google Chrome. To know about Microsoft Edge Manifest V2 extensions timelines, see [Overview and timelines for migrating to Manifest V3](#).

You have the following options to switch to Manifest V3 extensions:

- New customers: Users starting with Automation 360 v.26 will directly use Manifest V3 extensions. You will not be impacted by the deprecation of Manifest V2 extensions.
- Cloud customers: Our Cloud deployments is updated to Automation 360 v.26 in October, and customers can switch to Manifest V3 extensions when they update their Bot Agent.
- On-Premises customers:
 - Updating to v.26: Customers updating from an earlier version to Automation 360 v.26 will switch to Manifest V3 extensions when they update their Bot Agent.
 - v.25: We have provided a Control Room patch with Automation 360 v.25. After installing the patch, the V2 extensions is switched to Manifest V3 extensions when you update the Bot Agent.
 - v.24, v.23, and v.22: For customers on Automation 360 v.24 or earlier, we strongly recommend that you update to Automation 360 v.26 or later releases. If you choose not to update, we will provide a set of steps to perform on all Bot Agent and Bot Runner devices to switch to Manifest V3 extensions. See [Manifest extension manual upgrade](#).
 - v.21 and earlier: We strongly recommend that you update to the latest version of Automation 360.

Note: You can choose to delay switching to MV3 extensions by using a Chrome group policy that extends support for Manifest V2 extensions until Jan 2024 for Google Chrome, see [Manifest V3 transition timeline](#). To know about Microsoft Edge Manifest V2 extensions timelines, see [Overview and timelines for migrating to Manifest V3](#).

Customers migrating to Automation 360

We recommend that you migrate to Automation 360 v.26, which uses Manifest V3 extensions by default. If you are migrating to Automation 360 v.25, install the Control Room patch, that we released in October.

Enterprise 11 customers

For details, see [Enterprise 11: Deprecation of Basic authentication and MV2 extensions](#).

Extend Manifest V2 extensions usage through group policy

You can choose to use the enterprise group policy for both Google Chrome and Microsoft Edge to continue to use Manifest V2 extensions till Jan 2024 .

For information about Manifest V2 extension timelines for Google Chrome, see [Manifest V3 transition timeline](#). For Microsoft Edge, see [Overview and timelines for migrating to Manifest V3](#).

You can extend the Manifest V2 deprecation only using the group policy. This extension provides you adequate time to plan upgrading to Manifest V3 extensions. You can use any extension group policy to extend the use of Manifest V2 extensions.

To update the policy, perform these steps:

1. Copy the following entries to a `.txt` file and save the file as a `.reg` file.

- Chrome:

```
Windows Registry Editor Version 5.00
[HKEY_LOCAL_MACHINE\SOFTWARE\Policies\Google\Chrome
\ExtensionInstallForcelist]
"ExtensionSettings"="{\kammdlphdfejlopponbapgbgagakimokm\":
{"installation_mode\": \"normal_installed\", \"update_url\":
 \"http://clients2.google.com/service/update2/crx\"}}"
```

- Edge:

```
Windows Registry Editor Version 5.00
[HKEY_LOCAL_MACHINE\SOFTWARE\Policies\Microsoft\Edge
\ExtensionInstallForcelist]
"ExtensionSettings"="{\dbmodiepejcgijlbmeebedkmegndokbk\":
{"installation_mode\": \"normal_installed\", \"update_url\":
 \"https://edge.microsoft.com/extensionwebstorebase/v1/crx\"}}"
```

2. Run the `.reg` file.

3. Restart the browser for the changes to take effect.

Review the features and capabilities (from Automation Anywhere or third party) that are deprecated or nearing deprecation to understand how they affect your automation and what action is required.

Related tasks

[Switch Manifest V3 to Manifest V2 extension manually](#) on page 1095

If you want to switch from Manifest V3 extension to Manifest V2 extension while remaining on Automation 360 v.26, you can manually switch to v2 extension.

[Manage multiple browser profiles for Manifest V3 extension](#) on page 1093

Automation 360 v.26 automatically includes Manifest V3 extensions to support browser-based automation. However, these V3 extensions in v.26 are by default for a single browser profile only.

Manifest V3 extensions FAQ

As Google will deprecate Manifest V2 extensions by June 2023, this might impact your existing automation that use the current Manifest V2 extensions for Google Chrome and Microsoft Edge browsers.

We have published Manifest V3 extensions with the Automation 360 v.26 release to help you start switching to Manifest V3 extensions.

What is Manifest V2 extension deprecation?

A manifest is a specification using which browser extensions are built. Google is deprecating Manifest V2 extensions by June 2023 for Google Chrome. To know about Microsoft Edge Manifest V2 extensions timelines, see [Overview and timelines for migrating to Manifest V3](#). The deprecation might impact your existing automation that use Manifest V2 extensions for Google Chrome and Microsoft Edge browsers. So, we recommend that you plan to switch to Manifest V3 extensions, which provide enhanced security, privacy, and performance.

See the following resources for information on Manifest V2 extensions deprecation timelines: :

- Google Chrome: [Manifest V2 support timeline](#)
- Microsoft Edge: [Overview and timelines for migrating to Manifest V3](#)

When will the Manifest V2 support end?

In June 2023, Manifest V2 extensions for Google Chrome will stop functioning. You can update the group policy for both Google Chrome and Microsoft Edge to extend the use of Manifest V2 extensions until Jan 2024 . For Microsoft Edge Manifest V2 extension timelines, see [Overview and timelines for migrating to Manifest V3](#) for more information.

Support for Manifest V2 for Google Chrome ends in Jan 2024 (see [Manifest V3 transition timeline](#)). To know about Microsoft Edge Manifest V2 extensions timelines, see [Overview and timelines for migrating to Manifest V3](#). You must switch to Manifest V3 based Google Chrome and Microsoft Edge browser extensions by then.

To extend support for Manifest V2, see [Extend Manifest V2 extensions usage through group policy](#) on page 1084.

How do I know if I am going to be impacted by the deprecation?

If you are using any or all of the following features on Google Chrome or Microsoft Edge browsers, you will be impacted by the Manifest V2 deprecation.

- Automation of web applications through Universal Recorder or Browser package
- User interface based triggers
- Bot Agent device registration with the Control Room
- Packages that use Browser variables, for example, Recorder, OCR and Mouse Click

Do I have to do anything in advance of the deprecation?

To avoid being affected by the deprecation, you can choose one of the following options:

- Upgrade to Automation 360 v.26, which includes the latest Manifest V3 extensions.
- Switch to Manifest V3 extensions before June 2023 if you are using Google Chrome. For Microsoft Edge Manifest V2 extensions timelines, see [Overview and timelines for migrating to Manifest V3](#) .
- Update the group policy to extend support for Manifest V2 extensions.

See [Extend Manifest V2 extensions usage through group policy](#) on page 1084.

What should I do to extend the group policy to continue using Manifest V2 extensions?

You can use the group policy for both Google Chrome and Microsoft Edge browsers to extend support for Manifest V2 extensions. For more information, see the following articles:

<p>Will the Manifest V2 extensions be automatically updated to V3 or do I have to manually add V3 extensions to the browser?</p>	<ul style="list-style-type: none">• Extend Manifest V2 extensions usage through group policy on page 1084• Manifest V3 transition timeline• Overview and timelines for migrating to Manifest V3 <ul style="list-style-type: none">• If you are on Automation 360 v.26 or later, and if you have updated to Bot Agent 21.222 or later, you will be automatically updated to Manifest V3.• If you are on Automation 360 v.25 and earlier, you must manually upgrade the Manifest V2 to V3. See Manifest extension manual upgrade.
<p>Which Automation 360 versions are certified for upgrading from Manifest V2 to V3 extensions?</p>	<p>The following versions are certified for the upgrade:</p> <ul style="list-style-type: none">• v.25• v.24• v.23• v.22
<p>I plan to continue with Automation 360 v.25, so what should I do to continue using MV2 extensions?</p>	<p>You can continue to use Manifest V2 extension only till Jan 2024 for Google Chrome (see Manifest V3 transition timeline). You will have to perform manual steps to extend the support.</p> <p>For more information, see Extend Manifest V2 extensions usage through group policy on page 1084.</p>
<p>What about the automations that I have already built using Chrome or Edge?</p>	<p>If your automations are dependent on browser extensions, you must either upgrade to Manifest V3 extensions or extend support for Manifest V2 extensions for your automations to continue working after the deprecation.</p>
<p>Do I need to update the Recorder package in the bots or will they continue to work with the earlier versions?</p>	<p>The Recorder package will work as intended, so there is no need to update the package.</p>
<p>I am using Automation 360 Cloud, so will my automations be impacted by the deprecation?</p>	<p>Cloud deployments are automatically updated to the Automation 360 v.26 release, which includes Manifest V3 extensions. The Bot Agent in v.26 refers to Manifest V3 extensions.</p>

Note: If the **Automatically update all bot agents** option in your Control Room settings is disabled on your device, you will not be automatically updated to Manifest

	<p>V3 extensions. So ensure that this option is enabled to receive automatic updates. Alternatively, you have to install the Bot Agent manually on all the Bot Runner devices.</p> <hr/>
How does the deprecation impact my migration?	<p>We recommend that you migrate to Automation 360 v.26, which uses Manifest V3 extensions by default.</p> <p>If you are using Automation 360 v.25 or earlier, you must either upgrade to Manifest V3 extensions or extend Manifest V2 extensions before you migrate browser-based automations.</p>
Will the URL for the extensions change? Will the URLs that I have added in the trusted list for proxy settings be impacted?	<p>Yes, the URLs for the extensions are different for Manifest V2 and V3. Use the following URLs for Manifest V3:</p> <ul style="list-style-type: none">• Chrome: Google Chrome extension for Automation 360• Edge: Microsoft Edge extension for Automation 360
Will Manifest V2 extensions be retained after I upgrade to Manifest V3?	<p>Until Jan 2024, you can continue to use the extensions for Google Chrome. To know about Microsoft Edge Manifest V2 extensions timelines, see Overview and timelines for migrating to Manifest V3. However, these extensions cannot be modified after December 2022, so Automation Anywhere will not be able to make any updates to these extensions after December 2023. Also see, Manifest V3 transition timeline.</p> <hr/> <p>Note: If you are on Automation 360 v.26 release and using Bot Agent 21.222, you will see both Manifest V2 and Manifest V3 registry entries in the Windows Registry.</p> <ul style="list-style-type: none">• You can remove the Manifest V2 entry from Windows Registry by uninstalling the existing Bot Agent 21.222 and installing the Bot Agent 21.222 again.• You can remove the Manifest V2 extension from the Extensions page. <p>Uninstalling the Bot Agent will remove both Manifest V2 and Manifest V3 extensions.</p> <p>Uninstall or remove apps and programs in Windows</p> <hr/>

If Enterprise 11 and Automation 360 are running on the same device, will there be any conflicts due to the Manifest V2 deprecation?

There will be no impact in such scenarios because the Manifest V3 extensions IDs are different for Enterprise 11 and Automation 360.

As I am currently on Cloud deployment, I'd prefer to continue using Manifest V2 extensions. Can I continue to use Manifest V2?

We recommend that you upgrade to the latest Automation 360 version to get the benefits of Manifest V3 extensions. However, if you still want to continue using Manifest V2 based extensions, ensure that you disable the **Automatically update all bot agents** option (in the Control Room settings) for all devices and ensure that users do not install the latest Bot Agent. This is required because the Automation 360 v.26 Bot Agent supports only Manifest V3 extensions.

Do I have an option to upgrade my devices in a phased or staggered manner?

Yes, you can upgrade your devices in a staggered manner to Manifest V3. You can disable the **Automatically update all bot agents** option for all devices and then select the devices individually for which you want to upgrade the Bot Agent.

Can I continue to use Manifest V2 extensions with the latest version of Automation 360?

Manifest V2 extensions are updated to Manifest V3 extensions when you update Bot Agent to the corresponding version of Automation 360 v.27. Any existing configurations in the Manifest V2 extensions are overwritten.

Starting from Automation 360 v.26, Manifest V3 extensions are bundled with the Bot Agent installation. Therefore, Manifest V3 extensions are installed when you update the Bot Agent. To continue using the Manifest V2 extensions:

- Ensure that you do not update the Bot Agent.
- Select **Disable auto updates** option in Control Room before updating your existing Automation 360 version.

See [Automatically update the Bot Agent](#) on page 1302.

Can I revert the upgrade from Manifest V3 to V2?

Yes, you can switch from Manifest V3 to V2. Update the JSON file with following Manifest V2 extension IDs:

- Chrome V2 Extension ID:
kammdlphdfejllopponbapggpbgakimokm
- Edge V2 Extension ID:
dbmodiepejcg1jbmeebedkmegndokbk

For more information, see [Switch Manifest V3 to Manifest V2 extension manually](#) on page 1095.

I had switched from Manifest V3 to V2 extensions for Automation 360 v.26. Can I now update to Manifest V3 extensions when I update Automation 360 to v.27?

When you update to Automation 360 v.27, the corresponding Bot Agent is also updated. Manifest V3 extensions are installed with the latest version of Bot Agent.

Additionally, ensure that you select **Enable Automation 360 extension for this browser profile** option on Google Chrome and Microsoft Edge browsers. See [Manage multiple browser profiles for Manifest V3 extension](#) on page 1093.

Note: If you are currently using Manifest V2 extensions or earlier versions, we recommend that you update and use the Manifest V3 extension.

My bot uses a Recorder package from an earlier Automation 360 version and has a hard-coded Manifest V2 extension ID in it. How do I change the extension ID?

When you update to Automation 360 v.26, the extension ID for Manifest V3 is updated automatically.

My application has IFrame with Content Security Policy enabled. Will the **Run JavaScript** action run the JavaScript inside the IFrame?

With Manifest V3, Google has restricted access to IFrame where Content Security Policy (CSP) is enabled in target page. If your business application does not have CSP enabled, you will be able to run JavaScript inside the IFrame. If your business application has CSP enabled, you will not be able to run JavaScript inside the IFrame and the **Run JavaScript** action will timeout or fail.

What version of the browsers are supported for Manifest V3?

Manifest V3 is supported on Google Chrome and Microsoft Edge Version 91 and later.

I am currently on Automation 360 v.26. Can I switch to Manifest V2 extension?

Yes, you can switch to Manifest V2 extension while being on Automation 360 v.26. For more information, see [Switch Manifest V3 to Manifest V2 extension manually](#) on page 1095.

I am currently on Automation 360 v.26. Are there any settings that I have to configure to continue to avail the latest browser extension versions?

If you have an internet connection, you will continue to receive the updates through automatic updates.

Can I use MV3 extension offline or without internet connection?

MV3 extensions are automatically installed when you update the Bot Agent to the latest version. MV3 based offline extensions are available for:

- Google Chrome from Automation 360 v.26. See [Install Chrome Plugin offline or without internet access in Automation 360](#).
- Microsoft Edge from Automation 360 v.27.

	<p>For additional help, contact Automation Anywhere support.</p>
<p>Will there be any impact to the remote agent that I have been using?</p>	<p>The remote agent installed with Automation 360 v.25 or earlier is not compatible with the Manifest V3 extension. You must install the latest Automation Anywhere remote agent and use the latest Recorder package.</p> <p>See Install Automation Anywhere remote agent for Citrix 2.0: Recorder package version 2.8.6 on page 1171.</p>
<p>What are the prerequisites to configure the browser extension settings?</p>	<p>Following are the prerequisites to configure the browser extension settings:</p> <ul style="list-style-type: none">• Bot Agent version 21.222 or later.• You must have installed the Bot Agent with installation type as system-wide.
<p>How to remove the Manifest V3 group policy?</p>	<p>For Google Chrome : Navigate to [HKEY_LOCAL_MACHINE\SOFTWARE\Policies\Google\Chrome\ExtensionInstallForcelist] and remove the entries that contain bboccnojhhogfffpcllbeigipedjedf as the extension ID.</p> <p>For Microsoft Edge : Navigate to [HKEY_LOCAL_MACHINE\SOFTWARE\Policies\Microsoft\Edge\ExtensionInstallForcelist] and remove the entries that contain fnmjcdajlonpigpcfnemeikipmolbfii as the extension ID.</p> <p>Restart the browser for the changes to take effect.</p>
<p>After updating to Automation 360 v.26, do I have to disable Manifest V2 extensions?</p>	<p>When you upgrade to Automation 360 v.26, Manifest V3 extensions is installed automatically, without impacting the already installed Manifest V2 extensions. Both Manifest V2 and V3 extensions can co-exist. The Manifest V2 extension does not interfere with Manifest V2 extensions. You can remove the Manifest V2-based extensions as needed.</p>
<p>How to remove the MV2 extension?</p>	<p>For Google Chrome : Navigate to HKEY_LOCAL_MACHINE\SOFTWARE\WOW6432Node\Google\Chrome\ . Expand Extensions folder and remove the folder by name kammdlphdfejlopponbapggpbgakimokm.</p> <p>For Microsoft Edge : Navigate to HKEY_LOCAL_MACHINE\SOFTWARE</p>

	<p>\WOW6432Node\Microsoft \Edge. Expand Extensions folder and remove the folder by name dbmodiepejcg1jlbmeebedkmegndokbk.</p> <p>Alternatively, go to the Extensions page of your respective browser and remove the entry related to Manifest V2.</p>
How to remove the MV3 extension?	<p>For Google Chrome : Navigate to HKEY_LOCAL_MACHINE\SOFTWARE \WOW6432Node\Google\Chrome \. Expand Extensions folder and remove the folder by name bbocnojhhoegfffpcllbeigipedjedf.</p> <p>For Microsoft Edge : Navigate to HKEY_LOCAL_MACHINE\SOFTWARE \WOW6432Node\Microsoft \Edge. How to force enable Google Chrome or Microsoft Edge extension for user-specific Bot agents?	<p>You can force enable the Manifest V3 extension on Google Chrome or Microsoft Edge by running the .reg files for Manifest V3. See Manifest extension manual upgrade.</p>
How to add an extension force group policy if another extension policy has already been added by my IT team?	<p>If a key by name 1 is already present, create a key name with the subsequent number, in this case, 2. See the following articles:</p> <ul style="list-style-type: none">• ExtensionInstallForcelist for Google Chrome• ExtensionInstallForcelist for Microsoft Edge.
I have installed the latest Bot Agent and am currently on Automation 360. However, I ignored the browser extension pop-up dialog box. What do I do?	<p>If you updated the Bot Agent when you launched a browser, you will be prompted to add or remove the Manifest V3 extension with a pop-up dialog box. To enable the Manifest V3 extension, you must select the Add Extension option. If you ignore the pop-up dialog box, the Manifest V3 extension is disabled. To enable the extension and apply the group policy, you must restart your browser.</p>
How do I continue to use Manifest V2 extensions with Automation 360 v.26 and later versions?	<p>We recommend that you upgrade to the latest Automation 360 version to get the benefits of Manifest V3 extensions. However, if you still want to continue using Manifest V2 based extensions, ensure that you disable the Automatically update all bot agents option (in the Control Room settings) for all devices and ensure that users do not install the latest Bot Agent. This is required because the Automation</p>

360 v.26 Bot Agent supports only Manifest V3 extensions.

You can continue using Manifest V2 extensions until for Google Chrome until Jan 2024 (see [Manifest V3 transition timeline](#)). To know about Microsoft Edge Manifest V2 extensions timelines, see [Overview and timelines for migrating to Manifest V3](#).

What is the 'Automation 360 started debugging this browser' pop-up and how do I disable it?

Google Chrome displays the 'Automation 360 started debugging this browser' pop-up for **Browser > Run JavaScript** or for inline JavaScript click action. Google has restricted software providers to add JavaScript in the page content that restricts execution of any inline JavaScript click. In Manifest V3, Google has updated the security to ensure that the Google Chrome browser is not compromised.

You can disable the 'Automation 360 started debugging this browser' by creating a new registry with Data value as browser extension ID. See [A360 | Getting pop-up while running the bots "Automation 360" started debugging this browser](#).

[Chrome and Edge Manifest V3 extensions](#) on page 1082

As Google will deprecate Manifest V2 extensions, this might impact your existing automations that use the current Manifest V2 extensions for Google Chrome and Microsoft Edge browsers. We have published Manifest V3 extensions with the Automation 360 v.26 release to help you start switching to Manifest V3 extensions.

[Manually upgrade from Manifest V2 to V3 extensions for Chrome and Edge](#)

[Feature deprecations affecting Automation Anywhere products](#) on page 1030

Review the features and capabilities (from Automation Anywhere or third party) that are deprecated or nearing deprecation to understand how they affect your automation and what action is required.

Manage multiple browser profiles for Manifest V3 extension

Automation 360 v.26 automatically includes Manifest V3 extensions to support browser-based automation. However, these V3 extensions in v.26 are by default for a single browser profile only.

You can enable browser extension for only one browser profile at a time. If you have multiple browser profiles, you must enable browser extension only from the profile that is used to run the bots. You must disable the Automation 360 browser extension from all other browser profiles. You also have the option to debug logging, for troubleshooting purposes.

Note: This procedure is applicable only if your browser is using Manifest V3 extension.

To enable or disable the browser extension individually for each browser profile, perform these steps:

1. Open the Google Chrome or Microsoft Edge browser:

- On Microsoft Edge, navigate to **Extensions > Automation 360 > Extension Options**.
- On Google Chrome, navigate to `chrome://extensions/` and select **Details** in Automation 360 and select **Extension options**.

The following page is displayed:

Enable Extension Functionality

Enable Automation 360 extension for this browser profile

Only one profile per browser is supported.
Enable this option only on the profile which will be used for automation.

Debug Logging Options

Enable debug logging

Displays extension activity messages on the developer console. Enable this option for troubleshooting issues with the extension.

Enable ALL logging

Enable native messenger logging

Enable script execution logging

Save

2. Select or deselect the **Enable Automation 360 extension for this browser profile** option.

Note: When you enable this option, only the current active profile is used for communication with the Bot Agent.

3. Select the **Enable debug logging** option to troubleshoot any browser extension issues.
4. Click **Save** and then restart the browser for the changes to take effect.
5. Verify that the debugging option is enabled for this browser profile by performing these steps:
 - a) Press **F12** key or **Ctrl+Shft+I** keys on an active browser window.
 - b) In the **Developer** console, select the **Application** tab and then select **Service Workers**.
 - c) Click **See all registrations**.

In the **Service Workers** window, the extension ID in `chrome://extensions` and the ID in the **ServiceWorker** window will be the same. Also, the **Log** field displays the logs continuously.

Related tasks

[Switch Manifest V3 to Manifest V2 extension manually](#) on page 1095

If you want to switch from Manifest V3 extension to Manifest V2 extension while remaining on Automation 360 v.26, you can manually switch to v2 extension.

Switch Manifest V3 to Manifest V2 extension manually

If you want to switch from Manifest V3 extension to Manifest V2 extension while remaining on Automation 360 v.26, you can manually switch to v2 extension.

To switch Manifest V3 extension to Manifest V2 extension manually, perform these steps:

1. Disable the Manifest V3 extension from the browser extension options.
See [Manage multiple browser profiles for Manifest V3 extension](#) on page 1093.
2. Edit the browser agent JSON file to replace the browser extension ID.
 - Chrome
 - a) Navigate to `C:\Program Files\Automation Anywhere\Bot Agent\AABrowserAgent\`.
 - b) Open the `AAChromeAgentManifest.json` file.
 - c) Replace the browser extension ID `bboccnjhhhoegffffpccllbeigipedjedf` to `kammdlphdfejllopponbapgpbgakimokm`.
 - d) Restart the browser for the changes to take effect.
 - Edge
 - a) Navigate to `C:\Program Files\Automation Anywhere\Bot Agent\AABrowserAgent\`.
 - b) Open the `AAEdgeAgentManifest.json` file.
 - c) Replace the browser extension ID from `fnmjcdajlonpigpcfnemeikipmolbfii` to `dbmodiepejcgjljbmeebedkmegndokbk`.
 - d) Restart the browser for the changes to take effect.

Alternatively, download the JSON files from the link given below, and replace the files at the Bot Agent installation location (typically located at `C:\Program Files\Automation Anywhere\Bot Agent\AABrowserAgent`) on your Bot Agent machines.

- For Chrome: Download the `AAChromeAgentManifest.json` from [Google Chrome JSON file download for Manifest V2](#).
- For Edge: Download the `AAEdgeAgentManifest.json` file from [Microsoft Edge JSON file download for Manifest V2](#).

If you have uninstalled the Manifest V2 extension manually, you must reinstall it from the [Chrome web store](#). Otherwise, your web-based automation might not continue to work.

If you are facing any issues, see [Google Chrome extension troubleshooting](#) on page 2175.

Deprecation of Tesseract OCR v3

IQ Bot will permanently discontinue Tesseract OCR v3 starting from Automation 360 v.26. This affects customers who have created learning instances using Tesseract OCR v3. We recommend that you plan to train your learning instances with alternative OCRs (including Tesseract OCR) before you update to Automation 360 v.26.

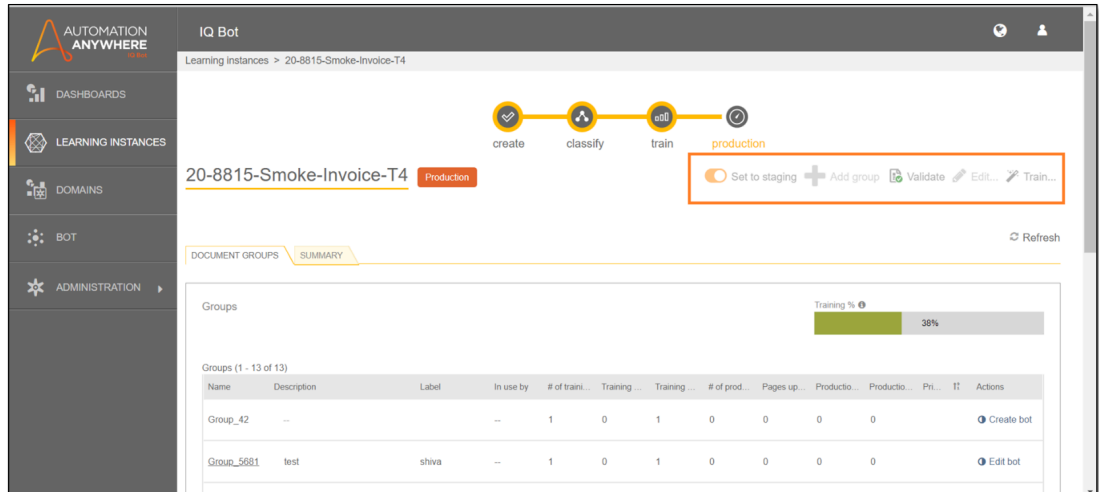

Removal of Tesseract OCR will affect the following product areas:

- My Learning Instances page:

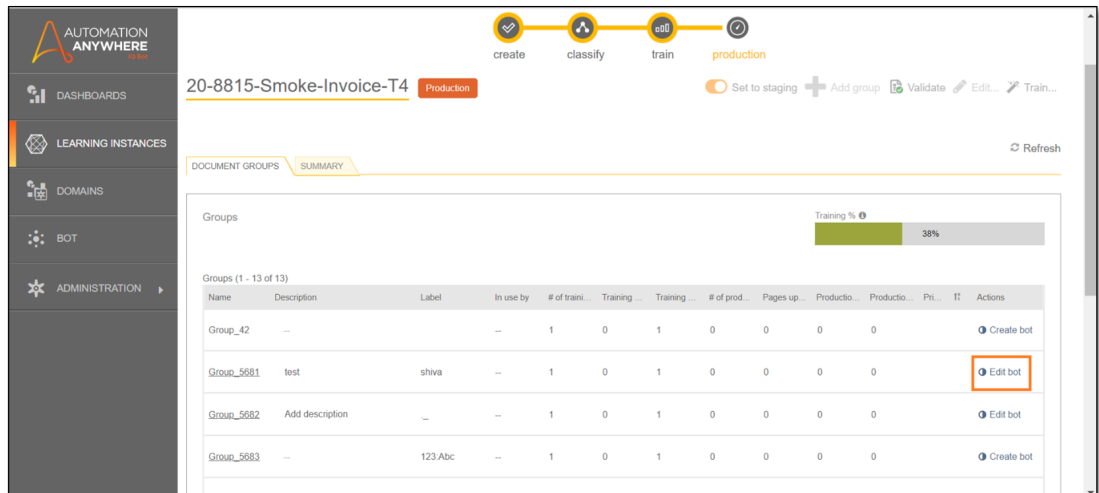

Instance name	Provider	# of IQ Bots	# of Files	Training %	Actions
20-8815-Smoke-Invoice-T4	Tesseract3 OCR	8	0	38%	Set to Production (disabled), Launch Validator (disabled)
25	Tesseract4 OCR	0	1	0%	Set to Staging, Add group, Validate, Edit, Train
25Shiva	Tesseract4 OCR	0	1	0%	Set to Staging, Add group, Validate, Edit, Train
26www	Tesseract4 OCR	3	18	0%	Set to Staging, Add group, Validate, Edit, Train
CheckValidationIssue	Abbyy OCR	0	2	0%	Set to Staging, Add group, Validate, Edit, Train
checkvalidations	Tesseract4 OCR	2	2	0%	Set to Staging, Add group, Validate, Edit, Train

For all Tesseract3 OCR learning instances, the **Set the instance to Production** button and **Launch Validator** button are unavailable.

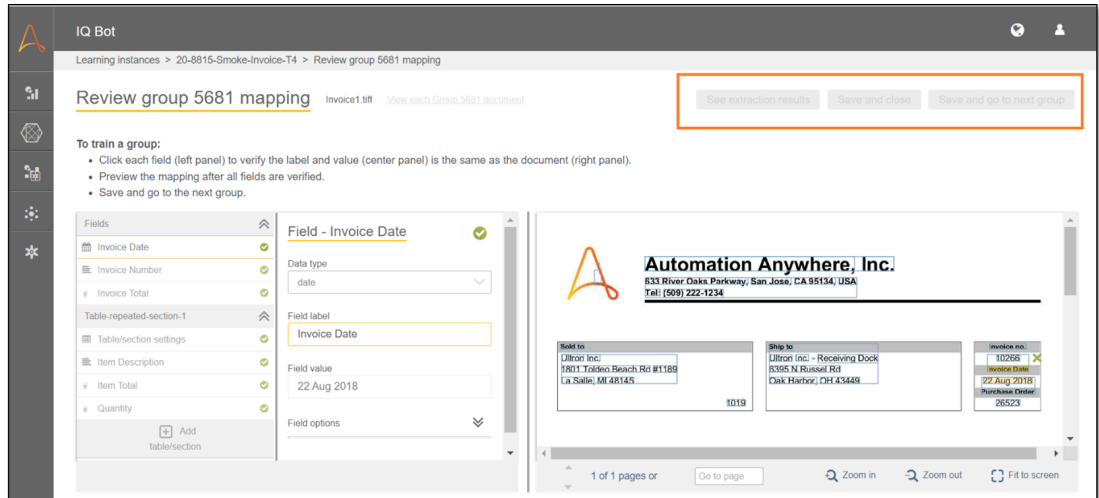

- My Learning Instance details page:
 - Select the Tesseract OCR v3 learning instance and go to the **Learning Instance details** page.
 - The **Set to staging**, **Add group**, **Validate**, **Edit**, and **Train** buttons are unavailable.

- Edit Bot page:
 - In the **My Learning Instance** page, click the **Edit bot** button of any existing bot.

- The **See extraction result**, **Save and close**, **Save and go to next group**, and **Delete Bot** buttons are unavailable.

- Bot page:
- Go to Bot page.

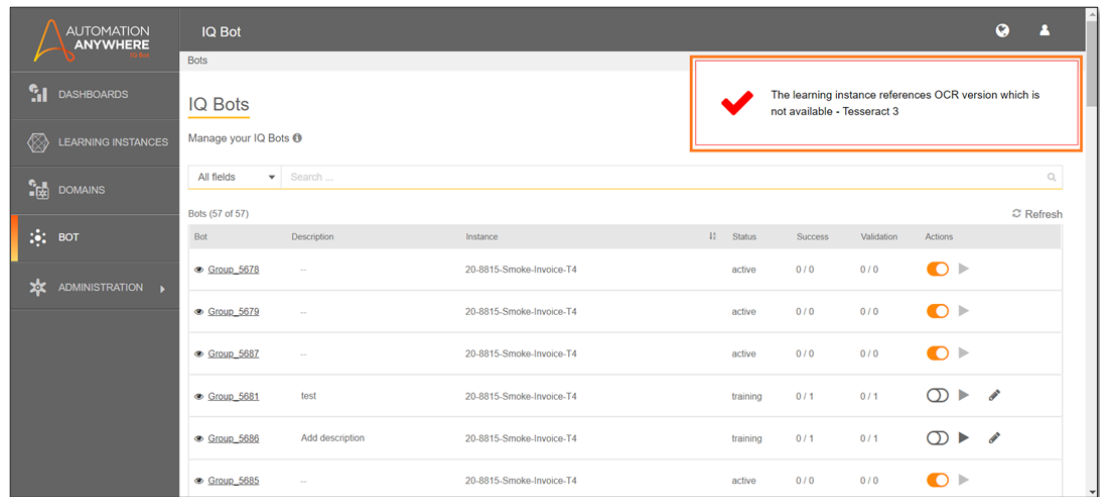

- Click **Test**.

- The following error message is displayed:

The learning instance references OCR version which is not available - Tesseract 3

- There is no change in the **Dashboard** page, and it continues to show Tesseract 3 metrics.

Deprecation of EWS APIs in Exchange Online

Microsoft has announced End-of-life of EWS APIs that is used to connect to Exchange Online. This is an ongoing deprecation and Microsoft will continue deprecating the least used EWS API. This impacts customers running bot for email automation that connect to Exchange Online using EWS API.

To know more about EWS API deprecation, see [Upcoming API Deprecations in Exchange Web Services for Exchange Online](#).

We have released a new Microsoft 365 Outlook package with Automation 360 v.29 release which is based on the latest version of Graph API and will enhance Office 365 package suite capabilities, see [Microsoft 365 Outlook package](#) on page 2741.

To ensure that your existing bots that are using the existing Email package with the EWS option are supported after the EWS APIs are deprecated, we recommend that you replace the actions from the Email package with the actions from the new Microsoft 365 Outlook package to automate Outlook emails for Exchange Online. This package contains all actions similar to those available in the Email package. You can use the Microsoft 365 Outlook package instead of the Email package with EWS option to change from EWS API to Graph API, see [EWS API deprecation FAQ](#) on page 1100.

Update bots using Email EWS option to Microsoft 365 Outlook package

You must update your bots that are using EWS API in the actions of the Email package and Email trigger before EWS API is deprecated.

Note: Ensure that you update your Bot Agent version to 21.250 (which was released with Automation 360 v.29) on your system.

To update the bots, perform the following steps:

1. Run Bot Scanner to scan bots having Email action with EWS option. See [Running Bot Scanner to scan bots for EOL features](#) on page 1077.
2. Edit the impacted bot by replacing each Email action with EWS option with the equivalent actions in the Microsoft 365 Outlook package, see [Microsoft 365 Outlook package](#) on page 2741.
3. Test the bot and ensure the result is same.

EWS API deprecation FAQ

Microsoft has announced EOL for EWS APIs that are used to connect to Exchange Online. This deprecation might impact automations (bots) that use the Email package or Email trigger with EWS option. Review the FAQ for details about the EWS API deprecation.

What is EWS API deprecation?

Microsoft has deprecated 25 least used EWS APIs since March 31, 2022. This is an ongoing deprecation and Microsoft will continue deprecating additional EWS APIs as and when the equivalent Graph APIs are available.

Why this change?

To know more about EWS API deprecation, see [Upcoming API Deprecations in Exchange Web Services for Exchange Online](#).

EWS is a legacy API, which is less secure and does not meet the security and manageability needs of modern application development. Per Microsoft, you are requested to switch from SOAP-based EWS APIs to REST-based Graph API if your clients or applications are using EWS APIs to connect to Exchange server via Exchange Online.

Microsoft Graph offers the following advantages compared to EWS:

- Security: Microsoft Graph is more secure and has stricter governance policies with OAuth and enables you to limit data access in a mailbox compared to the all or none access model in EWS.
- Simplicity: Microsoft Graph provides Graph Explorer to discover and test APIs easily and quickly, SDKs in different programming languages, and an active developer community.
- Efficiency: Microsoft Graph APIs are REST-based, where EWS APIs are SOAP-based. The advantage of using REST-based protocols include faster JSON serialization and lower network usage.

Note: The EWS API deprecation applies to Exchange Online only and not the Exchange on-premises version.

How will this deprecation impact me?

For now you will not be impacted because Automation 360 does not use any of the EWS APIs that were deprecated by Microsoft. Per Microsoft, the non-deprecated EWS APIs will continue to be supported for use in production environments and we do not have a fixed timeline when these APIs will get deprecated in future.

In case, specific EWS APIs which are used in Automation 360 gets deprecated in future, and if you have automated email using Email package and Email Trigger actions with EWS

option then such automations will break due to connection failure with Exchange Online.

Where does Automation 360 use EWS API?

Automation 360 uses EWS API in Email package and Email trigger for EWS option, which allows you to connect to Exchange Online hosted on Azure Cloud and access emails from Office 365.

How can I identify impacted bots which uses Email EWS option?

You can use the Automation 360 Bot Scanner utility for EOL feature to scan and identify the impacted bots that use EWS. See [Running Bot Scanner to scan bots for EOL features](#) on page 1077.

What is the guidance for Automation 360 customers to switch from EWS API to Graph API?

We have released a new Microsoft 365 Outlook package with Automation 360 v.29 release which is based on the latest version of Graph API. You can use this package to automate Outlook emails for Exchange Online. This package contains all actions similar to those available in the Email package. You can use the Microsoft 365 Outlook package instead of the Email package with EWS option to switch from EWS API to Graph API.

How do I update my existing bots to Microsoft 365 Outlook package?

To update your existing impacted bots to Microsoft 365 Outlook package, see [Deprecation of EWS APIs in Exchange Online](#) on page 1099.

Will Automation Anywhere provide any tool for Automation 360 customers to update their bots from EWS API to Graph API?

No. You must manually update your impacted bots to switch to Graph API (Microsoft 365 Outlook package).

Is there a one to one mapping between Email and Microsoft 365 Outlook packages or are there any differences?

All the actions available in the Email package are also available in the Microsoft 365 Outlook package. However you must consider the following differences when you build a bot with the new Microsoft 365 Outlook package:

- In the Email package, the **Send**, **Forward**, **Reply**, and **Reply All** actions have connection parameters and therefore when you create an automation, you can use these actions independent of the **Connect** action. However, in case of Microsoft 365 Outlook package, you must use the **Connect** action before each of these actions since they refer to the session created by the **Connect** action, see [Microsoft 365 Outlook package](#) on page 2741

- The new Microsoft 365 Outlook package supports two authentication modes: Authorization code with PKCE and Client Credentials. The Email package with EWS option supports four authentication modes: ROPC, Implicit, authorization code with PKCE, and Client Credentials.

Note: ROPC and Implicit authentication modes are deprecated and hence not supported in Microsoft 365 Outlook package. You must use the more secure authorization code with PKCE flow for attended automation and Client Credentials flow for unattended automation.

In-product user assistance

Automation 360 provides in-product assistance through the Resource center widget. The in-product help and guide provides on-demand access to product documentation, walkthroughs, and other guides to help you familiarize with the interface and learn more about the capabilities in the product.

Help center (in-product help)

The Help center (a part of the Resource center widget in Automation 360) provides contextual assistance to access real-time documentation within the product when you use the interface and build automations.

Important: The Help center is available only on Cloud Control Room instances and can be accessed only from the **Home** page and the Bot editor. Administrators cannot disable this feature for any of the users.

When you log in to the Control Room, the Help center shows content related to the features or settings in the **Home** page and in the Bot editor page. The Help center is located at the bottom-right of these pages. In the Help center, you can search for content from the documentation portal or click the suggested topic links to open and view related content within the Help center.

Professional developers can use the suggested topics or search for specific packages, actions, or other information for bot development. Additionally, the documentation link in the contextual help loads the content directly in the Help center. This feature helps developers eliminate the need to switch between the Bot editor and the documentation portal, thus providing a better user experience.

The Help center provides quick assistance for developers when they create bots in the Bot editor. Developers can search for contextual information about actions and packages by clicking the document help icons. The Help center updates to show content relevant to the selected action without the user having to navigate outside the Bot editor. Depending on your preference, you can view the content in **Theater** or **Full screen** mode.

View how to access the Help center and its features in the following video:

In-product guide

Automation 360 uses a digital adoption platform to provide in-product user assistance (guides and walkthroughs) and anonymously analyze product usage such as page views and feature clicks. This data is used to inform user research and improve the overall experience of Automation Anywhere solutions.

Services performed

- In-product guides and user notifications
- In-product educational spotlights
- Informational tips and other contextual user assistance elements within the product to help onboard users
- Anonymized user analytics to understand usage patterns of Automation Anywhere products

Data processed

- Clicks on user interface elements within Automation Anywhere products
- User ID in a form that does not disclose the identity of the user (for example, 159:0a664495-7f3e-126a-817f-513aeedf003e)
- Web-browser type, web-browser version
- Server Control Room URL
- Language selected (English, Japanese, and so on)
- User's first visit and last visit
- User's permissions settings
- List of features to which the user has access
- Product features that are used
- Automation Anywhere license type (Developer, Attended User, and so on)
- Automation Anywhere product version number
- User provided ratings and feedback comments on product features and functionality

Note: The digital adoption platform does not receive the user's IP address or bot information such as which bot was run and what the bot does.

Types of data captured

Automation Anywhere captures the following three types of data when using the digital adoption platform:

- Event data
Includes click and focus events providing usage metrics. This enables us to

understand the adoption of features and usage patterns to inform future improvements to the experience of our products.

For example:

- Clicking the **Run Bot** option
- Clicking the paths to open a bot in the Bot editor
- Tabbing into a search input

Note: The platform does not collect any user-entered text.

- Page load data

Includes data captured as users navigate to various parts of the web application, such as root paths of links and page titles

Note: The platform does not collect any input parameters sent through a link.

- Metadata

Includes metadata that is associated with clicks and page loads when a user logs in to Automation Anywhere products.

Metadata that is sent to the digital adoption platform includes the following types of information:

- Pseudonymized user ID
- Pseudonymized account ID
- Selected language
- Build number
- Browser version

Note: The platform explicitly does not:

- Record the screen
 - Perform any sort of screen-scraping
 - Capture data entered in any input field
-

Blocking the platform

Blocking the digital adoption platform will block in-product user assistance and important system messages such as the following:

- Productivity boosts through targeted user tutorials
- Targeted important announcements and direct communications

- Opportunity for in-app direct feedback, requests, and support
- In-app integration to Automation Anywhere documentation and support
- Ability to see user behavior so that we can proactively make improvements to the product

Set up Automation 360

Automation 360 provides a web-based, cloud-native RPA platform for users of all types. Review the tasks involved in setting up Automation 360.

Legal disclaimer: The information provided in this workflow might vary depending on which offering you use. Administrator steps might not be applicable to Cloud or Community Edition.

1. Choose your Automation 360 deployment model.

[Deployment models](#) on page 964

2. Verify the system prerequisites based on your deployment model:

- Cloud: [Automation 360 Cloud prerequisites](#) on page 1110
- On-Premises: [Automation 360 On-Premises prerequisites](#) on page 1124
- Community Edition: [Get started with Community Edition](#) on page 1269

3. Administrators: Set up bot users.

Bot users, skip this step and proceed to Step 4.

- a) Receive your administrator credentials.

- Cloud administrators: Receive your login credentials with administrator privileges and your Automation 360 dedicated URL from Automation Anywhere.
- On-Premises administrators: Receive your licensing information from Automation Anywhere and install Automation 360.

The installation user is assigned administrator privileges.

Installation type	Go here
Windows	Installing Control Room On-Premises on page 1121 To view this installation task in an interactive visual format, see Install Control Room On-Premises (custom mode) .
Linux	Installing Control Room on Linux on page 1237
Amazon Web Services	Installing Control Room on Amazon Web Services on page 1216
Microsoft Azure	Installing Control Room on Microsoft Azure on page 1222
Google Cloud Platform	Installing Control Room on Google Cloud Platform on page 1231

- b) Log in to a supported device, open a supported web browser, and log in to your Control Room using the dedicated URL.
 - [Bot Runner device requirements](#) on page 1111
 - [Log in to Automation Anywhere Control Room](#) on page 1428
 - c) Create your bot users by assigning a role and device license.
 - [Create a user](#) on page 1678
 - [Create an Active Directory user](#) on page 1679
 - d) Set up email notifications to Control Room users when events affect them, such as changes to passwords or user information, and account activation or deactivation.
4. Bot users: Perform these steps to get started with Automation 360.
- a) Receive your user login credentials and the Control Room dedicated URL.
Credentials are sent to you from your company's Automation Anywhere administrator or from Automation Anywhere.
Community Edition users: If you do not have an Automation 360 account, register for a free Community Edition account by visiting [Automation Anywhere Community Edition](#).
 - b) Log in to your Automation 360 account.
Log in to a supported device, open a supported web browser, and log in to your Control Room.
 - [Bot Runner device requirements](#) on page 1111
 - [Log in to Automation Anywhere Control Room](#) on page 1428
 - c) [Install Bot Agent and register device](#) on page 1288.

Note: The Bot Agent is installed only on devices running supported Windows operating systems. See [Bot Runner device requirements](#) on page 1111. You can create bots using the Bot editor in the Control Room, but to run the bots you must install the Bot Agent on your device.

 - d) Start creating bots:
 - [Create your first bot](#) on page 1429
 - [Build a Go be Great bot](#) on page 3068

Update Automation 360: See [Update Automation 360 to latest version](#) on page 1363.

Cloud and the Community Edition are updated automatically.

Related tasks

[Log in to Automation Anywhere Control Room](#) on page 1428

To log in to Automation 360, open the Control Room URL in your browser, enter your credentials in the login screen, and click **Log in**.

Use these tasks to register for, and start creating and using bots with the Community Edition of Automation 360.

Related reference

[Bot Runner device requirements](#) on page 1111

Review the hardware requirements, operating system versions, and browser types supported for creating and running bots on a device. The same requirements are also valid for Automation 360 Community Edition.

[Browser requirements for Automation Workspace](#) on page 1154

Access the Automation Workspace interface from a browser. After you have installed and enabled extensions in the browser, perform several tasks through the Automation Workspace interface based on your user role and automation requirements.

Related information

[Install and update Automation 360 IQ Bot Enterprise v11 Client installation](#)

Get started with Automation 360 Cloud

Use these tasks to start creating and using bots with Automation 360 Cloud.

1. Complete the prerequisites for Cloud.

[Automation 360 Cloud prerequisites](#) on page 1110

Use the checklist to determine whether your device fulfills the requirements for registering with Automation 360 Cloud.

2. [Provision Cloud Control Room instances](#) on page 1356.

Use the Licenses and Cloud Services portal to provision Cloud Control Room and Cloud sandbox Control Room instances on demand.

3. Receive your Control Room URL and login credentials. The URL points to your Automation 360 instance.

If you are your company's principal administrator and ordered cloud-deployed Automation 360, you receive an email from Automation Anywhere with your URL and credentials.

4. [Log in to Automation Anywhere Control Room](#) on page 1428.

To log in to Automation 360, open the Control Room URL in your browser, enter your credentials in the login screen, and click **Log in**.

5. Install Bot Agent, register your device, and set user device credentials.

[Install Bot Agent and register device](#) on page 1288 | [Set user device credentials](#) on page 1295

The Bot Agent is a lightweight application that enables you to run bots on your device by connecting the device to the Control Room. To run bots on a local machine, install the Bot Agent and add the local device to the list of enabled host devices.

To enable a device for running bots, set the local device credentials.

If you are using an operating system other than Windows, you will not be able to install the Bot Agent at this time. See [system requirements](#). However, you can still build bots using the [Bot editor](#).

6. [Create your first bot](#) on page 1429.

Follow these steps to create your first bot that prints the message, Go be great!, the Automation Anywhere version of Hello World!

7. [Run your first bot](#) on page 1433.

Run a bot from the same device that you used to create the bot.

Bot Runner device requirements

Review the hardware requirements, operating system versions, and browser types supported for creating and running bots on a device. The same requirements are also valid for Automation 360 Community Edition.

Hardware requirements for registered devices

You communicate with the Control Room through a registered local machine (device). Bot Creators and Bot Runners use the registered devices to create and run bots. Part of registering a device with Automation 360 is installing a Bot Agent.

The Bot Agent can be installed on devices that meet or are equivalent to the following hardware requirements:

Device	Processor	RAM	Storage (free disk space)	Network
Machine	Intel Core i3 2.6 GHz with 4 multi-cores or higher 64-bit	<ul style="list-style-type: none"> 4 GB (Minimum) 8 GB (Recommended) 	32 GB Add 100 through 150 KB per Automation Anywhere script Add 40 through 50 GB per long-term project	<ul style="list-style-type: none"> 5Mbps (Minimum) 20Mbps or higher (Recommended)
Additional users on a multi-user device	2 CPU per additional user	4 GB per additional user	No additional storage required	No additional network needed

Additional RAM requirements for the registered devices

Add additional RAM to account for applications and services running on the registered devices, for example:

- Microsoft Office applications (example: Excel)
- Browsers (example: Google Chrome)
- Enterprise applications (example: CRM, Oracle EBS, and SAP)
- VDI infrastructure applications
- Anti-virus software
- AI Sense Recorder

Additional disk space on registered devices

- Automation 360 scripts average approximately 100-150 KB. Additional free disk space is required to develop automation projects because temporary files such as screenshots, server logs, and audit files are created during the execution of the automation scripts.
- Free space required increases with the project size. Recommendation: Have at least 40-50 GB of free disk space for each long-term project.
- Increase storage space configuration after installation, as needed, depending on product usage. For example, depending upon the complexity of your bot, generating log files and logic creation require additional disk space later.

Additional CPU or processor on registered devices

AI Sense Recorder: Additional CPU or processor is required on a device if the existing CPUs are utilized by customer applications. It is also required in case of a VDI infrastructure where CPU or processors are shared across the infrastructure.

Platform compatibility for registered devices

A device used to connect to the Control Room and perform bot tasks must meet the platform requirements.

Note: Platform requirements are different for Control Room and Bot Agent.

Registered devices	Physical machines that you want to use for creating bots or deploying bots and running any of the supported operating systems.
Terminal servers	Using remote desktop (RDP), running any of the supported operating systems is supported on Automation 360 Version A2019.11 or later.
Virtual machines	Bot Agent is supported on all VMs where the supported Windows OS has been hosted on Version A2019.09 or later. For example, Virtual Desktop Infrastructure (VDI) are supported on Amazon Web Services, Microsoft Azure, Google Cloud Platform, VMware virtual machines, and Oracle Virtual Box.

Supported operating systems for registered devices

A device used to run the Bot Agent, connect to the Control Room, and perform bot tasks as a Bot Creator and Bot Runner must meet the operating system requirements.

Note:

- Only 64-bit operating system version supported.
- Bot Creator tasks are supported with all the listed operating systems.
- You cannot register a device that is running on a Linux system. The Bot Agent cannot be installed on Linux systems. However, you can use a registered device running on a Windows system to access a Control Room that is installed on a Linux system.

Windows version	Windows edition	Attended Bot Runner	Unattended Bot Runner	Bot Creator
Windows Server 2019	Datacenter and Standard	Supported	Supported ¹	Supported
Windows Server 2016	Datacenter and Standard	Supported	Supported ¹	Supported
Windows Server 2012	Datacenter and Standard	Supported	Supported ¹	Supported
Windows 11	Enterprise	Supported	Supported ¹	Supported
Windows 10	Professional and Enterprise	Supported	Supported ¹	Supported
Windows 8 ²	Professional and Enterprise	Supported	Supported	Supported
Windows 7 ²	Professional and Enterprise	Supported	Supported	Supported

(1) Auto-login

Auto-login is only supported on 64-bit systems.

(2) Supported OS

Windows 11 (64-bit) supported on Automation 360 Build 15459 or later.

Windows 8 (64-bit) supported on Enterprise A2019 (Builds 1598 and 1610) or earlier.

Windows 7 (64-bit) supported on Enterprise A2019.12 or later.

Add service URLs to trusted list for Cloud

For Cloud deployment, to ensure secure access to Automation 360 online services, add the service URL list to the safe recipients or trusted list.

URLs list

Online service hosting uses dynamic IP addresses, therefore we recommend that you add to the safe recipients or trusted list, the complete URL instead of an IP address for the Automation Anywhere online services.

Note: See your device documentation for information about how to add URLs to trusted list on your device.

Service	URL	Port	Device
Automation Anywhere	<code>www.automationanywhere.com</code>	TCP 443 (HTTPS)	All devices
Automation Anywhere Cloud customer tenant Includes Automation Anywhere Control Room and IQ Bot	<code>crdomainname- X.my.automationanywhere.com</code>	TCP 443 (HTTPS)	All devices that access Automation 360
	<p>Note:</p> <ul style="list-style-type: none"> <code>crdomainname-X</code> refers to your specific tenant name. The tenant name does not support the underscore (<code>_</code>) character. So an underscore is used in the tenant name, the specified URL will not be created.

[Ports, protocols, and firewall requirements](#) on page 1147

View the default and configurable firewall, port, and protocol requirements for Automation Anywhere deployment. View the default ports and protocols that are required to be allowed on customer's firewall for Automation Anywhere deployment. The default ports that are used for HTTP/HTTPS are configurable.

[Add service URLs to trusted list for On-Premises](#) on page 1265

For On-Premises deployment, to ensure secure access to Automation 360 online services, add service URL list to the safe recipients or trusted list.

[Add IQ Bot cloud server IP addresses to allowed list](#) on page 1118

To ensure seamless connectivity of your IQ Bot cloud servers with the Cloud Control Room, specify a list or range of IP addresses that are allowed to access the Cloud Control Room URL.

[Control Room IP addresses for external integrations](#) on page 1767

To ensure seamless connectivity to your Git instance, On-Premises key vault, or SIEM with the Cloud Control Room, configure your network firewall to include Automation Anywhere outbound Automation 360 IP addresses to the allowed list.

Allow Automation Anywhere communications ports

As part of the Automation 360 Cloud prerequisites, you must allow Automation Anywhere communications ports and protocols from the customer network.

Cloud communications ports

You can set the following connection modes between the customer network and the Control Room:

- Outbound: The traffic flows from the customer network to the Control Room.
- Inbound: The traffic flows from the Control Room to the customer network.

Note:

- You do not need an inbound connection for a regular bot execution. The inbound connection is only required when you have configured any integrations to: Git repository, On-Premises external key vault, or SIEM server with your cloud-hosted Control Room.
- You must open the Cloud communications ports to unidirectional (outbound connection) to transmit traffic from the customer network to the cloud-hosted Control Room.

The following table describes the required Cloud communications ports:

Automation 360 Cloud communications ports				
From	To	Port	Protocol	Connection type
Bot Agent (customer hosted)	Control Room (Automation Anywhere hosted)	443	HTTPS	Outbound
Bot Agent (customer hosted)	Control Room (Automation Anywhere hosted)	443	WebSocket	Outbound
Access to Control Room through browser	Control Room (Automation Anywhere hosted)	443	HTTPS	Outbound
Control Room (Automation Anywhere hosted) where Control Room connects from these Control Room IP addresses for external integrations on page 1767	Third-party Keystore (customer hosted and optional)	443	HTTPS	Inbound

Automation 360 Cloud communications ports				
From	To	Port	Protocol	Connection type
Control Room (Automation Anywhere hosted) where Control Room connects from these Control Room IP addresses for external integrations on page 1767	Git Repository (customer hosted and optional)	443	HTTPS	Inbound
Control Room (Automation Anywhere hosted) where Control Room connects from these Control Room IP addresses for external integrations on page 1767	SIEM server (customer hosted and optional)	443	HTTPS	Inbound

Add IQ Bot cloud server IP addresses to allowed list

To ensure seamless connectivity of your IQ Bot cloud servers with the Cloud Control Room, specify a list or range of IP addresses that are allowed to access the Cloud Control Room URL.

Based on your region, add the following outbound NAT IP addresses to the allowed list in the Cloud Control Room network settings:

Region	IP addresses
- Africa	<ul style="list-style-type: none"> • 13.244.57.44 • 13.244.197.159 • 13.244.185.72 • 54.228.5.1 • 54.228.48.30 • 54.217.103.248
- Australia	<ul style="list-style-type: none"> • 54.153.153.175 • 52.65.8.56 • 3.106.147.142

Installing Control Room On-Premises

Review the installation core tasks and topics for installing the Automation 360 Control Room in a data center on an On-Premises server or a cloud service provider server instance.

The Control Room provides centralized management for a digital workforce and an interface for Bot Insight. It is deployed on a server in a data center.

Note:

- For instructions on installing Control Room on Linux, see [Installing Control Room on Linux](#) on page 1237.
 - Linux is not supported for Cloud-enabled On-Premises installations.
 - During On-Premises installation, the Control Room tries to connect to `http://async-io.org/`. You need not allow this connection, or you can ignore if the connection fails. Because this connection is not required, we plan to disable the request for this connection in a future release.
-

Control Room installation core tasks

Prerequisites

Before you begin, download the appropriate installer for your operating system and version from [A-People Downloads page \(Login required\)](#).

Step 1: Pre-installation

[Automation 360 On-Premises prerequisites](#) on page 1124 Determine whether the system has the required hardware and software to install Control Room for On-Premises.

Step 2: Installation

The Control Room installer allows you to select installation modes (Express or Custom), and during the installation process, it also installs missing software dependencies.

Note: The Control Room installer is available only in English.

Use Custom mode to install on a cloud-based platform such as Amazon Web Services.

[Installing Control Room using Express mode](#) on page 1213 Log in to the servers as an Administrator and install Automation Anywhere Control Room in Express Mode using the default settings.

[Installing Control Room using Custom mode](#) on page 1189 Log in to the server as an administrator and install Automation Anywhere Control Room in Custom mode to select installation and configuration options, including installing non-default requirements. Select this mode for a data center deployment.

To view this installation task in an interactive visual format, see [Install Control Room On-Premises \(custom mode\)](#).

	Installing Control Room on Microsoft Windows Server using scripts on page 1251	Silent Control Room installation, also known as unattended installation, uses a customized script for a full setup or the command line for a hot fix patch. Silent install runs the entire installation process in the background without requiring user interaction or displaying messages.
Step 3: Post-installation	Configuring post-installation settings on page 1258	The options for launching the Control Room for the first time and the authentication method depend on the installation mode and deployment type.
	Verifying Automation Anywhere services on page 1260	Automation Anywhere specific services are installed on the Control Room server.
Step 4: Validation	Configure Control Room authentication options on page 1314	The options for launching the Control Room for the first time and the authentication method depend on the installation mode and deployment type.
	Managing Cloud and file licenses on page 1346	Follow the instructions to install a valid license key or license file on your On-Premises Control Room. <ul style="list-style-type: none">• For the license key, install a license GUID from the Licenses and Cloud Services portal on your On-Premises Control Room.

- For file-based licensing, generate a license file from the Licenses and Cloud Services portal and install it on your On-Premises Control Room.

Automation 360 On-Premises prerequisites

Determine whether the system has the required hardware and software to install Control Room for Automation 360 On-Premises.

Hardware requirements

[Control Room server requirements](#) on page 1131

The Control Room is deployed on servers in data centers. The minimum Automation Anywhere hardware requirements include: server type, machine type, processor, RAM, disk storage, and network requirements.

[Operating system, environment, and platform supported for Control Room](#) on page 1138

Automation 360 can be hosted on AWS, Microsoft Azure, Google Cloud Platform, IBM, and any public, private, or hybrid cloud service that meets the Control Room and Bot Agent hardware and software requirements.

[Bot Agent compatibility](#) on page 1274

Bot Agent is the Automation 360 plug-in that enables you to create and run bots. The agent is installed on devices used to access the Control Room. Installing the Bot Agent is part of registering a device.

[Credential requirements](#) on page 1141

Login credentials are required at different stages of Automation Anywhere deployment and use. Credentials are required for installation and data center servers, access to Automation Anywhere components, and to run tools in bots.

[Supported cloud platforms](#) on page 1141

Review the supported cloud platforms for various Automation 360 features.

Data center requirements

[Installing Control Room on Microsoft Windows Server using scripts on page 1251](#)

Silent Control Room installation, also known as unattended installation, uses a customized script for a full setup or an update setup. Silent installation runs the entire installation process in the background, without requiring user interaction or displaying messages.

Capacity and performance planning

Scale your automation by planning for capacity and performance requirements. To plan your capacity and performance for Control Room On-Premises, review the requirements, limits, and defaults that determine the number of simultaneous bots, user sessions, and processing rates.

Keep in mind concurrency requirements for your automations when you plan capacity.

Concurrent bot deployments

Concurrent bot deployments refer to bot runs that occur at the same time. Deployments can be from any of the deployment models, such as schedules, run bot now, WLM, trigger, Automation Co-Pilot for Business Users, or API.

Bots can be deployed in the following ways:

- Same bot deployed on multiple devices
- Different bots deployed on different devices
- Multiple bots deployed on the same device (depending on the configuration at the device level in a scenario where a multi-user device used is used)

Concurrent users

Concurrent users refer to multiple Control Room users using the same device simultaneously. These users can perform the same tasks or different tasks. The users can be either Bot Creators or attended or unattended Bot Runners.

Concurrent schedules

Concurrent schedules refer to one or more schedules planned for the next deployment at the same time. These schedules are triggered to deploy bots on different machines but at the same time.

Review capacity planning based on your requirements.

- [Attended automation capacity planning](#) on page 1127
- [Unattended automation capacity planning](#) on page 1129

Attended automation capacity planning

To plan capacity and performance for your Control Room On-Premises, review an example use case to understand the requirements, limits, and defaults that determine the number of simultaneous (concurrent) bots, user sessions, and processing rates.

Overview

Attended automation is a collaboration between humans and bots. Attended automations are run on devices that have users logged in and interacting with the automations and applications that are active and running on their desktop. The devices can be physical, virtual, single user, or multi-user devices.

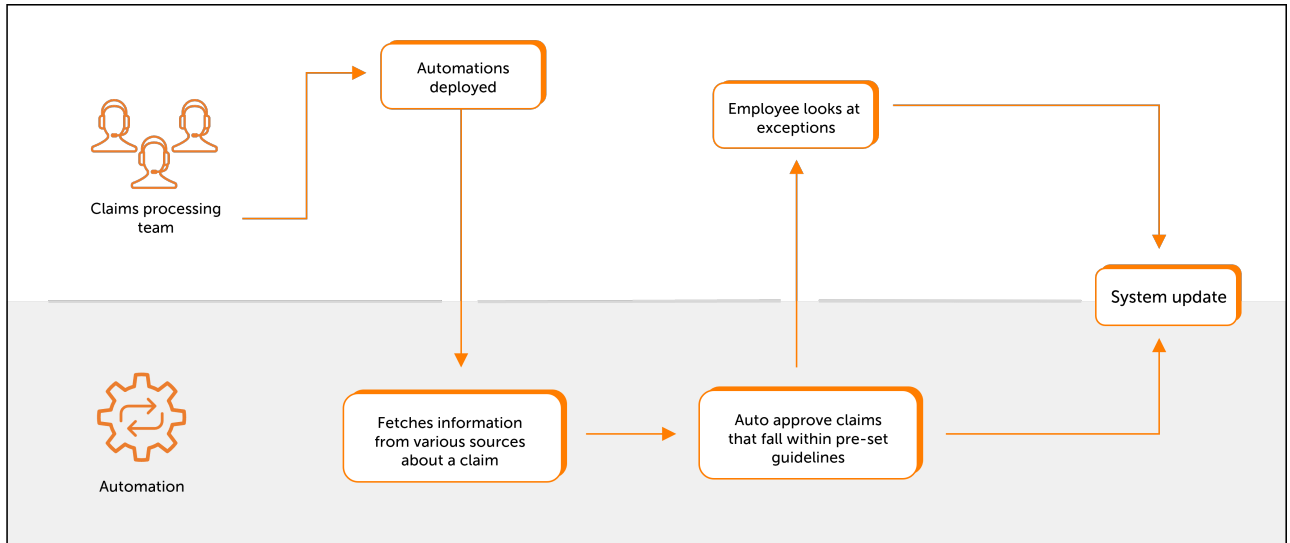

Attended automations are initiated and concluded in a single user session. Only one active automation can run at a time. Attended automations usually require human intervention to finish automations, by either inputting data into forms or performing data verification.

For more information, see [Attended and unattended automation](#) on page 3143 | [Using Automation Co-Pilot for Business Users on desktop](#) on page 3206.

Example scenario

Let us understand the scaling of automation with the help of an example scenario. Consider an insurance company that is looking to automate some of its repetitive business processes and improve efficiency. For this example, we will consider claims processing.

The following image illustrates this example scenario.

Company name

Acme Insurance

Contact center use case

Claims processing

Concurrent users

1000 agents

Shifts

3 shifts of 8 hours duration

Contact center production environment

- Users are assigned attended Bot Runner licenses
- Agents use Automation Co-Pilot to access automations
- Agents trigger automation deployment
- Agents pause, stop, and resume automations
- Agents access and control queued automations

Daily operations

- The contact center receives a high volume of incoming calls from policyholders reporting insurance claims. These claims can range from automotive accidents to property damage, and the contact center agents handle the initial intake process.
- 1000 agents log in and access the Control Room at the same time.
- The agents run automations on their local devices where user interaction is required.
- User authentication is the first step. Once they have authenticated, agents can access automations available to them.
- When a policyholder calls in to report a claim, the agents go through the automated claims processing workflow, following a step-by-step process with prompts for required actions.

- Agents access automations available to them and run automations to perform their tasks.
- When an automation is complete, agents either move on to next automation or rerun the same automation depending on the next assigned call, activity, or ticket.
- This process continues with the agents running a set of automations repeatedly to address customer cases.

Based on the number of concurrent users, review the infrastructure recommendations for your automation requirements in Acme insurance company.

Maximum number of concurrent users	Number of nodes	Configuration	Database server specifications (minimum)
100	Single node	16 CPUs 32-GB RAM	8 CPUs and 16-GB RAM with SSD hard drive. For example, AWS instance type m5d.2xlarge.
750	3-node cluster	16 CPUs 32-GB RAM	
1500	5-node cluster	16 CPUs 32-GB RAM	

Unattended automation capacity planning

Plan your capacity and performance for Control Room On-Premises, understand the requirements, limits, and defaults that determine the number of simultaneous bots, user sessions, and processing rates for unattended automations.

Overview

Review the information on the maximum number of concurrent bot deployments and executions for On-Premises deployment.

The entity count in the following list provides information only about the maximum number of entities that the Control Room can support irrespective of the machine resources. Deploying additional machine resources does not increase the entity count.

Control Room supports either of the following, for maximum number of concurrent bot deployments and executions:

- 1000 concurrent bot deployments and executions on Bot Runner sessions (typically in a production Control Room)
- 700 concurrent bot deployments and executions on Bot Creator sessions (typically in a development Control Room)

Entity Type	Count
Users	10,000*
Roles	5000*

Entity Type	Count
Schedules	1500
Audit entries	10,000,000*
Lockers	100
Credentials	5000
Repository files (Including all file types in the Control Room Public workspace)	25,000*
Note: Repository files include dependent files that you check in to the Public workspace (visible on the UI) such as Task Bots, .atmx, .dll, .txt, .csv, and so on, and the related files from the database (not visible on the UI). For example, .png files generated after an automation is recorded are stored in the database and are included in the repository files.	
Repository folders	9000*
Note: Applies to the public workspace.	
Queues	30
Device pools	10
Work Items	30 million

* Applicable from Automation 360 v.21 and later.

Concurrent bot deployments and executions

Control Room supports up to 1000 concurrent bot deployments and executions across the Control Room cluster. These 1000 bots can be a combination of the same or different bots.

Note: If you use different bots, because of the load, the compiler slows down the execution for the first-time deployment. For subsequent deployments, bot execution process might accelerate.

Control Room edition and configuration	Number of Run as users
One instance of On-Premises	Maximum 1000
Three instances of On-Premises with High Availability (HA) configuration	Maximum 1000

The bot deployment depends on the network quality and the size of data that needs to be transferred from Control Room to Bot Agent.

Therefore, in the above scenario when the network connectivity speed is increased for the three Control Room instances, the network throughput improves, so the completion time will become shorter but the maximum accepted concurrent bot deployments will remain the same.

Bot concurrent schedules

Scheduling considerations when running bots repeatedly.

When configuring bots to run repeatedly on a schedule it is important to make sure that the time between runs does not drop below the total time for deployment and execution of the bot. Otherwise, sequential executions of the bot might overlap leading to unexpected behavior.

For example if it takes two (2) minutes to run a bot, do not schedule the bot to run every one (1) minute. The previous run cannot complete before the next run begins.

With the reference specification, it is possible to successfully configure concurrent schedules.

Activity	Schedule data
Concurrent schedules	100
Run as user per schedule	10
Total concurrent bots	1000

Control Room server requirements

The Control Room is deployed on servers in data centers. The minimum hardware requirements for Control Room include server type, machine type, processor, RAM, disk storage, and network requirements.

Note: Automation Anywhere does not provide any monitoring functions for repository, such disk space usage, memory, or other alert mechanisms related to repository. There are commercial tools available from other third-party independent software vendors (ISV) who provide such tools.

The installation wizard requires the following:

- IP addresses: Identify all the nodes (servers) IP addresses in the data center cluster before installation. You provide these IP addresses during Control Room installation.
- Access hardware: To enable viewing the Automation Anywhere interface, provide:
 - keyboard
 - mouse or other pointing device
 - monitor with 1366 x 768 or higher resolution

Note: For IQ Bot server requirements, see [IQ Bot hardware and software requirements](#) .

Control Room must be installed on a 64-bit, server-level machine, and there can only be one instance of it on the machine. All previous Control Room versions must first be removed from the server machine before you begin the installation.

The following are server requirements for Windows and Linux.

Component server	Processor	RAM	Storage (free disk space)	Network
Control Room Servers	8 core Intel Xeon Processor or equivalent 64-bit Processor with 2.5 GHz plus speed	16 GB	500 GB	1 GbE <ul style="list-style-type: none"> • IPv4 • IPv6

Memory utilization: A Control Room configured with the recommended 16 GB RAM utilizes 80 to 90 percent memory in idle condition and up to 95 percent memory under load, for example, concurrent bot deployments.

Tip: We recommend that you configure the Control Room network bandwidth to be above 1 GbE for all inter-cluster communication between or among the following:

- Control Room and database
- All Control Room nodes
- Control Room and Elasticsearch nodes
- Control Room and storage systems
- Database nodes for high availability (HA) and disaster recovery (DR) configuration

Database requirements

View the list of supported databases, database server type, version, hardware, and operating system requirements, and database backup and recovery requirements.

Automation Anywhere installation creates a database to store bot data and metadata for the analytics dashboards.

Note: Automation Anywhere does not provide any monitoring functions for database activities, such as disk space usage, memory, or other alert mechanisms related to databases. There are commercial tools available from database vendors and other third-party independent software vendors (ISV) who provide such tools.

For latest updates, see [Microsoft SQL Server Hardware and Software requirements](#).

Database server hardware requirements

Component server	Processor	RAM	Storage	Network
Database server	4-core Intel Xeon Processor with 2.5 GHz plus speed	8 GB	500 GB	1 GbE

Note: If you are hosting the Control Room databases along with other application databases, ensure that the hardware resources are increased proportionately.

Database server version and operating system requirements

Database type	Database version	Database edition	Installed OS	Supported platforms	Configuration requirement
Microsoft SQL Server database	2019 2017 2016 2014	Enterprise Express Standard Developer (for 2019)	Windows Server 2008 R2 Standard or later Linux CentOS 7.7 and 7.9 Red Hat Enterprise Linux 7.7 and 7.9	Amazon Web Services Relational Database Service (RDS)	Installed and configured. Only option for Express installations. Enable protocols for Named Pipes and TCP/IP.

Database type	Database version	Database edition	Installed OS	Supported platforms	Configuration requirement
Oracle Server database	Oracle 19c	<ul style="list-style-type: none"> Standard Enterprise 	Windows Server 2012 R2 or later Linux CentOS 7.7 and 7.9 Red Hat Enterprise Linux 7.7 and 7.9	Amazon Web Services Relational Database Service (RDS)	Installed and configured with <code>max_string_size</code> parameter set to EXTENDED. Supported only on non-container Database. Available only through an On-Premises custom installation.

- All database versions support all certified operating systems.
- We have certified Amazon RDS for SQL Server and Azure SQL single database for PaaS deployment.

Note that for Azure SQL, CPU or memory requirements are not applicable because it is a scalable and high performance Cloud database built on similar lines with SQL Server and certified for PaaS deployment in Automation 360.

- We recommend hosting the databases on separate hosts to take into account failover scenarios.
- We recommend Enterprise or Standard editions of Microsoft SQL Server database for production use and to ensure business continuity with HA and DR deployments.

You can configure the Express edition of Microsoft SQL Server for Automation 360 testing and proof of concept (POC) purposes based on considerations such as limit on data size, SQL agent unavailability, and DR capabilities.

For more information about scale limits, see [Microsoft SQL Server Express edition scale limits](#).

- Transparent Data Encryption (TDE) is a function of Microsoft SQL Server database. Additional configurations are not required on the Control Room as the TDE supportability is managed by Microsoft. For more information, see [Transparent data encryption \(TDE\)](#) and [Transparent data encryption for SQL Database](#).

Required database information for Automation Anywhere installation

When you install Automation Anywhere, you are prompted to provide information specific to the database type you are using. The following table summarizes the required information.

Microsoft SQL Server database	
Required information	Description
Database (SQL Server) authentication <hr/> Note: Linux installations use this authentication method <hr/>	Provide credentials for a Microsoft SQL Server user who has permission to connect to the database. Use only supported characters for the authentication user name and password. See Supported special characters on page 1161. Do not use semicolons (;) in the database password. Linux example: SQL Database server Login ID: sa SQL Database password: Automation123 sa user authentication is mandatory.
Database names	Database names cannot be blank, have spaces, or include a percent (%). Restrict the names to alphanumeric, period (.), hyphen (-), and underscore (_). Default name: Automation360-Database
Database port	Default: 1433 Connection to this port is mandatory.
Secure connection (optional) and certificate	Provide a CA certificate. Ensure the certificate host name and database connection are the same.
Service credentials	Provide the user with <code>db_datareader</code> , <code>db_datawriter</code> , and <code>db_ddladmin</code> permissions to create databases during installation. The preferred method is to use the Domain user account.
Windows authentication	The Windows credentials of the user logged in to the device to connect to the database server.
Database collation	Use the default database collation: <code>SQL_Latin1_General_CP1_CI_AS</code>

For Oracle Server database information, see [Installing Control Room using custom mode for Oracle installation](#) on page 1211.

Before installing Automation 360, ensure that you have configured additional firewall settings, verified the connection to the default port and an SQL query with SA user works as expected.

Related concepts

[Installing Control Room on Amazon Web Services](#) on page 1216

Log in to an Amazon Web Services (AWS) server instance as Administrator. Then, download and start the Control Room installer and select **Custom** mode.

[Installing Control Room on Microsoft Azure](#) on page 1222

Installing Control Room on Microsoft Azure begins in the Azure environment and ends with configurations in the Control Room.

Related tasks

[Installing Control Room on Linux](#) on page 1237

You start installing the Automation Anywhere Control Room in the Linux environment and complete the installation in the Control Room.

[Configure default database port](#) on page 1201

Configure and enable the TCP/IP in the SQL database server to use the default port 1433 when you install the Control Room.

Related reference

[Ports, protocols, and firewall requirements](#) on page 1147

View the default and configurable firewall, port, and protocol requirements for Automation Anywhere deployment. View the default ports and protocols that are required to be allowed on customer's firewall for Automation Anywhere deployment. The default ports that are used for HTTP/HTTPS are configurable.

Working with SQL Servers

Configure Microsoft SQL Servers before setting up the Control Room database.

Configuring SQL Server Settings

SQL Server settings can be configured in the SQL Server Configuration Manager.

1. Enable protocols for Named Pipes and TCP/IP in **SQL Server Network Configuration > Protocols for MSSQLSERVER**.
2. Double-click TCP/IP to open the properties window.
3. Input the default or custom port number for `IP11` in the IP Addresses tab of the TCP/IP Properties window.
The default port number is 1433.
4. Click **OK**.
5. Restart the MSSQLSERVICE for the updates to take effect.

Note: Ensure the Control Room database uses `SQL_Latin1_General_CP1_CI_AS` as the default database collation.

Database and Services Matrix

See [Database requirements](#) on page 1132 for a list of supported Microsoft SQL Server versions.

Service Credentials	Windows Authentication	SQL Authentication
Local System Account	<ul style="list-style-type: none"> Current logged in user account is used to create: <ul style="list-style-type: none"> Tables Installer gives db_owner permission to NT AUTHORITY\SYSTEM account. 	SQL User account is used to create: <ul style="list-style-type: none"> Databases Tables
Domain User Account	<ul style="list-style-type: none"> Current logged in user account is used to create database. Domain user account is used to create tables. Installer gives db_owner permission to domain user account. 	SQL User account is used to create: <ul style="list-style-type: none"> Databases Tables
Service User Account		For Microsoft Azure installations, the service account user needs to have read/write access to the remote Microsoft Azure repository share path.

View the default and configurable firewall, port, and protocol requirements for Automation Anywhere deployment. View the default ports and protocols that are required to be allowed on customer's firewall for Automation Anywhere deployment. The default ports that are used for HTTP/HTTPS are configurable.

Working with Azure SQL PaaS

Using PaaS SQL database with Azure requires configuration from the Azure instance.

Configure the Azure instance before you install Automation 360.

1. Log in to your Azure account.
2. Navigate to the **Azure SQL** option.
3. Create a database based on your custom requirements.
4. Enable the firewall option.
5. Add the IP address to safe recipients list for accessing the database.

Install Automation 360 and point the database server to this instance of the SQL database. See [Customize Control Room installation on Microsoft Azure](#) on page 1226.

Operating system, environment, and platform supported for Control Room

Automation 360 can be hosted on AWS, Microsoft Azure, Google Cloud Platform, IBM, and any public, private, or hybrid cloud service that meets the Control Room and Bot Agent hardware and software requirements.

Automation 360 is currently certified on AWS, Google Cloud Platform, and Microsoft Azure. For Bot Agent operating system and platform compatibility, see the Bot Agent compatibility matrices in [Bot Agent compatibility](#) on page 1274.

Automation 360 supports the 64-bit version of the Microsoft operating system.

Recommendation: Enable Desktop Experience when using the server or client operating system.

Note: When you install the Control Room on Microsoft Windows Server 2012 and 2012 R2 Datacenter, a warning message indicating installation prerequisites is displayed. However, you can still proceed with the installation without any issues.

Note: Before you install the Control Room for On-Premises, ensure that you have installed the Visual C++ Redistributable for Visual Studio 2015 package on the Control Room host machine. For more information about the package, see [Visual C++ Redistributable for Visual Studio 2015](#).

The following sections list the environment and deployment types with the release or build number applicable to each supported operating system:

Microsoft Windows Server 2012 and 2012 R2 Datacenter

Environment	Automation 360 build (version)
Amazon Web Services Elastic Compute Cloud (EC2)	<ul style="list-style-type: none"> On-Premises: Build 4105 (A2019.12) or later Cloud: Build 4111 (A2019.12) or later
Microsoft Azure VM	<ul style="list-style-type: none"> On-Premises: Build 4105 (A2019.12) or later Cloud: Build 4111 (A2019.12) or later
Google Compute Engine	On-Premises: Build 7103 (A2019.17) or later

Microsoft Windows Server 2016 Standard and Datacenter

Microsoft Windows Server 2016 is the minimum recommended operating system.

Environment	Deployment type with release and build
Microsoft Azure VM	<ul style="list-style-type: none"> On-Premises: Build 2079 or later Cloud: Build 2079 or later
Google Compute Engine	On-Premises: Build 7103 (A2019.17) or later
VMware VMs on ESXi 6.x	<ul style="list-style-type: none"> On-Premises: Build 7103 (A2019.17) or later Cloud: Build 2079 or later

Microsoft Windows Server 2019 Standard and Datacenter

Environment	Deployment type with release and build
Amazon Web Services Elastic Compute Cloud (EC2)	<ul style="list-style-type: none"> On-Premises: Build 1089 or later Cloud: Build 1082 or later
Google Compute Engine	On-Premises: Build 7103 (A2019.17) or later
Microsoft Azure VM	<ul style="list-style-type: none"> On-Premises: Build 2079 or later Cloud: Build 2079 or later

Microsoft Windows 10

Environment	Deployment type with release and build
VMware VMs on ESXi 6.x	<ul style="list-style-type: none"> On-Premises: Build 7103 (A2019.17) or later Cloud: Build 2079 or later

Linux CentOS

Environment	Deployment type with release and build
Amazon Web Services Elastic Compute Cloud (EC2)	<p>For Linux CentOS 7.7:</p> <ul style="list-style-type: none"> • On-Premises: From Build 2545 or later • Cloud: From Build 2545 or later <p>For Linux CentOS 7.9:</p> <ul style="list-style-type: none"> • On-Premises: From Build 9664 or later • Cloud: From Build 9664 or later

Red Hat Enterprise Linux

Environment	Deployment type with release and build
Amazon Web Services Elastic Compute Cloud (EC2)	<p>For Red Hat Enterprise Linux 7.7:</p> <ul style="list-style-type: none"> • On-Premises: From Build 2545 or later • Cloud: From Build 2545 or later <p>For Red Hat Enterprise Linux 7.9:</p> <ul style="list-style-type: none"> • On-Premises: From Build 9664 or later • Cloud: From Build 9664 or later

Amazon Linux 2

Environment	Deployment type with release and build

Related reference

[Bot Agent compatibility](#) on page 1274

Before you install the Bot Agent, ensure that you review the compatible Automation 360 builds.

[Control Room server requirements](#) on page 1131

The Control Room is deployed on servers in data centers. The minimum hardware requirements for Control Room include server type, machine type, processor, RAM, disk storage, and network requirements.

Supported cloud platforms

Review the supported cloud platforms for various Automation 360 features.

Automation 360 feature	Google Cloud Platform	AWS	Microsoft Azure
Control Room	Yes	Yes	Yes
Bot Agent	Yes	Yes	Yes
Bot Insight	Yes	Yes	Yes
IQ Bot	Yes	Yes	Yes
Discovery Bot	Yes	Yes	Yes
AI Sense Recorder	Yes	Yes	Yes

Credential requirements

Login credentials are required at different stages of Automation 360 deployment and use. Credentials are required for installation and data center servers, access to Automation 360 components, and to run tools in bots.

Access point	Task	Type
Data center servers	Install Control Room.	User on the hosting server: <ul style="list-style-type: none"> Windows - system administrator Linux - superuser sudo, root
Data center servers	Manage (run, stop, restart) Control Room.	Administrator and Logon as Service permission for Windows services and the Domain or the VM technical user account.
Bot Agent devices	Install, setup, or update Bot Agent.	Administrator permission on the device.

Access point	Task	Type
Bot Agent devices	Start or stop Bot Agent service.	Administrator permission on the device. Write permission on Bot Agent device system paths: C:\ProgramData C:\Windows\System32\config\systemprofile C:\Users\ <loggedInUser>\AppData\Local\AutomationAnywhere
Local devices	Register device.	Windows login to open a browser and login into the Control Room and register the local device. Administrator permission not required.
Local devices	Download bots to local device. Run new bots or existing (downloaded) bots.	Windows login. Administrator permission not required.
Automation 360 login	Perform specific tasks, such as create a bot or run a bot.	License and role based permissions. Bot Creator and Bot Runner users do not require administrator privileges.
Bot task	Used by bots to perform bot tasks.	Credential Vault stores securely created credentials. Read permission on bot machine system path: C:\Windows\System32\config\systemprofile C:\Users\ <loggedInUser>\AppData\Local\AutomationAnywhere
Automation Anywhere Service	Run all Windows services created by Automation 360.	Local system account user or Domain user account The Interactive logon rights should be enabled for the service account.

Access point	Task	Type
Remote Desktop Protocol (RDP) to a Windows machine	Run bots on Bot Creators and unattended Bot Runners if RDP connection exists for the deployed user.	Administrator permission is not required. RDP access for the bot is not required. View the Control Room Activity page.
Remote Desktop Protocol (RDP) to a server OS or a hosted VM	Run bots on Bot Creators and unattended Bot Runners if RDP connection exists for the deployed user.	Administrator permission required. RDP access for the bot is required. For confirmation, view the Control Room Activity page.

Data center server credentials

Data center server credentials for Automation Anywhere hosting servers and integrated product servers are required to deploy Automation 360.

To install and deploy Automation 360 requires that users log in to the hosting servers. These users must have permissions to install and run Automation 360 components on the servers. Permissions levels need to be assigned to the user on selected data center applications and servers.

Automation 360 login

Log in toAutomation 360 requires a username and password. These credentials are linked to the machine you use to access the Automation 360 components. Your credentials are assigned roles that give you permission to perform specific tasks, such as create a bot or run a bot.

Bot task

As an automation expert, Credential Vault provisions you to securely create and store your credentials. This ensures that your credentials can be used in bots without compromising security with safe deployment of tasks. Any authorized user can create credentials.

Windows services

The Windows service credentials include a user name and password. The user specified needs to be:

- A member of the local system administrator group.
- Have permission to manage services, including Automation Anywhere services.

- If you use Windows authentication to connect to the SQL database, ensure you grant the db_owner permission to the service credential user.

The service credentials are used to create database tables and allow the Control Room processes to access the database and repository.

The service credential choices are:

User role	Bot program folder	Bot data folder	Log folders or files	User type
Install user	<ul style="list-style-type: none"> • Read • Write • Delete 	<ul style="list-style-type: none"> • Read • Write • Delete 	<ul style="list-style-type: none"> • Read • Write • Delete 	<ul style="list-style-type: none"> • Admin • Non-Admin
Service run user				<ul style="list-style-type: none"> • Local system account • Domain user account
Bot deployment user				<ul style="list-style-type: none"> • Local system account • Domain user account

The following are the different user types:

- Admin** A user who has administrator privileges.
- Non-Admin** A user who does not have administrator privileges.
- Local system account** The logged-on user performing the installation (default).
- Domain user account** A user that is not the local system account user.

Reasons and requirements for using a domain account user include:

- Use the Windows domain credentials
- PowerShell script restrictions

Enter credentials valid for running Automation Anywhere services.

Specify a user with permissions to launch PowerShell scripts, who is not a Windows domain user, or database table creation can fail.

[Install Bot Agent and register device](#) on page 1288

Load balancer requirements

View the load balancer requirements for Automation 360 installation. This includes load balancer minimum requirements, and both TCP and HTTPS layer load balancing requirements.

Load balancer minimum requirements

As a best practice, ensure the load balancer:

- (Required) Adheres to the Domain Name System (DNS) guidelines when configuring the domain and subdomain URLs in load balancer.
[Naming guidelines for Control Room URLs](#) on page 1311
- (Required) Supports WebSocket protocol (RFC 6455)
- (Preferred) Uses round-robin host selection and is not configured to use persistent (sticky) sessions.
- (Preferred) Uses the appropriate TLS security layer:
 - TCP (layer 4) load balancing
 - HTTPS (layer 7) load balancing

With a Nginx load balancer, set HTTPS termination at nodes by changing `http://Backend` to `https://Backend`.

- (Preferred) Has idle timeout set to 120 seconds.

The timeout value depends on the process time of various actions in the Control Room such as the time required to check in and check out bots, import bots, and download bot dependencies.

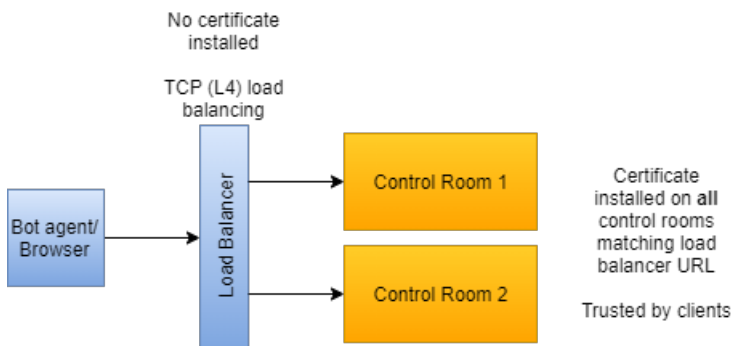

If the idle timeout is less than the Control Room processing time, a browser request can time out. For example, if the configured idle timeout is not sufficient to complete a bot check-in action, you will have to refresh your browser to validate whether the bot check-in action is successful or not.

Load balancer health check parameters

The load balancer health check parameters depend on various factors such as the type of load balancer used, network latency, and user interface responsiveness within and outside the load balancer.

TCP (Layer 4) Load Balancing

When TCP is applied at layer 4 with the load balancer, the certificate is installed on every Control Room corresponding to the load balancer URL.

In the image, Control Room components are shown in orange and other components are shown in blue.

Pros	End-to-end encryption without the possibility of intercept at the load balancer.
	Single certificate required.
Cons	If audit logging is required, the load balancer cannot report the requests from clients.
	Does not use TLS hardware offloading, even if the load balancer supports it.

HTTPS (Layer 7) Load balancing

When HTTPS is applied at layer 7 with the load balancer, the certificate corresponding to the load balancer URL is applied through the load balancer. The Control Room trusts the certificates received from the load balancer.

Pros	<p>Allows request logging, when supported by the load balancer.</p> <p>Reduces load from TLS handshake through hardware offloading, when supported by the load balancer.</p>
Cons	<p>Certificates must be managed both on the load balancer and on the control room nodes</p> <p>Possible interception of data at the load balancer hardware level, because TLS session is not end-to-end.</p>

For Automation 360 users on release Build 7560 and later, if SSL offloading is applied at load balancer level for communication between load balancer and application nodes, the `traefik.toml` file in application server needs to be re-configured.

See [SSL offloading for Automation 360 v.18 and later \(A-people login required\) | A360 | Device shows disconnected after registration with Load Balancer URL \(A-People login required\)](#)

Ports, protocols, and firewall requirements

View the default and configurable firewall, port, and protocol requirements for Automation Anywhere deployment. View the default ports and protocols that are required to be allowed on customer's firewall for Automation Anywhere deployment. The default ports that are used for HTTP/HTTPS are configurable.

- Add Automation Anywhere to the Windows Firewall exception list. Follow the steps as directed by Microsoft for your Windows version.
- Allow communication from Automation Anywhere by adding it to the allowed list in firewall. Follow the steps in the firewall documentation of the operating system.
- Configure the firewall rules and add the Control Room URLs to safe recipients list.
- Configure the firewall rules to allow communication on the server or the firewall appliances that are configured in between, or add the Control Room URLs to the safe recipients list in firewall or end device browsers.

Refer to the following tables for lists of required ports and their use.

Control Room

Important: It is critical that communication between the Control Room servers is properly protected. The communication between Control Room servers contain security sensitive information. Therefore, in addition to allowing all the required communication directly between the Control Room cluster servers, you should block all the inbound traffic from hosts except for HTTP/HTTPS ports to communicate with the Control Room servers.

Protocol	Port	Usage	Clients
HTTP	80	HTTP	Web browsers
HTTPS	443	HTTPS and Web Socket	Web browsers
TCP/UDP	1234	ActiveMQ	Automation 360 Services
TCP	5672	Cluster Messaging	Automation 360 Services
TCP	47100 - 47200	Cluster Messaging and Caching	Automation 360 Services
TCP	47500 - 47598	Cluster Messaging and Caching	Automation 360 Services
HTTP	47599	Elasticsearch	Automation 360 Services
TCP	47600	Elasticsearch	Automation 360 Services
HTTP	4567	Control Room	Automation 360 Services
HTTP	4569 - 4571	Automation Co-Pilot for Business Users	Automation 360 Services
TCP	5800 - 5900	Automation Co-Pilot for Business Users	Automation 360 Services

Internal ports for localhost services

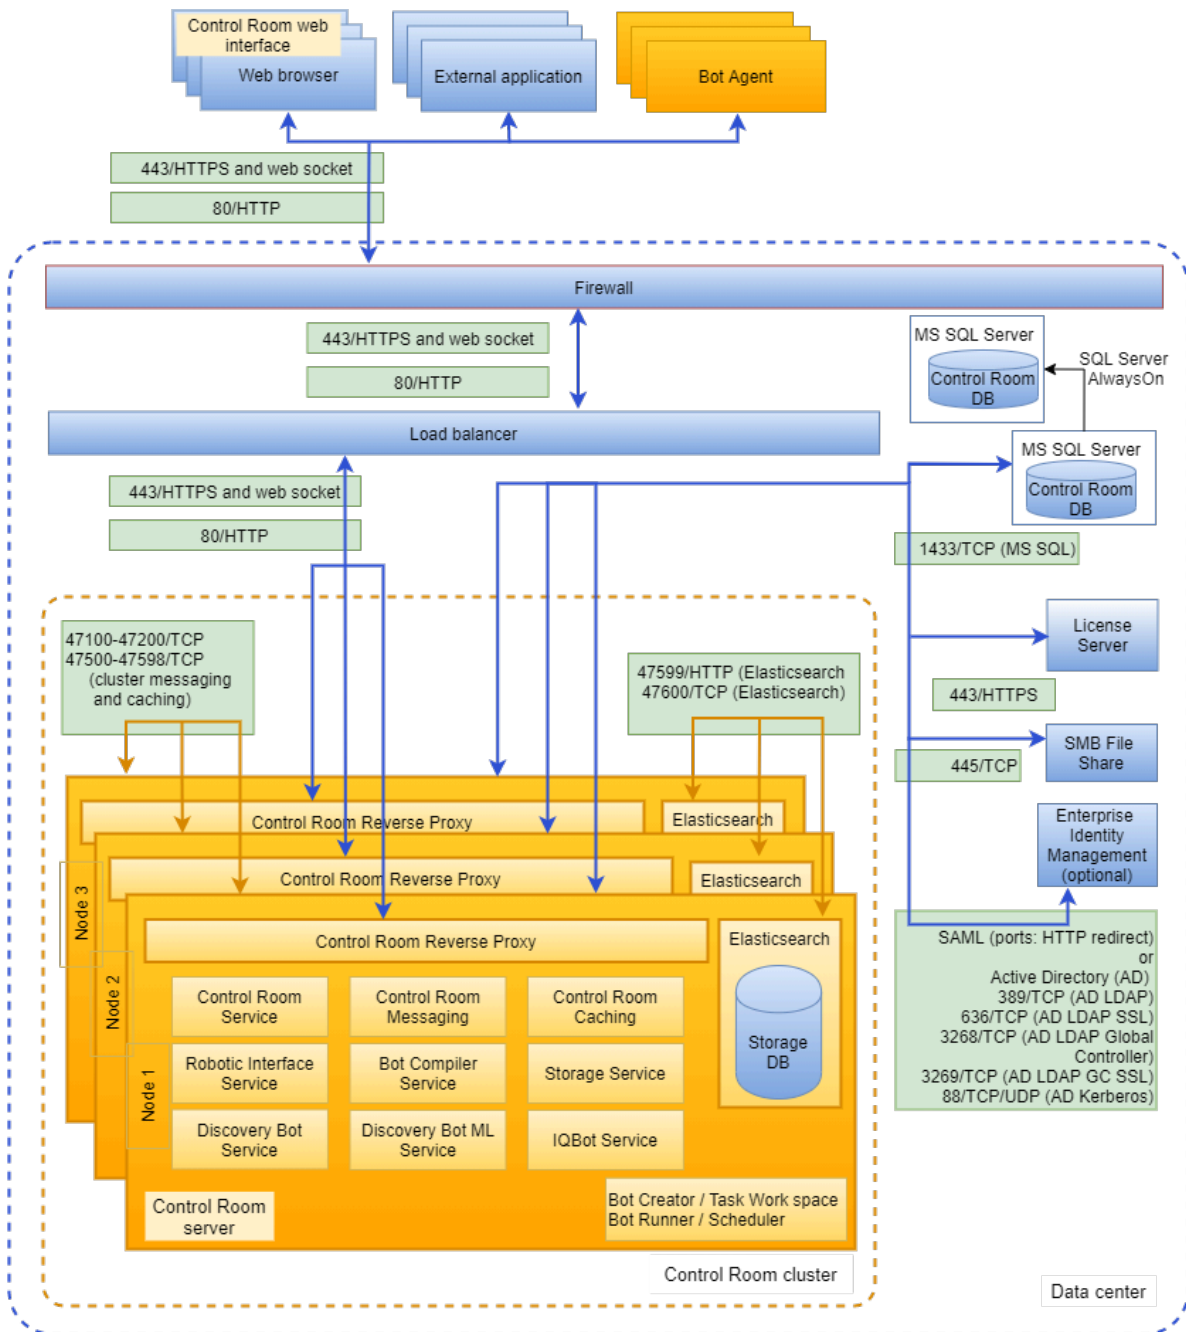

Note that the following internal ports are used for Automation 360 localhost services:

Port	Protocol
4567 - 4571	HTTPS REST
5678 - 5708	gRPC

Data center ports and protocols for Automation 360

Configure each of the data center components that are required for Control Room integration. In the image below, Control Room components are shown in orange and data center components provided by your organization are shown in blue.

Note: The arrows in the image indicates the combination of communicating hosts and does not indicate the direction of the establishing the connection.

Default ports are listed for illustration purposes. Some ports can have alternative port numbers specified during Control Room installation. Some port numbers can be modified after Control Room installation. Active Directory ports are listed as an example of an enterprise identity management.

After the HTTP/HTTPS connection is established between the Control Room and Bot Agent, the communication will be bidirectional (inbound and outbound) using the WebSocket .

All three objects, the web browser, Bot Agent, and external applications communicate directly with the Control Room. A user logs into the Control Room through a browser, to do tasks, such as creating users, or bot related tasks, such as creating, deploying, and scheduling bots. Bot Agent establishes a connection with the Control Room on registration and keeps it alive in order to receive bot deployments from the Control Room. External applications talk to the Control Room directly through the Control Room APIs to perform tasks such as creating users or running bots.

Connection from	Connection to	Protocol	Port	Usage
Bot Agent	Load balancer or firewall, or both	HTTP and WebSocket	80 (TCP) Default	HTTP and WebSocket
Bot Agent	Load balancer or firewall, or both	HTTP and WebSocket	443 (TCP)	HTTP and WebSocket
Web Browser	Load balancer or firewall, or both	HTTP and WebSocket	80 (TCP)	HTTP and WebSocket
Web Browser	Load balancer or firewall, or both	HTTP and WebSocket	443 (TCP)	HTTP and WebSocket
Control Room services	Enterprise identity management (for example, Active Directory)	LDAP	389 (TCP)	User authentication
		LDAP SSL	636 (TCP)	User authentication
		LDAP global controller	3268 (TCP)	User authentication
		LDAP global controller SSL	3269 (TCP)	User authentication
		Kerberos	88 (TCP and UDP)	User authentication
Control Room services	File share with Microsoft Server Message Block (SMB)	SMB 2.0 or SMB 3.0	445 (TCP)	Repository file share access
Control Room services	Microsoft SQL database server	SQL	1433 (TCP) Configurable	Database access

Microsoft Azure supported data center elements

Data center object	Supported version	Configuration
Control Room operating system	<ul style="list-style-type: none"> Microsoft Windows Server 2012 and 2012 R2 Datacenter Microsoft Windows Server 2016 Standard and Datacenter Microsoft Windows Server 2019 Standard and Datacenter 	IaaS
Identity management: Azure	Azure Active Directory	<ul style="list-style-type: none"> IDaaS Windows 2016 for IaaS
	Azure File Share with Server Message Block 2.0 and 3.0 (SMB) protocol	PaaS
	Azure Load Balancer (Not Application Gateway)	PaaS
	Azure SQL Database with single database (Microsoft SQL Azure (RTM) - 12.0.2000.8)	PaaS

Microsoft Azure security policy recommended ports

Data center object	Port	Protocol
Control Room	<ul style="list-style-type: none"> 80 443 	HTTP/HTTPS
LDAP	<ul style="list-style-type: none"> 3268 3269 	TCP (LDAPS - Secure TCP)
email SMTP	587	SMTP

For Cloud deployment, to ensure secure access to Automation 360 online services, add the service URL list to the safe recipients or trusted list.

Control Room repository requirements

The repository location is configured in the Control Room after installation. All your automations are stored in this repository.

Before you configure the Control Room server repository, review the repository requirements for deploying Automation 360 On-Premises.

- For a single node Control Room deployment, the repository can be a local folder.
For example, `C:\ProgramData\AutomationAnywhere\Server Files`.
- For a multiple-node Control Room deployment, the repository should be accessible from all Control Room nodes in the cluster over the network.

You can create a file share and access the repository from a local machine. For example, `\<fileserver>\AutomationAnywhere\Server Files`.

The Control Room repository contains server files, such as packages and resource files.

Microsoft Windows: Control Room repository requirements

Review the following requirements for configuring the repository location of cluster nodes:

- The Control Room uses its service account to connect to the repository, you must have read/write permission to the repository location.
- The repository path must meet the Universal Naming Convention (UNC) requirements.

For details, see [UNC Path](#).

- The repository size depends on the user data.

For details about storage requirements, see [Control Room server requirements](#) on page 1131. For supported file and folder size, see [Capacity and performance planning](#) on page 1126.

For repository migration requirements, contact your Automation Anywhere representative.

- You can configure the repository using Network File System (NFS) protocols, such as Microsoft Windows, Microsoft Azure Files, and Amazon Elastic File System (EFS).
- Network-attached storage (NAS) uses Server Message Block version 3 (SMBv3) for supported platforms: Microsoft Windows, Amazon Web Services, Microsoft Azure, Google Cloud Platform, and Linux.

Linux: Control Room configuration using the default repository path

- Ensure that the default path exists in the system and use this default path during the Linux installation.

After the installation, you can modify the repository path or copy files from one directory to another. Verify that all copied files and folders have the same permissions as before the installation.

- Ensure that permission for the path is `crkernel:controlroom`.
- If there is no permission, add the following permission.

```
sudo chmod -R 775 /opt/automationanywhere/enterprise/appdata
```

- Run the following command to allow users access to the `crkernel:controlroom` path:

```
sudo chown -R crkernel:controlroom /opt/automationanywhere/enterprise/appdata
```

Linux: Control Room configuration with a user-defined repository path

- Ensure that the default path exists in the system.
- Ensure that permission for the path is `crkernel:controlroom`.
- If there is no permission, add the following permission.

```
sudo chmod -R 775 /CRRepo/AutomationAnywhere
```

- Run the command to allow users access the `crkernel:controlroom` path:

```
sudo chown -R crkernel:controlroom /CRRepo/AutomationAnywhere
```

The `crkernel:controlroom` user is created after the Control Room installation, so set the user permission to a specified repository before performing the final Control Room configuration.

Browser requirements for Automation Workspace

Access the Automation Workspace interface from a browser. After you have installed and enabled extensions in the browser, perform several tasks through the Automation Workspace interface based on your user role and automation requirements.

Important:

As of Automation 360 v.25 release in June 2022, Microsoft Internet Explorer 11 reached end-of-life (EOL) and Control Room is no longer supported on the browser.

The impact on your automation depends on the operating system that is currently used for your bot deployments. See the following table for details.

Microsoft operating system	Automation 360
Windows 10 Semi-Annual Channel	Upgrade bots to use one of the other compatible browsers. Supported browsers
All other supported operating systems Bot Agent compatibility on page 1274	No action required.

For more information, see [Microsoft Internet Explorer 11 EOL FAQ](#) on page 1044.

Supported browsers

You can use a browser to perform a range of tasks from automation creation to automation management, such as the following:

- Control Room activities, such as creating users and roles, managing devices, configuring settings, creating and deploying bots, and maintaining audit logs.
- User activities, such as Bot Agent installation and device registration.
- Automation Co-Pilot for Business Users activities, such as creating users and roles and creating a human and bot tasks in the process editor.

Browser support for Control Room and Bot Agent and Automation Co-Pilot for Business Users

The following table shows supported browsers for Control Room activities, Bot Agent installation, Automation Co-Pilot for Business Users, and device registration:

Activity	Google Chrome (version 57 or later)	Internet Explorer (version 11)	Microsoft Edge based on Chromium (version 93.0.96 or later)	Mozilla Firefox (version 80 or later)	Safari (version 15.3 or later)
Control Room activities	Yes	No	Yes	No	No
Bot Agent installation and device registration	Yes ¹	No	Yes ³	Yes	No
Automation Anywhere remote agent for Citrix	Yes ²	Yes	No	No	No
Automation Anywhere Co-Pilot for Business Users	Yes	No	Yes	No	Yes
Bot Insight	Yes	No	Yes	Yes	No

1. If you have trouble registering your device from a browser, run the Bot Agent diagnostic utility.
For details, see [Perform Bot Agent diagnostic checks](#) on page 1306
2. Automation Anywhere remote agent for Citrix supports Google Chrome (XenApp) automation with Automation Anywhere extension (version 11.2.0.0).
[Chrome web store](#)
3. If you are using Microsoft Edge based on Chromium to register your Bot Agent and your device is unable to connect to the

Control Room due to proxy settings, add the authentication details.

Browser support for recording automation

The following table shows supported browsers for recording automation:

Activity	Google Chrome (version 57 or later)	Internet Explorer (version 11)	Microsoft Edge based on Chromium (version 79 or later)	Mozilla Firefox (version 80 or later)	Microsoft Edge (Chromium) with Internet Explorer compatibility (version 93.0.961.52 or later)
Record automation	Yes ¹	Yes	Yes	Yes	Yes ²
	<ul style="list-style-type: none"> Extensions must be enabled for recording. Supported from v.10. 	<ul style="list-style-type: none"> Extensions must be enabled for recording. Supported from A2019.06. 	<ul style="list-style-type: none"> Extensions must be enabled for recording. Supported from v.17. 	<ul style="list-style-type: none"> Extensions must be enabled for recording. Supported from v.19. 	<ul style="list-style-type: none"> Internet Explorer with compatibility mode must be enabled for recording. Supported from Automation 360 v.23.

- Record automation refers to opening a target application for recording in a supported browser, and recording actions or capturing objects using the Automation Anywhere recorders.
 - For details on automation using Universal Recorder and Recorder capture action, see [Universal Recorder for object-based automation](#) on page 2163 | [Edit a task recorded with the Universal Recorder](#) on page 2166
 - If you have trouble recording automation using Google Chrome, see [Google Chrome extension troubleshooting](#) on page 2175

2. Microsoft Edge (Chromium) with Internet Explorer compatibility mode is supported for capturing objects from web applications based on HTML technology.

Extensions for automation

When you install the Bot Agent from a browser, extensions for Automation 360 are installed. Extensions are required to record automation using a supported browser.

You can enable extensions on a device from supported browsers. For example, after you install a Bot Agent from a Google Chrome browser, click the enable extension option from the browser task bar. The Google Chrome extension will allow you to record automation using the Google Chrome browser.

When you connect your Bot Agent device to the Control Room, you can enable the following extensions from your browser to record automation:

Extension name	Link to extension
Google Chrome	Automation 360 extension for Chrome
Microsoft Edge based on Chromium	Automation 360 extension for Microsoft Edge
Mozilla Firefox	Automation 360 extension for Mozilla Firefox

For updates to latest extension version, see [Browser extensions for Automation 360](#) on page 933

Related tasks

[Perform Bot Agent diagnostic checks](#) on page 1306

Use the Bot Agent diagnostic utility for connectivity-related issues between the Bot Runner device and Control Room. The utility helps to diagnose issues either by providing solutions or suggestions to help resolve the issues.

Related reference

[Universal Recorder supported applications and browsers](#) on page 2172

Use the Universal Recorder to record interactions with objects from the supported technologies.

[Bot Agent compatibility](#) on page 1274

Before you install the Bot Agent, ensure that you review the compatible Automation 360 builds.

[Google Chrome extension troubleshooting](#) on page 2175

If you encounter an error when recording or running a bot that automates tasks in a Google Chrome browser and you have installed Google Chrome, you must perform additional steps to configure your system.

[Browser extensions for Automation 360](#) on page 933

Create automation from supported browsers by using browser extensions. Extensions are periodically updated to support feature enhancements and fixes. Therefore, ensure that you have

the latest versions of extensions for the Google Chrome, Microsoft Edge, and Mozilla Firefox browsers.

Internationalization, localization, and language support

Automation 360 provides internationalization and localization support for its user interface (UI), automation, and documentation.

Internationalization means that you can automate using supported languages. Localization means the user interfaces are translated to languages supported by Automation Anywhere. Also, these supported languages have been tested and certified to work in that language.

Internationalization	Perform automation in various languages to work with localized operating systems and keyboards.
Encoding format	UTF-8 is the default encoding format for Automation 360.
Product documentation	View the Automation Anywhere documentation in the supported language at https://docs.automationanywhere.com/ . To view information in one of the supported languages, select the language from the drop-down menu at the top-right of the website. The default language is English for any topic that is not available in another language.
Interface	<p>View the user interface for Automation 360 components, including Control Room and IQ Bot, in the supported language.</p> <ul style="list-style-type: none">• Automate applications (web and desktop) with the language UI, text, and controls values (for example, push-button with a language name and combo-box items in language text).• Provide the language name to a bot, workflow, and report in Control Room.• Provide the language name to bot schedules, automation name and description, role name and description, a user's first and last names, workload pools, and queues.• Deploy bots with the language name on Bot Runners.• View the language entities (names, description, and so on) across all the pages in Control Room.
Select a language in the user interface	From the Control Room interface, next to the user ID, click the language icon (globe icon) and select a language from the list.

Parts of the Control Room interfaces that are translated do not include the applications or tools that are used within the bots. For example, Microsoft Excel is not translated through the Control Room.

Automation 360

Note: The language setting of the Control Room does not translate language in Bot Insight, due to the difference in applications. For alternative languages in Bot Insight, users should seek translation from either browser language options or an operating system, configured to their language of choice.

Components for Control Room and bot actions

Control Room and bots have additional requirements depending upon the Automation 360 deployment model you choose. Some third party applications are installed with Automation 360.

Control Room supported platforms

View the listed supported platforms and components for Control Room.

Component	Supported Control Room option
Amazon Web Services Elastic Compute Cloud (EC2)	Required to install Control Room platform.
HTML	Required for Microsoft Azure: Use Load Balancer, not Application Gateway.
Java Database Connectivity (JBDC) driver	Required for Oracle Database.
Linux CentOS or Red Hat Enterprise Linux	Python 3.6 required for Build 6463 and later. Install Control Room platform.
Microsoft Active Directory	Required to configure as either IDaaS or IaaS. For IaaS use Windows 2016.
Microsoft Azure	Required to install Control Room platform.

Third-party components for bot actions

View the listed third party components for the bot actions.

Component	Automation 360 Plug-in	Supported Bot action
ABBYY FineReader Engine version 12.2.27.12		Required for capturing images in the OCR, AISense, and IQ Bot packages.
Citrix Receiver Version 4.4 LTSR or later <hr/> Note: You can also use the Citrix Workspace app. All major releases of Automation 360 starting from v.22 (Build 10526) are certified with the Citrix Workspace.	Automation 360 Citrix remote agent	Prerequisite for bot actions on the Bot Agent installed on Citrix resident apps.
Citrix Virtual Apps version 6.5 or later	Automation 360 Citrix remote agent	Prerequisite for bot actions on business applications hosted on Citrix server resident apps. Supported with Universal Recorder.
IBM WebSEAL		For reverse proxy for Bot Runner.
Microsoft .NET Framework version 4.6.1 or later		For the Recorder package.

Supported special characters

Use only supported special characters when creating user names and passwords. Supported characters vary depending upon where they are used.

In all of the below listed cases, the standard alphanumeric characters, a-z, A-Z, 0-9 are supported. The special characters allowed or specifically excluded from particular use are typical to standard English keyboards. See the table below to verify the special characters that can be used in names or passwords.

TLS certificate	Do not use at sign (@) in passwords
Wildcards	The asterisk (*) is supported.
Windows	Do not use the pipe () or semicolon (;) in user names or passwords.
Worksheet	Do not use the asterisk (*), question mark (?), or bracket left or right ([]) in the worksheet name.

Database

Do not use percent (%) or space () in the database name.

Do not use semicolon (;) in the database username or password.

Supported characters

Characters supported for authentication are acceptable for both user names and passwords. In the table:

- Supported means the character is explicitly supported for that use.
- Do not use means the character is explicitly not supported for that use.
- Double dash (--) means results with using the character for that use are unknown.

Character	Windows authentication	Control Room authentication	Database name, username, or password	JSON Web Token authentication
ampersand (&)	Supported	Supported	--	Supported
angle bracket, left or right (< >)	Supported	--	--	--
apostrophe, straight single (')	Supported	--	--	--
asterisk (*)	Supported	--	--	--
at sign (@)	Supported	Supported	--	Supported
braces left or right ({ })	Supported	--	--	--
bracket left or right ([])	Supported	--	--	--
caret (^)	Supported	--	--	--
colon (:)	Supported	--	--	--
dollar sign (\$)	Supported	Supported	--	Supported
equal sign (=)	Supported	--	--	--
exclamation point (!)	Supported	Supported	--	Supported
hyphen (-)	Supported	Supported	Supported	Supported
parenthesis, left or right (())	Supported	--	--	--
percent (%)	Supported	Supported	Do not use	Supported
period (.)	Supported	Supported	Supported	Supported

Character	Windows authentication	Control Room authentication	Database name, username, or password	JSON Web Token authentication
pipe ()	Do not use	--	--	--
plus sign (+)	Supported	--	--	--
number sign (#)	Supported	Supported	--	Supported
question mark (?)	Supported	--	--	--
semicolon (;)	Do not use	--	Do not use	--
slash, forward or backward (/ \)	Supported	--	--	--
space	Supported	--	Do not use	--
underscore (_)	Supported	Supported	Supported	Supported

Citrix integration on Cloud

Automation 360 integration with Citrix enables you to create bots that run tasks on remote Citrix Virtual Apps servers.

Process overview

Ensure the following tasks are completed before you begin automating tasks in a Citrix environment:

Verify the Citrix component version

Following are the various Citrix components and its related versions that are supported for the Automation 360 integration with Citrix.

Citrix component version	Automation Anywhere Plug-in	Automation 360 client or Bot option
Citrix Receiver Version 4.9 LTSR or later	Automation Anywhere Citrix plug-in	For using Citrix server resident apps or installing Automation 360 client.
<p>Note: You can also use the Citrix Workspace app. All major releases of Automation 360 starting from v.22 (Build 10526) are certified with the Citrix Workspace.</p>		
Citrix Virtual Apps version 7.15 LTSR		For using Citrix server resident apps.
Citrix XenDesktop Version 7.15 LTSR		For using Citrix server resident apps or installing Automation 360 client.

Verify credentials and licensing

- Ensure you have the credentials to access the Citrix server.

Note: We recommend you have different Citrix login credentials for each Bot Runner user.

- Ensure the appropriate Citrix license is available for the Automation Anywhere Enterprise system.

Install components

Specific Citrix and Automation Anywhere components are required on both the local user machine and the Citrix Virtual Apps server.

Local machine

1. Install Citrix Receiver.

2. Install the Bot Agent. This is automatically installed when you register the local machine with the Control Room.

The Bot Agent and Automation Anywhere plug-in for Citrix are installed at the same time if the Citrix Receiver is installed on the local machine.

3. Install the Automation Anywhere plug-in for Citrix.

If the Bot Agent is already installed, the Automation Anywhere plug-in for Citrix is automatically installed when the Universal Recorder is initiated.

Citrix server

1. Install the Automation Anywhere remote agent for Citrix.
2. Register the Automation Anywhere remote agent for Citrix as a Virtual App in the Citrix StoreFront.

Create a bot

1. From the Citrix StoreFront, run the **AARemoteAgent** and the target application.
2. From the Control Room, create the bot, start the **Recorder**, select the target

application, and record your actions on the Citrix server to build your bot.

Using Citrix architecture with bots

To create and run bots using applications that reside on a Citrix server, see the following resources:

[Using the Recorder on Citrix Virtual Apps servers](#) on page 1166

The **Record: Capture** cloning action requires specific configurations to capture objects from applications available through the Citrix StoreFront on a remote Citrix Virtual Apps server. Ensure the required components are installed on the local machine and the remote Citrix Virtual Apps server.

Related concepts

Access the Automation Workspace interface from a browser. After you have installed and enabled extensions in the browser, perform several tasks through the Automation Workspace interface based on your user role and automation requirements.

Using the Recorder on Citrix Virtual Apps servers

The **Record: Capture** cloning action requires specific configurations to capture objects from applications available through the Citrix StoreFront on a remote Citrix Virtual Apps server. Ensure the required components are installed on the local machine and the remote Citrix Virtual Apps server.

Complete the steps listed in the following tasks:

- [Installing the Citrix required components on local machines](#) on page 1169
- [Installing Automation Anywhere remote agent on Citrix servers](#) on page 1171

If you are using Google Chrome for automation, ensure the Automation Anywhere extension (version 11.2.0.0) for Automation Anywhere remote agent for Citrix is installed and enabled. For Automation 360 remote agent, ensure that the Automation Anywhere extension (version 3.0.0.0 or later) is installed and enabled.

Chrome web store

Create bots with applications running on a remote Citrix Virtual Apps server using the Automation Anywhere remote agent for Citrix.

1. Log in to the Citrix Virtual Apps server StoreFront.

Note: You can also use the Citrix Workspace app. All major releases of Automation 360 starting from v.22 (Build 10526) are certified with the Citrix Workspace.

2. Depending on the Automation 360 release, select and run one of the following remote agents from the **Citrix StoreFront**.

- Select **Citrix server > Citrix StoreFront > AARemoteAgent**.

Note: **AARemoteAgent** is the Citrix name for the Automation Anywhere remote agent for Citrix.

- Select **Citrix server > Citrix StoreFront > A360 Remote agent**.

Note: **A360 Remote agent** is the Citrix name for the Automation 360 remote agent.

3. Run the target application from the Citrix StoreFront.
4. Log in to your registered local machine with the Bot Agent and Citrix Receiver installed.
5. Log in to the Control Room from your registered local machine.
6. Create a new bot or edit an existing bot.
7. Select the auto login feature to log in to a Citrix environment when it is locked or logged off.

Note: To ensure the auto login works, always log off the Citrix Receiver associated with the Citrix Virtual Apps server before you disconnect.

8. Start the **Recorder**.
9. From the **Automation Anywhere Record Application** selection window, select the target application from the drop-down list in the **Window or URL** field, and click **Start recording**.

Note: The remote application has `\\Remote` label at the end of the application name.

10. When the steps to record are completed, click **End recording**.

Access the Automation Workspace interface from a browser. After you have installed and enabled extensions in the browser, perform several tasks through the Automation Workspace interface based on your user role and automation requirements.

Using Citrix XenDesktop on Cloud

Install the Bot Agent on a Citrix XenDesktop virtual machine to create or run bots using applications that reside on that Citrix XenDesktop virtual machine.

Ensure the required components are installed on the local Bot Agent machine and the remote Citrix server. The required components are:

On the local machine

Citrix Receiver : Install this on every machine you use to connect to a Citrix server.

Note: You can also use the Citrix Workspace app. All major releases of Automation 360 starting from v.22 (Build 10526) are certified with the Citrix Workspace.

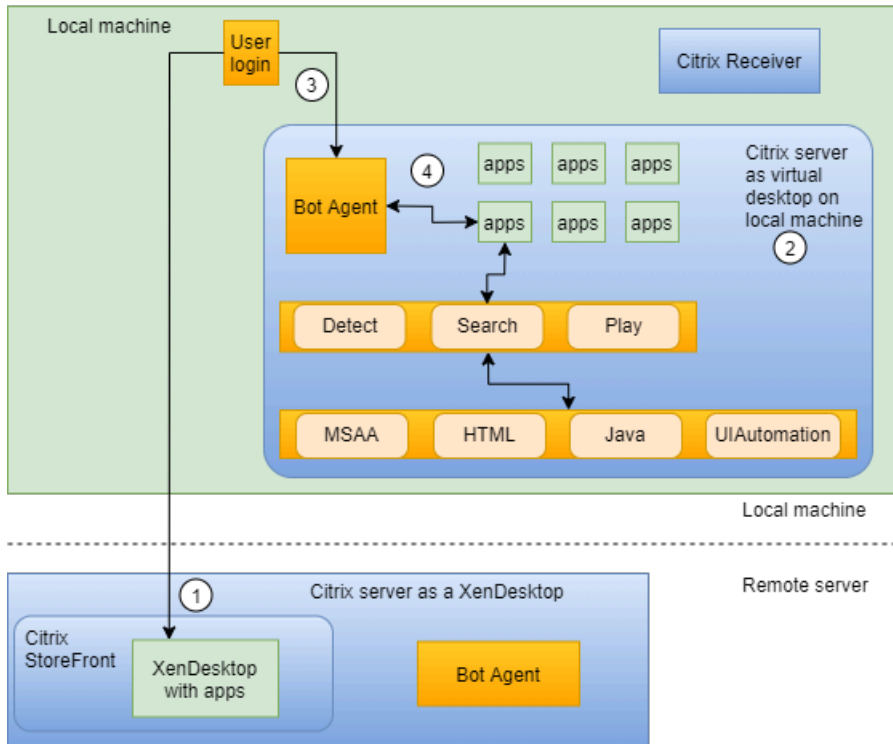

On the Citrix XenDesktop

Bot Agent : Install this on the Citrix XenDesktop virtual desktop.

Log in to the Control Room and launch the recorder. This triggers the Bot Agent installer.

The Citrix XenDesktop is a virtual machine sitting on a remote Citrix server. It contains the applications to be used for the bots.

The following figure shows the process flow when the Bot Agent is installed on a Citrix XenDesktop with the applications on the virtual desktop.

The Bot Agent can be installed on multiple platforms, which includes a Citrix XenDesktop virtual machine. Ensure the virtual desktop meets the requirements for any Bot Agent installation.

Create bots with Citrix XenDesktop.

1. Prepare for bot activities.
 - a) Install the Citrix Receiver on your local machine.
 - b) Install the Bot Agent on Citrix XenDesktop.
2. From your local machine with Citrix Receiver installed, log in and open **Citrix server > Citrix StoreFront**.
3. Select the Citrix XenDesktop virtual desktop with the Bot Agent.
The whole Citrix XenDesktop is presented as a local virtual desktop on your local machine. This is automatic when you start the Citrix XenDesktop.
4. From the virtual desktop, launch the Enterprise Client that is installed on the Citrix XenDesktop, or launch a browser and log in to the Control Room.
5. From your Control Room, create the bot.

Installing the Citrix required components on local machines

Install the Automation Anywhere components to enable you to use bots on Citrix Virtual Apps servers. Two components are installed: Bot Agent and Automation Anywhere plug-in for Citrix.

1. Log in to your local machine.
2. Install Citrix Receiver.

Note: You can also use the Citrix Workspace app. All major releases of Automation 360 starting from v.22 (Build 10526) are certified with the Citrix Workspace.

This Citrix component is required to communicate from a local machine to a Citrix virtual application server.

To install the Citrix Receiver, see the Citrix documentation.

3. Register your local machine with the Control Room. This installs the Bot Agent. The Bot Agent enables local machine communication with the Control Room.

To install the Bot Agent:

- a) Log in to the Control Room through your Automation Anywhere URL.
- b) Navigate to **Devices** in the **Manage** tab.
- c) From the action icons, click **Add local bot agent**.
- d) Click **Connect to my computer**.
- e) Follow the steps outlined in the wizard.
- f) Refresh the **Devices** page and verify that the local device is added.

4. Install Automation Anywhere plug-in for Citrix on your local machine.

The Automation Anywhere plug-in for Citrix provides the Citrix driver. This driver communicates with the Citrix server.

To install the Automation Anywhere plug-in for Citrix:

- a) Log in to the Control Room.
- b) Launch one of the designated events.
Designated events include: launch **Recorder**, use the **Devices** tab or **Device Status** tab, or run a bot from **Editor**.
- c) Optional: Verify that the Automation Anywhere plug-in for Citrix is installed.
Check for the file `C:\Program Files (x86)\Citrix\ICA Client\Automation.CitrixDriver.dll`.

Control Room and bots have additional requirements depending upon the Automation 360 deployment model you choose. Some third party applications are installed with Automation 360.

Install Automation Anywhere remote agent for Citrix 2.0: Recorder package version 2.8.6

Install the Automation Anywhere remote agent for Citrix 2.0 available with Build v 2.0.0.7 on the Citrix Virtual Apps server where the virtual applications are installed.

Keep the following considerations in mind when automating a task in the Citrix environment using the new Automation Anywhere remote agent for Citrix 2.0:

- If you are using Google Chrome for automation, ensure that the Automation Anywhere extension (version 3.0.0.0 or later) for Automation 360 remote agent is installed and enabled.

[Google Chrome extension for Automation 360](#)

- Both Automation Anywhere remote agent for Citrix 1.0 and 2.0 can run on Citrix environment at the same time.
- When you use the 2.8.6-20220823-160834 or later version of the Recorder package in your bots, we strongly recommend that you use the Automation Anywhere remote agent for Citrix 2.0. If you have not installed the Automation Anywhere remote agent for Citrix 2.0, then we

have support for an automatic fallback where the existing Automation Anywhere remote agent for Citrix 1.0 will be used.

Note:

- During fallback, the Automation Anywhere remote agent for Citrix 1.0 will work only with technologies and browsers that it supports.
 - Bots created using Recorder package (version 2.8 and later) will work with Manifest V3 extension. For Manifest V3 extensions, ensure that you connect to Automation Anywhere remote agent for Citrix 2.0.
-
- For Citrix automation, bots created using Recorder package (versions earlier than 2.8.6) will not work with Automation Anywhere remote agent for Citrix 2.0. Ensure that you connect to Automation Anywhere remote agent for Citrix 1.0 instead.
 - If you are using Automation Anywhere remote agent for Citrix 2.0 and the Bot Agent over the same Citrix environment, ensure that you do not uninstall the Automation Anywhere remote agent for Citrix or Bot Agent without reinstalling the updated version of either of these. For example, if you uninstall Automation Anywhere remote agent for Citrix, then ensure that you either install the new version of Automation Anywhere remote agent for Citrix or you reinstall the Bot Agent so that the registry entries remain updated.
 - If you have bots that use 2.7.3-20220527-004608 or earlier version of the Recorder package, then the bots will use the existing Automation Anywhere remote agent for Citrix 1.0.
 - Automation Anywhere remote agent for Citrix 2.0 will not work if Citrix XenDesktop is also connected from the same Bot Creator or Bot Runner device.
 - Technology selection drop-down option for Recorder is not supported.
 - Microsoft UI automation (COM) is not supported.
 - SAP automation is not supported.

The following technologies and browsers are supported with Automation 360 remote agent for Citrix:

- Google Chrome
- Internet Explorer
- Microsoft Edge
- Microsoft Edge with IE mode
- Mozilla Firefox
- Java
- Electron apps
- Microsoft Active Accessibility (MSAA)
- Microsoft UI automation

1. Log in to the Citrix Virtual Apps server.
2. Download the latest version of the Automation Anywhere remote agent for Citrix 2.0 installer file to the Citrix Virtual Apps server. The Automation 360 remote agent running on the Citrix server interprets data received from Automation 360 and responds appropriately.
 - a) Go to [A-People Downloads page \(Login required\)](#).
 - b) Select and download the Automation Anywhere remote agent for Citrix 2.0.
3. Run the Automation Anywhere remote agent for Citrix 2.0 installer.

- a) Extract the AARemoteAgent_2.0.zip file and double-click the A360RemoteAgent.exe file.
 - b) On the **Automation 360 Remote agent Setup** screen, click **Next**.
 - c) On the **Select Destination Folder** screen, click **Browse** to specify a non-default location for installing the remote agent. Click **Next**.
The default location for installation is set to C:\Program Files (x86)\Automation Anywhere\A360 Remote Agent.
 - d) On the **Setup Status** screen, track the status of the installation process.
 - e) On the **Setup Wizard Complete** screen, click **Finish** to complete the setup.
4. From the Citrix interface, add the Automation Anywhere remote agent for Citrix 2.0 application to the Citrix **Delivery Controller**.
This registers the Automation Anywhere remote agent for Citrix 2.0 as a Virtual App in the Citrix StoreFront.
 5. Verify that the Automation Anywhere remote agent for Citrix 2.0 is available from the Citrix StoreFront.
The Citrix StoreFront name for the Automation Anywhere remote agent for Citrix 2.0 remote agent is **A360 Remote agent**.

Install Automation Anywhere remote agent for Citrix 1.0: Recorder package version 2.7.3 and earlier

Install the Automation Anywhere remote agent for Citrix 1.0 available with Build v 1.0.0.0 on the Citrix Virtual Apps server where the virtualized applications are installed.

Keep the following considerations in mind when automating a task in the Citrix environment using the Automation Anywhere remote agent for Citrix:

- If an application hosted on the Citrix environment runs in elevated mode, the Automation Anywhere remote agent for Citrix must also run in elevated mode.
- If some applications hosted on the Citrix environment run in elevated mode and some on non-elevated mode, you can install two instances of the Automation Anywhere remote agent for Citrix: One instance of the agent will run in elevated mode and the other instance in non-elevated mode.
- If you are using Google Chrome for automation, ensure the Automation Anywhere extension (version 11.2.0.0) for Automation Anywhere remote agent for Citrix is installed and enabled.

[Chrome web store](#)

1. Log in to the Citrix Virtual Apps server.
2. Download the latest version of the Automation Anywhere remote agent for Citrix installer file to the Citrix Virtual Apps server. The Automation Anywhere remote agent for Citrix running on the Citrix server interprets data received from Automation 360 and responds appropriately.
 - a) Go to [A-People Downloads page \(Login required\)](#).
 - b) Select and download the Automation Anywhere remote agent for Citrix.
3. Run the Automation Anywhere remote agent for Citrix installer.
 - a) Extract the AARemoteAgent_1.0.zip file and double-click the AAE_Remote_Agent_1.0.0.exe file.

- b) On the **Automation Anywhere Remote Agent Setup** screen, click **Next**.
- c) On the **License Agreement** screen, accept the license agreement, and click **Next**.
- d) On the **Select Destination Folder** screen, click **Browse** to specify a non-default location for installing the remote agent. Click **Next**.

The default location for installation is set to: C:\Program Files (X86)\Automation Anywhere\AARemoteAgent

- e) On the **Setup Status** screen, track the status of the installation process.
 - f) On the **Setup Wizard Complete** screen, click **Finish** to complete the setup.
4. From the Citrix interface, add the Automation Anywhere remote agent for Citrix application to the Citrix **Delivery Controller**.
This registers the Automation Anywhere remote agent for Citrix as a Virtual App in the Citrix StoreFront.
 5. Verify that the Automation Anywhere remote agent for Citrix is available from the Citrix StoreFront.
The Citrix StoreFront name for the Automation Anywhere remote agent for Citrix is **AARemoteAgent**.

HA and DR deployment models

Automation 360 provides several deployment options to meet various levels of enterprise cost/price performance and resiliency requirements. The options include installation on single nodes and on multiple nodes. Multi-node deployments can be configured for highly available (HA) clusters and disaster recovery (DR) sites.

The deployment services are set up using the Automation 360 installer. A typical Automation 360 server node runs the following services:

- Automation Anywhere Automation Services
- Automation Anywhere Messaging Services
- Automation Anywhere Caching Services
- Automation Anywhere Search Services
- Repository storage
- (Optional) IQ Bot VM

The Automation 360 installer also supports the multi-node deployment configuration.

Planning

Identify your requirements before selecting a deployment model. For best results, deploy the same operating systems across the Automation Workspace development, testing, and production environments. At minimum, have the same OS on both test and production environments.

Deployment models

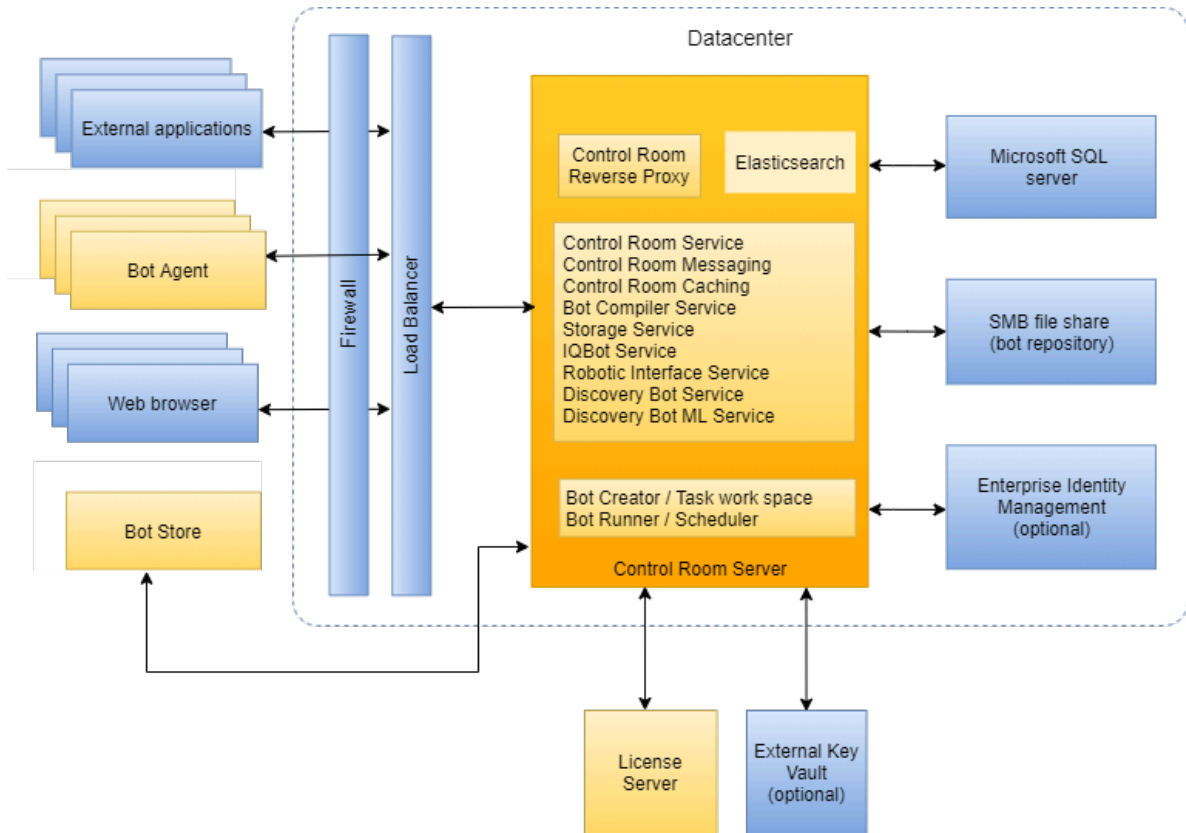

At a high level, there are two ways to deploy or install Automation 360 - single-node and multi-node. Choose the option that meets your business continuity requirements.

Single-node deployment

As the name suggests, there is a single physical server node, on which all the services related to Automation 360 are run. By design, this configuration does not provide any redundancy and hence the availability depends on the services on this single node.

Database	<p>In single-node deployment, the database can be anywhere if the Control Room server is able to connect to the database server. This can involve network configurations.</p> <hr/> <p>Note: You cannot host the database server on the same server as the Control Room server as it requires higher processing/memory configuration on the server.</p> <hr/>
Characteristics	<ul style="list-style-type: none">• No disaster recovery (single point of failure): If the single node fails, RPA operation will be adversely affected.• No high availability: If the server is taken offline for upgrade or maintenance, RPA operations will be affected.• No RPA up-scaling: When RPA deployments scale up and users increase, the single node will have to manage the increased load. This might adversely affect the RPA performance.
Usage Recommendations	<p>Single-node deployments are typically recommended for small-scale usage in proof of concepts, demos, testing, and trials, to name a few.</p> <p>Single-node deployments are NOT RECOMMENDED for production usage because any downtime will impair RPA operation and business continuity.</p>
Advantages	<ul style="list-style-type: none">• Quick and easy installation and setup• Additional servers not required• Load balancers and clustering configuration not required

The following image shows the Automation Anywhere and data center components for a single node. The Automation Anywhere components are shown in orange and components provided by your organization are shown in blue. Components that are centrally hosted on cloud and managed by Automation Anywhere such as license server are shown in light orange.

Multi-node deployment

To achieve higher processing scale, higher availability in production setups, Automation 360 services are deployed across multiple server nodes. Installer enables you to setup multi-mode configuration. This involves additional configuration steps such as linking services to same database and so on.

Distributed approach

The Control Room provides the flexibility to process large number of requests in given time window.

Deploy multiple instances of Control Room on multiple physical or virtual servers as required. This also means configuring the cluster setup for the caching, search, and messaging services.

Load balancing

Performed by a load balancer, this is the process of distributing application or network traffic across multiple servers to protect service activities, allowing workloads to be distributed among multiple servers. This ensures automation activity is continued on clustered servers.

[Load balancer requirements](#) on page 1145

Databases

In multi-node deployments, databases use their own built-in failover to protect the data. This ensures database data recovery.

If you use cloud-based database services like of AWS-RDS, the High Availability and Disaster Recovery as part of their service offerings, in which case no further database configurations are necessary.

For pure on-premises database scenarios, configure synchronous replication between the primary (active) and secondary (passive) clustered Microsoft SQL Server in the data center. This ensures consistency in the event of a database node failure.

For synchronous replication, configure the database using publisher and subscriber model in Microsoft SQL Server from the primary disaster recovery site to the secondary disaster recovery site that is at a geographically separated location from the primary site.

[Replicate data between primary and secondary sites](#) on page 1188

The following image shows the Automation Anywhere and data center components for three nodes in a data center cluster. The Automation Anywhere components are shown in orange and components provided by your organization are shown in blue. Components that are centrally hosted on cloud and managed by Automation Anywhere such as license server are shown in light orange.

Important: Stretch clusters are not supported.

- Ensure that all the HA cluster nodes are configured in the same location. Do not configure the nodes in a single HA cluster that is located across various sites. Ensure that you configure one HA cluster at the primary site and the other HA cluster at the secondary site.
- The Control Room and IQ Bot must be configured in the same data center to ensure communication between both the applications.

Related concepts

[High availability deployment](#) on page 1179

To support Automation 360 in your data center, configure an high availability (HA) cluster. Follow your company methods and procedures for implementing your data center cluster.

Convert single-node deployment to multi-node deployment

You can convert your single-node deployment into a multi-node deployment by editing the configuration files and restoring the data in the repository for the single-node setup.

The single-node deployment can run on one of several infrastructures, local machines, private data centers, and cloud providers.

To convert a single-node deployment running on AWS or other supported environment into a multi node-deployment, perform the following steps.

1. In the Task Manager, stop all Automation Anywhere services.
2. Stop the Control Room instance.

3. Create an Amazon Machine Images (AMI) instance using the Control Room instance.
For information about how to create AMI in AWS, see [Create an AMI from an Amazon EC2 Instance](#).
4. Create a new instance using the AMI created in the previous step.
5. Edit the configuration files related to the database server, Ignite cluster, and Elasticsearch to form the clusters in the configuration directory on a standard installation.
The files are located in `C:\Program Files\Automation Anywhere\Enterprise\config`
 - a) Edit the database server URL to point to the intended database server in `boot.db.properties`.
Do not change the URL if the original server already refers to a non-localhost address.
 - b) Edit the following property in the `cluster.properties` file:
Append the list with a new server IP in `ignite.discovery.static.ips=<existing list of ips>, <current server ip>`
 - c) Edit the following properties in the `elasticsearch.yaml` file:
 - Add the current server address in `node.name: "<local-ip>"`
 - Add the current server address in `network.host: "local-ip"`
 - Leave the existing values intact and append the IP of the current server in `discovery.zen.ping.unicast.hosts: ["ip1", "<local-ip>"]`
 - Leave the existing values intact in `cluster.initial_master_nodes: ["<master-ip>"]`
6. Restore and mount the repository to the respective path from the same timed snapshot as the selected Control Room snapshot.
7. Update the configuration tables to ensure TCP visibility between the nodes.
8. Start the services on the replicated node and wait for a couple of minutes for the clustering to establish.
9. Log in to the Control Room to verify whether the bots are available and the repository structure is intact.
10. Check Git integration for standard installations.
If the installation has external Git configured, check the validity by exercising test check-in and confirm audit logs.

High availability deployment

To support Automation 360 in your data center, configure an high availability (HA) cluster. Follow your company methods and procedures for implementing your data center cluster.

Why only odd number of nodes are supported	A cluster comprising even number of nodes can merge inconsistencies but can result in a split-brain condition where the cluster has no majority and cannot resolve transactions, which might result in data inconsistencies. Split-brain condition is a known limitation of clustering systems that can be caused by network issues including latency.
--	--

Deployment configurations with odd numbered nodes can help avoid split-brain issues and are recommended for Automation 360 deployments.

Quorum

The nodes determine which transaction can be processed through voting on each transaction. The number of votes constituting a majority of the nodes in the cluster is referred to as a quorum and determines how many nodes have to vote for or confirm a transaction before it can be processed.

Fault Tolerance

Fault tolerance in terms of node failure is determined by how many nodes can fail before a quorum or majority of nodes is not available to vote on the validity of any transaction. Fault tolerance is optimized with an odd number of nodes in the cluster because a majority in odd-numbered clusters is a lower number than in even-numbered clusters

Supported Configurations

A cluster with three or higher odd number of nodes prevents the split-brain condition or inconsistencies due to network issues, while giving the higher scale and availability.

Number of nodes in cluster	Majority (quorum)	Fault tolerance (node failures)	Support
3	2	1	Certified
5	3	2	Contact Automation Anywhere support
7 and so on	4 and so on	3 and so on	Contact Automation Anywhere support

Multi-availability Zone/Multi-datacenter Configurations

When going for a multi-zone deployment in further enhance the availability, say with 3 nodes deployment, we recommend that you have each Control Room in separate availability zones. Deployments with more than 3 nodes, spread these deployments across at least 3 availability zones. One thing we need to be concerned about in these setups is the latency between the zones/providers. The nodes in a high availability cluster must be deployed in the same region.

In terms of the cloud providers, we currently support 3 major cloud providers - Amazon Web Services, Google Cloud Platform, and Microsoft Azure.

Note: In a multi-node environment, if a node goes down, operations such as bot deployments and schedules, triggers, and work items in queues on that node will be adversely affected.

Tip: For information on how to backup and restore files to recover a Control Room High Availability cluster in case of failure, see [Backing up and restoring a Control Room High Availability Cluster \(A-People login required\)](#).

Related concepts

[Disaster recovery deployment](#) on page 1181

The disaster recovery (DR) deployment model uses high availability (HA) clusters distributed across separate geographic areas.

Related tasks

[Configure IP cluster](#) on page 1204

Use the **Cluster Configuration** wizard page under **Custom installation type** in Control Room installer to configure resiliency requirements. Select the **Enable Cluster setup** option and for high availability cluster, provide multiple (three or more) IP addresses from your cluster setup.

[Configure disaster recovery site for Elasticsearch IP addresses](#) on page 1262

If you have configured the Control Room for high availability (HA) and disaster recovery (DR) and installed the Control Room on both the primary and secondary sites, configure Elasticsearch IP addresses for the secondary site.

Related information

[Cluster coordination in ElasticSearch](#)

Disaster recovery deployment

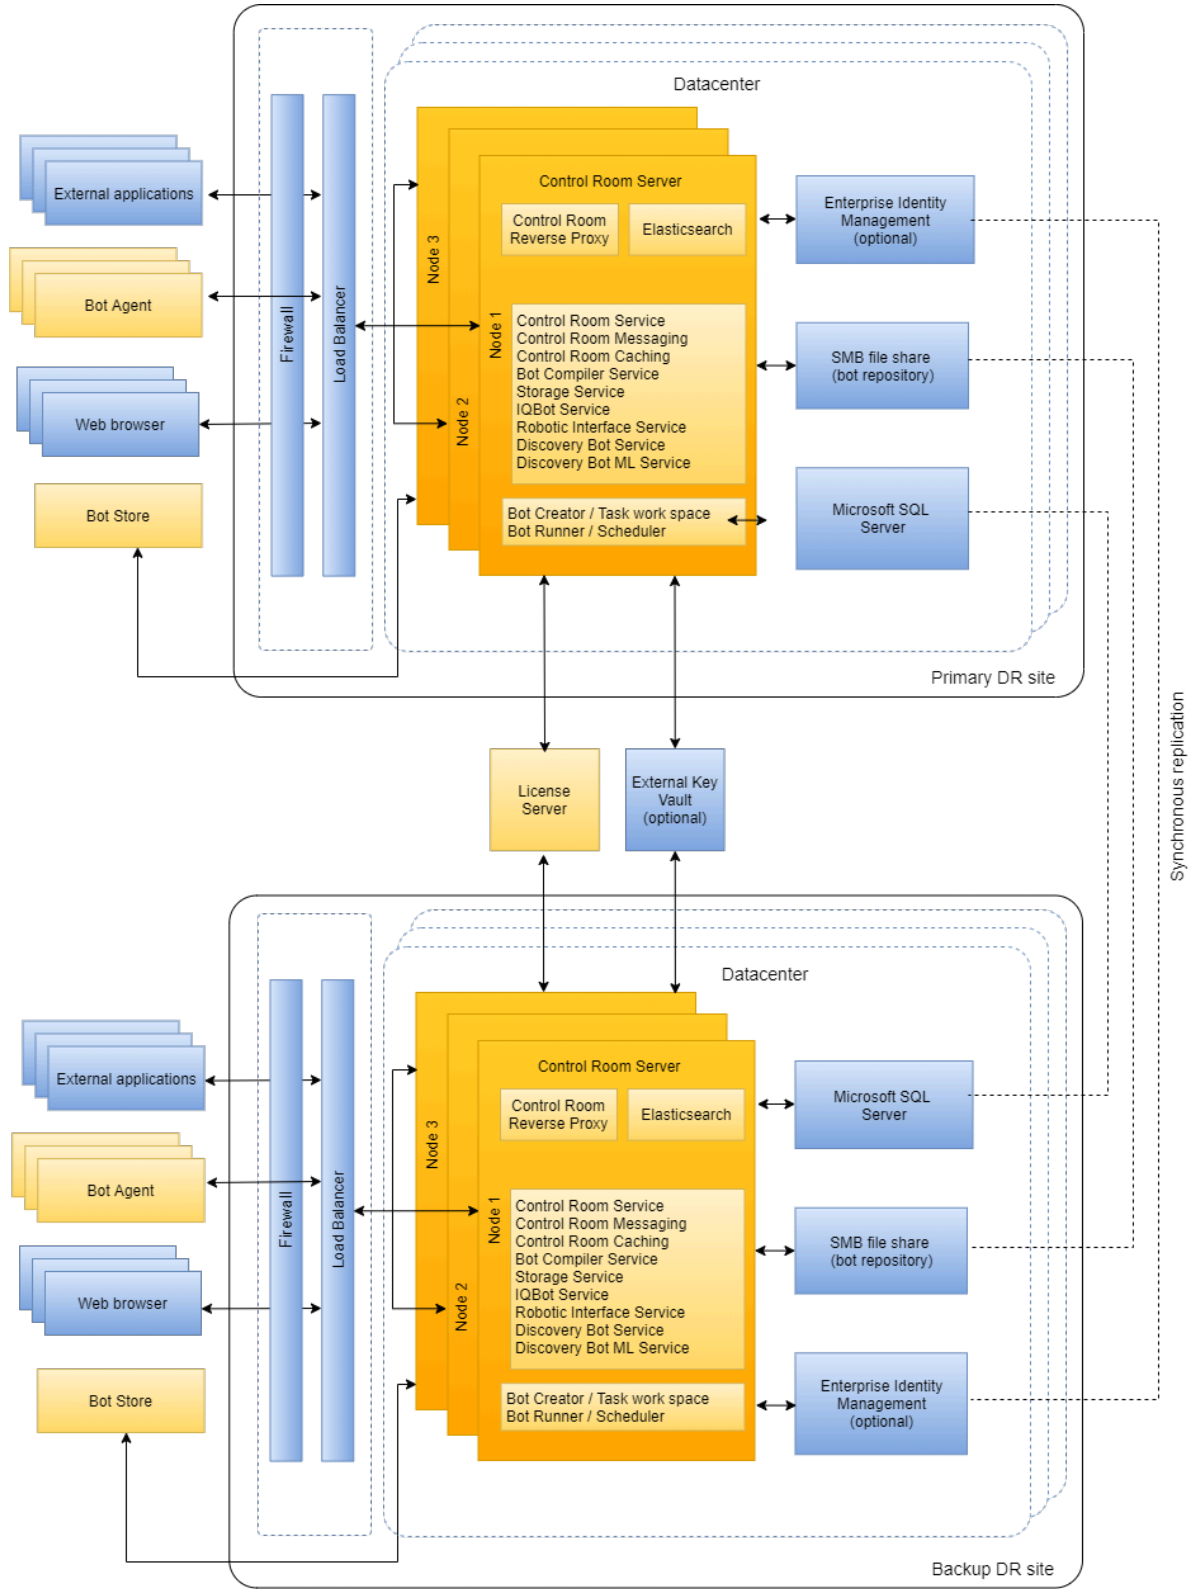

The disaster recovery (DR) deployment model uses high availability (HA) clusters distributed across separate geographic areas.

Disaster recovery (DR) is a method where the two high availability (HA) data center configurations are separated geographically. In the event of a localized disaster at the primary site, the physically removed data center on the secondary site can resume functions with minimum downtime.

If there were external systems used in the setup, it is essential to restore the network level connectivity. Some examples for these external systems include any external key vaults, Git, and so on. All the firewall rules, IP white-listings, host-names referred in configurations are still intact and available to the restored services.

Note: The Control Room clusters in the primary and secondary disaster recovery sites are recommended to use a minimum of three nodes each because a three-node configuration can help avoid split-brain issues with two-node clusters and increase security by using node authentication and transport layer security (TLS) features.

The following image shows the Automation Anywhere and data center cluster components for three nodes in primary and secondary sites configured for disaster recovery. The Automation Anywhere components are shown in orange and components provided by your organization are shown in blue. Components that are centrally hosted on cloud and managed by Automation Anywhere such as license server are shown in white.

Disaster recovery methods

There are two ways to perform disaster recovery - Image based replication and Warm standby. Choose the option that meets your business continuity requirements.

Related tasks

[Image based replication](#) on page 1183

The replication process is similar across environments and cloud providers. A scheduled way is used for creating and storing the snapshots. The snapshot interval is based on the tolerance of the customer for potential data loss.

[Replicate data between primary and secondary sites](#) on page 1188

The process of replicating the data between the primary and the secondary site involves database replication using publisher and subscriber models in Microsoft SQL Server Management Studio, server repository replication using Windows Distributed File System (DFS), and backing up Elasticsearch (audit log) data.

Related information

[Cluster coordination in ElasticSearch](#)

Image based replication

The replication process is similar across environments and cloud providers. A scheduled way is used for creating and storing the snapshots. The snapshot interval is based on the tolerance of the customer for potential data loss.

We recommend that the replication schedule should be at least 1 day (one snapshot daily).

The following describes the procedure for AWS as an example cloud provider.

As a first step in any image-based DR setup, create snapshots at fixed intervals. In case of the disaster, the setup would revert to the latest good image/snapshot and system would be back, up and fully functional in a short time, however with a data loss and short down time.

1. Decide on the snapshot interval based on potential data loss.
2. Stop the Automation Anywhere services on the server being imaged.
3. If on AWS, create AMI using standard image creation steps.
[Create an AMI from an Amazon EC2 Instance](#)
4. After the image is created, start the Automation Anywhere services.
5. Run the repository backup mechanism on the same schedule.

The subsequent steps describe restoring data from an image.

6. Spin a new instance using the previously created AMI.
Depending on the original setup, if the setup is spread across availability zones, you must do the same in all relevant availability zones.

The following steps are applicable to each instance being recovered.

7. Edit the configuration files related to the database server, Ignite cluster, and Elasticsearch to form the clusters in the configuration directory.

On a standard installation, the files are located in: `C:\Program Files\Automation Anywhere\Enterprise\config`

- a) Edit the database server URL to point to the intended database server in: `boot.db.properties`.
Do not change the URL if the original server already refers to a non-localhost address.
- b) Edit the following property in the `cluster.properties` file:

Append the list with a new server IP in: `ignite.discovery.static.ips=<existing list of ips>, <current server ip>`

- c) Edit the following properties in the `elasticsearch.yaml` file:
- Add the current server address in: `node.name: "<local-ip>"`
 - Add the current server address in: `network.host: "local-ip"`
 - Leave the existing values intact and append the IP of the current server in: `discovery.zen.ping.unicast.hosts: ["ip1", "<local-ip>"]`
 - Leave the existing values intact in: `cluster.initial_master_nodes: ["<master-ip>"]`
8. Optional: If mounted, restore the repository from the same timed snapshot as the selected Control Room snapshot and mount to the respective path.
 9. Update configuration tables.
 10. Ensure Transmission Control Protocol (TCP) visibility between the nodes.
 11. Start the services on the replicated node and wait for couple of minutes the clustering to establish.
 12. Verify the following:
 - Login and check the bots are listed and visible.
 - If the installation has external Git configured, check the validity using functions such as check-in.
 - Verify the audit logs.
 13. Update the load balancer tier or DNS as needed if any host names/IPs change with corresponding current values.

Related tasks

[Replicate data between primary and secondary sites](#) on page 1188

The process of replicating the data between the primary and the secondary site involves database replication using publisher and subscriber models in Microsoft SQL Server Management Studio, server repository replication using Windows Distributed File System (DFS), and backing up Elasticsearch (audit log) data.

[Warm stand-by](#) on page 1184

Host two setups or sites - primary and backup for the warm stand-by DR procedure.

Warm stand-by

Host two setups or sites - primary and backup for the warm stand-by DR procedure.

Each setup would have following recommended configurations:

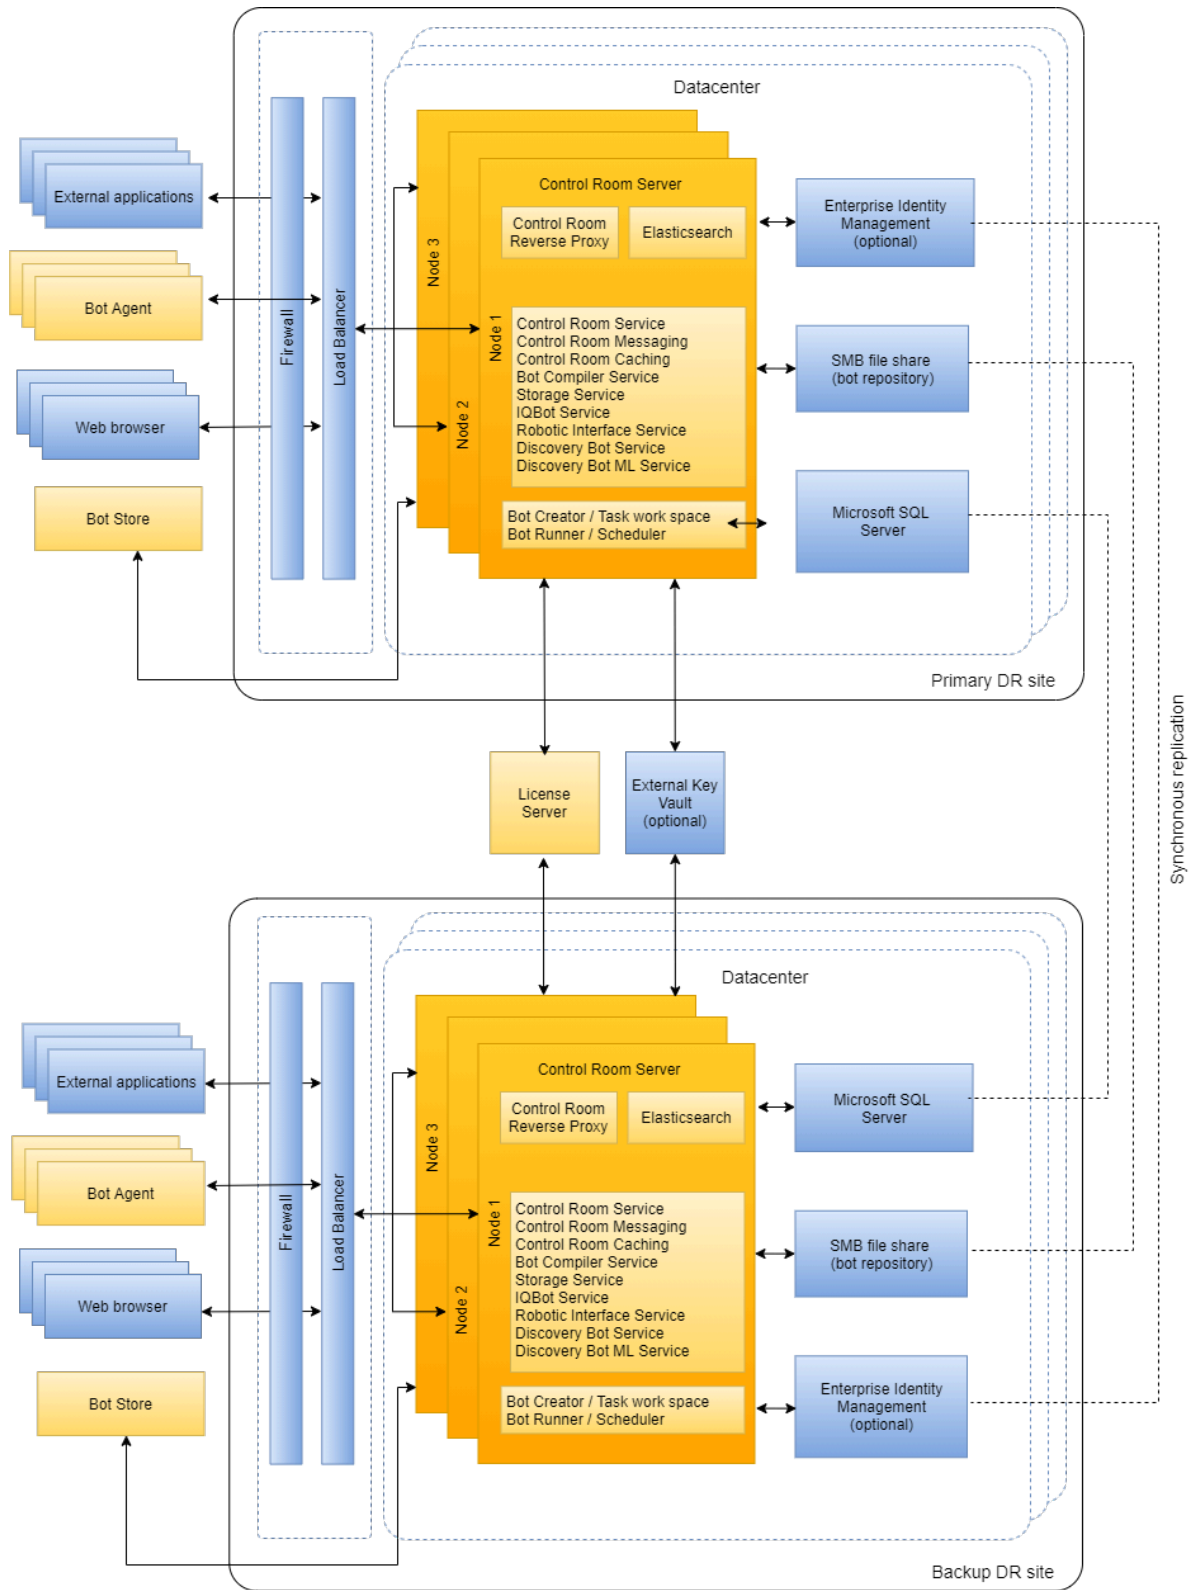

1. Automation 360 hosted in clustered mode (three nodes)
2. SQL instance
3. Repository storage (shared network drive)
4. Git repository

Synchronous replication of the data onto the backup node should be configured. The backup node should have the exact same configuration as Primary node; except for Control Room.

- To sync Git repository, back up Git repository path from primary to backup path.

- To sync SQL database, setup replication from primary to backup database.
[Replicate data between primary and secondary sites](#) on page 1188

Once configured the setup scheme would look like this:

Complete the disaster recovery deployment on the two geographically separated sites, where one site is the primary (active) site and the other is the secondary (passive) site used for backup. If the primary site cluster fails, perform recovery on the secondary site.

Note: The secondary site should be set up as a passive configuration so that the failover procedure can be performed without delay.

The procedure is identical regardless of whether you are switching over from primary to secondary, or from the secondary to primary sites. Connect the Control Room to the replicated database and shared the repository on the secondary site.

These steps apply to all the servers in the Automation 360 cluster, including the Control Room servers, SQL server, and Elasticsearch server.

1. Install Automation 360 on the secondary site.
Follow the steps for installation up to the database configuration.
[Installing Control Room using Custom mode](#) on page 1189
2. In the **Database Configuration** window, add database details for the secondary site such as the database server IP address and default port number.
[Configure Microsoft database type and server](#) on page 1198
3. Verify the Elasticsearch details in the **Provide Elasticsearch Credentials** window.
Because the Elasticsearch data is already replicated from the primary database, you do not have to provide the Elasticsearch password.
4. After the installation is complete, verify that the Control Room URL and repository path is available in the Control Room **Welcome** page.
You can change the Control Room URL and repository path after you log in to the Control Room as the next step.
5. Log in to the Control Room using your administrator credentials to change the **Configuration Settings** in **Administration > Settings**:
 - a) To allow users to access the Control Room using a public IP address, change the **Control Room Access URL** settings to point to the secondary site access URL in **General Settings > General**.
 - b) Change the **Repository path** to the secondary site repository path in **Control Room database and software > Control Room repository**.
6. Verify the data for the following:
 - Users, roles, schedule, triggers, credential information, and workload settings
 - Elasticsearch certificate and connectivity
 - Automation Co-Pilot for Business Users, Bot Insight, Discovery Bot, and IQ Bot

Note: Perform a byte-by-byte measurement of the recovered data and compare the primary and secondary site data. If you see any difference, verify the subscriber logs for any intermittent failure due to any network issue.

After the recovery site is operating as the primary site, configure a replacement secondary site. Using the database tools, set up replication from the recovery primary site to the replacement secondary site.

Replicate data between primary and secondary sites

The process of replicating the data between the primary and the secondary site involves database replication using publisher and subscriber models in Microsoft SQL Server Management Studio, server repository replication using Windows Distributed File System (DFS), and backing up Elasticsearch (audit log) data.

- The DFS requires Automation 360 v.29 or later version.
- Ensure that you have set up your secondary site before installing Automation 360 installer.

Configure the database and shared repository in the secondary site that is used for disaster recovery. Back up your Elasticsearch data by setting up the backup cluster.

1. Replicate the database from the primary site to the secondary site using the publisher and subscriber models in Microsoft SQL Server Management Studio.
-

Recommendations:

- Use the Microsoft SQL Server Developer or Enterprise edition for database replication.

The publisher and subscriber versions must be the same, or the gap between the two versions must not be more than two releases. For example, do not use Microsoft SQL Server 2012 publisher with Microsoft SQL Server 2019 subscriber.

- Configure the publisher and distributor on the same system to avoid latency in data sharing.

Use different systems only for load distribution, for example, for data larger than 200 GB.

- a) Connect to the primary database to create a snapshot publication for your local publications.
- b) Add the tables and views as articles.
- c) Use the snapshot agent option to create a snapshot and keep the snapshot available to initialize subscriptions.
- d) Schedule the snapshot agent to back up the data at regular intervals (for example, every 10 seconds from 12 AM to 11:59:59 PM).
- e) To select the account to run the snapshot agent, configure the security and agent settings.
- f) Add a publication option.
- g) Run all agent and distributors after ensuring that the publisher and database names are correct.
- h) To add subscribers to the local subscriptions, connect to the database server and provide connection details for the database at the secondary site.

For detailed steps, see [Database Mirroring and Replication \(SQL Server\)](#).

2. Replicate the repository (bots and data files) using the Windows DFS from the primary site to the secondary site.
 - a) Open the DFS on the machine where the shared repository is saved.
 - b) Create a new multipurpose replication group to add replication group members.

The group members include the source machine in the primary site and the destination machine in the secondary site to store the shared repository.

- c) Use the full mesh option for DFS replication groups composed of less than 10 servers.
- d) Use the full bandwidth option to replicate the data continuously.
- e) Add the machine where you are configuring the repository as a primary member.
- f) Add a backup folder for the shared repository from the destination machine.
- g) Verify that the data is replicated in the backup folder on the destination machine.

For detailed steps, see [Distributed File System Replication](#).

3. Back up the Elasticsearch (audit log) data by adding the secondary site cluster IP address in the Control Room on the primary site.

For detailed steps, see [Configure disaster recovery site for Elasticsearch IP addresses](#) on page 1262.

[Warm stand-by](#) on page 1184

Host two setups or sites - primary and backup for the warm stand-by DR procedure.

Installing Control Room using Custom mode

Log in to the server as an administrator and install Automation Anywhere Control Room in Custom mode to select installation and configuration options, including installing non-default requirements. Select this mode for a data center deployment.

Linux users: See [Installing Control Room on Linux](#) on page 1237.

Procedure

1. Prepare for installation
 - Verify [Automation 360 On-Premises prerequisites](#) on page 1124.
 - Ensure that you have the following:
 - Automation Anywhere Control Room installation file
 - TLS certificate
 - License file

2. [Run Control Room installer](#) on page 1191

Run the installer to verify the operating system and hardware requirements, select the deployment option, accept the licensing agreement, and select the installation file path.

3. Select the database type that you want to use
 - Microsoft SQL Server
 - Oracle

4. Use the **External key vault integration** page to configure a connection to an external key vault such as CyberArk, HashiCorp, or AWS Secrets Manager, that is optionally used for retrieving credentials for either installation or runtime purposes. Configuring the key vault connection enables retrieval options for credentials during installation. Ensure that you have the follow information:
 - All necessary database and user credentials.
 - Any necessary credential requirements for the external key vault such as secret keys, vault URL, application IDs, server certificate. See the specific requirements for your external key vault on the External Key Vault integration configure page.
5. [Configure application Transport Layer Security](#) on page 1193
Use the **Transport Layer Security (TLS) configuration** page to generate a self-signed certificate or import a security certificate to set up a highly secure Control Room instance.
6. [Configure service credentials](#) on page 1195
Use the **Service Credentials** page to specify the account that will be used to run all Windows services that are created by the installer.
7. Configure database type and server
Use the **Database type** page to configure the Microsoft SQL Server database, or Oracle Database for use with the Control Room.
 - [Configure Microsoft database type and server](#) on page 1198
 - [Configure Oracle database type and server](#) on page 1201
8. [Add Elasticsearch credentials](#) on page 1203
Add Elasticsearch credentials for enhanced monitoring and alerting in the Control Room.
9. [Configure IP cluster](#) on page 1204
Use the **Cluster Configuration** page to configure resiliency requirements. Provide only one IP address to configure the Control Room on a single node. Provide multiple (three or more) IP addresses to configure the Control Room for high availability cluster.
10. [Review the installation summary](#)
Use the **Ready to Install the Program** page to complete the installation wizard and monitor the installation progress.
11. Complete Control Room configuration and validation

Complete Control Room post-installation configuration on page 1258	After installing the Control Room, complete the configuration settings to ensure timely Automation Anywhere communications are specified and confirm Automation Anywhere services are running.
Post-installation user management on page 1312	After completing the post-installation tasks, validate the setup by logging in to the Control Room and installing a license. First-time access to the Control Room walks you through the configuration for your authentication method.
12. [Prepare for users](#)

As an administrator, you can create, view, edit, delete, and enable or disable a user. Creating users steps vary depending on whether the user is a non-Active Directory, Active Directory, or single sign-on (SSO) user from an IdP server.

Related concepts

[Migrate to Automation 360](#) on page 1436

Migration (upgrade) is the process of moving your data and bots from Enterprise 11 or Enterprise 10 to Automation 360. Migration includes but is not limited to replicating and updating your existing database and repository, converting your bots to the Automation 360 format, and migrating learning instances for IQ Bot and dashboards for Bot Insight.

Run Control Room installer

Run the installer to verify the operating system and hardware requirements, select the deployment option, accept the licensing agreement, and select the installation file path.

To install Automation Anywhere Control Room in Custom Mode, follow these steps:

1. Start the installer wizard.
 - a) Extract all files from the Automation360_Build_<build-number>.zip file.
 - b) Right-click the Automation360.exe file and select **Run as administrator**.

The installation process will create a Control Room database with the name Automation360-Database on your SQL database server instance.

However, if you are migrating from Enterprise 11 to Automation 360, the restored Enterprise 11 database will be used instead of the Automation 360 database.

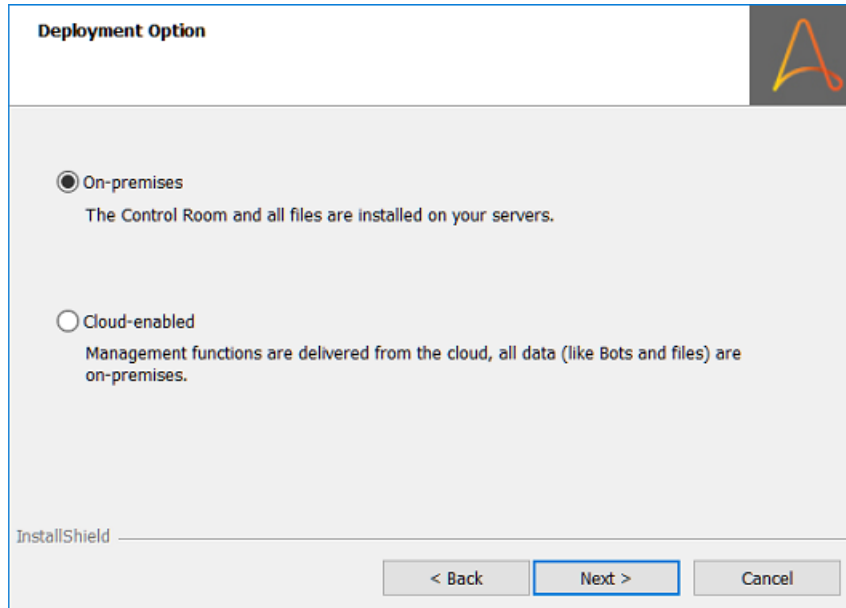

Note: Ensure the SQL database server is installed on a different server than that of the Control Room.

The installation process checks for supported operating system and recommended hardware requirements. The following message appears if the requirements are not met:

```
This system does not meet all the installation prerequisites for
Automation Anywhere Enterprise.
Some features might not work as expected after installation. For
details, verify the Control Room Installation Prerequisite.
```

For more information, see [Automation 360 On-Premises prerequisites](#) on page 1124.

2. Select the **On-Premises** deployment type and click **Next**.

In On-Premises deployment type, the Control Room, Bots and files are installed on your servers.

In **Cloud-enabled** deployment type, all data such as bots and files are installed on your servers. The management functions of the Control Room are delivered through Cloud.

3. Accept the licensing agreement and click **Next**.
4. Select the **Custom** option and click **Next**.

The **Destination Folder** page appears. By default, the destination folder is C:\Program Files\Automation Anywhere\.

5. If you are upgrading from one Automation 360 version to another, confirm the upgrade and choose whether to use the existing installation parameters.

Existing installation parameters include, for example: the installation path, HTTPS ports, database names, IP addresses, and TLS configuration. The username and password have to be manually entered.

- **Yes**—all the installation parameters are pre-filled and disabled. You cannot change pre-filled fields.
- **No**—enter the same or different installation parameters through the installation prompts.

Note: Choose **No** if the previous installation did not use the default installation path `C:\Program Files`.

6. To make changes to the destination folder, click **Change**, enter a new destination folder name, and click **OK**.

Note: Do not install the application directly in the root directory (`C:\`). You should create a folder, for example, `C:\Program Files\Automation Anywhere\Automation360\`.

7. Click **Next**.

Integrate external key vaults

You can integrate external key vaults to the Automation 360 On-Premises Control Room.

As part of your external key vault integration planning strategy, if you determined that you are using an Automation 360 On-Premises Control Room deployment (where the Control Room and external key vault are hosted at the customer's site and environment), then select from the following list of external key vaults to configure:

- CyberArk Password Vault – Customer On-Premises environment
[On-Premises integration using CyberArk Password Vault](#) on page 1870
- Azure Key Vault – Customer Azure environment
[On-Premises integration using Azure Key Vault](#) on page 1883
- AWS Secrets Manager – Customer AWS environment
[On-Premises integration using AWS Secrets Manager](#)
- HashiCorp Vault – Customer On-Premises environment
[On-Premises integration using HashiCorp Vault](#) on page 1919

Configure application Transport Layer Security

Use the **Transport Layer Security (TLS) configuration** wizard page from the Automation 360 installer to generate a self-signed certificate or import a security certificate to set up a highly secure Control Room instance.

Automation Anywhere leverages TLS 1.2 and TLS 1.3 encryptions for HTTPS and TCP communications between our components. The TLS certificates are installed on the Automation Anywhere Control Room and IQ Bot servers. The certificates are installed in .PFX format and leveraged for communications.

Note: If your load balancer uses HTTP to forward traffic to the Control Room, do not use the **Enable Force HTTP traffic to HTTPS** option. We recommend that you use HTTPS to forward the load balancer traffic for enhanced security instead.

1. In the **TLS Configuration** page, configure the following:

- Generate a Self-Signed Certificate

Enabling the **Self-Signed Certificate** option allows the installer to generate a unique private key and a self-signed certificate for the Control Room.

- Import a Certificate

To import a custom certificate, clear the **Self Signed Certificate** check box. This setting allows you to import a certificate using the **Certificate Path** field.

Note: The certificate file must be a PKCS12 format.

Provide the following information:

- **Certificate Path:** Click **Browse** to import the certificate.
- **Private Key Password:** Enter the password for the private key.

Password limitation: Do not use the at sign (@) in passwords. Using the special character @ in the password causes the certificate file import to fail.

- **Intermediate certificates .zip File:** Click **Browse** to import the certificate.

The intermediate certificate file must be a single .zip file that includes the P12 or PKCS12 certificate file format and PEM certificate file format.

Note:

- Importing intermediate certificates is supported only on Windows.
- All the certificates in the zip file must be in the top-level folder and must not contain any subfolders.
- Password-protected intermediate certificates are not supported.

-
- **Webserver Port:** Enter the web server port – either HTTP or HTTPS. If the port is already assigned, an error message is displayed.
-

Important: The port validation message is also displayed when you add 8080 for the web server and if that port is already in use for a Control Room license service. Use a different unassigned port in these cases.

- **Enable Force HTTP traffic to HTTPS:** This option redirects all HTTP port requests to HTTPS. To access to the Control Room through HTTPS using the generated self-signed certificate, ensure the port numbers are different for HTTP and HTTPS.

To generate a custom certificate for HTTPS, ensure your custom certificate meets the following:

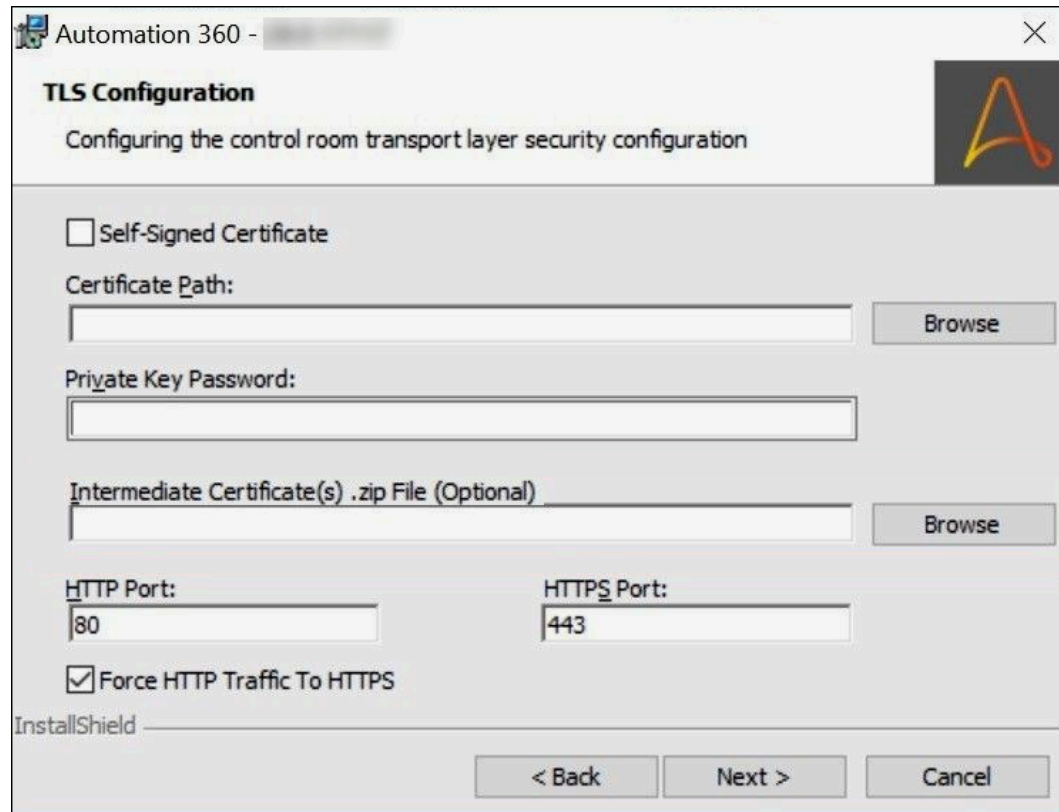

- Create a .pfx certificate with a pass code from a CA trusted authority.
- Combine Root, Intermediate, and Machine level certificates into a single certificate.
- Use the format [WS Machine Host Name].[DomainName].com for the private key.
- Include the host name as a fully qualified domain name (FQDN) in the certificate.

You provide the host name during Control Room installation.

- In multi-node HA clusters, issue certificates to the load balancer DNS name.
- Add individual URLs, which require access to all nodes, to the Subject **Alternative Name** field in the certificate.

For more information, see Automation Anywhere support site: [Automation 360 On-Premises prerequisites \(A-People login required\)](#).

The following sample illustration shows options for importing a custom certificate:

2. Click **Next** to configure service credentials.
[Configure service credentials](#) on page 1195

Related tasks

[Change Control Room configuration to HTTPS from HTTP mode](#) on page 1326

If your Control Room is configured for HTTP mode, you can change the configuration to HTTPS mode. You must use a self-signed certificate either before or after performing a custom Control Room configuration.

[Import HTTPS, intermediate, and CA certificates](#) on page 1327

After you install the Control Room for an On-Premises deployments, you can use the Windows or Linux command prompt to import all or some of these certificate:

Configure service credentials

Continue from the Control Room installer to the **Service Credentials** wizard page. Use this page to specify the account that will be used to run all Windows services that are created by the Automation Anywhere installer.

1. In the **Service Credentials** screen, choose from the listed options.
The Windows Service credentials include a user name and password. The user specified must meet these requirements:

- Have permission to manage services, including Automation Anywhere services.
- If you use Windows authentication to connect to the SQL database, ensure you grant the `db_owner` permission to the service credential user.

These service credentials allow the Control Room processes to run the required services.

- **Local System Account**—(default) The logged-on user performing the installation.
 - **Use a Group Managed Service Account**—Specify to manage Automation 360 services.
 - a) Clear the **Local System Account** check box.
 - b) Select the **Use a Group Managed Service Account** option.
 - c) Enter the user name only. No password is required to use this option.

[Group Managed Service Accounts Overview](#)

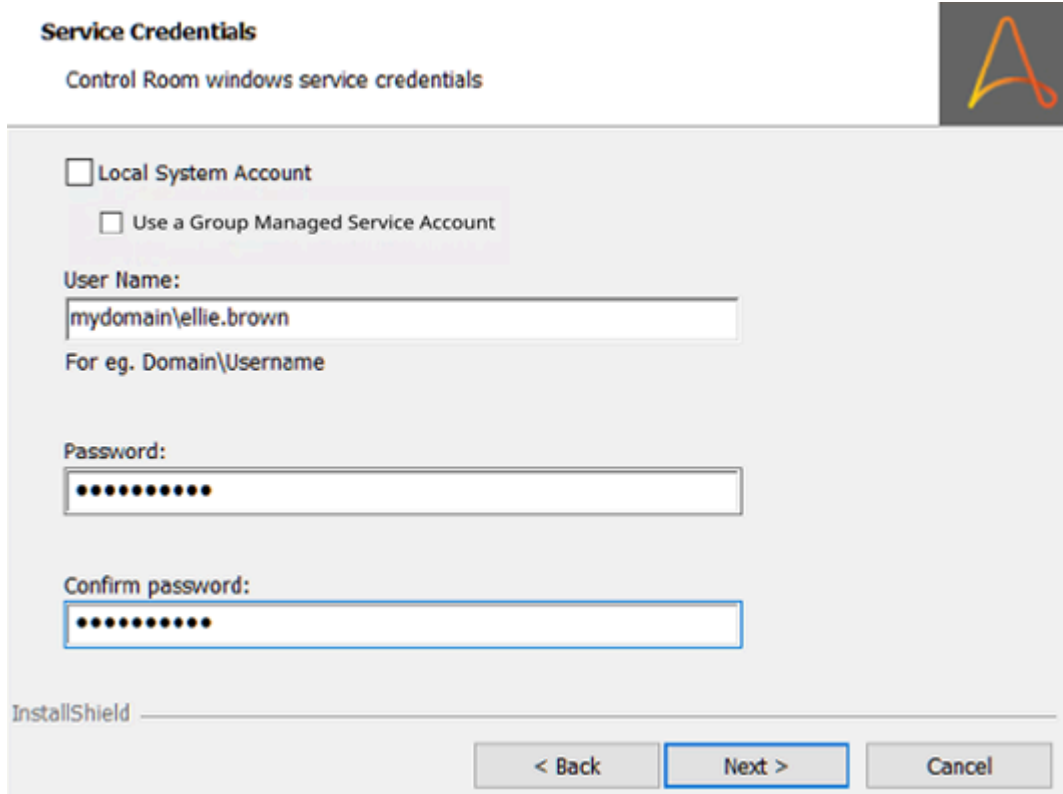

- **Domain Account**—Specify a user that is not the local system account user
 - a) Clear the **Local System Account** check box.
 - b) Enter the user name and password for the domain account.

Use only supported characters for the user name and password. See [Supported special characters](#) on page 1161.
- Do not use the Windows domain credentials

Enter credentials valid for running Automation Anywhere services. Without the valid credentials, the Control Room will fail to launch.
- PowerShell script restrictions

Specify a user with permissions to launch PowerShell scripts who is not a Windows domain user. Without the relevant permissions, database table creation can fail.
- **Service Account (manually enter credential)**
 - a) Enter username.
 - b) Enter password.
- **Service Account (optionally retrieve service account credential from the previously configured external key vault)**
 - a) If using CyberArk, enter the safe name and object name for the credential.
 - b) If using AWS Secrets Manager, enter the secret name.
 - c) If using Azure, enter the vault URL.

The following example shows selection of a domain account:

Service Credentials

Control Room windows service credentials

Local System Account

Use a Group Managed Service Account

User Name:
mydomain\ellie.brown
For eg. Domain\Username

Password:
●●●●●●●●

Confirm password:
●●●●●●●●

InstallShield

< Back Next > Cancel

2. Click **Next**.

Select Control Room services to automatically run at startup

Continue from the Control Room installer to the Control Room Service Startup Options wizard page. Use this page to select the Control Room services that you want to automatically run at startup.

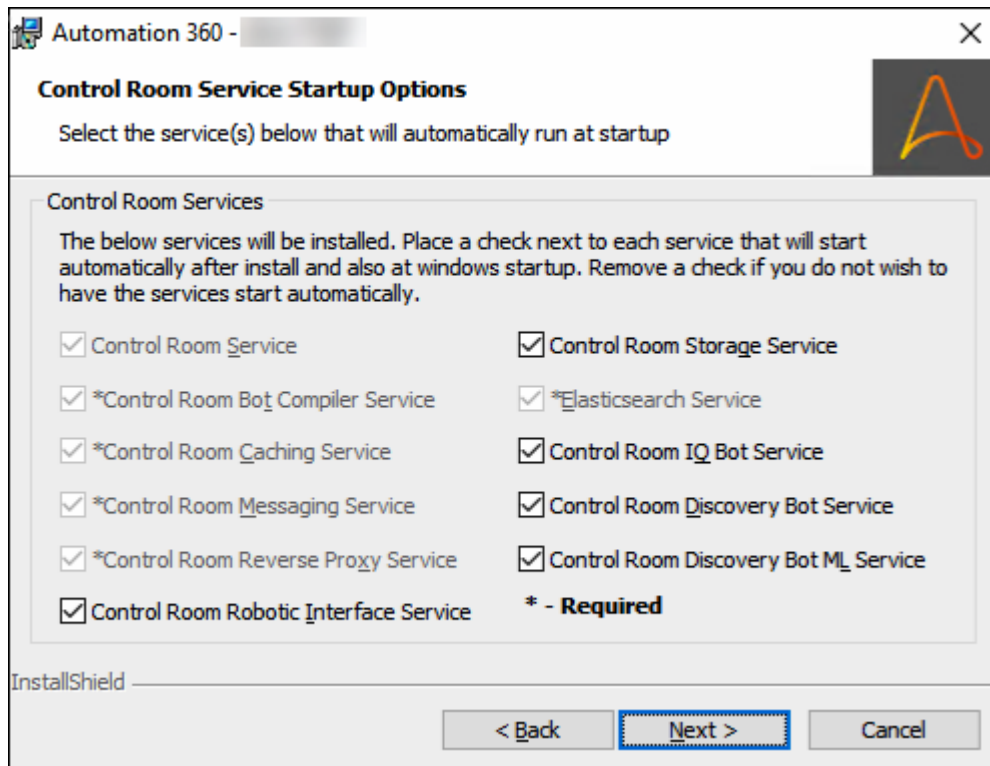

All the services will be installed on the device. However, only the selected services will automatically run at startup. If required, you can manually start the unselected services from the Windows Services application.

1. In the **Control Room Service Startup Options** screen, select the services that you want to automatically run at startup.

Note:

- To ensure effective utilization of computational resources, you can choose the Control Room services that are applicable to your environment. However, ensure that you do not exclude any of the dependent services.
 - For those services that you do not include to run at startup when installing the Automation 360 On-Premises Control Room, a `products.notinstalled` file is created in the config files directory that you can open using a text editor. This file includes the name of the services that were not selected when installing the Automation 360 On-Premises Control Room. For information about the directory structure, see [Installed Control Room directories and files](#) on page 1338.
-

2. Click **Next**.

Configure Microsoft database type and server

Continue from the Control Room installer to the **Database type** wizard page. Use this page to configure the Microsoft SQL Server database for use with the Control Room.

This procedure applies only to Microsoft Windows Server based installations.

Linux users: See [Installing Enterprise Control Room on Linux - Database configuration](#).

If you are installing Automation 360 as part of migration, this task includes the step to select the Enterprise 11 (cloned) database.

1. Select the **Microsoft SQL Server** database.
An instance of the SQL Server should be already configured.
2. Click **Next**.
The **Database Server** page is displayed (if you selected **SQL Server** for configuring your database).
3. Set the connection and authentication for the database server.
To configure the **Database Server** for the Control Room instance, use the default **Database Server** port 1433. If multiple instances are running on the same database host on different ports, you can use the corresponding custom port for that instance (for example, 1435 or 1437).

Note: The instance name is not supported in the **Database Server** field.

Note:

- If possible, do not set the value for **Database Server** as **localhost**. If you must use **localhost**, note that the **Secure Connection** to the database will not work.
-
- Click **Browse** to select the SQL Server instance where the Control Room database will be created. Alternatively, enter a database server name or select one from the list.

Migration task: If you are migrating from Enterprise 11 to Automation 360, browse to the restored Enterprise 11 database.

Provide the following details:

- a) Database Port:** Use the default port (1433) or specify a custom value.

[Configure default database port](#) on page 1201

- b) Use Secure Connection:** Select to use a CA certificate as specified.

Note: Use the same host name for certificate and database connections.

- c) Certificate:** This option is enabled when you select **Use Secure Connection**. Browse to select a CA certificate.

[Import HTTPS, intermediate, and CA certificates](#) on page 1327

- d)** Select one of the following for database authentication:

- **Windows authentication:** This option is selected by default and allows connection to the SQL Server using Windows authentication.

Note: If you select Windows authentication, then the user running the installer is used to test that the database exists, create it if required, and grant `db_owner` to the service account user (NT Authority/System).

- **SQL Server authentication:** (manually enter credential) Select this option to use SQL Server authentication to connect to the database. Provide the correct user name and password for SQL authentication.

1. Enter username.
2. Enter password.

- **SQL Server authentication:** (retrieve credential from external key vault) Select this option to use SQL Server authentication to connect to the database.

Note: SQL Server Authentication is required if you will retrieve the credentials for the database from an external key vault.

1. If using CyberArk, enter the safe name and object name.
2. If using AWS Secrets Manager, enter the secret name.
3. If using HashiCorp Vault, enter the HashiCorp secret name.

- **AD Azure authentication:** Select this option to use Microsoft Azure Active Directory credentials to connect to the database when you install the Control Room on Microsoft Azure.

Use only supported characters for the user name and password. See [Supported special characters](#) on page 1161. Do not use semicolons (;) in the database password.

- e) **Name of Control Room database:** Enter the name of the Control Room database.

Migration task: If you are migrating from Enterprise 11 to Automation 360, enter the name of the restored database in the database field as shown in the following image:

The screenshot shows the 'Database Server' configuration window. The 'Database Server' dropdown is set to '(local)\SQLEXPRESS' and the 'Database Port' is 1433. The 'Use Secure Connection' checkbox is checked. Under 'Authentication', 'Windows authentication' is selected. The 'Name of Control Room database:' field is highlighted with a red box and contains the text 'Restored-11.x-Database'. The 'Next >' button is highlighted with a blue box.

The following sample illustration shows SQL Server authentication for database

The screenshot shows the 'Database Server' configuration window with 'Sql Server authentication' selected. The 'Login ID:' field contains 'sa' and the 'Password:' field is masked with dots. The 'Name of Control Room database:' field contains 'Automation360-Database'. The 'Next >' button is highlighted with a blue box.

connection:

4. Click **Next** to provide the Elasticsearch credentials.
[Add Elasticsearch credentials](#) on page 1203

Configure default database port

Configure and enable the TCP/IP in the SQL database server to use the default port 1433 when you install the Control Room.

Enable TCP/IP from the Microsoft SQL Server Configuration Manager.

Transparent Data Encryption (TDE) is a function of Microsoft SQL Server database. Additional configurations are not required on the Control Room as the TDE supportability is managed by Microsoft. For more information, see [Transparent data encryption \(TDE\)](#) and [Transparent data encryption for SQL Database](#).

1. Ensure the SQL Server Browser service is running in the Task Manager.
2. To set the default port for the SQL database server, launch the Microsoft SQL Server Configuration Manager.
3. Select **SQL Server Network Configuration > Protocols for <SQL server instance>**.
4. Right-click **Protocols for <SQL server instance>** and select **Open** to show the available protocols.
5. Ensure **TCP/IP** is enabled.
6. Right-click **TCP/IP** and select **Properties**.
You can configure the default port for the SQL database from the **TCP/IP Properties** window that is displayed.
7. Select the **IP Addresses** tab to update the default **TCP Port** to **1433** in the **IPAll** node.
If provided, clear the value shown in the **TCP Dynamic Ports** field.
8. Click **OK** to confirm and exit the window.
9. Select the **SQL Server Services** option to **Restart** the **SQL Server <instance name>**.
The SQL database server is now configured and enabled to use the default port in the Control Room.

Configure Oracle database type and server

Configure the Oracle Database Server for use with the Control Room by using the Database type wizard page.

This procedure applies only to installations based on Microsoft Windows Server.

Oracle must be installed on a machine that is accessible from the Automation 360 Control Room.

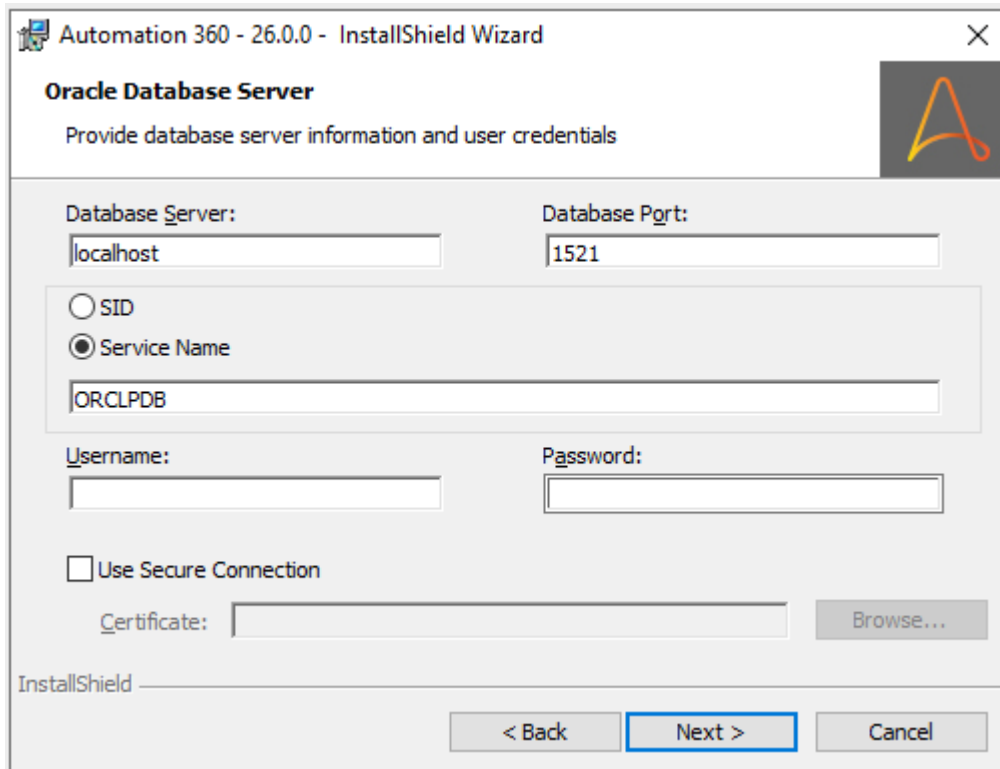

Create users for Automation Anywhere to access the Database.

This is supported only on non-container Database. Oracle installation is supported only for first-time setup of Automation Anywhere. Oracle installation does not support updates.

Note: Oracle database for Control Room installation is supported only in Custom mode and not in Express mode.

1. Select **Oracle** database.
An instance of the Oracle Server must be configured already. For more information, see [Installing Control Room using custom mode for Oracle installation](#) on page 1211.
2. Click **Next**.
The Oracle Database server page is displayed (if you selected Oracle for configuring your database).

The following sample illustration shows Oracle Database Server authentication for database connection:

3. Set the connection and authentication for the database server. Provide the following details:
 - a) **Database Server:** Enter the server name or IP address of the Oracle Database server. The **localhost** IP address can be used.
 - b) **Database Port:** Enter your database server port number. The default port is 1521.
 - c) For the connection, select one of the following options and enter the name of your Oracle instance in the text field:

Option	Action in text field (example)
SID	ORCL
Service name	ORCLPDB

Note: The SID and service name entered in the text field provided is unique to your Oracle database. The Oracle instance name entered in the text field is not case-sensitive.

4. In the **Username** field, enter your Oracle database user or schema name.
 5. In the **Password** field, enter the password for the user or schema name.
 6. **Use Secure Connection:** Select to use a CA certificate as specified.
- Note:** Use the same host name for certificate and database connections.
7. **Certificate:** This option is enabled when you select **Use Secure Connection**. Browse to select a CA certificate.

[Import HTTPS, intermediate, and CA certificates](#) on page 1327

8. Click **Next.**

The database connection begins validating for the database server and the elastic search.

9. Enter the Elasticsearch credentials in the fields provided.

[Add Elasticsearch credentials](#) on page 1203

Add Elasticsearch credentials

When installing Automation 360, add Elasticsearch credentials for enhanced security.

Based on whether you are performing a new installation, running the setup for the first time to upgrade to a later version, or a subsequent re-installation, the options to add the Elasticsearch credentials or select a backup Elasticsearch server are enabled.

1. In the **Provide Elasticsearch Credentials window, enter the credentials for Elasticsearch in the **Elasticsearch password** field.**

Important: Ensure the following for your Elasticsearch authentication password:

- The password cannot include a space, semicolon (;), percent (%), or backslash (\).
- The first character cannot be a minus sign (-) or forward slash (/).
- Include at least one alphabetical character.

This option is enabled only for the primary node of the cluster when you run the setup for the first time for an upgrade or a new installation of the Control Room. When you enter the password, self-signed certificates are generated for encrypting the data traffic for inter-node and client communication.

The option is disabled for subsequent installations because the password and certificates are retrieved and reused from the second node onwards.

2. Repeat the credentials in the **Confirm Elasticsearch password field.**

3. Select the **Check only if installing on the first node of the backup Elasticsearch cluster** check box when you want to install the Control Room on the primary node that will be used as a backup for the Elasticsearch cluster.

This option is available only if you have provided the Elasticsearch credentials for the primary node during a previous installation. The option enables you to use the database backup that is created from the Elasticsearch settings table after the primary node of the cluster is installed.

The option is disabled for subsequent installations.

4. Click **Next** to configure the IP cluster.

If you encounter errors when performing this task, see these resources:

- Error on storing Elasticsearch certificate to database, see [Installation error storing Elasticsearch certificate to database \(A-People login required\)](#).
- Error restarting the Automation Anywhere Elastic Search Service, see [Automation 360 v.16 upgrade error: Elasticsearch Service fail to start during certificate retrieval process \(A-People login required\)](#).

[Configure IP cluster](#) on page 1204.

Configure IP cluster

Use the **Cluster Configuration** wizard page under **Custom installation type** in Control Room installer to configure resiliency requirements. Select the **Enable Cluster setup** option and for high availability cluster, provide multiple (three or more) IP addresses from your cluster setup.

Before you install Control Room in cluster mode:

- Ensure that the default/custom and configurable firewall, port, and protocol requirements for Automation 360 deployment are configured. For more information, see [Ports, protocols, and firewall requirements](#) on page 1147.
- Ensure that the network location (UNC) path is configured to access the repository files from all Control Room nodes in the cluster.

Ensure that the Network Attached Storage (NAS) file sharing can be configured using Server Message Block (SMB) protocol.

- Ensure that all nodes that will be configured for the IP cluster are available for configuration before the installation. Also, while installing on each of the node, ensure that the list of IP addresses of all nodes are provided in the same order when configuring the **Cluster IP addresses** field in **Cluster Configuration** wizard page.
- Ensure to sign all the PowerShell files if the machine on which you are installing Automation 360 has MachinePolicy as AllSigned or UnRestricted. For example on how signing in a Windows PowerShell script, see [Signing in Windows PowerShell scripts](#).

To view the MachinePolicy on your machine, run the following command in PowerShell:

```
Get-ExecutionPolicy -List
```

You can find the following PowerShell files in the temp folder:

- servicecredsvalidate
- getsysip
- getfileprodversion
- ecertprocess
- createstorageables

- createpddtables
- createiqbottables
- createcrdbtables
- createaaridbtables

Example of a temp folder path: C:\Users\ADMINI~1\FD\AppData\Local\Temp\.

Note: GUID is generated dynamically for each installer session.

A sample URL for reviewing the health of the cluster is:

```
https://<cr ip>:47599/_cat/health?pretty
```

You are prompted to enter the following credentials:

- Username: es_client (default)
- Password: <your set_ elastic_search_password>

A green or yellow color icon is displayed for a healthy cluster.

1. Select the **Enable Cluster Setup** check box.
2. If the nodes in your network use IPv6 address, select the **IPv6** check box.
3. Enter the IP addresses of the nodes in the cluster.

Use a comma (,) to specify more than one IP address. For example, to specify three IP addresses in the cluster, enter: 192.0.2.1,192.0.2.2,192.0.2.3

Note: The first IP address in the list is used as the initial master node. Ensure that you enter the IP addresses in the same order on all node configurations in subsequent installations.

You can install multiple nodes at the same time after the master node is installed. After installation, you can add a new IP address to the cluster at the end of the list. However, you cannot change the IP address version (such as IPv4 to IPv6).

4. Select an IP address from the **Local IP Address** drop-down list.
If multiple local IP addresses are configured on the machine, ensure that you select an IP address (private IP address recommended) on which the Control Room is

installed, as it will be used by other nodes internally to communicate with each other.

5. Click **Next** to complete the Control Room installation process.
6. Optional: To review or monitor the installation progress, see [Setup installation summary](#) on page 1211.

Add nodes to a cluster setup

As an RPA platform administrator, you can add nodes to a cluster for better performance and better load distribution.

Ensure the following:

- Verify whether the prerequisites for on-premises installation are met.

[Automation 360 On-Premises prerequisites](#) on page 1124

- Verify that all the primary nodes and databases have backups.
- You must have the IP addresses of all the cluster members for the Control Room server network interfaces used for Elasticsearch communications.

Note: The Control Room servers can have multiple network interfaces. The server IP addresses must be statically assigned and cannot use the Dynamic Host Configuration Protocol (DHCP).

- If any external load balancers are used in the environment, update them with IP addresses from the new server nodes.
- Ensure that you have administrator or root privileges on the Control Room servers. You must be familiar with installing Control Room in custom mode and also with the related configuration settings.

Adding nodes to a cluster helps you to upgrade the configuration of the nodes in a cluster. You can add nodes to a Control Room cluster setup, change the IP addresses of nodes in the cluster, and monitor the health of the underlying cluster services.

Note: The minimal number of nodes supported within a Control Room cluster is three. The nodes in a cluster synchronize with each other over a local network. All the nodes in a cluster connect to the same database.

Perform the following steps to add three nodes (N4, N5, and N6) to a cluster that has three nodes (N1, N2, and N3).

1. On node N4, log in to the operating system as an administrator and run the Control Room installer.
2. Proceed through the installer to the cluster configuration.
 - a) Select **Enable Cluster Setup**.
 - b) In the **Cluster IP addresses** box, enter the IP addresses of all the nodes that you need to configure in the cluster.
172.31.30.120, 172.31.21.216, 172.31.17.110, 172.31.20.242,
172.31.17.149, 172.31.18.37
 - c) Select or add your Local IP address.

Note: The IP addresses must be entered in the same sequence on every node.

3. Restart the nodes, one at a time.
After you restart the nodes, each node will have six IP addresses.
4. Complete the remaining steps to install Control Room.
[Installing Control Room On-Premises](#) on page 1121
5. Repeat the steps 1 on page 1207 through 4 on page 1207 for nodes N5 and N6.
6. Ensure that all the Control Room services have started for all the nodes.
7. To verify the health of the cluster, use the Elasticsearch API through a browser or API tool.
 - a) From a browser, navigate to the IP address of any node in the cluster by using the Elasticsearch port 47599 and use the `_cat/nodes` API.
`https://172.31.30.120:47599/_cat/nodes`
The master node is indicated by an asterisk character (*).
 - b) Verify that the IP address of the master node is the same as the one mentioned in the `elasticsearch.yml` file for all the nodes.

- c) From a browser, navigate to the IP address of any node in the cluster by using the Elasticsearch port 47599 and use the `_cat/health?pretty` API.
`https://172.31.30.120:47599/_cat/health?pretty`

You must wait until the replication status turns green. The replication time varies depending on the data load in the clusters. The replication status turns green when the cluster is fully synchronized.

Update nodes in a cluster setup

In a multi-node cluster setup, when you update from Automation 360 v.27 and earlier versions to Automation 360 v.28 and later versions, the installation might fail if any Elasticsearch (ES) index created by ES 6.x is present.

- Ensure that all the Control Room services (except Elasticsearch service) are stopped in all the nodes in the three-node cluster.
- Ensure that the Automation Anywhere Elastic Search Service is up and running before you run the installer on the node.

Note: This procedure is applicable to Automation 360 v.28 and later versions.

You can update only ES indices created by ES v7.x and cannot update the ES v6.x indices. You must update all the ES indices from ES 6.x to ES 7.x before you update to Automation 360 v.28 and later versions. This example describes how to update a three-node cluster.

Consider you have three nodes with the following IP addresses:

- N1: 10.239.178.41
- N2: 10.239.178.6
- N3: 10.239.180.39

To successfully update to Automation 360 v.28 and later versions, you must perform the following steps:

1. Identify the Elasticsearch (ES) master node by running the below API from any browser on any one of the three Control Room nodes.

```
GET https://<ES_IP>:<ES_PORT>/_cat/nodes?v=true&h=id,ip,port,v,m
```

A prompt for the Elasticsearch username and password displays while running the API.

For example,

```
curl -k -X GET --user username: password
```

```
https://10.239.180.39:47599/_cat/nodes?v=true&h=id,ip,port,v,m
```

Note: The master node is indicated by an asterisk character (*)

In this example, N1(10.239.178.41) is master node when Automation Anywhere Elastic Search Service is running all three nodes.

2. Start with the current Elasticsearch master node (N1), run the installer (v.28 or later) on N1(10.239.178.41) and complete the configuration.
The N1(10.239.178.41) is on Automation 360 v.28 or later version after the successful installation.
3. Stop the Automation Anywhere Elastic Search Service on N1(10.239.178.41).
4. Identify the next ES master node by running the API request from any browser on N2(10.239.178.6) and N3(10.239.180.39).

If N2(10.239.178.6) is the next ES master node, run the installer (v.28 or later) on N2(10.239.180.39) and complete the configuration. Otherwise, proceed with N3(10.239.180.39) ES master node update.

In this example, N2(10.239.178.6) is the next ES master node.

5. Run the installer (v.28 or later) on N2(10.239.178.6) and complete the configuration.
After the successful installation, N1(10.239.178.41) and N2(10.239.178.6) are on Automation 360 v.28 or later version with the OpenSearch libraries.
6. Verify that N3(10.239.180.39) is still the current ES master node by running the API request from any browser on N3(10.239.180.39).
7. Start the Automation Anywhere Elastic Search Service on N1(10.239.178.41).
8. Stop the Automation Anywhere Elastic Search Service on N3(10.239.180.39).
9. Identify the next ES master node by running the API request from any browser on N1(10.239.178.41) and N2(10.239.178.6).
10. Start the Automation Anywhere Elastic Search Service on N3(10.239.180.39).
11. Run the installer (v.28 or later) on N3(10.239.180.39) and complete the configuration.
All the cluster nodes, N1(10.239.178.41), N2(10.239.178.6), and N3(10.239.180.39) are updated to Automation 360 v.28 or later version with the OpenSearch libraries.

Remove nodes from a cluster setup

As an RPA platform administrator, you can remove nodes from a Control Room cluster setup to replace them or upgrade them for enhanced performance.

Ensure the following:

- Verify that all the primary nodes and databases have backups.
- Ensure that you have administrator or root privileges on the Control Room servers.

Perform the following steps to remove three nodes (N1, N2, and N3) from a cluster that has six nodes (N1, N2, N3, N4, N5, and N6).

1. Verify the master node. Use the following Elasticsearch API through a browser or API tool to identify the master node:
`https://172.31.18.37/_cat/nodes`
2. Log in to the server as an administrator and stop all the Control Room services by running the following command:
`services.msc`
Log in to any of the original nodes N2 or N3 and not the master node N1.

3. Similarly, stop all the Control Room services for the master node N1.
4. Before removing the nodes, verify the health of the cluster by using the following Elasticsearch API through a browser or API tool:
From a browser, navigate to the IP address of any node in the cluster by using the Elasticsearch port 47599 and use the `_cat/nodes` API.

```
https://172.31.18.37/_cat/nodes
```

Note: The master node is indicated by an asterisk character (*).

5. Edit the `cluster.properties` file located at `C:\Program Files\Automation Anywhere\Automation 360\config`.
 6. Remove the IP addresses for the original three nodes from the `cluster.properties` attribute.
-

Note: Perform this action for all the nodes in the cluster. When you remove the IP addresses of the original three nodes, do not change their sequence.

7. Edit the `elasticsearch.yml` file at `C:\Program Files\Automation Anywhere\Automation 360\elasticsearch\config`.
 8. Remove the IP addresses for the original three nodes from the `discovery.zen.ping.unicast.hosts` attribute.
-

Note: The `discovery.zen.ping.unicast.hosts` attribute must contain the IP addresses only for the new nodes and in the same sequence within the file on each node.

9. To verify the new master node, use the following Elasticsearch API through a browser or API tool:

```
https://172.31.18.37/_cat/nodes
```
10. Update the IP address of the new master node in the `cluster.initial_master_nodes` attribute.
11. Run the following command to start the services on each node:

```
services.msc
```

You must start the services on the master node at the end.

12. To verify the health of the cluster, use the Elasticsearch API through a browser or API tool.
 - a) From a browser, navigate to the IP address of any node in the cluster by using the Elasticsearch port 47599 and use the `_cat/nodes` API.

```
https://172.31.30.120:47599/_cat/nodes
```
-

Note: The master node is indicated by the asterisk character (*).

- b) From a browser, navigate to the IP address of any node in the cluster by using the Elasticsearch port 47599 and use the `_cat/health?pretty` API.

```
https://172.31.30.120:47599/_cat/health?pretty
```

You must wait until the replication status turns green. The replication time varies depending on the amount of data in the clusters. The replication status turns green when the cluster is fully synchronized.

Setup installation summary

Continue from the Control Room installer to the **Ready to Install the Program** wizard page. From this stage of the installation wizard, you finish the installation wizard and monitor the installation progress.

1. Click Next.

The **Ready to Install the Program** screen appears.

2. Click Install and allow the installation process to complete.

The **InstallShield Wizard Completed** screen appears.

3. Click Finish.

Launch Automation Anywhere is enabled by default.

Enable **Show installer settings** to open the `aae-installsummary.html` file. By default, this is located at `C:\Program Files\Automation Anywhere\Enterprise\`. Use this file to view a summary of the installation.

Complete the Control Room configuration and validation.

- [Complete Control Room post-installation configuration](#) on page 1258

After installing the Control Room, complete the configuration settings to ensure timely Automation Anywhere communications are specified and confirm Automation Anywhere services are running.

- [Post-installation user management](#) on page 1312

After completing the post-installation tasks, validate the setup by logging in to the Control Room and installing a license. First time access to the Control Room walks you through the configuration for your authentication method.

- [Users](#) on page 1676

As a Cloud user with administrator permissions, you can create, view, edit, delete, and enable or disable a user. Creating users steps vary depending on whether the user is a non-Active Directory, Active Directory, or single sign-on (SSO) user from an IdP server.

Related tasks

[Installing Control Room using Express mode](#) on page 1213

Installing Control Room using custom mode for Oracle installation

Install the Automation Anywhere Control Room using Oracle Database for On-Premises and complete the installation in the Control Room.

Ensure the following:

- Oracle Database is preconfigured in your environment before you complete the Control Room installation.
- Oracle 19c On-Premises or over AWS RDS Oracle is supported. Ensure that the following settings are enabled with version 19c:
 - The value of the Oracle instance `max_string_size` parameter is set to EXTENDED.
 - If you want to use the SSL/TLS connection for the database, it is required that you configure TLS on the Oracle Server.

- Oracle credentials are created. Database credentials must be created and the following grants must be provided: CONNECT, RESOURCE, CREATE TABLE, CREATE VIEW.

Note: The QUOTA on tablespace USERS is UNLIMITED.

Note: External vault integration is not supported on Oracle-based Windows Control Room installation.

Procedure

1. Prepare for installation

- Verify [Automation 360 On-Premises prerequisites](#) on page 1124.
- Ensure that you have the following:
 - Automation Anywhere Control Room installation file
 - TLS certificate
 - License file

2. Run Control Room installer on page 1191.

Run the installer to verify the operating system and hardware requirements, select the deployment option, accept the licensing agreement, and select the installation file path.

Note: Ensure that you select Oracle for **Database type**.

3. Configure application Transport Layer Security on page 1193.

Use the **Transport Layer Security (TLS) configuration** page to generate a self-signed certificate or import a security certificate to set up a highly secure Control Room instance.

4. Configure service credentials on page 1195.

Use the **Service Credentials** page to specify the account that will be used to run all Windows services that are created by the installer.

5. Configure Oracle database type and server on page 1201

Use the **Database type** page to configure the Oracle Database for use with the Control Room.

6. Add Elasticsearch credentials on page 1203.

Add Elasticsearch credentials for enhanced monitoring and alerting in the Control Room.

7. Configure IP cluster on page 1204.

Use the **Cluster Configuration** page to configure resiliency requirements. Provide only one IP address to configure the Control Room on a single node. Provide multiple (three or more) IP addresses to configure the Control Room for high availability cluster.

8. Review the installation summary.

Use the **Ready to Install the Program** page to complete the installation wizard and monitor the installation progress.

9. Complete Control Room configuration and validation.

[Complete Control Room post-installation configuration](#) on page 1258

After installing the Control Room, complete the configuration settings to ensure that timely Automation Anywhere communications are specified and confirm that Automation Anywhere services are running.

[Post-installation user management](#) on page 1312

After completing the post-installation tasks, validate the setup by logging in to the Control Room and installing a license. First-time access to the Control Room walks you through the configuration for your authentication method.

10. Prepare for users.

As an administrator, you can create, view, edit, delete, and enable or disable a user. The steps for creating users can vary depending on whether the user is a non-Active Directory, Active Directory, or single sign-on (SSO) user from an IdP server.

Installing Control Room using Express mode

Log in to the servers as an Administrator and install Automation Anywhere Control Room in Express Mode using the default settings.

Note: Linux users, see [Installing Control Room on Linux](#) on page 1237.

- Verify [Automation 360 On-Premises prerequisites](#) on page 1124.
- Ensure that you have the following:
 - Automation Anywhere Control Room installation file
 - TLS certificate
 - License file

Important: This installation mode is ideal for demo and training purposes. This installation mode is not recommended for the production environment.

The Express Mode installation quickly sets up the Control Room with default parameters for the various components.

Default parameters

Microsoft SQL Server is the default database for Control Room.

The following parameters are installed by default:

Parameter	Default value
SQL database instance	SQLEXPRESS
Authentication type	Windows authentication
Control Room database	Automation360-Database

Parameter	Default value
Port	1433

To install Automation Anywhere Control Room in Express Mode, follow these steps:

1. Log in to the installation server.
2. Start the installer wizard.
 - a) Extract all files from the Automation360_Build_<build-number>.zip file.
 - b) Right-click the Automation360.exe file and select **Run as administrator**.

The installation process creates the Control Room database with the name Automation360-Database on your SQL database server instance.

Note: Ensure the SQL database server is installed on a different server than that of the Control Room.

The installation process checks for supported operating system and recommended hardware requirements. The following message appears if the requirements are not met:

```
This system does not meet all the installation prerequisites for
Automation Anywhere Enterprise.
Some features might not work as expected after installation. For
details, verify the Control Room Installation Prerequisite.
```

For more information, see [Automation 360 On-Premises prerequisites](#) on page 1124.

3. Click **Next** on the **Welcome to the Setup Wizard** page.
4. Select one of the following deployment types and click **Next**:

Deployment type	Description
On-Premises	The Control Room, Bots and files are installed on your servers.
Cloud-enabled	All data such as bots and files are installed on your servers. The management functions of the Control Room are delivered through Cloud.

5. Accept the licensing agreement and click **Next**.
6. On the **Installation Type** page, select the **Express** option and click **Next**.

The **Database Server** configuration page appears.

- a) Enter the port you want to use to connect to the database server in the **Port** field. The default port is 1433. The installer uses the first available port and checks the availability of each consecutive port.
- b) Select any one of the following options to connect to the database server.

Option	Action
Use Windows Authentication	The system uses your Windows credentials. The Login ID and Password fields are disabled in the installer.

Option	Action
Sql Server authentication	Enter the Login ID and Password used for connecting to the database server.
AD Azure authentication	Enter the Login ID and Password used for connecting to the database server. Select this option to use Microsoft Azure Active Directory credentials to connect to the database when you install the Control Room on Microsoft Azure.

Note: The user who connects to the database server must have database creator privileges.

- c) Enter the name of the database that you want to use for Control Room in the **Name of Control Room** database field.
7. Click **Next** on **Provide Elasticsearch credentials** page to configure Elasticsearch for enhanced monitoring and alerting in the Control Room.

Important: Ensure the following for your Elasticsearch authentication password:

- The password cannot include a space, semicolon (;), percent (%), or backslash (\).
- The first character cannot be a minus sign (-) or forward slash (/).
- Include at least one alphabetical character.

This option is enabled only for the primary node of the cluster when you run the setup for the first time for a new installation or an upgrade of the Control Room. When you enter the password, self-signed certificates are generated for encrypting the data traffic for inter-node and client communication.

The option is disabled for subsequent installations because the password and certificates are retrieved and reused from the second node onwards.

8. Optional: When you want to install the Control Room on the primary node that will be used as a backup for the Elasticsearch cluster, select the **Check only if installing on the first node of the backup Elasticsearch cluster** check box.

This option is available only if you have provided the Elasticsearch credentials for the primary node during a previous installation. The option enables you to use the database backup that is created from the Elasticsearch settings table after the primary node of the cluster is installed.

The option is disabled for subsequent installations.

9. Click **Next**.
10. On the **Ready to Install the Program**, click **Install** and allow the installation process to complete.

During this process, the Automation 360 services are started automatically.

11. On the **InstallShield Wizard Completed** page, click **Finish**.

Launch Automation 360 is enabled by default.

Enable **Show installer settings** to open the `aae-installsummary.html` file. By default, this is located at `C:\Program Files\Automation Anywhere`. Use this file to view a summary of the installation.

The Control Room launches in your default browser with the **Configure Control Room settings** page displayed. Proceed to [Complete Control Room post-installation configuration](#) on page 1258.

Related concepts

[Installing Control Room using Custom mode](#) on page 1189

Log in to the server as an administrator and install Automation Anywhere Control Room in Custom mode to select installation and configuration options, including installing non-default requirements. Select this mode for a data center deployment.

Installing Control Room on Amazon Web Services

Log in to an Amazon Web Services (AWS) server instance as Administrator. Then, download and start the Control Room installer and select **Custom** mode.

Note:

- Many possible system configurations and requirements exist. These installation steps do not account for all those possibilities, so your specific setup and installation steps will vary, and Automation Anywhere does not make any warranties that these steps conform to your specific configurations.
- For Automation 360 to work properly on Amazon Workspace, update the registry on all Workspace machines. For details, see [Device compatibility](#) on page 1283 .

Step 1: Prepare for installation

- Verify [Automation 360 On-Premises prerequisites](#) on page 1124.
- Ensure that you have the following:
 - Automation Anywhere Control Room installation file
 - TLS certificate
 - License file

Step 2: [Prepare for installation on Amazon Web Services](#) on page 1217

Use these steps to prepare the Amazon Web Services (AWS) instances for the Control Room installation.

Step 3: [Customize Control Room installation on Amazon Web Services](#) on page 1219

Install and apply the customized configuration required for the Control Room cluster on Amazon Web Services (AWS) after completing initial preparations.

Step 4: Complete Control Room configuration and validation.

[Complete Control Room post-installation configuration](#) on page 1258

After installing the Control Room, complete the configuration settings to ensure timely

Automation Anywhere communications are specified and confirm Automation Anywhere services are running.

[Post-installation user management](#) on page 1312

After completing the post-installation tasks, validate the setup by logging in to the Control Room and installing a license. First time access to the Control Room walks you through the configuration for your authentication method.

Step 5: Prepare for users.

[Users](#) on page 1676

As a Cloud user with administrator permissions, you can create, view, edit, delete, and enable or disable a user. Creating users steps vary depending on whether the user is a non-Active Directory, Active Directory, or single sign-on (SSO) user from an IdP server.

Prepare for installation on Amazon Web Services

Use these steps to prepare the Amazon Web Services (AWS) instances for the Control Room installation.

If you have not done so already, prepare your AWS Identity and Access Management (IAM) user account to login to the AWS Console.

Do the following:

1. Create AWS Elastic Compute Cloud (EC2) Instances for the Control Room Servers.
2. If you use RDS, create Relational Database Service (RDS) Instances for the SQL Server Enterprise 2014 Database server.
3. Configure the AWS Load Balancer.

Note: There are many possible system configurations and requirements. These installation steps do not account for all those possibilities so your specific setup and installation steps will vary and

Automation Anywhere does not make any warranties that these steps conform with your specific configurations.

To prepare AWS instances, do the following:

1. Set up the on Amazon Web Services Elastic Compute Cloud (AWS EC2) or Relational Database Service (RDS).
AAE supports both. For a comparison of the two, see [Microsoft SQL Server on AWS](#).
2. Test the database connection with the Microsoft SQL Server.
 - a) Install Microsoft SQL Management Studio on one of the AWS EC2 instances inside the Virtual Private Cloud (VPC).
For more information, see [Download SQL Server Management Studio](#).
 - b) Connect to the Microsoft SQL Server.
For configuration information, see [Working with SQL Servers](#) on page 1136.
 - c) (Skip this step if the master database user installs the Control Room). Create the following empty database and assign `db_owner` privileges to the master database user for the Automation360-Database.

3. Set up the shared repository.
 - a) Create an AWS EC2 instance as a Windows File Server with an additional volume of 100 GB.
 - b) Join the Active Directory domain.
 - c) Create a folder and set up the permissions for the repository.
Assign the Control Room admin full access to this folder.

Important: Only the Control Room admin is to have full access to this folder because this is the account from which all Control Room services run.

4. Launch three AWS instances, one for each Control Room server.
 - a) Establish three AWS instances, each with the following configuration:
 - Type: c5.2xlarge or similar instance type (8 CPU, 16 GB RAM)
 - Storage: Root Device: 100 GB
 - Storage: Additional Device: D:\ 200 GB (For Automation Anywhere Install files)
 - Accidental Deletion Prevention: Enabled
 - b) Access the three instances through Remote Desktop Protocol.
 - c) Add the instances to the Active Directory domain.
 - d) For each instance, add the Control Room system admin as a local administrator on the computer and reboot the system.
5. Configure the firewall and port.
See [Ports, protocols, and firewall requirements](#) on page 1147.
6. Set up the AWS Application Load Balancer.
See [Details for Elastic Load Balancing Products](#).
 - Disable the stickiness attribute.

- Set the idle time-out to 120 seconds.
7. Upload the SSL certificate to the Load Balancer.

Continue with [Customize Control Room installation on Amazon Web Services](#) on page 1219.

Customize Control Room installation on Amazon Web Services

Install and apply the customized configuration required for the Control Room cluster on Amazon Web Services (AWS) after completing initial preparations.

If you have not done so already, complete the initial installation steps in [Prepare for installation on Amazon Web Services](#) on page 1217.

Note: There are many possible system configurations and requirements. These installation steps do not account for all those possibilities so your specific setup and installation steps will vary and Automation Anywhere does not make any warranties that these steps conform with your specific configurations.

To install the Control Room in a cluster setup, do the following steps:

1. Login to the first AWS instance as an Administrator.
2. Download `Automation Anywhere_<version>.exe`.
3. Click **Next** on the **Welcome to the Setup Wizard** page.
4. Accept the licensing agreement and click **Next**.
5. Select the **Custom** option and click **Next**.
The **Destination Folder** page appears. By default, the destination folder is `C:\Program Files\Automation Anywhere\Enterprise\`.
6. To make changes to the destination folder, click **Change**, enter a new destination folder name, and click **OK**.

Note: Do not install the application directly in the root directory (`C:\`). You should create a folder, for example, `C:\Program Files\Automation Anywhere\Enterprise\`.

7. Click **Next** to configure the IP cluster.
8. Select the **Enable Cluster Setup** check box.
The check box is enabled by default if the machine on which the setup is being run has local IP addresses configured.
To install the Control Room on a single node and not a cluster, clear the **Enable Cluster Setup** check box.
9. Enter the IP addresses of the nodes in the cluster.
 - Enter IPv6 addresses if all the nodes in the network are using IPv6.
 - Enter IPv4 addresses if some nodes in the network are using a combination of IPv4 and IPv6 addresses.
 - a) Use a comma (,) to specify more than one IP address.
For example, to specify three IP addresses in the cluster, enter:
`192.0.2.1,192.0.2.2,192.0.2.3`

Important: The first IP address in the list is used as the master node. Ensure that you enter the IP addresses in the same order on all node configurations in subsequent

installations. An incorrect order causes the application to configure the IP addresses as separate clusters, which will result in data loss when the issue is fixed after installation.

You can install multiple nodes at the same time after the master node is initially installed. After installation, you can add a new IP address to the cluster at the end of the list.

- b) After you enter the cluster IP addresses correctly, select a valid address IP at the message prompt to provide network access to the machine.

10. Click **Next** to configure the application Transport Layer Security (TLS).

11. In the **TLS Configuration** page, configure the following:

- Generate a Self-Signed Certificate

Enabling the **Self-Signed Certificate** option allows the installer to generate a unique private key and a self-signed certificate for the Control Room.

- Import a Certificate

To import a custom certificate, clear the **Self Signed Certificate** check box. This setting allows you to import a certificate using the **Certificate Path** field.

Note: The certificate file must be a PKCS12 format.

Provide the following information:

- **Certificate Path:** Click **Browse** to import the certificate.
 - **Private Key Password:** Enter the password for the private key.
-

Password limitation: Do not use the at sign (@) in passwords. Using the special character @ in the password causes the certificate file import to fail.

- **Webserver Port:** Enter the web server port – either HTTP or HTTPS. If the port is already assigned, an error message is displayed.
-

Important: The port validation message is also displayed when you add 8080 for the web server and if that port is already in use for a Control Room license service. Use a different unassigned port in these cases.

- **Enable Force HTTP traffic to HTTPS:** This option redirects all HTTP port requests to HTTPS. To access to the Control Room through HTTPS using the generated self-signed certificate, ensure the port numbers are different for HTTP and HTTPS.

To generate a custom certificate for HTTPS, ensure your custom certificate meets the following:

- Create a `.pfx` certificate with a pass code from a CA trusted authority.
- Combine Root, Intermediate, and Machine level certificates into a single certificate.
- Use the format `[WS Machine Host Name].[DomainName].com` for the private key.
- Include the host name as a fully qualified domain name (FQDN) in the certificate.

You provide the host name during Control Room installation.

- In multi-node HA clusters, issue certificates to the load balancer DNS name.
- Add individual URLs, which require access to all nodes, to the `Subject Alternative Name` field in the certificate.

For more information, see Automation Anywhere support site: [Automation 360 On-Premises prerequisites \(A-People login required\)](#).

12. Click **Next** to configure the service credentials.

13. In the **Service Credentials** screen, choose from the listed options.

The Windows Service credentials include a user name and password. The user specified must meet these requirements:

- A member of the local system administrator group.
- Have permission to manage services, including Automation Anywhere services.
- If you use Windows authentication to connect to the SQL database, ensure you grant the `db_owner` permission to the service credential user.

These service credentials allow the Control Room processes to run the required services.

- **Local System Account**—(default) The logged-on user performing the installation
- **Domain Account**—Specify a user that is not the local system account user

a) Clear the **Local System Account** check box.

b) Enter the user name and password for the domain account.

Use only supported characters for the user name and password. See [Supported special characters](#) on page 1161.

- Do not use the Windows domain credentials

Enter credentials valid for running Automation Anywhere services. Without the valid credentials, the Control Room will fail to launch.

- PowerShell script restrictions

Specify a user with permissions to launch PowerShell scripts who is not a Windows domain user. Without the relevant permissions, database table creation can fail.

14. Add the SQL Server and click **Next**.

Select Microsoft SQL Server, type the **Name**, and click **Next**.

15. On the **InstallShield Wizard Completed** page, click **Finish**.

Launch Automation Anywhere is enabled by default.

Enable **Show installer settings** to open the `aae-installsummary.html` file. By default, this is located at `C:\Program Files\Automation Anywhere\Enterprise\`. Use this file to view a summary of the installation.

The Control Room launches in your default browser with the Configure Control Room settings page shown. Continue with [Configure settings post-installation on Amazon Web Services](#) on page 1221.

Configure settings post-installation on Amazon Web Services

After installation is complete, configure Control Room settings on Amazon Web Services.

If you have not done so already, complete the installation steps in [Customize Control Room installation on Amazon Web Services](#) on page 1219.

Note: There are many possible system configurations and requirements. These installation steps do not account for all those possibilities so your specific setup and installation steps will vary and Automation Anywhere does not make any warranties that these steps conform with your specific configurations.

To install Automation Anywhere on Amazon Web Services (AWS), do the following steps:

1. Configure the following Control Room settings:
 - a) Specify the host name URL by providing the AWS Load Balancer URL.
This is the URL that users use to access your installation of Control Room.
 - b) Select the Active Directory authentication type. For more information, see [Configure Control Room for Active Directory: manual mode](#) on page 1315.
2. After you configure the Control Room, install product licenses.
3. Test Control Room access using the AWS Load Balancer URL.
This completes the Control Room installation on AWS.

Complete the Control Room configuration and validation.

- [Complete Control Room post-installation configuration](#) on page 1258
After installing the Control Room, complete the configuration settings to ensure timely Automation Anywhere communications are specified and confirm Automation Anywhere services are running.
- [Post-installation user management](#) on page 1312
After completing the post-installation tasks, validate the setup by logging in to the Control Room and installing a license. First time access to the Control Room walks you through the configuration for your authentication method.
- [Users](#) on page 1676
As a Cloud user with administrator permissions, you can create, view, edit, delete, and enable or disable a user. Creating users steps vary depending on whether the user is a non-Active Directory, Active Directory, or single sign-on (SSO) user from an IdP server.

Installing Control Room on Microsoft Azure

Installing Control Room on Microsoft Azure begins in the Azure environment and ends with configurations in the Control Room.

Note: There are many possible system configurations and requirements. These installation steps do not account for all those possibilities so your specific setup and installation steps will vary and Automation Anywhere does not make any warranties that these steps conform with your specific configurations.

Step 1: Prepare for installation.

- Verify [Automation 360 On-Premises prerequisites](#) on page 1124.
- Ensure that you have the following:
 - Automation Anywhere Control Room installation file

- TLS certificate
- License file

Step 2: [Verify readiness for installation on Microsoft Azure](#) on page 1224

Use these steps to configure third-party products for the Control Room installation.

Step 3: [Begin Control Room installation on Microsoft Azure](#) on page 1226

Initial steps for Control Room installation on Microsoft Azure.

Step 4: [Customize Control Room installation on Microsoft Azure](#) on page 1226

Install and apply the customized configuration required for the Control Room cluster on Microsoft Azure.

Step 5: Complete Control Room configuration and validation.

[Complete Control Room post-installation configuration](#) on page 1258

After installing the Control Room, complete the configuration settings to ensure timely Automation Anywhere communications are specified and confirm Automation Anywhere services are running.

[Post-installation user management](#) on page 1312

After completing the post-installation tasks, validate the setup by logging in to the Control Room and installing a license. First time access to the Control Room walks you through the configuration for your authentication method.

Step 6: Prepare for users.

[Users](#) on page 1676

As a Cloud user with administrator permissions, you can create, view, edit, delete, and enable or disable a user. Creating users steps vary depending on whether the user is a non-Active Directory, Active Directory, or single sign-on (SSO) user from an IdP server.

Verify readiness for installation on Microsoft Azure

Use these steps to configure third-party products for the Control Room installation.

Note: There are many possible system configurations and requirements. These installation steps do not account for all those possibilities so your specific setup and installation steps will vary and Automation Anywhere does not make any warranties that these steps conform with your specific configurations.

To configure third-party products prior to installation, do the following steps:

1. Ensure the installation environment meets the data center requirements and collect the necessary information about the following components:

- Load balancer - IP address
- Microsoft SQL Server - port credentials
- Azure SMB file share - address credentials
- Enterprise identity management system (optional)

If you have Active Directory (AD) - AD server domain credentials

- SMTP - host port HTTP/S ports for TLS (optional)
- Control Room servers - Have Windows credential manager installed

Refer to [Supported data center component versions on Microsoft Azure](#) on page 1225 for configuration and version information.

2. Configure the Network Security Group as per the recommended security policies for Inbound Port rules:

Data center object	Port	Protocol
Control Room	<ul style="list-style-type: none"> • 80 • 443 	Any
LDAP	<ul style="list-style-type: none"> • 3268 • 3269 	Any
email SMTP	587	Any
SSH	22	Any
RDP	3389	TCP

3. Configure the AD server.

Ensure all users are part of the AD domain and the AD server is setup in IaaS mode for Azure cluster environment installations. To add user, navigate to **Active Directory Users and Computers > <domain> > Users** and add the necessary user.

To configure the AD server on Azure with IDaaS, refer to the [Microsoft Azure documentation](#).

4. Ensure the Control Room servers in the cluster can ping each other.

If the ping is not successful:

- a) In **Windows Defender Firewall with Advanced Security>Inbound rules**, set the following values for the file and printer sharing firewall rule:

- **Name:** File and Printer Sharing (Echo Request - ICMPv4-In)
- **Group:** File and Printer Sharing
- **Profile:**All
- **Enabled:** Yes
- **Action:** Allow
- **Override:** No
- **Program:** Any
- **Local address:** Any
- **Remote address:** Any
- **Protocol:** ICMPv4

b) Ping the Control Room after enabling the firewall rule change.

When you have completed the pre-installation configurations, [Begin Control Room installation on Microsoft Azure](#) on page 1226.

Supported data center component versions on Microsoft Azure

For installing Automation Anywhere on the Microsoft Azure cluster environment, the versions of data center components that are supported are identified for each component.

Data center object	Supported version	Configuration
Control Room operating system	<ul style="list-style-type: none"> • Microsoft Windows Server 2012 and 2012 R2 Datacenter • Microsoft Windows Server 2016 Standard and Datacenter • Microsoft Windows Server 2019 Standard and Datacenter 	IaaS
Identity management: Azure	Azure Active Directory	<ul style="list-style-type: none"> • IDaaS • Windows 2016 for IaaS
	Azure File Share with Server Message Block 2.0 and 3.0 (SMB) protocol	PaaS
	Azure Load Balancer	PaaS
	Azure Application Gateway	
	Azure SQL Database with single database (Microsoft SQL Azure (RTM) - 12.0.2000.8)	PaaS

Begin Control Room installation on Microsoft Azure

Initial steps for Control Room installation on Microsoft Azure.

If you have not done so already, complete the pre-installation configuration in [Verify readiness for installation on Microsoft Azure](#) on page 1224.

Note: There are many possible system configurations and requirements. These installation steps do not account for all those possibilities so your specific setup and installation steps will vary and Automation Anywhere does not make any warranties that these steps conform with your specific configurations.

To begin the installation:

1. Use Remote Desktop Connection (RDC) to connect to the Control Room server, as an Administrator, and run the Control Room installer.
2. Click **Yes** to start the installer.
3. Click **Next** on the **Welcome to the Setup Wizard** page.
4. Accept the licensing agreement and click **Next**.
5. Select the **Custom** option and click **Next**.
6. Click **Next** to setup the system IPs.

The **Cluster Configuration** window displays.

Continue with [Customize Control Room installation on Microsoft Azure](#) on page 1226.

Customize Control Room installation on Microsoft Azure

Install and apply the customized configuration required for the Control Room cluster on Microsoft Azure.

If you have not done so already, complete the initial installation steps in [Begin Control Room installation on Microsoft Azure](#) on page 1226. This task requires the configuration information you gathered in the prerequisites stage. This includes IP addresses, certificates, and credentials for the the Control Room servers, datacenter servers, and databases.

Note: There are many possible system configurations and requirements. These installation steps do not account for all those possibilities so your specific setup and installation steps will vary and Automation Anywhere does not make any warranties that these steps conform with your specific configurations.

Important: Automation 360 software components are not compatible with Distributed Resource Scheduling (DRS) and Virtual Migration of Dynamic Processes across hosts. Ensure that you do not enable the corresponding properties of the host virtual machines.

To install the Control Room in a cluster setup, do the following steps:

1. Select the **Enable Cluster Setup** check box.

The check box is enabled by default if the machine on which the setup is being run has local IP addresses configured.

To install the Control Room on a single node and not a cluster, clear the **Enable Cluster Setup** check box.

2. Enter the IP addresses of the nodes in the cluster.
 - a) Use a comma (,) to specify more than one IP address.
For example, to specify three IP addresses in the cluster, enter:
192.0.2.1,192.0.2.2,192.0.2.3

Important: The first IP address in the list is used as the master node. Ensure that you enter the IP addresses in the same order on all node configurations in subsequent installations. An incorrect order causes the application to configure the IP addresses as separate clusters, which will result in data loss when the issue is fixed after installation.

You can install multiple nodes at the same time after the master node is initially installed. After installation, you can add a new IP address to the cluster at the end of the list.

- b) After you enter the cluster IP addresses correctly, select a valid address IP at the message prompt to provide network access to the machine.
3. Click **Next** to configure the application Transport Layer Security (TLS).
4. In the **TLS Configuration** page, configure the following:

- Generate a Self-Signed Certificate

Enabling the **Self-Signed Certificate** option allows the installer to generate a unique private key and a self-signed certificate for the Control Room.

- Import a Certificate

To import a custom certificate, clear the **Self Signed Certificate** check box. This setting allows you to import a certificate using the **Certificate Path** field.

Note: The certificate file must be a PKCS12 format.

Provide the following information:

- **Certificate Path:** Click **Browse** to import the certificate.
- **Private Key Password:** Enter the password for the private key.

Password limitation: Do not use the at sign (@) in passwords. Using the special character @ in the password causes the certificate file import to fail.

- **Webserver Port:** Enter the web server port – either HTTP or HTTPS. If the port is already assigned, an error message is displayed.

Important: The port validation message is also displayed when you add 8080 for the web server and if that port is already in use for a Control Room license service. Use a different unassigned port in these cases.

- **Enable Force HTTP traffic to HTTPS:** This option redirects all HTTP port requests to HTTPS. To access to the Control Room through HTTPS using the generated self-signed certificate, ensure the port numbers are different for HTTP and HTTPS.

To generate a custom certificate for HTTPS, ensure your custom certificate meets the following:

- Create a .pfx certificate with a pass code from a CA trusted authority.
- Combine Root, Intermediate, and Machine level certificates into a single certificate.
- Use the format [WS Machine Host Name].[DomainName].com for the private key.

- Include the host name as a fully qualified domain name (FQDN) in the certificate.
You provide the host name during Control Room installation.
- In multi-node HA clusters, issue certificates to the load balancer DNS name.
- Add individual URLs, which require access to all nodes, to the Subject `Alternative Name` field in the certificate.

For more information, see Automation Anywhere support site: [Automation 360 On-Premises prerequisites \(A-People login required\)](#).

5. Click **Next** to configure the service credentials.
6. In the **Service Credentials** screen, choose from the listed options.
The Windows Service credentials include a user name and password. The user specified must meet these requirements:
 - A member of the local system administrator group.
 - Have permission to manage services, including Automation Anywhere services.
 - If you use Windows authentication to connect to the SQL database, ensure you grant the `db_owner` permission to the service credential user.

These service credentials allow the Control Room processes to run the required services.

- **Local System Account**—(default) The logged-on user performing the installation
- **Domain Account**—Specify a user that is not the local system account user
 - a) Clear the **Local System Account** check box.
 - b) Enter the user name and password for the domain account.
Use only supported characters for the user name and password. See [Supported special characters](#) on page 1161.
- Do not use the Windows domain credentials
Enter credentials valid for running Automation Anywhere services. Without the valid credentials, the Control Room will fail to launch.
- PowerShell script restrictions
Specify a user with permissions to launch PowerShell scripts who is not a Windows domain user. Without the relevant permissions, database table creation can fail.

7. Click **Next** to configure database type and server.
8. Set the connection and authentication for the database server.

Note:

- If possible, do not set the value for **Database Server** as **localhost**. If you must use **localhost**, note that the **Secure Connection** to the database will not work.
- Click **Browse** to select the SQL Server instance where the Control Room database will be created. Alternatively, enter a database server name or select one from the list.

Migration task: If you are migrating from Enterprise 11 to Automation 360, browse to the restored Enterprise 11 database.

Provide the following details:

a) Database Port: Use the default port (1433) or specify a custom value.
[Configure default database port](#) on page 1201

b) Use Secure Connection: Select to use a CA certificate as specified.

Note: Use the same host name for certificate and database connections.

c) Certificate: This option is enabled when you select **Use Secure Connection**. Browse to select a CA certificate.

[Import HTTPS, intermediate, and CA certificates](#) on page 1327

d) Windows authentication: This option is selected by default and allows connection to the SQL Server using Windows authentication.

Note: If you select Windows authentication, then the user running the installer is used to test that the database exists, create it if required, and grant db_owner to the service account user (NT Authority/System).

e) SQL Server authentication: Select this option to use SQL Server authentication to connect to the database. Provide the correct user name and password for SQL authentication.

Use only supported characters for the user name and password. See [Supported special characters](#) on page 1161. Do not use semicolons (;) in the database password.

f) AD Azure authentication: Select this option to use Microsoft Azure Active Directory credentials to connect to the database when you install the Control Room on Microsoft Azure

g) Name of Control Room database: Enter the name of the Control Room database.

Migration task: If you are migrating from Enterprise 11 to Automation 360, enter the name of the restored database in the database field as shown in the following image:

9. Click **Next**.

10. On the **Ready to Install the Program**, click **Install** and allow the installation process to complete.
11. On the **InstallShield Wizard Completed** page, click **Finish**.
Launch Automation Anywhere is enabled by default.
Enable **Show installer settings** to open the `aae-installsummary.html` file. By default, this is located at `C:\Program Files\Automation Anywhere\Enterprise\`. Use this file to view a summary of the installation.

The Control Room launches in your default browser with the Configure Control Room settings page shown. Continue with [Configure settings post-installation on Microsoft Azure](#) on page 1230.

Configure settings post-installation on Microsoft Azure

After Control Room installation is complete, use the Microsoft Azure Portal to configure the clusters. Use the Azure Portal to configure Windows credentials, Control Room settings for repository and URL, master key for Credential Vault, Active Directory authentication, and optionally SMTP settings.

- If you have not done so already, complete the installation steps in [Customize Control Room installation on Microsoft Azure](#) on page 1226.
- The service account user must have read and write access for the Azure data drive (SMB).

Note: There are many possible system configurations and requirements. These installation steps do not account for all those possibilities so your specific setup and installation steps will vary and Automation Anywhere does not make any warranties that these steps conform with your specific configurations.

1. From the Azure Portal where SMB File Share is setup, get the Connection String to retrieve following parameters:
 - Internet or network address
 - User name
 - Password
2. Locate the Window Credential Manager on the control room server and click **Add a Windows Credential**.
3. Enter the credential information.

Note: Adding a user under Windows Credential Manager needs to be repeated on all the servers used for testing in the cluster environment (Control Room, Clients/Devices).

4. Enter information and click **Save and Continue**.
Repository path is extracted from SMB File Share and Control Room access URL in is a load balancer Public IP.
5. **Copy** the Master Key and save it (it will be needed to restart the services).
6. Select Express mode and click **Save and Continue**.
7. Enter the Active Directory authentication configuration information, including URL, Domain username, and password, then click **Check Connection**. If settings are correct, click **Next**.
8. Enter the AD user created previously and click **Check name in Active Directory**. Upon validation, click **Save and Log in**.

Create additional users as needed and create corresponding users in the Control Room.

9. Optional: Continue with installing other control room nodes in the cluster.
10. Perform the SMTP registration.

Note: A real SSL certificate is recommended for use with deployments.

This completes the Control Room installation on Microsoft Azure.

If you see a `Bad Gateway` error message after you install the Control Room in a three-node cluster setup with SO Azure SQL Database, see the following article for troubleshooting steps.

[Automation A360 - Bad Gateway error in a three node cluster setup \(A-people login required\)](#)

Complete the Control Room configuration and validation.

- [Complete Control Room post-installation configuration](#) on page 1258

After installing the Control Room, complete the configuration settings to ensure timely Automation Anywhere communications are specified and confirm Automation Anywhere services are running.

- [Post-installation user management](#) on page 1312

After completing the post-installation tasks, validate the setup by logging in to the Control Room and installing a license. First time access to the Control Room walks you through the configuration for your authentication method.

- [Users](#) on page 1676

As a Cloud user with administrator permissions, you can create, view, edit, delete, and enable or disable a user. Creating users steps vary depending on whether the user is a non-Active Directory, Active Directory, or single sign-on (SSO) user from an IdP server.

Installing Control Room on Google Cloud Platform

Log in to a Google Cloud Platform (GCP) server instance as administrator. Then download and start the Control Room installer and install in Custom mode.

Note: There are many possible system configurations and requirements. These installation steps do not account for all those possibilities so your specific setup and installation steps will vary and Automation Anywhere does not make any warranties that these steps conform with your specific configurations.

1. Complete the prerequisites for installation:

- Verify [Automation 360 On-Premises prerequisites](#) on page 1124.
- Ensure that you have the following:
 - Automation Anywhere Control Room installation file
 - TLS certificate
 - License file

2. [Prepare to install Control Room on Google Cloud Platform](#) on page 1232

Ensure that you complete the required steps to prepare the Google Cloud Platform instances for installing the Control Room.

3. [Perform custom installation of Control Room on Google Cloud Platform](#) on page 1233
Install and apply the customized configuration required for the Control Room cluster on Google Cloud Platform after completing initial preparations.
4. [Configure Google Cloud Platform settings after installation](#) on page 1236
After installing the Control Room, configure the required settings on Google Cloud Platform.
5. Complete the Control Room configuration and validation.
 - a) [Complete Control Room post-installation configuration](#) on page 1258
After installing the Control Room, complete the configuration settings to ensure timely Automation Anywhere communications are specified and confirm Automation Anywhere services are running.
 - b) [Post-installation user management](#) on page 1312
After completing the post-installation tasks, validate the setup by logging in to the Control Room and installing a license. First time access to the Control Room walks you through the configuration for your authentication method.
6. [Manage your users](#)
As a Cloud user with administrator permissions, you can create, view, edit, delete, and enable or disable a user. Creating users steps vary depending on whether the user is a non-Active Directory, Active Directory, or single sign-on (SSO) user from an IdP server.

Tip: To ensure that the bots run properly in GCP, we recommend that you create a whitelist for the following APIs:

- `/v2/repository/files/:id/content`
 - `/v2/repository/files/public/:id/content`
 - `/v2/blm/import`
-

Prepare to install Control Room on Google Cloud Platform

Ensure that you complete the required steps to prepare the Google Cloud Platform instances for installing the Control Room.

1. Configure the Network Security Group of all the servers as specified in the following list:
 - Name: aarestrictedsecuritygroup
 - Type: Ingress
 - Targets: aarestrictedsecuritygroup
 - Filters: IP ranges: List of IP addresses provided by the IT security team
 - Protocols and ports: all
 - Action: Allow
 - Priority: 1000
 - Network: default

Note: In the IP address ranges field, enter all the IP addresses of all the virtual machines (VMs) in the cluster environment.

2. Set up the F5 load balancer with the following configurations:
 - Select standard as the type option.

- Enter 0.0.0.0/0 as the Source address in Host.
- Enter F5-LB-Private IP as the Destination Address/Mask in Host.
- Enter 80 as the Port and select **HTTP** as the Service Port.
- Select the **Notify Status to Virtual Address** check box.
- Enable the load balancer state.

To use SSL offload with the F5 load balancer, provide the SSL certificate at the load balancer level, and configure your Control Room application servers to use HTTP mode only.

Note: Your IT team should configure the F5 load balancer with the Control Room.

3. Set up pools and nodes with the following configurations:
 - a) Update the pool properties:
 - Choose a basic configuration.
 - Select ICMP as your gateway to monitor health.
 - b) Update the pool member options:
 - Choose the round-robin method for load balancing.
 - Disable the priority group activation.
 - c) Update the node properties:
 - Change the state to enabled.
 - Select node-specific health monitors.
 - Select ICMP as your gateway to monitor health.
4. Configure the Active Directory server.

Verify that all the VMs in the cluster can ping each other using private IP addresses.
5. Connect using RDP to one of the Control Room nodes or servers and run the Control Room installer.

The Installation Prerequisite Check verifies that your system has the basic configurations required for Automation Anywhere. See [Automation 360 On-Premises prerequisites](#) on page 1124.

[Perform custom installation of Control Room on Google Cloud Platform](#) on page 1233

Perform custom installation of Control Room on Google Cloud Platform

Install and apply the customized configuration required for the Control Room cluster on Google Cloud Platform after completing initial preparations.

If you have not done so already, complete the initial installation steps: [Prepare to install Control Room on Google Cloud Platform](#) on page 1232.

1. Log in to the first Google Cloud Platform instance as an administrator.
2. Download the `Automation Anywhere__<version>.exe` file.
[A-People Downloads page \(Login required\)](#)

3. Run the installer file.
4. Click **Next** on the **Welcome to the Setup Wizard** page.
5. Accept the licensing agreement and click **Next**.
6. Select the **Custom** option and click **Next**.
The **Destination Folder** page appears. By default, the destination folder is `C:\Program Files\Automation Anywhere\Enterprise\`.
7. To make changes to the destination folder, click **Change**, enter a new destination folder name, and click **OK**.

Note: Do not install the application directly in the root directory (`C:\`). You should create a folder, for example, `C:\Program Files\Automation Anywhere\Enterprise\`.

8. Click **Next** to configure the IP cluster.
9. Select the **Enable Cluster Setup** check box.
The check box is enabled by default if the machine on which the setup is being run has local IP addresses configured.
To install the Control Room on a single node and not a cluster, clear the **Enable Cluster Setup** check box.
10. Enter the IP addresses of the nodes in the cluster.
 - Enter IPv6 addresses if all the nodes in the network are using IPv6.
 - Enter IPv4 addresses if some nodes in the network are using a combination of IPv4 and IPv6 addresses.

- a) Use a comma (,) to specify more than one IP address.
For example, to specify three IP addresses in the cluster, enter:
`192.0.2.1,192.0.2.2,192.0.2.3`

Important: The first IP address in the list is used as the master node. Ensure that you enter the IP addresses in the same order on all node configurations in subsequent installations. An incorrect order causes the application to configure the IP addresses as separate clusters, which will result in data loss when the issue is fixed after installation.

You can install multiple nodes at the same time after the master node is initially installed. After installation, you can add a new IP address to the cluster at the end of the list.

- b) After you enter the cluster IP addresses correctly, select a valid address IP at the message prompt to provide network access to the machine.

11. Click **Next** to configure the application Transport Layer Security (TLS).
12. In the **TLS Configuration** page, configure the following:

- Generate a Self-Signed Certificate
Enabling the **Self-Signed Certificate** option allows the installer to generate a unique private key and a self-signed certificate for the Control Room.
- Import a Certificate

To import a custom certificate, clear the **Self Signed Certificate** check box. This setting allows you to import a certificate using the **Certificate Path** field.

Note: The certificate file must be a PKCS12 format.

Provide the following information:

- **Certificate Path:** Click **Browse** to import the certificate.
- **Private Key Password:** Enter the password for the private key.

Password limitation: Do not use the at sign (@) in passwords. Using the special character @ in the password causes the certificate file import to fail.

- **Webserver Port:** Enter the web server port – either HTTP or HTTPS. If the port is already assigned, an error message is displayed.

Important: The port validation message is also displayed when you add 8080 for the web server and if that port is already in use for a Control Room license service. Use a different unassigned port in these cases.

- **Enable Force HTTP traffic to HTTPS:** This option redirects all HTTP port requests to HTTPS. To access to the Control Room through HTTPS using the generated self-signed certificate, ensure the port numbers are different for HTTP and HTTPS.

To generate a custom certificate for HTTPS, ensure your custom certificate meets the following:

- Create a `.pfx` certificate with a pass code from a CA trusted authority.
- Combine Root, Intermediate, and Machine level certificates into a single certificate.
- Use the format `[WS Machine Host Name].[DomainName].com` for the private key.
- Include the host name as a fully qualified domain name (FQDN) in the certificate.

You provide the host name during Control Room installation.

- In multi-node HA clusters, issue certificates to the load balancer DNS name.
- Add individual URLs, which require access to all nodes, to the `Subject Alternative Name` field in the certificate.

For more information, see Automation Anywhere support site: [Automation 360 On-Premises prerequisites \(A-People login required\)](#).

13. Click **Next** to configure the service credentials.

14. In the **Service Credentials** screen, choose from the listed options.

The Windows Service credentials include a user name and password. The user specified must meet these requirements:

- A member of the local system administrator group.
- Have permission to manage services, including Automation Anywhere services.
- If you use Windows authentication to connect to the SQL database, ensure you grant the `db_owner` permission to the service credential user.

These service credentials allow the Control Room processes to run the required services.

- **Local System Account**—(default) The logged-on user performing the installation
- **Domain Account**—Specify a user that is not the local system account user

- a) Clear the **Local System Account** check box.
- b) Enter the user name and password for the domain account.

Use only supported characters for the user name and password. See [Supported special characters](#) on page 1161.

- Do not use the Windows domain credentials
Enter credentials valid for running Automation Anywhere services. Without the valid credentials, the Control Room will fail to launch.
- PowerShell script restrictions
Specify a user with permissions to launch PowerShell scripts who is not a Windows domain user. Without the relevant permissions, database table creation can fail.

15. Add the SQL Server and click **Next**.

Select **Microsoft SQL Server**, enter the name, and click **Next**.

16. On the **InstallShield Wizard Completed** page, click **Finish**.

Launch Automation Anywhere is enabled by default.

Enable **Show installer settings** to open the `aae-installsummary.html` file. By default, this is located at `C:\Program Files\Automation Anywhere\Enterprise\`. Use this file to view a summary of the installation.

The Control Room is opened in your default browser and displays the Configure Control Room settings page.

[Configure Google Cloud Platform settings after installation](#) on page 1236

Configure Google Cloud Platform settings after installation

After installing the Control Room, configure the required settings on Google Cloud Platform.

If you have not done so already, complete the installation steps: [Perform custom installation of Control Room on Google Cloud Platform](#) on page 1233.

- 1.** Configure the following Control Room settings:
 - a)** Specify the host name URL by providing the Google Cloud Platform load balancer URL.
This is the URL that users use to access the Control Room.
 - b)** Select the Active Directory authentication type.
See [Configure Control Room for Active Directory: manual mode](#) on page 1315.
- 2.** After you configure the Control Room, install product licenses.
- 3.** Test access to the Control Room using the Google Cloud Platform load balancer URL.

Complete the Control Room configuration and validation.

- [Complete Control Room post-installation configuration](#) on page 1258
After installing the Control Room, complete the configuration settings to ensure timely Automation Anywhere communications are specified and confirm Automation Anywhere services are running.
- [Post-installation user management](#) on page 1312

After completing the post-installation tasks, validate the setup by logging in to the Control Room and installing a license. First time access to the Control Room walks you through the configuration for your authentication method.

- [Users](#) on page 1676

As a Cloud user with administrator permissions, you can create, view, edit, delete, and enable or disable a user. Creating users steps vary depending on whether the user is a non-Active Directory, Active Directory, or single sign-on (SSO) user from an IdP server.

Installing Control Room on Linux

You start installing the Automation Anywhere Control Room in the Linux environment and complete the installation in the Control Room.

Note: The installation steps do not list any specific configurations or requirements and therefore your setup might be different. Automation Anywhere does not provide any warranties that the installation steps conform with your system configurations or requirements.

This task applies to first-time installation and updates of Automation 360 On-Premises.

Note: Linux external key vault is not supported on the Automation 360 On-Premises installation.

Ensure the following:

- The Microsoft SQL Server or Oracle Server database is installed and running.
 - The Automation 360 installation server is connected to the Microsoft SQL Server or Oracle Server database.
 - For Oracle Server, ensure that you have installed the appropriate JDBC driver for the Oracle version that is connected to the Control Room.
 - From Automation 360 Build 6463, ensure that Python 3.6 is installed.
 - For Oracle Server, only non-container database is supported.
1. Verify the installation prerequisites.
 - a) Verify the [Automation 360 On-Premises prerequisites](#) on page 1124.
 - b) Depending on the server you want to use, verify that the Microsoft SQL Server or Oracle Server is running, and execute the command:

```
$ sudo systemctl status mssql-server
```

If Microsoft SQL Server is not running, install it.

Note: The Microsoft SQL Server or Oracle Server installation instructions refer to Red Hat Enterprise Linux version 8. For version 7, change the paths to `/rhe1/7` instead of `/rhe1/8`.

See [Quickstart: Install SQL Server](#).

- c) Ensure the following files are available:
 - SSL certificate
 - License file

- d) Download the `Automation360_e17_Build_<build_number>.bin` installation file to the Linux server from [A-People Downloads page \(Login required\)](#)

Note: We do not support the patch updates (updating between builds in the same release) in Linux. When you are performing a patch update, we recommend that you always uninstall and do a fresh install of the patch release.

- e) Verify that the installation server has internet access in order to update Linux kernel files and OS libraries using Yum updates.
Alternatively, configure `/etc/yum.conf` on the installation server to use a Yum repository local to its network. The Yum repository should be up to date before starting the installation.
- f) Starting in Automation 360 Build 6463, Python 3.6 is required.

2. Log in to the installation server.

3. Run the installer command as a superuser from the Linux shell:

a) `$ sudo chmod +x Automation360_e17_Build_<build_number>.bin`

b) `$ sudo ./Automation360_e17_Build_<build_number>.bin`

The installation wizard verifies the installation requirements and proceeds with the installation.

Tip:

- Enter the `back` command to return to a previous command step.
 - Press the **return key** to accept default values, or enter an alternate value and then press the **return key**.
-

4. To accept the license agreement, enter `Y`.

5. In the **Transport Layer Security (TLS)** screen, configure the following:

a) Control Room HTTP Port (Default: 80)

b) Control Room HTTPS Port (Default: 443)

c) To enable the Self Signed Certificate, enter 1 to enable or enter 2 to disable. When you disable this option, you can install custom certificates.

1. Enter Certificate Path: Enter the certificate path.

2. Enter Certificate Password: Enter the certificate password.

3. Use Intermediate Certificates, enter 1 to enable or enter 2 to disable.

When you enable this option, enter the intermediate certificates path in the Enter path to Intermediate Certificates .zip File option to install the intermediate certificates.

d) To Force HTTP Traffic to HTTPS, enter 1 to disable it or enter 2 to enable it.

[Configure application Transport Layer Security](#) on page 1193

6. In the **Cluster Configuration** screen, enter 1 to disable it or enter 2 to enable it.

- If you choose to enable cluster configuration, enter the IP addresses of the cluster nodes. Use a comma (,) to specify more than one IP address. Do not add space between IP addresses. For example: 192.168.0.1,192.168.0.2,192.168.0.3
- The repository location should be a shared location accessible from all Control Room nodes in the cluster.
- Ensure that you select the IP address that is used to communicate with other nodes of the Control Room.

[Configure IP cluster](#) on page 1204

7. In the **Database Type** screen, select one of the following servers:
 - Microsoft SQL Server
 - Oracle
8. In the **Service Startup Options** screen, select one of the following options:
 - **Default (Start All Services)**: Enables all Control Room services to automatically run at startup.
 - **Custom (Choose Startup Options)**: Enables you to select the Control Room services that you want to automatically run at startup. All the services will be installed on the device. However, only the selected services will automatically run at startup. If required, you can manually start the services that were set to **Manual**.

For each service, select one of the following options:

- **Automatic**: Enables to automatically run the selected service at startup.
- **Manual**: Enables to manually enable the selected service when required.

Note:

- Depending on the database type you selected, some services might not be available for selection as some of the services might not yet be supported for the selected database type.
- For those services that you do not include to run at startup when installing the Automation 360 On-Premises Control Room, a `products.notinstalled` file is created in the config files directory that you can open using a text editor. This file includes the name of the services that were not selected when installing the Automation 360 On-Premises Control Room. For information about the directory structure, see [Installed Control Room directories and files](#) on page 1338.

9. Depending on the database server you chose, configure the following settings the server:

Microsoft Databse Configuration	Oracle Databse Configuration
Database Server address (default: localhost)	Database Server (default: localhost)
Database port (default: 1433)	Database port (default: 1521)

Microsoft Database Configuration	Oracle Database Configuration
Control Room Database (default: Automation360-Database) or enter a name.	Connect with SID or Service Name Note: The SID and Service Name entered in the text field provided is unique to your Oracle database.
SQL Server Login credentials: provide the login ID and SQL Server password.	Database User/Schema Password: provide the password.
Password prompt for elasticsearch: Enter or define any password.	(Optional) Use Secure Connection: Enable to use a CA certificate as specified and select a CA certificate. Note: Use the same host name for certificate and database connections. Import HTTPS and CA certificates

10. In the **Database Configuration** screen, configure the following:
 - a) Database Server address (default: localhost)
 - b) Database port (default: 1433)
 - c) Control Room Database (default: Automation360-Database) or enter a name.
 - d) SQL Server Login credentials: provide the login ID and SQL Server password.
 - e) Password prompt for elasticsearch: Enter or define any password.
11. Review the pre-installation summary.
12. Press Enter to install Automation 360 in the default directory.

Linux installer	Version	Default directory path
Installation file path	Version .22 and earlier versions	/opt/automationanywhere/enterprise
	Updating from earlier versions to version .22	
	New installation of version .22 and later	/opt/automationanywhere/automation360

A message appears stating the installation is successfully completed. See [Installed Control Room directories and files](#) on page 1338 for the location of control room assets.

13. Configure the post-installation settings.
 - [Configuring post-installation settings](#) on page 1258

Post-installation, a Control Room group `controlroom` is automatically created. Following users are a part of this group which run the respective Control Room services:

crkernel, traefik, ignite, activemq, crelasticsearch, criqbot, crbotinsight, craari, crdiscoverybot, crstorage, crdiscoverybotml.

14. Verify Automation 360 services started successfully.
[Stop and start Control Room services on Linux](#) on page 1250
15. Set up Control Room access.
[Configure Control Room database](#) on page 1324
16. Set up licenses.
[Installing additional licenses](#) on page 1725
17. The log files for the Control Room installation are available at:

Linux installer	Version	Log file path
Log path	Version .22 and earlier versions	<code>/var/log/automationanywhere/enterprise</code>
	Updating from earlier versions to version .22	
	New installation of version .22 and later	<code>/var/log/automationanywhere/automation360</code>

After the Control Room installation and configuration is complete, users can register their devices to create and run bots.

[Install Bot Agent and register device](#) on page 1288

For more information on Out of Memory Management (OOM Killer), see [Linux Automation 360 Control Room service stopped \(A-People login required\)](#).

[Control Room repository requirements](#) on page 1152

The repository location is configured in the Control Room after installation. All your automations are stored in this repository.

Performing silent installation of Control Room on Linux

Silent Control Room installation, also known as unattended installation, uses a customized script with parameters specific to your business requirements. The entire installation process runs in the background without requiring user interaction or displaying messages.

- Verify you have completed the [Automation 360 On-Premises prerequisites](#) on page 1124.

- Ensure that you have the following:
 - Automation Anywhere Control Room installation file
 - SSL certificate
 - License file
- Verify the installation server has internet access in order to update Linux kernel files and OS libraries using Yum updates. Alternatively, configure `/etc/yum.conf` on the installation server to use a repository local to its network. The repository should be up to date before starting the installation.

Two scripts run the Linux silent installation:

- `LinuxInstaller.sh`: This script contains the installation parameters you want to apply during installation.
- `CallLinuxScript.sh`: This script executes the first script.

See the installation parameters and sample scripts.

Run the script in Linux shell.

1. Review the parameters and identify the settings you require.

Control Room installation parameters		
Installation parameter	Description	Script response options
Proceed with Installation	The installer analyzes your system and notifies you if it does not meet the prerequisites. In silent mode, set the value to 1.	1 = Continue 2 = Cancel
Continue setup wizard	The installer displays an introduction and offers options of <code>back</code> to return to a previous step and <code>quit</code> to cancel the installation. Default is <code>Enter</code> .	\n
Advance to end of License Agreement	In console mode, you have the option to page through the license agreement. In silent mode, you advance to the end by selecting 0.	0
Accept License Agreement	Accept the license agreement to continue with the installation. In silent mode, set the value to Y.	Y = Yes N = No

Control Room installation parameters		
Installation parameter	Description	Script response options
Control Room HTTP Port	The web server port you will use to access the Control Room with HTTP. The default value is 80. Replace the number 80 in the sample script to use a different port.	80 = Default port yy = your port number yy
Control Room HTTPS Port	The web server port you will use to access the Control Room with HTTPS. The default value is 443. Replace the number 443 in the sample script to use a different port.	443 = Default port zzz = your port number zzz
TLS configuration: Self-Signed Certificate	Choose to enable or disable the self-signed certificate. The default is Enable, or 1.	1 = Default (Enable) 2 = Disable
TLS Configuration: Force HTTP traffic to HTTPS	Choose to disable or enable forcing traffic from HTTP to HTTPS. The default is Disable.	1 = Default (Disable) 2 = Enable
Cluster setup	Choose to disable or enable clustering. The default is Disable.	1 = Default (Disable) 2 = Enable
Database server URL	server1.yourcompany.com	Enter the URL of the server where the database resides.
Database server port	Default is 1433	1433
Database name	Default is localhost	Default is localhost. If database is on a separate server, enter the host name.
Database SA user name	Database system administrator login ID	Default is sa.
Database SA user password	Database system administrator login ID	The password to log in to your database as system administrator user.
Database Secure Connection	Choose to disable or enable the connection. Default is Disable (1).	1 = Default (Disable) 2 = Enable

Control Room installation parameters		
Installation parameter	Description	Script response options
Pre-Installation summary	If the output is directed to a console, the installer will show a summary of features selected and whether the prerequisites are met. Default is Enter	\n
Proceed	Confirm to proceed with the installation. Default is Enter.	\n

2. Create the script `LinuxInstaller.sh`, substituting values for your own environment.

Important: Be sure to test the connection to the SQL Server and enter verified values for database name, database administrator login ID, database administrator password. Invalid values cause the script to stall and fail.

Example script:

```
echo "Starting Installation"
#Change the next two lines to match the install filename you
downloaded
sudo chmod a+x AutomationAnywhereEnterprise_A2019_e17_4799.bin
sudo ./AutomationAnywhereEnterprise_A2019_e17_4799.bin << EOF
1
\n
0
Y
80
443
1
1
1
#Change the next line to your Automation Anywhere install server
mybotserver.mycompany.com
1433
#Replace next line with your database name
AAE-Database
#Change the next two lines to your SQL Server admin ID and password
admin
youradminpasswordhere
1
\n
\n
\n
EOF
```

3. Create the script `CallLinuxscript.sh` to execute `Linuxinstaller.sh`. This script writes the installation results to `/home/Instal1log`. Change the path to the install log file, if required.

```
echo "Starting Linux installation"
sudo ./LinuxInstaller.sh >> /home/Instal1log
```

```
echo "Installation Completed Successfully"
```

4. On the installation server, logged in as an Administrator, execute the scripts.
 - a) `$ sudo chmod a+x LinuxInstaller.sh`
 - b) `$ sudo chmod a+x CallLinuxscript.sh`
 - c) `$ sudo ./CallLinuxscript.sh`

5. Review the installation log to confirm there were no errors.

Note: The Control Room installation folder on Linux is located by default at `/opt/automationanywhere/enterprise`.

Continue from the step [Configure the post-installation settings in Installing Control Room on Linux](#) on page 1237.

Uninstall Automation 360 On-Premises from Linux server

Uninstall the On-Premises Control Room from your Linux server.

Ensure that the Automation 360 installation server is disconnected from the Microsoft SQL Server database.

1. Log in to the installation server.
2. Run the uninstaller command as a superuser:

```
$ sudo /opt/automationanywhere/enterprise/_Automation\ Anywhere\ Enterprise_installation/Change\ Automation\ Anywhere\ Enterprise\ Installation
```

The installation wizard verifies the installation and proceeds with the uninstallation.

Tip:

- Enter the `back` command to return to a previous command step.
- Press the **return key** to accept default values, or enter an alternate value then press the **return key**.

-
3. Confirm the uninstallation by entering `Y`.

The Automation 360 components are removed from the Linux system.

The databases with associated Automation 360 information about users and bots remains stored in the database and remain connected to any other Control Room in your cluster.

Performing silent uninstallation of Control Room on Linux

Use the sample script to perform an unattended uninstallation of Control Room.

Ensure that the Automation 360 installation server is disconnected from the Microsoft SQL Server database.

1. Log in to the installation server.

2. Create a shell script named `LinuxUninstall.sh` that will run the uninstallation process and automatically respond to prompts:

```
sudo /opt/automationanywhere/enterprise/_Automation\ Anywhere\
Enterprise_installation/Change\ Automation\ Anywhere\ Enterprise\
Installation << EOF
\n
1
\n
EOF
```

3. Mark the script as executable and run the uninstallation process.

a) `$ sudo chmod a+x LinuxUninstall.sh`

b) `$ sudo ./LinuxUninstall.sh`

The script is executed:

```
=====
Automation Anywhere Enterprise                               (created with
  InstallAnywhere)
-----
Preparing CONSOLE Mode Uninstallation...
=====
Uninstall Automation Anywhere Enterprise
-----
About to uninstall...
```

4. When the uninstallation is complete, manually remove any remaining files.

Configure Control Room in cluster setup with shared repository for Linux

As an RPA platform administrator, you can configure the Control Room in a cluster setup across a shared repository to achieve high availability, load balancing, and disaster recovery.

- Verify whether the prerequisites for on-premises installation are met.

[Automation 360 On-Premises prerequisites](#) on page 1124

- Ensure that you have the following:
 - Three Linux VMs with RHEL 7.9
 - One Linux VM with MS SQL 2019 connected to a database
 - One load balancer with access to all the nodes
 - One AWS NFS

If one of the Control Room nodes is down, the other nodes maintain continuity of service and manage the load on the server. If a specific node fails, data can be recovered from the other shared nodes on the server.

Perform the following steps to configure the Control Room in a cluster that has three nodes (N1, N2, and N3) using a shared repository.

1. Set up the NFS in AWS.

2. Create a directory in the nodes N1, N2, and N3.
`/CRRepo/AutomationAnywhere`
3. Run the following commands to grant the read and write permissions to the new directory across all the nodes:
 - a) `sudo chown -R crkernel:controlroom /CRRepo/AutomationAnywhere`
 - b) `sudo chmod -R 775 /CRRepo/AutomationAnywhere`
4. Run the following command in all the three nodes to edit the `fstab` file to mount and map the new directory with NFS.
`fs-eec88e3f.efs.ap-south-1.amazonaws.com:/ /CRRepo/AutomationAnywhere
nfs rw,hard,intr,rsize=1048576,wsiz=1048576,timeo=14 0 0`
5. To verify that the remote NFS volume is successfully mounted, reboot nodes N1, N2, and N3, and run the `df -h` command.
After the share is mounted, the mount point becomes the root directory of the mounted file system.
6. To verify that the NFS is working across the shared repository, create a text file in the `/CRRepo/AutomationAnywhere` directory of node N1.
You can view the same file in the nodes N2 and N3 directory.
7. Install Control Room in the nodes N1, N2, and N3.
[Installing Control Room on Linux](#) on page 1237

After Control Room is configured across the shared repository, perform the following steps:

1. Access Control Room through the load balancer URL.
2. Continue with the following steps after the Control Room configuration steps.
 - a) In the Control Room repository path, enter `/CRRepo/AutomationAnywhere`.
 - b) In the URL field, enter the load balancer server URL.
 - c) Complete steps required to create an admin user.
3. Verify the Control Room on all the three nodes by navigating to the **Administration > Settings > General tab**.

Add nodes to a cluster setup for Linux

As an RPA platform administrator, you can add nodes to a cluster for better performance and better load distribution.

Ensure the following:

- Verify whether the prerequisites for on-premises installation are met.
[Automation 360 On-Premises prerequisites](#) on page 1124
- Verify that all the primary nodes and databases have backups.
- You must have the IP addresses of all the cluster members for the Control Room server network interfaces used for Elasticsearch communications.

Note: The Control Room servers can have multiple network interfaces. The server IP addresses must be statically assigned and cannot use the Dynamic Host Configuration Protocol (DHCP).

- If any external load balancers are used in the environment, update them with IP addresses from the new server nodes.
- Ensure that you have administrator or root privileges on the Control Room servers. You must be familiar with installing Control Room in custom mode and also with the related configuration settings.

Adding nodes to a cluster helps you to upgrade the configuration of the nodes in a cluster. You can add nodes to a Control Room cluster setup, change the IP addresses of nodes in the cluster, and monitor the health of the underlying cluster services.

Note: The minimal number of nodes supported within a Control Room cluster is three. The nodes in a cluster synchronize with each other over a local network. All the nodes in a cluster connect to the same database.

Perform the following steps to add three nodes (N4, N5, and N6) to a cluster that has three nodes (N1, N2, and N3).

1. On node N4, run the installer command as a superuser from the Linux shell:

```
$ sudo ./Automation360_e17_Build_<build_number>.bin
```
2. Proceed through the installer to the cluster configuration.
 - a) Select **Enable Cluster Setup**.
 - b) In the **Cluster IP addresses** box, enter the IP addresses of all the nodes that you need to configure in the cluster.

```
172.31.30.120, 172.31.21.216, 172.31.17.110, 172.31.20.242,  
172.31.17.149, 172.31.18.37
```

Note: The IP addresses must be entered in the same sequence on every node.

3. Complete the remaining steps to install Control Room.
[Installing Control Room on Linux](#) on page 1237
4. Repeat the steps 1 on page 1248 through 3 on page 1248 for nodes N5 and N6.
5. Add the complete set of IP addresses for all the nodes in the older nodes N1, N2, and N3. Restart the nodes, one at a time.
6. To verify the health of the cluster, run the following commands in the command line:
 - a)

```
curl -k --user es_client:<es password> https://172.31.30.120:47599/_cat/nodes
```

The master node is indicated by an asterisk character (*).
 - b) Verify that the IP address of the master node is the same as the one mentioned in the `elasticsearch.yml` file for all the nodes.
 - c)

```
curl -k --user es_client:<es password> https://172.31.30.120:47599/_cat/health?pretty
```

You must wait until the replication status turns green. The replication time varies depending on the data load in the clusters. The replication status turns green when the cluster is fully synchronized.

Remove nodes from a cluster setup for Linux

As an RPA platform administrator, you can remove nodes from a Control Room cluster setup to replace them or upgrade them for enhanced performance.

Ensure the following:

- Verify that all the primary nodes and databases have backups.
- Ensure that you have administrator or root privileges on the Control Room servers.

Perform the following steps to remove three nodes (N1, N2, and N3) from a cluster that has six nodes (N1, N2, N3, N4, N5, and N6).

1. Run the following command in the Linux shell to identify the master node.

```
curl -k --user es_client:Automation123 https://172.31.46.2:47599/_cat/nodes
```
2. Remove the non-master nodes N2 and N3 from the cluster.
 - a) Log in to the server as an administrator and run the following command to stop all the Control Room services.

```
sudo systemctl stop controlroom*
```
 - b) Log in to any of the non-master nodes.
 - c) Edit the cluster.properties file located at /opt/automationanywhere/automation360/config.
 - d) Remove the IP addresses for the original three nodes.

Note: Perform this action for all the nodes in the cluster. When you remove the IP addresses of the original three nodes, do not change their sequence.

 - e) Edit the elasticsearch.yml file at /opt/automationanywhere/automation360/elasticsearch/config.
 - f) Remove the old IP addresses from the list in the discovery.zen.ping.unicast.hosts attribute.
 - g) Restart the non-master nodes, one at a time.
3. Remove the master node N1 from the cluster.
 - a) Log in to the server as an administrator and run the following command to stop all the Control Room services.

```
sudo systemctl stop controlroom*
```
 - b) Log in to the any of the non-master nodes.
 - c) Edit the cluster.properties file and remove the IP address of the old master node.
 - d) Run the following command in any of the other nodes to identify the new master node.

```
curl -k --user es_client:<es password>https://172.31.18.37/_cat/nodes
```
 - e) Edit the elasticsearch.yml file at /opt/automationanywhere/automation360/elasticsearch/config.
 - f) Update the IP address of the new master node in the cluster.initial_master_nodes attribute.

- g)** Remove the IP address of the old master node from the list in the `discovery.zen.ping.unicast.hosts` attribute.
 - h)** Run the following command to start the services on each node:

```
sudo systemctl start controlroom*
```
- 4.** To verify the health of the cluster, run the following command in the command line:
`curl -k --user es_client:<es password>https://172.31.18.37/_cat/nodes`
You must wait until the replication status turns green. The replication status turns green when the cluster is fully synchronized.

Stop and start Control Room services on Linux

Review the instructions and service names to stop and restart Automation Anywhere Control Room services on Linux.

Log in to your Automation Anywhere Control Room server.

- 1.** If you just finished installing A2019, use the following command to display the status of all Control Room services:

```
sudo systemctl status control*
```

Browse through the output. If any of the services are not actively running, you can manually start the service with the following command (see the next step for specific service names):

```
sudo systemctl start <servicename>
```

Note: If more than one service is not running, you can use the script in the next step to start all the services.

For other Linux installation issues, contact Automation Anywhere support: [Open a support case \(A-People login required\)](#).

- 2.** Optional: Create a script from the following code, such as `startallaae.sh`, to start all the Control Room services.

This sample script lists the Control Room services that need to be restarted. You can restart the services in any sequence.

The `sleep` commands allow each service to complete startup before the next service is started.

Note: `controlroomdiscoverybot.service` is only installed by default starting in Automation 360 version 16.

```
echo Starting elasticsearch
sudo systemctl start controlroomelasticsearch.service
sleep 30
echo Starting botcompiler
sudo systemctl start controlroombotcompiler.service
sleep 30
echo Starting control room caching
sudo systemctl start controlroomcaching.service
sleep 30
echo Starting backend service
sudo systemctl start controlroombackend.service
```

```

sleep 30
echo Starting reverse proxy
sudo systemctl start controlroomreverseproxy.service
sleep 30
echo Starting messaging
sudo systemctl start controlroommessaging.service
sleep 30
echo Starting iq bot
sudo systemctl start controlroomiqbot.service
sleep 30
echo Starting discovery bot
sudo systemctl start controlroomdiscoverybot.service
sleep 30
echo Starting aari
sudo systemctl start controlroomaari.service
sleep 30
echo Starting storage
sudo systemctl start controlroomstorage.service
sleep 30
echo Starting ml services
sudo systemctl start controlroomdiscoverybotml.service
sleep 30

```

Assign execute permission to the script and run it: `sudo ./startallaae.sh`

3. To stop a single service, use the following command: `sudo systemctl stop <servicename>`.

Optional: To stop all services for maintenance or other requirements, create a script, such as `stopallaae.sh`, to stop the Control Room services.

```

sudo systemctl stop controlroommessaging.service
sudo systemctl stop controlroomreverseproxy.service
sudo systemctl stop controlroombackend.service
sudo systemctl stop controlroomcaching.service
sudo systemctl stop controlroombotcompiler.service
sudo systemctl stop controlroomelasticsearch.service
sudo systemctl stop controlroomiqbot.service
sudo systemctl stop controlroomdiscoverybot.service

sudo systemctl stop controlroomaari.service
sudo systemctl stop controlroomstorage.service
sudo systemctl stop controlroomdiscoverybotml.service

```

Assign execute permissions to the script and run it: `sudo ./stopallaae.sh`

Installing Control Room on Microsoft Windows Server using scripts

Silent Control Room installation, also known as unattended installation, uses a customized script for a full setup or an update setup. Silent installation runs the entire installation process in the background, without requiring user interaction or displaying messages.

To perform the task, you must have a administrator account with the required rights and permissions.

- Disable the User Access Control (UAC) on host VM for Control Room.
- Verify [Automation 360 On-Premises prerequisites](#) on page 1124.

- Ensure that you have the following:
 - Automation Anywhere Control Room installation file
 - TLS certificate
 - License file

- Create a Powershell script.
 - See the installation parameters and sample scripts.
- Run the script in Powershell.

Note: For instructions on performing silent install and configuration of Automation 360 separately, see [.Silent installation and configuration of Automation 360 using scripts \(A-People login required\).](#)

1. Review the parameters and identify the settings you require.
 - Control Room installation parameters

Variable name	Description
AA_CRCLUSTERCONFIG	if AA_SETCLUSTERMODE=1 then cluster IP comma separated
AA_CRDBPORT	Control Room database port. Default value is 1433
AA_CRDBSSLMODE	Secure SQL connection
AA_CRFORCEHTTPSCONFIG=" "	--
AA_CRFORCETOHTTPS="1"	Force traffic from HTTP to HTTPS
AA_CRHTTPPORT	Control Room HTTP port. Default is 5432
AA_CRHTTPSPPORT	Control Room HTTPS port
AA_CRLISTENPORT	Web server port. Default value is 80
AA_CRSERVICECONFIRMPASSWD	If AA_CRSETLOCALSERVICECRED=0, then confirm password
AA_CRSERVICEPASSWD	If AA_CRSETLOCALSERVICECRED=0, then confirm password
AA_CRSERVICEUSERNAME	if AA_CRSETLOCALSERVICECRED=0, then add domain\user name
AA_CRSETLOCALSERVICECRED	<ul style="list-style-type: none"> • 1 if service logon as System • 0 if service logon as specific user
AA_CRWCCERTPASSWD	Certificate password
AA_CRSELFSIGNCERT	1 for self-signed certificate

Variable name	Description
AA_CRWCCERTPATH	Certificate path
AA_SDSFEATURE	<ul style="list-style-type: none"> true=Cloud deployment type false=On-Premises deployment type
AA_SETCLUSTERMODE	For cluster set 1, otherwise 0
AA_SETUPTYPE	Setup type Custom or Express
INSTALLDIR	Installation Directory
IS_SQLSERVER_AUTHENTICATION	<ul style="list-style-type: none"> 0 for Windows authentication 1 for SQL authentication 2 for Azure AD authentication
IS_SQLSERVER_DATABASE	SQL database name
IS_SQLSERVER_SERVER	SQL server name (host name)

- Elasticsearch related parameters

Parameter	Description
AA_ELASTICSEARCH_BACKUP	<p>Used only if installing on the first node of a backup server. Enter 1 if yes.</p> <hr/> <p>Note: The AA_ELASTICSEARCH_BACKUP parameter is used when you install an Control Room as backup server for audit.</p> <hr/>
AA_ELASTICSEARCHSYSIP	Valid IP address
AA_ESPASSWD	<p>Password for Elasticsearch</p> <hr/> <p>Note: An additional parameter for confirming the password is not available. The password must have a minimum of 6 characters.</p> <hr/>

- Key-vault related parameters

Parameter	Description
AA_KEYVAULTTYPE	Enter any of the following: <ul style="list-style-type: none"> NONE if you do not want to define a key vault AWSS for AWS Secrets Manager CARK for CyberArk
IS_SQLSERVER_AUTHENTICATION	Enter any of the following: <ul style="list-style-type: none"> 0 if SQL server authentication is not set 1 if SQL server authentication is set
IS_SQLSERVER_EKVAUTHENTICATION	Use this if the SQL server authentication is configured for an external key vault. Enter any of the following: <ul style="list-style-type: none"> 0 if SQL server authentication does not use an external key vault 1 if SQL server authentication for a key vault is configured for CyberArk 2 if SQL server authentication for a key vault is configured for AWS Secrets Manager
AA_CRSERVICECREDTYPE	Enter any of the following: <ul style="list-style-type: none"> LOCAL if the Control Room database uses local authentication. SERVICE if the Control Room database uses custom authentication. SERVICEEKV if the Control Room database uses external key vault for authentication.
AWS Secrets Manager key vault parameters	
AA_AWSSREGION	AWS region
AA_DBAUTHAWSSECRET	AWS sqllogin secret
AA_CRSERVAWSSECRET	AWS service secret
CyberArk key vault parameters	
AA_CARKAPPID	CyberArk app ID
AA_CARKCERTIFICATE	Full certificate filename with path

Parameter	Description
AA_CARKOPTIONALCERT	Optional certificate filename with path
AA_CARKCERTPASSPHRASE	Certificate passphrase
AA_CARKVAULTURL	CyberArk URL
AA_DBAUTHCARKOBJECTNAME	CyberArk sqllogin object name
AA_DBAUTHCARSAFENAME	CyberArk sqllogin safe name
AA_CRSEVVCARKOBJECTNAME	CyberArk service credential
AA_CRSEVVCARSAFENAME	CyberArk service locker

- IPv6-related parameters

Parameter	Description
AA_IPV6ENABLED	Enter 1 to enable IPv6 addresses To disable IPv6 addresses, do not enter the parameter.

2. Optional: Edit the sample script to use a Microsoft SQL Server database.

Use the script to install the Control Room with the configuration options available in the installer.

- a) Correct values for variables such as `$service_username`, `$service_pwd`, `$db_server`, `$cr_port`.
- b) Run the script with Credentials in Service logon, and a non-secure connection using Microsoft SQL Server authentication with a new database.

Sample script:

```
$cr_port=80

$service_username= "domain\username" #e.g."aaspl-brd\ellie.brown"
$service_pwd="password"

#$certpath = "C:\SilentInstall\test256.pfx"
#$certpass = "changeit"

$db_server="localhost"
$cr_db_name="CRDB-NEW-SI-3"
$db_user="sa"
$db_pwd="Admin@123"

$elastic_password="Test@123"

$installation_path="C:\Program Files\Automation Anywhere"

#Install latest setup
$static_installation_path="\Enterprise\*****"
$silent_details=" /s ", "v"" -join "/"
$installpath_details=" /qn INSTALLDIR=*****"
```

```

$deployment_details=" /AA_SDSFEATURE=true"

$custom_details=" /vAA_SETUPTYPE=Custom
                 /vAA_CUSTOMMODETYPE=1"

$port_cluster_details=" /vAA_SETCLUSTERMODE=0
                      /vAA_CRLISTENPORT=$cr_port"

#$service_details=" /vAA_CRSETLOCALSERVICECRED=0
                  /vAA_CRSERVICEUSERNAME=$service_username
                  /vAA_CRSERVICEPASSWD=$service_pwd
                  /vAA_CRSERVICECONFIRMPASSWD=$service_pwd"

$service_details=" /vAA_CRSETLOCALSERVICECRED=1"

#$db_details=" /vAA_BIMETADATADBTYP=AA_BIMETADATADBTYP
             /vIS_SQLSERVER_SERVER=$db_server
             /vIS_SQLSERVER_DATABASE=$cr_db_name
             /vIS_SQLSERVER_DATABASE1=$bi_db_name"

$db_details=" /vIS_SQLSERVER_SERVER=$db_server
            /vIS_SQLSERVER_USERNAME=$db_user
            /vIS_SQLSERVER_PASSWORD=$db_pwd
            /vIS_SQLSERVER_DATABASE=$cr_db_name
            /vIS_SQLSERVER_AUTHENTICATION=1"

$other=" /vAA_ESPASSWD=$elastic_password
       /vAA_CRWCHTTPPORT=80

       /LIweamoruc! log.txt""

$final_commandline = -join($silent_details,
                          $installpath_details,$installation_path,
                          $static_installation_path,$custom_details,
                          $port_cluster_details,$service_details,
                          $db_details,$pg_details,$other)

Write-Host $final_commandline
$a=Get-ChildItem $PSScriptRoot\* -Include *.exe
#$a = "C:\Silent\AutomationAnywhereEnterprise_A2019_<build>.exe"

Write-Host $a
Write-Host "Starting the installation wait for sometime..."

$processdetail=(Start-Process -FilePath
                  $a -ArgumentList $final_commandline
                  -Wait -PassThru).ExitCode

Write-Host $a.Name execution is done.
If installation is not proper check msi logs in the temp folder.
pause

```

Note: When using Windows authentication for connecting to Microsoft SQL Server database, ensure that the following settings are configured:

- The `IS_SQLSERVER_AUTHENTICATION` installation parameter should be set to 0
- The user assigned to the `$service_username` parameter should be an active user in Microsoft SQL Server with permissions set as: `db_datareader`, `db_datawriter`, and `db_ddladmin`
- The `$db_user` and `$db_pwd` parameter values should be disabled or commented out

-
3. Save the script you edit to the server for installation.
 4. On the installation server, log on as an administrator, open Powershell in admin mode, and execute the following: `Set-ExecutionPolicy Unrestricted -Scope CurrentUser -Force`
 5. Start Powershell in admin mode and execute: `.\install.ps1`

Note: The silent installation logs are stored in the folder from which the installation script is executed. For example, if you run the script from `C:\Silent Install`, the logs are stored in `C:\Silent Install` folder.

Complete the Control Room configuration and validation.

- After installing the Control Room, complete the configuration settings to ensure timely Automation Anywhere communications are specified and confirm Automation Anywhere services are running.
- After completing the post-installation tasks, validate the setup by logging in to the Control Room and installing a license. First time access to the Control Room walks you through the configuration for your authentication method.
- As a Cloud user with administrator permissions, you can create, view, edit, delete, and enable or disable a user. Creating users steps vary depending on whether the user is a non-Active Directory, Active Directory, or single sign-on (SSO) user from an IdP server.

Related concepts

[Post-installation user management](#) on page 1312

After completing the post-installation tasks, validate the setup by logging in to the Control Room and installing a license. First time access to the Control Room walks you through the configuration for your authentication method.

Related tasks

[Users](#) on page 1676

As an administrator, you can create, view, edit, delete, and enable or disable a user. Creating users steps vary depending on whether the user is a non-Active Directory, Active Directory, or single sign-on (SSO) user from an IdP server.

Complete Control Room post-installation configuration

After installing the Control Room, complete the configuration settings to ensure timely Automation Anywhere communications are specified and confirm Automation Anywhere services are running.

1. [Configure post-installation settings](#)

After installing the Control Room, complete the configuration settings to ensure timely Automation Anywhere communications are specified and confirm Automation Anywhere services are running.

2. [Verify Automation Anywhere services](#)

Automation Anywhere specific services are installed on the Control Room server.

3. [Change Control Room configuration to HTTPS from HTTP mode](#) on page 1326

Configure Control Room for HTTPS mode using a self-signed or CA certificate either before or after performing a custom Control Room configuration.

4. [Import HTTPS, intermediate, and CA certificates](#) on page 1327

After installing the Control Room, import a certificate for HTTPS, Certificate Authority (CA), or both using the Windows or Linux command prompt.

5. [Configure disaster recovery site for Elasticsearch IP addresses](#) on page 1262

If you have configured the Control Room for high availability (HA) and disaster recovery (DR) and installed the Control Room on both the primary and secondary sites, configure Elasticsearch IP addresses for the secondary site.

6. [Add primary IP address for cluster](#) on page 1263

If your Control Room server has dual IP addresses or network interface cards (NICs) and you configure the second NIC as your backup IP address, you must manually update the `cluster.properties` file to include the backup IP address.

7. [Configure additional IP address for a new cluster node](#) on page 1264

After installing the Control Room in the cluster node, when you add new nodes in the cluster, you must configure additional static IP addresses for all the nodes in the property file on each node in the cluster.

Configuring post-installation settings

After you finish installing the Control Room, configure specific items to ensure timely Automation Anywhere communications.

Post-installation tasks and settings

Exclude anti-virus

Exclude anti-virus scans from running in the Automation Anywhere local repository because they interfere with running bots.

By default, the repository path is `C:\ProgramData\AutomationAnywhere`

Set the language locale

`\Server Files`. If you have modified the repository path after installation, you can verify the path from **Administration > Settings > Control Room database & software**.

Select your language as the region setting.

The following example uses English (United States) as the region setting.

- Windows: Select **Control Panel > Region > Administrative > Change system locale**.

For usernames that contain non-ASCII characters, update the following settings:

1. From **Control Panel > Clock and Region > Administrative > Change system locale**, select the required language from the **Current system locale** list.
2. If available, clear the **Beta: Use Unicode UTF-8 for worldwide language support** check box.
3. To change the code page identifier, enter `chcp <identifier-code>` at the command prompt. For example, enter `chcp 949` to use ANSI or OEM Korean (Unified Hangul Code).

[Code Page Identifiers](#)

4. Restart your machine.

- Linux

1. Verify the current locale:

```
$ locale
```

2. Display a list of all available locales on the server:

```
$ locale -a
```

3. Depending on your operating system, use one of these options to set the locale for the whole server with the LANG variable.

Substitute language `en_US.UTF-8` with your own:

```
Ubuntu: sudo update-locale  
LANG=en_US.UTF-8 LANGUAGE
```

```
Red Hat Enterprise Linux: sudo  
localectl set-locale  
LANG=en_US.UTF-8
```

4. Update either the global locale settings file `etc/locale.conf` or settings `~/ .bash_profile` for the user that owns Automation 360:

```
LANG="en_US.utf8"
export LANG
```

Set the region

Select your language as the region format.
Windows: Select **Control Panel > Region > Format**.

Set time synchronization

Enable Network Time Protocol (NTP) on the Control Room .

For additional information about setting the NTP, contact your system administrator.

For Microsoft Azure platform installation, set configuration

Use the Microsoft Azure Portal to configure:

- Windows credentials
- Control Room settings for repository, URL, and master key for Credential Vault
- Microsoft Active Directory authentication
- Optionally, SMTP settings

Related tasks

[Complete Control Room post-installation configuration](#) on page 1258

After installing the Control Room, complete the configuration settings to ensure timely Automation Anywhere communications are specified and confirm Automation Anywhere services are running.

Related reference

[Verifying Automation Anywhere services](#) on page 1260

Automation Anywhere specific services are installed on the Control Room server.

[Working with SQL Servers](#) on page 1136

Configure Microsoft SQL Servers before setting up the Control Room database.

Verifying Automation Anywhere services

Automation Anywhere specific services are installed on the Control Room server.

Linux users: See [Stop and start Control Room services on Linux](#) on page 1250.

Verify installed Windows services

From your Windows device:

1. Select **Control Panel > Administrator Tools > Services**.

The specific path to **Services** can vary, depending on your specific Windows version.

2. Scroll through the list to find the listed service name. Note the **Status** should show as running.

Control Room installed services

Verify that the following Windows services are installed by the Automation Anywhere Control Room installer.

Service name	Description
Automation Anywhere Bot Compiler Service	Stores all details about the bot compile service. Receives and processes Bot compilation requests for the Control Room.
Automation Anywhere Control Room Caching	Used for distributed cache storage.
Automation Anywhere Control Room IQ Bot Service	Used for Automation 360 IQ Bot.
Automation Anywhere Control Room Messaging	Allows Control Room services to communicate asynchronously.
Automation Anywhere Control Room Reverse Proxy	Receives all incoming HTTP and HTTPS requests for Automation Anywhere products and forwards to the correct service.
Automation Anywhere Control Room Robotic Interface Service	Is the Automation Co-Pilot for Business Users (Automation Co-Pilot) service used to create and orchestrate workflows between forms and bots.
Automation Anywhere Control Room Service	Receives and processes API requests for the Control Room.
Automation Anywhere Elastic Search Service	Stores all logs and related activities for search functionality. For details about Elasticsearch, see Elastic Stack and Product Documentation .
Automation Anywhere Control Room Discovery Bot Service	Used for Discovery Bot.
Automation Anywhere Control Room Discovery Bot ML Service	Used to launch Discovery Bot from Control Room. Note: If the Automation Anywhere Control Room Discovery Bot ML Service does not start during installation, you must update Windows Server 12 with the Microsoft patch. For more details, see Update for Universal C Runtime in Windows .
Automation Anywhere Control Room Storage Service	Used as a storage solution to leverage automation projects.

- All the services can be configured either in the Local System or Domain account when the Control Room is installed in Custom mode. For a Control Room installed in Express mode, all the services are run in the Local System account.
- By default, the Automation Anywhere Control Room services restart automatically after a system reboot. You do not need a windows service start-up script to restart the services.
- We recommend you wait for two (2) minutes for the Automation Anywhere Control Room services to restart after a system reboot. If the services do not start automatically, you will see the `Bad gateway` error. You can restart the services manually in any sequence.
- Running Automation Workspace services is mandatory for using the Automation Workspace platform. However, running the Automation Co-Pilot, Discovery Bot, and IQ Bot services is optional for Automation Workspace platform.

Log in to the server as an administrator and install Automation Anywhere Control Room in Custom mode to select installation and configuration options, including installing non-default requirements. Select this mode for a data center deployment.

Related tasks

[Installing Control Room using Express mode](#) on page 1213

[Installing Control Room on Linux](#) on page 1237

You start installing the Automation Anywhere Control Room in the Linux environment and complete the installation in the Control Room.

Configure disaster recovery site for Elasticsearch IP addresses

If you have configured the Control Room for high availability (HA) and disaster recovery (DR) and installed the Control Room on both the primary and secondary sites, configure Elasticsearch IP addresses for the secondary site.

Ensure that you are logged in to the `as` as the administrator.

Complete the Control Room installation on both the primary and secondary DR sites.

Before adding a new node, ensure the existing cluster is in yellow or green state and all ports on the new node are open.

Perform this task to make the IP address of the secondary DR site Elasticsearch available to the primary DR site.

1. From the primary site Control Room, navigate to **Administration > Settings > General > Control Room Database & Software**.
2. Click **Edit**.
3. Enter the DR secondary site **Cluster IP address** in the **Elasticsearch disaster recovery backup cluster** field.
4. Click the plus sign to add additional cluster IP addresses.
5. Click **Save Changes**.

Related concepts

[High availability deployment](#) on page 1179

To support Automation 360 in your data center, configure an high availability (HA) cluster. Follow your company methods and procedures for implementing your data center cluster.

Related tasks

[Warm stand-by](#) on page 1184

Host two setups or sites - primary and backup for the warm stand-by DR procedure.

Add primary IP address for cluster

If your Control Room server has multiple IP addresses or network interface cards (NICs), you can manually update the `cluster.properties` file to include the primary IP address.

To perform the task, you must have a administrator account with the required rights and permissions.

- Ensure you have the view and manage settings permission.
- Complete the Control Room installation.
- Updating the `cluster.properties` file requires a downtime, so ensure a maintenance window for the following:
 - All the user devices will be disconnected.
 - No schedules will run during maintenance.
 - Bot Agent and Automation Anywhere Control Room will not be accessible.

Update the `cluster.properties` file to ensure the caching service requirement to define a single IP address for the primary NIC of the Control Room.

Ensure that you complete these tasks on all the Control Room nodes in a high availability cluster.

1. Locate the `cluster.properties` file in your Control Room directory.
For example, the default location is: `C:\Program Files\Automation Anywhere\Enterprise\config\`

If the file does not exist in your Control Room directory, create the file.

2. Add the following property option to the `cluster.properties` file:
`ignite.local.static.ip=<nic_ip_address>`
For example, `ignite.local.static.ip=172.16.20.168`

Note: The `ignite.local.static.ip` property is configured with a single IP address of the primary NIC of the Control Room with which the communication between the Control Room nodes is expected. You can manually reconfigure the property when more than one IP address is available.

3. Save the `cluster.properties` file.
4. Restart the following Automation Anywhere Windows services:
 - a) Automation Anywhere Control Room Caching
 - b) Automation Anywhere Control Room Messaging
 - c) Automation Anywhere Control Room Service
5. To ensure all the cache is in sync, restart the rest of the Automation Anywhere Windows services.

Configure additional IP address for a new cluster node

After installing the Control Room in the cluster node, if you add new nodes in the cluster, you have to configure additional static IP addresses for all the nodes in the property file on each node in the cluster.

To perform the task, you must have a administrator account with the required rights and permissions.

- Ensure that you have a maintenance window, which requires complete downtime for the following:
 - All the user devices will be disconnected.
 - No schedules will run during maintenance.
 - Bot Agent and Automation Anywhere Control Room will not be accessible.
- Complete the Control Room installation on any new node.

Perform the following steps on each node in the cluster:

1. Stop the following Automation Anywhere services on the Control Room node:
 - a) Automation Anywhere Control Room Reverse Proxy
 - b) Automation Anywhere Control Room Caching
 - c) Automation Anywhere Control Room Service
 - d) Automation Anywhere Elastic Search Service
 - e) Automation Anywhere Bot Insight Elastic Search
 - f) Automation Anywhere Control Room IQ Bot Service
 - g) Automation Anywhere Control Room Robotic Interface Service
 - h) Automation Anywhere Control Room Discovery Bot Service
2. Locate the `cluster.properties` file in your Control Room directory.
For example, the default location is: `C:\Program Files\Automation Anywhere\Enterprise\config\`
If the file does not exist in your Control Room directory, create the file.
3. Add the following properties and configure the primary IP addresses as a static IP address for all the cluster nodes (including existing cluster nodes) in the `cluster.properties` file.

```
ignite.discovery.mode=static
ignite.discovery.static.ips=<primary ip addresses>
```

For example: `ignite.discovery.static.ips=10.0.11.153,10.0.11.13`

4. If the nodes have multiple IP addresses, also add the following property and configure a specific primary IP address on each node in the cluster:

```
ignite.local.static.ip=<primary ip address>
```

For example: `ignite.local.static.ip=10.0.11.153`

5. Save the `cluster.properties` file.
6. Modify the `elasticsearch.yml` file for the new IP address:
 - a) Locate the `elasticsearch.yml` file in the Control Room directory.

For example, the default location is: C:\Program Files\Automation Anywhere\Enterprise\elasticsearch\config\elasticsearch.yml

- b) Update `elasticsearch.yml` with the new IP address using the following property:
`discovery.zen.ping.unicast.hosts: ["ip1", "ip2", "ip-new"]`
- c) Save the `elasticsearch.yml` file.

7. Start all the services that were stopped in Step 1 on each Control Room node.

Note: Wait for an interval of 40 seconds before starting the next service.

Add service URLs to trusted list for On-Premises

For On-Premises deployment, to ensure secure access to Automation 360 online services, add service URL list to the safe recipients or trusted list.

URL list

Online service hosting uses dynamic IP addresses, therefore we recommend that you add to the safe recipients or trusted list, the complete URL instead of an IP address for the Automation Anywhere online services.

Service	URL	Port	Devices
Automation Anywhere	<code>www.automationanywhere.com</code>	TCP 443 (HTTPS)	All devices
Automatic download of newly released package versions for On-Premises Control Room	<code>https://aai-artifacts.my.automationanywhere.digital/packages/</code>	TCP 443 (HTTPS)	All devices
Automation Anywhere community (A-People)	<code>apeople.automationanywhere.com</code>	TCP 443 (HTTPS)	All devices
Automation Anywhere documentation	<code>docs.automationanywhere.com</code>	TCP 443 (HTTPS)	All devices
Automation Anywhere Cloud license server	<code>license.automationanywhere.digital</code> (192.124.249.160: Add this IP address to the safe recipients list in the outbound direction so that the Control Room can now securely connect to the Cloud license server)	TCP 443 (HTTPS)	All devices that run Automation 360 Control Room
Bot Store	<code>botstore.automationanywhere.com</code>	TCP 443 (HTTPS)	All devices

Service	URL	Port	Devices
Telemetry Allows performance and usage information to be gathered anonymously in order to improve product quality.	<ul style="list-style-type: none"> cdn.pendo.io app.pendo.io/ data.pendo.io/ https://pendo-static-5673999629942784.storage.googleapis.com/ 	TCP 443 (HTTPS)	All devices

CoE Manager	<ul style="list-style-type: none"> US region: https://util.shibumi.com* EU region: https://util.eu.shibumi.com* AP region: https://util.ap.shibumi.com* 	--	--

Files and folders

For information on files and folders to add to the safe list and to the antivirus exception list, see these articles:

- [Files and URLs to add to safe list for Automation 360 \(A-People login required\)](#)
- [List of files to add to antivirus exception list for Automation 360 \(A-People login required\)](#)

Related reference

[Add service URLs to trusted list for Cloud](#) on page 1114

For Cloud deployment, to ensure secure access to Automation 360 online services, add the service URL list to the safe recipients or trusted list.

Using the Control Room diagnostics utility

Use the Control Room diagnostics utility to gather the Control Room logs, event viewer logs and system information for a specified duration and troubleshoot any Control Room related issues.

Because the diagnostic utility is designed for On-Premises Windows environment only, ensure that the Control Room is installed on the machine. To gather the required information, you must execute the utility independently on each node of the Control Room cluster.

1. Open the Windows Command Prompt with elevated privileges (Run as administrator).
2. Navigate to the Control Room installation path.

Default installation path for Control Room is:

```
C:\Program Files\Automation Anywhere\Automation360
```

3. Run the Control Room diagnostic utility using the following command:

```
C:\Program Files\Automation Anywhere\Automation360\jdk11\bin\java -jar crdiagnosticutility.jar [OPTIONS]
```

Note: The Java Development Kit (JDK) is bundled with the Control Room and the default location is C:\Program Files\Automation Anywhere\Automation360\jdk11\bin\java.

4. The following table describes the option for performing the diagnostic check:

Option	Description
-collectLogs	<p>By capturing multiple logs for the Control Room, you reduce the turnaround time for collecting information on issues. The logs are collected as a zip file on the machine where the utility is being run.</p> <p>The logs are saved in the configured log directory of Control Room. For example, the default log directory is C:\ProgramData\AutomationAnywhere\Logs\ . The compressed file will be created in C:\ProgramData\AutomationAnywhere\Logs\CR_logs_<datetimestamp>.zip.</p> <p>Review the following considerations on using the Control Room diagnostic utility:</p> <ul style="list-style-type: none"> • To capture Windows logs for security events, run the utility with administrative or elevated privileges. An alert is displayed if you run the utility without elevated privileges. • To save the storage space, delete the zip file after debugging.

Uninstalling Automation 360

Use the Automation 360 installer or the **Uninstall or change a program** option from the Windows Control Panel to remove or uninstall a Control Room instance.

1. To uninstall the Control Room using the installer, run the setup file from the installation path. Run the installer in admin mode.
2. In the InstallShield wizard, click **Next**.
3. Click **Remove**.
4. Click **Finish** to complete uninstalling the Control Room from your machine or server.

Related concepts

[Migrate to Automation 360](#) on page 1436

Migration (upgrade) is the process of moving your data and bots from Enterprise 11 or Enterprise 10 to Automation 360. Migration includes but is not limited to replicating and updating your existing database and repository, converting your bots to the Automation 360 format, and migrating learning instances for IQ Bot and dashboards for Bot Insight.

Related reference

[Installing Control Room On-Premises](#) on page 1121

Review the installation core tasks and topics for installing the Automation 360 Control Room in a data center on an On-Premises server or a cloud service provider server instance.

Get started with Community Edition

Use these tasks to register for, and start creating and using bots with the Community Edition of Automation 360.

1. Register for the Automation Anywhere Community Edition:
 - a) From the Automation Anywhere website <https://www.automationanywhere.com> scroll to and click the **Get Community Edition** option.
Alternatively, select **Customers & Partners > A People Community > Community Edition**. Scroll to the registration form: **GET COMMUNITY TODAY**.
 - b) Enter your identification information in the form that appears.
The form information includes your first name, last name, email, country, phone number, and company. This information is used to create your Community Edition user login credentials.

Restriction: Only the period/dot (.) and at sign (@) are allowed in the email field. No other special characters are supported.

 - c) Read and agree to the terms, privacy policy, and license agreement. Select and click **Submit**.
Wait for the email from Automation Anywhere that contains the information for you to log in to the Community Edition. The email includes the Community Control Room URL, your username, and assigned user password. After you log in, you are prompted to reset your password.
2. [Log in to Automation Anywhere Control Room](#) on page 1428.
To log in to Automation 360, open the Control Room URL in your browser, enter your credentials in the login screen, and click **Log in**.
3. Install the Bot Agent, register your device, and set user device credentials.
[Install Bot Agent and register device](#) on page 1288 | [Set user device credentials](#) on page 1295
The Bot Agent is a lightweight application that enables you to run bots on your device by connecting the device to the Control Room. To run bots on a local machine, install the Bot Agent and add the local device to the list of enabled host devices.
To enable a device for running bots, set the local device credentials.
If you are using an operating system other than Windows, you will not be able to install the Bot Agent at this time. See [system requirements](#). However, you can still build bots using the [Bot editor](#) .
4. [Create your first bot](#) on page 1429.
Follow these steps to create your first bot that prints the message, Go be great!, the Automation Anywhere version of Hello World!
5. [Run your first bot](#) on page 1433.

Run a bot from the same device that you used to create the bot.

Watch the following videos that illustrate some of the steps in this task:

- Installing the Bot Agent in Automation 360:
- Building your first bot:
- Running your first bot in the Community Edition:

Community capacity and limitations

Community Edition offers most of the same features as Automation 360. See below for Community Edition access, bot creation, and running condition details.

Number of bots creators per Community Edition user	Each Community Edition user can use one Bot Creator and one attended Bot Runner at a time. Community Edition user does not have access to unattended Bot Runner licenses.
Number of bots created by Community Edition user	Each Community Edition user can create multiple bots.
Number of registered devices per Community Edition user	Each Community Edition user can register multiple devices, but only be logged in to one at a time, and only run a bot on one device at a time.
Number of bots run by Community Edition user	Each Community Edition user can run one bot at a time on any one registered device.
Export bots function for Community Edition user	Community Edition user cannot export bots from the Control Room.
Import bots function for Community Edition user	Community Edition user cannot import bots downloaded from the Bot Store to the Control Room.

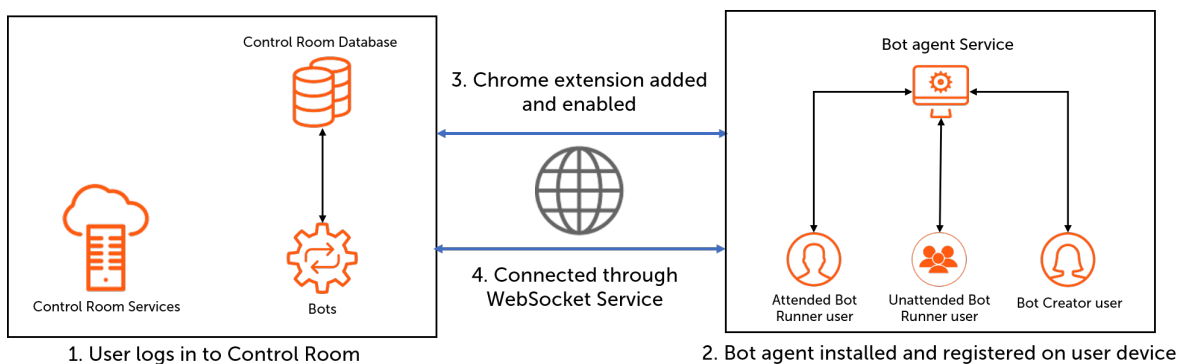

Note: In addition to these limitations, Community users do not have access to administrator settings, Bot Insight, Bot Runner, IQ Bot, Automation Co-Pilot, and Center of Excellence (CoE). To access these settings and features, you must upgrade to Automation 360.

Get started with Bot Agent

The Bot Agent is a lightweight application that enables you to run bots on your local device by connecting it to Control Room. After installing the Bot Agent on a device, a registered user with role-based access privileges can create, manage, and deploy bots on that device.

Bot Agent configuration

1. A Control Room administrator creates and shares the user credentials. You can then log into Control Room using these sign in credentials.
2. After signing into Control Room, you install the Bot Agent and register your local device. This device is then mapped to your username in Control Room.
3. The Bot Agent is registered as a Windows service (Automation Anywhere Bot Agent Service) on your device and the Automation Anywhere extension is added to your browser.
4. The device communicates with the Control Room using WebSocket and stays connected.

Privilege mapping

A user is granted privileges governed by role-based access and assigned a device license by a Control Room administrator. User is assigned a Bot Creator or Bot Runner license.

Bot Creator

Users with this license can log into the Control Room from a browser to perform the following actions:

- Create, edit, or delete bots.
- Manage bots for using in Bot Insight, IQ Bot, and Bot Store.

Bot Runner

Users with this license can deploy bots from the Control Room. Additionally, a user can be assigned one of the following Bot Runner licenses:

- Unattended Bot Runner license

Users with this license are can allow other Control Room users with the required role to run and schedule automations in Control Room. These users are also referred as **Run as users**.

- Attended Bot Runner license

Users with this license are allowed to run attended automations on their devices from the Control Room.

Note: If you encounter black screen when running bots in unattended mode, see the following article for troubleshooting steps.

[Black screenshot while running the bot in unattended mode \(A-People login required\)](#)

Related tasks

Before you install the Bot Agent, ensure that you review the compatible Automation 360 builds.

[Automation 360 licenses](#) on page 1347

The **All Licenses** page displays detailed information about current product and device licenses.

Bot Agent communication with Control Room

Bot Agent uses various channels to communicate with the Control Room. Relevant data is transferred directly and indirectly using communication channels such as loop-back interface, browser plug-in, and WebSocket connection.

Browser to loop-back interface

The browser-to-loop-back-interface channel is used during initial Bot Agent device registration and post-registration to check the current connection status to the Control Room. The loop-back interface uses HTTP unencrypted connection.

The following initial registration data is transferred over this channel:

- Control Room user token. This is accessible through developer tools on the browser.
- Control Room URL
- Proxy metadata, such as device ID, whether the proxy is configured or not, and whether it uses authentication or not.

The following connection status data is transferred over this channel:

- Device ID
- Control Room URL
- Installation type, such as system-level or user-level
- Proxy metadata, such as device ID, whether the proxy is configured or not, and whether it uses authentication or not.

Browser to Control Room

The browser-to-Control Room channel is used by the browser to connect to the Control Room. The data transferred over this channel includes all Control Room web data. The browser uses HTTPS encrypted connection.

Plug-in to Bot Agent named pipe

The plug-in to the Bot Agent named pipe channel is used to fetch current logged-in username and credentials if an authenticated proxy is to be obtained for the browser. The plug-in channel is protected by user permissions.

Bot Agent to Control Room WebSocket

The Bot Agent-to-Control Room WebSocket channel is used for all command and data transfer between the Bot Agent and Control Room. Data transferred over this channel includes requests from the Bot Agent to the Control Room, bot code transfer, password data, Control Room-to-Bot Agent requests. Password data is payload-encrypted, with the device public key in addition to the TLS encryption of the channel.

Bot Agent compatibility

Before you install the Bot Agent, ensure that you review the compatible Automation 360 builds.

The latest version of Bot Agent is available for download and is compatible with the Control Room version that is used.

Guidelines

- When you update the Bot Agent in Windows Server 2012 or earlier versions of the operating system, you might encounter unexpected system reboots during the update because of the limitations in the operating system.
- When the Bot Agent update is optional, you can continue to use the Bot Agent from any of the previous (optional) releases, which will be compatible with the current release. For example, the Bot Agent update is optional for v.26. So you can continue to use the Bot Agent from v.25 release.

You can download and install the latest version of Bot Agent anytime on your device. However, an alert on the availability of a newer Bot Agent version is displayed on the login screen if you are connected to a device that is running an older version of Bot Agent.

- In Community Edition, the Bot Agent is automatically updated to the compatible version when a Bot Agent update is required.
- If you want to use the latest version of packages from a new release, you might be required to update to the latest version of the Bot Agent even if it is optional.

Compatibility with release builds

Automation 360 version	Automation 360 build	Bot Agent version	Bot Agent update
Automation 360 v.30	<ul style="list-style-type: none"> • Build 19621 (On-Premises) • Build 19621 (Cloud-Sandbox) • Build 19621 (Community Edition) 	<ul style="list-style-type: none"> • 22.0.23331 • 22.0.23331 • 22.0.23331 	Optional
Automation 360 v.29	<ul style="list-style-type: none"> • Build 18371 (On-Premises) • Build 18361 (Cloud) • Build 18361 (Community Edition) 	<ul style="list-style-type: none"> • 21.250 • 21.250 • 21.250 	Optional

For information on Bot Agent device requirements, see [Bot Agent device requirements](#) on page 1282.

Related concepts

[Update Bot Agent](#) on page 1302

Updating to the latest Bot Agent version enables users to use new features available in the Automation 360 release.

Related tasks

[Install Bot Agent and register device](#) on page 1288

Install Bot Agent on your local device and connect it to Control Room. In order to run bots on that local device, ensure that you add it to the list of enabled host devices.

Related reference

[Automation 360 feature comparison matrix](#) on page 937

Compare Automation 360 features with Enterprise 11.3.x and Enterprise 10 features to understand the benefits to Automation 360. Review advantages of Automation 360 if you are a new user of the product.

[Universal Recorder supported applications and browsers](#) on page 2172

Use the Universal Recorder to record interactions with objects from the supported technologies.

Auto Login support for Bot Agent

Use auto-login to automatically log on to a device, run a scheduled automation, and restore the device to its original locked or logged off state after running the automation.

The **Run as user** device credentials are used for Auto-login. Auto-login restores a device to its original state in the following scenarios:

- Automation was stopped on the Control Room or device.
- An error is encountered during bot execution.

- When the automation completed successfully.

Auto-login support: operating system

Identify the operating system support specific to auto-login on Bot Agent devices. The auto-login process involves several stages and depends on the Bot Agent activity.

The following scenarios are supported on Windows 10 and virtual machines only:

SID#	Scenario
1	No user session established (user is not logged in)
2	User session established
3	User has logged in but locked the screen
4	A different user (not the device login user used for deployment) is logged in
5	A different user is logged in and locked the screen
6	Fast user switching

For scenarios 4, 5, and 6 in the above table, the active user is logged off and a new session is created with device credentials for deploying the bot.

The following scenarios are applicable and supported on Windows Server 2019, Windows Server 2016, Windows Server 2012 R2, Windows 10, 8, and 7:

SID#	Scenario
1	No active RDP session
2	User has active RDP session
3	User's RDP session is disconnected
4	User's RDP session is locked
5	Another user has active RDP session
6	Another user has a disconnected session
7	Another user has an active session and locked

Auto-login support: operating system with cloud platform

Note: Remote Desktop Protocol (RDP) based deployment on a Virtual Machine (VM) hosted in Amazon Web Services (AWS) workspace is not supported when there is an active user session (no active console session from previous user login).

The following table identifies the support specific to auto-login on Bot Agent devices for operating system across cloud platforms:

SID#	Scenario	Supported OS
1	No active RDP session	<ul style="list-style-type: none"> • Windows 2019 - AWS • Windows 2016 R2 - AWS • Windows 2012 R2 - AWS • Windows 10 AWS • Windows 11 (Enterprise) • Windows 10 Azure (Enterprise) • Windows 10 VMWare (ESXi 6.7 and Horizon) • Windows 10 Citrix
2	User has active RDP session	<ul style="list-style-type: none"> • Windows 2019 - AWS • Windows 2016 R2 - AWS • Windows 2012 R2 - AWS • Windows 10 AWS • Windows 11 (Enterprise) • Windows 10 Azure (Enterprise) • Windows 10 VMWare (ESXi 6.7 and Horizon) • Windows 10 Citrix
3	User's RDP session is disconnected	<ul style="list-style-type: none"> • Windows 2019 - AWS • Windows 2016 R2 - AWS • Windows 2012 R2 - AWS • Windows 10 AWS • Windows 11 (Enterprise) • Windows 10 Azure (Enterprise) • Windows 10 VMWare (ESXi 6.7 and Horizon) • Windows 10 Citrix
4	User's RDP session is locked	<ul style="list-style-type: none"> • Windows 2019 - AWS • Windows 2016 R2 - AWS • Windows 2012 R2 - AWS • Windows 10 AWS • Windows 11 (Enterprise) • Windows 10 Azure (Enterprise) • Windows 10 VMWare (ESXi 6.7 and Horizon) • Windows 10 Citrix

SID#	Scenario	Supported OS
5	Another user has active RDP session	<ul style="list-style-type: none"> Windows 2019 - AWS Windows 2016 R2 - AWS Windows 2012 R2 - AWS Windows 10 AWS Windows 11 (Enterprise) Windows 10 Azure (Enterprise) Windows 10 VMWare (ESXi 6.7 and Horizon) Windows 10 Citrix
6	Another user has a disconnected session	<ul style="list-style-type: none"> Windows 2019 - AWS Windows 2016 R2 - AWS Windows 2012 R2 - AWS Windows 10 AWS Windows 11 (Enterprise) Windows 10 Azure (Enterprise) Windows 10 VMWare (ESXi 6.7 and Horizon) Windows 10 Citrix
7	Another user has an active session and locked	<ul style="list-style-type: none"> Windows 2019 - AWS Windows 2016 R2 - AWS Windows 2012 R2 - AWS Windows 10 AWS Windows 11 (Enterprise) Windows 10 Azure (Enterprise) Windows 10 VMWare (ESXi 6.7 and Horizon) Windows 10 Citrix

Additional notes on auto-login:

- Auto-login is only supported on 64-bit operating systems.
- Auto-login is unable to sign-out the root admin session, when trying with scenarios that involve two different auto-login users. Remember to log out of the admin user account before deploying a bot.

Related concepts

Configure auto-login settings in the Control Room to either create user sessions or reuse existing user sessions to reduce the bot startup time.

Related reference

[Bot Agent compatibility](#) on page 1274

Before you install the Bot Agent, ensure that you review the compatible Automation 360 builds.

Bot Agent device requirements

Review the Bot Agent device requirements such as hardware components, compatible devices, supported operating systems and browser extensions.

Hardware requirements

You can install the Bot Agent on devices that meet the following hardware requirements.

Device	Processor	RAM	Storage (free disk space)	Network
Machine	Intel Core i3 2.6 GHz with 4 multi-cores or higher 64-bit	<ul style="list-style-type: none"> 4 GB (Minimum) 8 GB (Recommended) 	32 GB Add 100 through 150 KB per Automation Anywhere script Add 40 through 50 GB per long-term project	<ul style="list-style-type: none"> 5Mbps (Minimum) 20Mbps or higher (Recommended)
Additional users on a multi-user device	2 CPU per additional user	4 GB per additional user	No additional storage required	No additional network needed

Additional RAM requirements for the registered devices

Add additional RAM to account for applications and services running on the registered devices, for example:

- Microsoft Office applications (example: Excel)
- Browsers (example: Google Chrome)
- Enterprise applications (example: CRM, Oracle EBS, and SAP)
- VDI infrastructure applications
- Anti-virus software
- AISense Recorder

Additional disk space on registered devices

- Automation 360 scripts average approximately 100-150 KB. Additional free disk space is required to develop automation projects because temporary files such as screenshots, server logs, and audit files are created during the execution of the automation scripts.
- Free space required increases with the project size. Recommendation: Have at least

40-50 GB of free disk space for each long-term project.

- Increase storage space configuration after installation, as needed, depending on product usage. For example, depending upon the complexity of your bot, generating log files and logic creation require additional disk space later.

Note: The hardware requirements for Document Automation are the same as the Bot Agent.

Device compatibility

A device running the Bot Agent to perform automation must meet the following requirements:

Note:

- Device requirements are different for the Control Room and Bot Agent.
For Control Room compatibility, see [Operating system, environment, and platform supported for Control Room](#) on page 1138.
- For your device to work properly on Amazon WorkSpaces, update the registry on all workspace machines by renaming the `spacedeskHookKmode.sys` file to `spacedeskHookKmode.sys.old` in `C:\Windows\System32\drivers`. Restart your machine and verify that `STXHD Hosted Application Service` is not running.
For more information, see [Troubleshooting Amazon WorkSpaces issues](#).
- If the deployment type for your device is set as **Regular**, you will not encounter any issues with bot deployments in Amazon WorkSpaces. If the deployment type for your device is set as **RDP**, you must enable RDP sessions on Amazon WorkSpaces for successful bot deployments. To enable the RDP sessions on Amazon WorkSpaces, see [How to connect to Workspace with RDP](#).

On-Premises machines	Physical machines running on supported operating systems.
Terminal servers	Remote desktop (RDP) running on supported operating systems from Enterprise A2019.11 or later.
Virtual machines	<p>From Enterprise A2019.09 or later, the Bot Agent can be installed on all virtual machines (VMs) with supported Windows OS.</p> <p>For Alsense recorder to work on a VM, enable AVX instructions for both Bot Runner and Bot Creator.</p> <p>For details, see Automation 360: AI Sense Recorder is crashing (A-People login required).</p> <p>The Bot Agent is certified on all major versions of VMs and supports the following:</p>

Virtual Machine (VM)	Operating System and edition	Supported for multi-user deployments
Amazon Web Services EC2	<ul style="list-style-type: none"> • Windows 11 (Enterprise) • Windows 10 (Professional) • Windows 2012 Server, Windows 2016 Server, and Windows 2019 Server (Standard and Datacenter) 	Yes
Amazon Web Services WorkSpaces (Performance bundle)	<ul style="list-style-type: none"> • Windows 11 (Enterprise) • Windows 10 (Professional) 	No
Google Compute Engine	<ul style="list-style-type: none"> • Windows 11 (Enterprise) • Windows 10 (Professional) • Windows 2012 Server, Windows 2016 Server, and Windows 2019 Server (Standard and Datacenter) 	No

Virtual Machine (VM)	Operating System and edition	Supported for multi-user deployments
Microsoft Azure Virtual Machine (VM)	<ul style="list-style-type: none"> Windows 11 (Enterprise) Windows 10 (Professional and Enterprise) Windows 2019 Server (Datacenter) 	Yes
Microsoft Azure Windows Virtual Desktop (WVD)	<ul style="list-style-type: none"> Windows 11 (Enterprise) Windows 10 (Enterprise) 	Yes
VMware VMs on ESXi 6.x	<ul style="list-style-type: none"> Windows 10 (Professional) Windows 2016 Server 	Yes
Citrix XenDesktop (VDI)	Windows 2016 Server	No
Citrix VM	<ul style="list-style-type: none"> Windows 10 (Enterprise) Windows 2016 (Server) 	Yes
VMware Horizon	Windows 10 (Enterprise)	Yes
Windows 365 Cloud PC	Windows 11 (Enterprise)	No

Note: Multi-user deployment for Windows 10 (Professional) is not supported.

Note: When you install the Bot Agent on virtual machines, ensure that you change the virtual machine **Power and Sleep** settings to **Never** so that bot deployments from the Control Room can run without interruption.

Operating system compatibility

You can install the Bot Agent on machines running the following operating systems.

This compatibility applies to On-Premises, Cloud deployments, and Community Edition of Automation 360.

Note:

- Only 64-bit operating system version is supported.
- Bot Creator tasks are supported with all the listed operating systems.
- The Bot Agent cannot be installed on Linux systems. You cannot register a device that is running on a Linux system. However, you can use a registered device running on a Windows system to access a Control Room that is installed on a Linux system.

Windows version	Windows edition	Attended Bot Runner	Unattended Bot Runner	Bot Creator
Windows Server 2019	Datacenter and Standard	Supported	Supported ¹	Supported
Windows Server 2016	Datacenter and Standard	Supported	Supported ¹	Supported
Windows Server 2012	Datacenter and Standard	Supported	Supported ¹	Supported
Windows 11	Enterprise	Supported	Supported ¹	Supported
Windows 10	Professional and Enterprise	Supported	Supported ¹	Supported
Windows 8 ²	Professional and Enterprise	Supported	Supported	Supported
Windows 7 ²	Professional and Enterprise	Supported	Supported	Supported

(1) Auto-login

Auto-login is only supported on 64-bit systems.

(2) Supported OS

Windows 11 (64-bit) supported on Automation 360 Build 15459 or later.

Windows 8 (64-bit) supported on Enterprise A2019 (Builds 1598 and 1610) or earlier.

Windows 7 (64-bit) supported on Enterprise A2019.12 or later.

Browser compatibility

The user interface for Bot Agent is through a browser. Log in to Automation 360 using the supported browsers to install and register your device.

For a list of supported browsers, see [Supported browsers](#) on page 1154

Supported extensions

When you connect your Bot Agent device to the Control Room, you can enable supported extensions from your browser to record automations.

For a list of supported extensions, see [Extensions for automation](#) on page 1157

Auto-login support

Auto-login is used to automatically log on to a device, run a scheduled automation, and restore the device to its original locked or logged off state after running the automation.

For operating system support specific to auto-login on Bot Agent devices, see [Auto Login support for Bot Agent](#) on page 1278

Related tasks

[Bulk install Bot Agent on devices](#) on page 1296

Installing Bot Agent across multiple devices such as on-premises machines, virtual machines (VM), and non-persistent virtual desktop infrastructure (VDI) including Amazon WorkSpaces is called Bulk install (or silent install). You must edit the Bot Agent MSI file for bulk installation.

Manage Bot Agent

Users can perform tasks based on their assigned role after installing the Bot Agent on their device.

1. Review the prerequisites to install the Bot Agent are complete.
 - [Bot Agent compatibility](#) on page 1274
2. Install Bot Agent on your device.
 - [Install Bot Agent and register device](#) on page 1288
 - [Bulk install Bot Agent on devices](#) on page 1296
3. In order to deploy bots on your device, connect the Bot Agent to your device using an authentication proxy and ensure that the changed proxy setting or credentials are updated.
 - [Connect Bot Agent to a device with a proxy](#) on page 1293
4. Set device credentials to for the Control Room to deploy bots on your device.

[Set user device credentials](#) on page 1295

5. Switch to a different Control Room based on your automation requirements.

[Switch Bot Agent to a different Control Room](#) on page 1291

6. When updates are available, you can update the Bot Agent to the latest version. You can enable one of the following methods of updating Bot Agent:

- [Automatically update the Bot Agent](#) on page 1302
- [Manually update the Bot Agent](#) on page 1303

7. Verify the Bot Agent version and device connection under the **Devices** page in Control Room.

[Devices](#) on page 1808

Related tasks

Users can also perform the following tasks:

- Use the Bot Agent diagnostic utility to perform diagnostic checks on Bot Runner devices and to help in resolution of Bot Agent connectivity challenges.

[Perform Bot Agent diagnostic checks](#) on page 1306

- Use the Bot Agent relevant logs to resolve issues.

[Bot Agent log files](#) on page 3440

- Create and edit Task Bots

[Create your first bot](#) on page 1429 | [Edit a bot](#) on page 2222

- Deploy bots on attended and unattended Bot Runners with or without Workload automation.

[Run a bot](#) on page 2206 | [Schedule a bot](#) on page 2056 | [Run bot with queue](#) on page 1940

- Manage different bots and packages using Bot Store, Bot Insight, and Automation 360 IQ Bot.

- [Bot Store](#) on page 3440
- [Using Bot Insight](#) on page 3747
- [Automation 360 IQ Bot](#) on page 3538

- Perform other activities such as updating user profile.

[Edit profile](#) on page 1337

Note: For additional information about the Bot Agent, see [Automation Anywhere Certification \(A-People login required\)](#)

Install Bot Agent and register device

Install Bot Agent on your local device and connect it to Control Room. In order to run bots on that local device, ensure that you add it to the list of enabled host devices.

Starting with Automation 360 v.29, we have enhanced the Bot Agent installer by-, including new .exe files for the **Bot launcher**, **Node manager**, **Triggers**, and **Child session launchers**. The following changes occur in the installer when you:

- Install the Bot Agent, `java.exe` will be replaced by `NodeManager.exe`.
- Run a bot, `javaw.exe` will be replaced by `BotLauncher.exe`.
- Configure a trigger, the trigger will be activated with `TriggerListener.exe` instead of `javaw.exe`.
- Run a bot with Automation Co-Pilot (integrations) (AARI), `javaw.exe` will be replaced with `ChildSessionLauncher.exe`.

Note: When you install or update the Bot Agent, you must include the new `.exe` files in the trusted list.

- To install the Bot Agent, the Windows installer policy must be enabled for your local device.
- The read, write, and execute permissions must be enabled for the Bot Agent folders on your local device.
- Ensure that the local device system date and time are in sync with the current date and time so that the device registration is successful.

[Credential requirements](#) on page 1141

The Bot Agent version available for download is the latest and compatible with the Control Room version that is used.

Note:

- You can now install the Bot Agent on a device with an existing Enterprise 11 client. However, ensure that the Automation 360 and Bot Agent versions that you are using are v.25 or later.
 - A Bot Creator can log in and access both Automation 360 and Enterprise 11 client to create bots.
 - Attended Bot Runners can run bots from both Automation 360 and Enterprise 11 Control Room instances.
 - Unattended Bot Runners can deploy bots by using the run and schedule permission on the same device.
- You cannot run bots from Enterprise 11 and Automation 360 at the same time.
- You cannot install a Bot Agent on a device with an existing Enterprise 10 client.
- When the Bot Agent is installed on a device where Enterprise 11 client is also installed and then you uninstall the client, you might face login issues with the device. Therefore, you must uninstall and re-install the Bot Agent on the device.

Note: If the Bot Agent is installed at system level, then as part of the configuration update, permissions for the Global Cache folder is set as follows:

- Full access for System user and Administrator group.
 - Read, Execute, and List access for Authenticated users.
-

1. Use a supported browser to log into Control Room through your Automation Anywhere URL.
2. Install the Bot Agent and add a local device by choosing one of the following options:
 - From the menu on the left, click the device icon to connect a local device.
 - Go to the **Devices** page, and click the **Connect local device** icon located at the top-right of the Devices list.

3. Click **Connect to my computer**.

The Bot Agent setup file is downloaded.

4. Follow the steps outlined in the wizard.

Authenticated proxy access: If your device's access to the internet is controlled through an authenticating proxy server, you are prompted to provide the proxy server authentication details. These credentials are required for the device to communicate with the Control Room.

To enable the authenticated proxy, register the device through a Google Chrome browser with the Automation 360 Chrome extension enabled.

Note: The Chrome and Edge extensions are installed for Google Chrome and Microsoft Edge Enterprise browser users, respectively, even if the device is offline. The extension is downloaded with the Bot Agent MSI installer file.

5. Select an option to install the Bot Agent either at the system level or user level.

- To install at the system level, select **Anyone who uses this computer (all users)**

All users of the device can use this Bot Agent. However, users installing the Bot Agent must have administrator privileges.

- To install at the user level, select **Only for me (username)**.

The Bot Agent will be available only to the individual user.

6. Enter the following in the **Additional information** screen:

- Device nickname (optional)
- Device type (single user or multiple user)

Note: For a multiple user device, enter the number of concurrent sessions that will be allowed. A minimum of two concurrent sessions is supported.

7. Click **Done**.

- The Bot Agent is installed to the default location `C:\Program Files\Automation Anywhere\Bot Agent`.
- The Bot Agent is registered as a Windows service: Automation Anywhere Bot Agent Service.
- A shortcut to access Automation Co-Pilot Desktop Assistant is added to the Windows Start menu and desktop.
- The Java Runtime Environment (JRE) files are installed with the Bot Agent in the Bot Agent install folder: `C:\Program Files\Automation Anywhere\Bot Agent\jre`.

8. Set the user device credentials so that your device can run bots.

9. Refresh the **Devices** page and verify that the local device is added.

You can identify the devices by their IP address and hostname.

Note: After you remove a device, wait for 35 seconds to re-register the device.

Troubleshooting:

- If you face any issues registering your device, see [Automation 360: Error while registering device - An unexpected problem occurred \(A-People login required\)](#).

- If the Bot Agent service is paused and does not start after installation, see [Automation 360 Error: Device is disconnected or needs upgrade \(A-People login required\)](#).
- If you are using Google Chrome browser version 94 or later and if you face issues registering your device in a Control Room On-Premises, we recommend that you configure the Control Room for HTTPS instead of HTTP. Alternatively, use Microsoft Internet Explorer or Mozilla Firefox to register your device.

If you face any issues adding a new device, see [Unable to Add New Device \(A-people login required\)](#).

- We recommend that you do not remove the Google Chrome extension. If you remove the extension, existing Google Chrome policy will restrict you from adding the extension (online or offline) even after you reinstall the Bot Agent. However, if you have removed the extension, use the following instruction to add it:
 - Go to the Google Chrome extension store to add the extension online. See [Automation 360 extension for Chrome](#).
 - Drag the ChromeExtension.crx file (C:\Program Files\Automation Anywhere\Bot Agent\AABrowserAgent) to the Google Chrome extension tab (**three vertical dots menu on top-right > Settings > Extensions**).
- Similarly, ensure that you do not remove the Microsoft Edge extension as the existing Microsoft Edge policy will restrict you from adding the extension (online or offline) even after you reinstall the Bot Agent. For Microsoft Edge extension store, see [Microsoft Edge extension for Automation 360](#)

Watch the following video on how to install the Bot Agent in Automation 360:

Optionally, [Edit profile](#) on page 1337.

If your device is set with a proxy, see the tasks that apply to your proxy settings, [Connect Bot Agent to a device with a proxy](#) on page 1293.

Related concepts

[About device pools](#) on page 1816

Device pools are a logical grouping of devices or similar unattended Bot Runner machines on which you can run your workload management automations or scheduled unattended automations. For example, you can group the devices (system-wide type) of a specific department or unit and create a device pool.

Related tasks

[Create device pools](#) on page 1818

Create a device pool with a unique name and add Unattended Bot Runners to the device pool.

[Set user device credentials](#) on page 1295

To enable a device for running bots, set the local device credentials.

Switch Bot Agent to a different Control Room

Switch the Bot Agent on a registered device to work with a different Control Room manually when you work on automations using different environments.

Ensure that you have the start, stop, and pause permissions to access and edit the Windows services.

Perform this task to manually associate your device with a different Control Room in the following scenarios:

- When the Control Room is on a different release version.
 - When the setting to switch devices is not enabled in the Control Room.
1. Stop the Bot Agent service from the local Windows Task Manager.
 2. Navigate to the following folder: `C:\Windows\System32\config\systemprofile\AppData\Local\AutomationAnywhere`
 3. Optional: Delete the `registration.properties` file.

Note: This is only required if you want to register the device in a different Control Room environment. To view the Control Room where the device is registered, open the `Registration.properties` file and check the value for the Control Room URL.

4. Delete all `.db` files.
For example, `AA-DB.mv.db` file.
5. Log in to the Control Room.
6. Navigate to **Devices > My devices**.
7. Click the **Add local device** icon.
8. Download and install the latest Bot Agent.
9. Return to the **Devices** page in the Control Room from the updated device to check the device status.

The `registration.properties` file is not generated immediately after the Bot Agent installation. It is generated only when a user accesses a Control Room URL from that device. If the device registration is successful, the machine is shown as **Connected** and the `registration.properties` file is created at the specified location on the Bot Runner machine.

10. Navigate to the `C:\Windows\System32\config\systemprofile\AppData\Local\AutomationAnywhere` folder to ensure that the `registration.properties` file is present and verify the Bot Agent update.

Related tasks

[Install Bot Agent and register device](#) on page 1288

Install Bot Agent on your local device and connect it to Control Room. In order to run bots on that local device, ensure that you add it to the list of enabled host devices.

[Switch device registration between Control Room instances](#) on page 1744

Configure the device settings in the Control Room to enable single-user devices to easily switch between different instances of the Control Room to run bots in multiple environments. This

option enables you to register the Bot Agent on multiple Control Room instances without uninstalling the Bot Agent.

Connect Bot Agent to a device with a proxy

When you install a Bot Agent, your device proxy settings are imported during the installation process. However, if the proxy settings are not imported during installation, you can update the proxy configuration details manually.

Note: Your device proxy settings for authenticated proxy can be set during the Bot Agent registration process and can be updated via the Bot Agent diagnostic utility. The same credentials will be used for all users on the device.

Typically, when you change your proxy settings, whether you added a proxy or changed the credentials to the authenticating proxy, the Bot Agent prompts for the new credentials.

You can use two methods to add or update proxy credentials manually.

- Using `PSEXEC -sid` command.
- Using `netsh winhttp` command.

You can perform these steps before or after installing the Bot Agent.

1. Use any one of the following methods to add or update proxy credentials.

- Using `PSEXEC -sid` command.
 - a) Download PSTools.
[PsExec](#)
 - b) Extract the files from downloaded zip file.
 - c) Open the Microsoft command prompt in administrator mode.
 - d) Change to the directory where you extracted the PSTools files.
 - e) Execute the following command:

```
.\psexec -i -s -d cmd
```

- f) In the new command prompt window, execute the following command:

```
whoami
```

The system returns the following:

```
nt authority\system
```

- g) Execute the following command:

```
inetctl.cpl
```

- h) In the **Internet Properties**, navigate to **Connections > LAN settings**.
- i) Select the **Use automatic configuration script** option.
- j) Provide the address to the proxy auto-configuration (PAC) file.
For example: `http://localhost:888/proxy.pac`.

- k) Click **OK**.
- Using `netsh winhttp` command.
 - a) Open the Microsoft command prompt in administrator mode.
 - b) List the proxy status by running the command:

```
netsh winhttp show proxy
```
 - c) If the command returns `Direct access`, then run the command:

```
netsh winhttp import proxy source = ie
```

If proxy settings are configured, the command returns the proxy server address. See following sample:

```
Current WinHTTP proxy settings:  
Proxy server(s): 123.0.0.4:1234  
Bypass List      : (none)
```

You do not have to import the settings.

Note: We recommend you import proxy settings using Bot Agent installer because of limitations to importing PAC file using the `netsh winhttp import proxy source = ie` command.

2. Restart the Bot Agent service from Windows services.
3. Open a Google Chrome browser with the Automation Anywhere extension enabled.
4. Log out and log back in to the Control Room.
If prompted, provide the proxy credentials.
5. From the Control Room, check the device status and verify that it is connected.

Before you install the Bot Agent, ensure that you review the compatible Automation 360 builds.

[Add service URLs to trusted list for Cloud](#) on page 1114

For Cloud deployment, to ensure secure access to Automation 360 online services, add the service URL list to the safe recipients or trusted list.

[Add service URLs to trusted list for On-Premises](#) on page 1265

For On-Premises deployment, to ensure secure access to Automation 360 online services, add service URL list to the safe recipients or trusted list.

Set user device credentials

To enable a device for running bots, set the local device credentials.

The Bot Agent is a lightweight application that enables you to run bots on your device by connecting the device to the Control Room. To run bots on a local machine, install the Bot Agent and add the local device to the list of enabled host devices. Add the local device before editing the credentials. See [Install Bot Agent and register device](#) on page 1288.

For Community Edition users, your profile contains only one set of credentials at a time. These credentials are applied to any of your registered devices you select to run your bots. Ensure each device that you use accepts the credentials in your profile.

Automation 360 Cloud users have the option to apply different credentials to registered devices.

1. In the Control Room panel, click your user name and select **My settings**.
2. In **My Settings** page, navigate to **Devices > Credentials** section to update the **Username** and **Password** for the device.

Device login credentials are required to run a bot from this device.

Note: Automation 360 does not validate the device login credentials until you run a bot.

If your username is part of a domain, include the domain within the format `domain\username`. Typically, home users are not part of a domain, unless they are specifically configured.

3. Save the changes.

[Create your first bot](#) on page 1429

Related tasks

[Install Bot Agent and register device](#) on page 1288

Install Bot Agent on your local device and connect it to Control Room. In order to run bots on that local device, ensure that you add it to the list of enabled host devices.

View and update Bot Agent device settings

View your local device details and update the bot running device settings. The local device is the one from which you access the Bot Agent. The bot running device is the one on which the recorder will record your automations and run the bots.

You must have the register device, view and manage all devices, attest device credentials, and edit devices permissions to perform this task. See [Credential requirements](#) on page 1141.

This task is performed by a user to select a local user or remote Bot Agent device to create and run bots.

1. In the Control Room, click your username and select the **My settings** link.
2. In the **Devices > Bot running device** section, click **Edit**.
3. Select a bot running device.
4. Save the changes.

Note: To update the local device settings, click the device name link. This will open the **Devices** page for your local device in view mode.

Related concepts

[Manage device settings](#) on page 1735

Control Room administrator can configure the device settings to automatically set a user's default device when that user logs into Control Room.

Bulk install Bot Agent on devices

Installing Bot Agent across multiple devices such as on-premises machines, virtual machines (VM), and non-persistent virtual desktop infrastructure (VDI) including Amazon WorkSpaces is called Bulk install (or silent install). You must edit the Bot Agent MSI file for bulk installation.

To perform the task, you must have a administrator account with the required rights and permissions.

- Ensure that you have downloaded the MSI file from the Control Room and the parameters required to install devices are available in the Bot Agent MSI file.

Note: If you are trying to download the MSI file for the first time, you must click **Settings** > **Bot agent bulk install** > **Edit** > **Save changes** to generate a registration key and view the **Download installer** for the MSI file. .

- Ensure that the Windows 10 Software Development Kit including Orca is installed on the device.

You can install Orca from `C:\Program Files (x86)\Windows Kits\10\bin\10.0.18362.0\x86\Orca-x86_en-us.msi`.

Note: You can find a sample `autoregistration.properties` file at the end of the page for your reference.

1. Use the latest `AutomationAnywhereBotAgent.msi` file from the following locations:
 - Download the file from the Control Room (**Administrator** > **Settings** > **Bot agent bulk install**).
 - The download option is available for On-Premises and Cloud deployments.
 - Select the file from the `<application filepath>\crui\asset` folder. For example `C:\Program Files\Automation Anywhere\crui\asset`
 - This option is available only for On-Premises deployments.
2. Edit the `AutomationAnywhereBotAgent.msi` file using the Orca tool.
3. Click the **Property** option.
4. Enter appropriate values for the following parameters:

Parameter	Description
AA_CRURL	<p>Enter the Control Room instance to which the Bot Agent will be connected.</p> <hr/> <p>Note: Ensure you do not add a backslash (/) at the end of the Control Room URL. For example, <code>mycr.mydomain.com/</code>.</p> <hr/>
AA_CRTOKEN	<p>Enter the corresponding registration key value for each Control Room. The registration key is provided by the Control Room admin.</p> <p>You can configure up to 20 Control Room URLs. Ensure that:</p> <ul style="list-style-type: none"> • You provide the corresponding registration tokens under AA_CRTOKEN, AA_CRTOKEN2 through AA_CRTOKEN20 for each configured Control Room URL. • There is a one-to-one match between CR_URL and CR_TOKEN. • There is no skipping between CR_URL and CR_TOKEN, and this is filled consecutively. <p>For example, to configure three Control Room URLs, it must be populated in the following order: AA_CRURL, AA_CRURL2, AA_CRURL3.</p> <p>See Generate registration key to install Bot Agent in bulk on page 1774.</p>
AA_DELAY_REGISTRATION_UNTIL_LOGIN	<p>Enter <code>True</code> to delay the Bot Agent registration to a Control Room until a user logs in to that Control Room.</p> <p>If a user logs in to any of the Control Room instances configured from the device where the Bot Agent is installed, the Bot Agent on that device will be automatically registered with that associated Control Room. If the logged-in Control Room URL is not configured, then Bot Agent is not registered with that Control Room.</p>

Parameter	Description
AA_DEVICE_TYPE	<p>Enter one of the following values for the device type:</p> <ul style="list-style-type: none"> • SINGLE_USER • MULTIPLE_USERS <hr/> <p>Note: Ensure that you enter the values in uppercase.</p>
AA_LIFESPAN	<p>Enter one of the following values for a non-persistent or persistent device:</p> <ul style="list-style-type: none"> • TEMPORARY • PERSISTENT <hr/> <p>Note: Ensure that you enter the values in uppercase when you install the Bot Agent.</p>
AA_CONCURRENT_SESSIONS	<p>Enter the concurrent sessions allowed, from 1 through 99. The default value is 1.</p> <hr/> <p>Note: The concurrent sessions are only applicable for multi-user devices (AA_DEVICE_TYPE = Multiuser)</p>
AA_INSTALL_ONLY	<p>Choose whether you want to install the Bot Agent without registering with the Control Room.</p> <ul style="list-style-type: none"> • Enter <code>True</code> to only install and not register the Bot Agent. <hr/> <p>Note:</p> <p>The <code>autoregistration.properties</code> file is created when <code>AA_INSTALL_ONLY</code> is set to <code>True</code>. You can set <code>AA_INSTALL_ONLY</code> to <code>True</code> only for system-level installation.</p> <hr/> <ul style="list-style-type: none"> • Enter <code>False</code> to install and register the Bot Agent.

Parameter	Description
AA_DEVICE_POOL_NAME	Specify the device pool name. The default value is 0. Note: Ensure that you use an existing device pool.

5. Save the changes.
6. Copy the `AutomationAnywhereBotAgent.msi` file to the VM instance (golden image) on which you want to install the Bot Agent.

Note: Ensure that you do not restart the VM instance (golden image).

7. Run the `AutomationAnywhereBotAgent.msi` file.
8. Validate that the Bot Agent is installed on the VM instance and Bot Agent service is not running in the Task Manager Services tab.

Note: An `autoregistration.properties` file will be generated at:

```
C:\Windows\System32\config\systemprofile\AppData\Local
\AutomationAnywhere\autoregister
```

To deploy the Bot Agent on temporary or non-persistent devices, you must configure the SysPrep settings and create machine images on the VM instance.

9. Shut down the VM instance without SysPrep after you enable temporary or non-persistent computer name settings for the VM.
For an example of how to use SysPrep on AWS EC2 instance, see [Use Sysprep to create and install custom reusable Windows AMIs](#).
10. Create machine images on the VM instance as required.
For an example of how to create Amazon Machine Images (AMI) from an AWS EC2 instance, see [Create an AMI from an Amazon EC2 Instance](#).

If a Bot Agent is registered in the VM instance by mistake, perform these steps to restore the machine image:

1. Uninstall the Bot Agent from the Windows Control Panel of the VM instance.
2. Delete all files from `C:\Windows\System32\config\systemprofile\AppData\Local\AutomationAnywhere`.
3. Enter `True` for the `AA_INSTALL_ONLY` parameter in the `AutomationAnywhereBotAgent.msi` file that you previously used to install the Bot Agent.
4. Run the `AutomationAnywhereBotAgent.msi` file again.

Sample `autoregistration.properties` file

```
url=http://ec2-myexampleCR.com
url2=URL2
url3=URL3
url4=URL4
```

```
token=eyJhbGciOiJSUzUxMiJ9.eyJjbGllbnRUeXB1IjoiaQk9UX0FHRU5UX0FVVE9fUkVHSVNUUkFUSU90IiIjKVOnMeupDQF4IQ3oZbjpyk73vrLI2k0UeTVpvKuURbZhz8bPIBYer4z1zRjEB-9nOID8MtNRcpz1XgkQ27GENIMzer-R8sxMnr7hSfi_aYDx8emyoH2XtFAQAYuXiw6vOXWalo-TYDtPknIJsga6aAifJ9-w6ndJAov0JvTClmeyLQgBA
token2=t2
token3=t3
token4=t4
device_type=MULTIPLE_USERS
concurrent_sessions=4
lifespan=TEMPORARY
delay_registration_until_login=true
```

Validate that the devices are added on the Control Room **Devices** page.

Bulk install Bot Agent using Microsoft Endpoint Configuration Manager

Install Bot Agent in bulk on multiple devices from a central location using the Microsoft Endpoint Configuration Manager or System Center Configuration Manager (SCCM).

- Ensure that Microsoft SCCM is installed on two machines, first on a machine that hosts the Control Room primary site and distribution server and then on a second machine that hosts the database server to store and process all client-server communication and operations.
- Ensure that the latest `AutomationAnywhereBotAgent.msi` file is downloaded from one of the following locations based on your Control Room deployment:
 - For On-Premises and Cloud: **Administrator > Settings > Bot agent bulk install**
 - For On-Premises: `<application filepath>\crui\asset` folder

For example, C:\Program Files\Automation Anywhere\cru\asset.

1. Add parameters in the AutomationAnywhereBotAgent.msi file using the Orca tool.
For detailed steps, see [Bulk install Bot Agent on devices](#) on page 1296.
2. Configure the Bot Agent application in SCCM.
 - a) Add general details, such as application name.
For example, Automation Anywhere Bot Agent Windows installer (*.msi file).
 - b) Add content details, such as content location, settings for uninstalling, and deployment options.
For example:
 - Content location: \\crserver\msibackup\
 - Settings for content uninstalling: Same as install content
 - Deployment options: Download content from distribution point and run locally
 - c) Provide the program commands required to install the application.
For example, `msiexec /i "AutomationAnywhereBotAgent.msi" /q`.
 - d) Provide the application detection method to determine whether the application is already installed on a device.
The SCCM automatically detects and adds the clause for the msi file.
 - e) Provide user experience details, such as installation behavior (install for system or user), logon requirement, installation visibility (interactive or hidden), and whether or not to enforce configuration manager behavior.
For example:
 - Installation behavior: Install for system
 - Logon requirement: Whether or not a user is logged on
 - Installation visibility: Hidden

For more information, see [Create and deploy an application with Configuration Manager](#).

3. Distribute the application on devices using the SCCM Distribution Point (DP).
To install the Bot Agent, configure the DP on the primary server on which the Control Room is installed. It is important to ensure that after the application is created, it is distributed properly to DP and it can be monitored in SCCM.
For more information, see [Install and configure distribution points in Configuration Manager](#).
4. Use boundaries in SCCM to virtually partition the devices identified through domains, subnets, or a range of IP addresses.
Boundaries help in segregating the DP for different applications and can be configured through the hierarchy configuration section from the Administration option of SCCM.
For more information, see [Define network locations as boundaries for Configuration Manager](#).
5. Right-click Automation Anywhere Bot Agent application to deploy the Bot Agent using the SCCM Applications option.
For more information, see [Deploy applications with Configuration Manager](#).
6. Verify that the devices are added on the Control Room **Devices** page.

[Devices](#) on page 1808

The device is a machine through which a user connects to the Control Room to create or run bots. Manage devices that are registered to the Control Room through the **Devices** page located in the **Manage** tab.

Update Bot Agent

Updating to the latest Bot Agent version enables users to use new features available in the Automation 360 release.

A Control Room administrator can choose between updating the Bot Agent version automatically or manually when a new version becomes available.

Automatically update the Bot Agent

Using the auto-update capability to update the Bot Agent to a later version reduces the downtime because each user is not required to log into the Control Room to update the Bot Agent version.

Ensure that you are logged in to the [Control Room](#) as the administrator.

The automatic update of the Bot Agent is based on the following:

- All user devices are connected to the Control Room.
- The Automation 360 deployment you use.
- The following update settings:
 - In Automation 360 v.21 and earlier, the Bot Agent update setting was **Auto update** by default. Therefore, the Bot Agent was updated automatically when Automation 360 was updated. Starting from Automation 360 v.22, the default setting for the Bot Agent update was **Auto update** for Cloud and Community Edition, but was optional for On-Premises.
 - Starting from Automation 360 v.29, the Bot Agent update was set to manual for On-Premises by default to provide users control on the Bot Agent update. Therefore, if the default setting in the Control Room for updating the Bot Agent is not changed, when updating to Automation 360 v.29 the default value for updating the Bot Agent is set to manual to ensure the Bot Agent version is not updated automatically. To manually update Bot Agent, see [Manually update the Bot Agent](#) on page 1303.

1. Navigate to **Administration > Settings > Devices**.
2. Select **Bot-agent software** settings.

3. Click the **Edit** icon. 
4. For automatic updates of the Bot Agent, you can choose either all updates (required and optional) or only the required updates.

Option	Description
Auto update optional and mandatory	Automatically update the Bot Agent for both required and optional updates. During the update, new bot deployments on the Bot Runner user devices are queued.
Auto update mandatory updates only	Automatically update the Bot Agent only for required updates. During the update, new bot deployments on the Bot Runner user devices are queued. Note: When you update Automation 360 to version 30, the mandatory update feature for the Bot Agent is turned off. Therefore, the Bot Agent will not be automatically updated even if you have selected the Auto update mandatory updates only option.

Note: To set manually update the Bot Agent, choose **Disable auto updates** option.

5. Optional: [Update the Bot Agent from a local drive](#) on page 1305.
6. Click **Save changes**.

Verify the Bot Agent version and device connection in the **My Devices** page of the Control Room.
Related tasks

Manually update the Bot Agent

Update the Bot Agent to an available version manually. The Bot Agent version available for download is the latest and compatible with the Control Room version that is used.

- To install the Bot Agent, the Windows installer policy must be enabled for the user device.
- The read, write, and execute permissions must be enabled for the Bot Agent folders on the user device.

Some of the Bot Agent version updates are optional and does not affect your existing bots. For more information, see [Bot Agent compatibility](#) on page 1274.

- Update the Bot Agent on connected host devices
 - a) Use your Automation Anywhere URL to log in to the Control Room as an administrator or a user with administrator privileges.
 - b) Click **Manage > Devices**.
On the **Devices** page, the device status indicates if the Bot Agent requires an update. The arrow color on the device icon indicates the status:
 - Red: Update required
 - Blue: Update available but not required
 - Green: Most recent version; no update required
 - c) Select the device where you want to update the Bot Agent and click the **Update checked items** icon (🔍).
The **Status** of the device changes while the update is in progress. After the update is complete, the **Status** changes to **Connected**.

Note: If you have multiple devices, ensure that you select only the devices with the **Status** as **Connected**, and click the **Update checked items** icon to update the Bot Agent. However, if all the listed devices are connected to the Control Room, you can select the **Check all** check box and click the **Update checked items** icon.

Video: See the following video on updating the Bot Agent on connected host device:

- Update the Bot Agent on a locally connected device or a remote device using the local device option
You can update the Bot Agent on a locally connected device or a remote device without manually downloading and installing the Bot Agent.
 - a) On the home screen, at the bottom-left corner, click the **Local device** icon (📍).
 - b) In the **Bot running device** window, click **Update now**.
The **Status** for the devices changes to indicate the progress of the update. After the update is complete, the **Status** changes to **Connected**.

Video: See the following video on how to update the Bot Agent on a locally connected device:

Video: See the following video on how to update the Bot Agent on a remote device using the local device option:

- Update Bot Agent on the locally connected device using the connect local device option
You can update the Bot Agent on your locally connected device by manually downloading and installing the Bot Agent.
 - a) From the Devices page, click the **Connect local device** icon (📍) at the top-right corner of the devices table.
 - b) Click **Connect to my computer**.
 - c) Click the **Manually download the latest version** link.
 - d) After the `AutomationAnywhereBotAgent.exe` is downloaded, install the Bot Agent and follow the instructions on the installation wizard to complete the installation.

- e) After the Bot Agent installation is complete, go back to Automation 360 Control Room and click **Next**.
- f) Follow the instructions on the screen to complete the update.

Video: See the following video on how to update the Bot Agent on the locally connected device using the connect local device option:

The following message is displayed: `Connected to your computer. Your local bot agent has been successfully installed configured.`

If you see the following message displayed: `Device is disconnected or needs upgrade!`, see [Error: Device is disconnected or needs upgrade \(A-People login required\)](#)

Verify the Bot Agent version and device connection in the **Devices** page of the Control Room.

Before you install the Bot Agent, ensure that you review the compatible Automation 360 builds.

Update the Bot Agent from a local drive

As a Control Room administrator, you can download the Bot Agent installation file to a local machine and update the Bot Agent from the local drive.

Ensure that the Bot Agent installation file is downloaded to the local machine.

Important: This functionality is implemented in v.26 and can be used from v.27. That is, after you update your Bot Agent to v.26, future updates can be performed from the local drive.

Update the Bot Agent on several devices by providing the local file path to the installation file.

1. Navigate to **Administration > Settings > Devices** and click the **Edit** icon (✎).
2. Go to the **Bot-agent software** settings.
3. Click the **Edit** icon. (✎)
4. In the **Bot agent installation** section, select the **Update bot agent from local drive** option.
When the **Update bot agent from local drive** option is enabled, the device checks for the installation file in the local drive and use it to update the Bot Agent.

Note: If an installation file is not available in the local drive or not compatible with Control Room, the Bot Agent will be updated with the latest version from the Control Room.

5. Enter the file path to the Bot Agent installation file in your local drive.
For example: `C:\Temp\AutomationAnywhereBotAgent.exe` or `\\network-share-name\foldername1\AutomationAnywhereBotAgent.exe`

6. Click **Save changes**.

Perform Bot Agent diagnostic checks

Use the Bot Agent diagnostic utility for connectivity-related issues between the Bot Runner device and Control Room. The utility helps to diagnose issues either by providing solutions or suggestions to help resolve the issues.

Ensure the Bot Agent is installed on the user device.

1. Open the Windows command prompt.
2. Navigate to the Bot Agent installation path.
 - Default path for Bot Agent installed at system level is `C:\Program Files\Automation Anywhere\Bot Agent`.
 - Default path for Bot Agent installed at local user level is `%USERPROFILE%\AppData\Local\Programs\Automation Anywhere\Bot Agent`.
3. Enter `AADiagnosticUtility.exe` to run the Bot Agent diagnostic utility. Various options to perform the diagnostic check are displayed with their descriptions.

Option	Description
<code>-checkDownloadError <CR_URL></code>	<p>Check for bot dependency download errors if the bot deployment fails.</p> <hr/> <p>Note: Error messages are maintained in the device memory and are removed when the Bot Agent service is restarted.</p> <hr/> <p>Use this option when the Bot Runner device is connected to the Control Room but automations fail because the dependent packages are not downloaded on the Bot Runner device. In this case, the utility provides suggestions for further diagnosis.</p>
<code>-checkProxy <CR_URL></code>	<p>Check the proxy settings on the device.</p> <p>When the Bot Runner device is unable to connect to the Control Room, use this option to verify if a proxy is available or configured for the Bot Agent to use.</p> <p>You are also provided the option to import proxy settings using the <code>importProxy</code> option.</p> <hr/> <p>Note: Your device proxy settings for authenticated proxy can be set during the Bot Agent registration process and can be updated through the Bot Agent diagnostic utility. The same credentials are used for all users on the device.</p>

Option	Description
<p><code>-checkWSError <CR_URL></code></p>	<p>Check for WebSocket connectivity and errors.</p> <hr/> <p>Note: Error messages are maintained in the device memory and are removed when the Bot Agent service is restarted from Services tab of the Windows Task Manager.</p> <hr/> <p>When a Bot Runner device is unable to connect to the Control Room because of WebSocket connection errors, this option provides the possible reasons for further investigation.</p>
<p><code>-collectLogs</code></p>	<p>Reduce the turnaround time for collecting information on issues by capturing multiple logs for the Bot Runner device.</p> <p>Use this option to capture and save current day node manager, bot launcher, and event viewer logs for debugging and troubleshooting in a zipped folder on the device where the utility is being run.</p> <ul style="list-style-type: none"> • For Bot Agent installed at system level, the logs are saved in <code>C:\ProgramData\AutomationAnywhere\BotRunner\Logs\bot_agent_logs_<datetimestamp>.zip</code> • For Bot Agent installed at local-user level, the logs are saved in <code>%USERPROFILE%\AppData\Local\AutomationAnywhere\BotRunner\Logs\bot_agent_logs_<datetimestamp>.zip</code> <hr/> <p>Note:</p> <ul style="list-style-type: none"> • To capture Windows logs for security events, run the utility with elevated privileges (run as administrator). If you run the utility without elevated privileges, the following error is displayed: <code>Error: Unable to capture security_event_viewer_<date>.evtx</code> • To save storage space, delete the file after debugging.

Option	Description
<code>-configProxy <CR_URL></code>	<p>Check proxy configuration and configure proxy credentials, if required.</p> <p>When the Bot Runner device is unable to connect to the Control Room because of missing credentials for an authenticated server, use this option to configure the proxy server credentials. Verify that the connectivity problem is resolved by logging in to the Control Room.</p>
<code>-importProxy <CR_URL></code>	<p>Import the proxy settings from a logged-in user device to the system user device.</p> <hr/> <p>Note: You must have administrator permission to import proxy settings.</p> <hr/> <p>When the Bot Runner device is unable to connect to the Control Room because of proxy server issues, use this option to import the proxy settings from a logged-in user to the system user for the Bot Agent.</p> <p>This option provides information about the following:</p> <ul style="list-style-type: none"> • Whether the proxy server is authenticated or not. • Control Room URL is added to the safe recipients list in the proxy server. • WebSocket connections are allowed as part of the proxy configuration.
<code>-importSSLCertificate path_to_ssl_certificate</code>	<p>Import a SSL certificate into the Java credential store, if required.</p> <hr/> <p>Note: You must have administrator permission to import the SSL certificate.</p> <hr/> <p>When the Bot Runner device is unable to connect to the Control Room because of an invalid SSL certificate, use this option to import the SSL certificate. You must ensure a valid certificate file is available in the file location specified in the <code>importSSLCertificatepath_to_ssl_certificate</code> option.</p> <p>You must restart the Automation Anywhere Bot Agent service so that the imported certificate becomes effective.</p>

Option	Description
<code>-list</code>	View active bot deployments on the local devices. Use this option to check and list the automation (bots) that are running.
<code>-ping <CR_URL></code>	Check connectivity between the Control Room and Bot Runner devices. Use this option to check if a Bot Runner device can ping (reach) the Control Room.
<code>-validateSSLCertificate <CR_URL></code>	Check for a valid SSL certificate and view whether the certificate is valid or invalid. Note: You must have read permission to perform this check. When the Bot Runner device is unable to connect to the Control Room because of an invalid SSL certificate, use this option to check and view if the SSL certificate is valid or not. To resolve the issue, use the <code>importSSLCertificate</code> option.

4. Enter the following option in the command prompt: `<filepath> \AADiagnosticUtility.exe -<option> <CR_URL>`
For example, to verify WebSocket errors, enter the following in the command prompt:
`AADiagnosticUtility.exe -checkWSError https://yourcrurl.com/`
The option returns the following result: Recently this device have not encountered any Web Socket errors

Use the other options to perform further diagnostic checks.

Installing Control Room for Cloud-enabled deployment

With Cloud-enabled deployment, you can store and process native business and operational data on site and take advantage of management and operational services delivered from Automation Anywhere Cloud.

Automation Anywhere deploys and provisions an Automation 360 Cloud-enabled service instance in our cloud to deliver management and operational capabilities. Customer then installs the Cloud-enabled application within their infrastructure to consume these capabilities for storing and processing customer data.

Note: Linux is not supported for Cloud-enabled deployments.

For Cloud-enabled deployment, the initial welcome email that you received from Automation Anywhere contains:

- URL to the Automation Anywhere Cloud-enabled instance
- Provisioning token needed to establish trust connectivity with the Automation Anywhere Cloud Control Room

Important: Do not discard the content of this email. You will need the information in the email to setup on-premises application.

1. Receive your Automation 360 Cloud-enabled service URL from Automation Anywhere and provisioning token.
2. Install and access the On-Premises application.
Download and install the Cloud-enabled application on your network; the installation user is assigned administrator privileges.
[Installing Control Room On-Premises](#) on page 1121
3. Log in to the On-Premises Control Room.
[Log in to Automation Anywhere Control Room](#) on page 1428
4. Navigate to **Administration > Settings > Cloud-Enabled**.
5. Provide the provisioning token to connect to the Control Room.
6. Click **Save changes**.
The trusted relationship between the instances is created.
7. To test Cloud-Enabled functionality, open a browser, enter the URL of the Cloud Control Room service instance, and press Enter.
You are redirected to the On-Premises Control Room.

[Installed Control Room directories and files](#) on page 1338

When installing the Automation Anywhere Control Room on different operating systems, the installer executes and installs files and folders in the following directories.

Naming guidelines for Control Room URLs

Adhere to Domain Name System (DNS) guidelines when you configure domain and subdomain Control Room URLs for On-Premises and Cloud deployments.

Guidelines for On-Premises Control Room deployments

By following these DNS guidelines, you can successfully register your Bot Agent with the On-Premises Control Room. According to RFC 952, RFC 1035, and RFC 1123, the following guidelines apply when creating names for domain and subdomain URLs:

- The host name can be up to 63 characters in length and can contain the following characters:
 - Uppercase characters (A–Z)
 - Lowercase characters (a–z)
 - Numerals (0–9)
 - Hyphens (-)
- The host name should not consist of all numeric values.
- The host name should not start nor end with a hyphen (-).
- The URL domain and subdomain names should not contain the underscore character (_).

Note: Instead of an underscore (_), use a hyphen (-).

Guidelines for Cloud Control Room deployments

By following DNS guidelines, you can successfully register your Bot Agent with the Cloud Control Room. The Cloud Control Room URL syntax is: `https://<domainname>.myautomationanywhere.digital`, where <domainname> is configurable.

- The domain name can be up to 27 characters in length and can contain the following characters:
 - Lowercase characters (a–z)
 - Numerals (0–9)
 - Hyphens (-)
- The domain name should not consist of all numeric values.
- The domain name should not start nor end with a hyphen (-).
- The URL domain and subdomain names should not contain the underscore character (_).

Note: Instead of an underscore (_), use a hyphen (-).

Post-installation user management

After completing the post-installation tasks, validate the setup by logging in to the Control Room and installing a license. First time access to the Control Room walks you through the configuration for your authentication method.

[Configure Control Room authentication options](#) on page 1314

The options for launching the Control Room for the first time and the authentication method depend on the installation mode and deployment type.

Validate services

Validate that the following services are running in automatic mode:

- Automation Anywhere Control Room Caching
- Automation Anywhere Control Room Messaging
- Automation Anywhere Control Room Reverse Proxy
- Automation Anywhere Control Room Service
- Automation Anywhere Elastic Search Service
- Automation Anywhere Bot Compiler Service
- Automation Anywhere Control Room IQ Bot Service
- Automation Anywhere Control Room Robotic Interface Service
- Automation Anywhere Control Room Discovery Bot Service
- Automation Anywhere Control Room Discovery Bot ML Service
- Automation Anywhere Control Room Storage Service

[Users](#) on page 1676

As an administrator, you can create, view, edit, delete, and enable or disable a user. Creating users steps vary depending on whether the user is a non-Active Directory, Active Directory, or single sign-on (SSO) user from an IdP server.

Related tasks

[Complete Control Room post-installation configuration](#) on page 1258

After installing the Control Room, complete the configuration settings to ensure timely Automation Anywhere communications are specified and confirm Automation Anywhere services are running.

Configure Control Room as a service provider

A valid SAML IdP setup must be configured before the Control Room can be switched to a SAML-authentication environment.

This task is performed by a network administrator on SAML IdP. You must have the necessary privileges to complete this configuration.

Create a user in Active Directory to match one of your Control Room Admin users. This user tests the Control Room configuration as the last step in the configuration. We recommend that you do not test SAML login with a non-Admin Control Room user access, or you risk having a Control Room that has no Admin user.

Complete the necessary network-side preparations to switch the Control Room to act as the service provider in the SAML IDP setup.

1. Create an application on a SAML IdP.
For information on commonly used SAML IdPs, see [Automation 360 - Change control room authentication to SAML based SSO](#).
2. Set the ACS or service provider URL to `<Enterprise Control Room URL>/v1/authentication/saml/assertion`.

Note: Ensure that you do not configure the SAML assertions for single logout.

3. Configure the application that is created in the SAML IdP to map the key user attributes defined in the IdP to be used in the Control Room.
Key attributes include: **UserID**, **FirstName**, **LastName**, and **EmailAddress**.
This value is required when setting up the Control Room to use SAML IdP.
4. Optional: Provide access to users on the application created on SAML IdP.

Note:

- Download the SAML IdP metadata and share it with the Control Room administrator for setting up the Control Room.
 - The SAML assertion includes an authentication statement that must include the SessionIndex attribute. As per the SAML specifications, the assertion ID is used as the session index. The purpose of the SessionIndex attribute is to identify which sessions to logout during SAML logout.
-

```
<saml2:AuthnStatement
  AuthnInstant="authenticated_instance" SessionIndex="index_value_required">
```

[Set up SAML authentication on the Control Room](#)

Related tasks

[Set up SAML authentication](#) on page 1330

Switch user authentication for Control Room from Control Room database to SAML single sign-on (SSO).

Configure Control Room authentication options

The options for launching the Control Room for the first time and the authentication method depend on the installation mode and deployment type.

The authentication options for Control Room in Cloud and Cloud-enabled deployments differ from the options for On-Premises deployment (installed using the Custom mode).

After the installation (Custom mode) is complete, configure the Control Room in Custom mode to authenticate users with an Active Directory (AD), Control Room database, or single sign-on (SSO).

Note: The Active Directory authentication mode is available for On-Premises deployment and not for Cloud and Cloud-enabled deployments.

Based on your installation mode (express or custom) and deployment type (On-Premises, Cloud, and Cloud-enabled), select any of the following authentication methods for the Control Room:

- After an Express mode installation, configure the Control Room in Express mode using the default settings.
[Configure Control Room in Express mode](#) on page 1314
- Authenticate users using Active Directory by manually adding the LDAP URLs.
[Configure Control Room for Active Directory: manual mode](#) on page 1315
- Authenticate users using Active Directory by enabling the Control Room to discover and list domains and sites in your organization.
[Configure Control Room for Active Directory: auto mode](#) on page 1318
- Authenticate users using the database option.
[Configure Control Room database](#) on page 1324
- Configure an authenticated environment Control Room database to a SAML identity provider (IDP).
[Set up SAML authentication](#) on page 1330
- Configure the environment for Smart Card, X.509 Certificate authentication.
[Configure Smart Card authentication installation procedure](#) on page 1320

Configure Control Room in Express mode

After completing the installation in Express Mode, configure the Control Room in Express Mode using the default settings.

To configure Control Room when you start it for the first time, do the following steps:

1. Open Control Room in a browser to launch the **Getting Started** wizard.
 - **Windows:** Double-click the Automation Anywhere Control Room icon on the desktop.
 - **Linux:** Open a browser and navigate to the Linux server hostname. Example:
`server1.mycompany.com`
2. Fill in the following fields:

- **Username:** Enter a user name.
 - **First name** Enter the first name.
 - **Last name** Enter the last name.
 - **Email** Enter an email address.
 - **Password** Enter a password.
 - **Confirm password** Confirm the password.
3. Click **Next**.
The **Create security questions** page appears.
 4. Enter three security questions and answers.
 5. Click **Next**.
The **Credential settings** page appears.
 6. Select from the following options:
 - **Express mode:**The system stores your master key to connect to the Credential Vault on the Control Room filesystem. This option is not recommended for a production environment.
 - **Manual mode:** You store the Master Key on your own, and then provide the Master Key when the Credential Vault is locked. Users use the Master Key to connect to the Credential Vault to secure their credentials and access them when creating and running Task Bots.
-
- Important:** If you lose the key, you will not be able to access the Control Room.
-
7. Click **Save and log in**.
You are logged in to the Control Room as an administrator. You can now configure and manage the overall RPA environment with Control Room and clients.

After configuring the Control Room, install product licenses.

Configure Control Room for Active Directory: manual mode

Configure the Control Room to authenticate users using Active Directory by manually adding the Lightweight Directory Access Protocol (LDAP) URLs.

To configure the Control Room when you start it for the first time, do the following:

1. Double-click the Automation Anywhere Control Room icon on your desktop.
The Configure Control Room settings page appears.
2. Type the repository path.
This is the location where the uploaded automation files, for example, IQ Bots, and Task Bots are stored. For example, `C:\ProgramData\AutomationAnywhere\Server Files`.
3. Enter the access URL.
This is the URL for accessing your installation of Control Room.
4. Click **Save and continue**.

Important: The **back** button of your web browser is automatically disabled after you click **Save and continue**. This ensures that the Credential Vault Master Key that generates matches the repository path and Control Room access URL.

To return to the Configure Control Room settings page, press `Ctrl` plus `F5` and restart.

The Credential Vault settings page appears.

5. Select from the following options:

- **Express mode:** The system stores your master key to connect to the Credential Vault. This option is not recommended for a production environment.
 - **Manual mode:** You store the Master Key on your own, and then provide the Master Key when the Credential Vault is locked. Users use the Master Key to connect to the Credential Vault to secure their credentials and access them when creating and running Task Bots.
-

Important: If you lose the key, you will not be able to access the Control Room.

6. Click **Save and continue**.

Important: The **back** button of the web browser is automatically disabled after you click **Save and continue**. No further changes to the Control Room configuration or Credential Vault settings are allowed.

To make changes, reinstall the Control Room.

The Authentication type for Control Room users page appears.

7. Select Active Directory.

Automation Anywhere supports Active Directory Multi-Forest authentication for the Control Room. Before providing the Authentication Type, ensure the following:

- One-way or two-way trust is set up between all forests. For a one-way trust, this is from the Enterprise Client forest to the Control Room forest (Control Room forest must always be the trusting forest).
- Two-way trust is set up for every domain in a forest.
- The root certificate of the LDAP server is imported using the provided CertMgr tool via command.
- The provided LDAP URLs per forest cannot be behind a load balancer. Also, all LDAP URLs must point to the root (main) domain controllers.
- The node that runs the Control Room is in the same domain network where the Active Directory runs.
- The user is in the parent domain and the URL points to the parent.

This ensures that when there are two or more forests, and one of the forest has a subdomain with a different name space, a user from the other forests does not have permission to access that subdomain.

8. Type the Global Catalog URL.

For example, `ldap://server01.domain.com`.

For failsafe authentication, click the plus option to provide additional LDAP URLs.

Note: For users and groups from one or more Active Directory domains, to access the Control Room, use a fully qualified host name of the Global Catalog (GC) server, listening on port 3268 (3269 if SSL).

When adding LDAP URLs, ensure that you provide a fully qualified host name like `ldap://server01.ldap.com`.

Provide URLs of multiple Global Catalogs per forest so that if one Global Catalog in a forest goes down, the other can serve. This feature does not provide support for the load-balanced URL.

You must enter the Domain username and password and click **Manually add connections** to enter the LDAP URLs.

9. Provide service account credentials

Ensure that the username provided is a user in the Domain Users group and ideally and be set up in Active Directory with a **password never expires** option. If otherwise, there will be some downtime in RPA authentication as the service account password is reset. Provide the username in a User Principal Name (UPN) in the `username@domain.com` format and password.

10. Click **Check connection**.

If Control Room is unable to connect to the Active Directory database, an error message appears.

11. Click **Next**.

The Control Room first administrator page appears.

12. Select the **Active Directory domain** from the drop-down list and type the Control Room administrator username.

13. Click **Check name in Active Directory**.

If the username is in the Active Directory the following user details are shown:

- **First name**
- **Last name**
- **Email**

You can edit these prepopulated fields.

14. Click **Save and log in**.

You are logged in to the Control Room as an administrator. You can now configure and manage the overall RPA environment with Control Room and clients.

After configuring the Control Room, install product licenses.

Related tasks

[Configure Control Room for Active Directory: auto mode](#) on page 1318

Configure the Control Room to authenticate users using Active Directory by enabling the Control Room to discover and list domains and sites in your organization.

Configure LDAP channel binding

Configure LDAP channel binding in Automation 360 On-Premises for enhanced security in network communications between an Active Directory and its clients. This method provides a more secure LDAP authentication over SSL and TLS.

Enable channel binding in the `um.properties` file when required.

1. Go to the Control Room installation path.
2. From the list of files in the `config` folder, open the `um.properties` file with an XML editor.
3. Add the `um.ldap.channel.binding.enabled` property in the `um.properties` file.

For example, `um.ldap.channel.binding.enabled=false`

4. To enable channel binding, change the value to `true`.

The default value is `false` and channel binding is disabled.

Channel binding is enabled if it is enabled on the server side.

For information about enabling channel binding on the server side, see [LDAP enforce channel binding registry entry](#).

5. Save the file.

Configure Control Room for Active Directory: auto mode

Configure the Control Room to authenticate users using Active Directory by enabling the Control Room to discover and list domains and sites in your organization.

To configure the Control Room when you start it for the first time, do the following:

1. Double-click the Automation Anywhere Control Room icon on your desktop.

The Configure Control Room settings page appears.

2. Type the repository path.

This is the location where the uploaded automation files, for example, IQ Bots, and Task Bots are stored. For example, `C:\ProgramData\AutomationAnywhere\Server Files`.

3. Enter the access URL.

This is the URL for accessing your installation of Control Room.

4. Click **Save and continue**.

Important: The **back** button of your web browser is automatically disabled after you click **Save and continue**. This ensures that the Credential Vault Master Key that generates matches the repository path and Control Room access URL.

To return to the Configure Control Room settings page, press `Ctrl` plus `F5` and restart.

The Credential Vault settings page appears.

5. Select from the following options:

- **Express mode:** The system stores your master key to connect to the Credential Vault. This option is not recommended for a production environment.
- **Manual mode:** You store the Master Key on your own, and then provide the Master Key when the Credential Vault is locked. Users use the Master Key to connect to the Credential Vault to secure their credentials and access them when creating and running Task Bots.

Important: If you lose the key, you will not be able to access the Control Room.

6. Click **Save and continue**.

Important: The **back** button of the web browser is automatically disabled after you click **Save and continue**. No further changes to the Control Room configuration or Credential Vault settings are allowed.

To make changes, reinstall the Control Room.

The Authentication type for Control Room users page appears.

7. Select Active Directory.

Automation Anywhere supports Active Directory multi-forest authentication for the Control Room. Before providing the authentication type, ensure the following:

- For one-way trust between forests:
 - The Bot Agent devices are in one or more forests and the Control Room is in a different forest, the Control Room must be in the trusting forest.
 - Set up trust between the forest that contains the Control Room and each of the forests containing the Bot Agent devices.
 - Domains containing Bot Agent devices and the Control Room must be configured with two-way trust between the domains.
- For two-way trust between forests:
 - In the scenario where the Bot Agent devices are in one or more forests and the Control Room is in a different forest, all forests containing Bot Agent device and the Control Room are configured with two-way trust between forests.
 - Set up trust between all forests containing the Control Room and the Bot Agent devices.
 - Domains containing Bot Agent devices and the Control Room must be configured with two-way trust between the domains.
- The root certificate of the LDAP server is imported using the provided CertMgr tool via command.
- The provided LDAP URLs per forest cannot be behind a load balancer. Also, all LDAP URLs must point to the root (main) domain controllers.
- The node that runs the Control Room is in the same domain network where the Active Directory runs.
- The user is in the parent domain and the URL points to the parent.

This ensures that when there are two or more forests, and one of the forest has a sub-domain with a different name space, a user from the other forests does not have permission to access that sub-domain.

8. Type the Domain username.

Ensure you use the User Principal Name (UPN) in the `username@domain.com` format. The username you enter is for a user who has access to all domains using the same credentials.

9. Type the Domain password.

This user is not expected to use the Control Room. Although you have an option to update the password, use an Account with the password never expires option. If it expires, it can be updated but with some downtime.

10. Click **Discover connections.**

All discovered Active Directory domains with one or more sites per domain are shown.

By default, all domains and sites are selected. If only one domain and one site under it is discovered, then it is shown in read-only mode and cannot be edited.

You can configure the maximum number of sites per domain that can be discovered across multiple domains by adding the following property in the `um.properties` file saved in `<installation path>/config`:

```
um.ldap.auto.discovery.find.max.sites=<number of sites>
```

For example, you can configure auto-discovery for a maximum of 15 sites per domain by adding the entry `um.ldap.auto.discovery.find.max.sites=15` in the `um.properties` file. This means that for every domain that you have, a maximum of 15 associated sites can be discovered per domain.

Note: If this property is not configured, by default, 10 sites per domain will be discovered.

11. Select the domains and sites to use for authentication.

Select the domains and sites to use for authentication. Select a minimum of one site for each domain that is selected

12. Click **Test connections** to register the sites to use for authentication.

13. Click **Check connection**.

If Control Room is unable to connect to the Active Directory database, an error message appears.

14. Click **Next**.

The Control Room first administrator page appears.

15. Select the **Active Directory domain** from the drop-down list and type the Control Room administrator username.

16. Click **Check name in Active Directory**.

If the username is in the Active Directory the following user details are shown:

- **First name**
- **Last name**
- **Email**

You can edit these pre-populated fields.

17. Click **Save and log in**.

You are logged in to the Control Room as an administrator. You can now configure and manage the overall RPA environment with Control Room and Bot Agent.

After configuring the Control Room, install product licenses.

Related tasks

[Configure Control Room for Active Directory: manual mode](#) on page 1315

Configure the Control Room to authenticate users using Active Directory by manually adding the Lightweight Directory Access Protocol (LDAP) URLs.

[Configure Control Room database](#) on page 1324

Configure the Control Room to authenticate users using the database option.

Configure Smart Card authentication installation procedure

Configure the Control Room to authenticate users using the Smart Card option.

To perform the task, you must have a administrator account with the required rights and permissions.

Follow these steps to configure your Cloud Control Room to use Smart Card, X.509 certificate authentication.

1. Configure the secondary hostname to point to the Control Room load balancer.

This process defines the secondary hostname used for authentication requests when the Control Room is configured for Smart Card authentication. The secondary hostname is configured within the Control Room load balancer automatically. Both the primary and secondary hostnames must be configured within the DNS system used by the Control Room environment (add DNS entries for primary and secondary hostnames - external to Control Room).

2. How to obtain Java KeyStore with trusted CA certificates.

Configure the location the Control Room will check for Certificate Authority (CA) certificates used to authenticate user certificates for user logins.

Note: The certificates in this location are the server certificates for the CAs that will issue the user certificates.

Option	Action
Periodically scan the following location	This setting allows the administrator to define the path to keystore file containing the CA certificates. Use this setting if you periodically update the CA truststore and set the frequency of the scan.
Upload the KeyStore manually	This setting allows the administrator to load a keystore file containing the CA certificates. Use this setting if your CAs are known and static and indicate whether or not the keystore is password protected. If the keystore is password protected, supply and confirm the password.

3. Select the revocation checking method.

Revocation checking configures the Control Room to reject authentication requests for certificates that have been revoked.

Option	Action
Online Certificate Status Protocol (OCSP)	Use this setting if your CA has OSCP implemented.
Certificate Revocation List	Use this setting if you maintain a static list of revoked certificates.
No Revocation Checking	Using this setting the Control Room will not perform revocation check. Note: This is not recommended for production deployments where revocation will typically be used.

4. Use the other method if selected method fails

This setting will attempt to use the non-selected method of revocation checking if the configured method fails.

5. Allow user to authenticate even if revocation status cannot be determined

Use this setting to assure users can authenticate if either of the revocation check method fails.

6. Configure user name mapping.

User name mapping specifies which attribute of the user certificate is used for the Control Room username. The user name must be configured in the Control Room prior to the user logging into the Control Room and must match the user name derived from the certificate.

a) Obtain user name from

Certificate subject

Use this setting if the Control Room user name is the same as the string in the Subject field for the user certificate.

Universal Principal Name

Use this setting if the Control Room user name is the same as the string in the Universal Principal Name field for the user certificate.

b) Use Regular Expression

Enter Regular Expression that will filter the Control Room user name from the selected field of the user certificate. This may not be necessary if the Control Room user name is the same as the data within the selected certificate field.

7. Configure first name mapping.

First name mapping specifies which attribute of the user certificate is used for the Control Room username. The first name must be configured in the Control Room prior to the user logging into the Control Room and must match the user first name derived from the certificate.

a) Obtain first name from

Certificate subject

Use this setting if the Control Room first name is the same as the string in the Subject field for the user certificate.

Universal Principal Name

Use this setting if the Control Room user name is the same as the string in the Universal Principal Name field for the user certificate.

b) Use Regular Expression

Enter Regular Expression that will filter the Control Room user first name from the selected field of the user certificate. This may not be necessary if the Control Room user first name is the same as the data within the selected certificate field.

8. Configure last name mapping.

Last name mapping specifies which attribute of the user certificate is used for the Control Room username. The last name must be configured in the Control Room prior to the user logging into the Control Room and must match the user last name derived from the certificate.

a) Obtain last name from

Certificate subject

Use this setting if the Control Room last name is the same as the string in the Subject field for the user certificate.

Universal Principal Name

Use this setting if the Control Room user name is the same as the string in the

Universal Principal Name field for the user certificate.

b) Use Regular Expression

Enter Regular Expression that will filter the Control Room user last name from the selected field of the user certificate. This may not be necessary if the Control Room user last name is the same as the data within the selected certificate field.

9. Configure email address mapping.

Email address mapping specifies which attribute of the user certificate is used for the Control Room username. The email address must be configured in the Control Room prior to the user logging into the Control Room and must match the user last name derived from the certificate.

a) Obtain last name from

Certificate subject

Use this setting if the Control Room email address is the same as the string in the Subject field for the user certificate.

Universal Principal Name

Use this setting if the Control Room user name is the same as the string in the Universal Principal Name field for the user certificate.

b) Use Regular Expression

Enter Regular Expression that will filter the Control Room user email address from the selected field of the user certificate. This may not be necessary if the Control Room user email address is the same as the data within the selected certificate field.

10. Click **Next.**

Control Room smart card first administrator

After configuring the smart card authentication process, an administrator user is needed. This process will walk you through setting up the first administrator for the Control Room.

To perform the task, you must have a administrator account with the required rights and permissions.

When authenticating with smart cards, the authenticating system will send a signal to the operating system to "Insert Smart Card" and prompt the user, from the smart card software, to select the certificate to use for authentication.

The following steps guide you through setting up your first administrator user with smart card authentication installed.

You should be on the correct configuration page if you have completed [Configure Smart Card authentication installation procedure](#) on page 1320.

- 1. Navigate to > Control Room first administrator.**
- 2. Insert the smart card for the administrator.**
- 3. Click **Authenticate and pre-fill user data**.**

This will start the smart card authentication process and pre-fill data from the selected certificate base on the mappings defined during the configuration of the Certificate (smart

card) authentication installation process. If any information requires correction, click the **Back** button and make the necessary changes.

4. Verify the data.

View the Username, First Name, Last Name, and Email Address that is pre-filled and verify that these data points were correctly mapped during the smart card authentication installation procedure.

5. Click **Save and log in**

The configuration of Certificate (smart card) authentication strategy is complete.

After configuration of the smart card authentication process, the login page of the Control Room will display only the "Insert CAC/PIV" option for authenticating the user. Pressing this button will start the smart card authentication process and the browser will signal a smart card login request to the operating system which will then prompt the user to insert their smart card and possibly an optional PIN.

The user selects the appropriate certificate on the smart card and proceeds with the Control Room login.

Configure Control Room database

Configure the Control Room to authenticate users using the database option.

To configure the Control Room when you start it for the first time, do the following:

1. Open a browser and navigate to the Control Room URL.

The Configure Control Room settings page appears.

- Windows

Double-click the Automation Anywhere Control Room icon on your desktop.

- Linux

Open a browser and navigate to the host name of the server on which you installed Automation Anywhere Control Room. Example: `myserver.mycompany.com`

Note: Do not retain a following slash at the end of the URL, as the validation will fail.

2. Enter the repository path.

- Windows

This is the location where the uploaded automation files, for example, IQ Bots, and Task Bots are stored. For example,

`C:\ProgramData\AutomationAnywhere\Server Files`

- Linux

`/opt/automationanywhere/enterprise/appdata`

3. Enter the access URL.

This is the URL for accessing your installation of Control Room.

4. Click **Save and continue**.

Important: The **back** button of your web browser is automatically disabled after you click **Save and continue**. This ensures that the Credential Vault Master Key that generates matches the repository path and Control Room access URL.

To return to the Configure Control Room settings page, press **Ctrl** plus **F5** and restart.

The Credential Vault settings page appears.

5. Select from the following options:

- **Express mode:** The system stores your master key to connect to the Credential Vault. This option is not recommended for a production environment.
 - **Manual mode:** You store the Master Key on your own, and then provide the Master Key when the Credential Vault is locked. Users use the Master Key to connect to the Credential Vault to secure their credentials and access them when creating and running Task Bots.
-

Important: If you lose the key, you will not be able to access the Control Room.

6. Click **Save and continue**.

Important: The **back** button of the web browser is automatically disabled after you click **Save and continue**. No further changes to the Control Room configuration or Credential Vault settings are allowed.

To make changes, reinstall the Control Room.

The Authentication type for Control Room users page appears.

7. Select **Control Room database**.

Select from Active Directory, Single Sign-On (SAML 2.), Certificate (Smart Card), or Control Room database. Please refer to those configuration topics for specific steps and processes.

8. Click **Next**.

The Control Room first administrator page appears.

9. Fill in the following fields:

- **Username:** Enter a user name.
- **First name** Enter the first name.
- **Last name** Enter the last name.
- **Email** Enter an email address.
- **Password** Enter a password.
- **Confirm password** Confirm the password.

10. Click **Next**.

The **Create security questions** page appears.

11. Enter three security questions and answers.

12. Click **Save and log in**.

You are logged in to the Control Room as an administrator. You can now configure and manage the overall RPA environment with Control Room and clients.

Install a license.

Related tasks

[Configure Control Room for Active Directory: manual mode](#) on page 1315

Configure the Control Room to authenticate users using Active Directory by manually adding the Lightweight Directory Access Protocol (LDAP) URLs.

[Configure Control Room for Active Directory: auto mode](#) on page 1318

Configure the Control Room to authenticate users using Active Directory by enabling the Control Room to discover and list domains and sites in your organization.

Change Control Room configuration to HTTPS from HTTP mode

If your Control Room is configured for HTTP mode, you can change the configuration to HTTPS mode. You must use a self-signed certificate either before or after performing a custom Control Room configuration.

Transportation Layer Security is configured as part of the Control Room installation. If that step was skipped or the certificate expires, configure the TLS certificate with this post-installation configuration.

Important: It is not recommended to use self-signed certificates. However, if you use a self-signed certificate, ensure you install the certificate on each device manually and accept the certificate to enable communication between the device and the Control Room after configuring the self-signed certificate.

1. Log in to the Control Room.
The Control Room instance launches in your default browser.
2. Change the Control Room URL setting and port to HTTPS and port number to 443.
The **Website Security Warning** page is displayed.
3. Select the **Force HTTP Traffic to HTTPS** check box.
4. Continue to the Control Room website to access the Control Room.

[Configure Control Room authentication options](#) on page 1314

If you have already configured it, then log in to the Control Room.

Related tasks

[Import HTTPS, intermediate, and CA certificates](#) on page 1327

After you install the Control Room for an On-Premises deployment, you can use the Windows or Linux command prompt to import all or some of these certificates:

[Configure application Transport Layer Security](#) on page 1193

Use the **Transport Layer Security (TLS) configuration** wizard page from the Automation 360 installer to generate a self-signed certificate or import a security certificate to set up a highly secure Control Room instance.

Intermediate certificates

Intermediate certificates are used to determine if a certificate is issued by a valid and trusted root certification authority (CA).

The certificate chain or certification path is a list of certificates with intermediate certificate issuers. The certificate chain or certification path verification check starts with a leaf certificate and each certificate in the chain is checked by the entity identified by the next certificate in the chain until the root certificate is verified.

The certificate chain verification will fail if following sample conditions are encountered:

- Certificates are expired.
- Certificates do not have a valid signature.
- Certificates do not have a valid issuing CA.

The server makes intermediate certificates available to the client as part of the secure connection established between the client and server. An intermediate certificate is used to determine if a certificate was issued by a valid root CA. The root CA certificate issues or signs the intermediate certificate, and the intermediate certificate issues or signs a TLS certificate. If the intermediate certificate is not installed on the sever where the TLS certificate is installed, then applications might not trust the server TLS certificate. To have clients trust the TLS certificate, you must make the intermediate certificates available on the server.

Import HTTPS, intermediate, and CA certificates

After you install the Control Room for an On-Premises deployments, you can use the Windows or Linux command prompt to import all or some of these certificate:

- HTTPS
- Intermediate
- Certificate Authority (CA)

You can import HTTPS, intermediate, and CA certificates in the following scenarios:

- When you switch the Control Room from HTTP to HTTPS after Automation 360 is installed.
- The certificates expire or need modification, for example, when you add a new server.

These instructions apply to both Windows and Linux installations.

To import an HTTPS, intermediate, or CA certificate to configure the Control Room for secure connection using the command prompt, perform the following steps:

1. Run the command prompt in administrator mode.
2. Navigate to the Automation Anywhere installation path.
The default installation path for Windows is `C:\Program Files\Automation Anywhere\Automation360`.
The default installation path for Linux is `/opt/automationanywhere/enterprise`
3. Enter or paste the following at the command prompt:
 - For Windows, if only server certificate is required or if the intermediate certificates are required and all certificates are in a single file (single file with certificate chain), then enter the command:

```
jdk11\bin\java -jar certmgr.jar -appDir "C:\Program Files
\Automation Anywhere\Automation360" -setServerCert "C:\Users
\cradmin\Desktop\test_automationanywhere_com.pfx" -privateKeyPass
<PFX Password>
```

- For Windows, if intermediate certificates are required and the server certificate file does not contain any intermediate certificates, then copy all the intermediate certificates to a directory on your device and use the directory path in the following command. Enter the command only after you have updated it with the required values:

```
jdk11\bin\java -jar certmgr.jar -appDir "C:\Program Files
\Automation Anywhere\Automation360" -setServerCert "<path to P12/
PKCS12 certificate file>" -privateKeyPass <cert file password> -
intermediateCertDir "<path to unzipped certs directory>"
```

Note:

- Importing intermediate certificate is supported on Windows only.

- Password protected intermediate certificates are not supported.

- For Windows CA certificate, enter the command:

```
jdk11\bin\java -jar certmgr.jar -appDir "C:\Program Files
\Automation Anywhere\Automation360" -importTrustCert "D:\<user
name>\My Downloads\CA31.cer"
```

- For Linux CentOS HTTPS certificate, enter the command:

```
jdk11/bin/java -jar certmgr.jar -appDir "/opt/
automationanywhere/enterprise" -setServerCert "/home/<user>/
test_automationanywhere_com.pfx" -privateKeyPass <PFX Password>
```

- For Linux CentOS CA certificate, enter the command:

```
jdk11/bin/java -jar certmgr.jar -appDir
"/opt/automationanywhere/enterprise"
-importTrustCert "CA31.cer"
```

4. Restart the Control Room Reverse Proxy Service to view the imported certificates.
5. During the installation, if you did not accept the default and indicated you want to upload your own (self-signed) certificate, add the following parameters to the `boot.db.properties` file that is located in the `config` folder, in the Automation Anywhere installation path.

- Windows file location:

```
root:\Program Files\Automation Anywhere\config\boot.db.properties
```

- Linux file location:

```
/opt/automationanywhere/enterprise/config/boot.db.properties
```

Parameter:

```
trustServerCertificate=false
```

Add Control Room certificate to Windows certificate stores

To ensure that the Bot Agent is registered successfully and works as intended, manually add or update the Control Room certificate to the Windows certificate stores. Perform this task if the Windows certificate stores does not accept the certificate and you see a certificate path validation error.

You must reinstall the certificates in the Windows certificate stores if the Bot Agent is updated.

To resolve the certificate on the browser of the Bot Agent machine, download and install the certificate.

Note: On-Premises users can import intermediate certificates and server certificate to their Control Room. If the certificates are issued by an intermediate Certificate Authority (CA), import the intermediate certificates to your server. To import intermediate certificates, see [Import HTTPS, intermediate, and CA certificates](#) on page 1327.

We recommend that you have the CA root certificates made available on client devices.

1. To download the certificate using Google Chrome, perform these steps:
 - a) Open the Control Room instance used to access the Bot Agent.
 - b) Press the function key F12 to open the developer window.
 - c) Navigate to the **Security** tab and click the **View certificate** option. The **Certificate Viewer** window appears.
 - d) In the **Details** tab, click the **Export** option.
 - e) Select a Base-64 encoded option from the Save as type drop-down list.
 - f) Save the file to a location of your choice.

2. To import the certificate, perform these steps:
 - a) Open a command window.
 - b) Enter MMC to launch the console window.
 - c) Select the **Add/Remove Snap-in** option from the **File** menu.
 - d) Double-click **Certificates** option and then select **Computer account** in the **Certificates snap-in** window.
 - e) Click **Next** and select the **Local Computer** option in the **Select Computer** window.
 - f) Click **Finish**.
 - g) Click **OK** to return to the console window.

3. Now add the certificates to the **Trusted Root Certification Authorities** and **Trusted Publishers** folders.
 - a) Double-click the **Certificates** name.
 - b) Right-click the **Trusted Root Certification Authorities** name.
 - c) Select the **Import** option from the **All Tasks** menu. The **Certificate Import Wizard** is launched.
 - d) Click **Next**.
 - e) Click **Browse** and select the certificate that was saved.
 - f) Click **Next** and select the option to place all certificates in a store.
 - g) Click **Next** and click **Finish** to import the certificates. The certificate is imported successfully.
 - h) Repeat the above steps to import certificates in the **Trusted Publishers** folder. The console window now shows the certificates imported for current user.

4. Restart the Bot Agent device to validate that the device is registered successfully.

For more information on troubleshooting steps, see [Automation 360: Error while registering device - An unexpected problem occurred \(A-People login required\)](#).

Preparing for users

After completing initial installation and depending upon your deployment option, the post-installation configuration and validation, you are ready to prepare for users to login and work with bots.

See [Users](#) on page 1676.

Set up SAML authentication

Switch user authentication for Control Room from Control Room database to SAML single sign-on (SSO).

Note: SAML integration is irreversible. After it has been established, you cannot modify the configuration.

When using SAML for authentication, use the network access capabilities of the IdP to restrict access of the Control Room to specific allowed IP addresses. Ensure all allowed IP addresses configured are removed from the Control Room network settings before switching to SAML for authentication. For more information, see [Add access public IP addresses](#) on page 1745.

Ensure that you are logged in to the as the administrator.

Before you set up authentication for the Control Room, setup tasks (such as introducing credentials on a new system and importing users) might be required. If you import users, then you must also include matching user IDs, email addresses, first and last names, in both the Automation Anywhere credentials and matching records to log in after the SAML integration. For example, if using Okta as a SSO, then users must have matching IDs, email addresses, first name and last names in both Automation Anywhere and Okta to log in after the SAML integration.

You should have the required user information and certificate ready. Typical user information consists of user ID, first and last name, and an email address.

Note: You must validate the SAML IdP setup before you configure the Control Room. See [Configure Control Room as a service provider](#) on page 1313.

After switching to SAML authentication, any users with non-SAML IdP formatted IDs will not be able to log in. You need to verify that any bots in the private workspace of such users are exported beforehand so that the bots can be imported for their new SAML SSO enabled user accounts.

Much of this configuration relies on third-party applications to create the necessary metadata. If you require more specific configuration information based on a specific provider, see [Configure SSO authentication with Okta](#) on page 1332.

To switch the Control Room to SAML SSO, follow these steps.

1. Navigate to **Administration > Settings > User authentication**.
2. Select the **Use SAML** option.

Note: The **Use Control Room database** option is selected by default.

3. In the **SAML metadata** field, enter the metadata from your SAML IdP setup. The following shows an example SAML2 response:

```
<saml:AuthnStatement AuthnInstant="2022--10-24T13:41:04Z"
  SessionIndex="_dc2ab824-cb14-40d3-8e7f-d823193fd6a2">
  <saml:AuthnContext>
    <saml:AuthnContextClassRef>
      urn:oasis:names:tc:SAML:2.0:ac:classes:Password
    </saml:AuthnContextClassRef>
  </saml:AuthnContext>
</saml:AuthnStatement>
```

Note: SAML metadata format varies based on your IdP.

4. In the **Unique Entity ID for Control Room (Service Provider)** field, enter the entity ID.

Note: The Unique Entity ID is defined in SAML IdP to identify the Control Room.

5. In the **Sign authentication requests** field, select one of the following options:

Option	Description
Do not sign	SAML authentication requests are not signed.
Sign	SAML authentication requests are signed.

6. In the **Encrypt SAML Assertions** field, select one of the following options:

Option	Description
Do not encrypt	SAML assertions are not encrypted.
Encrypt	SAML assertions are encrypted.

Note: The **Encrypt SAML Assertions** option is automatically enabled when you click the **Validate SAML Settings** button when the following conditions are met:

- You have selected the **Sign** option in the **Sign authentication requests** field.
- You have selected the **Do not encrypt** option in the **Encrypt SAML Assertions** field.

7. Optional: Enter the **Public key** and **Private key** values.

- Public key: Specifies the SAML IdP X.509 format certificate.
- Private key: Specifies the private key generated for signing SAML authentication requests and/or encrypting SAML assertions for the Control Room.

Note: Enter keys only if you require signed SAML authentication requests and/or encrypted SAML assertions.

Refer to the following article for generating public and private key pair for signing SAML authentication requests and/or encrypting SAML assertions for Control Room: [How to generate signing certificate public and private keys to sign SAML authentication request](#).

8. Click **Validate SAML Settings**.

The Control Room will log in through the SAML IdP and redirect back to the **Control Room User Authentication** section on the settings page.

When you click this option, you will be redirected to a SAML 2.0 IdP webpage where you will be prompted to enter your SAML SSO user credentials and other applicable data.

9. Log in to your SAML IdP when prompted.
10. Click **Save changes**.
The Control Room authentication is switched to SAML SSO.

Related tasks

[Configure Control Room as a service provider](#) on page 1313

A valid SAML IdP setup must be configured before the Control Room can be switched to a SAML-authentication environment.

Configure SSO authentication with Okta

To log in after SAML integration, configure single sign-on (SSO) authentication with Okta as identity provider (IDP).

Note: Okta is a third party and might update their user interface (UI) anytime. Hence, the Okta UI references and images here are indicative and meant only for basic guidance.

Ensure that the following requirements are fulfilled:

- The Control Room is a secure environment.
- A secure Automation 360 Cloud tenant is used.

1. Create a user in Okta and an admin account in Automation 360.

Note: The user must be created with the same User ID, , First Name, Last Name, and Email Address. You might need to use email address for User ID. During testing, only email address is allowed in Okta.

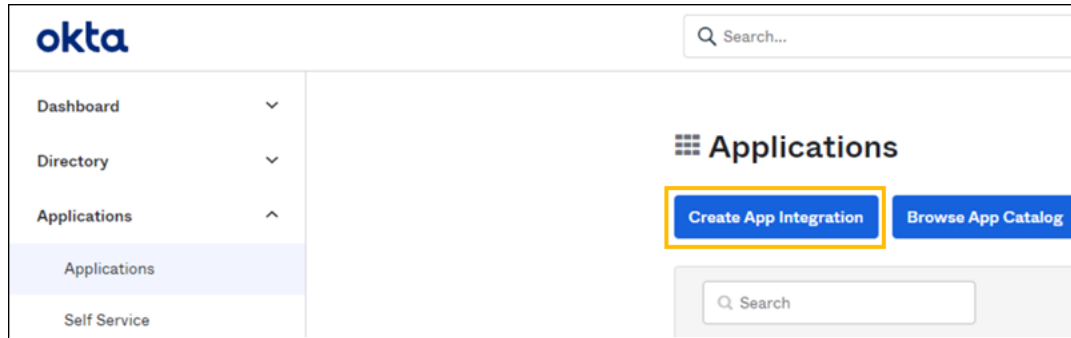

2. Generate an SSL certificate with private and public keys.
These keys are required to encrypt the communication between Okta and Automation 360.
3. [Create app integration](#) on page 1332.
4. [Assign application to the user](#).
5. [Configure the Control Room](#) .
6. [Validate the connection](#).

Create app integration

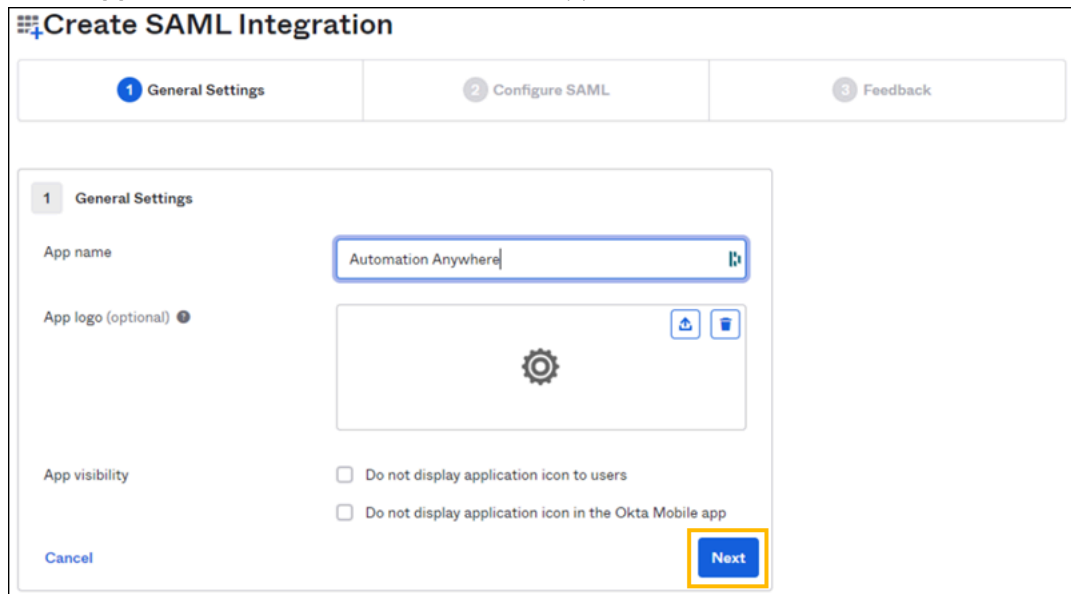

Configure Okta on a system before you import users and perform other setup tasks. Create SAML integration in Okta and set the advanced settings and attributes.

When you import users, ensure that they have a matching user ID, email address, first name, and last name in both Automation 360 and Okta to log in after the SAML integration.

1. In Okta, navigate to **Applications** and click **Create App Integration**.

2. Select the **SAML 2.0** sign-in method and click **Next**.
3. In the **App name** field, enter the name of the app and click **Next**.

4. Enter the **Single sign-on URL**.
It is the Assertion URL on the Control Room in the <CRURL>/v1/authentication/saml/assertion format.
5. Enter the **Audience URI**.
This can be any word or phrase (no spaces). Make note of this term to use in the Control Room configuration.
6. Click **Show Advanced Settings**.
7. In the **Advanced Settings** section, select the **Assertion Encryption** as **Encrypted**.
8. For **Encryption Certificate**, click **Browse files** and select the public key certificate that you generated.

[Hide Advanced Settings](#)

[Assign application to user](#) on page 1336

Assign application to user

After the application is created, assign it to the user.

1. In Okta, navigate to the **Applications > Assignments** tab.
2. Click **Assign** and select **Assign to People**.

3. Click the **Assign** link that is next to the required user and confirm the assignment, and then click **Done**.

[Configure Control Room for Okta user](#) on page 1337

Configure Control Room for Okta user

After the application is assigned to the user, configure the Control Room for a user assigned in Okta.

1. Log in to the Control Room as the same user configured in Okta (User ID as Email address on both systems).
2. Navigate to **Administration > Settings > User authentication**.
3. Select **Use SAML**.

Note: **Use Control Room database** is selected by default.

4. In the **Unique Entity ID for Control Room (Service Provider)** field, enter the entity ID.
5. In the **Encrypt SAML Assertions** field, select one of the following options:

Option	Description
Do not encrypt	SAML assertions are not encrypted.
Encrypt	SAML assertions are encrypted.

6. Optional: Enter the **Public key** and **Private key** values.

Note: Enter the keys only if you require encrypted SAML assertions.

[Validate the connection](#) on page 1337

Validate the connection

After the Control Room is configured, validate the SAML settings.

1. Click **Validate SAML Settings**.
The Control Room will log in through the SAML provider and redirect back to the **Control Room User Authentication** page.
When you click this option, you are redirected to a SAML 2.0 service provider web page where you are prompted to enter the credentials and other data.
2. Log in to Okta when prompted and click **Save changes**.

Edit profile

Manage user profiles.

For users of Control Room configured with a non-directory environment, change the password, first name, last name, and email address.

1. Click the Device icon and select **Update credentials**.
In the Control Room panel, click your username and select the **My settings** link.
2. In the **Device login credentials** section, enter the **Username** and **Password** for the device.
In the **My profile** section, click **Edit**.
Device login credentials are required to run a bot from this device.

Note: Automation 360 does not validate the device login credentials until you run a bot.

If your username is part of a domain, include the domain within the format `domain\username`. Typically, home users are not part of a domain, unless they are specifically configured.

If your username contains non-ASCII characters, ensure your system locale settings are configured to use these characters.

[Configuring post-installation settings](#) on page 1258

3. Enter information for general details, contact info and change password.
4. Click **Update**
Save the changes.

Installed Control Room directories and files

When installing the Automation Anywhere Control Room on different operating systems, the installer executes and installs files and folders in the following directories.

Window OS directory structure

When you install the Automation Anywhere Control Room on Windows OS, the default installation directory for many configuration files is located:

`C:\Program Files\Automation Anywhere\`

Linux OS directory structure

When you install the Automation Anywhere Control Room on Linux OS, the installer creates the following directories.

Directory path	Description	Comments
<code>/opt/automationanywhere/automation360</code>	All binary files	
<code>/opt/automationanywhere/automation360/config</code>	Config files	
<code>/var/log/automationanywhere/automation360</code>	Log files	
<code>/tmp</code>	Temporary files	Directory that contains temporary files created by the system and users. Files under this directory are deleted when the system is rebooted.

Directory path	Description	Comments
/opt/automationanywhere/ automation360/appdata/Server Files	Server files	Control Room repository folder.
/opt/automationanywhere/ automation360/_Automation 360_installation/Logs	Installer logs	Installation logs provide details about issues during installation, if any.

Configuration files

Note: Automation 360 supports UTF-8 file encoding type. When you edit or create any Bot Agent or Control Room configuration file, ensure to use UTF-8 file encoding type.

The minimum installed configuration files include:

- Installation license keys - Request the installer and appropriate license keys from your account manager.
- Bot Creator schedules configuration files
 - Log file name: `logging.properties`
 - Log file location: `<install_location>\config`
- Auto-login configuration files
 - Configuration file name: `autologinhelper-logging.xml`
 - Configuration file location: `C:\Program Files\Automation Anywhere\Bot Agent\config`
- Device configuration files
 - Configuration file name: `settings.properties`
 - Configuration file location: `<install_location>\config`
- Database configuration files

The database connection string is configured in:

- Configuration file name: `boot.db.properties`
- Configuration file location: `<installation_location>\config`

Additional configuration files that are created as needed, include:

- Cluster configuration
 - Configuration file name: `cluster.properties`
 - Configuration file location: `<installation_location>\config\`
- Key distribution center (KDC)
 - Configuration file name: `um.properties`
 - Configuration file location: `<installation_location>\config\`

- Parallel repository tuning
 - Configuration file name: `boot.server.properties`
 - Configuration file location: `<installation_location>\config\`
- Remote Desktop Protocol (RDP)
 - Configuration file name: `deployment.properties`
 - Configuration file location: `<installation_location>\config\`
- URL resources
 - Configuration file name: `DWMP_CONNECTIONS.properties`
 - Configuration file location: `<installation_location>\DWAService\bin\src\main\resources`
- Trusted list restrictions
 - Configuration file name: `repository.properties`
 - Configuration file location: `<installation_location>\config\`
- Workload management
 - Configuration file name: `wlm.properties`
 - Configuration file location: `<installation_location>\config`

Control Room fail-safe status

The Control Room connects to the Automation Anywhere Cloud license server and obtains license entitlements based on the license key that is installed on the Control Room.

A Control Room can enter the fail-safe mode in one of the following scenarios:

1. When the Control Room cannot connect to the license server, it moves into the fail-safe status.
2. When the licenses are oversubscribed on the Control Room, the Control Room moves into the fail-safe status.

With respect to the Control Room license server database, the Control Room is in one of three states. These states indicate what user licensing actions can be performed. With each state change, an entry is made in the audit log.

Active

Normal operations. All API calls from the Control Room are accepted by the license server.

Users can be assigned floating licenses as they log on. Floating licenses can be released as users log off.

When the Control Room is restarted and operational, and connectivity to the license

server is established, the Control Room is in the Active state:

- Users who had licenses assigned prior to the fail-safe have their original licenses reallocated.
- New users can request for and be allocated licenses.

Fail-safe

Only the heartbeat API call is allowed to the license server. All other calls from the Control Room are stopped.

- Fail-safe entry threshold: If the license does not receive the heartbeat from the Control Room for 48 hours, then the license server considers that the Control Room is running in the fail-safe mode. This 48-hour period is called the fail-safe entry threshold.

Fail-safe-expired

The Control Room stops all operations, and all users are logged out of the Control Room.

- Fail-safe expiry threshold: After the license server moves a Control Room into fail-safe mode, it waits up to 30 days to reinstate the license. After 30 days, the status is changed to **Suspended**, and you need to connect to technical support to restore the Control Room to fail-safe mode.

	Fail-safe entry		Fail-safe expiry	
	Due to loss of connectivity	Due to license overconsumption	Due to loss of connectivity	Due to license overconsumption
Days	Two days after loss of connectivity	Two days after overconsumption	30 days from fail-safe entry	30 days from fail-safe entry
Reason	Loss of connectivity/ license server down	License overconsumption. If user licenses are consumed more than allocated, the Control Room displays a message showing the overconsumption.	Loss of connectivity/ license server down	License overconsumption. (Consumption is more than purchased license count.)

	Fail-safe entry		Fail-safe expiry	
	Due to loss of connectivity	Due to license overconsumption	Due to loss of connectivity	Due to license overconsumption
Remedy	Restore connection	Release overconsumed license and sync license with LS or renew the licenses overconsumed. <ul style="list-style-type: none"> You can remove the extra licenses associated with users and resync with the license server by clicking Sync license from server. 	Restore connection	<ol style="list-style-type: none"> 1. Renew the overconsumed license. 2. Raise support ticket to restore fail-safe entry, and then release the overconsumed license and sync data with license server.

	Fail-safe entry		Fail-safe expiry	
	Due to loss of connectivity	Due to license overconsumption	Due to loss of connectivity	Due to license overconsumption
Possible operations	<ol style="list-style-type: none"> 1. Only license allocation and deallocation is allowed. The data is later synced when connectivity is restored. 2. Both admin and non-admin users are able to log in. 3. Banner is shown when you log in, along with error message on the license page. 4. RPA operations continue normally. 	<ol style="list-style-type: none"> 1. All license operations are allowed 2. Both admin and non-admin users are able to log in 3. Banner is shown when you log in along with error on license page, along with license overconsumption error on license page. 4. RPA operations continue normally. 	<ol style="list-style-type: none"> 1. Only admin user can log in. Non-admin users cannot log in. 2. No license operations are allowed 3. Banner is shown when you log in along with error message on license page. 4. RPA operations cannot continue. 	<ol style="list-style-type: none"> 1. Admin can log in and install licenses. 2. No license operations are allowed 3. Banner is shown last day before the Control Room shuts down along with overconsumption error on license page 4. RPA operations cannot continue.
Notifications		After the initial 48 hours, you will see a banner in your Control Room with a message about the overconsumption.		On the 30th day, you will see the banner with a red background and a post that the user will not be able to log in. After the 30th day, you will not be able to use the Control Room.

Related concepts

[Licenses and cloud services](#) on page 1344

The Licenses and Cloud Services portal enables you to manage the licenses, Cloud Control Room instances, and cloud RPA services linked to your account. As an Automation Anywhere customer

or partner, and an RPA, Control Room, or IT administrator, you need to manage your entire IT asset framework efficiently to realize the value of your investments.

Related reference

[Automation 360 licenses](#) on page 1347

The **All Licenses** page displays detailed information about current product and device licenses.

[Control Room license expiry notifications](#) on page 1361

The Automation Anywhere Control Room license expiry notifications appear when the Control Room license is about to expire.

Licenses and cloud services

The Licenses and Cloud Services portal enables you to manage the licenses, Cloud Control Room instances, and cloud RPA services linked to your account. As an Automation Anywhere customer or partner, and an RPA, Control Room, or IT administrator, you need to manage your entire IT asset framework efficiently to realize the value of your investments.

The main functionalities provided by the Licenses and Cloud Services portal are license management and cloud services management for customers and partners.

Customers can perform the following tasks through this portal:

- Provision and manage their cloud services.
- Get details about the globally unique identifiers (GUIDs) of the licenses served from the license cloud.
- Configure and download their license files (where applicable).

Partners can perform the following tasks through this portal:

- Provision and manage their cloud services and their customers' cloud services.
- Get details about their own and their customers' cloud license GUIDs served from the license cloud.
- Configure and download license files for themselves and their customers.

Overview

To efficiently use and manage their environments, IT and RPA administrators require visibility into license entitlements and a real-time view of available and used licenses. Also, these administrators require visibility into the purchased cloud services and service instances to efficiently manage the RPA requirements of their organizations. The portal helps these users gather this data and view and manage licenses and cloud services.

Accessing the portal

You can access the Licenses and Cloud Services portal on the A-People site. You must have an account on A-People, and you must be assigned as a designated portal user as part of the sales process.

1. Log in to A-People using your login credentials: [A-People home page \(login required\)](#)
2. Click the **License and Cloud Services** tab.

Alternatively, navigate directly to this page by clicking the link provided in the welcome email.

License management

You can manage the following types of product licenses through the Licenses and Cloud Services portal:

Cloud licenses

Software license entitlements that are distributed and governed by the Automation Anywhere cloud license server. The Control Room connects to the Automation Anywhere cloud license server and obtains license entitlements based on the license key that is installed on the Control Room.

The license key is in the form of a GUID and is made available on the portal. Automation 360 Cloud and On-Premises Control Room instances that have access to the cloud license server can use the cloud licenses.

File licenses

File licenses are mainly used for Automation Anywhere Enterprise 11 and Enterprise 10 versions and for some Automation 360 On-Premises Control Room deployments. One license file per Control Room can be generated from the portal and manually installed on the Control Room.

Customers and partners can perform the following tasks related to licenses:

- View all the license entitlements and get details of purchased and available licenses and subscription terms (license start and end dates).
- Configure and download the license files as needed.
- View all the license entitlements and get details of GUIDs for cloud licenses.
- As a partner, you can view and manage license entitlements for your company as well as for your end customers.

Cloud services management

Use the Licenses and Cloud Services portal to manage the following types of Cloud Control Room services:

- Pure Cloud Control Room
- Pure Cloud Sandbox Control Room
- Cloud-enabled Control Room
- Cloud-enabled Sandbox Control Room
- Cloud Control Room Migration

Pure Cloud Control Room and pure Cloud Sandbox Control Room instances have to be explicitly provisioned by the Customer License User (CLU) on demand when the customer is ready for consuming the cloud service.

Cloud-enabled Control Room and Cloud-enabled Sandbox Control Room instances are automatically provisioned by the Licenses and Cloud Services portal, providing the CLU user with a token required to install the Cloud-enabled Control Room on their infrastructure.

Customers and partners can perform the following tasks related to cloud services:

- View an inventory of all the Cloud Control Room subscribed services, with a visual display of configuration parameters associated with the cloud service.
- Perform on-demand provisioning of cloud services, such as Cloud Control Room and IQ Bot. This helps in real-time provisioning of your services.
- Access and manage ordered Control Room services.
- Migrate production and QA Control Room services.

Managing Cloud and file licenses

The Licenses and Cloud Services portal includes the following main tabs: Manage File Licenses, Manage Cloud Licenses, Cloud Control Room Instances, and Partner Drawdowns.

Manage Cloud Licenses

The tab provides customers and partners visibility into all Cloud-based license entitlements and the license keys (GUID) to be applied to all customer Control Room instances.

For Automation 360 On-Premises, a designated user can obtain the Control Room GUID from this tab and paste it into their respective Control Room instance. Please refer to [Installing additional licenses](#) on page 1725.

Note: For first-time Automation 360 Cloud customers, this tab is only informational because when a Cloud Control Room is provisioned for the first time, the GUID is already applied to their Control Room instance.

Manage File Licenses

The **Manage File Licenses** tab provides customers and partners the visibility to all file-based license entitlements available. Designated license users can configure a license file for each of their Control Room instances with the necessary entitlements. Please refer to [Manage licenses](#) on page 1720 and [Installing additional licenses](#) on page 1725 for more information.

The steps below offer guidance to the licensing process for Automation 360 and Enterprise 11.

1. In the Control Room list view, click the Control Room name available as a hyperlink.
The hyperlink redirects you to the license configuration page, where you can select the entitlements you want to add to the Control Room and save and generate a license file.

Note: The portal takes a few minutes to generate the file.

2. Use the **Refresh** option to see whether the license file is generated.
After the Control Room status changes to **Active**, you can click the Control Room name again and download the file.
3. Based on your business requirements, reconfigure license files at any point of time from the same tab.

You can only configure entitlements that are in **Available** status. If all the entitlements are used in your license files, you need to reconfigure a file to release entitlements and make them available to be added to a different license file.

Please refer to these videos for more information:

For partners, the page displays an additional drop-down list, which enables you to switch context between multiple customers that you are managing. The page provides a similar view, with an additional drop-down list, which enables partners to switch the context between various customer entitlements.

Automation 360 licenses

The **All Licenses** page displays detailed information about current product and device licenses.

Product licenses

The Automation Anywhere Control Room is the web-based application at the center of the Digital Workforce providing enterprise-wide management and control. The Control Room ensures reliable, scalable, and secure bot deployment and execution. From this central vantage point, operators can receive tasks from the Bot Creator and push to the Bot Runners for execution with simple mouse clicks. The Control Room monitors and audits all scheduled and running bots, in real time.

The Control Room provides an automated mechanism for tracking and controlling the use of licensed software across Bot Creators and Bot Runners, addressing NIST Change Management CM-10.

Device licenses

The device licenses section shows the number of licenses purchased, used, and available. If the licenses are added to the Control Room from the Cloud, the Licenses page also shows the number of pages processed in other Control Room instances.

License	Permission
Bot Creator	<p>Users with this license can create, edit, schedule, and trigger bots. Additionally, these users can run bots in the following ways:</p> <ul style="list-style-type: none"> • On their local machine • From the public workspace if the Control Room administrator has specified a Run as user for unattended Bot Runner

License	Permission
Unattended Bot Runner Run-time license	<p>Users with this license can perform all automation tasks that attended users can perform. Additionally, this license can also be used for Automation Anywhere Control Room deployment, centralized scheduling, and API-based deployment.</p> <hr/> <p>Note: Among all the triggers, you can associate any trigger only with a user who has a Bot Runner license. Also, for a user with unattended Bot Runner license, if you associate triggers such as Hot key, Interface, or Window, the following conditions apply:</p> <ul style="list-style-type: none"> • The default device must not be in the logged-off or locked state. • The user must be logged in to the device to perform the predefined task that can trigger the bot. <hr/>
Attended Bot Runner Run-time license	Users with this license can run bots on their devices. However, these users cannot run or schedule bots on another device.
Citizen Developer license	<p>Users with this license can create and run bots (including bots with triggers) on their devices.</p> <p>Create a Citizen Developer role on page 1703</p>
IQ Bot pages (Number of pages)	This license is required for uploading documents to Automation 360 IQ Bot.
Standard Forms pages (Number of pages)	This license is required for uploading documents for processing in Standard Forms.
Google Document AI (Number of pages)	<p>Enables Document Automation users to process documents in Google Document AI.</p> <hr/> <p>Note: This metric is visible only to customers who purchased Google Document AI licenses through Automation Anywhere.</p> <hr/>
Document Automation Standard Forms (Number of pages)	This license is required for processing documents in standard forms in Document Automation.
Document Automation 360 Extraction (Number of pages)	This license is for processes documents in an Automation Anywhere (Pre-trained) model, including the User-defined document type.
Document Workspace (Number of pages)	This license tracks consumption for customers who brought their own license for Google Document AI or Standard Forms.
Classifier (Number of pages)	This license can be used to classify documents and pages leveraging the IQ Bot Classifier package.

License	Permission
Bot Insight	Bot Insight provides real-time, RPA native analytics for both business insights and operational intelligence. The Bot Insight license is purchased on a per-user basis. To access the Business dashboard, the user must be assigned this license.
AARI (Automation Co-Pilot)	Users with the AARI license can be added to a Team for Process Composer consumption. This allows them to create requests and submit tasks within Automation Co-Pilot.
Discovery Bot	Process Discovery licenses must be purchased for use for business analysts and business users using Discovery Bot. Discovery Bot supports two licenses. The business analyst uses the process analyzer license to view and manage the metadata from all recordings within the process. The business user uses the process recorder license to view, record, and submit a process using the Discovery Bot recorder.

RBAC on License Management

Access to License Management is deny-all and allow by exception based on roles and domains as defined in RBAC. Only those users who have access to License Management permission can view the entitlement details from the Automation Anywhere Control Room.

Baseline inventory controls: Bot Creators, Bot Runners, and Bots

The Automation Anywhere Control Room manages all automation operations. Inventory controls are maintained through the application of RBAC to establish a single point of control for Base Line Configurations (NIST CM-2), access restrictions for configuration management (NIST CM-5 and 6). Automated baseline reporting can be configured.

Licensing in high availability and disaster recovery

The license information that is centrally stored in the database or license cloud, is shared within High Availability clusters and across Disaster Recovery sites because synchronous data replication is configured between multiple Control Room servers.

[HA and DR deployment models](#) on page 1174

Related tasks

[Installing additional licenses](#) on page 1725

Upload new licenses to the Automation Anywhere Control Room to be distributed to users as required.

Related reference

[Control Room license expiry notifications](#) on page 1361

The Automation Anywhere Control Room license expiry notifications appear when the Control Room license is about to expire.

Accessing Automation 360

Any new customer who orders our products receive license confirmation from Automation Anywhere.

The designated person responsible for configuring licenses for their company receives two email confirmations.

The SSO email from sso@automationanywhere.com grants you access to set up a new password for your Automation Anywhere Single Sign-On (SSO) account. The Orders email from orders@automationanywhere.com grants you access to your license entitlement information.

Do the following:

1. Open SSO email → access link.
2. Enter and confirm new password.
3. Access **A-People Community**.
4. There are two options to access your license entitlements.

Option	Action
A-People	Navigate to LICENSES .
Orders email	Access link to redirect to license page.

Note: Your license entitlement validation date is provided within the context of the Orders email and on the A-People License configuration page.

5. You now have access to your license entitlements.

On this page, you have access to more information of your order. The **Product Versions** shows your current license entitlement version, the **License Entitlements** shows the number of license entitlements in your order, and the **Control Rooms** shows the number of control rooms in your order, and allows to configure each licenses.

Understanding licenses in Document Automation

This topic describes Document Automation device licenses and associated permissions.

To obtain specific Document Automation licenses, contact your sales representative or Customer Success Manager.

Note:

- Document Workspace is available to customers from Automation 360 v.28 onwards.
- If you are leveraging BYOK (bring your own key), we recommend that you update to Document Automation v.28 or later.

The following table describes the different licenses for the Document Automation platform and Document Automation Classifier:

Licenses	Descriptions
Document Automation Platform	

Licenses	Descriptions
IQ Bot#pages (Up to X number of pages a year)	<p>Process documents in Document Automation via Automation 360 IQ Bot learning instances by using the Connect learning instance capability. This capability will only count pages that have been processed against the consumption.</p> <hr/> <p>Note: For more consumption details for Automation 360 IQ Bot, see Review the dashboard on page 3601.</p> <hr/>
Google Document AI#for Document Automation (Up to X number of documents a year)	<p>Process invoices, utility bills, or expense receipts using the Google Document AI engine. For example, 10 pages = 1 document</p>
Document Automation (Up to X number of pages a year)	<p>Process documents usingAutomation Anywhere#pre-trained models (invoice, arrival notice, bill of lading, packing list, and waybill), including the User-defined document type for semi-structured and unstructured documents.</p>
Standard Forms for Document Automation (Up to X number of pages a year)	<p>Process documents using the Standard Forms engine inDocument Automation for fixed/structured forms.</p>
Document Workspace (Number of pages)	<p>Process documents using own license (BYOK set-up) forGoogle Document AI,Standard Forms, or Google Custom Document Extractor (CDE).</p>
Document Automation Document Classifier	
Document Classifier (Up to X number of pages a year)	<p>Classify documents and pages, leveraging the Document Classifier package.</p> <p>Classify documents and pages, leveraging the Document Classifier package and tracks consumption on the license administration page for processed documents (number of pages) in the Document Classifier package.</p> <ul style="list-style-type: none"> • For a document of 30 pages, the Classify action decrements it by 30 pages. • For a document of 30 pages, the Classify documents action decrements it by 1 document. • The Train Classifier action does not consume any pages. <hr/> <p>Note: This consumption of processed documents (number of pages) in the Document Classifier package is available from Document Automation v.30 onwards.</p> <hr/>

Licenses	Descriptions
Advanced Classifier	Classify documents and pages, leveraging the Advanced Classifier package. A valid Skillja (3rd Party provider) license is mandatory for utilizing the Advanced Classifier package.

Monitor license consumption and availability

The **Manage > Licenses** page displays the number of product licenses purchased, used, and remaining for each product for the current license period. If your device is connected to the Internet, your Control Room instance receives updated counts every hour.

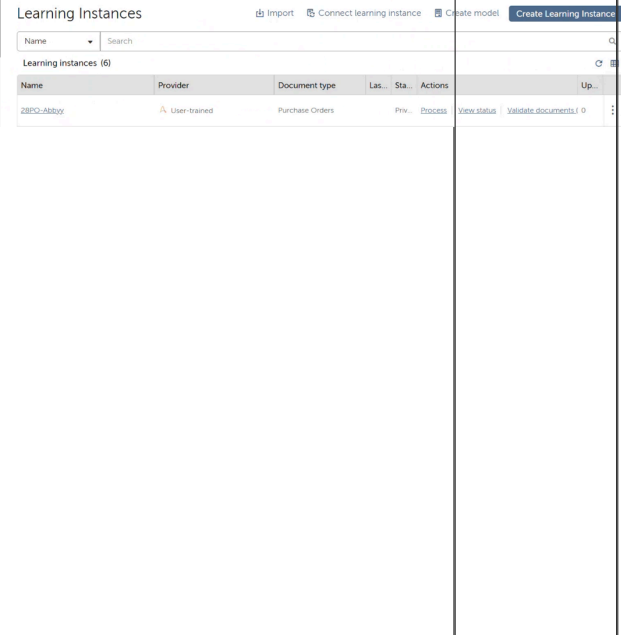

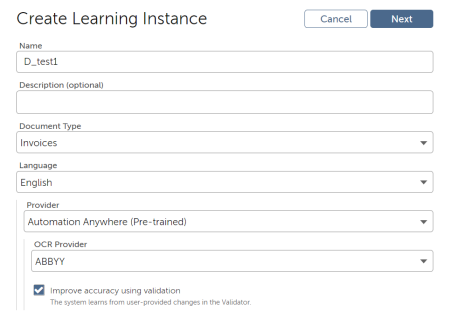

You will receive notifications for your license consumption when the following criteria are met:

- When 90% of your licenses are consumed
- When 95% of your licenses are consumed
- When 99% of your licenses are consumed
- When 100% of your licenses are consumed

Note: When your license consumption is 100%, notifications are sent every week until you have purchased additional licenses.

You will receive notifications depending on the type of events that you have enabled. For more information, see [Enable or disable event categories](#) on page 2131.

The following table describes how licenses are consumed based on different document types:

Type	Provider	Related Learning Instance	Is BYOK applicable?	License entity consumption
Contract, Health Insurance, Invoices, Purchase Orders, Other, and so on.	User-Trained	Document Automation > IQ Bot Connected Learning Instances 	No	IQ Bot (Number of pages) Note: You can track IQ Bot consumption by leveraging the IQ Bot Dashboard . This license is consumed only for Document Automation > IQ Bot Connected Learning Instances .
Invoices	Automation Anywhere (Pre-trained)	Create Learning Instance 	No	Document Automation 360 Extraction (Number of pages)

Type	Provider	Related Learning Instance	Is BYOK applicable?	License entity consumption
Invoices	Google Document AI	<div style="border: 1px solid #ccc; padding: 5px;"> <p style="text-align: right;">Create Learning Instance Cancel Next</p> <p>Name <input type="text" value="D_test2"/></p> <p>Description (optional) <input type="text"/></p> <p>Document Type <input type="text" value="Invoices"/></p> <p>Language <input type="text" value="English"/></p> <p>Provider <input type="text" value="Google Document AI"/></p> <p><small>Google Document AI can extract documents in other languages besides the language you selected above.</small></p> </div>	Yes	Google Document AI#(Number of documents) <hr/> Note: If using BYOK, the applicable license entity is Document Workspace (Number of pages).
Receipts	Google Document AI	<div style="border: 1px solid #ccc; padding: 5px;"> <p style="text-align: right;">Create Learning Instance Cancel Next</p> <p>Name <input type="text" value="D_test3"/></p> <p>Description (optional) <input type="text"/></p> <p>Document Type <input type="text" value="Receipts"/></p> <p>Language <input type="text" value="English"/></p> <p>Provider <input type="text" value="Google Document AI"/></p> <p><small>Google Document AI can extract documents in other languages besides the language you selected above.</small></p> </div>	Yes	Google Document AI#(Number of documents) <hr/> Note: If using BYOK, the applicable license entity is Document Workspace (Number of pages).

Type	Provider	Related Learning Instance	Is BYOK applicable?	License entity consumption
Standard Forms	Microsoft Forms Recognizer	<p>Create Learning Instance Cancel Next</p> <p>Name D_test4</p> <p>Description (optional)</p> <p>Document Type Standard Forms</p> <p>Language English</p> <p>Provider Microsoft Forms Recognizer</p> <p>Model Browse...</p>	Yes	<p>Document Automation Standard Forms (Number of pages)</p> <hr/> <p>Note: If using BYOK, the applicable license entity is Document Workspace (Number of pages).</p>
User-defined	Automation Anywhere (User-defined)	<p>Create Learning Instance Cancel Next</p> <p>Name D_test5</p> <p>Description (optional)</p> <p>Document Type User-defined</p> <p>Language English</p> <p>Provider Automation Anywhere (User-defined)</p> <p>OCR Provider ABBYY</p> <p><input checked="" type="checkbox"/> Improve accuracy using validation <small>The system learns from user-provided changes in the validation.</small></p>	No	<p>Document Automation 360 Extraction (Number of pages)</p>
User-defined	Google Document AI (User-defined)	<p>Create Learning Instance Cancel Next</p> <p>Name D_test7</p> <p>Description (optional)</p> <p>Document Type User-defined</p> <p>Language English</p> <p>Locale English (United States)</p> <p>Provider Google Document AI (User-defined)</p>	Yes	<p>The applicable license entity is Document Workspace (Number of pages).</p> <hr/> <p>Note: In addition, you need a valid subscription to Document AI workbench.</p>

Type	Provider	Related Learning Instance	Is BYOK applicable?	License entity consumption
Utility Bill	Google Document AI	<p>Create Learning Instance Cancel Next</p> <p>Name D_test6</p> <p>Description (optional)</p> <p>Document Type Utility Bill</p> <p>Language English</p> <p>Provider Google Document AI</p> <p><small>Google Document AI can extract documents in other languages besides the language you selected above.</small></p>	Yes	<p>Google Document AI#(Number of documents)</p> <hr/> <p>Note: If using BYOK, the applicable license entity is Document Workspace (Number of pages).</p>

Type	Related package	Is BYOK applicable?	License entity consumed								
All document types	<p>Selected package details</p> <table border="1"> <tr> <td>Name IQ Bot Classifier</td> <td>Description Provides actions to perform training and classification of documents.</td> <td>Version 2.4.5-20230406-070414</td> <td>Status Disabled</td> </tr> <tr> <td>Vendor Unspecified</td> <td>Recommended bot agent version 21.98 or above</td> <td>Recommended Control Room version 10520 or above</td> <td></td> </tr> </table> <p>Actions (3)</p> <ul style="list-style-type: none"> > Classify > Classify Document > Train Classifier 	Name IQ Bot Classifier	Description Provides actions to perform training and classification of documents. Name IQ Bot Classifier	Description Provides actions to perform training and classification of documents.	Version 2.4.5-20230406-070414	Status Disabled								
Vendor Unspecified	Recommended bot agent version 21.98 or above	Recommended Control Room version 10520 or above									

Note:

- If you have an invalid license, the following error message is displayed:
License expired or not available. Obtain the necessary license.
- The BYOK (bring your own key) refers to using your own license key for third party providers.

Provision Cloud Control Room instances

You can access, view, provision, and edit all the purchased Cloud Control Room instances. If required, you can also purchase and provision the IQ Bot services later.

Use the Licenses and Cloud Services portal to provision Cloud Control Room and Cloud sandbox Control Room instances on demand. Cloud-enabled Control Room instances are automatically provisioned by the portal.

Customers can provision their own Cloud Control Room instances, and partner users can provision Cloud Control Room for themselves and their customers.

1. Log in to A-People using your login credentials: [A-People home page \(login required\)](#).
2. Click the **Licenses and Cloud Services** tab.
3. On the navigation pane on the left side, click the **Cloud Control Rooms Instances** tab to display a list of provisioned and unprovisioned Cloud Control Room instances for the different types of Cloud Control Room instances.

The inventory view displays the different parameters about provisioned Cloud Control Room instances, such as domain name, Control Room URL, and the region from where the Control Room is hosted. Use the region name to subscribe to maintenance notifications on `status.automationanywhere.digital`.

4. In the **Control Room Name** field, enter a name.
5. In the **Cloud Control Room Domain Name** field, enter a domain name.

The domain name must be a unique name that will be part of your Cloud Control Room URL. The portal checks and validates the uniqueness of the domain name across the system.

Consider the following examples for domain names:

- Example URL for Cloud Control Room: `https://<domain-name>.my.automationanywhere.digital`
- Example URL for Cloud sandbox Control Room: `https://<domain-name>.cloud#.automationanywhere.digital`

Note: After provisioning is done, the domain name for a Cloud Control Room cannot be changed.

6. Select an **Environment** option.
The options are **Production**, **Development**, and **UAT**. By default, for sandbox Control Room, only the sandbox option is displayed here.
7. Select the **Country** from where most of your users will access this Control Room.
Based on the country you select, your Cloud Control Room will be hosted from a region that is nearest.

Note: After provisioning is done, the **Country** for the Cloud Control Room cannot be changed.

8. Select and specify the Cloud Control Room administrator.
You can either select from existing customer contacts or create one. If you are creating a user, enter details such as first name, last name, and email address.
9. Optional: If your account is entitled for IQ Bot service, you can register for IQ Bot by selecting the check box.
10. Click **Save** to provision the Cloud Control Room instance.

The Cloud Control Room instance is automatically provisioned, and the Control Room status changes from **Provision** to **Provisioning in-Progress**. Provisioning takes some time to complete. When provisioning is complete, the status changes to **Provisioning Complete**.

Self-service Control Room Migration

Manage the migration provisioning process with self migration capabilities and the flexibility to choose manual or automated migration.

To perform the task, you must have a administrator account with the required rights and permissions.

Complete the Cloud Migration Control Room setup before provisioning an IQ Bot server with the Control Room, if proper entitlement is licensed.

Note: Migration is currently not supported on GCP.

1. Log in to A-People using your login credentials: [A-People home page \(login required\)](#).
2. Click the **Licenses and Cloud Services** tab.
3. On the navigation pane on the left side, click the **Cloud Control Rooms Instances** tab to display a list of provisioned and unprovisioned Cloud Control Room instances for the different types of Cloud Control Room instances.

The inventory view displays the different parameters about provisioned Cloud Control Room instances, such as domain name, Control Room URL, and the region from where the Control Room is hosted. Use the region name to subscribe to maintenance notifications on status.automationanywhere.digital.

4. In the **Control Room Name** field, enter a name.
5. Select the type of migration.
 - Automation Migration with Migration Utility. For more information, see [Install Cloud Migration Utility](#) on page 1493.
 - Manual Migration. You will get a new Cloud Control Room to work with.

6. In the **Cloud Control Room Domain Name** field, enter a domain name.

The domain name must be a unique name that will be part of your Cloud Control Room URL. The portal checks and validates the uniqueness of the domain name across the system. Consider the following examples for domain names:

Example URL for pure Cloud Control Room: <https://<domain-name>.my.automationanywhere.digital>

Example URL for pure Cloud Sandbox Control Room: <https://<domain-name>.cloud#.automationanywhere.digital>

7. Select an **Environment** option.

The options are **Production**, **Development**, and **UAT**. By default, for Sandbox Control Room, only the Sandbox option is displayed here.
8. Select the **Country** from where most of your users will access this Control Room.

Based on the country you select, your Cloud Control Room will be hosted from a region that is nearest.

Note: After provisioning is done, the **Country** for the Cloud Control Room cannot be changed.

9. Select you **Region**.

Note: After provisioning is done, the **Region** for the Cloud Control Room cannot be changed.

10. Select and specify the Cloud Control Room administrator.
You can either select from existing customer contacts or create one. If you are creating a user, enter details such as first name, last name, and email address.
11. To generate the migration code, click **Save**.
The **View** tab displays the migration code.
12. Copy the migration code to the **Cloud Migration utility**. This will export and import the data to Cloud.

Note: You can click the **View** tab for the following:

- View the migration code.
- Regenerate the migration code when the code is expired.
- Indicates that the Cloud Control Room is ready for use by displaying the user credentials.
- Displays the status of the Cloud Control Room during the migration process.

Note: During the migration process, you can view the stages of migration: New, Consumed, Expired, Renewed, or Complete.

Viewing the Cloud Migration Control Room Details

In addition to the other details shown for regular Cloud Control Room, this page displays the migration code to being used by the migration utility.

View Cloud Migration Control Room Details

Users who trigger the provisioning and administrators of the Cloud Migration Control Room receive an email with instructions on how to get the migration code, how to install the migration utility, and how to start the migration process.

Here is some additional information regarding this process, related to **Migration Status**, **Migration Code**, and **Migration Code Expiry Date**.

Following are the important details to track from this page for Administrators:

Migration Status	Displays the current status of the migration
Migration Code	The necessary code required to complete the migration process
Migration Code Expiry Date	If the expiry date for the code has lapsed, you must generate a new migration code for application.

Manage and allocate licenses (partners)

Automation Anywhere partners can manage and process Licenses and Cloud services.

Partners can manage their and their customers entitlements from the portal. Partners access the Licenses and Cloud portal in the following ways:

- Purchases Automation Anywhere licenses for their own use.

- Participates in a customer purchases Automation Anywhere licenses through the partner.
- Partner draws down from their own license entitlements and allocates some portion of the entitlements to a customer.

Use the **Select an Account** to switch entitlements via the drop-down list. Partners can view license entitlements, configure licenses (file-based licensing), view Control Room GUIDs (cloud-based licensing), and view and manage provision ready cloud services (Control Room, IQ Bot server).

For information, see [Managing Cloud and file licenses](#) on page 1346.

Assigning a customer and entitlements

To draw down on entitlements and assign to a customer, perform the following tasks.

1. Log in to the A-People portal: [A-People home page \(login required\)](#).
2. Click the **Licenses and Cloud Services** tab, and navigate to the **Partner Draw downs** tab.
An empty page is displayed when you log in for the first time. After a few requests have been processed, this page displays a list of draw-downs that you have processed.
3. To start a new draw-down process, click **New**.
4. From the **New Partner Draw Down Request** page, select an order from the drop-down list.
You can draw down from only one order at a time.
5. Enter the required information in the following fields:
 - **Assign to customer account:** Customer account name
 - **Customer website:** URL to the customer's website
 - **Customer name:** Name of your customer contact
 - **Customer email:** Email address of the customer contact

6. After entering the customer information, generate a partner draw down request (PDR) by specifying a number for each of the products available.

7. Click **Save** to generate a new PDR.

The PDR is in submitted state.

First, generate the PDR, an email notification is sent to your accounts team for approval.

Once the PDR is validated and approved (or rejected), the partner who requested for the PDR will receive an email notification. The PDR requesting partner has to then navigate back to the portal to take appropriate action.

8. After approval, click **Accept**.
After acceptance, the license entitlements from the PDR are transferred from the partner to the customer. If the PDR is rejected, you can see the reason for rejection.

Note: If for any reason the draw down is no longer required, the partner can cancel the request at this point.

9. Clone the PDR if required, make the necessary changes and resubmit the PDR.

Partners can refer to the customer documentation for managing licenses and provisioning cloud services.

- For configuring file licenses, see [Configure new licenses](#).
- For provisioning of cloud services, see [Provision Cloud Control Room instances](#) on page 1356.

The Licenses and Cloud portal provides the partners with an automated way to process draw downs for their customers.

View and edit Cloud Control Room instances

You can get a complete inventory view of all the Cloud Control Room instances and Migration Control Rooms that have been purchased and linked to your account. You can check their provisioning status, which can be Not Provisioned, Provisioning in progress, Provisioning complete, or Provisioning failed. You can provision these instances as and when required.

1. Log in to A-People using your login credentials: [A-People home page \(login required\)](#).
2. Click the **License and Cloud Services** tab to open the Licenses and Cloud Services portal.
3. On the navigation pane on the left side, click the **Cloud Control Rooms Instances** tab to display a list of provisioned and unprovisioned Cloud Control Room instances for the different types of Cloud Control Room instances.

The inventory view displays the different parameters about provisioned Cloud Control Room instances, such as domain name, Control Room URL, and the region from where the Control Room is hosted. Use the Region name to subscribe to any maintenance notifications on status.automationanywhere.digital.

4. Click the **View** option for any of the provisioned Cloud Control Room instances. It opens the page with the details about the Cloud Control Room instances, such as name and domain name, provisioning status, service type (Pure Cloud, Cloud-enabled, Cloud Sandbox, and so on), license GUID, provisioning date, Cloud-enabled token, type of environment in which the instance is deployed, and cloud region where the instance is hosted.
5. Optional: On the displayed page, click **Edit** to change the Cloud Control Room name to a name of your choice.
6. If your account is entitled for an IQ Bot service, register for it by selecting the check box in the displayed page.
7. Click **Save** to apply the changes in the page.

Control Room license expiry notifications

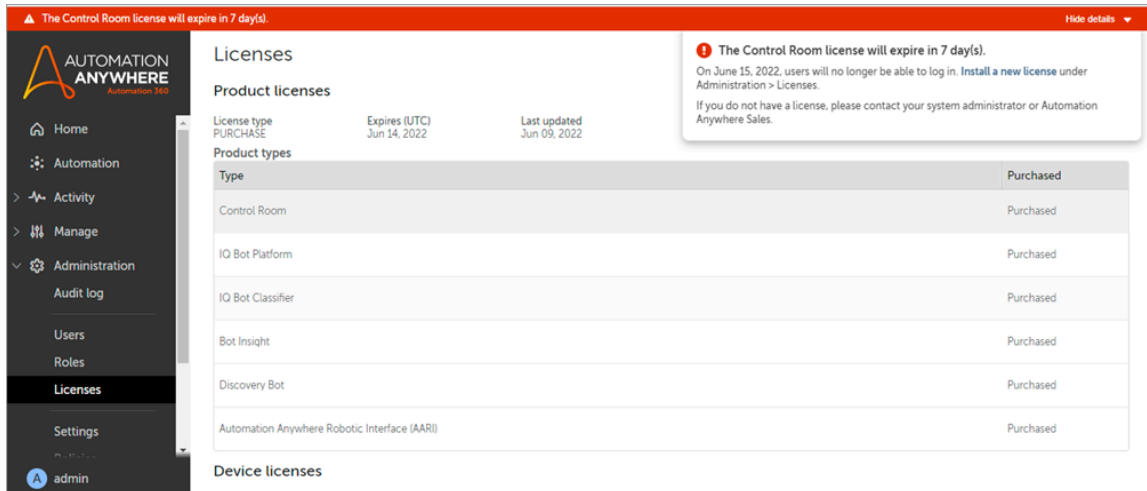

The Automation Anywhere Control Room license expiry notifications appear when the Control Room license is about to expire.

When the Control Room license is about to expire, the administrator sees a visible banner notification on log in to the Control Room. The Control Room checks the license status daily. At 30 days before a license expiration date, a notification message is displayed in the Control Room with the number of days remaining for the license to expire. The banner is displayed every time the administrator logs in to the Control Room during the last 30 days before the Control Room license expiration. The severity of the banner notification becomes critical in the last seven days before Control Room license expiration. As the expiration date approaches, notifications become more persistent at the following countdown intervals:

- 30 days: When a license is within 30 days of expiration, a dismissible notification appears in the Control Room banner and the message is displayed in the banner until the license is renewed or expired.

- 7 days: When the approaching license expiration date is in seven days or less, a red banner appears showing the expiry date and a link to extend the license. This notification appears in the console until the service is extended or the 30-day expiration period elapses.

- 0 days (expired): After the license has expired, you will not be able to use the Control Room. You will see a screen similar to the following with a non-dismissible notification.

Note: In the SSO environment, if the option to install license is not displayed after the license has expired, clear the browser cache and refresh the browser. The install license option becomes visible.

Update Automation 360 to latest version

Update Automation 360 On-Premises to the latest version to get new features and enhancements that help improve and scale your automation programs.

- Before each release update, ensure that you back up the database, repository, and installation configuration files.
- Ensure you are on one of the previous three releases from the latest release (on an $n-3$ release, where n refers to the latest release).

For example, to update to Automation 360 v.21 release, you must be on the v.20, v.19, or v.18 release. However, to update from v.15 to Automation 360 v.21 release, you must first update to v.18 release and then update to Automation 360 v.21 release. In the second scenario, ensure you perform backup of v.15 data before you update to v.18, and then backup v.18 data before you update to v.21.

Important:

- You must perform the following steps before you update the Automation 360 version:
 - Ensure you reconfigure the settings for `log4j2.xml` files after the installation because when you update, the previous settings set at log level in `log4j2` change back to default.
 - Configure the SSL settings (certificates) every time you update.
- When you update from an Automation 360 release earlier than an $n-3$ release to the latest release, you might see an Elasticsearch Open Distro error message. Before updating, delete the multiple `application_log` indices from Elasticsearch, which will free up disk space for the update.

For details on the Elasticsearch indices limit, see [Cluster-level shard allocation and routing settings](#).

- Before you update from Automation 360 On-Premises v.22 to the latest release, see [A360 | Upgrading to A360.23, A360.24, A360.25 from A360.22 \(A-People login required\)](#)
- When you update to Automation 360 v.25 from an earlier release, an error might occur when the database server includes the instance name. In such a scenario, remove the instance name in the database server and continue with the installation.

For information on removing the instance name from the database server, see [Error parsing the SQL instance name while upgrading to Automation 360 v.25 \(A-People login required\)](#).

- Before you update to Automation 360 v.28 On-Premises from any of the earlier versions, review the following article: [Automation 360 On-Premise Edition | A360.28 – Upgrade Considerations \(A-People login required\)](#). This article is applicable only to On-Premises

customers who started using Automation 360 from v.15 or previous versions. To successfully update to Automation 360 v.28, you must perform the pre-update steps in the KB article.

-
1. Log in to Automation Anywhere Support site to download the latest version of the Automation 360 setup file: [A-People Downloads page \(Login required\)](#).
 2. On the **Downloads** page, click the link to the latest Automation 360 setup file.
 3. Click **Installation Setup**, and then click either **Windows Setup** or **Linux Setup** based on the operating system of the machine on which you want to install Automation 360.
 4. Download the `Automation360_Build_<build-number>.<file-extension>` file.
Watch the following video on downloading the build:
 5. Install the latest version of Automation 360 without uninstalling your current version.
[Installing Control Room On-Premises](#) on page 1121
-

Important: You must use the existing SQL database from current installation in the newer version of Automation 360.

Related concepts

[Migrate to Automation 360](#) on page 1436

Migration (upgrade) is the process of moving your data and bots from Enterprise 11 or Enterprise 10 to Automation 360. Migration includes but is not limited to replicating and updating your existing database and repository, converting your bots to the Automation 360 format, and migrating learning instances for IQ Bot and dashboards for Bot Insight.

Update Automation 360 on Microsoft Windows Server using scripts

You can update Automation 360 using a customized script with parameters to maintain existing user configurations.

To perform the task, you must have a administrator account with the required rights and permissions.

- Verify [Automation 360 On-Premises prerequisites](#) on page 1124.
- Ensure that you have the following:
 - Automation Anywhere Control Room installation file
 - TLS certificate
 - License file

Sample config.properties file: For your reference, you can find a sample config.properties file at the end of the page.

Note: For instructions on performing silent install and configuration of Automation 360 separately, see [Silent installation and configuration of Automation 360 using scripts \(A-People login required\)](#).

Create and run a PowerShell script to update Automation 360.

1. Create a PowerShell script with the required parameters:

The following is a sample PowerShell script for upgrading Automation 360:

```
# Script Begins
# It fetches Data from config.properties file present under the same
  directory level

$PropertyFilePath = 'C:\script\config.properties'
$rawProperties = cat $PropertyFilePath
$propertiesToConvert = ($rawProperties -replace '\\', '\\') -join
  [Environment]:: NewLine;
$properties=ConvertFrom-StringData $propertiesToConvert
$env:SEE_MASK_NOZONECHECKS = 1

# Setting up the logger and InstallerRoot Directory

$baseLogFilePath=$properties.baseLoggingDirectory
$logFilePath=$baseLogFilePath
+'Express_CR_Installation_Scenario1.txt'
$baseInstallerPath=$properties.baseInstallerDirectory
$installer_name_regex=$properties.installerNameRegex

# Logging Begins

Start-Transcript -Path $logFilePath -Append -IncludeInvocationHeader

$binary = Get-ChildItem $baseInstallerPath | Where-Object
  { $_.FullName -imatch $installer_name_regex }
$a = $binary.FullName
$final_commandline = " /update /s /v/qn /v"/L*v
  CR_Onprem_Installationlog_Scenario1.txt""

# Recording the Start Time
Get-Date -Format g

# Invoking the Installer here
$processdetail = (Start-Process -FilePath $a -ArgumentList
  $final_commandline -Wait -Passthru).ExitCode

# Recording the End Time
Get-Date -Format g

Stop-Transcript
```

2. Optional: Customize the script to include parameters according to your requirements.
3. Save the script to the installation server.
4. Log in to the installation server as administrator.
5. Start PowerShell in administrator mode.
6. Run the following:

```
Set-ExecutionPolicy Unrestricted -Scope CurrentUser -Force
.\install.ps1
```

Note: The silent installation logs are stored in the folder from which the installation script is run. For example, if you run the script from `C:\Silent Install`, the logs are stored in the `C:\Silent Install` folder.

7. Validate the following:

- All Automation Anywhere services are running in Windows Task Manager.
[Verifying Automation Anywhere services](#) on page 1260
- You are able to log in to the Control Room from a supported browser.
[Log in to Automation Anywhere Control Room](#) on page 1428
- You are able to install the required license in the Control Room.
[Installing additional licenses](#) on page 1725
- All automations (deployed and scheduled) are running in the Control Room.
[Activities](#) on page 2048

Example of config.properties file

```
# Properties utilized across all Scenarios

# Default/Express Mode Params

baseLoggingDirectory=C:\script\logs\
baseInstallerDirectory=C:\script\
installerNameRegex=AutomationAnywhereEnterprise_A2019
```

Install and update Automation 360 IQ Bot

This collection of topics guide you through the process of installing or setting up Automation 360 IQ Bot On-Premises and Cloud.

- [Automation 360 IQ Bot Cloud deployed](#)
- [Automation 360 IQ Bot On-Premises](#)

Automation 360 IQ Bot On-Premises

Step 1: Pre-installation

Go to Automation Anywhere support site and download the Automation 360 IQ Bot On-Premises package:

[A-People Downloads page \(Login required\)](#)

Note: Automation 360 IQ Bot On-Premises uses a 3-node cluster to ensure high availability (HA).

[High availability and disaster recovery overview](#)

Review and verify the requirements and options before installing IQ Bot. This topic provides you with important information about the supported operating systems, hardware and software requirements, and the prerequisite steps you have to complete even before you begin the installation process.

[IQ Bot installation prerequisites](#) on page 1369 Verify the hardware, software, and configuration required to install IQ Bot On-Premises.

Step 2: IQ Bot installation

Install IQ Bot using any of the following installation options:

[Installing IQ Bot in Express mode](#) on page 1379 Install IQ Bot in Express mode with the default settings.

[Installing IQ Bot in Custom mode](#) on page 1380 Use Custom mode to install IQ Bot with configuration details.

[Installing IQ Bot in Cluster mode](#) on page 1384 Install IQ Bot in Cluster mode for improved throughput. IQ Bot supports clustering of up to five IQ Bot installations.

[Installing IQ Bot in Cluster mode on Amazon EC2](#) on page 1388 Install IQ Bot in the cluster mode on Amazon Elastic Compute Cloud (Amazon EC2).

Step 3: Post installation

After downloading IQ Bot, register with the Control Room and do the various configurations as required. You would also go through the checklist to ensure all services, databases, tables, and configuration settings are in place.

[Postinstallation checklist](#) on page 1389 Verify that IQ Bot is installed, ensure that the IQ Bot services are running using the healthcheck APIs, and register IQ Bot with the Control Room.

- Step 4 (optional): Install an OCR engine
- During IQ Bot installation, the system sets the latest version of Tesseract Optical Character Reader as the default OCR engine. To use a different engine, follow the steps in the respective link:
- [Use Microsoft Azure Computer Vision OCR engine](#) on page 1399
 - [Use ABBYY FineReader Engine OCR engine in IQ Bot](#) on page 1402
 - [Use Google Vision API OCR engine](#) on page 1405
 - [Use Tegaki API OCR engine](#) on page 1409
- Step 5: Login and set up the Control Room
- Create and register IQ Bot specific users in the Control Room. Learn more about IQ Bot roles and access permissions:
- [IQ Bot user personas and roles](#) on page 3543
- Next: Connect to IQ Bot with the assigned user role, and begin creating learning instances
- [Automation 360 IQ Bot](#) on page 3538

Automation 360 IQ Bot Cloud deployed

Follow these steps to deploy and register as a user:

- Step 1: Pre-installation
- If you are your company's principal administrator and ordered Cloud deployed Automation 360 IQ Bot, you receive an email from Automation Anywhere with your URL and credentials.
- Step 2: Log in to IQ Bot
- To log in to Automation 360, open the Control Room URL in your browser, enter your credentials in the login screen, and click **Log in**.
- [Log in to Automation Anywhere Control Room](#) on page 1428
- Step 3: Set up the Control Room
- Create and register IQ Bot specific users in the Control Room. Learn more about IQ Bot roles and access permissions:
- [IQ Bot user personas and roles](#) on page 3543
- Next: Connect to IQ Bot with the assigned user role, and begin creating learning instances
- Go to the Control Room dashboard to access the IQ Bot URL link.
- [Automation 360 IQ Bot](#) on page 3538

Related concepts

[Automation 360 IQ Bot](#) on page 3538

Automate document-centric business processes, end to end, by using IQ Bot, a web-based, Cloud-native intelligent document processing solution that can read and process complex

documents and email. This solution combines RPA with AI techniques to extract and classify semi-structured and unstructured data.

[Get started with Automation 360 Cloud](#) on page 1109

Use these tasks to start creating and using bots with Automation 360 Cloud.

[Migrate to Automation 360 IQ Bot](#) on page 1657

Migration is the process of upgrading from earlier versions of IQ Bot (Enterprise 11.x, 6.x, or 5.x) to the latest Automation 360 IQ Bot version. This includes replicating your existing database and repository, converting your bots to Automation 360 format, and migrating all the learning instances.

IQ Bot installation prerequisites

Verify the hardware, software, and configuration required to install IQ Bot On-Premises.

Note: This page applies to On-Premises installations only. For Cloud deployment, see [Automation 360 IQ Bot Cloud deployed](#) on page 1368.

Hardware and software requirements

Important: As a prerequisite step, open ports 4369 and 25672 and add inbound firewall rules to allow traffic to these ports on each target machine. To add nodes to the cluster, sync the RabbitMQ v3.8.18 cookies to enable running any RabbitMQ v3.8.18 commands. If IQ Bot is already installed on the target machine, clean up and remove the existing cookies.

[Automation 360 IQ Bot version compatibility](#)
on page 957

[IQ Bot system requirements](#) on page 1370

Prerequisite

[IQ Bot prerequisite steps](#) on page 1373

[IQ Bot service configuration](#) on page 1374

[IQ Bot Windows services](#) on page 1375

page 1376

[Installing IQ Bot in Cluster mode on machines
with IQ Bot preinstalled](#) on page 1377

[Prerequisites for installing IQ Bot in Express
mode](#) on page 1378

Installation limitations

Database encryption limitations

Installation time increases when encryption of the SQL database backup file is in progress, and also when the database backup file size increases.

The encryption process of the SQL database might result in the creation of large transaction logs. Allocate at least 3 to 4 times more disk space than the database backup file size.

Note:

- The following list of installation packages are not supported from Automation 360 v.28 release onwards:
 - Custom installation + HTTPS + Windows authentication + Service user installation + Custom output path + Cyber ark
 - Express installation + Windows authentication (Automation 360 v.27 to Automation 360 v.28) and Express fresh installation
 - Custom installation + HTTPS + Windows authentication + Local account installation + SMB output path
 - Custom installation + HTTPS + Azure authentication + Local user account installation + custom output path
 - The following list of installation packages are not supported from Automation 360 v.27 release onwards:
 - On-Premises custom fresh installation - custom installation + HTTP + SQL authentication + local account installation
 - On-Premises Express fresh installation
 - On-Premises without internet fresh installation
 - On-Premises GCP fresh and upgrade
 - On-Premises SDS fresh installations (AD and Non-AD)
 - On-Premises migration from IQ Bot 11.x to On-Premises Automation 360.x using Migration Assistant Tool (MAT).
-

Note: The base version must be Version 11.3.5.6. Any customer on IQ Bot 11.x version prior to On-Premises must first upgrade to On-Premises and then migrate to Automation 360.27.

Related tasks

[Installing IQ Bot in Express mode](#) on page 1379

Install IQ Bot in Express mode with the default settings.

[Installing IQ Bot in Custom mode](#) on page 1380

Use Custom mode to install IQ Bot with configuration details.

IQ Bot system requirements

Review the operating system and database compatibility, database information, and the hardware and software requirements for Automation 360 IQ Bot.

Legal disclaimer: The information provided in this workflow might vary depending on which offering is being used. Administrative instructions might not be applicable to Automation 360 IQ Bot Community Edition.

Note: When you migrate from any of the earlier IQ Bot versions (11.x or 6.x) to Automation 360 IQ Bot, ensure that you update the Microsoft Windows Server Operating System to one of the versions listed in the table below.

The following table lists the Operating System and database compatibility with Automation 360 IQ Bot On-Premises:

Operating System	Supported platforms	Database type	Database version	Database edition
Microsoft Windows Server:	<ul style="list-style-type: none"> Microsoft Azure Virtual Machines Amazon Elastic Compute Cloud (Amazon EC2) Google Cloud Platform 	<ul style="list-style-type: none"> Microsoft SQL Azure (RTM) Amazon Relational Database Service (Amazon RDS) Microsoft SQL Server 	<ul style="list-style-type: none"> 2019 2017 2016 	<ul style="list-style-type: none"> Express Standard Enterprise

The following table provides the required database information:

Microsoft SQL Server and Amazon RDS databases	
Required information	Description
Database (SQL Server) authentication	Provide credentials for a Microsoft SQL Server user who has permission to connect to the database.
Database name	IQBot
Database port	Default: 1433
Service credentials	Provides the user with the following permissions: <ul style="list-style-type: none"> CONNECT SQL CREATE ANY DATABASE VIEW ANY DATABASE

Note:

If you are using an older version of the Microsoft SQL Server which does not support TLS 1.2, then you must keep a IQ Bot database backup and update to a Microsoft SQL Server version that supports TLS 1.2. For more information, see <https://support.microsoft.com/en-us/topic/kb3135244-tls-1-2-support-for-microsoft-sql-server-e4472ef8-90a9-13c1-e4d8-44aad198cdbc>.

Hardware requirements

IQ Bot	Minimum requirements
Application server	<ul style="list-style-type: none"> • 32 GB RAM • 8 Core Processor with support for AVX instructions set (this is a requirement starting from A2019.19) • 500 GB hard disk space • Ensure drive C has 100 GB plus free hard disk space
For all IQ Bot related database servers	<ul style="list-style-type: none"> • 16 GB RAM • 8 Core Processor • 500 GB hard disk space <p>Note: If you are hosting IQ Bot databases along with other application databases, ensure the hardware resources are increased proportionately.</p>
Microsoft Azure SQL Database: production environment	<ul style="list-style-type: none"> • vCore model (recommended) • DTU model (Premium tier recommended)

Software requirements

Software	Details
Database Management System	Automation 360 IQ Bot feature comparison matrix on page 952
Automation Anywhere Control Room	Automation 360 IQ Bot version compatibility on page 957
Web browsers	Google Chrome 80 (or later) Microsoft Edge Chromium 98 (or later) Mozilla Firefox 80 (or later)
	Azure File Share with Server Message Block 2.0 and 3.x (SMB) protocol.

Software	Details
Dependencies	<p>Automation 360 requires the following software, which is automatically installed during the installation:</p> <ul style="list-style-type: none"> • Microsoft .NET Framework v4.7.2 <p>The system prompts for a restart to complete the update.</p> <ul style="list-style-type: none"> • Microsoft Visual C++ Redistributable 2017 x64 package • Erlang 25.1 (13.1) • RabbitMQ 3.10.8 • NodeJS v14.20.0 • Microsoft SQL Server 2012 Native Client-QFE • Python 3.11.0 (64 bit) • Java Virtual Machine (JVM) 8 <hr/> <p>Note: In a cluster environment, all dependencies are installed on each machine where IQ Bot is installed.</p> <hr/>

Related reference

[IQ Bot installation prerequisites](#) on page 1369

Verify the hardware, software, and configuration required to install IQ Bot On-Premises.

IQ Bot prerequisite steps

Complete the steps before you begin installing IQ Bot.

1. User needs to have either the SYSADMIN role or the following privileges for SQL database account as this is used during installation to create database and run the BULK INSERT statement.
 - SQL connection (CONNECT SQL)
 - Database creation (CREATE ANY DATABASE)
 - View any database (VIEW ANY DATABASE)

Note: Installation with Microsoft Azure SQL requires the dbmanager role.

Note: Installation with AWS RDS requires a role with the above three privileges. These privileges are already assigned to the db_owner role in RDS.

Grant permissions for a specific database user and see the permissions for that role using the following TSQL query:

```
SELECT * FROM fn_my_permissions(NULL, 'SERVER');
```

2. First enable HTTPS, to configure IQ Bot with HTTPS. Keep the following HTTPS certificate files ready for use:

- Control Room certificate in `.crt` format (Certificate Authority list bundle).
- Control Room certificate in `.crt` format (Server side public certificate).
- IQ Bot server certificate in `.pfx` and `.crt` format.

Important: Install the `.crt` certificates for Control Room manually to their appropriate certificate stores.

Note: See [Configuring IQ Bot with HTTP when Control Room is configured with HTTPS](#) on page 1397 for more information.

3. Keep the following ports open because they are used by IQ Bot services:
 - Application access port (configurable): 3000
 - Database access port (configurable): 1433
 - Internal application services ports (fixed): 8100, 9002, 9991, 9992, 9995, 9996, 9997, 9998, 9999
 - Inbound listening ports:
 - 47100-47200 on IQ Bot server for IQ Bot-Control Room communication.
 - 47100-47200 and 47500-47600 on Control Room server.
 - RabbitMQ v3.8.18
 - Port: 5672
 - Port: 5673
4. If your SQL Server version is older than SQL Server Native Client 2012, a dialog box appears, giving you the option to upgrade. Open `services.msc` and stop the SQL Server (MSSQLSERVER) to do the upgrade. Then continue with the installation process.
5. During the upgrade process, the installer will detect existing learning instances from a previous version of IQ Bot. To retain the original classifier for those learning instances, select that earlier version of IQ Bot from the drop-down list. This ensures consistency in the behavior of the learning instances with that earlier version.
6. IQ Bot installer is case sensitive about the user account created for SQL Server or Windows.

Important: Use the username as it appears on the Microsoft SQL Server Management Studio under **Security > Logins**. If it was created in upper case, then use upper case for the username to launch the installer. Additionally, verify if the collation database property is set to case sensitive.

IQ Bot service configuration

In some IQ Bot deployments, the service account can be different from the login account. As an administrator, provide the service credentials during installation.

IQ Bot Installer supports service credentials during Microsoft Windows or SQL server authentication. When installing Services for IQ Bot, in the service installation window, the **Local System Account** check box is selected by default. You can deselect this and provide a username and password.

Note:

- Use Windows authentication with a valid system administration user in service configuration.
- Use Windows authentication with a local system for a system administration user.
- When using a remote SQL server to create a database, the combination of local system account for service credentials and Windows authentication for SQL connection is not supported.
- The service account used for IQ Bot services must have full rights to the IQ Bot installation folder.

If you do not select the **Local System Account** checkbox, provide your user credentials to run the IQ Bot Services.

Note:

- A valid system administrator user requires Windows authentication with the Services user credentials.
- When entering user credentials, ensure the credentials are associated with a domain. For example: example.com/testuser. User is unable to use this function without the domain.

See [Installing IQ Bot in Custom mode](#) on page 1380 to view the use of service credentials in IQ Bot.

[IQ Bot installation prerequisites](#) on page 1369

Verify the hardware, software, and configuration required to install IQ Bot On-Premises.

IQ Bot Windows services

IQ Bot Windows services are automatically installed when running the installation and setup.

Make sure that the following Windows services are set when installing IQ Bot.

Service name	Description
Automation Anywhere Cognitive Alias	IQ Bot service that manages domains, domain dictionary, aliases, and languages supported in the system.
Automation Anywhere Cognitive Application	IQ Bot service that provides support for all Control Room integration points and information about IQ Bot application configuration.
Automation Anywhere Cognitive Classifier	IQ Bot service that provides support to classify documents in a learning instance, into different groups.

Service name	Description
Automation Anywhere Cognitive Console	IQ Bot user interface. Note: In contrast to other services, the Automation Anywhere Cognitive Console service runs on the local user account rather than the domain or service account.
Automation Anywhere Cognitive File Manager	IQ Bot service that manages documents in the file management system.
Automation Anywhere Cognitive Gateway-2	IQ Bot Gateway for all the IQ Bot backend services, handling authorization and validation of request/response of APIs.
Automation Anywhere Cognitive MLScheduler Service	IQ Bot service scheduler for ML Web Service.
Automation Anywhere Cognitive MLWeb Service	IQ Bot service that prepares models based on user validation.
Automation Anywhere Cognitive Projects	IQ Bot service managing learning instances.
Automation Anywhere Cognitive Report	IQ Bot dashboard.
Automation Anywhere Cognitive Validator	IQ Bot service to manage documents that go for validation.
Automation Anywhere Cognitive Visionbot Manager	IQ Bot service to manage vision bots in the system.
Automation Anywhere Cognitive VisionbotEngine Service	IQ Bot service to process document based on different inputs provided.

Note: All the services can be configured either in Local System or Domain account when IQ Bot is installed in Custom mode. For IQ Bot installed in Express mode, all the services are run in Local System account.

Verify the hardware, software, and configuration required to install IQ Bot On-Premises.

RabbitMQ v3.8.18 and Erlang/OTP upgrade

The IQ Bot installation package includes the RabbitMQ v3.8.18 version 3.7.17 and Erlang/OTP version 22.0.

For Automation 360 IQ Bot, ensure that you download the Microsoft Visual C++ Redistributable 2017 x64 version because it is required for the latest version of Erlang/OTP.

The following information explains different scenarios for upgrading RabbitMQ v3.8.18/Erlang/OTP:

- Fresh installation of IQ Bot

For a fresh installation, you do not have to perform any additional steps, as RabbitMQ v3.8.18 Erlang/OTP are included in the IQ Bot installation package. These get installed automatically on the machine during the installation process.

- Upgrade from previous version of IQ Bot

Uninstall the earlier version of RabbitMQ v3.8.18 / Erlang/OTP.

1. Uninstall existing RabbitMQ v3.8.18 and Erlang/OTP from the Control Panel.
2. Run the `Cleanup_Components.bat` file as an administrator.
3. Restart your machine.
4. After running the scripts, verify that RabbitMQ v3.8.18 and Erlang/OTP are removed completely. If not, uninstall them manually to delete any remaining files from the program files folder, and then repeat Step 3.

- An earlier version of RabbitMQ v3.8.18/Erlang/OTP exists on the machine and the user wants to upgrade to the latest versions:

You need to manually remove any older versions from the system using a batch utility file provided by Automation Anywhere. Contact the Automation Anywhere Support team to get the utility. You can then proceed with installing IQ Bot.

[IQ Bot installation prerequisites](#) on page 1369

Verify the hardware, software, and configuration required to install IQ Bot On-Premises.

Installing IQ Bot in Cluster mode on machines with IQ Bot preinstalled

If you have IQ Bot already installed on your machine, uninstall IQ Bot, stop service, and clean the existing RabbitMQ v3.8.18 cookies before installing IQ Bot in Cluster mode.

- Open ports 4369 and 25672 and add inbound firewall rules to allow traffic to these ports on each target machine.
- To add nodes to the cluster, sync the RabbitMQ v3.8.18 cookies to enable running any RabbitMQ v3.8.18 commands. If IQ Bot is already installed on the target machine, clean up and remove the existing cookies.

Follow the clean up procedure before setting up a cluster:

1. Uninstall IQ Bot from Program and Features.
2. Stop the RabbitMQ v3.8.18 service, by running the command: `net stop RabbitMQ /yes`.
3. Uninstall RabbitMQ v3.8.18 from `%Programfiles%\RabbitMQ Server\uninstall`.
4. Stop the `epmd.exe` and its descendants by running this command: `Taskkill /IM epmd.exe /F`.
5. Stop `erl.exe` and `erlsrv.exe` and its descendants by running the following commands:
 - a) `Taskkill /IM erl.exe /F`
 - b) `Taskkill /IM erlsrv.exe /F`
6. Uninstall Erlang from `%Programfiles%\erl8.2\Uninstall`.
7. Remove the following folders if they were not removed from the uninstall:

- a) %Programfiles%\Rabbit MQ Server
 - b) %Programfiles%\erl8.2
8. Remove the following folders: %appdata%\RabbitMQ, %WINDIR%\erlang.cookie, %USERPROFILE%\erlang.cookie.

Do the following after completing the installation steps:

- The load balancer details for the following are available:
 - name of the load balancer
 - port
 - type of security used (For example, HTTP or HTTPS)
- Share a folder for configuring the output path.

Note: The user installing IQ Bot requires appropriate access permissions.

[IQ Bot installation prerequisites](#) on page 1369

Verify the hardware, software, and configuration required to install IQ Bot On-Premises.

Prerequisites for installing IQ Bot in Express mode

Complete the prerequisites to set up in express mode.

Complete the following steps before you begin installing IQ Bot in express mode.

1. Install the Control Room in a version that is compatible with IQ Bot.
[Automation 360 IQ Bot version compatibility](#) on page 957
2. Ensure that SQL Server Browser service is up and running before installing IQ Bot in express mode.
3. Start the SQL Server Browser service in any one of the following ways:

Option 1	<ul style="list-style-type: none"> a) Launch the SQL Server Configuration Manager. b) Go to SQL Server Services. c) Start the SQL Server Browser services.
Option 2	<ul style="list-style-type: none"> a) Launch the Task Manager. b) Go to the Services tab. c) Start the SQLBrowser services.

4. Use the Automation_Anywhere_IQ_BOT_<version_number>.exe file to install IQ Bot.
5. The setup wizard guides you through the installation process. During installation, any software dependencies or missing prerequisites are installed.

Note: When a file is uploaded to a fresh IQ Bot instance, the database administrator is unable to extract any information about that file from the database as the data is encrypted.

6. Enable SQL authentication.
Enable the TCP protocol on the SQL server and listen to the local host at port 1433.
7. Set the SQL server instance name to AACRSQLEXPRESS.
8. Create a user with sysadmin permissions for username aaadmin, and password aabots@123.

See [Installing IQ Bot in Express mode](#) on page 1379 for steps to install in Express mode.

Related reference

[IQ Bot installation prerequisites](#) on page 1369

Verify the hardware, software, and configuration required to install IQ Bot On-Premises.

Installing IQ Bot in Express mode

Install IQ Bot in Express mode with the default settings.

Complete the prerequisites: [Prerequisites for installing IQ Bot in Express mode](#) on page 1378

1. Double-click the Automation_A360_IQ_BOT_<build number>.exe file.
2. In the IQ Bot Setup Wizard, click **Yes**, and then click **Next**.
3. In the **Prerequisites** page, review the prerequisites and click **Next**.
4. In the **License Agreement** page, review the license agreement, accept the terms, and click **Next**.

IQ Bot runs a pre-installation check.

The pre-installation screen appears, displaying the applications that do not have the required version and necessary ports along with the services occupying those ports.

5. If the pre-installation check is not successful, uninstall the mentioned software and free the required ports.
 - a) Click **Retry**.
 - b) When the pre-installation check is successful, click **Next**.

The **Installation Type** page appears with **Express** and **Custom** options.

Note: Express installation installs HTTP-based IQ Bot without Active Directory support.

6. Select **Express** and click **Next**.
7. After you click **Next**, the unable to proceed with installation message might appear if the installer is unable to communicate with the Control Room or SQL Express. If the error message appears, perform these steps:
 - a) Click **Back** to review or change the installation settings. Alternatively, exit the Setup Wizard and click **Cancel**.
 - b) In the confirmation dialog box, click **Yes** to exit the Setup Wizard.
This rolls back all the changes.
 - c) Click **No** to resume.
8. In the **Ready to install the program** page, click **Install**.

The express installation begins and the system shows the **Finished** page after a few minutes to indicate a successful installation.

IQ Bot is installed with the following default settings:

Security type: None (HTTP)
Web configuration: <web url:port>
Database configuration: <database url:port> (user: aaadmin ; Authentication: SQL)
Database password: aabots@123
Host Gateway: <gateway:port> (SSL Offloading: No)
Output path: C:\Users\Public\Documents\Automation Anywhere IQBot Platform\Output\
Logging Path: C:\Users\Public\Documents\Automation Anywhere IQBot Platform\Logs\
Logging path Automation 360 IQ Bot A360.21 onward: C:\Users\Public\Documents\Automation 360 IQBot Platform\Logs\
Installation path for Automation 360 IQ Bot: C:\Program Files (x86)\Automation Anywhere IQ Bot A2019\
Installation path for Automation 360 IQ Bot A360.21 onward: C:\Program Files (x86)\Automation 360 IQ Bot\

Verify that IQ Bot is installed, ensure that the IQ Bot services are running using the healthcheck APIs, and register IQ Bot with the Control Room. [Postinstallation checklist](#) on page 1389

Installing IQ Bot in Custom mode

Use Custom mode to install IQ Bot with configuration details.

1. Run the `Automation_A360_IQ_BOT_<build number>.exe` installation file as an administrator.
2. For first-time installations, a server restart might be required after the installation. Restart the IQ Bot installation process if required.
3. In the Automation Anywhere IQ Bot setup wizard, click **Next**.
 - a) Click **Next** in the **Prerequisites** window.
4. Read the license agreement, accept the terms, and click **Next**.
IQ Bot runs a pre-installation verification.

The pre-installation screen appears, displaying the applications that do not have the required version and necessary ports along with the services occupying those ports.

5. If the pre-installation verification is not successful, uninstall the mentioned software and free the required ports.
 - a) Click **Retry**.
 - b) When the pre-installation verification is successful, click **Next**.

The **Installation Type** page appears with **Express** and **Custom** options.

Note: Express installation installs HTTP-based IQ Bot without Active Directory support.

6. Select the **Custom** option and click **Next**.

7. On the **Database Configuration** window, add these details:

a) Hostname or IP: Enter the hostname or IP address.

Note: An underscore is not accepted in a hostname.

b) Port: Enter the port number.

Note: If a Microsoft Windows SQL Server Express database is installed locally on the target machine, the hostname is auto-populated as localhost, and port as 1433.

8. Optional: To connect to your CyberArk vault to store the custom keys for encrypting and decrypting IQ Bot data, select the **Use CyberArk external vault** option and provide the following connection details to your CyberArk account.

- **Vault URL:** The CyberArk URL endpoint on the CyberArk server
- **Application ID:** The CyberArk-issued Application ID
- **Object and Safe Name:** Identify the custom key in CyberArk
- **Client certificate path:** The Control Room Client Certificate certificate used to authenticate to CyberArk. If the certificate is distributed in a passphrase protected file, you must enter the passphrase.
- **(Optional) Server certificate:** You can load the CyberArk AIM Server certificate to the Control Room trust store here to make sure that the Control Room will trust the CyberArk server.

Obtain the connection details from your CyberArk vendor or IT team.

9. Enter the following database server details on the **Database Configuration** window, and click **Next**.

Option	Description
Option 1	Provide your Microsoft Windows SQL Server user credentials to log in to the database server.
Option 2	If you select the Use Windows Authentication check box, you do not need to provide the Microsoft Windows credentials to log in to the database server because the installer detects them automatically.

The Unable to connect to the SQL server with given configuration error message appears if the following scenarios occur:

- Incorrect server name/IP address, and port number
- Incorrect database server credentials
- Insufficient user privileges to connect to the database

Note:

- When installing IQ Bot, configure the credentials of a newly hosted database on Microsoft Azure SQL PaaS. This can take up to 300 seconds to verify the credentials and move to the next screen. However, if the on-premise database for IQ Bot is already migrated to Microsoft Azure SQL PaaS before the installation, there is no delay during the database configuration.

- IQ Bot does not support retry logic for Microsoft Azure SQL PaaS. Avoid operating IQ Bot during planned maintenance events in the Microsoft Azure SQL database.
- When IQ Bot and the database instance already exist, and IQ Bot is installed again, and IQ Bot takes the default database instance during installation.
- Windows authentication with the local system works only if the `NT Authority\System` user has system administrator permissions.
- The combination of the Local System account for Service credentials and the Microsoft Windows authentication for SQL connection is not supported if you use the remote SQL server to create databases.

10. In the **Services Configuration** window, select the **Local system account** check box and click **Next**.

- Select the **Local system account** check box to run the services on your local system account.
- If you do not select the **Local system account** check box, provide your user credentials to run the IQ Bot services.
 - A valid system administrator user requires Windows authentication with the Services user credentials.
 - When entering user credentials, ensure the credentials are associated with a domain. For example: `example.com/testuser`. The user cannot avail this function without the domain.

11. Enter the following details in the IQ Bot **Portal Configuration** window and click **Next**.

Portal security	
Select the security type: HTTPS or HTTP .	
If you select HTTPS , verify that you can browse and then select a valid PFX certificate file from the Certificate Path field. Configuring IQ Bot with HTTP when Control Room is configured with HTTPS on page 1397	
If you select HTTP then go to the next step.	
Enter a valid certificate passphrase from the Certificate Passphrase field.	

Portal configuration	
Hostname or IP	Enter the hostname or IP address of IQ Bot or use the auto-populated default, which is the fully qualified domain name (FQDN) of the machine on which you are installing IQ Bot. Note: This is auto-populated by default with the FQDN of the machine on which you are installing IQ Bot.

Portal configuration	
Port	Enter the port number or use the auto-populated default, 3000.

12. In the **Load Balancer Configuration** window, do the following:

- a) Select the **Use same as IQ Bot Portal** check box to use the same hostname and port number for the load balancer as specified previously in the IQ Bot **Portal Configuration** window. This check box is selected by default. Keep this check box selected if any of the following conditions exist:
 - You are installing the IQ Bot on a single machine
 - You plan to keep the load balancer configuration the same as the IQ Bot page
- b) If the configuration values for the load balancer are different from the IQ Bot page, clear the **Use same as IQ Bot Portal** check box and enter the following:
 - **Load Balancer Hostname:** Enter the hostname or IP address.
 - **Load Balancer Port:** Enter the port number.
- c) Select the **Load Balancer can handle SSL Offloading** check box if required, and click **Next**.

Note: When configuring the load balancer, if you set the security mode to HTTPS in the IQ Bot **Portal Configuration** window, the SSL offloading is disabled by default. To enable SSL offloading for the load balancer, select **HTTP** in the IQ Bot **Portal Configuration** window.

These are some additional load balancer customization options:

- When you install IQ Bot on AWS, to access the IQ Bot server from an external location, replace the Host Gateway name with the Public DNS .
- During re-installation, the hostname of the load balancer and port are automatically detected by the installer based on the previous installation details stored in the Control Room. Change them as required because this is useful when you install multiple instances of IQ Bot for scalability (because you are not required to remember the details for each instance).
- When using an HTTPS certificate in the load balancer with an alias name, which is different from the hostname of the machine (FQDN), enter the alias name as the hostname.
- The installer takes the value from the IQ Bot Portal **Configuration** window, (from the previous page), but shows the previously retrieved values in the disabled text boxes from the Control Room.

13. In the **Destination Folder** window, make the required changes to the destination folders and click **Next**.

- **Installation Path:** Select a different installation path if required.

The default installation path is: C:\Program Files (x86)\Automation Anywhere IQ Bot <version number>\

IQ Bot A360.21 onward: C:\Program Files (x86)\Automation 360 IQ Bot\

- **Output Path:** Select the output path where the output is stored. The output path can also be a shared network path. During re-installation, the **Output Path** is automatically detected by the installer (based on the previous installation details stored in IQ Bot's Configuration database). Change the details if required.

The default output path is: C:\Users\Public\Documents\Automation Anywhere IQ Bot Platform\Output\

14. In the **Ready to Install the Program** window, verify and review your installation settings and click **Install** to start the installation.
 - On first installation, during the installation process, a Microsoft Windows Security alert can prompt you to allow the installer to install Erlang. If prompted, click **Allow access**.
 - Sometimes, the **Windows Security Alert** window is not visible (it can be hidden behind other active windows). Use the Alt plus tab key combination, and verify that the **Windows Security Alert** window is not hidden behind other visible windows.

15. Click **Allow access** to complete the installation, and in the **Installation Successful** window, click **Finish**.

An IQ Bot icon is created on the desktop.

If you encounter an error in launching IQ Bot, you might have to restart the Automation Anywhere Control Room Reverse Proxy and the Automation Anywhere Cognitive Console services.

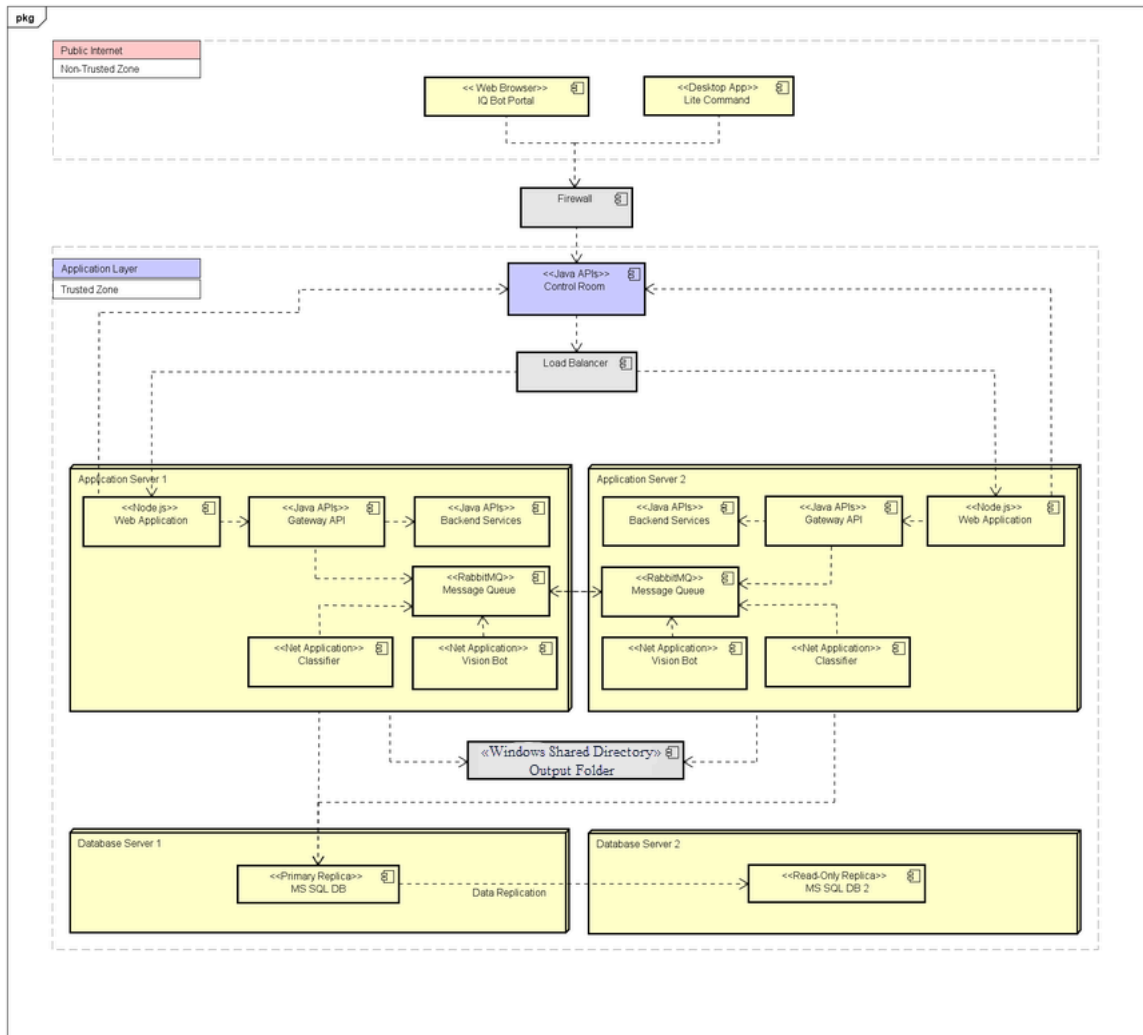

16. For the Control Room, set the `cluster.properties` file as required based on the release version..

Verify that IQ Bot is installed, ensure that the IQ Bot services are running using the healthcheck APIs, and register IQ Bot with the Control Room. [Postinstallation checklist](#) on page 1389

Installing IQ Bot in Cluster mode

Install IQ Bot in Cluster mode for improved throughput. IQ Bot supports clustering of up to five IQ Bot installations.

Ensure you have a load balancer for a cluster setup to distribute traffic to all application server nodes.

powered by Astah

1. Install IQ Bot on each machine in custom mode.
 - During installation, on the **Load Balancer Configuration** screen, type in the load balancer host name and port.
 - Select the **Load Balancer can handle SSL Offloading** option, if the load balancer supports is to enable SSL offloading.
 - Provide the shared output path on the **Destination Folder** screen.
 - During installation, use the same database server details on all the nodes.

[Installing IQ Bot in Custom mode](#) on page 1380

2. Share the **output** folder with the access role **Everyone**.
See [Make a Shared Folder Accessible](#) on page 1387.
3. Use Command Prompt to link each machines containing an IQ Bot installation to the primary cluster.
See [RabbitMq cluster configuration for IQ Bot](#) on page 1386.
4. Optional: If you have set up in High Availability mode, you can set up IQ Bot in High Availability mode as well.

[High Availability and Disaster Recovery overview](#) on page 1420

5. Configure the firewall to have ports 4369 and 25672 open.

For each machine containing an IQ Bot installation, verify that IQ Bot is installed, ensure the IQ Bot services are running using the healthcheck APIs, and register IQ Bot with Control Room.

[Postinstallation checklist](#) on page 1389

Note: When you register each installation of IQ Bot, in the **URL** field, enter the URL to the load balancer.

Important: In a cluster setup, if a temporary network issue occurs, the cluster breaks. To add the nodes back into the cluster, you must manually execute commands in each of the participating nodes. You also have to monitor the cluster status to know if it is healthy or broken. To avoid such issues, you can configure the cluster to automatically recover (auto-recover) from temporary network issues. See this article for information about how to enable auto-recovery: [RabbitMQ Cluster Configuration with Auto-recovery \(A-People login required\)](#).

RabbitMq cluster configuration for IQ Bot

Use the command prompt to configure three clusters.

Complete steps 1 and 2 in [Installing IQ Bot in Cluster mode](#) on page 1384.

1. Open command prompt, navigate to {RabbitMq installation directory}\sbin and execute the following command: `rabbitmqctl.bat cluster_status`.
You will see an output similar to this:

```
Cluster status of node
rabbit@IQBotCluster1 ... [{ nodes, [{ disc, [rabbit
@IQBotCluster1] } ] }, { running_nodes, [rabbit @IQBotCluster1] },
{ cluster_name, << "rabbit@IQBotCluster1" >> }, { partitions, [] },
{ alarms, [{ rabbit @IQBotCluster1, [] } ] } ] }
```
2. Execute the following command: `rabbitmqctl list_queues -p test`.
3. Configure the primary cluster.
 - a) In IQBotCluster1 VM, open command prompt and navigate to {IQ Bot Installation Directory}\Configurations
 - b) Execute the following command: `messagequeue_cluster_configuration.bat "IQBotCluster1"`.
4. Link the second cluster to the primary cluster.
 - a) In IQBotCluster2 VM, open command prompt and navigate to {IQ Bot Installation Directory}\Configurations.
 - b) Execute the following command: `messagequeue_cluster_configuration.bat "IQBotCluster1"`.
5. Verify if the clusters were added successfully.
Open command prompt, navigate to {RabbitMq installation directory}\sbin and execute the following command: `rabbitmqctl.bat cluster_status`.
You should see a similar output to the following, confirming that the two clusters were successfully added: `Cluster status of node rabbit @IQBotCluster2...[{ nodes, [{ disc, [rabbit @IQBotCluster1, rabbit @IQBotCluster2] }] }, { running_nodes, [rabbit @IQBotCluster1,`

```
rabbit @IQBotCluster2] }, { cluster_name, << "rabbit@IQBotCluster1"
>> }, { partitions, [] }, { alarms, [{ rabbit @IQBotCluster1, [] },
{ rabbit @IQBotCluster2, [] }] }
```

6. Link the third cluster to the primary cluster.
 - a) In IQBotCluster3 VM, open command prompt and navigate to {IQ Bot Installation Directory}\Configurations.
 - b) Execute the following command: `messagequeue_cluster_configuration.bat "IQBotCluster1"`.

You should see a similar output to the following, confirming that the third cluster was successfully added: Cluster status of node rabbit @IQBotCluster3...

```
[{ nodes, [{ disc, [rabbit @IQBotCluster1, rabbit @IQBotCluster2,
rabbit @IQBotCluster3] }], { running_nodes, [rabbit @IQBotCluster1,
rabbit @IQBotCluster2, rabbit @IQBotCluster3] }, { cluster_name, <<
"rabbit@IQBotCluster1" >> }, { partitions, [] }, { alarms, [{ rabbit
@IQBotCluster1, [] }, { rabbit @IQBotCluster2, [] }, { rabbit
@IQBotCluster3, [] }] }
```

When you are done linking the clusters, proceed to step 4 in [Installing IQ Bot in Cluster mode](#) on page 1384.

Make a Shared Folder Accessible

Share the output folder with all the devices on the cluster so that when IQ Bot processes documents, the extracted data is saved to the one output folder.

Follow the steps to make your shared folder accessible to IQ Bot.

1. Change log on of the application services with .\Administrator account on all cluster nodes.
2. On primary (shared folder) node, change following settings:
 - a) Click **Control Panel > Network and Internet > Network and Sharing Center > Advanced Sharing Setting**
 - b) Expand **Private** and click **Network Discovery**.
 - c) In **Network Discovery**:
 1. Select **Turn on Network Discovery**.
 2. Check the **Turn on automatic setup of network connected devices** checkbox.
 3. Click **File and Printer Sharing** and then select the **Turn on file and printer sharing** checkbox.
 - d) Expand **Guest or Public** and click **Network Discovery**.
 - e) In **Network Discovery**:
 1. Select **Turn on Network Discovery**.
 2. Click **File and Printer Sharing** and then select the **Turn on file and printer sharing** checkbox.

Open "Local Group Policy Editor". Go to Local Computer Policy >> Windows Settings >> Security Settings >> Local Policies >> Security Options. Find "Network access :

Sharing and security model for local accounts". Change it to "Guest only - local users authenticate as Guest".

- f) Click **Local Group Policy Editor**.
- g) Click **Local Computer Policy > Windows Settings > Security Settings > Local Policies > Security Options**.
- h) Find **Network access : Sharing and security model for local accounts** and change it to Guest only - local users authenticate as Guest.
- i) Execute this Powershell script:

```
Set-ItemProperty -Path "HKLM:\SYSTEM\CurrentControlSet\Services  
\LanmanWorkstation\Parameters" -Name "AllowInsecureGuestAuth" -Type  
DWord -Value 1
```

You need to execute this Powershell script on every machine which is a part of the cluster.

After you have made the shared folder accessible to every device in the cluster, proceed to step 3 in [Installing IQ Bot in Cluster mode](#) on page 1384.

Installing IQ Bot in Cluster mode on Amazon EC2

Install IQ Bot in the cluster mode on Amazon Elastic Compute Cloud (Amazon EC2).

If you install IQ Bot in Cluster mode on Amazon EC2, make a note of the following.

- The name for the Amazon EC2 RabbitMQ v3.8.18cluster is in this format: `rabbit@ip-XXX-XXX-XX-XX`.
- Connecting to a node works if both the nodes are in the same local network, but if you connect to a cluster outside the local Amazon EC2 network, configure the host file of node 2.
- Add an entry in the host file where `AA.AA.AAA.AAA` is the public IP of node 1.

```
AA.AA.AAA.AAA  
ip-XXX-XX-XX-XX
```

If all the IQ Bot instances in a cluster are not a part of the same domain, ensure that the following services are running using the Administrator user login on each instance.

- Automation Anywhere Cognitive Projects
- Automation Anywhere Cognitive Validator
- Automation Anywhere Cognitive File Manager

To run a service using the Administrator user login, do the following procedure.

1. Click **Task Manager > Services > Open Services**.
2. Right-click the target service, for example, Automation Anywhere Cognitive Projects, and click **Properties**.
3. In the Properties dialog box, select **This account** and enter the credentials for the administrator user.

4. Click **OK** and restart this service. Repeat these steps for the remaining services on this instance and all the other IQ Bot instances in the cluster.

Postinstallation checklist

Verify that IQ Bot is installed, ensure that the IQ Bot services are running using the healthcheck APIs, and register IQ Bot with the Control Room.

Step 1: Verify IQ Bot in the Control Panel

Ensure that the Automation Anywhere IQ Bot item exists in **Control Panel > Programs > Programs and Features** of the machine where IQ Bot is installed.

Step 2: Confirm that Automation Anywhere cognitive services are running

Ensure that the following services are installed on the machine where IQ Bot is installed and the status of the services is set to Running on the Microsoft Windows services window.

To see the list of services that are currently running, open services.msc using **Start > Run**.

- Automation Anywhere Cognitive Alias
- Automation Anywhere Cognitive Application
- Automation Anywhere Cognitive Classifier Service
- Automation Anywhere Cognitive Console
- Automation Anywhere Cognitive File Manager
- Automation Anywhere Cognitive Gateway-2
- Automation Anywhere Cognitive MLScheduler Service

Note: As of Build 12350, this service is disabled, by default.

- Automation Anywhere Cognitive MLWeb Service

Note: As of Build 12350, this service uses a new model to better detect check boxes and tables. To revert to the previous model, open the CognitiveServiceConfiguration.json file, locate the following code snippet, and update the `version` value to `v1`:

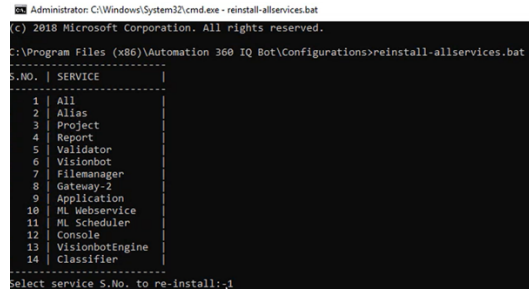

```
"MLWebService": {
  "port": "9991",
  "version": "v2"
}
```

- Automation Anywhere Cognitive Projects

- Automation Anywhere Cognitive Report
- Automation Anywhere Cognitive Validator
- Automation Anywhere Cognitive Visionbot Manager
- Automation Anywhere Cognitive VisionbotEngine Service

To reinstall the IQ Bot services, **Run** reinstall-allservices.bat as an administrator from **IQ Bot Installation Directory > Configuration Folder**. You will see a list of services with serial numbers. Perform either of the following steps to reinstall the services:

1. Enter the serial number of the service that you want to reinstall.

2. Enter the serial number of the service followed by the domain username and password.

Step 3: Perform a healthcheck

Use the Healthcheck API to verify about the required service. The request/response details of the Healthcheck API are described in the following table.

Requests

The following table lists the API requests sent for doing a healthcheck of different IQ Bot services:

Service name	URL
Alias	http://<hostname/IP>:9997/healthcheck

Service name	URL
Application Service	http://<hostname/IP>: 9002 /healthcheck
Project Service	http://<hostname/IP>: 9999 /healthcheck
FileManager Service	http://<hostname/IP>: 9996 /healthcheck
Visionbot	http://<hostname/IP>: 9998 /healthcheck
Validator Service	http://<hostname/IP>: 9995 /healthcheck
Report Service	http://<hostname/IP>: 9992 /healthcheck
Gateway Service	http://<hostname/IP>: 8100 /healthcheck
Frontend or Console Service	http://<hostname/IP>: 3000 /healthcheck
MLWeb Service	http://<hostname/IP>: 9991 /healthcheck

In the table listing, replace <hostname/IP> with the host name/IP address of IQ Bot to create the Healthcheck API request using a web browser on the machine on which IQ Bot is installed.

For example, if your IQ Bot is accessible at http://localhost:3000, the FileManager Healthcheck can be accessed using this URL: http://localhost:9996/healthcheck.

Responses

A typical successful response is in the following code example:

Subsystem

```

Application: <Service Name>
Status: OK
Application uptime: 0d 3h 45m 6s
Version: 1.2.0-RELEASE
Branch: RC-5.2-1
GIT #:
    d88e59c0435c3a836bb47cd586081205564904c5
Build Time:
    2018-02-17T09:26:52.523Z
Dependencies:
Database Connectivity: OK
MessageQueue Connectivity: OK
Project: OK
VisionBot: OK
**<Service Name> could be alias,
application, filemanager, project, reports,
gateway, validator, or visionbot.

```

Dependencies: lists the status of all the dependent services, for example, database and message queue of probed service.

If the API responds with `Status: Not_OK`, see [Healthcheck status Not_Ok \(A-People login required\)](#).

Step 4: Verify the database

The system creates the IQBot database. Log in to the database using the `<dbusername>` and `<dbpasswd>` to verify the names of the databases and tables using `<hostname>`, `<dbusername>`, and `<dbpasswd>`.

Step 5 (optional): Create the appropriate certificates and configure the HTTP and HTTPS settings

[Creating a self-signed certificate with Subject Alternative Name](#) on page 1393
[Configuring IQ Bot with HTTP and HTTPS](#) on page 1395

Step 6: Register

You must register IQ Bot with Control Room before you can start using IQ Bot.
[Registering IQ Bot with the Control Room](#) on page 1395

If registration fails:

Do the steps in the following pages to resolve the issue:

1. [Unregistering IQ Bot from the Control Room](#) on page 1410

2. [Resolving IQ Bot registration failure](#) on page 1410

Next:

Install an OCR engine (optional): During IQ Bot installation, the system sets the latest version of Tesseract Optical Character Reader as the default OCR engine. To use a different engine, follow the steps in the respective link:

[Use Microsoft Azure Computer Vision OCR engine](#) on page 1399

[Use ABBYY FineReader Engine OCR engine in IQ Bot](#) on page 1402

[Use Google Vision API OCR engine](#) on page 1405

[Use Tegaki API OCR engine](#) on page 1409

Login and set up the Control Room: Create and register IQ Bot specific users in the Control Room. Learn more about IQ Bot roles and access permissions: [IQ Bot user personas and roles](#) on page 3543

Related concepts

[Install and update Automation 360 IQ Bot](#) on page 1366

This collection of topics guide you through the process of installing or setting up Automation 360 IQ Bot On-Premises and Cloud.

Creating a self-signed certificate with Subject Alternative Name

Create a self-signed certificate with Subject Alternative Name (SAN) when you want to use an SSL certificate for multiple domains.

1. Create a file with the name `domain.cnf` and add the following configuration as per your requirement:

```
[req]
default_bits = 2048
prompt = no
default_md = sha256
x509_extensions = v3_req
distinguished_name = dn
[dn]
C = ES
ST = MyState
L = MyCity
O = MyOrg
emailAddress = email@mydomain.com (Any email address)
```

```

CN = sss-laptop136.aaspl-brd.com (CR FQDN Url Name)
[v3_req]
subjectAltName = @alt_names
[alt_names]
DNS.1 = sss-laptop136.aaspl-brd.com (CR FQDN Url Name)
DNS.2 = sss-laptop151.aaspl-brd.com (IQBOT URL FQDN Name)

```

2. Download the Openssl utility.

3. Create the certificate either on Microsoft Windows or on Linux:

- Run the following command to create the certificate on Microsoft Windows:

```

openssl.exe req -new -x509 -newkey rsa:2048 -sha256 -nodes -keyout
"D:\ssc\ssc\key.key" -days 3560 -out "D:\ssc\ssc\cert.crt" -config
"D:\ssc\ssc\domain.cnf"

```

- Run the following command to create the certificate on Linux:

```

openssl req -new -x509 -newkey rsa:2048 -sha256 -nodes -keyout /
tmp/cert/key.key -days 3560
-out /tmp/cert/cert.crt -config /tmp/cert/domain.cnf

```

4. Create the .pfx file from cert and key file:

- Run the following command to create the .pfx file from the cert and key file on Microsoft Windows:

```

openssl.exe pkcs12 -export -out "D:\ssc\ssc\sss-aspl.pfx" -inkey
"D:\ssc\ssc\key.key"
-in "D:\ssc\ssc\cert.crt"

```

- Run the following command to create the .pfx file from the cert and key file on Linux:

```

openssl.exe pkcs12 -export -out /tmp/cert/sss-aspl.pfx -inkey /
tmp/cert/key.key -in
/tmp/cert/cert.crt"

```

5. Import the .pfx file in Microsoft IIS.

Use the same .pfx file with the installation of IQ Bot.

6. Run the following command to import the certificate in the Java keystore:

```

keytool.exe -import -alias dev -keystore "C:\Program Files
(x86)\Java\jre1.8.0_91\lib\security\cacerts" -file "D:\cert
\xyz.com.crt"

```

Based on the type of operating system 32-bit / 64-bit, this C:\Program Files (x86)\Java\jre1.8.0_91\lib\security\cacerts directory can differ.

If the certificate is not imported in the Java keystore, then Control Room shows the following error message: Java security certificate path validator signature check failed.

7. Go to `%installation_dir%\Configurations` and run `stopanduninstallallservices.bat` as an administrator.
8. Go to `%installation_dir%\Configurations` and run `installandstartservices.bat` as an administrator.
9. Import the `cert.crt` file to the Trusted Root using the Microsoft Management Console (MMC).

[Install and update Automation 360 IQ Bot](#) on page 1366

This collection of topics guide you through the process of installing or setting up Automation 360 IQ Bot On-Premises and Cloud.

Registering IQ Bot with the Control Room

IQ Bot is integrated with Control Room for user management. Log in to the Control Room and register IQ Bot.

Do the following before registering IQ Bot with Control Room:

- Launch the Control Room and create an admin user.
- Install the license for IQ Bot. See [Configure new licenses](#).

IQ Bot can be accessed after registering it with Control Room.

Note: Make a note of the database credentials used for the Control Room installation. This is required for IQ Bot installation if you are using the same database.

1. Log in to Control Room as an administrator.
If you already logged into Control Room in the same browser session, you are automatically logged in to IQ Bot.
2. Click **Administration > Settings > IQ Bot**.
3. Click **Edit** in the IQ Bot section, and a text box appears.
4. Enter the correct IQ Bot URL for example, `http(s)://IQBotURL/`, and click **Save changes**.
If the application registration fails, try registering again.

Note: The URL `https://{CR_URL}/IQBot/` is case-sensitive. For example, ensure that the URL mentions "IQBot" and not "IQbot".

Configuring IQ Bot with HTTP and HTTPS

This section describes single and multiple domain scenarios when installing IQ Bot and Control Room with various server certificates.

There are two main scenarios:

- Installing and with wildcard server certificates (single domain).
- Installing and with individual server certificates (different domains).

You can encrypt the communication between IQ Bot and Control Room by configuring Two-way (Mutual) SSL. The following steps explain how to configure this and can be achieved by exchanging the SSL certificates between IQ Bot and the Control Room.

Note: IQ Bot does not support self-signed certificate.

Prerequisite for single domain

If Control Room and IQ Bot are on a single domain, and we name the domain as DomainOne, the following certificate files are required:

- PFX file:

Ensure you have the `DomainOne.pfx` file. The file size is approximately 7/8 KB. One pfx file is required for a single domain.

- CA Bundled certificate from the Enterprise Control Room (with all intermediate certificate information):

Use any tool to create the bundle certificate, or you can use openssl to create CA/bundled certificate from `DomainOne.pfx` file.

Use the following example command to create CA/Bundled certificate using openssl for `DomainOne.pfx`:

```
openssl.exe pkcs12 -in "{DomainOne.pfx file location}" -cacerts -nokeys -chain -out "{Outputlocation}\DomainOne_ControlRoom_CA.crt"
```

Note: You will need the Control Room bundle certificate for single or multiple domains.

- Public certificates from IQ Bot and Control Room:

Use any tool to create the public certificates or use openssl to create Public certificate from the `DomainOne.pfx` file.

Use the following example command to create the Public certificate using openssl for `DomainOne.pfx`:

```
openssl.exe pkcs12 -in "{DomainOne.pfx file location}" -clcerts -nokeys -out "{Outputlocation}\DomainOne_ControlRoom_PublicCertificate.crt"
```

Note: For a single domain, there will be one public certificate for both, IQ Bot and Control Room.

Prerequisite for multiple domains

If the Control Room and IQ Bot are on separate domains, and the domain names are DomainOne (Control Room) and DomainTwo (IQ Bot), the following certificate files are required:

- Pfx file:

Ensure you have the `DomainOne.pfx` and `DomainTwo.pfx` files. The file size is approximately 7/8 KB.

- Public certificates from IQ Bot and Control Room:

Use any tool to create the bundle certificate or use openssl to create Public certificate from DomainTwo.pfx file.

Use the following example command to create the Public certificate using openssl for DomainTwo.pfx:

```
openssl.exe pkcs12 -in "{DomainTwo.pfx file location}" -clcerts -nokeys -out "{Outputlocation}\DomainTwo_IQBot_PublicCertificate.crt"
```

Note: : If you set up Control Room or IQ Bot with HTTPS, then configure IQ Bot with HTTPS before registering.

Configuring IQ Bot with HTTPS when Control Room is configured with HTTP

Configure IQ Bot with HTTPS when Control Room is configured with HTTP.

1. Set up IQ Bot using the PFX file with HTTPS configuration during installation.
2. Put the bundled certificate (DomainTwo_IQBot_CA.crt) for Control Room in the IQ Bot folder, after IQ Bot installation at C: \Program Files (x86)\Automation Anywhere IQ Bot\Portal\keys. Rename the DomainTwo_IQBot_CA.crt to ca.crt.

Important: If the ca.crt file in the C:\Program Files (x86)\Automation Anywhere IQ Bot <version number>\Portal\keys folder is already present, then replace it with the new ca.crt file.

3. Add the IQ Bot Public certificate (DomainTwo_IQBot_PublicCertificate.crt) to the keystore for the Control Room by running the following command as a system administrator:

```
"{Control Room installation directory}\JRE\bin\java.exe" -jar certmgr.jar -appDir "{Control Room installation directory}" -importTrustCert "{FolderLocation}/DomainTwo_IQBot_PublicCertificate.crt"
```

Configuring IQ Bot with HTTP when Control Room is configured with HTTPS

Configure IQ Bot with HTTP and HTTPS to access IQ Bot using HTTPS and HTTP in the IQ Bot URL.

1. Put the bundled certificate (DomainOne_ControlRoom_CA.crt) for Control Room in the IQ Bot folder after IQ Bot installation at C: \Program Files (x86)\Automation Anywhere IQ Bot\Portal\keys. Rename the ControlRoom_CA.crt to ca.crt.

Important: If the ca.crt file in the C:\Program Files (x86)\Automation Anywhere IQ Bot <version number>\Portal\keys folder is already present, then replace it with the new ca.crt file.

2. Add the Control Room public certificate (DomainOne_ControlRoom_PublicCertificate.crt) to the keystore for IQ Bot by running this command as a system administrator:

```
"{IQ Bot installation directory}\JRE\zulu8.40.0.20-sa-fx-jre8.0.222-win_x64\bin\keytool.exe" -import -alias cr -keystore "{IQ Bot installation directory}\JRE\zulu8.40.0.20-sa-fx-jre8.0.222-win_x64\lib\security\cacerts" -file "{FolderLocation}\DomainOne_ControlRoom_PublicCertificate.crt "
```

The system will ask for a keystore password, which is `changeit`.

Note: Sometimes the system shows a message saying `cr` exists. In this case, change `cr` in the command to `cr1` or something else.

Configuring IQ Bot with HTTPS using single domain

Configure IQ Bot with HTTPS when Control Room is configured with HTTPS using single domain.

1. Set up IQ Bot using the PFX file with HTTPS configuration during installation.
2. Put the bundled certificate (`DomainOne_ControlRoom_CA.crt`) for Control Room in the IQ Bot folder after IQ Bot installation at `C:\Program Files (x86)\Automation Anywhere IQ Bot <version number>\Portal\keys`. Rename the `DomainOne_ControlRoom_CA.crt` to `ca.crt`.

Important:

If the `ca.crt` file in the `C:\Program Files (x86)\Automation Anywhere IQ Bot <version number>\Portal\keys` folder is already present, then replace it with the new `ca.crt` file.

3. Add the Control Room public certificate (`DomainOne_ControlRoom_PublicCertificate.crt`) to the keystore for IQ Bot by running this command as a system administrator:

```
"{IQ Bot installation directory}\JRE\zulu8.40.0.20-sa-fx-jre8.0.222-win_x64\bin\keytool.exe" -import -alias cr -keystore "{IQ Bot installation directory}\JRE\zulu8.40.0.20-sa-fx-jre8.0.222-win_x64\lib\security\cacerts" -file "{FolderLocation}\DomainOne_ControlRoom_PublicCertificate.crt "
```

The system will ask for a keystore password, which is `changeit`.

Note: Sometimes the system shows a message saying `cr` exists. In this case, change `cr` in the command to `cr1` or something else.

Related concepts

[Naming guidelines for Control Room URLs](#) on page 1311

Adhere to Domain Name System (DNS) guidelines when you configure domain and subdomain Control Room URLs for On-Premises and Cloud deployments.

Configuring IQ Bot with HTTPS using multiple domains

Configure IQ Bot with HTTPS when Control Room is configured with HTTP using multiple domains.

1. Set up IQ Bot using the PFX file with the HTTPS configuration during installation.
2. Put the bundled certificate (DomainOne_ControlRoom_CA.crt) for the Control Room in the IQ Bot folder after IQ Bot installation at: C:\Program Files (x86)\Automation Anywhere IQ Bot\Portal\keys.

Rename the DomainOne_ControlRoom_CA.crt to ca.crt.

Important: If the ca.crt file in the C:\Program Files (x86)\Automation Anywhere IQ Bot <version number>\Portal\keys folder is already present, then replace it with the new ca.crt file.

3. Add the Control Room public certificate (DomainOne_ControlRoom_PublicCertificate.crt) to the keystore for IQ Bot by running this command as a system administrator:

```
"{IQ Bot installation directory}\JRE\zulu8.40.0.20-sa-fx-jre8.0.222-win_x64\bin\keytool.exe" -import -alias cr -keystore "{IQ Bot installation directory}\JRE\zulu8.40.0.20-sa-fx-jre8.0.222-in_x64\lib\security\cacerts" -file "{FolderLocation}/DomainOne_ControlRoom_PublicCertificate.crt "
```

The system will ask for a keystore password, which is changeit.

Note: Sometimes the system shows a message saying cr exists. In this case, change cr in the command to cr1 or something else.

4. Add the IQ Bot Public certificate (DomainTwo_IQBot_PublicCertificate.crt) to the keystore for the Control Room by running the following command as a system administrator:

```
"{Control Room installation directory}\JRE\bin\java.exe" -jar certmgr.jar -appDir "{Control Room installation directory}" -importTrustCert "{FolderLocation}/DomainTwo_IQBot_PublicCertificate.crt"
```

Note: For Automation 360 IQ Bot (Build 550), change JRE to jrk in the command mentioned above.

5. Next, restart the machine(s) and follow instructions to register IQ Bot.

See [Registering IQ Bot with the Control Room](#) on page 1395

Use Microsoft Azure Computer Vision OCR engine

Microsoft Azure Computer Vision OCR engine is a cloud OCR engine and is available to all customers of IQ Bot. IQ Bot automates some installation steps for Microsoft Azure Computer Vision OCR engine.

When you process documents using the Microsoft Azure Computer Vision OCR engine, data is removed immediately. Microsoft Azure Computer Vision OCR engine provides approximately 18% STP and 80% accuracy with data extraction. For more information on privacy for data retention, see [Microsoft Azure Cognitive Services](#).

Note: IQ Bot also supports containerized deployment of Microsoft Azure Computer Vision OCR engine:

[Configure IQ Bot using Docker container and Azure OCR \(A-People login required\)](#)

When creating a learning instance, you can select any language from the **Primary language of documents** drop-down menu. During processing, the OCR engine tries to auto-detect the primary language and can override your selection. For example, you can specify English, but if you upload a Spanish document, the API will try to process the Spanish language.

Tip: You can troubleshoot any issues with extracting data from low quality or handwritten documents [IQ Bot unable to extract data from low quality and Handwritten documents \(A-People login required\)](#)

Follow the steps to configure the `Settings.txt` file and use Microsoft Azure Computer Vision OCR engine.

Important: Configuring the `settings.txt` file is not applicable to Automation 360 IQ Bot Cloud

1. Ensure your IQ Bot server has internet connectivity and external DNS resolution.
Check to enable communication for the API endpoint on default port = 443: `default endpoint = https://aai-iq-bot-ocr.cognitiveservices.azure.com/`.
-

Note: To validate connectivity to the API endpoint and the server, open a web browser on the server and type in the complete URL for the API endpoint. If the browser returns a **404 error**, then it implies that a response from the API endpoint was received.

2. You can use your own Microsoft Azure Computer Vision OCR engine subscription or spell-check keys. See [Use your own keys for Microsoft Azure Computer Vision OCR engine](#) on page 1401 for more information.
3. Optional: From the `C:\Program Files (x86)\Automation 360 IQ Bot <version number>\Configurations` folder, open the `Settings.txt` file, and change the OCR engine value to `OCREngine=Tesseract4` or `OCREngine=Abbyy` to `OCREngine=MicrosoftAzureAPI`. Then save the file.
4. Run the `stopanduninstallallservices.bat` file at `C:\Program Files (x86)\Automation 360 IQ Bot\Configurations`.
After stopping the services, run `installandstartallservices.bat` file to install and start the services.
5. Create learning instances in IQ Bot, and use Microsoft Azure Computer Vision OCR engine for the text segmentation, and OCR engine for these learning instances.
For these learning instances, you can continue to use the IQ Bot capabilities for document classification, auto-mapped fields, cognitive extraction, and field value auto-correction.

List of service URLs used for Microsoft Azure Computer Vision OCR engine (optional)

- `https://aai-iq-bot-ocr.cognitiveservices.azure.com/`
 - `https://aai-iq-bot-ocr-spellcheck.cognitiveservices.azure.com/`
-

Note: All URLs point to a global service region in United States.

If IQ Bot is unable to process a document using Microsoft Azure Computer Vision OCR engine, you can review the troubleshooting tips.

[IQ Bot unable to process the document with Microsoft Azure OCR \(A-People login required\)](#)

Use your own keys for Microsoft Azure Computer Vision OCR engine

You can use your own Microsoft Azure Computer Vision OCR engine subscription or Spell Check keys.

Users can use a combination of their own Microsoft Azure Computer Vision OCR engine keys with the Spell Check keys provided by Automation Anywhere. Using the provided Spell Check keys from Automation Anywhere will send your data to the Automation Anywhere account. If you do not want to send any data to the Automation Anywhere Microsoft Azure account, you would have to provide your own Spell Check service keys, or turn it off by setting the value in the `AzureOCREngineSettings.json` file to `EnableAutoCorrectSegmentText: false`.

Follow the steps to use your own keys for Microsoft Azure Computer Vision OCR engine.

1. By default, IQ Bot's encrypted Microsoft Azure Computer Vision OCR engine subscription and Spell Check keys are used. If you prefer to use your own Microsoft Azure Computer Vision OCR engine subscription and, or Spell Check keys, go to `C:\Program Files (x86)\Automation Anywhere IQ Bot <version>\Configurations` and folder **Configurations** > **AzureOCREngineSettings.json** file, and specify your keys.

If both `SubscriptionKey` and `SubscriptionClientKey` are specified, then `SubscriptionClientKey` is used:

- `VisionSubscriptionKey`
- `VisionSubscriptionClientKey`
- `SpellCheckSubscriptionKey`
- `SpellCheckSubscriptionClientKey`

2. Enter your keys correctly to ensure proper API calls as follows:

Before:

```
{
  "VisionServiceUrl": "https://aai-iq-bot-ocr.cognitiveservices.azure.com/",
  "EngineType": 0,
  "VisionSubscriptionKey": "",
  "VisionSubscriptionClientKey": "",
  "SpellCheckSubscriptionKey": "",
  "SpellCheckSubscriptionClientKey": "",
  "EnableDebugging": false,
  "DebuggingFolder": "C:\\Users\\Public\\Documents\\Automation Anywhere IQBot Platform\\Output\\Engine\\Azure",
  "HttpTimeoutInSec": 300,
  "EnableReprocessLowConfidentSegment": true,
  "EnableAutoCorrectSegmentText": true,
  "EnableResolveOverlappedSegment": true,
  "EnableFieldMerging": true,
  "EnableFieldRegions": true
}
```

After:

```
{
```

```

    "VisionServiceUrl": "https://aai-iq-bot-ocr.cognitiveservices.azure.com/",
    "EngineType": 0,
    "VisionSubscriptionKey": "",
    "VisionSubscriptionClientKey": "191234d5e7abc1f382123459d4399e33",
    "SpellCheckSubscriptionKey": "",
    "SpellCheckSubscriptionClientKey": "336f8f6a503a4c30ba123456834d4abc",
    "EnableDebugging": false,
    "DebuggingFolder": "C:\\Users\\Public\\Documents\\Automation Anywhere IQBot Platform\\Output\\Engine\\Azure",
    "HttpTimeoutInSec": 300,
    "EnableReprocessLowConfidentSegment": true,
    "EnableAutoCorrectSegmentText": true,
    "EnableResolveOverlappedSegment": true,
    "EnableFieldMerging": true,
    "EnableFieldRegions": true
  }

```

3. Run the `stopanduninstallallservices.bat` file as an administrator. The default location of the file is at `C:\Program Files (x86)\Automation Anywhere IQ Bot <version>\Configurations`.
4. Run the `installandstartallservices.bat` file as an administrator. The default location of the file is at `C:\Program Files (x86)\Automation Anywhere IQ Bot <version>\Configurations` .
Log in or refresh your IQ Bot web page.

Use ABBYY FineReader Engine OCR engine in IQ Bot

IQ Bot supports ABBYY FineReader Engine version 12.2, 12.3, and 12.4.

When installing IQ Bot, the system automatically installs an ABBYY FineReader Engine open run-time license on your server.

Note: If you have completed the steps to upgrade IQ Bot, you must update the folder path to the `AbbyyOCREngineSettings.json` configuration file.

Use the following steps to manually install ABBYY FineReader Engine:

1. Download the OCR plug-in with IQ Bot.
2. Unzip the OCR plug-in folder in your downloads folder, and place that unzipped folder, at `<IQ Bot Installation Path>\Automation 360 IQ Bot\` .
3. Ensure the folder says `<IQ Bot Installation Path>\Automation 360 IQ Bot\OCR Plugins\ABBY SDK\12\FineReader Engine. . .`, and the unzipping does not create `OCR Plugins\OCR Plugins` twice. After you unzip the downloaded file, make sure to keep the folder name as `OCR Plugins`, and remove the version number. For example: If the unzipped folder name is `OCR Plugins 12.4`, remove the version number (12.4) from the end of the folder name.
4. To use ABBYY FineReader Engine with IQ Bot you have the following options:

Options	Description
Set ABBYY FineReader Engine as your default OCR engine	<p>Configure the <code>Settings.txt</code> file.</p> <p>Follow steps 5 and 6 to configure the <code>Settings.txt</code> file.</p> <hr/> <p>Important: Configuring the <code>settings.txt</code> file is not applicable to Automation 360 IQ Bot Cloud</p> <hr/>
Select ABBYY FineReader Engine OCR engine from the UI	To select from the UI, see Select an OCR engine on page 3557.

5. **Important:** Configuring the `settings.txt` file is not applicable to Automation 360 IQ Bot Cloud .

In Automation 360 IQ Bot Cloud, you can use the `appConfigurations` API to read and update the OCR settings.

For help with using the API, contact the Support team. [Open a support case \(A-People login required\)](#)

To set ABBYY FineReader Engine as your default OCR engine, from the `C:\Program Files (x86)\Automation 360 IQ Bot <version>\Configurations` folder, open the `Settings.txt` file, change `OCREngine=Tesseract4` to `OCREngine=Abbyy`, and save the file.

Important: Troubleshoot classification issue in processing Chinese language documents: [All files are getting unclassified while processing Chinese language documents \(A-People login required\)](#)

6. Next, run the `stopanduninstallallservices.bat` file at `C:\Program Files (x86)\Automation 360 IQ Bot\Configurations`.

Note: After stopping the services, run `installandstartallservices.bat` file to install and start the services.

7. Create learning instances in IQ Bot, and use ABBYY FineReader Engine for the text segmentation and OCR engine for these learning instances. At the same time, for these learning instances you still partner with the IQ Bot capabilities on document classification, auto-mapped fields, cognitive extraction, and field value autocorrection.

Note: If you install IQ Bot in a different folder besides `C:\Program Files (x86)\Automation 360 IQ Bot <version>`, find and open the **Configurations** > **ABBYOCREngineSettings.json** folder, and update the embedded `EnginePath` and `LicensePath` to match the different folder.

For example:

```
{
  "UseOpenRuntimeLicense": true,
  "EnginePath": "C:\\Program Files (x86)\\Automation 360 IQ Bot\\OCR
Plugins\\ABBY SDK\\12\\FineReader Engine\\Bin",
  "DeveloperSN": "",
  "ProjectId": "",
```

```
"LicensePath": "C:\\Program Files (x86)\\Automation 360 IQ Bot\\
\\Configurations\\Runtime.ABBYY.LocalLicense",
"LicensePassword": ""
}
```

Note: Sometimes, documents can fail to classify with ABBYY FineReader Engine as your default OCR engine. See recommended workaround for this issue.

[Document uploads are moving to unclassified state while using Abbyy OCR engine \(A-People login required\)](#)

- The following table lists the various ABBYY FineReader Engine versions that are supported and compatible with IQ Bot:

Table 3: Version compatibility matrix of ABBYY FineReader Engine and IQ Bot

ABBYY FineReader Engine version	IQ Bot version
12.2	(A2019.12) and below
12.2 and 12.3	(A2019.13) to (A2019.16)
12.2, 12.3, and 12.4	(A2019.17) and later

Use your own ABBYY FineReader Engine license

Follow the steps to use your own ABBYY FineReader Engine license.

- Navigate to the **IQ Bot installation directory > configuration folder**, and open `AbbyyOCREngineSettings.json` to update the following properties:
 - Change the `EnginePath` and paste the installed ABBYY FineReader Engine engine path. For example, `C:\\Program Files\\ABBYY SDK\\12\\FineReader Engine\\Bin`. Ensure the path includes separators as two backward slashes. Update the `DeveloperSN` property with the license key.
 - Update the `ProjectId` property with your license project ID.
 - Update the `UseOpenRuntimeLicense` to `false`.
- From the `C:\\Program Files (x86)\\Automation Anywhere IQ Bot <version>\\Configurations` folder, open the `Settings.txt` file to ensure or modify `OCREngine=ABBYY FineReader Engine`, and save the file.
- Run the `stopanduninstallallservices` file at `C:\\Program Files (x86)\\Automation Anywhere IQ Bot <version>\\Configurations`.
- Run the `installandstartallservices` file and log in to or refresh your IQ Botweb page.

Installation steps if ABBYY FineReader Engine remains installed from a previous IQ Bot version

If ABBYY FineReader Engine remains installed from a previous IQ Bot version, use the IQ Bot ABBYY FineReader Engine open run-time license.

- Navigate to the **IQ Bot installation directory > configuration folder**, and open the `AbbyyOCREngineSettings.json` file to update the following properties:

Change the `EnginePath` and paste the installed ABBYY FineReader Engine engine path. For example, `C:\Program Files\ABBYY SDK\12\FineReader Engine\Bin`. Ensure the path includes separators as two backward slashes.

2. Go to the ABBYY FineReader Engine installation directory, open the `Bin` folder, and remove the `Protection.Developer.dll` file.
3. From the `C:\Program Files (x86)\Automation Anywhere IQ Bot <version>\Configurations` folder, open the `Settings.txt` file, modify or ensure `OCREngine=ABBYY FineReader Engine`, and save the file.
4. Run the `stopanduninstallallservices` file at `C:\Program Files (x86)\Automation Anywhere IQ Bot <version>\Configurations`.
5. Run the `installandstartallservices` file and log in, or refresh your IQ Bot web page.

Use Google Vision API OCR engine

Use the Google Vision API OCR engine with IQ Bot to improve the accuracy of the optical character recognition (OCR) results for training documents in Asian languages, particularly in Japanese and Korean. Google Vision API OCR engine in IQ Bot supports all languages supported by the engine.

Verify that the default port 443 is available to enable communication for the API endpoint using TCP.

Note: See a list of allowed service URLs for using Google Vision API in the example section below.

Google Vision API files are installed on your machine automatically during the IQ Bot installation and is provided as a built-in plug-in, with a single-step installation, and is available for all users:

- It is a cloud OCR engine.
- Google Vision API does not support documents with more than one language. Before using this feature, ensure you want to primarily extract Japanese or Korean text only.
- Languages that are written right to left, rather than left to right, are not supported within IQ Bot for document extraction. For example, Arabic, Aramaic, Azeri, Divehi, Fula, Hebrew, Kurdish, N'ko, Persian, Rohingya, Syriac, and Urdu.

Prior to this release, the engine primarily supported data extraction for Japanese and Korean text only.

[Languages supported in Automation 360 IQ Bot](#) on page 3547

- Data is not stored in Google Cloud and is removed immediately.

For additional information on privacy for data retention see: [Google Data Usage](#)

IQ Bot provides you with the license to use the Google Vision API OCR engine. You can also use your own license key.

[Use your own license keys for Google Vision API OCR engine](#) on page 1407

Note: Updates to Google Vision API such as OCR engine improvements, enhancements, and bug fixes might affect content extraction when you use this OCR engine in IQ Bot. Therefore, we recommend that you periodically refer to the Google Vision API release notes for the latest updates.

See [Potential impact of Google Vision API OCR upgrade](#) on page 1408.

You have the following options for using this OCR engine:

Options	Description
Option 1: Set Google Vision API as your default engine	Configure the <code>Settings.txt</code> file. <hr/> Restriction: Configuring the <code>settings.txt</code> file is not applicable to Automation 360 IQ Bot Cloud <hr/>
Option 2: Select Google Vision API engine directly from the UI when creating a learning instance	Select an OCR engine on page 3557

To set Google Vision API as your default OCR engine, configure the `Settings.txt` file as follows:

Restriction: Configuring the `settings.txt` file is not applicable to Automation 360 IQ Bot Cloud

1. Run the IQ Bot installer.
2. Optional: Set Google Vision API as the default OCR for new learning instances.
Navigate to `..\Automation 360 IQ Bot\Configurations\Settings.txt`, and modify the following value: `OCREngine=GoogleVisionAPI`.
This will set Google Vision API OCR engine as the default engine for your environment.
3. The `GoogleOCREngineSettings.json` file is generated within the `..\Automation 360 IQ Bot\Configurations` folder with default values as follows:
Use the following with Google Vision API:

```
{
  "ADCJson": null,
  "EngineType": 2,
  "EnableFieldMerging": true,
  "EnableFieldRegions": true,
  "DebuggingFolder": "C:\\Users\\Public\\Documents\\Automation 360
  IQBot Platform\\Logs\\Engine\\Google"
}
```

4. For Japanese and Korean language documents, update the field: `"EnableCustomParse": true`.

Note: A service restart is not required after making the change.

List of service URLs used for Google Vision API (optional)

Use the following allowed URLs if required:

Note: All URLs point to a global service region in the US.

- API URL: <https://vision.googleapis.com/>
- Auth URL: <https://accounts.google.com/o/oauth2/auth>
- Token URL: <https://oauth2.googleapis.com/token>

- Auth Provider URL: <https://www.googleapis.com/oauth2/v1/certs>
- Client Auth URL: <https://www.googleapis.com/robot/v1/metadata/x509>

1. Create a new learning instance with the Asian language document you want to train.
2. Train the document and set your learning instance to production.
3. Upload Asian language files and run the bot.
4. Download and view the accuracy of the extraction results.

Use your own license keys for Google Vision API OCR engine

You can use your own keys for Google Vision API OCR engine subscription.

Users can use their own authentication of Google Vision API. They would need to create Google Cloud Application Default Credentials (ADC) and copy the content from ADC JSON file to the "ADCJson" field in `GoogleVisionOCREngineSettings.json`.

Note: Use the link to create Google Cloud Application Default Credentials for Google Vision API: <https://cloud.google.com/docs/authentication/production>.

Follow the steps to use your own keys for Google Vision API OCR engine.

1. By default, IQ Bot's encrypted Google Vision API subscription keys are used. If you prefer to use your own Google Vision API subscription keys, go to `C:\Program Files (x86)\Automation Anywhere IQ Bot <version>\Configurations`, and folder **Configurations > GoogleVisionOCREngineSettings.json** file, and specify your keys.
2. IQ Bot provides you with an inbuilt license for Google Vision API, but you have the option to overwrite this license if you would like to use your own. Copy the content from the ADC JSON file correctly to ensure proper API calls as follows:

```
{
  "ADCJson": {

}
```

Potential impact of Google Vision API OCR upgrade

Google Vision API OCR is Cloud based, and typically, it is upgraded to a newer version according to Google's release cycle. As a result of this upgrade, an impact might be observed on document extraction processing and extraction results in IQ Bot.

Impact on document classification in IQ Bot after the update of Google Vision API OCR

The classification of documents is based on the OCR result, particularly the order in which the fields are detected. Thus, if the content of the OCR results varies, then the classification results of the similar document processed previously might show visible differences during document extraction.

The auto-upgrade affects the classifier service in two ways:

- Different groups are assigned to documents: The documents when processed will be assigned to different groups versus what they were originally routed to so far. Consequently, some data extractions might fail, which were previously successful.
- New groups are created: The documents previously being processed with a group might now result in new group being created.

Impact on data extraction in IQ Bot after update of Google Vision API OCR

A change in OCR output might result in the following differences during data extraction from a similar document type:

- Improvement in character recognition and its associated impact: As a result of improved keyword character recognition, previously unrecognized values from a document will now provide better extraction results.

Note: If any processing logic is written to fix the lack of detected characters, it might cause issues when the document is processed.

- Degradation in character recognition and its impact: Validation might fail due to degradation in OCR output, and the document will be routed to the Validator. In a scenario where there is no validation setup, the extracted data output might see a degradation.

Options to mitigate

If you encounter any of the previously mentioned issues, you have the following options to explore:

- Retrain existing learning instance to fix issues with document classification.
- Write processing logic using Python to mitigate extraction outcomes.
- Evaluate creating learning instance with different OCR provider supported by IQ Bot.

- Raise a support ticket with Automation Anywhere.

Use Tegaki API OCR engine

Use the Tegaki API OCR engine with IQ Bot to improve the accuracy of the optical character recognition (OCR) results that is used for training documents in Japanese and Korean languages. You can configure it for use with Automation 360 IQ Bot On-Premises.

Review the following prerequisites for setting up Tegaki API OCR engine:

- Only Automation 360 IQ Bot On-Premises supports Tegaki API OCR.
- You must have a dedicated server that meets the requirements set by Cogent Labs. For more information, contact your Customer Success Manager.
- IQ Bot provides Tegaki API as a built-in plug-in. Set Tegaki API as your default OCR engine in the `settings.txt` file available in the following folder:

```
C:\Program Files (x86)\Automation 360 IQ Bot <version>\Configurations
```

- Set the communication for the API endpoint on default `port = 443`, using TCP protocol.

Important: Not available in Automation 360 IQ Bot Cloud.

Tegaki API OCR supports documents in the following languages:

- Japanese
- Korean
- Japanese- English
- Korean- English

1. Run the IQ Bot installer.
2. Configure the Tegaki API OCR engine for the On-Premises version on your machine based on instructions received from your Automation Anywhere representative.
3. Input your license key in the Tegaki OCR settings.json file.

As IQ Bot does not provide you with the license to use the Tegaki API OCR engine, you must use your own license key. Follow the steps to install your own license key:

- a) Navigate to the following location:

```
C:\Program Files (x86)\Automation 360 IQ Bot\Configurations
```

- b) Set up the Tegaki API endpoint where you have installed the On-Premises version. Set `APIKey = <your key here>` and configure the `TegakiOCREngineSettings.json` file.

```
{
  "APIKey": "<ensure your key meets UUID format (https://www.uuidgenerator.net)>",
  "RestEndpointURL": "<your Tegaki Server URL here>",
  "RestEndpointPort": <80>,
  "EngineType": 3,
  "EnableFieldMerging": false,
  "EnableFieldRegions": false,
  "DebuggingFolder": "C:\\Users\\Public\\Documents\\Automation Anywhere IQBot Platform\\Logs\\Engine\\Tegaki"
}
```

See [How to change OCR Settings in IQ Bot \(A-People login required\)](#).

4. Navigate to `..\Automation 360 IQ Bot\Configurations\Settings.txt`, and modify the following value: `OCREngine=TegakiAPI`.

The `TegakiOCREngineSettings.json` file is available after IQ Bot installation.

1. Create a new learning instance with the Asian language document you want to train.
2. Train the document and set your learning instance to production.
3. Upload Asian language files and run the bot.
4. Download and view the accuracy of the extraction results.

Related concepts

[Install and update Automation 360 IQ Bot](#) on page 1366

This collection of topics guide you through the process of installing or setting up Automation 360 IQ Bot On-Premises and Cloud.

Resolving IQ Bot registration failure

Use the instructions in this topic if IQ Bot registration fails due to HTTPs URL issues.

1. Use Windows **Services** to restart the Control Room service.
2. Update the Control Room HTTPs URL by logging in to **Control Room > Administration > Settings > General**.
3. Use Windows **Services** to restart the following services:
 - Automation Anywhere Control Room Cognitive Console
 - Automation Anywhere Control Room Reverse Proxy
4. Re-register IQ Bot with the HTTPs URL in the Control Room.
IQ Bot is registered successfully.

Unregistering IQ Bot from the Control Room

You have to unregister IQ Bot from the Control Room if the IQ Bot URL changes because of installation or uninstallation of IQ Bot, or when a load balancer is added.

After unregistering IQ Bot from the Automation Anywhere Control Room, restart the Automation Anywhere Cognitive Console service.

1. Using the **sysadmin** role, run two separate SQL queries in different databases.
2. Run the first set of SQL statements in the Control Room database to delete the following data:

Run the following SQL statements for versions A2019.10 to A2019.13:

```
DELETE FROM [AAE-Database].[dbo].[ACTIVEMQ_ACKS]
```

```
DELETE FROM [AAE-Database].[dbo].[ACTIVEMQ_MSGS]
```

```
DELETE FROM [AAE-Database].[dbo].[SERVICE_USER]
```

```
DELETE FROM [AAE-Database].[dbo].[USERS] where  
user_type='APP'
```

Run the following SQL statements for version A2019.14 and later:

a) Run the following query:

```
USE [AAE-Database]
SELECT T.uuid As TenantID,T.name AS  
TenantName,T.created_by,T.enabled,U.id AS  
IQBotAppUserId,U.user_type,S.url AS  
IQBotURL FROM [dbo].[TENANTS] T  
LEFT JOIN [dbo].[USERS] U ON T.uuid = U.tenant_uuid  
LEFT JOIN [dbo].[SERVICE_USER] S ON U.id = S.id  
WHERE (U.user_type='APP' AND S.type='IQBOT')
```

b) The above query will provide you an 'IQBotAppUserId' number. Replace id = 'IQBotAppUserId'.

c) Execute the following delete queries:

```
DELETE FROM [AAE-Database].[dbo].[SERVICE_USER] WHERE  
[type]='IQBOT'
```

d)

```
DELETE FROM [AAE-Database].[dbo].[USERS] WHERE id =  
'IQBotAppUserId'
```

3. Run the second set of SQL statements in the IQ Bot configuration database to delete the following data:

- ```
DELETE FROM [IQBot].[dbo].[Configurations] where
[key]='controlRoomVersion'
```
- ```
DELETE FROM [IQBot].[dbo].[Configurations] where  
[key]='appRegistered'
```
- ```
DELETE FROM [IQBot].[dbo].[Configurations] where
[key]='controlRoomUrl'
```
- ```
DELETE FROM [IQBot].[dbo].[Configurations] where [key]='appId'
```

You have unregistered successfully.

Set up log file automatic rollover

This topic addresses setting up automatic rollover of log files based on the file size.

After the log files are created, the system continues logging messages, which increases the log file size to a point where they are too large to open. This prevents the user from opening the log files for reviewing the information and error messages.

Note:

- This happens sooner if the logging level is increased to DEBUG or TRACE modes.
- To ensure smooth operation of the system, manual clear the logs periodically.

For all Java services, user can identify the log files under `<IQ Bot installation directory>/Services` . Open any logging configuration file, and add the following change under `<SizeBasedTriggeringPolicy size="100MB" />` in the first occurrence of Policies:

```
<Policies>
<TimeBasedTriggeringPolicy interval="720" />
<SizeBasedTriggeringPolicy size="50MB" />
</Policies>
```

In the following example setting, after the log file reaches 50 MB, the system creates a new file automatically and starts logging in it. Though the user ends up with more files, but each file would be 50 MB only. This is standard practice to manage log files.

This example shows entries a user can add to the setting for Automation 360 IQ Bot On-Premises to automatically roll over the logs after the files reach a certain size.

```
<RollingFile name="Alias" fileName="${env:PUBLIC}/Documents/Automation
Anywhere IQBot Platform/Logs/Alias.log"
    filePattern="${env:PUBLIC}/Documents/Automation
Anywhere IQBot Platform/Logs/Archive/${date:yyyy-MMM}/Alias-%d{yyyy-
MMM-dd}-%i.log.zip"
    immediateFlush="true"
    append="true">
    <PatternLayout pattern="CPL1 Alias %X{cid} %d{ISO8601}
{UTC}Z %-5level %C %M %msg %n"/>
    <Policies>
        <TimeBasedTriggeringPolicy />
        <SizeBasedTriggeringPolicy size="50MB" />
    </Policies>
    <DefaultRolloverStrategy max="10"/>
</RollingFile>
```

Health Check API response if RabbitMQ v3.8.18 fails to start

Check the status of each IQ Bot service using the Health Check API if RabbitMQ v3.8.18 fails to start.

The Health Check response for RabbitMQ startup failure is different in case of FileManager, Project, Validator, VisionBot as described in the following table.

Service name	Health Check response	Reason for failure
FileManager http:// <hostname>:<9996>/ healthcheck	<u>Failure 1</u> : localhost refused to connect <u>Failure 2</u> : localhost refused to connect	Reason for failure 1: The RabbitMQ v3.8.18 node/ service went down when the Filemanager service was running. Reason for failure 2: The RabbitMQ node/service was already down when the Filemanager service started.
Project http:// <hostname>:<9999>/ healthcheck	<u>Failure:</u> localhost refused to connect	Reason for failure: The RabbitMQ v3.8.18 node/ service is down.
Validator http:// <hostname>:<9995>/ healthcheck	<u>Failure:</u> localhost refused to connect	Reason for failure: The RabbitMQ v3.8.18 node/ service is down.
VisionBotManager http:// <hostname>:<9998>/ healthcheck	<u>Failure:</u> localhost refused to connect	Reason for failure: The RabbitMQ v3.8.18 node/ service is down.
Gateway-2 service http:// <hostname>:8100/ healthcheck	Application: gateway-2 <u>Failure 1:</u> localhost refused to connect <u>Failure 2:</u> localhost refused to connect	Reason for failure 1: Port is blocked and the Gateway-2 service is running. Reason for failure 2: The Gateway-2 service is not running.

Reinstalling HTTPS SSL certificate for secure communication when it expires

Reinstall HTTPS SSL certificate in Automation 360 IQ Bot when your HTTPS SSL certificate expires.

The HTTPS SSL certificate is required for secure and encrypted communication between your browser and IQ Bot, to protect highly confidential online transactions, for example, online financial and shopping transactions. The padlock icon on your browser indicates that you have an active secure connection.

To enable a secure connection, get the HTTPS SSL certificate as follows:

1. Go to `%installation_dir%\Configurations` and as an administrator, run `stopanduninstallallservices.bat`.

Note: In a cluster installation, stop the services on each of the nodes for IQ Bot and Control Room cluster.

2. Go to `%installation_dir%\Portal\keys` and make a backup of the `cert.crt`, `key.key`, and `ca.crt` files.
3. Convert the `.pfx` file of the IQ Bot certificate to `.crt` and `.key` formats by running the following commands:

- Extract an encrypted key from `.pfx` file.

```
openssl.exe pkcs12 -in "path_to_cert\example.pfx" -nocerts -out
"path_to_cert\example encp.key"
```

Note: If the `.pfx` file is password protected, you need to enter the pass phrase when prompted.

- Convert an encrypted key to a readable format.

```
openssl.exe rsa -in "path_to_cert\example encp.key" -out
"path_to_cert\key.key"
This command converts encrypted key to a readable format.
```

- Convert the `.pfx` file to `.crt` format.

```
openssl.exe pkcs12 -in "path_to_cert\example.pfx" -clcerts -nokeys
-out
"path_to_cert\cert.crt"
```

- Fetch the `ca.crt` file from the Control Room certificate (`.pfx`) file only if the Control Room certificate also expires.

```
openssl pkcs12 -in <filename.pfx> -cacerts -nokeys -chain -out
<ca.crt>
```

4. Copy or replace the `cert.crt`, and `key.key` (generated in the previous step), and the `ca.crt` (generated using the Control Room certificate `.pfx` file) to the `%installation_dir%\Portal\keys` folder.

5. Import the IQ Bot public certificate into the Java Key store for IQ Bot by running this command as a system administrator:

```
"JRE Location\bin\keytool.exe" -import -alias iqbot-keystore
"cacerts location of iq bot" -file " iq bot public certificate
file"
```

Example: C:\Program Files (x86)\Automation Anywhere IQ Bot <version number>\JRE\1.8.0_161\bin\keytool.exe" -import -alias cr -keystore "C:\Program Files (x86)\Automation Anywhere IQ Bot <version number>\JRE\1.8.0_161\lib\security\cacerts" -file "C:\Certificate\cert.crt"

6. To import the IQ Bot public certificate into Control Room, go to the Control Room installation path, such as: C:\Program Files\Automation Anywhere\Enterprise, and run the following command as a system administrator: jrk\bin\java -jar certmgr.jar -appDir "C:\Program Files\Automation Anywhere\Enterprise" -importTrustCert "C:\Certificate\cert.crt".
7. After importing the certificates, restart the Control Room and IQ Bot servers.
This refreshes the system caches.
8. On IQ Bot Server, go to %installation_dir%\Configurations and as an administrator, run installandstartallservices.bat.

If the Control Room certificate expires

1. Follow the steps: [Import HTTPS and CA certificates](#)
2. Convert .pfx to .crt format.openssl.exe pkcs12 -in "path_to_cert\example.pfx" -clcerts -nokeys -out "path_to_cert\cert.crt".
3. Fetch the ca.crt file from the Control Room certificate (.pfx) file.openssl pkcs12 -in <filename.pfx> -cacerts -nokeys -chain -out <ca.crt>
4. Copy or replace the ca.cert to the keys folder in IQ Bot.
5. Import the Control Room public certificate into Java Key store for IQ Bot by running this command as a system administrator: "JRE Location\bin\keytool.exe" -import -alias cr -keystore "cacerts location of iq bot" -file "control room public certificate file".

Example: C:\Program Files (x86)\Automation Anywhere IQ Bot <version number>\JRE\1.8.0_161\bin\keytool.exe" -import -alias cr -keystore "C:\Program Files (x86)\Automation Anywhere IQ Bot <version number>\JRE\1.8.0_161\lib\security\cacerts" -file "C:\Certificate\cert.crt"

Note: To change the Control Room certificate, follow steps here: [Import HTTPS and CA certificates](#)

Updating Automation 360 IQ Bot

Update Automation 360 IQ Bot On-Premises to the most recent version for all the latest features and enhancements.

Ensure you back up your existing IQ Bot learning instances. Depending on the Automation 360 IQ Bot version you are currently using, the following update options are available:

- Update from earlier Automation 360 IQ Bot builds (1089, 1598, and 2079) to the latest Automation 360 IQ Bot On-Prem version

The earlier versions of Automation 360 IQ Bot had five databases. A single unified database is available starting with Automation 360 IQ Bot On-Premises Build 2545. Use the migration script to migrate these five databases to a unified database.

[Run IQ Bot On-Premises database migration script](#) on page 1416

- Update to the latest version of Automation 360 IQ Bot On-Prem.

Ensure you update your existing Automation 360 IQ Bot On-Premises to the latest version which provides the product improvements and bug fixes.

[Update Automation 360 IQ Bot On-Premises to the latest version](#) on page 1417

- Troubleshoot CyberArk vault integration for upgrade

If you encounter a vault key validation error while upgrading Automation 360 IQ Bot to Build 15112, troubleshoot the issue by ensuring the JDBC Driver is in the `C:\Windows\System32` folder.

[Troubleshoot CyberArk vault integration for upgrade \(A-People login required\)](#)

Run IQ Bot On-Premises database migration script

IQ Bot On-Premises Builds 1089, 1598, and 2079 included five databases. Starting with IQ Bot On-Premises Build 2545, one unified database is supported. You have to run a migration script to migrate the databases of Builds 1089, 1598, 2079 to the latest build.

Before you run the migration script, you must be on the latest IQ Bot On-Premises build, and verify that the SQL command utility `SQLCMD.exe` is installed on your system.

Also, verify and ensure Microsoft ODBC Driver 17 for SQL Server is installed on the IQ Bot server. This can be obtained from: <https://www.microsoft.com/en-us/download/details.aspx?id=56567>

1. Uninstall the current build of IQ Bot On-Premises.
2. Install the latest IQ Bot On-Premises build.

During installation, a new IQ Bot database is created.

Note: Remember your database username and password in order to the update migration script value.

3. Navigate to your Binn folder.

This might be located in `C:\Program Files\Microsoft SQL Server\Client SDK\ODBC\170\Tools\Binn`.

4. Verify that `SQLCMD.exe` is installed.

If `SQLCMD.exe` is not installed, follow these steps:

- a) Download and extract the `Data Migration.zip` from the [Installation Setup](#) folder onto the IQ Bot server.
- b) Navigate to **DataMigration > UTILITY-MsSqlCmdLnUtils**.
- c) Run `MsSqlCmdLnUtils.msi` to install `SQLCMD.exe`.

After `SQLCMD.exe` is installed, run the migration script.

1. Access the `AA.IQBot_Database_Migration.bat` file within the `DataMigration` folder.
2. Edit the `AA.IQBot_Database_Migration.bat` file.
3. Update the values as follows:
 - a) Set the `SQLCMD` value to the path of your Binn.

```
SQLCMD="C:\Program Files\Microsoft SQL Server\Client SDK\ODBC
\170\Tools\Binn\SQLCMD.exe"
```

- b) Set `LOGIN` value to your database username.
`LOGIN="database username"`

Note: The **bulkadmin**, **dbcreator**, and **public** roles are required to run the migration script.

- c) Set the `PASSWORD` value to your database password.
`PASSWORD="database password"`
- d) Set the `SERVER` value to the path of your database server hostname.
`SERVER="path of database server hostname"`

4. Run the migration script `AA_IQBot_Database_Migration.bat` file with administrator privilege.
After the migration is complete, an output is created. Verify `C:\Datamigrationlog.txt` for log history and errors.

Note: If an output is not displayed, contact support.

Update Automation 360 IQ Bot On-Premises to the latest version

If you are using any of the earlier versions of Automation 360 IQ Bot On-Premises, you can update to the latest version, which offers enhancements and bug fixes.

It is recommended that you review your existing Automation 360 IQ Bot On-Premises version and back up your database, output path, and installation configuration files.

Note: Uninstall the existing version of Automation 360 IQ Bot On-Premises from your device before updating to the latest version.

1. Go to Automation Anywhere support site to download the latest version of the Automation 360 IQ Bot setup file.
[A-People Downloads page \(Login required\)](#)

2. Click the link to the latest Automation 360 IQ Bot setup file.
3. Click **Installation Setup**.
4. Download the `Automation_Anywhere_IQ_Bot_A2019_Build_<build number>.exe` file and install it.
[Install and update Automation 360 IQ Bot](#) on page 1366

The latest version of Automation 360 IQ Bot On-Premises is installed on your device.

Upgrading and downgrading IQ Bot

Uninstall and install a later version to upgrade IQ Bot. Uninstall and install an earlier version of IQ Bot to downgrade.

To upgrade or downgrade IQ Bot, perform the following procedure.

- Upgrading IQ Bot
 - a) Create a new folder in any location and take a backup of the `Settings.txt` and both or either of the `.json` files `ImageProcessingConfig.json` or `AbbyyImagePreProcessingSettings.json` for your reference from the `<Installation Path/Configuration>` folder to this new folder.
 - b) Take a backup of the existing IQ Bot databases before starting the upgrade.
 - c) Follow the uninstall process:
[Uninstalling IQ Bot](#) on page 1419
 - d) Copy a later version of IQ Bot installable file from `<path of the installable file>` to your local system.
 - e) Follow the installation process.

Note:

- Refer to the settings from the `Settings.txt` and both or either of the `.json` files `ImageProcessingConfig.json` or `AbbyyImagePreProcessingSettings.json` to enter the configuration values when you are installing an earlier version of the product.
- Back up your database to restore it in case any issue occurs in future or in case you downgrade to an earlier version of IQ Bot.
- If you are using the ABBYY FineReader Engine OCR, you must update the folder path to the `AbbyyOCREngineSettings.json` configuration file after completing the upgrade installation steps.

[Migrate learning instances](#) on page 1664

- Downgrading IQ Bot
 - a) Create a new folder in any location and take a backup of the `Settings.txt` and both or either of the `.json` files `ImageProcessingConfig.json` or `AbbyyImagePreProcessingSettings.json` for your reference from the `<Installation Path/Configuration>` folder to this new folder.
 - b) Uninstall the later version of IQ Bot.
 - c) Take a backup of the current databases.

- d) Remove the backup of the current databases.
- e) Restore the database backup of the earlier IQ Bot version.
- f) Install the earlier version of IQ Bot.

Note:

- Refer to the settings from the Settings.txt and both or either of the .json files ImageProcessingConfig.json or AbbyyImagePreProcessingSettings.json to enter the configuration values when you are installing an earlier version of the product.
 - Back up your database to restore it in case any issue occurs in future or in case you upgrade to a different version of IQ Bot.
-

Uninstalling IQ Bot

If you have installed Automation 360 IQ Bot On-Premises, use these steps to uninstall IQ Bot and its dependencies.

To manually uninstall, go to **Windows > Control Panel > Programs > Uninstall a program**, and choose IQ Bot.

For all other versions, use the following steps.

1. Double-click the Automation_360_IQ_BOT_<version-number>.exe installer file. The Automation Anywhere IQ Bot - Wizard appears.
2. Enter the administrative permissions in the **User Access Control** dialog box if a dialog box appears.

Note: Ensure you close all the existing browser instances running IQ Bot before you begin uninstallation.

3. Click **Next**. The **Ready to Remove** page appears.
4. Click **Remove**.

The uninstallation process begins.

Note: During the uninstallation process, if setup information appears, click **OK** to continue. Clicking **Cancel** to close the process.

5. When complete, the **Finished** page appears. Click **Finish** to complete the process.

Note: Uninstalling IQ Bot does not delete the IQ Bot database or any of the following dependencies. Manually remove them using recommended third party procedures.

- Erlang/OTP
- RabbitMQ v3.8.18
- NodeJS
- SQL Server Native Client

- Python
-

High Availability and Disaster Recovery overview

High availability (HA) provides a failover mechanism if an IQ Bot service or server fails. Disaster recovery (DR) enables recovery across a geographically separated distance if a disaster causes an entire data center to fail.

IQ Bot uses a minimum of 3 nodes and a maximum of 5 nodes in a cluster for high availability (HA).

IQ Bot HA and DR solution

In the context of IQ Bot, implementation of High Availability (HA) and Disaster Recovery (DR) reduces downtime and maintains continuity of business (CoB) for your bot activities.

- **High Availability (HA)**—High availability is an architectural system design that attempts to safeguard a system against certain failure scenarios. This means that even if parts of a system is failing, as a whole it is still available and usable. High availability solutions typically protect against specific scenarios such as: server failures, single component failures, dependency failures, variable load increases, and networks splits where dependent on system components that become unreachable on a network.
- **Disaster Recovery (DR)**—Disaster recovery involves a set of policies and procedures to enable the recovery or continuation of vital infrastructure and systems following a natural or human-induced disaster. Disaster recovery addresses many different causes of failures in a system where high availability typically accounts for a predictable few. Disaster recovery has a focus on re-establishing services after an incident not just failover. Recovery of a system includes scenarios such as: restarting a service or system, restoring configuration files or a database from backups.

To ensure HA and DR protection of your IQ Bot components, configure your existing HA and DR infrastructure, load balancing, and failover systems to include IQ Bot servers and services. See your data center administrator for your approved local HA and DR procedures.

Required HA and DR infrastructure elements

- **Distributed Approach**—In addition to clustering IQ Bot related data center components, we also recommend that you deploy IQ Bot on multiple physical and, or virtual servers.
- **Load balancing**—Performed by a load balancer, this is the process of distributing application or network traffic across multiple servers to protect service activities and allows workloads to be distributed among multiple servers. This ensures bot activity continues on clustered servers.
- **Databases**—Databases use their own built-in failover to protect the data. This ensures database data recovery.
 - Between the HA clusters, configure synchronous replication between the primary (active) and secondary (passive) clustered MS SQL servers in the data center. This ensures consistency in the event of a database node failure.

For the required HA synchronous replication, configure one of the following:

- Backup replica to **Synchronous-Commit mode of SQL Server Always On** availability groups
- SQL to **Server Database Mirroring**
- Between the DR sites, configure your database to provide asynchronous replication from the primary (production) DR site to the secondary (recovery) DR site that is at a geographically separated location from the primary DR site.

Sample scenario

Point all IQ Bot instances within the same cluster to the same database and repository files. This is required to enable sharing data across multiple servers and ensuring data integrity is maintained across IQ Bots servers within a cluster.

HA and DR deployment models

To ensure your IQ Bot is protected by HA and, or DR, configure your data centers according to the deployment models described in:

- [High Availability deployment model](#) on page 1424
- [Disaster Recovery deployment model](#) on page 1424

HA implementation requirements

- Install IQ Bot on multiple servers.
- Access to IQ Bot is through a load balancer.
- Open a RabbitMQ v3.8.18 synchronization port between IQ Bot servers.
- Configure the Microsoft SQL Server in high availability mode.

Installation HA and DR configuration requirements

- The IQ Bot installer does not directly support cluster installation. To set up a cluster do the following:
 - Run the installer on each application server node.
 - Share the `output` folder using the access role `Everyone`.
 - Post installation, execute the `messagequeue_cluster_configuration.bat` with appropriate command line arguments.
- Configure IQ Bot in a high availability configuration.
- Open firewall ports: 4369 and 25672.
- Install RabbitMQ v3.8.18 on every IQ Bot node in the cluster.

The first node where IQ Bot is installed becomes the primary RabbitMQ v3.8.18 node. The host name of the primary node is used to configure the RabbitMQ v3.8.18 cluster.

- The load balancer is required to distribute a traffic to all IQ Bot server nodes.
- Configure Microsoft SQL Server for high availability. Use the Microsoft SQL Server **Always On** option.
- For RabbitMQ v3.8.18 specific installation, see your RabbitMQ v3.8.18 documentation.

HA and DR known limitations

- To discover the availability of IQ Bot instances, a load balancer periodically sends pings, attempts connections, or sends requests to test the IQ Bot instances. These tests are called health checks.
- Health checks do not verify the availability of RabbitMQ v3.8.18 instances.

HA cluster configuration overview

To support Automation Anywhere your data center, configure an HA cluster. Follow your company methods and procedures for implementing your data center cluster.

HA clusters protect services and data in the event of a server or service failure. The following is a list of processes associated with clusters.

Database replication	Configure synchronous replication between the primary site (active) and secondary site (passive) MS SQL servers to ensure consistency in the event of a database node failure.
Downtime	The amount of downtime depends on the number of restart attempts the administrator configures for the primary server services, the number of failovers allowed per number of hours, and the failback configuration.
Failback	After the primary server is returned to normal, fail back the workload from the secondary servers to the primary servers. The primary server becomes the active server again. Restoring operations to the primary system or site after a failover or disaster recovery on a secondary system or site.
Failover	If one of the primary servers fails, the workload of the failed server automatically shifts to the secondary server in the cluster. This automatic process is called failover. Failover ensures continuous availability of applications and data. When failover completes, the secondary server becomes the active server. When a (primary) system detects a fault or failure, it automatically transfers control to a (secondary) duplicate system. This applies to HA clusters, where failover is from one server to another.

Graceful degradation	Process allowing cluster dependencies to operate gracefully on a degraded primary site.
Redundancy	HA clusters use redundancy to prevent single points of failure (SPOF), such as a failed server or service. HA clusters include primary (active) servers that host services or databases and secondary (passive) servers that host replicated copies of the services and databases.
Replication	The secondary servers have the same configuration and software as the primary servers, they are a duplicate (redundant copy) of the primary. Data is replicated (copied) from the primary servers to the secondary servers.

To support HA and DR for Automation Anywhere, configure the selected components in your data center for HA.

Note: In the context of clusters, though the terms server, host, and node each have specific meaning, they are frequently used interchangeably.

Cluster	A cluster is a set servers (nodes) that are connected by physical cables and software. In an HA environment, these clusters of servers are allowed to be in the same physical data center.
Cluster group (role)	Group of clustered services that failover together and are dependent on each other.
Host	The cluster machine that is hosting the services.
Multiple servers	The HA technique where operations are available across multiple servers with workload managed by a load balancer. This applies to IQ Bot instances.
Node	A generic term for a machine in a cluster.
Primary node	The active node in the cluster. The machine where the production activities run. This applies to the database servers.
Secondary node	The machine that is designated as the target in the event of a failover. The secondary node is a passive duplicate of the primary node. This applies to the database servers.
Server	The machine in the cluster installed with the server operating system.

HA cluster technologies guard against three specific types of failures:

Application and service failures	These affect application software and essential services.
Site failures in multisite organizations	This is caused by natural disasters, power outages, or connectivity outages.

System and hardware failures	This affects hardware components such as CPUs, drives, memory, network adapters, and power supplies.
------------------------------	--

This ability to handle failure allows clusters to meet two requirements that are typical in most data center environments:

High availability	The ability to provide end users with access to a service for a high percentage of time and reduces unscheduled outages.
High reliability	The ability to reduce the frequency of system failure.

High Availability deployment model

The High Availability (HA) deployment model provides failure tolerance for the IQ Bot servers, services, and databases.

The following shows IQ Bot and data center components.

In this example, the IQ Bot servers and Microsoft SQL Servers have HA redundancy.

- Multiple users have access the IQ Bot cluster through their web browsers. The web browsers communicate to the IQ Bot cluster through the load balancer.
- Multiple Bot Runners communicate to the IQ Bot cluster through the load balancer.
- The server message block (SMB) file share and the Microsoft SQL Server store data from the IQ Bot cluster.
- Microsoft SQL Server uses redundancy through replication syncing to the clustered Microsoft SQL Server.

Pros	Maintains availability when server failures occur within a single data center.
Cons	Does not provide protection against data center outage.
Use Cases	Small to medium-size businesses that do not require multi-site disaster recovery.

Disaster Recovery deployment model

The Disaster Recovery (DR) deployment model uses high availability (HA) clusters distributed over a geographic area.

Disaster Recovery (DR) is a method where two high availability (HA) data center configurations are separated geographically. The extra benefit here from a single location HA configuration is that in the event of a localized disaster, the physically removed data center resumes functions with minimum downtime.

Prerequisites

Before performing the IQ Bot DR, review the following prerequisites:

- Enable the inbound and outbound ports.

- Add all the hostnames in the host file entries for all the nodes.
- Ensure that the primary and secondary databases are in sync.
- Automation Anywhere Control Room and IQ Bot must be installed on both primary (active) and secondary (passive) DR sites.
- While switching between the primary and secondary servers, ensure the following:
 - If the secondary database has read-only permission, the primary database has read/write permission.
 - If the secondary database has read/write permission, the primary database has read-only permission.

The following diagram shows the IQ Bot DR setup:

In this example, all the servers have redundancy.

- Multiple users have access the IQ Bot cluster through their web browsers. The web browsers communicate to the IQ Bot clusters through the load balancers.
- Multiple Bot Runners communicate to their IQ Bot cluster through the load balancer.
- The server message block (SMB) file share and the Microsoft SQL Server store data from their IQ Bot cluster. Both servers are asynchronously replicated to the backup disaster recovery site.
- Microsoft SQL Server uses redundancy through replication syncing to the clustered Microsoft SQL Server on the primary disaster recovery site.

For disaster recovery in IQ Bot environment.

- Deploy a second IQ Bot HA cluster in an additional data center that is in a separate geographic location.
- In the event of a primary site failure, do the disaster recovery manually. See [Disaster recovery failover steps overview](#) on page 1427.

Note: When a failover to a backup site occurs, it is possible that very recent changes made on the primary site are lost.

Pros	Provides business continuity when faced with data center outage or loss.
Cons	Increased operational burden.

Contact your Customer Success Manager (CSM) or Partner Enablement Manager (PEM) for more information on benchmarking IQ Bot On-Premises Disaster Recovery.

[IQ Bot On-Premises Disaster Recovery benchmarking \(A-People login required\)](#)

DR configuration requirements

When you configure your Disaster Recovery enabled data centers for IQ Bot, ensure the listed conditions are met.

Disaster Recovery configuration requirements

- Asynchronous replication—Configure asynchronous, rather than synchronous replication, between DR sites for all supporting services. This ensures off-site replication does not impact performance of the primary site.
- AD domain—Ensure the same Active Directory domain is available to both the primary and backup sites.
- Site domains—Ensure the backup site Control Room and device machines are members of the same domain as the primary site Control Room and machines.
- Licenses—Assign floating licenses for users, so that they are able to log into devices on the backup site.
- Backup site services—Shutdown the Control Room services at the backup site until they are needed.
- Site configurations—Ensure the machines at the primary site and backup site have the same specification and configuration. This includes the Control Room, Bot Runners, associated devices, and login credentials. This is required to ensure equal level of service during an outage.

Note: Schedules are stored in UTC and therefore run at the same time regardless of the physical location or time zone settings of the server.

Database Replication Details

The database replication configuration for disaster recovery is an extension of the high availability configuration. This configuration requires the use of **Always On** availability groups.

- Configure the primary site replica in **Synchronous-Commit** mode.
- Configure the recovery site replica in **Asynchronous-Commit** mode. **Asynchronous-Commit** mode ensures that the latency and reliability of the inter-datacenter does not impact the performance and availability of the primary site.
- Do not configure the recovery site replica to offer any database services until a recovery failover is triggered.

Failure mode

With asynchronous replication there is the possibility that a transaction that occurs on the primary site does not reach the recovery site replica before the failure occurs.

Note: This possibility of losing the most recent transactions applies to all DR automated application solutions using asynchronous replication, not just Automation Anywhere solution.

Deployment requires strict consistency between distant geographical locations. **Synchronous-Commit** configured between replicas with significant latency has a detrimental effect on all Control Room operations.

To prevent work items being processed twice when a failure occurs, some work items awaiting delivery to a device are placed into an error state. This ensures they can be manually reviewed and marked as ready to be processed or complete as appropriate.

Disaster recovery failover steps overview

Overview of failover steps for IQ Bot recovery after a disaster.

Complete the disaster recovery deployment on two geographically separated sites, where one site is primary (active) and the other is a backup (passive) site. Disaster recovery is performed on remote backup site.

The procedure is identical regardless of whether switching over from primary to secondary (recovery), or secondary to primary.

If the failed IQ Bot nodes are still available:

1. Shut off all IQ Bot services at the primary site.
2. Failover all IQ Bot-related databases using the database tools.
3. Failover your Server Message Block (SMB) share using the appropriate tools to make the recovery site SMB file share writable.
4. Start IQ Bot services at the recovery site.
5. Wait until the IQ Bot web interface is available.
6. Login to the web interface as an administrator.
7. After the recovery site is operating as the primary site, configure a replacement secondary site. Using the database tools, set replication from the recovery primary site to the replacement secondary site.

Re-establish a duplicate DR site

After a secondary (backup) site is recovered as the primary (production) site, establish a new secondary DR site.

The recovery site is up and running as the new production site.

The process of returning activity to a primary (active) production site, plus secondary (backup) site depends on the state of the original primary site.

- If the old production environment becomes available again, complete the following to switch back to the original DR primary site.
 - a) Restore/replicate the DR database and file system to the original production database and file system respectively.
 - b) Bring up the new DR primary (production) IQ Bot.
 - c) Verify new DR primary (production) environment is working, as expected.
 - d) Stop the DR IQ Bot services on the DR recovery site.
 - e) Establish the replication between the new DR primary (production) and DR secondary (standby) IQ Bot (DB and NAS).
- If the old DR primary production environment is rendered completely unusable due to the disaster, re-establish a new secondary (standby) DR site. Complete the recovery DR steps to re-establish primary and secondary DR sites.

- a) Restore/replicate the database and file system data from DR environment to the new production environment.

No additional steps are required. The DR primary and secondary sites are restored.

- The bot Activation utility does not need to be run again. Activation occurs when IQ Bot is first deployed to the DR cluster sites only.
- For any subsequent disasters, only the database query needs to be run on DR secondary (standby) IQ Bot database. This is required because the replication between DR primary (production) and DR secondary (standby) overwrites DR secondary site Bot Runner data in DR secondary site database with DR primary (production) Bot Runner data.
- Similarly, the mapping between DR primary and DR secondary Bot Runner is established. Use the same mapping for all subsequent disasters or mock drills.

Log in to Automation Anywhere Control Room

To log in to Automation 360, open the Control Room URL in your browser, enter your credentials in the login screen, and click **Log in**.

Receive your registration confirmation email.

- Automation 360 users: This is sent by your system administrator.
- Community Edition users:
 1. Register for the Community Edition.
[Get started with Community Edition](#) on page 1269
 2. This is sent by Automation Anywhere using the information you provided when you registered.

This email contains:

- Control Room URL
- Username, credentials, and provisioning tokens (where applicable)
- Temporary password

Reset this password when you log in the first time.

Note: If you use the Microsoft Internet Explorer browser to log in to the Control Room, a notification banner is displayed indicating that support for Internet Explorer 11 is ending. Your Control Room will no longer be accessible on Internet Explorer. Starting from the Automation 360 v.25 release, you will be prompted to access the Control Room through an alternative supported browser, such as Google Chrome or Microsoft Edge (Chromium). Refer to the banner for details on how you can evaluate any potential impact to your existing automations. [Microsoft Internet Explorer 11 EOL FAQ](#) on page 1044

1. Open the URL in your browser.
2. In the **Log in** form, enter your username and password.
If this is the first time you are logging in, use the password provided in your welcome email.
3. First-time users: Change your password. For Cloud users, create your security questions.

The change password and create security questions form automatically opens when you log in for the first time. Complete the form.

a) Complete the **Change password** fields.

Enter your current password, enter your new password, and confirm the new password.

Passwords must be 8-15 characters long and can only contain the following characters: a-z, A-Z, 0-9, at sign (@), dash (-), underscore (_), exclamation point (!), number sign (#), dollar sign (\$), percent (%), ampersand (&), and period (.).

b) For Cloud users: In each pair of question and answer fields, enter a question and an answer that you will remember if you forget your password or must confirm your login.

c) Click **Save and log in**.

After the first login, to change the password, click your **username**, select **Change password**, and complete the form.

4. Optional: Select **Remember my username** to quickly log in to the Cloud Control Room.

5. Optional: Click **Forgot password?** to reset your password.

An email is sent to you with a link to the necessary page to reset the account password.

6. Click **Log in**.

The credentials are authenticated directly with the Cloud Control Room or Community Control Room database.

Note: When you access the Enterprise Control Room with the **Login with Windows** option selected, you must enter the FQDN to log in successfully.

Note: Your account is locked if you enter the wrong password a specific number of times depending on the password policy set by your administrator. For security reasons, failed log-in attempts are audited. This allows the administrator to analyze and take appropriate actions.

Related tasks

[Create your first bot](#) on page 1429

Perform the following steps to create your first bot that prints the message, `Go be great!`, the Automation Anywhere version of `Hello World!`

[Install Bot Agent and register device](#) on page 1288

Install Bot Agent on your local device and connect it to Control Room. In order to run bots on that local device, ensure that you add it to the list of enabled host devices.

[Reset user password](#) on page 1686

The Control Room administrator generates an email process for the user to reset their password.

Create your first bot

Perform the following steps to create your first bot that prints the message, `Go be great!`, the Automation Anywhere version of `Hello World!`

This task is performed by the user who wants to build and deploy . You must have the necessary rights and permissions to complete this task, and authorization to log in to the as the licensed user.

- You must have the Bot Creator license to create bots in the Control Room.

- You must have the following permissions:
 - Check in
 - View packages
 - Create folders
- naming conventions: Keep the following considerations in mind when creating and naming :
 - When creating a , ensure that your name does not include the following special characters:

Slash (/)	Asterisk (*)	Comma (,)
Backslash (\)	Less than sign (<)	Left or right braces ({})
Question mark (?)	Greater than sign (>)	Left or right brackets ([])
Pipe ()	Double quotation marks (")	Plus sign (+)
Percent sign (%)	--	--

- The name must be unique. If a with the same name exists in the same folder location to which you have access in the public workspace, you cannot create or rename the with this name in the private workspace.
- Do not use names that are reserved for the Windows operating system. The reserved names are as follows:

CON	PRN	AUX	NUL	COM1
COM2	COM3	COM4	COM5	COM6
COM7	COM8	COM9	LPT1	LPT2
LPT3	LPT4	LPT5	LPT6	LPT7
LPT8	LPT9	--	--	--

- Ensure that a name does not end with a period (.) or space.
- For more information about file naming, see [Microsoft guidelines](#).

Note: These steps describe the guided workflow for first time users. The guided workflow is only displayed the very first time you complete these steps.

- Log in to your instance of the Automation Anywhere Control Room.
- Create a new bot:
 - On the left panel, click **Automation**.
 - Click **Create new > Bot**.
 - In the **Create Task Bot** window, enter the bot name.
 - Accept the default folder location: `\Bots\`
To change the default bot storage location, click **Choose** and follow the prompts.
 - Click **Create and edit**.
- Insert a **Message box** action.
 - Click **Actions**.
 - Search for the Message Box package.

Click in the **Actions** search box and enter `message`. Click the arrow to expand the Message Box options.

- c) Double-click or drag the **Message box** action to the Bot editor (open space to the right).
4. In the dialog box on the right, specify the conditions for the **Message box** action.
 - a) In the **Enter the message box window title** field, enter `My first bot!`.
 - b) In the **Enter the message to display** field, enter `Go be great!`.
 - c) Accept the defaults in the **Scrollbar after lines** field and **Close message box after** check box.
 5. Click **Save**.

Your bot is now ready to run.

You can view the time spent to create a bot by navigating to **Automation > Home > My metrics**. The **Active Task Bots** table displays the time taken to create every bot. When a bot is edited, the table shows the total time spent on the bot.

For example, if you spend 10 minutes on creating and saving a bot, the **Active Task Bots** table displays the time spent as 10 minutes. If you spend 5 more minutes on editing the same bot, the **Active Task Bots** table displays the total time spent as 15 minutes.

Similarly, the **Average time spent to create a Task Bot** field on the **My Metrics** page displays the average time spent across all users on all bots.

For example, if user 1 spends 120 minutes on **Bot A**, user 2 spends 2 minutes on **Bot B**, and user 3 spends 4 minutes on **Bot C**, the average time is calculated as $(120+2+4)/3 = 42$ minutes.

6. Click through the Bot editor options for viewing and editing bots:
They are located at the top of the Bot editor.

Note: You can use the search box in the **Flow**, **List**, or **Dual** view to search for text, variables, or actions in a bot. This feature can be helpful when you view or edit a bot with longer code lines.

-
- **Flow:** Displays actions used in an automation as a flow diagram (Default)

Note: The **Flow** view is not available when you create or edit a bot and the bot exceeds 500 lines of code. Use the **Show list view** option to navigate to the list view.

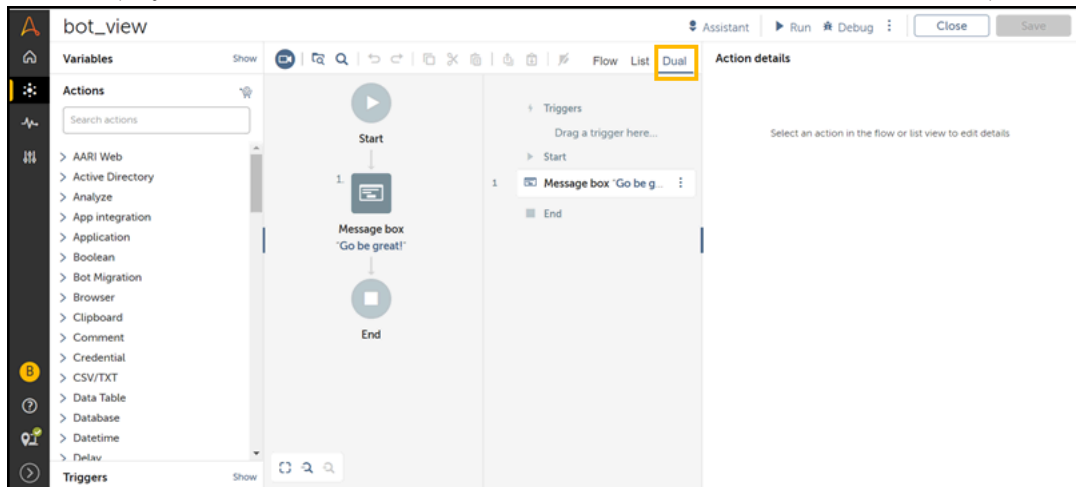

- **List:** Displays the actions used in an automation as a list

Note: Drag the selected actions within the task logic.

- **Dual:** Displays the actions used in an automation from both **Flow** and **List** view aspects

7. Run your bot from your device.
See [Run your first bot](#) on page 1433.

Run your first bot

Run a bot from the same device that you used to create the bot.

Log in to your instance of the Automation Anywhere Control Room, and complete these steps:.

1. [Install Bot Agent and register device](#) on page 1288
2. [Set user device credentials](#) on page 1295
3. [Create your first bot](#) on page 1429

These steps describe the guided workflow for first-time users. The guided workflow is only displayed the very first time you complete these steps.

You can run a bot from the following devices:

- The same device you are using to log in to the Control Room.
- Another device you registered that has the same login credentials as the machine you are using to log in to your Community Control Room or a device with defined credentials in the Control Room.

Note: Windows NT LAN Manager (NTLM) is a challenge or response authentication method that enables clients to provide their user name and password as encrypted credentials or plain text. Use Google Chrome browser to enable the Automation Anywhere extension and capture the proxy information. After the proxy information is captured, you can use any browser to run a bot in Automation 360.

1. Locate and select your bot.
From your Control Room dashboard left panel, select **Automation**. A list of available bots and forms is displayed.
2. Select the bot to run.
From the **Files and folders** table, mouse over the ellipsis (three stacked dots) to the right of your bot's name.
The **Edit** Task Bot panel appears.
3. Click the **Run Task bot** icon.
The **Run bot now** window opens. In the **Task Bots** table, your bot is selected to run.
4. Click **Next**.
The **Device** tab opens with a table of one or more registered devices.
5. If your device is not already selected, select your device to run the bot, and click the right arrow.
6. Click **Run bot now**.
Control Room uses the credentials in your profile to log in to the device you selected and runs the bot.
The **In progress activity** window opens with the status of the running bot. When the bot is done, it disappears from this window.

7. Click **Historical** to see if your bot ran successfully.

Watch the following video on how to run your first bot in the Community Edition:

Build bots using variables, actions, and the Universal Recorder. See [Get started building bots](#) on page 3067.

Moving from Automation 360 On-Premises to Cloud

If you are on Automation 360 On-Premises, move your data and bots to Cloud to get the benefits of a cloud-native architecture.

Requirements

- Obtain a Cloud license for every On-Premises Control Room instance that you want to migrate to Cloud. Work with the Automation Anywhere sales, Customer Success Manager (CSM), and partner teams to obtain the required licenses.

Note: You can move data from multiple On-Premises Control Room instance to one or more Cloud Control Room instances. There is no restriction that you can only move data from a single On-Premises Control Room instance to a single Cloud Control Room. You can migrate data as per your requirements.

- Ensure that you have the correct number of licenses in your Cloud Control Room for executing automations from your Cloud.
- Ensure that you back up your data before migration.

See: [Integrating Control Room with Git repositories](#) on page 1762.

Choose your method

Use one of the following procedures to migrate from your On-Premises Control Room instance to your Cloud Control Room instance:

- [Moving data using Control Room operations](#) on page 1435
- [Migrate using Control Room APIs](#) on page 1435

Post-requisite tasks

After the migration is complete, perform the following steps:

1. Open firewall rules to allow connectivity between the Cloud Control Room and the On-Premises Bot Runners.

See: [Bot Agent communication with Control Room](#) on page 1273.

2. Perform sanity testing of the migrated bots in the Cloud Control Room. Ensure that the bots are working as they were in your On-Premises Control Room.

3. Deregister the Bot Runners from the On-Premises Control Room and register them to the Cloud Control Room.
4. Decommission the On-Premises Control Room after the migration is complete and when the workload can be managed from your Cloud Control Room.
5. Repeat all these tasks for all your On-Premises Control Room instances.

Note: You can use these instructions to not only migrate from your On-Premises Control Room instances to your Cloud Control Room instances but also to move data between your Cloud Control Room instances.

Moving data using Control Room operations

You can manually move bots and queues from your On-Premises Control Room to Cloud using the Bot Lifecycle Management and Workload Management import and export features.

For the rest of the data (such as users, roles, lockers, and so on) in your On-Premises Control Room, you must manually move the data to Cloud, if required.

1. Use Bot Lifecycle Management to export bots from On-Premises Control Room to a local system and then import them manually into your Cloud Control Room.
See: [Bot Lifecycle Management](#).
2. Export [Workload Management](#) queues from the On-Premises Control Room to a local system.
See: [Export queues](#) on page 1955.
3. Import [Workload Management](#) queues manually into your Cloud Control Room.
See: [Import queues](#) on page 1957.
4. Move the rest of the Control Room data manually using the Cloud Control Room operations. For example, to manually move roles from your On-Premises Control Room to Cloud, export the roles from your On-Premises Control Room and manually create the roles in your Cloud Control Room.
5. After the moving the data is complete, ensure that you perform the [Post-requisite tasks](#) on page 1434.

Migrate using Control Room APIs

You can manually migrate your On-Premises Control Room data using the Control Room APIs.

1. Set up an API orchestrator (such as Postman) that can use the `*_read_*` API from an endpoint and use the information in the response to form a new request in the format required by the `*_write_*` API at another endpoint and call the API method.
2. Use the Control Room APIs to migrate data from your On-Premises Control Room to your Cloud Control Room.

Note: You can use the Control Room APIs to migrate or move data from an On-Premises or Cloud Control Room instance to another Cloud Control Room instance.

See: [Control Room APIs](#) on page 3760.

Migrate to Automation 360

Migration (upgrade) is the process of moving your data and bots from Enterprise 11 or Enterprise 10 to Automation 360. Migration includes but is not limited to replicating and updating your existing database and repository, converting your bots to the Automation 360 format, and migrating learning instances for IQ Bot and dashboards for Bot Insight.

Automation 360 is a single, integrated cloud-native Digital Workforce platform that is designed for flexibility and agility. Migrating to this platform provides you benefits such as faster time to value, business agility, and lower TCO.

For more information, see [Automation 360](#) on page 960.

What is migration

The migration (or upgrade) process copies all your Enterprise 11 or Enterprise 10 entities such as users, roles, lockers, and bots to Automation 360. This eliminates the efforts required to re-create all these entities in Automation 360. The migration process also eliminates the possibility of missing out on copying an entity that might be required to run a bot after migration. All the Enterprise 11 or Enterprise 10 entities are ready for use in Automation 360 after they are successfully migrated, except bots and MetaBots.

When Enterprise 11 or Enterprise 10 data is migrated, bots are copied as `.atmx` files and MetaBots are copied as `.mbot` files. You must convert these bots and MetaBots to the Automation 360 format before you use them.

Migration also includes migrating your IQ Bot learning instances and Bot Insight dashboards.

IQ Bot migration

When migrating Enterprise 11 or Enterprise 10 bots, migrate your IQ Bot learning instances. Before starting the IQ Bot migration, ensure that your Automation 360 environment is installed and set up for use. IQ Bot migration involves migrating the bots built to use IQ Bot as well as the IQ Bot learning instances that have been trained for data extraction.

Use the IQ Bot server upgrade and learning instance procedures to move the information over to your new system. See [Migrate to Automation 360 IQ Bot](#) on page 1657.

Bot Insight migration

Migration of the Bot Insight data and dashboard is performed as part of the overall migration process. It involves cloning your Bot Insight database (which is separate from your Enterprise 11 Control Room database) and using the pre-migration utility to extract your dashboard metadata (widgets, layouts, and so on).

Migration phases

Migration involves three main steps, as shown in the following image:

1. [Check migration readiness](#) on page 1445

Analyze your bots using the Bot Scanner and review the generated report to verify your migration readiness.

2. [Prepare new Control Room for migration](#) on page 1485

Choose your deployment model (Cloud, On-Premises, or Cloud-enabled) and request for the migration licenses. Prepare your Control Room and environment for the migration.

3. [Migrate and validate bots](#) on page 1525

Convert your Enterprise 11 or Enterprise 10 bots to Automation 360 format. After migration, verify the converted bots run successfully, and update bots as required based on the migration reports or testing phase.

Note: If you encounter any error when you migrate from Enterprise 11 or Enterprise 10, you might have to review or take some actions on the migrated bots. See [Migration messages](#) on page 1617.

Tools used for migration

The following tools are available for migration:

Bot Scanner

The Bot Scanner scans your existing bots (Task Bots and MetaBots) and generates reports. These reports provide information about the commands and variables used in these bots and how many of these commands and variables are supported for migration in Automation 360. (The scanner was previously called the pre-migration utility.)

[Bot Scanner for migration](#) on page 1469

Bot Migration Wizard

Integrated in the Automation 360 Control Room, this tool guides you through the process of converting the bots to the Automation 360 compatible format after you have completed the prerequisites steps. The wizard enables you to migrate multiple bots (Task Bots and MetaBots) and their dependent bots.

The migration wizard migrates a bot only if all of the components used in that bot are supported for migration in Automation 360.

[Migrate Enterprise bots](#) on page 1529

Cloud Migration Utility

This tool enables you to upload all your Enterprise 11 data to Automation Anywhere Cloud. After the data is successfully uploaded to Cloud, the Cloud Control Room is created and all the uploaded data is available for use in that Control Room. The utility migrates data from Control Room repository (bots, their dependencies, and Credential Vault) and Control Room database (users, roles, schedules, queues, and Control Room settings).

[Upload Enterprise 11 data using Cloud Migration Utility](#) on page 1495

Audit log data migration utility

This utility enables you to export the audit log data from the Enterprise 11 Control Room to a JSON file. You must paste the JSON file in the Automation 360 repository and then migrate the audit log data.

Bot Insight pre-migration utility

This utility enables you to export Enterprise 11 Bot Insight dashboard metadata (widgets and layouts) and dashboard profiles as a zip file. You must paste the zip file in the Automation 360 repository to migrate the Bot Insight dashboards.

[Export Enterprise 11 Bot Insight dashboards for migration](#) on page 1507

What is migrated and not migrated

Enterprise 10 : Review the information about what is migrated and what is not migrated for the On-Premises deployment model.

Enterprise 10	Migrated to On-Premises
Bots and their dependencies	Yes
Credential Vault	Yes
Roles	Yes
Users	Yes
Schedules (these are disabled after they are migrated to Automation 360)	Yes
Audit logs	No
Bots version control history	No

Enterprise 10	Migrated to On-Premises
Devices and device pools	No
File system logs	No
IQ Bot (IQ Bot migration requires a separate process)	No

Enterprise 11 : Review the information about what is migrated and what is not migrated for the different deployment models.

Enterprise 11	Cloud	On-Premises
Users, roles, and credential variables and lockers	Yes	Yes
Bots and their dependencies	Yes	Yes
Schedules (these are disabled after they are migrated to Automation 360)	Yes	Yes
Workload queues	Yes	Yes
Bot Insight dashboards <ul style="list-style-type: none"> • Published dashboard • Default and customized dashboard 	Yes	Yes
Bots transactional data <ul style="list-style-type: none"> • Private workspace transactional data (bots which run with Bot Creator license) • Public workspace transactional data (bots which run with Bot Runner license) 	Yes	Yes
Bot execution operational data	Yes	Yes
Licenses	Yes (Requires unique license GUID)	Yes
IQ Bot learning instances (IQ Bot migration requires a separate process)	No	Yes
Audit logs	No	Yes
Device pools	No	Yes
Historical data	Yes	Yes

Enterprise 11	Cloud	On-Premises
Control Room settings	No	Yes

Bot Insight dashboards for imported bots	Yes	No
AASettings.xml file data	No	No

Choose your migration path

After you have verified the migration readiness for your current version, choose your migration path based on the Automation 360 deployment model that meets your business requirements.

If you are on this version	Start your migration
Enterprise 11	<ul style="list-style-type: none"> Enterprise 11 to Automation 360 Cloud (using the Cloud Migration Utility) <p>Workflow map: Click the following schematic image to view this migration workflow in an interactive visual</p>  <p>format:</p> <ol style="list-style-type: none"> Migrating from Enterprise 11 to Automation 360 Cloud Enterprise 11 to Automation 360 On-Premises <p>Workflow map: Click the following schematic image to view this migration workflow in an interactive visual</p>  <p>format:</p> <ol style="list-style-type: none"> Migrating from Enterprise 11 to Automation 360 On-Premises Manually migrate to Automation 360 Cloud Manually migrate to Automation 360 On-Premises Enterprise 11 to Cloud-enabled Enterprise 11 to Automation 360 on Linux CentOS

If you are on this version	Start your migration
Enterprise 10	<p data-bbox="883 245 1333 306">Enterprise 10 to Automation 360 On-Premises</p> <p data-bbox="883 325 1354 420">Workflow map: Click the following schematic image to view this migration workflow in an interactive visual</p>  <p data-bbox="883 682 971 711">format:</p> <ol data-bbox="883 730 1308 791" style="list-style-type: none"> <li data-bbox="883 730 1308 791">1. However, you can manually migrate to by using the bot export utility. For assistance, contact support: .</p>

If you have a large number of bots, you can run both Automation 360 and Enterprise 11 or 10 in parallel. This dual-environment method helps to eliminate downtime. Choose one of the following procedures based on your deployment model:

If you want to use these dual environments	Use this procedure
Enterprise 11 and Automation 360 Cloud	Enterprise 11 and Automation 360 Cloud in parallel
Enterprise 11 and Automation 360 On-Premises	Enterprise 11 and Automation 360 On-Premises in parallel
Enterprise 10 and Automation 360 On-Premises	Enterprise 10 and Automation 360 On-Premises in parallel

Other resources

The following resources can help you in your journey with Automation 360:

- [Migration resource center](#): Access multiple migration resources, including videos, project templates, and high-level information from one place.
- [Automation Anywhere University: RPA Training and Certification \(A-People login required\)](#): Access the Migrating to Automation 360 learning trail.

Learn how to use Automation 360 with Automation Anywhere University for hands-on learning that is designed for beginners to advanced developers. Instructor-led training options are also available.

- [XML path is not working which works fine in Enterprise 11](#)

Related tasks

[Update Automation 360 to latest version](#) on page 1363

Update Automation 360 On-Premises to the latest version to get new features and enhancements that help improve and scale your automation programs.

Migration best practices

Review best practices and guidelines on the migration process (migrating your bots, Bot Insight, and IQ Bot) and on the Bot Scanner, Control Room, and Credential Vault to complete your migration successfully.

Bot Scanner

When using the Bot Scanner to check your migration readiness, consider these best practices:

- Create a copy of your Enterprise 11 or Enterprise 10 Control Room repository.
Create a copy of your Control Room repository on the device on which you want to run Bot Scanner.
- Use the latest version of Bot Scanner.

New versions of Bot Scanner are available with each Automation 360 release. The latest version is updated with support for more Enterprise 11 or Enterprise 10 commands and features, which helps you to decide when to migrate.

- Always run the Bot Scanner on the copy of the Enterprise 11 or Enterprise 10 repository.
- Do not mix bots from multiple Control Room instances. For example, if you have two Control Room instances, do not copy bots from both Control Room instances at the same location and use that location in the Bot Scanner to scan these bots.
- Review the Bot Scanner report thoroughly.

The report helps you to determine which bots are ready for migration and when support for unsupported commands and features will be available. Understanding timelines for unsupported commands and features helps you decide when to migrate.

Control Room and Credential Vault

- Create and save a backup of Enterprise 11 or Enterprise 10 Control Room repository and database before you install Automation 360.

Use this backup to perform migration so that there is no disruption to your existing Enterprise 11 or Enterprise 10 automation.

- Do not change the name of the database when you restore the backup of the Enterprise 11 or Enterprise 10 database.
- For migration, do not use a machine on which Automation 360 is already installed.
- Configure Credential Vault in express mode.

Bot building

When building new bots in Enterprise 11 or Enterprise 10, keep the following considerations in mind so that migration to Automation 360 is easier.

Note: These considerations will mainly help users who have a dual environment (running Enterprise 11 or Enterprise 10 and Automation 360 in parallel).

- Do not use Microsoft Internet Explorer to build your automations as Microsoft is planning to discontinue support for Internet Explorer from June 2022 on certain operating systems.
- Use object-based automation wherever possible: For example, use Object Cloning command instead of Web Recorder command.
- Use AI Sense Recorder very minimally as migration of this recorder is not yet supported in Automation 360.
- Do not use Citrix Automation, Internet Connection commands, Apache Flex, Adobe Flash, or the Microsoft Edge (legacy) browser in Object Cloning as these are not supported in Automation 360.

Bot migration

- Assign the required migration role and permissions to users who will start the migration process and the Bot Runners that will be used for bot migration.
- Assign the required device permissions for the devices that will be used for bot migration.
- Install the Bot Agent on the devices that will be used for bot migration.
- Test the Automation 360 setup before using the Bot Migration Wizard to migrate your bots.

Create and run a sample bot before using the Bot Migration Wizard. This helps to ensure that Automation 360 system prerequisites such as device registration, credential updates, and Auto Login are met.

- Start migration with a business process for which all the bots are completely ready for migration.
- Check for any required manual updates for migrated .

Review the messages for the migrated bots to check if any updates are required for the migrated bots to run these bots successfully. The list of bots that require updates after migration is available in the **Action required** tab of the Bot Scanner report.

Post-migration

- Validate the migrated bots.

Plan a dedicated time to validate and ensure that the bots are migrated successfully. Do not delete the Enterprise 11 or Enterprise 10 format bots until you complete validating that these bots run successfully after migration.

- Create all new bots in Automation 360 after migration is completed.
- If you have updated any bots in Enterprise 11 or Enterprise 10 after migration, you must migrate these bots again.

Bot Insight migration

- Back up and restore the Enterprise 11 Bot Insight database before you install Automation 360.
- Use the same credentials you have used for Enterprise 11 database when you restore the database.

IQ Bot migration

- Download the database migration assistant that is compatible with your Automation 360 version.
- Create backups of Enterprise 11 databases.
- Stop processing, training, and validating documents in Enterprise 11.
- Prepare a new environment for IQ Bot and the database migration assistant installation.
- Restore backed-up Enterprise 11 databases in different locations.
- Review the database migration assistant log file.
- Clean up the application registration information in the IQ Bot database if the Automation 360 Control Room address is new.
- Migrate learning instances one at a time. Do not place all learning instances in one `iqba` file.

Tools for migration

We have moved the information that was on this page to other pages. See the following links for more information.

- For an overview of migration, including information that was previously on this page, see [Migrate to Automation 360](#) on page 1436.
- For information about Bot Scanner, see [Bot Scanner for migration](#) on page 1469.
- For information about Bot Migration Wizard, see [Bot Migration Wizard](#) on page 1526.

Check migration readiness

Perform the tasks in this workflow to verify whether you are ready to migrate to Automation 360 from Enterprise 11 and Enterprise 10.

1. Verify the current version of your Enterprise 11 or Enterprise 10 platform.
[Verifying your Enterprise 11 or Enterprise 10 version for migration](#) on page 1451
2. Check whether your current Enterprise 11 or Enterprise 10 version is supported for migration.
[Supported Control Room versions for migration](#) on page 1446
3. Compare Automation 360 and Enterprise 11 or Enterprise 10 features.
[Automation 360 feature comparison matrix](#) on page 937

4. Review information about packages mapping and variables mapping to understand how Enterprise 11 or Enterprise 10 commands and variables differ from the equivalent Automation 360 packages and variables.
[Package mapping for migration](#) on page 1559 | [Variable mapping for migration](#) on page 1593
5. Use the Bot Scanner to analyze your bots and identify commands and variables used in the bots that are supported for migration in Automation 360.
[Scan Enterprise 11 or 10 bots using Bot Scanner](#) on page 1471
6. Analyze the report generated by the Bot Scanner.
[Analyze Bot Scanner report for migration](#) on page 1474

[Prepare new Control Room for migration](#) on page 1485

Supported Control Room versions for migration

Review the Enterprise 11 and Enterprise 10 versions that are certified and supported for migration to Automation 360 On-Premises and public or private Cloud on Microsoft Windows Server. A certified Enterprise 11 or Enterprise 10 version means that major functionality of that platform version and bots developed on the version are supported in Automation 360.

Note: We do not support migration from . However, you can manually migrate to by using the bot export utility. For assistance, contact [support](#):

Support for more Enterprise 11 and Enterprise 10 versions will be added over a period of time.

Remember: The Enterprise 11 and Enterprise 10 versions that are not listed in the following tables are not certified for migration. If you are using a version that is not certified for migration and you want to migrate to Automation 360, you must first upgrade to a version that is certified and then proceed with migration.

If you are migrating from OEM products such as IBM RPA, contact Automation Anywhere Support: [Open a support case \(A-People login required\)](#)

On-Premises migration: Supported Enterprise 11 and 10 versions

If you are using any of the following Enterprise 11 and Enterprise 10 versions, you can perform the migration. The table also lists the base version of Automation 360 from which the specific Enterprise 11 or Enterprise 10 version is supported.

[Supported Enterprise 11 versions](#) | [Supported Enterprise 10 versions](#)

Cloud migration: Supported database deployment types

Cloud migration is supported for the following database deployment types:

Database deployment type	Contained database	Uncontained database
Microsoft SQL Server on AWS RDS	Yes	Yes
Microsoft SQL Server on Azure PaaS	Yes	Yes
Microsoft SQL Server on Google cloud	Yes	Yes

Supported Microsoft SQL Server database versions

For database deployment types listed in the previous table, you can host any of the following Microsoft SQL Server database versions. Note that all the Database editions (Enterprise, Express, Standard, Developer (for 2019), and GCP Cloud SQL) are supported for migration.

Database	Build	File version	Supported operating system
Microsoft SQL Server 2014	12.0.2000.8	2014.120.2000.8	Windows Server 2012 R2 Standard and later
	12.0.6024.0	2014.120.6024.0	
Microsoft SQL Server 2016	13.0.5026.0	2015.131.5026.0	Windows Server 2012 R2 Standard and later
Microsoft SQL Server 2017	14.0.1000.169	2017.140.1000.169	Windows Server 2012 R2 Standard and later
Microsoft SQL Server 2019	15.0.2000.5	2019.150.2000.5	Windows Server 2016 and later

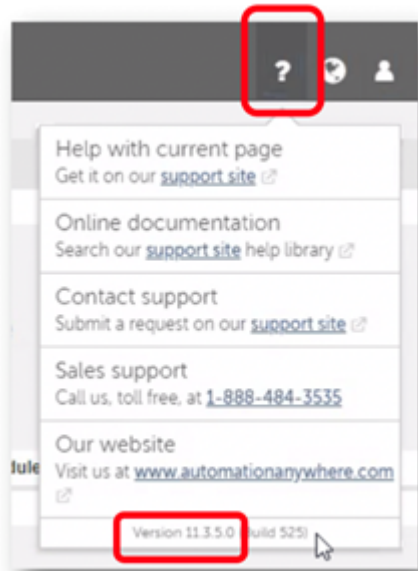

Verifying your Enterprise 11 or Enterprise 10 version for migration

Migration to Automation 360 is supported for many certified versions of Enterprise 10 and Enterprise 11. Before you start the migration process, verify your current platform version and then check if that version is currently supported for migration.

Verify your current platform version

You can find your current platform version in both the Control Room and Enterprise Client. Verify your platform version from your Control Room:

1. Log in to your Enterprise 11 Control Room.
2. Click the Help icon on the top-right of the Control Room to verify the version number, which is listed at the bottom of the menu.

Verifying versions supported for migration

After you have verified which Enterprise 11 or Enterprise 10 version your organization has deployed, check which versions are supported for migration.

1. Go to the following page: [Supported Control Room versions for migration](#) on page 1446.
2. Verify if your version is supported for migration.

The supported versions for both Cloud and On-Premises migration are listed on this page.

Platform version not on supported list

Although we recommend that you begin migration after confirming if your version is supported for migration, you can still run the Bot Scanner to determine which of your bots and their corresponding commands are ready for migration. This will help you plan your migration by learning when currently unsupported bots and commands will be supported in an upcoming release.

Unsupported features for migration

Review the features that are not supported for migration from Enterprise 11 or Enterprise 10 to Automation 360.

Features not yet supported

The following features are not yet supported for migration:

- Migration of audit logs from Enterprise 11 is not supported on Cloud deployments.

- In Enterprise 11, if bots were using the **Before-After** string operation with the **OR** logical operator and operation output resulted in an empty string, then the output displayed as an empty string.

However in Automation 360, if the output of such an operation results in an empty string, the value used in the **End before text** string operation is ignored and the result displays in the output.

For example, in the text `email:user@outlook.com`, if the value in the **Before** operation is `email:` and the value in **After** operation is `user`, the results differ based on product version:

- Enterprise 11 displays an empty string as the output.
 - Automation 360 displays `user@outlook.com` as the output.
- In Enterprise 11, if users select internal variables for the window titles; but not used in the bot, after migration, these internal variables are also migrated to Automation 360.
 - In migrated bots, if you are using OLE DB Driver version 18 or later and when you export SQL Server Database with bit columns to a CSV file, the bit value of `-1` is returned instead of `1` for string value `TRUE`.

Fixed in: v.27

- When you migrate bots using **SAP > Select item by index** command, incorrect index is displayed in the migrated bot.

Fixed in: v.26

- Bots that include the Terminal Emulator package are migrated only to **Advanced Technology** and not to **Legacy Technology**.
- When you migrate a bot that was using the Manage Window Controls action, the last digit of the height value is not available after migration. However, the bot will execute successfully.

Fixed in: v.26

- When an Excel session is active in SAP, a corresponding Excel process starts in the background. In such a scenario, Automation 360 uses the same Excel process that SAP started. When you run a bot to automate spreadsheet data, Automation 360 processes the first request successfully. However, during execution, if the Excel is closed and a subsequent request is sent for automating the spreadsheet data, Automation 360 does not process the request because the Excel process is still being accessed by SAP. Therefore, the correct window is not activated for automating the spreadsheet data.

Fixed in: v.26

- If a bot is using the **Structured text** type field in the **PDF > Extract text** action, some of the characters might not be extracted correctly.

Fixed in: v.25

- After migration, the **Before**, **Before and/or after**, and **After** options in the **String > Extract text** action does not match the case in a string.

Fixed in: v.25

- After migration, bots that were using the **Get text > All lines** action in Enterprise 11 will display only 24 rows of lines in the Terminal Emulator.

Fixed in: v.26

- Migrating bots with **Get Total Rows** command in SAP GUI returns values as **Float** string type instead of an **Integer** type after migration.

Fixed in: v.26

- If you are a Bot Creator or a Bot Runner user, you might not be able to view the Review messages displayed in the **Bot Assistant** without having the **View migration** permission.

Fixed in: v.26

- When you use counter as a variable in a nested loop, the parent loop functions properly but the child loop does not run as expected.

Fixed in: v.27

- Bots with SAP packages cannot pick and convert window titles that include "*" (asterisk) character. These window titles are not converted to currently active window names after migration.

Fixed in: v.26

- Bot deployment might fail when you run migrated bots with the **SAP > Get Property** command. This issue occurs because of the following reason: In Enterprise 11, property name is case in-sensitive. During migration, property name is changed to being case sensitive, so bot deployment fails when the case of property name does not match.

Fixed in: v.26

- When you send an email through **Exchange Web Services** (EWS), the format of the email output do not have line breaks , the content appears tampered, and the entire content of the email appears in a single line.

Fixed in: v.26

- The Enterprise 11 or Enterprise 10 Bot Runner and Bot Creator devices are not included in the migration process and are therefore not migrated to Automation 360.

The Automation 360 Bot Agent replaces the Enterprise 11 and Enterprise 10 Enterprise Client. Use the Bot Agent to connect a device to the Automation 360 Control Room and run bots on the connected devices.

- When you run a migrated bot with the option **Validate if attachment is missing** option checked, and if the attachment is missing when you send the email, the bot might not run successfully.
- Workflows, triggers, version control history of bots, and file system logs.
- Migration of Enterprise 11 bots that uses Subversion Version Control for version control.
- Migration of Enterprise 11 On-Premises Control Room to Automation 360 Cloud service on GCP using the Cloud Migration Utility is not supported.
- Control Room that uses Oracle Database.
- Migration of Bot Insight data and other entities such as users, roles, schedules and credential variables when Automation 360 is installed using a fresh database.
- Cut, copy, paste, and Ctrl+A functions on the terminal screen when using Terminal Emulator.

Fixed in: v.27

- Use of a variable within a variable (except value type variables) in a bot.

For example, if a bot contains \$variable1\$, where \$variable1\$ contains \$variable2\$, and \$variable2\$ contains the actual value, this bot cannot be migrated.

- Use of a fixed value and a variable to specify the index position, for example, \$v_ArrVar(1\$RowIndex\$,1)\$.
- The capability to capture images from the runtime window when a bot is being executed.
- Enterprise 11 or Enterprise 10 bots that use a string value in a variable that is used in the If command along with '<' or '=' operator are migrated to Automation 360. However, these bots encounter an error when they run in Automation 360.
- The If command or the Loop command that use '<', '>', '<=', or '>=' operator with variables that contain a string value encounters an error after migration.

For example, if you have a bot that contains a variable with the value abcd and uses the > operator, the bot encounters an error when it is run after the migration because string type variables are not suppose to use the <, >, <=, or >= operator.

- Object Cloning command that automates the following applications:
 - Flash applications
 - Web application running on Edge-Legacy browser
- Enterprise 11 or Enterprise 10 bots were able to run a Microsoft Excel macro from the Microsoft Excel file available in the XLSTART folder when the that macro is called from another Excel file that does not contain that macro. After migration, these bots are not able to run the macros which are available in another Excel
- The arrow symbol is not displayed in the Automation 360 Bot editor.

When the arrow symbol is used in Enterprise 11 or Enterprise 10 bots, the Bot editor does not display any symbol after migration, with one exception. The exception is that when the symbol is used in multiple IF/ELSE commands, the Bot editor displays the \$\$String:FormFeed\$ variable instead of the arrow symbol.

Unsupported features with workaround

You can migrate bots with the following features if you update them based on the specified workaround:

- The output of the String Length action is different in Automation 360 when compared to Enterprise 11 because Automation 360 considers the line feed character whereas Enterprise 11 considers both carriage return and line feed characters when calculating the string length.

Workaround: Calculate the number of line feed characters used in the string and add it to the string length.

- If you have created triggers, indexes, views and such custom Database objects in addition to the existing standard objects created in the Enterprise 11 Control Room, you might not be able to restore the exported data to Cloud using the Cloud Migration Utility. If you need help to identify such objects, contact Automation Anywhere support: [Open a support case \(A-People login required\)](#).

Workaround: Disable the additionally created Database objects before exporting data to the Cloud.

- In Enterprise 11, if bots were using a window title value or variable that contained leading spaces, after migration, the bots will be unable to select the corresponding window.

Workaround: Remove the leading spaces from the window title value or variable and then run the bots.

- When you use the Recorder to capture an object, select **HTML Tag**, **HTML InnerText**, and **HTML type** properties in **Search** Criteria, or migrate a bot with similar properties selected in **Search** Criteria, the bot fails to identify or locate the object and perform the selected action.

Workaround: Modify the **DomXPath** according to the controls you capture or add more properties in **Search** Criteria.

- When your bot has some error, you add the **Try/Finally** block around those actions and insert one more action in the **Finally** block. When you save and run the bot, you will see the Bot error dialog shows the wrong error line number within the **Finally** block.

Workaround: If you are using **Try** and **Finally** without using **Catch** action, the Bot error dialog will not show the correct line number. Instead, use **Try/Catch**, the **Try** action handles the error

and sends execution to **Catch** with line number and description. This would give the correct line number within the **Finally** block.

- Note: Issue applies only to v.22 and earlier (as this is fixed in v.23, see [Migration of non-credential vault variables](#)). The **Run Logic** command that uses credential variables as input for a logic of a MetaBot

Workaround: Bots that use the **Run Logic** command that passes Credential Vault attributes from a Task Bot to a MetaBot logic can be migrated to Automation 360. The credential name and attribute name are displayed in the fields in the corresponding line of the migrated bot.

If you have migrated using the restored Enterprise 11 database, an equivalent locker is created in Automation 360 for the credential variables used in the Enterprise 11 bot.

Choose one of the following options to run the migrated bots successfully:

- Option 1: Pass the credential type variables.
 1. Create a credential type variable in the child bots as input variables.
 2. In the **Run** action of the Task Bot package of the parent bot, update the input value fields to use the Credential Vault attributes for the credential type variable created for the child bot (corresponding to MetaBot logic).
- Option 2: Pass the credential values as a global value.
 1. Create the Global value in Automation 360 for the credentials use in the **Run Logic** command in Enterprise 11.
 2. In the **Run** action of the Task Bot package of the parent bot, update the Input value fields to use the Global values for the credential type variable created for the child bot (corresponding to MetaBot logic).

If you have not used the restored Enterprise 11 database when installing Automation 360, you must first create the required locker for the credential variables used in the Enterprise 11 bot, before performing the preceding steps.

Note: Automation 360 provides enhanced security by allowing you to assign Credential Vault attributes only to the credential type variables. This restricts any nonsecure handling of Credential Vault attributes where they might have been assigned to non-credential type variables.

- When you create DLLs with different functions, if you use the same filename for DLLs and add them to multiple MetaBots, after migration, if a Task Bot is using the Logic of these MetaBots, an error occurs during execution.

The error occurs because the DLL sessions are based on the DLL filenames, and only the session of the first DLL will be active during execution. Any function called from subsequent DLLs will not be present in the first DLL session that is active.

For example, consider that MetaBot1 is using a DLL that has function1 and MetaBot2 is using a DLL that has function2, and both the DLLs have the same filename `test.dll`. After migration, when you run a Task Bot that uses MetaBot1 Logic and MetaBot2 Logic, the DLL session of MetaBot1 Logic is activated and function1 runs successfully. However, when the MetaBot2 Logic is run, the corresponding DLL is not activated because the session with the same DLL filename is already active, and function2 is not present in the DLL of MetaBot1 Logic, which results in an error.

Workaround: Depending on your requirements, you can perform one of the following workarounds:

- Before migrating the bots, ensure that you rename the DLL filename of one of the DLLs, update the references to the DLL function in MetaBots Logic, and then migrate the bots.
- After migrating the bots, change the session name in the **Create DLL session** box of the Open DLL action and then update the same DLL session name in the related **If** action for the **DLL Session does not exist** condition and the **Run DLL** action.
- In Enterprise 11, if a MetaBot was using `Microsoft.Exchange.WebServices.dll` to use Microsoft Exchange services, after migration, when you use the **Get DLL details** option in the **DLL Run function**, an error is encountered. The error is because, in Automation 360, the `Microsoft.Exchange.WebServices.dll` is not automatically installed in the global assembly cache (GAC) on your device.

Workaround: You must manually install the `Microsoft.Exchange.WebServices.dll` in GAC on your device and then use the **Get DLL details** option.

See [How to: Install an assembly into the global assembly cache](#) .

- In Enterprise 11, if a bot was using the Log To File action and you entered text greater than 1000 characters in the **Enter text to log** field, then after migration, the bot will encounter an error.

Workaround: Ensure that you configure the text as a variable, and then use this variable in the **Enter text to log** field instead of entering the static text.

- In Enterprise 11, if you used the Loop action to open the same Excel sheet multiple times without closing it, after migration, an error occurs. The error occurs because, in Automation 360, only one Excel session can be active at a time.

Workaround: In the Loop action, ensure that you use the **Close** action to close the Excel session before opening the Excel sheet again with the same session name.

- In Enterprise 11, if bots were using the **String > Replace** action to find a carriage return line feed (CRLF) character and replace it with another character, after migration, the output might not be the same as the output seen in Enterprise 11.

Workaround: In the **Find string** option, instead of the **Enter** (LF) variable, use the **Newline** (CRLF) variable.

- After migration, bots that were using the Log To File action to log files are using the LF character instead of the CRLF character for new lines.

Workaround: Use the `$String:Newline$` variable to use the CRLF character in the migrated bots.

- If a MetaBot Logic (for example, Logic A) is referenced to a Task Bot or another MetaBot Logic and if Logic A was renamed or moved from one logic folder to another within the same MetaBot, after migration, the Task Bot or MetaBot Logic does not work when it calls for Logic A.

Workaround: In the Task Bot or MetaBot Logic which calls for Logic A, update the name or path to reference to Logic A.

- If a bot is using the **Browser > Download files** action to download files from a URL, some files whose URLs have special characters or require Windows native authentication access might not download properly.

Workaround: Use the **Browser > Open** action instead.

- Automated migration to Automation 360 Cloud.

Workaround: You can use the manual process to migrate to a Cloud-enabled instance. See [Prepare for Enterprise 11 to Automation 360 Cloud-enabled migration](#) on page 1513.

- When you insert XML > **Insert node** as an attribute using a variable, the bot migration might fail.

Workaround: Insert the attribute by providing the direct value instead of a variable.

- When you run migrated bots that open URL without the protocol information (such as http, https, or file), the web page might not open properly.

Workaround: Ensure that you add the appropriate protocol information to the URL.

- If a MetaBot Logic was using a DLL file that used classes without a namespace, after migration, any Task Bot that uses the MetaBot Logic will not work.

Workaround: Manually update the DLL file to include namespace for classes.

- After migrating bots, an error is seen when using FTP actions on bots that are using comma in the filenames and when using the Delete files and Delete folder FTP actions on bots that are using colon in the filenames.

Workaround: Ensure that you remove comma in the filenames before using the FTP actions and colon in the filenames before using the Delete files and Delete folder FTP actions.

- If a bot was using the Send action to send an email with attachments where the path for the attachments were variables, the bot will either fail to execute or ignore the attachment.

Workaround: Replace variables with the paths for the attachments.

- Enterprise 11 or Enterprise 10 bots encounter an error after migration when these bots use the **Run Logic** command to run a MetaBot logic and the location of the logic is specified up to the folder that contains that logic. For example, consider you want to run Logic1 that is available in D:Metabots\Logics\Finance location. If you specify only D:Metabots\Logics\Finance instead of the complete path (D:Metabots\Logics\Finance\Logic1) of the logic, an error is encountered.

Workaround: Update the path of all the MetaBot logic to the complete path in Enterprise 11 or Enterprise 10 bots before migration.

- Enterprise 11 or Enterprise 10 MetaBots that use the credential variable to pass a numeric value as an input to a DLL function.

Workaround:

1. Update the DLL function to use the input parameter of type string.
 2. Delete the commands from the MetaBots that pass the numeric type input parameter to the DLL function.
 3. Add the commands in the MetaBots to pass the string type input parameters to the DLL function.
 4. Migrate the relevant Task Bots and MetaBots.
- If you are migrating to Automation 360 Cloud and you have configured SAML as the authentication type in Enterprise 11, the migration process changes the authentication type to the Control Room database authentication type for the migrated Automation 360 Control Room.

Workaround: To configure SAML as the authentication type for the Cloud Control Room after migration, perform these steps:

1. Delete the user that was used to configure SAML in Enterprise 11 from Automation 360.

2. Create another user with the required permissions and use that user to configure SAML in Automation 360.

- Applicable to v.24 and earlier: Migration from Enterprise 10 to Automation 360 Cloud.

Workaround: Migrate to an Enterprise 11 version that is supported for migration to Automation 360 Cloud and then migrate to Automation 360 Cloud.

- Enterprise 11 bots that use the Exchange Web Service (EWS) to send email using the Send Email command encounters an error after they are migrated to Automation 360

Workaround: Create the following global values in Automation 360 and update the migrated bots to use EWS in all the actions:

- AAE_EmailSettings_auth
- AAE_EmailSettings_host
- AAE_EmailSettings_port
- AE_EmailSettings_ssl

The values for these global values must be as specified in Enterprise 11.

- The Loop command or the If command that use date conditions to compare dates in different formats encounters an error after migration. For example, a date with MM/dd/yyyy format does not work with a date with MM/dd/yyyy hh:mm:ss format.

Workaround: Update dates with the different format to the same format.

- A bot cannot use a variable or an object that contains data larger than 64 KB. For example, if you have captured a table from a website using the Object Cloning command and the captured object contains data larger than 64 KB. Bots containing such objects encounters an error after migration.

Workaround: Remove unwanted data or copy the data in a CSV or a text file and uses the **Read** action of the CSV/TXT package.

- Migration fails for action from which the Credential Vault value is missing in the Control Room.

Workaround: Create the Credential Vault value in the Automation 360 before migration and start the migration again using the Bot Migration Wizard.

Migrating bots with N/A status

The Bot Scanner reports shows the status of bots that contain unsupported commands and cannot be migrated as N/A. You can migrate such bots by modifying them in your Enterprise 11 or Enterprise 10 machine as specified in the following table:

Message	Migration of bots not yet supported due to child bots using unsupported commands.
Description	A child bot that uses a command that is currently unsupported for migration cannot be migrated. As a result, parent bots that use this child bot also cannot be migrated.

Action	<p>To migrate these parent bots, remove references to the child bot from the parent bot and then migrate that parent bot.</p> <p>To view the unsupported commands used in the child bots, go to the list of bots that cannot be migrated and click the child bot name.</p>
--------	--

Message	Migration of "Object Cloning" with "HTML (Edge)" is not yet supported
Description	The Microsoft Edge Legacy browser is not supported in the Automation 360, so the migration of bots configured with this browser is not supported.
Action	Update the Enterprise 11 bots using other supported browsers such as Google Chrome, Firefox, Internet Explorer, or Microsoft Edge Chromium browser.

Message	Migration of MetaBot is not supported. The screen file does not exist. Please fix the bot and try again.
Description	MetaBot Logic refers to a screen that does not exist in the MetaBot.
Action	To migrate the MetaBot, either add the screen again or remove references to the non-existent screens.

Message	Migration of "Variable Operation" command where variable types do not match is not supported. Please fix the bot and try again.
Description	Enterprise 11 or Enterprise 10 bot uses the Variable Operation command where the variable types of the variables used are not the same.
Action	Update the Variable Operation command in the Enterprise 11 or Enterprise 10 bots to ensure that the referenced variables are of the same type.

Message	Migration of "Variable Operation" command where the variable does not exist is not supported. Please fix the bot and try again.
Description	Enterprise 11 or Enterprise 10 bot references a non-existent variable in the Variable Operation command.
Action	Either create a variable with the same name and type, or remove the command that references the non-existent variable.

Message	Migration of "If" command where the variable does not exist is not supported. Please fix the bot and try again.
Description	Enterprise 11 or Enterprise 10 bot references a non-existent variable in the If command.
Action	Either create a variable with the same name and type, or remove the command that references the non-existent variable.

Message	Migration of "ElseIf" command where the variable does not exist is not supported. Please fix the bot and try again.
Description	Enterprise 11 or Enterprise 10 bot references a non-existent variable in the Else If command.
Action	Either create a variable with the same name and type, or remove the command that references the non-existent variable.

Message	Migration of "Loop" command where the variable does not exist is not supported. Please fix the bot and try again.
Description	Enterprise 11 or Enterprise 10 bot references a non-existent variable in the Loop command.
Action	Either create a variable with the same name and type, or remove the command that references the non-existent variable.

Message	Migration of "Run Task" with bot path defined using "AAApplicationPath" not followed by valid repository folder path is not supported. Please fix the task bot path in the 11.x bot and migrate again.
Description	Enterprise 11 or Enterprise 10 bot uses an invalid path in the Run Task command of the child bot.
Action	To migrate this bot, modify the Enterprise 11 bot to ensure a valid child bot path is provided after AAApplicationPath.

Message	Migration of "If - TaskSuccessful" with bot path defined using "AAApplicationPath" not followed by valid repository folder path is not supported. Please fix the task bot path in the 11.x bot and migrate again.
Description	Enterprise 11 or Enterprise 10 bot uses an invalid path within the If > Task Successful condition of the child bot.

Action	Update the Enterprise 11 or Enterprise 10 bot to ensure a valid child bot path followed by a proper folder structure is provided after AAApplicationPath.
--------	---

Message	Migration of "If - TaskUnsuccessful" with bot path defined using "AAApplicationPath" not followed by valid repository folder path is not supported. Please fix the task bot path in the 11.x bot and migrate again.
---------	---

Description	Enterprise 11 or Enterprise 10 bot uses an invalid path within the If > Task Unsuccessful condition of the child bot.
-------------	---

Action	Update the Enterprise 11 or Enterprise 10 bot to ensure a valid child bot path followed by a proper folder structure is provided after AAApplicationPath.
--------	---

Message	Migration of "Elseif - TaskSuccessful" with bot path defined using "AAApplicationPath" not followed by valid repository folder path is not supported. Please fix the task bot path in the 11.x bot and migrate again.
---------	---

Description	Enterprise 11 or Enterprise 10 bot uses an invalid path within the Else If > Task Successful condition of the child bot.
-------------	--

Action	Update the Enterprise 11 or Enterprise 10 bot to ensure a valid child bot path followed by a proper folder structure is provided after AAApplicationPath.
--------	---

Message	Migration of "Elseif - TaskUnsuccessful" with bot path defined using "AAApplicationPath" not followed by valid repository folder path is not supported. Please fix the task bot path in the 11.x bot and migrate again.
---------	---

Description	Enterprise 11 or Enterprise 10 bot uses an invalid path within the Else If > Task Unsuccessful condition of the child bot.
-------------	--

Action	Update the Enterprise 11 or Enterprise 10 bot to ensure a valid child bot path followed by a proper folder structure is provided after AAApplicationPath.
--------	---

Message	Migration of "Variable Operation" command resetting system variable "\$WorkItemResult\$" will not be supported.
---------	---

Description	Resetting the system variable \$WorkItemResult\$ is not supported for Variable Operation command.
-------------	---

Action	Use the String > Assign operation and assign an empty string to the \$WorkItemResult\$ system variable instead of resetting it.
--------	--

Message	Migration of "Windows - Close All Open Windows" is not yet supported.
Description	If you have used the Close command with the All open windows option selected in a bot, you cannot migrate that bot.
Action	Update the Enterprise 11 or Enterprise 10 bot so that it does not use the All open windows option before you migrate it

Message	Migration of "If - ObjectProperties" with field "OObjectPlay_PropertyInfo_ReviewMessage" of type "String" is not yet supported.
Description	Enterprise 11 or Enterprise 10 bot uses an object in the If > Object Properties command that has one of the properties with size larger than 64 KB.
Action	To migrate this bot, you can perform one of the following actions: <ul style="list-style-type: none"> • Delete the property value that is larger than 64 KB in size, in the If > Object Properties command. • Store the property value which exceeds 64 KB into a text file. Then, create a variable which reads the value from this file. Assign this new variable to the corresponding property in the If > Object Properties command.

Message	Migration of "ElseIf - ObjectProperties" with field "OObjectPlay_PropertyInfo_ReviewMessage" of type "String" is not yet supported.
Description	Enterprise 11 or Enterprise 10 bot uses an object in the Else If > Object Properties command that has one of the properties with size larger than 64 KB.
Action	To migrate this bot, you can perform one of the following actions: <ul style="list-style-type: none"> • To migrate this bot, delete the property value that is larger than 64 KB in size, in the Else If > Object Properties command. • Store the property value which exceeds 64 KB into a text file. Then, create a variable which reads the value from this file. Assign this new variable to the corresponding property in the Else If > Object Properties command.

Message	Migration of "Loop.Condition - ObjectProperties" with field "OObjectPlay_PropertyInfo_ReviewMessage" of type "String" is not yet supported.
Description	Enterprise 11 or Enterprise 10 bot uses an object in the Loop while > Object Properties command that has one of the properties with size larger than 64 KB.
Action	<p>To migrate this bot, you can perform one of the following actions:</p> <ul style="list-style-type: none"> To migrate this bot, delete the property value that is larger than 64 KB in size, in the Else If > Object Properties command. Store the property value which exceeds 64 KB into a text file. Then, create a variable which reads the value from this file. Assign this new variable to the corresponding property in the Else If > Object Properties command.

Differences in Automation 360 and Enterprise 11/Enterprise 10 features

Review how some features and functionalities, such as folder structure, bot deployment, packages, variables, and MetaBots, are different in Automation 360 as compared with Enterprise 11 and Enterprise 10.

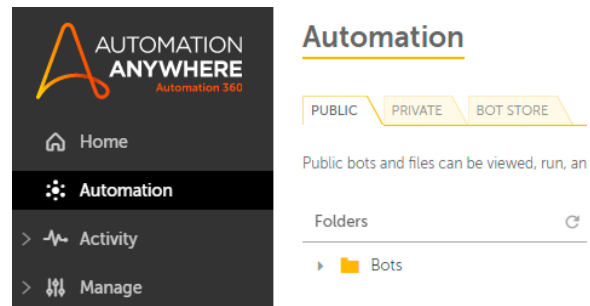

Folder structure

The folder structure in which bots (Task Bots and MetaBots) are stored in Automation 360 is different compared with Enterprise 11 and Enterprise 10.

Automation 360 folder structure

The bots (Task Bots and MetaBots) are available in the **Automation > Bots**. Bots that are migrated from Enterprise 11 or Enterprise 10 are available in the public workspace.

The following image shows the folder structure in Automation 360

Enterprise 11 and Enterprise 10 folder structure

Bots (Task Bots only) are available in the **My Tasks** folder (**Automate > Tasks > My Tasks**) and MetaBots are available in the **My MetaBots** folder.

The following image shows the folder structure in Enterprise 11:

Bot deployment

- Enterprise 11 : When a low-priority bot is running and a high-priority bot is deployed, the system pauses the low-priority bot and runs the high-priority bot. After the high-priority bot is run, the low-priority bot resumes.
- Automation 360 : The priority of bots is verified at deployment. When bots are queued for a Bot Runner user, higher-priority bots are deployed before lower-priority bots. However, if a lower-priority bot is already running, the higher-priority bots are deployed only after the lower-priority bot completes running.

Packages

For most of the Enterprise 11 or Enterprise 10 commands, similar or equivalent actions and packages are available in Automation 360. However, the behavior of some of the Automation 360 commands is different compared with those in Enterprise 11 or Enterprise 10.

- Automation 360 is created afresh to support not only the current but also the future automation needs of modern enterprises. Accordingly, Automation 360 is built to meet important objectives, such as providing the following features:
 - A standardized, predictable, and scalable platform
 - Consistent user experience
 - Improved flexibility and security

With Automation 360, we aim to provide these features by employing industry-standard exception handling, rich support for dedicated data types, and so on.

Because Automation 360 is created afresh, some of the Enterprise 11 capabilities that have been redesigned in Automation 360 might not have a directly corresponding Automation 360 feature.

However, to ensure that the migrated bots produce output that is identical to that produced by their corresponding Enterprise 11 bots, we have mapped Enterprise 11 commands to their corresponding actions in Automation 360.

In instances where a direct mapping between an Enterprise 11 command and an Automation 360 action is unavailable, we have used "expressions" to ensure that the migrated bots produce output that is identical to that produced by their corresponding Enterprise 11 bots, without requiring you to manually update the bots.

Note: The usage of expressions leads to more number of lines and additional variables in the migrated bots as compared to their corresponding Enterprise 11 bots.

For information about expressions, see [Legacy Automation package](#) on page 2660.

- For Enterprise 10/Enterprise 11 command using a windows title field configured with a user defined variable, the migration process migrates the bot by adding the **Set Title** action just above the respective command. Automation 360 does not allow user variables in the **Windows Title** field. Use the **Set Title** action to achieve the same behavior.
- In Enterprise 11, when a bot contains more than one command with the **resize window** option selected, the window is resized to the dimensions specified by the first command. In Automation 360, the window is resized each time the bot encounters an action with the **resize window** option selected. This ensures that at runtime the window dimensions of each action match the dimensions at which that action was configured, which enhances the bot's ability to find the object.
- In Enterprise 11 or Enterprise 10, loop indexing of table starts with 1 and increments by 1. Automation 360 starts indexing with 0 and increments by 1.
- The migration process migrates IF and Loop commands that contain multiple conditions of a variable.
- Disabled commands are migrated as follows based on the different coding patterns:
 - An individually disabled command (with or without any validation error) is migrated as a disabled action. All actions are disabled if one disabled command is migrated to multiple actions in Automation 360.

- Disabled **Error Handling** command is migrated to disabled try and catch block including all other actions depending on its configuration.
- Disable **Loop** command is migrated to a disabled **Loop** action in Automation 360.
- Disabled **If** command is migrated as a comment so that the migrated bot returns the same result as that returned by the corresponding Enterprise 10 or Enterprise 11 bot.
- In Enterprise 11 or Enterprise 10, some String operation commands use Tab, Enter, and Separator special characters. In Automation 360, these characters are system variables in the String package.

Enterprise 10/Enterprise 11	Automation 360
[Tab]	\$String:Tab\$
[Enter]	\$String:Enter\$
[Separator]	\$String:Separator\$

See [String package](#) on page 2957.

- Enterprise 11 or Enterprise 10 provides various presets as part of the windows title selection and they are migrated to respective presets in Automation 360.

Enterprise 10/Enterprise 11 Options	Automation 360 Options
Current Active Window	Current Active Window
Desktop	<ul style="list-style-type: none"> • For the Insert mouse click command, use the Screen for window title option. • For the Insert keystroke command, use the Current Active Window option. • For Screen > Capture area, use the Screen for window title option. • For the Capture Desktop command of the Screen Capture command, use the Capture area action of the Screen package with the Screen option selected from the list available in the Application tab.
Wallpaper	Desktop
Taskbar	Taskbar

[Package mapping for migration](#) on page 1559

Variables

For most of the Enterprise 11 or Enterprise 10 user, system, and credential variables, similar or equivalent system variables are available in Automation 360. The behavior of some of the Enterprise 11 or Enterprise 10 variables is different compared with Automation 360.

- For each variable passed as input in Enterprise 11 or Enterprise 10 bot, a line is added in the migrated bot in Automation 360. For example, if you are passing 100 variable as input in Enterprise 11 bot, after migration that bot has 100 new lines.
- In Enterprise 11 or Enterprise 10, you can use the **Session Name** field in paired commands to specify a session name as both a static value and a variable value. For example, you can specify a session name to open a file or establish a connection. You can then use that same session name as a variable value in a Loop command. However, migrated bots differentiates between a static value and a variable value, and handle the values differently after migration. As a result, after you migrate these bots to Automation 360, you must update the bot to use the correct output Dataset variables in the Loop command (which is aligned with the **Open file** session variable). For migrated bots, we recommend that you configure the session name as a static value or a variable value in all the instances.
- Enterprise 11 or Enterprise 10 commands that store the return values to the \$Clipboard\$ system variable are not supported in Automation 360. When you migrate bots with this functionality, the migration process assigns the values to a temporary variable and then assigns the value to the Automation 360 \$System:Clipboard\$ system variable by adding the **Copy To** action to the **Clipboard** package.
- Some commands return values to variables for further processing. In Enterprise 11 or Enterprise 10, users can store these values in different types of variables, where as in Automation 360, these values are stored in a specific type of variable only.

For example, if a command returns a value to an array for a specific cell, then in Automation 360, we store the value in a temporary string variable. Then in the next action, we store this temporary value to an actual array variable to ensure that the bot execution logic stays intact.

- In Automation 360, the single dollar sign (\$) is reserved for Automation Anywhere use, so all user entries of a single dollar sign are automatically replaced with two dollar signs (\$\$). For example, if you have a text field, "Pay \$5.00", we convert that field to read "Pay \$\$5.00" in Automation 360 for it to display properly to users.
- In Enterprise 11 or Enterprise 10, bots can use a variable to specify the child bot you want to run. In Automation 360, the task path is updated to the Bots folder. The following table provides a few examples:

Enterprise 11/ or Enterprise 10	Automation 360
D:\My Documents \AAE_v11\Automation Anywhere Files\Automation Anywhere\My Tasks\Migration\\${bot_name}	Bots\My Tasks\Migration\ \${bot_name}
\$\$\$Applicationpath\$\Automation Anywhere\My Tasks\Migration\ \${bot_name}	Bots\My Tasks\Migration\ \${bot_name}
D:\\${UserName}\My Documents \AAE_v11\Automation Anywhere Files\Automation Anywhere\My Tasks\Migration\\${bot_name}	Bots\My Tasks\Migration\ \${bot_name}

Enterprise 11/ or Enterprise 10	Automation 360
D:\My Documents \AAE_v11\Automation Anywhere Files\Automation Anywhere\ \$bot_path\$\\$bot_name\$	Bots\My Tasks\\${bot_path}\ \${bot_name}

[Variable mapping for migration](#) on page 1593

[Variables support](#) on page 948

MetaBots

MetaBots are not available in Automation 360. When you migrate Enterprise 11 or Enterprise 10 MetaBots, they are migrated to equivalent Task Bots in Automation 360. These Task Bots provide similar output and capabilities of the MetaBots.

The migration process migrates the DLLs and logic to equivalent bots. The **Run Logic** command is converted to the **Run** action of the Task Bot package. The DLLs in the MetaBots use the **Execute** command to run a function from that DLL. After migration to Automation 360, each **Execute** command is converted to **Open**, **Run function**, and **Close** actions of the **DLL** package. Information about which function to run from the DLL, which parameters to use, and other details in the **Execute** command is migrated to the **Run** action. MetaBots with DLLs that use credential variables of string, character, and Byte data type can be migrated to Automation 360.

Earlier to Automation 360 v.17, the dictionary variable was used to provide input parameters in a migrated bots which used to add additional steps in the bot. Starting from v.17, the Entrylist variable is used to provide input parameters in a migrated bot. This reduces the number of steps added to the migrated bot.

[How MetaBots are migrated](#) on page 1535

Bot Scanner for migration

The Bot Scanner analyzes bots (Task Bots and MetaBots) created in your Enterprise 10 or Enterprise 11 Control Room. The scanner generates a report summarizing the number of bots, commands, and variables that are ready for migration and those not yet supported for migration, and provides a recommendation on whether you are ready for migration.

Note: A new version of Bot Scanner is released with each Automation 360 release. Use the latest Bot Scanner version to monitor the commands and variables that are supported for migration in Automation 360 with each update. The scanner obtains information about the Automation Anywhere components used by customers and prioritizes support for these components for migration.

Considerations for using Bot Scanner

- Ensure that you are on the supported Enterprise 10 or Enterprise 11 Control Room version for migration before you scan your bots.

[Supported Control Room versions for migration](#) on page 1446

- You do not have to install Automation 360 to run the Bot Scanner, but access to your Enterprise 10 or Enterprise 11 repository is a requirement.
- You must run the Bot Scanner before performing any migration steps.

How Bot Scanner works

The Bot Scanner reads the contents of your Enterprise 10 or Enterprise 11 and provides a summary report for your analysis. The scanner provides a recommendation on whether or not to migrate now and an estimated time of availability (ETA) on when unsupported commands will be supported in Automation 360.

Note: The Bot Scanner does not migrate bots or perform any other action. If you are not ready for migration, the Bot Scanner identifies the reasons why the bots cannot be migrated.

The bots (.atmx and .mbot files) are scanned at the location you specify and the summary report provides the following information:

- The number of bots scanned
- The number of bots that can and cannot be migrated to Automation 360
- The commands and variables that are used in the scanned bots and supported in Automation 360
- The commands that are migrated to Automation 360 with some modifications that have to be reviewed

Note: The Bot Scanner generates the summary report in HTML format and a separate report for each bot in XML format.

Bot Scanner reports

The Bot Scanner generates the following reports to help you decide whether you should start the migration.

Proceed with migration

This recommendation is provided when 95% or more than 95% of your bots can be migrated. As the majority of your bots are ready for migration, you are eligible for migration. You might have to perform some work before or after migration to migrate some of the remaining bots.

Wait to migrate

This recommendation is provided when less than 95% of your bots can be migrated. In this case, you must run the latest version of the Bot Scanner available with next release of Automation 360, to assess your eligibility for migration.

Sharing Bot Scanner report to improve experience

You can help improve the experience of migration to Automation 360 by sharing the reports generated by the Bot Scanner. These reports help our engineering team focus on supporting the components that are more frequently used by our customers.

Important: We maintain the privacy of the shared reports. No personally identifiable information (PII) is included and you can review the reports before sharing. Contact your Customer Success Manager (CSM) or Partner Enablement Manager (PEM) for more details.

Bot Scanner for EOL features

For information about Automation 360 Bot Scanner for EOL features, go to [Running Bot Scanner to scan bots for EOL features](#) on page 1077.

Scan Enterprise 11 or 10 bots using Bot Scanner

Before you migrate to Automation 360, it is important to verify the migration readiness of your bots. Scan the bots using Bot Scanner and analyze the generated report for information about the commands and variables used in these bots and how many of these commands and variables are supported for migration.

Ensure you meet the system requirements for using the Bot Scanner:

- Hardware requirements

Processor	2.66 GHz or higher (64-bit)
RAM	8 GB or higher
Disc space	128 GB or higher
Repository size	up to 10 GB

- Software requirements
 - Operating systems: Windows 7 or later (32-bit and 64-bit)
 - Number of bots: 10,000

You can also use the Bot Scanner to scan and identify bots that use Internet Explorer that can be converted to a supported browser.

Note:

- If your repository size is high or the number of bots is more than 10,000, then increase the Xmx heap size or RAM size to generate the report.
- If your repository size is more than 10 GB or if the number of bots is more than 50,000, we recommend that you only scan for bots and skip scanning for processes.

-
1. Download the latest version of Bot Scanner from the Automation Anywhere Support site.
 - a) Navigate to the [A-People Downloads page \(Login required\)](#).
 - b) Click the `Automation 360 v.xx <Build_number>` link.

The **xx** in the link refers to the release number. For example, Automation 360 v.21.

- c) Click the **Installation Setup** folder.
- d) Click the **AAE Bot Scanner** zip file, and then click **Download** on the toolbar.

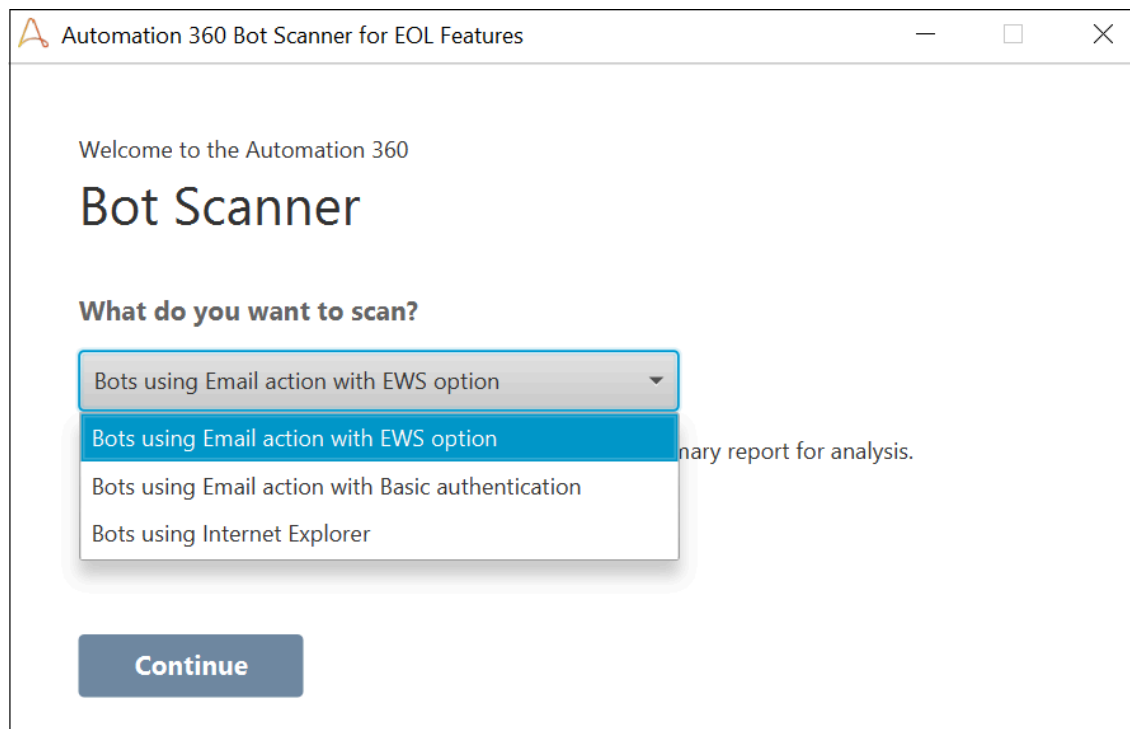

See the following video on how to download Bot Scanner:

2. Extract the files from the zip file you have downloaded and double-click **AAE_Bot_Scanner.exe**.

Note: Ensure that you save the **AAE_Bot_Scanner.exe** file in a location path that does not contain a double-byte character. Otherwise, the Bot Scanner encounters an error when it is run.

You can use the Bot Scanner to scan bots that use Internet Explorer. The scanner generates a report that provides details on the number of bots that can be converted and the number of bots that cannot be converted to a supported browser.

3. From the **Automation Anywhere Bot Scanner** dialog box, select one of the following options:
 - Migration to Automation 360
 - Migration + Bots using Internet Explorer
 - Bots using Internet Explorer

The second and third options provide Internet Explorer usage statistics that helps you to convert Internet Explorer bots to a supported browser.

4. In the **Automation Anywhere Bot Scanner** dialog box, enter the location of the folder that contains the bots that you want to analyze in the **Select repository path** field.

Important: You must create a copy of the Control Room repository and provide the location of the copied folder instead of the actual repository folder.

- a) Copy the Control Room repository.

For example, if the current location of the repository is `C:\ProgramData\AutomationAnywhere\Server Files\Default\Automation Anywhere`, you must copy the `Automation Anywhere` folder.

- b) Paste the copied repository at a temporary location. For example, `D:\My Bots` folder. You must provide this location (`D:\My Bots`) in the **Select repository path** field in Step 3.

5. Enter the location where you want to save the generated report in the **Select destination folder** field.
-

Note: The Bot Scanner related files and folders in the destination folder are overwritten if you have specified the same location when you have used the Bot Scanner previously.

6. Enter a value in the **Timeout** field to specify the maximum time the Bot Scanner should take to analyze a bot.
If the scanning of a bot takes more than the value specified in the **Timeout** field, Bot Scanner stops scanning that bot and proceeds to scanning other bots in the repository.
7. In the **Generate output report for** option, select the options for which you need to generate the report.
-

Note: For repositories that are more than 10 GB in size, we recommend that you select only the **Bots** option for generating the report.

8. Click **Create report**.

The Bot Scanner starts analyzing the bots available in the repository.

The Bot Scanner displays an error if it scans a bot that is created using an unsupported version of Enterprise Client. You must upgrade the bot to a supported version of Enterprise Client and scan the bot again.

9. Optional: You can click **Stop scanning** when the Bot Scanner is analyzing the bots to cancel the operation.

The summary report and individual reports are available for the bots that were analyzed before the operation was canceled.

10. Click **Open report** to open the summary report in the default browser after the Bot Scanner has completed analyzing all the bots available in the repository.

See the following video on how to use the scanner to scan Enterprise 11 or 10 bots:

- For migration: [Analyze Bot Scanner report for migration](#) on page 1474
- For IE EOL: [Analyze report for Internet Explorer bots](#) on page 1059
- For Basic authentication EOL: [Running Bot Scanner to scan bots for EOL features](#) on page 1077

Related concepts

[Bot Scanner for migration](#) on page 1469

The Bot Scanner analyzes bots (Task Bots and MetaBots) created in your Enterprise 10 or Enterprise 11 Control Room. The scanner generates a report summarizing the number of bots, commands, and variables that are ready for migration and those not yet supported for migration, and provides a recommendation on whether you are ready for migration.

Related reference

[Analyze Bot Scanner report for migration](#) on page 1474

You can analyze the report generated by the Bot Scanner to get information about the bots (Task Bots and MetaBots) and processes that can be migrated. Use the Bot Scanner to decide if you are ready to start migration now or prefer to wait until more commands are supported.

Analyze Bot Scanner report for migration

You can analyze the report generated by the Bot Scanner to get information about the bots (Task Bots and MetaBots) and processes that can be migrated. Use the Bot Scanner to decide if you are ready to start migration now or prefer to wait until more commands are supported.

The Bot Scanner report provides the following information:

- **Bots:** In the Bot Scanner report, a bot is an individual Task Bot (.atmx) or MetaBot (.mbot) that is used in other bots.

The **Bots** tab provides detailed information about bots that can be migrated, those that require action or review, and those that cannot be migrated.

- **Processes:** In the Bot Scanner report, a process is a bot that is not used in any other bots and can include one or more child bots.

The **Processes** tab provides detailed information about processes that can be migrated, those that require action or review, and those that cannot be migrated.

The Bot Scanner provides the following important information about the bots and processes:

- Number of bots and processes analyzed
- A high-level summary in the form of boards to indicate the migration status of bots and processes
- Number of bots and processes that you can and cannot migrate to Automation 360
- Commands that are used in the bots and the frequency of usage
- Reasons why bots and processes cannot be currently migrated and frequency of such occurrences
- Actions and reviews required by the users after migration due to change in the behavior of the commands
- Bots and processes that cannot be migrated and their corresponding error messages
- Number of lines in bots, and total number of lines of each bots associated with a process
- Line number for individual bots and processes that need review or action

Important: Automation 360 is updated frequently in order to achieve 100% functional equivalency with Enterprise 10 or Enterprise 11 versions. The percentage of bots, commands, and variables that are supported for migration in Automation 360 will increase until it reaches 100% over the next upcoming releases. That is, for every function you do in Enterprise 10 or Enterprise 11, an equivalent capability is in Automation 360.

Most of the Enterprise 10 or Enterprise 11 features are available as is; however, some features are implemented differently to support web (without a client) operations. For these features, you have to change the way bots are written.

The Bot Scanner is designed to scan bots (Task Bots and MetaBots) created using both Enterprise 10 and Enterprise 11 versions of Enterprise Client. The total file count includes the number of files that were skipped and not scanned.

The reports are available at the output location you specified in the **Select destination folder** field in the **Automation Anywhere Bot Scanner** dialog box. The Bot Scanner generates a summary report (`summary.html`) and a separate XML for each bot that it scanned. It creates a separate report for each logic available in a MetaBot.

A `raw-data` folder is created that contains the reports (in XML format) for each bot scanned. It helps our engineers to further analyze the migration process and take corrective actions, if required. No personally identifiable information (PII) is included in the summary report or the individual reports of the scanned bots.

If you choose to share the reports with us to help improve the product, compress the files in the `raw-data` folder and coordinate with your Customer Success Manager (CSM) or Partner Enablement Manager (PEM). No data is automatically shared with Automation Anywhere.

Summary report for all bots

The Bot Scanner utility provides an option to scan for either bots or processes, or bots and processes. Depending on what you choose, the summary report will contain information about the bots, processes, or bots and processes. Most of the sections seen in these summary reports will be the same except that in the bots and processes summary report you will also see an additional **All** tab that lists all the bots or processes that are flagged and sorted as **Action required**, **Review required**, **No review required**, and **Non Migratable**.

Note: For generating processes summary report, the maximum repository size that is supported is up to 10 GB.

The summary report provides information about the following:

- whether you can migrate to Automation 360
- the total number of bots scanned
- bots only report that provides information about the bots supported for migration to Automation 360 (in percentage)
- processes only report that provides information about the processes supported for migration to Automation 360
- bots and processes combined report that provides information about the bots and processes supported for migration to Automation 360

For example, consider the Bot Scanner has scanned 10 bots. Of the 10 bots, if 8 bots are ready for migration to Automation 360, then percentage of bots that can be migrated is 80% and the percentage of bots that cannot be migrated now is 20%.

Reviewing the Bot Scanner report for bots

Consider a scenario where you have scanned a total of 1618 bots, of which 98% (1614 bots) can be migrated to Automation 360. However, 5% of bots require action after migration, and 2% (4 bots) cannot be currently migrated due to certain reasons. In such a scenario, the Bot Scanner report enables you to perform the following actions:

- Identify the actions and reviews for the remaining 5% of bots so that you can successfully migrate a majority of your bots and run them in Automation 360 after migration.
- Identify bots that can be migrated to Automation 360 without any manual intervention.

- Identify the reason why 2% of bots cannot be currently migrated and the estimated time for when you can migrate them later. The reason might be due to commands and variables not yet supported in Automation 360.

Reviewing the Bot Scanner report for processes

To review a process message, perform these steps:

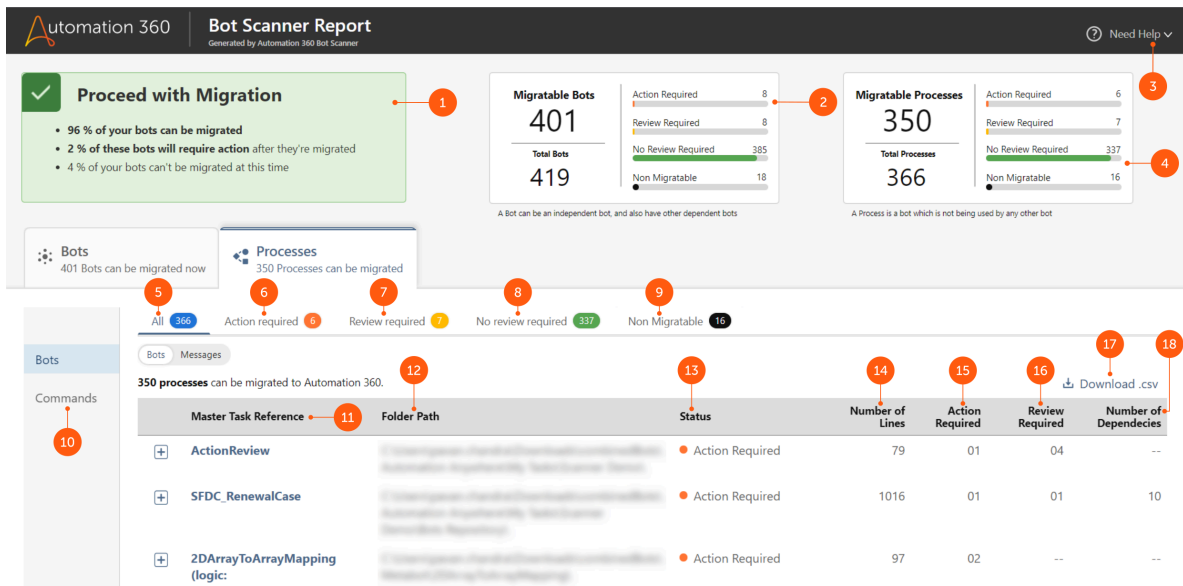

1. Click the **Processes** tab.
2. Click the messages tab that you want to review.
3. In the **Master Task Reference** column, click the expand icon () to view the process.
4. Click a process name to view the message.

Consider a scenario where you have a total of 100 processes, of which 99 processes can be migrated to Automation 360. However, 5 processes require action after migration, 10 processes require review after migration, and 1 processes cannot be currently migrated due to certain reasons. In such a scenario, the Bot Scanner report enables you to perform the following actions:

- Identify the actions and reviews for the remaining 15 processes so that you can successfully migrate a majority of your processes and use them in Automation 360 after migration.
- Identify processes that can be migrated to Automation 360 without any manual intervention.
- Identify the reason why that 1 process cannot be currently migrated and the estimated time for when you can migrate them later.

The reason might be due to commands and variables not yet supported in Automation 360.

The following image is a sample report from the Bot Scanner:

The following table describes the various fields in the sample Bot Scanner report (as numbered in the previous image):

Field/option	Description
1	<p>Provides a summary and status of the migration readiness of your bots. Review the status of migrated based on the following:</p> <ul style="list-style-type: none"> • Green: You can proceed with migration provided that you review the report for any action or review required for your bots. • Amber: You have to wait for migrating your bots as the percentage of bots that are qualified for migration do not meet the migration requirements.
2	<p>Provides a summary of the following information for bots:</p> <ul style="list-style-type: none"> • Migratable Bots: Provides a summary of the total number of bots that can be migrated. • Total Bots: Provides a summary of the total number of bots that were scanned. • Action Required: Provides a summary of the total number of bots that require action after migration to Automation 360. • Review Required: Provides a summary of the total number of bots that require review after migration to Automation 360. • No Review Required: Provides a summary of the total number of bots that can be migrated to Automation 360 without any manual intervention. • Non Migratable: Provides a summary of the total number of bots that cannot be currently migrated to Automation 360.
3	<p>Provides additional resources to ease the migration process.</p>
4	<p>Provides a summary of the following information for processes:</p> <ul style="list-style-type: none"> • Migratable Processes: Provides a summary of the total number of processes that can be migrated. • Total Processes: Provides a summary of the total number of processes that were scanned. • Action Required: Provides a summary of the total number of processes that require action after migration to Automation 360. Even if a child bot in a process requires action, the process is flagged as Action Required. <hr/> <p>Note: If a process contains bots where some of them require review and some others require action, then the process is flagged as Action Required. The Action Required status takes precedence over the Review Required status.</p> <hr/> <ul style="list-style-type: none"> • Review Required: Provides a summary of the total number of processes that require review after migration to Automation 360. Even if a child bot in a process requires review, the process is flagged as Review Required. • No Review Required: Provides a summary of the total number of processes that can be migrated to Automation 360 without any manual intervention. All the bots in the process can be migrated. • Non Migratable: Provides a summary of the total number of processes that cannot be currently migrated to Automation 360. All the bots in the process cannot be migrated.

Field/option	Description
5	<ul style="list-style-type: none"> • Bots > All > Bots or Processes > All > Bots: Go to this view for a list of all the bots or processes that are flagged and sorted as Action required, Review required, No review required, and Non Migratable. • To view the message for a specific bot that require action or review, click the bot name. • To view the message for a specific process that require action or review, click the expand icon (), and then click the task reference name. <p>Click the message code to view the information about changes in Automation 360 behavior for the command compared with the Enterprise 11 or Enterprise 10 behavior.</p> <hr/> <p>Note: Each message includes information you have to review after migration. For a list of these messages, see Review required messages on page 1633. Use the message code (for example R102) to view the specific message quickly.</p>
6	<p>Bots > Action required > Bots or Processes > Action required > Bots: Go to this view for the list of bots or processes that require action after migration to Automation 360.</p> <ul style="list-style-type: none"> • To view the message for a specific bot that require action, click the bot name. • To view the message for a specific process that require action, click the expand icon (), and then click the task reference name. <p>Click the message code to view the information about changes in Automation 360 behavior for the command compared with the Enterprise 11 or Enterprise 10 behavior.</p> <hr/> <p>Note: Each message includes information you have to review after migration. For a list of these messages, see Review required messages on page 1633. Use the message code (for example R102) to view the specific message quickly.</p>

Field/option	Description
7	<ul style="list-style-type: none"> • Bots > Review required > Bots or Processes > Review required > Bots: Go this view for a list of the bots or processes that require review after migration to Automation 360. • To view the review required message for a specific bot, click the bot name. • To view the review required message for a specific process, click the expand icon (), and then click the task reference name. <p>Click the message code to view the information about changes in Automation 360 behavior for the command compared with the Enterprise 11 or Enterprise 10 behavior.</p> <hr/> <p>Note: Each message includes information you have to review after migration. For a list of these messages, see Review required messages on page 1633. Use the message code (for example R102) to view the specific message quickly.</p> <hr/>
8	<p>Bots > No review required > Bots or Processes > No review required > Bots: Go to this view for a list of bots or processes that can be migrated to Automation 360 without any manual intervention.</p>
9	<p>Bots > Non Migratable > Bots or Processes > Non Migratable > Bots: Go to this view for a list of bots or processes that cannot be currently migrated to Automation 360.</p>
10	<p>Bots > Commands : Go to this view for a list of the commands that can be migrated and the number of times the commands are used across all your scanned bots.</p>
11	<ul style="list-style-type: none"> • Bot name: In the Bots tab, click a bot name to view the action required message of a specific bot, click the bot name. • Master Task Reference: In the Processes tab, to view the action required message of a specific process, click the expand icon (), and then click a task reference name. <p>Click the message code to view the manual steps you must perform to run the migrated process successfully in Automation 360.</p> <p>You can also view the commands that the bot contains and the frequency or the number of times the command is used in the bot.</p> <hr/> <p>Note: Each message includes the cause and the action you have to perform after migration. For a list of these messages, see Action required messages on page 1617. Use the message code (for example A101) to view a specific message quickly.</p> <hr/>
12	Provides the location of the bot.
13	Provides the status of the bot or process.

Field/option	Description
14	<ul style="list-style-type: none"> For bots, this field displays the number of lines used in a bot. This information will help you understand the complexity of the bot. For processes, this field displays the sum of the total number of lines used in the parent and child bots within a process. This information will help you understand the complexity of the process.
15	<p>For processes, this field displays the number of bots in a process that requires action after migration to Automation 360.. Click the expand icon () and then click a task reference name that is flagged as Action Required.</p> <p>Click the message code to view the information about changes in Automation 360 behavior for the command compared with the Enterprise 11 or Enterprise 10 behavior.</p> <hr/> <p>Note: This field is available only for processes.</p>
16	<p>For processes, this field displays the number of bots in a process that requires review after migration to Automation 360. Click the expand icon () and then click a task reference name that is flagged as Review Required.</p> <p>Click the message code to view the information about changes in Automation 360 behavior for the command compared with the Enterprise 11 or Enterprise 10 behavior.</p> <hr/> <p>Note: This field is available only for processes.</p>
17	Download (as a CSV file) the list of bots, processes, or commands that can or cannot be migrated so that you can share the file with others.
18	<ul style="list-style-type: none"> For bots, this field displays the number of times a bot is used as a child bot. For processes, this field displays the sum of the total number of dependencies used in the parent and child bots within a process.

The report is valid until the next version of Bot Scanner is available. When the next version of Bot Scanner is available, a report expiry message is displayed. You must download the latest version of Bot Scanner and scan the bots again.

Verifications and actions required after migration

Some commands in the bots might be marked as review required in the Bot Scanner report. For these items, you need perform certain validation or update the bots after they are migrated.

The following Bot Scanner messages require verification or some actions:

- Child bot path is completely variablized and is resolved at runtime. Bot would fail upon execution if the path specified in the variable is not valid. Please review the migrate bot.

Ensure that the child bot is available at the location specified in the variablized path. If the path in the parent bot is not correct, update the path to point to the correct child bot.

- Value returned by system variable "Error Description" might be different w.r.t. legacy versions. Please review the migrated bot.

Description of some of the error messages in Automation 360 might be different than Enterprise 11 or Enterprise 10 for the same error. If an Enterprise 11 or Enterprise 10 bot is configured to take decisions based on the description of the error messages, you might have to update the migrated bot based on the new description of error messages.

- Migration of "Database - Connect" command is completed but additional configuration required for "Windows authentication". Please refer the database package documentation for more details.

Complete the steps specified to connect to a Microsoft SQL Server with Windows authentication. See [Connect to Microsoft SQL Server with Windows authentication](#) on page 2386.

- Migration of "IF" with variable condition is completed. However, could not determine the date format of the user variable, hence migrated with default date format mm/dd/yyyy HH:mm:ss. Please review and change the format if required.

Update the date format in the migrated bot to the same format used in Enterprise 11 for that bot.

- Could not determine if a variable used as position is index or column name. Index position starts from 0 instead of 1 hence take necessary actions if needed.

If you have used the FileData Column[\$variable\$] or Excel Column[\$variable\$] system variables in the Enterprise 11 or Enterprise 10 bot, we assume that you have used the column name in the \$variable\$. In such cases, the migrated bot contains the FileData Column{\$variable\$} expression. If the \$variable\$ in the Enterprise 11 or Enterprise 10 bot contains the column number, you must update the expression in the migrated bot to FileDataColumn[\$var.String:toNumber()\$].

- The Run Logic command that uses credential variables as input for a logic of a MetaBot

Bots that use the **Run Logic** command that passes Credential Vault attributes from a Task Bot to a MetaBot logic can be migrated to Automation 360. The credential name and attribute name are displayed in the fields in the corresponding line of the migrated bot.

If you have migrated using the restored Enterprise 11 database, an equivalent locker is created in Automation 360 for the credential variables used in the Enterprise 11 bot.

Choose one of the following options to run the migrated bots successfully:

- Option 1: Pass the credential type variables.
 1. Create a credential type variable in the child bots as input variables.
 2. In the **Run** action of the Task Bot package of the parent bot, update the input value fields to use the Credential Vault attributes for the credential type variable created for the child bot (corresponding to MetaBot logic).

- Option 2: Pass the credential values as a global value.
 1. Create the Global value in Automation 360 for the credentials use in the **Run Logic** command in Enterprise 11.
 2. In the **Run** action of the Task Bot package of the parent bot, update the Input value fields to use the Global values for the credential type variable created for the child bot (corresponding to MetaBot logic).

If you have not used the restored Enterprise 11 database when installing Automation 360, you must first create the required locker for the credential variables used in the Enterprise 11 bot, before performing the preceding steps.

Note: Automation 360 provides enhanced security by allowing you to assign Credential Vault attributes only to the credential type variables. This restricts any nonsecure handling of Credential Vault attributes where they might have been assigned to non-credential type variables.

Report for an individual bot

The report for each bot provides information about its dependencies, variables, and commands used.

The individual bot report looks similar to the following code:

```

    <analysis version="1.3.0">
      <stat>
        <dependencies ucount="0" count="0"/>
        <errors ucount="6" count="12">
          <error count="1">System variable
$AAApplicationPath$</error>
          <error count="1">Command [If FolderNotExist]
is not supported</error>
          <error count="3">System variable
$CurrentDirectory$</error>
          <error count="3">System variable $Extension$</
error>
        </errors>
      </stat>
      <commands>
        <command target-action="assign"
name="VariableOperation" line="1"
          grp="VariableOperation" api="VarOpe">
          <msg type="error" review="true"
category="variable">System
variable $AAApplicationPath$</msg>
          <msg type="info" review="false"
category="default">Command
parameter [Option] of type [String] is not
required.</msg>
        </command>
        <command target-action="createFolder"
name="createFolder" line="3"
          grp="FilesFolders" api="CreateFolder"/>

```

```

line="5"          <command target-action="copyFiles" name="CopyFiles"
                  grp="FilesFolders" api="CreateFolder"/>
line="3"          <command target-action="connect" name="Connect"
                  grp="Database" api="Connect"/>
line="9"          <command target-action="OpenCSVTEXT" name="ReadFrom"
                  grp="CsvText" api="Csv"
                  <msg tpye="info" review="false"
category="command">Line
                  in 11.x client, there is no separate option
given for CSV
                  and TEXT in Automation 360</msg>
                  <msg type="error" review="true"
category="variable">System
                  variable $CurrentDirectory$</msg>
                  <msg type="error" review="true"
category="variable">System
                  variable $Extension$</msg>
                  <msg type="error" review="true"
category="variable">System
                  variable $FileName$</msg>
                  </command>
</commands>
<variables>
  <variable name="$CSV-TXT-Default-DATA$"
            type="TABLE" value-type=""/>
</variables>
</analysis>

```

The following table describes the various attributes available in the XML report shown in the previous image:

Node	Attribute	Description
Stat	--	Provides information about the number of dependencies, error, and warnings.
--	dependencies	Specifies the number of dependencies for the bot. The <code>u</code> count indicates the number of unique dependencies and the <code>count</code> indicates the total number of dependencies.
--	error	Specifies the number of errors for the bot. The <code>u</code> count indicates the number of unique errors and the <code>count</code> indicates the total number of errors.
Command--		Provides information about the various commands and actions used in the bot.
--	command target-action	Specifies the action being performed for the command.
--	name	Specifies the name of the command.
--	line	Specifies the line number where the command is available in the bot.
--	grp	Specifies the command group the command belongs to.

Node	Attribute	Description
--	api	Specifies the name of the API the command uses.
--	msg type	Provides information about the message type. The <code>error</code> type indicates that the command cannot be migrated to Automation 360, and an <code>info</code> type indicates that the command can be migrated but some of its attributes will be changed during migration.
--	review	Provides information about whether the command has to be reviewed. This attribute is always true for <code>error</code> type messages, which indicates that migration of that command to Automation 360 is not yet supported. For <code>info</code> type messages, if the attribute is true, you must review the value in the <code>category</code> attribute. You can decide whether you want to take any action on the migrated bot based on the value available in the <code>category</code> attribute.
--	category	Provides information about the command or variable for which the message is displayed.
Variables		Provides information about the system variables used by the bot.
--	variable name	Specifies the name of the variable.
--	type	Specifies the type of variable.
--	value type	Specifies the type of value provided for that variable.

See the following video on how to analyze the scanner report

Get migration license

Migration is offered for free. To migrate to an Automation 360 environment (Cloud or On-Premises), you must request a migration license.

License terms and duration

- If your migration is taking longer than expected to complete, contact your Customer Success Manager or Account Representative to discuss extensions.
- Your Automation 360 migration license is transitional, which means it will overlap with your Enterprise 10 or Enterprise 11 license during the migration period.

After you have completed your migration, your Automation 360 products and licenses will transfer over to the 1-to-1 equivalents of your current contract. You should review your automation requirements or renewal dates and determine if any updates in licensing are necessary.

Note: Run the Bot Scanner and determine when to migrate first. We recommend that you request a migration license only after you have run the Bot Scanner and have reviewed the prerequisites for your deployment choice.

Requesting your migration license

When you are ready to begin migration, contact your Account Representative, submit your Bot Scanner report, and specify if you are requesting licenses for an Automation 360 Cloud or On-Premises deployment.

- To get started with Automation 360 (Cloud or On-Premises), you will be required to accept the in-product user terms.
- Because Automation Anywhere will be hosting customer data, customers migrating to Automation 360 Cloud must also agree to the Cloud Automation Agreement.

For Cloud migration, keep in mind the following:

- You must request the equivalent number of licenses for Control Room and other entitlements such as Bot Creators, Bot Runners, IQ Bot, and Bot Insight.

Migration fails if the number of Automation 360 licenses is not equivalent to the number of Control Room and other entitlements available in your Enterprise 11 environment.

Ensure that the number of Automation 360 licenses is equal to the number of Control Room and other entitlements available in your environment.

Otherwise, non-migrated user accounts will require further action after migration.

- You must request for the license when you are ready to begin migration because the migration code is valid for 30 days.

If you are not ready to begin migration and you get the migration license (along with the migration code), the 30-day validity of the code might expire by the time you begin migration or you might not have sufficient time to complete the migration.

Activating the license

- Automation 360 Cloud: You will be provided with a migration code that includes your migration license. Paste this code into the Cloud Migration Utility, and then run the utility to activate your license.
- Automation 360 On-Premises: When you complete your Automation 360 installation, upload your GUID when you open the Automation 360 Control Room. If you do not have a license GUID, then upload the current license file.

Prepare new Control Room for migration

Perform the tasks in this workflow to prepare your Automation 360 environment for migration.

Ensure that you have completed all the tasks to check your readiness for migration: [Check migration readiness](#) on page 1445.

1. Choose a deployment model (Cloud, Cloud-enabled, or On-Premises).
2. Request and activate your migration license.
3. Based on the deployment model you have selected, prepare your environment for migration:

Deployment model	Actions
Cloud	<ul style="list-style-type: none"> • Migrate using the Cloud Migration Utility: Prepare for Enterprise 11 to Automation 360 Cloud migration on page 1490 • Use both Automation 360 Cloud and Enterprise 11 in parallel: Prepare for migration when using Enterprise 11 and Automation 360 Cloud in parallel on page 1498 • Manually migrate to Cloud: Prepare to manually migrate to Automation 360 Cloud on page 1499 <hr/> <p>Note: We do not support migration from to . However, you can manually migrate to by using the bot export utility. For assistance, contact support: .</p> <hr/>
Cloud-enabled	Prepare for Enterprise 11 to Automation 360 Cloud-enabled migration on page 1513

Deployment model	Actions
On-Premises	<ul style="list-style-type: none"> • Enterprise 11 to Automation 360: <ul style="list-style-type: none"> • Prepare for Enterprise 11 to Automation 360 On-Premises migration on page 1502 • Use both Automation 360 On-Premises and Enterprise 11 in parallel: Prepare for migration when using Enterprise 11 and Automation 360 On-Premises in parallel on page 1510 • Enterprise 10 to Automation 360: <ul style="list-style-type: none"> • Prepare for Enterprise 10 to Automation 360 On-Premises migration on page 1516 • Use both Automation 360 On-Premises and Enterprise 10 in parallel: Prepare for migration when using Enterprise 10 and Automation 360 On-Premises in parallel on page 1522

4. [Complete the pre-migration tasks.](#)

[Migrate and validate bots](#) on page 1525

Choose deployment model

The Automation 360 platform is developed on a cloud-native architecture with a single codebase that supports both Cloud and On-Premises deployments. The experience of all the components is the same whether the platform is deployed on Cloud or On-Premises on your own infrastructure, which can be physical servers, your private Cloud, or a public Cloud.

Note: Migration is available in Automation 360 starting from Build 2079 for On-Premises and from Build 7554 for Cloud deployments.

Deployment models

Automation 360 provides the following deployment models:

Cloud

Automation 360 Cloud is hosted by Automation Anywhere, providing an easy consumption model of the Automation 360 platform built on a cloud-native architecture. With the Automation 360 Cloud service, the Automation 360 platform, which includes the Automation 360 Control Room and applications (Automation Workspace, IQ Bot, Bot Insight, Automation Co-Pilot, and Discovery

Bot), is hosted by Automation Anywhere and accessed by users through a web browser. The Bot Agent devices where the bots run and execute the automations remain on the customer's infrastructure and securely connect to the Automation 360 Cloud service through HTTPS.

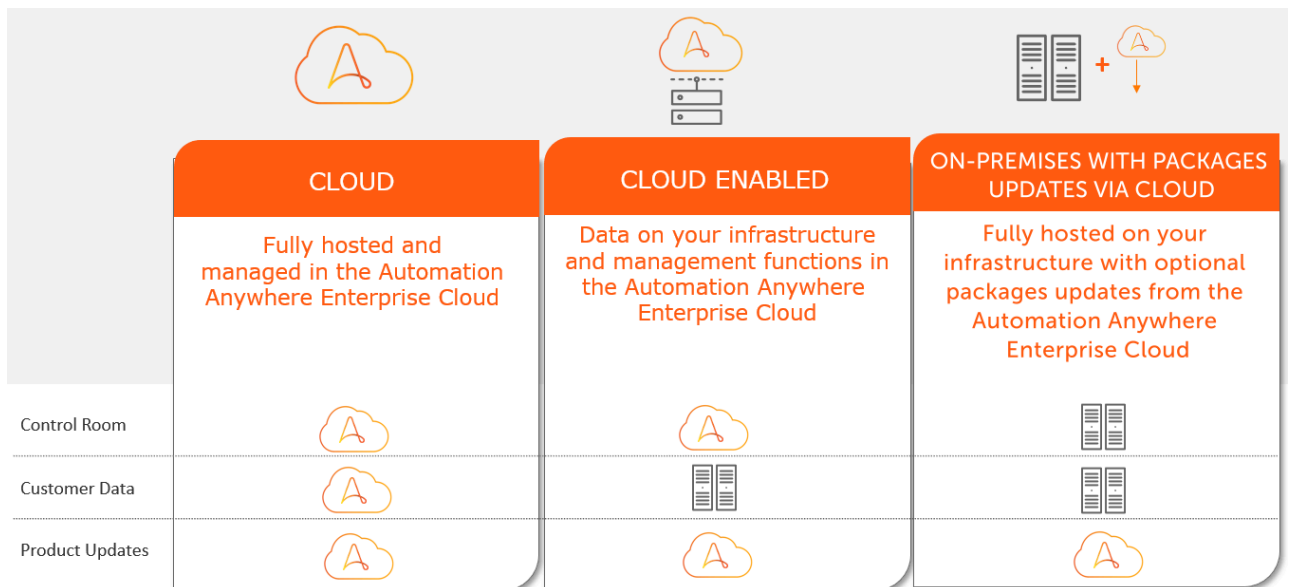

Cloud-enabled

In this deployment model, data is hosted On-Premises. This model is suitable for customers who have to adhere to strict regulatory norms where data sovereignty is mandatory.

On-Premises with packages updates through Cloud

With Automation Anywhere On-Premises with packages updates through Cloud service, all business, personal, and operational data is kept on and deployed from the server on-premises on the customer network.

The following image shows the deployment models for Automation 360:

See also [Cloud operational responsibilities](#) on page 980.

Important:

- Irrespective of the deployment model you choose, we recommend that you set up your first Automation 360 instance as a development (Dev) environment.
- We recommend that you have three separate environments for Bot Lifecycle Management: development (Dev), testing (Test or UAT), and production (Prod).
- Setting up a Dev environment during the migration process provides two advantages:
 - A platform to test the migrated Enterprise 11 or Enterprise 10 bots to ensure that they run successfully and provides expected outcomes.

- Access for your developers to the new Automation 360 environment to build new automation simultaneously when migrated bots are being tested.
-

Getting ready for Cloud

When you choose an Automation Anywhere Cloud deployment, there is no additional physical server infrastructure to set up for the Control Room. After you have completed your upgrade, you will benefit from automatic updates across your organization and scale easily in the Cloud. As you get started with Automation 360 on Automation Anywhere Cloud, ensure the system and compatibility requirements for running Automation 360:

- [Bot Agent compatibility requirements](#): Bot Agent must be installed on registered devices so users can build and run bots on them.

Getting ready for Automation 360 Cloud-enabled

When you choose the Cloud-enabled deployment, two instances of Control Room are required: one deployed on Automation Anywhere Cloud and another installed on your own infrastructure. The Control Room deployed on Cloud manages the operational services and the Control Room installed on your infrastructure manages your business and operational data.

- [Bot Agent compatibility requirements](#): Bot Agent must be installed on registered devices so users can build and run bots on them.
- [System requirements](#): Hardware and data center requirements, including server, database, ports, protocols, and more.

Getting ready for On-Premises (customer's infrastructure)

Install and maintain Automation 360 on your own infrastructure. After you have completed your upgrade, you will benefit from regular updates for packages with new release builds made available to download and install. Ensure you meet the system and setup requirements for Automation 360 On-Premises:

- [Bot Agent compatibility requirements](#): Bot Agent must be installed on registered devices so users can build and run bots on them.
- [System requirements](#): Hardware and data center requirements, including server, database, ports, protocols, and more.

Prepare for Enterprise 11 to Automation 360 Cloud migration

Perform the tasks in this workflow to migrate from Enterprise 11 to Automation 360 Cloud, including migrating your bots.

Workflow map: You can also view this migration workflow in an interactive visual format by clicking the following schematic

image:

1. [Migrating from Enterprise 11 to Automation 360 Cloud](#)

1. Ensure that you have completed the following tasks to check your readiness for migration
[Check migration readiness](#) on page 1445
2. Ensure you have procured and activated your migration license.
[Get migration license](#) on page 1484

For information about managing and processing licenses and Cloud services , see [Manage and allocate licenses \(partners\)](#).

Important:

- We support migration only to an Automation 360 Control Room that is hosted on Amazon Web Services (AWS).
- Migration is performed to a new Cloud Control Room, which will be provisioned during the migration. You cannot reuse an existing Cloud Control Room for the migration.
- Logs and Bot Insight dashboard data are excluded from the upload to the new Cloud Control Room.
- Migrating data from standard Microsoft SQL database deployments is supported. See [Supported Control Room versions for migration](#) on page 1446.
- If Enterprise 11 is configured to use Active Directory or single sign-on (SSO), the authentication type for all migrated users in Automation 360 Cloud is changed to database. The password for all the migrated users is set to null except for the principal administrator.

Login credentials for the principal administrator is shared through email. The principal administrator can change the authentication type for users to SSO before migrating bots.

- Recommended: Create a backup of your data that is not migrated to Automation 360 Cloud such as audit logs and system logs before you decommission your Enterprise 11 instances.

For IQ Bot migration, see [Migrate from Automation 360 IQ Bot On-Premises to Cloud](#) on page 1663.

1. Ensure that all the credential variables used in the Enterprise 11 bots are available in the Enterprise 11 Control Room.
2. Download and install the Cloud Migration Utility.
[Install Cloud Migration Utility](#) on page 1493
3. Use the utility to upload Enterprise 11 data to Automation Anywhere Cloud.
[Upload Enterprise 11 data using Cloud Migration Utility](#) on page 1495

[Prerequisite tasks for migrating bots](#) on page 1524

Recommended workflow for Cloud migration

Review the process of how Enterprise 11 data is migrated to Automation 360 Cloud, particularly when you maintain separate development, testing, and production environments.

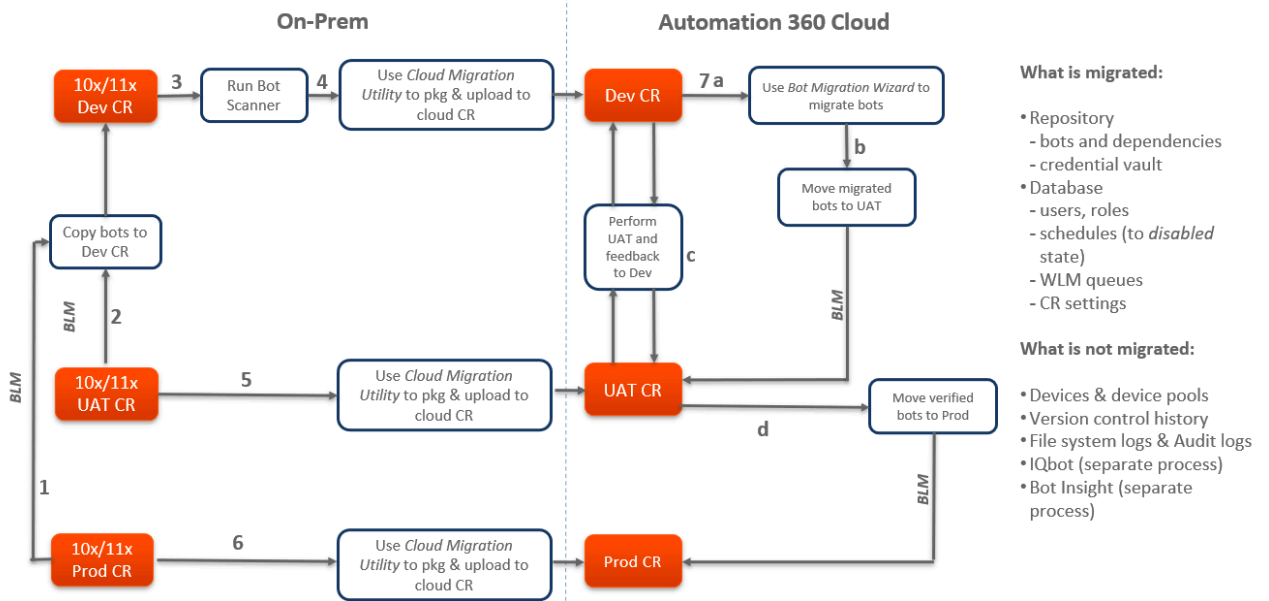

Important: This is the recommended workflow for migrating from Enterprise 11 to Automation 360 Cloud.

Note: We do not support migration from `Enterprise 11` to `Automation 360 Cloud`. However, you can manually migrate `Enterprise 11` to `Automation 360 Cloud` by using the bot export utility. For assistance, contact `support`.

In some scenarios, there might be a separate Enterprise 11 environments for development (Dev), testing (UAT), and production (Prod) based on the requirements and each of these environments might have multiple Control Room instances. The number of Cloud Control Room licenses you request must be the same as the total number of Control Room instances in all of your Enterprise 11 environments. For example, if you have separate environments for Dev, UAT, and Prod, and each of these environments has two Control Room instances, you must request six Cloud Control Room licenses.

When you migrate from Enterprise 11 to Automation 360 Cloud, you must copy all the bots from the production and testing environments to the development environment using Bot Lifecycle Management. This ensures that all new or modified bots available in the production and testing environments are available in the development environment before you start the migration process.

The following image shows the Enterprise 11 to Automation 360 Cloud migration workflow:

1. Optional: Copy bots from the Enterprise 11 Prod environment to the Dev environment using Bot Lifecycle Management.

[Bot Lifecycle Management - an overview](#)

2. Optional: Copy bots from the Enterprise 11 UAT environment to the Dev environment using Bot Lifecycle Management.

[Bot Lifecycle Management - an overview](#)

3. Analyze your bots and identify commands and variables used in the bots that are supported for migration to Automation 360.

[Scan Enterprise 11 or 10 bots using Bot Scanner](#) on page 1471 | [Analyze Bot Scanner report for migration](#) on page 1474

4. Upload Enterprise 11 data to Dev Cloud Control Room using the Cloud Migration Utility.

[Install Cloud Migration Utility](#) on page 1493 | [Upload Enterprise 11 data using Cloud Migration Utility](#) on page 1495

5. Upload Enterprise 11 data to UAT Cloud Control Room using the Cloud Migration Utility.

6. Upload Enterprise 11 data to Prod Cloud Control Room using the Cloud Migration Utility.

7. Complete the following steps on Automation 360 Cloud Dev environment:

a) Convert the bots (Task Bots and MetaBots) in .atmx and .mbot format to the .bot Automation 360 format using the Bot Migration Wizard.

b) Copy the converted bots to the Automation 360 Cloud UAT environment using Bot Lifecycle Management.

[Bot Lifecycle Management](#) on page 1964

c) Test the converted bots in the Automation 360 Cloud UAT environment.

If any of the migrated bots are not working as expected and require some modification, move such bots to the Automation 360 Cloud Dev environment.

After the bots are modified, move them to Automation 360 Cloud UAT environment for testing. Repeat this process until all of the migrated bots work as expected.

- d) After all the converted bots are tested and work as expected, copy these bots to the Automation 360 Cloud Prod environment.

Install Cloud Migration Utility

The Cloud Migration Utility enables you to upload all your Enterprise 11 data to Automation Anywhere Cloud. After the data is successfully uploaded to Cloud, the Cloud Control Room is created and all the uploaded data is available for use in that Control Room.

The utility migrates data from Control Room repository (bots, their dependencies, and Credential Vault) and Control Room database (users, roles, schedules, queues, and Control Room settings).

Note: Migration of Enterprise 11 Control Room data, such as users, roles and credentials, to Automation 360 Cloud on Google Cloud Platform is not supported.

Consider the following recommendations:

- Ensure that you install the Cloud Migration Utility on the same application server where the Enterprise 11 Control Room is installed. For Enterprise 11, also ensure that the utility is installed on the same database where the Bot Insight database is hosted.
- If you installed Enterprise 11 in cluster mode, install the migration utility on one of the nodes of the cluster.

Note: We do not support migration from `to` . However, you can manually migrate `to` by using the bot export utility. For assistance, contact `support`: .

1. Download the latest version of the Cloud Migration Utility from the Automation Anywhere support site: [A-People Downloads page \(Login required\)](#).
 - a) In the Automation Anywhere Automation 360 section, click the **Automation Anywhere Enterprise Cloud Migration Utility** link.
 - b) Download the `.zip` file.
2. Extract the `.zip` file and run the `AAE Cloud Migration Utility.exe` file as administrator.
3. On the **Requirement** screen, click **Install**.

The screen lists the applications that are required to install the utility on the machine. The utility installs the required applications; no separate installation is required.
4. On the **Welcome** screen, click **Next**.
5. On the **License Agreement** screen, read and accept the license, and click **Next**.
6. On the **Destination Folder** screen, click **Change** if you want to change the location where you want to install the utility, and click **Next**.
7. On the **Ready to Install the Program** screen, click **Install**.

The **Installing AAE Cloud Migration Utility** screen displays the progress of the installation.
8. On the **Completed** screen, click **Finish**.

For Enterprise 11, [Upload Enterprise 11 data using Cloud Migration Utility](#) on page 1495

Prerequisites for Cloud migration

After you have installed the Cloud migration utility, you must perform certain tasks before you start uploading data to Automation 360.

Complete the following requirements before you run the Cloud Migration Utility to upload data to Automation 360 Cloud:

- Cloud Migration Utility
 - [Install the Cloud Migration Utility](#)
 - You can migrate only one Control Room at a time. So when you connect to the Control Room, ensure that the installation path, the repository path, and the database details belong to the same Control Room before you run the Cloud Migration Utility.

- Migration code: Ensure you have received an email that contains a migration code. Contact your sales representative to receive the code.

The migration code is valid for one Control Room only. If you have multiple Control Room instances, you will receive an equivalent number of migration codes. Ensure that you use the correct migration code for the migration of a specific Control Room.

Important: The migration code you receive through email is valid for 30 days from the date it is generated and shared with you. So start the migration before the code expires. Otherwise, you will have to request a new code, which might take a significant amount of time.

- Automation Anywhere Cloud customer tenant:
 - The tenant name does not support the underscore (_) character. So an underscore is used in the tenant name, the specified URL will not be created.
- Port, firewall, internet connection
 - The port that is used to connect to the Enterprise 11 Control Room database must be open and available for the utility.
 - The firewall must be configured to allow the utility to connect to the following for outbound HTTPS traffic over the port 443:
 - <https://aa-provsvc.globalservices.automationanywhere.digital/>
 - <https://aws.amazon.com>
 - Ensure a stable internet connection with sufficient bandwidth to upload the data within 60 minutes. If the upload time exceeds 60 minutes, the Cloud Migration Utility will timeout and you need to start the upload process again.
- Enterprise 11 Control Room
 - We recommend that you plan for some downtime for the Enterprise 11 Control Room or stop all user activities when you use the migration utility.

The downtime is required to ensure that no data is missed when the Cloud Migration Utility is packaging Enterprise 11 data for upload. If downtime is not possible, ensure no user activities are performed on the Enterprise 11 Control Room for the time period when the Cloud Migration Utility is uploading data.

- Control Room: Ensure that the size of the Enterprise 11 repository is less than 20 GB and the Enterprise 11 database is less than 9 GB.

If the size of the repository or database is more than these sizes, contact Automation Anywhere support for assistance.

- Ensure that the credentials you have used to connect with the Enterprise 11 database has db_owner permission.
- Ensure that the Enterprise 11 repository and database you specify in the Cloud Migration Utility belong to the same Enterprise 11 Control Room.
- Log files: Grant access to the C:\ProgramData\AutomationAnywhere folder for the migration utility to store the log files.
- Credential Vault: Ensure that the Credential Vault mode is set to express mode.
 - This mode ensures that the credentials and variables available within the Enterprise 11 Credential Vault are migrated to the Cloud Control Room.
 - If the Credential Vault mode is set to manual mode in Enterprise 11, the credentials and variables in the Enterprise 11 Credential Vault are not migrated to the Cloud Control Room.

You can change the mode back to manual after the Control Room data is migrated. See [Configure Credential Vault Connection mode](#) on page 1750.

- SSO: If you want to integrate SSO after migrating to Automation 360 Cloud, ensure that the IDs of users in the Enterprise 11 Control Room exactly match the IDs in the SSO database. SSO integration will fail for IDs that do not match.

Related concepts

[Get migration license](#) on page 1484

Migration is offered for free. To migrate to an Automation 360 environment (Cloud or On-Premises), you must request a migration license.

Upload Enterprise 11 data using Cloud Migration Utility

Use the Cloud Migration Utility to gather Enterprise 11 data and upload it to Automation Anywhere Cloud.

Ensure you have completed all the prerequisites before you start uploading data to Automation 360. See [Prerequisites for Cloud migration](#) on page 1494.

Note: Stop the Automation Anywhere Control Room Reverse Proxy service.

If Enterprise 11 is installed in a cluster setup, you must stop the Automation Anywhere Control Room Reverse Proxy service on all the nodes in the cluster.

Note: In Enterprise 11, if the domain name and email address of an Active Directory user match, the same Customer License User (CLU) account is migrated to Automation 360. Else, a new user account is created with the account-level CLU details registered with Automation Anywhere.

-
1. Run the Cloud Migration Utility as administrator.
 2. Select the **Connect to the internet via proxy** option if you want to connect to the internet using a proxy server, and then click **Get started**.
 - a) Specify the hostname or IP address of the proxy server in the **Proxy hostname/IP address** field.
 - b) Specify the port you want to use to connect to the proxy server in the **Port** field.
 - c) Select the **Authentication** option if the proxy server requires authentication.
 - d) Specify the credentials you want to use for authentication in the **Username** and **Password** fields.

3. On the **Connect to Control Room** screen, enter the following details about the Enterprise 11 environment.

Important: These fields are automatically populated with the required values from the Enterprise 11 environment when the Cloud migration utility is run on the same application server where the Enterprise 11 Control Room is installed.

As you can migrate only one Control Room at a time, ensure that the installation path, the repository path, and the database details belong to the same Control Room.

Field	Value
Installation Path	Location where the Control Room is installed. The Installation path value is auto-populated to ensure that the details match with the Control Room database. Note: Network path is not supported as an Installation Path value.
Repository Path	Location where the Control Room repository is stored. The Repository Path value is automatically populated and cannot be edited. This is to ensure that the details match those in the Control Room database.
IP address/Hostname	IP address or hostname of the database server.
Port	Port that is used to connect to the database server.
Database Name	Name of the Control Room database that you want to upload.
Secure Connection	Option to use a secure connection to connect with the database.

Field	Value
Authentication	<p>Authentication method that you want to use:</p> <ul style="list-style-type: none"> Windows authentication: Select this option to use Windows authentication for establishing a connection with the database server. <hr/> <p>Note: The user who is logged in to the Enterprise 11 server and is running the Cloud migration utility must be a Windows user administrator with db_owner permission to the Enterprise 11 database.</p> <hr/> <ul style="list-style-type: none"> SQL authentication: Select this option to use database credentials for authentication when establishing a connection with the database server. <p>If you select this option, provide the credentials you want to use to connect to the database server in the Username and Password fields.</p>
Backup Path	Location where you want to store backup of the Enterprise 11 Control Room data.

4. Click **Next**.
5. On the **Summary** screen, review the information and click **Next**.
6. On the **Validate migration code** screen, enter the migration code you received through email and click **Validate**.
The system validates the migration code you have entered.
7. Click **Next**.
The system extracts the Enterprise 11 data and starts transferring data to Automation Anywhere Cloud.
8. Click **Exit**.
After the data is successfully uploaded, you will receive an email with a link and login credentials to access the Control Room.

See the following video on how to upload Enterprise 11 data using the Cloud Migration Utility:

See the following video on how to verify the Enterprise 11 data in the Cloud Control Room:

[Migrate Enterprise bots](#) on page 1529

Prepare for migration when using Enterprise 11 and Automation 360 Cloud in parallel

Perform the tasks in this workflow if you want to use both Automation 360 Cloud and Enterprise 11 in parallel. You can continue to use both environments till the time you are ready to start the migration from Enterprise 11 to Automation 360 Cloud.

1. Ensure that you have completed the following tasks to check your readiness for migration
[Check migration readiness](#) on page 1445.
2. Ensure you have procured and activated your migration license.
[Get migration license](#) on page 1484

Important:

- Migration is performed to a new Cloud Control Room, which will be provisioned during the migration. You cannot reuse an existing Cloud Control Room for the migration.
- You cannot use the Cloud Migration Utility to upload your data to the Cloud Control Room if you have selected the standard Automation 360 Cloud SKUs when you signed the order form.
If you want to use the Cloud Migration Utility, you must have selected the Automation 360 Cloud migration SKUs when you signed the order form.

-
1. Ensure that all the credential variables used in the Enterprise 11 bots are available in the Enterprise 11 Control Room.
 2. Download and install the Cloud migration utility.
[Install Cloud Migration Utility](#) on page 1493
 3. Use the Cloud migration utility to upload Enterprise 11 data to Automation Anywhere Cloud.
[Upload Enterprise 11 data using Cloud Migration Utility](#) on page 1495
 4. Continue using both Enterprise 11 and Automation 360 environments in parallel.

Note: Create all new bots and entities such as users, roles, and schedules in Automation 360.

5. If you create any new entity such as users, roles, or schedules (except bots) in Enterprise 11 after installing Automation 360, create the same entity in Automation 360.
6. When you are ready to use only Automation 360 as your production environment:
 - a) If you have created new bots in Enterprise 11 data is uploaded in Automation 360 Cloud:
 1. Export all the bots and their dependencies that were created after data was uploaded in Automation 360 Cloud using Bot Lifecycle Management.
[Export bots](#)
 2. Import all the bots to Automation 360 using Bot Lifecycle Management.
[Import bots](#) on page 1969

Note: After migration, if you add any new Bot Insight data or dashboard or modify any existing data in Enterprise 11, these changes are currently not imported to Automation 360 and therefore will not be migrated.

[Prerequisite tasks for migrating bots](#) on page 1524

Prepare to manually migrate to Automation 360 Cloud

You can manually migrate from Enterprise 11 or Enterprise 10 to Automation 360 Cloud (without using the Cloud Migration Utility) by creating users, roles, permissions, and other entities required by the migrated bots to run successfully.

Note: The only way by which you can migrate from Enterprise 11 or Enterprise 10 to Automation 360 Cloud on Google Cloud Platform is by using the following procedure.

1. Ensure that you have completed the following tasks to check your readiness for migration
 - [Check migration readiness](#) on page 1445.
2. Ensure you have procured and activated your migration license.
 - [Get migration license](#) on page 1484

Note: Use the manual migration in the following scenarios:

- You have an existing Automation 360 Cloud instance and want to migrate your Enterprise 11 data.
- When you want to migrate only bots and re-create all other Enterprise 11 or Enterprise 10 entities such as users, roles, and credentials manually in Automation 360.
- When you want to migrate only a few of the Enterprise 11 or Enterprise 10 entities. For example, if you have 50 users and 10 user-defined roles in Enterprise 11 or Enterprise 10 and you want to migrate only 40 users and 7 roles to Automation 360. Similarly, if you want to migrate only users and roles and want to re-create the required schedules in Automation 360.

For information about automated migration to Cloud (using the Cloud Migration Utility), see [Prepare for Enterprise 11 to Automation 360 Cloud migration](#) on page 1490.

1. Create all the Enterprise 11 or Enterprise 10 entities in Automation 360 Cloud. For more information about the entities you must create, see [Prerequisites for manual migration](#) on page 1500.

2. Upload the bots:

Version	Steps
Enterprise 11	Import bots on page 1969

Version	Steps
Enterprise 10	<p>a) Upload bot and its dependencies on page 2269</p> <p>The bots are uploaded to the private workspace in Automation 360. Ensure you have created the same folder structure in the public workspace as in Enterprise 10 Control Room.</p> <p>You must upload all dependent bots and other files required by the uploaded bots to run successfully in Automation 360. All uploaded bots, their dependent bots, and other required files must be stored in the same folder in the Automation 360 as in Enterprise 10.</p> <p>b) Check in the uploaded bots that are available in the private workspace.</p> <p>Check in a bot on page 2210</p>

See the following video on how to manually migrate to Automation 360 using Bot Lifecycle Management:

[Prerequisite tasks for migrating bots](#) on page 1524

Prerequisites for manual migration

When you migrate from Enterprise 11 or Enterprise 10, if you have not used the Enterprise 11 database or copied Enterprise 10 data, you must manually create all the entities of Enterprise 11 or Enterprise 10 in Automation 360.

Create the following Enterprise 11 or Enterprise 10 entities except bots in Automation 360:

- [Create a user](#) on page 1678
- [Create a role](#) on page 1687
- Credentials and lockers used in bots

[Credentials and lockers in the Credential Vault](#) on page 1796

- AAApplicationPath global value and set its value the same as Enterprise 11 or Enterprise 10 for the required users
- AADefaultDateFormat global value and set its value as MM/DD/YYYY HH:MM:SS.
- The following global values that will be used by the **Send email** action:
 - AAE_EmailSettings_auth
 - AAE_EmailSettings_host
 - AAE_EmailSettings_port
 - AAE_EmailSettings_ssl

The values for the preceding global values must be the same as those specified in Enterprise 11 in **Tools > Options > Email Settings**.

You must create the `AAE_EmailSettings_auth` and `AAE_EmailSettings_ssl` global values of type boolean. The value for these must be assigned based on the Enterprise 11 configuration. For example, if the **My server requires authentication** option is selected in Enterprise 11, you must set the `AAE_EmailSettings_auth` value as `true`. Similarly, if the **My server uses a secure connection** option is selected in Enterprise 11, you must set the `AAE_EmailSettings_ssl` value as `true`.

- The following global values if you have used Exchange Web Services (EWS) in Enterprise 11:
 - `AAE_EmailSettings_tenantId`
 - `AAE_EmailSettings_clientId`
 - `AAE_EmailSettings_domainName`
- Create the same folder structure as Enterprise 11 or Enterprise 10 in Automation 360.

Important: You must create the `MetaBots` folder in the `Bots` folder in Automation 360 even if you do not have any MetaBots in Enterprise 11 or Enterprise 10.

- Upload all Enterprise 11 or Enterprise 10 bots and their dependencies to the Automation 360 Control Room.

You must upload the bots and their dependencies at the same location as in Enterprise 11 or Enterprise 10.

- Migrate the bots in the following sequence:
 1. MetaBots
 2. Child bots
 3. Parent or main bots

Important: You must create all of the preceding entities in Automation 360 the same as how they are available in Enterprise 11 or Enterprise 10.

Prepare for Enterprise 11 to Automation 360 On-Premises migration

Perform the tasks in this workflow to migrate from Enterprise 11 to Automation 360 On-Premises, including migration of your bots to Automation 360. Dashboards created in Bot Insight for Enterprise 11 analytics bots are also migrated.

Workflow map: You can also view this migration workflow in an interactive visual format by clicking the following schematic

image:

1. [Migrating from Enterprise 11 to Automation 360 On-Premises](#)

1. Ensure that you have completed the following tasks to check your readiness for migration
[Check migration readiness](#) on page 1445.
2. Ensure you have procured and activated your migration license.
[Get migration license](#) on page 1484
3. If you are installing Automation 360 on a machine on which Enterprise 11 was previously installed, you must delete the data from the Elasticsearch data folder located at `C:\ProgramData\elasticsearch\data`.

If the location of the Elasticsearch data folder was changed, you can find the updated information in the `C:\Program Files\Automation Anywhere\Enterprise\elasticsearch\config\elasticsearch.yml` file.

Important: If you delete the Elasticsearch data, you will lose the Enterprise 11 audit data.

Note: Install Automation 360 on a separate server to ensure that your Enterprise 11 environment is not impacted by the migration activities.

1. We recommend that you create a backup of the Enterprise 11 database and restore it in the same or different SQL instance to avoid failure of any automation task that is using the Enterprise 11 database.

[Quickstart: Back up and restore a SQL Server database on-premises](#)

Bot Insight migration: The Bot Insight data and dashboards are migrated as part of the overall migration process. For the migration, clone your Bot Insight database (which is different from

your Enterprise 11 Control Room database) and extract and export your dashboard metadata to Automation 360 using the Bot Insight pre-migration utility.

[Export Enterprise 11 Bot Insight dashboards for migration](#) on page 1507

The following video shows how to create a backup of the Enterprise 11 database:

2. If you are migrating from Version 11.3.x or later versions, delete data from the `ES_SETTINGS` table from the Enterprise 11 Control Room database.
3. Copy and paste the Enterprise 11 Control Room repository and update the Enterprise 11 database with the Automation 360 repository path.
[Copy and paste Enterprise 11 information to Automation 360](#) on page 1504
4. Ensure that all the credential variables used in the Enterprise 11 bots are available in the Enterprise 11 Control Room.
5. Install Automation 360 On-Premises:
 - a) Ensure you meet the system requirements.
[Automation 360 On-Premises prerequisites](#) on page 1124
 - b) Install Automation 360 On-Premises Control Room in custom mode to a staging environment.
[Installing Control Room using Custom mode](#) on page 1189

Important: During the installation, configure the Automation 360 On-Premises Control Room to use the restored Enterprise 11 database. This ensures that all your Enterprise 11 data is available in Automation 360 as is. For information on what is migrated and not migrated, see [What is migrated and not migrated](#) on page 1438.

6. After installing the Automation 360 On-Premises, update Automation 360 access URL in the restored Enterprise 11 Control Room database. This access URL will be used to access the Control Room in Automation 360.

To update the access URL: update CONFIGURATION set value = '[Automation 360 Control Room URL]' where category = 'CR_setup_general' and config_key = 'AccessUrl'
Example query: update [Automation 360-Database].[dbo].[CONFIGURATION] set value = 'http://Automation 360-crurl.com' where config_key='AccessUrl'

Note: Do not include a slash ('/') at the end of the access URL that you provide in the above command.

7. Verify that all the data you pasted is available in the relevant files and folders.
8. Optional: Migrate audit log data.

[Migrate Enterprise 11 audit logs](#) on page 1508

To learn more, search for the Migrating from enterprise 11 to Automation 360 On-Premises course in [Automation Anywhere University: RPA Training and Certification \(A-People login required\)](#).

[Prerequisite tasks for migrating bots](#) on page 1524

Related tasks

[Prepare for Enterprise 10 to Automation 360 On-Premises migration](#) on page 1516

Perform the tasks in this workflow to migrate from Enterprise 10 to Automation 360 On-Premises, including migration of your bots to Automation 360.

Back up and restore Enterprise 11 or Enterprise 10 database

Before you start migration, back up and restore your Enterprise 11 or Enterprise 10 database.

[Quickstart: Back up and restore a SQL Server database on-premises.](#)

Copy and paste Enterprise 11 information to Automation 360

The Enterprise 11 server repository files and the Credential Vault file are required in the Automation 360 environment. The most efficient way to get this data is to copy it from the Enterprise 11 environment into Automation 360.

You must copy the necessary files from Enterprise 11 data and paste it before installing Automation 360. You must also run the queries to update the Control Room access URL and repository path.

To learn more about how to migrate to Automation 360, search for the following courses in [Automation Anywhere University: RPA Training and Certification \(A-People login required\)](#):

- Migrating from Enterprise 11 to Automation 360 On-Premises
- Migrating from Enterprise 10 to Automation 360 On-Premises

1. Copy and paste the Enterprise 11 repository data.

The location of the Enterprise 11 repository is available from **Administration > Settings > General** in the Enterprise 11 Control Room.

See [Configuration settings](#) .

Remember:

- If the Enterprise 11 Credential Vault is configured in **Manual** mode, copy the file containing the master key of the Credential Vault that is stored at a secured location. The master key is required when you log in to Automation 360 for the first time after migrating from Enterprise 11 using the restored Enterprise 11 database.
 - If your Enterprise 11 Control Room has version control enabled, the latest versions of each bot, including the dependencies, are copied and migrated from the Enterprise 11 repository to Automation 360. However, the version history of the bot and its dependencies are not copied and migrated.
 - If you want to set up a cluster configuration in Automation 360, you must paste the copied Enterprise 11 data on a shared network location that all the nodes can access in the cluster.
 - If you are using NAS to store Enterprise 11 repository data and your Automation 360 repository data is on local drive, the process of copying Enterprise 11 data from NAS to Automation 360 local drive remains the same.
-

a) Create the following folder structure at any location on the device if it does not already exist.

For example, `C:\ProgramData\AutomationAnywhere\Server Files`

Note:

- If you want to set up a cluster configuration in Automation 360, you must paste the copied Enterprise 11 data on a shared network location that all the nodes can access in the cluster.
-

- If your Enterprise 11 database is stored in NAS storage and you want to migrate to your Automation 360 local drive, the process of copy and paste is same.

- b)** Create the following folders within the Server Files folder you have created in Step a:
 Default\0\Automation Anywhere\Bots
- Based on the folders you created in the previous step, the final folder structure must be:
 C:\ProgramData\AutomationAnywhere\Server Files\Default\0\Automation Anywhere\Bots

The C:\ProgramData\AutomationAnywhere\Server Files in the folder structure is the dynamic path, which can be any location based on your requirement. Whereas the Default\0\Automation Anywhere\Bots is a constant path that does not change.

Note: This path is not a temporary path for migration but will be used to store all the bots and packages.

- c)** Copy and paste the Enterprise 11 CredentialVault.dat file and the folders that contain bots and MetaBots in the folder structure you have created in the previous step.

Enterprise 11 files and folders to be copied	Enterprise 11 location	Automation 360 location
CredentialVault.dat file	AutomationAnywhere\Server Files	AutomationAnywhere\Server Files
	The CredentialVault.dat file is available at this location only if the Enterprise 11 Credential Vault is configured in Express mode.	
All the files and folder including My Tasks and My MetaBots folders	\AutomationAnywhere\AutomationAnywhere\Server Files\Default\Automation Anywhere\	\AutomationAnywhere\AutomationAnywhere\Server Files\Default\Automation Anywhere\Bots\

- a)** Create a folder for Automation 360 at any location on the device.
 For example, D:\New project\Automation 360.

Notes:

- If you want to set up a cluster configuration in Automation 360, you must paste the copied Enterprise 11 data on a shared network location that all the nodes can access in the cluster.
- If your Enterprise 11 database is stored in NAS storage and you want to migrate to your Automation 360 local drive, the process of copy and paste is same.

- b) Create the following folders within the Automation 360 folder you have created in the previous step: AutomationAnywhere\Server Files\Default\0\Automation Anywhere\Bots

Based on the folders you created in the previous step, the final folder structure must be: D:\New project\Automation 360\AutomationAnywhere\Server Files\Default\0\Automation Anywhere\Bots

The D:\New project\Automation 360 in the folder structure is the dynamic path, which can be any location based on your requirement. Whereas the AutomationAnywhere\Server Files\Default\0\Automation Anywhere\Bots is a constant path that does not change.

- c) Copy and paste the Enterprise 11 CredentialVault.dat file and the folders that contain bots and MetaBots in the folder structure you have created in the previous step.

Enterprise 11 files and folders to be copied	Enterprise 11 location	Automation 360 location
CredentialVault.dat file	AutomationAnywhere\Server Files	AutomationAnywhere\Server Files
	The CredentialVault.dat file is available at this location only if the Enterprise 11 Credential Vault is configured in Express mode.	
All the files and folder including My Tasks and My MetaBots folders	\AutomationAnywhere\AutomationAnywhere\Server Files\Default\Automation Anywhere\	\AutomationAnywhere\AutomationAnywhere\Server Files\Default\0\Automation Anywhere\Bots\

See the following video on how to create the Enterprise 11 Control Room repository in the Automation 360 server:

You must perform the following step (Step 2) on the Enterprise 11 restored database that you backed up as part of Step 1 in [Prepare for migration](#).

- 2. Update the Automation 360 repository path in the restored Enterprise 11 database by running the following SQL command:

To update the repository path, update CONFIGURATION set value = Automation 360 Control Room dynamic path followed by \AutomationAnywhere\Server Files where category = 'CR_setup_general' and config_key = 'RepositoryPath'

The dynamic path in the query is the dynamic path where you have pasted the copied Enterprise 11 data in the above step.

Example query: update [Automation 360-Database].[dbo].[CONFIGURATION] set value = 'C:\ProgramData\AutomationAnywhere\Server Files' where config_key='RepositoryPath'

The path mentioned in the query is the same as the dynamic path where the Enterprise 11 data is copied in the example in the previous step.

See the following video on how to restore a backed-up Enterprise 11 database:

Complete the steps listed in [Prepare for Enterprise 11 to Automation 360 On-Premises migration](#) on page 1502.

Export Enterprise 11 Bot Insight dashboards for migration

Use the Bot Insight pre-migration utility to export your Enterprise 11 Bot Insight dashboard metadata (widgets and layouts) and dashboard profile as a zip file. Run this utility in your Enterprise 11 device and paste the zip file in the Automation 360 repository to migrate the Bot Insight dashboards.

- Back up the Bot Insight database after you have backed up the Enterprise 11 Control Room database and restore it in the SQL Server instance. Ensure the following when you restore the Bot Insight database:
 - Use the same username and password of the Control Room database used in Automation 360.
 - The name of the Bot Insight database that you are restoring in Automation 360 environment is the same as the Enterprise 11 Bot Insight backed up database.
- Ensure that JRE is installed in the Enterprise 11 device.

Important: Migration of Bot Insight is supported only if the database is installed on Microsoft SQL Server or if the Metadatabase is installed on either Microsoft SQL Server or PostgreSQL Server. Bot Insight migration is not supported if the database is installed on PostgreSQL Server.

Note: After data is migrated from Enterprise 11 to Automation 360, ensure that the end-to-end migration activity is completed within 90 days from the first day of data migration. After 90 days, the Bot Insight analytical data will be deleted.

1. Download the latest version of the Bot Insight pre-migration utility from the Automation Anywhere Support site.

Important: You must download the utility on the device on which the Enterprise 11 Control Room is installed.

- a) Navigate to the Automation Anywhere Downloads page: [A-People Downloads page \(Login required\)](#).
- b) Click the **Automation 360** download link.
- c) Open the **Installation Setup** folder and download the `AAE_Export_BI_Dashboards_<version_number>.jar` file, for example, `AAE_Export_BI_Dashboards_A360.23.jar`.

See the following video on how to download the pre-migration utility:

2. Run the utility in the Enterprise 11 device.
 - a) Open the Windows command prompt.
 - b) Run the following command to export the Bot Insight dashboards to a zip file: `java -jar "<path_of_downloaded_utility_jar>/AAE_Export_BI_Dashboards_<version_number>.jar" -installationPath "<installation_path>/Enterprise" -outputDir "<path_to_save_zip_file>/dashboards"`

```
For example: java -jar "Downloads/
AAE_Export_BI_Dashboards_A360.23.jar " -installationPath "C:/
Program Files/Automation Anywhere/Enterprise" -outputDir "E:/AA/
work/release/A360/migration/dashboard"
```

The utility generates the `dashboards.zip` file at the output directory you specified.

Note: You can also use double backslash (\\) to run the JAR file.

3. Create the `bot-insight` folder at the Automation 360 installation location.
For example, `C:\Program Data\Automation Anywhere\Server Files\bot-insight`

In this path, `C:\Program Data\Automation Anywhere\Server Files` is a dynamic path, which can be any location based on your requirement. The folder structure following the dynamic path (`\bot-insight`) is a constant path that does not change.
4. Copy the `dashboards.zip` file available at the output location and paste in the `Server Files\bot-insight` folder.

After exporting dashboards in the Automation 360 repository, do the following for migrating the Bot Insight dashboards.

1. Install Automation 360 and log in to your Automation 360 staging environment.
[Installing Control Room On-Premises](#) on page 1121
2. Migrate the bots along with the Bot Insight data and dashboards using the Bot Migration Wizard.
[Migrate Enterprise bots](#) on page 1529

See the following video on how to prepare Bot Insight data for migration:

Migrate Enterprise 11 audit logs

The audit log export utility enables you to export the audit log data from the Enterprise 11 Control Room to a JSON file. You must paste the JSON file in the Automation 360 repository and then migrate the audit log data.

Note: Migration of audit logs from Enterprise 11 to Automation 360 is supported only for On-Premises deployments.

Ensure you have the **AAE_Admin** role or the **Manage Migration** permission.

- Starting with Automation 360 v.23, you can migrate audit log data of Version 11.3.5 or later versions.
- The audit log export utility exports information about all Enterprise 11 log events, including those that are currently not supported in Automation 360 such as multi-factor authentication (MFA) and run bots through command line.

Based on the current version of your Control Room, choose one of the following ways to export and migrate the audit log data:

- For Version 11.3 and later:
 - a) Download the latest version of the audit log export utility from the Automation Anywhere Support site.

Important: You must download the utility on the machine on which the Version 11.3 Control Room is installed. If the Control Room is installed in **Cluster mode**, you can download the utility on any of the node available in the cluster.

- a) Navigate to the Automation Anywhere Downloads page: [A-People Downloads page \(Login required\)](#).
 - b) Click the Automation 360 link.
 - c) Click **Installation Setup**, and then click `AAE_Export_Audit_Log_v3.zip` file..
- b) Extract the files from the zip file you have downloaded.
 - c) Open the Windows command prompt.
 - d) Change the working directory to `AAE_Export_Audit_Log_v3` and enter the following command: `bin\java -jar AAE_Export_Audit_Log_v3.jar export.path="OUTPUT LOCATION" cr.version="CONTROL ROOM VERSION" install.path="CONTROL ROOM INSTALLATION PATH"`
Update the following values in the command:
 - **OUTPUT LOCATION:** Replace the text with the location where you want to save the output.
 - Ensure that the folders mentioned in the location exist.
 - Ensure that you specify the location of the output folder in double quotation marks.
 - **CONTROL ROOM VERSION:** Replace the text with the current version of the Enterprise 11 Control Room that is installed. The `cr.version` value is the first three digits of the Enterprise 11 Control Room. For example, if the Control Room is Version 11.3.4.4, enter the `cr.version` value as 11.3.4.
 - **CONTROL ROOM INSTALLATION PATH:** Replace the text with the full path of the location where the Control Room is installed. For example, `C:\Program Files\Automation Anywhere\Enterprise`.

Command example: `bin\java -jar AAE_Export_Audit_Log_v3.jar export.path="C:\Migration\Audit Log" cr.version="11.3.2" install.path="C:\Program Files\Automation Anywhere\Enterprise"`

The utility generates the `es_export.json` file at the output location you specified. The generated JSON file contains a maximum of 10000 records. If there are more than 10000 records available in the audit data, the utility generates multiple JSON files at the same location and adds a suffix such as `es_export_1`.
 - e) Create the `migration\es-data` folders in the Automation 360 repository.
 - f) Copy the JSON file available at the output location.
If the utility has generated multiple JSON files, you must copy all the files.
 - g) Paste the JSON file in the `Server Files\migration\es-data` folder.
See the following video on exporting 11.3.x audit log data for migration:
 - h) Log in to your Automation 360 staging environment.
 - i) Go to **Administration > Migration**.
 - j) Click **Migrate Audit log** from the **Migrate bots** menu on the top-right of the screen.

The system starts retrieving and migrating the audit log data from the `es_export.json` file and uploading it to Automation 360 Elasticsearch. The entries are displayed in the **Audit Log** tab of Automation 360.

After the Audit log migration is complete, navigate to **Administration > Migration** page to view the status of the audit log migration and other related information. You can also filter the audit log migration results based on the migration **Type** as the **Audit log migration**.

Click the **View migration** option for each audit migration instance to see additional information such as the audit log file path and the reasons why individual `es_export.json` files were skipped or were not successfully migrated when migrating the audit logs.

[View migration reports](#) on page 1614

- For version 11.2 and earlier:
 - a) Log in to your Automation 360 staging environment.
 - b) Go to **Administration > Migration**.
 - c) Click **Migrate Audit data** from the **Migrate bots** menu on the top-right of the screen. The system starts retrieving and migrating the audit data from the database and uploading it to the Automation 360 Elasticsearch. The entries are displayed in the **Audit Log** tab of Automation 360.

See the following video on migrating Enterprise 11 audit log data:

Related tasks

[View migration reports](#) on page 1614

Use the reports to analyze the status of individual bot migration, data migration, and audit log migration and identify the status and summary of the individual migration.

Prepare for migration when using Enterprise 11 and Automation 360 On-Premises in parallel

Perform the tasks in this workflow if you want to use both Automation 360 On-Premises and Enterprise 11 in parallel. You can continue to use both environments till the time you are ready to start the migration from Enterprise 11 to Automation 360 On-Premises.

1. Ensure that you have completed the following tasks to check your readiness for migration
 - [Check migration readiness](#) on page 1445.
2. Ensure you have procured and activated your migration license.
 - [Get migration license](#) on page 1484
3. If you are installing Automation 360 on a machine on which Enterprise 11 was previously installed, you must delete the data from the Elasticsearch data folder located at `C:\ProgramData\elasticsearch\data`.

If the location of the Elasticsearch data folder was changed, you can find the updated information in the `C:\Program Files\Automation Anywhere\Enterprise\elasticsearch\config\elasticsearch.yml` file.

Important: If you delete the Elasticsearch data, you will lose the Enterprise 11 audit data.

Note: Install Automation 360 on a separate server to ensure that your Enterprise 11 environment is not impacted by the migration activities.

1. We recommend that you create a backup of the Enterprise 11 database and restore it in the same or different SQL instance to avoid failure of any automation task that is using the Enterprise 11 database.

[Quickstart: Back up and restore a SQL Server database on-premises](#)

Bot Insight migration: The Bot Insight data and dashboards are migrated as part of the overall migration process. For the migration, clone your Bot Insight database (which is different from your Enterprise 11 Control Room database) and extract and export your dashboard metadata to Automation 360 using the Bot Insight pre-migration utility.

[Export Enterprise 11 Bot Insight dashboards for migration](#) on page 1507

2. If you are migrating from Version 11.3.x or later versions, delete data from the `ES_SETTINGS` table from the Enterprise 11 Control Room database.
3. Copy and paste the Enterprise 11 Control Room repository and update access URL and repository path.
4. Ensure that all the credential variables used in the Enterprise 11 bots are available in the Enterprise 11 Control Room.
5. Install Automation 360 On-Premises:

- a) Ensure you meet the system requirements.

[Automation 360 On-Premises prerequisites](#) on page 1124

- b) Install Automation 360 On-Premises Control Room in custom mode to a staging environment.

[Installing Control Room using Custom mode](#) on page 1189

Important: During the installation, configure the Automation 360 On-Premises Control Room to use the restored Enterprise 11 database.

6. Continue using both Enterprise 11 and Automation 360 environments in parallel.
-

Note: Create all new bots and entities such as users, roles, and schedules in Automation 360.

7. If you create any new entity such as users, roles, or schedules (except bots) in Enterprise 11 after installing Automation 360, create the same entity in Automation 360.
 8. When you are ready to use only Automation 360 as your production environment:
 - a) If you have created new bots in Enterprise 11 after installing Automation 360:
 1. Export all the bots and their dependencies that were created after Automation 360 was installed using Bot Lifecycle Management.
[Export bots](#)
 2. Import all the bots to Automation 360 using Bot Lifecycle Management.
[Import bots](#) on page 1969
 9. Optional: Migrate audit log data.
-

[Migrate Enterprise 11 audit logs](#) on page 1508

[Prerequisite tasks for migrating bots](#) on page 1524

How workload management data is migrated

Enterprise 11 workload management data is automatically migrated to Automation 360 when you install Automation 360 and point the Control Room to the restored Enterprise 11 database.

When you migrate workload management data to Automation 360, all related workload management is moved to the Automation 360 environment, including queues, device pools, owners, and consumers. Migrated device pools are empty because the migration process does not migrate devices. You must update the device pool with the relevant unattended Bot Runner devices.

Note: Bots that are deleted in the workload management automation records are skipped during migration. These bots are displayed as **N/A** in the workload queues.

Bots associated with a workload template are migrated to the same Automation 360 template with all information intact.

The following work item variables are supported for migration:

- `$WorkItem$` – How this variable is migrated depends on the String, Number, and DateTime type associated with it.

[Variable mapping for migration](#) on page 1593

- `$WorkItemResult$` – Bots using this variable must be associated with a workload template in Enterprise 11 if you want to use it after migration. If you migrate a bot that has the `$WorkItemResult$` variable in a command and the bot is not linked to a workload template, then the command shows an error when it is opened in the Bot editor in Automation 360.

The following work item variable operations are not yet supported and bots using these variable operations cannot be migrated successfully:

- Reset `$WorkItem$`
- Reset `$WorkItemResult$`

Related tasks

[Edit device pools](#) on page 1820

As a Control Room user with device pool management privileges or as a device pool owner, you can edit device pool details to customize your automation requirements.

[Use Work Item variables](#) on page 2253

You can use the Work Item variables to pass the Work Item attributes or values to the Task Bot from the Control Room when you run the bot with the option **Run bot with queue**.

Prepare to manually migrate to Automation 360 On-Premises

You can manually migrate from Enterprise 11 to Automation 360 On-Premises by creating users, roles, permissions, and other entities required by the migrated bots to run successfully.

1. Ensure that you have completed the following tasks to check your readiness for migration

[Check migration readiness](#) on page 1445

2. Ensure you have procured and activated your migration license.

[Get migration license](#) on page 1484

Note: Use the manual migration in the following scenarios:

- You have an existing Automation 360 On-Premises instance and want to migrate your Enterprise 11 data.
- When you want to migrate only bots and re-create all other Enterprise 11 entities such as users, roles, and credentials manually in Automation 360.
- When you want to migrate only a few of the Enterprise 11 entities. For example, if you have 50 users and 10 user-defined roles in Enterprise 11 and you want to migrate only 40 users and 7 roles to Automation 360. Similarly, if you want to migrate only users and roles and want to re-create the required schedules in Automation 360.
- When you want to migrate Enterprise 11 entities to Automation 360 using a freshly installed database and server.

-
1. Install Automation 360 On-Premises:
 - a) Ensure you meet the system requirements.
[Automation 360 On-Premises prerequisites](#) on page 1124
 - b) Install Automation 360 On-Premises Control Room in custom mode to a staging environment.
[Installing Control Room using Custom mode](#) on page 1189

Important: You must install Automation 360 with a new database.

2. Create all the Enterprise 11 entities in Automation 360 On-Premises.
For more information about the entities you must create, see [Prerequisites for manual migration](#) on page 1500.
3. Export all the bots and their dependencies that were created after Automation 360 was installed using Bot Lifecycle Management.
[Export bots](#)
4. Upload the bots to Automation 360 On-Premises.
[Import bots](#) on page 1969

[Prerequisite tasks for migrating bots](#) on page 1524

Prepare for Enterprise 11 to Automation 360 Cloud-enabled migration

Perform the tasks in this workflow to migrate from Enterprise 11 to Automation 360 Cloud enabled, including migration of your bots.

If you are installing Automation 360 on a machine on which Enterprise 11 was previously installed, we recommend you delete the data from the Elasticsearch data folder located at `C:\ProgramData\elasticsearchdata`.

Note: If the location of the Elasticsearch data folder was changed, you can find the updated information in the C:\Program Files\Automation Anywhere\Enterprise\elasticsearch\config\elasticsearch.yml file.

1. Ensure that you have completed the following tasks to check your readiness for migration
[Check migration readiness](#) on page 1445.
2. Ensure you have procured and activated your migration license.
[Get migration license](#) on page 1484
1. Install the Automation 360 for Cloud enabled deployment.
[Installing Control Room for Cloud-enabled deployment](#) on page 1309
2. Create all the entities such as users, roles, and credentials except bots in Automation 360 the same as how they are available in Enterprise 11.
[Prerequisites for manual migration](#) on page 1500
3. Export all Enterprise 11 bots and their dependencies that you want to migrate to Automation 360 using Bot Lifecycle Management.
[Export bots](#)
4. Import all Enterprise 11 bots to Automation 360 using Bot Lifecycle Management.
[Import bots](#) on page 1969
5. Optional: Migrate audit log data.
[Migrate Enterprise 11 audit logs](#) on page 1508

[Prerequisite tasks for migrating bots](#) on page 1524

Prepare for Enterprise 11 to Automation 360 on Linux CentOS migration

Perform the tasks in this workflow to migrate from Enterprise 11 to Automation 360 On-Premises on Linux CentOS, including migrating your bots to Automation 360. If the Enterprise 11 bot is enabled for analytics, the associated Bot Insight data and business analytics dashboard are also migrated.

Note: Create a new environment for migrating to Automation 360 to avoid any issues to your existing bots due to migration activities.

1. We recommend that you create a backup of the Enterprise 11 database and restore it in the same or different SQL instance to avoid failure of any automation task that is using the Enterprise 11 database.
[Quickstart: Back up and restore a SQL Server database on-premises](#)
2. If you are migrating from Version 11.3.5 or later versions, you must delete data from the ES_SETTINGS table from the Enterprise 11 Control Room database.
3. Ensure that all the credential variables used in the Enterprise 11 bots are available in the Enterprise 11 Control Room.
4. Copy and paste the Enterprise 11 Control Room repository:
 - a) Use the `sudo mkdir -p /opt/automationanywhere/enterprise/appdata/` command to create the required Automation 360 folders.

- b) Use the `sudo chmod -R 775 /opt/automationanywhere` command to provide the required permissions for the folders.
 - c) Use the `sudo mv` command to copy the Enterprise 11 repository and paste it in the `automationanywhere/enterprise/appdata/` location.
5. Update the Control Room access URL and repository path by running the following SQL commands on the restored Enterprise 11 database:
- a) To update the access URL: `update CONFIGURATION set value = '[Automation360 Control Room URL]' where category = 'CR_setup_general' and config_key = 'AccessUrl'`
Example query: `update [Automation360-Database].[dbo].[CONFIGURATION] set value = 'http://Automation360-crurl.com' where config_key='AccessUrl'`

Note: Do not include a slash (/) at the end of the access URL that you provide in the above command.

- b) To update the repository path: `update CONFIGURATION set value = /opt/automationanywhere/enterprise/appdata/Server Files where config_key = 'RepositoryPath'`
6. Install Automation 360 On-Premises:
- a) Ensure you meet the system requirements.
[Automation 360 On-Premises prerequisites](#) on page 1124
 - b) Install Automation 360 On-Premises Control Room in custom mode to a staging environment.
[Installing Control Room on Linux](#) on page 1237

Important: During the installation, configure the Automation 360 On-Premises Control Room to use the restored Enterprise 11 database.

7. Optional: Migrate audit log data.
[Migrate Enterprise 11 audit logs](#) on page 1508

[Prerequisite tasks for migrating bots](#) on page 1524

Prepare for Enterprise 10 to Automation 360 Cloud migration

Note: We do not support migration from `to` . However, you can manually migrate `to` by using the bot export utility. For assistance, contact `support`: .

See: [Migrate new or updated Enterprise 10 bots to Automation 360](#) on page 1523.

Prepare for Enterprise 10 to Automation 360 On-Premises migration

Perform the tasks in this workflow to migrate from Enterprise 10 to Automation 360 On-Premises, including migration of your bots to Automation 360.

Workflow map: You can also view this migration workflow in an interactive visual format by clicking the following schematic

image:

1. [Migrating from Enterprise 10 to Automation 360 On-Premises](#)

1. Ensure that you have completed the following tasks to check your readiness for migration
[Check migration readiness](#) on page 1445.
2. Ensure you have procured and activated your migration license.
[Get migration license](#) on page 1484

Note: Install Automation 360 on a separate server to ensure that your Enterprise 10 environment is not impacted by the migration activities.

1. We recommend that you create a backup of the Enterprise 10 database and restore it in the same or different SQL instance to avoid failure of any automation task that is using the Enterprise 10 database.
[Quickstart: Back up and restore a SQL Server database on-premises](#)
2. Ensure that all the credential variables used in the Enterprise 10 bots are available in the Enterprise 10 Control Room.
3. Install Automation 360 On-Premises:
 - a) Ensure you meet the system requirements.
[Automation 360 On-Premises prerequisites](#) on page 1124
 - b) Install Automation 360 On-Premises Control Room in custom mode to a staging environment.
[Installing Control Room using Custom mode](#) on page 1189

Important: You must install Automation 360 with a new database.

- c) Configure the same authentication in Automation 360 as in Enterprise 10.

Do not switch authentication types between Enterprise 10 and Automation 360. For example, if Active Directory is set as authentication in Enterprise 10, you must configure Active Directory as authentication in Automation 360 as well.

4. Copy the Enterprise 10 data to Automation 360.
[Copy Enterprise 10 data](#) on page 1520
5. Create the **AAApplicationPath** global value in Automation 360 and set the same value as Enterprise 10.
[Migrating from Enterprise 10](#) on page 1547
6. Complete the pre-migration tasks.
[Pre-migration tasks](#)

[Migrate Enterprise bots](#) on page 1529

How Enterprise 10 data is copied to Automation 360

Enterprise 10 users, roles, licenses, credentials, bots, and schedules are copied to Automation 360 as part of the copy data process.

The system copies Enterprise 10 data in the following order:

1. Roles
2. Users
3. Credentials
4. Bots
5. Schedules

If the copy process skips an item in the sequence for any reason, then all related items are also skipped and are not migrated. For example, if the Bot_Manager role is not migrated and the user Jane_Smith belongs only to that role, then that user account and any credentials, bots, or schedules associated with that role are also not migrated.

Enterprise 10 items	How Enterprise 10 items are copied to Automation 360
Users	<p>When you copy Enterprise 10 users the first time, if the system encounters a user of the same name in Automation 360, the migration process renames the Enterprise 10 username by adding a suffix such as _1, _2, and so on, and then copies the renamed user to Automation 360. For example, a duplicate username Jane_Smith is renamed as Jane_Smith_1 in Automation 360. Subsequent data copy operations will skip the previously migrated user data.</p> <p>For Active Directory users, the system does not migrate duplicate users. If a domain user with the same name already exists in Automation 360, the migration process skips that user and its dependencies.</p>

Enterprise 10 items	How Enterprise 10 items are copied to Automation 360
Roles	<p>The first time you copy Enterprise 10 roles, the migration process handles duplicate system roles and custom roles differently. The migration process maps Enterprise 10 system roles to Automation 360 system roles. For example, the Enterprise 10 Admin role and Basic role are mapped to the AAE_Admin role and AAE_Basic role, respectively.</p> <p>If a custom role of the same name exists in Enterprise 10 and Automation 360, the migration process renames it by adding a suffix such as _1, _2, and so on, and then copies the renamed role to Automation 360. For example, a duplicate Sales_Operations role is renamed as Sales_Operations_1 in Automation 360.</p> <p>Subsequent data copy operations will skip previously migrated roles.</p>
Licenses	<p>The migration process automatically migrates user allocated licenses, but they are not shown in the migration report. If the Automation 360 Control Room has fewer Bot Creator or Bot Runner licenses than Enterprise 10 Control Room and all Automation 360 licenses have been consumed, then newly migrated users will not be allocated any licenses. The system migrates these users and the related data without allocating any new licenses.</p>

Enterprise 10 items	How Enterprise 10 items are copied to Automation 360
<p>Credentials</p>	<p>For system credentials associated with a migrated user, the system migrates only the Email Settings and Autologin Settings system credentials.</p> <p>For credentials created by the Control Room administrator, the system creates the AAE_10x_Credentials locker in the Automation 360 Credential Vault and adds the credentials from Enterprise 10 as standard credentials. The system assigns the user who migrates the Enterprise 10 data as the owner of the AAE_10x_Credentials locker and all custom roles as consumers of the locker. If a locker with the name AAE_10x_Credentials already exists in Automation 360, the system adds the migrated credentials in that locker.</p> <hr/> <p>Note:</p> <ul style="list-style-type: none"> • Migration of credentials with more than 50 attributes is not supported. • Users with only AAE_Basic role assigned to them in Enterprise 10 must be granted a custom role in Automation 360 to be a consumer of the AAE_10x_Credential locker. <hr/> <p>For MetaBots that contain screens as assets and use password type variables in these screens, equivalent credential type variables are created in Automation 360. If the password type variable in the MetaBot is an input variable and a value to that variable is passed from the parent bot in Enterprise 10, complete the following steps before you run the migrated bots:</p> <ol style="list-style-type: none"> 1. Create the credential with the Standard option selected as input. 2. Create a locker and use the credential you created in the previous step in that locker. 3. In the migrated parent bot, use the credential you created to pass that credential to the child bots. <p>If you have used an array variable within a loop to pass multiple values to the password type variable used in the MetaBot, the migrated bot uses the credential you created to pass a single value.</p>

Enterprise 10 items	How Enterprise 10 items are copied to Automation 360
Bots	<p>If a bot of the same name exists in Enterprise 10 and Automation 360, the copy data process skips the bot migration and its associated schedule. Commands that use credential variables in Enterprise 10 bots use the AAE_10x_Credentials locker after migration.</p> <p>If your Enterprise 10 Control Room is configured with SVN version control, then the copy data process also copies the latest version of each bot including the dependencies from the Enterprise 10 repository to the Automation 360 repository. Use the bot migration wizard to migrate the Enterprise 10 bots to Automation 360. However, the version history of the bot and its dependencies are not copied and migrated.</p> <hr/> <p>Note: Migration of the production version of Enterprise 10 bots is currently not supported. As a workaround, make or set the current production version of the bots as the latest version and then migrate the bots.</p> <hr/>
Schedules	<p>If duplicate schedules exist in both environments, the duplicate schedule is migrated and results in two schedules of the same name in Automation 360.</p> <p>Migration of schedules fails if the associated user does not exist in Automation 360.</p>

See the following video on how to review the copied Enterprise 10 data in Automation 360:

Related tasks

[Copy Enterprise 10 data](#) on page 1520

You must copy the Enterprise 10 data to Automation 360 before you convert the Enterprise 10 bots.

[Enable schedules after migration](#) on page 1555

When you copy Enterprise 10 data to Automation 360, the Enterprise 10 schedules are migrated. Version Enterprise 11 schedules are migrated when you update the Enterprise 11 data to Automation 360.

Copy Enterprise 10 data

You must copy the Enterprise 10 data to Automation 360 before you convert the Enterprise 10 bots.

The user performing this task must have the **AAE_Admin** role.

1. Log in to your Automation 360 staging environment.
2. Click **Administration > Migration**.
3. Click **Copy 10.x data**.
4. Provide the following information on the **GENERAL** page.

Option	Action
Name	Enter a migration name or use the default one. The default migration name shows the name of the user who is logged in, current date, and time stamp.
Description	Enter a description for the migration.

5. Click **Next**.

6. Provide the following information on the **DATABASE** page.

Option	Action
Use secure connection	Select this option to use a secure connection to connect with the database.
Server host name	Enter the host name of the database server that contains the Enterprise 10 data you want to migrate.
Server port	Enter the port you want to use to connect with the database server.
Use database credentials	Select this option to use database credentials for authentication when establishing a connection with the database server. If you have selected this option, provide the credentials you want to use to connect to the database server in the Username and Password fields.
Use Windows authentication	Select this option to use Windows authentication for establishing a connection with the database server. Important: This option works only if you have configured a domain account during installation and which has read and write permissions for Enterprise 10 database.
Database name	Enter the database name that contains the Enterprise 10 data you want to migrate.
Connect	Click this option to establish a connection with the database.

7. Click **Next**.

8. Provide the following information on the **REPOSITORY** page.

Option	Action
Repository path	Enter the location of the restored Enterprise 10 data that is available on the device.
Master key	Enter the master key for Enterprise 10.
Validate	Click this option to validate the connection before you copy the Enterprise 10 data.

9. Click **Copy data**.

See the following video on how to copy Enterprise 10 data to Automation 360:

[Create AAApplicationPath global value in Automation 360](#)

Related concepts

[How Enterprise 10 data is copied to Automation 360](#) on page 1517

Enterprise 10 users, roles, licenses, credentials, bots, and schedules are copied to Automation 360 as part of the copy data process.

Related tasks

[Enable schedules after migration](#) on page 1555

When you copy Enterprise 10 data to Automation 360, the Enterprise 10 schedules are migrated. Version Enterprise 11 schedules are migrated when you update the Enterprise 11 data to Automation 360.

Prepare for migration when using Enterprise 10 and Automation 360 On-Premises in parallel

Perform the tasks in this workflow if you want to use both Automation 360 On-Premises and Enterprise 10 in parallel. You can continue to use both environments till the time you are ready to start the migration from Enterprise 10 to Automation 360 On-Premises.

1. Ensure that you have completed the following tasks to check your readiness for migration
[Check migration readiness](#) on page 1445.
2. Ensure you have procured and activated your migration license.
[Get migration license](#) on page 1484

Note: Create a new environment for migration to Automation 360 to avoid any issues to your existing bots because of migration activities.

1. We recommend that you create a backup of the Enterprise 11 database and restore it in the same or different SQL instance to avoid failure of any automation task that is using the Enterprise 11 database.
[Quickstart: Back up and restore a SQL Server database on-premises](#)
2. Ensure that all the credential variables used in the Enterprise 11 bots are available in the Enterprise 11 Control Room.
3. Install Automation 360 On-Premises:
 - a) Ensure you meet the system requirements.
 - b) Install Automation 360 On-Premises Control Room in custom mode to a staging environment.
[Installing Control Room using Custom mode](#) on page 1189

Important: You must install Automation 360 with a new database.

4. Complete the pre-migration tasks.
[Pre-migration tasks](#)

5. Create the **AAApplicationPath** global value in Automation 360 and set the same value as Enterprise 10.
[Variable mapping for migration](#) on page 1593
6. Copy the Enterprise 10 data to Automation 360.
[Copy Enterprise 10 data](#) on page 1520
7. Continue using both Enterprise 10 and Automation 360 environments in parallel.

Note: Create all new bots and entities such as users, roles, and schedules in Automation 360.

8. If you create any new entity such as users, roles, schedules, and bots in Enterprise 10 after installing Automation 360, create the same entity in Automation 360.
9. When you are ready to use only Automation 360 as your production environment:
If you have created new bots or updated the existing ones in Enterprise 10 after installing Automation 360, based on your environment, follow these steps:
 - Applies from v.24 onwards:
 - a) Export all the bots and their dependencies that were created after Automation 360 was installed using the export utility.
[Migrate new or updated Enterprise 10 bots to Automation 360](#) on page 1523
 - b) Import all the bots to Automation 360 using Bot Lifecycle Management.
[Import bots](#) on page 1969
 - Applies to v.23 and previous versions
 - a) Copy all the bots and their dependencies from Enterprise 10 by using the **Copy 10.x data** option in the Automation 360.
 - b) Login as the Bot Creator to upload the bots and their dependencies to the Automation 360 private workspace. Note that the folder structure of the bots and their dependencies must be same as that of version Enterprise 10.
 - c) Check in the bots to the public workspace.

[Migrate Enterprise bots](#) on page 1529

Migrate new or updated Enterprise 10 bots to Automation 360

The Enterprise 10 export utility enables you to migrate new or modified Enterprise 10 bots to Automation 360 after an earlier migration.

Use the export utility to create an `.aapkg` package that can be imported using the Bot Lifecycle Management and then migrated using the Bot Migration Wizard in Automation 360.

1. Download the latest version of the bot export utility from the Automation Anywhere Support site.
 - a) Navigate to the Automation Anywhere Downloads page: [A-People Downloads page \(Login required\)](#).
 - b) Click the Automation 360 link.
 - c) Click **Installation Setup**, and then click `AAE_Export_Legacy_Bots_v1.zip` file.
2. Extract the files from the zip file you have downloaded.

3. Open the Windows command prompt.
4. Change the working directory to `AAE_Export_Legacy_Bots_v1` and enter the following command:
`bin\java -jar AAE_Export_Legacy_Bots_v1.jar -INPUT="INPUT LOCATION" -OUTPUT="OUTPUT LOCATION" -INCLUDE_SUBFOLDERS`
Update the following values in the command:
 - **INPUT:** Replace the text with the file path or folder path of the Control Room repository from where the bot files (.atmx and .mbot files) have to be exported.
 - Ensure that the folders mentioned in the location exist.
 - Ensure that you specify the location of the input folder in double quotation marks.
 - **OUTPUT:** Replace the text with an output location where you want to store the exported bot files in a package (.aapkg) with time stamp.
 - Ensure that the folders mentioned in the location exist.
 - Ensure that you specify the location of the output folder in double quotation marks.
 - **INCLUDE_SUBFOLDERS:** Provide this optional parameter to indicate whether the bot files from the nested subfolders of the Control Room repository should be exported or not.

Command example to export folder: `bin\java -jar AAE_Export_Legacy_Bots_v1.jar -INPUT="E:\Migration10x\Automation Anywhere Server Files\Default\Automation Anywhere\My Tasks\10X\Sample_Tasks" -OUTPUT="F:\10x-Export-Utility\Exported-Bots"`
Command example to export file: `bin\java -jar AAE_Export_Legacy_Bots_v1.jar -INPUT="E:\Migration10x\Automation Anywhere Server Files\Default\Automation Anywhere\My Tasks\10X\AutomationTask.atmx" -OUTPUT="F:\10x-Export-Utility\Exported-Bots"`
The utility generates the .aapkg file at the output location you specified.

5.
 1. Navigate to **Automation > Import bots** to import the .aapkg package file in Automation 360.
[Import bots](#) on page 1969
 2. Navigate to **Administration > Migration** to migrate the bots (convert .atmx file to .bot file) in Automation 360 using the Bot Migration Wizard.
[Migrate Enterprise bots](#) on page 1529

Prerequisite tasks for migrating bots

After you have set up Automation 360, you must perform certain tasks before migrating the Enterprise 11 or Enterprise 10 bots.

- Licenses:
 - For migration to be successful, the license requirements of the target environments must match the existing source environments.
 - At least one license is required for migration.
- Roles:

Assign the **AAE_Bot Migration Admin** role to the user who will initiate the migration and the Bot Runner user who will perform the migration. The Bot Runner user who runs the migration must have the following permissions and criteria:

- An unattended Bot Runner license
- **Autologin Set** status
- Default device configured

See the following video on how to create an Admin user to initiate bot migration:

See the following video on how to create a Bot Runner user to perform the bot migration:

- Control Room settings:
 - Enterprise 11 users who have installed Automation 360 using a fresh database and Enterprise 10 users who have not copied Enterprise 10 data must manually create all the Enterprise 11 or Enterprise 10 entities, except bots, in Automation 360. See information about the entities you must create, see [Prerequisites for manual migration](#) on page 1500.

- Bot Agent: Install the Bot Agent on the device that you want to use for migration: [Install Bot Agent and register device](#) on page 1288.

See the following video on how to install the Bot Agent on the device identified for bot migration:

- Bots: To migrate the production version of bots, import the Enterprise 11 bots using the Bot Lifecycle Management feature from the SVN version control enabled Enterprise 11 Control Room. See [Import bots](#) on page 1969.

Next steps

[Migrate Enterprise bots](#) on page 1529

Migrate and validate bots

Perform the tasks in this workflow to convert your bots to the Automation 360 format and to validate them after migration.

Ensure that you have completed all the tasks about preparing your Automation 360 environment for migration: [Prepare new Control Room for migration](#) on page 1485.

1. Migrate your Enterprise 11 and Enterprise 10 bots to Automation 360: [Migrate Enterprise bots](#) on page 1529.
2. Verify the migration is completed successfully:
 - [View migration reports](#) on page 1614
 - [Verify the bot migration](#) on page 1613

- [Export to CSV](#) on page 1615
- [View changes to migrated bots using Bot Assistant](#) on page 1616

See also the following video on migrating, testing, and updating your migrated bots:

Bot Migration Wizard

This wizard is integrated in Control Room in Automation 360 and guides you through the migration process after you complete the prerequisites. You can migrate multiple bots and their dependent bots using this wizard.

The Bot Migration Wizard migrates a bot only if all of the components used in that bot are supported for migration. If a bot uses other dependent files such as .txt, .doc, and .png, you have to add these files as dependencies manually after migrating the bots.

You can also use the **Bot migration** package to migrate individual bots. However, we do not recommend using this package because it does not migrate bot dependencies and other entities that are required to run the bot after migration.

In the Control Room (**Administration > Migration > Overview**) tab, you can get a consolidated view of the status of migrated bots.

Overview tab

Important: You must have both View migration and Manage Migration permission to view this tab.

You can view the overall status of bot migration, including the following details:

- Bots that are migrated successfully
- Bots that failed to migrate
- Bots that are migrated with a review message
- Bots that are migrated with an action required message
- History of migration: Information about past migrations that were run from a specific folder or from all folders.

You can also perform the following actions:

- Rerun migration on selected bots and view the history of each bot that has gone through multiple migrations.
- View the time when the bot was migrated using the time stamp.
- Get a summary count of bots that are successfully migrated, that failed to migrate, and those that require your review or action.
- Export a specific list of bots.
- View the version of the migrated bot.

- View the version history of the migrated bot (the check-in message indicates that the bot is migrated from legacy Enterprise 10 and Enterprise 11 version).

To view the updated status of the remigrated bot, you can refresh either the table or the screen, shown in the following

Migration List

Before you migrate bots

1. Review your Bot Scanner Report to determine which bots can be migrated.
2. Create a Bot Runner with a bot running device, migration role, and unattended bot runner license.

For more information, [Go to Documentation](#)

Watch the following video to learn how to convert Enterprise 11 or 10.x bots in .atmx and .mbot format to .bot format to Automation 360. You perform this task after you have replicated your Enterprise 11 or Enterprise 10 database and bots are available in Automation 360 Control Room.

Considerations when you migrate and validate bots

The migration process is designed to be seamless. Learn what to expect while you convert, validate, and migrate bots so that you can run your daily automated processes as usual.

Time taken for migration

Migration time will vary based on the number of bots in your Enterprise 11 or Enterprise 10 repository, the number of processes automated, and the number of Bot Runners and machines that are performing the migration. The time required to migrate varies based on your internal processes and requirements.

Note: After data is migrated from Enterprise 11 to Automation 360, ensure that the end-to-end migration activity is completed within 90 days from the first day of data migration. After

90 days, the Bot Insight analytical data will be deleted.

The following factors impact the time taken for migration:

- Number and complexity of bots
- Number of lines in a bot
- Control Room and Bot Agent configuration
- Current load on Control Room (indicated by the number of users connected to a Control Room at a specific time)
- Migration environment: whether migration is being performed on an isolated production or staging environment.

Migration in an isolated environment occurs faster.

- Whether the bots to be migrated are located in a single folder or are located across multiple folders

Bots present in a single folder are migrated faster.

- Hardware requirements of the device from where the migration is performed
- Network bandwidth
- Public repository size: When you run the Bot Migration Wizard on a Git public repository that is larger than 1 GB and contains more than 50,000 files or objects, the migration time might be impacted.

Migrating at your pace

The migration tools provide you with control over what to migrate and when to migrate. You can choose to migrate all of your bots at the same time or migrate a few bots at a time. During the transition period from Enterprise 11 or Enterprise 10 to Automation 360, you can continue to run bots on the previous platform as usual until your migration is complete.

Note: After the migration is completed, all new bots must be built on Automation 360. This will help you manage your bots and your organization to transition.

Zero downtime

Migration does not impact any scheduled bots or the ability to run bots as planned on Enterprise 11 or Enterprise 10 when you migrate data to Automation 360. As long as your infrastructure requirements are met according to your automation needs, and

Running Enterprise 11 or Enterprise 10 and Automation 360 in parallel

you run Enterprise 11 or Enterprise 10 and Automation 360 in parallel, there should be no pause in regular automation activities.

During the transition period, we recommend that customers run automation on Enterprise 11 or Enterprise 10 until migrated bots are tested and running successfully on Automation 360. This is the best way to ensure zero downtime.

Migrate Enterprise bots

The bot migration process uses the Bot Migration Wizard to convert Enterprise 11 or Enterprise 10 bots (Task Bots and MetaBots) in `.atmx` and `.mbot` format to the `.bot` format used in Automation 360 and uploads the successfully migrated bots to the Control Room public workspace.

Ensure you have completed all the prerequisite tasks for migrating bots: [Prerequisite tasks for migrating bots](#) on page 1524.

All manual dependencies of bots are automatically converted as Control Room dependencies during migration. The **Copy Control Room file** action copies these dependencies from the Control Room to the respective locations.

1. Log in to your Automation 360 staging environment.
2. Click **Administration > Migration**.

Note: If you have migrated bots from Enterprise 10 to Enterprise 11, the information about that migration is not displayed on the **Migration List** page.

3. On the Bot Migration Wizard screen, click **Migrate bots**.

Maximum = 255 characters

Bot Migration settings

Overwrite if a bot with the same name exists

Exclude bot dependencies
If this option is selected, all the bot dependencies will be excluded while migrating.

Bot behaviour configuration

Use "Excel Cell Row" legacy behavior
If you are migrating from 11.3.0 and below, we recommend selecting this option.

Use outgoing Email server settings
If this option is selected, settings will be applicable to bots that contain send email action. You may need to update the global value if required.

Include web services settings
This allows you to migrate along with the web services proxy host and port. If this value is selected, pre-created global values will be available to the bot for connecting with web services proxy.

Convert bots built using Internet Explorer to Edge with Internet Explorer mode
If you are migrating bots built on Internet Explorer, we recommend selecting this option to convert them to Edge with Internet Explorer mode.

Convert \n characters to \r\n in 'Log to File' action
This allows you to convert \n characters (LF) into \r\n characters (CRLF), which automatically take new line in bots using Log to File action.

Bot Insight configuration

Tag bots and variables for analytics
This allows you to tag bots and variables for analytics through Bot Insight. If you are not using Bot Insight in legacy bots, we recommend you not to select this option.

Next >

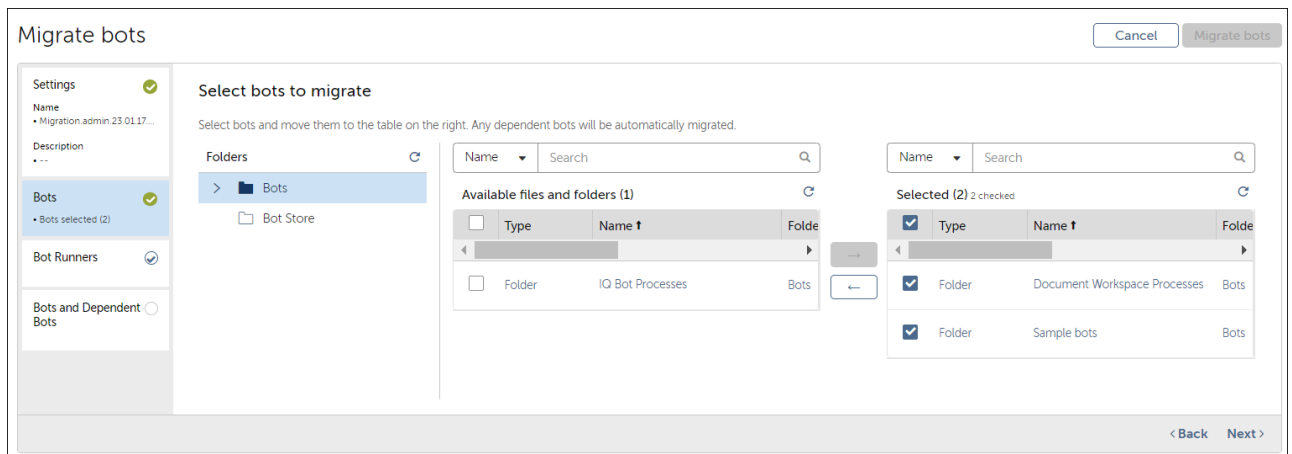

4. Select the options and configuration as required in the the **Settings** tab.

Option	Action
Name	Enter a migration name or use the default one. The default migration name shows the name of the user who is logged in, current date, and time stamp.
Description	Enter a description for the migration.
Overwrite if a bot with the same name exists	Select this option to overwrite an existing bot if a bot with the same name exists in the folder.
Exclude bot dependencies	Select this option to exclude child bots of sub-tasks from migration or updating. By selecting this flag, you can now choose to migrate parent and child bots separately or independently.
Use "Excel Cell Row" legacy behavior	Select this option if you are migrating from a version earlier than Version 11.3.0 or you want to retain the legacy behavior of the Excel Cell Row system variable.
Use outgoing Email server settings	Select this option if your bot contains the Send Email command. Use these settings to specify the type of email server to use.
Include web service settings	Select this option for custom proxy configuration support. When you select this option, the REST commands with Custom proxy configurations that use the following global variables are migrated: <ul style="list-style-type: none"> • <code>AAProxyHost</code> for Hostname • <code>AAProxyPort</code> for Port
Convert bots built using Internet Explorer to Edge with Internet Explorer mode	Select this option if you want to migrate Enterprise 10 or Enterprise 11 bots that use Internet Explorer to Automation 360 bots that use Microsoft Edge with IE mode.
Convert \n characters to \r\n in Log to File action	Select this option to convert \n characters (LF) into \r\n characters (CRLF), which automatically take new line in migrated bots using Log to File action.

Option	Action
Tag bots and variables for analytics	<p>Select this option when Bot Insight data exists in the Enterprise 11 bots, and you also want to migrate the Bot Insight data with those bots. When you select this option, the Bot Insight Open and Close actions are created.</p> <hr/> <p>Note: To migrate Bot Insight data, you must enable this option.</p> <hr/> <p>When you migrate Bot Insight data along with bot migration, ensure that the Bot Insight prerequisites are met. Bot Insight prerequisites Cloud Migration Utility prerequisites</p> <p>If the Bot Insight prerequisites are not met, Cloud migration with Bot Insight might become stuck in the In Progress state.</p> <p>Also, regardless of whether the Bot Insight and the Cloud Migration utility prerequisites are met or not, import or upload of the .atmx file > Migrate. This issue is observed on both On-Premises and Cloud deployments.</p>

5. Click **Next**.
 6. Select the bots and the folders that contain the bots (Task Bots and MetaBots) that you want to migrate.
- The ability to select a folder eliminates the effort required in selecting individual bots from that folder.
- If you selected a folder, all subfolders within that folder and the bots within these subfolders are automatically selected for migration.
 - If the folder is empty, the migration process encounters an error.

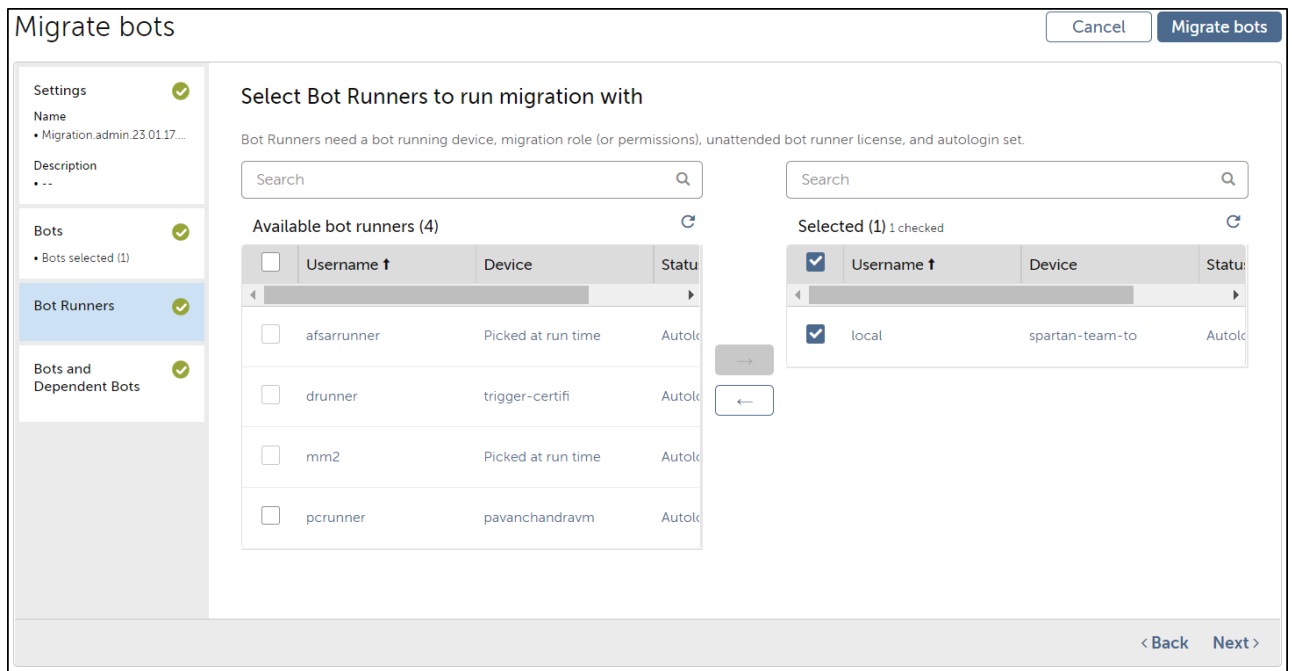

The **Last Migrated** column indicates when the bot was migrated previously. N/A means the bot has not been migrated before.

7. Click **Next**.
8. Select one or more usernames from the list to run the migration and click the right arrow.

Username can display either the message `Picked at run time` or the device name in the **Device** column. `Picked at run time` is shown when a user does not have a default device, for example, a user who has not registered a device and a system administrator has assigned a device to that user. A default device must be configured for all Bot Runners you have selected.

 - Bots are distributed across selected Bot Runner users in a round-robin method.
 - The first Bot Runner user on the selected list is the first one used.
 - A parent bot and its dependencies are assigned to a single Bot Runner user.

9. Click **Next**.
10. Optional: Review the dependent Task Bots and MetaBots on the **Bot and Dependent Bots** page before you migrate them.

If you have selected a folder and bots from the **Bots** page, that folder and dependencies of the selected bots are displayed in the table.

Dependent bots (Task Bots and MetaBots) are migrated before the primary bot.

The table shows the primary bot at the bottom and its dependencies above. For example, the following information means that `Sample05.atmx` has a dependency on `Sample04.atmx`, and `Sample04.atmx` has a dependency on `MessageBox.atmx` and `MetaTask.mbot`.

Type	Name	Path
MetaBot (mbot)	MetaTask.mbot	Bots\My Metabots \MetaTask.mbot
Task Bot (atmx)	MessageBox.atmx	Bots\MyTasks \MessageBox.atmx
Task Bot (atmx)	Sample04.atmx	Bots\MyTasks \Sample04.atmx

Type	Name	Path
Task Bot (atmx)	Sample05.atmx	Bots\MyTasks \Sample05.atmx

11. Click **Migrate bots**.

The system validates whether the user who initiated the migration and the Bot Runner users selected have the required permissions to perform the migration. The system verifies whether all of the following permissions are granted to the user performing the migration and the Bot Runners you have selected:

- User performing migration:
 - **View Migration** permission
 - **Manage Migration** permission
 - Permission on the folders containing the bots and MetaBots you want to migrate
 - A role that has access to Bot Runners that you want to select for running the migration (on the **Administration > Migration > Run As** page)
 - **View & edit ALL credentials attributes value** permission
- Bot Runners:
 - An unattended Bot Runner license
 - **Autologin Set** status
 - **Allow a bot-runner user to run migrations** permission
 - **Create standard attributes for a credential** permission
 - **Create folder** permission
 - **View package** permission
 - **Register device** permission
 - **View my bots** and **Run my bots** permissions
 - **Check-in** and **Check-out** permissions for the **My Tasks** and **My Metabots** folders in Automation 360
 - **Default device** settings

If any of the required permission is not granted, the system displays those permissions in the validation results. You must grant the required permissions and start the migration process again.

If all the required permissions are granted to the users, the system starts migrating the selected bots and their dependent bots.

After the migration, the system uploads successfully migrated bots, the associated Bot Insight data, and the published dashboards to the public workspace of the Automation 360 Control Room (in the same folder in which the .atmx file is available). Only bot migrations initiated from the Control Room are stored in the public workspace.

Validation error details for each bot are displayed in the bot migration results. The error details include the line number, error details, and the reason and recommendation.

The Bot migration results display the number of bots migrated, along with their individual statuses. Click the **Status** column to filter bots with specific statuses for quick analysis.

In the **Reasons** column, click the **View Migration issues** option to see detailed reasons for the error. The **View Migration issues** dialog box displays the line number where the error occurred, a summary of the error, and a detailed error report for your review.

- a) Check out the bot to migrate the private dashboards associated with that bot.
The private dashboards are migrated only for the user who checked out the associated bot for the first time.
- b) View in-progress migration activities from the **Activity > In progress** page.

Use the reports to analyze the status of individual bot migration, data migration, and audit log migration and identify the status and summary of the individual migration.

[Export Enterprise 11 Bot Insight dashboards for migration](#) on page 1507

Use the Bot Insight pre-migration utility to export your Enterprise 11 Bot Insight dashboard metadata (widgets and layouts) and dashboard profile as a zip file. Run this utility in your Enterprise

11 device and paste the zip file in the Automation 360 repository to migrate the Bot Insight dashboards.

How MetaBots are migrated

When you migrate a MetaBot to Automation 360, equivalent bots are created for the various logic available in the MetaBot, except for application screens. After successful migration, each logic in a .mbot file is converted to a Task Bot file.

A MetaBot contains assets and logic. Assets are the application screens or DLLs that are used to automate a task on an application. Logic is a set of commands to perform an operation and interact with other logic and bots.

Note:

- Before you migrate .atmx or .mbot using the Bot Migration Wizard, ensure that all the Logics, dlls, .mbots, .atmx files and other dependencies related to the MetaBots or Task Bots that were previously migrated are not in the **Checked-out** state. Otherwise, the following error occurs during re-migration:

`Bot is not ready for migration.`

The details of the unsuccessful migration are displayed in the **Bot Migration wizard > Results > Skipped** tab.

- If the bot that you are migrating has been checked out or has been migrated previously, ensure that the bot to be migrated is in the **Checked-in** state. Also, to reuse the migrated bot, in the Bot Migration Wizard, select the **Overwrite if a bot with same name exists** option. To use an updated bot, disable the **Overwrite if a bot with same name exists** option.

The migration process performs the following actions:

- Converts MetaBot logic to corresponding Task Bots.
- Maintains the folder structure of the MetaBots after it is migrated. The new folders created in Automation 360 contain the Task Bots for each logic migrated to Automation 360.
- Updates the Task Bots that use MetaBot logic to refer to the new Task Bots that are created for the migrated MetaBot logic.

You do not have to update the Task Bots manually.

Features such as use of DLLs, input and output variables, and **Execute** permission which were available only for MetaBots are now available for all Task Bots.

We will use the following MetaBot to explain how it is migrated to Automation 360:

- MetaBot name: MetaTask
- Assets:
 - Login screen
 - General.dll
 - DLL\Binary.dll
- Logic:
 - Common
 - Process1\Connect
 - Process1\Disconnect

- Process1\Operations\Numeric

Benefits of reusable Task Bots in Automation 360

The following table lists the benefits of using reusable Task Bots in Automation 360 compared with MetaBots in Enterprise 11:

Automation 360 reusable Task Bots	v11 MetaBots
You can navigate to a child bot through fewer clicks using the Finder component, thus saving time. Navigate to Editor > Finder to reach the child bot.	You must navigate through the TaskBot > Run action to reach the child bot.
You can search the child bots from the private workspace as well as public workspace to use them in Task Bots.	You must download the MetaBots to the local repository to use a child bot in the Task Bots.
Only a specific Logic is deployed when it is used in a task, which saves time and bandwidth.	Entire MetaBot is deployed to the Bot Runner machine even if only one Logic is used in the Task.
Provides better RBAC, which enables you to customize permissions.	MetaBots forces all Logic to have the same permissions even if multiple Logic are spread across different folders.

MetaBot migration process

The system creates a folder with the same name as the MetaBot within the **My MetaBots** folder available in the **Bots** folder, and the same folder structure as Enterprise 11 is retained. For example, if the folder structure in Enterprise 11 is **Accounts/Tax/MetaTask.mbot**, the system retains the folder structure as **Accounts/Tax/MetaTask.mbot**. All the components of a MetaBot are stored in the folder created for that MetaBot. In this example, the system creates the **MetaTask** folder in the **Bots\My MetaBots** folder and stores all the components the MetaBot in that folder.

Enterprise 10 bots that directly call DLLs and screens in a MetaBot without using MetaBot logic are migrated to the equivalent Task Bots and actions in Automation 360. In Enterprise 10, if a DLL that returns a list or array type parameters and the output of that DLL is mapped with a value type parameter, an extra space is added at the start of the output value. The extra space is not added to the output value after the bot is migrated.

10.1 MetaBots that use DLL functions that accept one-dimensional array and list type input parameters and is mapped with the array type parameter. In such cases, row index and column index are required as input to specify the value to be returned. After migration, the row index is considered as column number.

Note: For bots that are upgraded from 10.1 to 10.3.5 and then migrated to Automation 360, the Bot Migration Wizard does not show the dependency on the **Bot and Dependent Bots** page. For

such bots, you must migrate the MetaBots before migrating the Task Bots that are calling those MetaBots.

Migration of DLLs

The system does not maintain the folder structure for assets in order to maintain the references between the DLLs. For the above example, `General.dll` and `Binary.dll` are stored in the `MetaTask` folder although the `Binary.dll` is stored in the `DLL` subfolder.

See the following video for information on migrating MetaBots with DLLs to Automation 360:

MetaBot migration process overview

Use the information provided in this section to understand the processes involved in migrating MetaBot to Automation 360.

<p>Concept of DLL session in the migrated bot</p>	<p>The following DLL changes are observed in the migrated bot:</p> <ul style="list-style-type: none"> When you migrate a Task Bot with multiple MetaBots that contain DLLs with the same name, a session name using the name of the first DLL is created. When the subsequent DLL with the same name from another MetaBot is migrated, the ID of the folder in which the DLL resides is used as a session name. <p>For example: <code>M_DLL_Session-<MetabotFolderId>_<DLLName></code>.</p> <ul style="list-style-type: none"> When the Execute DLL command in Enterprise 11 is migrated to Automation 360, the command is converted to the Open and Run function actions and the DLL Session does not exist If condition. The DLL session name is created by appending the DLL name to the "M-DLL-Session-" token. For example, if the DLL name is <code>Sample.dll</code>, after migration, the DLL session name will be <code>M-DLL-Session-Sample</code>. The DLL session represents the DLL it is using to run the DLL functions. To run multiple functions from the same DLL, the same DLL session name must be provided in the Session name field.
<p>Condition to check for the existence of a DLL session in a migrated bot</p>	<p>After migration, when the same DLL is used across multiple logics of the same MetaBot, a condition to check if a DLL session is already open is added for every DLL to ensure that</p>

the DLL session is opened only once. Some DLLs that are used in MetaBot share sessions or global variables across multiple DLL functions. If such DLL functions are called from different logics, sharing of such sessions and variables is possible only if the DLL session is opened only once and a condition is added to check if a DLL session is already available. If a DLL session is missing, Automation 360 creates a DLL session of type **Global**.

What happens to a migrated Task Bot that has reference to two DLL functions from same or different logics of a MetaBot?

In Enterprise 11, if a Task Bot was referencing to a logic that called two functions using the **Run Logic** command, in Automation 360, a DLL session will be created in the Task Bot (logics are migrated as Task Bots) and will be used in the **Run function** action. Also, when a Task Bot refers multiple logics that calls multiple functions, the Task Bots will use the same DLL session name to execute the functions. The DLL session condition check will ensure that only one session is created across such logics.

For example, if a Task Bot is using MetaBot1 Logic and MetaBot2 Logic where MetaBot1 Logic and MetaBot2 Logic are calling multiple functions, when you run the Taskbot, a DLL session name is created to run MetaBot1 Logic. The DLL session name that was created to run MetaBot1 Logic will be used to run MetaBot2 Logic as well.

Migration of screens

Each screen in a MetaBot is converted to a windows variable and the actions performed on the screen are migrated to the equivalent actions in Automation 360.

The following table lists the screens that can be migrated to Automation 360:

Browser	Internet Explorer Google Chrome (for object play type only)
Screen type	Standard
Technology	Java, HTML, MSAA, .Net, UI Automation (for object play type only)
Play type	Object, Image, Coordinate

You can also migrate MetaBots with screens that are captured in the Citrix environment from applications that are based on Java, UI Automation, and MSAA technologies.

The linked objects on a MetaBot screen that are captured using the object play type are migrated to the **Capture** action of the Recorder package. The source object is displayed in the **Main** tab and the linked object is displayed in the **Anchor** tab of the **Capture** action.

The following table provides information about the actions that are performed on an object play type object and text play type linked object available on the screen is migrated to the equivalent actions in Automation 360:

Play type	Enterprise 11 Action	Automation 360 Action
Object	Get Property, Get Total Items, Get Selected Index, Get Selected Text, Select Item by Text, Select Item by Index, Click, Left Click, Right Click, Double Click, Set Text, Append Text, Get Property, Check, Uncheck, Toggle, Expand, Select, Get Status,	<p>Migrated to the Capture action of the Recorder package.</p> <p>The GetAllChidrenName and GetAllChidrenValue commands in Enterprise 11/Enterprise 10 return string type variable values. In Automation 360, they return list values. The migration process joins the list values and stores them into a string variable to maintain consistent bot behaviors across releases.</p> <p>The Object Cloning command with the Export to CSV action in Enterprise 11/Enterprise 10 is migrated to:</p> <ul style="list-style-type: none"> The Capture action of the Recorder package. This action saves the captured date into a table variable. The Write to file action of the Data Table package. This action saves the data from the table variable to the CSV file.

The following table provides information about the actions that are performed on an image play type object image play type linked object available on the screen is migrated to the equivalent actions in Automation 360:

Play type	Enterprise 11 Action	Automation 360 Action
Image	Left Click	Migrated to the Find window in window action of the Image Recognition package with the Left Click selected from the Action list.
	Right Click	Migrated to the Find window in window action of the Image Recognition package with the Right Click selected from the Action list.
	Double Click	Migrated to the Find window in window action of the Image Recognition package with the Double Click selected from the Action list.

Play type	Enterprise 11 Action	Automation 360 Action
	Middle Click	Migrated to the Find window in window action of the Image Recognition package with the Left Click selected from the Action list.
	Set Text	Migrated to: <ul style="list-style-type: none"> • The Find window in window action of the Image Recognition package with the Left Click selected from the Action list. • The Delay action of the Delay package with the Regular delay set to 500 milliseconds. • The Simulate keystrokes action of the Simulate keystrokes package.
	Get Text	Migrated to the Capture area action of the OCR package.
	GetVisibility	Migrated to IF action with condition Image Recognition: Find Window in window . The GetVisibility action returns a True or False value based on whether the object in an image is visible or not. Similarly, the condition within the IF action is evaluated based on whether the window is found in another window. The result is stored in a temporary variable.

The following table provides information about the actions that are performed on a coordinate play type object coordinate play type linked object available on the screen is migrated to the equivalent actions in Automation 360:

Play type	Enterprise 11 Action	Automation 360 Action
Coordinate	Click	Migrated to the Click action of the Mouse package with the Left Button and Click options selected.
	Left Click	Migrated to the Click action of the Mouse package with the Left Button and Click options selected.
	Right Click	Migrated to the Click action of the Mouse package with the Right Button and Click options selected.
	Middle Click	Migrated to the Click action of the Mouse package with the Middle Button and Click options selected.
	Double Click	Migrated to the Click action of the Mouse package with the Left Button and Double click options selected.

Play type	Enterprise 11 Action	Automation 360 Action
	Set text	Migrated to: <ul style="list-style-type: none"> The Click action of the Mouse package with the Left Button and Click options selected. The Delay action of the Delay package with the Regular delay set to 500 milliseconds. The Simulate keystrokes action of the Simulate keystrokes package.
	Get text	Migrated to: <ul style="list-style-type: none"> The Click action of the Mouse package with the Left Button and Click options selected. The Clear action of the Clipboard package. The Delay action of the Delay package with the Regular delay set to 500 milliseconds. The Simulate keystrokes action of the Simulate keystrokes package. The Delay action of the Delay package with the Regular delay set to 500 milliseconds. The Copy to action of the Clipboard package.

The following table provides information about actions that are performed on a coordinate play type custom object available on the screen that is migrated to equivalent actions in Automation 360:

Play type	Enterprise 11 action	Automation 360 action
Coordinate	Click	Migrated to the Click action of the Mouse package with the Left Button and Click options selected.
	Left Click	Migrated to the Click action of the Mouse package with the Left Button and Click options selected.
	Middle Click	Migrated to the Click action of the Mouse package with the Middle Button and Click options selected.
	Double Click	Migrated to the Click action of the Mouse package with the Left Button and Double click options selected.
	Set text	Migrated to the following: <ul style="list-style-type: none"> The Click action of the Mouse package with the Left Button and Click options selected. The Delay action of the Delay package with the Regular delay set to 500 milliseconds. The Simulate keystrokes action of the Simulate keystrokes package.

Play type	Enterprise 11 action	Automation 360 action
	Get text	<p>Migrated to the following:</p> <ul style="list-style-type: none"> The Click action of the Mouse package with the Left Button and Click options selected. The Clear action of the Clipboard package. The Delay action of the Delay package with Regular delay set to 500 milliseconds. The Simulate keystrokes action of the Simulate keystrokes package. The Delay action of the Delay package with Regular delay set to 500 milliseconds. The Copy to action of the Clipboard package.

The following table provides information about actions that are performed on a text play type custom object available on the screen that is migrated to equivalent actions in Automation 360:

Play type	Enterprise 11 action	Automation 360 action
Text	Click	Migrated to the Find window in window action of the Image Recognition package with Left Click selected from the Action list.
	Left Click	Migrated to the Find window in window action of the Image Recognition package with Left Click selected from the Action list.
	Double Click	Migrated to the Find window in window action of the Image Recognition package with Double Click selected from the Action list.
	Set text	<p>Migrated to the following:</p> <ul style="list-style-type: none"> The Find window in window action of the Image Recognition package with Left Click selected from the Action list. The Delay action of the Delay package with Regular delay set to 500 milliseconds. The Simulate keystrokes action of the Simulate keystrokes package.
	Get text	Migrated to the Capture area action of the OCR package.

Migration of logic

Each logic in a MetaBot is converted to a Task Bot and each command used in a logic is converted to the equivalent action in Automation 360. The variable used in a logic is converted to an equivalent variable in Automation 360. Credential variables used in the logic are migrated to

Automation 360 and used in the equivalent actions in the migrated bots. If the **Parameter Type** of a variable is input or output, the same is maintained after that variable is migrated to Automation 360. For example, if the **Parameter Type** of the variable ABC is set as **Input**, the variable ABC created in Automation 360 has the **Use as input** option selected after it is migrated. The system retains the internal folder structure of the logics. For the above example, all the migrated logics are stored as listed in the following table:

Folder structure in Automation 360	Entry
MetaTask	Common
MetaTask\Process1	Connect
MetaTask\Process1	Disconnect
MetaTask\Process1\Operations	Numeric

The following table provides information about how the Import DataSet command used in the MetaBot logic is migrated to the equivalent actions in Automation 360:

Play type	Enterprise 11 Action	Automation 360 Action
Object	Get Property, Get Total Items, Get Selected Index, Get Selected Text, Select Item by Text, Select Item by Index, Click, Left Click, Right Click, Double Click	Migrated to the Capture action of the Recorder package.
Image	Left Click	Migrated to the Find window in window action of the Image Recognition package with the Left Click selected from the Action list.
	Right Click	Migrated to the Find window in window action of the Image Recognition package with the Right Click selected from the Action list.
	Double Click	Migrated to the Find window in window action of the Image Recognition package with the Double Click selected from the Action list.
	Middle Click	Migrated to the Find window in window action of the Image Recognition package with the Left Click selected from the Action list.
	Set Text	Migrated to: <ul style="list-style-type: none"> • The Find window in window action of the Image Recognition package with the Left Click selected from the Action list. • The Delay action of the Delay package with the Regular delay set to 500 milliseconds. • The Simulate keystrokes action of the Simulate keystrokes package.

Play type	Enterprise 11 Action	Automation 360 Action
Coordinate	Click	Migrated to the Click action of the Mouse package with the Left Button and Click options selected.
	Left Click	Migrated to the Click action of the Mouse package with the Left Button and Click options selected.
	Middle Click	Migrated to the Click action of the Mouse package with the Middle Button and Click options selected.
	Double Click	Migrated to the Click action of the Mouse package with the Left Button and Double click options selected.
	Set text	Migrated to: <ul style="list-style-type: none"> The Click action of the Mouse package with the Left Button and Click options selected. The Delay action of the Delay package with the Regular delay set to 500 milliseconds. The Simulate keystrokes action of the Simulate keystrokes package.

The following table provides information about how the Export Dataset command used in the MetaBot logic is migrated to the equivalent actions in Automation 360:

Play type	Enterprise 11 Action	Automation 360 Action
Object	Get Property, Get Total Items, Get Selected Index, Get Selected Text, Select Item by Text, Select Item by Index, Click, Left Click, Right Click, Double Click	Migrated to the Capture action of the Recorder package.
Image	Left Click	Migrated to the Find window in window action of the Image Recognition package with the Left Click selected from the Action list.
	Right Click	Migrated to the Find window in window action of the Image Recognition package with the Right Click selected from the Action list.
	Double Click	Migrated to the Find window in window action of the Image Recognition package with the Double Click selected from the Action list.
	Middle Click	Migrated to the Find window in window action of the Image Recognition package with the Left Click selected from the Action list.

Play type	Enterprise 11 Action	Automation 360 Action
	Get Text	Migrated to the Capture area action of the OCR package.
Coordinate	Click	Migrated to the Click action of the Mouse package with the Left Button and Click options selected.
	Left Click	Migrated to the Click action of the Mouse package with the Left Button and Click options selected.
	Middle Click	Migrated to the Click action of the Mouse package with the Middle Button and Click options selected.
	Double Click	Migrated to the Click action of the Mouse package with the Left Button and Double click options selected.
	Get text	Migrated to: <ul style="list-style-type: none"> • The Click action of the Mouse package with the Left Button and Click options selected. • The Clear action of the Clipboard package. • The Delay action of the Delay package with the Regular delay set to 500 milliseconds. • The Simulate keystrokes action of the Simulate keystrokes package. • The Delay action of the Delay package with the Regular delay set to 500 milliseconds. • The Copy to action of the Clipboard package.

Migration of Run Logic command

The **Run Logic** command is used in a bot to run a specific logic from a MetaBot in Enterprise 11. When you migrate that bot, the **Run Logic** command is converted to the **Run** action of the Task Bot package.

The input variables are converted to equivalent variables in Automation 360 and the output variables are migrated to a dictionary variable. You use the key in the dictionary variable to use the associated value. The dictionary variable might contain other variable types, for example, list, value, integer, and array. You can map the variables available in the dictionary variable with other variable types. For example, you can map the list type variable available in the dictionary variable with the list, value, and array type variables.

Migration of Execute command

The DLLs in the MetaBots use the **Execute** command to run a function from that DLL. After migration to Automation 360, each **Execute** command is converted to **Open, Run function, and Close** actions of the **DLL** package. Information about which function to run from the DLL, which parameters to use, and other details in the **Execute** command is migrated to the **Run** action.

Starting from Enterprise A2019.16 (6448), you can migrate MetaBots that contain DLLs whose return types are different from that of the MetaBot. The following table provides information about the variable type of the output of the MetaBot and the return type of a DLL.

MetaBot variable type	DLL function return type
Value	Two-dimensional array, List, Byte in array (Byte[]), unsigned integers (UInt32, UInt64), signed integers, IDictionary, IList, and unsigned integers in array (UInt16[], UInt32[], UInt64[]), signed Byte
Array	Two-dimensional array, List, unsigned integers (UInt16[], UInt32, UInt64), signed integers, IList, signed Byte and IDictionary

Note: The migration of bots that uses IDictionary variable is supported, however, the migrated bots might not return the correct value. This behavior is same as in Enterprise 11 or Enterprise 10.

The following table provides information about the variable type that is passed from the MetaBot and the input type a DLL accepts.

Variable type of MetaBot	Input variable type the DLL accepts
List	Two-dimensional array, list, byte, unsigned integers (UInt16, UInt32, UInt64), signed integers, signed Byte, byte in array (Byte[]), and unsigned integers in array (UInt16[], UInt32[], UInt64[])
Array	Two-dimensional array, list, byte, unsigned integers (UInt16, UInt32, UInt64), signed integers, signed Byte, byte in array (Byte[]), and unsigned integers in array (UInt16[], UInt32[], UInt64[])
Value	Byte, unsigned integers (UInt16, UInt32, UInt64), signed integers, signed Byte
Dictionary	Byte, unsigned integers (UInt16, UInt32, UInt64), signed integers, signed Byte

How AAApplicationPath variable is migrated

The AAApplicationPath variable is used in Enterprise 11 and Enterprise 10 to specify the physical path of a bot or file that is used in the current bot. The AAApplicationPath system variable returns the path that is set in **Tool > Option** of what is known as the "client application".

Migrating from Enterprise 11 using restored Enterprise 11 database

When you migrate to Automation 360 using a restored Enterprise 11 database, the migration process performs the following actions:

- Creates the AAAApplicationPath global value when the first bot is migrated using the Bot Migration Wizard.
- Copies the value for the AAAApplicationPath system variable specified for each user in Enterprise 11 and sets that value to the AAAApplicationPath global value for all these users in Automation 360.
- Updates references you have used in Enterprise 11 bots with the AAAApplicationPath global value available in the Automation 360 Control Room, eliminating any requirement to update the migrated bots to use the AAAApplicationPath.
- Updates the path in the **Run Task** command set in the Enterprise 11 bot. For example, if the path in the **Run Task** command is set to \$AAAApplicationPath\$\Automation Anywhere\My Tasks\child-task.atmx in Enterprise 11, this path is automatically converted to Bots\My Tasks\child-task.atmx after migration.

Therefore, no manual update is required and the bot runs as is after migration.

Important: When you migrate bots using the Bot Migration package, you must manually create the AAAApplicationPath global value. After you have created the AAAApplicationPath global value, all users who have used the AAAApplicationPath system variable in Enterprise 11 must update the AAAApplicationPath global value with the value that is used in Enterprise 11.

See [Migrate from Enterprise 11 using a restored Enterprise 11 database](#).

Migrating from Enterprise 10

When you migrate from Enterprise 10, you must manually create the AAAApplicationPath global value in Automation 360 with the **CAN be changed** option selected. After you have created the AAAApplicationPath global value, all users who have used the AAAApplicationPath system variable in Enterprise 10 must update the AAAApplicationPath global value with the value that is used in Enterprise 10. This update ensures that when you run the bot in Automation 360, the AAAApplicationPath folder value is uniquely resolved for each user.

Example: If the Enterprise 10 path value for AAAApplicationPath is D:\John.Doe\My Documents\Automation Anywhere Files, then you must create the AAAApplicationPath global value in Automation 360 and update with this path.

Note: Bot Runners and Bot Creators must update the global value for the AAAApplicationPath in the Control Room before they run migrated bots in Automation 360.

See [Prepare for Enterprise 10 to Automation 360 On-Premises migration](#) on page 1516.

Manually migrating from Enterprise 11 or Enterprise 10

When you manually migrate from Enterprise 11 or Enterprise 10, you must manually create the AAAApplicationPath global value in Automation 360 with the **CAN be changed** option selected. After you have created the AAAApplicationPath global value, all users who have

used the AAApplicationPath system variable in Enterprise 11 or Enterprise 10 must update the AAApplicationPath global value with the value that is used in Enterprise 11 or Enterprise 10.

See [Prerequisites for manual migration](#) on page 1500.

AASettings in Automation 360 after migration

After you migrate to Automation 360, some of the values available in AASettings in Enterprise 11 can be configured.

The following table shows the keys, descriptions, values allowed, default values, and what's supported in Automation 360 (scroll to the right to view the columns):

Key	Description	Values allowed	Default value	Supported in Automation 360
allowaddingdefaultnamespace	<p>Allows you to enable DefaultNSPrefix. In the XML package, when you insert a node into the XML file, DefaultNSPrefix is no longer added. In the Advanced view tab of the insert a node action, xmlns (the default XML namespace) is not allowed either as a prefix or as an attribute.</p> <hr/> <p>Note: If DefaultNSPrefix is enabled and the value of allowaddingdefaultnamespace is set to True, when you insert or update a new node as an empty node, a newline character will be added and indentation will be lost.</p>	True, False	False	No

Key	Description	Values allowed	Default value	Supported in Automation 360
allowlowersecurity	Allows you to lower the security cipher for connecting to mainframe hosts that use SSL connections with lower security cipher.	True, False	False	No
applyshiftkeyfix	Allows you to check for any missing special key in child bots and executes the key if the special key is missing.	0, 1	0	No
capturehtmlwithjs	Allows you to enable capturing HTML by MetaBot screen capture.	True, False	True	No
citrixchanneltimeout	Allows you to set the Citrix channel timeout value for the Citrix remote agent.	Integer	--	No
closebrowserbyhandle	Allows you to enable CloseInstanceByhandle if CloseInstanceByprocess fails.	0, 1	0	No
connectionretryattempts	Allows you to configure the number of attempts to try for connecting to the mainframe if connection to the mainframe failed.	Integer	3	No

Key	Description	Values allowed	Default value	Supported in Automation 360
connectionretryinterval	Allows you to configure the timeout value, in milliseconds, to wait before attempting the next connection.	Integer	3000	No
connectiontimeout	Allows you to configure the timeout value, in minutes, for database connections. We recommend that you configure this timeout value to 30 minutes.	Integer	30	No
CustomDateFormat	Allows you to set a custom date format.	String (mm/dd/yyyy HH:mm:ss)	--	No
DecimalPlaces	Allows you to configure the number of decimal places for digits used in the Number element.	Integer from 0 to 16	4	No
enablesetfocusapi	Allows you to configure the SetFocus API for Oracle applications.	True, False	False	No
fetchemailretrycount	Allows you to configure the number of retries for fetching emails.	Integer	3	No
findiewndatmpt	Allows you to use the MetaBot recorder to search for objects.	Integer	5	No

Key	Description	Values allowed	Default value	Supported in Automation 360
ietimeoutvalue	Allows you to configure the timeout value for capturing MetaBot screens.	Integer	240	No
IETimeoutValue	Allows you to configure the maximum timeout value, in seconds, for loading a webpage on Internet Explorer.	Integer	240	No
IsEnabled	Allows you to check whether the decimal places option in the Number element is enabled or disabled.	True, False	False	No
isremoteobjectdetected	Allows you to enable automation of Citrix XenApp through the Enterprise Client.	True, False	False	No
iterationtoverify	Allows you to configure the number of retries to verify a value in a cell.	Integer	3	No
keystrokedelay	Allows you to configure a delay between the up and down keys in an Excel table.	Integer	25	No
legacybehaviourforcomma	Allows you to retain the legacy behavior for the comma sign.	True, False	True	No

Key	Description	Values allowed	Default value	Supported in Automation 360
multithreadlogic	Allows you to enable or disable multithreading.	0, 1	1	No
NormalizationForm	Allows you to verify whether string normalization is available.	NFC, NFD, NFKC, NFKD	--	No
ParallelThreadCount	Allows you to configure the number of links that can be processed at a time.	Integer	10	No
perchardelay	Allows you to configure the delay between entering two characters as input.	Integer	0	No
percommanddelay	Allows you to configure the delay between running keystroke commands.	Integer	0	No
readvirtualproperty	Allows you to enable the GetvirtualAccessibleName API.	True, False	True	No
readwithsystemencoding	Allows you to configure the default encoding for the system.	True, False	True	No
restclienttype	Allows you to execute REST Web Service.	restsharpclient, nativerestclient	restsharpclient	No
retainexcelcellrow	Allows you to revert the behavior of ExcelCellRow to Enterprise 11 version 11.3.1 or earlier.	True, False	False	No

Key	Description	Values allowed	Default value	Supported in Automation 360
screenchangewaittime	Allows you to configure the timeout value, in milliseconds, to wait for the application after sending certain keys because the screen might change after sending some keys.	Integer	5	No
searchinmultiplewindows	Allows you to check for windows with the same name.	0, 1	0	No
ShutDownTimeout	Allows you to configure the timeout value for the Shutdown action in the System package.	Integer	30000	No
skipappnames	Allows you to check whether the application is Oracle.	Comma-separated application starting name. For example, if the application window title is Test Application, then it should contain the following value: Test,abc,xyz	--	No
textplayirpercentage	Allows you to configure the match percentage of the image recognition based control finding in the legacy AISense Recorder.	Integer from 0 to 100	95	No

Key	Description	Values allowed	Default value	Supported in Automation 360
timeout	Allows you to configure the HTTP request timeout value for the REST Web Service command.	String	60000	No
Timeout	Allows you to configure the timeout value for each web response while traversing through webpages.	Integer	10	No
usesinglethreading	Allows you to enable or disable single threading.	True, False	True	No
version	Allows you to select multiple versions of keystroke commands in Enterprise 11.	Integer	1	No
WaitForPageLoad	Allows you to configure additional delay for loading webpages in MetaBot and Recorder.	0, 1	0	No
WaitForWindow	Allows you to configure the wait time for window.	Integer	30	No
WaitForWindowClosed	Allows you to check whether the wait time for window is enabled.	0, 1	0	No
windowactivationmode	Allows you to activate Window using a None key.	0, 1, 2	0	No

Key	Description	Values allowed	Default value	Supported in Automation 360
windowresize	Allows you to disable the resizing of window during execution.	True, False	True	No

Enable schedules after migration

When you copy Enterprise 10 data to Automation 360, the Enterprise 10 schedules are migrated. Version Enterprise 11 schedules are migrated when you update the Enterprise 11 data to Automation 360.

After you migrate a bot associated with a schedule, the system automatically replaces the .atmx bot within that schedule with the Automation 360 bot. Migrated schedules are inactive and do not have associated devices, so some dependencies must be remapped in the Automation 360 environment.

To reenable migrated schedules, follow these steps:

1. Confirm that the bot linked to the schedule has been successfully migrated.
Migrated schedules only point to successfully migrated bots. If a bot migration fails, then the associated schedule continues pointing to the .atmx bot.
2. Install the Bot Agent on your Bot Runner devices.
[Install Bot Agent and register device](#) on page 1288
3. Edit the schedule to add relevant devices.
[Schedule a bot](#) on page 2056
4. Enable the schedule by clicking **Enable** after you have provided the required information for scheduling a bot.
[Schedule a bot](#) on page 2056

Related concepts

[Migrate to Automation 360](#) on page 1436

Migration (upgrade) is the process of moving your data and bots from Enterprise 11 or Enterprise 10 to Automation 360. Migration includes but is not limited to replicating and updating your existing database and repository, converting your bots to the Automation 360 format, and migrating learning instances for IQ Bot and dashboards for Bot Insight.

Related tasks

[Copy Enterprise 10 data](#) on page 1520

You must copy the Enterprise 10 data to Automation 360 before you convert the Enterprise 10 bots.

[Copy and paste Enterprise 11 information to Automation 360](#) on page 1504

The Enterprise 11 server repository files and the Credential Vault file are required in the Automation 360 environment. The most efficient way to get this data is to copy it from the Enterprise 11 environment into Automation 360.

[Migrate Enterprise bots](#) on page 1529

The bot migration process uses the Bot Migration Wizard to convert Enterprise 11 or Enterprise 10 bots (Task Bots and MetaBots) in .atmx and .mbot format to the .bot format used in

Automation 360 and uploads the successfully migrated bots to the Control Room public workspace.

Pause and resume bot migration

You can pause and then resume the paused bot migration. You might want to pause a bot migration if you want to perform a high-priority task on the same Bot Runner device on which the bot migration is running.

You must have the required permissions to start bot migration.

- Pause and resume bot migration when only one Bot Runner is used for bot conversion:
 - a) Select the active bot migration you want to pause from the **Activity > In progress** page.
 - b) Click the pause icon in the bot Launcher or on the **In progress** page.
The system pauses the bot migration. The status of bot migration is listed on the following:
 - The **Activity > In progress** page and marked as paused.
 - The bot migration on the **Administration > Migrations** page, where the status is displayed as paused.
 - The **Bot migration report** tab, where the status of the bot that was being converted and the bot migration that was paused is set as paused. The status of all other bots that were not converted is set as pending.
 - c) Select the paused bot migration that you want to resume from the **Activity > In progress** page.
 - d) Click the resume icon in the bot Launcher or on the **In progress** page.
The system resumes the paused bot migration. The details status of the resumed bot migration is available on the following:
 - The **Activity > In progress** page where the status is marked as active.
 - The **Administration > Migrations** page where the status is marked as in progress.
 - The **Bot migration report** tab, where the status of the bot that was being converted and the bot migration was paused is set as in progress.

- Pause and resume bot migration on some of the Bot Runners when multiple Bot Runners are used for bot conversion:
 - a) Select the active bot migration you want to pause from the **Activity > In progress** page.
 - b) Click the pause icon on the toolbar to pause the selected migration processes.
The system pauses the selected migration processes that were running on various Bot Runners. The status of the paused bot migration is displayed on the **Activity > In progress** page and marked as paused.

There is no change in the status of the bot migration on the **Administration > Migrations** page and on the **Bot migration report** tab.
 - c) Select the paused bot migrations you want to resume from the **Activity > In progress** page.
 - d) Click the resume icon on the toolbar to resume the selected paused bot migration.
The system resumes the bot migration for the selected Bot Runners. The status of Bot Runners for which the bot migration is resumed is displayed on the **Activity > In progress** page and marked as active.

The status of the bot migration on the **Administration > Migrations** page is displayed as in progress.

- Pause a bot migration for all Bot Runners when multiple Bot Runners are used for bot conversion.
 - a) Select all the active bot migration you want to pause from the **Activity > In progress** page.
 - b) Click the pause icon on the toolbar to pause the selected bot migration.

The system pauses the selected bot migrations that were running on various Bot Runners. The entry for all the paused migration processes is available on the following:

 - The **Activity > In progress** page and marked as paused.
 - The **Administration > Migrations** page where it is displayed as paused.
 - The **Bot migration report** tab, where the status of the bots for which migration has not started is set as paused.
 - c) Select all the paused bot migration you want to resume from the **Activity > In progress** page.
 - d) Click the resume icon in the bot Launcher or on the **In progress** page for all Bot Runners.

The system resumes the paused the bot migration. The status for all the Bot Runners is available on the following:

 - The **Activity > In progress** page and marked as active.
 - The **Administration > Migrations** page where it is displayed as in progress.
 - The **Bot migration report** tab, where the status of the bot that was being converted and the bot migration was paused is set as in progress.

Stop bot migration

You can stop an in-progress bot migration if that bot migration is not progressing or is not responding.

You must have the required permissions to start bot migration.

1. Select the active bot migration that you want to stop from the **Activity > In progress** page.
2. Click the stop icon in the bot Launcher or on the **In progress** page.

The system immediately terminates the bot migration. The status of the stopped bot migration is listed on the following:

 - The **Activity > Historical** page and marked as failed.
 - The **Administration > Migrations** page, where it is displayed as unsuccessful.
 - The **Bot migration report** tab, where the status of the bot that was being converted and the migration process that was stopped is set as unsuccessful. The status of all other bots that were not converted is set as pending.
 - The **View historical activity** page for the entry shows the reason for the failure.

Validating and updating bots after migration

Migrated bots are uploaded to the public repository of the Automation 360 Control Room (in the same folder containing the equivalent .atmx files). You can review the current status of the

migrated bots and any errors encountered due to unsupported commands or attributes available in those bots from the **Migration List** page.

It is important that you review, test, and verify all migrated bots to ensure that they run successfully in the Automation 360 environment.

The migration assistant is merged with the error assistant to provide a comprehensive view of all the lines in a bot that require review or action by you, or which have errors in these and therefore require you to address them. This feature helps you to quickly identify the areas of bots that require your attention. Before testing any bot, scroll through the entire migrated bot from the first to last line so that the Migration Assistant flags any issues.

If you do not review the entire bot, you might see a `failed to compile` error.

Updating your bots

If a bot requires any modifications based on the migration reports or testing phase, you can edit the bot:

1. Check out the bot from the public repository into a private repository.
2. Use the Migration Assistant to view changes to migrated bots.

The Migration Assistant will guide you for any required changes and provide opportunities to leverage new Automation 360 features.

3. Edit the bot in the Bot editor if required.

You can run the bot directly from the Bot editor as you modify your bot and test the process steps.

Perform these steps in your Development (DEV) environment. After the migrated bots clear your preset pass criteria, move them to the User Acceptance Testing (UAT) environment to test the bots against production-like systems with larger datasets.

Only when the bot clears the UAT requirements should you deploy it in a Production (PROD) environment. This process is part of the typical industry standard software development lifecycle (SDLC) best practices.

Moving bots using Bot Lifecycle Management

Use Bot Lifecycle Management to move bots from one environment to another. After you have tested and successfully run the migrated bots in the development (DEV) environment, you can use Bot Lifecycle Management to move the bots from the development environment to the UAT environment. Similarly, you use Bot Lifecycle Management to move the bots from the UAT production (PROD) environment.

When you move bots, if the following error occurs `"Can't create directory: <directory name>"`, see [Unable to import or export the bots from v11 to Automation 360 \(A-People login required\)](#).

Bot compatibility version

After migration, if you remove the `AAApplicationPath` from the destination path and the bot compatibility version is set to **1**, the bot deployment fails. This occurs because in version 1 the

file path is parsed during compilation time. Depending on the Control Room device (Linux or Windows), the file or folder paths might differ causing an error when this path is parsed during bot compilation time.

Recommendation: Change the bot compatibility version to **2**. In this version, the file path is parsed during bot runtime depending on the device on which the bot runs.

See the following video on how to validate changes made to migrated bots:

Related reference

[Package mapping for migration](#) on page 1559

This page contains information about Enterprise 10 and Enterprise 11 commands and how they map to respective Automation 360 actions or packages. In some cases, an Enterprise 10 or Enterprise 11 command migrates to more than one Automation 360 action. This is to ensure that the behavior of the migrated bot is unchanged.

[Variable mapping for migration](#) on page 1593

In migration, some variables map directly from previous product versions to Automation 360 while others behave differently or contain configuration changes.

Package mapping for migration

This page contains information about Enterprise 10 and Enterprise 11 commands and how they map to respective Automation 360 actions or packages. In some cases, an Enterprise 10 or Enterprise 11 command migrates to more than one Automation 360 action. This is to ensure that the behavior of the migrated bot is unchanged.

Automation 360 has a new package called **Legacy automation**. This package provides the additional support needed during migration. The **Legacy automation** package is for use during migration only; we do not recommend using this package for new bot development. [Legacy Automation package](#) on page 2660

You can migrate bots when the user doing the migration is using an authenticated proxy server.

Note: For a list of packages and actions that support migration and conversion of Internet Explorer bots from Enterprise 11 or Enterprise 10 to Automation 360 with **Edge with IE mode**, see [Packages and Actions](#).

Active Directory

Respective **Active Directory** commands are migrated within the **Connect** and **Disconnect** actions. Each command is migrated as follows:

Enterprise 11 or Enterprise 10 commands	Equivalent Automation 360 actions and packages
Create user	Create user
Modify group command with the Rename group option selected	Rename group
Modify group command with the Delete group option selected	Delete group

Enterprise 11 or Enterprise 10 commands	Equivalent Automation 360 actions and packages
Modify group command with the Add users to group option selected	Add users to group
Modify group command with the Remove users from group option selected	Remove users from group
Modify group command with the Set property option selected	Set group property
Modify group command with the Disable user account option selected	Disable user account
Modify group command with the Update user details option selected	Update user details
Modify user command with the Rename user option selected	Rename user
Modify user command with the Delete user option selected	Delete user
Modify user command with the Enable user account option selected	Enable user account
Modify user command with the Update Account Options option selected	Update account options
Modify user command with the Change Password option selected	Change Password
Create object command with the Computer object option selected	Computer object
Create object command with the Organizational unit object option selected	Create organizational unit
Search command with the Run Query option selected	Run Query
Search command with the Get all users of a Group option selected	Get all users of a group
Get property command with the User option selected	Get user property
Get property command with the Group option selected	Get group property
Get property command with the Computer option selected	Get computer property
Get property command with the Organizational unit option selected	Get organizational unit property
Modify Object command with Computer object type and the Rename Object option selected	Rename computer
Modify Object command with Computer object type and the Delete Object option selected	Delete computer
Modify Object command with Computer object type and the Move Object option selected	Move computer

Enterprise 11 or Enterprise 10 commands	Equivalent Automation 360 actions and packages
Modify Object command with Computer object type and the Set Property option selected	Set computer property
Modify Object command with Organizational Unit object and the Rename Object option selected	Rename organizational unit
Modify Object command with Organizational Unit object and the Delete Object option selected	Delete organizational unit
Modify Object command with Organizational Unit object and the Move Object option selected	Move organizational unit
Modify Object command with Organizational Unit object and the Set Property option selected	Set organizational unit property

See [Active Directory package](#) on page 2283.

App Integration

App Integration in Automation 360 does not have actions for each technology, unlike in Enterprise 10/Enterprise 11. In Automation 360, all actions are divided into individual actions.

Enterprise 11 or Enterprise 10 commands	Equivalent Automation 360 actions and packages
App Integration commands that capture text from a window	Capture text from window action of the App Integration package
Modify group command with the Rename group option selected	Rename group
Modify group command with the Delete group option selected	Delete group
Modify group command with the Add users to group option selected	Add users to group

Enterprise 11 bots that resize the application window when they are deployed can be migrated to Automation 360.

See [App Integration package](#) on page 2321.

Clipboard

All commands of Clipboard are migrated to equivalent actions of the Automation 360 **Clipboard** package. There is no change in behavior or command name.

See [Clipboard package](#) on page 2360.

Comment

Comment is migrated to Automation 360 **Comment** action.

If the Comment command contains a variable or a \$ symbol, the command gets disabled after migration.

Database

Enterprise 10/Enterprise 11 uses ODBC drivers and Automation 360 uses JDBC drivers.

The **SQL Query** action is called **Read from** in Automation 360.

The following table shows the commands that currently can be migrated.

Enterprise 11 or Enterprise 10 commands	Equivalent Automation 360 actions and packages
Connect	<p>Migrates to the Connect command. If you encounter an unsupported connection string in Automation 360, the reasons might vary based on your environment. More details are available as part of the migration process. Contact Technical Support if you need assistance resolving the issue.</p> <p>0 is not a valid time out value in Automation 360. The migration process replaces 0 with an empty value.</p>
Run Stored Procedure	<p>The parameter name and output parameter are mandatory fields in Automation 360.</p> <hr/> <p>Important: After you migrate the bot, you must provide the parameter name and output parameter type in the Run stored procedure action.</p> <hr/>

See [Database package](#) on page 2379.

Delay

Delay command is migrated to the **Delay** action in Automation 360. "Delay in Milliseconds" and "Delay in Seconds" options (Enterprise 11) have changed to radio options within the **Time unit** area (Automation 360). See [Delay package](#) on page 2405.

Email

There are no sessions for Email commands in Enterprise 10 or Enterprise 11. However, Automation 360 includes **Connect** and **Disconnect** actions to ensure email sessions are started and closed. Therefore, during migration, the **Connect** action is placed before the respective email action and the **Disconnect** action after the respective email action.

The **Save attachment** option of the **Get All Messages** command is now a dedicated action called **Save attachment** in the **Email** package in Automation 360.

For bots created to automate email-related tasks on the Exchange Web Services (EWS) server, the **Get All Message** command is migrated to the **Loop** action with the iteration set to **For all each mail in mailbox**. Similarly, the **Delete** and **Delete all** commands are migrated to **Delete** and **Delete all** actions.

When you migrate Enterprise 11 bots that contain the Email package with **Authentication type** set to OAuth2, most of the parameters included in the package migrate to the same values in Automation 360. However, the following parameters migrate with different values:

- The **IMAP** and **POP3** protocols migrate to the corresponding Email server in Automation 360.
- The **Use Local timezone** migrates to the **Loop** action as a Boolean value in Automation 360.

See [Email package](#) on page 2431.

Error Handling

Disabled Error Handling commands are not migrated to Automation 360.

Begin Error Handling and **End Error Handling** is migrated to the **Try/Catch** block of the Error handler package in Automation 360. Many options available in Begin Error Handling are migrate to respective Automation 360 actions.

Note: To avoid an exception error when you use the **Try/Catch** block in a Loop, we recommend that you validate all the command inputs.

Refer the below table for details:

Enterprise 11 or Enterprise 10 commands	Equivalent Automation 360 actions and packages
Continue	By default, execution continues after executing the Catch block in Automation 360.
Stop	Stop action of the Task package is added in the Catch block.

Enterprise 11 or Enterprise 10 commands	Equivalent Automation 360 actions and packages
Take Snapshot	<p>When the Take Snapshot option is selected and the location is provided in the File Path field of the Enterprise 11 bot, the migrated bot contains:</p> <ul style="list-style-type: none"> • The Capture desktop action of the Screen package to capture the error screen. • The Log to file action of the Log To File package to capture the error message in a text file. • The To string action of the Datetime package to convert the datetime value to string that will be stored in the text file along with the error message. <p>The above actions are added in the Catch block of the migrated bot and the captured image and the error message are stored at the location provided in the File Path field of the Enterprise 11 bot.</p> <p>When the Take Snapshot, Send Email, and Attach Sanpshot options are selected and the location is not provided in the File Path field in the Enterprise 11 bot, the migrated bot contains the following:</p> <ul style="list-style-type: none"> • The Create action of the Folder package to create a temporary location to store the captured image and the text file that contains the error message. • The Capture desktop action of the Screen package to capture the error screen. • The Log to file action of the Log To File package to capture the error message in a text file. • The To string action of the Datetime package to convert the datetime value to string that will be stored in the text file along with the error message. • The Send action of the Email package to send an email notification with the image and text file attached. • The Delete action of the File package to delete the image and text file stored in the temporary location. <p>The above actions are added in the Catch block of the migrated bot.</p>
Run Task	<p>Run action of the Task package is added in Try block.</p> <p>When a child bot encounters an error, the bot continues with the execution of the next action of the parent bot.</p>
Log Data into File	<p>Log to File action is added in Catch block.</p>
Send Email	<p>Send action from the Email package is added to the Catch block.</p> <p>The Task Bot variables and variable values sent as email attachment using the Attach Variable option are also migrated.</p>
Variable Assignment	<p>Assign action of the String package is added with respective the condition in the Catch block.</p>

See [Error handler package](#) on page 2466.

Excel

The Enterprise 10/Enterprise 11 Excel commands are migrated to respective Automation 360 actions of the **Excel Advanced** package.

In Enterprise 11, a bot can open a Microsoft Excel spreadsheet even when a file extension is not provided. In Automation 360, the migrated bots uses the **Open** action in the Excel advanced package to open a Microsoft Excel spreadsheet when a file extension is not provided.

In Enterprise 10/Enterprise 11, data returned by **Get Multiple Cells** and **Get All Cells** commands are returned to the **Loop > Each Row in an Excel Dataset** command. In Automation 360, the functionalities of **Get Multiple Cell** and **Get All Cells** are available in **Loop > Each Row in an Excel Dataset** action, so values from these commands are migrated to the loop instead of actual actions.

Bots that use the **Get Single Cell** command with the **Specific cell** and **Get Cell Value** options are migrated to the **Get single cell** action of the Excel advanced package with the **Specific cell** and **Read cell value** options selected after migration.

When you run a migrated bot with the **Excel Advanced > Cell range** option, ensure that you use a numeric value as the last character in the **From cell** and **To cell** fields (for example, testa1). The last character cannot be an alpha character.

The following table shows action name changes:

Enterprise 11 or Enterprise 10 commands	Equivalent Automation 360 actions and packages
Save Spreadsheet	Save workbook
Open Spreadsheet	Open
Close Spreadsheet	Close Note: When you migrate a bot with Excel: Close action, in Enterprise 10/Enterprise 11, the bot ignores the Save option for the read-only file, whereas in Automation 360, the following prompt is displayed: The File already exists .
Get Cells	Divided into Get single cell and Get multiple cells actions Note: The Get Cells action retrieves output in different formats for Enterprise 10/Enterprise 11 and Automation 360 for specific data types such as Boolean and Date.

Enterprise 11 or Enterprise 10 commands	Equivalent Automation 360 actions and packages
Activate Sheet	Switch to sheet Note: In Enterprise 11, the bot containing the Activate Sheet command does not switch to and perform operations on a hidden worksheet. However, after migration to Automation 360, the bot containing the equivalent Switch to worksheet action switches to the hidden worksheet and performs operations on it. After the operations are completed, the worksheet remains hidden and is not activated.
Find/Replace	Divided into Find and Replace actions When you migrate a bot with the Excel > Find action and if the value is present at the beginning of a cell address, the migrated bot retrieves the same output results in a different sequence for the Find Text for Enterprise 11 and Automation 360. For example, if A2, B5, and D15 cell addresses have the value XYZ and you search for XYZ in the range A2:D15, the Enterprise 11 bot collects the result in the sequence: B5, D15, and A2. However, the migrated bot will collect the result in a different sequence: A2, B5, and D15, after migrating to Automation 360.

See [Excel advanced package](#) on page 2479.

- In Enterprise 11 or Enterprise 10 and in Automation 360, a session (used to open a Microsoft Excel spreadsheet) can be shared between the parent bot and a child bot. In Automation 360, you can close a shared session from the child bot.

Note: When you use more than one spreadsheet to automate an operation, you must use different session names for each spreadsheet. If you want to use the same session name to automate all the spreadsheets, you must first close the session of one spreadsheet before using the same session name for another spreadsheet.

- In Enterprise 11 or Enterprise 10, when you try to save a read-only spreadsheet, an error is not displayed. However, in Automation 360, when you try to save a read-only spreadsheet, an error message that the workbook cannot be saved is displayed.

Workaround: Ensure that you have the **Edit** access for the file and retry the operation. If the issue persists, contact your system administrator. The **Write** action is not allowed on such files.

File and Folder

All commands of **File/Folder** have been split into **File** and **Folder** packages.

The following **File** related actions have changed in Automation 360:

Enterprise 11 or Enterprise 10 commands	Equivalent Automation 360 actions and packages
Copy Files	Copy action of the File package

Enterprise 11 or Enterprise 10 commands	Equivalent Automation 360 actions and packages
Create Files	Create action of the File package
Create File Shortcut	Create shortcut action of the File package
Delete Files	Delete action of the File package
Open Files	Open action of the File package
Print Files	Print action of the File package
Rename Files	Rename action of the File package
Unzip Files	Unzip action of the Folder package
Zip Files	Zip action of the Folder package

The following **Folder** related actions have changed in Automation 360:

Enterprise 11 or Enterprise 10 commands	Equivalent Automation 360 actions and packages
Copy Folder	Copy action of the Folder package
Create Folder	Create action of the Folder package
Create Folder Shortcut	Create shortcut action of the Folder package
Delete Folder	Delete action of the Folder package
Open Folder	Open action of the Folder package
Rename Folder	Rename action of the Folder package

See [File package](#) on page 2513 and [Folder package](#) on page 2523.

Enterprise 11 bots can use regular expressions in the **Copy Files**, **Delete Files**, **Print Multiple Files**, **Rename Files**, and **Zip Files** commands to search for files on which you want to perform an operation. The equivalent actions in Automation 360 too can use regular expressions to search for files on which you want to perform an operation.

FTP/SFTP

All commands of **FTP/SFTP** are migrated to equivalent Automation 360 actions of the **FTP/SFTP** package. There is no change in behavior or command name.

Get files and **Get folder** actions return runtime errors if they have additional criteria based on dates, which are provided as variables that have values in a format other than MM/DD/YYYY. You must fix such instances after bot migration. During the migration process, these two actions also add extra error handlers in the migrated bots when filtering is done on datetime.

In Enterprise 11, if a bot was using the FTP / SFTP commands, after migration, the respective FTP / SFTP actions are assigned a local session in Automation 360.

If/Else

Variables containing string condition

" If " with the following operators is migrated as a String condition in Automation 360:

- =
- < >
- Include
- Does not Include

For the **Random** variable of the **String** subtype, Automation 360 adds the **Generate random string** action of the **String** package to generate a random string above the If condition and assigns the value to the respective migrated variable.

Variable containing number condition

" If " with the following operators is migrated as a Number condition in Automation 360:

- >=
- <=
- >
- <

For the **Random** variable of the **Number** subtype, Automation 360 adds the **Assign a random number** action of the **Number** package to generate a random string above the If condition and assigns the value to the respective migrated variable.

Value type variable containing date

The system tries to evaluate if a condition on a variable has a date value. If found, it migrates If with the Datetime condition in Automation 360. Otherwise, the system migrates it as a string or number condition based on the operator used. In those cases, you must change it to a date condition after the bot migration if a date operation is involved.

Additionally, you might also have to change the date format to one that is compatible with your data. The default format used to convert a date to string is `MM/dd/yyyy HH:mm:ss`.

See [If package](#) on page 2619.

Image Recognition

The **If** command with the **Image Recognition** condition in Enterprise 10/Enterprise 11 can become one of the following actions in Automation 360 based on the selected Enterprise 10/ options:

- If > **Image file is found in image file** – Created if Image1 has the **From File** option selected and Image2 has the **From File** option selected in Enterprise 10 or Enterprise 11.
- If > **Image file is found in a window** – Created if Image1 has the **From File** option selected and Image2 has the **From Window** option selected in Enterprise 10 or Enterprise 11.
- If > **Window is found in image file** – Created if Image1 has the **From Window** option selected and Image2 has the **From File** option selected in Enterprise 10 or Enterprise 11.
- If > **Window is found in a window** – Created if Image1 has the **From Window** option selected and Image2 has the **From Window** option selected in Enterprise 10 or Enterprise 11.

See [If package](#) on page 2619.

Important: If a condition involves date, under certain situation, you must change the migrated information to a date condition after the bot migration.

The table below shows how various conditions are migrated to the respective Automation 360 conditions.

Enterprise 11 or Enterprise 10 commands	Equivalent Automation 360 actions and packages
Task Successful or Task Unsuccessful	Migrated to the equivalent If condition of Task Bot package.
Script Successful or Script Unsuccessful	Script successful/unsuccessful is migrated to respective If > Script Successful and If > Script Unsuccessful actions of the Legacy automation package.
Object Properties	Migrated to the If > Condition > Window Exists and Object conditions of the Recorder package.
Application Running or Application Not Running	Migrated to the equivalent If condition of the Application package.
File Exists, File Does Not Exist, File Date, File Size	Migrated to the equivalent If condition of the File package.
Folder Exists or Folder Does Not Exist	Migrated to the equivalent If condition of the Folder package.
Ping Successful Or Ping Unsuccessful	Migrated to the equivalent If condition of the Ping package.
Web Control Exists or Web Control Does Not Exist	Migrated to the equivalent If condition of the Legacy Automation package.

Enterprise 11 or Enterprise 10 commands	Equivalent Automation 360 actions and packages
Window Exists/Window Does Not Exist	<p>The following commands configured with the "Show child and hidden windows" option selected are migrated to the Automation 360 Legacy Automation package:</p> <ul style="list-style-type: none"> • If > Condition > Window Exists • If > Condition > Window Does Not Exist
Logic Successful/Logic Unsuccessful	<p>The If command is migrated to If > Task Successful and If > Task Unsuccessful respectively.</p> <p>The Else If command is migrated to Else If > Task Successful and Else If > Task Unsuccessful respectively.</p> <p>Bots that use the Logic Successful or Logic Unsuccessful condition and return an output variable to the parent bot, can be migrated to Automation 360.</p> <p>Bots that use Credential Vault variables are passed from one MetaBot Logic to another MetaBot Logic for both IF > Logic Successful and IF > Logic Unsuccessful commands.</p> <p>You can migrate a MetaBot with a Logic (parent) that includes a renamed Logic (child). If a child Logic is renamed after it is mapped to the parent Logic, this parent Logic mapping is migrated with the new name.</p> <p>Applies from v.25: Enterprise 11 or Enterprise 10 bots that use the If > Logic Successful or If > Logic Unsuccessful command are migrated when a referred MetaBot Logic name is renamed or has changed the relative path after mapping. If a MetaBot Logic is renamed or changed the path after being mapped in the TaskBots, then the TaskBots are now migrated with the new MetaBot Logic name or path.</p> <p>For information about how a bot is migrated if the Logic Successful command passes a Credential Vault variable, see Run Logic on page 1582.</p>
Service is running/Service is not running	<p>The If command is migrated to If > Service is running and If > Service is not running.</p> <p>The ElseIf command is migrated to Else If > Service is running and Else If > Service is not running.</p>

Image Recognition

The **Image Recognition** command is split into **Find file image inside window image** and **Find window image inside another window image** actions in Automation 360.

In Automation 360, **Advanced** option is used as the default comparison mode. The other comparison modes (such as **Gray-scale**, **Normal** and **Monochrome**) that existed in Enterprise 10 and Enterprise 11, are hidden in Automation 360 but match the behavior with Automation 360

after migration. The migration process maps the information automatically and does not impact related bots.

When you run a migrated bot with Image Recognition that contains an If, IF/ELSE, or Loop action, an error displays when the window does not exist.

Migration of bots with the **Image Recognition** command might fail if the command is using any file type other than the following:

- .jpg
- .jpeg
- .jpe
- .jfif
- .bmp
- .gif

See [Image Recognition package](#) on page 2626.

Insert Keystrokes

This command is called **Simulate Keystrokes** in Automation 360. The following keystroke conventions have changed:

Enterprise 11 or Enterprise 10 commands	Equivalent Automation 360 actions and packages
[PAGE UP]	[PAGE-UP]
[NUM LOCK]	[NUM-LOCK]
[SCROLL LOCK]	[SCROLL-LOCK]
[PAGE DOWN]	[PAGE-DOWN]
[CAPS LOCK]	[CAPS-LOCK]
[UP ARROW]	[UP-ARROW]
[LEFT ARROW]	[LEFT-ARROW]
[RIGHT CLICK]	[MENU]
[RIGHT ARROW]	[RIGHT-ARROW]
[DOWN ARROW]	[DOWN-ARROW]
[ALT GR DOWN]	[ALT-GR DOWN]
[ALT GR UP]	[ALT-GR UP]
[\$]	[DOLLAR]

In Enterprise 11 or Enterprise 10, the delay time is divided by the total characters and applied between each character stroke. In Automation 360, the delay you specify applies to the time between each keystroke.

The legacy **Get keystrokes delay** action in Automation 360 supports migrated bots that include the **Simulate keystrokes** action. The legacy **Get keystrokes delay** action matches the duration of delay defined in Enterprise 11 bots for the Insert Keystrokes command and simulates the same

value in Automation 360 for the **Simulate keystrokes** action. After migration, if keystrokes are typed faster (for example, keystrokes used to perform shortcuts in Microsoft 365 Excel), add the **Delay** action after the **Simulate keystrokes** action to ensure that the bots run without issues. The legacy **Get keystrokes delay** action provides similar delay, as seen in Enterprise 11, in the migrated bots to ensure that the migrated bots produce the same output as seen in Enterprise 11. However, this change leads to the command being split into multiple lines after migration.

If the **Encrypt Keystrokes** option is selected in Enterprise 11 or Enterprise 10 bots, after migration the value is stored in the Credential Vault. The migration process creates a locker in the Credential Vault with the following attributes:

- Name of the locker created in Automation 360 is name `AAE_<folder_name>` (folder_name is the folder in which the migrated bot is available).

The migrated bot uses this locker. Users who have any permission for the folder that contains the bot can access the locker. The migration run-as user must have the **Create standard attributes for a credential** permission.

- A locker contains only one credential for each bot. The name of the credential created is `Keystrokes_<bot_name>` for the Task Bots and `Keystrokes_<Metabot_name>_<Logic_name>` for MetaBots.
- Attributes for the locker are created with the name `Encrypted_keystrokes`.

If a locker, credential, or attribute with the same name is already available, the system appends the locker name, credential name, and attribute name with a numeric value. For example, `AAE_<folder_name>_1`, `Keystrokes_<bot_name>_1`, and `Encrypted_keystrokes_1` respectively. If name of the locker, credential, or attribute is longer than 50 characters, the system trims the characters at the end to limit the name to 50 characters.

Note: You cannot migrate a bot that is available on the local device and the **Encrypt Keystrokes** option is selected.

See [Simulate keystrokes package](#) on page 2941.

Launch Website

This command is migrated to the **Open** action of the **Browser** package in Automation 360.

Commands with the **Edge** or **Override default browser** option deselected in the legacy product is automatically changed to use **Default Browser** after migration.

Enterprise 11 bots that open a website in a new window of all browsers supported by Automation 360 can be migrated. The Enterprise 11 bots that open the website in a new or an existing tab of the Internet Explorer browser can be migrated to Automation 360. The equivalent option to open the website in a new window, tab, or an existing tab is selected in the migrated bots.

Note: The support for the Microsoft Edge Legacy browser is no longer available, whereas the Microsoft Edge Chromium browser is supported. As a result, you cannot create new bots using the Microsoft Edge Legacy browser. However, the existing bots created in Microsoft Edge Legacy browser can be updated using other supported browsers such as Google Chrome or Microsoft Edge Chromium browser.

See [Browser package](#) on page 2348.

Important: If you have created bots in Enterprise 11 or Enterprise 10 using the Microsoft Edge browser, you must first port these bots to another browser, and then you can migrate them.

Log To File

This command is migrated to **Log to file** action in Automation 360.

See [Log To File package](#) on page 2676.

Loop

The following table shows how the Loop command is migrated to the equivalent Automation 360 actions and packages:

Enterprise 11 or Enterprise 10 commands	Equivalent Automation 360 actions and packages
Loop command with the Times option selected	Loop action of the Loop package with the For n times option selected.
Loop command with the List option selected	Loop action of the Loop package with the For n times option selected.
Loop command with the Each Row in an Excel Dataset option selected	Loop action of the Loop package with the For each row in worksheet option selected. The system variable \$Excel Column\$ used inside the loop is now a user defined variable specified in the same iterator.
Loop command with the Each Row In A SQL Query Dataset option selected	Loop action of the Loop package with the For each row in a SQL query Dataset option selected. The system variable \$Dataset Column\$ used inside the loop is now a user defined variable specified in the same iterator.
Loop command with the Each File In A Folder option selected	Loop action of the Loop package with the For each file in a folder option selected. The system variables \$Filename\$ and \$Extension\$ are now keys name and extension of a dictionary variable specified in the same iterator. In Enterprise 11, the bots does not encounter an error if the folder does not exist. In Automation 360, the migrated bots encounter an error if the folder does not exist.
Loop command with the Each Folder In A Folder option selected	Loop action of the Loop package with the For each folder in a folder option selected. The system variable \$Folder name\$ used inside the loop is now a user defined variable specified in the same iterator. In Enterprise 11, the bots does not encounter an error if the folder does not exist. In Automation 360, the migrated bots encounter an error if the folder does not exist.

Enterprise 11 or Enterprise 10 commands	Equivalent Automation 360 actions and packages
Loop command with the Each Row In A CSV/Text File option selected	Loop action of the Loop package with the For each row in CSV/TXT option selected. The system variable \$Filedata Colum\$ used inside the loop is now a user defined variable specified in the same iterator.
Loop command with the Each Email Message On Mail Server option selected	Loop action of the Loop package with the For each mail in mailbox option selected. The system variables \$Email Cc\$, \$Email From\$, \$Email Message\$, \$Email Received Date\$, \$Email Received Time\$, \$Email Subject\$, and \$Email To\$ are now keys emailCc, emailFrom, emailMessage, emailReceivedDate, emailReceivedTime, emailSubject, and emailTo respectively of a dictionary variable specified in the same iterator.
Loop command with the Each Node In An XML Database option selected	Loop action of the Loop package with the For each node in an XML database option selected. The system variable \$XML Data Node\$ used inside the loop is now a user defined variable specified in the same iterator.

The following commands configured with the **Show child and hidden windows** option selected are migrated to the Automation 360 **Legacy Automation** package:

- **Loop > Condition > Window Exists**
- **Loop > Condition > Window Does Not Exist**

Variables containing string condition

" If " with the following operators is migrated as a String condition in Automation 360:

- =
- < >
- Include
- Does not Include

For the **Random** variable of the **String** sub-type, Automation 360 adds the **Generate random string** action of the **String** package to generate a random string above the If condition and assigns the value to the respective migrated variable.

Variable containing number condition

" If " with the following operators is migrated as a Number condition in Automation 360:

- >=
- <=
- >
- <

Variable containing date conditions	<p>For the Random variable of the Number sub-type, Automation 360 adds the Assign a random number action of the Number package to generate a random string above the If condition and assigns the value to the respective migrated variable.</p>
List type variable	<p>The system tries to evaluate if a condition on a variable has a date value. If found, it migrates IF with the Datetime condition in Automation 360. Otherwise, the system migrates it as a string or number condition based on the operator used. In those cases, you must change it to a date condition after the bot migration if a date operation is involved.</p> <p>Additionally, you might also need to change the date format to one that is compatible with your data. The default format used to convert a date to string is MM/dd/yyyy HH:mm:ss.</p>
Web Control Exists or Web Control Does Not Exist	<p>Loop on a variable condition of type List is migrated to either String or Number condition based on the operator used in the condition. The system uses the list index to validate the condition.</p> <p>Loop with Web control exists and Web control does not exist conditions are migrated to Loop > While conditions Web control exists and Web control does not exist of the Legacy Automation package respectively.</p>

See the following table to understand how various conditions are migrated to the respective Automation 360 conditions.

Enterprise 11 or Enterprise 10 conditions	Equivalent Automation 360 actions and packages
Web Control Exists or Web Control Does Not Exist	Migrated to the equivalent If condition of the Legacy Support package.
Object Properties	Migrated to the Object condition of the Recorder package.
Application Running or Application Not Running	Migrated to the equivalent If condition of the Application package.
File Exists, File Does Not Exist, File Date, File Size	Migrated to the equivalent If condition of the File package.
Folder Exists or Folder Does Not Exist	Migrated to the equivalent If condition of the Folder package.
Ping Successful Or Ping Unsuccessful	Migrated to the equivalent If condition of the Ping package.

Enterprise 11 or Enterprise 10 conditions	Equivalent Automation 360 actions and packages
Service is running or Service is not running	Migrated to the equivalent If condition of the Service package.

The following table shows the Loop commands supported for migration and their respective mappings in Automation 360.

Enterprise 11 or Enterprise 10 commands	Equivalent Automation 360 actions and packages
Exit Loop	Break
Continue	

Message Box

This command is migrated to **Message box** action in Automation 360.

See [Message box package](#) on page 2691.

Object Cloning

This command is migrated to the **Recorder** package > **Capture** action in Automation 360.

Migration is supported for applications using the following technologies (including when they are within a Citrix environment):

- MSAA (Standard desktop technology)
- Google Chrome browser
- Internet Explorer browser
- Java desktop
- Web Java
- UI Automation (advanced)
- Firefox browser (object based on HTML technology only)
- Microsoft Silverlight version 5

The following table lists the behavioral differences between Enterprise 11 or Enterprise 10 and Automation 360:

Enterprise 11 or Enterprise 10 behavior	Automation 360 behavior
GetAllChildrenName and GetAllChildrenValue commands return string type variable values	The equivalent actions in Automation 360 return list values. The migration process joins the list values and stores them into a string variable to maintain consistent bot behaviors across releases.
In Enterprise 11, the command is used to capture the control in an image	The entire window image is captured with the control highlighted using a red rectangle

Object Cloning with the **Export to CSV** action in Enterprise 10/Enterprise 11 is migrated into the following packages/actions combinations because the action does not exist in Automation 360:

- The **Capture** action saves the captured data into a table variable.
- The **Write to file** action of the **Data table** package is then used to save the data from the table variable to the CSV file.

The window title is copied from the source command to the destination action.

The X, Y coordinates and window title are also migrated to Automation 360.

The **Coordinate** and **Image** execution or play modes from Enterprise 11 are migrated as the following actions:

Play mode as coordinates:

Play mode as coordinates

Mouse click actions: The Click, Right Click, Left Click, Middle Click, and Double Click actions are migrated in the Mouse: Click action as a combination of Button and Events. The corresponding mouse buttons with events are migrated as shown:

- Click changes to Left Button-Click
- Right Click changes to Right Button-Click
- Left Click changes to Left Button-Click
- Middle Click changes to Middle Button-Click
- Double Click changes to Left Button Double-Click

Get Text

The Get Text action is migrated as a combination of actions that include Mouse: Click with Left Button-Click, Clipboard: Clear, Delay, and Simulate keystrokes.

Set Text

The Set Text action is migrated as a combination of actions that include Mouse: Click with Left Button-Click, Clipboard: Clear, Delay, and Simulate keystrokes.

The following table shows the property name changes for the controls and objects captured using **Object Cloning**. The migration process automatically maps the name changes. However, if a property is used inside a variable, you must manually enter the new name in the variable.

Enterprise 11 or Enterprise 10 property name	Automation 360 property name
Object ID	ID
Type	Control Type
State(s)	States
Action	DefaultAction
Bold	IsBold
Italic	IsItalic
Underline	IsUnderline

Enterprise 11 or Enterprise 10 property name	Automation 360 property name
Strike Through	IsStrikethrough
Super Script	IsSuperscript
Sub Script	IsSubscript
Background Color	BackgroundColor
Foreground Color	ForegroundColor
Font	FontFamily
Font Size	FontSize
First Line Indent	FirstLineIndent
Left Indent	LeftIndent
Right Indent	RightIndent
Line Spacing	LineSpacing
Space Above	SpaceAbove
Space Below	SpaceBelow
Item Name	ItemName
Item Value	ItemValue
Animated	IsAnimated
CapStyle	Cap
Font Weight	FontWeight
Horizontal Alignment	HorizontalAlignment
Hidden	IsHidden
Read Only	IsReadOnly
Bottom Margin	BottomMargin
Left Margin	LeftMargin
TopMargin	TopMargin
Right Margin	RightMargin
Overline Color	OverlineColor
Strikethrough Color	StrikethroughColor
Tabs Style	Tabs
Text Flow Direction	TextFlowDirection
Underline Color	UnderlineColor
HTML ID	IEID
HTML Name	IEName
HTML Alt	IEAlt

Enterprise 11 or Enterprise 10 property name	Automation 360 property name
HTML Tag	IEtag
HTML Class	IEClass
HTML InnerText	IEInnerText
HTML SourceIndex	IESourceIndex
HTML HRef	IEHref
HTML Value	IEValue
HTML Type	IEType
HTML ClassId	IEClassId
HTML Title	IETitle
HTML Tag Index	IEtagIndex
HTML HasFrame	IEHasFrame
HTML FrameID	IEFrameID
HTML Frame Name	IEFrameName
HTML Frame Src	IEFrameSrc
HTML Width	IEWidth
HTML Top	IETop
HTML Left	IELeft
HTML Height	IEHeight
HTML Frame Path	IEFramePath
Item Collection	ItemCollection
OCR Engine	OCREngine
OCR Occurrence	OCROccurrence
Row Control Type	RowControlType
GetSelectedIndex	GetSelectedIndex
GetSelectedText	GetSelectedText

- The migration process truncates the data to 64 KB if the Enterprise 11 or Enterprise 10 bots that use an object and any properties of that object contain data larger than 64 KB. This is to ensure that these bots do not encounter an error after migration.
- In Enterprise 11, you can remove the control type of an object from the search criteria, but this option is not available in Automation 360. In Automation 360, the capture action executes only on objects with the same control types. If you want to use this action on objects with different control types, you must capture these control types in separate capture actions.

See [Using the Capture action](#) on page 2818.

OCR

All commands of **OCR** are migrated to equivalent Automation 360 actions of the **OCR** package. There is no change in behavior or command name.

In Enterprise 11, **ABBYY, MODI, TESSERACT, TOCR** OCR options are available as OCR engines. In Automation 360, by default only **ABBY** OCR engine is used.

See [OCR package](#) on page 2699.

Open Program/File

This command is migrated to the **Open program/file** action of the **Application** package. In Enterprise 10/Enterprise 11, this command does not throw an error if you provide an incorrect value in the **Start In** field. Automation 360 validates the value entered for the same field and throws an error during bot execution.

See [Application package](#) on page 2326.

Important: Users must change the bot accordingly if they want to continue even if the Start In value field is incorrect.

PDF integration

The following table shows the PDF integration command and their equivalent actions and packages in Automation 360:

Enterprise 11 or Enterprise 10 commands	Equivalent Automation 360 actions and packages
Merge Document	Merge document
PDF to Image	Extract image
Extract Form Fields	Extract field
Extract Text	Extract text
Split Documents	Split documents
Encrypt Document	Encrypt document
Decrypt Document	Decrypt document

If the Enterprise 11 bot uses the **Extract Form Fields** command and stores values in the Credential Vault, the migration process migrates these values in the Automation 360 Credential Vault.

The output of an Enterprise 11 bot is mapped with multiple variables in the equivalent actions of the PDF package after that bot is migrated to Automation 360. This reduces the number of actions in the migrated bot because a separate action is no longer required to map output to a variable.

See [PDF package](#) on page 2763.

PGP

All commands of **PGP** are migrated to equivalent Automation 360 actions of the **PGP** package. There is no change in behavior or command name.

See [PGP package](#) on page 2772.

Play Sound

All commands of Play Sound are migrated to its equivalent actions of the **Sound** package in Automation 360.

Automation 360 supports only .mp3 and .wav file types in Play media file action.

See [Play Sound package](#) on page 2775.

Printer

Default Printer, **Remove Printer**, and **Select Default Printer** are migrated to the equivalent actions of the **Printer** package in Automation 360.

See [Printer package](#) on page 2775.

Prompt

All commands of **Prompt** are migrated to equivalent Automation 360 actions of the **Prompt** package.

The following table shows commands that can be migrated with name changes.

Enterprise 11 or Enterprise 10 commands	Equivalent Automation 360 actions and packages
Prompt For Value	Converts to the For value action. In addition, Simulate keystroke action is added below the For value action to perform the keystrokes on the specific window title. This is to retain the execution behavior of old bots.
Prompt for File	For file
Prompt for Folder	For folder
Prompt For Yes/No	For yes/no

See [Prompt package](#) on page 2787.

Read from CSV/Text

The **Read from CSV/Text** is converted to **Open**, **Read**, and **Close** actions in the Automation 360 **CSV/TXT** package.

If your Enterprise 10/Enterprise 11 bot is using a variable as a session name and the **Loop** action used to read all rows of the **CSV/TXT** is using a hard-coded session name instead of a variable, then you must review the migrated bot and set the output variable of the **CSV/TXT > Read** action in the respective loop. Otherwise, you will get a UI error when you edit the Automation 360 bot.

In Automation 360, if the CSV/TXT file is not present in the specified file path, the bot returns an error message, whereas in Enterprise 11, the bot does not return such message.

Important: Review the migrated bot and set the output variable of the **CSV/TXT > Read** action in the respective loop.

REST Web Service

The **Save Header To** option in Enterprise 11 is migrated to Automation 360. This option enables you to store the response header in the array and dictionary variables with the response header name as key and its header value as the value of the dictionary.

In Enterprise 11, the failure response is captured by default. In Automation 360, enabling the **Capture failure response** option captures the errors and adds to the response dictionary variable. When you migrate an Enterprise 11 bot to Automation 360, the **Capture failure response** option is enabled by default to capture the failure response of the migrated bot.

The time-out value configured in Enterprise 11 to send REST request is migrated to Automation 360 as part of global values (AARestTimeOut). The default time-out value is set as 60000 ms in Automation 360. You can update this value if the REST Web Service is taking more time to receive a response.

See [REST Web Service package](#) on page 2834.

Run Logic

Run logic command is migrated to the **Run** action of the **Task Bot** package in Automation 360.

Additionally, **Error Handling** with the **Run Logic** command is migrated to the **Try and Catch** block.

- Applies from v.25: Enterprise 11 or Enterprise 10 bots that use the **Run Logic** command are migrated where a referred MetaBot Logic name is renamed or has changed the relative path after mapping. If a MetaBot Logic is renamed or changed the path after being mapped in the **TaskBots**, then the **TaskBots** are now migrated with the new MetaBot Logic name or path.

Changing the relative path is applicable in the following scenarios:

- Logic is moved from one folder to another.
 - Logic is moved from a MetaBot root-level folder to a subfolder.
 - Logic is moved from a subfolder to a folder at MetaBot root level.
 - The folder that has the Logic is renamed.
- Bots that use the **Run Logic** command that passes Credential Vault attributes from a Task Bot to a MetaBot logic can be migrated to Automation 360. The credential name and attribute name are displayed in the fields in the corresponding line of the migrated bot.
 - If you have migrated using the restored Enterprise 11 database, an equivalent locker is created in Automation 360 for the credential variables used in the Enterprise 11 bot.

- Applies from v23: Enterprise 11 or Enterprise 10 bots that use the **Run Logic** command are allowed to pass Credential Vault type variables from the parent bot to a MetaBot non-Credential Vault type variable. However, in Automation 360, Credential Vault variables are passed only to credential type variables (and not to non-Credential Vault type variable) for enhanced security. Therefore, the migration process first converts the Credential Vault type variable to the string type variable using the **Convert credential to string** action of the **Credential package** so that the migrated bot can run successfully. The string variable is then assigned to a temporary variable that is used as an input parameter in the **Task > Run** action to call the MetaBot Logic.
- Bots that use Credential Vault variables are passed from one MetaBot Logic to another MetaBot Logic for the **Begin Error Handling > Run Logic** command.
- When you perform a **Begin Error Handling > Run Logic** command, you can migrate a MetaBot with a Logic (parent) that includes a renamed Logic (child). If a child Logic is renamed after it is mapped to the parent Logic, this parent Logic mapping is migrated with the new name.

Choose one of the following options to run the migrated bots successfully:

- Option 1: Pass the credential type variables.
 1. Create a credential type variable in the child bots as input variables.
 2. In the **Run** action of the Task Bot package of the parent bot, update the input value fields to use the Credential Vault attributes for the credential type variable created for the child bot (corresponding to MetaBot logic).
- Option 2: Pass the credential values as a global value.
 1. Create the Global value in Automation 360 for the credentials use in the **Run Logic** command in Enterprise 11.
 2. In the **Run** action of the Task Bot package of the parent bot, update the Input value fields to use the Global values for the credential type variable created for the child bot (corresponding to MetaBot logic).

If you have not used the restored Enterprise 11 database when installing Automation 360, you must first create the required locker for the credential variables used in the Enterprise 11 bot, before performing the preceding steps.

Note: Automation 360 provides enhanced security by allowing you to assign Credential Vault attributes only to the credential type variables. This restricts any nonsecure handling of Credential Vault attributes where they might have been assigned to non-credential type variables.

Run Script

The **Run Script** command is migrated to the **Run Script** action of the **Legacy automation** package.

When you use the **Legacy automation** package with the **Run Script** action after migration, you might run into issues in some scenarios, so review the cause and how to resolve the issue:

- Cause: In the **Run Script action > Input Parameters** field, if the value of the argument (passed by **String > Assign action**) contains double quotation marks followed by a backslash at the

end of the argument and the variable value contains a space, the string breaks where the first space occurs (this is due to upgrade changes in openJDK).

- Example: Consider a folder path as the argument value that is passed using **String > Assign action**, "\\fwus129ns.ny.fw.gs.com\mahatb\home\My Documents\Test Adhoc Request\". When you migrate this Enterprise 11 bot to Automation 360, this single argument value is considered as four different argument values in Automation 360, as follows:
 - \\fwus129ns.ny.fw.gs.com\mahatb\home\My
 - Documents\Test
 - Adhoc
 - Request\
- Solution: Edit the Enterprise 11 bot and remove the double quotation marks in the variable value in **String > Assign action**.

SAP Integration

This command is migrated to the Recorder package > **Capture** action in Automation 360. All object properties in the Enterprise 11 bots are mapped with the equivalent properties in the migrated bots.

Note: If the Enterprise 11 bot with the SAP Integration command is using SAP GUI 740 or earlier versions, perform additional steps in the Bot Agent machine to run the migrated bot successfully in Automation 360. For more information, see [Failed to capture SAP application using SAP GUI 740 \(A-People login required\)](#).

If you run migrated bots with the SAP GUI option selected but the SAP GUI window is closed, an exception error is displayed. This occurs because, the Recorder package uses the **Window** title during runtime and, in Automation 360, SAP Integration is migrated to Recorder package.

The following table provides a list of SAP objects and the actions that can be migrated to Automation 360.

Object	Action
Text box	Set Text, Append Text, Left Click, Right Click, Double Click
Combo box	Select Item By Text, Select Item By Index, Get Total Items, Get Selected Item Text, Get Selected Item Key, Get Property, Set Focus, Left Click, Right Click, Double Click
Check box	Check, Uncheck, Toggle, Get Status, Get Property, Set Focus, Left Click, Right Click, Double Click
Button	Click, Get Property, Left Click, Right Click, Double Click
Radio button	Select, Get Status, Get Property, Set Focus, Left Click, Right Click, Double Click
Menu bar	Select Item By Text, Get Property, Set Focus, Left Click, Right Click, Double Click

Object	Action
Tree	Get Property, Set Focus, Left Click, Right Click, Double Click, Get total items, Get selected index, Get selected text, Select item by index, Select item by text
Label	Click, Get Property, Set Focus, Left Click, Right Click, Double Click
Tab	Get Property, Set Focus, Left Click, Right Click, Double Click, Get total items, Get selected index, Get selected text, Select item by index, Select item by text
Rest of the control (It includes controls such as: GuiMainWindow, GuiBox, GuiUserArea, GuiTitlebar, and GuiStatusbar)	Get Property, Set Focus, Left Click, Right Click, Double Click

The following table shows the actions performed on the main window object and their equivalent actions in Automation 360:

Enterprise 11 action	Equivalent Automation 360 action
Activate Window	Activate action of the Window package.
Close Window	Close action of the Window package.
Execute Script	Append SAP session and Run function actions of the Legacy Automation package.
Maximize Window	Maximize action of the Window package
Restore Window	Restore action of the Window package

SAP commands that support BAPI features in Enterprise 11 are migrated to equivalent actions of the SAP BAPI package in Automation 360.

The following table shows the Enterprise 11 command and its equivalent action in Automation 360:

Enterprise 11 command	Automation 360 action
Connect	SAP BAPI > Connect You must create the JcoDllPath and JcoJarPath global values. Update the JcoJarPath global value with the location of the SAP Java connector package and the JcoDllPath with the location of the SAP Java connector DLL.
Create Function	SAP BAPI > Create function
Get Data command with the Field option selected	SAP BAPI > Get field

Enterprise 11 command	Automation 360 action
Get Data command with the Table option selected	SAP BAPI > Get table
Get Data command with the Structure option selected	SAP BAPI > Get structure
Set Data command when the Fields, Table, or Structure option is selected	SAP BAPI > Set field
Invoke Function	SAP BAPI > Run function
Run standard workflow	SAP BAPI > Run standard workflow
Run custom workflow	SAP BAPI > Run custom workflow

Send Email

In Enterprise 10/Enterprise 11, the Send Email command uses user-specific email settings stored as credential attributes within the system locker. When the first bot is migrated, we create a custom locker called AAE_Email and add the AAE_EmailSettings credential with the Username and Password attributes to it. Additionally, we create Global Values for the non-credential attributes, such as Server host, port, SSL and authentication, which correspond to the same Email Settings. Enterprise 10/Enterprise 11 Email Settings credentials are split into Credential Variable and Global Values in Automation 360, so during the migration process, email settings are migrated as follows:

Enterprise 10/Enterprise 11 Email Settings	Automation 360 Email Settings	Automation 360 Storage Type
Host	AAE_EmailSettings_host Global Value of type String	
Port	AAE_EmailSettings_port Global Value of type Number	
Use secure connection (SSL/TLS)	AAE_EmailSettings_ssl Global Value of type Boolean	
My server requires authentication	AAE_EmailSettings_auth Global Value of type Boolean	
Username	userName Credential attribute within AAE_EmailSettings credential assigned to AAE_Email locker	
Password	password Credential attribute within AAE_EmailSettings credential assigned to AAE_Email locker	

Services

All commands of **Services** are migrated to equivalent Automation 360 actions of the **Service** package. There is no change in behavior or command name.

SOAP Web Service

This package behaves the same in Automation 360.

If a SOAP web service is configured to call REST APIs, then we migrate them to the REST web service action instead of the SOAP web service action. Based on additional XML operations, we add actions from the **XML** package to make sure the migrated bot gives same result as the legacy bot.

The time-out value configured in Enterprise 11 to send SOAP request is migrated to Automation 360 as part of global values (AASoapTimeOut). The default time-out value is set as 60000 ms in Automation 360. You can update this value if the SOAP Web Service is taking more time to receive a response.

[Example of using the SOAP web service action](#) on page 3097

Enterprise 11 provides options to select the **URI type for execution** such as **Default**, **Static**, and **Dynamic**. However, in Automation 360, no option is available to select the URI type for execution. The Enterprise 11 URI types are migrated in Automation 360 as follows:

- Default and Static: If your Enterprise 11 bot is configured with the **Default** or **Static** URI type, it is migrated as static and the **Address location** field is automatically populated.
- Dynamic: If your Enterprise 11 bot is configured with the **Dynamic** URI type, it is migrated as dynamic and the **Address location** field is empty.

See [SOAP Web Service package](#) on page 2955.

String Operation

The Enterprise 11 or Enterprise 10 String Operation command is migrated to equivalent actions of the String package.

The following table shows the String Operation commands and their equivalent actions in Automation 360.

Enterprise 11 or Enterprise 10 commands	Equivalent Automation 360 actions and packages
Before-After	Extract
Compare	Compare
Find	Find
Length	Length
Lower Case	Lowercase
Replace	Replace
Reverse	Reverse

Enterprise 11 or Enterprise 10 commands	Equivalent Automation 360 actions and packages
Split	Split
Substring	Substring
Trim	Trim
Upper Case	Uppercase

In Enterprise 11, if you are using carriage return (CR) (\r) in regular expression in the String Find command, after migration, the output displayed in Automation 360 is different from the output in Enterprise 11.

Workaround: In Automation 360, use \x|\R instead of \r for carriage return.

In Enterprise 11, both carriage return (CR) and newline (LF) were enumerated to calculate the total length of String Operation. However, in Automation 360, only newline (LF) is considered for the length of String Operation. Hence, the length count in the resulting output in Automation 360 is lesser.

Enterprise 11 bots can use regular expressions in the **Find** and **Replace** commands to search for the string on which you want to perform an operation. The equivalent actions in Automation 360 too can use regular expressions to search for the string on which you want to perform an operation.

In Enterprise 11, the system considers the new line character (/n) used in the variable when you use the **Find** and **Replace** commands. However, in Automation 360, the system does not consider the new line character when you use the **Find** and **Replace** commands.

When you migrate a bot to Automation 360 with the string operation set to **Before** or **After** action, the output is retrieved correctly and the operation is successful. The matching output is displayed even if no characters are present before the matched string. In Enterprise 11, bots with **Before** or **After** action do not retrieve output correctly and therefore retrieve the source string itself. If no characters are present before the matched string, the output is displayed as no match is found.

Example:

```
Drag Before/After Action → (Inputs : [Source = (ABCZ)] → [Before = Z] →
[assign to Prompt-assign] → Output : Empty(""))
```

```
Drag Before/After Action → (Inputs : [Source = (ZABC)] → [After = Z] →
[assign to Prompt-assign] → Output : ZABC
```

System

Lock computer, **Logoff**, **Restart**, and **Shutdown** actions are migrated to the equivalent actions of the **System** package in Automation 360.

See [System package](#) on page 2976.

Task

The following table shows the different commands that are migrated to the respective actions of the Automation 360 **Task Bot** package.

Enterprise 11 or Enterprise 10 commands	Equivalent Automation 360 actions and packages
Pause	Pause
Stop Task	Stop
Run Task	Run. The output returned by the child bots is mapped to the respective variable in the parent bots.

Terminal Emulator

Encrypt text is not supported in the **Send Text** and **Set Field** actions for Automation 360. We recommend that you use Credential Vault instead of plain text.

In Enterprise 11 and in Automation 360:

- Bots that use the following terminal model can be migrated to Automation 360:
 - VT 220 model of the VT Series terminal type
 - IBM 5555 B01 and C01 models of the TN 5250 terminal type
- A session (used to establish a connection with the terminal server) can be shared between the parent bot and a child bot. You can close a session from the child bot instead of closing the session from the parent bot.
- You can use the **Default** terminal in bots for the VT100 terminal type.
- Bots that send Japanese text using the **Send Text** command in Enterprise 11 with the **DBCS** option from the **Encoding** list and the **Japanese Shift-JIS (932)** option from the **CodePage** list selected in the **Connect** command can be migrated to Automation 360.
- Applies only to v.24 and earlier : In the Terminal Emulator, when you manually click the key in the keyboard, the main keyboard Enter is identified as {enter} in Enterprise 11, while in Automation 360, it is identified as {return}.

Automation 360 does not support legacy technology and by default supports all capabilities of Advance Technology of the Enterprise 10/Enterprise 11 bots.

The maximum index value in Automation 360 is 99999. The migration process automatically updates the value of **Field index** in the **Set Field** action to 99999 to meet the maximum value restriction. If the index value is higher than 99999 and is used in a variable, then you must change it manually.

The SSHI feature is not yet supported in Automation 360.

The **Search field** action enables you to search for field index or field name by using a text.

Bots created in Enterprise 11 no longer show the `Trying...` text after the bots are migrated to Automation 360.

See [Terminal Emulator package](#) on page 2988.

Variable Operation

The following are the operations when a value is assigned to the variable:

Value type variables

The functionality for this command has been divided into multiple packages in Automation 360.

In Enterprise 10/Enterprise 11, this command was performing assignment operations for all the supported datatypes. Automation 360 has built a dedicated **Assign** action for each data type. The migration process handles the mapping of the corrected packages and action based on the assignment that the respective variable operation is performing.

For Enterprise 11 bots that use the **Decimal configuration** option, the **To string** action of the Number package is added in the migrated bots. In Enterprise 11, the system rounds off the value based on the value specified in the **Decimal configuration** field. For example, if the value that is assigned to the variable is 13.456 and the value specified in the **Decimal configuration** field is 2, the system rounds off the value in Enterprise 11 to 13.46. In Automation 360, the value is trimmed instead of rounded off. For example, the value 13.456 will be converted to 13.45 in Automation 360.

List type variables

Operations involving on list assignments are migrated to the **Set item** of the **List** package. If the operation has a fixed value, the system creates a temporary variable and stores the fixed value in it. You can then use this temporary variable in the **Assign** action of the **List** package to save it.

Array type variables

Operations involving on array assignment is migrated to **Set value of a single cell** action of the **Datatable** package to set a value for specific rows and columns.

Dictionary type variables

Operations involving dictionary assignment is migrated to the **Put** action of the **Dictionary** package to set the value for a specific key. If the key is a combination of a variable and fix value (for example `$Dictionary(key-$id $)`), then the **String** package > **Assign** action is added to get the actual key.

System variable \$Date\$

The Enterprise 10/Enterprise 11 Variable Operation command that uses the **\$Date\$** system variable is migrated to Automation 360 by adding new date actions based on

the operation being performed using **\$Date\$**. The migration process also converts the date value to a default string format – **mm/dd/yyyy HH:mm:ss**.

Random variable of sub type string: We migrate and map this directly.

The following are the variable operations when a value of the variable is reinitialized:

List variable

For the **Variable Operations** command that reinitialize the list variable in Enterprise 10/Enterprise 11, the migration process creates a temporary list variable with new values and assign it to the destination list variable in Automation 360.

List variable declared by reading a Text file

This command is migrated to the **Import list from text file** action in the **Legacy Automation** package.

Note: In Automation 360, the bot encounters an error if the source file is empty or does not contain a key for initializing the list variable, unlike in Enterprise 10 or Enterprise 11.

Array variable declared by reading a Text file

The Array variable type is migrated as a Table variable type in Automation 360. The system uses the **CSV/TXT** package to read and load the respective data into the table variable in the bot.

Dictionary variable

The migration process creates a temporary dictionary variable to store all keys and values. Then the system uses the **Dictionary** package > **Assign** action to update the target variable with the keys and values from the temporary dictionary variable.

Dictionary variable declared by reading a Text file

The migration process addresses this use case by adding actions to read the CSV file using the **CSV/Text** package and storing the data in a table variable. Then it adds actions to perform a loop on the table variable and uses the **Dictionary** package > **Put** action to add keys and values into the dictionary variable.

Array variable declared by reading an Excel/CSV file

The migration process addresses this use case by migrating the Array variable type as a Table variable type in Automation 360. The system adds **Open**, **Get Multiple Cells**, and **Close** actions of the **Excel Advance** package and populates the table variable.

The following are the variable operations when a value of the system variable is reset:

Variable Operation (resetting system variables) The following system variables are migrated as user defined variables in Automation 360. The system adds a respective action to clear the value of the equivalent variable created in Automation 360.

- Email Cc
- Email From
- Email Message
- Email Received Date
- Email Received Time
- Email Subject
- Email To
- Error Description
- Error Line Number

Wait

Wait for window and **Wait for screen change** in Automation 360 throws an exception error if the respective window is not open/close in the specified time or the screen is not found in specified time. In these cases, the system adds try and catch block if the command was configured to stop the bot and adds the **Stop task** action in the catch block. This is to ensure that the execution behaviour of migrated bots is the same as Enterprise 10/Enterprise 11.

Because we are migrating commands with the **Stop bot** action is encapsulated with the try and catch block in Automation 360, the bot also stops if the action fails due to some other reason. During the migration process, the **Stop bot** action also adds extra error handlers in the migrated bots when the **Stop the task** option is selected.

The **Wait for window** action can have negative values for coordinates that are not supported in Automation 360. The negative values are changed to 0 during the migration process.

Web Recorder

All commands (except those mentioned below explicitly) of **Web recorder** are migrated to respective actions within the **Legacy Automation** package in Automation 360. The **Legacy Automation** package ensures that the migrated bots give the same results as Enterprise 10/Enterprise 11. However, it is not recommended to use the **Legacy Automation** package for new development.

Find broken links is migrated to **Browser > Find broken links** package. Additionally, Enterprise 10/Enterprise 11 has the "Find broken links timeout" and "Find broken links" options within the Tools > Options. Automation 360 has these options as part of the action and the timeout defaults to 10 seconds and the number of parallel threads value defaults to 10.

Download files is migrated to **Browser > Download files** package.

During the migration process, the **Extract table** action adds extra error handlers in the migrated bots when the **On error continue with next action** check box is enabled.

Window Action

All commands of Windows Actions are migrated to its equivalent actions of the Window package in Automation 360.

Enterprise 11 bots can use regular expressions in the **Get Active Window Title**, **Activate Window**, **Maximize Window**, **Minimize Window**, **Close Window**, and **Resize Window** commands to search for the window on which you want to perform an operation. The equivalent actions in Automation 360 too can use regular expressions to search for the window on which you want to perform an operation.

See [Window package](#) on page 3044.

XML

All commands of XML are migrated to its equivalent actions of the **XML** package in Automation 360.

The following command names have changed:

Enterprise 10/Enterprise 11	Automation 360
End XML session	End session
Start XML session	Start session
Delete Node/Attribute	Delete node
Update Node/Attribute	Update node
Get nodes action with the "Single Nodes" option selected	Get single node action
Get nodes action with the "Multiple Nodes" option selected	Get multiple node action

In Enterprise 11, when you set the XML command to **Get Node(s)** with the **Multiple Nodes** option selected, the **XPath Expression** returns only the last element of the matching expression. In Automation 360, the **XPath Expression** returns all the matching elements.

Enterprise 11 bots that extract nodes that contain namespaces from an XML file can be migrated to Automation 360. If you add a namespace to a node in an XML file, you must save and reload the XML file to reflect the changes.

See [XML package](#) on page 3056.

Variable mapping for migration

In migration, some variables map directly from previous product versions to Automation 360 while others behave differently or contain configuration changes.

Note: In Enterprise 11, if a bot used a variable that was followed by a space and a string that began with a dollar sign character (\$) and enclosed in parentheses, brackets, or braces, after migration, the variable field encounters an error. The error occurs because, in Automation 360, two dollar sign characters (\$\$) are required in a string to display the dollar sign. To fix this error, add another

dollar sign to the string. For example, if you are using the **prompt-assignment** variable to display a string followed by \$5 [`[$Prompt-Assignment$ ($5)]`], after migration, the variable field displays an error. To fix the error, edit the variable field to add another dollar sign, as follows: [`[$Prompt-Assignment$ ($$5)]`].

User-defined variables

In Automation 360, all variables defined in bots are created as `Use as input` and `Use as output` types during migration to exchange values between parent bots and child bots.

If variables are mapped between a parent bot and a child bot in Enterprise 11 and some of the mapped variables are not available in either the parent bot or the child bot, the migration process removes these variables. The migration process removes such variables for child bots that are migrated along with the parent bots and for child bots that are already migrated.

For information about the list of variables supported, see [Variables support](#) on page 948.

Review how the following user-defined variables are migrated.

- [Array](#)
- [Dictionary](#)
- [List](#)
- [Random](#)
- [Value](#)

Array

This section explains how **Array** variable is migrated to Automation 360. In some cases, you might have to perform some actions or ensure a few things before or after migration.

Subtype "Value"

Variables with this subtype are migrated to **Table** with all column values as **String**.

Subtype "Read from text file"

Variables with this subtype are migrated to **Table** with all column values as **String**.

The following actions are added as part of migration to configure data in the variable:

Automation 360 actions	Function
CSV/TXT > Open	Opens the file for reading.
CSV/TXT > Read	Returns the value in the Table variable.
CSV/TXT > Close	Closes the file.

Subtype "Read from database"

Variables with this subtype are migrated to the **Table** package with all column values as **String**.

The following actions are added as part of migration to configure data in the variable:

Automation 360 actions	Function
Database > Connect	Adds the Connect action with the respective connection string.
Database > Export to datatable	Adds the Export to datatable action to return the results to the datatable variable.
Database > Disconnect	Adds the Disconnect action to disconnect the database.

See also: [Database package](#) on page 2379.

Subtype "Read from Excel/CSV file"

Variables with this subtype are migrated to **Table** with all column values as **String**.

The following actions are added as part of migration to configure data in the variable:

Automation 360 actions	Function
Advance Excel > Open	Opens the file for reading.
Advance Excel > Get multiple cells	Returns the Table variable value if the All Cells or Range option is chosen in the variable declaration.
Advance Excel > Read now	Returns the Table variable value if the Entire Row option is chosen in the variable declaration.

Automation 360 actions	Function
Advance Excel > Read column	Returns the Table variable if the Entire Column option is chosen in the variable declaration. Additionally, the Assign list to datatable of list package is used to store the returned valued to the variable.
Advance Excel > Close	Closes the file.

Important: In Automation 360, an empty table variable returns a runtime error. If your migrated bot contains an empty table variable, you must resolve the issue in Automation 360.

Array variable: Input types accepted by DLL function

When the system passes an Array variable from an Enterprise 11 bot to a DLL function of a different type, the DLL function accepts the following as input types:

- UInt16[], Int16[], Int32[], Int64[], Int[], Char[], Single[], Decimal[], Float[], Double[], Boolean[], bool[], Byte[], String[], and Datetime[]
- UInt16, Int16, Int32, Int64, Int, Char, Single, Decimal, Float, Double, Boolean, bool, Byte, String, and Datetime
- List<UInt16>, List<Int16>, List<Int32>, List<Int64>, List<Int>, List<Char>, List<Single>, List<Decimal>, List<Float>, List<Double>, List<Boolean>, List<bool>, List<Byte>, List<String>, List<Date-Time>
- UInt16[,], Int16[,], Int32[,], Int64[,], Int[,], Char[,], Single[,], Decimal[,], Float[,], Double[,], Boolean[,], bool[,], Byte[,], String[,], and Datetime[,]

More information

You can migrate your Enterprise 10 or Enterprise 11 bots that include Array variables.

The following are some key behavior differences:

- The index position starts with 1 in Enterprise 10 and Enterprise 11, while the index position starts with 0 in Automation 360. For example, `$arrayVariable(1,1)$` becomes `$arrayVariable[0][0]$`
- If an array has 10 rows/columns and a loop is running more than 10 times, then Enterprise 10/Enterprise 11 returns the name of the array variable with the index position.
- In Enterprise 11, if you pass a constant string value to an array index in any command (for example `$array(field1)`, where `field1` is not a variable), the value is used as is (for example, `$array(field1)`). However, after the bot is migrated to Automation 360, a compile time error occurs if the command has a non-variable value.
- In Enterprise 11, if you pass an array variable without any index (for example `"$array$"`, `"$array() $"`, where index is missing), the value is used as is (for example, `"$array $"`, `"$array() $"`). However, after the bot is migrated to Automation 360, a compile time error occurs.

Important: If an invalid index is used to access any arrays in Enterprise 11, ensure that you resolve the bot error before or after migration.

Dictionary

This section explains how **Dictionary** variable is migrated to Automation 360. In some cases, you might have to perform some actions or ensure a few things before or after migration.

Run Logic

In Enterprise 11, when you perform a **Run Logic** operation, you can select a specific key from the Dictionary variable and map it to the required value variable.

In Automation 360, you can only map variables directly and cannot map a Dictionary(key) variable to a string.

Subtype "Value"

The system migrates these variables to the **Dictionary** type with the **String** subtype in Automation 360.

Subtype "Read from CSV file"

The migration process adds actions to read the CSV file using the **CSV/Text** package and stores the data in a table variable. The process also adds actions to perform a loop on the **Table** variable and uses the Put action of the

Dictionary variable: Input types accepted by DLL function

Dictionary package to add the key and values in the **Dictionary** variable.

When the system passes a dictionary variable from an Enterprise 11 bot to a DLL function of a different type, the DLL function accepts the following as input types: UInt16, Int16, Int32, Int64, Int, Char, Single, Decimal, Float, Double, Boolean, bool, Byte, String, and Datetime.

More information

You can migrate your Enterprise 10 or Enterprise 11 bots that include Dictionary variables.

The following table describes some key behavior differences and how they work in Automation 360:

Enterprise 10 or Enterprise 11 behavior	Automation 360 behavior
Dictionary keys are not case-sensitive in Enterprise 10 or Enterprise 11.	Dictionary keys are case-sensitive in Automation 360. To maintain the bot execution resilience, the migration process converts all dictionary keys to lowercase values. String express Lower case is used if a variable is used as a dictionary key to obtain the lowercase key name.

List

This section explains how **List** is migrated to Automation 360. In some cases, you might have to perform some actions or ensure a few things before or after migration.

Subtype "Value"

These variables are migrated to **List** with subtype **String**.

Sub-type Array

These variables are migrated to **List** with subtype **String**.

Subtype "Reading from text file"

Where a variable that is declared by reading a file is called, the **Import list from text file** action of the **Legacy automation** package is added above the action that is being migrated.

Declared as "Make Random"

The **List** variable can be declared as **Make Random** in Enterprise 10 or Enterprise 11 to return a random item from the list. The

migration process adds the new **Size** action to the **List** package to get the list size and adds the **Assign a random number** action to the **Number** package to find the random position and use it to get a random list item.

Important: In Automation 360, an empty list variable used outside a loop returns a runtime error. If your migrated bot meets this criteria, you must resolve the issue in the Automation 360 environment.

More information

- In Enterprise 10 and Enterprise 11, **List** is accessible without specifying any index. In Automation 360, you must specify the respective index to retrieve the specific value from the list.

Example: **List** variables can be accessed by index in the following way:

```
$listVariable[0]$
```

Here, 0 represents the first value in the list.

- Index position starts with 1 in Enterprise 10 or Enterprise 11, whereas it starts with 0 in Automation 360.
- Enterprise 11 behavior: In Enterprise 11, when a list with a fixed index is used, the system returns the value available in the first index of the list.

Example: For example, consider that you have a list with values 1, 2, 3, and 4, and you use `$IntList(3)$` to retrieve the value in the third index position of the list. The system returns the value available in the first index position of the list (1) instead of the specified index position (3).

Automation 360 behavior: In Automation 360, the system returns the value available in the specified index position (for the above example, it returns 3).

Behavior of migrated bots: Enterprise 11 bots that use such expressions with fixed indexes in the list and are migrated to Automation 360 return the value available in the specified index position.

- If a list has 10 items and a loop is running for more than 10 times, then Enterprise 10 or Enterprise 11 returns the first value of the list after the 10th iteration.

List variable: Input types accepted by DLL function

When the system passes a List variable from an Enterprise 11 bot to a DLL function of a different type, the DLL function accepts the following as input types:

- UInt16[], Int16[], Int32[], Int64[], Int[], Char[], Single[], Decimal[], Float[], Double[], Boolean[], bool[], Byte[], String[], and Datetime[]
- UInt16, Int16, Int32, Int64, Int, Char, Single, Decimal, Float, Double, Boolean, bool, Byte, String, and Datetime
- List<UInt16>, List<Int16>, List<Int32>, List<Int64>, List<Int>, List<Char>, List<Single>, List<Decimal>, List<Float>, List<Double>, List<Boolean>, List<bool>, List<Byte>, List<String>, List<Date-Time>
- UInt16[,], Int16[,], Int32[,], Int64[,], Int[,], Char[,], Single[,], Decimal[,], Float[,], Double[,], Boolean[,], bool[,], Byte[,], String[,], and Datetime[,]

See also: [List package](#) on page 2669.

Random

This section explains how **Random** variable is migrated to Automation 360. In some cases, you might have to perform some actions or ensure a few things before or after migration.

Subtype "Random String"

When there is a Random variable of the subtype **String**, the migration process adds the **Generate random string** action of the **String** package to generate a random string above the **If** condition and assigns the value to the respective migrated variable in Automation 360

Subtype "Random Number"

When there is a Random variable of the subtype **Number**, the migration process adds the **Assign a random number** action of the **Number** package to generate a random string above the **If** condition and assigns the value to the respective migrated variable in Automation 360.

Value

This section explains how **Value** is migrated to Automation 360. In some cases, you might have to perform some actions or ensure a few things before or after migration.

Subtype "Value"

These variables are always migrated as **String** in Automation 360, even if they have number, boolean, or datetime values in them. Expressions are used in Automation 360 to convert a string to other types if required.

Subtype "Read from text file"

To maintain the integrity of bot execution during migration, where a variable that is declared by reading a file is called, the **Import string from text file** action of the **String** package is added just above the action being migrated.

If Enterprise 11 bots contain variables that read values from a text file, then these bots are migrated using the **Read variable** action.

If a specific variable does not exist in the text file, or if the specific variable is reading a value from a file that does not exist, then Automation 360 generates an exception error.

After migration, when you run the bot that contains the **Read from file** variable, the reading occurs only once in the **Read variables** action at the start of the bot running process. If the file that the variable is trying to read gets updated while the bot is running, then the **Read file** variable is not refreshed.

More information

Bots that use value type variables within a variable can be migrated to Automation 360. For Enterprise 11 bots that use a variable within a variable in the Insert Keystrokes command, the **Evaluate value** action of the String package is added in the migrated bot

See also: [String package](#) on page 2957 | [Number package](#) on page 2697 | [Boolean package](#) on page 2343 | [Datetime package](#) on page 2397

System variables

In some cases, system variables such as Error Line Number, Error Description, and OS Name return a different value in Automation 360. Bots using these variables in a decision-making or string operation require a review after migration.

Some system variables used inside a loop are user-defined variables in the loop after migration. In some instances, the user-defined variable might require some configuration in the migrated bot.

Some system variables are migrated as actions in Automation 360. These actions are added just above the action that uses these variables.

If a variable is defined at the index position for the following system variables, you might have to resolve the migrated bots because the migration process could not determine if the variable contains an index or column name. If you do not resolve it, the bot might return a `Key not found in record` runtime error. The migration process treats the value of a variable as name; but if it is an index, you must change it accordingly.

- \$Filedata Column\$
- \$Dataset Column\$

- \$XML Data Node\$
- \$Excel Column\$

The following table provides information about the various system variables and how they are migrated to Automation 360. Some variables are part of actions, some become actions, and some are known as system variables but have syntax changes.

Note: Migrated bots do not preserve data outside of the loop for the following system variables:

- \$FolderName\$
- \$FileName\$
- \$Extension\$

System variable	How they are migrated to Automation 360
\$Day\$	Becomes \$System:Day.Number:toString\$ in Automation 360
\$FileName	After migration, the system automatically creates this variable according to the Automation 360 naming convention, to run the migrated bots successfully.
\$Error Description	After migration, the system automatically creates this variable according to the Automation 360 naming convention, to run the migrated bots successfully.
\$Error Line Number\$	After migration, the system automatically creates this variable according to the Automation 360 naming convention, to run the migrated bots successfully.
\$Extension\$	After migration, the system automatically creates this variable according to the Automation 360 naming convention, to run the migrated bots successfully.
\$Folder Name\$	After migration, the system automatically creates this variable according to the Automation 360 naming convention, to run the migrated bots successfully.
\$Month\$	Becomes \$System:Month.Number:toString\$ in Automation 360
\$Year\$	Becomes \$System:Year.Number:toString\$ in Automation 360
\$Date\$	Becomes \$System:Date\$ in Automation 360 The date format set for the variable in the Enterprise 11 or Enterprise 10 bot is stored in the AADefaultDateFormat global value.
\$Hour\$	Becomes \$System:Hour.Number:toString\$ in Automation 360
\$Minute\$	Becomes \$System:Minute.Number:toString\$ in Automation 360
\$Clipboard\$	Becomes \$System:Clipboard\$ in Automation 360
\$Machine\$	Becomes \$System:Machine\$ in Automation 360
\$MiliSecond\$	Becomes \$System:MiliSecond.Number:toString\$ in Automation 360

System variable	How they are migrated to Automation 360
\$ArrayColumns(\$arrayVariable)\$	Becomes an expression in Automation 360: \$arrayVariable.DataTable:columnCount\$
\$ArrayRows(\$arrayVariable)\$	Becomes an expression in Automation 360: \$arrayVariable.DataTable:rowCount\$
\$AAControlRoom\$	Becomes \$System:AAControlRoom\$ in Automation 360
\$RAMUsage\$	Becomes \$System:RAMUsage\$ in Automation 360
\$TotalRAM\$	Becomes \$System:TotalRAM\$ in Automation 360
\$OSName\$	Enterprise 10 or Enterprise 11 returns the Microsoft Windows 10 Pro 64-bit value. In Automation 360, this variable becomes \$System:OSName\$ and returns the Windows 10 64-bit .
\$CPUUsage\$	Becomes \$System:CPUUsage\$ in Automation 360
\$Counter\$	This system variable is deprecated in Automation 360. The migration process creates a user-defined variable type Number and modifies the bot to ensure it provides the same output as the 11.x bot. If you have used the \$Counter\$ variable in a loop, the migration process replaces the variable with the \$Condition-Counter\$ variable in the migrated bot and sets its value to 1.
\$Dataset Column\$	This system variable is now part of the For each row in a SQL query dataset iterator in Loop . The system creates a new variable in the loop and uses it inside the loop wherever \$Dataset Column\$ is present. If the variable is used outside a loop, it is converted to a record type user-defined variable and assigned to a Record action, which enables you to assign the value of the source record variable to the destination record variable. Therefore, when you run migrated bots that contain this variable, data from the last row is displayed.
\$Excel Column\$	This system variable is now part of the For each row in worksheet iterator in Loop . The system creates a new variable in the loop and uses it inside the loop wherever \$Excel Column\$ is present. If the variable is used outside a loop, it is converted to a record type user defined variable and assigned to a Record action, which enables you to assign the value of the source record variable to the destination record variable. Therefore, when you run migrated bots that contain this variable, data from the last row is displayed.
\$Extension\$ and \$FileName\$	These system variables were used in the For each file in a folder iterator of Loop . However, in Automation 360, a dictionary type variable is used to capture the extension and file name, which can be retrieved with "extension" and "name" key name respectively. Loop package on page 2679.

System variable	How they are migrated to Automation 360
\$Email\$ \$Email From\$ \$Email Message\$ \$Email Received Date\$ \$Email Received Time\$ \$Email Subject\$ \$Email To\$ \$Email Sent date\$ \$Email Sent time\$	<p>These system variables were used inside the For each mail in mail box iterator of Loop. In Automation 360, a dictionary type variable is used to capture all email values that can be retrieve with the respective keys.</p> <p>See Using dictionary variable for email properties on page 2461.</p>
\$Filedata Column\$	<p>This system variable is now part of the For each row in CSV/TXT iterator in Loop. The system creates a new variable in the loop and uses it inside the loop wherever <code>\$Filedata Column\$</code> is present.</p> <p>If the variable is used outside a loop, it is converted to a record type user defined variable and assigned to a Record action, which enables you to assign the value of the source record variable to the destination record variable. Therefore, when you run migrated bots that contain this variable, data from the last row is displayed.</p>
\$FolderName\$	<p>This system variable is used inside the For each folder in a folder iterator of Loop. In Automation 360, the value is returned to the string variable specified in the loop.</p>
\$Excel Cell Row\$	<p>This system variable is migrated to the Get row number action of the Excel package in Automation 360 and added just above the action in which it is used.</p> <p>In Enterprise 11, the last executed Excel session is used as a Session Name value in the Excel Cell Row variable. However, in Automation 360, the Excel Cell Row variable is not present. So, the last executed Excel session used before Excel Cell Row is taken as a value for Get row number during migration.</p> <p>Workaround: Create a string variable, assign a name to it, and add it after the Excel command in the migrated bot. Use the newly created string variable in Get row number.</p>

System variable	How they are migrated to Automation 360
\$Excel Cell Column\$	<p>This system variable is migrated to the Get column name action of the Excel package in Automation 360 and added just above the action in which it is used.</p> <p>Enterprise 10/Enterprise 11 returns the first column (for example column A) for the \$Excel Cell Column\$ even if the active cell is not column A (for example column F10) inside a loop. In Automation 360, the same configuration returns the active cell (for example column F10). Below are the use cases that result in the above behavior change:</p> <ul style="list-style-type: none"> • Excel is opened with or without <code>contains header</code> checked containing 10 rows. • Set active cell as F10 • A loop is performed to row read • Put a Message Box with \$Excel Cell Column\$ in it • Run the bot <hr/> <p>Important: Considering the behavior differences, you might have to change some bots.</p>
\$Excel Cell\$	<p>This system variable is migrated to the Get cell address action of the Excel package in Automation 360 and added just above the action in which it is used.</p>
\$AATaskExecutor\$	<p>This system variable becomes \$AATaskExecutor\$ and \$AATaskInvoker\$ in Automation 360.</p> <p>In Enterprise 11, this variables return various values about the task invoker and executor (for example, the invoker's and executor's first name, last name, email address, and username). In Automation 360, the \$AATaskInvoker\$ variable returns the following values:</p> <ul style="list-style-type: none"> • Invoker_Username • Invoker_Firstname • Invoker_Lastname • Invoker_Email <p>The \$AATaskExecutor\$ variable returns the following values:</p> <ul style="list-style-type: none"> • Executor_Username • Executor_Firstname • Executor_Lastname • Executor_Email • Executor_Type

System variable	How they are migrated to Automation 360
\$AATaskName\$	<p>This system variable becomes \$System.AATaskName\$ in Automation 360.</p> <p>In Enterprise 10/Enterprise 11, this variable returns the value to your computer path directory (for example Automation Anywhere \My Tasks\My Folder\My Folder2\AATaskName.atmx). In Automation 360, it returns the value to the bot path relative to the Control Room (for example Bots/AATaskName).</p> <hr/> <p>Action required: Considering the values returned are different between the versions, you might have to change some bots.</p>
\$AAApplicationPath\$	<p>Enterprise 11 specific: This Enterprise 11 system variable returns the path set by users in the Tool > Option setting of what is known as the "client application". In Automation 360, the variable becomes a global value. The migration process maps this change automatically and the value set of each user in Enterprise 11 is copied to the global value variable @AAApplicationPath.</p> <hr/> <p>Note: No action is required by a user for Enterprise 11 because the system variable is automatically mapped as a global value during migration if you have used the restored Enterprise 11 database when installing Automation 360.</p> <hr/> <p>Enterprise 10 specific: This Enterprise 10 system variable does not automatically migrate to Automation 360 as a global value, so some action is required after migration.</p> <hr/> <p>Important:</p> <ul style="list-style-type: none"> Enterprise 10 users must create the AAApplicationPath global value in Automation 360 and update it with the Enterprise 10 path. This update ensures that when you run the bot in Automation 360, the AAApplicationPath folder value is uniquely resolved for each user. <p>Example: If the Enterprise 10 path value for AAApplicationPath is D:\John.Doe\My Documents\Automation Anywhere Files, then you must create the AAApplicationPath global value in Automation 360 and update with this path.</p> <ul style="list-style-type: none"> Ensure that the CAN be changed option is selected when creating the AAApplicationPath global value. Bot Creators and Bot Runners must set the value for the AAApplicationPath global value before they run the migrated bots. <hr/> <p>See Global values on page 2260.</p>

System variable	How they are migrated to Automation 360
\$AAInstallationPath\$	<p>This system variable becomes \$\$System:AAInstallationPath\$ in Automation 360.</p> <p>Enterprise 10/Enterprise 11 behavior: Returns the Enterprise Client installation path (for example C:\Program Files (x86)\Automation Anywhere\Enterprise\Client).</p> <p>Automation 360 behavior: Returns the Bot Agent installation path (for example C:\Program Files\Automation Anywhere\Bot Agent).</p> <hr/> <p>Action required: Considering the values returned are different between the versions, you might have to change some bots.</p>
\$Current Directory\$	<p>This system variable is deprecated in Automation 360 and automatically converted to a user-defined variable during migration. The value of the variable is set per the value defined in Loop > For each file in a folder and For each folder in a folder.</p>
\$Date\$	<p>This system variable becomes \$\$System:Date\$ in Automation 360.</p> <p>Enterprise 10 and Enterprise 11 behavior: The \$Date\$ variable returns the current date and time in a format specified in the AA.Settings.XML file.</p> <p>Automation 360 behavior: The \$\$System:Date\$ variable returns values of type Datetime and users must use an action to change it in to String. To minimize disruption to users, the migration process does the following to each \$Date\$ instance:</p> <ul style="list-style-type: none"> • Creates a temp variable \$\$SystemDateInString\$ of type String. • Adds a ToString action of Datetime package to convert \$\$System:Date\$ to string with customer format as "MM/dd/yyyy HH:mm:ss" and store the output into above string variable. • Uses this string variable where ever \$Date\$ is used. • The above steps are repeated for each occurrence of \$Date\$. <p>Depending on how your bot is configured, you might have to update the date/time configuration.</p> <hr/> <p>Action required: Change the bot if the date format is not MM/dd/yyyy HH:mm:ss.</p>
\$Error Line Number\$ \$Error Description\$	<p>In Enterprise 10 or Enterprise 11, these system variables are used after the Error Handling command. In Automation 360, the value is returned to the user defined variables specified in the Catch action.</p>

System variable	How they are migrated to Automation 360
\$PDFFileName\$ \$PDFTitle\$ \$PDFAuthor\$ \$PDFSubject\$	<p>In Enterprise 10 or Enterprise 11, these system variables were used after any PDF command. In Automation 360, a Dictionary type variable is used to capture all PDF values that can be retrieve with the respective keys. Every PDF action returns this Dictionary variable with corresponding PDF values.</p> <p>See Using a dictionary variable for PDF properties on page 2772.</p>
\$System\$	<p>In Enterprise 11 or Enterprise 10, this system variable is used to retrieve information about a device's settings and its performance. In Automation 360, the Get environment variable action of the System package is used.</p> <p>See Get environment variable action on page 2977.</p>
\$WorkItem\$	<ul style="list-style-type: none"> • \$WorkItem\$ is String: Migrated as is. • \$WorkItem\$ is Number <ul style="list-style-type: none"> • If it is displaying or logging a Number, the number is changed to a String • If it is displaying as a Number, migrate as a Number type • \$WorkItem\$ is DateTime: Migrated as is, but the migrated package results in an error, so you cannot migrate the package. <hr/> <p>Note: For the DateTime type, you cannot migrate the package yet, so the associated bot must be migrated at another time.</p> <hr/>
\$Trigger Value\$	<p>Becomes \$TriggerValue\$ in Automation 360. For Enterprise 11 bots that use this variable, perform the following tasks to run the migrated bots successfully:</p> <ul style="list-style-type: none"> • Create the equivalent triggers in Automation 360 for all the triggers that were used in Enterprise 11 bots. <p>The output of triggers in Automation 360 is stored in a record type variable.</p> <ul style="list-style-type: none"> • Update the migrated bots to use the appropriate actions to assign the values from the record variable that contains output from triggers to the \$TriggerValue\$ variable. <p>For example, if you want to assign a host and port key from the record variable of an email trigger to the \$TriggerValue\$ variable, use the \$EmailTriggerData(host)\$EmailTriggerData(port)\$ expression. Similarly, to retrieve location of a file use \$FileTriggerData(file)\$ expression and to retrieve location of a folder use \$FolderTriggerData(fromFolder)\$ expressions.</p>

System variable	How they are migrated to Automation 360
\$Table Column\$	<p>This system variable is now part of the For each row in table iterator in Loop. The system creates a new variable in the loop and uses it inside the loop wherever \$Table Column\$ is present.</p> <p>If the variable is used outside a loop, it is converted to a record type user defined variable and assigned to a Record action, which enables you to assign the value of the source record variable to the destination record variable. Therefore, when you run migrated bots that contain this variable, data from the last row is displayed.</p>
\$XML Data Node\$	<p>This system variable is used inside the For each node in XML dataset iterator of Loop. In Automation 360, the value is returned to the string variable specified in the loop.</p> <p>If the variable is used outside a loop, it is converted to a string type user defined variable and assigned to a Record action, which enables you to assign the value of the source record variable to the destination record variable. Therefore, when you run migrated bots that contain this variable, data from the last row is displayed.</p>

Credential variables

The credential variables used for the **Username** and **Password** fields in Enterprise 10 and Enterprise 11 are migrated as **Credential variables** in Automation 360.

The method of migration differs for Enterprise 10 and Enterprise 11.

To learn how Enterprise 10 credentials are migrated, see the section on credentials in [How Enterprise 10 data is copied to Automation 360](#) on page 1517.

The credential variables used in fields other than the **Username** and **Password** fields are migrated as **Global Values**. These fields include hostname, port number, and so on. The migrated global values have the following syntax: <credentialname>_<attributename>. For example in Enterprise 11, a credential FTPConnection with an attribute hostname is migrated as FTPConnection_hostname.

The following table provides information about the packages and actions that support the migration of credential variables from Enterprise 11 to Automation 360:

Package	Actions
Active Directory	<ul style="list-style-type: none"> • Create and Modify User • Create and Modify Group • Create and Modify Object • Search • Get Property
Database	<ul style="list-style-type: none"> • Connect with connection string • Username • Password

Package	Actions
Email Automation	<ul style="list-style-type: none"> • Hostname • Username • Password
Excel	Open Spreadsheet
FTP / SFTP	Connect
Insert Keystrokes	All keystrokes that require use of credentials
Legacy Automation	Set Text in Manage Web Controls action
Manage Window Controls	<ul style="list-style-type: none"> • Set Text • Append Text
PDF	<ul style="list-style-type: none"> • PDF to Image • Extract Form Fields • Extract Text • Split, Encrypt, and Decrypt Document
PGP	<ul style="list-style-type: none"> • Encrypt and Decrypt Files • Create Keys
Recorder	<ul style="list-style-type: none"> • Set Text • Append Text <hr/> <p>Note: Migrated from Object Cloning command as Capture action.</p> <hr/>
REST Web Service	<ul style="list-style-type: none"> • URI • Username • Password • Headers • Operation parameters <hr/> <p>Note: Domain name is migrated as a global value.</p> <hr/>
SOAP Web Service	<ul style="list-style-type: none"> • Username • Password • Headers • Operation parameters • Raw data parameters

Package	Actions
Terminal Emulator	<ul style="list-style-type: none"> • Connect command for SSH2 with User and Key file authentication options • Send Text • Set Field
Web Recorder	Manage Web Controls with Set Text and Append Text functions

Global values in migrated bots

After migration, bots use various global values to support different capabilities provided in Enterprise 11 or Enterprise 10. You must create or update these global values in Automation 360 to ensure that the migrated bots run successfully.

Note: Global values are created when you migrate bots for the first time using the Bot Migration Wizard or migration APIs. If you are using the Migration package to migrate bots, you must create the global values manually.

The following table lists the various global values that are used by the migrated bots to run successfully:

Global value	Description
AAApplicationPath	<p>Use this global value to specify the physical path of a bot or file that is used in the current bot.</p> <ul style="list-style-type: none"> • Enterprise 11 : This global variable is automatically created by the system if you have used the restored the Enterprise 11 database when installing Automation 360. • Enterprise 10: You must create this global value in Automation 360 and update all the Enterprise 10 bots that have used the AAApplicationPath system variable to the AAApplicationPath global value in Automation 360 with the same value as Enterprise 10. <p>How AAApplicationPath variable is migrated on page 1546</p>

Global value	Description
AABasePath	<p>This global value is equivalent to the Start In Path of Task option in Enterprise 11 or Enterprise 10.</p> <p>In Enterprise 11 or Enterprise 10, this option is used to specify the location of new files or folders when a relative path for that file or folder is specified in a command. When you migrate Enterprise 11 or Enterprise 10 bots, keep in mind the following:</p> <ul style="list-style-type: none"> • If the path in the Enterprise 11 or Enterprise 10 bot is an absolute path, the migration process does not make any change in the migrated bot. • If the path in the Enterprise 11 or Enterprise 10 bot is a relative path and does not contain any variable, the migration process prefixes the path with the AABasePath global value. • If the path in the Enterprise 11 or Enterprise 10 bot is a relative path and contains variables: <ul style="list-style-type: none"> • If the variable contains an absolute path, the runtime execution process does not make any change in the migrate bot. • If the variable contains a relative path, the runtime execution process prefixes the path with the AABasePath global value.
AADefaultDateFormat	Use this global value to change the default date and time format for Date variables.
AAE_EmailSettings_auth	Use this global value to enable or disable authentication for the email server.
AAE_EmailSettings_clientId	Use this global value to specify the client ID that is generated when you registered the application in the Microsoft Azure portal.
AAE_EmailSettings_domainName	Use this global value to specify a domain name for the email server.
AAE_EmailSettings_host	Use this global value to specify the host name of the email server that you want to use to send email notifications about the status of a bot.
AAE_EmailSettings_port	Use this global value to specify the port that you want to use to connect to the email server.

Global value	Description
AAE_EmailSettings_ssl	Use this global value to specify whether the email account uses the secure connection.
AAE_EmailSettings_tenantId	Use this global value to specify the tenant ID that is generated when you registered the application in the Microsoft Azure portal.
AAProxyHost	Use this global value to specify the proxy host that will primarily be used by the REST Web Service and SOAP Web Service actions.
AAProxyPort	Use this global value to specify the proxy port that will primarily be used by the REST Web Service action.
AARestTimeOut	Use this global value to specify the timeout value, in milliseconds, for the REST Web Service action. This value can be used when the REST server takes a long time to respond.
AASoapTimeOut	Use this global value to specify the timeout value, in milliseconds, for the SOAP Web Service action. This value can be used when the SOAP server takes a long time to respond.
AAWaitForControl	Use this global value to specify the maximum wait time, in seconds, for the Control Room.
JcoDllPath	Use this global value to specify the DLL path for the Java connector used in SAP Business Application Programming Interface (BAPI).
JcoJarPath	Use this global value to specify the JAR path for the Java connector used in SAP BAPI.

Verify the bot migration

It is important that you verify that the migration is complete and the migrated bot runs successfully in the Automation 360 environment. The bot might have been converted, but it might contain errors that prevent it from running successfully.

1. Log in to your Automation 360 environment from a machine with the Bot Agent installed using a Bot Creator account and the "View Migration" permission.
2. Verify that the migration completed successfully by clicking **Administration > Migration**.
3. Confirm that your migration instance has the `successful` status (green check mark) and the **Migrated Item** column shows 1 to indicate that 1 bot was migrated.

If the **Migrated Item** column shows 0, your bot has not migrated successfully and will not be available on the **Automation** page.

4. Verify that the bot runs successfully by clicking **Activity > In progress**.
5. Navigate to the migrated bot.

For example, if you migrated a bot from the **My Tasks** folder, then navigate to the same folder to find your migrated bot.

6. Click the bot and fix any errors.
7. Run the bot to confirm that all errors have been fixed.

Related concepts

[Migrate to Automation 360](#) on page 1436

Migration (upgrade) is the process of moving your data and bots from Enterprise 11 or Enterprise 10 to Automation 360. Migration includes but is not limited to replicating and updating your existing database and repository, converting your bots to the Automation 360 format, and migrating learning instances for IQ Bot and dashboards for Bot Insight.

Related tasks

[View changes to migrated bots using Bot Assistant](#) on page 1616

The Bot Assistant provides a comprehensive view of all the lines in a bot that require your review or action, or which have errors and therefore require you to address them. You can quickly identify areas of bots that require your attention and view changes in an Enterprise 11 or Enterprise 10 bot after migration Automation 360.

View migration reports

Use the reports to analyze the status of individual bot migration, data migration, and audit log migration and identify the status and summary of the individual migration.

You must have the **View migration** permission to access these reports.

The migration reports provide summary and status based on following type of migration:

- The bot migration that includes details about the conversion of Enterprise 10 or Enterprise 11 bots to Automation 360.
- The data migration that include details about copying Enterprise 10 data to Automation 360.
- The audit migration includes details about migrated Enterprise 11 audit log data to Automation 360.

Access the reports from the **Administration > Migrations > View migration** icon associated with the migration instance for which you want to view the report.

- Bot migration reports: Applies to both Enterprise 10 and Enterprise 11.

View the following information:

- Migration details such as name of the migration instance, its description, and status.
- Migration results such as the start and end time of the migration process, status of the migration, and the number of items migrated.
- Settings: Whether the option to overwrite files was selected.
- Bot Runners: Information about the run-as user selected for the migration instance.
- Bot migration results such as all the bots (parent bots and their child bots) that are migrated and their status.

The bot migration result separately lists the bots that might require action or review after migration. Navigate to the each tab to view the list of bots that will require action or review and plan the post migration steps accordingly.

Click the View migration issues icon associated with an unsuccessfully migrated bot to see the unsupported commands or attributes.

- General details about the user who created the migration instance, last modification date, and its object type.
- Bot Insight Migration Results: Applies to Enterprise 11 only.

View Bot Insight results if you have migrated Enterprise 11 analytics bots. This tab displays information such as the status of the Bot Insight migration, number of Bot Insight dashboards, and data rows that are migrated, not migrated, or skipped.

- Data migration reports: Applies to Enterprise 10 only.

View the following information:

- Migration details such as name of the migration instance, its description, and status.
- Data migration results such as the start and end time of the migration process, status of migration, and number of items migrated.
- Roles that are copied and their status.
- Users that are copied and their status.
- Auto-login credentials that are copied and their status.
- Bots that are copied and their status.
- Schedules that are copied and their status. The copied schedules are disabled in Automation 360 because migration of the associated devices is not supported and therefore they are not available.
- General details about the user who created the migration instance, last modification date, and its object type.

- Audit log migration reports: Applies to Enterprise 11 only.

View the following information:

- Migration details such as name of the migration instance, its description, and overall status of migration such as in progress, successful, or unsuccessful.
- Migration results such as the start and end time of the migration process, duration, and number of items skipped, not migrated, or migrated.
- Audit log migration results such as file path of audit log JSON files, status of each `es_export.json` file if it was skipped, not migrated, migrated, or is pending for migration. It also displays the reasons because of which a particular `es_export.json` file was skipped or unsuccessful when migrating audit logs.
- General details about the user who created the migration instance, last modification date, and its object type.

View the following video on how to review the bot migration report:

Export to CSV

You can export two sets of data to a CSV file: the migration instances on the **All migrations** page and bot migration results data, including any action mapping for each bot. Exported data can be used for offline analysis and to identify bots that failed the migration and their associated failed actions.

For migration instance data, the export process exports all data (including hidden data columns), but only for the current page. If you have migration instances on additional pages, you must navigate to those pages to export that data. For migration result data, all pages are exported, even if the data is paginated.

Users with the "View migration" permission can perform the export.

1. Click **Administration > Migrations**.
2. Export migration instances:
 - a) Use the checkboxes to select the migration instances you want to export.
 - b) Click the **Export checked items to CSV** icon.
3. Export migration results data:
 - a) Select the migration instance where **Type** is "Bot migration" that you want to export.
Only bot migration results can be exported.
 - b) Click the **Export bot migration results** option to export the data.
You can also export from inside the Migration report.
4. Open the CSV file to see the exported data.

View changes to migrated bots using Bot Assistant

The Bot Assistant provides a comprehensive view of all the lines in a bot that require your review or action, or which have errors and therefore require you to address them. You can quickly identify areas of bots that require your attention and view changes in an Enterprise 11 or Enterprise 10 bot after migration Automation 360.

- Enterprise 11 or Enterprise 10 bots must be migrated to Automation 360.
- The user reviewing the migration review and action messages must have the Bot Creator or Bot Runner license assigned to them.
- Bot Creators must have the **View migration** permission to view the migration review and action messages in the Bot Assistant.

Review messages are available for bots that are successfully migrated to Automation 360 but with some changes in the migrated bots. These review messages indicate changes in the behavior of the Enterprise 11 or Enterprise 10 commands after they are migrated to Automation 360.

You can open the Bot Assistant for a migrated bot that is listed in the **Messages** tab of the **Bot Scanner** report. Review the messages about the changes in the commands after migration and mark these messages as reviewed after analyzing the change. The Bot Assistant also enables you to review all the changes made in a bot from the Bot editor.

1. On the left pane, click **Automation**.
A list of available and forms is displayed.
2. Open the migrated bot for which you want to review the messages.
3. Click the Bot Assistant icon on the toolbar to open the Bot Assistant.
4. Click **Get started**.
5. On the Bot Assistant screen, click the **Need review** tab to list the messages that require review.
6. Click a message in the **Need review** tab to view detailed information about the change.
7. Click the **Mark as reviewed** option to mark the message as reviewed.
The messages that are marked as reviewed are available in the **Reviewed** tab.

Note: You can mark a message as reviewed only for the migrated bots that are available in your private repository.

See the following video on how to use the Bot Assistant to review changes to migrated bots

Migration messages

Migration messages might display at any stage of the migration or Internet Explorer bot conversion. You can review or act on migration messages from these possible sources: Bot Scanner report, Bot Assistant or Bot migration report.

Note:

- Some messages described on this page do not include a cause or action when the cause is provided as part of the message and do not require any further action.
 - This page also includes Internet Explorer conversion messages that are applicable only for customers impacted by the Internet Explorer end-of-life (EOL) and have chosen to convert IE bots.
-

Action required messages

These messages in the Bot Scanner report, Bot Migration Wizard, and Migration Assistant after you migrate the bots. You must perform certain actions to successfully run the bots. We recommend that you review the cause and action required to update and run these bots.

Code	A103
Message	For the migrated bot to run, update the Task bot: Run action in the <i>migrated bot</i> by specifying the credential variable for input parameter . A Credential Vault variable cannot be passed in an insecure manner .
Cause	The fields in the migrated Enterprise 11 or Enterprise 10 bot display the value as plain text, so to prevent the risk of a security breach in Automation 360, the Credential Vault variable is restricted from passing it in a nonsecure (or insecure) manner. Unsupported features with workaround

Code	A108
------	------

Message	<p>For the migrated bot to run, update the action in the <i>migrated bot</i> by specifying an appropriate Credential Vault Value.</p> <p>An Automation 360 Credential Vault Value needs to match version 10.x / 11.x Credential Vault value.</p>
Cause	The migrated bot does not have the Credential Vault value assigned to the corresponding action.
Action	To run the migrated bot, create or update the Credential Vault value and assign it to the corresponding action. Ensure that the Credential Vault value in Automation 360 is same as the Enterprise 10 or Enterprise 11 Credential Vault value.

Code	A109
Message	<p>Referenced variables are missing in the V10/11 bot.</p> <p>For the migrated bot to run, update the corresponding actions in the migrated bot by providing missing required variables.</p>
Cause	Enterprise 11 or Enterprise 10 bot references a non-existent variable in the Variable Operation command.
Action	Either create a variable with the same name and type, or remove the command that references the non-existent variable.

Code	A110
Message	<p>Referenced variables are missing in the V10/11 bot.</p> <p>For the migrated bot to run, update the IF action in the migrated bot by providing missing required variables.</p>
Cause	The Enterprise 11 or Enterprise 10 bot references a non-existent variable in the If command.
Action	Create a variable with the same name and type, or remove the command that references the non-existent variable.

Code	A111
------	------

Message	Referenced variables are missing in the V10/11 bot. For the migrated bot to run, update the Assign To Clipboard action in the <i>migrated bot</i> by providing missing required variables.
Cause	The Enterprise 11 or Enterprise 10 bot references a non-existent variable in the Assign To Clipboard command.
Action	Update the Assign To Clipboard action with the required missing variable in the migrated bot so that the referenced variables are of the same type.

Code	A112
Message	Referenced variables are missing in the V10/11 bot. For the migrated bot to run, update the ElseIf action in the <i>migrated bot</i> by providing missing required variables.
Cause	Enterprise 11 or Enterprise 10 bot references a non-existent variable in the ElseIf command.
Action	Either create a variable with the same name and type, or remove the command that references the non-existent variable.

Code	A113
Message	Referenced variables are missing in the V10/11 bot. For the migrated bot to run, update the Loop action in the <i>migrated bot</i> by providing missing required variables.
Cause	The Enterprise 11 or Enterprise 10 bot references a non-existent variable in the Loop command.
Action	Create a variable with the same name and type, or remove the command that references the non-existent variable.

Code	A116
Message	The MetaBot Logic referenced in the TaskBot is missing. For the migrated bot to run, ensure the referenced MetaBot logic bot is available at the required path in A360. Message code: A116
Cause	The Enterprise 11 or Enterprise 10 bot references a non-existent Taskbot.

Action	Ensure that the MetaBot Logic bot exists in Automation 360.
--------	---

Code	A117
Message	The MetaBot Logic referenced in the parent MetaBot Logic is missing. For the migrated bot to run, ensure the referenced MetaBot Logic bot is available at the required path in A360. Message code: A117
Cause	The Enterprise 11 or Enterprise 10 parent MetaBot Logic references are missing.
Action	Ensure that the MetaBot Logic bot exists in Automation 360.

Code	A118
Message	For the migrated bot to run, ensure the child bot is available at the required path. A child metabot is required for the parent bot to run.
Cause	When migrating a parent bot, if you have not migrated the child bot or you migrated the child bot at a different location.
Action	Verify that you have successfully migrated the child bot. After your verification, perform one of the following actions: <ul style="list-style-type: none"> • Update the link within the parent bot so that it points to the correct location of the migrated child bot. • Move the child bot to the same location as the parent bot location.

Code	A119
Message	A referenced DLL file is missing in the V10/11 bot. For the migrated bot to run, ensure the referenced DLL file is available at the required path.
Cause	When migrating a parent bot, if you have not migrated the DLL file or you migrated the DLL file to a different location, then this issue occurs.
Action	Verify that you have successfully migrated the reference DLL file. After your verification, perform one of the following actions: <ul style="list-style-type: none"> • Update the link within the migrated bot so that it points to the right location of the migrated DLL file. • Move the DLL file to the same location as the migrated bot location.

Code	A124
Message	'Play Sound' action has been migrated. File formats .mid, .wma and .avi formats are not supported. Update the files to .mp3 or .wav format to run the migrated bot.

Code	A125
Message	Credential value of non string type is not supported for DLL Run function in the migrated bot. For the migrated bot to run, update the "DLL - Run function" with a string type credential variable or a Global value of appropriate variable type and corresponding mapping. Refer documentation for more details.
Cause	For the DLL Run action, the credential value of only string type is supported. If the credential value is deleted from the DLL Run command in the Enterprise 10 or Enterprise 11 bot, then this issue occurs.
Action	Update the DLL Run action in the migrated bot by specifying the string type credential value and map it to the corresponding parameters in the migrated bot for it to run. If you want to pass a variable type other than string, create a global value of the required variable and map it to the DLL Run action.

Code	A126
Message	Referenced variables are missing in the V10/11 bot. For the migrated bot to run, update the 'String-BeforeAfter' action in the migrated bot by providing missing required variables.
Cause	In the Enterprise 10 or Enterprise 11 bot, if the referenced variable is deleted from the String-BeforeAfter command, there are no issues. However, after migration, the missing variable causes an issue because the reference variable is required to run the bot in Automation 360.
Action	Because the reference variable is required for the bot to run, create the missing variable and assign it to the String-BeforeAfter action.

Code	A127
------	------

Message	Referenced variables are missing in the V10/11 bot. For the migrated bot to run, update the 'String-Compare' action in the migrated bot by providing missing required variables.
Cause	In the Enterprise 10 or Enterprise 11 bot, if the referenced variable is deleted from the String-Compare command, there are no issues. However, after migration, the missing variable causes an issue because the reference variable is required to run the bot in Automation 360.
Action	Because the reference variable is required for bot to run, create the missing variable and assign it to the String-Compare action.

Code	A128
Message	Referenced variables are missing in the V10/11 bot. For the migrated bot to run, update the 'String-Find' action in the migrated bot by providing missing required variables.
Cause	In the Enterprise 10 or Enterprise 11 bot, if the referenced variable is deleted from the String-Find command, there are no issues. However, after migration, the missing variable causes an issue because the reference variable is required to run the bot in Automation 360.
Action	Because the reference variable is required for bot to run, create the missing variable and assign it to the String-Find action.

Code	A129
Message	Referenced variables are missing in the V10/11 bot. For the migrated bot to run, update the 'String-Join' action in the migrated bot by providing missing required variables.
Cause	In the Enterprise 10 or Enterprise 11 bot, if the referenced variable is deleted from the String-Join command, there are no issues. However, after migration, the missing variable causes an issue because the reference variable is required to run the bot in Automation 360.
Action	Because the reference variable is required for bot to run, create the missing variable and assign it to the String-Join action.

Code	A130
------	------

Message	Referenced variables are missing in the V10/11 bot. For the migrated bot to run, update the 'String-Length' action in the migrated bot by providing missing required variables.
Cause	In the Enterprise 10 or Enterprise 11 bot, if the referenced variable is deleted from the String-Length command, there are no issues. However, after migration, the missing variable causes an issue because the reference variable is required to run the bot in Automation 360.
Action	Because the reference variable is required for the bot to run, create the missing variable and assign it to the String-Length action.

Code	A131
Message	Referenced variables are missing in the V10/11 bot. For the migrated bot to run, update the 'String-Lowercase' action in the migrated bot by providing missing required variables.
Cause	In the Enterprise 10 or Enterprise 11 bot, if the referenced variable is deleted from the String-Lowercase command, there are no issues. However, after migration, the missing variable causes an issue because the reference variable is required to run the bot in Automation 360.
Action	Because the reference variable is required for the bot to run, create the missing variable and assign it to the String-Lowercase action.

Code	A132
Message	Referenced variables are missing in the V10/11 bot. For the migrated bot to run, update the 'String-Replace' action in the migrated bot by providing missing required variables.
Cause	In the Enterprise 10 or Enterprise 11 bot, if the referenced variable is deleted from the String-Replace command, there are no issues. However, after migration, the missing variable causes an issue because the reference variable is required to run the bot in Automation 360.
Action	Because the reference variable is required for the bot to run, create the missing variable and assign it to the String-Replace action.

Code	A133
------	------

Message	<p>Referenced variables are missing in the V10/11 bot.</p> <p>For the migrated bot to run, update the 'String-Reverse' action in the migrated bot by providing missing required variables.</p>
Cause	<p>In the Enterprise 10 or Enterprise 11 bot, if the referenced variable is deleted from the String-Reverse command,, there are no issues. However, after migration, the missing variable causes an issue because the reference variable is required to run the bot in Automation 360.</p>
Action	<p>Because the reference variable is required for the bot to run, create the missing variable and assign it to the String-Reverse action.</p>

Code	A134
Message	<p>Referenced variables are missing in the V10/11 bot.</p> <p>For the migrated bot to run, update the 'String-Substring' action in the migrated bot by providing missing required variables.</p>
Cause	<p>In the Enterprise 10 or Enterprise 11 bot, if the referenced variable is deleted from the String-Substring command, there are no issues. However, migration, the missing variable causes an issue because the reference variable is required to run the bot in Automation 360.</p>
Action	<p>Because the reference variable is required for the bot to run, create the missing variable and assign it to the String-Substring action.</p>

Code	A135
Message	<p>Referenced variables are missing in the V10/11 bot.</p> <p>For the migrated bot to run, update the 'String-Trim' action in the migrated bot by providing missing required variables.</p>
Cause	<p>In the Enterprise 10 or Enterprise 11 bot, if the referenced variable is deleted from the String-Trim command, there are no issues. However, after migration, the missing variable causes an issue because the reference variable is required to run the bot in Automation 360.</p>
Action	<p>Because the reference variable is required for the bot to run, create the missing variable and assign it to the String-Trim action.</p>

Code	A136
------	------

Message	Referenced variables are missing in the V10/11 bot. For the migrated bot to run, update the 'String-Uppercase' action in the migrated bot by providing missing required variables.
Cause	In the Enterprise 10 or Enterprise 11 bot, if the referenced variable is deleted from the String-Uppercase command, there are no issues. However, after migration, the missing variable causes an issue because the reference variable is required to run the bot in Automation 360.
Action	Because the reference variable is required for the bot to run, create the missing variable and assign it to the String-Uppercase action.

Code	A137
Message	A variable is missing in the V10/11 bot. For the migrated bot to run, update the 'String-BeforeAfter' action in the migrated bot by providing a valid variable.
Cause	The unsupported variable type is assigned to the String-BeforeAfter action in the migrated Enterprise 10 or Enterprise 11 bot.
Action	To run the migrated bot, create a valid string variable type and assign it to the String-BeforeAfter action.

Code	A138
Message	A variable is missing in the V10/11 bot. For the migrated bot to run, update the 'String-Compare' action in the migrated bot by providing a valid variable.
Cause	The unsupported variable type is assigned to the action in the migrated Enterprise 10 or Enterprise 11 bot.
Action	To run the migrated bot, create a string variable type and assign it to the action.

Code	A139
------	------

Message	<p>A variable is missing in the V10/11 bot.</p> <p>For the migrated bot to run, update the 'String-Find' action in the migrated bot by providing a valid variable.</p>
Cause	<p>The unsupported variable type is assigned to the action in the migrated Enterprise 10 or Enterprise 11 bot.</p>
Action	<p>To run the migrated bot, create a string variable type and assign it to the action.</p>

Code	A140
Message	<p>A variable is missing in the V10/11 bot.</p> <p>For the migrated bot to run, update the 'String-Join' action in the migrated bot by providing a valid variable.</p>
Cause	<p>The unsupported variable type is assigned to the action in the migrated Enterprise 10 or Enterprise 11 bot.</p>
Action	<p>To run the migrated bot, create a string variable type and assign it to the action.</p>

Code	A141
Message	<p>A variable is missing in the V10/11 bot.</p> <p>For the migrated bot to run, update the 'String-Length' action in the migrated bot by providing a valid variable.</p>
Cause	<p>The unsupported variable type is assigned to the action in the migrated Enterprise 10 or Enterprise 11 bot.</p>
Action	<p>To run the migrated bot, create a string variable type and assign it to the action.</p>

Code	A142
Message	<p>A variable is missing in the V10/11 bot.</p> <p>For the migrated bot to run, update the 'String-LowerCase' action in the migrated bot by providing a valid variable.</p>

Cause	The unsupported variable type is assigned to the action in the migrated Enterprise 10 or Enterprise 11 bot.
Action	To run the migrated bot, create a string variable type and assign it to the action.

Code	A143
Message	A variable is missing in the V10/11 bot. For the migrated bot to run, update the 'String-Replace' action in the migrated bot by providing a valid variable.
Cause	The unsupported variable type is assigned to the action in the migrated Enterprise 10 or Enterprise 11 bot.
Action	To run the migrated bot, create a string variable type and assign it to the action.

Code	A144
Message	A variable is missing in the V10/11 bot. For the migrated bot to run, update the 'String-Reverse' action in the migrated bot by providing a valid variable.
Cause	The unsupported variable type is assigned to the action in the migrated Enterprise 10 or Enterprise 11 bot.
Action	To run the migrated bot, create a string variable type and assign it to the action.

Code	A145
Message	A variable is missing in the V10/11 bot. For the migrated bot to run, update the 'String-SubString' action in the migrated bot by providing a valid variable.
Cause	The unsupported variable type is assigned to the action in the migrated Enterprise 10 or Enterprise 11 bot.
Action	To run the migrated bot, create a string variable type and assign it to the action.

Code	A146
Message	A variable is missing in the V10/11 bot. For the migrated bot to run, update the 'String-Trim' action in the migrated bot by providing a valid variable.
Cause	The unsupported variable type is assigned to the action in the migrated Enterprise 10 or Enterprise 11 bot.
Action	To run the migrated bot, create a valid string variable type and assign it to the action.

Code	A147
Message	A variable is missing in the V10/11 bot. For the migrated bot to run, update the 'String-UpperCase' action in the migrated bot by providing a valid variable.
Cause	The unsupported variable type is assigned to the action in the migrated Enterprise 10 or Enterprise 11 bot.
Action	To run the migrated bot, create a valid string variable type and assign it to the action.

Code	A149
Message	MetaBot screen that is referenced in the Logic is not present in the MetaBot. For the migrated bot to run, update the object details in the Recorder action. Message code: A149
Cause	Screen details are missing in the Recorder package of the migrated bot. These screen details are required in Automation 360.
Action	You must manually capture the screen details in the migrated bot for it to run successfully.

Code

A151

Note: As of v.27, bots that contain non-referenced variables are not flagged as **Action Required** or **Review Required** in the Bot Scanner utility for the following variables:

- \$Excel Column\$
 - \$Filedata Column\$
 - \$Dataset Column\$
 - \$Table Column\$
 - \$XML Data Node\$
 - \$PDFTitle\$
 - \$PDFSubject\$
 - \$PDFFileName\$
 - \$PDFAuthor\$
-

Note: As of v.25, bots that contain non-referenced variables are not flagged as **Action Required** in the Bot Scanner utility for the following variables:

- '\$Error Description\$'
 - '\$Error Line Number\$'
 - '\$FileName\$'
 - '\$Extension\$'
 - '\$FolderName\$'
-

Messages

1. **'\$Error Description\$'** variable name has been migrated as **'\$Error-Description\$'**.

The '\$Error Description\$' variable used in version 10.x/ 11.x is not created in the A360 due to the absence of actions from corresponding packages.

For the migrated bot to run, create a variable with the same name '\$Error-Description\$' or remove the variable from the respective action.

2. **'\$Error Line Number\$'** variable name has been migrated as **'\$Error-LineNumber\$'**.

The '\$Error Line Number\$' variable used in version 10.x/ 11.x is not created in the A360 due to the absence of actions from corresponding packages.

For the migrated bot to run, create a variable with the same name '\$Error-LineNumber\$' or remove the variable from the respective action.

3. **'\$FileName\$'** variable name has been migrated as **'\$Loop-Files\$'**.

The '\$FileName\$' variable used in version 10.x/ 11.x is not created in the A360 due to the absence of actions from corresponding packages.

For the migrated bot to run, create a variable with the same name '\$Loop-Files\$' or remove the variable from the respective action.

4. **'\$Extension\$'** variable name has been migrated as **'\$Loop-Files\$'**.

The '\$Extension\$' variable used in version 10.x/ 11.x is not created in the A360 due to the absence of actions from corresponding packages.

For the migrated bot to run, create a variable with the same name '\$Loop-Files\$' or remove the variable from the respective action.

5. **'\$FolderName\$'** variable name has been migrated as **'\$Loop-FolderName\$'**.

The '\$FolderName\$' variable used in version 10.x/ 11.x is not created in the A360 due to the absence of actions from corresponding packages.

For the migrated bot to run, create a variable with the same name '\$Loop-FolderName\$' or remove the variable from the respective action.

6. **'\$PDFAuthor\$'** variable name has been migrated as **'\$PDF-Metadata-Dictionary\$'**.

The '\$PDFAuthor\$' variable used in version 10.x/ 11.x is not created in the A360 due to the absence of actions from corresponding packages.

For the migrated bot to run, create a variable with the same name '\$PDF-Metadata-Dictionary\$' or remove

7. **'\$PDFFileName\$'** variable name has been migrated as **'\$PDF-Metadata-Dictionary\$'**.

Cause	(Applies to all A151 messages): This issue occurs if a certain variable is not created in Automation 360 because actions are not present from the corresponding package.
Action	(Applies to all A151 messages): You must create a variable of the relevant variable type (string, number, dictionary, and so on) with the same name in Automation 360, or remove the variable from the respective action to run the migrated bot successfully.

Code	A152
Message	<p>This bot has been migrated.</p> <p>The size of Array type variables exceeds 160,000. Some of the Array type variables are migrated as Table type variables in A360 without the default values.</p> <p>Default value for the Table type variable may be required for the bot to give same results.</p>

Code	A154
Message	<p>For the migrated bot to run, update the 'Simulate keystrokes' action. The excel paste special behavior in A360 is different from the version 10.x/11.x. Message Code: A154</p>
Cause	The Paste Special dialog box varies between Automation 360, Enterprise 11, and Enterprise 10. As a result, the Simulate keystrokes command functions differently.
Action	Update the Simulate keystrokes command in the migrated bot.

Code	A155
Message	For the migrated bot to run update the bot name in the Run Task command. The Metabot logic has been migrated by suffixing '-bot' to the file name
Cause	When a Logic and a folder in the MetaBot have the same name in Enterprise 11, after migration the name of the Logic name is suffixed with -bot so that the Logic can be migrated.
Action	Update the bot name in the Run Task command.

Code	A156
------	------

Message	<p>The migrated bot contains DLL action that returns two dimensional arrays of type Single, Int, Int16, Int32, Int64, UInt, UInt16, UInt32, UInt64, Double, Decimal or Boolean and the output of it is mapped to an array type variable.</p> <p>Update the bot to convert the output array variable (mapped to the return of above listed DLL functions) to String while using it in any operation.</p> <p>E.g. <code>\$arrayoutput[0][0].Number:toString\$</code> <code>\$arrayoutput[0][0].Boolean:toString\$</code></p>
Cause	<p>When RunDLL output of a function returns 2D array of type number or boolean and is mapped to an array, then Enterprise 11 saves those values as string even though they are number or boolean. However in Automation 360 the values are saved as number. Therefore, runtime error is displayed.</p>
Action	<p>To run the migrated bot, convert the output array variable that is mapped to the return of DLL functions to string when using it in bot.</p>

Code	A157
Message	<p>For the migrated bot to run, update the source string in the String command.</p> <p>The variable stored in a text file and assigned to the variable during bot run is not resolving to the expected value. Update the variable directly in the source string without storing it in a text file.</p>
Cause	<p>The size of the string variable is greater than 64 kb.</p>
Action	<p>Update the variable directly in the source string without storing it in a text file.</p>

Code	A158
Message	<p>Recorder action has been migrated. The object property values greater than 64kb have been truncated. Remove such properties from the object search criteria in the corresponding Recorder action or object condition inside the If or 'Loop While' action in the migrated bot.</p>
Cause	<p>The size of the object property value is greater than 64 kb during migration.</p>
Action	<p>To ensure that the search criteria works properly for the corresponding Recorder action, update the object property value that is truncated.</p>

Review required messages

These messages are displayed in the Bot Scanner report, Bot Migration Wizard, and Migration Assistant after you migrate the bots. In such cases, the bot is successfully migrated but you still have to manually verify the migrated bots as described in the following messages.

Code	R101
------	------

Messages

- 1. Excel: Switch to sheet** action has been migrated.
Review the action session name and type to ensure the shared session name is correct.
- 2. Excel: Close** action has been migrated.
Review the action session name and type to ensure the shared session name is correct.
- 3. Excel: Delete cells** action has been migrated.
Review the action session name and type to ensure the shared session name is correct.
- 4. Excel: Find** action has been migrated.
Review the action session name and type to ensure the shared session name is correct.
- 5. Excel: Get multiple cells** action has been migrated.
Review the action session name and type to ensure the shared session name is correct.
- 6. Excel: Get single cells** action has been migrated.
Review the action session name and type to ensure the shared session name is correct.
- 7. Excel: Get cell address** action has been migrated.
Review the action session name and type to ensure the shared session name is correct.
- 8. Excel: Get column name** action has been migrated.
Review the action session name and type to ensure the shared session name is correct.
- 9. Excel: Get row number** action has been migrated.
Review the action session name and type to ensure the shared session name is correct.
- 10. Excel: Replace** action has been migrated.
Review the action session name and type to ensure the shared session name is correct.
- 11. Excel: Run macro** action has been migrated.
Review the action session name and type to ensure the shared session name is correct.
- 12. Excel: Save workbook** action has been migrated.
Review the action session name and type to ensure the shared session name is correct.
- 13. Excel: Set cell** action has been migrated.
Review the action session name and type to ensure the shared session name is correct.

Code	R102
Message	<p>System variable OS Name has been migrated. Review the value returned for the system variable OS Name in the <i>migrated</i> bot.</p> <p>The value returned by system variable OS Name may be different from version 10.x/11.x.</p>

Code	R103
Message	<p>Object Cloning has been migrated. Review the Image Recognition LeftClick action in the migrated bot.</p> <p>Migration of Object Cloning configured with play mode Image with action MiddleClick has been migrated with Image Recognition LeftClick action.</p>

Code	R104
Message	<p>String operation - Split action has been migrated. Review the String operation - Split action in the migrated bot.</p> <p>The Limit field is now divided into 2 fields: All Options and Only. Limit has been migrated to Only since it has a variable.</p>

Code	R105
Message	<p>App Integration action has been migrated. Review the application type Other in the migrated bot.</p> <p>Migration of App Integration action with application type Other is supported.</p>

Code	R106
Message	<p>OCR action has been migrated. Read the Automation 360 OCR package documentation for details.</p> <p>ABBYY is the only OCR engine supported.</p>
Cause	<p>Only the ABBYY OCR engine is supported with Automation 360. Irrespective of which OCR engine you have been using in Enterprise 11, after migration your bots will run using only the ABBYY OCR engine.</p>
Action	<p>To learn more about the OCR package, see OCR package on page 2699.</p>

Code	R107
Message	<p>Email - Connect with Exchange server action has been migrated.</p> <p>The exchange server version 'Exchange 2013_SP1' is migrated as 'Exchange 2013'. Ensure this version of the Exchange server will work with your system.</p>

Code	R114
Message	<p>Terminal Emulator - Connect action has been migrated.</p> <p>The connection type is configured as SSH2 since SSH1 is not supported in A360.</p> <p>No further action required.</p>
Cause	<p>Enterprise 11 and Enterprise 10 support both the SSH1 and SSH2 connection types. Automation 360 is upgraded to support only the SSH2 connection type. However, your migrated bots that were configured with SSH1 will work in Automation 360 and will be configured with the SSH2 connection type by default.</p>

Code	R115
Message	<p>Terminal Emulator - Connect action has been migrated.</p> <p>All bots now use the Advanced Technology setting. Please test and validate the bot.</p>
Cause	<p>In Enterprise 10 and Enterprise 11, you can choose whether to use the Advanced Technology for the Terminal Emulator - Connect command. Because Automation 360 is upgraded to support only Advanced Technology, all the migrated bots will be configured with Advanced technology for the Terminal Emulator Connect action by default.</p>

Code	R116
Message	<p>The value of the Error Description variable in the <i>migrated bot</i> may be different from version 10.x / 11.x.</p> <p>Review any action that uses the value of the Error Description variable.</p>

Code	R117
------	------

Message	<p>Workload: Insert work item action has been migrated.</p> <p>The date format needs to be the same in version 10.x / 11.x and Automation 360.</p>
Cause	<p>The date format field in the Workload: Insert work item action uses a default date format.</p>
Action	<p>If the date format is different from the global value <code>AADefaultDateFormat</code>, update the required format in the Workload: Insert work item action.</p>

Code	R118
Message	<p>Assign To Clipboard action has been migrated.</p> <p>The referenced variable does not exist in version 10.x / 11.x and has been migrated as a string to Automation 360.</p> <p>The bot may not run as expected.</p>

Code	R119
Message	<p>The Variable Operation action has been migrated.</p> <p>Variable types do not match. The variable has been disabled in the <i>migrated bot</i>.</p> <p>No further action required.</p>
Cause	<p>In Enterprise 11 if you change the variable type (for example, from string to dictionary), the bot ignores the change and moves to the next line. However, in Automation 360, the change in the variable is not supported. So if there is a change in variable type in the migrated bot, the variable is disabled to maintain consistent behavior with Enterprise 11.</p>

Code	R120
Message	<p>'Wait for Window' action has been migrated. The negative value of the X1 coordinate has been set to 0. No further action required.</p>
Cause	<p>In Enterprise 10 and Enterprise 11, the negative value for the X1 coordinate is supported for the Wait for Window action. In Automation 360, the negative value is not supported, so the negative value of the migrated bot is set to 0 by default.</p>

Code	R121
Message	'Wait for Window' action has been migrated. The negative value of the X2 coordinate has been set to 0. No further action required.
Cause	In the Enterprise 10 and Enterprise 11, the negative value for X2 coordinate was supported for Wait for Window action. In Automation 360, the negative value is not supported, so, negative value of the migrated bot is set to 0 by default.

Code	R122
Message	'Wait for Window' action has been migrated. The negative value of the Y1 coordinate has been set to 0. No further action required.
Cause	In Enterprise 10 and Enterprise 11, the negative value for Y1 coordinate is supported for the Wait for Window action. In Automation 360, the negative value is not supported and so the negative value of the migrated bot is set to 0 by default.

Code	R123
Message	'Wait for Window' action has been migrated. The negative value of the Y2 coordinate has been set to 0. No further action required.
Cause	In Enterprise 10 and Enterprise 11, the negative value for Y2 coordinate is supported for the Wait for Window action. In Automation 360, the negative value is not supported and so the negative value of the migrated bot is set to 0 by default.

Code	R124
Message	'Terminal Emulator' action has been migrated. Review the action session name to ensure the shared session name is correct.

Code	R126
------	------

Message	<p>'Window title regex has been migrated.</p> <p>Review the Window title regex in the migrated bot if the window is not found during Bot run.</p>
---------	---

Code	R127
------	------

Message	<p>IfImageReco-FileInFile Command has been migrated.</p> <p>'.jpg, .jpeg, .jpe, .jfif, .bmp, .gif, .png' are the supported file formats for the field 'ImageFile1' action.</p>
---------	--

Code	R128
------	------

Message	<p>Variable with default value greater than 64kb is not supported. The value is stored in a text file and assigned to the variable during bot run.</p>
---------	--

Code	R129
------	------

Message	<p>This bot has been migrated.</p> <p>For the migrated bot to run, a dictionary variable is required in the input variable mapping of run task action. Review the temp dictionary variable created in the parent and mapped in the input variable.</p>
---------	--

Code	R130
------	------

Message	<p>'Run Task' action has been migrated.</p> <p>A credential variable is passed to a non-credential type variable in an unsecured manner. For enhanced security pass the credential variable to a credential type variable.</p> <p>No further action required.</p>
---------	---

Code	R133
------	------

Message	<p>Action with 'AAInstallationPath' has been migrated.</p> <p>The value of the 'AAInstallationPath' in the migrated bot may be different from version 10.x / 11.x.</p> <p>Review any action that uses the value of the 'AAInstallationPath' action.</p>
---------	---

Code	R134
Message	<p>Run Task action has been migrated.</p> <p>The child bot path in the Run Task action is passed through a variable during run time. The value of the variable should pass the correct path of the child bot during the bot run.</p>

Code	R135
Message	<p>Screen Capture action has been migrated along with Log to file action to capture the image and the error description.</p> <p>The file path in the Screen capture action is passed through a variable during run time. The file path in the Log to File action is set to \$AAAApplicationPath\$/Temp/Error Handling/ErrorMessage.txt.\ No further action required.</p>

Code	R136
Message	<p>Metabot with logic has been migrated.</p> <p>The same name is used for the Metabot asset folder or logic folder in version 10.x/11.x. The Metabot logic has been migrated by suffixing '-bot' to its name. If any other existing bot matches this new name, the bot will be overridden.</p> <p>Review the migrated bot.</p>

Code	R137
------	------

Message	<p>Metabot with logic has been migrated.</p> <p>This bot has been migrated. The migrated bot has a circular dependency with another bot. Review the bot dependencies in the migrated bot and update the missing dependencies.</p> <p>Review the migrated bot.</p>
---------	---

Code	R138
Message	<p>This bot has been migrated.</p> <p>Object property ClickX or ClickY is variablized.</p> <p>Please recapture the UI object.</p>

Code	R139
Message	<p>This bot has been migrated.</p> <p>Object property SessionId or Id is variablized.</p> <p>Please recapture the UI object.</p>

Code	R140
Message	<p>The Value of the Error Line Number in the migrated bot may be different from the one in version 10.x/11.x. Review any action that uses the value of the Error Line Number in the migrated bot. Message code:R140</p>

Code	R1004
Message	<p>This bot has been migrated.</p> <p>A variable is used in the 'Host' property of this bot. If the variable is pointing to 'office365.com', this can potentially have an impact on the action since the Basic authentication mode that is used to connect to the email server is deprecated by Microsoft. You are advised to review the variable and update the authentication mode by selecting OAuth 2.0 and configuring the required parameters.</p>

Error messages

These messages are displayed in the Bot Scanner report and Bot Migration Wizard. These messages are displayed when the bot migration is not successful.

Code	E101
Message	This bot cannot be migrated because it has a child bot that uses an unsupported action or system variable.
Cause	A child bot that uses a command that is currently unsupported for migration cannot be migrated. As a result, parent bots that use this child bot also cannot be migrated.
Action	To migrate these parent bots, remove references to the child bot from the parent bot and then migrate that parent bot. To view unsupported commands that are used in the child bots, go to the list of bots that cannot be migrated and click the child bot name.

Code	E104
Message	This bot cannot be migrated. The Object Cloning command which automates Flash application is not supported in Automation 360. Delete the Object Cloning command which automates Flash application in Enterprise 10.x/Enterprise 11.x bot and then migrate. Message code: E104

Code	E106
Message	This bot cannot be migrated. The migration of MetaBot with Screens having play mode as Text is not yet supported. Note: This message is applicable only for Automation 360 v.25 and earlier releases.

Code	E109
Message	This bot cannot be migrated. The migration of REST API call using SOAP web service with authentication through client certificate is not yet supported.

Code	E110
Message	<p>This bot cannot be migrated.</p> <p>The migration of OCTET DECIMAL BYTE STRING data type is not yet supported.</p>

Code	E112
Message	<p>This bot cannot be migrated.</p> <p>The migration of REST API call using SOAP web service action with Outer XML is not yet supported.</p>

Code	E113
Message	<p>This bot cannot be migrated.</p> <p>The migration of REST API call using SOAP web service action with Inner XML is not yet supported.</p>

Code	E114
Messages	<ol style="list-style-type: none"> 1. This bot cannot be migrated. The migration of VariableOperation - ResetSysVariable action is not yet supported. 2. This bot cannot be migrated. The migration of Internet - IntCon action is not yet supported.

Code	E115
Message	<p>This bot cannot be migrated.</p> <p>The migration of Variable Operation action resetting system variable \$WorkItem\$ is not supported.</p>
	<p>Resetting the system variable \$WorkItem\$ is not supported for Variable Operation command.</p>
	<p>Use the String > Assign operation and assign an empty string to the \$WorkItem\$ system variable instead of resetting it.</p>

Code	E116
Message	This bot cannot be migrated. The migration of Variable Operation action resetting system variable \$WorkItemResult\$ is not supported.
Cause	Resetting the system variable \$WorkItemResult\$ is not supported for Variable Operation command.
Action	Use the String > Assign operation and assign an empty string to the \$WorkItemResult\$ system variable instead of resetting it.

Code	E118
Message	Create the Credential or Locker in Automation 360 before migrating this version 10.x / 11.x bot. The credential variables for MetaBot-DLL cannot be migrated because the corresponding Credential or Locker is not present in the Control Room.
Cause	The associated Credential variable is not migrated for the Metabot-DLL because the associated credential or locker is not present in the Enterprise 11 Control Room.
Action	Manually create the credential or locker in the Automation 360 and then migrate the bot.

Code	E119
Message	This bot has an invalid path. Modify the bot path in version 10.x / 11.x and ensure that the bot runs before migrating. The path defined in the Run Task action using \$AAApplicationPath\$ is not in a valid repository folder.
Cause	The Enterprise 11 or Enterprise 10 bot uses an invalid path in the Run Task command of the child bot.
Action	To migrate this bot, modify the Enterprise 11 bot to ensure a valid child bot path is provided after AAApplicationPath .

Code	E120
------	------

Message	<p>This bot has an invalid path.</p> <p>Modify the bot path in version 10.x / 11.x and ensure that the bot runs before migrating.</p> <p>The path defined in the If - TaskSuccessful action using \$AAApplicationPath\$ is not in a valid repository folder.</p>
Cause	The Enterprise 11 or Enterprise 10 bot uses an invalid path in the If - TaskSuccessful command of the child bot.
Action	To migrate this bot, modify the Enterprise 11 bot to ensure a valid child bot path is provided after AAApplicationPath .

Code	E121
Message	<p>This bot has an invalid path.</p> <p>Modify the bot path in version 10.x / 11.x and ensure that the bot runs before migrating.</p> <p>The path defined in the If - TaskUnsuccessful action using \$AAApplicationPath\$ is not in a valid repository folder.</p>
Cause	The Enterprise 11 or Enterprise 10 bot uses an invalid path in the If - TaskUnsuccessful command of the child bot.
Action	To migrate this bot, modify the Enterprise 11 bot to ensure a valid child bot path is provided after AAApplicationPath .

Code	E122
Message	<p>This bot has an invalid path.</p> <p>Modify the bot path in version 10.x / 11.x and ensure that the bot runs before migrating.</p> <p>The path defined in the Elseif - TaskUnsuccessful action using \$AAApplicationPath\$ is not in a valid repository folder.</p>
Cause	The Enterprise 11 or Enterprise 10 bot uses an invalid path in the Elseif - TaskUnsuccessful command of the child bot.
Action	To migrate this bot, modify the Enterprise 11 bot to ensure a valid child bot path is provided after AAApplicationPath .

Code	E123
------	------

Message	<p>This bot has an invalid path.</p> <p>Modify the bot path in version 10.x / 11.x and ensure that the bot runs before migrating.</p> <p>The path defined in the Elseif - TaskSuccessful action using \$AAApplicationPath\$ is not in a valid repository folder.</p>
Cause	<p>The Enterprise 11 or Enterprise 10 bot uses an invalid path in the Elseif - TaskSuccessful command of the child bot.</p>
Action	<p>To migrate this bot, modify the Enterprise 11 bot to ensure a valid child bot path is provided after AAApplicationPath.</p>

Code	E124
Message	<p>The value being passed to the DLL function is in an invalid format.</p> <p>Modify bot in version 10.x / 11.x before migrating.</p> <p>Validate the array/list variable and the column/index value passed in the DLL function and update the 10.x/11.x bot.</p>

Code	E125
Message	<p>Modify bot in version 10.x / 11.x before migrating.</p> <p>Update the version 10.x / 11.x bot to include referenced variables for the Assign From Clipboard action. A referenced variable was not found.</p>

Code	E127
Message	<p>Modify bot in version 10.x / 11.x before migrating.</p> <p>Variable types do not match or have been changed.</p> <p>Update the variable type in the Variable Operation action in the version 10.x/11.x bot.</p>

------	------

Message	<p>This bot cannot be migrated.</p> <p>The total number of 'Loop' conditions used in the bot exceed the number of 'Loop' conditions we currently support.</p> <p>For the migrated bot to run, split the bot into smaller units and try again.</p>
---------	---

Internet Explorer conversion or scanning messages

These messages are displayed in the Bot Scanner report when bots that use Internet Explorer is run or scanned and are not migrated successfully to other supported browsers.

Code	R1001
Message	<p>A variable is used in the 'Location of the program/file' property of this bot. If the variable is pointing to Internet Explorer, update it such that it points to Chromium based Microsoft Edge browser instead. If not, no further action required.</p>

Code	R1002
Message	<p>Browser components such as Menu bar, Status bar, Favorites bar, Command bar and other non-webpage components differ in each browser, and this can potentially have impact on the captured screens in <PACKAGE_NAME - ACTION_NAME>.</p> <p>You are advised to review and recapture the screen if required.</p>

Code	R1003
Message	<p>RegEx variable used in the window title seems to have partial text corresponding to 'Internet Explorer' hence the title may not get converted as per 'Microsoft Edge' text that is used in the Edge browser window.</p> <p>You are advised to use 'Internet Explorer' text as a whole in the RegEx variable.</p>

Basic authentication messages

Code	A1001
Message	The Basic authentication mode that is used to connect to the email server is deprecated by Microsoft. For the bot to run, update the authentication mode by selecting OAuth 2.0 and configuring the required parameters. Otherwise, a connection error will occur.
Cause	The Basic authentication mode that is used to connect to the email server is deprecated by Microsoft for Exchange Online.
Action	For the bot to run, update the authentication mode by selecting OAuth 2.0 and configuring the required parameters.

Code	A1002
Message	The Basic authentication mode that is used to connect to the EWS server is deprecated by Microsoft. For the bot to run, update the authentication mode by selecting OAuth 2.0 and configuring the required parameters. Otherwise, a connection error will occur.
Cause	The Basic authentication mode that is used to connect to the email server is deprecated by Microsoft for Exchange Online.
Action	For the bot to run, update the authentication mode by selecting OAuth 2.0 and configuring the required parameters.

Differences while migrating APIs from Enterprise 11/Enterprise 10 to Automation 360

When you migrate from Enterprise 11 to Automation 360, review any Control Room APIs migration issues and their workarounds.

One difference between the Enterprise 11 and Automation 360 versions occurs in the Credential Value API - Get attributevalues.

```
GET https://{ControlRoomURL}/v2/credentialvault/credentials/{credentialId}/attributevalues
```

In Automation 360, the `CredentialAttribute` object is not available in the response of `GET attributevalues` API. If you are using any parameters in this object in your bot logic then you must modify your response parsing logic and use `GET /v2/credentials/{id}` (See [Credential Vault API](#)) to consume those parameters.

Sample responses for the GET `attributevalues` for both Enterprise 11 and Automation 360 versions:

Enterprise 11	Automation 360
<pre>{ { "list": [{ "id": "2221", "credentialAttributeId": "9271", "value": "LNC2021132D", "createdBy": "21", "createdOn": "2021-09-29T12:37:48.765Z", "updatedBy": "131", "updatedOn": "2021-10-18T20:47:58.027Z", "version": "3", "credentialAttribute": { "id": "2277", "name": "ABCD Account", "description": "", "userProvided": false, "masked": false, "createdBy": "77", "createdOn": "2021-09-29T12:37:48.638Z", "updatedBy": "77", "updatedOn": "2021-09-29T12:37:48.638Z", "version": "0", "passwordFlag": false } }] }</pre>	<pre>{ "list": [{ "id": "4008", "credentialAttributeId": "1622", "value": "LNC2021132D", "createdBy": "21", "createdOn": "2021-09-29T12:37:48.765Z", "updatedBy": "274", "updatedOn": "2021-10-18T20:47:58.027Z", "version": "3", "password": false }]</pre>

Migrate Community Edition bots

Bots created in the Enterprise 11 Community Edition environment must be migrated to the Automation 360 Community Edition to allow users to use these bots in Automation 360. You use the Bot Migration package available in the Automation 360 Community Edition to manually migrate the bots.

Before you start migrating bots, do the following:

- Use the Bot Scanner utility to determine if your Enterprise 11 bots can be migrated successfully. [Bot Scanner for migration](#) on page 1469
- Get access to Automation 360 Community Edition.
- Register a device in Automation 360 Community Edition to run bots. [Install Bot Agent and register device](#) on page 1288

This procedure migrates one bot at a time. To migrate all bots within the same folder, you can create a complex bot by iterating files in a folder in a loop or add multiple **Migrate bot** actions for each `.atmx` file you want to migrate.

Important: If a bot has dependencies on other bots, you must migrate the dependent bots first and then the parent bot. For example, the `main.atmx` parent bot has a dependency on `child1.atmx`, which also has a dependency to `child2.atmx`, then add the **Migrate bot** actions in the following order: `child2.atmx`, followed by `{{child1.atmx}}` and then `{{main.atmx}}`.

1. Log in to Automation 360 Community Edition.
2. Use the Bot Migration package to migrate your bots.
 - a) Click **Automation** on the left pane.
 - b) Click **Create New > Bot**, specify the required details, and click **Create & edit**.
 - c) Expand the **Bot Migration** package and double-click the **Migrate bot** action.
 - d) Select **Desktop file** within the **Bot file path** section.
 - e) Enter the complete path of the Enterprise 11 `.atmx` file you want to migrate.
 - f) Optional: Enter the output folder path into the **Output folder path** field to specify where you want package conversion information and errors to be stored.
A report showing relevant information is generated for each migrated bot.
 - g) Leave the **Overwrite the file if exists** option selected (default setting) if you want this migrated bot to overwrite any bots of the same name in the Automation 360 Community Edition environment.
 - h) Save the bot.
 - i) Run the bot on the connected device to perform the migration.

Successfully migrated bots are uploaded to the Automation 360 private repository of the user who performed the migration. Only successfully migrated bots are migrated. Use the reports in the specified **Output folder path** to see the migration errors.

Related tasks

[Scan Enterprise 11 or 10 bots using Bot Scanner](#) on page 1471

Before you migrate to Automation 360, it is important to verify the migration readiness of your bots. Scan the bots using Bot Scanner and analyze the generated report for information about the commands and variables used in these bots and how many of these commands and variables are supported for migration.

Related reference

[Bot migration package](#) on page 2346

The **Bot migration** package enables you to migrate Enterprise 10 and Enterprise 11 bots to Automation 360 format. The package also enables you to convert Enterprise 10, Enterprise 11, or Automation 360 bots that use Internet Explorer to Microsoft Edge with IE mode. This package is used internally by the Bot Migration Wizard and the Update Bot wizard.

Migrate to Automation 360 IQ Bot

Migration is the process of upgrading from earlier versions of IQ Bot (Enterprise 11.x, 6.x, or 5.x) to the latest Automation 360 IQ Bot version. This includes replicating your existing database

and repository, converting your bots to Automation 360 format, and migrating all the learning instances.

Check migration readiness

Automation 360 IQ Bot features and functionality are the same as IQ Bot Enterprise 11. The existing Enterprise 11 content also applies to Automation 360 IQ Bot.

- You can upgrade to any version of Automation 360 IQ Bot without any restrictions. However, ensure that you use the Database Migration Assistant of the target version to migrate.

For example, if you want to migrate to Automation 360 IQ Bot (Build 11513), you must use the Database Migration Assistant for Automation 360 IQ Bot (Build 11513), which is available as a separate utility in the Automation 360 IQ Bot installation folder.

- Compare some of the key features of Automation 360 IQ Bot deployment models with IQ Bot release.

[Automation 360 IQ Bot feature comparison matrix](#) on page 952

- Review the IQ Bot version compatibility information.

[Automation 360 IQ Bot version compatibility](#) on page 957

- Obtain the migration license: [Get migration license](#) on page 1484
- Before migrating from IQ Bot 11.x to Automation 360 IQ Bot On-Premises, ensure you have downloaded the latest version of the Database Migration Assistant from Automation Anywhere Support site.

This tool enables you to migrate data and is supported on the following Microsoft SQL Server versions:

- Microsoft SQL Server 2019 15.0 Developer Edition and Express Edition
- Microsoft SQL Server 2016 13.0 Express Edition
- Microsoft SQL Server 2012 Express Edition

Note: Database Migration Assistant does not support Azure PaaS Database Service. If you are using Azure PaaS Database Service, you must copy all IQ Bot databases to any of the versions supported above, and run the Database Migration Assistant. Unified databases created using the Database Migration Assistant can then be uploaded back to Azure PaaS Database Service.

- If you are migrating from IQ Bot 11.x to Automation 360 IQ Bot On-Premises, we recommend that you have a 3-node cluster to ensure high availability (HA) for IQ Bot.

[High availability and disaster recovery overview](#)

- For RabbitMQ v3.8.18 disaster recovery (DR), we recommend that you have the same number of nodes in the primary and secondary sites to achieve same load handling capability.

Similarly, the RabbitMQ v3.8.18 cluster setup of the secondary site must replicate the cluster setup of the primary site.

[Disaster recovery deployment model](#)

For RabbitMQ v3.8.18 cluster configuration with auto-recovery, see [RabbitMQ Cluster Configuration with Auto-recovery \(A-People login required\)](#)

Choose your migration path

Choose your migration path based on the IQ Bot version you are currently using and the Automation 360 IQ Bot deployment model that meets your business requirements.

Important: In earlier IQ Bot versions, five databases were created, and in Automation 360 IQ Bot a single unified database is created. So ensure you back up your existing IQ Bot databases before you start the migration.

If you are on this version	Perform this migration procedure
IQ Bot 11.3.4 (or later)	Migrate to Automation 360 IQ Bot On-Premises or Cloud: <ol style="list-style-type: none"> 1. Migrate earlier IQ Bot versions to Automation 360 IQ Bot On-Premises on page 1661 2. Migrate from Automation 360 IQ Bot On-Premises to Cloud on page 1663 Install the latest version of Automation 360 IQ Bot On-Premises before you migrate to IQ Bot Cloud.
IQ Bot 6.5.x	You can migrate to Automation 360 IQ Bot On-Premises only from IQ Bot Version 11.3.4. <ol style="list-style-type: none"> 1. Update IQ Bot Version 6.5 to IQ Bot Version 11.3.4 Update IQ Bot from 6.5 or earlier to 11.3.4 2. Migrate earlier IQ Bot versions to Automation 360 IQ Bot On-Premises on page 1661 3. Related concepts

[Install and update Automation 360 IQ Bot](#) on page 1366

This collection of topics guide you through the process of installing or setting up Automation 360 IQ Bot On-Premises and Cloud.

Prepare for IQ Bot migration

Perform these tasks before you migrate to Automation 360 IQ Bot (On-Premises) from an earlier IQ Bot version (from Enterprise 6.x through 11.x).

1. If you are currently using any of the earlier versions of Automation Anywhere Enterprise (10.x or 11.x), ensure you migrate to the latest Automation 360 version.

[Migrate to Automation 360](#) on page 1436

2. Ensure the Automation 360 version corresponds to the Automation 360 IQ Bot that you are installing.

[Automation 360 IQ Bot version compatibility](#) on page 957

3. Migrate to the latest Automation 360 IQ Bot On-Premises from IQ Bot Version 11.3.4 or later versions. If you are currently using any of the earlier IQ Bot versions (5.3.x), you must first perform these tasks:

- a) Update to IQ Bot Version 6.5.

See [Update IQ Bot from 5.3.x or 6.0 to 6.5](#)

- b) Update IQ Bot Version 6.5 to IQ Bot Version 11.3.4 before migrating to Automation 360 IQ Bot On-Premises.

See [Update IQ Bot from 6.5 or earlier to 11.3.4](#)

4. Back up your existing IQ Bot databases.

In the earlier IQ Bot versions, five databases were created. With Automation 360 IQ Bot On-Premises Build 2545, a single unified database is created.

- a) Ensure you back up all five databases:

- AliasData
- ClassifierData
- Configurations
- FileManager
- MLData

- b) Uninstall any earlier IQ Bot versions.

Uninstalling an existing IQ Bot build does not delete the databases.

5. Install Database Migration Assistant.

- a) Log into Automation Anywhere support site and download the Database Migration Assistant:

[A-People Downloads page \(Login required\)](#)

Note: Ensure that **ODBC Driver version 17.0 for SQL Server** is available on your system before you run the Database Migration Assistant.

- b) Double-click the file to run Database Migration Assistant.

- c) Click **Next** to continue.

- d) Accept the license agreement. and click **Next**.
- e) In the **Database Configuration** screen, enter your existing IQ Bot database host name and credentials, and click **Next**.

Note: The SQL Server Browser service must be running if you want to use the full name of the SQL Server as the host name.

- f) (Optional) Click **Browse** to change the default installation folder for the Database Migration Assistant.
- g) Click **Install**.
After a successful installation, a new database called IQBot is created. You can use the following path to review the log files:

C:\Users\Public\Documents\Migration_Assistant_Logs

Note: After migration to Automation 360 IQ Bot completes, output files processed in IQ Bot 11x will not be available for download through the IQ Bot package in the Control Room.

Migrate earlier IQ Bot versions to Automation 360 IQ Bot On-Premises

Migrate from an earlier IQ Bot version (from Enterprise 6.x through 11.x) to Automation 360 IQ Bot (On-Premises) for the latest features and enhancements.

1. Download Automation 360 IQ Bot
 - a) Log into Automation Anywhere support site to download the latest Automation 360 IQ Bot build:
[A-People Downloads page \(Login required\)](#)
 - b) Extract (unzip) the `Automation_Anywhere_IQ_Bot_A2019_(Build number)` folder and run the following `.bat` files:
 1. `CleanupRabbitMQandErlang.bat`
 2. `CleanupRabbitMQErlangPython.bat`
 3. `UninstallPython.bat`
 4. `UninstallPython385.bat`

These files remove the registry entries of RabbitMQ v3.8.18, Erlang/OTP relevant IQ Bot Python. No other Python versions are affected.
 - c) Restart your machine.
2. Install Automation 360 IQ Bot
 - a) Open `Automation_Anywhere_IQ_Bot_A2019_(Build number)` folder and run the following files again:
 1. `CleanupRabbitMQandErlang.bat`
 2. `CleanupRabbitMQErlangPython.bat`

3. UninstallPython.bat
4. UninstallPython385.bat

This procedure removes any empty folders from RabbitMQ v3.8.18, Erlang, and Python.

- b) Install the Automation 360 IQ Bot build.
 - c) During installation, specify the same host name where the IQBot database was created. Automation 360 IQ Bot automatically connects to the IQBot database that was created by the Database Migration Assistant before migrating the data.
 - d) When the installation completes, unregister IQ Bot Enterprise 11.
[Unregistering IQ Bot from the Control Room](#)
Automation 360 IQ Bot automatically connects to the IQBot database that was created by the Database Migration Assistant before migrating the data.
 - e) Clear the browser cache.
 - f) (Optional) Restart the **Cognitive Console** service if IQ Bot fails to load.
3. Register Automation 360 IQ Bot
 - a) Register IQ Bot A360.x with the Control Room.
x refers to the latest version of Automation 360 IQ Bot.
[Registering IQ Bot with the Control Room](#)
Troubleshooting:
 - If the login page is not displayed after registering IQ Bot A360.x, restart the Control Room services (Control Room and Control Room Reverse proxy).
 - If none of the domains or dashboards are displayed when you log in to Automation 360 IQ Bot after a successful migration, perform the following steps:
 - Press the F12 key and click the **Network** tab to view the APIs.
If the APIs are unauthorized or display an error message, restart the IQ Bot service.
 - If the bots are not displayed in the learning instances, clear the browser cache.
 - b) After the registration, restart the Automation Anywhere Cognitive Application service.
4. Modify the output file name
 - a) After the data is migrated, ensure you modify the name of the output .csv file.
The output .csv file in Automation 360 IQ Bot contains additional characters. If you are using the download command, use the following instructions to edit the output .csv filename:
 - Remove the brackets [].
 - Replace the underscore (_) character with a hyphen (-).
 - Replace spaces with underscore (_).For example, if the output .csv filename is [sales-7d6961f3d28]_Invoice.tiff, rename it as sales-7d6_961f3d28-Invoice.tiff.
5. Verify the migrated data

- a) Log in to the Automation 360 IQ Bot as a newly created IQ Bot user.
- b) Review the data displayed on the **Dashboard** to ensure that the IQ Bot 11.3.x data has been migrated.
- c) You can also verify the migrated data by checking the following pages:
 - Learning Instances
 - Domains
 - Bot Pages

Ensure that the current OCR version is supported in Automation 360 IQ Bot.

- ABBYY FineReader Engine - 12.2, 12.3, or 12.4 (use the version provided in the installation folder)

Note: To upgrade the OCR version, download the OCR package to the installation folder.

- Tesseract OCR - 4
- Google Vision API - version is updated automatically to match current release
- Microsoft Azure Computer Vision OCR engine - 2.0 or 3.2
- Tegaki API - check with your Cogent Labs sales representative

Related information

[IQ Bot migration with keys stored in external vault \(Login required\)](#)

Migrate from Automation 360 IQ Bot On-Premises to Cloud

IQ Bot Cloud offers all the Automation 360 IQ Bot On-Premises features through a browser-based interface.

- Migrate Control Room before migrating to IQ Bot Cloud. If you have Control Room available on Cloud, you can migrate to IQ Bot Cloud.
- Install the latest version of Automation 360 IQ Bot On-Premises before migrating to IQ Bot Cloud.

See [Migrate earlier IQ Bot versions to Automation 360 IQ Bot On-Premises](#) on page 1661.

- Ensure that an active IQ Bot Cloud instance with the same version is available.
- If there is an incorrect IQ Bot registration data, ensure that you remove it before creating the correct registration data.

Keep in mind the following considerations when migrating from Automation 360 IQ Bot On-Premises to IQ Bot Cloud:

- IQ Bot Cloud is a single-node instance.

Before you start the migration, ensure that you review the document processing and concurrency requirements. Cluster setup is not supported on IQ Bot Cloud.

- Configuration files cannot be accessed in the IQ Bot Cloud.

Custom OCR settings in configuration files have to be uploaded into Automation 360 IQ Bot On-Premises database before migration.

[How to change OCR Settings in IQ Bot \(A-People login required\)](#)

- Python scripting is restricted to specific libraries on IQ Bot Cloud.

Customer-specific Python files, specific libraries, and methods are not allowed in IQ Bot Cloud.

[List of supported Pandas Libraries in Automation 360 IQ Bot \(A-People login required\)](#)

- Role-Based Access Control (RBAC) setup that you have configured on the Automation 360 IQ Bot On-Premises is not migrated to IQ Bot Cloud.

See [RBAC in Control Room](#) on page 984.

- Transfer the `.iqba` files to IQ Bot Cloud.

Any custom roles that you have created are removed before `.iqba` files are created. Ensure that you add these roles after transferring the `.iqba` files to IQ Bot Cloud.

Users have the following options to upload the `.iqba` file to IQ Bot Cloud :

- Click **Migration Utility** > **Export/Import** in Automation 360 IQ Bot On-Premises (starting from Build 5931).

[Migrate learning instances](#) on page 1664

- Migrate learning instance in IQ Bot Cloud through API. Use the Migration Utility feature to generate `.iqba` learning instance files, transfer them between systems, and import them into new IQ Bot databases.

[Migrate Learning Instances in IQ Bot Cloud through API \(A-People login required\)](#)

1. Export custom domains from Automation 360 IQ Bot On-Premises to IQ Bot Cloud.
[Custom domains in IQ Bot](#) on page 3604
2. Use the Migration Utility feature to export learning instances from the Automation 360 IQ Bot On-Premises version.
3. Use the IQ Bot UI or API to upload the `.iqba` file to IQ Bot Cloud.
4. Open IQ Bot Cloud and import learning instances by using Migration Utility.

All your learning instances from Automation 360 IQ Bot On-Premises are imported and available on IQ Bot Cloud.

Important: Review the following points:

- If the learning instances are large, migrate them one at a time to avoid timeouts.
- If you use custom domains, migrate them.
- Import the custom domains in the same order as they were in in the Automation 360 IQ Bot On-Premises version.

Migrate learning instances

Use the Automation 360 IQ Bot Migration Utility feature to migrate (export and import) learning instances between environments to avoid recreating similar learning instances and easily manage the lifecycle of the associated bots.

The learning instances can be migrated by the IQ Bot administrator or a user associated with custom role that has migration permissions. View a list of available learning instances by using **IQ Bot > Administrator > Migration** to go to the Migration Utility page.

What is transferred across environments

When you export a learning instance, an IQBA file is created with the following assets:

- Document groups
- Training documents (one per document group)
- RPA bots (one per document group)
- Custom domain (contact Automation Anywhere Enterprise support for assistance with transferring this type of asset)

Note: Production documents cannot be exported.

Transferring learning instances between IQ Bot environments

To move a learning instance from one environment to another, perform the following steps:

1. Ensure that the source and destination systems are running the same IQ Bot version. Learning instances from different IQ Bot versions cannot be imported because their database schemas will not match.
2. Back up your database and export the learning instances from the source IQ Bot environment: [Backup and export learning instance](#) on page 1665
3. Import the IQBA file into the destination IQ Bot environment: [Import learning instance](#) on page 1666

Note: From Automation 360 v.29 version, you can export, import, download, and upload an IQBA file with maximum size of 5 GB. You can follow these best practices or recommendations when the IQBA file size is 5 GB.

- When you export a 5 GB file, the system slows down significantly. This cannot be avoided since resources are utilized to support this export activity.
- You must perform an LI export activity during IQ Bot downtime or off-peak hours when you are not actively using the system. During the export process, you must not perform any other actions on IQ Bot which could lead to inconsistent results.

Backup and export learning instance

Ensure you backup your existing learning instance before exporting it. A learning instance is exported as IQ Bot archive (IQBA) file. Groups, bots, and learnings associated with the learning instance are also exported.

When you export a learning instance, only a single document associated with every available bot (Group) training is exported. However, the production documents do not get exported.

Note:

- Ensure that you do not export a learning instance that has only unclassified groups.
- Due to reduced staging document size while exporting IQBA files, the training numbers in the table are not displayed correctly. Possible workaround for the issue are as follows:
 - Before import: Open the exported IQ Bot archive (IQBA) files, and delete all records from the `VisionBotRunDetails.csv` and `DocumentProcessedDetails.csv` files in it.

Doing this after import, results in the **files processed through test bot** value to be zero. The **training unprocessed** will not show the correct training files value instead of any negative value.

- After import: Run the **Test Bots** for bots that are showing negative **training unprocessed** values against them. After the successful execution of **Test Bot**, its **training unprocessed** value is 0.

1. Log into IQ Bot as an administrator.
2. Click **Administration > Migration**.
3. Click **Create Backup**.
4. Select the learning instances you want to back up and then click **Backup**.
5. Enter an appropriate name for the IQBA file and click **Backup** to begin the export process. The exported data file with the `.iqba` extension is available in the `BackupData` folder in your IQ Bot output directory. For example, `C:\Users\Public\Documents\Automation Anywhere IQBot Platform\Output\BackupData`.

Import learning instance

Import a learning instance to use the associated groups and bots in a different Automation 360 IQ Bot environment.

You can only import a learning instance into a similar or equivalent IQ Bot version. For example, you can only import an IQ Bot On-Premises (Build 9642) learning instance into an equivalent version of IQ Bot On-Premises or Cloud.

1. Log into IQ Bot as an administrator.
2. Click **Administration > Migration**.
3. Click **Upload**.
4. Select the `.iqba` file you want to upload from your file system.

Exported learning instances are stored as `.iqba` files. Ensure you select the correct file to import your learning instances into your new IQ Bot environment.

5. Select from the following import options:

Import option	Result
Option 1: Append imported groups and trained bots to duplicate existing learning instances:	Merges new document groups and bots in existing learning instances. Note: When you import the <code>.iqba</code> file using this option, a trained group in the imported file overwrites an untrained group in the destination environment.

Import option	Result
Option 2: Import learning instances, and ignore duplicate learning instances:	Appends only new learning instances, where the learning instance ID in the <code>.iqba</code> file differs from the ID in the destination environment. If a learning instance ID in the <code>.iqba</code> file is the same as an ID in the destination environment, the learning instance from the file is not appended.
Option 3: Overwrite duplicate existing learning instances with imported learning instances:	All documents groups and bots in the existing learning instance in the destination environment are replaced with the ones from the imported file. This does not impact the dashboard metrics. Note: You must use this option if the learning instance in the <code>.iqba</code> file was edited (for example, if fields or table columns were added).
Option 4: Remove all existing learning instances and replace with imported learning instances:	Only use this option if it is okay to lose all the work done so far in an IQ Bot environment.

Additional considerations

- If the `.iqba` file contains a document group that was previously deleted from the learning instance in the destination environment and you import it using Options 1,3, or 4, IQ Bot restores the deleted version of that group.
- Document groups in the `.iqba` file are imported in the same state as they were exported. For example, if you select Option 3 to overwrite a learning instance with a group in production mode with an imported learning instance that has a group in staging mode, that imported group remains in staging mode and incoming documents will not be automatically processed.

For more information on how each option impacts the groups, see [Example: Import options results](#) on page 1668.

6. Click **Open**.

After your file is uploaded, click **Refresh** to manually refresh the page and use the uploaded file from the list.

7. Click the import icon next to the backup entry in the list.

The imported learning instances are restored in the destination environment.

Example: Import options results

If the destination IQ Bot environment contains a learning instance with the same ID as the one in the IQBA file, you must select an import option to instruct IQ Bot how to handle the document groups in the learning instance. This page walks you through the most-common scenarios.

Scenario 1: Destination environment is empty

In this scenario, the destination environment is empty, such as in the case of a new installation of a testing environment. For the simplicity of this example, the IQBA file contains one learning instance with two groups. The fourth column of the table shows the outcome of each import option.

G = group

Import option	Environment before importing IQBA file	IQBA file	Environment after importing the IQBA file
Option 1: Append imported groups and trained bots to duplicate existing learning instances:		G1, G2	G1, G2
Option 2: Import learning instances, and ignore duplicate learning instances:			G1, G2
Option 3: Overwrite duplicate existing learning instances with imported learning instances:			G1, G2
Option 4: Remove all existing learning instances and replace with imported learning instances:			G1, G2

Scenario 2: Import a learning instance with new groups

In this scenario, the learning instance in the IQBA file has document groups which are not present in the learning instance in the destination environment. The fourth column of the table shows the outcome of each import option, with the groups already present in the environment italicized for emphasis.

Note that in option 3, the imported learning instance (IQBA file) overwrites the duplicate existing learning instance. To determine whether a learning instance is a duplicate, the system compares the IDs of the learning instances in the two environments, not the groups. As a result, the environment after the import only contains G3.

Import option	Environment before importing IQBA file	IQBA file	Environment after importing the IQBA file
Option 1: Append imported groups and trained bots to duplicate existing learning instances:	G1, G2	G3	G1, G2, G3
Option 2: Import learning instances, and ignore duplicate learning instances:			G1, G2
Option 3: Overwrite duplicate existing learning instances with imported learning instances:			G3
Option 4: Remove all existing learning instances and replace with imported learning instances:			G3

Scenario 3: Import a learning instance with duplicate groups

In this scenario, the learning instance in the IQBA file has the same groups as the learning instance in the destination environment, for example, the groups were retrained. The fourth column of the table shows the outcome of each import option, with the groups already present in the environment italicized for emphasis.

Import option	Environment before importing IQBA file	IQBA file	Environment after importing the IQBA file
Option 1: Append imported groups and trained bots to duplicate existing learning instances:	G1, G2, G3	G3	G1, G2, G3
Option 2: Import learning instances, and ignore duplicate learning instances:			G1, G2, G3
Option 3: Overwrite duplicate existing learning instances with imported learning instances:			G3

Import option	Environment before importing IQBA file	IQBA file	Environment after importing the IQBA file
Option 4: Remove all existing learning instances and replace with imported learning instances:			G3

Migration Utility enhancements

Starting from the Automation 360 IQ Bot.14 release, enhancements for importing learning instances (that were created using a custom domain) to the production server are available.

Migrating learning instances (that were created using a custom domain) from one system to another does not automatically import the associated domain to the target system. Therefore, when you run the imported learning instances on the production documents, the documents do not get classified because the associated field names and IDs for the custom domain do not work in the imported learning instance.

Migrating single or multiple learning instances

Prerequisite: The same version of the custom domain must exist in the staging (source) and production (target) servers.

IQ Bot includes some checks for importing a learning instance to the production environment to ensure the custom domain associated with a learning instance is migrated to the production server first, so the learning instances do not fail after migration.

- You can import the same learning instance to the production server multiple times.
 - However if you import a learning instance with an edited or updated domain and if the updated domain does not exist in the production server, the system will not allow you to import the learning instance.
- In this scenario, if the **Import** option is used (**IQ Bot > Migration** tab) to import the learning instance, a system-generated error message is displayed stating that the learning instance version is incompatible, and the import process is canceled.
- IQ Bot checks for the following when importing a learning instance to the production server:
 - Does the domain exist in the production server?
 - Do the same fields exist in the production server?
 - Do the same field aliases (available variations for a specific field in the documents) exist in the production server?
- Learning instance import fails if the system detects an issue with any of the checks.
- An import is successful when the user has maintained the same version of the custom domains, associated with the learning instance, in the staging and production servers.

If the learning instance import fails, the user can find the reason for the migration failure in the following locations:

- In the IQ Bot `Project service log` files, which will show an inconsistency in any of the following parameters:
 - domain name

- field names
 - project or learning instance name
 - field alias names
- In the **Control Room > Audit logs**

[Custom domains in IQ Bot](#)

Migrating RBAC in IQ Bot

When you migrate learning instances that are associated with custom roles, you must also migrate the roles to enable users in the destination environment to access the learning instances. Before you start your migration, review the comparison matrix for in RBAC IQ Bot 11.3.5.x with Automation 360 IQ Bot.

Comparing RBAC

The following table compares RBAC provided in IQ Bot 11.3.5.x with Automation 360 IQ Bot:

Feature	Supported in IQ Bot 11.3.5.x	Supported in Automation 360 IQ Bot
Separation of permissions to learning instances by departments using custom roles	Yes	Yes
Assigning roles to learning instances on creation	Yes	Yes
Support for system roles: <ul style="list-style-type: none"> • Automation 360 IQ Bot administrator • IQ Bot services • IQ Bot Validator 	Yes	Yes
Changing assigned role for learning instances	Yes	No
User can have different access levels to different learning instances	Yes	No
Transfer of roles when learning instances are moved from one environment to another	No	No

However, you can use the **Assign Roles** functionality to assign roles to the learning instance.

Feature	Supported in IQ Bot 11.3.5.x	Supported in Automation 360 IQ Bot
All permissions of IQ Bot are implemented	Yes	No The following permissions are not implemented: <ul style="list-style-type: none"> Edit learning instance Delete learning instance Send learning instance to production Import domain

Requirements before migrating RBAC

- Ensure that you do not associate the role of a user who can create a learning instance with any of the IQ Bot system roles. Instead, associate these users with a custom role.
- If a user who can create a learning instance has a custom role, a correct role corresponding to the department must be assigned to ensure a seamless RBAC operation on the learning instance. However, ensure that these users do not have any other role assigned other than the custom role for creating a learning instance and the corresponding department role.
- User who can create a learning instance must not be associated with any non IQ Bot roles. This restriction is not applicable to other users with custom roles.
- All users who can create a learning instance must not be assigned to one custom role (for creating learning instance). Instead, these users must be assigned to department-specific custom role (for creating learning instance).
- Ensure that the **View ALL learning instances** permission is not used in the custom role because it provides users with access to IQ Bot services.
- Ensure that any role other than the department role is not assigned to a learning instance, as this can increase the risk of unauthorized users accessing the learning instance.
- Users with the **Launch validator** permission in the custom role can only view IQ Bot if there is at least one learning instance with documents to validate.

Plan your migration

RBAC functionality such as setup and features for custom roles differ between IQ Bot 11.3.5.x and Automation 360 IQ Bot. So keep the following in mind for migration:

- You can migrate RBAC to Automation 360 IQ Bot only from IQ Bot 11.3.5 or later versions.
- You can migrate IQ Bot 11.3.5.x to both Automation 360 IQ Bot On-Premises and Cloud.
- When you migrate RBAC, all the custom and user roles are also migrated from Control Room 11.3.5.x to Automation 360.
- Ensure you segregate the learning instances for RBAC use cases between departments, organization units, and so on.

Choose your RBAC migration path

Choose your RBAC migration path based on the IQ Bot version you are currently using and the Automation 360 IQ Bot deployment model that meets your business requirements:

- [Migrate RBAC to On-Premises](#)
- [Migrate RBAC to Cloud](#)

If you are performing the migration steps using APIs, see [IQ Bot roles migration APIs \(A-People login required\)](#)

Migrate RBAC to Automation 360 IQ Bot On-Premises

Migrate RBAC from an earlier IQ Bot version (11.3.5.x or later) to Automation 360 IQ Bot On-Premises for the latest features and enhancements.

1. Create new custom roles (department roles) corresponding to each department or organizational unit in Control Room.

Consider a scenario where you have setup the RBAC across various departments in your organization with HR_Dept, Finance_Dept and Sales_Dept as the department roles. For sub-divisions within these departments, the roles can be Finance_AP_Payments, Finance_Cash_Payments, and so on.

2. Ensure you give the following permissions for each department role that you create:

- **View IQ Bot**
- **View learning Instances**
- **View learning instances for same role in Control Room**

3. Add the respective department roles to all of the IQ Bot users in Control Room.

For example, Sam from the Human Resource department is assigned the HR_Dept role and Susan from the Finance department is assigned the Finance_Dept role.

4. Associate users who create learning instances with the corresponding roles.

Users creating learning instances for a department can only be associated with IQ Bot roles. For example, these users cannot be associated with roles such as AA Basic, AA Bot Developer, and so on.

Additionally, only the IQ Bot custom role with **Create learning instance** permission must be assigned along with the corresponding department role.

5. Backup the `LearningInstanceRoles` table in the Automation 360 IQ Bot database.

The database schema name is `IQBot`.

6. Use the following database query to get the list of learning instances and the roles from the migrated Automation 360 IQ Bot database:

```
SELECT p.name as LearningInstance,
r.projectid as LearningInstanceID,
r.role as Role FROM [IQBot].[dbo].LearningInstanceRoles r inner join
[IQBot].[dbo].ProjectDetail p on r.projectid=p.id;
```

7. Download the output query of the database to a local CSV file.

For example, `learninginstanceroles.csv`

8. Remove all the role entries against the learning instances in the local CSV file.

For example, `learninginstanceroles.csv`. After removing the role entries, duplicate rows for each learning instance must be removed to keep just 1 row per learning instance in the CSV file.

Note: If there are learning instances which are not RBAC controlled, then role entries must not be changed

9. Assign the department role (Step 3) to each of the learning instance in the local CSV file and save your changes.
10. Remove all the entries from the `LearningInstanceRoles` table in IQBot database scheme. You can use the following SQL command to remove the entries:

```
DELETE from [IQBot].[dbo].LearningInstanceRoles;
```

11. Insert the modified learning instance role association defined in local CSV file (Step 8) into the `LearningInstanceRoles` table.

For example, use the following SQL statement:

```
INSERT INTO [IQBot].[dbo].LearningInstanceRoles
(projectid, role) values
('i13454546erty', 'HR_Dept');
```

12. Verify the RBAC setup in Automation 360 IQ Bot and ensure that only the correct users have the access to the learning instances.

Migrate RBAC to Automation 360 IQ Bot Cloud

Migrate RBAC from an earlier IQ Bot version (11.3.5.x or later) to Automation 360 IQ Bot Cloud for the latest features and enhancements.

1. Create new custom roles (department roles) corresponding to each department or organizational unit in Cloud Control Room.

Consider a scenario where you have setup the RBAC across various departments in your organization with `HR_Dept`, `Finance_Dept` and `Sales_Dept` as the department roles. For sub-divisions within these departments, the roles can be `Finance_AP_Payments`, `Finance_Cash_Payments`, and so on.

2. Ensure you give the following permissions for each department role that you create:

- **View IQ Bot**
- **View learning Instances**
- **View learning instances for same role in Control Room**

3. Add the respective department roles to all of the IQ Bot users in Control Room.

For example, Sam from the Human Resource department is assigned the `HR_Dept` role and Susan from the Finance department is assigned the `Finance_Dept` role.

4. Associate users who create learning instances with the corresponding roles.

Users creating learning instances for a department can only be associated with IQ Bot roles. For example, these users cannot be associated with roles such as `AA Basic`, `AA Bot Developer`, and so on.

Additionally, only the IQ Bot custom role with **Create learning instance** permission must be assigned along with the corresponding department role.

5. Backup the `LearningInstanceRoles` table in the Automation 360 IQ Bot database.

The database schema name is IQBot.

6. Use the following database query to get the list of learning instances and the roles from the migrated Automation 360 IQ Bot database:

```
SELECT p.name as LearningInstance,  
r.projectid as LearningInstanceID,  
r.role as Role FROM [IQBot].[dbo].LearningInstanceRoles r inner join  
[IQBot].[dbo].ProjectDetail p on r.projectid=p.id;
```

7. Download the output query of the database to a local CSV file.

For example, `learninginstanceroles.csv`

8. Remove all the role entries against the learning instances in the local CSV file.

For example, `learninginstanceroles.csv`. After removing the role entries, duplicate rows for each learning instance must be removed to keep just 1 row per learning instance in the CSV file.

Note: If there are learning instances which are not RBAC controlled, then role entries must not be changed

9. Assign the department role (Step 3) to each of the learning instance in the local CSV file and save your changes.
10. As the `LearningInstanceRoles` table in IQBot Cloud will be empty, provide the CSV file (Step 9) to Automation Anywhere support so that they can update the Cloud database.
11. Insert the modified learning instance role association defined in local CSV file (Step 9) into the `LearningInstanceRoles` table.

For example, use the following SQL statement:

```
INSERT INTO [IQBot].[dbo].LearningInstanceRoles  
(projectid, role) values  
(\i13454546erty', 'HR_Dept');
```

Note: Ensure you perform this step for all the entries in the local CSV file.

12. Verify the RBAC setup in Automation 360 IQ Bot and ensure that only the correct users have the access to the learning instances.

Configure Automation 360

Control Room administrators manage settings related to the database, Credential Vault, users, roles, action packages, licensing, and more.

Related tasks

[Create a role](#) on page 1687

As an administrator, you can configure roles with permissions to access features and perform operations such as create, edit, or delete a bot in the Control Room, and assign the role to a user.

[Create a user](#) on page 1678

Create a user and assign their specific license based role.

[Installing additional licenses](#) on page 1725

Upload new licenses to the Automation Anywhere Control Room to be distributed to users as required.

[Create credential](#) on page 1798

Create a credential and add the required attributes.

Users

As an administrator, you can create, view, edit, delete, and enable or disable a user. Creating users steps vary depending on whether the user is a non-Active Directory, Active Directory, or single sign-on (SSO) user from an IdP server.

Column actions

- Click a column header to sort by ascending or descending order.
- Drag and drop a column header to move the column left or right.
- Drag the end of a column corner to re-size.

Note: The **API key expiration** column displays the date and time when the API key expires for users who have generated their API keys. You can use this information to notify the users to renew their API keys before the API keys expire so that the users can run their automations seamlessly.

Individual user actions

Perform the following tasks on an individual user:

View

Opens the **View user** page in read-only mode. It shows user details, assigned roles, and general details such as **Last Modified**, **Modified by**, **Object type**, and **User type**.

You can edit a user detail and enable or disable a user.

Edit	<p>Opens the Edit user page in write mode. You can update user details, device login credentials, assigned roles, and device licenses. When you edit a user, an email is sent notifying the user if SMTP is enabled.</p> <p>Only user devices with the Bot Agent installed at the system level are available for selection as the default device.</p>
Enable Disable	<p>Activates or deactivates the user. When you enable or disable a user, an email is sent notifying the user if SMTP is enabled.</p>
Delete	<p>Deletes the user. This is useful when users leave an organization or move to another role. This frees both the device to which the user was attached and the allocated license.</p> <p>When you delete a user, an email is sent notifying the user if SMTP is enabled.</p> <hr/> <p>Note: Before removing a user from the active RPA, administrators should make certain all unfinished development of bots are checked-in.</p> <hr/>

Table-level actions

Perform the following tasks by hovering the mouse over the icons at the top-right of the **User** table. These actions can be performed only at a table-level and not on individual items.

Create role with checked items	<p>Adds a role and assigns the selected users.</p> <p>Create a user on page 1678</p>
Delete checked items	<p>Deletes the selected users. You cannot delete a user who is currently logged in.</p>
Export to CSV	<p>Exports the users listed in the table in CSV format.</p> <hr/> <p>Note: You can view the API key expiration information for users who have generated their API keys. You can use this information to notify the users to renew their API keys before the API keys expire.</p> <hr/>
Refresh table	<p>Refreshes the table and reflects the latest data.</p>
Customize columns	<p>Select the columns to show or hide in the table.</p>

Create a user

Create a user and assign their specific license based role.

Ensure that you are logged in to the as the administrator.

1. Navigate to **Administration > Users**.
2. Click **Create user**.
3. Enter the required general details as follows:

Field	Value
Enable User	Select for the user to be activated and log in immediately. Note: If this option is not selected, user will be in the inactive state and cannot log in.
Username	Enter a unique user name.
Description	Enter a description for the user.
First name	Enter the first name for the user. Note: The number of characters allowed in the First name field is 50.
Last name	Enter the last name for the user. Note: The number of characters allowed in the Last name field is 50.
Password	Enter and confirm a password for the user. Ensure that the password follows all the necessary password policies.
Email	Enter and confirm the email address for the user. If SMTP is enabled, an email is sent to this address to confirm the account. All important Control Room notifications are sent to this email address.

4. Select the required role from the list of **Available roles**.
5. Click the right arrow (→) to add your selection.
6. Select **Allow** to allow multiple sessions.
You must be Control Room administrator to set a user as a multi-login service user. It is possible to set a user as a multi-login user either in the UI or API, however a user may only access multiple sessions through the API.
7. Assign a device license to the user.

Note: When you logged in as administrator, you cannot allocate any device license to the user and **None** option is selected by default.

License	Privilege
None	The user can access the Control Room only.
Bot Creator- Development license	Enables user to create and run bots. Auto login is enabled by default.
Unattended Bot Runner - Run-time license	Users with this license can perform all automation tasks that attended users can perform. Additionally, this license can also be used for Control Room deployment, centralized scheduling, and API-based deployment.
Attended Bot Runner - Run-time license	Users with this license can run bots on their devices and use any event trigger associated with their user account or role. However, these users cannot schedule bots.
Citizen Developer - Development license	Users with this license can create and run bots (including bots with triggers) on their devices.

The **Bypass legal disclaimer** option is automatically enabled to allow the user to run bots on a device without having to manually acknowledge a disclaimer.

After you select a device license, the **Device login credentials** are enabled. If you have the **Attest device credentials** permission, you can choose to attest the device credentials for this user to bypass credential validation when you deploy bots. The Bot Runner user should have an unlocked and active user session.

Note: This works only if the auto login setting **Reuse an existing session** is selected in the Control Room by the administrator.

8. Click **Create user**.

Watch the following video on how to create a user in Automation 360:

Create an Active Directory user

Add the Active Directory user by selecting the AD domain, providing AD environment details, and assigning a role and device license.

Ensure that you are logged in to the as the administrator.

Note: Before removing a user, administrators should make certain all unfinished development of bots are checked-in.

1. Navigate to **Administration > Users**.

2. In the **General Details** section, enter the following information:

a) **Enable User**: Select this option so that the user can log in immediately.

b) **Active Directory domain**: Select the active directory name for the user.

The list displays all the domains that are available in the Active Directory domain controller.

Note: Control Room Active Directory supports single forest multi-domain environment.

c) **Username**: Click **CHECK NAME IN ACTIVE DIRECTORY**.

- If the user name is present in the Active Directory database, the **First name**, **Last name**, **Email**, and **Confirm email** fields are automatically populated.

If the data is not automatically populated, enter the details in the fields.

Note: You can use reserved characters, such as the comma (,), in the username.

- If the username is not present in the Active Directory database, an error message is displayed. Contact the network administrator to resolve the issue.

If SMTP is enabled, the user is sent an email to this address to confirm the account. All important Control Room notifications will be sent to this email address. You can use the "@" character to accommodate email user names.

Note: To support SSO over SAML, the User Principal Name (such as in Azure Active Directory) must match the corresponding username in the control room.

3. Select the required role from the list of **Available roles**.

4. Assign a device license to the user.

Note: When you logged in as administrator, you cannot allocate any device license to the user and **None** option is selected by default.

License	Privilege
None	The user can access the Control Room only.
Bot Creator- Development license	Enables user to create and run bots. Auto login is enabled by default.
Unattended Bot Runner - Run-time license	Users with this license can perform all automation tasks that attended users can perform. Additionally, this license can also be used for Control Room deployment, centralized scheduling, and API-based deployment.
Attended Bot Runner - Run-time license	Users with this license can run bots on their devices and use any event trigger associated with their user account or role. However, these users cannot schedule bots.

License	Privilege
Citizen Developer - Development license	Users with this license can create and run bots (including bots with triggers) on their devices.

The **Bypass legal disclaimer** option is automatically enabled to allow the user to run bots on a device without having to manually acknowledge a disclaimer.

After you select a device license, the **Device login credentials** are enabled. If you have the **Attest device credentials** permission, you can choose to attest the device credentials for this user to bypass credential validation when you deploy bots. The Bot Runner user should have an unlocked and active user session.

Note: This works only if the auto login setting **Reuse an existing session** is selected in the Control Room by the administrator.

5. Click **Create user**.

Citizen Developer user

A Citizen Developer is a business user who can create and run bots, and share these automated tasks with peers. Citizen Developer is typically not a technical expert but a specialist such as a marketing analyst, HR manager, and accounts manager.

Overview

Users with bot creation capability can create, edit, run, or schedule bots on their device. While users with bot execution capability can access a public folder to run or schedule published bots. Citizen Developer users combine these capabilities to create bots, access the public folder, and clone published bots and run them on their devices.

Capabilities

In an organization, an administrator typically creates the Citizen Developer role with the necessary bot permissions and specifies the database or folder access. The administrator assigns this role to existing or new users and allocates the Citizen Developer license to them.

A Citizen Developer user can then perform the following tasks:

- Create bots and run them on their devices.
- Add and delete event triggers for bots on their devices.

Citizen developer user can create a private event trigger. However, the associated bot must be checked in to a public folder for other citizen developer or Bot Runner users to access that event trigger.

- Publish their bots to the public folder where other Citizen Developer users can access them.
- Access the public folder and clone published bots (including bots with triggers).
- Customize cloned bots and run them on their devices.
- Check in bots from their devices to the public folder.
- Check out bots from the public folder.

The following image illustrates the capabilities of a Citizen Developer user:

Example

Consider a scenario where an organization has Marketing and Finance teams. The administrator creates the following two Citizen Developer roles:

- CD (Marketing): provides access to all Marketing team folders
- CD (Finance): provides access to all Finance team folders

The administrator then assigns the Citizen Developer license to users within each team. Citizen Developer users with the CD (Marketing) role can create and run bots on their devices. When a user with the CD (Marketing) role publishes a bot to a public folder, other Citizen Developer users within the Marketing team can clone and run this bot on their devices.

Similarly, Citizen Developer users with the CD (Finance) role will have the same capabilities within the Finance team folders. However, users from one team cannot access any folders and published bots from the other team.

Comparing Citizen Developer and Bot Creator licenses

Understand the capabilities available for each user to help you choose license based on the automation requirements for your organization.

Citizen Developer license

Citizen Developers are business users who can create simple automations with little to no coding knowledge. A Citizen Developer license is designed for a business user such as marketing analyst, HR manager, and accounts manager. They have limited technical knowledge but have strong practical experience in the business processes. This helps them create simple, easy-to-use applications to improve the business processes. Based on the business requirements, an administrator can restrict package access for bot development to a Citizen Developer to provide a simplified developer experience. Complex packages are hidden from Citizen

Bot Creator license

Developers so that they can focus on easy-to-complete automation.

Bot Creators are advanced developers who design, develop, and implement bots to improve business process efficiency and have substantial coding knowledge. A Bot Creator license is designed for professional developers who have strong technical knowledge and can build complex and critical applications. Depending on the privileges provided by the administrator, they can access more functionalities in the Automation 360 platform such as advanced and complex packages, ability to create API tasks, approve code reviews submitted by Citizen Developers, and so on.

Review the capabilities available for a Citizen Developer and Bot Creator license:

Citizen Developer	Bot Creator
Business user with strong process knowledge but limited coding skills	Professional developer with strong technical skills and knowledge of system architecture
Does not have access to advanced packages or features	Has access to advanced packages and features
Low coding knowledge	In depth knowledge about coding and system architecture
Builds simple applications to simply business processes	Build complex and critical applications for business processes
Does not have to follow the software development lifecycle to build applications	Follows software development lifecycle to build applications
Low cost and resource is easily available	High cost and resource not easily available

For more information (including advanced packages restricted for Citizen Developers), go to [Restricted User Terms for AAI Citizen Developer Licenses](#) → Citizen Developer Licenses section.

Related tasks

[Create a Citizen Developer user](#) on page 1684

A Citizen Developer is a business user who can build and run bots on their devices, which then function as their digital assistants.

[Create a Citizen Developer role](#) on page 1703

A Citizen Developer role enables the associated users to create and run bots on their registered devices.

[Adding event triggers](#) on page 2066

Any bot with triggers can be associated with users or role to enable event trigger. Control Room user (or role) with **Manage event triggers** permission can add event triggers.

The **All Licenses** page displays detailed information about current product and device licenses.

Create a Citizen Developer user

A Citizen Developer is a business user who can build and run bots on their devices, which then function as their digital assistants.

Ensure that you are logged in to the as the administrator.

1. Navigate to **Administration > Users**.
2. Click **Create user**.
3. Enter the following user details:
 - a) Select the **Enable User** option if you want the user to be able to log in immediately.
 - b) Enter a unique user name.
 - c) Optional: Enter a description for the user.
 - d) Optional: Enter the first name and last name.

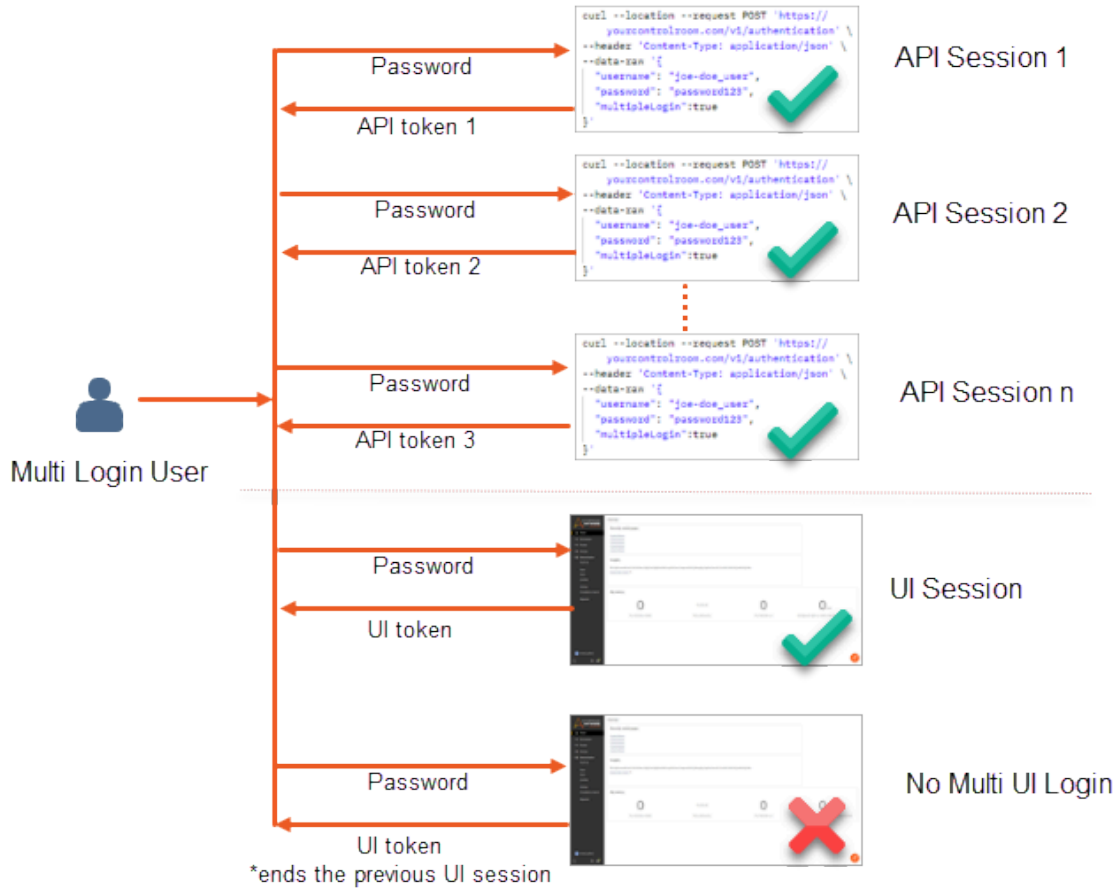

Note: The number of characters allowed for the first and last name is 50.

- e) Enter and confirm a password for the user.
Ensure the password follows any necessary password policy.
 - f) Enter and confirm the email address for the user.
If SMTP is enabled, the user is sent an email to this address to confirm the account. All Control Room notifications will be sent to this email address.
4. Select a Citizen Developer role from the list of **Available roles**.
If there is no Citizen Developer role available, create one in Control Room.
[Create a Citizen Developer role](#) on page 1703
 5. Click the right arrow (→) to add your selection.
 6. Assign the Citizen Developer license to the user.
The license enables users access to the Control Room only and enables them to create and run bots.

The **Bypass legal disclaimer** option is automatically enabled to allow the user to run bots on a device without having to manually acknowledge a disclaimer.
 7. Click **Create user**.

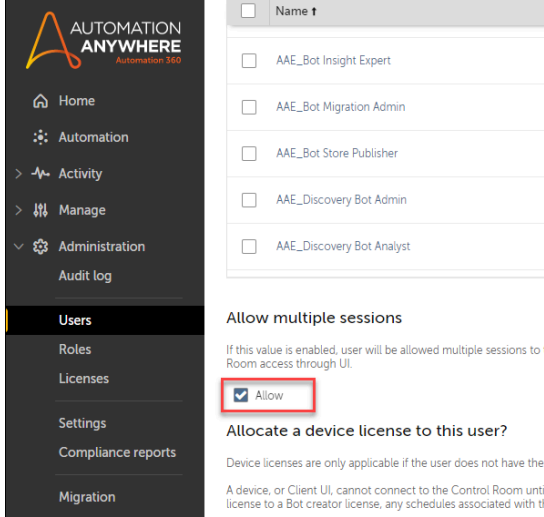

Multi-login user

A multi-login user can log in to multiple sessions of a Control Room through the API at the same time.

Note: Multiple sessions are not allowed for Control Room access through the UI.

A multi-login token is required if you want to configure a Control Room user to use different processes at the same time using multi tokens generate using the API. You need a Control Room administrator role to set a user as a multi-login service user. It is possible to set a user as a multi-login user either in the UI or API.

Authorize using UI	Authorize using API
<p>In the Control Room, go to Administration > Users and select Allow under Allow multiple sessions to enable multi-login.</p> 	<p>Using the Authentication API</p> <p>Request</p> <pre>POST http://{{ControlRoomURL}}/v1/authentication</pre> <p>Request body to generate multi-login token:</p> <pre>{ "username": "jdoe", "password": "mypassword@123", "multipleLogin": true }</pre>

Reset user password

The Control Room administrator generates an email process for the user to reset their password. Ensure that you are logged in to the as the administrator.

The change password email process.

1. Navigate to **Administration > Users**.
2. Select user from the list.
3. Click the **Edit** icon. (✎)
4. Select **Send reset password email**.

Note: If there is no email server configured, follow these steps to reset the password for a user:

- a) Open the URL for the Control Room in your browser.
- b) Enter the user name, click **Forgot Password**, and follow the prompts to reset or change the password.
- c) Enter the user name, click the **Forgot Password** button, and follow the prompts to reset or change the password.

The selected user receives an email with the necessary instructions to reset the password.

Related tasks

[Log in to Automation Anywhere Control Room](#) on page 1428

To log in to Automation 360, open the Control Room URL in your browser, enter your credentials in the login screen, and click **Log in**.

Roles

The Control Room enforces role-based access control. There are two types of roles: **System-created** and **User-created**.

Role-based access control (RBAC) gives users access to specific features, based on the assigned roles and the accessibility provided to the user. The benefits of creating roles include:

- Increased security through controlling users access according to their specified roles.
- Create User-created roles
 - Create roles as per the requirements of your organization.
 - Create roles with all possible permissions that are supported in the Control Room.
- Configure permissions for roles
 - Roles can be customized as per your needs without any permissions being disabled. You can select all the required permissions.
 - Assign permissions to a role as per the requirements of your organization.

System-created roles

These roles are preconfigured with the permissions necessary to perform the tasks within the scope of that role. They cannot be modified or deleted.

Note: Using system-created roles is not mandatory.

User-created roles

Roles created by authorized users are user-created roles. A user-created role can be created with all possible or available permissions.

Note: Ensure that you understand the risks involved in creating and assigning roles that are similar to the system roles. For example, if you create a role with permissions similar to **AAE_Admin**, such users will be able to make changes to the Control Room settings.

Before removing a user role from active RPA, administrators should ensure that all unfinished development of bots are checked-in.

Create a role

As an administrator, you can configure roles with permissions to access features and perform operations such as create, edit, or delete a bot in the Control Room, and assign the role to a user.

Ensure that you have the **Mange roles** permission.

Note: You can create user roles with any or all permissions and user roles that are similar to the system roles. However, ensure that you understand the risks involved in creating and assigning such user roles. For example, if you create a role with permissions similar to `AAE_Admin`, such users will be able to make changes to the Control Room settings.

Assign specific permissions to each user. You can only select active users.

1. Navigate to **Administration > Roles**.
2. Click **Create role**.
3. Enter the **Name**.
4. Optional: Enter a description.
5. Select the feature permissions.

For more information about the available feature permissions by product, see [Feature permissions for a role](#) on page 1688.

6. Click **Next**.
7. Based on the option you select, perform the required action:

Option	Action
View my bots permission	Select the bots permissions. Bot permissions for a role on page 1702
Run my bots permission	Select the Bot Runner devices.

8. Click **Next**.
9. Select user from the list.
10. Click **Create role**.

The following video shows how to create custom roles:

Related concepts

[Bot permissions for a role](#) on page 1702

Assign bot permissions when creating a role with the View my bots feature permission.

Related reference

[System roles](#) on page 1706

System roles are preconfigured with the permissions necessary to perform the tasks within the scope of that role. They cannot be modified or deleted. Administrators assign the roles to users to enable them to access features and perform operations in the Control Room.

Feature permissions for a role

A user with the **Manage roles** permission can create and assign roles to users to provide them with access to features and operations.

We recommend that you create individual roles with specific permissions. You can then assign the limited roles to users with that specific permission requirement.

Administration

Permission	Description
View users	<p>Allows users to only view all other users in the system. They cannot create, edit, or delete users.</p> <hr/> <p>Note: You must assign this permission before assigning the <code>Create user</code>, <code>Update user</code>, or <code>Delete user</code> permission.</p> <hr/>
Create users	Allows users to create new users in the Control Room.
Edit users	Allows users to edit all users in the system.
Delete users	Allows users to delete other users the Control Room.
View roles	<p>Users with this permission are able to view the roles in the Control Room.</p> <hr/> <p>Note: You must assign this permission before assigning the <code>Manage roles</code> permission.</p> <hr/>
Manage roles	Allows users to view and manage all roles in the Control Room.
View users and roles basic information	Allows users to view basic information on users and roles in the Control Room.
View Settings	Allows users to view all the administrator settings in the Control Room. However, users will be unable to edit the settings.
Manage Settings	Allows users to edit the administrator settings in the Control Room.
View and manage compliance reports	Allows users to view, create, and download compliance reports for users.
View migration	<p>Allows users to view new migrations, but not run them.</p> <hr/> <p>Note: You must assign this permission before assigning the <code>manage migration</code> permission.</p> <hr/>
Manage migration	Allows users to view and run new migrations.
Allow a Bot Runner user to run migrations	Allows Bot Runner user to update the bot conversion status in the Control Room.

Permission	Description
View bot update	Allows a user to view the status and summary of each bot update instance when the bots are converted on the Administration > Update Bot wizard page. However, the user cannot run the updates. To do that, a user needs the Manage bot update permission.
Manage bot update	Allows a user to run new bot updates by using the Update Bot wizard.
Allow a Bot Runner user to update bots	Allows Bot Runner users to send bot update status back to the Control Room so that it is visible in the Update Bot wizard report. This permission is assigned by default to the user with the AAE_Admin role.
View licenses	Allows users to view the license details for the Control Room.
Manage user's device licenses	Allows users to assign device licenses to other users.
Install licenses	Allows users to install Automation 360 licenses for the Control Room.
View policies	Allows users to view the policies which define how automations can be built.
Manage policies	Allows users to view and manage the policies which define how automations can be built.
View operations data	Allows users to view operations related widgets on the Automation Command Center homepage.
View operations details	Allows users to select widgets on the Automation Command Center homepage to view their operations details.

Automation Co-Pilot for Business Users (Automation Co-Pilot)

Permission	Description
Cross Team Read	View all teams and see the team members
Cross Process Read	View all processes and see team members and managers
Team Management	Create and view teams, edit team names, descriptions, and process tags. Add new teams, team members, and assigned processes
Task Management	Submit and view tasks from processes that are assigned to the team
Case Management	Create and view requests from processes that are assigned to the team

Permission	Description
Global Case Management	View process requests and tasks. Note: This permission does not grant the capability to create a request or submit a task
Global Process Management	View checked-in public processes and assigned managers and teams, edit process tags, and assign managers and teams Note: This permission does not grant the capability to create a process.
Global Team Management	View teams and assigned users, edit team names and descriptions. Add new processes, managers, and users to a team Note: This permission does not grant the capability to create a team.

API

Permission	Description
Bot Insight Data API	Allows access to Bot Insight RESTful APIs to the data logged by the Control Room and by a task during production runs.
Generate API-Key	Users can generate an apiKey that can be used in the Authentication API. Note: Users without the <code>generateapikey</code> permission can use APIs by authenticating using their username and password. Authentication API

Activity

Permission	Description
View my activity	Allows users to view their in progress and historical activities.
Manage my activity	Allows users to pause, resume, or cancel their in progress activity and move their finished activities to history.

Permission	Description
View activity from user's folder	Allows user to view in progress and historical activity of bots from the assigned folders where the user has either run or schedule access.
Manage activity from user's folder	Allows users to pause, resume or cancel in progress activity, and view historical activity for bots from the assigned folders where the user has either run or schedule access.
View everyone's activity	Allows users to monitor ongoing automations where the user has either run or schedule access on the respective bot.
Manage everyone's activity	Allows users to pause, resume, or cancel all in progress activities and move the finished activities to history.
View my scheduled bots	Allows users to view their own schedules only.
Schedule my bots to run	Allows users to schedule their bots to run when they have permission to view and manage Bot Runners.
Edit my scheduled activity	Allows users to edit their own schedules only.
Delete my scheduled activity	Allows users to delete their own schedules only.
View ALL scheduled activity from my Folders	Allows users to view all the schedules for the bot folders to which they have access. It includes their own schedules and schedules created by other users.
Manage ALL scheduled activity from my Folders	Allows users to view, edit, and delete all schedules for the bot folders to which they have access. It includes their own schedules and schedules created by other users.
View ALL scheduled activity	Allows users to view all the schedules in the system. This includes schedules that the user created or schedules created by other users.
Manage ALL scheduled activity	Allows users to view, edit, and delete all the schedules in the system. This includes schedules that the user created or schedules created by other users.
Set automation priority to high	Allows users to set the automation priority to high to run and schedule bots. Automations with high priority are given preference over the medium and low priority automations so that you can run and schedule the high priority automations.

Audit log

Permission	Description
View everyone's audit log actions	Allows users to view all audit log activity for the Control Room.

Bots

Permission	Description
View my bots	<p>Allows users to view the bots they created and bots that were assigned to them.</p> <hr/> <p>Note: You must assign this permission before assigning any other bots permissions.</p> <hr/>
Run my bots	Allows users to run the bots they created and bots that were assigned to them.
Export bots	Allows users to export bots and related bot dependencies for which they have download permission.
Download exported files	Allows users to download exported zip files.
Import bots	Allows users to import bots and bot dependencies for which they have upload permission.
Label bots	<p>Allows users to create labels for a particular version of a bot. These labels allow the users to schedule, run, queue, export, and trigger bot development workflows with the version of their choice.</p> <hr/> <p>Note: The Set production version permission is redundant in Automation 360 although it might be displayed when you migrate bots from Enterprise 11. The Label bots permission is the equivalent of Set production version in Automation 360.</p> <p>If you want to select the Export bots option, you must select the Set production version permission in such cases. Also, if you want to provide the ability to set production version, you must select the Label bots permission.</p> <hr/>

Permission	Description
Recover bots	Allows users to recover the private workspace of deleted users (Bot Creators or Citizen Developers)
Create folders	Allows users to create folders within the folders that they have access to.
Rename folders	Allows users to rename the folders to which they have access. Note: Only empty folders can be renamed.
Cancel checkout	Allows users to cancel bot checkout and unlock the file from the public repository.
Restore from git	Allows users to restore bots and files from Git.

Bot Store

Permission	Description
View Bot Store	Allows users to view Bot Store.
Add bots from Bot Store to My Bots	Allow users to add bot packages from Bot Store to their Control Room private workspace.
Submit bots to Bot Store	Allow users to submit bot packages to Bot Store.

Code analysis policy enforcement

Permission	Description
Enable enforcement for bot check-in	Allows users to check in the automation file if it has no code analysis violations.
Allow check-in with low severity violations	Allows users to check in the automation file if it has low severity code analysis violations.
Allow check-in with high severity violations	Allows users to check in the automation file if it has high severity code analysis violations.

Credentials

Permission	Description
Manage my credentials and lockers	Allows users to create, edit, and delete their own credentials. In addition, the user can interact with credentials from their assigned lockers.
Manage my lockers	Allows users to create and manage their own lockers.
Administer ALL lockers	Allows users to create, edit, and delete all lockers (including lockers created by other users) available in their Control Room.
Create standard attributes for a credential	Allows users to create a standard attribute for a credential that is shared across all users of that credential.
View and edit ALL credentials attributes value	<p>Allows authorized users to access and modify attribute values for all credentials, including masked credentials, through APIs</p> <hr/> <p>Important: Be extremely cautious while granting this permission, as it will provide the user with access to all credential values including passwords.</p> <hr/>
Bot Auto-Login Credentials API	Allow users to automate the login process to run bots remotely.

Note: A user with the `AAE_Locker Admin` role can view all credentials and lockers in the Control Room. See [System roles](#) on page 1706.

Dashboards

Permission	Description
View dashboards	Allows users to view the dashboard.

Devices

Permission	Description
Register device	Allows users to register a local host device. Devices on page 1808

Permission	Description
Edit the devices	<p>Allows users to edit the devices that they have permission to see.</p> <p>Allows you to view and manage all (registered and non-registered) devices from a specific accessible group.</p> <hr/> <p>Note: To view and manage registered and non-registered devices,</p> <ul style="list-style-type: none"> • The Control Room administrator must grant access to manage a specific set of devices. • You must select Devices from my device pool(s) to edit devices from device pools and Run as user(s) default device to edit Run as user(s) default device options in the Edit devices permission. <hr/>
Devices from my device pools	Allows users to view and edit devices from the device pools that they own.
Run as users default devices	Allows users to view and edit run-as users default devices that they have access to.
Delete the devices	Allows users to edit the devices that they have permission to see.
View and manage ALL devices	Allows users to view and manage all devices in the Control Room.
View all bot runner users	Allows users to view all run-as-users (unattended Bot Runner users) to add when creating a role, running bots, or scheduling bots.
Attest device credentials	<p>Allows users to attest device credentials for Bot Runner users. You can deploy bots on user devices with unlocked and active user session without a system password to bypass credential validation.</p> <hr/> <p>Note: This permission works only if the auto-login setting Reuse an existing session is selected in the Control Room by the administrator.</p> <hr/>
View and manage my Bot Runners, Bot Creators and device pools	<p>Allows users to view and manage Bot Creators, Bot Runners, and device pools.</p> <hr/> <p>Note: All roles have this permission by default.</p> <hr/>

Permission	Description
Create device pools	Allows users to create and manage their own device pools.
Administer ALL device pools	Allows users to manage all device pools.

Note: A user with the `AAE_Poo1_Admin` role can manage all device pools in the Control Room. See [System roles](#) on page 1706.

Discovery Bot process

Permission	Description
View assigned process	Allows users to view assigned processes. Note: This is the standard permission. You must assign this permission before assigning any process discovery permissions.
View all processes	Allows users to view all the defined processes.
Edit process	Allows users to create and edit processes.

Discovery Bot recording

Permission	Description
View all recordings	Allows users to view all recordings.
View own recording	Allows users to view their own recording. Note: You must assign this permission before assigning any of the following permissions.
Run recorder and create recording	Allows users to run the recorder and create recording.
Edit own recording	Allows users to edit their own recording.
Delete own recording	Allows users to delete their own recording.

Discovery Bot aggregation

Permission	Description
View all aggregation	Allows users to view all aggregations.

Permission	Description
View own aggregation	Allows users to view their own aggregations. Note: You must assign this permission before assigning any of the permissions below.
Create or delete own aggregation	Allows users to create and delete aggregations.
Edit aggregation	Allows users to update aggregations.
View system generated aggregation	Allows users to view system aggregations.

Discovery Bot opportunity

Permission	Description
View all opportunities	Allows users to view all opportunities.
View opportunity	Allows users to view opportunities within assigned process. Note: You must assign this permission before assigning any of the permissions below.
Create or delete opportunity	Allows users to create and delete opportunities within the assigned process.
Convert to bot	Allows users to convert an opportunity to a bot.
Export opportunity	Allows users to export an opportunity.

Event triggers

Permission	Description
View event triggers	Allows users to view event triggers.
Manage event triggers	Allows users to view and manage event triggers. Note: You must assign the view permission before assigning this permission.

Global values

Permission	Description
View and manage global values	Allows users to view, create, edit, and delete global values.

IQ Bot

Permission	Description
View IQ Bot	<p>Allows users to view the default dashboards in the IQ Bot portal.</p> <hr/> <p>Note: You must assign this permission before assigning any of the other IQ Bot permissions.</p> <hr/>

IQ Bot administration permissions

Permission ID	Description
View Administration	<p>Allows users to access the Administration tab in the IQ Bot portal.</p> <hr/> <p>Note: You must assign this permission before assigning any other administration permissions.</p> <hr/>
View and manage settings	Allows users to manage the IQ Bot portal advanced configuration settings.
View and manage migration	Allows users to access the migration utility to import and export learning instances in the IQ Bot portal.

IQ Bot domains permissions

Permission	Description
View domains	<p>Allows users to view all domains in the IQ Bot portal.</p> <hr/> <p>Note: You must assign this permission before assigning any other domain permissions.</p> <hr/>
Create domains	Allows users to create domains in the IQ Bot portal.
Import domains	Allows users to import domains in the IQ Bot portal.

Permission	Description
Export domains	Allows users to export domains in the IQ Bot portal.

IQ Bot learning instance permissions

Permission	Description
View learning instances	Allows users to view their learning instances in the IQ Bot portal. Note: You must assign this permission before assigning any other learning instance permission.
View learning instances from the same role	Allows users to view learning instances created by other users with the same role in the IQ Bot portal.
View ALL learning instances	Allows users to view all learning instances in the IQ Bot portal.
Launch validator	Allows users to access the IQ Bot Validator to review and update documents with exceptions.
Create learning instances	Allows users to create learning instances in the IQ Bot portal.
Edit learning instances	Allows users to edit learning instances in the IQ Bot portal.
Delete learning instances	Allows users to delete their learning instances in the IQ Bot portal.
Send learning instances to production	Allows users to send their learning instances to production in the IQ Bot portal.
Train learning instance groups	Allows users to train their learning instance groups in the IQ Bot portal.

OAuth connections

Permission	Description
View connections	Allows users to view the configured OAuth connections and the respective attributes.
Mange connections	Allows users to create, edit, and delete OAuth connections.

Package manager

Permission	Description
View packages	Allows users to view packages.
Manage packages	Allows users to view and manage packages.

Workload

Permission	Description
Schedule my bots to run	Allows a user to run a bot with queue
View and manage all activities from my folders	Allows users to pause, resume, and stop all the WLM automations on the bot folders which they have access to.
View and manage all activities	Allows users to pause, resume, and stop all the WLM automations.
Create queues	Allows users to create and manage their own queues.
Manage ALL queues	Allows users to manage all queues.
Export queues	Allows users to export queues.
Import queues	Allows users to import queues.

Note: A user with the `AAE_Queue Admin` role has all the workload permissions. In addition, the `AAE_Queue Admin` can manage all the queues in the Control Room. See [System roles](#) on page 1706.

Update Bot wizard permissions

You can assign feature permissions to access and convert a bot from Internet Explorer to Microsoft Edge with IE by using the **Update Bot wizard**. These permissions can be assigned from the **Administration > Roles > Create or edit roles** page.

Permission	Description
View bot update	Allows a user to view the status and summary of each bot update instance when the bots are converted on the Administration > Update Bot wizard page. However, the user cannot run the updates. To do that, a user needs the Manage bot update permission.
Manage bot update	Allows a user to run new bot updates by using the Update Bot wizard.

Permission	Description
Allow a Bot Runner user to update bots	<p>Allows Bot Runner users to send bot update status back to the Control Room so that it is visible in the Update Bot wizard report.</p> <p>This permission is assigned by default to the user with the AAE_Admin role.</p>

Bot permissions for a role

Assign bot permissions when creating a role with the View my bots feature permission.

Permission	Description
Select all	Enables users to check in, check out, view, delete, run, and schedule bots.
Run/Schedule/ Run and Schedule	<p>Enables users to run and schedule bots when the role has the Run my bots and Schedule my bots to run feature permissions.</p> <hr/> <p>Note:</p> <ul style="list-style-type: none"> This permission is limited to running bots when the role has only the Run my bots feature permission. This permission is limited to scheduling bots when the user has only the Schedule my bots to run feature permission. <hr/>
Check in	Enables users to check in bot files or folders to the public workspace from their private workspace. When this permission is selected, the Clone and View content permissions are automatically enabled. These permissions can only be disabled by an user with the AAE_Admin role .
Check out	<p>Enables users to check out bot files or folders from the public workspace. It creates an editable copy of the bot in the private workspace. A bot can be checked out by one user at a time. When this permission is selected, the Clone and View content permissions are automatically enabled. These permissions cannot be disabled.</p> <hr/> <p>Note: To check out dependent folders and files, you must have the Check out permission on the dependency folders.</p> <hr/>
View content	<p>Enables users to view the contents of a bot. This permission applies to both the public and private workspaces. To create a copy of the cloned bot or file in the private workspace, you must have the View content permission on the same folder in the public workspace.</p> <hr/> <p>Note: You must have the View content permission enabled to export a bot and its dependencies.</p> <hr/>
Clone	Enables users to create a read-only copy of the bot from the public workspace to their private workspace. A bot can be cloned by multiple users. The Clone permission must be assigned at the folder level for the bot in the

Permission	Description
	<p>public workspace. To clone a dependency folder, you must have the Clone permission on the dependency folder.</p> <hr/> <p>Note:</p> <ul style="list-style-type: none"> If you have cloned a bot and the corresponding public folder is deleted, then there will be no classifications on the cloned bot in your private workspace. Copy, view, or delete permissions will be available at the bot level. You cannot move or rename a cloned bot in your private workspace. You must have the View content permission on the same folder in the public workspace to view the contents of your cloned bot in the private workspace.
Delete	Enables users to remove files and their dependencies from the public workspace.

Related tasks

[Create a role](#) on page 1687

As an administrator, you can configure roles with permissions to access features and perform operations such as create, edit, or delete a bot in the Control Room, and assign the role to a user.

Create a Citizen Developer role

A Citizen Developer role enables the associated users to create and run bots on their registered devices.

Ensure that you are logged in to the as the administrator.

Although you can create a Citizen Developer role and assign additional custom bot permissions, ensure the role has all the feature permissions mentioned in this procedure.

1. Navigate to **Administration > Roles**.
2. Click **Create role**.
3. Enter the **Name**.
4. Optional: Enter a description.
5. Select the following feature permissions:

- Event triggers

Select the **View and manage my event triggers** option to allow the user to view, run trigger-based automation, or delete event triggers.

Note: The **View and Manage my event triggers** option is specific to the Citizen Developer license and can fail if it is assigned to users with Bot Creator or other licenses. Adding trigger events from the private repository is not supported.

- Bots

Select the **View my bots** option and the following permissions:

- **Run my bots**
- **Import bots**

- **Cancel checkout**
- Devices
 - Select the following permissions:
 - **Register device**
 - **View and manage ALL device(s)**
 - **Edit the device(s)**

6. Click **Next**.
7. Click **Create role**.

A Citizen Developer role is created in the Control Room. You can create a Citizen Developer user and assign this role to that user.

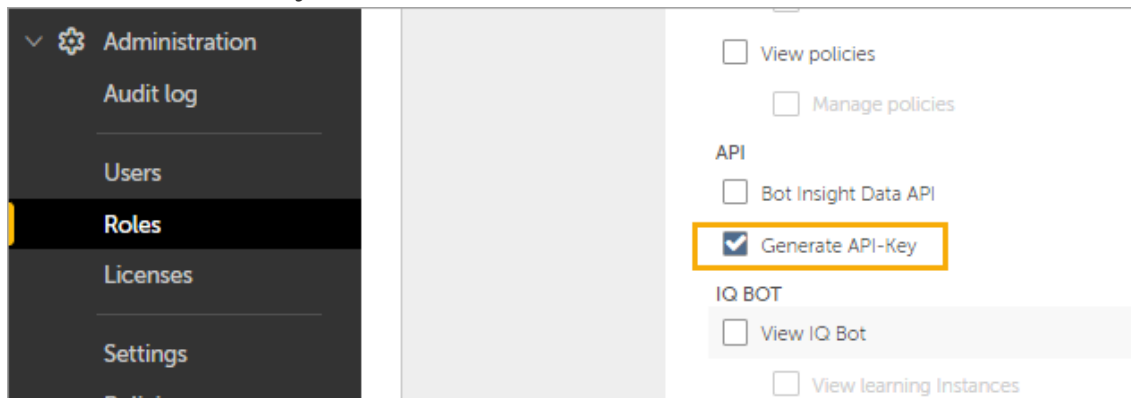

[Create a Citizen Developer user](#) on page 1684

Create API key generation role

As an Administrator, you can create a custom role to generate an API key and assign that custom role to users. By default, the `Generate API-Key` parameter is not enabled for any of the System-created roles.

To create and assign a custom role to generate an API key:

1. Log in as an Administrator to the Automation 360 Control Room.
2. Navigate to: **Administration > Roles**.
3. Click **Create role**. For more information, see [Create a role](#) on page 1687.
4. Scroll down to the **API** section.
5. Select **Generate API-Key**.

6. Enter a unique name in the **Role name** field.
7. Click **Create role**.
8. Navigate to: **Administration > Users**, and assign the custom role you just created to a non-Administration user.
9. Log in as the user you assigned the **Generate API-Key** role to.
10. Navigate to the username profile at the bottom left of the page and select **username > My settings**.
11. Click **Generate API-Key** at the top right of the page.

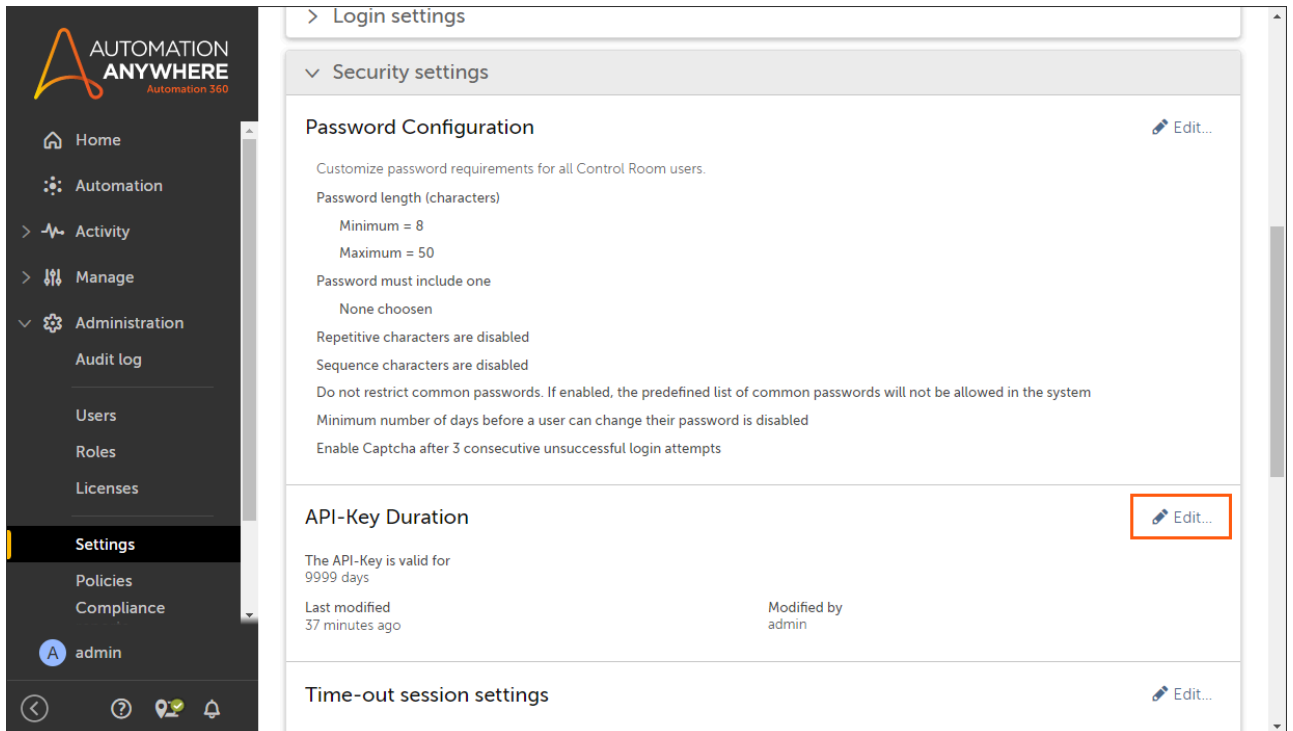

12. Copy the generated **API-Key** to your clipboard.

The API expiration field displays the date and time when the API key expires. Use this information to renew the API key so that you can run your automation seamlessly.

You can configure the validity of the API-key by setting the API-Key Duration. To set the API-Key duration,

- Navigate to: **Administration > Setting > Security Configuration** in your Control Room.
- Click **Edit**.

- Set the API-Key validity.

Note: You can set API-Key validity to a minimum of 1 minute or a maximum of 9999 days.

Use the **API-Key** to log in to a Control Room using SSO, or use the **API-Key** to log in as a user without a password.

Assign a role

Roles grant specific permissions to users, such as Bot Creators and Bot Runners.

Ensure that you are logged in to the as the administrator.

Assign specific permissions to each user. You can only select active users.

1. Navigate to **Administration > Roles**.
2. Click **Create role**.
3. Enter the **Name**.
4. Optional: Enter a description.
5. Set the required permissions for the role associated with this repository.
6. Click **Bots**.
7. Select the desired repository folder and grant associating permissions.

Option	Action
Select all	Grant all associated permissions for the repository.
Run	Permission to run bots from the repository.
Check in	Permission to import bots to the repository.
Check out	Permission to export the bot from of the repository.
Delete from Public	Permission to permanently remove bots from the Public repository.

8. Optional: Click **RUN AS**.
This is where administrators select the specific device this role will have access to.
9. Click **Create role**.

Assign this role to the appropriate Bot Creator users.

System roles

System roles are preconfigured with the permissions necessary to perform the tasks within the scope of that role. They cannot be modified or deleted. Administrators assign the roles to users to enable them to access features and perform operations in the Control Room.

Note: You can create your own roles as per your organizational requirements and use them instead of using system defined roles. You are no longer restricted to user system defines roles.

Automation 360 roles

Role	Permissions	
<p>AAE_Admin</p> <p>This role allows access to all features, enables users to create other Admin users, and access to all folders and files in the public workspace, including permissions to Create/Edit/Delete Global Values. Automation Co-Pilot for Business Users roles

Role	Permissions	
AAE_Robotic Interface Admin	Code Analysis Policy Enforcement	Enable enforcement for bot check-in
	Administration	<ul style="list-style-type: none"> • View users • Edit users • View Users and Roles basic information
	Automation Co-Pilot	<ul style="list-style-type: none"> • Cross Team Read • Cross Process Read • Global Case Management • Global Process Management • Global Team Management
AAE_Robotic Interface Manager	Code Analysis Policy Enforcement	Enable enforcement for bot check-in
	Administration	<ul style="list-style-type: none"> • View users • Edit users • View Users and Roles basic information
	Automation Co-Pilot	<ul style="list-style-type: none"> • Team Management • Case Management • Task Management
AAE_Robotic Interface User	Code Analysis Policy Enforcement	Enable enforcement for bot check-in
	Administration	View Users and Roles basic information
	Automation Co-Pilot	<ul style="list-style-type: none"> • Case management • Task management

Export roles

You can export assigned users and **Run as user** roles to a CSV file to view folder permissions, and included in offline audits and records.

Ensure that you are logged in to the as the administrator.

You can export selected roles and their permissions to separate CSV files to view the following information:

- Role to user: Provides information about the users assigned to the role.
- Role to run-as user: Provides information about the run-as users assigned to the role.
- Role to permission: Provides information about the permissions assigned to the role.
- Role to folder permission: Provides information about the folder permissions assigned to the role.

You can download the CSV file with the exported roles from the **Activity > Historical** page.

1. Navigate to **Administration > Roles**.
2. Select the assigned users and **Run as user** roles that you want to export.
3. Click the **Export checked items to CSV** icon at the top-right corner of the table.
A message is displayed indicating that the exported CSV file is available from the **Activity > Historical** page.
4. Click **Continue**.
5. Navigate to the **Activity > Historical** page and search for exported roles activity.

Note: You can search for role activity by username. The role activity name uses the following format: Role-Export: Roles_admin_03122022155910111.

6. Click the role activity that you want to download.
7. Click **Download exported zip file**.
The CSV file downloads to your local system as a zip file.

Manage Active Directory role mapping

An administrator or a user with permission to view and manage roles can view the details of the available Active Directory role mappings.

Ensure that you are logged in to the as the administrator.

By default, the Control Room will retrieve all security groups from the Users directory.

To create role mappings with filters for the Users directory along with other organizational units (OU), you must update the `um.properties` file. In the Control Room, the Users directory is considered similar to the OUs. Therefore, you must define the filter in the `um.properties` file.

For example, set the filter in the file as follows:

```
um.ldap.groupmapping.domain.filter='mydomain.com:OU1&groupFilter|
OU2&groupFilter|Users&groupFilter'
```

Note: Group filters such as `groupFilter` are optional.

In this example, by applying this change to the `um.properties` directs the Control Room to perform the following tasks:

1. Go to domain `mydomain.com`
2. Retrieve all security groups from Organization Unit OU1 that have the group name starts with `groupFilter`.
3. Retrieve all security groups from Organization Unit OU2 that have the group name starts with `groupFilter`.
4. Retrieve all security groups from Users directory that have the group name starts with `groupFilter`.

This setting ensures that the users from the organization units OU1 and OU2 will be retrieved in addition to the `Users` directory.

Recommendation: Use filters to narrow down the group display as displaying larger number of groups impacts the performance and makes troubleshooting difficult.

The filters defined in the `um.properties` file are stored in the database. When you update to a newer version of the Control Room, the Control Room references the filters stored in the database because the default `um.properties` file that comes with the installation will not contain these filters. If you define new filters in the default `um.properties` file, the Control Room references the filters defined in the `um.properties` file and overwrites the ones stored in the database.

Multiple Domain Mapping

Mapping supports multiple domains separated by a coma.

```
um.ldap.groupmapping.domain.filter='mydomain.com:OU1&groupFilter|
OU2&groupFilter|Users&groupFilter,mydomain2.com:OU3|OU4'
```

In the example above, the Control Room will perform the additional processes:

1. Go to domain `mydomain2.com`
2. Retrieve all security groups from Organization Unit OU3.
3. Retrieve all security groups from Organization Unit OU4.

Retrieving security groups from nested OUs

Example for retrieving security groups from nested OUs.

In the following example organization, consider "Marketing" as the parent OU with additional nested OUs and security groups located in each of these nested OUs.

- Marketing
 - Group 1
 - Group 2
 - US_OU
 - Group 3
 - California_OU
 - Group 4
 - NoCal_OU

- Group 5
- SoCaLOU
- Group 6

By adding the following entry, Control Room will retrieve all groups, group1, group2, group3, group4, group5 and group6 from Marketing and the nested OUs.

```
um.ldap.groupmapping.domain.filter='mydomain.com:Marketing'
```

Note: Providing nested OU in the entry is not supported.

Active Directory role mapping

Navigate to **Administration > > Roles > Active Directory role mappings** and the page displays any role mappings that are created in the Control Room. You can view or edit the role mappings. You can also create new role mappings or restart the role synchronization process between the Control Room and Active Directory.

When enabled, this synchronization process is triggered once a day (1440 minutes) by default. You can trigger synchronizations in any interval by changing the number of minutes. We recommend that you set the interval settings larger than the default.

Recommendations:

- You should set the interval settings larger than the default setting of 1440 minutes.
- The synchronization process mappings and users is process intensive. We recommend that you maintain a short list of groups and assign specific users to each of these groups on the Active Directory so that you can avoid any scalability issues.
- Do not use both **Import** and **Do not import** mappings in the same system because it may complicate use cases and make troubleshooting more difficult to correct any issues.
- If both **Import** and **Do not import** mappings are defined and a user is included in both mappings, then the **Import** mappings take precedence over the **Do not import** mappings.

Consider these examples:

- AD Mapping A = Role A – Group A – Import users from this group into Automation 360
- AD Mapping B = Role B – Group B – Do not import users from this group

Where user D is included in both Groups A and B within Active Directory.

User D will be created in Automation 360 and will be assigned Role A.

- AD Mapping A = Role A – Group A – Import users from this group into Automation 360
- AD Mapping B = Role B – Group B – Do not import users from this group
- AD Mapping C = Role C – Group C – Import users from this group into Automation 360

Where user D is included in Groups A, B, and C in Active Directory (AD).

User D will be created in Automation 360 and will be assigned to Role A and Role C.

Device license conflict

When there are multiple mappings with different device licenses and a user is mapped to all of the mappings, it becomes difficult to determine which device license will be assigned to the user because one device license is allowed per user. For this scenario, the Control Room supports a preferred ordered list that you can define in the `um.properties` file. The default configuration for device licenses in the `um.properties` file is:

```
um.ldap.groupmapping.device.license.preferable.order=Development:Runtime:AttendedRuntime
```

The mapping assignment will choose the default license based on the following order of availability:

1. Development
2. Runtime
3. AttendedRuntime
4. CitizenDeveloper

You can change the default device license by adding the preferred keyword as a new entry in the `um.properties` file.

The following table lists the keywords for the device licenses that you need to use for the preferable order list:

Keywords	License
Development	Bot Creator
Runtime	Unattended Bot Runner
AttendedRuntime	Attended Bot Runner
CitizenDeveloper	Citizen Developer

If a user is mapped to multiple mappings and the mappings have the same device license for different auto-login options (enable or disable), then the auto-login configuration will override the settings. As a result, we recommend that you keep the auto-login option consistent across all the mappings for the same device licenses.

One or more available role mappings that match your search criteria appear in the **Role Mapping** table.

Note: The role mappings page displays only the list of mappings and does not validate the mappings by default. Because the changes in security groups and roles are infrequent and take more time in case of slow network or higher number of mappings, the page displays only the list of mappings. To configure default validation on the role mappings page, in the `um.properties` file, add the following entry: `um.ldap.groupmapping.sync.on.get.mappings=true`. Validation of role mappings occurs when you sync the role mappings between the Active Directory and the Control Room.

You can run automations either on the device which is set as your bot running device or from a device pool for which you have consumer privileges ([Create a user](#)). When using Active Directory role mapping, if you want any mapped Active Directory user to be able to use more than one device, you must configure a device pool ([Create device pools](#)).

Sync Active Directory role mapping

Manually or automatically synchronize (sync) role mappings between the Active Directory and Control Room.

Automatically synchronize Active Directory role mapping

By default, synchronizing between Active Directory and Control Room occurs by default at the time interval of 1440 minutes (one day). The time interval for synchronization can be changed in the Active Directory role mappings main page.

Note: As this can be a time-consuming and an expensive operation, set the role synchronization time period to the default value of 1440 minutes (1 day).

Manually run or restart synchronizing Active Directory role mapping

To run or restart automatic synchronizing between the Active Directory and Control Room, do this: From the Control Room go to the **Active Directory role mappings** page and click the **Sync roles from Active Directory** option.

This starts the synchronizing process immediately and continues to run it automatically based on the time interval set.

Cancel automatic synchronizing Active Directory role mapping

To cancel automatic synchronizing between Active Directory and Control Room, do this: From the Control Room go to the **Active Directory role mappings** page and click the **Cancel Sync** option to turn off the periodic automatic sync.

Events that require Active Directory role mapping sync

Sync the role mappings whenever these events occur:

- Changes to AD groups

If any group that is mapped is deleted from the AD, the mappings must be validated before they are deleted because the group is no longer available.

- Update to the license file

Updating the license file can change the available roles. Mappings must be synchronized before updating the roles.

Note: After a sync, the user must wait a few seconds for the updated changes to appear.

Create Active Directory role mapping

When users are created, they automatically inherit the roles assigned to their Active Directory security groups. Create the mapping before synchronizing the user and roles during the user login or background process.

To complete the task, you must have **AAE_Admin** role assigned to you. Ensure you are logged in to the Control Room as the administrator.

In order to create a role mapping, as the administrator will have to provide the following information:

- Unique mapping name.
- The targeted domain where the security groups will pulling the credentials from (see `um.properties` for details).

Note:

In order to avoid to import a long list of users, a specific security group should be created on the AD side that has only the users who will access Control Room is recommended.

Map a single AD security group to one or more Control Room roles. Create any roles you want to use with the Active Directory security groups. You can also use the default roles available in the Control Room. .

Note: It is recommended that the `AAE_Admin` role not be used.

-
1. Log in to the Control Room.
 2. Navigate to **Administration > Roles**.
 3. Click **Active Directory Role Mapping**.
 4. Click **Create Role Mapping**.
 5. Enter the **Name**.
 6. Click the **Active Directory domain** drop-down and select an available domain.
 7. Use the **Active Directory security group** field to search for a group.
For example, if you have a group named `Certified Publishers`, search for `Certified`. All the groups that contain `Certified` in their name are listed in **GROUPS**.
 8. Choose whether **Import users** or **Do not import users**.

Option	Outcome
Import users	<p>All the users who are assigned for the selected security group will be created and assign the mapped roles and licenses in Control Room. If users already exist in Control Room, they will be updated with the latest roles and licenses from the mapping.</p> <p>If synchronization process is enabled and triggered, the existing Control Room users will have the updated roles and licenses from the mapping.</p> <p>If there are new users added to the security group on the Active Directory side, these users will be created in the Control Room.</p> <p>If there are users removed from the security group, these users will be deleted from Control Room.</p>
Do not import users	<p>After the role mapping is created; no user will be created in Control Room. How this mapping is being used in this deployment:</p> <ul style="list-style-type: none"> • On the Create user configuration page, when you create a new user, the role(s) will automatically be assigned to the new user if any of the user security group maps to the existing role mapping. • If synchronization process is enabled and triggered, any existing Control Room users whose security group maps to any role mappings will get the role assignment updated.

When you create multiple Active Directory (AD) role mappings for multiple security groups, the roles used in the mappings are combined for the users who belong to the security groups.

Consider the following example:

- AD Mapping 1 = Role Y – Group Y – User A, User B, User C
- AD Mapping 2 = Role Z – Group Z – User A, User D, User E

Where User A is part of both Groups Y and Z within Active Directory. User A will be created in Automation 360 and will be assigned Role Y and Role Z. If you delete AD Mapping 2, then Role Z will be removed for User A. However, User A will continue to use Role Y.

Note: After a mapping is created and switched from the **Import user** to **Do not import users** option, the previously assigned licenses are retained for the users.

9. Click the right arrow (→) to add your selection.
10. Select the required role from the list of **Available roles**.
11. Click the right arrow (→) to add your selection.

12. Select the device licenses to assign to the security group.

License mapping is only supported when the **Import users** options is selected.

Note: The **Do not import users** option does not support license assignment. Administrators will be required to map the licenses manually for users. If any of the licenses that are defined in the mappings became unavailable during the synchronization process (not enough license), licenses will not be assigned to the users. Therefore, ensure that there is enough licenses before creating the mappings.

You can run automations either on the device which is set as your bot running device or from a device pool for which you have consumer privileges ([Create a user](#)). When using Active Directory role mapping, if you want any mapped Active Directory user to be able to use more than one device, you must configure a device pool ([Create device pools](#)).

13. Click **Create Mappings**.

When the synchronization runs, all users with the assigned roles are updated.

Edit Active Directory role mapping

As an Automation Anywhere Control Room administrator, edit the Active Directory security group mappings assigned to roles in the Control Room.

Ensure that you are logged in to the as the administrator.

Ensure that the mapping name is unique and cannot be duplicated. If you rename a map with an existing mapping name, an error message appears stating that the same name already exists. Changes to mapping name or roles are updated in the audit log.

1. Navigate to **Administration > Roles**.
2. Click **Active Directory Role Mapping**.
3. Hover over the **Actions** icon for the role and select **Edit role mapping**.
4. Supply any required changes for Role Mapping.

Edit the roles by either adding or removing roles from the **Available roles** list, except Bot Insight roles. If you assign Bot Insight roles, an error message appears stating that the role mapping cannot be updated as it contains unsupported roles.

Note: You cannot edit the rest of the fields. The process to update mappings and synchronize users starts at a previously defined interval or when you manually update the mappings.

5. Click **Save changes**.

When the LDAP sync runs, all users with the assigned roles are updated.

Delete Active Directory role mapping

An administrator or a user with permission to view and manage role can delete role mappings listed in the Role Mapping table.

Ensure that you are logged in to the as the administrator.

1. Navigate to **Administration > Roles**.
2. Click **Active Directory Role Mapping**.

3. Hover over the **Actions** icon for the role and select **Delete role mapping**.
4. Click **Yes, delete**.

Manage licenses

The Automation Anywhere Control Room provides an automated mechanism for tracking the use of licensed software across multiple Control Room instances and share these entitlements in real-time.

Note: Ensure that you add the static IP address (192.124.249.160) of the Cloud license server to the safe recipients or trusted list to allow your On-Premises Control Room to connect to the Cloud license server.

The Control Room can also use your network proxy to connect to the Cloud license server provided your Control Room is connected to the proxy server. For more information, see [Configure forward proxy settings](#) on page 1749.

All licenses

Automation Anywhere Control Room administrators can view and manage user license entitlements for your account. Navigate to **Administration > License** to view a summary of product licenses.

The following image displays licenses information for a Control Room:

Licenses Sync license from server Install license from server...

License mode: Purchased **1** Last updated: Jun 14, 2023 **2** Control Room license expires: Wed, 11 Mar 2026 23:59:59 UTC **3**

Products **4**

- Control Room
- Document Automation Platform
- Document Automation Classifier
- Bot Insight
- Discovery Bot
- Automation Anywhere Robotic Interface (AARI)

Licenses 5	Total purchased	Used in this Control ...	Used in other Contro...	Remaining licenses

The **Licenses** page provides the following information:

Field/option	Description
1	Indicates whether the Control Room license is a purchased or trial license.

Field/option	Description
2	Displays when the Licenses page was last updated.
3	Displays the license expiration date and time.
4	Indicates whether the license is available for the specified product.
5	<p>When a license type is available, the link to the license is activated and you can click the link to view the license details.</p> <p>Displays license details for:</p> <ul style="list-style-type: none"> • Total available: Displays the total number of available licenses. • Used in this Control Room: Displays the total number of licenses used in the Control Room where you are viewing the license information. • Used in other Control Room: Displays the total number of licenses used in other Control Rooms. • Remaining licenses: Displays the number of unassigned licenses.

License Cloud services

To edit and or update the license settings, via the License Cloud service, **Click Edit license settings** and supply the necessary information on the **Edit** page.

For more information on this subject, see these resources:

- [Licenses and cloud services](#) on page 1344
- [Managing Cloud and file licenses](#) on page 1346
- [View and edit Cloud Control Room instances](#) on page 1361

License summaries

The License Summary table details the status of all licenses deployed, or available to be deployed, across any active Control Room. The details displayed are from the point-of-view of the current Control Room to which you are logged into. This real-time access to license information from multiple deployments across the network enable a seamless integration for allocation of needed RPA resources as the need arises.

Updating licenses from a server

To add licenses for users, select the desired method of accessing the license by clicking **Install license from server** or **Install license from file**.

View license details

You can view license details for the various licenses assigned to users in one place.

When a license type is available, the license link becomes activated on the **Licenses** page and you can click the activated license link to open the **License details** page.

The following image shows license details for Control Room instances:

The **License details** page provides the following information:

Field/option	Description
1	Displays the selected license and its description. You can click the drop--down to select a different license to view the details.

Field/option	Description
2	<p>Displays the following information:</p> <ul style="list-style-type: none">• User licenses: Displays the license type.• Total purchased: Displays the total number of licenses purchased.• Used in this Control Room: Displays the total number of licenses used in this Control Room where you are viewing the license information.• Used in other Control Rooms: Displays the total number of licenses used in other Control Room instances.• Remaining licenses: Displays the number of remaining licenses.
3	<p>Usage details: Displays the license usage details by users in this Control Room and usage details for the license type across other Control Room instances.</p>

Field/option	Description
4	<p>This Control Room: Displays the Control Room name and the licenses allocated to the different users in this Control Room.</p> <p>Control Room details: Displays the following information:</p> <ul style="list-style-type: none">• Control Room name: Displays the name of the Control Room where you are viewing the license information.• Licenses allocated: Displays the licenses used in the Control Room where you are viewing the license information. <p>User details: Displays the list of users using the license and their details. You can search for a specific user.</p> <p>The following information is displayed for the users:</p> <ul style="list-style-type: none">• Username: Displays the username.• First name: Displays the first name of the user.• Last name: Displays the last name of the user.• Last login: Displays when the user was last logged in.• User status: Displays if the user is enabled or disabled.• Role: Displays the roles assigned to the user.• Last modified: Displays when the user license was last modified.• Modified by: Displays the user who modified the user license. <p>To view user details, click the menu button and click View user to view the user information.</p>

Field/option	Description
5	<p>Other Control Rooms: Displays the other Control Room instances for the same account, and the number of licenses used in each Control Room instance.</p> <p>Other Control Rooms details: Displays the Control Room instances and the licenses used in each Control Room instance. You can search for specific Control Room instances.</p> <ul style="list-style-type: none"> • Control Room names: Displays the Control Room name. Click the name to view the Control Room. • License allocated: Displays the number of licenses used in the Control Room.

Installing additional licenses

Upload new licenses to the Automation Anywhere Control Room to be distributed to users as required.

Ensure that you are logged in to the as the administrator.

Designate the source of the license (server or filepath) to load into the Control Room. You may also take advantage of the License Cloud services from this page if enabled. Please see [Licenses and cloud services](#) on page 1344 for more information.

1. Navigate to **Administration > Licenses**.
2. Select **Install license from server** or **Install license from file** or **Edit license settings**.

Choose installation source.

Option	Action
Install license from server	<ol style="list-style-type: none"> a) Supply the unique Control Room GUID. b) Click Install license from server.
Install license from file	<ol style="list-style-type: none"> a) Browse to and select the license. b) Click Install license from file.
Edit license settings	<ol style="list-style-type: none"> a) Enter you unique GUID in the filed provided.

3. Click **Save changes**.

Related reference

[Users](#) on page 1676

As an administrator, you can create, view, edit, delete, and enable or disable a user. Creating users steps vary depending on whether the user is a non-Active Directory, Active Directory, or single sign-on (SSO) user from an IdP server.

[System roles](#) on page 1706

System roles are preconfigured with the permissions necessary to perform the tasks within the scope of that role. They cannot be modified or deleted. Administrators assign the roles to users to enable them to access features and perform operations in the Control Room.

[Settings](#) on page 1728

Use the **Settings** tab to configure the connection to the Credential Vault, enable email notifications, integrate the Control Room with a Git repository, enable secure recording mode, and configure user authentication.

Create your users and assign their licensed roles

Create a user and assign their specific license based role.

Ensure that you are logged in to the as the administrator.

Create or otherwise edit the user information to assign the licensed role for accessing repositories, packages, and bot building tools and functionality.

1. Navigate to **Administration > Users**.
2. Click **Create user**.
3. Enter the required general details as follows:

Field	Value
Enable User	Select for the user to be activated and log in immediately. Note: If this option is not selected, user will be in the inactive state and cannot log in.
Username	Enter a unique user name.
Description	Enter a description for the user.
First name	Enter the first name for the user. Note: The number of characters allowed in the First name field is 50.
Last name	Enter the last name for the user. Note: The number of characters allowed in the Last name field is 50.
Password	Enter and confirm a password for the user. Ensure that the password follows all the necessary password policies.

Field	Value
Email	Enter and confirm the email address for the user. If SMTP is enabled, an email is sent to this address to confirm the account. All important Control Room notifications are sent to this email address.

4. Select the required role from the list of **Available roles**.
5. Click the right arrow (→) to add your selection.
6. Select **Allow** to allow multiple sessions.
You must be Control Room administrator to set a user as a multi-login service user. It is possible to set a user as a multi-login user either in the UI or API, however a user may only access multiple sessions through the API.
7. Assign the device Bot Creator license to the user.
The Bot Creator license enables user to create and run bots. Auto login is enabled by default.

Note: When you logged in as administrator, you cannot allocate any device license to the user and **None** option is selected by default.

License	Privilege
None	The user can access the Control Room only.
Bot Creator- Development license	Enables user to create and run bots. Auto login is enabled by default.
Unattended Bot Runner - Run-time license	Users with this license can perform all automation tasks that attended users can perform. Additionally, this license can also be used for Control Room deployment, centralized scheduling, and API-based deployment.
Attended Bot Runner - Run-time license	Users with this license can run bots on their devices and use any event trigger associated with their user account or role. However, these users cannot schedule bots.
Citizen Developer - Development license	Users with this license can create and run bots (including bots with triggers) on their devices.

The **Bypass legal disclaimer** option is automatically enabled to allow the user to run bots on a device without having to manually acknowledge a disclaimer.

After you select a device license, the **Device login credentials** are enabled. If you have the **Attest device credentials** permission, you can choose to attest the device credentials for this user to bypass credential validation when you deploy bots. The Bot Runner user should have an unlocked and active user session.

Note: This works only if the auto login setting **Reuse an existing session** is selected in the Control Room by the administrator.

8. Click **Create user**.

Update the Bot Creator packages and grant permissions to this user to build, test, and run bots. For more information, see

- [Automatic package updates for On-Premises Control Room](#) on page 1840
- [Automatic package updates for Cloud Control Room](#) on page 1841
- [Feature permissions for a role](#) on page 1688
- [Bot permissions for a role](#) on page 1702

Settings

Use the **Settings** tab to configure the connection to the Credential Vault, enable email notifications, integrate the Control Room with a Git repository, enable secure recording mode, and configure user authentication.

Bots

- Secure recording mode ensures that sensitive data is not stored in the bots. When secure recording mode is enabled, the bots do not capture values of certain properties or store application images. You can enable this setting for some or all users of the Control Room.

Note: Secure recording mode only applies to bots that are created or edited after the mode is enabled.

Click **Edit** in the **Bots** tab to enable or disable secure recording mode. See [Secure recording](#) on page 990.

- Bot validation performs an additional compile time validation on migrated bots at the preprocessing stage to save your time and effort. By default, the Bot validation feature is set to **Off**.

Note: You must be a Control Room administrator to view and edit the validation option.

Navigate to **Administration > Settings > Bots** and set the bot validation option to **On** to detect compilation errors with bots.

Validation happens at the time of running the bot, for new bots. For migrated bots, this check is performed immediately after bot migration, per configuration.

For example, if a parent bot calls a child bot and the child bot has compilation errors, these errors are displayed when you try to run the parent bot. This ensures that an error does not occur in the middle of an automation or make it an incomplete automation.

In the Bot migration results page, select a bot that needs review. Click the three dots under **Reason** tab to see the details. With the Bot validation feature set to **On**, the bots that have compile time errors are displayed as a separate line entry in the migration report.

Migrated bots with compilation errors are shown in **Successful with Review** section of the migration report and ensures that you can get a list of bots that require your attention.

- Loop package enables you to run a sequence of actions repeatedly for a specific number of times or until a specific condition is met.

For bots that were created using the Loop action in Automation 360 v.26 or earlier releases, you can enable the **Legacy Loop behavior** option from the **Administration > Settings** to iterate the loop based on the specified value.

In the **Legacy Loop behavior** tab, click **Edit** to select one of the following options:

- 1. Enabled:** Loop is iterated based on the specified value. When you select this option and either increment or decrement the variable value in the end condition, loop iterations will not vary dynamically based on the new value generated.
- 2. Disabled:** Loop iterations will continue to vary dynamically based on the variable value generated in the end condition.

Policies

Code Analysis: Enable the code analysis feature to run code analysis on your automations. This feature analyzes the code and displays a list of violations based on a set rules. You can review and fix any coding or stylistic errors for your automation.

[Code analysis](#) on page 2103| [Code analysis policy management](#) on page 2106

Devices

When there is a new version of the Bot Agent, it is automatically updated.

IQ Bot

View the website address where IQ Bot is currently installed, if applicable. Click **Edit** to update the IQ Bot URL.

Email

All users must confirm email accounts by clicking the confirmation link that they receive, set the password, and security questions before user can log in to the Automation Anywhere Control Room. By default, email notifications are disabled. Hover over the **Edit** icon to make changes.

[Edit email notifications](#) on page 1758

Git integration

Remote Git repository must support Git LFS (Large File Support). Bots are synced using standard Git push over HTTPS.

CoE Manager

Enable access to CoE Manager from the Control Room so that you can access CoE Manager from the quick links section on the Control Room home page.

[Enable CoE Manager](#) on page 2006

Login settings

For security, privacy, or any other pertinent announcement, you can provide an additional statement, such as consent text, in the **Login settings** section. The statement is visible to users every time they log in to the Control Room.

This statement on the login page is disabled by default. If you enable it, you can also provide an option (using a check box) for users to read and accept the statement before logging in to the Control Room.

Security settings

Password Configuration

Administrators can configure password requirements for users to log in to the Control Room. This configuration prevents users from setting weak or most commonly used passwords that might prevent unauthorized access to the Control Room.

Password length (characters): Password length determines the strength of a password.

- **Minimum:** Set the minimum number of characters allowed for the password. By default, the minimum number of characters is set to eight and the number cannot be reduced further.
- **Maximum:** Set the maximum number of characters allowed for the password. By default, the maximum number of characters is set to 50 and cannot be set to more than 64 characters.

You can also enforce the users to include one of the following characters in the password:

- A number
- An alphanumeric letter
- A symbol
- A capital letter

Note:

- On-Premises users: The check-boxes for **Alphabetical character**, **Number**, **Capital letter**, and **Special character** are enabled, and the user can select or deselect the options.
- Cloud users: The check-boxes for **Alphabetical character**, **Number**, **Capital**

letter, and **Special character** are disabled, and the user cannot select or deselect the options.

Repetitive Characters: Repetitive characters such as aaaa, bbbb, cccc, and so on in passwords make it easier for attackers to guess the password and are considered to be weak passwords.

- **Allow unlimited repetitive characters:** This option is set as default and allows users to use unlimited repetitive characters in their passwords. Selecting this option might allow users to set weak passwords and vulnerable to attacks.
- **Limit repetitive characters:** Select this option to restrict the users from using repetitive characters in their passwords. Set the repetitive characters limit in the **Maximum characters can be repeated** option. If you set this limit as one, then no characters in the password can be repeated. If you set this limit as two, users can use two repetitive characters in their passwords. For example, users can use aa, bb, and so on in their passwords.

Sequence Characters: Sequential characters such as qwerty, 123456, abc123, and so on in passwords make it easier for attackers to guess the password and are considered to be weak passwords.

- **Allow unlimited sequence characters:** This option is set as default and allows users to use unlimited sequential characters in their passwords. Selecting this option might allow users to set weak passwords and vulnerable to attacks.
- **Limit sequence characters:** Select this option to restrict the users from using sequential characters in their passwords. Set the sequential characters limit in the **Maximum characters can be used in sequence** option. If you set this limit as one, then no characters in the password can be used in a sequence. If you set this limit as two, users can use two sequential characters in their passwords. For example, users can use 12, ab, and so on in their passwords.

Restrict common passwords from the system: Allowing users to use common passwords such as 123456, qwerty123, 1q2w3e, and so on makes it easier for attackers to guess the passwords and are considered to be weak passwords.

- **Do not restrict common passwords:** This option is set as default and allows users to use commonly used passwords. Selecting this option might allow users to set weak passwords and vulnerable to attacks.
- **Restrict common passwords:** Select this option to restrict the commonly used passwords. Add the commonly used passwords on separate lines in the text box to avoid users using such passwords.

Set minimum number of days before a user can change their password: If you allow users to change their passwords anytime, they can continue to use the same password even if there is a restriction about not using the last few instances of their passwords. For example, if a user is prompted to change their password and restricted to not use any of their last three passwords, the user can change the password three times continuously and set their existing password the fourth time. Setting a minimum number of days before a user can change their password restricts the user from using the same password when they are prompted to change their password.

- **Disabled:** This option is set as default and allows users to change their passwords anytime. Selecting this option might allow users to use the same password and vulnerable to attacks.
- **Enabled:** Select this option to set the number of days users are restricted from changing their passwords. The maximum number of days that you can set is 10. For example, if you set the days to five, a user can change their password again only after five days of changing their password.

Captcha and user lockout: This option prevents attackers from using scripts or bots to guess user credentials and locks the user account after certain unsuccessful login attempts.

- **Captcha on:** This option is set as default and prompts users to solve a captcha before

logging into their account. Set the **Lock the user out after unsuccessful login attempts** option to lock the user after the set number of unsuccessful login attempts.

- **Lockout on:** Set the **Lock the user out after unsuccessful login attempts** option to lock the user after the set number of unsuccessful login attempts.

API-Key duration

The generated API-Key is used to authenticate users. You can customize how long the generated API-Key is valid to authenticate users until either:

- A selected duration is reached (in minutes or days), or
- A new API-Key is generated

Note: You determine the validity duration based on your organization's requirements. Maximum supported API-Key duration is 1 to 14,398,560 minutes, or 1 to 9,999 days.

Time-out session settings

You can enable time-out settings to automatically sign out users from the Control Room browser session after the specified minutes of inactivity. You can set the **Time-out session setting** field to one of the following values: 10 minutes, 20 minutes, 30 minutes, 40 minutes, 50 minutes, 1 hour, 2 hours, 4 hours, 8 hours, 12 hours, 24 hours, or 7 days. You can configure the session using increments of 10 minutes or 1 hour. The default value is 20 minutes, which means you will be logged out of the session after 20 minutes of inactivity.

File upload settings

As an Administrator, you can restrict the upload of executable files (dll files, media type application/x-msdownload) to prevent a security breach. To use this feature, enable the **File upload settings** in **Administration > Settings > Security settings**.

Two factor authentication (2FA)

Enable 2FA to provide an additional layer of defense against unauthorized users from accessing the Control Room. As an administrator, you can set up 2FA so that the users can validate their identity when logging in to the Control Room using both their user credentials and a second authentication factor.

[Two-factor authentication](#) on page 1747

Audit log retention

If you want to retain audit log entries for only a limited period to save storage space or if you do not want to retain historical audit log entries, configure your settings to automatically purge (delete) such entries.

- **Do not purge:** Audit log entries are retained and never deleted.
- **Purge older than 15 months:** Audit log entries that are older than 15 months are automatically deleted.
- If you are updating to v.30 release from a previous release, then you must manually enable the **Purge older than 15 months** option.
- If you are directly setting up v.30 or later releases, the **Purge older than 15 months** option is enabled by default.
- The audit log entries are deleted once a week from the time the **Purge older than 15 months** option is enabled.

Bot promotion settings

Add the approved list of target URLs so that you can move bots and files between Control Room instances in a single flow, thus avoiding the multi-step export and import process.

[Move bots across environments](#) on page 1971

Notification settings

Manage the notification settings for notification categories and channels. The notification settings defined by the Control Room administrator are applicable for all the Control Room users. Based on these defined settings, Control Room users will be notified about the events.

[Administer notifications for Control Room](#) on page 2129.

User authentication

Configure the to authenticate users through the database option or switch to a SAML Identity Provider (IdP).

[Set up SAML authentication](#) on page 1330

Network settings

Forward Proxy Configuration

Configure a forward proxy so that Control Room features can connect to Cloud-hosted Control Room services outside of customer's internal network.

[Configure forward proxy settings](#) on page 1749

External key vault

[External key vaults](#) provide a way to securely store and retrieve credentials using a third-party key manager such as CyberArk, Azure, and AWS Secrets Manager.

Related tasks

[Set up SAML authentication](#) on page 1330

Switch user authentication for Control Room from Control Room database to SAML single sign-on (SSO).

[Edit email notifications](#) on page 1758

You can edit the email settings to select scenarios in which a Control Room sends email notifications.

Manage device settings

Control Room administrator can configure the device settings to automatically set a user's default device when that user logs into Control Room.

Related tasks

[Configure screen resolution for a device session](#) on page 1739

For user devices, you can set the screen resolution of the Bot Runners for every bot deployment through the RDP in the Control Room.

[Configure temporary devices](#) on page 1741

Configure your device settings to automatically delete a temporary device when the device is disconnected from the Control Room after a certain time interval.

[Configure threshold settings for user devices](#) on page 1741

Configure the CPU utilization and device memory threshold values to control the concurrent bot deployment on user devices based on resource utilization.

[Configure auto-login settings](#) on page 1742

Configure auto-login settings in the Control Room to either create user sessions or reuse existing user sessions to reduce the bot startup time.

Configure general settings

Configure the default device setting for temporary or non-persistent devices so that users of such devices users do not have to log in to the Control Room to mark their device as a temporary device.

1. Navigate to **Administration > Settings > Devices**.
2. Click **Edit** in the **General** tab.
3. To automatically set a logged-in user's device as the default device, verify that the **Enabled** option is selected.
The option is selected by default. You can change it to **Disabled** if you do not want to set a logged-in user's device as the default device.
4. (Optional) While enabling users to switch Control Room

5. Click **Save changes**.

Configure device registration

Control Room administrator can customize and configure the default device registration settings.

1. Navigate to **Administration > Settings > Devices**.
2. Click **Edit** in the **Device registration configuration**.
3. Use **Device type** to change the default setting:

- **Single user**: is the default setting and enables only a single user session on the device.

Use **Deployment type** to change the default setting:

- **Remote Desktop Protocol**: When you deploy a bot for an unattended Bot Runner from the Control Room, the Control Room handles the unattended Bot Runner session through Remote Desktop Protocol (RDP) setting and executes the bot.

Note: If your registered local device is a laptop or a desktop (local device) that does not support RDP, your bot execution will fail as local device does not support RDP. Additionally, this is applicable to the **Device type > Multiple users** since the multiple users are not supported on local devices.

- **Regular** (Default): For regular deployments, a Windows session is created using the existing resolution settings of the device. In this case, the screen resolution set in the Control Room is ignored.

- **Multiple users**: enables multiple users to concurrently log into a single device.

Enter the number of sessions in the **Concurrent sessions** field. The maximum number of allowed concurrent user sessions depends on your device license type and the hardware configuration. For example, if your device license permits 4 users, you can have up to 4 concurrent user sessions, and each session would require a minimum of 4 GB RAM for execution. If your system RAM is lower than this value, the bot execution might fail.

For information on Bot Agent device requirements, see [Bot Agent device requirements](#) on page 1282.

4. Use **Lifespan** to change the default setting:

- **Persistent**: is the default setting and the devices are created to support persistent virtual desktop infrastructure (VDI) and are not deleted after the device is disconnected from the Control Room.

Note: Non-persistent desktops are stateless desktops that get destroyed at the end of the session. Non-persistent VDIs do not exist when the user logs out.

- **Temporary**: devices are created to support non-persistent virtual desktop infrastructure (VDI) and are automatically deleted after a specified time when the device is disconnected from the Control Room. You can specify the time to automatically delete the temporary devices in the **Devices** settings of Control Room.

5. Optional: Select the **Use these settings while registering a device through registration wizard** check box.

If you enable this option, the device registration settings that you have configured are automatically applied during device registration. For example, if you have changed the device

type from **Single user** to **Multiple users**, the device type will be set as **Multiple users** for all new device registrations.

6. Click **Save changes**.

Configure browser extensions

You can customize the browser extension settings for user devices at the device level. Customizing the setting helps you to continue to use browser-based automations seamlessly even when there is an update to the browser extension.

- You must be a Control Room administrator to configure this setting.
- You must have installed Bot Agent version 21.222 or later.
- You must have installed the Bot Agent with installation type as system-wide.

By default, the Google Chrome and Microsoft Edge browser extensions are enabled on all Bot Agent devices. When this option is enabled, the browser extensions are automatically updated on all the connected devices through a single click.

1. In the Control Room, navigate to **Administration > Settings > Devices**.
2. In the **Browser extensions** settings, select **Edit** and then select one of the following options:
 - **Enabled**: Select this option to enable the Google Chrome or Microsoft Edge extensions on all the connected devices.
 - **Disabled**: Select this option to disable the automatic update of browser extensions. This option is applicable only when a Bot Agent is upgraded or a new Bot Agent is installed.
 - **Force disable Chrome and Edge extensions from all bot running devices**: Select this option when you want to manually upgrade the browser extension.

This option disables browser extensions on all the Bot Agent devices.

Note: These settings on the browser extension depends on the `ExtensionInstallForceList` group policy. None of these settings can be applied if the `ExtensionInstallForceList` group policy with Automation Anywhere extension is not available in the system.

Note: Selecting this option might disrupt the functioning of your browser-based automation.

Consider the following when configuring the browser extensions option:

- If the **Browser extensions** option is selected and you disable this option when the **Force disable extension on all bot running devices** option is unselected, then the `ExtensionInstallForceList` group policy is not applied on the devices that are newly registered or upgraded. You will have to enable the extension manually on the newly registered or upgraded devices.
- If the **Browser extensions** option is selected and you deselect it, with the **Force disable extension on all bot running devices** option selected, the `ExtensionInstallForceList` group policy is deleted from all the Bot Agent devices and you must manually update the browser extension.
- If the **Browser extensions** option is unselected and you select it, the group policy changes are pushed to all the Bot Agent devices.

Note: Automation Anywhere does not interfere with the `ExtensionInstallForceList` group policy if it is already present on the system. However, if a key by name **1** is already present in the `ExtensionInstallForceList` folder, create a key name with the subsequent number, in this case, **2**. See [ExtensionInstallForcelist](#) for Google Chrome or [ExtensionInstallForcelist](#) for Microsoft Edge.

Configure log collection

The log collection configuration enables you to collect log entries from the devices connected to the Control Room.

You can view the system log information on your device at the following locations:

- Bot Agent installed as admin user: `C:\ProgramData\AutomationAnywhere\BotRunner\Logs`
- Bot Agent installed as local user or non-admin user: `%userprofile%\AppData\Local\AutomationAnywhere\BotRunner\Logs`

The following logs are collected:

- Node manager logs
- Bot launcher logs
- Browser extension logs

Note: Starting from Automation 360 v.29 (Cloud), all the Bot Agent logs are retrieved and stored in the Amazon Simple Storage Service (Amazon S3) by default for all instances. This is only applicable to the Amazon Web Services (AWS). The Bot Agent logs are collected at a regular interval and might result in the slowness of Control Room.

Although a Control Room administrator can disable the log collection functionality, it is not available as part of the standard Automation 360 Cloud. Contact your Automation Anywhere Customer Success Manager (CSM) for assistance.

You can choose to collect one of the following log-level information:

Note: In the production (PROD) environment, we recommend that you set the log file configuration level to **INFO** for optimal performance.

- **Info (default):** Informational messages that highlight the progress of the application
- **Debug:** Fine-grained information that is useful for debugging an application
- **Trace:** Captures every behavior of the application in detail

1. Navigate to **Administration > Settings > Devices**.
2. Click **Edit** in the **Log collection configuration** tab.
3. To configure the level of log collection, select one of the following:
 - **Info** - to get informational messages that highlight the progress of the application.
 - **Debug** - to get detailed information that are useful for debugging an application

- **Trace** - to capture the application behavior in detail.
4. Set the maximum log file size between 1 MB and 100 MB.
 5. Set the maximum number of log files between 1 and 500.
 6. Save the settings.

Configure screen resolution for a device session

For user devices, you can set the screen resolution of the Bot Runners for every bot deployment through the RDP in the Control Room.

This task is performed by the user who wants to build and deploy . You must have the necessary rights and permissions to complete this task, and authorization to log in to the as the licensed user.

The RDP session is created using the set screen resolution during bot deployment.

1. Navigate to **Administration > Settings > Devices**.
2. Edit the **Resolution settings for a device session** field.
3. Set the resolution by either selecting a predefined value from the **Screen resolution** drop-down list or by selecting **Custom** and entering the values you want.

Note that the screen resolution settings are applicable only when you use RDP-based deployments. For regular deployments, a Windows session is created using the existing resolution settings of the device. In this case, the screen resolution set in the Control Room is ignored.

Note: When resolution dependent packages are used to build bots, any screen resolution difference between the Bot Creator and Bot Runner device will impact the bots during runtime. Therefore, ensure the resolution settings on devices match when you create and run bots. See [Screen resolution dependent packages](#) on page 1739.

4. Select one of the following options:
 - **Enforce this screen resolution for existing device sessions**

To enforce the resolution settings at the device level.

Note: Option to enforce the screen resolution at a device or Control Room level only works for new device sessions and not on existing device sessions.

- **Do not allow devices to override resolution settings**

To ensure that the resolution settings cannot be changed at the device level.

5. Click **Save**.

Screen resolution dependent packages

The screen resolution between the Bot Runner and Bot Creator device should be consistent as when resolution-dependent packages are used to build bots, any screen resolution difference between the Bot Creator and Bot Runner device will impact the bots during runtime.

Ensure the resolution settings on Bot Creator and Bot Runner devices match when you create and run bots. Review the table given below for information on the resolution-dependent packages and their attributes.

Package	Effects of display parameter changes	Resolution-dependent attributes
Image Recognition	<p>If we use the Image Recognition package in a computer that has a different resolution, scaling, or zooming than the resolution that was configured in the system, it can affect the output as it works on image pixel values and the features.</p> <p>For RDP machines, when you configure Image Recognition package in a different machine and run it on an RDP machine with same resolution and scaling, and if RDP is using a different display driver, the capture might not be accurate. It can render image with slightly different pixel values that can cause a reduction of matching percent.</p>	X, Y, width, and height
Mouse	<p>The Mouse > Click action requires X and Y coordinates to capture the UI element. If there is a change in screen resolution, scaling, or zooming, the coordinates might move, and it might click different coordinates. Due to this, the Click action will fail to capture the specific UI element. If you are using the RDP machine with the same resolution, scaling, or zooming then it will not create any issue as the Mouse package does not depend on the pixel value.</p>	X, Y
App Integration	<p>The App Integration > Capture area action requires X and Y co-ordinates to capture the text from a window. Any change in screen resolution, scaling, or zooming might cause change in the coordinates, and the correct text is not captured. In the RDP machine, use same resolution, scaling, and zooming so that you do not encounter any issues.</p>	X, Y, width, and height
Screen	<p>The Screen > Capture area action requires X and Y co-ordinates to capture the screenshot of the application window area. Use the same resolution and scaling in the RDP machine so that the output is not affected.</p>	X, Y, width, and height
OCR	<p>The OCR > Capture area action uses the X and Y co-ordinates to extract text from a specified area in the selected window. Ensure you have the same resolution, scaling, and zooming in the RDP machine so that extraction of the text is not affected.</p>	X, Y, width, and height

Configure temporary devices

Configure your device settings to automatically delete a temporary device when the device is disconnected from the Control Room after a certain time interval.

Ensure that you are logged in to the as the administrator.

1. Navigate to **Administration > Settings > Devices**.
2. Edit the **Temporary devices - auto delete settings**.
3. Use plus (+) or minus (-) to select the number of **Days, Hours, or Minutes** to wait before the temporary device should be deleted automatically.

The default time is 24 hours.

You can also manually delete the temporary device from the **My devices** page in the Control Room.

4. Save the settings.

Note: Non-persistent desktops are stateless desktops that get destroyed at the end of the session. Non-persistent VDIs do not exist when the user logs out.

Configure threshold settings for user devices

Configure the CPU utilization and device memory threshold values to control the concurrent bot deployment on user devices based on resource utilization.

Ensure that you are logged in to the as the administrator.

Based on the CPU utilization and device memory threshold values, you can determine whether to deploy bots on user devices. If the threshold value is the same or more than the value provided, bots are not deployed on user devices.

The default values for CPU utilization and device memory are based on the following parameters:

- When the frequency of data collection is 10 seconds, the system collects 6 data points in 1 minute.
- When time interval to upload data is 120 seconds, the system uploads 6 data points to the Control Room every 2 minutes.
- When the moving average time window is 2 minutes, the system uses the last 12 data points to calculate the average resource utilization.

1. Navigate to **Administration > Settings > Devices**.
2. Edit **Threshold settings for multi-user devices**.
3. Optimize the behavior for concurrent sessions by choosing one of the following options:
 - Do not enable threshold settings
Use this option to deploy bots on single-user devices.
 - Enable threshold settings to set the maximum values:
 - a) Enter the CPU and memory utilization frequency of data collection.
 - b) Enter the time interval to upload data.
 - c) Enter the moving average time window.
 - d) Enter the CPU threshold limit for new bot deployments on a device.

- e) Enter the memory threshold limit for new bot deployments on a device.

Use this option to deploy on multi-user devices.

You can either enter the values or click the plus (+) or minus (-) signs to increase or decrease the limit.

4. Save the settings.

Configure auto-login settings

Configure auto-login settings in the Control Room to either create user sessions or reuse existing user sessions to reduce the bot startup time.

Ensure that you are logged in to the as the administrator.

Auto-login enables you to deploy a bot for unattended Bot Runners after automatically logging on to a machine and restoring the machine to its original locked/unlocked state after completing the deployment.

Note: The **Run as user** device credentials are used for Auto-login.

Configure auto-login settings to either create new user sessions or reuse existing sessions in the following scenarios:

- Before deploying a bot, some applications are kept running to accommodate a delay in the application launch.
- When Windows updates or Active Directory policy updates are pushed after a user logs in, changes in the automation environment might affect bot execution.
- Logging off from temporary or non-persistent devices stops bot execution.
- You can reuse existing user sessions when your company's IT policy prevents you from providing device user password for auto-login credentials.
- To bypass legal disclaimers on RDP-based deployments.

1. Navigate to **Administration > Settings > Devices**.
2. Edit the **Auto login settings**.
3. Optional: [External key vault setting](#).
4. Choose how to run bots on user sessions by selecting one of the following options:

- **Always create a new session**

Select this option for desktop deployments where it is possible to create user sessions on devices.

- **Reuse an existing session**

Recommendation: Select this option for auto-login settings in the Control Room to use event triggers on unattended Bot Runners and to run bots when a device is locked or is in a disconnected state (such as RDP).

Available options to lock or unlock the session are:

- An existing locked session
- An existing unlocked session

- A disconnected session
- Allow users to change these settings for each device

Use this option for deployments on devices where it is not possible to create user sessions.

Note: When you use the **Reuse an existing session** option, ensure user sessions are available. If there is no existing user session, triggers and bot deployments will fail.

- **Reuse an existing session, if available**

Use this option if you must create a new session or reuse an existing session. If a session does not exist, create a new session and leave it unlocked for next user session after bots complete their run from the following:

- A new session
- An existing locked session
- An existing unlocked session
- A disconnected session

5. To allow a user to change the auto-login settings at the device level, go to **Administration > My Devices** and select **Allow changes**.
The **Do not allow changes** option disables the user-level auto-login settings for user sessions.
6. Save the settings.

Related reference

[Devices](#) on page 1808

The device is a machine through which a user connects to the Control Room to create or run bots. Manage devices that are registered to the Control Room through the **Devices** page located in the **Manage** tab.

Configure advanced options

Configure the default settings for your device. For example, if you can change the default location of global cache as per your requirement.

A Control Room administrator can use any of the following optional instructions to change the default settings:

1. Navigate to **Administration > Settings > Devices**.
2. Click **Edit** in the **Advanced options** settings.
3. Click **Allow changes on the Edit device page** to change the default settings and enable users to make changes on the device page.
4. Enter a new filepath for global cache in the **Global Cache Location** field.

This option is available in the Control Room for all devices but can be used only by devices that have the **All Users/System Level (Recommended)** option selected when installing the Bot Agent.

Note: If the specified path is not valid on the device, then the default path is used.

5. Use the following fields to enter custom values:
 - **Autologin timeout:** time duration within which a user can auto-login to the device.
 - **Bot launcher JVM options:** send dynamic properties supported for Java.

For example, you can use this option to increase the memory of the bot launcher.

- **Maximum simultaneous downloads:** set the number of simultaneous downloads.

For example, 5 downloads including dependent files.

- **Console readiness wait time:** set a wait time for the console to be displayed when you run a bot.
- **Bot response wait time:** set a wait time for an active bot session.
- **RDP command options:** provide different RDP-based commands.

For example, ports-related commands.

6. Click **Save changes**.

Switch device registration between Control Room instances

Configure the device settings in the Control Room to enable single-user devices to easily switch between different instances of the Control Room to run bots in multiple environments. This option enables you to register the Bot Agent on multiple Control Room instances without uninstalling the Bot Agent.

Ensure that you are logged in to the as the administrator.

- You must have the View and Manage ALL device permission to enable the switching option.
- You must enable the switching option on both Control Room instances.
- You can switch between Control Room instances only if the instances are on the same build.

For example, if one Control Room instance is on Build 9664 and another instance is on Build 8815, you cannot switch user device between the two Control Room instances. Both instances should be either on Build 9664 or Build 8815.

1. Navigate to **Administration > Settings > Devices**.
2. **Edit** the **General** settings.
3. Select **Enabled** to enable the local device as the default bot running device after a user logs into the Control Room.
4. Optional: Select the **Clear the user's existing bot running device if the bot agent is not present on the local device** checkbox to remove the existing default device.

By default, the **Clear the user's existing bot running device if the bot agent is not present on the local device** checkbox is not selected.

When no Bot Agent is available on the local device and if you select this checkbox, the existing default device for the logged-in Bot Creator, attended Bot Runner, or Citizen developer users is removed. Otherwise, the default available device is assigned for the bot deployment.

Note: If the local device is not enabled as the default bot running device and **Clear the user's existing bot running device if the bot agent is not present on the local device** checkbox is selected, then the existing default device is discarded. In this case, you must select the default device manually.

5. Select **Enabled** to enable a single-user device to be switched to another Control Room without reinstalling the Bot Agent.

Additionally, the **Allow fast switching** option allows you to switch the Bot Agent with a single click.

Note: Fast switching is recommended only if there is no change in the network configuration when connecting to a new Control Room. The first time you switch the Bot Agent to a new Control Room, the device lifespan information (that is, whether the device is **Persistent** or **Temporary**) is copied over to the new Control Room. No other configuration information is copied over.

If this setting is not enabled, you must uninstall Bot Agent first and then reinstall it to switch device registration to different Control Room instances.

6. Optional: For additional security, you can enable the following setting in the **Validate device credentials** field to validate the device credentials prior to bot deployment:
 - **Device credentials for all users:** Validates the device credentials for Bot Creator, attended Bot Runner, Citizen Developer, and unattended Bot Runner users.
 - **Device credentials for unattended bot runner users only:** Validates the device credentials for unattended Bot Runner users only.
-

Note: This is applicable for all trigger-based bot deployments too.

7. Save the settings.
8. Log in as a Bot Creator user to a Control Room configured in a different environment to verify that users can switch between instances.
The **Connect device** option is available when you click the device icon in the Control Room panel.

Related tasks

[Switch Bot Agent to a different Control Room](#) on page 1291

Switch the Bot Agent on a registered device to work with a different Control Room manually when you work on automations using different environments.

Add access public IP addresses

Use this setting to limit user login access to the Control Room URL based on IP addresses or subnets that you specify in a list. You add IP address ranges using the Classless Inter-Domain Routing (CIDR) format, and you can add multiple CIDR ranges.

Note:

If a user attempts to log in to the Cloud Control Room using an IP address that is not included in the access list, an error message displays indicating invalid user or user credentials.

Ensure that you are logged in to the [Administration](#) page as the administrator.

You must have access to **Administration > Settings** page with view, add, or edit permissions.

Specify a list of IP addresses or IP subnets to permit access to the Cloud Control Room URL and API. If your network egress uses dynamic IP addresses, then the ranges you enter must include the entire range of dynamic IP addresses that can be assigned outbound traffic. For example, to specify a single IP address use, 11.10.10.12/32; or to specify an IP address range, use 192.169.20.0/24.

Note: When using SAML for authentication, use the network access capabilities of the Identify provider to restrict access to specific allowed IP addresses. Ensure all allowed IP addresses configured are removed before switching to SAML for authentication. For more information, see [A360 | Reset Network Access list](#).

Perform the following steps to add an IP address or subnet to the list of permitted network access addresses:

1. Log in to the [Automation Anywhere](#) as the administrator.
2. Navigate to **Administration > Settings > Network settings**.
3. Click **Edit** to add to or edit the listed IP addresses.

Note: There is a limit of 25 independent entries in the access permitted table. An entry can be a single IP address or an IP subnet.

4. Enter the IP address information:

Option	Description
Single IP address	Enter the necessary IP address in x.x.x.x format.
Range of IP addresses	Enter the address in x.x.x.x format and specify the subnet mask.

5. Enter the **Name**.
6. Optional: Enter a description.
7. Click **Save changes**.

Related reference

[Add IQ Bot cloud server IP addresses to allowed list](#) on page 1118

To ensure seamless connectivity of your IQ Bot cloud servers with the Cloud Control Room, specify a list or range of IP addresses that are allowed to access the Cloud Control Room URL.

[Add service URLs to trusted list for Cloud](#) on page 1114

For Cloud deployment, to ensure secure access to Automation 360 online services, add the service URL list to the safe recipients or trusted list.

Set callback URLs

You can specify valid callback URLs, enabling the Control Room to post the results of the task execution only to defined and secure URLs for more granular security over the network.

Ensure that you are logged in to the [Automation Anywhere](#) as the administrator.

As a Control Room administrator, you can configure and audit specific, permitted URLs for more granular control of the network access points. Only the Callback URLs can be used in bot deployment APIs.

1. Navigate to **Administration > Settings > Network settings > Deployment settings > Callback URL**.
2. Click the **Edit** icon. 
3. Add the required URLs.
Use the **Add** option for more URL fields.

4. Click **Save**.

Two-factor authentication

Two-factor authentication (2FA) provides an additional layer of defense against unauthorized users from accessing the Control Room. As an administrator, you can set up 2FA so that the users can validate their identity when logging in to the Control Room using both their user credentials and a second authentication factor.

How 2FA works

2FA is an additional authentication mechanism added to your login process. 2FA is disabled by default. The Control Room administrator configures the 2FA for either all users or users with specific roles. Once 2FA is enabled, it is applicable to all Control Room users that it is intended for.

When you are assigned a role that requires 2FA, you must set up an authenticator application on your mobile or other device and establish a connection between the authenticator application and the Control Room. On subsequent logins, you will be prompted to enter, along with the username and password, a time-based one-time password (TOTP) from the authenticator application to complete the Control Room login.

Note: 2FA is not supported for Control Room setup using Active Directory (AD) or SSO. 2FA is supported only when the Control Room is the authentication provider.

Components

Three main components are used in 2FA.

- **Authenticator application:** Installed on your mobile device, this application generates TOTP for verifying your identity. Any authenticator application that supports the TOTP protocol, such as DUO or Google Authenticator is supported.
- **Registered device:** This is the mobile or other device that you register with the Control Room during first login after 2FA is set up. The TOTP is generated through this registered device, which is required any time you log in to the Control Room. If your registered device is lost or unavailable, you must request the Control Room administrator to delete the device, and you can add another device later. Therefore, we recommend you to set up more than one device and register them with the Control Room.
- **Time-based one-time password:** This is a temporary password generated by an algorithm that uses the current time of the day as an authentication factor.

Set up 2FA

1. Enable 2FA in the Control Room.
 - a) Log in to the Control Room as an administrator.
 - b) Navigate to **Administration > Settings > Security settings > Two factor authentication**.
 - c) Click **Edit** to configure the settings.
 - d) Select **Enable**. This is not enabled by default.
 - e) Choose the settings based on your requirements:

Option	Action
All users	Select this option to enable 2FA for all users who have access to the Control Room.
Selected roles	To enable 2FA for users with specific roles: <ol style="list-style-type: none"> 1. From the Available roles column, search and select roles for which you want to enable 2FA. 2. Move these roles to the selected column.

- f) Save your changes.
2. Optional: If a user's registered (mobile) device is unavailable or changed, delete the device and register a new one.
 - a) Log in to the Control Room as an administrator.
 - b) Navigate to **Administration > Users**.

- c) Select the user that you want to edit. Hover over the action menu (vertical ellipsis) located to the right of the username and click **View user**.
 - d) In the **Authenticators** section, select the device that you want to delete, click the delete icon, and confirm deletion.
 3. Set up an authenticator application and establish a connection between the authenticator application and the Control Room.
 - a) Log in to the Control Room as a Citizen Developer or a Bot Creator (RPA Developer).

Ensure that you have an authenticator application set up on your mobile device. During your first login, a QR code is displayed.
 - b) Either scan the QR code using your authenticator application or manually enter the code displayed in the authenticator application.
 - c) Enter the name of your authenticator and the new code generated in your authenticator application.

This is a temporary code that is refreshed every few of minutes based on your authenticator application.
 - d) Click **Confirm**.

Follow the next steps in the login flow, change your password and set the security questions. You will be successfully logged in to the Control Room. On subsequent logins, you must enter the code generated in your authenticator application and confirm.
 4. Optional: You can manage (add or delete) your authenticator device.
 - a) Log in to the Control Room as a Citizen Developer or a Bot Creator (RPA Developer).
 - b) On the **Home** page, click your username.
 - c) Navigate to **My settings > Two factor authentication**.
 - d) Click the plus (+) icon.
 - e) Perform steps 3.b on page 1749 through 3.d on page 1749.
 - f) Optional: Select the device that you want to delete, click the delete icon, and confirm deletion.

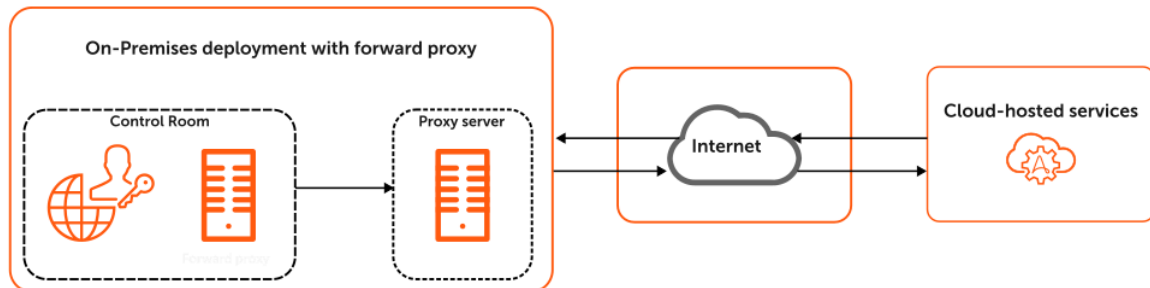

Configure forward proxy settings

For On-Premises deployments that are using a proxy to connect to the internet, the forward proxy configuration feature enables Control Room features that require internet connectivity to function seamlessly.

In such deployments, Control Room features (such as license server, packages server, and audit log server) cannot easily connect to Cloud-hosted services for updates outside of their internal network. So configure forward proxy for such features so that the features can function seamlessly.

The following Control Room offered services and servers are supported to use the forward proxy hosts:

- License server
- OAuth services

1. Log in to the Control Room as an administrator.
2. Navigate to **Settings > Network settings > Forward Proxy Configuration**.
3. Click **Edit** and then select **Enabled**.
This feature is disabled by default.
4. From the **Type of connection/scheme** menu, select a connection.
5. In the **Host** field, enter the host IP address of the proxy host.
6. In the **Port** field, enter the port number of the proxy host.
7. Select an appropriate authentication type:
 - **None**: No authentication is used to connect to the proxy host.
 - **Basic Authentication**: Uses basic authentication to connect to the proxy host. Enter the **Username** and **Password** to connect to the proxy host.
8. **Ignore addresses**: Specify the IP addresses or host names (separated by comma) that need not use the proxy server to connect to the internet.

The following video shows how to configure forward proxy:

Configure Credential Vault Connection mode

Credential Vault is a centralized location for securely storing credential information used by bots.

Configure the **Connection mode** to connect to the Credential Vault using a **Master key**.

Note: Provide this key every time you start or restart the Control Room.

To configure settings for Credential Vault, select **Express** or **Manual** mode.

Express mode

Auto connect to the Credential Vault with the master key that is stored in the system during Control Room configuration.

Manual mode

Use this to manually connect to the Credential Vault using the master key that was available during Control Room configuration.

When switching modes, provide the **Master Key** in the field and click **Save** for the changes to take effect.

Tip: Restart the server machine (on which the Control Room is installed) or services to allow changes to take effect.

All updates to the Credential Vault **Connection mode** are captured in the **Audit Log**.

- If you are facing Credential Vault connection issues while accessing the Control Room URL, see [CR fails to load with the Error Code 'cv.validation.secure.cv.locked' \(A-People login required\)](#).
- If the Credential Vault is configured to connect to the Control Room in **Manual** mode, and the **Master Key** is not added within a certain time period (for example, within 2 minutes), the devices might disconnect from the Control Room.

For more information, see [Bot agent device status remains disconnected post restart of Control Room server after windows maintenance \(A-People login required\)](#).

Related tasks

[Set up locker and assign credentials](#) on page 1798

Create a role, credentials, and locker to share related sensitive values with a group of users, so they can use those values to build or run bots.

Manage domain

Administrators can use the **Display domain options** to hide a single domain or multiple domains, and use the **Select default domain** option to set any of the available (unhidden) domains as the default.

This applies to the visible domains on the Control Room login page, the **Create user** page, and the **Create an Active Directory role mappings** page. However, you can set the default domain on the **Create an Active Directory role mappings** page.

1. Navigate to **Administration > Settings > Active directory**.
2. Click **Edit** to edit the **Default domain**.
3. Select the default domain from the **Select default domain** drop-down list.

Note: If you did not set a default domain, then the first domain from the list is set as the default on the Control Room login page and the **Create user** page.

4. Click **Save changes**.
5. Click **Edit** to edit the **Allowed domains**.
6. Select the desired domains under the **Displayed domains** table and add it to the **Hidden domains** table.

Note: You cannot hide a domain for which users were added and mappings were created for the domain in the Control Room.

7. Click **Save changes**.

Editing SQL user information

Edit MS-SQL configuration related settings, including username, password, database server name, database server IP and port numbers.

To perform the task, you must have a administrator account with the required rights and permissions.

Download the latest Control Room utility and make certain this utility installed on every sever where Automation 360 is running.

Users are required to make changes to the running configuration via the command line interface.

Note: Please stop all Automation 360 services on all nodes where a Control Room is installed before performing this task.

1. Open the command line prompt and navigate to the Automation 360 application.
For example, `C:\Program Files\Automation Anywhere\jdk11\bin`.
2. Follow the prompts from the utility to select the SQL database and enter the required credentials.

Note: The password will not be displayed on the console

3. Restart the Automation 360 services on the nodes.
The SQL user information has been successfully updated.

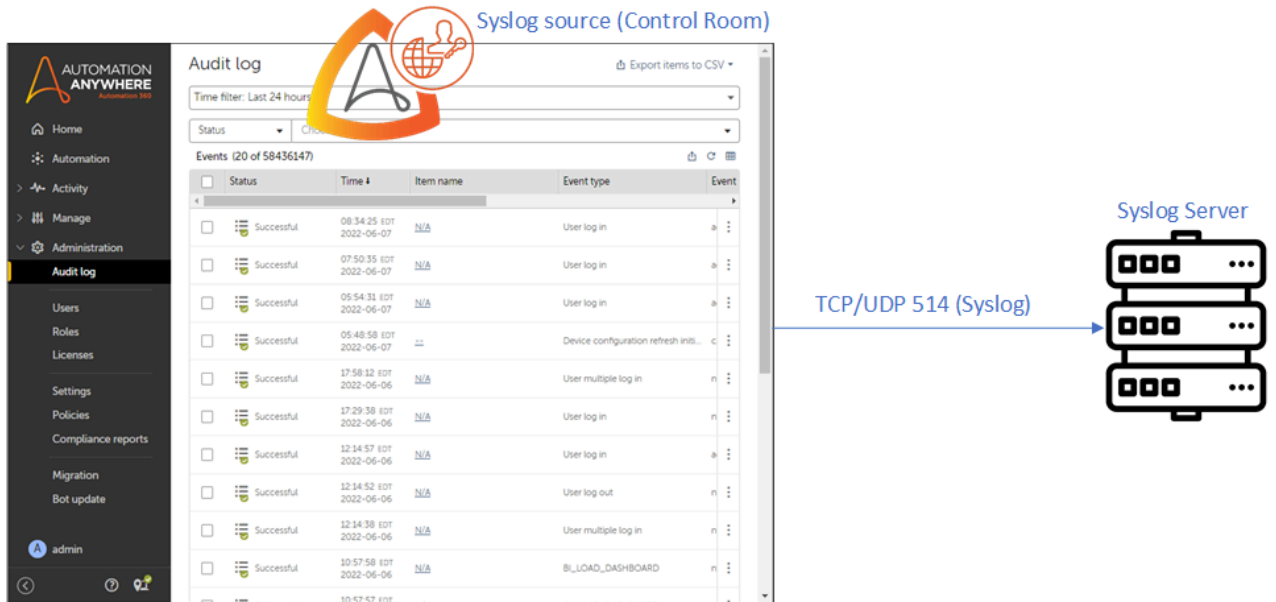

Syslog server integration

The Automation Anywhere Control Room supports ingesting tenants' audit log entries in Syslog format to any Syslog server.

Important: The options to specify or modify the Syslog configurations are available only for the On-Premises deployment.

By pushing syslog data to a Syslog server, you can integrate and leverage the advanced searching and reporting features of Syslog server solutions. When configured, the Control Room audit logs are forwarded to both the Transmission Control Protocol (TCP) and User Datagram Protocol (UDP) network protocols. You can use any syslog server. The following syslog servers are tested and certified by Automation Anywhere:

- Kiwi Syslog Server
- Splunk

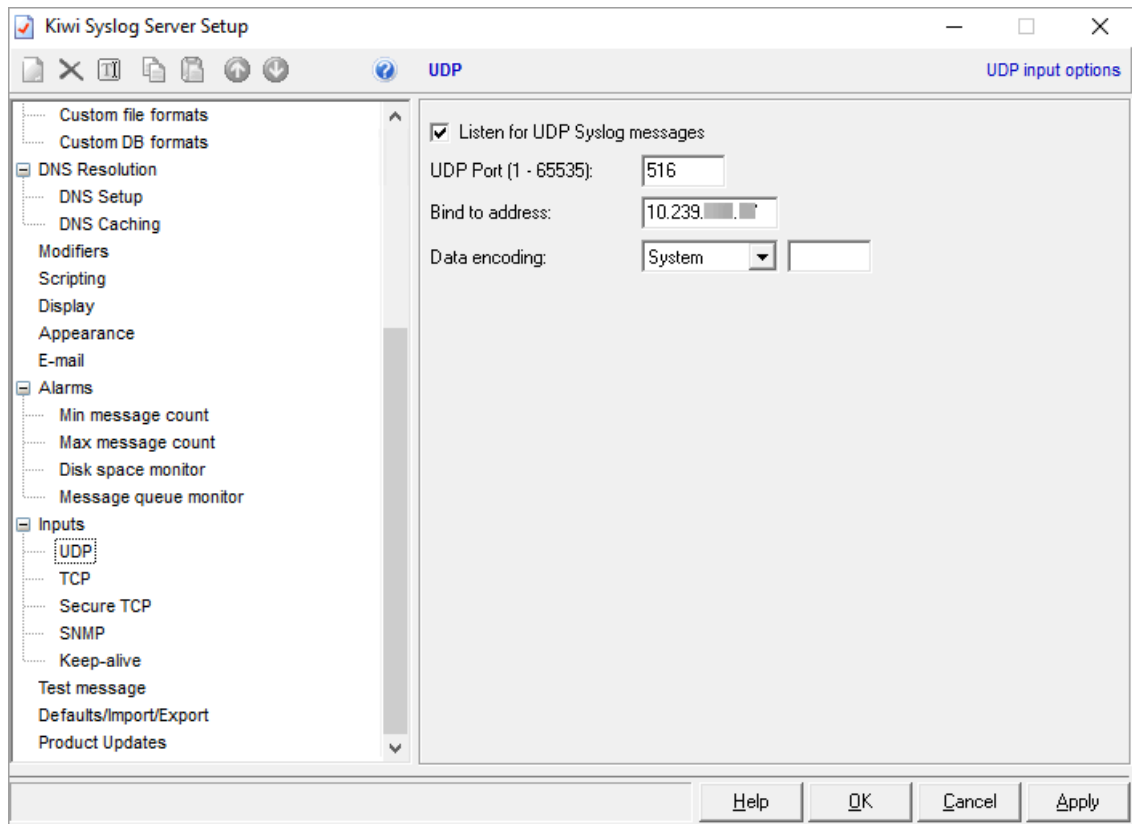

You can configure a Kiwi Syslog Server or a Splunk server that accepts data from a Control Room instance's syslog through a TCP or UDP port. The following example illustrates sending the Syslog data to Kiwi Syslog server through TCP or UDP ports.

Configure Kiwi Syslog Server

Solarwinds Kiwi Syslog Server is a widely used commercial Syslog server. Kiwi Syslog Server Free Edition can monitor Syslog for up to five devices. Download Kiwi Syslog Server Free Edition from the following link: [Kiwi Syslog Server Free Edition](#). After installation, perform the following steps to configure the Kiwi Syslog Server:

1. Navigate to **File > Setup > Inputs**.
2. To forward the logs through UDP, click **UDP**.

3. Enter the UDP port and the IP to which you want to forward the logs.
4. To forward the logs through TCP, click **TCP**.

5. Enter the TCP port and the IP to which you want to forward the logs.

Configure Control Room to send Syslog on UDP or TCP

To configure the Control Room to send Syslog on UDP or TCP, perform the following steps:

Note:

To perform the task, you must have a administrator account with the required rights and permissions.

1. Navigate to **Administration > Settings > Network settings**.

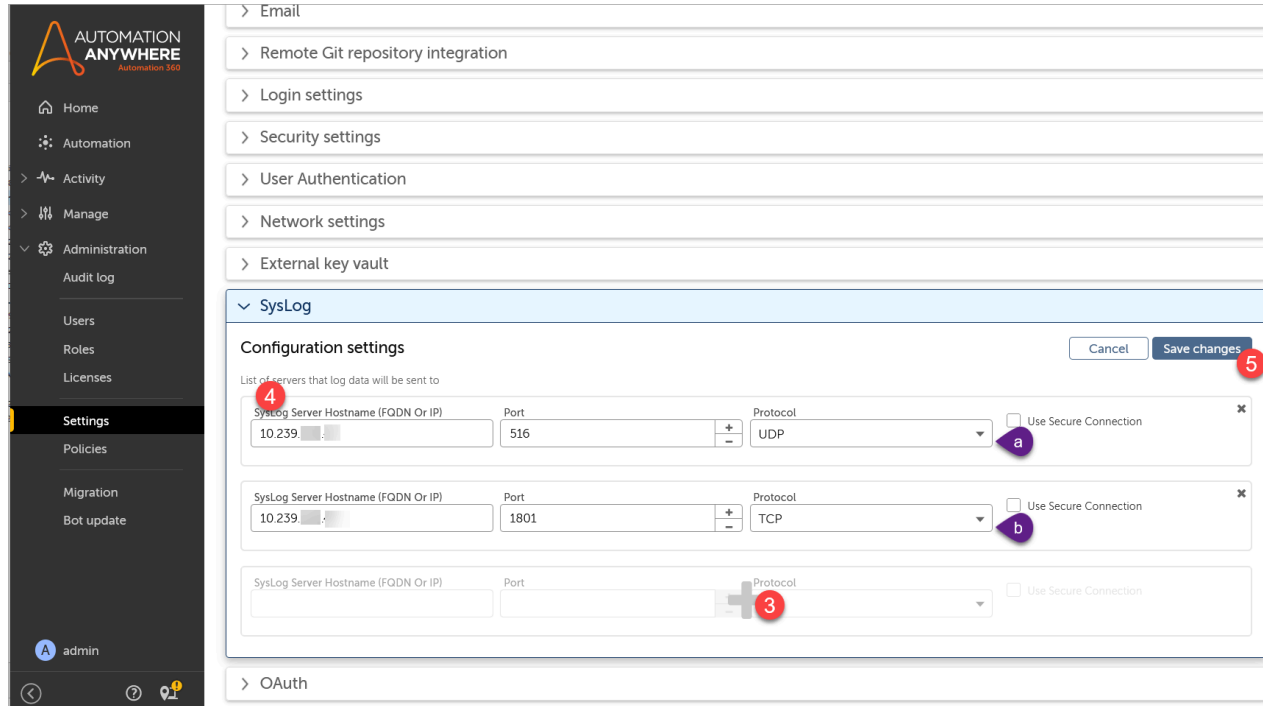

2. Click the **Edit** icon. 
3. To add more Syslog servers, click the plus (+) sign.
4. Enter the Syslog server information.

Option	Action
Syslog server hostname	Fully qualified domain name (FQDN) or the IP address of the Syslog server to deliver the log reports.
Port	Port that the remote Syslog server uses to receive incoming Syslog records (for example, port 514).
Protocol	TCP or UDP.
Use Secure Connection	Use a TLS encrypted channel to send Syslog records to the remote server. This option is available for TCP only.

- a) To forward the logs to a UDP port, enter the UDP settings (IP, port, and select UDP from **Protocol** drop-down).

Note: For information about specific settings, see the Kiwi Syslog Server documentation.

b) To forward the logs to an TCP port, enter the TCP settings (IP, port, and select TCP from **Protocol** drop-down) .

5. Click **Save changes**.

Verifying data in the Syslog Server

Reception of logs is verified in the Syslog Server. Perform the following steps to verify the data in Syslog Server:

1. Generate a Syslog event by logging in or logging out of the Control Room.
2. Verify the logs in the Kiwi Syslog Server.

Date	Time	Priority	Hostname	Message

Edit email notifications

You can edit the email settings to select scenarios in which a Control Room sends email notifications.

Ensure that you are logged in to the as the administrator.

Specify details about the email server you want to use and the events when the email notification must be sent. To configure **Email** settings, perform these steps:

1. Navigate to **Administration > Settings > Email**.

2. Click the **Edit** icon. 

3. Select **Send email notifications**.

By default, the email notifications are disabled. You might choose not to send a verification ("Welcome") to the created/edited users.

4. Specify the details of the server that you want to use to send email notifications.

Option	Description
From this email address	Enter the email address that you want to use to send email notifications.
Email server host	Specify the email server that you want to use to send email notifications.
Email server port	Specify the email port that you want to use to send email notifications.
My server uses a secure connection (SSL/TLS)	Select the option if the server uses a secured connection.
My server requires authentication	Select the option if the server requires credentials for access, such as for an external credential vault.
Specify the Username and Password that you want to use to access the server.	Specify the credentials.
External Key Vault	Specify the HashiCorp secret name to retrieve the credentials.

Important: The options to specify or modify the email server details are available only for the On-Premises deployment.

5. Select the required event for which you want to receive the email notification.

- **User initiates Forgot Password process from Login screen:** When a user clicks the **Forgot Password** option on the login screen
- **User information changes, to the user:** When a user's information is updated
- **A user is activated, deactivated or deleted, to the user:** When a user is enabled, disabled, or deleted
- **A Task Bot stops running because it is unsuccessful, to the user who started or scheduled it:** When a Task Bot execution is unsuccessful
- **A BLM package is exported or imported, to the user who performed BLM export or import:** When a BLM package is imported or exported
- **A checkin process fails :** When a check-in process fails
- **A schedule run is missed or automation doesn't run to schedule creator:** When a scheduled run fails to execute because of a Control Room shutdown
- **A compliance report has been generated to, the user who requested the report:** When a compliance report is generated

Important: If the **Require verification** option is not selected, an email notification without verification link is sent to the specified email ID. You can log in to the Control Room without verifying the email ID and setting the login credentials.

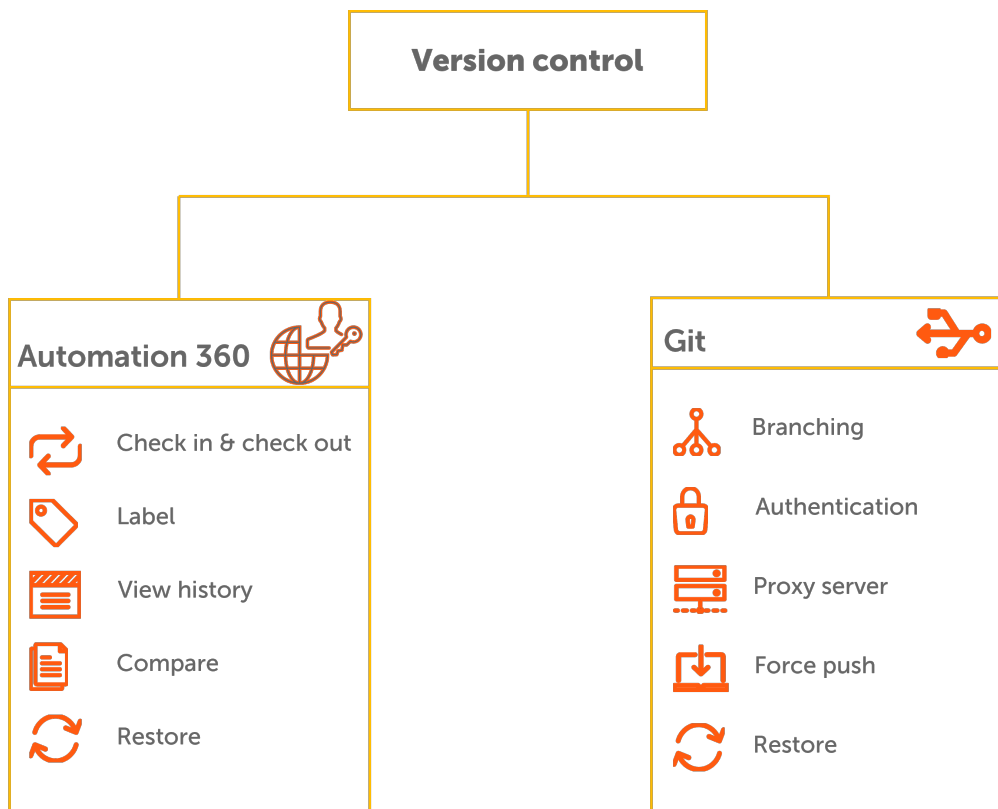

6. Click **Save changes**.

Version control in Automation 360

Version control helps you to manage the changes that you make to files that include Task Bots, documents, reports, scripts, executable files, and workflows. With version control, you can track and monitor changes to your bot logic.

With version control, you can identify the version of a bot that you want to modify and compare your recent changes against the changes made to the bot previously. As a Control Room admin, you can configure version control in the Control Room settings.

Automation 360 includes version control capabilities, and you can use these capabilities irrespective of whether you have integrated your Control Room with Git. Review the capabilities available in Automation 360 and Git.

Version control in Automation 360

- Check out and check in Task Bots: You can check out one version of a bot (version 1) from public to your private workspace, make changes to it, and then check in the bot to the public workspace. This creates a new version (version 2) of the bot, which is the latest version. Every

time you check out, make changes to, and check in a bot, a new version of the bot is created as the latest version.

Note: You can run either the latest version of a bot or the version that has the production label.

You can roll back to a particular version of a bot by selecting **Advanced options** in the check out action to select a specific version of the bot to check out. Also, you can select the dependencies to check out. By doing this, you can make changes to a specific version of a bot and its dependencies. When you check in this bot, it becomes the latest version. For example, if the latest version of a bot is version 8 and you want to roll back to version 3, you must first check out version 3 of the bot and then check it back in, which creates version 9. This latest version, which is identical to version 3, is now available in the public workspace for bot operations.

[Check in a bot](#) on page 2210 | [Check out a single bot](#) on page 2214

- **Label Task Bot :** You can also roll back to a specific version of a bot by assigning a label to that version of the bot. You can use this label to choose the version with which you want to perform certain bot operations. With the version of your choice, you can schedule, run, queue, export, and trigger bot development workflows.

[Assign label to a bot](#) on page 2221

- **View Task Bot history:** You can view the version history of your Task Bots in the public workspace. With **View history**, you can view the history of changes that have occurred in your Task Bots and identify the actions performed by a user. The list of all the versions of a bot is shown in reverse chronological order. The information displayed includes version number, check-in message, date and time of check-in, and the name of the user who checked in the version.

[View Task Bot version history](#) on page 2220

- **Compare versions:** You can compare any two versions of your Task Bots to view the differences between those two versions.

[Compare bot versions](#) on page 2222

- **Restore bots from Git:** Even if your Control Room is not integrated with Git, you can restore bots from Git to your public workspace. For example, if you have 50 bots in your public workspace and 75 bots in Git, you can restore the remaining 25 bots from Git to your public workspace.

Note: This restore option is available only for On-Premises deployments and not supported on Cloud deployments.

Version control with Git

If your Control Room is integrated with Git, all the versions of the bots and files in Automation 360 are synced with Git, and you can use the following additional capabilities:

- Integrate with a Git branch.
- Integrate with Git through SSH authentication.
- Integrate with Git through a proxy server.
- Restore bots or files to an empty public repository from an existing Git configuration.
- Configure force push when connecting to Git.

[Integrating Control Room with Git repositories](#) on page 1762

Integrating Control Room with Git repositories

Git integration with the Control Room ensures one-to-one mapping of the bots checked in to the public workspace of the Control Room and the remote Git file structure. Git commits enable you to enforce security, compliance, and code standards, and ensures that an organization's established best practices can be applied to their bot development processes.

The Control Room has Git Client that is connected to the Git repository that stores the file history of your public workspace. Each time a bot developer performs a bot check-in:

- The bot and the dependent files are checked in to the public workspace.
- The Control Room creates a commit that contains all the contents of the particular check-in within the Git repository.
- The comment entered in the check-in process is used as the Git commit message and the user details are recorded as the author of the Git commit.
- The Bot definitions are stored as JSON files in the Git repository.

Note: The Git repository must be configured to have write access only to the Control Room and not to any other Git client.

Supported Git repositories

You can configure the Control Room to replicate the built-in Git repository with the remote Git host, and synchronize information using Git push. The following sources are certified for Git integration with the Control Room.

- GitHub
- BitBucket
- Azure DevOps

Exposing the files to your remote Git host enables you to review the bot code and files using third-party comparisons and static code analysis tools to help enforce compliance and maintain security standards.

Configure a remote Git repository in Control Room

Configure a remote Git repository in the Control Room so that you can version all the bots and their dependencies and store them in the Git repository. In addition to the local Automation 360 repository in the Control Room, the remote Git provides a backup for the bots and their dependencies.

- In order to configure a remote Git repository in the Control Room, ensure that you have the `AAE_Admin` role.
- Based on your region, configure your network firewall to add outbound NAT gateway IP addresses to the allowed list.

[Control Room IP addresses for external integrations](#) on page 1767

When you are configuring a remote Git repository, keep the following considerations in mind:

- The Git repository must be configured to have write access only to the Control Room and not to any other Git client.
 - You cannot upload files greater than 100 MB to the Git repository.
 - Ensure that you integrate with an empty Git repository.
 - You should not check in any file manually into the Git repository from any other user, product, or application.
 - When you integrate with Git, the repository should not contain the `ReadMe.md` file.
- 1.** In the Control Room, navigate to **Administration > Settings > Remote Git repository integration**.
 - 2.** Click **Edit**.
 - 3.** Choose one of the following authentication methods and perform the corresponding steps to set up your Git configuration:

Authentication method	Steps
HTTPS Authentication	<p>a) Enter the HTTPS repository path, including the username in the following format:</p> <pre>https://<username>@bitbucket.org/ companyname/product.git</pre> <hr/> <p>Note: Use the Git host that you want to obtain the Git repository address.</p> <hr/> <p>b) Enter the branch name.</p> <p>The changes are pushed to the branch selected. By default, the master branch is selected.</p> <p>You can use lower case characters for branch names, but they must not exceed 250 characters. Do not include ASCII control characters such as spaces, tildes, or colons in branch names. You can use hyphen to separate words. For more information on branch naming, see Create a new Git branch.</p> <p>c) Enter your Git repository password or a generated Git token.</p> <hr/> <p>Note:</p> <ul style="list-style-type: none">• The token length must be limited to 75 characters.• You must enter the password generated for your repository connection. It is recommended that you use tokens as they are more secure than passwords.• For GitHub, you must use only the Personal Access Tokens (classic). The Personal Access Tokens (fine-grained) do not work in GitHub.• For BitButcket, you must use only the App passwords. <hr/> <p>d) Re-enter the password or Git token to confirm.</p>

Authentication method	Steps
SSH Authentication	<p>a) Enter the SSH repository path in the following format:</p> <pre>https:// git@bitbucket.org:companyname/ product.git</pre> <hr/> <p>Note: Use the Git host that you want to obtain the Git repository address.</p> <hr/> <p>b) Enter the branch name.</p> <p>The changes are pushed to the branch selected. By default, the master branch is selected.</p> <p>You can use lower case characters for branch names, but they must not exceed 250 characters. Do not include ASCII control characters such as spaces, tildes, or colons in branch names. You can use hyphen to separate words. For more information on branch naming, see Create a new Git branch.</p> <p>c) Enter your SSH authentication private key.</p> <p>You must create the private and public key pair by using the RSA algorithm.</p> <hr/> <p>Note: Ensure that the private key entered in the Control Room contains the following string:</p> <pre>-----BEGIN RSA PRIVATE KEY----- AND -----END RSA PRIVATE KEY-----</pre> <p>You must generate the public key and enter it in your Git server.</p> <p>See the following topics for steps on how to generate the public key depending on your server:</p> <ul style="list-style-type: none"> • Adding a new SSH key to your GitHub account • Set up an SSH key to your BitBucket account <hr/> <p>d) Optional: Enter the passphrase.</p>

4. Optional: Select the **Connect to Git via proxy** check box.
 - a) Enter the proxy host name or IP address.
 - b) Enter the port number.
 - c) Optional: Select the authentication check box and enter the user name and password.
5. Click **Connect and Save**.

The Control Room connects to the remote Git repository, and the following message is displayed: `Git integration settings successfully saved`. You can also check the audit log where the status for **Set git settings** is displayed as successful.

Note:

- The check-in operation might take longer if you have many bot files in your Git folder in the public workspace. This is because an increase in the repository size leads to a slowing down of the git commits. As a best practice, we recommend you delete your bot files that are not used from your public workspace.
- If the Git repository has any lock files such as `index.lock` or `master.lock`, delete these lock files as they might hinder the check-in and check-out operations.

You can connect to the same Git repository with a different username in the Control Room. For more information, see [How to change the remote Git repository username in the control room \(A-People login required\)](#).

See the following video for an overview of Git:

Connect to Azure DevOps Git from Control Room

You can connect to Azure DevOps Git through the Control Room to check in and manage a bot and its dependent files to the remote Azure DevOps Git repository. It creates a back-up for all your checked-in bot and its dependent files on Azure DevOps.

- To connect to Azure DevOps Git from Control Room, ensure that you have the `AAE_Admin` role.
 - Make sure that you have an Azure DevOps account.
1. Log in to the Azure DevOps account.
 2. Create an Azure DevOps project. Provide a project name and description, select project visibility (public or private), and then click **Create**.
 3. Click **Repos**.
 4. Click **Generate Git Credentials**. Enter the username and the password or token. When you obtain a token to connect to Git, ensure that you have **Read** and **Write** permissions.
 5. Copy the Git repository path without any changes to **Administration > Settings > Git integration > Configuration > Setup Git integration > Edit > Git repository path (including username)** in the Control Room and enter the password/token.
 6. Click **Connect and Save**.
 7. To confirm whether your connection is successful, check in a file from the private repository to a public repository and verify that your changes are pushed to Azure DevOps Git repository.

Remove Git integration configuration

If there is no longer a need to synchronize the bot information stored in your Control Room with the remote Git host, you can remove or disable it.

Ensure that you have the `AAE_Admin` role assigned to you.

1. Navigate to **Administrators > Settings > Git Integration**.
2. In the **Git Integration** window, click **Edit**.
3. Select **Do not set up Git integration**.
4. Click **Connect and Save**.
This setting removes the remote Git configuration, and the Control Room will no longer push the Git history to the remote Git host.

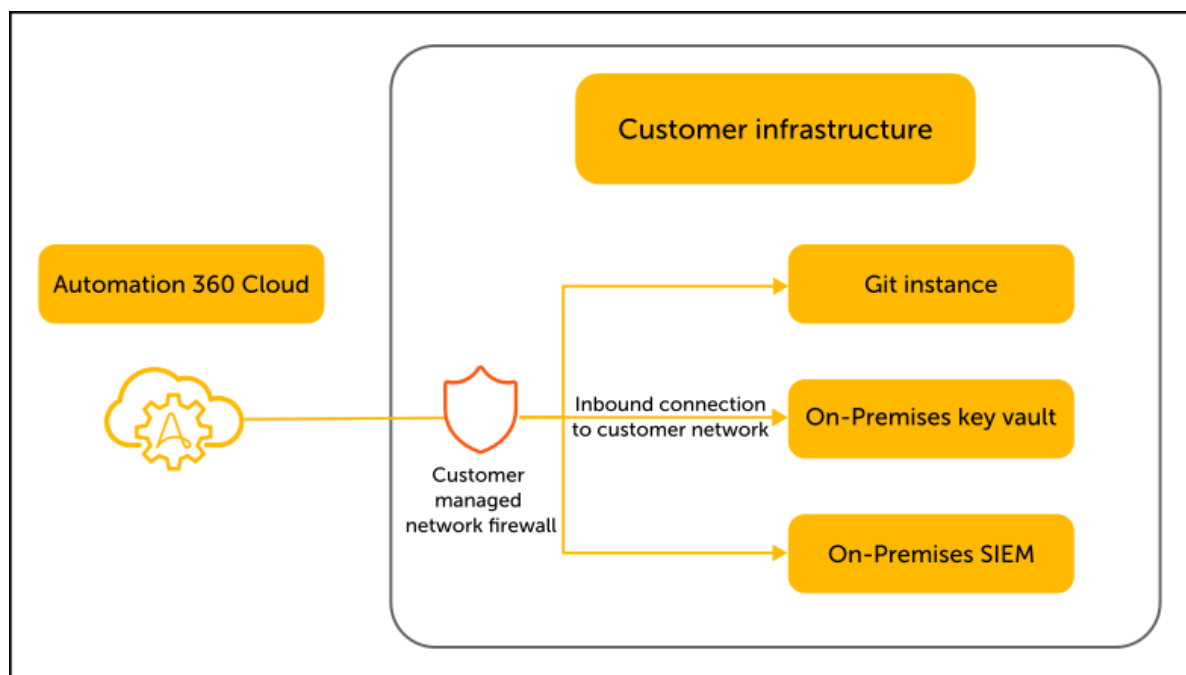

Control Room IP addresses for external integrations

To ensure seamless connectivity to your Git instance, On-Premises key vault, or SIEM with the Cloud Control Room, configure your network firewall to include Automation Anywhere outbound Automation 360 IP addresses to the allowed list.

When you configure an Automation 360 Cloud deployment to connect to external systems or to capabilities such as a Git instance, On-Premises key vault, or SIEM with your Cloud Control Room, then you must provide connections to those systems or services for the Automation 360 Cloud instance.

The Automation 360 server instance initiates the connection by using one of the listed Automation 360 IP addresses. As a result, you must configure these IP addresses in your network firewall and add the regional outbound Automation 360 IP addresses to the allowed list.

The following diagram shows a typical Automation 360 Cloud deployment for external integrations:

Based on your region, add the following outbound Automation 360 IP addresses to the allowed list:

Region	IP addresses
- Africa	<ul style="list-style-type: none"> • 13.244.57.44 • 13.244.197.159 • 13.244.185.72 • 54.228.5.1 • 54.228.48.30 • 54.217.103.248
- Australia	<ul style="list-style-type: none"> • 54.153.153.175 • 52.65.8.56 • 3.106.147.142
- Canada	<ul style="list-style-type: none"> • 35.203.94.19 • 34.152.28.44
- EU West 1	<ul style="list-style-type: none"> • 108.128.188.103 • 63.34.200.237 • 52.30.160.238 • 18.197.15.181 • 18.195.27.35 • 3.123.208.13
- EU West 4	<ul style="list-style-type: none"> • 35.204.101.230 • 34.141.232.185 • 34.141.55.27 • 34.141.57.227

Restore bots from Git repository

You can restore all your bots and their dependent files from the Git repository to your server repository. This restore option is available only for On-Premises deployments and not supported on Cloud deployments.

Ensure the following before you restore your bots from Git:

- You must have a backup of the bots on Git.
- You must have the **AAE_Admin** role assigned.

Keep the following considerations in mind while restoring bots from a Git repository:

- You can restore either all or differential bots and files from the external Git repository. You cannot selectively restore specific bots or files from the external Git repository.
- The Git restore process requires some downtime. When the restore process is running, the following public workspace operations are disabled:
 - Check-out

- Clone
 - Run and schedule bots
 - Run bots with queue
 - Import and export bots
- When the restore process is running, the check-in operation is not allowed from the private workspace. However, you can use the private workspace for the rest of the operations.
 - You can restore your bots to your empty or non-empty repository.
 - You cannot abort an ongoing restore process.

The Git restore functionality is important in the following scenarios:

- The server repository is corrupted and you are starting with a new server repository.
- You want to restore bots to a different Git branch.

For example, consider there are two branches of Git: Dev and Test integrated with Dev and Test Control Room. The Test branch can pull the contents from the Dev branch and you can restore bots from Git in the Test Control Room.

1. Log in to the Control Room as an admin user.
2. On the left pane, click **Automation**.
A list of available and forms is displayed.
3. Click the **Restore from Git** option in the **Public** workspace.
The **Restore from Git** dialog box appears, displaying a warning that all the public repository operations will be disabled during the Git restore process.
4. If you have duplicate files in the Git repository, select to either **Overwrite existing files** or **Skip existing files** in the Git repository.
5. Based on whether the repository is empty or non-empty, choose one of the following options:
 - To restore files to a repository that is not fully empty, enter your Git credentials for the associated repository.

Note: You cannot use the existing Git configuration for a partially filled repository.

- To restore files to a fully empty repository, you can choose the Git repository from which you want to restore your files.

Option	Action
Use existing git configuration settings	<p>Select this option to restore your data from the Git repository configured with the Control Room.</p> <hr/> <p>Note: Ensure you connect your Control Room to the remote Git repository from Administration > Settings > Remote Git repository integration.</p> <hr/>

Option	Action
Use manual settings	<p>Select this option to restore data from any other repository.</p> <p>a) Enter the HTTPS repository path including the username in the following format:</p> <pre>https:// <username>@bitbucket.org/ companyname/product.git</pre> <p>b) Enter the branch name.</p> <p>c) Enter your Git repository password or a generated Git token.</p> <p>d) Re-enter the password or Git token to confirm.</p> <hr/> <p>Note: If you are using the same settings as the existing Git configuration, you will encounter an error. To use the same configuration, first remove the remote Git repository integration setting in Administration > Settings > Remote Git repository integration before providing the same in this manual settings option.</p>

6. Optional: Select the **Connect to Git via proxy** check box.
 - a)** Enter the proxy host name or IP address.
 - b)** Enter the port number.
 - c)** Optional: Select the authentication check box and enter the user name and password.

7. Click **Continue** to proceed with the restore process.

The system starts restoring the bots and the dependent files from Git. This process takes some time.

After the restore process is completed successfully, you are automatically returned to the **Automation** page. The bots and the dependent files are restored in your new server repository, maintaining the original structure of the dependent files.

If the Git restore process fails after restoring some bots, you are redirected to the public workspace with the following options. Choose the required option to complete the restore process:

Option	Action
Revert restoration bots	<p>This option clears all the bots that were restored.</p> <hr/> <p>Note: This option will delete the public bots that were restored from the Git repository.</p>

Option	Action
Restart restoration	The Git restore process restarts from where it ended.
Keep only the restored files	This option retains whatever files were restored and will exit the restore process.

Usage statistics

Automation Anywhere collects usage statistics from Automation 360 for product improvements.

Usage statistics provides information on where users might be facing issues with the product, the most used or least used features, and so on. This information helps in product improvement which in turn helps in improving the customer experience.

By default, the **Usage statistics** option is enabled in the Control Room and usage data is collected. The data collected is stored in Automation 360 and the service provider cloud. The collected data is typically generic information such as anonymized user details, customer name, and user navigation workflows such as menus the users access and clicks.

An administrator can disable the **Usage statistics** option by changing the settings in the Control Room.

Note: The option can be disabled only for On-Premises deployments.

Disable usage statistics

An administrator can disable the **Usage statistics** option by changing the settings in the Control Room.

Ensure that you are logged in to the as the administrator.

1. Navigate to **Administration > Settings > General > Advanced settings**.
2. Click the **Edit** icon. 
3. Select the **Disabled** option.
4. Click **Save changes**.

Set up instances for Cloud-enabled deployments

Manage trust relationship between the cloud-deployed Automation 360 Cloud-enabled instance and the On-Premises applications.

Ensure that you are logged in to the as the administrator.

For Cloud-enabled deployment, the initial welcome email that you received from Automation Anywhere contains:

- URL to the Automation Anywhere Cloud-enabled instance
- Provisioning token needed to establish trust connectivity with the Automation Anywhere Cloud Control Room

Automation Anywhere deploys and configures an Automation Anywhere Automation 360 Cloud instance for this Cloud-enabled deployment option. The customer then installs the On-Premises application within their infrastructure for storing and processing customer data. After this is complete, you install the On-Premises application within your infrastructure for storing and processing customer data.

1. Log in to the On-Premises Control Room as the administrator.
2. Navigate to **Administration > Settings > Cloud-enabled**.
3. Provide the provisioning token to connect to the Control Room.
4. Click **Save changes**.
5. Optional: Test the Cloud-enabled functionality.
Open a browser and enter the URL for the Cloud Control Room service instance. Click **Enter** to be redirected to the On-Premises Control Room.

Generate registration key to install Bot Agent in bulk

The Control Room administrator can generate a registration key to install the Bot Agent on multiple devices at a time in bulk.

Ensure you have set up the Microsoft Active Directory group policy to remotely install the Bot Agent on multiple devices.

[Use Microsoft Active Directory Group Policy to remotely install software](#)

Generate and copy the key for use in an installation script or as part of the Active Directory group policy to install the Bot Agent on multiple devices at a time.

Also, download the latest Bot Agent MSI installer file to your default downloads path to install the Bot Agent in bulk.

1. Navigate to **Administration > Settings**.
2. Select the **Bot agent bulk install** option.
3. Generate a new registration key for installation.

Note: Before you generate a new key, keep in mind that the new key invalidates the previous key and any entries or references to the previous key must be replaced with the new key value. Therefore, we recommend that you generate a new key only if the previous key is compromised.

- a) To launch the setting in edit mode, click the **Edit** option.
When you open this setting for the first time, the option **Generate a new key** is shown by default and the phrase `Key not set` appears.
 - b) To create a new registration key, select the **Generate a new key** option.
-

Note: A generic registration key is valid for 10 years.

- c) To install the Bot Agent using an installation script or through a Active Directory group policy, click **Copy to clipboard**.
 - d) Save the settings.
4. Replace the registration key:

- a) To launch the setting in edit mode, click the **Edit** option.
The **Keep current key** option is displayed by default.
 - b) To generate a new registration key, select the **Generate a new key** option.
 - c) Select **Continue** on the **Current registration key replacement** message box.
 - d) To use the key, click **Copy to clipboard**.
 - e) Save the updates.
5. To download the latest Bot Agent MSI installer file, click **Download installer**.
The Bot Agent installer MSI file is downloaded to your default Downloads folder.

Edit the Bot Agent MSI file to remotely install the Bot Agent on multiple devices.

Related tasks

[Bulk install Bot Agent on devices](#) on page 1296

Installing Bot Agent across multiple devices such as on-premises machines, virtual machines (VM), and non-persistent virtual desktop infrastructure (VDI) including Amazon WorkSpaces is called Bulk install (or silent install). You must edit the Bot Agent MSI file for bulk installation.

Edit the Bot Agent installer file

Edit the Bot Agent MSI installer file to add the registration key and Control Room URL to remotely install the Bot Agent on multiple devices.

To perform the task, you must have a administrator account with the required rights and permissions.

Ensure the Windows 10 Software Development Kit including Orca and Control Room are installed on your device. You can install Orca from C:\Program Files (x86)\Windows Kits\10\bin\10.0.18362.0\x86\Orca-x86_en-us.msi.

Set up the Microsoft Active Directory group policy to remotely install the Bot Agent on multiple devices.

[Use Microsoft Active Directory Group Policy to remotely install software](#)

Edit the Bot Agent .msi file to enable the Control Room administrator to implement the auto-update Bot Agent policy.

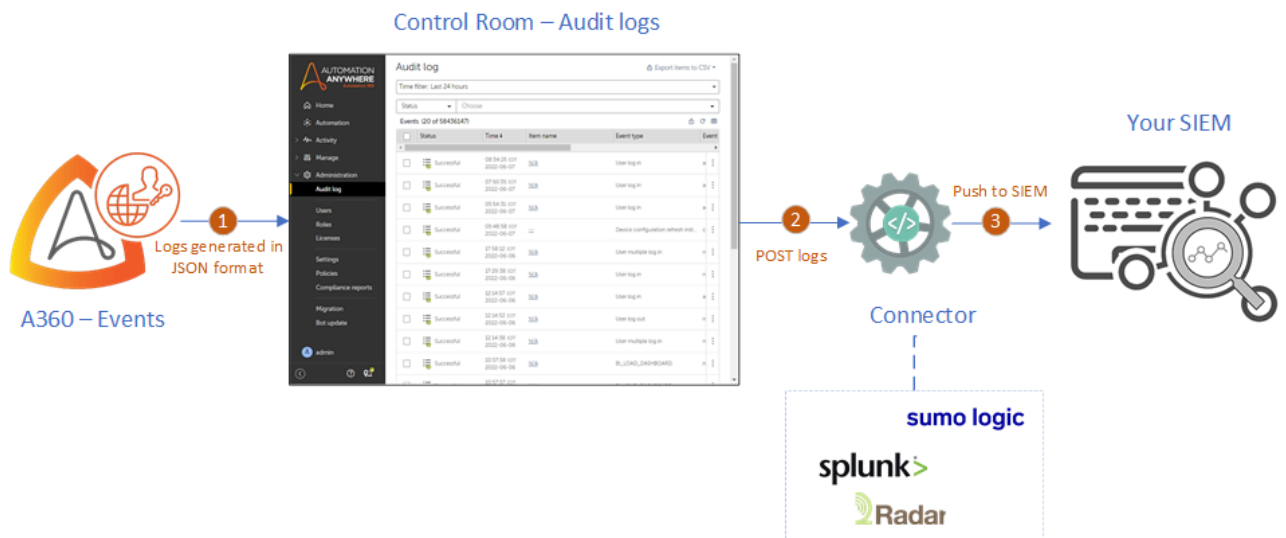

1. Use the latest AutomationAnywhereBotAgent.msi file from the following locations:
 - Download the file from the Control Room (**Administrator > Settings > Bot agent bulk install**).
 - The download option is available for On-Premises and Cloud deployments.
 - Select the file from the <application filepath>\crui\asset folder. For example C:\Program Files\Automation Anywhere\crui\asset
 - This option is available only for On-Premises deployments.
2. Edit the AutomationAnywhereBotAgent.msi file using Orca tool.
3. Click the **Property** option.
4. Change the value for AA_CRTOKEN and AA_CRURL.
The AA_CRTOKEN uses the registration key and the AA_CRURL uses the Control Room URL for which the registration key is generated.

5. Save your changes.

Configure integration with SIEM

The Automation Anywhere Control Room supports security information and event management (SIEM) tools ingesting logs from your tenant's Audit logs.

With SIEM integration, audit logs can be sent to analytic tools, such as [Splunk](#), [Qradar](#), [Sumologic](#), and [ArcSight](#). By pushing audit log entries to SIEM tools, you can integrate and leverage the advanced searching and reporting features of SIEM solutions. When configured, the Control Room audit logs are forwarded to the configured SIEM server.

Configure an SIEM server step by step so that Automation 360 sends the audit messages to the SIEM server. In the following example, Sumo Logic is used as the SIEM provider. Use the same procedure to configure any other SIEM server.

Setting up Sumo Logic

Setup the Sumo Logic as a SIEM tool to collect logs.

To use Sumo Logic as a logging endpoint, you will need to create a Sumo Logic account, add a new source, and save the HTTP source URL.

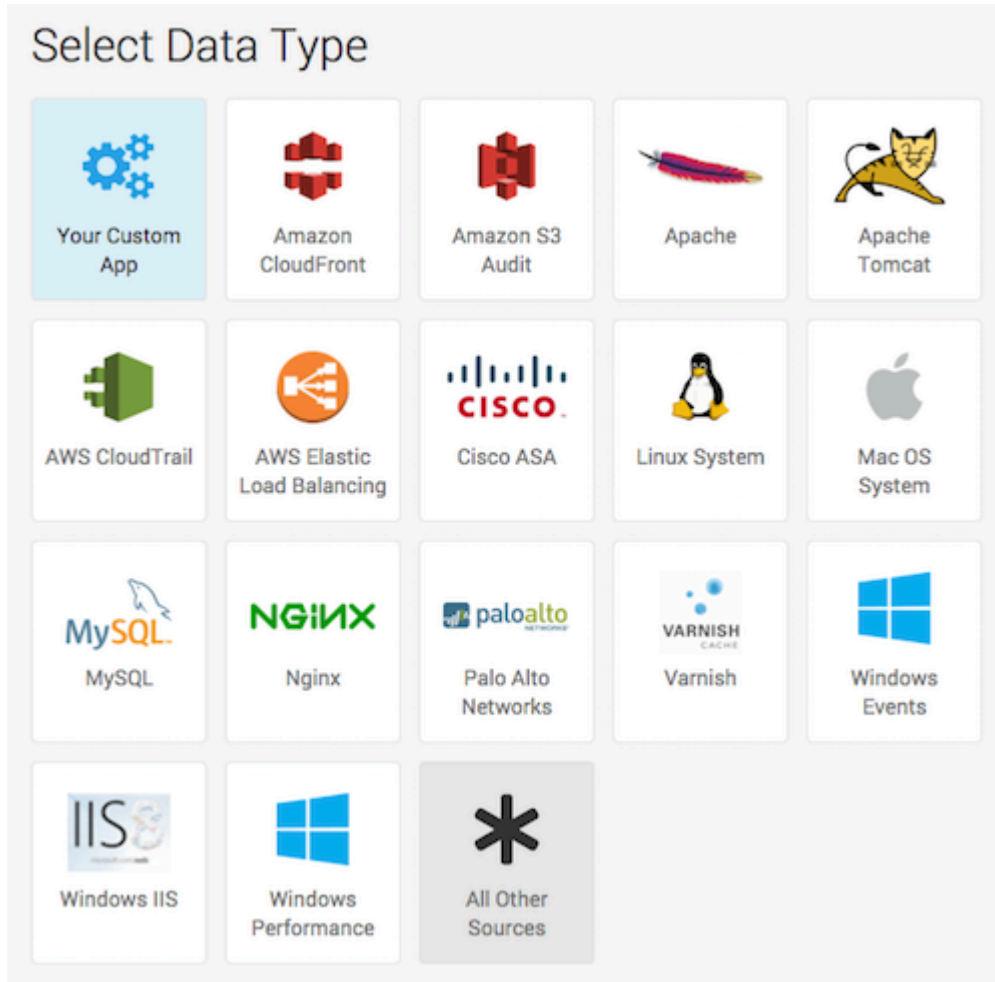

To add a new source in the Sumo Logic website, perform the following steps:

1. After you create your Sumo Logic account, the Sumo Logic Setup Wizard appears. If you already have an account, you can access the wizard by selecting **Setup Wizard** from the **Manage** menu at the top of the Sumo Logic application. In the **Setup Wizard**, click **Set Up Streaming Data**

The **Select Data Type** window appears.

2. Click **All Other Sources**.

The **Set Up Collection** window appears.

3. Click **HTTP Source**.

The **Configure Source: HTTP Source** window appears.

4. Enter a name in the **Source Category** (for example, Http Input), and select a timezone for your log files.

Configure Source: HTTP Source

1. Enter a Source Category that will help you search your logs later.

Source Category ?

custom_http_logs

2. Select a time zone for your log file.

Use time zone from log file. If none present use:

(UTC) Etc/UTC

Ignore time zone from log file and instead use:

(UTC) Etc/UTC

Go Back Continue

5. Click **Continue** to see a magic url such as the following:
`https://endpoint1.collection.us2.sumologic.com/receiver/v1/http/ZaVnA4dhaV0nFJAEMuwFDGEEZUnDedm7hYhkdUJSAE44bmKKp1mp4LsYDCr2MzTA0C21czkqjz9UVjC1mk4`
6. Save this URL in an editor. You will need it when you add Sumo Logic as an SIEM logging endpoint. [Adding Sumo Logic as an SIEM logging endpoint](#) on page 1779

Adding Sumo Logic as an SIEM logging endpoint

To configure the server where audit logs will be sent, add the Sumo Logic as an SIEM logging endpoint.

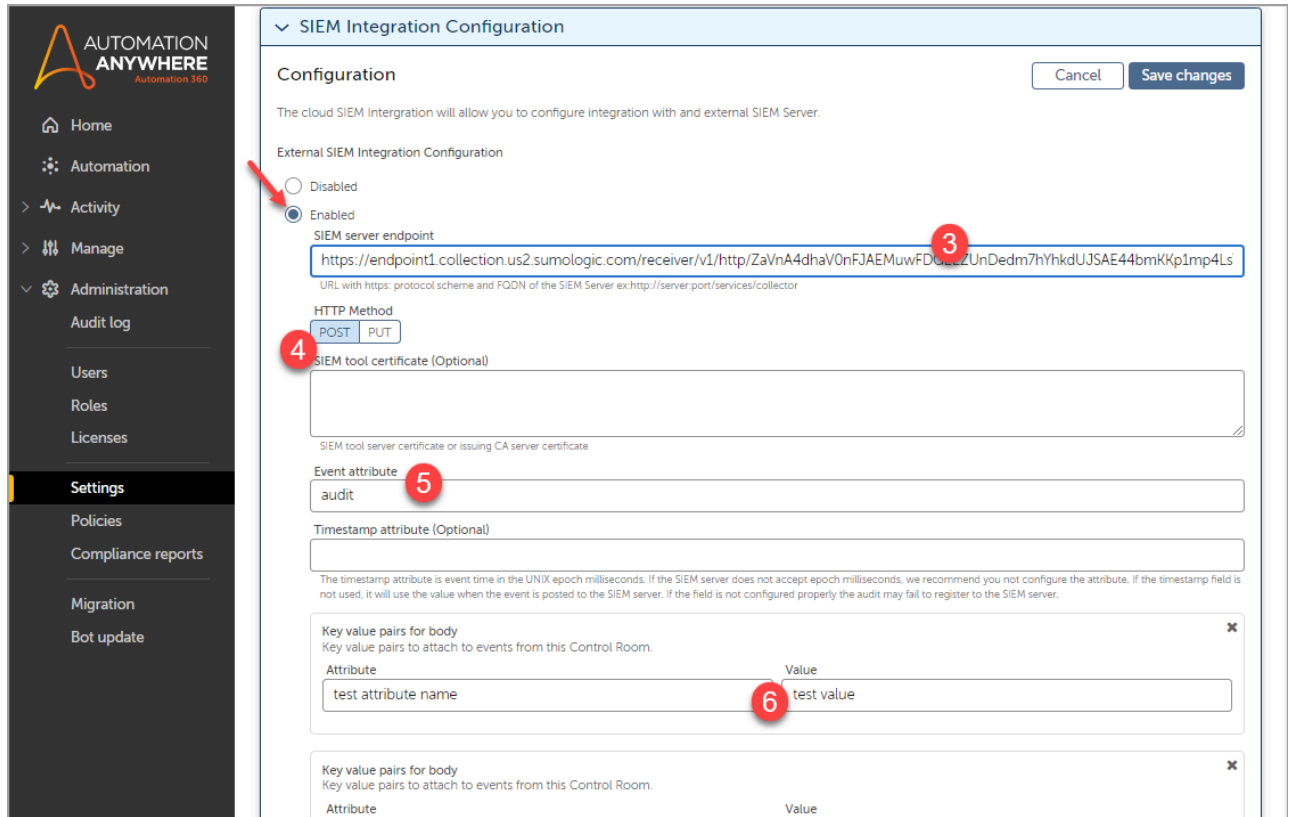

Note:

To perform the task, you must have a administrator account with the required rights and permissions.

1. Navigate to **Administration > Settings > SIEM Integration Configuration**.

The screenshot displays the Automation Anywhere Administration console. On the left is a dark sidebar with the 'AUTOMATION ANYWHERE Automation 360' logo at the top. Below the logo are navigation items: Home, Automation, Activity, Manage, and Administration. Under Administration, there are sub-items: Audit log, Users, Roles, Licenses, Settings (highlighted with a red circle '1'), Policies, Compliance reports, Migration, and Bot update. At the bottom of the sidebar is a user profile for 'admin' and navigation icons. The main content area on the right shows a list of settings categories: Bots, Packages, Devices, IQ Bot, Bot agent bulk install, Email, Remote Git repository integration, Login settings, Security settings, User Authentication, Network settings, and External key vault. The 'SIEM Integration Configuration' section is expanded, showing a 'Configuration' card with an 'Edit' icon (highlighted with a red circle '2'). The configuration text reads: 'The cloud SIEM Intergration will allow you to configure integration with and external SIEM Server. External SIEM Integration Configuration Disabled'.

2. Click the **Edit** icon. 
3. Select **Enabled** and paste the **SIEM server endpoint** that you copied previously, from [Adding Sumo Logic as an SIEM logging endpoint](#).

Note: Ensure that you refer to your SIEM provider's documentation to get the information regarding the HTTP headers and requirements around JSON attributes (request body).

4. Select **POST** HTTP method, because Sumo Logic accepts the inputs as a POST method.

Note: The SIEM tool certificate is optional and depends on the SIEM provider. Some SIEM providers require you to enter a valid SIEM tool certificate.

5. Enter a name for **Event attribute**(for example, audit). All the log messages will be logged under this category and will act as key to locate all the event logs.

Note: The timestamp attribute is an optional field and depends on the SIEM provider's mapping for this field. For example, Splunk requires the value to be time and mapped to one of its timestamp fields. The maximum length allowed is 256 characters. All special characters are allowed except the backslash (\) and double quotation marks ("). These characters have to be escaped.

6. Click on plus (+) sign to enter a few **key-value pairs for body** (static attributes) that are sent out along with the logs. The key-value pairs also take special characters as inputs. You will be able to configure a maximum of 50 attributes.

- Click on plus (+) sign to enter a few **key value pairs for header** to be sent with every event data log. The header data is specific to the SIEM provider. For example, with Sumo Logic, it supports header names starting with the letter X (for example, X-Sumo-Fields). You will be able to configure a maximum of 50 headers.

Key value pairs for header
Additional key value pairs to attached to event headers for events sent from this Control Room.

Header	Value
X-Sumo-Fields	environment=devcloud,cluster=aaedev

For more information about header data, see the corresponding SIEM provider's documentation.

Verifying data in Sumo Logic

Reception of audit logs are verified using the Sumo Logic web interface. One way to do this is to search for events using the name of the collector and source.

Perform the following steps to verify the data in Sumo Logic:

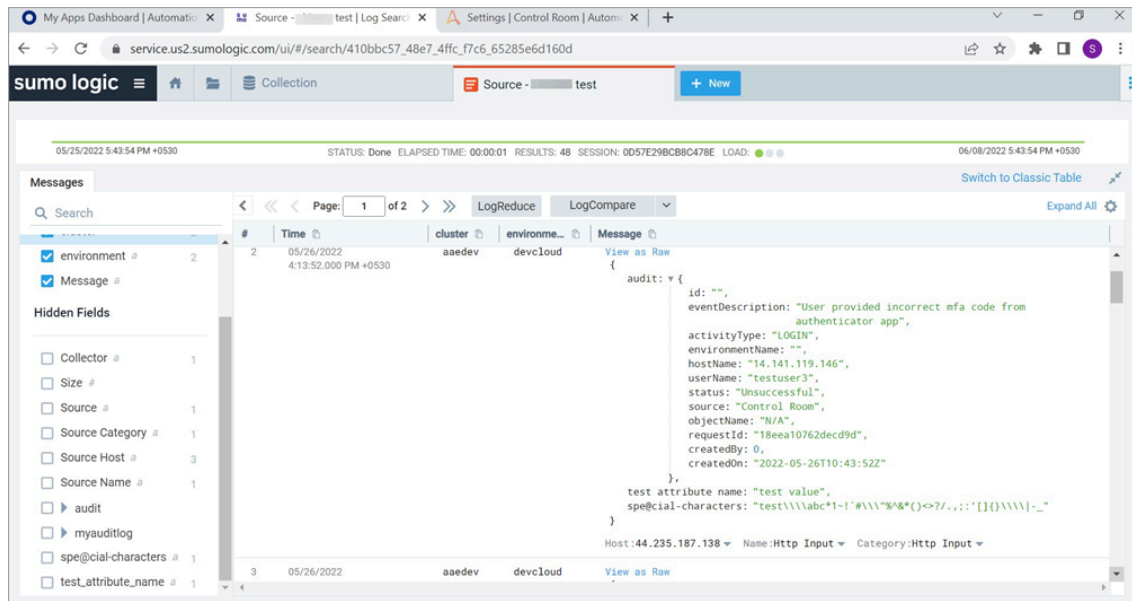

- Generate an audit log by generating an event. For example, create a user ([Create a user](#) on page 1678).
- Go to [Audit log](#) on page 2068 to see the entry in the logs.

In Sumo Logic, you will notice the event logged in the source that you configured when setting up Sumo Logic. [Setting up Sumo Logic](#) on page 1776

- Navigate to **Manage Data > Collections**
- On the **Collection** tab, click **Open in Log Search** icon next to the respective log source.

The screenshot shows the Sumo Logic 'Collection' page. The table lists various sources, including 'test', 'HTTP', 'devops-global', '(default-metrics)', 'apiserver-metrics', 'control-plane-metrics', and 'events'. The 'devops-global' source is expanded, and a red arrow points to the 'Open in Log Search' icon next to it. The table columns include Name, Health, Type, Status, Source Category, Sources, Last Hour, and Messages.

It displays events filtered by collector and source. A user creation event in JSON format sent to Sumo Logic through HTTPS is displayed.

Use AuthConfig App to enable OAuth2 services

As an Organization Administrator with access to the Licenses and Cloud Services portal, you use the AuthConfig App to manage the relationship between a set of Automation 360 Control Room instances and our OAuth2 (Open Authorization) services. OAuth2 services are used to interact with the Automation 360 Control Room by third-party applications. Currently, you can only use the PixieBrix extension to use the OAuth services to interact with the Control Room.

Note: The availability of this feature is based on your region.

For more details regarding licenses and the PixieBrix extension, click:

- [Licenses and cloud services](#) on page 1344
- [PixieBrix and Automation Anywhere](#)

You use OpenID tokens to authenticate to the AuthConfig App.

Token overview

Automation Anywhere and the AuthConfig App support the following token types:

- **Control Room registration token:** The AuthConfig App generates this token which you enter in the **OAuth Settings** panel of the Automation 360 Control Room. The Control Room registration token establishes the identity of your Control Room to the AuthConfig App. After you register and enable the token, the Control Room can consume access tokens to call APIs.
- **Access token:** A JSON web token generated from an authorization provider after authenticating with an Identity Provider (IdP). Access tokens contain claims that provide information to a resource server. API calls use access tokens to enable an authorized client to gain access to data on the resource server.
- **Refresh token:** Refresh tokens provide a method to get new access tokens without having to collect and authenticate credentials every time an access token expires.

The AuthConfig App generates Control Room registration tokens to enable OAuth2 services. The following diagram shows how a registration token flows between the AuthConfig App and the Automation 360 Control Room:

1. The Administrator uses the AuthConfig App to generate a registration token.
2. The registration token is stored in the database.
3. The Administrator enters the generated registration token into the OAuth Settings in the Automation 360 Control Room.
4. The registration token is stored in the database.
5. The registration token is then sent to the AuthConfig App where if the token matches the token stored in the database, the Control Room is registered.

Note: Authorization code flow with PKCE is currently supported.

Benefits

You use the AuthConfig App to:

- Enable or disable OAuth2 services for an Automation 360 Control Room (On-Premises or Cloud).
- Configure an Identity Provider (IdP) configuration using a SAML authentication connection for your organization to use with OAuth2 services.
- Generate registration tokens for each Control Room to securely enable OAuth2 services.

For details about accessing automations in a web scenario with Automation Co-Pilot (extensions) and using a custom widget through Google Chrome extensions, click [here](#).

Prerequisites

Before you use the AuthConfig App:

- Create your Automation Anywhere community (Apeople) credential: [A-People home page \(login required\)](#).
- From the Automation 360 Control Room:
 - To enable an IdP authenticated user to use an access token to call a Control Room API, you must also add the IdP authenticated user as a Control Room user.

- To use access tokens, you must register and enable Control Room instances with OAuth2 services.

After you complete the prerequisites, you can [access the AuthConfig App](#).

Access the AuthConfig App

The AuthConfig App generates Control Room registration tokens to enable OAuth2 services.

To access the AuthConfig App:

1. Log in to the Automation 360 Control Room as the Administrator.
2. To obtain the AuthConfig App login URL, you can either:
 - From the Control Room, navigate to: **Administration > Settings > OAuth**, and then click the link provided in the Registration text area, or
 - Copy and paste this URL (default URL) into a browser window: `https://oauthconfigapp.automationanywhere.digital`
3. The **AuthConfig App Log in** dialog box displays:

Click **Log in** to log in with your existing Apeople credentials. You are re-directed to the [A-People home page \(login required\)](#) page.

- From the A-People home page, enter your credentials (username and password) and click **Log in**. You are re-directed to the AuthConfig App

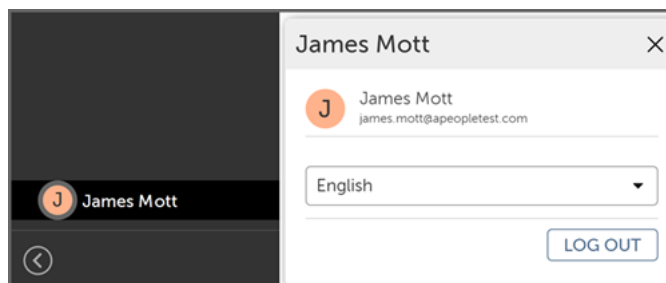

From AuthConfig App page, you can:

- [Review existing On-Premises and Cloud Control Room instances to enable OAuth2 services](#)
- [Configure SAML](#)
- [Manage refresh tokens](#)

To log out of the AuthConfig App:

1. Click your username profile at the bottom of the page to open the **Log Out** dialog box:

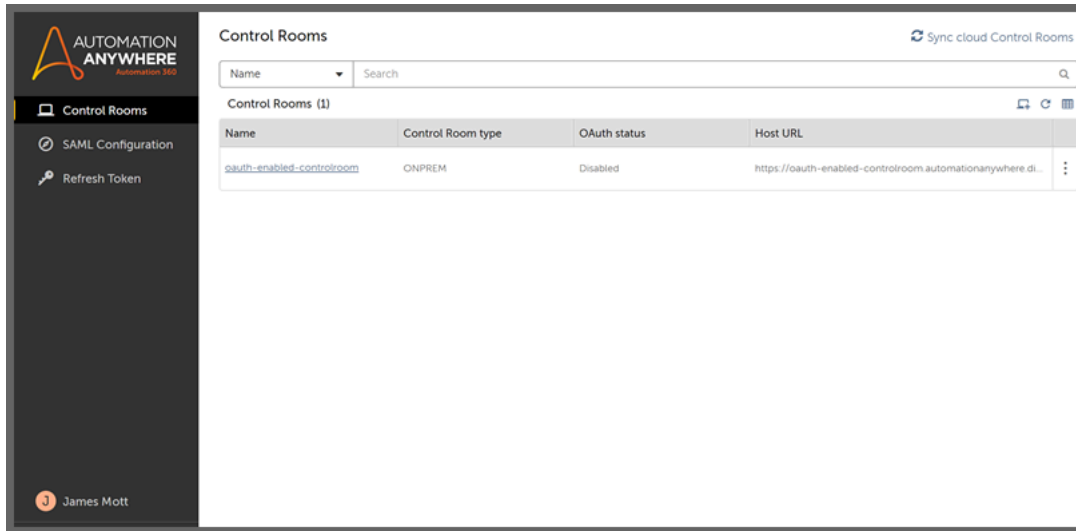

2. Click **Log Out**.

Review Control Rooms

If not already displayed on the AuthConfig App page, select **Control Rooms** on the left side of the page to display a list of all your On-Premises and Cloud Control Rooms.

If new Control Room instances were added through the [Licenses and cloud services](#) on page 1344 portal, click Sync cloud Control Rooms at the top of the page to update and display them in the list.

Note: If you delete a Cloud Control Room from the AuthConfig App (which still has a valid license), then the Cloud Control Room will re-appear in the Control Room list after syncing.

From the **Review Control Room** page, you can:

- [Generate a registration token for a Control Room](#)
- [Enable or disable OAuth2 services for a Control Room](#)
- [Add or delete an On-Premises Control Room](#)

Generate a registration token for a Control Room

To generate a registration token for a Control Room:

1. Click the Control Room name or hover over the actions menu (three vertical ellipses) located to the right of the Control Room name and click the **Binoculars** icon. The Control Room details page displays.

- To generate a registration token for the Control Room to enable OAuth2 services, click **Generate token** at the top right of the

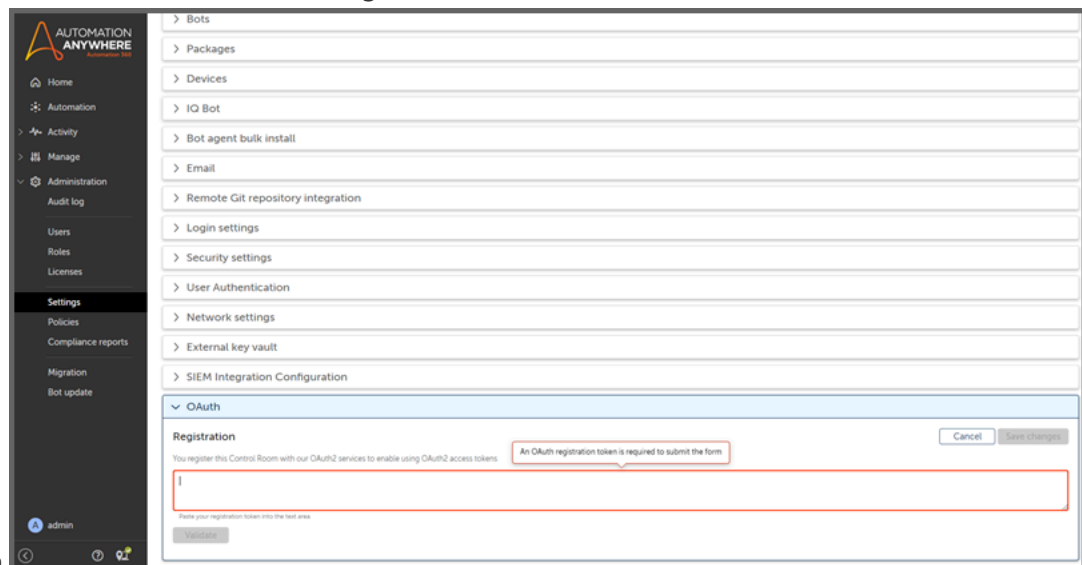

page:

- A confirmation message displays asking if you want to generate the token. The generated token is required to register your Control Room tenant with OAuth2. Click **Generate**.
- A dialog box displays the newly generated registration token. Click **Copy token**.

Note: You should store this token in a safe place for future use. You cannot retrieve this token after you close the window.

- Navigate to: **Administration > Settings >**

OAuth.

the text area, paste the token you copied to register the Control Room with our OAuth2 services to enable using OAuth2 access token.

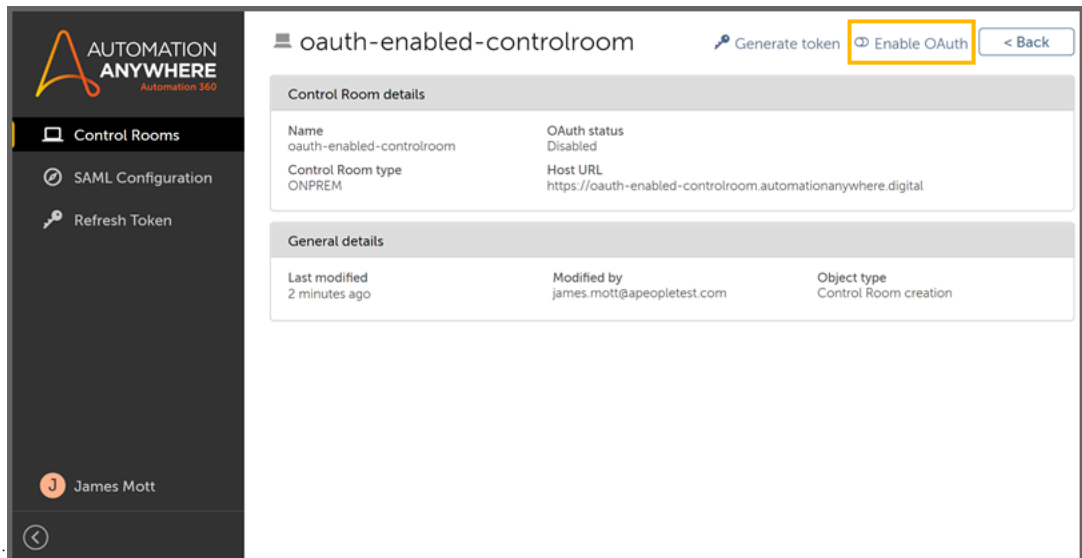

- Click **Validate** and review the data to ensure that it matches the Name and Host URL you were expecting.
- Click **Save changes**.

This registers the AuthConfig App with the selected Control Room.

Enable or disable OAuth2 services for a Control Room

To enable or disable OAuth2 services for a Control Room:

1. Click the Control Room name or hover over the actions menu (three vertical ellipses) located to the right of the Control Room name and click the **Binoculars** icon. The Control Room details page displays.
2. By default, the OAuth2 services for a Control Room are disabled. To enable OAuth2 service, click the **Enable OAuth** toggle at the top right of the

page:

The OAuth status changes to Enabled.

3. Click **< Back** to return to the Control Room list.

Add or delete an On-Premises Control Room

Note: You cannot add a Cloud Control Room because it is consumed automatically by the AuthConfig App.

To add an On-Premises Control Room:

1. Click the **Add Control Room** icon at the top right of the page:

2. The **Add an On-Premises Control Room** dialog box displays:

The dialog box titled 'Add an On-premises Control Room' contains the following fields and buttons:

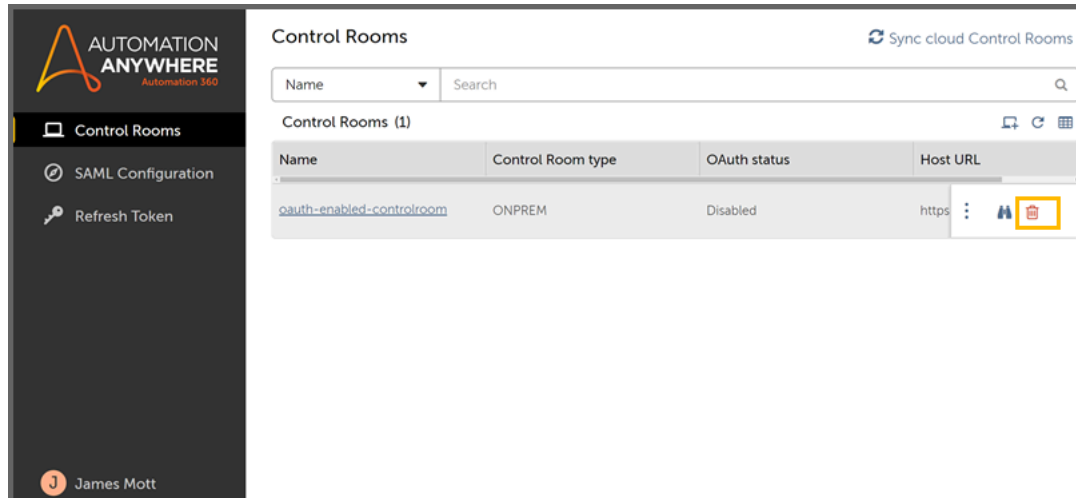

- Name:** oauth-enabled-controlroom
- Host URL:** https://oauth-enabled-controlroom.automationanywhere.digital
- Buttons:** Cancel, Submit

Below the Host URL field, there is a small text: eg : https://.....

- a) Enter a unique **Name** and **Host URL** (for example: `https://digital.automationanywhere.com/nextbank`) for the new On-Premises Control Room. The host URL you enter must match the URL you provided to your external OAuth client (for example: PixieBrix).
- b) Click **Submit** when finished.

To delete an On-Premises Control Room:

1. Hover over the actions menu (three vertical ellipses) located to the right of the Control Room name and click the **Delete** icon:

2. A confirmation message displays asking if you want to permanently delete the Control Room. Click **Yes, delete** to remove the registered Control Room from the AuthConfig App.

Configure SAML connection details

You configure SAML to authenticate to your Identity Provider (IdP) to obtain OAuth access tokens.

Note: To configure OAuth, you must create a separate SAML web app. Ensure that you do not use the SAML web app that you use to connect to the Control Room to configure OAuth.

To configure SAML connection details:

1. From **AuthConfig App** page, select **SAML Configuration** on the left side of the page.
2. Click **New SAML configuration** at the top of the page.
3. The **New SAML configuration** dialog box displays:

- a) Enter the connection name. The connection name is user defined.
- b) Enter the sign-in URL. This URL information is provided in your external authentication provider and is typically referred to as IdP URL by most providers.
- c) Click **Browse** to locate your IdP public key. This key must be in the PEM format (.pem). The public key validates the IdP's signed response.
- d) Click **Create**.

The SAML configuration is created and provides the configuration details.

- e) From the SAML configuration details section, select and copy the **Entity ID** and **ACS URL** values.
- f) Navigate to the SAML configuration page of your IdP.

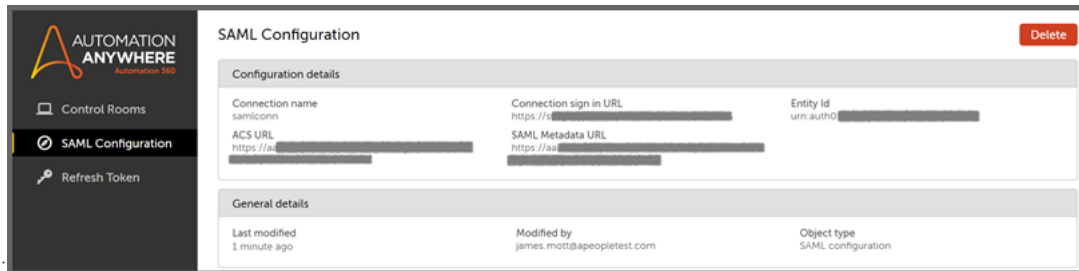

- g) Enter the **Entity ID** value in the **SP Entity ID** field of your IdP.

Note: Most IdPs use the **SP Entity ID** field to identify the entity ID field. However, some IdPs might use a different name. In such a scenario, identify the entity ID field for the IdP and enter the **Entity ID** value.

- h) Enter the **ACS URL** value in the ACS (Assertion Creation Service) URL field of your IdP.

Note: You can perform step e to step h by downloading the SAML metadata from the AuthConfig App and uploading it directly into your IdP SAML configuration.

The connection name configuration details

display:

The ACS (Assertion Creation Service) URL directs your IdP where to send its SAML response after authenticating a user, and the Entity ID is the unique identifier of the IdP.

To delete the SAML configuration, click **Delete** at the top right of the page. A confirmation message displays asking if you want to delete the SAML configuration.

Note: If you delete the SAML configuration, Control Room users will not be able to obtain new access tokens using our OAuth2 service.

Click **Delete** to continue.

Manage refresh tokens

One SAML connection can have multiple tokens.

To manage the refresh tokens:

1. From **AuthConfig App** page, select **Refresh Token** on the left side of the page. The Refresh Token Management page displays:

2. You can enter SAML connection name or subject search parameters in the **Search** box.
3. To revoke a refresh token, hover over the actions menu (three vertical ellipses) located to the right of the token name and click the **X (Revoke)** icon.

4. A confirmation message displays asking if you want to revoke the token.

Note: By revoking the refresh token, the associated application will not be able to obtain a new access token using the refresh token.

Click **Revoke**.

Edit My settings

The **My settings** page provides user profile specific information.

My profile

Each RPA user is required to have an active profile in the Control Room to build, run and schedule the deployment of bots as well as for security authorization. Profile information includes user names, email addresses, passwords, and so on.

To access this information, click the **My Settings** navigation tab.

The **My Settings** page displays an expandable **My profile** tab that shows specific and configurable user details. Click the **Edit** icon to update this profile information.

Related tasks

[Edit profile settings](#) on page 1793

Update your user profile settings in the Control Room.

Edit profile settings

Update your user profile settings in the Control Room.

Ensure that you are logged in to the as the administrator.

Each RPA user is required to have an active profile in the Control Room to build, run and schedule the deployment of bots as well as for security authorization. Profile information includes user names, email addresses, passwords, and so on.

1. Navigate to **My Settings**.

The **My Settings** page displays the expandable **My profile** tab for specific and configurable user details. Click the **Edit** icon to update this profile information.

2. Update any or all of the general details for your profile.

Option	Description
First name	Maximum character length is 50.
Last name	Maximum character length is 50.
Contact email	Maximum character length is 255.
Change password	8-15 characters: a-z (lowercase), A-Z (uppercase), 0-9, and the following special characters are allowed: @, -, _, !, #, \$, %, ., and &

3. Click **Save changes**.

Set up your bot repository

Administrators create repositories for Bot Creators to develop and build bots .

Ensure that you are logged in to the as the administrator.

Administrators create repositories for Bot Creators to develop , test, and debug bots. After configuring the repository, the administrator creates the role for the Bot Creator.

1. Log in to the as the administrator.
2. On the left pane, click **Automation**.
3. Click **Create subfolder**.
4. Provide the repository folder name and navigation path.

This repository folder is where the bots created by Bot Creators will be stored.

Important: Based on limits requirement in the Windows operating system (primarily Windows Server 2019 and 2016), ensure your folder, file names, and the nested folder structure is not long; otherwise, your bot execution or repository backup can be impacted.

5. Click **Create folder**.

Create roles for users. Roles grant specific permissions to users, such as Bot Creators and Bot Runners.

Working with repositories, credentials and roles

Control room administrators configure repositories for Bot Creators to develop RPA bots. Administrators create roles, assign users, and grants permission to action packages used in creating bots.

This topic is intended for experienced Automation Anywhere Automation 360 users.

Administrator tasks

Control room administrators setup repositories for Bot Creators to develop bots. For this process, administrators create users and assign these users specific roles, such as Bot Creators or Bot Runners. Bot Creators are granted access to specific RPA action packages to create, test, and run bots. Completed bots are transferred to the public repository for other users to deploy. The following is a breakdown of control room administrator related tasks to complete this process.

[Set up your bot repository](#) on page 1794

Administrators create repositories for Bot Creators to develop , test, and debug bots. After configuring the repository, the administrator creates the role for the Bot Creator.

[Assign a role](#) on page 1706

Roles grant specific permissions to users, such as Bot Creators and Bot Runners.

[Create your users and assign their licensed roles](#) on page 1726

Create or otherwise edit the user information to assign the licensed role for accessing repositories, packages, and bot building tools and functionality.

[Add packages to the Control Room](#) on page 1842

Administrators can add packages to the Control Room for use by Bot Creators.

[Set up lockers and credentials in Credential Vault](#) on page 1797

The credentials assigned are typically those where the administrator is granting some internal, business-related access to a Bot Creator or Bot Runner for RPA development, for example to a Salesforce account.

Bot Creator task

Bot Creators often require access to protected data to automate a process. Each Bot Creator is given credentials governing the data they are permitted to access. The administrator creates the credential and assigns it to individual users by configuring specific roles for the Bot Creator to access those credentials. Bot Creators must add their own specific attributes to the credentials after they have been assigned by the administrator.

Manage user credentials

Bot Creators and Bot Runners rely on credentials to access necessary data relevant to the bot building process.

This task is performed by the user who wants to build and deploy . You must have the necessary rights and permissions to complete this task, and authorization to log in to the as the licensed user.

Bot Creators often require access to protected data to automate a process. Each Bot Creator is given credentials governing the data they are permitted to access.

Note: Administrators are required to have created the necessary roles and entitlements assigned to the user in order to update and use any granted permissions.

1. Navigate to **Bots > Credentials > My Credentials**.

Select the credential to view and or manage.

2. Click **Edit**.

The configurable fields for the credential are displayed, based on the user granted permissions.

For example, a bot is built that requires the authentication username and password to log in to a specific URL. The user will create a custom credential for this operation by amending the credential governed by the administrator, adding the additional security details. This way, the Bot Creator can authorize only that protected data deemed necessary for the automation.

3. Click **Save changes**.

Credentials and lockers in the Credential Vault

The Credential Vault securely stores sensitive information such as passwords, account numbers, and social security numbers in credentials and lockers for use in automation tasks. It facilitates role-based access for users of a Control Room and ensures that sensitive values are not stored in bots or on devices.

The Credential Vault consists of two main features: credentials and lockers.

Best Practices:

- Each credential should contain a single password used for authentication to a specific system.
- The credential may have additional attributes such as user name or hostname depending upon what is required in the authentication process that the credential is used for.
- Credentials for applications that process data which requires the highest confidentiality have the least number of consumers where credentials for applications that require lower confidentiality can have a higher number of consumers. Segregate credentials based on applications and data confidentiality.
- Lockers are created to hold credentials that are related to a specific business purpose or class of application based on confidentiality.

Credentials

A credential holds the sensitive information in attributes. An attribute can have a value that is standard for all users or it can accept a user-input value. For example, an `Email` credential can hold three attributes: `host_name` (standard value), `username` (user input), and `password` (user input).

By default, all users can create, manage, and use their own credentials. A user is granted access to another user's credentials by receiving access to a locker that holds the credential. If the credential requires a user-input value, it appears in the **CREDENTIAL REQUESTS** tab.

A credential must be assigned to a locker to be used for building and running a bot.

Lockers

A locker specifies which users can view, modify, or access the credentials. For example, a human resources (HR) locker can hold `Email`, `Database`, and `Training website` credentials and allow only specific employees of the HR department to use the credentials in their bots.

A user with either the `AAE_Locker Admin` role or a user-created role with the **Manage my credentials and lockers** permission configures lockers, adds credentials, and grants access to other users.

Benefits of using the Credential Vault

Apart from providing a secure and centralized location for storing credentials, using the Credential Vault also:

- Minimizes credential fraud.
- Provides an environment to enable improved security.
- Enables businesses to adhere to the processes and credential management compliance standards.
- Offers increased automation opportunities with secure data applications.

Related concepts

[RBAC for Credential Vault credentials management](#) on page 985

Credentials created in the Control Room are used across Bot Creators and Bot Runners.

[Configure Credential Vault Connection mode](#) on page 1750

Credential Vault is a centralized location for securely storing credential information used by bots.

Set up lockers and credentials in Credential Vault

Assign credentials to lockers for Bot Creators to access during the bot building process.

Ensure that you are logged in to the as the administrator.

The credentials assigned are typically those where the administrator is granting some internal, business-related access to a Bot Creator or Bot Runner for RPA development, for example to a Salesforce account.

Note: Credential and attribute names are not case-sensitive and are stored as "lower-case".

1. Navigate to **Manage > Credentials**.
2. Click **Create credential**.
3. Enter the **Credential name** and a **Description** for the configured credential or select **External key vault**.

If integrating with an external key vault, then proceed to [Select External key vault](#) .

4. Enter the **Attribute name** and supply the **Description** for the attribute.
5. Select one of the following **Input** options:

Input	Value
Standard	Enter the value. All users see the same credential value set by the credential owner.
User-provided	The value field is not available because the values are not preset during creation. Only users of the locker containing this credential can provide the value.

6. Set **Security** for the attribute.

Note: When the **Masked** option is selected, the attribute value is hidden for security purpose.

7. Click **Create credential**.
8. Click the **MY LOCKERS** tab.

9. Click **Create locker**.
10. Enter the **Name**.
11. Optional: Enter a description.
12. Click **Create locker**.

Set up locker and assign credentials

Create a role, credentials, and locker to share related sensitive values with a group of users, so they can use those values to build or run bots.

Do the following to set up the locker and assign credentials:

1. [Create a role](#) on page 1687

Define a role and assign permissions to access various features for building bots.

Note: You must have the **AAE_Admin** role or the **Manage roles** permission to create a role and assign it to users.

2. [Create credential](#) on page 1798

Create a credential and add the required attributes.

Note: You must have the **Manage my credentials and lockers** and **Create standard attributes for a credential** permission to create a credential and attributes.

3. [Create locker](#) on page 1801

Create a locker to group similar credentials and share with other users.

Note: You must have the **AAE_Locker Admin** role or the **Manage my credentials and lockers** permission to create a locker and assign users and roles to it.

Related concepts

[RBAC for Credential Vault credentials management](#) on page 985

Credentials created in the Control Room are used across Bot Creators and Bot Runners.

Related tasks

[Edit a credential](#) on page 1800

Modify credential details and add or remove attributes.

[Edit a locker](#) on page 1803

Add or remove credentials, owners, managers, participants, or consumer roles.

Create credential

Create a credential and add the required attributes.

This task is performed by the Automation Anywhere Control Room administrator. You must have the necessary rights and permissions to complete this task. Ensure you are logged in to the Control Room as the administrator, or a user with either the **AAE_Locker Admin** role, or a user-created role with the **Manage my credentials and lockers** permission to configure lockers, add credentials, and grants access to other users.

Assign the credential when adding the credential details. If no locker was created, create a locker and then assign the credential. Add up to 50 attributes to a credential.

1. Log in to the Control Room as the administrator.
2. Navigate to **Manage > Credentials** and click **Create credential**.
3. Enter the **Credential name** and a **Description** for the configured credential or select **External key vault**.

If integrating with an external key vault, then proceed to [Select External key vault](#) .

4. Enter the **Attribute name** and supply the **Description** for the attribute.
5. Select **External key vault**.

If integrating with an external key vault, such as AWS, Microsoft Azure, CyberArk, or HashiCorp, enter the required credentials for the specified external vault as follows:

AWS

Enter the secret name.

CyberArk

Enter the object name.

Note: Optionally, you can add attributes and enter property set using CyberArk properties to use in your bot automation.

The following examples show how to create property sets in different scenarios:

- If you want to use a username in the format `domain\username` where the domain is stored in the CyberArk property called **Address** and the username is stored in the CyberArk property called **UserName**, then enter the property set in the format `$$Address$$\$$UserName$$` in the credential attribute and use this attribute in your bot automation.
- If you want to use a username in the format `username@example.com` where the username is stored in the CyberArk property called **UserName**, the address (example) is stored in the CyberArk property called **Address**, and the domain (.com) is stored in the CyberArk property called **Domain**, then enter the property set in the format `$$UserName$$@$$Address$$$$Domain$$` in the credential attribute and use this attribute in your bot automation.
- If you want to use a password that is stored in two different CyberArk properties called **PasswordFirst** and **PasswordLast**, then create an attribute with the property set as `$PasswordFirst$$$$PasswordLast`

\$\$ and use this attribute in your bot automation.

Microsoft Azure

Enter the secret name.

HashiCorp

Enter the HashiCorp secret name.

6. Select one of the following **Input** options:

Input	Value
Standard	Enter the value. All users see the same credential value set by the credential owner.
User-provided	The value field is not available because the values are not preset during creation. Only users of the locker containing this credential can provide the value.

7. Set **Security** for the attribute.

Note: When the **Masked** option is selected, the attribute value is hidden for security purpose.

8. Optional: Select **Use attribute ONLY on Password or Masked fields**.

This option ensures that bots input the attribute value only into fields that are identified as password fields.

Note: When this option is selected, an attribute is available only for the commands in Automation Anywhere Enterprise client that support credential variables and where the fields are of **Password** type.

9. Click **Create credential**.

Assign this credential to a locker.

Edit a credential

Modify credential details and add or remove attributes.

A credential can be edited by the owner when the credential is not assigned to a locker. If a credential input type is user-provided, then locker consumers can edit the credential to input a value.

[Role-based access and locker permissions](#)

Note: A user with the **AAE_Locker Admin** role can assign a credential to a new owner. For more information, see [Transfer credential ownership](#) on page 1801.

1. Navigate to **Manage > Credentials**.
2. Hover over the **Actions** icon for the credential.
3. Click the **Edit** icon. 
4. Edit the credential.

If the email notification setting is enabled and credentials are added to a locker, then all the locker consumers receive an email.

The maximum limit of credential attributes that is allowed is 50. If you have upgraded to the current version and have migrated credentials that have more than 50 attributes, when editing that particular credential, the following message displays: `Credentials can only have a maximum of 50 attributes`. To continue, remove the additional attributes that cannot be saved and add those to a new credential.

5. Click **Save changes**.

Related reference

[Credential Vault email notifications](#) on page 1804

When the email notification setting is enabled, it ensures that users are notified of any changes to credentials and lockers.

Transfer credential ownership

A user with the **AAE_Locker Admin** role can transfer a credential to a different owner.

A credential can only be reassigned to a different owner if it is in a locker. The new owner can be either the locker owner, manager, or participant.

1. Navigate to **Manage > Credentials**.
2. Use the search bar to find the credential.
3. Hover over the vertical ellipses to the right of the credential.
The actions menu opens.
4. Click **Transfer credential ownership**.
A list of users with access to the locker appears.
5. Select the new credential owner.
6. Click **Yes, submit**.

Create locker

Create a locker to group similar credentials to share with other users.

You must either have the `AAE_Locker Admin` role or **Manage my credentials and lockers** permission and the necessary permission to View Users and Roles.

Note:

- You must have the View Users and Roles basic information permission to view information about other users to add them as locker owners/Managers/participants. Without this permission, an "Access denied" error will occur.
See [RBAC for Credential Vault credentials management](#) on page 985
- Ensure that you do not use a locker name starting with `oAuth_` (case insensitive, for example, `OAuth_`, `oAuth_`, and so on) as it is a reserved namespace.

There is no limit on the number of credentials that can be stored in a locker. A credential can only belong to one locker. See [Create credential](#) on page 1798. Credentials are further divided in logical groups called lockers.

To create a locker, follow these steps:

1. Navigate to **Manage > Credentials**, and then click the **Lockers** tab.
2. Click **Create locker**.
3. Enter the **Name**.
4. Optional: Enter a description.
5. Select the **Credentials** to add to the locker or select **External key vault**.
6. Enter **External key vault** credentials.

If integrating with an external key vault, such as AWS, Azure, CyberArk, or HashiCorp, enter the required credentials for the specified external locker:

AWS	Enter the prefix of secrets stored in the locker.
CyberArk	<p>Enter the safe name where the credential lockers are stored and optionally enter the property set to your CyberArk username. The <code>\$\$attribute\$\$</code> property is used to retrieve information from the CyberArk object property. You can create a property set by combining multiple CyberArk object properties.</p> <p>The following examples show how to create property sets in different scenarios:</p> <ul style="list-style-type: none"> • If you want to use a username in the format <code>domain\username</code> where the domain is stored in the CyberArk property called Address and the username is stored in the CyberArk property called UserName, then enter the property set in the format <code>\$\$Address\$\$\\$\$UserName\$\$</code> in the credential attribute and use this attribute in your bot automation. • If you want to use a username in the format <code>username@example.com</code> where the username is stored in the CyberArk property called UserName, the address (example) is stored in the CyberArk property called Address, and the domain (.com) is stored in the CyberArk property called Domain, then enter the property set in the format <code>\$\$UserName\$\$@\$\$Address\$\$\$\$Domain\$\$</code> in the credential attribute and use this attribute in your bot automation. • If you want to use a password that is stored in two different CyberArk properties called PasswordFirst and PasswordLast, then create an attribute with the property set as <code>\$PasswordFirst\$\$\$\$PasswordLast</code>

\$\$ and use this attribute in your bot automation.

Azure

Enter the prefix stored in the locker.

HashiCorp

Enter the prefix of secrets stored in the locker. For example, enter the prefix `prfusr1` for secret that is stored as `prfusr1_obj1_usr1`.

7. Click **Next**.

8. Add the **Owners**.

A locker must have at least one owner. The locker owner can edit, view, and delete a locker and also add or remove other owners.

9. Click **Next**.

10. Optional: Add the **Managers** and click **Next**.

The locker manager can view, edit and delete the locker, and add participants but cannot add owners or managers to the locker.

11. Optional: Add the **Participants** and click **Next**.

A locker participant has access to view a locker and add their own credentials to a locker.

Note: A **locker participant** does not have access to or visibility of credentials created by other users.

12. Add the **Consumers**.

Select one or more roles. Users with these roles have access to the locker. System-created roles are not shown in the **Consumers** list.

Type	Permission
Standard	Locker consumers can view the locker and all the credentials inside the locker. All consumers see the same credential value set by the credential owner.
User-provided	Locker consumers can input their information in user-provided credentials with user-provided attributes.

13. Click **Create locker**.

If the email notification setting is enabled, users receive an email confirming the locker name and their permissions to that locker.

Edit a locker

Add or remove credentials, owners, managers, participants, or consumer roles.

Only a locker owner, locker manager, or locker admin can edit a locker. To edit a locker, follow the steps mentioned below:

Note: Credential, owner, managers, participants, and consumers are separate entities associated with the locker to grant permission. These are not locker entity attributes and modifying these

does not change locker objects. Therefore when you edit these fields inside a locker, the locker object is not modified and thereby locker's last modified field is also not updated.

1. Navigate to **Manage > Credentials**, and then click the **Lockers** tab.
2. Hover over the **Actions** icon for the locker.
3. Click the **Edit** icon. 
4. You can make changes to the following:

Option	Description
Credentials	Add or remove credentials that are assigned to a locker.
Owners	Add or remove locker owners. Note: A locker must have at least one owner.
Managers	Add or remove locker managers.
Participants	Add or remove locker participants.
Consumers	Add or remove locker consumers.

If email notification setting is enabled and credentials are added to a locker, then all the locker consumers will receive an email.

5. Click **Save changes**.

Credential Vault email notifications

When the email notification setting is enabled, it ensures that users are notified of any changes to credentials and lockers.

Overview

Email notifications are sent for the following scenarios:

Credential is added to a locker	When credential is added to a locker, a notification is sent to all consumers of the locker to their email address registered in the Control Room. The email consists of a link to the credential that is added to the locker. The consumers are redirected to edit the credential page wherein they input the credential value.
Member is added or removed from a locker	An email notification is sent when a new member (co-owner or participant) is added to a locker or removed from the locker as a member of participant.
Change in permission for locker members	When a locker owner/admin grants or removes locker membership permissions from a locker, an email notification is sent to the locker

Locker consumer gets added or removed from a role assigned to a locker, or consumer role gets added or removed from a locker

members at their email address. This ensures that members are notified of their membership changes within the locker.

When a role assigned to a locker is modified by addition or removal of users, an email notification is sent to the new or existing user at their email address so that the consumers are notified that credentials are pending for their input in the locker.

Also when a new role added to a locker or an existing role is revoked from the locker, an email notification is sent to the new or existing consumers at their email address so that the consumers are made aware of the changes.

Manage Automation 360

As a Control Room administrator, create users and roles, and configure devices that access Automation 360. From the Control Room, you can also monitor and manage all activities to ensure a secure and seamless bot execution environment for your users.

Activity and audit log

Monitor and manage automations, such as bot execution, scheduled and event trigger activities using the Activity console (**Activity** from the left menu). You can also review and troubleshoot any failed activities using the Audit log console (**Administration > Audit log**).

See the following pages for more information:

- [Historical activity](#) on page 2051
- [Scheduled activities](#) on page 2056
- [Event triggers](#) on page 2064
- [Audit log](#) on page 2068

The following short video shows how to check your bot runs:

Users, roles, and permissions

You can configure users and roles (role-based access control or RBAC) to provide access to specific features and operations, based on their assigned roles. Creating users depends on whether the user is a non-Active Directory, Active Directory, or single sign-on (SSO) user from an IdP server.

- [Users](#) on page 1676
- [Roles](#) on page 1687
 - [Feature permissions for a role](#) on page 1688
 - [Bot permissions for a role](#) on page 1702
- [Credentials and lockers in the Credential Vault](#) on page 1796

Devices and queues

A device is the machine through which a user connects to the Control Room to create or run bots. Manage devices that are registered to the Control Room from **Manage > Devices**.

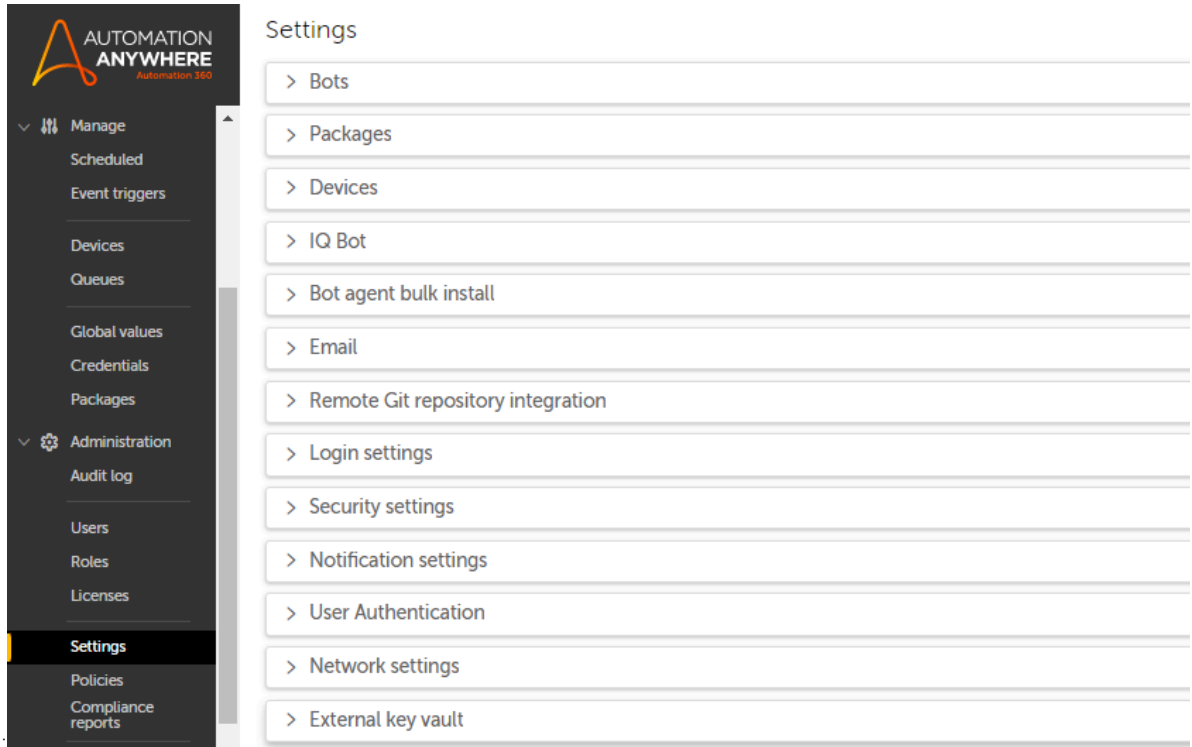

A queue is a logical group of Work Items that are processed for automation by the Bot Runners from a pool based on priority selected in the device pool and sort criteria configured in the queue.

- [Devices](#) on page 1808
- [Workload management](#) on page 1931
- [Device pools](#)
- [Add queue, Bot Runner, and device pool](#) on page 1823

Settings

After initial setup of the Control Room, you (as an administrator) might have to set up and edit some of the initial configurations to enable certain features. Go to **Administration > Settings** to configure and edit settings for bots, packages, devices, email, network, user authentication, security, Git repository, external key vault and so on.

The following image shows some of these

settings:

See [Settings](#) on page 1728.

Upload new licenses to the Automation Anywhere Control Room to be distributed to users as required.

Devices

The device is a machine through which a user connects to the Control Room to create or run bots. Manage devices that are registered to the Control Room through the **Devices** page located in the **Manage** tab.

Tasks performed from the Devices page

As a Control Room user with Bot Runner, Bot Creator, and Device pools privileges, use the **Devices** page to perform the following actions:

- View a list of devices registered and connected to the current instance of the Control Room.
- Create and view a list of device pools available from the current instance of the Control Room.
- Run bots immediately on selected Bot Runners.

If the device is already registered by another user other than the Bot Creator and the Bot Creator does not have the `Register` device permission or the associated device assigned to it, when you run a bot from the bot editor window, the deployment fails with an `insufficient permission` error message.

- Schedule bots to run on selected Bot Runners.
- Run bots on selected device pools.

Note:

- Only an admin user has access to view all the devices in the Control Room. A non-admin user does not have access to view Bot Creators.
- Only one Bot Creator can be logged in to a device to run bots at any one time. For a new user as a Bot Creator on the same device, the first Bot Creator has to be removed.

Devices

The **Devices** page lists all configured devices and the current state for each device listed. Devices are identified by IP and hostname. A device can be in one of the following states:

Connected

Device is logged in to the Control Room.

Note: Wait for 35 seconds for a device to show as connected in the devices list after you remove and re-register the device.

Disconnected

Device is not logged in to the Control Room.

Offline

Device has been unregistered or disabled by the Control Room administrator.

The following actions are enabled:

Connect local device

Install Bot Agent on your local device and connect it to Control Room. In order to run bots on that local device, ensure that you add it to the list of enabled host devices.

Run bot now with checked items

Runs the bot on selected device.

Export checked items to CSV

Exports the data to a CSV file based on:

- Filters
- Selection

Refresh table

Refreshes the table contents to view the updated status.

Customize columns

Show or hide specific columns.

View and edit device

With the **View and manage ALL device(s)** permission, you can view and edit the following device settings:

- Name
- Status
- Bot Agent version
- Device pool name
- Nickname (optional)
- Description
- Device type (single user or multiple users)

In case of a multi-user device, you can edit the **Concurrent sessions supported** field.

- Add or edit device permissions
- Screen resolution

You can set the screen resolution by either selecting a value from the predefined resolution drop-down list or by selecting custom and entering the values.

- You can edit only the nickname, description, device type, and screen resolution fields.
- Ensure that you have selected the **Allow devices to override resolution settings**

option in the Control Room settings for the device level resolution to take effect.

Note: The screen resolution settings are applicable only when you use RDP-based deployments. For regular deployments, a Windows session is created using the existing resolution settings of the device. In this case, the screen resolution set in the Control Room is ignored.

- Lifespan

Device lifespan can be **Persistent** or **Temporary**. Temporary devices are created to support non-persistent virtual desktop infrastructure (VDI) and are automatically deleted after a specified time when the device is disconnected from the Control Room. You can specify the time to automatically delete temporary devices in the Control Room devices settings.

Persistent devices are created to support persistent virtual desktop infrastructure (VDI) and are not deleted after the device is disconnected from the Control Room.

Note: Non-persistent desktops are stateless desktops that get destroyed at the end of the session. Non-persistent VDIs do not exist when the user logs out.

- Auto-login settings

You can customize the auto-login settings for each device. Choose between the settings configured in the Control Room or at the selected device level to either create new user sessions or use existing user sessions after a bot finishes running.

- Installation type

This setting is based on whether the Bot Agent is installed at user level or system level on the user device.

- Deployment type

This setting is based on the user type and installation type. For single users installed at the system level, the default deployment type is regular. For multi-users installed at system level, the default deployment is RDP.

Preload packages

Use preloaded packages to download the most commonly used or customized packages

on your local device. As the packages are saved offline on your device, when you run a bot, the system skips the package download process and starts executing the bot, thereby reducing the bot execution time. You can download specific versions of the package to the user device folder `C:\ProgramData\AutomationAnywhere\AAPreloadedPackages`.

Device pools

Device pools provide a logical grouping of similar Bot Runners to run bots with the work items from a queue. For example, group devices of a particular department or unit and create a device pool for it.

Related tasks

[Install Bot Agent and register device](#) on page 1288

Install Bot Agent on your local device and connect it to Control Room. In order to run bots on that local device, ensure that you add it to the list of enabled host devices.

[Set user device credentials](#) on page 1295

To enable a device for running bots, set the local device credentials.

[Configure auto-login settings](#) on page 1742

Configure auto-login settings in the Control Room to either create user sessions or reuse existing user sessions to reduce the bot startup time.

About multi-user devices

A multi-user device is any Windows terminal server device (Windows 2019, Windows 2016, Windows 2012, Windows 10 Enterprise on Azure) which enables multiple users to concurrently log in to a single device.

The multi-user device server enables multiple users to access the same operating system and share the hardware, performing the tasks for each user concurrently. In multi-user devices, bots are deployed using RDP.

Benefits of a multi-user device

A multi-user device ensure that each machine in an organization is fully used, reducing the hardware and software cost by enabling different users to access the same device. Bot Creator users and Bot Runner (attended or unattended) users can be configured on a multi-user device. The multi-user device also provides security and authentication for every user. Each user is assigned unique login credentials for the device and can access only the assigned applications and device settings.

Note: In a multi-user device, if two user sessions with the same device credentials try to deploy a bot, the deployment will fail for one of the user sessions. An appropriate failure message is recorded in the audit log.

Multi-user device in a device pool

A multi-user device can be part of a device pool and the device can be set as the default device for Bot Creator users and Bot Runner (attended and unattended) users.

Set as default device

As a licensed user, when you log in to a non-default device, you can set that device as your default device. You must have the **View and manage ALL device(s)** permission if you want to set another device that is not registered by you as your default device: To set it as the default device, follow these steps:

1. Click the device icon on the top-right of your screen.
2. Select the **Make default device** option from the menu.

If you do not have the necessary permission, a message prompt appears, stating that you will lose access to your current default device.

Related concepts

[Bot Agent device requirements](#) on page 1282

Review the Bot Agent device requirements such as hardware components, compatible devices, supported operating systems and browser extensions.

Configure RDP-based deployment for multi-user devices

RDP-based deployment is used for multi-user devices. When a bot is deployed for an unattended Bot Runner from the Control Room, the Control Room handles the unattended Bot Runner session through RDP and executes the bot.

Ensure that you are logged in to the Control Room as the administrator.

Ensure the following requirements are completed:

- Active Directory Domain Services are set up (Optional).
- Remote Desktop Services (RDS) are set up on the machine ready to host multiple (RDS) bot runner sessions (Mandatory).
- Active Directory/Local users are created (Mandatory).
- Users are provided access to RDS (Mandatory).

When registering your device, you can register it as a multi-user device.

1. Change device type to multiple users.
 - a) Navigate to **Manage > Devices**.
 - b) Hover over the actions menu (three vertical ellipses) located to the right of the device name and click the **Edit device** icon.
 - c) Under **Deployment** tab, change the **Device type** to **Multiple users**.
 - d) Enter a value for the **Concurrent sessions supported** field.

The maximum number of allowed concurrent sessions depends on your device license type and the hardware configuration. For example, consider that concurrent sessions is set to 10 and each bot requires 4 GB RAM for execution. If your system RAM is lower than this value, the bot execution might fail.

Also, if the maximum number of sessions allowed in your device is 10 and the multi-user device is set as the default device for 3 Bot Creator users and 2 attended Bot Runner users, then the value for the concurrent sessions supported will be 5. Therefore, at a time, only 5 bots can be deployed concurrently by the unattended Bot Runner users. So ensure that your hardware and device license type support the number of sessions you set.

e) Click **Save changes**.

2. Set the RDP screen resolution.

This ensures your automation runs seamlessly during RDP-based deployment, even if the resolution of the screen varies between the Bot Runner and Control Room.

You can set it in the following ways:

- At the Control Room level: [Configure screen resolution for a device session](#) on page 1739.
- At the device level: [Devices](#) on page 1808.

Note that you can update the screen resolution at device level only if the option to override screen resolution is enabled in **Administration > Settings > Devices**.

3. Configure the RDP settings.

a) Select **Devices** option from **Administration > Settings**.

b) Edit the **RDP settings for multiple user devices** field.

c) Enter the **Port**.

Note: Use the default port 3389 for RDP-based bot deployments.

d) Enter the **RDP session timeout** value.

The default session timeout value is 60.

e) Click **Save changes**.

4. By default clipboard data is shared across RDP sessions. Follow the below steps to prevent sharing of clipboard data across multi-user RDP sessions:

a) Select **Devices** option from **Administration > Settings**.

b) Edit the **Advanced options** field.

c) In the **RDP command options** field, enter `-clipboard`.

d) Click **Save changes**.

For more information about troubleshooting black screen and lock screen images, see

- [Black screenshot while running the bot in unattended mode \(A-People login required\)](#)
- [Black screen and lock screen images being captured \(A-People login required\)](#)

1. Create users in the Control Room.

These users can be unattended Bot Runners, Attended Bot Runners, or Bot Creators. You can select the multi-user option when you register the device for the first time. See [Create a user](#) on page 1678.

2. Associate the correct device and session login credentials based on the Active Directory users that you create before configuring the multi-user device settings.

You can register an Active Directory user one time as an admin user and the sessions are created when you deploy bots. You do not have to create an RDP session on the Bot Runners server and register the device under an Active Directory user name and user credentials.

3. Deploy the bots on parallel sessions.

Note: If the multi-user device per sessions count provided is less than the actual bot deployment, then the additional bot deployments are queued until the current deployments are in progress.

Convert an existing device to a multi-user device

If you have a server OS, multi-user OS, or hosted VMs such as AWS, Microsoft Azure, or VMware as the Bot Runner machine, you can convert your existing device to a multi-user device.

Ensure that you are logged in to the as the administrator.

Converting a device enables you to share the same device between Bot Runner and Bot Creator users because they can coexist in different sessions simultaneously. Also, multiple parallel executions of a bot can be performed on the same machine.

If you encounter Auto Login issues because multiple users are sharing the device or because it is a remote device, convert your device to a multi-user device.

If you have a single-user device and want to use multi-user or terminal server deployment, then set the **device type** as **Multiple users**.

1. Navigate to **Manage > Devices**.
2. Hover over the actions menu (three vertical ellipses) located to the right of the device name and click the **Edit device** icon.
3. Under **Deployment** tab, change the **Device type** to **Multiple users**.
4. Enter a value for the **Concurrent sessions supported** field.

The maximum number of allowed concurrent sessions depends on your device license type and the hardware configuration. For example, consider that concurrent sessions is set to 10 and each bot requires 4 GB RAM for execution. If your system RAM is lower than this value, the bot execution might fail.

Also, if the maximum number of sessions allowed in your device is 10 and the multi-user device is set as the default device for 3 Bot Creator users and 2 attended Bot Runner users, then the value for the concurrent sessions supported will be 5. Therefore, at a time, only 5 bots can be deployed concurrently by the unattended Bot Runner users. So ensure that your hardware and device license type support the number of sessions you set.

5. Click **Save changes**.

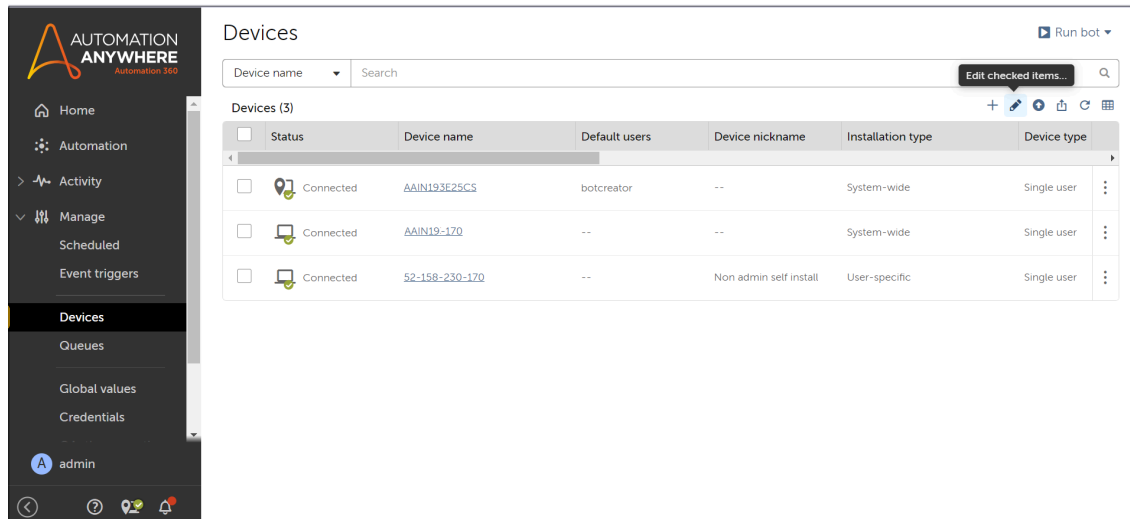

Edit multiple devices simultaneously

You can edit multiple devices (or bulk edit devices) to change the settings across these devices at the same time.

Editing multiple devices is supported only for On-Premises Bot Runner devices (Virtual Machines or local devices created by users). However, the Cloud Bot Runner devices are not supported.

You must be a Control Room administrator or a user with **View and manage all devices** role to be able to perform this task.

1. Log in to the Control Room.
2. Click **Manage > Devices**.
A list of all the available devices in the Control Room is displayed.
3. Select the **Check all** check box at the top of the list to select all the devices and click the **Edit checked items** icon (as shown in the following image).

4. Use any of the following tabs to change these settings:

- **Devices**

Enables you to select the devices that you want to edit.

- **Device registration configuration**

Enables you to change the registration configuration of the registered devices. Use the **Device type** field to select the **Enable device registration configuration** check box to change the default setting.

Changing the default device registration configuration settings is not supported on registered devices where the **Installation type** is **User-specific**. If you select the **Enable device registration configuration** check box for user-specific device, a warning message is displayed.

- **Single user:** This is the default setting and enables only a single user session on the device.

Use the **Deployment type** field to select one of the following options:

- **Remote Desktop Protocol:** If your registered local device is a laptop or a desktop that does not support Remote Desktop Protocol (RDP), your bot execution will fail as RDP is not supported on local device. This is applicable to the **Device type > Multiple users** as well since the multiple users are not supported on local devices.
- **Regular:** Is the default setting.
- **Multiple users:** Enables multiple users to concurrently log in to a single device.

Enter the number of sessions in the **Concurrent sessions** field. The maximum number of allowed concurrent user sessions depends on your device license type and the hardware configuration. For example, if your device license permits 4 users, you can

have up to 4 concurrent user sessions, and each session will require a minimum of 4-GB RAM for execution. If your system RAM is lower than this value, bot execution might fail.

- Use the **Lifespan** field to select the **Enable Lifespan configuration** and choose of the following options:
 - **Persistent**: This is the default setting. The devices are created to support persistent virtual desktop infrastructure (VDI) and are not deleted after the device is disconnected from the Control Room.
 - **Temporary**: Devices are created to support non-persistent virtual desktop infrastructure (VDI) and are automatically deleted after a specified time when the device is disconnected from the Control Room.

You can specify the time to automatically delete the temporary devices in the **Devices** settings of Control Room.

- **Log collection configuration**

Enables you to collect log entries from the devices connected to the Control Room. For more information, see [Configure log collection](#) on page 1738.

- **Review**

Review the list of devices and the associated settings.

5. Click **Submit**.

All the changes are applied across all the selected devices.

About device pools

Device pools are a logical grouping of devices or similar unattended Bot Runner machines on which you can run your workload management automations or scheduled unattended automations. For example, you can group the devices (system-wide type) of a specific department or unit and create a device pool.

Overview

You can use a device pool to restrict bot deployments to a specific set of devices that are available from your Control Room instance and take advantage of any device available in a device pool because any device in the device pool can run the bot.

You can also use a device pool to process work items from workload management queues. Workload management distributes work items across various devices in a device pool. This distribution of work items ensures efficient bot processing through optimal usage of devices and Automation 360 licenses. Device pools can contain different types of devices, such as single-user devices or multi-user devices.

You can share the device pool between multiple automations such as workload management, **Run bot**, and **Schedule bot**, thus improving the device utilization.

How a device pool works

When you deploy an unattended bot to a device pool at run time, system identifies the available devices from the pool. System starts with first device from the pool, if the first device is busy, it checks for next device and then the bot is automatically sent to the available device from the list of system-wide devices. As the other bots are deployed, they can run concurrently on the other devices in the device pool. By dynamically allocating devices when bots are deployed, bot deployments are executed quickly and efficiently.

High availability (HA) in device pools

Device pools provide built-in (HA) for the Bot Runner machines if your unattended license is free to use. You are not tied to a single Bot Runner machine, so if your Bot Runner machine is unavailable for any reason and your unattended license is free for deployment, your automation is not affected. The scheduled automation will automatically run on the next available Bot Runner machine, thereby providing high availability.

Note: Consider the following points when working with user credentials:

- Only one user credential can be attached to a licensed user.
- If all devices in a device pool are domain integrated and Active Directory users have access to all devices, licensed users can login to any device by using attached user credentials.
- For more information about running bots in device pool, see [Considerations for running a bot on page 2207](#).

Managing device pools

As a device pool administrator, you can create, edit, and view all device pools that can be used for scheduling automations and workload management.

As a device pool owner or consumer, you can view only those device pools of which you are the owner or consumer. Only users with the **AAE_Pool Admin** role or users with custom role containing the **Administer ALL device pools** permission can perform device management tasks.

Note: You have to create device pools to view those in the list.

To easily access your device pool, you can search by a device pool name.

- Click a column to sort it in ascending and descending order. You can sort up to three columns by holding the Shift key when you click two more columns. This enables you to sort two additional columns. The sorting is done on the entire table and not just the data that is currently visible to you. The last sorting is stored in memory applied by a user per session.
- Use a drag-and-drop operation to move the column left or right.
- Move your mouse cursor at the end of the column and drag to resize.

Create device pools

Create a device pool with a unique name and add Unattended Bot Runners to the device pool.

- Ensure that you have one of the following roles to view the **Device Pools** tab:
 - **Device pool owner**
 - **Device pool admin**
- Ensure that you have a role with **Create device pools** permission to create a device pool.

Note: A Control Room administrator without device pool admin rights cannot view or create a device pool.

- To add a device in the device pool, you must install it as a system-wide device (Bot Agent).
- After you add the device, you cannot add the same device to another device pool.
- You can add only those Unattended Bot Runners that are not part of any other pool.

Restriction: Unattended Bot Runners that are a part of other device pools are disabled for selection.

- You can use the **Scheduled automations** and **Run with Queue automations** options to run bots on that device.
- You can add Control Room user roles as consumers. Only users with these roles can use the pool for any automation.
- You can select only those devices with the Bot Runner installed at the system wide.
- If the devices in a device pool are more than the number of work items added to a queue, multiple entries equal to the number of devices are shown in the Control Room **In-progress activity** and **Historical** pages. For details, refer to the **View queue details** page on the actual user device on which the workload automation is deployed.

To create a device pool, perform the following steps:

1. Navigate to **Manage > Device pools**.
2. Click **Create device pool**.
3. Enter the **Name**.
4. Optional: Enter a description.
5. Select the **Devices** from the list of .
6. Click the right arrow (→) to add your selection.
7. Click **Next**.
8. Select the Device Pool **Owners**.
9. Select user(s) from the **Available users** list.

Tip: Search the list of users based on their **Username**, **First name**, or **Last name**.

10. Click the right arrow (→) to add your selection.
11. Click **Next**.
12. Optional: Select the Device Pool Consumers.
Complete this step to enable device pool consumers to view the device pool when they run the automation for the bot with a queue by following the next set of steps.

13. Optional: Select a Role from the list of **Available roles**.
14. Click the right arrow (→) to add your selection.
15. Click **Create device pool**.

The device pools for which you have consumer privileges are listed in the My Device Pools page.

[View device pool details](#) on page 1819

Related tasks

[Run bot with queue](#) on page 1940

Collectively process all work items of a queue across all the Bot Runners present in one or more device pools.

View device pool details

As a Control Room user with device pool management privileges or as a device pool owner, you can view device pool details to ensure the information provided is correct and if required customize as per your automation requirement.

Ensure you are logged in to the Control Room as an administrator or as a user with custom role containing the **Administer ALL device pools** permission.

Use the **Device pool details** page to view automations that are scheduled to run with or without workload. The following information is displayed as part of device pool data:

Automations	Shows the automations that are using the device pool and the order that is chosen to run those. This is shown as the default view. To find an automation quickly, use the search option using Status, Automation name, Queue, or Activity type. You can perform the following actions on a table column: <ul style="list-style-type: none"> • Click a column to sort it in ascending and descending order. You can sort up to three columns by holding the Shift key when you click two more columns. This enables you to sort two additional columns. The sorting is done on the entire table and not just the data that is currently visible to you. The last sorting is stored in memory applied by a user per session. • Use a drag-and-drop operation to move the column left or right. • Move your mouse cursor at the end of the column and drag to resize.
Devices	Shows list of unattended Bot Runner devices that are part of the device pool.
Owners	Shows list of device pool owners that are granted permission to view, edit, and delete the device pool.

Consumers	<p>Shows the list of device pool consumers who are granted permission to view the device pool as an option to running automations.</p> <p>Create device pools on page 1818</p>
General Details	<p>Shows the last modified date and time, name of the user who modified device pool details, and the Object Type which is the component on which modification was done.</p>

The **Scheduled Automations** tab is selected by default. Automations that are created using **Run bot now** or **Schedule bot** (upcoming schedules) on that device pool are listed.

The second tab, **Run with Queue Automations** lists the automations that are scheduled to run for **Workload** using the option **Run bot with queue**.

To view device pool details:

1. Navigate to **Manage > Device pools**.
2. Hover over the **Actions** icon for the device pool and select **View**.
Select each tab to view the related details.

[Edit device pools](#) on page 1820 , or [Run bot with queue](#) on page 1940 .

Related tasks

[Create device pools](#) on page 1818

Create a device pool with a unique name and add Unattended Bot Runners to the device pool.

[Delete device pools](#) on page 1822

Delete a device pool comprising of unattended Bot Runners after your entity's automation goals are achieved and the device pools are no longer required.

Edit device pools

As a Control Room user with device pool management privileges or as a device pool owner, you can edit device pool details to customize your automation requirements.

- You must have **Device pool owner**, **Device pool admin**, or a custom role containing the **Administer ALL device pools** permission to edit a device pool.
- Users without **AAE_Admin** role must have the following permissions to edit a device pool:
 - **View and manage ALL device(s)** to add or delete the devices
 - **View Users and Roles basic information** to add or delete the owners and consumers
- To add a device in the device pool, you must install it as a system-wide device (Bot Agent).
- After you add the device, you cannot add the same device to another device pool.

When you open the device pool in edit mode, you can update the queue details such as Bot Runner, Owners, Participants, and Consumers.

1. Go to **Manage > Device Pools**.

The **Device Pools** tab is visible only if you have **Device pool admin** role or you are an owner of any device pool.

2. Locate the device pool you want to edit, hover over the actions menu (vertical ellipsis), and click **Edit**.
You can also edit the device pool details in view mode. For more information, see [View device pool](#).
The **Device pool details** page is displayed with the default **Scheduled Automations** tab.
3. Set the Queue Execution mode to edit workload automations.
Go to the **Run with queue automations** tab, then choose one of the following options to define the order in which your automations run in the queues:
 - **Round robin**: Runs your automations at equal time intervals in the **Time slice** field. For more information, see [Round robin](#) on page 1821.
 - **Priority as shown in table**: Runs your automations based on a priority defined in the priority table. For more information, see [Priority as shown in table](#) on page 1822.
4. Update the list of unattended Bot Runner devices that are included in the device pool.
5. Update the list of device pool owners who are granted permission to view, edit, and delete the device pool.
6. Update the list of device pool consumers who are granted permission to view the device pool.
7. Click **Save changes**.

Related tasks

Delete a device pool comprising of unattended Bot Runners after your entity's automation goals are achieved and the device pools are no longer required.

[View device pool details](#) on page 1819

As a Control Room user with device pool management privileges or as a device pool owner, you can view device pool details to ensure the information provided is correct and if required customize as per your automation requirement.

Order of the automation queue

You can define the order in which your automations run in the queues.

This topic describes options of orders in which you can run the automation queues.

Round robin

This option runs your automations at equal time intervals specified in the **Time slice** field. You can set a **Time slice** in seconds, minutes, or hours and you can calculate or estimate the time for each automation, and then provide this number.

- The default time slice is **60 minutes**.
- The time slice cannot be set to zero.

Automations are executed for 60 minutes first, then the system checks for other automations in queue for execution. If there are other automations in the queue, that automation is paused and

the next automation is executed. This method continues until all automations in the queue are executed.

Priority as shown in table

With this option, automations run based on a priority defined in the priority table. You can run automations in the order of priority and set the individual priorities for each of the queues. Priority 1 is the highest priority and that queue is processed first and completely by the device pool. Then the device pool moves onto the processing queue with Priority 2. When the queue with Priority 2 is processed completely, the device pool proceeds to processing queue with Priority 3, and so on. Automations are processed until all automations are consumed from the specified automation queue.

Note: This option is available only on the **Run with queue automations** tab.

Delete device pools

Delete a device pool comprising of unattended Bot Runners after your entity's automation goals are achieved and the device pools are no longer required.

Ensure you are logged in to the Control Room as an administrator or as a user with custom role containing the **Administer ALL device pools** permission.

You can choose to delete your device pools in either of two ways:

- Delete one device pool
- Delete multiple or all device pools

If the device pool is being used for workload automation, you will not be allowed to delete it.

1. Navigate to **Manage > Device pools**.
2. Select the device pool(s) to delete.
Select the device pools to delete or select all device pools by selecting the **Select All** check box in the header.
3. Hover over the **Actions** icon for the device pool.
4. Click **Delete**.
Confirm or cancel.

Related tasks

[View device pool details](#) on page 1819

As a Control Room user with device pool management privileges or as a device pool owner, you can view device pool details to ensure the information provided is correct and if required customize as per your automation requirement.

[Create device pools](#) on page 1818

Create a device pool with a unique name and add Unattended Bot Runners to the device pool.

Add queue, Bot Runner, and device pool

Add a queue, Bot Runner, and device pool to the automation from the **Run bot with queue** page.

Ensure that you are logged in to the as the administrator.

Automation processes are queued until the specified **Run as user** and devices become available. Queuing permits other automation processes for that specific **Run as user** until the specified device becomes available. Any **In use** queues are shown as disabled in the **Available queues** list.

You can deploy the automation on the number of users that you choose with the **Run as** option and not on the total number of devices available in a device pool. Select only those queues that are not in use.

Note: You cannot use multiple queues to add Bot Runners.

1. Select a **Queue** from the **Queues** list.

The queues for which you have consumer access and same work item template as the selected bot are listed.

2. Click **Next**.

3. In the **Run as** tab, from the **Available bot runners** list, select a **Bot Runner**.

- a) Optional: Select the **Run on bot running devices** option.

If you want to select Bot Runners that are mapped one-on-one to their default (single-user) devices, select the **Run on bot running devices** option. This option enables the Work Items to be deployed only to the user's default device, whereby the security policy does not allow a user to log in to any other device or when applications for automation are installed on the default device.

If you select this option, ensure that all the default devices are part of the same device pool when you select from the **Device Pool** tab in Step 5.

Tip: Do not select this option if the run as users (Bot Runners) are configured to use multiple devices. In that configuration, if any device in the pool is processing an automation, the run as user can log in to another device, and the work items will be processed on that device. This enables optimal utilization of licenses (run as user) and devices.

For information on scenarios for choosing bot running devices for run as users, see [Considerations for running a bot](#) on page 2207.

4. Click **Next**.

5. In the **Device pool** tab, select a **Device Pool** from the **Available device pools** list.

6. Click **Add**.

The queue and device pool are added to the run bot with the queue list.

7. Optional: Click **Remove** to replace the queue or the device.

8. Click **Run bot with queue**.

The queue status changes to **In use** on the **Queues** page.

Note: In a Workload management (WLM) automation when you select the **Run on bot running devices** and

- If your device changes, ensure that the device is also part of the WLM device pool.
 - If you edit the device pool, ensure that all devices in the device pool are default devices for the WLM run-as users.
-

Related concepts

[Considerations for running a bot](#) on page 2207

There are certain considerations you have to keep in mind when running a bot.

Integrate OAuth with Control Room

OAuth is a secure, efficient, and easy-to-use open standard authorization protocol that helps you protect user privacy. It defines how to delegate or provide authorization to applications to access resources (such as remote or third-party APIs or user data) without the user having to provide their username and password credentials.

OAuth supports a set of predefined methods called grant types. Each grant type has specific requirements and flow depending on use cases.

OAuth supports the following grant types:

- Client credentials
- Authorization code with PKCE
- Implicit
- Resource owner password

However, only client credentials and authorization code with PKCE grant types are supported in the Control Room.

Note: We recommend that you use client credentials grant type for unattended automation and authorization code with PKCE for attended automation.

For more information, see [OAuth 2.0](#).

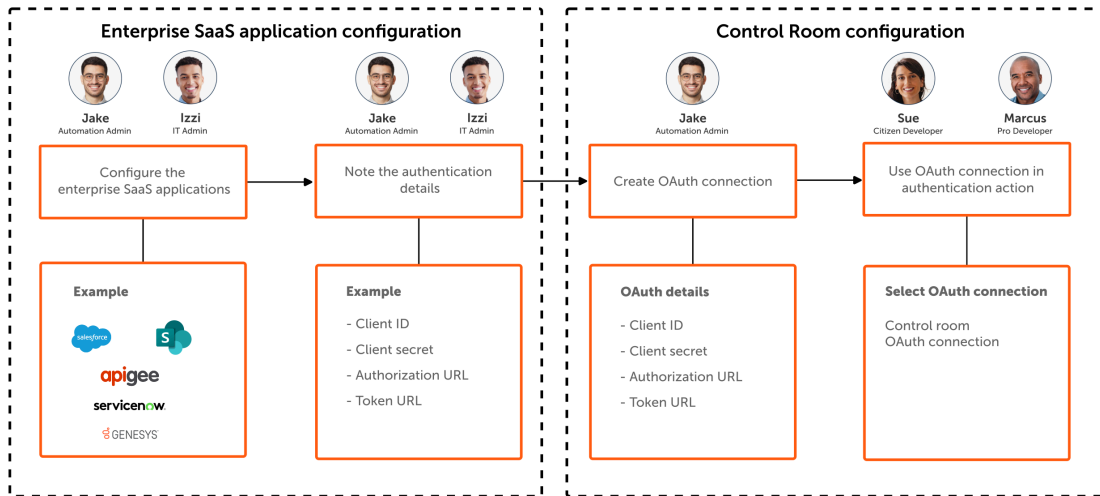

OAuth architecture

With OAuth managed in the Control Room, you can centrally manage connections and token lifecycle via the Control Room. This feature also supports securely storing the tokens required to authenticate and authorize access to enterprise applications without having to go through the process of obtaining them at every automation run-time. The Control Room supports the following options:

- Create and manage connections for every SaaS application used within automations.
- Manage token lifecycle for shared and user specific tokens.
- Secure storage of tokens using industry standard encryption levels.
- Grant permissions and role-based access to manage and consume the OAuth connections within automations.

OAuth workflow: The following steps provide information about configuring, creating, and using OAuth connection:

1. [Configure enterprise applications](#) on page 1827
2. [Create OAuth connection](#) on page 1827
3. [Use OAuth connection](#) on page 1830

Roles and responsibilities: Administrators perform the following tasks:

1. Creates a connection for an enterprise SaaS application.
2. Enters the authentication details such as client ID, client secret, authorization URL, and so on.
3. (Optional) Saves the login credentials and tests the connection.
4. Invites roles to use this connection or authenticates for unattended Bot Runners.
5. Saves and manages the connection.

See: [Create OAuth connection](#) on page 1827.

Professional developers or citizen developers perform the following tasks:

Note: To build and execute an API bot successfully, professional developers or citizen developers need to authenticate to the enterprise application unless the administrator has saved the login credentials for the developers (users) to use the connection.

1. Creates an API Task or Task Bot.
2. Adds authentication action for packages.
3. Selects the authentication type (**Control room OAuth connection**), connection name, and enterprise application information.

See: [Use OAuth connection](#) on page 1830.

OAuth tokens

OAuth provides the following token types:

Access token or shared token	A long string of characters that serves as the credential used to access protected resources. This token type is typically used in unattended automations where user authentication and consent is not required to run automations.
Refresh token	A long-lived special token used to obtain a new access token when the existing access token expires. The refresh token provides a short-lived access token instead of collecting credentials from the user every time a new access token is required. The Control Room uses the refresh token to get a new access token from the Authorization Server (AS).

When using OAuth, the access token and refresh token are returned in the same response during the token exchange process called Access Token Response.

Benefits of integrating OAuth with Control Room

When you integrate OAuth with the Control Room, you get the following benefits:

- Provides a secure and standard model for automations to authenticate and authorize enterprise applications.
- Eliminates the need to manually enter the credentials at runtime or hard code the credentials in automations.
- Ensures that the access tokens are always valid and available for automations at runtime by obtaining them ahead of their expiration time; therefore, eliminating the need for users to go through the authentication process to obtain them.
- Avoids repetitive task of configuring the OAuth parameters for every automation using the OAuth connection. The connections are referenced in automations using the enterprise application provider type.

Token lifecycle management

All access tokens have an expiration time dictated by the authorization server (AS). Tokens are refreshed using the token refresh mechanism to extend the token validity (by issuing a new token). With a centralized approach, the Control Room manages the token lifecycle and validates each token before a bot execution.

Configure enterprise applications

You must configure the enterprise applications (such as Salesforce, Apigee, ServiceNow, and so on) and make note of the authentication details (such as client ID, client secret, authorization URL, and so on) to use the OAuth connection in the Control Room.

See the following topics to configure the enterprise applications:

- [Apigee Connect](#) on page 2312
- [Genesys authentication action](#)
- [Salesforce Authentication action](#) on page 2846
- [ServiceNow authentication action](#) on page 2892
- [SharePoint authenticate action](#) on page 2911

The following table provides information about the enterprise application access and refresh tokens:

Third-party providers	Maximum duration of access token	Can you configure the access token duration?	Maximum duration of refresh token	Can you configure the refresh token duration?	Can the Control Room auto renew access token?
Apigee	1 hour (3600 seconds)	No	—	No	Yes
Genesys	48 hour (172800 seconds)	Yes	—	No	Yes
Salesforce	24 hours (86400 seconds)	No	Valid until revoked	Yes	Yes
ServiceNow	30 minutes (1800 seconds)	Yes	100 days	Yes	Yes
SharePoint	1 hour (3600 seconds)	No	Up to 90 days	Yes	Yes

Create OAuth connection

A Control Room administrator can create OAuth connections for users to use these connections in the authentication action for packages without having to enter any authentication details.

- Ensure that you are using a user role that has the **Manage connections** option enabled for the **OAUTH CONNECTIONS** feature. See [Feature permissions for a role](#) on page 1688.
- Ensure that you have configured an enterprise application and made a note of the Client ID, Client secret, Authorization URL, Token URL, and scope. See [Configure enterprise applications](#) on page 1827.

The following table provides the format of the Authorization URL, Token URL, and scope for the supported enterprise applications:

Enterprise applications	Authorization URL	Token URL	Scope
Apigee	https://accounts.google.com/o/oauth2/auth?prompt=consent&	https://accounts.google.com/o/oauth2/token?access_type=offline	https://www.googleapis.com/auth/cloud-platform
Genesys	https://login.<yourinstance>.purecloud/oauth/authorize	https://login.<yourinstance>.purecloud/oauth/token	Not required
Salesforce	https://<yourinstance>.salesforce.com/services/oauth2/authorize	https://<yourinstance>.salesforce.com/services/oauth2/token	api,refresh_token,offline_access
ServiceNow	https://<yourinstance>.service-now.com/oauth_auth.do	https://<yourinstance>.service-now.com/oauth_token.do	Not required
SharePoint	https://login.microsoftonline.<tenant-id>/oauth2/v2.0/authorize	https://login.microsoftonline.<tenant-id>/oauth2/v2.0/token	https://<domain-name>/AllSites.Manage offline_access openid

Note: We recommend that you use refresh tokens that are configured for a longer expiry duration.

To create a connection, perform the following steps:

1. Navigate to **Manage > OAuth connections**.
2. Click **Create connection**.
The **Connection settings** screen appears.
3. Select a **Provider type**.

Note: The **Callback URL** is used in your enterprise application configuration settings to connect to the Control Room.

4. Enter a unique **Connection name** to identify the connection.
5. Optional: Enter a **Description** for the connection.

6. Click **Next**.
The **Authentication details** screen appears.

7. Select a **Grant type**.
8. Enter the **Client ID** that is provided by the provider for your account.
9. Enter the **Client secret** that is provided by the provider for your account.
10. Enter the **Authorization URL** used to obtain an authorization code for your account.

Note: For Apigee or Google Cloud Platform (GCP) account, you must append `&access_type=offline` to the authorization URL. For example: `https://accounts.google.com/o/oauth2/v2/auth?prompt=consent&access_type=offline`.

11. Enter the **Token URL** used to exchange an authorization code for an access token.
12. Optional: Enter **Scope**.

The screenshot shows the 'Edit connection' dialog box with the 'Authentication details' tab selected. The form contains the following fields and options:

- Grant type:** Authorization Code Flow
- Client ID:** [Redacted]
- Client secret:** [Redacted]
- Authorization URL:** https://login.microsoftonline.com
- Token URL:** https://login.microsoftonline.com/
- Scope (optional):** [Redacted]

This information is used as claims (information about the user) in an access token and forwarded to the resource server to limit access.

Note: If you are adding more than one scope, ensure that you separate the scopes using commas.

13. Click **Next**.
The **Test connection and save credentials** screen appears.
14. Optional: Select the **Save login credentials**.

Note: When you select this option, an access or shared token is generated which grants permission to users or roles who have view or manage OAuth connection permission. When this option is not selected, such users or roles will not be able to use this connection. For information about access or shared connection, see [Integrate OAuth with Control Room](#) on page 1824.

15. Optional: Click **Save changes and test connection**.

The screenshot shows the 'Edit connection' dialog box with the 'Test connection and save credentials' tab selected. The form displays the following information:

- Test connection and save credentials** (selected)
- Test your connection to ensure that the provider has been correctly added. Optionally save these credentials to generate a shared token for unattended bot runners to use.
- Saved credentials will generate a shared token** (highlighted in yellow)
- Save login credentials
- Test connection** button
- Test connection succeeded

Note: If you are using the **Authorization Code Flow** grant type, after you click the **Save changes and test connection** option and if the connection is successful, the **Next** button is disabled. Click the **Back** button, enter the **Client secret** again, and then click **Next**. You need not test the connection again unless you have made any changes to the previously provided authentication details.

16. Click Next.

The **Invite roles** screen appears.

17. Optional: Select the custom roles that you want to invite to use this connection.

Edit connection Cancel Save changes

When you invite roles to use the OAuth connection, the users who are using the role get notified about the assigned connection if they have subscribed to event notifications. See [Notifications](#) on page 2118.

18. Click Create connection.

The following video shows how to create an OAuth connection:

[Use OAuth connection](#) on page 1830

Use OAuth connection

You can use the established OAuth connections to enable users or roles to use the connections without the need of entering the authentication details every time they want to use the corresponding authentication action.

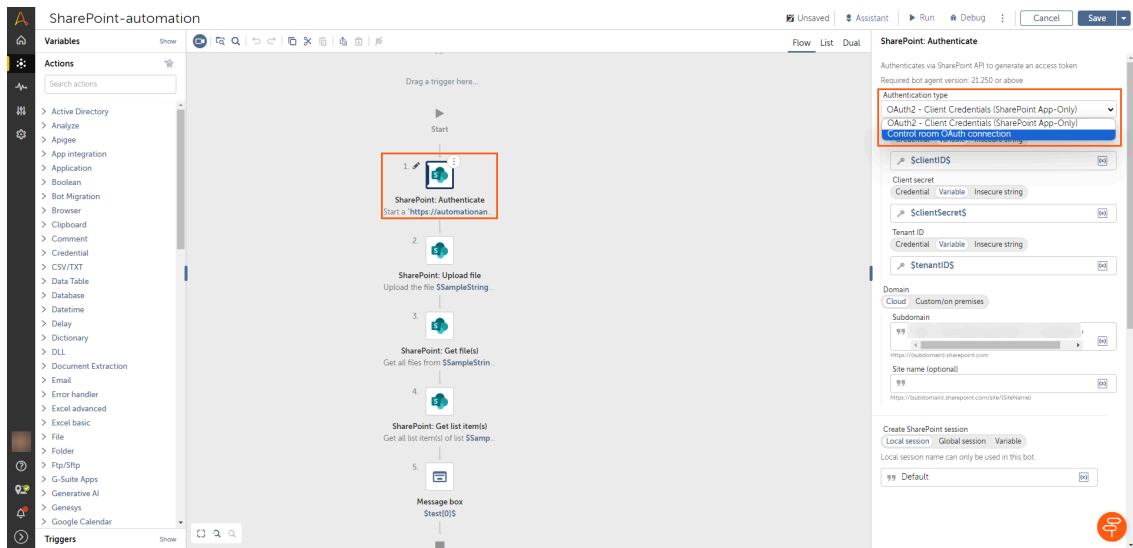

Ensure that you have configured the following options:

1. [Configure enterprise applications](#) on page 1827
2. [Create OAuth connection](#) on page 1827

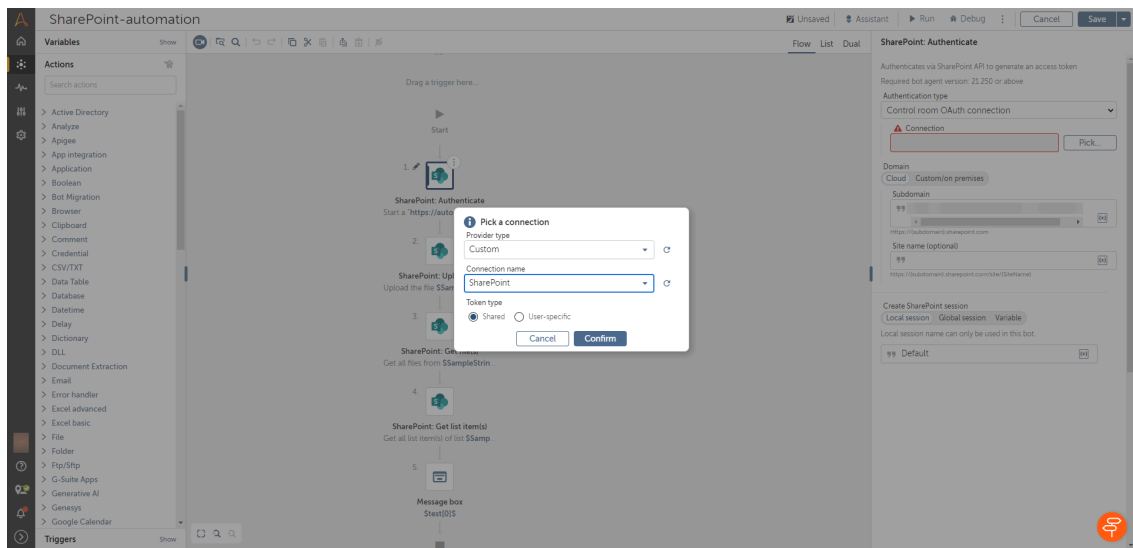

For example, if you are an administrator, you can create an enterprise application connection and make it available for users or roles. The users can then use this connection to authenticate the enterprise application without the need of requesting the authentication details from the administrator.

1. Open the bot that is using the enterprise application authentication action.
2. In the action properties panel, select the **Control room OAuth connection** option from the **Authentication type** drop-down.

© 2023 Automation Anywhere. All rights reserved. 1830

3. Click the **Pick** option to select a connection type.
4. In the **Pick a connection** window, select a **Provider type**, **Connection name**, and **Token type**.
5. Click **Confirm**.

The following video shows how to use OAuth connection in an enterprise application:

Packages

A package in Automation 360 is a collection of actions that you use and configure to build automations.

What is a package

A package provides the following building blocks for automation:

- Actions (also called commands in v11 and v10)
- Conditional statements (used to set If conditions)
- Iterators (used to set the number of times something has to be run)
- Triggers (conditions that cause an automation to run)
- Variables (system or custom)

As a developer, you can access the packages in the Bot editor in the following ways:

- Go to **Automation > Files and folders list**, and click an **automation**. In the **Actions** pane on the left, view packages and actions, variables, and triggers. Add new actions or modify the existing property values in the automation.
- Go to **Automation > Create new > Task Bot**. In the **Actions** pane on the left, view packages and actions, variables, and triggers that you use to build your automations.

Watch the following video for an overview on packages:

How packages are updated in Control Room

Updates to packages are available with each release of Automation 360. As an administrator, you can configure Control Room settings to get package updates. You can also enable or disable automation updates of packages in the Control Room.

See [Updating packages in Control Room](#) on page 1839.

Package permissions

Users must have the appropriate administrative permission (PACKAGE MANAGER role) to view or manage packages.

- **View packages:** A user with **View packages** permission can view the packages that are available to Bot Creators. Go to the **Manage > Packages** page to view all the packages in the Control Room that are available for Bot Creators. Packages can have multiple versions.
- **Manage packages:** A user with the **Manage packages** permission can add new packages to the Control Room and manage which packages versions are available in the Control Room. Go to **Manage > Packages** page and use the **Add** icon (plus sign) on the top-right of the packages list to add packages.

See [Add packages to the Control Room](#) on page 1842.

To manage Control Room packages by setting a package as default, disabling it, or deleting it, see [Manage Control Room packages](#) on page 1847.

If a specific version of the package is disabled, a **Disabled package** alert is displayed against any of the actions from that package that you might have used in your existing bots.

Configuring RBAC on packages

As an administrator, you can configure package availability for specific users for which you want to give access, select **View package** from the menu for that package and in the **Availability** tab, edit the settings as required.

See [RBAC on packages](#) on page 1833.

Updating package versions

You can choose and select which package version to set as default in the Control Room. You can also quickly update bots to a secure, stable, and default package version across multiple bots.

Note: We recommend that developers update their bots to use the latest version of a package.

See [Updating package versions](#) on page 1843.

Usage notes

- On the packages landing page **Manage > Packages** (On premises and Cloud), if all versions of a package are disabled, the status is displayed as **Disabled**.

All related fields, such as recommended Control Room version, Bot Agent version, and Last modified, will show the status as **Not Available**.

Note: The **Version** column is renamed to **Default version**.

- When you update to Automation 360 v.24, the Apache log4j2 library is no longer bundled in the packages. Note that earlier packages (from Automation 360 v.23 and earlier) might continue to have the log4j2 library bundled within them. If you want to use packages without the log4j2 library, we recommend that you use the newer Automation 360 v.24 packages in your autotmations.

RBAC on packages

Based on the business requirements and expertise of developers, administrators can restrict package access for a simplified developer experience, along with the capability to enforce access policies for custom groups.

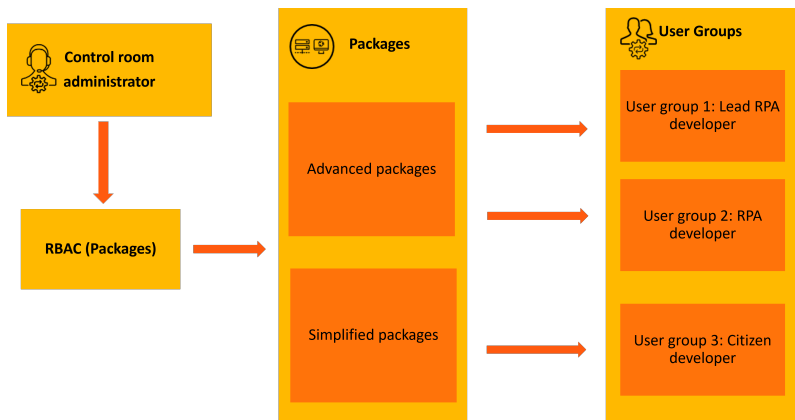

Overview

The RBAC feature helps you to set access at the package level to restrict usage and execution of packages to improve security. This feature can be applied to all package types, including custom packages where you can control assigning and managing the packages to your users.

RBAC access to packages applies only to the task of creating bots. If a user role does not have access to a particular package, these users cannot view the package on the **Actions** palette and therefore cannot use it when creating bots. However, these users can run bots (created by a different user who has access to the package) that uses the package.

- Each developer sees only the approved list of packages in their workspace.
- Some packages might be available for all users, while some are available only for certain groups.

The following image shows how RBAC can be set for user roles and groups:

Benefits of packages RBAC

- Centralized policy enforcement for secure, user-friendly developer access: Role-based access to automation provides enhanced security, confidence, and ease of use for developers.
- Enterprise-wide access policy: Establish group-based package access with clear policies restricting package access to all the users or users with specific roles.
- Access based on business needs: Create required access groups, expose group-appropriate library of packages, and manage the phased rollout of package access.
- Simplified automation for citizen developers: Hide complex packages from the action palettes for citizen developers so that they can focus on easy-to-complete automation.
- Automation reuse with compliance: Enable users to create utility bots from complex packages to use as cloned bots in the a private workspace or inside public bots.

The following image lists the benefits of packages RBAC:

User types

Administrator

- Customizes packages so that they are accessible to developers based on the developers' expertise, skill, business group, and more.
- Creates custom groups and assign access per group.
- Rolls out packages in a phased manner to different types of developers.
- Provides better control over how packages are made available to developers. For example:
 - New developers can avoid causing security risks as they do not have access to complex packages.
 - Advanced developers can get broader access to packages.

An organization can enforce centralized control over package access and best practices through this feature.

Roles and permission required: Administrators with the **View Users and Roles basic information** and **Manage packages** permission.

Bot developer

- Gets a customized view of packages in their workspace.
- Simplified (easy-to-use) packages are enabled for Citizen Developers so that they can build a basic functional task bot

using actions and packages available in their actions palette.

- Advanced developers can get access based on the entitlements or privileges provided by the administrator.

Roles and permission required: Users with the **View Users and Roles basic information** and **Manage packages** permission.

See the following video for an overview of how RBAC is configured:

Configure RBAC for packages

Restrict packages usage based on your business needs and roles for a secure and simplified developer experience. An administrator can customize access to packages based on developers' expertise, experience, and so on, while bot developers get a customized view of packages in their workspace based on their expertise and needs.

You must be an administrator or a user with the **View Users and Roles basic information** and **Manage packages** permission.

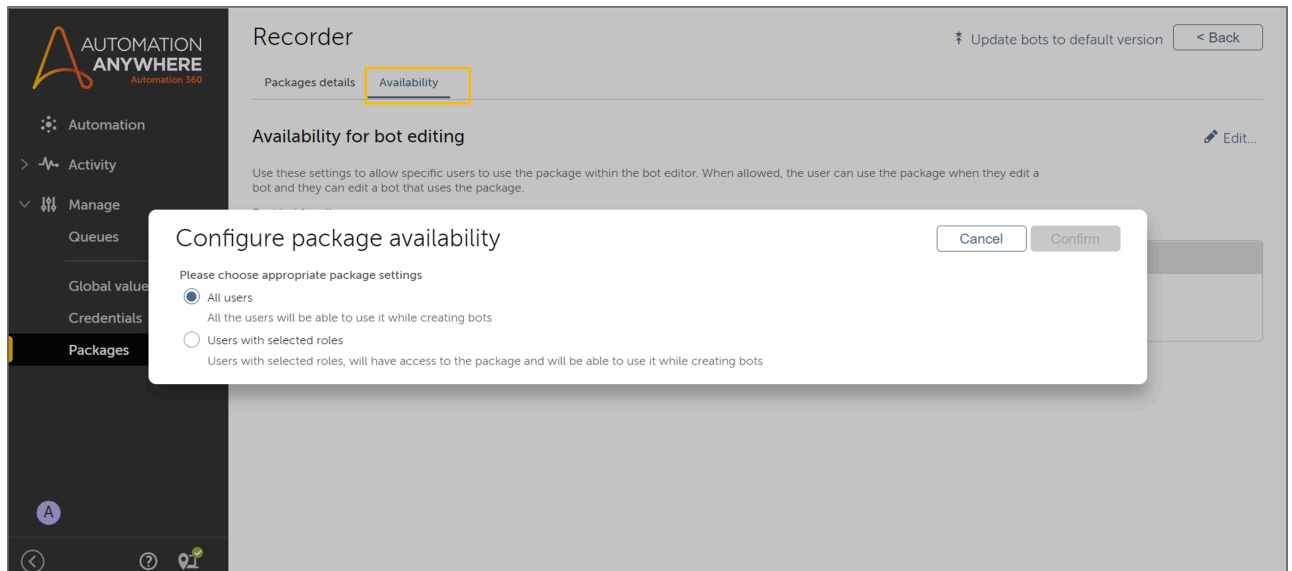

1. Log in to the Control Room.
2. Navigate to **Manage > Packages**.
3. From the list of packages, search for the package for which you want to give access to the users.
4. Click the selected package.

Status	Name ↑	Vendor	Version	Bot agent (recommen...	Control Room (reco...	# of a
Enabled	AARI Web	Automation Anywhere	7.0.1-20220727-162102	21.134 or above	12316 or above	7
Enabled	Active Directory	Automation Anywhere	3.5.0-20220416-233339	20.11 or above	8750 or above	3
Enabled	Analyze	Automation Anywhere	2.4.4-20220615-020937	20.11 or above	8750 or above	2
Enabled	App Integration	Automation Anywhere	4.8.0-20220616-123118	21.88 or above	10195 or above	3
Enabled	Application	Automation Anywhere	3.5.0-20220416-233350	20.11 or above	8750 or above	1
Enabled	Boolean	Automation Anywhere	2.5.0-20220118-153154	20.11 or above	8750 or above	6
Enabled	Bot Migration	Automation Anywhere	9.1.3-20220805-200018	21.220 or above	15224 or above	2

For example, when you click the **Recorder** package, the selected package window opens.

5. To allow specific users to use the package from the Bot editor, go to the **Availability** tab and click **Edit**.
6. On the **Configure package availability** page, choose one of the following options:

- **All user:** Select this option to allow the user to use the package while creating bots. By default, this option is selected for all the packages.
- **User with selected roles:** Select this option if you want users with selected roles to access the package and use it while creating bots.

7. To configure access for specific users, perform these steps:
 - a) Select the **User with selected roles** option.
 - b) From the available roles, select the roles you want to assign.
 - c) Move the selected roles to the right panel.
This step enables you to define users who will have access to the package in the Bot editor.
 - d) Click **Confirm**.

The availability tab shows the selected roles for whom the specific package is now enabled.

The screenshot shows the 'Recorder' interface in Automation Anywhere. The 'Availability' tab is selected, showing settings for 'Availability for bot editing'. A table titled 'Roles (4 of 22)' lists the roles enabled for users with selected roles:

Name
AAE_Basic
AAE_Bot Developer
RPA Developer role
Citizen developer

Packages RBAC for bot developer

As a Bot Creator (RPA developer) or Citizen Developer, you can create bots based on the packages that are available to you.

You can only use the package-defined actions, triggers, variables, and customized packages for which you have access. Your access to these packages are set by the administrator based on user roles. If you do not have access to a package, you cannot view that package on the **Actions** palette.

RBAC on packages applies when you create or edit bots in your private workspace. You cannot run bots with restricted packages directly. However, you can use a cloned bot as a sub bot in another main bot and run this bot in a public or private workspace.

When a bot contains packages (or packages that you cannot access), keep in mind these considerations:

- You cannot perform these bot actions:
 - Run a bot: Either a new bot or a checked-out bot with changes
 - Check in a bot

If you try to perform these actions, an error message is displayed that the bot contains packages that are restricted.

- While editing variables, you cannot use variable property options related to restricted packages. An error message is displayed that the variable is related to a package that is restricted.
- You cannot run a bot with triggers:
 - From the Bot editor, when you run a bot with a trigger that contains a restricted package, see an error message is displayed that the bot with triggers contains a restricted package.

- When a trigger event is configured for a user and a device, and the trigger event occurs on the device, access to the bot package is verified. If the bot contains a restricted package, the bot fails, and an audit log entry is recorded.

Updating packages in Control Room

The delivery of packages is developed to be separate from the main platform updates. This will help us respond quickly to changes and fixes required and provide the flexibility to deliver updates in packages, going forward.

A new package and new package version is downloaded and installed if it is compatible with your Control Room version.

- Cloud users cannot turn off this automatic installation of a new package and new package version, but the package administrator can control the status of the new package version.
- For On-Premises users, the automatic package download capability is disabled by default, but package administrators can enable it.

Note: From Automation 360 v.27, the automatic package download capability is enabled by default for any On-Premises new installation. As a package administrator, you can disable this feature.

This capability is enabled differently for Cloud and On-Premises Control Room instances, as listed in the following table:

Seamless package update capability	Cloud Control Room	On-Premises Control Room
Download packages from Automation Anywhere Cloud	Enabled by default and cannot be disabled.	Disabled by default and can be enabled. Note: From Automation 360 v.27, it is enabled for new installation and can be disabled.
Set downloaded package to default version	Enabled by default and can be disabled.	Enabled by default and can be disabled.

- Cloud users: [Automatic package updates for Cloud Control Room](#) on page 1841
- On-Premises users: [Automatic package updates for On-Premises Control Room](#) on page 1840

We recommend bot developers always use the latest version of the packages because that version provides the latest innovations and all the code and security fixes from previous versions. Note that this capability does not impact existing bots, which continue to run unchanged. Bots developed with a particular package version will continue to do so unless explicitly changed by the bot developer. However, if you want to modify existing bots to use the default version of a package, you can use the **Update bots to default package version** feature. For more information, see [Update bots to default package version](#) on page 1844.

Related reference

[Periodic package updates - summary list](#) on page 809

We will be updating specific packages in the Control Room to enable you to get early access to critical updates and fixes.

[Package updates overview](#) on page 808

Packages are typically updated in Automation 360 releases as part of new Control Room builds. We also plan to release some updates between these releases for early delivery of critical updates and fixes as package-only updates.

Automatic package updates for On-Premises Control Room

Configure the On-Premises Control Room settings to get package updates from the Cloud automatically or only when the Control Room is upgraded manually.

Seamless package update capability is part of our effort to make innovations and enhancements readily available to you. This capability in the Automation 360 platform provides you predictable, qualitative, and non-disruptive access to the latest innovations and enhancements.

When this seamless update capability is enabled, the Control Room can download new packages and new versions of existing packages from Automation Anywhere Cloud when they are released on a regular and predictable release cadence. Newly downloaded package versions are automatically set as default packages so that customers can start using these package versions on an ongoing basis as the packages become available.

Note: To automatically download newly released package versions, the Control Room uses the following URL and port number:

- URL: `https://aai-artifacts.my.automationanywhere.digital/packages/<package-jar-file-name>`
- Port number: TCP 443 (HTTPS)

Note that this capability has no impact on existing bots. Existing bots continue to run unchanged. These new package versions are also backward-compatible with the existing platform version.

Configure packages for On-Premises

Ensure that you are logged in to the On-Premises Control Room as administrator.

1. Navigate to **Administration > Settings > Packages**.
2. Click the **Edit** option.
3. Select one of the following options for updating the packages:
 - **Enable and set as default:** Is enabled by default and is used to automatically set the latest version of the packages as the default version.

Note: The new package version is downloaded and installed only if it is compatible with your Control Room version.

- **Enable:** To manually set the default version when the packages are updated.
- **Disable:** To prevent any automatic update of a newer version of the packages.

If this automatic package update is disabled, a notification is displayed for these packages in the **Manage > Packages** page to notify you that an updated version is available. Such notifications are displayed only for packages that are part of your Control Room installation.

This is applicable for new packages downloaded from the Cloud and the Control Room upgrade.

4. Click **Save changes**.

Automatic package updates for Cloud Control Room

Configure the Cloud Control Room settings to get package updates from the Cloud automatically.

Ensure that you are logged in to the as the administrator.

When a new package or a new package version is released in the Cloud, the package version will automatically get installed on Control Room. This automatic installation of a new package version cannot be turned off by cloud users and can only control the status of the new package version after it is installed.

1. Navigate to **Administration > Settings > Packages**.
2. Edit the **Packages** option. The page opens in edit mode.
3. Enable the settings to set the status of the new package.
 - **Enable and set as default:** Select this option to automatically set the new version of a package as the default version.

- **Enable:** Uploads and enables the package, but the package is not set as the default package. Bot Creators have to specifically select non-default packages to use them for creating bots.
- **Disable:** Choose this option to automatically disable the new version of a package.

4. Save the settings.

Related concepts

[Preload packages](#) on page 2219

You can preload packages on your local device to shorten the bot runtime.

Add packages to the Control Room

Administrators can add packages to the Control Room for use by Bot Creators.

Ensure that you are logged in to the as the administrator.

- You can add a package from either Bot Store or another source.
- For updated packages made available periodically, go to A-People and download the files: [Automation 360 package releases \(A-People login required\)](#).

For more information about periodic package updates, see [Package updates overview](#) on page 808.

To add a package from a source other than Bot Store, follow these steps:

1. Navigate to **Manage > Packages**.
2. Click **Add package**.
3. Click **Browse**.
4. Locate and select the package to add to the Control Room.
Packages are Java Archive (JAR) files that contain actions used to create bots.
5. Click **Upload package**.
6. On the **Bots > Packages > Confirm package** page, choose any of the following options:
 - **Accept, enable and set as default:** Uploads and enables the selected package, and sets it to the default package for the Control Room.
 - **Accept and enable:** Uploads and enables the package, but the package is not set as the default package. Bot Creators have to specifically select non-default packages to use them for creating bots.
 - **Accept but disable:** Uploads and disables the new package.

Choosing **Reject** stops the upload process.

To add a package from Bot Store, see the following video:

7. After installation, click **Administration > Packages** to verify that the package is added.
When you add or update a package in the Control Room, a notification is also sent through the **Notifications** icon. This notification is sent to the Control Room users who have the **View package** permission. For more information, see [Capabilities supporting notifications](#) on page 2132.

Related concepts

[Build and test a demo package and bot](#) on page 3402

This practical how to section demonstrates that creating, changing, and managing packages allow you to customize actions and efficiently manage packages for all Control Room users.

Related tasks

[Manage Control Room packages](#) on page 1847

Manage packages in the Control Room by setting a package as default, disabling it, or deleting it.

Updating package versions

You can update multiple packages to default version for multiple bots. This feature enables you to update multiple package versions across all available bots with one action thereby increasing the efficiency of a bulk package update. Additionally, you can review the bots and dependencies before a bulk update.

In an enterprise business, maintaining a large number of bots with default and up-to-date packages is a tedious and time-consuming process. You cannot update those packages manually because you need to check the latest released package version and then update them for any required bots.

The **Bot update** feature in the Automation 360 platform provides a multiple package version update for multiple bots with dependencies. With one action, you can update multiple packages, bots that contain selected packages, and dependent bots.

The **Bot update** feature provides the following benefits:

- Ability to select more than one package
You can view a list of all the available packages and select to update all the required packages instead of updating one package at a time. Also, you can update packages to their default versions for the required bots.
- Ability to select only required and multiple bots

You can select only the required bots that you want to update with default package version instead of selecting all bots for update. This decreases the time required to complete the update functionality.

- Advanced reporting to view progress of bulk package updates

The Automation 360 platform provides a comprehensive report to view the progress of a bulk update of a package with the user's information. It also provides the following details:

- Number of packages considered for the update
 - Number of bots updated with default package version
 - Number of bots for which package version is updated successfully
 - Number of bots for which package version update is unsuccessful
 - Number of bots for which package version update is pending
 - Total time elapsed in bulk package version update
 - User who started the bulk package update operation
 - All packages, bots, and dependencies selected by the user
- Enhanced compiler for accurate results

With an upgraded compiler, the Automation 360 platform improves the overall accuracy and outcome of the bulk package version update processes.

Related tasks

[Update bots to default package version](#) on page 1844

You can quickly update bots to a secure, stable, and default package version across multiple bots.

Update bots to default package version

You can quickly update bots to a secure, stable, and default package version across multiple bots.

- To update bots to the default package version, ensure you have the View packages permission and the permission to edit bots .

When you begin the bulk update process, this action updates the bots in a **Public** workspace for which you have check-out permission, and any bots using the non-default version of the specific package.

- To view the **Bot update** page in the Control Room and to view the bulk update reports, ensure that you have the **View bot update** permission.
- To perform the bulk package update action, ensure that you have the **Manage bot update** permission.
- Verify the bots are compatible with the current default version of the package.
- Navigate to **Administration > Settings > Bots > Bot validation** to turn on the bot validation.
- When you update the bots to the default package version, ensure that the bots are not checked out until the process is completed.
- Do not disable the package while the bulk update process is running.

1. Navigate to **Administration > Bot update**.
2. Click the **Update Bots** drop-down and click **Package Version**.
3. On the **Update - Package Version** page, define the settings.
 - a) **Name**: Shows a system-generated name for the update function.
 - b) Optional: **Description**: Add a description for the update package version function.

- c) If the current version is higher than the default version, then downgrade the current version by selecting the **Downgrade version if the current version is greater than default** option.
- d) View and search the list of available packages by the **Status, Name, and Version**.
- e) Select the required packages and click the right arrow (→) to add your selection.
- f) Select the required packages from the selection list and click **Next**.

You are redirected to the **Bots** section.

4. On the **Select bots to update** page, update bots and dependencies.
 - a) Select a Task Bot to process in the queue from the list.
 - Latest version: Click the **Latest version** tab to select the latest version of the bot.
 - Production label: Click the **Production label** tab to select the labeled version of the bot.

By default, the Bots folder is selected.

Tip: Use the search field to find a Task Bot quickly.

If you select the **Production label** option for the parent bot, then the corresponding dependent bots with the **Production label** are also automatically selected. If any of the dependent bots do not have the **Production label** applied, then the latest version of the bot is selected.

- b) Select a Task Bot to process in the queue from the list.
- c) From the list of available bots, select the required bots for which you want to update the package version.

Note: You can select a maximum of 100 bots with the dependencies for bulk package update.

You can select bots based on the following parameters:

- Type: Select one of these values: Folder, Task Bot, .ATMS Task Bot, .MBOT Task Bot, Form, and Process.
 - Name: Search the required bot by its name.
 - Code Analysis results: Select one of these values: N/A, Not scanned, No violations, Low severity, and High severity.
- d) Click the right arrow (→) to add your selection.
 - e) Select the required bots from the selection list and click **Next**.

You are redirected to the **Bots and Dependent Bots** section.

5. Review the selected bots and dependencies that you selected for the update.
6. Click **Update-Package Version**.

The system starts updating all the selected bots and dependencies in the Control Room repository which contain the selected packages. If any of the bots are not using the default version of the packages, those bots are updated.

The **Bot update list** page displays status, name, start and end time, and duration required for the update. It also displays the number of completed, failed, skipped, and total items with last modified time, and user details (such as username) who initiated the package update.

7. On the **Bot update list** page, click the three dot icon next to the required update and click **View update bot details** to view a detailed report.

A report displays the following information:

- **Summary:** Summary of the package update process with selected bots and dependencies.
- **Settings:** Settings defined in the package update process with selected packages.
- **Results:** Result of the package update process with these details such as status, type of bot, name of the bots and dependent files, folder path, name of the Bot Runner, and reason why the bot skipped or failed status.

For an example of this procedure, see [Example of updating default package version across bots](#) .

Related tasks

[View audit log for bulk package updates](#) on page 1846

You can view audit log details for bulk package updates and bots. It also provides detailed information of updated bots and events that you can download to a CSV file.

[Example of updating default package version across bots](#) on page 3116

This example shows how to perform a bulk update of multiple bots in the Control Room repository and use the default version of the Excel advanced and Message Box packages.

View audit log for bulk package updates

You can view audit log details for bulk package updates and bots. It also provides detailed information of updated bots and events that you can download to a CSV file.

1. Navigate to **Administration > Audit log**.
2. On the **Audit log** page, search the package update entry by the **Update default package** event type.

You can also view and search the **Update-Package Version** details by using the following filters in the **Audit log**:

- **Status:** Status of the update package version request
- **Time:** Time at which the update had completed
- **Item name:** Name of the update package version request
- **Event type:** Type of the event such as **Update default package to bot requested**
- **Event started by:** Name of the user (username) who initiated the update package version request
- **Source device:** Device on which the update package version request was initiated
- **Source:** Source of the request such as Control Room
- **Request ID:** Unique ID for the update package version request

3. To view the event details, click the three dots icon next to the required event and click **View event details**.

- **Event details:** Displays information such as status, details of the user who started the event, the user's device details, the request ID number, date and time of the initiated request, event type, and source of the request.

- **Update default package details:** Displays information such as name of the request, change in package version, name of the package being updated, and version of the package you are currently on.
4. Click the required bot to view the following information:
 - **Request name:** Displays the name of the initiated request
 - **Bot path:** Displays the file or folder path where the bot is located
 - **What changed:** Displays information on what was changed for the bot
 - **Package name:** Displays the name of the package
 - **Old package version:** Displays the previous version of the package
 - **Target package version:** Displays the version to which the package is being updated
 - **Old bot version:** Displays the previous version of the bot
 - **New bot version:** Displays the current version of the bot that is being updated
 - **Remark:** Displays any comments or remarks

During the bulk update process, some bots might fail to update the default package version. The failed bot displays an unsuccessful status on the **Audit log** page. For example, if the bots are checked out during the update package process, the package version update is not performed for these bots and they fail.

5. To download the audit data to a CSV file, select the required entry and click **Export checked items to CSV**.
A CSV file containing the audit log details is downloaded to your local system.

[Update bots to default package version](#) on page 1844

You can quickly update bots to a secure, stable, and default package version across multiple bots.

[Example of updating default package version across bots](#) on page 3116

This example shows how to perform a bulk update of multiple bots in the Control Room repository and use the default version of the Excel advanced and Message Box packages.

Manage Control Room packages

Manage packages in the Control Room by setting a package as default, disabling it, or deleting it.

Ensure that you are logged in to the as the administrator.

To manage packages in the Control Room, users must have **Manage package** permission.

Package management actions apply to all users; however, the user can select specific package versions within a bot.

1. Navigate to **Manage > Packages**.
2. Hover over the **Actions** icon for the package.
3. Click **View**.
4. Choose any of the following options:

Option	Description
Set as default	<p>Select a package and set it as the default. As soon as a package is set to default, it is the package that all Bot Creators in the Control Room use.</p> <hr/> <p>Note: By default, new versions of packages become the default version and will only be used the first time that package is used in editing a bot. If a bot already uses the package, it continues to use an earlier version.</p> <hr/>
Disable	<p>Disable a package so that users cannot use it to create new bots. Bots that were created using a disabled package continue to work.</p>
Delete	<p>Deleting a package removes the actions contained in the package from the Control Room for all users.</p> <p>You can delete a package version if:</p> <ul style="list-style-type: none"> • A Control Room user with Manage package permission added the package version. However, you cannot delete any package versions that were automatically installed by the system, or through a Control Room new installation or upgrade; you can only disable them. • The package version is not in Default status. • The package has only one version, but its status is Default.

Important: A package cannot be deleted if it is being used by a bot.

Administrators can add packages to the Control Room for use by Bot Creators.

External key vaults for Automation 360

Key vaults provide a secure, encrypted storage space for sensitive data used by automation.

Customers' sensitive data can be accessed and used by their automation platform by storing the

data in corporate-approved key vaults such as CyberArk Password Vault, AWS Secrets Manager, Azure Key Vault, or HashiCorp Vault.

Automation Anywhere provides a secure key vault called Credential Vault. Requirements for external key vault usage are generally related to certain compliance standards and corporate security policies implemented by your IT and IT security groups. As part of their data security policies, these groups select and maintain corporate key vault services, and define the standards for the protection of sensitive data. Integrating Automation 360 Control Room with external key vaults enables you to store credentials for security and compliance.

Note: External key vault integration is not supported on Oracle Database.

Users and roles

The following users typically configure and work with external key vaults:

Automation Administrators	Automation Administrators who have AAE_Admin and AAE_Locker_Admin roles with permissions to administer Automation 360 Control Room and Credential Vault instances. The Automation Admin works with the customer External Key Vault Admin.
Customer External Key Vault Administrators	Customer External Key Vault Administrators who are responsible for the administration and management of the external key vault tasks (for example, setting up, managing, and creating access policies).

Benefits

The Automation Anywhere Credential Vault is secure and provides deep integration with the automation platform. However, because corporate IT must provide secure data services as part of their IT security policies, the automation platform might be required to use external key vault technology to comply with corporate standards.

External key vaults enable the automation platform to fully comply with corporate requirements and can provide these additional benefits:

- Deep integration with the Identity Provider (IdP) and corporate authentication platforms such as single sign-on (SSO) and Directory Services (such as Microsoft Active Directory).
- Support of password rotation and synchronization with the systems used with the automation platform.
- Administration of the key vault and security best practices are performed by the IT group who manages the external key vault instead of the automation administrators. As a result, the automation platform becomes a consumer of the credential service.

Guidelines

External key vault integration guidelines support the operation of the automation platform relating to the coordination, configuration, and consumption of credentials and sensitive data from the external key vault technology.

- **Coordination:** Establish designated contacts for the key vault and automation platform technologies and identify the individuals responsible for communicating operational guidelines, security policy, and compliance requirements for credential management.
- **Configuration:** Designated contacts collaborate on the use case implementation and configuration requirements of the automation platform and the external key vault.
- **Consumption:** Based on which use cases are implemented, designated contacts monitor the integration of the automation platform and the external key vault and coordinate credential rotation and naming requirements.

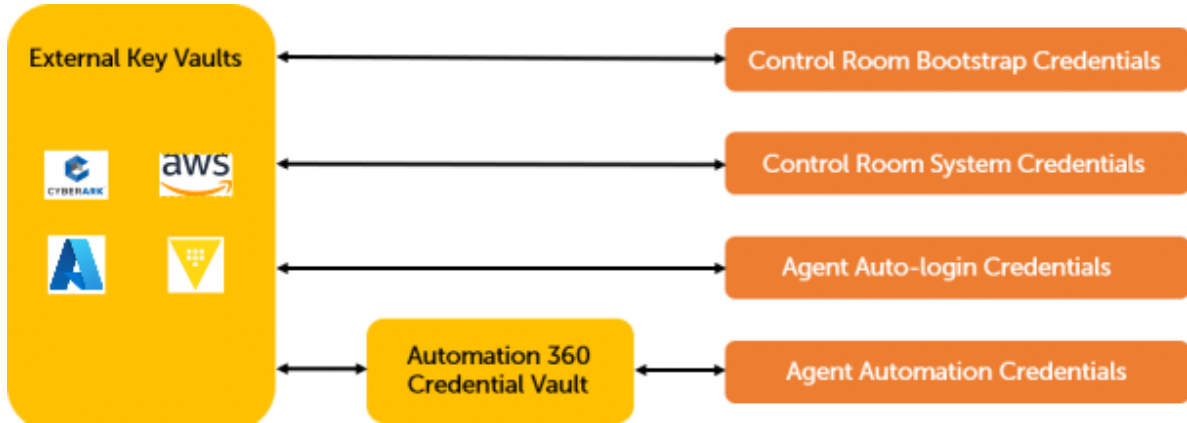

Integrating external key vault with Control Room

Automation Anywhere Control Room supports these external key vaults: CyberArk Password Vault, AWS Secrets Manager, Azure Key Vault, and HashiCorp Vault.

Use cases

The following use cases are supported:

Control Room bootstrap	Retrieval of credentials used by the Control Room to authenticate to supporting services such as database and Control Room software service account.
Control Room system	Retrieval of credentials used by the Control Room for Active Directory (AD) and email (SMTP) integration.
Agent auto-login	Retrieval of credentials used by the RPA platform to launch automations on designated Automation 360 Bot Agent devices.
Agent automation	Retrieval of credentials that the automation (bot) uses during runtime to perform authentications to the applications that are being automated.

Plan your integration

Before you integrate your external key vault with the Automation 360 Control Room, you need to develop an overall external key vault strategy.

The answers to these questions will help determine the integration requirements for the external key vault.

What type of Automation 360 Control Room deployment do you have: On-Premises or Cloud?

- On-Premises: The Control Room and external key vault are hosted at the customer's site and environment.

The external key vaults might contain these external key vaults hosted within the customer site (customer-controlled datacenter or environment):

- CyberArk Password Vault – Customer On-Premises environment
- AWS Secrets Manager – Customer AWS environment
- Azure Key Vault – Customer Azure environment
- HashiCorp Vault – Customer HashiCorp environment

You can configure the external key vault connection during initial installation or post-installation using the key vault utility.

- Cloud: The Control Room is hosted on the Automation 360 Cloud environment and the external key vault is hosted within the customer site (where the customer-controlled datacenter is either On-Premises or in a Cloud environment such as AWS):

The key vault in the customer network requires connection to the Automation 360 Cloud Control Room. You configure the connection to the external key vault from the Automation 360 user interface. Customer network perimeter configuration is required.

What type of third-party external key vault do you have?

CyberArk Password Vault, AWS Secret Manager, Azure Key Vault, or HashiCorp Vault.

Each external key vault has their own specific requirements. Review all configuration requirements with RPA and external key vault administrators before starting the integration.

What type of credentials do you need to retrieve from the external key vault based on the supported use cases?

By integrating the Automation 360 Control Room with your external key vault, you can retrieve credentials that support these use cases:

Use case	Credenti:	Supporte	Credenti:	Credenti:
		deplym	caching	rotation
Control Room bootstrap and start the Control Room services (Service account)	Used to authenticate the database (optionally)	On-premises only	Caches the retrieved values	You should rotate the database credential during scheduled downtimes

Use case	Credential deployment	Supported	Credential caching	Credential rotation
Control Room system	Used to authenticate Active Directory (AD), Service account, and SMTP	On-Premises only	Caches the retrieved values	You should rotate the AD, Service account, and SMTP credentials during scheduled downtimes
Agent auto-login	Used by Bot Agent to perform auto-login on a Bot Agent device before launching an automation	On-Premises and Cloud	Does not cache values from external key vault	Always retrieves the latest available credential rotated in the external key vault
Agent automation	Used by the automation to authenticate to the applications being automated	On-Premises and Cloud	Does not cache values from the external key vault	Always retrieves the latest available credential rotated in the external key vault

Coordinate with external key vault admin team

To ensure a productive, efficient, and rapid integration with the external key vault, you must coordinate with the external key vault administration team and exchange the technical requirements of the RPA platform. By carefully planning and coordinating with the external key vault administration team, you can quickly integrate the Automation Anywhere Control Room with the external key vault and avoid time-consuming troubleshooting issues.

We suggest you follow these guidelines to structure your integration process:

- Review the supported credential use cases to determine which credentials the RPA platform requires to retrieve from the external key vault.
- Schedule a kick-off meeting with the external key vault administration team to exchange information for these details:
 - Which key vault to use?
 - Which use cases to configure?
 - What are the credential naming conventions required by the RPA platform?
 - How are the credentials configured and updated on the external key vault?
 - Does the external key vault have multiple instances (multiple instances of the external key vault can be used for different Automation Anywhere Control Room instances)?
 - Who are the designated contacts for the RPA platform and key vault administration?
- Review the configuration requirements for the Control Room:
 - Are you installing a new Control Room with key vault integration?
If so, then review the installation procedure for the external key vault integration.
 - Are you configuring an existing Control Room to use external key vault integration for the first time?
If so, then review the key vault utility usage procedure to configure key vault integration post-installation.
 - Is the Control Room an Automation 360 Cloud Control Room that will connect to an on-premises key vault?
If so, then you must coordinate with your IT networking team to configure connectivity between the Cloud Control Room and your internal network.
- Review the external key vault configuration procedure and note all integration settings requirements:
 - Key vault configuration requirements to configure on the external key vault before integration
 - Control Room operating system configuration
 - Authentication method that the Control Room will use to connect to the external key vault
- Schedule integration meetings to coordinate these configuration and set up tasks for the Control Room and external key vault administrators:
 - Configuration of the key vault connection
 - Configuration of each use case
 - Testing of each use case

Note: These integration meetings should be ongoing until you have configured and tested all use cases.

-
- Add the external key vault integration to regular IT cadence meetings to monitor the operation of the Control Room and the external key vault, specifically credential rotation coordination.

External key vault naming conventions

Specific authentication credentials and external key vaults have restrictions on the use of certain characters in usernames, phrases, and other text. Also, there are different naming conventions to follow based on the external key vault and the credential use cases: Agent auto-login or Agent automation.

Agent auto-login naming conventions

For CyberArk, all Agent auto-login credentials are retrieved from the specified safe name and assumed to exist within the Auto-login Credential Safe. For AWS Secrets Manager, Azure Key Vault, and HashiCorp Vault, the Agent auto-login credentials must adhere to the required naming conventions detailed on this page.

If the Control Room performs an auto-login credential retrieval but no credential exists in the Auto-login Credential Safe that matches that user name, then the auto-login will fail. For any unattended automations, all robotic or digital worker user IDs must have an auto-login credential configured for each Control Room user within the external key vault.

The Control Room retrieves auto-login credentials based on the object naming convention within the external key vault. The Control Room searches for an object where the object name (the credential name in the external key vault) matches the Control Room username for which it is performing auto-login.

The prefix `autologin_` is required as part of the naming convention for auto-login credentials for all external key vaults: CyberArk, AWS, Azure, and HashiCorp. The name of the auto-login credential in the external key vault must contain `autologin_` followed by the Control Room username. In some cases, certain key vaults have restrictions on the characters that can be used in credential object names. Additionally, to support how different use cases encode credentials, Automation 360 requires that certain characters be reserved or encoded.

The following table lists examples of the object naming conventions expected in the Control Room:

Control Room username	Expected object name format
ABCD\user123	autologin_ABCD--user123
user123@rpa.abcd.com	autologin_user123-40-rpa-2e-abcd-2e-com
ABCD\user123	autologin_ABCD\user123
user123@rpa.abcd.com	autologin_user123@rpa.abcd.com
john	autologin_john

Note: For On-Premises customers using AD authentication, you must format auto-login usernames using the UPN format or `domain\username` postfix.

For auto-login credentials, keep these in mind:

- The object name in the external key vault must contain `autologin_` as a prefix.
- The auto-login credential names must map to the Control Room username (login ID) for the credential being retrieved.

Some external key vaults have usage restrictions of certain characters, such as backslash (\) and ampersand (@) in the secret name (object name), and restrictions on how special characters are interpreted within API calls. If the user ID contains special characters, then you must encode the secret name (object name) in the external key vault using ASCII code character substitutions, as listed in the following table.

This character	Changes to this ASCII code character substitution
\ (backslash)	--
- (dash)	-2d-
_ (underscore)	-5f-
@ (ampersand)	-40-
. (period)	-2e-

Note: Except for the backslash being mapped to double dashes, the dash, period, underscore, and ampersand are mapped using their ASCII code bracketed in dashes.

Agent automation naming conventions

Agent automation credentials are credentials retrieved by the automation during runtime and used by the automation bot to authenticate with applications. Automation credentials retrieved from external key vaults are mapped in the Automation Anywhere Credential Vault using the **External Key Vault** option when configuring lockers and credentials.

The Automation Anywhere locker is mapped to either of the following:

- Safe Name (CyberArk)
- Secret Name Prefix (AWS, Azure, and HashiCorp)

A credential is mapped to either of the following:

- An Object Name (CyberArk)
- A Secret Name body (AWS, Azure, and HashiCorp)

Note: You can map any Automation Anywhere locker to any CyberArk Safe Name. The Safe Names used to map Automation Credentials should be distinct from the Safe Name used for auto-login.

To support the Automation Anywhere user-defined credentials functionality, you can create credentials using a Control Room_username postfix because these credentials are retrieved based on the user context of the running bot. If you do not create user-defined credentials, then the automation bot credential retrieval process retrieves the system credential.

Note: For On-Premises customers using AD authentication, you must format Agent automation usernames using the UPN format or domain\username postfix.

External key vaults prohibit different special characters in secret names. As a result, you must encode some characters in the credential (secret) name in the external key vault based the type of external key vault (CyberArk, AWS, and Azure) you are using and its specific requirements.

HashiCorp secret naming convention

By default, the Control Room integration with HashiCorp allows the following characters without encoding:

- Uppercase characters (A–Z)
- Lowercase characters (a–z)
- Numerals (0–9)
- Special characters (+=)

For other special character, the secret name should have the ASCII encoded value for the special character. For example, an underscore character (_) must be used as `-5f-`.

On-Premises deployments: To override the default characters encoded by the Control Room, add the following property and regex value in the `keyvault.properties` file located in the Automation Anywhere configuration directory. For example, use the following expression if you do not want to encode special characters: `name.encoding.characters.allowed.regex.hashicorp=[A-Za-z0-9/_+=.@-]+$`.

CyberArk Password Vault automation example

The following table shows CyberArk external key vault examples using naming conventions for automation.

Note: The Safe Name maps to the locker for the Control Room, and the Object Name maps to the credential for the Control Room.

Automation credential example	Control Room username	Safe Name	Object in locker
System credential in locker mapped to Safe Name	None - system credential	finance	glaccess
User-defined credential in locker mapped to Safe Name	ABCD\RPA\user123	finance	glaccess_ABCD--RPA--user123
User-defined credential in locker mapped to Safe Name where username is encoded with ASCII mapping	ABCD\RPA.user123	finance	glaccess_ABCD--RPA-2e-user123

Configure username for different Automation 360 services using the CyberArk secret response

When configuring CyberArk settings for some of the Automation 360 services such as auto-login, Lightweight Directory Access Protocol (LDAP), and service credentials, you can optionally configure the username for the `Enter` property set to your CyberArk username option. Usernames can be a combination of values from the secret response or string literals.

The CyberArk secret response contains field values that you must enclose within dollar signs (\$) to construct the username. For example, to configure the username in the format `domain \username`, you must enter: `$$domain$$\$$username$$`. The domain and username values in this expression will be replaced with the corresponding values from the secret response.

AWS Secrets Manager automation example

The following table shows AWS Secrets Manager external key vault examples using naming conventions for automation.

Note: The AWS Secret Name Prefix maps to the locker for the Control Room, and the AWS Secret Body maps to the credential for the Control Room.

Automation credential example	Control Room username	AWS Prefix	AWS Secret Body	Secret in AWS
accounting_pdf System credential in locker mapped to AWS Secret Name prefix <code>accounting</code>	None - system credential	accounting	pdf	accounting_pdf (system)
accounting_pdf_ABCD--user123 User-defined credential in locker mapped to AWS Secret Name prefix <code>accounting</code>	ABCD \user123	accounting	pdf	accounting_pdf_ABCD--user123

Azure Key Vault automation example

The following table shows Azure Key Vault external key vault examples using naming conventions for automation.

Note: The Azure Prefix maps to the locker for the Control Room, and the Azure Secret Body maps to the credential for the Control Room.

Automation credential example	Control Room username	Azure Prefix	Azure Secret Body	Secret in Azure
accounting_cv1 System credential in locker mapped to Azure Secret name prefix <code>accounting</code>	None - system credential	accounting	cv1	pdf-5f-cv1 (system)

Automation credential example	Control Room username	Azure Prefix	Azure Secret Body	Secret in Azure
accounting_cv1_ABCD\user123 User-defined credential in locker mapped to Azure prefix	ABCDEF\user123	accounting	cv1	pdf-5f-cv1-5f-ABCD--user123

When deploying Azure credentials, the Azure Key Vault character underscore (_) is a reserved character and cannot be used in credential names. You must substitute any underscore (_) usage with the ASCII code value 5f bracketed by dashes:

This character	Changes to this ASCII code character substitution
\ (slash)	--
- (dash)	-2d-
_ (underscore)	-5f-
@ (ampersand)	-40-
. (period)	-2e-

HashiCorp Vault automation example

The following table shows HashiCorp Vault automation examples using external key vault naming conventions.

Note: The HashiCorp prefix maps to the Control Room locker and the HashiCorp secret name maps to the Control Room credential.

Automation credential example	Control Room username	Locker prefix	Credential secret name	Secret name in HashiCorp
accounting_cred01 System credential in locker mapped to HashiCorp secret name prefix accounting	None - system credential	accounting	cred01	accounting-5f-cred01(system)

Automation credential example	Control Room username	Locker prefix	Credential secret name	Secret name in HashiCorp
accounting_cred01-ABCD\user123 User-defined credential in locker mapped to HashiCorp prefix	ABCD\user123	accounting	cred01	accounting-5f-cred01-5f-ABCD--user123
accounting_cred01_john User-defined credential in locker mapped to HashiCorp prefix	john	accounting	cred01	accounting_cred01_john
<hr/> <p>Note: This example shows values without encoding.</p> <hr/>				

CyberArk Password Vault integration

You can integrate Automation 360 to retrieve credentials from the CyberArk Password Vault. The credentials become resident within the CyberArk Password Vault where they are managed, rotated, and synchronized.

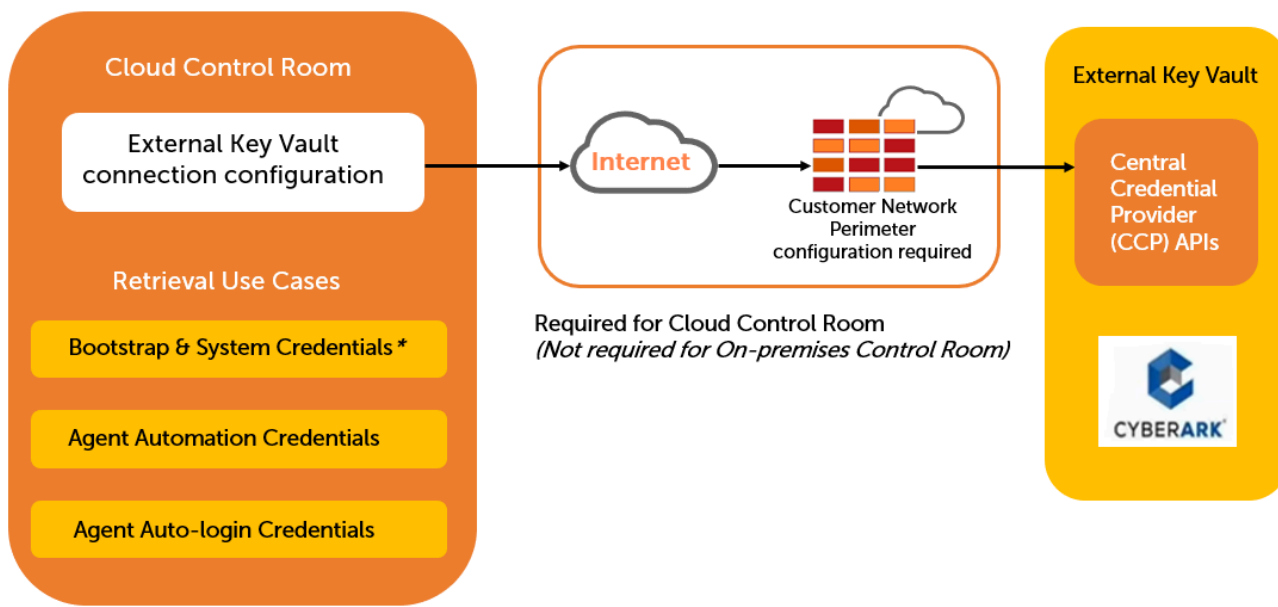

You integrate the Automation 360 Control Room by connecting it to the CyberArk Password Vault through the CyberArk Central Credential Provider (CCP) APIs. No additional licensing is required to integrate with the CyberArk Password Vault or use the CCP APIs.

Note: We recommend that you control access to the CyberArk Password Vault through an IP address.

You can integrate Automation 360 with the CyberArk Password Vault using either of these deployments:

- Cloud
- On-Premises

The following diagram shows an Automation 360 Cloud deployment where the Control Room is hosted on AAI Cloud:

**On-premises only*

For On-Premises deployments, you deploy the following:

- Control Room as software within your customer environment.
- Bot Agent within your customer environment where automations run and access customer applications.

Important: You can edit the external key vault connection settings through the user interface in Cloud deployments only. External key vault settings in On-Premises deployments are only configurable during installation or with the key vault utility post-installation.

CyberArk Password Vault integration requirements

- [Install CyberArk Central Credential Provider](#) on page 1861
- [Implement X.509 client certificate authentication method](#) on page 1862
- [CyberArk Central Credential Provider API configuration requirements](#) on page 1863
- [Review CyberArk Credential terminology and identifiers](#) on page 1864
- [Define CyberArk application ID](#) on page 1865
- [Provision accounts in CyberArk Password Vault](#) on page 1866
- [Set up access to the application and password providers](#) on page 1866

Install CyberArk Central Credential Provider

You must install and configure the CyberArk Central Credential Provider on the CyberArk server. See [CyberArk Central Credential Provider installation](#).

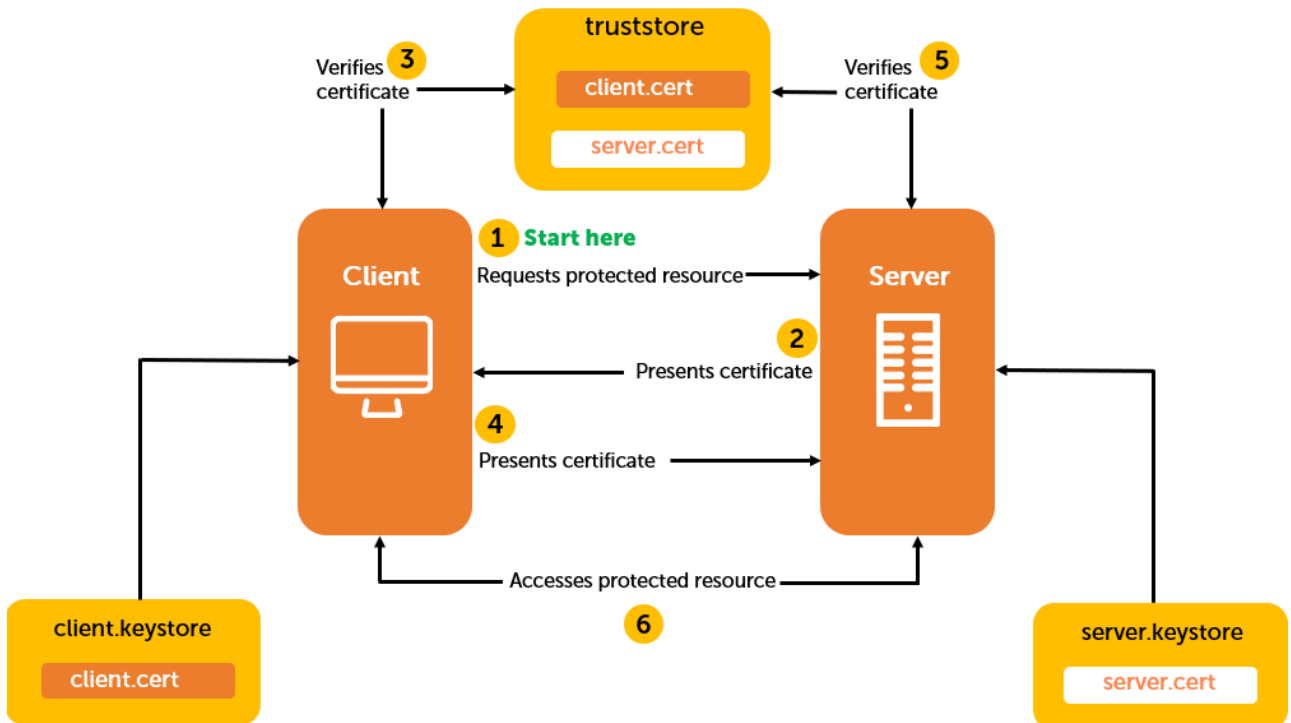

Implement X.509 client certificate authentication method

An X.509 client certificate is a type of digital certificate used by client systems to make authenticated requests to a remote server and uses the widely accepted international X.509 public key infrastructure (PKI) standard to verify that a public key belongs to the user, computer, or service identity contained within the certificate.

The Automation 360 Control Room uses a client certificate as the authentication method when connecting to the CyberArk CCP APIs.

This authentication method is highly secure and leverages the system's truststore to store the client certificate, server certificate, and private key. The truststore is a certificate storage location provided by the operating system's software and it contains the issuing Certificate Authority's (CA) certificate. You can import individual server certificates into the truststore. However it is more efficient to import the issuing Certificate Authority (CA) certificate.

The following image provides an overview of certificate-based authentication:

1. The client (Automation 360 Control Room) sends a request to the CyberArk AIM server (protected resource).
2. The server then responds by sending a certificate back to the client.
3. The Automation 360 Control Room verifies the certificate sent by the CyberArk AIM server by validating it against the trusted server certification information stored in the public part of the Control Room truststore.
4. After validating the information in the truststore, the Automation 360 Control Room resends the certificate back to the CyberArk AIM server.
5. The CyberArk AIM server then validates the certificate sent by Automation 360 Control Room against the trusted client certification information stored in the public part of the AIM server truststore.

Because client certificates (those with their private key) are generally distributed in password protected format, the certificate file (using .p12 format, such as: `c:\PATH\aaeCyberArkCertificate.p12`) requires a passphrase.

6. Both parties (client and server) gain access to the protected resources if the certificates pass validation based on the following:
 - The Control Room certificate must be trusted by the CyberArk AIM server
 - The Control Room must trust the certificate on the CyberArk AIM server
 - The Subject field in the certificate matches the calling system's Fully Qualified Domain Name (DNS Name)
 - The certificate has not expired

Important: As part of the integration planning phase, coordinate certificates and requests for certificates. You will have to request that certificates be issued by the Public Key Infrastructure (PKI) team before you can begin integration configuration. The certificate files are stored in the PKI folder and accessed with the Control Room passphrase when required. The Control Room passphrase is stored encrypted in the `keyvault.properties` file.

CyberArk Central Credential Provider API configuration requirements

You must have network connectivity between the Automation 360 Control Room and the CyberArk AIM server. The Automation 360 Control Room is connected to the CyberArk Password Vault through the CyberArk Central Credential Provider (CCP) APIs for both On-Premises or Cloud deployments.

Note: No additional licensing is required to use the CCP APIs.

To use the CCP API, you must set these required parameters:

- Automation 360 v.20 (supports bootstrap credentials with On-Premises deployment only)
- Automation 360 v.21 or later (supports all bootstrap and system use cases for On-Premises deployments, auto-login, and automation credentials for both On-Premises and Cloud deployments)
- The Control Room Key Vault contains these connection details:
 - CCP API vault connection URL – For example: `https://<host:port>/AIMWebService/api/Accounts?`

- CCP API AppID – You must configure the CyberArk AIM server with an Application ID (AppID). For example: AACompanyControlRoom1.
See [Define CyberArk application ID](#) on page 1865.
- X.509 client certificate with private key issued to the Automation 360 Control Room (The Control Room Fully Qualified Domain Name is in the Subject: field of the certificate) and configured with the CyberArk AIM server for authentication. For example: c:\PATH\aaeCyberArkCertificate.p12

Note: The .p12 format is required.

Review CyberArk Credential terminology and identifiers

CyberArk and Automation Anywhere use different terminology to describe and identify credentials:

Description	CyberArk	Automation Anywhere
Where credentials are stored	object	credentials
Primary partitioning of the key vault	safe (contains objects)	locker (contains credentials)

- Credentials in CyberArk are stored in objects, and each object is contained in a safe. A single CyberArk instance can have multiple safes, where each safe has access controls for users.
- Credentials in Automation Anywhere are stored in lockers, where each locker has access controls for Control Room users.

CyberArk identifies credentials by safe name AND object name. The CCP API uses a CyberArk safe name and CyberArk object name to access credentials within the CyberArk Password Vault (the credential must exist in CyberArk).

The following is a code sample CCP API call and corresponding response:

```
https://<host:port>/AIMWebService/api/Accounts?
AppID=BillingApp&Query=Safe=Billing;Object=MonthlyBilling
```

Response

```
{
  "Content": "",
  "PolicyID": "CyberArk",
  "CreationMethod": "PVWA",
  "Folder": "Root",
  "Address": "address tbd",
  "Name": "Application-CyberArk-address tbd-vb",
  "Safe": "aa_vb_safe",
  "DeviceType": "Application",
  "UserName": "vb",
  "PasswordChangeInProgress": "False"
}
```

The credential value or secret (for example, the password) is stored in the `Content` attribute and the User ID (the Control Room user name, for example `vb`) is stored in the `UserName` attribute.

Define CyberArk application ID

Automation 360 integrates with CyberArk Password Vault through the CyberArk Central Credential Provider (CCP) API. The application ID (AppID) is a required configuration parameter.

As a CyberArk Administrator, use the CyberArk Password Vault Web Access (PVWA) interface to define the application ID by following the specified procedure to prepare the CyberArk AIM server for integration with the Control Room. See [CyberArk Password Vault Web Access](#).

1. You must log in as a user allowed to manage applications on the CyberArk platform (requires Manage Users authorization).
2. From the **Applications** tab, click **Add Application**.
3. From the **Add Application** panel, enter the following information:

Option	Action
Name	Specify the unique name (ID) of the application. We recommend using a name based on the Control Room name or function, for example: <code>AACompanyControlRoom1</code> .
Description	Enter a short application description used to help identify it.
Business owner	Enter contact information about the application's business owner.
Location	Select the application location in the Vault hierarchy. If a location is not selected, the application will be added in the same location as the user who is creating this application.

4. Click **Add** to add the new application and display it on the **Applications Details** page.
5. From the **Applications Details** page, select the **Allow extended authentication restrictions** check box to specify an unlimited number of machines and Windows domain OS users for a single application.
6. From the **Authentication** tab, click **Add** to add details to the new application.

A list of available authentication characteristics are displayed, which the Credential Provider uses to verify before retrieving the application password.

7. Optional: Select **OS user** and enter the name of the user who will run the application, and then click **Add** to add the OS user to the list of users in the **Authentication** tab.

8. Select **Certificate Serial Number** and enter the certificate serial number for the Control Room client certificate, and then click **Add**.
9. (Automation 360 recommended): From the **Allowed Machines** tab, click **Add**, and specify the IP/host name/DNS address where the application is allowed to run and request passwords.
CyberArk AIM uses this address to ensure that only applications which run from specified machines can access their passwords.
10. Click **Add** to add the IP address to the list of allowed machines.

Provision accounts in CyberArk Password Vault

Before an application can function, you must give the application access to existing user accounts or to new user accounts to provision in the CyberArk Password Vault.

Use the Password Safe to provision the privileged user accounts required by the application. You can provision accounts using one of these methods:

- Manually add accounts one at a time, and then specify all the account details.
- Automatically add multiple accounts using the Password Upload feature. To add account automatically, you must have authorization to the **Add accounts** feature in the Password Safe.

For details about adding and managing privileged accounts, see [Privileged Access Manager - Self-Hosted](#).

Set up access to the application and password providers

After the user accounts have been provisioned by CyberArk, you must set up access to both the application and to CyberArk Application Password providers who are serving the application.

From where the Central Credential Provider is installed, add the provider user and application users as members of the Password Safes (where the application passwords are stored). You can add the users using one of these methods:

- Manually from the **Safes** tab
- By specifying the Safe names in the CSV file when adding multiple applications

To add users as safe members, from the **Add Safe Member** dialog box, add the provider as a safe member with these access authorizations selected, and then click **Add**:

- Retrieve accounts (Access)
- List accounts (Access)
- View Safe Members (Monitor)

Add Safe Member

Search: Search In: **Vault**

Selected Search: Vault

Name	Business Email	Full Name
------	----------------	-----------

Access

- Use accounts
- Retrieve accounts
- List accounts

Account Management

Safe Management

Monitor

- View Audit log
- View Safe Members

Note: When installing multiple providers for the CyberArk Password Vault integration, we recommend that you first create a group for them, and then add that group to the safe with the same selected access authorizations.

To add application (AppID) as a safe member, perform these steps:

1. From the **Add Safe Member** dialog box, add the (AppID) as a safe member with Retrieve accounts (Access) selected as the access authorization.
2. Click **Add**.

If the safe is configured for object level access, ensure that both the provider user and the application have access to the passwords to retrieve. For details about adding and managing privileged accounts, see [Privileged Access Manager - Self-Hosted](#).

Cloud integration using CyberArk Password Vault

You connect and integrate the external CyberArk Password Vault to the Automation 360 Control Room.

The following image shows CyberArk Cloud integration with the Control Room:

You must configure the customer network perimeter firewall to allow access to the `CyberArk_CCP_hostname:port` from the Automation 360 Cloud AWS NAT Gateway IP addresses.

The following table provides an example of how to configure the customer perimeter firewall:

From	To	Protocol used
Control Room in Automation 360 Cloud: Three AWS NAT Gateway IP addresses	CyberArk_CCP API_hostname:port For example: cyberarkpww.dev.abcd.com:4043	TLS Encrypted CCP API (TLS mutually authenticated)

For more details, see [Control Room IP addresses for external integrations](#) on page 1767.

For Cloud integrations, you can configure the Control Room and external key vault integration using the Automation 360 Control Room user interface.

The Agent auto-login and Agent automation use cases are only supported on Automation 360 Cloud Control Room instances. Neither of these use cases affect the Control Room boot sequence or Control Room functionality.

Note: Bootstrap and service account credential retrieval use cases are not supported on Cloud Control Room instances because the database and services are managed internally by Automation Anywhere. There is no compliance use case (requirement) for these credentials to be stored in the customer external key vault.

1. Gather the specific CyberArk information required to configure the external key vault connector using the Automation 360 Control Room.

Item	Description
Vault URL	<p>The CyberArk AIM server CCP API URL (for example: <code>https://<hostname>:<port_num>/</code>)</p> <hr/> <p>Note: To access the CCP APIs, the Control Room will automatically append <code>/AIMWebService/api/Accounts?</code> to the vault URL you enter. As a result, you must configure the Web Service on the CyberArk AIM server as <code>AIMWebService</code></p> <hr/>
Application ID	<p>The CCP API AppID (for example: <code>AAEControlRoom</code>).</p> <p>For details, see Define CyberArk application ID on page 1865.</p>
Certificate file	<p>Enter the path to the client certificate issued to the Control Room server.</p> <p>The client certificate file that is issued for the Control Room is a .p12 file that contains the private key. CyberArk admins configure this file on the CyberArk server. After configuring the certificate file, it is used to authenticate every client request that is sent from the Automation 360 Cloud Control Room to the CyberArk server.</p> <p>The certificate will be issued to the Cloud Control Room (Subject: field of the certificate will contain fully qualified domain name (FQDN) of the Control Room) by the customer internal certificate authority.</p>
Certificate file password	<p>A password used to open the certificate file.</p>

Item	Description
Server certificate - PEM format	<p>(Required only for Cloud integration): The server certificate without the private key of the CyberArk AIM server (Subject: field of the certificate will contain the FQDN of the CyberArk AIM server).</p> <p>This server certificate is a public certificate for the URL where CyberArk is hosted. This certificate is in the PEM text format and contains the Subject Alternative Names (SAN) on which the CyberArk is listening to requests. For more information, see CyberArk CACert.</p>

2. Log in to the Automation 360 Control Room as the Administrator.
3. From the Control Room, navigate to **Administration > Settings > External key vault**.
4. Click the **Edit** icon to open the **Configuration settings** pane.
5. Click **CyberArk** and then enter the specific CyberArk information described in the preceding table.
6. Click **Save changes** to connect the external key vault.

On-Premises integration using CyberArk Password Vault

As an Automation 360 administrator, you can configure the CyberArk On-Premises integration using one of these methods: initial installation or post-installation using a command-line interactive key vault utility.

Within the On-Premises installation wizard, bootstrap credential retrieval from external key vault configuration options are only available if you first configure the key vault connection. The configuration options vary based on the external key vault you select.

Note: If you are using CyberArk in an Automation 360 Cloud deployment, then the CyberArk external key vault must be reachable from the Cloud Control Room through the network perimeter firewall rules. For external firewall rules configuration details, see [Control Room IP addresses for external integrations](#) on page 1767.

Choose your integration method:

- [Initial installation](#)
- [Post-installation using key vault utility](#)

On-Premises initial installation using CyberArk Password Vault

Using the initial installation method, you can connect and configure the external key vault connector, service account credential (Active Directory master password), and bootstrap (database) credential identifier.

Note: You must select Microsoft SQL Server Authentication as the database; other database authentication methods are not supported for this use case.

The initial installation supports a password-less installation regarding the Control Room bootstrap credentials. The password-less installation identifies the bootstrap credentials by the Safe name and Object name within CyberArk.

You can configure the SMTP and AD credential identifier to retrieve from the external key vault using the Automation 360 user interface.

1. After you start the Automation 360 installation wizard, select **On-premises** as the **Deployment Option** and click **Next**.
2. Accept the license agreement and click **Next**.
3. Select **Custom** as the **Installation Type Preference** and click **Next**.
4. Accept the default locations for the destination folders and click **Next**.
5. To connect and configure the external key vault integration, select **CyberArk**.
 - a) In the **Vault URL** field, enter the CyberArk AIM server CCP API URL (for example: `https://<hostname>:<port_num>/`).

Note: To access the CCP APIs, the Control Room will automatically append `/ AIMWebService/api/Accounts?` to the vault URL you enter. As a result, you must configure the Web Service on the CyberArk AIM server as `AIMWebService`.

- b) In the **Application ID** field, enter the CCP API AppID (for example: `AAEControlRoom`).
- c) Enter the path to the CyberArk AIM server certificate (in `.pem` format using `.p12`) issued to the Control Room server (The certificate Subject: field contains the Control Room fully qualified domain name (FQDN)).
This certificate must be trusted by and configured within CyberArk.
- d) Click **Upload Certificate** to store on the Automation 360 Control Room server.
- e) Enter the certificate file passphrase used to access the Control Room certificate file.
- f) Optional: If the issuing Certificate Authority (CA) of the CyberArk server certificate is not trusted by the Control Room, then enter an optional server certificate.
This is the server certificate for the CyberArk server without a private key (the certificate Subject: field contains the CyberArk AIM Server FQDN). The installer will add the optional CyberArk Server certificate to the truststore used by the Control Room.
- g) Click **Next**.

6. Accept the default settings from the **TLS Configuration** dialog box and click **Next**.
7. From the **Service Credentials** dialog box, select an option to specify the **Safe name** and **Object name** from CyberArk instead of manually entering the user name and password for the **Service Account** used by the Control Room.

8. Click **Service Account (retrieve credential from external key vault)**, and then enter the **Safe name** and **Object name** values. Optionally, you can enter the property that is set to your CyberArk username. For example, to configure the username in the format `domain\username`, you must enter: `$$domain$$\$$username$$` where the values for domain and username are retrieved from the CyberArk secret response.

The installer will query CyberArk for the credential to validate that the object exists in the specified safe.

Note: If the **Service Account** option to specify **Safe name** and **Object name** is not available, then this indicates that the CyberArk Password Vault was not previously configured and connected properly as the external key vault. Contact your AAI Support team or review.

See also: [Troubleshooting external key vaults](#) on page 1929.

9. Click **Next**.
10. From the **Database Server** dialog box, select your **Database Server** and enter the name of your Control Room database, and then click **Next**.

11. From the **Database Authentication** dialog box, select an option to specify the **Safe name** and **Object name** from CyberArk instead of manually entering the user name and password the Control Room uses to authenticate to the database.

- a) Click **SQL Server authentication (retrieve credential from external key vault)**, and then enter the **Safe name** and **Object name** values.

Note: Enter the same **Safe name** you previously entered for the **Service Account** safe name.

- b) Click **Next** to continue and complete the initial installation.

After you successfully complete the initial installation, the Automation 360 Control Room can access and retrieve credentials within the CyberArk Password Vault.

On-Premises post-installation using CyberArk Password Vault

You use the command-line interactive key vault utility during a scheduled system downtime and you must stop all running Control Room services. You should coordinate any key vault configuration changes that might impact connectivity parameters (such as App ID, vault URL, port numbers, and certificate) during downtimes with the CyberArk administrative team.

Note: If you use the key vault utility to disable CyberArk Password Vault integration, you must first unmap any mapped credentials that are in use.

Using the post-installation method, you can perform these actions:

- Modify or configure the external key vault connection parameters.
- (If not configured during initial installation) Modify or configure the service account credential (Active Directory master password).
- (If not configured during initial installation) Modify or configure the database (bootstrap) credential identifier (retrieved when authenticating the database).

Note: Retrieving bootstrap credentials from an external key vault might cause the Control Room to fail if the external key vault is not accessible during boot-up, or if the external key vault is not accessible when the Control Room refreshes database connections and authenticates users with Active Directory.

- Recover the Control Room for these reasons:
 - By modifying the external key vault connection parameters, the service account, and database credential safe and object identifiers.
 - If CyberArk Password Vault connection parameters changes caused the Control Room to experience connectivity issues.

- When credential identifiers for bootstrap passwords change.
You can address any initial configuration settings that were not set correctly and recover the system.

You can configure and edit SMTP and AD credential identifiers to retrieve information from the external key vault from the Automation 360 Control Room by navigating to **Administration > Settings > Active Directory**.

1. Run the key vault utility for the CyberArk Password Vault

Note: You must import the CyberArk server certificate (the certificate issued to the CyberArk server) to the Java truststore before invoking the dB utility commands. The certificate can be in `.cer` (PEM) format and does not contain a private key.

To run the key vault utility and update key vault connection settings:

- a) As the Control Room administrator, access the Automation Anywhere Control Room installation directory that was created during the initial Automation 360 installation. For example: `C:\Program Files\Automation Anywhere\Enterprise`
- b) Download the latest version of the key vault utility. To download the jar file used to update the directory, open a browser and access the A-People site: [A-People Downloads page \(Login required\)](#).

Note: If DB authentication is configured to use external key vault, the utility returns the following exception: Database currently configured to retrieve credentials from key vault. Update database authentication to WINDOWS/SQL to proceed further and exit.

The utility requests the user to confirm the action: Disable/update of key vault might impact functionalities using key vault (for example, Active Directory configuration, Email Settings configuration). Make sure to update these settings (if any). Are you sure you want to continue?

- c) Enter `Y` to continue.
- d) Enter the following:

```
> jdk11\bin\java -jar certmgr.jar -appDir . -importTrustCert <Full path of the certificate>
```
- e) Add these JVM arguments to the command to run the key vault utility:
 1. `-Djavax.net.ssl.trustStore="C:\Program Files\Automation Anywhere\Enterprise\pki\trust\store.ks"`
 2. `-Djavax.net.ssl.trustStorePassword=changeit --module-path lib -jar crutils.jar -configPath "C:\Program Files\Automation Anywhere\Enterprise\config" -action [UPDATE_KEY_VAULT_CONFIGURATION or UPDATE_DB_AUTHENTICATION_CONFIGURATION]`

You can update either of these configuration actions:

- Enter `UPDATE_KEY_VAULT_CONFIGURATION` to edit the CyberArk key vault configuration.

- Enter `UPDATE_DB_AUTHENTICATION_CONFIGURATION` to change to database authentication using external key vault.
2. Based on which configuration action you used, choose the appropriate action:
- Update key vault configuration for CyberArk: If you entered `UPDATE_KEY_VAULT_CONFIGURATION` as the configuration action:
 - a) After the utility loads the current key vault configuration and properties, and this prompt is displayed: `Enter key vault [AWS/CYBERARK/AZURE/NONE] :`, enter `CYBERARK`
 - b) At the `Please enter Vault URL:` prompt, enter (for example): `https://services.uscentral.skytap.com:19516`
 - c) At the `Please enter Application ID:` prompt, enter (for example): `AAEControlRoom`
 - d) At the `Please enter Certificate path:` prompt, enter (for example): `C:\Users\Admin\Downloads\client_combined_cert_key_Adminat1234.p12`

Note: The client certificate issued to the Control Room for authenticating to CyberArk must be in .p12 (pkcs#12) format with the private key.

 - e) At the `Passphrase will not be displayed on the console Passphrase:` prompt, enter your passphrase.

The key vault utility runs. If the configuration was successful (the utility was able to connect to the external key vault using the configured parameters), these messages are displayed on the console:

```
Connection configurations valid
Key Vault configurations successfully updated
```

- Update database authentication for CyberArk: If you entered `UPDATE_DB_AUTHENTICATION_CONFIGURATION` as the configuration action:
 - a) After the utility loads the current database configuration information, this prompt is displayed:

```
Database authentication configurations loaded
Currently configured database authentication [SQL]

Change database authentication. Available options:
WINDOWS: Connect to database using windows authentication
SQL: Connect to database using SQL server authentication,
manually enter username and password
KEY_VAULT: Connect to database using SQL server
authentication, retrieve username and password from external
key Vault

Enter database authentication [WINDOWS/SQL/KEY_VAULT]:

Enter KEY_VAULT
```
 - b) At the `Please enter Safe name:` prompt, enter (for example): `aa_vb_safe`

- c) At the Please enter Object name: prompt, enter (for example): Database-MSSql-administrator-admin

The key vault utility runs. If the database configuration was successful (the utility was able to connect to CyberArk, retrieve the designated credential and then use the credential to connect to the database), these messages are displayed on the console:

```
Database Credentials are valid
Database authentication configurations successfully updated
```

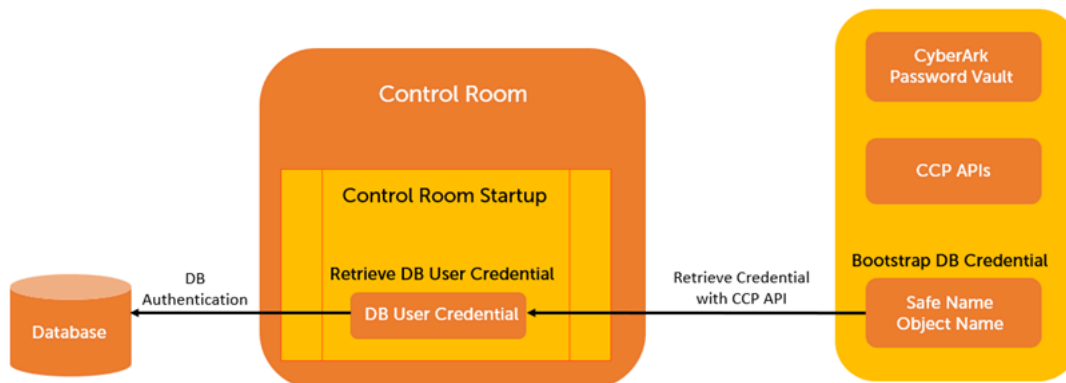

CyberArk credential retrieval use cases

You can retrieve CyberArk credentials for these use cases: bootstrap, system, auto-login, and automations.

Retrieve Control Room bootstrap credentials with CyberArk

The Automation 360 Control Room uses bootstrap credentials to access supporting services such as database, service account, and Active Directory (AD). You configure these credentials during the initial On-Premises installation or post-installation (using the key vault utility) by specifying the safe name and object name.

The following images shows the process of retrieving the Control Room bootstrap credentials with CyberArk:

When required during the bootup sequence or normal operations (such as refreshing a service authentication), the Control Room uses the key vault connection to retrieve the credential and perform the required authentication.

Note: You must select the Microsoft SQL Server Authentication for this use case; other database authentication methods are not supported for bootstrap.

Retrieve Control Room system credentials with CyberArk

Note: You can configure the service account only during the initial installation.

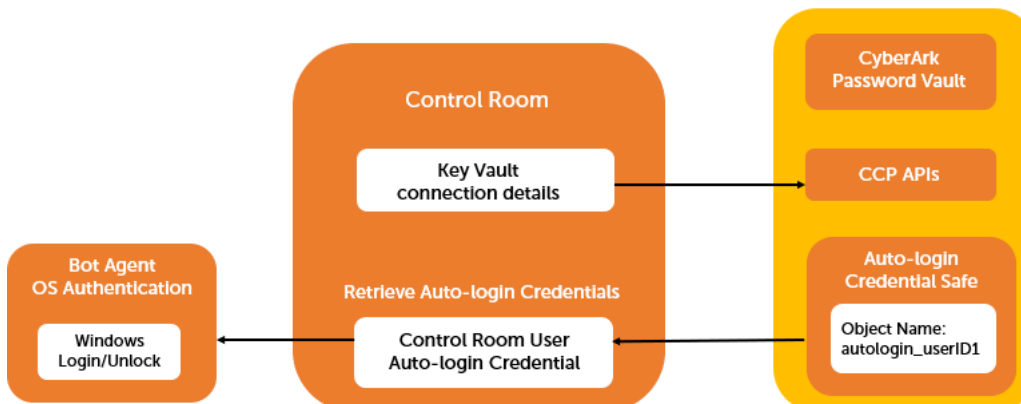

If you configured an external key vault during the initial installation, you can then use the Automation 360 user interface (post-installation) to configure SMTP and Active Directory (AD) credentials.

1. Log in to the Automation 360 Control Room as the Administrator.
2. From the Control Room, navigate to: **Administration > Settings > Email Settings**.
3. You can map the AD Master Account credential from the external key vault, configure external credentials, or set to manual (switch modes of AD Master Account credential retrieval).

Retrieve auto-login credentials with CyberArk

Auto-login credentials are used to authenticate to an Automation 360 Bot Agent device and start an active Windows session. Robotic Process Automation (RPA) requires an active Windows session to function. Auto-login occurs prior to the automation running when automations are launched from a remote Bot Agent device.

The following image shows the process of retrieving the auto-login credentials with CyberArk:

A Control Room administrator can manually launch or schedule a job to launch an automation on a Bot Agent device by specifying these details:

- Automation (bot) name
- Device name
- User context

The system performs auto-login to the specified device with the user name and password associated with the user context, and then runs the automation on the device.

To configure retrieval of auto-login credentials from the external key vault, perform these steps:

1. Log in to the Automation 360 Control Room as the Administrator with the view and manage setting permission set.
2. From the Control Room, navigate to **Administration > Settings > Devices**.
3. Scroll down to the auto-login settings section and click **Edit**.
4. If you previously configured CyberArk as the external key vault connection, click **Enabled** to retrieve the auto-login credentials from that external key vault.

If this option is disabled, then the external key vault connection was not configured.

Note: If you disable auto-login from the external key vault, then credentials are retrieved using the AAI Credential Vault and its stored credentials instead.

5. Enter the **Safe name** (for example: AA_Auto-login_Safe).
The safe name you enter is also known as the Auto-login Credential Safe.
6. Enter the property set to your CyberArk username. For example, to configure the username in the format `domain\username`, you must enter: `$$domain$$\$$username$$` where the values for domain and username are retrieved from the CyberArk secret response.
7. To add an optional safe, click **Add optional safe**, enter the **Safe name**, and then select roles. You can add up to 25 safes.
8. Click **Save changes**.
If successful, then the auto-login settings successfully saved message is displayed.

CyberArk auto-login credential example

For this auto-login credential retrieval example, consider a Control Room user who wants to deploy a bot on a device as a specific user. This example uses the following details:

- Automation (bot) name run on a device = ProcureToPayGeoEast
- Agent device name = WinVDI1138
- Agent user context = roboticworker2112@automation.abcd.com

The following image shows this an example of retrieving auto-login credentials with CyberArk:

Before starting the automation, ensure the following:

1. The Control Room connection details have been successfully configured, and the Control Room uses these connection details to connect to CyberArk and performs authentication.
2. The Control Room queries the Bot Agent device running on device WinVDI1138 to check if there is an active Windows (operating system) session currently on device WinVDI1138, and if that session belongs to Agent user roboticworker2112.

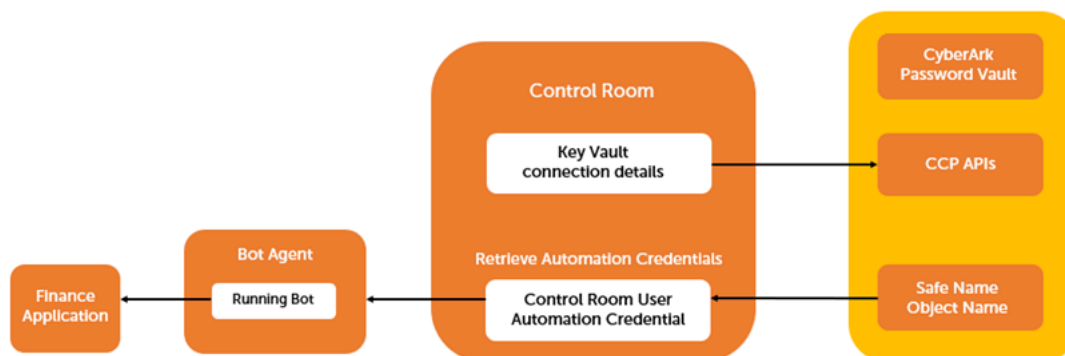

If there is an existing session on the device for user `roboticworker2112`, then there is no need to perform auto-login and the bot continues with the deployment.

3. However, if there is no active session or if there is an active session that does not belong to `roboticworker2112`, then the Control Room retrieves the auto-login credential from the CyberArk Password Vault.
4. The Control Room passes the credential (password) to the Bot Agent. The Bot Agent performs a Windows login on device `winVDI1138` as `roboticworker2112` (first, logging off any other user login session) using the auto-login credential for `roboticworker2112`. The automation (Bot) `ProcureToPayGeoEast` then starts to run on device `winVDI1138` as `roboticworker2112`.

Retrieve automation credentials with CyberArk

Automation credentials are variables used by bot developers within automation (bot) actions that define and retrieve data from encrypted storage. The automation uses the credentials to authenticate to applications (for example: finance application). Automation credentials are retrieved by the Automation 360 Bot Agent during runtime. Within CyberArk, a safe is a locker, and an object is a credential.

The following image shows the process of retrieving automation credentials with CyberArk:

Automation credentials retrieved from the CyberArk Password Vault are mapped in the Automation Anywhere Credential Vault. The Credential Vault supports these two types of automation credentials:

System credentials

Credentials where the value returned by the credential variable is the same for any automation that uses that variable.

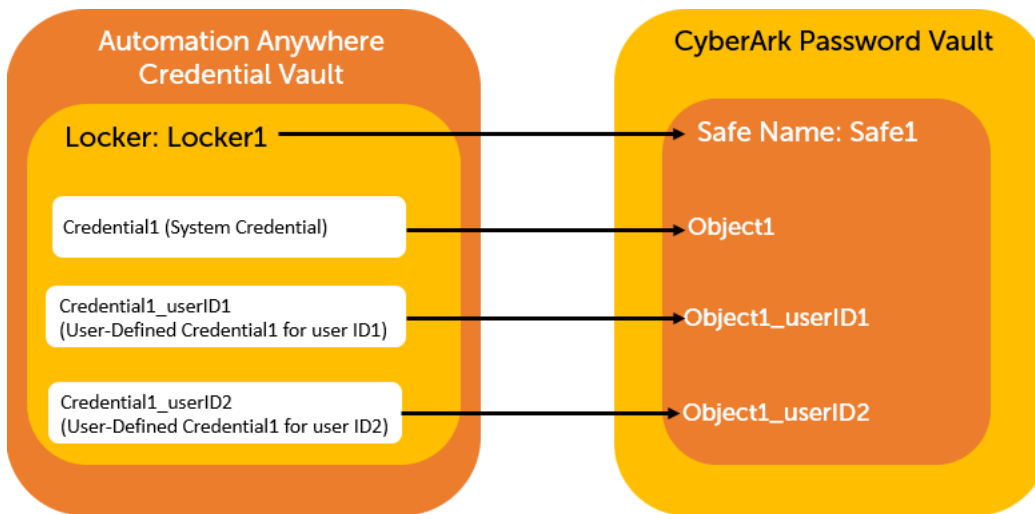

User-defined credentials

Credentials where the value returned by the credential variable is distinct based on the user context in which the automation is running.

For both system credentials and user-defined credentials, the bot developer specifies the same credential variable within the bot code. Then, the system determines which credential to retrieve during bot runtime.

User-defined credentials simplify automation development by enabling bot developers to write code using a single credential variable where the RPA platform substitutes the value returned during runtime with a unique user-specific value. Developers can avoid writing duplicate code with different user-specific credential variables.

The following image shows the relationship between the Automation Anywhere Credential Vault objects and the CyberArk credentials for system and user-defined credentials:

- The Control Room locker (Locker1) is mapped to the CyberArk safe name (Safe1).
- The Control Room system credential (Credential1) is mapped to the CyberArk object (Object1).

As an administrator, you create and configure a locker and credentials using the external key vault feature in the Automation 360 Control Room. Within the Control Room, an administrator maps the Automation Anywhere locker (Locker1) to a safe name (Safe1) and maps the credential (Credential1) to an object name (Object1). The credentials available to Control Room users are determined by what is configured in the external key vault (CyberArk Password Vault).

If you want to use user-defined credentials with the CyberArk integration, then the CyberArk administrator must create objects for each user-defined credential by naming those objects with the `Control Room_username` postfix. During runtime, the RPA platform retrieves the object name that is named with a postfix that matches the user context (user-defined credential) in which the automation is running. If there is no user-defined credential, then the RPA platform retrieves the object name without a username postfix (and uses the system credential).

Note: You can map any Automation Anywhere locker to any CyberArk Safe Name. However, any safe names you use to map automation credentials should be distinct from the safe names you use for auto-login.

As an administrator, you can use the access controls in the Automation 360 Control Room to separate access to credentials by providing users access to a locker. You control access to credentials by assigning different Control Room users to different roles and then associating different lockers with those roles. By mapping different CyberArk safes to different lockers, access to credentials in the CyberArk safes is mapped to and enforced by the access controls in the Control Room.

Note: The same permissions and privileges (assigned through roles) in the Control Room apply to credentials mapped to the external key vault.

CyberArk automations credentials retrieval example

To configure automation credentials retrieval and integrate with the CyberArk Password Vault, you first create a locker and then create credentials.

To create a locker to integrate with the CyberArk Password Vault, perform these steps:

1. From the Automation 360 Control Room, navigate to **Manage > Credential**.
A user with Manage my credentials and lockers permissions is authorized to create credentials.
2. Click the **Lockers** tab.
3. Click **Create locker**.
4. Enter a name for the locker.
This name is local to the Control Room and does not have any dependency on the CyberArk safe name.
5. Click **External Key Vault** and enter the CyberArk safe name in the **Safe name** field (for example: `Finance_Safe`).
6. Click **Next**.
7. Configure Owners, Managers, Participants, and Consumers for the locker.
8. Click **Create locker**.
See [Create locker](#) on page 1801.

The Control Room is now ready to retrieve credentials and enforce access controls on the mapped CyberArk safe. To continue, you now create the credentials.

To create a credential to integrate with the CyberArk Password Vault, perform these steps:

1. From the Automation 360 Control Room, navigate to **Manage > Credentials**.
A user with Manage my credentials and lockers permissions is authorized to create credentials.
2. From the **Credentials** tab, select **Create Credential**.
3. Enter the credential name in the **Credential name** field.
This name is local to the Control Room and does not have any dependency on the CyberArk safe name.
4. Click **External key vault** below the name field.
5. From the list of available lockers, select the appropriate locker that was previously mapped to the safe name for the credential you are now mapping to the object (credential).
6. Enter the CyberArk object name in the **Object name** field.
7. Click **Validate and retrieve attributes**.
The system validates the mapping by attempting to retrieve from the CyberArk Password Vault the combination of safe name (locker) and object name (credential). Within the safe name mapped to the locker, Automation 360 expects objects to use the correct naming conventions. . See [External key vault naming conventions](#) on page 1855.

If validation fails, then no object exists in the CyberArk Password Vault with the name that matches the combination of safe name (locker) and object name (credential).

When the system successfully retrieves the object details, it will display the CyberArk Password Vault object attributes (the fields within the secret).

8. From the list of attributes, select attributes to map to the credential.
9. Click **Create credential**.

If successful, then the credential successfully created message is displayed.

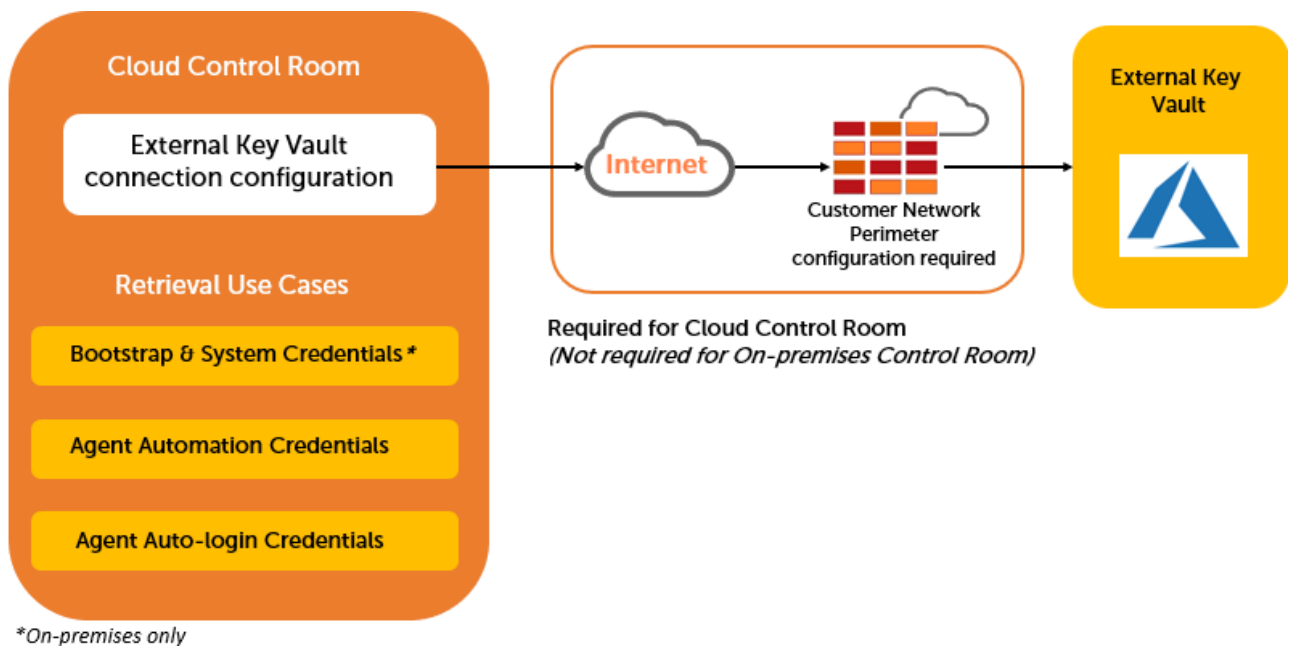

Azure Key Vault integration

You integrate the Automation 360 Control Room to retrieve credentials from the Azure Key Vault. The credentials become resident within the Azure Key Vault where they are managed, rotated, and synchronized.

You can integrate Automation 360 with the Azure Key Vault using either of these deployments:

- Cloud
- On-Premises

The following diagram shows an Automation 360 Cloud deployment where with Azure Key Vault:

For On-Premises deployments, you deploy the following:

- Control Room as software within your customer environment.
- Bot Agent within your customer environment where automations run and access customer applications.

Important: You can edit the external key vault connection settings through the user interface in Cloud deployments only. External key vault settings in On-Premises deployments are only configurable during installation or with the key vault utility post-installation. Customers will need

to ensure connectivity to the external key vaults from their On-Premises deployed Control Room instances.

On-Premises integration using Azure Key Vault

As an Automation 360 administrator, you can configure the Azure On-Premises integration using one of these methods: initial installation or post-installation using a command-line interactive key vault utility.

Within the On-Premises installation wizard, bootstrap credential retrieval from external key vault configuration options are only available if you first configure the key vault connection. The configuration options vary based on the external key vault you select.

Choose your integration method:

- [Initial installation](#)
- [Post-installation using key vault utility](#)

On-Premises post-installation using Azure Key Vault

You use the command-line interactive key vault utility during a scheduled system downtime and you must stop all running Control Room services. You should coordinate any key vault configuration changes that might impact connectivity parameters (such as `AZURE_CLIENT_ID`, `AZURE_CLIENT_SECRET`, and `AZURE_TENANT_ID`) during downtimes with the Azure administrative team.

Note: If you use the key vault utility to disable Azure Key Vault integration, you must first unmap any mapped credentials that are in use.

Using the post-installation method, you can perform these actions:

- Modify or configure the external key vault connection parameters.
- (If not configured during initial installation) Modify or configure the service account credential (Active Directory master password).
- (If not configured during initial installation) Modify or configure the database (bootstrap) credential identifier (retrieved when authenticating the database).

Note: Retrieving bootstrap credentials from an external key vault might cause the Control Room to fail if the external key vault is not accessible during boot-up, or if the external key vault is not accessible when the Control Room refreshes database connections and authenticates users with Active Directory.

- Recover the Control Room for these reasons:
 - By modifying the external key vault connection parameters, the service account, and database credential safe and object identifiers.
 - If Azure Key Vault connection parameters changes caused the Control Room to experience connectivity issues.
 - When credential identifiers for bootstrap passwords change.

You can address any initial configuration settings that were not set correctly and recover the system.

You can configure and edit SMTP and AD credential identifiers to retrieve information from the external key vault from the Automation 360 Control Room by navigating to **Administration > Settings > Active Directory**.

1. Run the key vault utility for the Azure Key Vault: To run the key vault utility and update key vault connection settings:
 - a) As the Control Room administrator, access the Automation Anywhere Control Room installation directory that was created during the initial Automation 360 installation. For example: `C:\Program Files\Automation Anywhere\Enterprise`
 - b) Download the latest version of the key vault utility. To download the jar file used to update the directory, open a browser and access the A-People site: [A-People Downloads page \(Login required\)](#).

Note: If DB authentication is configured to use external key vault, the utility returns the following exception: Database currently configured to retrieve credentials from key vault. Update database authentication to WINDOWS/SQL to proceed further and exit.

The utility requests the user to confirm the action: Disable/update of key vault might impact functionalities using key vault (for example, Active Directory configuration, Email Settings configuration). Make sure to update these settings (if any). Are you sure you want to continue?

- c) Enter `Y` to continue.
- d) Enter the following:

```
> jdk11\bin\java -jar certmgr.jar -appDir . -importTrustCert <Full path of the certificate>
```
- e) Add these `jvm` arguments to the command to run the key vault utility:
 1. `-Djavax.net.ssl.trustStore="C:\Program Files\Automation Anywhere\Enterprise\pki\trust\store.ks"`
 2. `-Djavax.net.ssl.trustStorePassword=changeit --module-path lib -jar crutils.jar -configPath "C:\Program Files\Automation Anywhere\Enterprise\config" -action [UPDATE_KEY_VAULT_CONFIGURATION or UPDATE_DB_AUTHENTICATION_CONFIGURATION]`

You can update either of these configuration actions:

- Enter `UPDATE_KEY_VAULT_CONFIGURATION` to edit the Azure Key Vault configuration.
- Enter `UPDATE_DB_AUTHENTICATION_CONFIGURATION` to change to database authentication using external key vault.

2. Based on which configuration action you used, choose the appropriate action:
 - Update key vault configuration for Azure: If you entered `UPDATE_KEY_VAULT_CONFIGURATION` as the configuration action:
 - a) After the utility loads the current key vault configuration and properties, and this prompt is displayed: `Enter key vault [AWS/CYBERARK/AZURE/NONE] :,` enter `AZURE`

- b)** At the Please enter Vault URL: prompt, enter (for example): `https://user-db-vault.vault.azure.net/`

The key vault utility runs. If the configuration was successful (the utility was able to connect to the external key vault using the configured parameters), these messages are displayed on the console:

```
Connection configurations valid
Key Vault configurations successfully updated
```

- Update database authentication for Azure: If you entered `UPDATE_DB_AUTHENTICATION_CONFIGURATION` as the configuration action:
 - a)** After the utility loads the current database configuration information, this prompt is displayed:

```
Database authentication configurations loaded
Currently configured database authentication [SQL]

Change database authentication. Available options:
WINDOWS: Connect to database using windows authentication
SQL: Connect to database using SQL server authentication,
manually enter username and password
KEY_VAULT: Connect to database using SQL server
authentication, retrieve username and password from external
key Vault

Enter database authentication [WINDOWS/SQL/KEY_VAULT]:
```

Enter `KEY_VAULT`

- b)** At the Please enter Secret name: prompt, enter (for example): `testDB`

The key vault utility runs. If the database configuration was successful (the utility was able to connect to Azure, retrieve the designated credential and then use the credential to connect to the database), these messages are displayed on the console:

```
Database Credentials are valid
Database authentication configurations successfully updated
```

On-Premises initial installation using Azure Key Vault

Using the initial installation method, you can connect and configure the external key vault connector, service account credential (Active Directory master password), and bootstrap (database) credential identifier.

Note: You must select Microsoft SQL Server Authentication as the database; other database authentication methods are not supported for this use case.

You can configure the SMTP and AD credential identifier to retrieve from the external key vault using the Automation 360 user interface.

- 1.** [Configure the Azure Key Vault requirements from the Microsoft Azure portal.](#)

2. [Integrate the Azure Key Vault and Automation 360 Control Room.](#)
3. [Set up the authentication type for Automation 360 Control Room users and Azure Key Vault.](#)

After you successfully complete the initial installation, the Automation 360 Control Room can access and retrieve credentials within the Azure Key Vault.

Configure Azure Key Vault requirements for initial installation

Before you can integrate the Automation 360 Control Room with the Azure Key Vault, you must configure Azure Key Vault requirements using the Microsoft Azure portal.

1. Sign in to the Microsoft Azure portal: [Azure portal](#)
2. Create a key vault in Azure.
See [Quickstart: Create a key vault using the Azure portal.](#)
3. From the Azure Home page, navigate to **Home > selected key vault**. Generate or import secrets for the use cases you will be using with the Azure Key Vault.
For example, if you will be using the bootstrap use case, you should generate a secret that contains the correct database credential that the Control Room will use to authenticate to the database.
4. Collect the following required Azure environment variables that must be set in the environment of the Control Room Server Microsoft operating system:
 - AZURE_CLIENT_ID: The client (application) ID of an App Registration in the tenant.
 - AZURE_CLIENT_SECRET: A client secret that was generated for the App Registration.
 - AZURE_TENANT_ID: The Azure Active Directory tenant (directory) ID.
5. After you set the environment variables in Azure, you must then add them to the Server Environment on the Automation 360 Control Room:

The Azure Key Vault has a flat name space with no organizational containers. There is no safe or locker within the Azure Key Vault and all credentials are stored together in the same container. Credentials are stored in objects which only have a secret name.

For RBAC policies and best practices, see [What is Azure RBAC?](#)

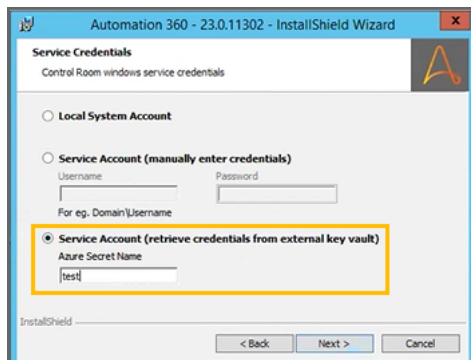

Integrate Azure Key Vault and Control Room

After you configured the Azure Key Vault requirements using the Microsoft Azure portal, you can integrate the Azure Key Vault and the Automation 360 Control Room.

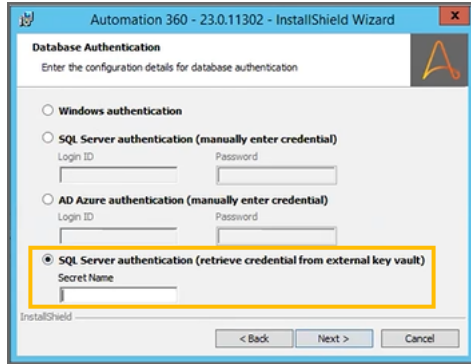

1. After you start the Automation 360 installation wizard, select **On-premises** as the **Deployment Option** and click **Next**.
2. Accept the license agreement and click **Next**.
3. Select **Custom** as the **Installation Type Preference** and click **Next**.
4. Click **Change...** to change the destination folder of where to install Automation 360. Browse to select the folder destination you want and click **Next**.
5. To connect and configure the external key vault integration, select **Azure**.

6. In the **Vault URL** field, enter the Azure Key Vault URL (for example: `https://user-db-vault.vault.azure.net/`).
7. Accept the default settings from the **TLS Configuration** dialog box and click **Next**.
8. From the **Service Credentials** dialog box, select an option to specify the **Azure Secret name** used by the Control Room and click **Next**.

9. From the **Database Authentication** dialog box, select an option to specify the **Secret name** from Azure instead of manually entering the secret name the Control Room uses to authenticate to the database.

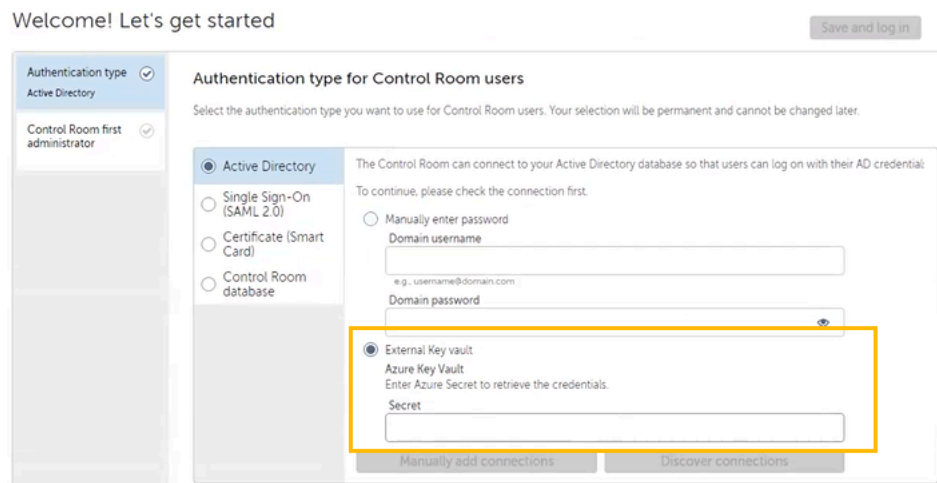

- a) Click **SQL Server authentication (retrieve credential from external key vault)**, and then enter the Azure **Secret Name** value.
- b) Click **Next** to continue and complete the initial installation.

After you successfully complete the initial installation, the Automation 360 Control Room can access and retrieve credentials within the Azure Key Vault.

Set up authentication type for Azure Key Vault

After you complete the initial installation and configure Azure Key Vault as the external key vault, you can set up the authentication type for Automation 360 Control Room users in the Initial Setup (this occurs directly after the initial installation completes).

1. From the **Authentication type for Control Room users** dialog box, click **Active Directory**.

2. Optional: Configure the Active Directory integration credential (this is the credential that the Control Room uses to authenticate users with Active Directory) to be retrieved from Azure Key Vault. Click **External Key vault** and enter the Azure secret to retrieve credentials in the field (for example: `userAD`).
3. Click **Discover connections**. The available domains and sites display.
4. Click **Next** and continue to create the Control Room first admin. Save the Admin user information.

The Control Room will attempt to retrieve the credential from the Azure Key Vault and then authenticate to the Domain Controller. If this fails, cause might be one of the following:

- There is no secret with that name in the Azure Key Vault

- There is a secret with that name, but it does not contain a username and password that is authorized for authentication with Active Directory

You can now log in to the Control Room as admin and add users and roles.

Note: The passwords within the Azure Key Vault are masked so ensure that you copy and save them after you create them.

Cloud integration using Azure Key Vault

For Cloud integrations, you can configure the Control Room and external key vault integration using the Automation 360 Control Room user interface.

The Agent auto-login and Agent automation use cases are only supported on Automation 360 Cloud Control Room instances. Neither of these use cases affect the Control Room boot sequence or Control Room functionality.

Note: Bootstrap and service account credential retrieval use cases are not supported on Cloud Control Room instances because the database and services are managed internally by Automation Anywhere. There is no compliance use case (requirement) for these credentials to be stored in the customer external key vault.

1. Gather the specific Azure information required to configure the external key vault connector using the Automation 360 Control Room.

Item	Description
Vault URL	The Azure Key Vault URL of the resource group (for example: https://user-db-vault.vault.azure.net/).
Client ID	The client (application) ID of an App Registration in the tenant.
Client Secret	A client secret that was generated for the App Registration.
Tenant ID	The Azure Active Directory tenant (directory) ID.

2. Log in to the Automation 360 Control Room as the Administrator.
3. From the Control Room, navigate to **Administration > Settings > External key vault** .
4. Click the **Edit** icon to open the **Configuration settings** pane.
5. Click **Azure** and then enter the specific Azure information described in the preceding table.
6. Click **Save changes** to connect the external key vault.

Azure credential retrieval use cases

You can retrieve Azure credentials for these use cases: bootstrap, system, auto-login, and automations.

Retrieve Control Room bootstrap credentials

Note: This use case applies to On-Premises deployments only.

The Automation 360 Control Room uses bootstrap credentials to access supporting services such as database, service account, and Active Directory (AD). You configure these credentials during the initial On-Premises installation or post-installation (using the key vault utility) by specifying the object name.

The following image shows the process of retrieving the Control Room bootstrap credentials with Azure:

When required during the bootup sequence or normal operations (such as refreshing a service authentication), the Control Room uses the key vault connection to retrieve the credential and perform the required authentication.

Note: You must select the Microsoft SQL Server Authentication for this use case; other database authentication methods are not supported for bootstrap.

Retrieve Control Room system credentials

Note: This use case applies to On-Premises deployments only, and you can configure the service account only during the initial installation.

If you configured an external key vault during the initial installation, you can then use the Automation 360 user interface (post-installation) to configure SMTP and Active Directory (AD) credentials.

1. Log in to the Automation 360 Control Room as the Administrator.
2. From the Control Room, navigate to: **Administration > Settings > Email Settings**.
3. You can map the AD Master Account credential from the external key vault, configure external credentials, or set to manual (switch modes of AD Master Account credential retrieval).

Retrieve auto-login credentials

Note: This use case applies to both On-Premises and Cloud deployments.

Auto-login credentials are used to authenticate to an Automation 360 Bot Agent device and start an active Windows session. Robotic Process Automation (RPA) requires an active Windows session to function. Auto-login occurs prior to the automation running when automations are launched from a remote Bot Agent device.

The following image shows the process of retrieving the auto-login credentials with Azure:

A Control Room administrator can manually launch or schedule a job to launch an automation on a Bot Agent device by specifying these details:

- Automation (bot) name
- Device name
- User context

The system performs auto-login to the specified device with the user name and password associated with the user context, and then runs the automation on the device.

You must have a secret for each Control Room user for whom the auto-login credentials will be retrieved from the external key vault, and the secret name in the Azure Key Vault must match the Control Room username.

To configure retrieval of auto-login credentials from the external key vault, perform these steps:

1. Log in to the Automation 360 Control Room as the Administrator.
2. From the Control Room, navigate to **Administration > Settings > Devices**.
3. Scroll down to the auto-login settings section and click **Edit**.
4. If you previously configured Azure Key Vault as the external key vault connection, click **Enabled** to retrieve the auto-login credentials from that external key vault.

If this option is disabled, then the external key vault connection was not configured.

Note: If you disable auto-login from the external key vault, then credentials are retrieved using the AAI Credential Vault and its stored credentials instead.

5. The Azure Key Vault has a flat name space without any organizational containers, so you do not need to enter a Safe name. Click **Save changes**.

If successful, then the auto-login settings successfully saved message displays.

Auto-login naming conventions

The Control Room retrieves auto-login credentials based on the object naming convention within the external key vault. The Control Room searches for an object where the object name (the credential name in the external key vault) matches the Control Room username for which it is performing auto-login.

The prefix `autologin_` is required as part of the naming convention for auto-login credentials for all external key vaults: CyberArk, AWS, and Azure. The name of the auto-login credential in the external key vault must contain `autologin_` followed by the Control Room username. In some cases, certain key vaults have restrictions on the characters that can be used in credential object names. Additionally, to support how different use cases encode credentials, Automation 360 requires that certain characters be reserved or encoded.

The following table lists examples of the object naming conventions expected in the Control Room:

Control Room username	Expected object name format
ABCD\user123	autologin_ABCD--user123
user123@rpa.abcd.com	autologin_user123-40-rpa-2e-abcd-2e-com

Note: For On-Premises customers using AD authentication, you must format auto-login usernames using the UPN format or `domain\username` postfix.

For auto-login credentials, keep these in mind:

- The object name in the external key vault must contain `autologin_` as a prefix.
- The auto-login credential names must map to the Control Room username (login ID) for the credential being retrieved.

Some external key vaults have usage restrictions of certain characters, such as backslash (\) and ampersand (@) in the secret name (object name), and restrictions on how special characters are interpreted within API calls. If the user ID contains special characters, then you must encode the secret name (object name) in the external key vault using ASCII code character substitutions, as listed in the following table.

This character	Changes to this ASCII code character substitution
\ (backslash)	--
- (dash)	-2d-
_ (underscore)	-5f-
@ (ampersand)	-40-
. (period)	-2e-

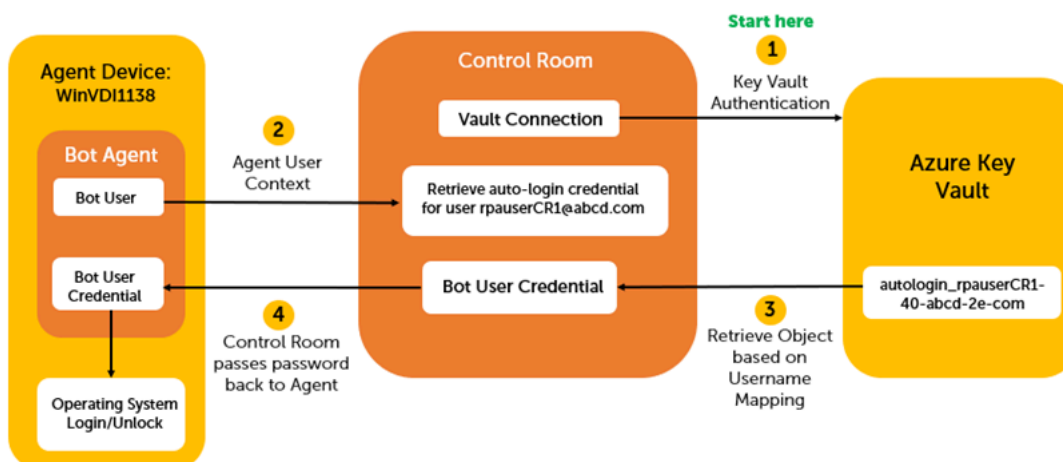

Note: Except for the backslash being mapped to double dashes, the dash, period, underscore, and ampersand are mapped using their ASCII code bracketed in dashes.

Azure auto-login credential example

For this auto-login credential retrieval example, consider a Control Room user who wants to deploy a bot on a device as a specific user. This example uses the following details:

- Automation (bot) name run on a device = ProcureToPayGeoEast
- Agent device name = WinVDI1138
- Agent user context = rpauserCR1@abcd.com

The following image shows this an example of retrieving auto-login credentials with Azure:

Before starting the automation, ensure the following:

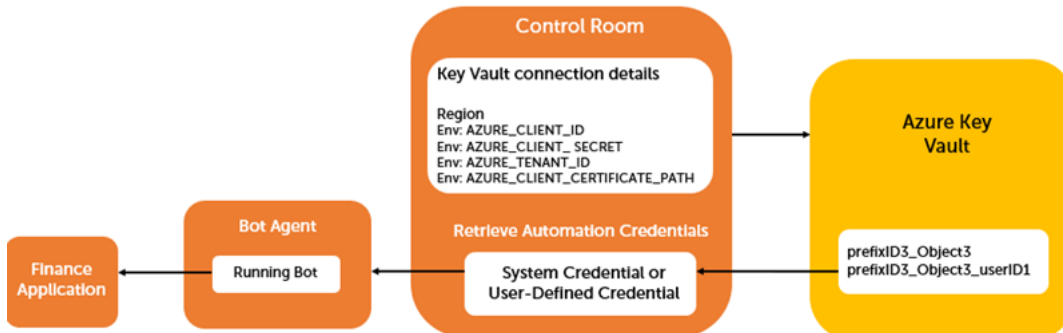

1. The Control Room connection details have been successfully configured, and the Control Room uses these connection details to connect to Azure and performs authentication.
2. The Control Room queries the Bot Agent device running on device WinVDI1138 to check if there is an active Windows (operating system) session currently on device WinVDI1138, and if that session belongs to Agent user rpauserCR1.
If there is an existing session on the device for user rpauserCR1, then there is no need to perform auto-login and the bot continues with the deployment.
3. However, if there is an no active session or if there is an active session that does not belong to rpauserCR1, then the Control Room retrieves the auto-login credential from the Azure Key Vault.
4. The Control Room passes the credential (password) to the Bot Agent. The Bot Agent performs a Windows login on device WinVDI1138 as rpauserCR1 (first, logging off any other user login session) using the auto-login credential for rpauserCR1. The automation (Bot) ProcureToPayGeoEast then starts to run on device WinVDI1138 as rpauserCR1.

Retrieve automation credentials

Note: This use case applies to both On-Premises and Cloud deployments.

Automation credentials are variables used by bot developers within automation (bot) actions that define and retrieve data from encrypted storage. The automation uses the credentials to authenticate to applications (for example: finance application). Automation credentials are retrieved by the Automation 360 Bot Agent during runtime.

The following image shows the process of retrieving automation credentials with Azure:

Automation credentials retrieved from the Azure Key Vault are mapped in the Automation Anywhere Credential Vault. The Credential Vault supports these two types of automation credentials:

System credentials

Credentials where the value returned by the credential variable is the same for any automation that uses that variable.

User-defined credentials

Credentials where the value returned by the credential variable is distinct based on the user context in which the automation is running.

For both system credentials and user-defined credentials, the bot developer specifies the same credential variable within the bot code. Then, the system determines which credential to retrieve during bot runtime.

User-defined credentials simplify automation development by enabling bot developers to write code using a single credential variable where the RPA platform substitutes the value returned during runtime with a unique user-specific value. Developers can avoid writing duplicate code with different user-specific credential variables.

The following image shows the expected naming convention for Azure credentials:

The diagram shows six secrets in the Azure Key Vault which can be mapped to two credentials within the Control Room Credential Vault

- Object3
- Object4

For example, you can map a locker in the Control Room to either `prefixID3` or `prefixID4`. Then, you map the secret to a credential. For each credential, the secrets will be consumed (retrieved by the Control Room) as a system-defined credential (without username postfix) and two user-defined credentials (one each for the Control Room users whose usernames are `User1ID1` and `User1ID2`).

Note: Within the Control Room Credential Vault, the name of the locker and the name of the credential are arbitrary and local to the Control Room. You map these names to specific secrets in the external key vault.

Within Azure Key Vault, each automation credential is stored with a name that contains specific identifiers including: a prefix, object identifier, and an optional postfix which identifies a username. This is a required naming convention that assures retrieval of the correct credential. The name of the secret (the credential) in Azure Key Vault encodes information about the mapping within the Automation Anywhere Credential Vault.

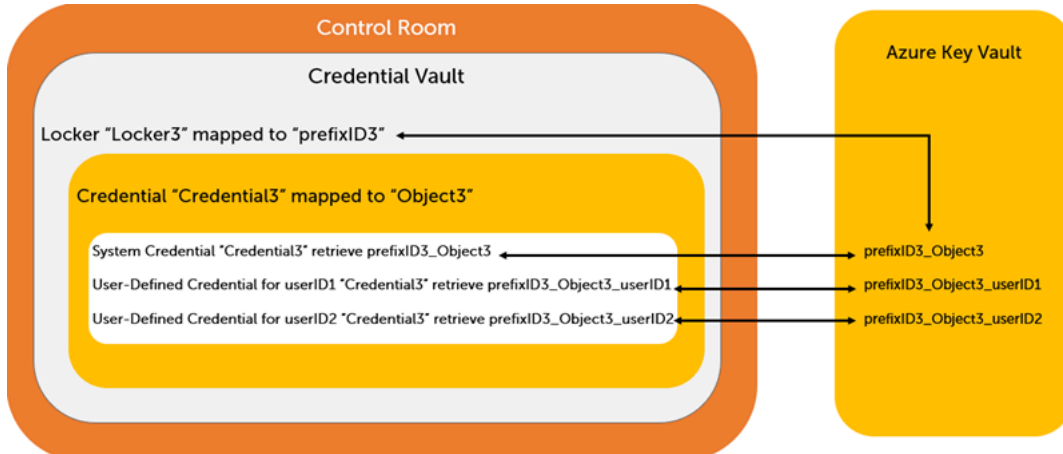

As an administrator, to map a Control Room to Azure Key Vault, you create and configure a locker and a credential using the external key vault option within the **Create Locker** and **Create Credential** features in the Automation 360 Control Room:

- You configure a locker in the Credential Vault to map to an Azure secret name prefix.
- You configure credentials in the Credential Vault that map to an Azure secret object identifier (optional postfix for user-defined credential).

During runtime, the RPA platform retrieves the secret that is named with a postfix that matches the user context (user-defined credential) in which the automation is running. If there is no user-defined credential, then the RPA platform retrieves the secret without a username postfix (system credential).

The Control Room implements access controls to the external credentials through permissions within roles. You control access to credentials by assigning different Control Room users to different roles and then associating different lockers with those roles.

The following image shows the Control Room Credential Vault locker and credential mapped to an Azure secret:

Important: When creating an externally mapped credential, you must place the credential in the appropriate externally mapped locker (the locker is mapped to the prefix in the secret name). The Azure secret name will have a naming convention: `Prefix + Secret_Name_Body + Postfix` (optional for user-defined credentials).

Note: The same permissions and privileges (assigned through roles) in the Control Room apply to credentials mapped to the external key vault.

Automation naming conventions

The following table shows Azure Key Vault external key vault examples using naming conventions for automation.

Note: The Azure Prefix maps to the locker for the Control Room, and the Azure Secret Body maps to the credential for the Control Room.

Automation credential example	Azure Prefix	Azure Secret Body	Secret in Azure	Control Room username
accounting_cv1 System credential in locker mapped to Azure Secret name prefix accounting	accounting	cv1	pdf-5f-cv1 (system)	None - system credential
accounting_cv1_ABCD\user123 User-defined credential in locker mapped to Azure prefix	accounting	cv1	pdf-5f-cv1-5f-ABCD--user123	ABCD\user123

When deploying Azure credentials, the Azure Key Vault character underscore (_) is a reserved character and cannot be used in credential names. You must substitute any underscore (_) usage with the ASCII code value 5f bracketed by dashes:

This character	Changes to this ASCII code character substitution
\ (slash)	--
- (dash)	-2d-
_ (underscore)	-5f-
@ (ampersand)	-40-
. (period)	-2e-

Azure automations credentials retrieval example

To configure automation credentials retrieval and integrate with the Azure Key Vault, you first create a locker and then create credentials.

To create a locker to integrate with the Azure Key Vault, perform these steps:

1. From the Automation 360 Control Room, navigate to **Manage > Credential**.
A user with Manage my credentials and lockers permissions is authorized to create credentials.
2. From the **Credentials** tab, select **Create Locker**.
3. Enter a name for the locker (for example, `Locker3`).
This name is local to the Control Room and does not have any dependency on the Azure secret name.
4. Click **External Key Vault** and enter the Azure secret name prefix (for example: `prefixID3`). You must name secrets within the Azure Key Vault using the name prefix for the configuration of the mapping to complete successfully.
5. Click **Next**.
6. Configure Owners, Managers, Participants, and Consumers for the locker.
7. Click **Create locker**.
See [Create locker](#) on page 1801.

The Control Room is now ready to retrieve credentials and enforce access controls on all Azure secrets with the prefix `prefixID3`. To continue, you now create the credentials.

To create a credential to integrate with the Azure Key Vault, perform these steps:

1. From the Automation 360 Control Room, navigate to **Manage > Credentials**.
A user with Manage my credentials and lockers permissions is authorized to create credentials.
2. From the **Credentials** tab, select **Create Credential**.
3. Enter the credential name in the **Credential name** field.

This name is local to the Control Room and does not have any dependency on the Azure secret name.

4. Click **External key vault** below the name field.
5. From the list of available lockers, select the appropriate locker that was previously mapped to the secret name prefix for the secrets you are now mapping to the credential.
6. Enter the Azure `Secret_Name_Body` in the **Secret name** field (for example: `Object3`).
7. Click **Validate and retrieve attributes**.

The system validates the mapping by attempting to retrieve from the Azure Key Vault a secret with the name `Prefix_Secret_Name_Body_LoggedInUser` (for example: `prefixID3_Object3_testuser1`).

If validation fails, check for the following parameters:

- Verify that no secret exists in the Azure Key Vault with the name that matches the combination of locker (prefix) and credential (`Secret_Name_Body`). In this example, there is no secret in the Azure Key Vault named `prefixID3_Object3`.
- Verify that there are no special characters or encoding in the username or secret name.

See: [External key vault naming conventions](#) on page 1855.

When the system successfully retrieves the secret, it will display the Azure Key Vault secret attributes (the fields within the secret).

Note: The secret value must be in the following JSON format:

```
{
  "username": "dummyUserName",
  "password": "dummyPassword"
}
```

-
8. From the list of attributes, select attributes to map to the credential.
 9. Click **Create credential**.

If successful, then the credential successfully created message displays.

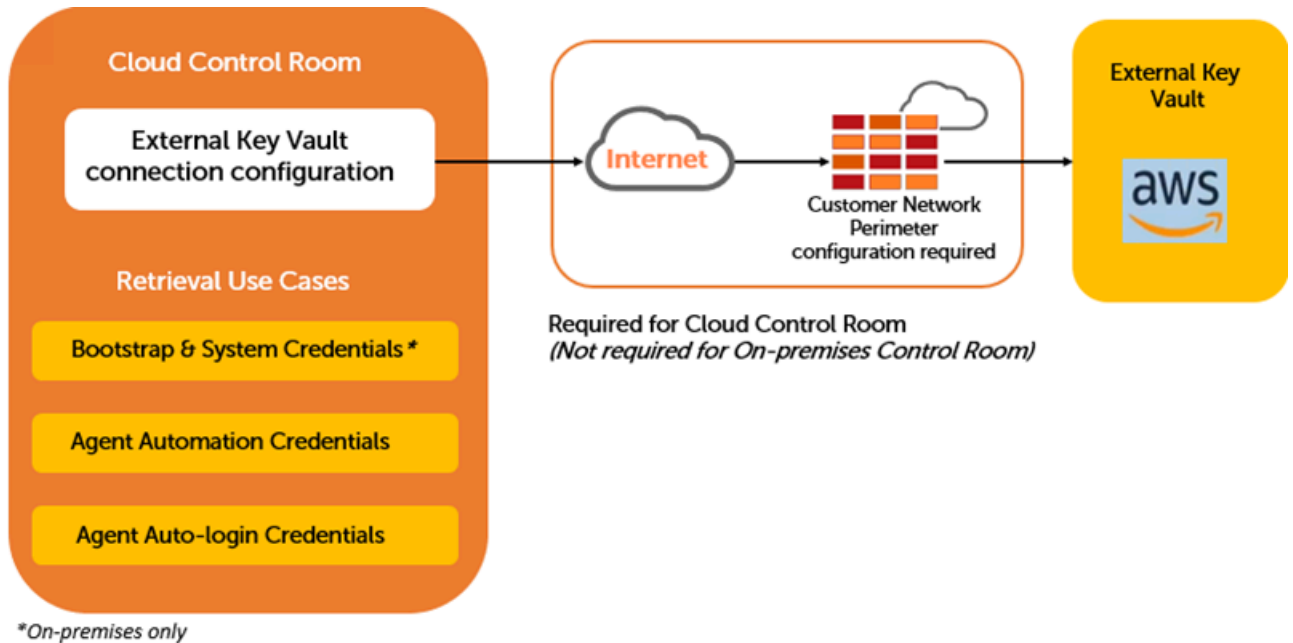

AWS Secrets Manager integration

You integrate the Automation 360 Control Room to retrieve credentials from the AWS Secrets Manager. The credentials become resident within the AWS Secrets Manager where they are managed, rotated, and synchronized.

You can integrate Automation 360 with the [AWS Secrets Manager](#) using either of these deployments:

- Cloud
- On-Premises

The following diagram shows an Automation 360 Cloud deployment where with AWS Secrets Manager:

For On-Premises deployments, you deploy the following:

- Control Room as software within your customer environment.
- Bot Agent within your customer environment where automations run and access customer applications.

Important: You can edit the external key vault connection settings through the user interface in Cloud deployments only. External key vault settings in On-Premises deployments are only configurable during installation or with the key vault utility post-installation. Customers will need to ensure connectivity to the external key vaults from their On-Premises deployed Control Room instances.

Cloud integration using AWS Secrets Manager

For Cloud integrations, you can configure the Control Room and external key vault integration using the Automation 360 Control Room user interface.

The Agent auto-login and Agent automation use cases are only supported on Automation 360 Cloud Control Room instances. Neither of these use cases affect the Control Room boot sequence or Control Room functionality.

Note: Bootstrap and service account credential retrieval use cases are not supported on Cloud Control Room instances because the database and services are managed internally by Automation Anywhere. There is no compliance use case (requirement) for these credentials to be stored in the customer external key vault.

1. Gather the specific AWS information required to configure the external key vault connector using the Automation 360 Control Room.

Item	Description
AWS_ACCESS_KEY_ID	The AWS environment variable that specifies an AWS access key associated with an IAM user or role.
AWS_SECRET_ACCESS_KEY	The AWS environment variable that specifies the secret key associated with the access key.
Region	A separate geographic area that AWS uses to house its infrastructure.

2. Log in to the Automation 360 Control Room as the Administrator.
3. From the Control Room, navigate to **Administration > Settings > External key vault**.
4. Click the **Edit** icon to open the **Configuration settings** pane.
5. Click **AWS** and then enter the specific AWS information described in the preceding table.
6. Click **Save changes** to connect the external key vault.

On-Premises integration using AWS Secrets Manager

As an Automation 360 administrator, you can configure the AWS On-Premises integration using one of these methods: initial installation or post-installation using a command-line interactive key vault utility.

Within the On-Premises installation wizard, bootstrap credential retrieval from external key vault configuration options are only available if you first configure the key vault connection. The configuration options vary based on the external key vault you select.

Choose your integration method:

- [Initial installation](#)
- [Post-installation using key vault utility](#)

On-Premises initial installation using AWS Secrets Manager

Using the initial installation method, you can connect and configure the external key vault connector, service account credential (Active Directory master password), and bootstrap (database) credential identifier.

Note: You must select Microsoft SQL Server Authentication as the database; other database authentication methods are not supported for this use case.

You can configure the SMTP and AD credential identifier to retrieve from the external key vault using the Automation 360 user interface.

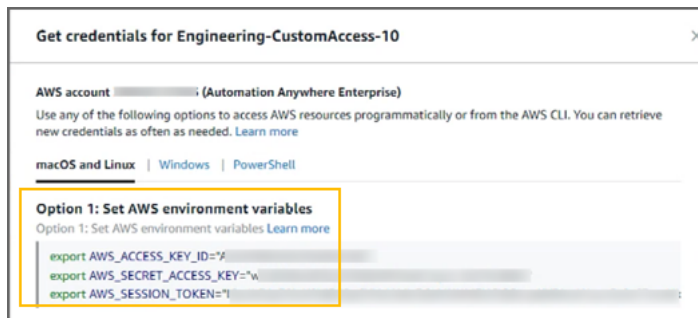

1. [Configure the AWS Secrets Manager requirements](#) from the AWS Administrative Console.
2. [Integrate the AWS Secrets Manager and Automation 360 Control Room](#).
3. [Set up the authentication type for Automation 360 Control Room](#) users and the AWS Secrets Manager.

After you successfully complete the initial installation, the Automation 360 Control Room can access and retrieve credentials within the AWS Secrets Manager.

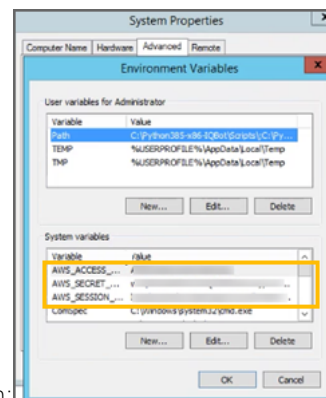

Configure AWS Secrets Manager requirements for initial installation

Before you can integrate the Automation 360 Control Room with the AWS Secrets Manager, you must configure AWS Secrets Manager requirements using the AWS Administrative Console.

1. Use the AWS Administrative Console to collect these AWS environment variables which you must set in the environment of the Control Room Server Microsoft Operating System:
 - AWS_ACCESS_KEY_ID
 - AWS_SECRET_ACCESS_KEY
 - AWS_SESSION_TOKEN

2. After you set the environment variables in AWS, you must then add them to the Server

Environment on the Automation 360 Control Room:

The AWS Secrets Manager has a flat name space with no organizational containers. There is no safe or locker within the AWS Secrets Manager and all credentials are stored together in the same container. Credentials are stored in objects which only have a secret name.

Integrate AWS Secrets Manager and Control Room

After you configured the AWS Secrets Manager requirements using the AWS Administrative Console, you can integrate the AWS Secrets Manager and the Automation 360 Control Room.

1. After you start the Automation 360 installation wizard, select **On-premises** as the **Deployment Option** and click **Next**.
2. Accept the license agreement and click **Next**.
3. Select **Custom** as the **Installation Type Preference** and click **Next**.
4. Accept the default locations for the destination folders and click **Next**.

- To connect and configure the external key vault integration, select **AWS Secret Manager**

Manager.

- In the **Region** field, enter the AWS region code (for example: us-east1 and click **Next**.
- Accept the default settings from the **TLS Configuration** dialog box and click **Next**.
- Accept the default settings from the **Service Credentials** dialog box, and click **Next**.
- From the **Database Authentication** dialog box, select an option to specify the **Secret name** from AWS instead of manually entering the secret name the Control Room uses to

authenticate to the database.

- Click **SQL Server authentication (retrieve credential from external key vault)**, and then enter the **Secret Name** value.
- Click **Next** to continue and complete the initial installation. The installer will query AWS Secrets Manager for the credential to validate that the secret exists.

After you successfully complete the initial installation, the Automation 360 Control Room can access and retrieve credentials within the AWS Secrets Manager.

Set up authentication type for AWS Secrets Manager

After you complete the initial installation and configure AWS Secrets Manager as the external key vault, you can set up the authentication type for Automation 360 Control Room users in the Initial Setup (this occurs directly after the initial installation completes).

1. From the **Authentication type for Control Room users** dialog box, click **Active**

Directory.

2. You can optionally configure the Active Directory integration credential (this is the credential that the Control Room uses to authenticate users with Active Directory) to be retrieved from AWS Secrets Manager. Click **External Key vault** and enter the AWS secret to retrieve credentials in the field (for example: `userAD`). The Control Room will attempt to retrieve the credential from the AWS Secrets Manager and then authenticate to the Domain Controller. If this fails either:
 - There is no secret with that name in AWS Secrets Manager, or
 - There is a secret with that name, but it does not contain a username and password that is authorized for authentication with Active Directory.
3. Click **Discover connections**. The available domains and sites display.
4. Click **Next** and continue to create the Control Room first admin. Save the Admin user information.

You can now log in to the Control Room as admin and add users and roles.

On-Premises post-installation using AWS Secrets Manager

You use the command-line interactive key vault utility during a scheduled system downtime and you must stop all running Control Room services. You should coordinate any key vault configuration changes that might impact connectivity parameters (such as `AWS_ACCESS_KEY_ID`, `AWS_SECRET_ACCESS_KEY`, and `AWS_SESSION_TOKEN`) during downtimes with the AWS administrative team.

Note: If you use the key vault utility to disable AWS Secrets Manager integration, you must first unmap any mapped credentials that are in use.

Using the post-installation method, you can perform these actions:

- Modify or configure the external key vault connection parameters.
- (If not configured during initial installation) Modify or configure the service account credential (Active Directory master password).

- (If not configured during initial installation) Modify or configure the database (bootstrap) credential identifier (retrieved when authenticating the database).

Note: Retrieving bootstrap credentials from an external key vault might cause the Control Room to fail if the external key vault is not accessible during boot-up, or if the external key vault is not accessible when the Control Room refreshes database connections and authenticates users with Active Directory.

- Recover the Control Room for these reasons:
 - By modifying the external key vault connection parameters, the service account, and database credential safe and object identifiers.
 - If AWS Secrets Manager connection parameters changes caused the Control Room to experience connectivity issues.
 - When credential identifiers for bootstrap passwords change.You can address any initial configuration settings that were not set correctly and recover the system.

You can configure and edit SMTP and AD credential identifiers to retrieve information from the external key vault from the Automation 360 Control Room by navigating to **Administration > Settings > Active Directory**.

1. Run the key vault utility for the AWS Secrets Manager: To run the key vault utility and update key vault connection settings:
 - a) As the Control Room administrator, access the Automation Anywhere Control Room installation directory that was created during the initial Automation 360 installation. For example: `C:\Program Files\Automation Anywhere\Enterprise`
 - b) Download the latest version of the key vault utility. To download the jar file used to update the directory, open a browser and access the A-People site: [A-People Downloads page \(Login required\)](#).

Note: If DB authentication is configured to use external key vault, the utility returns the following exception: Database currently configured to retrieve credentials from key vault. Update database authentication to WINDOWS/SQL to proceed further and exit.

The utility requests the user to confirm the action: Disable/update of key vault might impact functionalities using key vault (for example, Active Directory configuration, Email Settings configuration). Make sure to update these settings (if any). Are you sure you want to continue?

- c) Enter Y to continue.
- d) Enter the following:

```
> jdk11\bin\java -jar certmgr.jar -appDir . -importTrustCert <Full path of the certificate>
```
- e) Add these JVM arguments to the command to run the key vault utility:
 1. `-Djavax.net.ssl.trustStore="C:\Program Files\Automation Anywhere\Enterprise\pki\trust\store.ks"`
 2. `-Djavax.net.ssl.trustStorePassword=changeit --module-path lib -jar crutils.jar -configPath "C:`

```
\Program Files\Automation Anywhere\Enterprise
\config" -action [UPDATE_KEY_VAULT_CONFIGURATION or
UPDATE_DB_AUTHENTICATION_CONFIGURATION]
```

You can update either of these configuration actions:

- Enter `UPDATE_KEY_VAULT_CONFIGURATION` to edit the AWS Secrets Manager configuration.
- Enter `UPDATE_DB_AUTHENTICATION_CONFIGURATION` to change to database authentication using external key vault.

2. Based on which configuration action you used, choose the appropriate action:

- Update key vault configuration for AWS: If you entered `UPDATE_KEY_VAULT_CONFIGURATION` as the configuration action:
 - a) After the utility loads the current key vault configuration and properties, and this prompt is displayed: `Enter key vault [AWS/CYBERARK/AZURE/NONE] :`, enter `AWS`
 - b) At the `Please enter Vault URL:` prompt, enter (for example): `https://services.uscentral.skytap.com:19516`

The key vault utility runs. If the configuration was successful (the utility was able to connect to the external key vault using the configured parameters), these messages are displayed on the console:

```
Connection configurations valid
Key Vault configurations successfully updated
```

- Update database authentication for AWS: If you entered `UPDATE_DB_AUTHENTICATION_CONFIGURATION` as the configuration action:
 - a) After the utility loads the current database configuration information, this prompt is displayed:

```
Database authentication configurations loaded
Currently configured database authentication [SQL]

Change database authentication. Available options:
WINDOWS: Connect to database using windows authentication
SQL: Connect to database using SQL server authentication,
manually enter username and password
KEY_VAULT: Connect to database using SQL server
authentication, retrieve username and password from external
key Vault

Enter database authentication [WINDOWS/SQL/KEY_VAULT]:
```

Enter `KEY_VAULT`

- b) At the `Please enter Secret name:` prompt, enter (for example): `testDB`

The key vault utility runs. If the database configuration was successful (the utility was able to connect to AWS, retrieve the designated credential and then use the credential to connect to the database), these messages display on the console:

```
Database Credentials are valid
Database authentication configurations successfully updated
```

AWS credential retrieval use cases

You can retrieve AWS credentials for these use cases: bootstrap, system, auto-login, and automations.

Retrieve Control Room bootstrap credentials

Note: This use case applies to On-Premises deployments only.

The Automation 360 Control Room uses bootstrap credentials to access supporting services such as database, service account, and Active Directory (AD). You configure these credentials during the initial On-Premises installation or post-installation (using the key vault utility) by specifying the object name.

The following image shows the process of retrieving the Control Room bootstrap credentials with AWS:

When required during the bootup sequence or normal operations (such as refreshing a service authentication), the Control Room uses the key vault connection to retrieve the credential and perform the required authentication.

Note: You must select the Microsoft SQL Server Authentication for this use case; other database authentication methods are not supported for bootstrap.

Retrieve Control Room system credentials

Note: This use case applies to On-Premises deployments only, and you can configure the service account only during the initial installation.

If you configured an external key vault during the initial installation, you can then use the Automation 360 user interface (post-installation) to configure SMTP and Active Directory (AD) credentials.

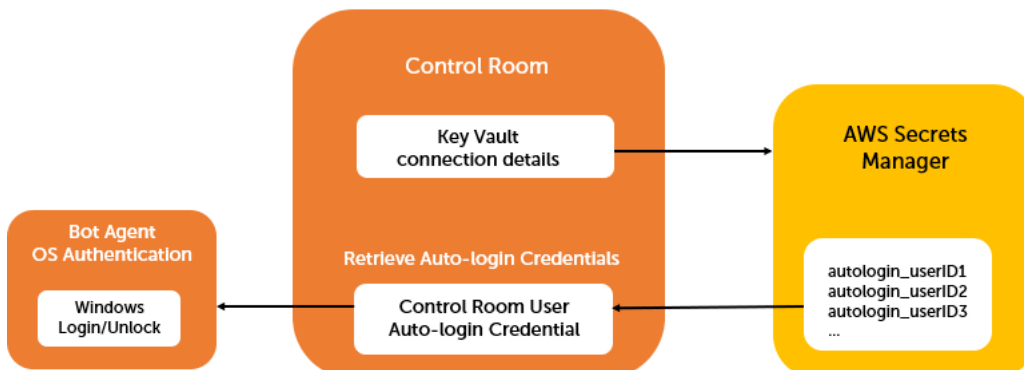

1. Log in to the Automation 360 Control Room as the Administrator.
2. From the Control Room, navigate to: **Administration > Settings > Email Settings**.
3. You can map the AD Master Account credential from the external key vault, configure external credentials, or set to manual (switch modes of AD Master Account credential retrieval).

Retrieve auto-login credentials

Note: This use case applies to both On-Premises and Cloud deployments.

Auto-login credentials are used to authenticate to an Automation 360 Bot Agent device and start an active Windows session. Robotic Process Automation (RPA) requires an active Windows session to function. Auto-login occurs prior to the automation running when automations are launched from a remote Bot Agent device.

The following image shows the process of retrieving the auto-login credentials with AWS:

A Control Room administrator can manually launch or schedule a job to launch an automation on a Bot Agent device by specifying these details:

- Automation (bot) name
- Device name
- User context

The system performs auto-login to the specified device with the user name and password associated with the user context, and then runs the automation on the device.

You must have a secret for each Control Room user for whom the auto-login credentials will be retrieved from the external key vault, and the secret name in the AWS Secrets Manager must match the Control Room username.

To configure retrieval of auto-login credentials from the external key vault, perform these steps:

1. Log in to the Automation 360 Control Room as the Administrator.
2. From the Control Room, navigate to **Administration > Settings > Devices**.
3. Scroll down to the auto-login settings section and click **Edit**.

4. If you previously configured AWS Secrets Manager as the external key vault connection, click **Enabled** to retrieve the auto-login credentials from that external key vault.

If this option is disabled, then the external key vault connection was not configured.

Note: If you disable auto-login from the external key vault, then credentials are retrieved using the AAI Credential Vault and its stored credentials instead.

5. The AWS Secrets Manager has a flat name space without any organizational containers, so you do not need to enter a Safe name. Click **Save changes**.

If successful, then the auto-login settings successfully saved message displays.

Auto-login naming conventions

The Control Room retrieves auto-login credentials based on the object naming convention within the external key vault. The Control Room searches for an object where the object name (the credential name in the external key vault) matches the Control Room username for which it is performing auto-login.

The prefix `autologin_` is required as part of the naming convention for auto-login credentials for all external key vaults: CyberArk, AWS, and Azure. The name of the auto-login credential in the external key vault must contain `autologin_` followed by the Control Room username. In some cases, certain key vaults have restrictions on the characters that can be used in credential object names. Additionally, to support how different use cases encode credentials, Automation 360 requires that certain characters be reserved or encoded.

The following table lists examples of the object naming conventions expected in the Control Room:

Control Room username	Expected object name format
ABCD\user123	autologin_ABCD--user123
user123@rpa.abcd.com	autologin_user123-40-rpa-2e-abcd-2e-com

Note: For On-Premises customers using AD authentication, you must format auto-login usernames using the UPN format or `domain\username` postfix.

For auto-login credentials, keep these in mind:

- The object name in the external key vault must contain `autologin_` as a prefix.
- The auto-login credential names must map to the Control Room username (login ID) for the credential being retrieved.

Some external key vaults have usage restrictions of certain characters, such as backslash (\) and ampersand (&) in the secret name (object name), and restrictions on how special characters are interpreted within API calls. If the user ID contains special characters, then you must encode the secret name (object name) in the external key vault using ASCII code character substitutions, as listed in the following table.

This character	Changes to this ASCII code character substitution
\ (backslash)	--
- (dash)	-2d-
_ (underscore)	-5f-
@ (ampersand)	-40-
. (period)	-2e-

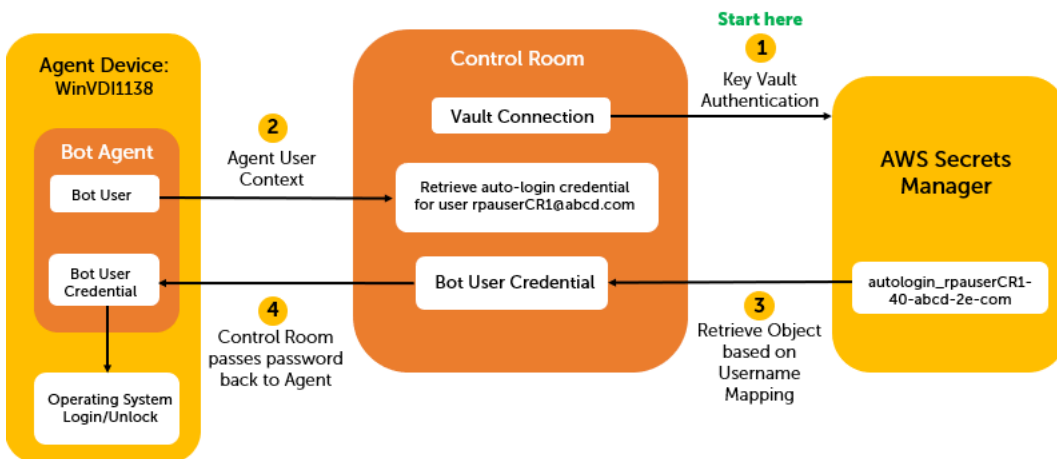

Note: Except for the backslash being mapped to double dashes, the dash, period, underscore, and ampersand are mapped using their ASCII code bracketed in dashes.

AWS auto-login credential example

For this auto-login credential retrieval example, consider a Control Room user who wants to deploy a bot on a device as a specific user. This example uses the following details:

- Automation (bot) name run on a device = ProcureToPayGeoEast
- Agent device name = WinVDI1138
- Agent user context = rpauserCR1@abcd.com

The following image shows this an example of retrieving auto-login credentials with AWS:

Before starting the automation, ensure the following:

1. The Control Room connection details have been successfully configured, and the Control Room uses these connection details to connect to AWS and performs authentication.
2. The Control Room queries the Bot Agent device running on device WinVDI1138 to check if there is an active Windows (operating system) session currently on device WinVDI1138, and if that session belongs to Agent user rpauserCR1.

If there is an existing session on the device for user rpauserCR1, then there is no need to perform auto-login and the bot continues with the deployment.

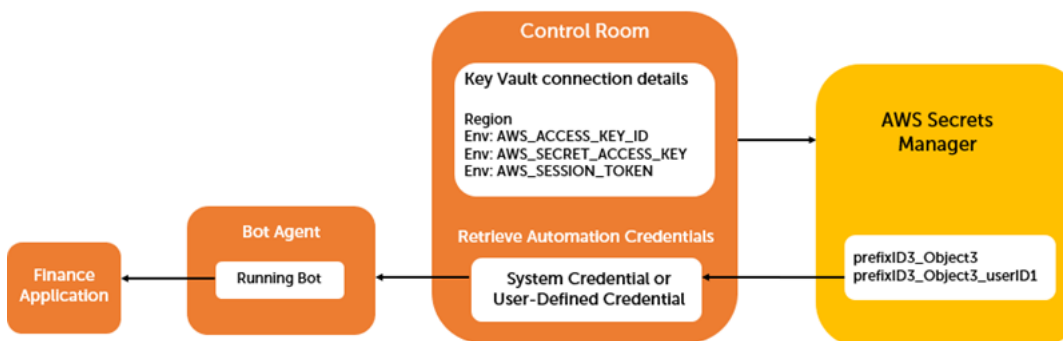

3. However, if there is an no active session or if there is an active session that does not belong to `rpouserCR1`, then the Control Room retrieves the auto-login credential from the AWS Secrets Manager.
4. The Control Room passes the credential (password) to the Bot Agent. The Bot Agent performs a Windows login on device `WinVDI1138` as `rpouserCR1` (first, logging off any other user login session) using the auto-login credential for `rpouserCR1`. The automation (Bot) `ProcureToPayGeoEast` then starts to run on device `WinVDI1138` as `rpouserCR1`.

Retrieve automation credentials

Note: This use case applies to both On-Premises and Cloud deployments.

Automation credentials are variables used by bot developers within automation (bot) actions that define and retrieve data from encrypted storage. The automation uses the credentials to authenticate to applications (for example: finance application). Automation credentials are retrieved by the Automation 360 Bot Agent during runtime.

The following image shows the process of retrieving automation credentials with AWS:

Automation credentials retrieved from the AWS Secrets Manager are mapped in the Automation Anywhere Credential Vault. The Credential Vault supports these two types of automation credentials:

System credentials

Credentials where the value returned by the credential variable is the same for any automation that uses that variable.

User-defined credentials

Credentials where the value returned by the credential variable is distinct based on the user context in which the automation is running.

For both system credentials and user-defined credentials, the bot developer specifies the same credential variable within the bot code. Then, the system determines which credential to retrieve during bot runtime.

User-defined credentials simplify automation development by enabling bot developers to write code using a single credential variable where the RPA platform substitutes the value returned during runtime with a unique user-specific value. Developers can avoid writing duplicate code with different user-specific credential variables.

The following image shows the expected naming convention for AWS credentials:

The diagram shows six secrets in the AWS Secrets Manager which can be mapped to two credentials within the Control Room Credential Vault

- Object3
- Object4

For example, you can map a locker in the Control Room to either `prefixID3` or `prefixID4`. Then, you map the secret to a credential. For each credential, the secrets will be consumed (retrieved by the Control Room) as a system-defined credential (without username postfix) and two user-defined credentials (one each for the Control Room users whose usernames are `User1ID1` and `User1ID2`).

Note: Within the Control Room Credential Vault, the name of the locker and the name of the credential are arbitrary and local to the Control Room. You map these names to specific secrets in the external key vault.

Within AWS Secrets Manager, each automation credential is stored with a name that contains specific identifiers including: a prefix, object identifier, and an optional postfix which identifies a username. This is a required naming convention that assures retrieval of the correct credential. The name of the secret (the credential) in AWS Secrets Manager encodes information about the mapping within the Automation Anywhere Credential Vault.

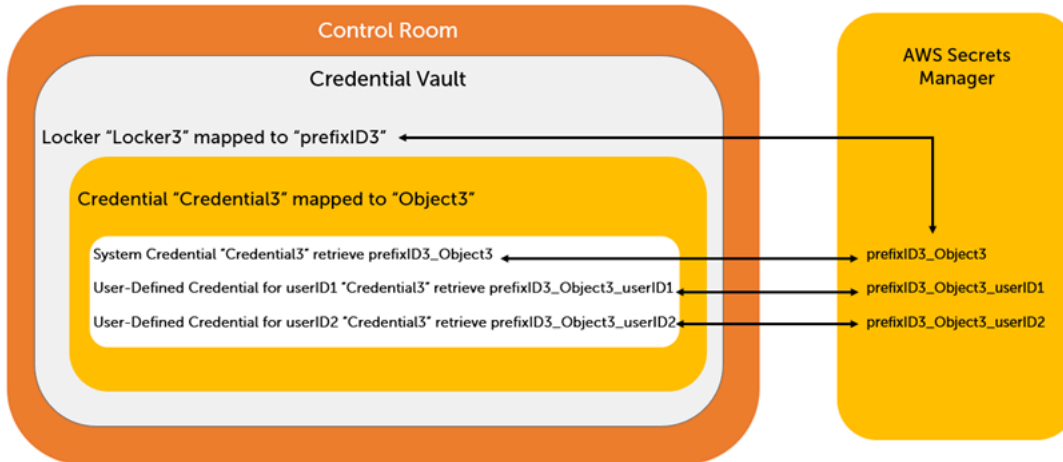

As an administrator, to map a Control Room to AWS Secrets Manager, you create and configure a locker and a credential using the external key vault option within the **Create Locker** and **Create Credential** features in the Automation 360 Control Room:

- You configure lockers in the Credential Vault that map to an AWS secret name prefix.
- You configure credentials in the Credential Vault that map to an AWS secret object identifier (optional postfix for user-defined credential).

During runtime, the RPA platform retrieves the secret that is named with a postfix that matches the user context (user-defined credential) in which the automation is running. If there is no user-defined credential, then the RPA platform retrieves the secret without a username postfix (system credential).

The Control Room implements access controls to the external credentials through permissions within roles. You control access to credentials by assigning different Control Room users to different roles and then associating different lockers with those roles.

The following image shows the Control Room Credential Vault locker and credential mapped to an AWS secret:

Important: When creating an externally mapped credential, you must place the credential in the appropriate externally mapped locker (the locker is mapped to the prefix in the secret name). The AWS secret name will have a naming convention: Prefix + Secret_Name_Body + Postfix (optional for user-defined credentials).

Note: The same permissions and privileges (assigned through roles) in the Control Room apply to credentials mapped to the external key vault.

Automation naming conventions

The following table shows AWS Secrets Manager external key vault examples using naming conventions for automation.

Note: The AWS Prefix maps to the locker for the Control Room, and the AWS Secret Body maps to the credential for the Control Room.

Automation credential example	AWS Prefix	AWS Secret Body	Secret in AWS	Control Room username
accounting_pdf System credential in locker mapped to AWS Secret name prefix accounting	accounting	pdf	accounting_pdf (system)	None - system credential

Automation credential example	AWS Prefix	AWS Secret Body	Secret in AWS	Control Room username
accounting_pdf_ABCD\user123 User-defined credential in locker mapped to AWS Secret Name prefix accounting	accounting	pdf	accounting_pdf_ABCD\user123	ABCD\user123

AWS automations credentials retrieval example

To configure automation credentials retrieval and integrate with the AWS Secrets Manager, you first create a locker and then create credentials.

To create a locker to integrate with the AWS Secrets Manager, perform these steps:

1. From the Automation 360 Control Room, navigate to **Manage > Credential**.
A user with Manage my credentials and lockers permissions is authorized to create credentials.
2. From the **Credentials** tab, select **Create Locker**.
3. Enter a name for the locker (for example, `Locker3`).
This name is local to the Control Room and does not have any dependency on the AWS secret name.
4. Click **External Key Vault** and enter the AWS secret name prefix (for example: `prefixID3`). You must name secrets within the AWS Secrets Manager using the name prefix for the configuration of the mapping to complete successfully.
5. Click **Next**.
6. Configure Owners, Managers, Participants, and Consumers for the locker.
7. Click **Create locker**.
See [Create locker](#) on page 1801.

The Control Room is now ready to retrieve credentials and enforce access controls on all Azure secrets with the prefix `prefixID3`. To continue, you now create the credentials.

To create a credential to integrate with the AWS Secrets Manager, perform these steps:

1. From the Automation 360 Control Room, navigate to **Manage > Credentials**.
A user with Manage my credentials and lockers permissions is authorized to create credentials.
2. From the **Credentials** tab, select **Create Credential**.
3. Enter the credential name in the **Credential name** field.

This name is local to the Control Room and does not have any dependency on the AWS secret name.

4. Click **External key vault** below the name field.
5. From the list of available lockers, select the appropriate locker that was previously mapped to the secret name prefix for the secrets you are now mapping to the credential.
6. Enter the AWS `Secret_Name_Body` in the **Secret name** field (for example: `Object3`).
7. Click **Validate and retrieve attributes**.

The system validates the mapping by attempting to retrieve from the AWS Secrets Manager a secret with the name `Prefix_Secret_Name_Body` (for example: `prefixID3_Object3`).

If validation fails, then no secret exists in the AWS Secrets Manager with the name that matches the combination of locker (prefix) and credential (`Secret_Name_Body`). In this example, there is no secret in the AWS Secrets Manager named `prefixID3_Object3`.

When the system successfully retrieves the secret, it will display the AWS Secrets Manager secret attributes (the fields within the secret).

8. From the list of attributes, select attributes to map to the credential.
9. Click **Create credential**.

If successful, then the credential successfully created message displays.

HashiCorp Vault integration

You can integrate Automation 360 to retrieve credentials from the HashiCorp Vault. The credentials reside in the HashiCorp Vault where you can manage, rotate, and synchronize them.

Note: No additional Automation Anywhere license is required to integrate with the HashiCorp Vault or use the HashiCorp APIs.

You integrate the Control Room by connecting it to the HashiCorp Vault through the HashiCorp HTTP APIs.

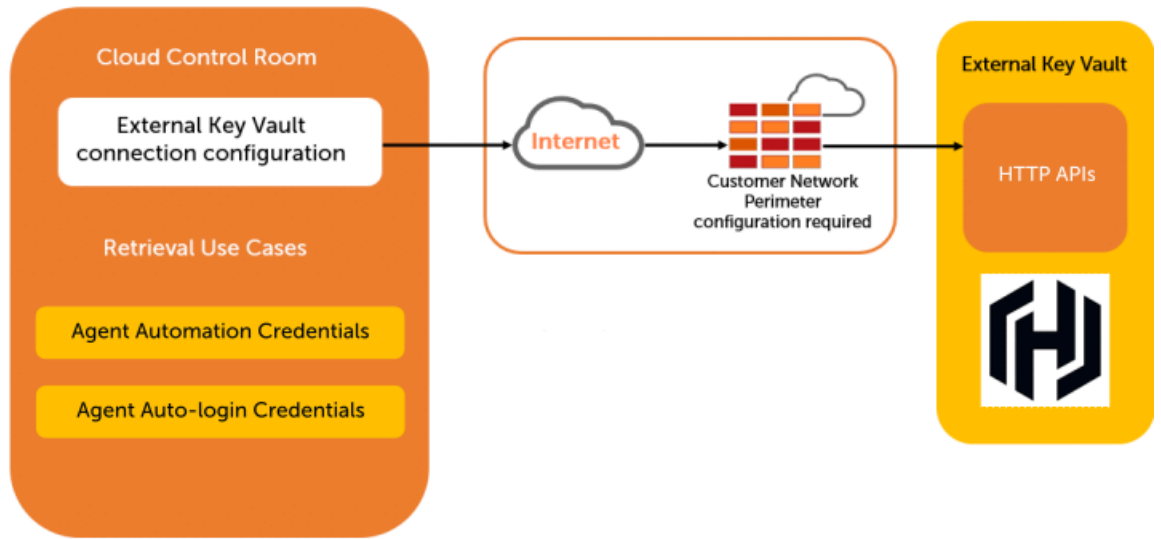

The following table lists the features supported by the different deployment types:

Feature	Cloud	On-Premises
Agent automation credentials	Supported	Supported
Agent auto-login credentials	Supported	Supported
Bootstrap and system credentials	Not supported	Supported

You can integrate the Control Room with the HashiCorp Vault using either of these deployments:

- Cloud

The following diagram shows a Cloud deployment where the Control Room is hosted on the AAI

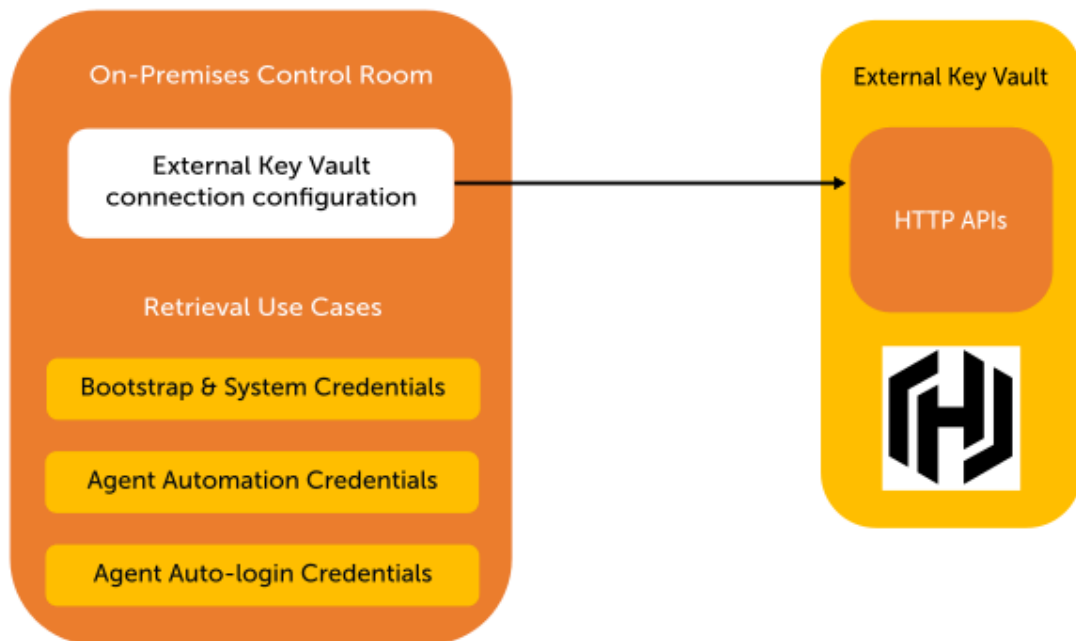

Cloud:

- On-Premises

For On-Premises deployments, you deploy the following:

- Control Room as software within your customer environment.
- Bot Agent within your customer environment where automations run and access customer applications.

Note: You can also connect your On-Premises Control Room to HashiCorp Cloud via the internet.

HashiCorp Vault integration requirements

- HashiCorp service should be accessible from the Control Room.
- The HashiCorp external key vault must be reachable from the Cloud Control Room through the network perimeter firewall rules. For external firewall rules configuration details, see [Control Room IP addresses for external integrations](#) on page 1767.
- Ensure that you have the following values configured in the HashiCorp Vault because you will use these values when you configure the vault in the Control Room. For information on how to configure these values in HashiCorp, see [AppRole Auth Method](#).

Note: For On-Premises deployments, you can configure the external key vault settings during installation or with the key vault utility post-installation. For more information, see the following topics:

- [On-Premises initial installation using HashiCorp Vault](#) on page 1919
- [On-Premises post-installation using HashiCorp Vault](#) on page 1924

Field name	Description
Vault URL	Specifies the HashiCorp vault URL. For example: <code>https://<host></code> or <code>https://<host or IP>:<port></code>
Role ID	Specifies the RoleID of the configured HashiCorp server. For example: <code>675a50e7-cfe0-be76-e35f-49ec009731ea</code> . See AppRole Pull Authentication .
Role Name	Specifies the role name of the configured HashiCorp server. For example: <code>jenkins</code> . See AppRole Pull Authentication .
Secret ID	Specifies the SecretID of the configured HashiCorp. For example: <code>ed0a642f-2acf-c2da-232f-1b21300d5f29</code> . See AppRole Pull Authentication .
Namespace	(Optional) Specifies the namespace for the organization (tenant). For example: <code>teant1</code> .
Optional Certificate	Upload the HashiCorp server public certificate to the Control Room. The certificate must be in the PEM format (.pem or .cer). For example: <code>C:\John\certs\hashicorpserver.pem</code> .

Install HashiCorp Vault

You must install and configure the HashiCorp Vault. See [HCP Vault Quick Start](#).

Use AppRole in HashiCorp Vault

AppRole is an authentication method used in the HashiCorp Vault for applications to interact with the vault. AppRole uses the following values for authentication:

- RoleID: A unique identifier for AppRole. You can use the Role ID with any number of instances of an application.
- SecretID: A randomly generated value that is used to authenticate the AppRole. The secret ID is intended for a single instance of an application, is short-lived, and can be used by authorized applications only.

Important: We recommend that you do not share this value.

- Role name: Roles are listed by the role name.
- Namespace: Allows you to create groups of secrets and apply policies to those namespaces to ensure that each tenant can only access the secrets they have permission to.

For information on how to configure AppRole, see [AppRole Auth Method](#).

Import server certificate

In On-Premises deployments, you can import individual server certificates into the truststore. However, we recommend that you import the issuing Certificate Authority (CA) certificate. For more information, see [Import HTTPS, intermediate, and CA certificates](#) on page 1327.

1. The client (Automation 360 Control Room) sends a request to the HashiCorp Vault (protected resource).
2. The server then responds by sending a certificate back to the client.
3. The Control Room verifies the certificate sent by the HashiCorp server by validating it against the trusted server certification information stored in the public part of the Control Room truststore.
4. Both parties (client and server) gain access to the protected resources if the certificates pass validation based on the following:
 - The Control Room must trust the certificate on the HashiCorp server
 - The Subject field in the certificate matches the Fully Qualified Domain Name (DNS Name) of the calling system.
 - The certificate has not expired.

HashiCorp HTTP API configuration requirements

You must have network connectivity between the Control Room and the HashiCorp server. The Control Room is connected to the HashiCorp Vault through the HashiCorp HTTP APIs for both On-Premises or Cloud deployments.

To use the HashiCorp API, you must set these required parameters:

- **Vault URL**
- **Role ID**
- **Role Name**
- **Secret ID**
- **Namespace** (optional)
- **Optional Certificate**

Review HashiCorp credential terminology and identifiers

HashiCorp and Automation Anywhere use different terminology to describe and identify credentials:

Description	HashiCorp	Automation Anywhere
Where credentials are stored	secrets	credentials

- Credentials in HashiCorp are stored as secrets.
- Credentials in Automation Anywhere are stored in lockers, where each locker has access controls for Control Room users.

For database, service account, SMTP, and AD credentials, the key vault secret data should use the following format:

- username: john
- password: 2zR%#sX#g

For automation, the key vault secret data should use the following format:

- email: john@email.com
- passcode: my-long-passcode

HashiCorp secret ID rotation

The Control Room runs a scheduled job to proactively rotate the HashiCorp secret ID for a tenant. This process ensures that the automation involving key vault credentials runs uninterrupted. By default, the secret ID rotation frequency is every hour. The secret ID is changed based on the secret ID's expiration time. You can change the secret ID when two-thirds of the secret ID has expired.

If the HashiCorp secret ID rotation fails, you can manually change the secret ID using the following Cloud or On-Premises procedures:

- Cloud: [Cloud integration using HashiCorp Vault](#) on page 1919

- On-Premises: [On-Premises post-installation using HashiCorp Vault](#) on page 1924.

Cloud integration using HashiCorp Vault

As an administrator, you can configure the HashiCorp Cloud integration in the Control Room.

- You must have administrator role to configure these settings.
- Ensure that you have configured the AppRole authentication and have the RoleID, SecretID, role name, and namespace values available. For more information, see [HashiCorp Vault integration](#) on page 1914.

1. Navigate to **Settings > External key vault**.
2. Select the HashiCorp Key Vault option.
3. Enter the **Vault URL**.
4. Enter the **Role ID**.
5. Enter the **Role Name**.
6. Enter the **Secret ID**.
7. Optional: Enter the **Namespace**.
8. Optional: Enter the **Server Certificate - PEM format**.
9. Click **Save changes**.

You can configure HashiCorp Vault for the following features:

- Email notifications: [Edit email notifications](#) on page 1758
- Create a locker: [Create locker](#) on page 1801
- Create credential: [Create credential](#) on page 1798

On-Premises integration using HashiCorp Vault

As an administrator, you can configure the HashiCorp On-Premises integration using one of these methods: initial installation or post-installation using a command-line interactive key vault utility.

Within the On-Premises installation wizard, bootstrap credential retrieval from external key vault configuration options are only available if you first configure the key vault connection. The configuration options vary based on the external key vault you select.

Select your integration method:

- [On-Premises initial installation using HashiCorp Vault](#) on page 1919
- [On-Premises post-installation using HashiCorp Vault](#) on page 1924
- [On-Premises post-installation for secret ID rotation](#) on page 1927

On-Premises initial installation using HashiCorp Vault

Using the initial installation method, you can connect and configure the external key vault connector, service account credential (Active Directory master password), and bootstrap (database) credential identifier.

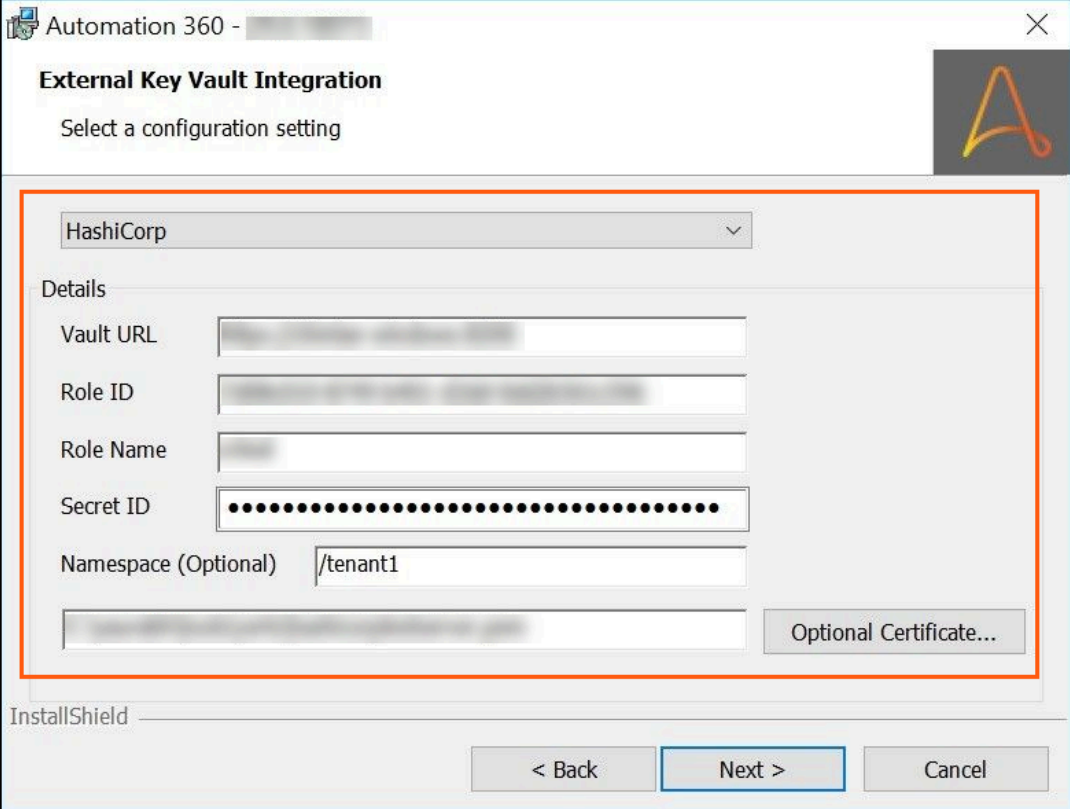

Note: You must select Microsoft SQL Server Authentication as the database; other database authentication methods are not supported for this use case.

The initial installation supports a `password-less` installation for the Control Room bootstrap credentials. The password-less installation identifies the bootstrap credentials identified by the secret name configured in the vault.

You can configure the SMTP and AD credential identifier to retrieve from the external key vault using the Automation 360 user interface.

1. After you start the Automation 360 installation wizard, select **On-premises** as the **Deployment Option** and click **Next**.
2. Accept the license agreement and click **Next**.
3. Select **Custom** as the **Installation Type Preference** and click **Next**.
4. Accept the default locations for the destination folders and click **Next**.
5. Select **Microsoft SQL Server** as the **Database Type** and click **Next**.
6. Select **HashiCorp** from the **External Key Vault Integration** drop-down.
 - a) In the **Vault URL** field, enter the HashiCorp server API URL (for example: `https://<host>` or `https://<host or IP>:<port>`).
 - b) In the **Role ID** field, enter the HashiCorp RoleID (for example: `675a50e7-cfe0-be76-e35f-49ec009731ea`).
 - c) In the **Role Name** field, enter the HashiCorp role name (for example: `jenkins`).
 - d) In the **Secret ID** field, enter the HashiCorp SecretID (for example: `ed0a642f-2acf-c2da-232f-1b21300d5f29`).
 - e) Optional: In the **Namespace** field, enter the namespace.
 - f) Optional: If the issuing Certificate Authority (CA) of the HashiCorp server certificate is not trusted by the Control Room, then enter an optional server certificate.

This is the server certificate (.pem format) for the HashiCorp server without a private key (the certificate Subject: field contains the HashiCorp server FQDN). The installer will add the optional HashiCorp server certificate to the truststore used by the Control Room.
 - g) Click **Next**.

Automation 360 - [blurred]

External Key Vault Integration

Select a configuration setting

HashiCorp

Details

Vault URL [blurred]

Role ID [blurred]

Role Name [blurred]

Secret ID [blurred]

Namespace (Optional) /tenant1

[blurred] Optional Certificate...

InstallShield

< Back Next > Cancel

7. Accept the default settings from the **TLS Configuration** dialog and click **Next**.
8. From the **Service Credentials** dialog, select an option to specify the **HashiCorp Secret Name** from HashiCorp instead of manually entering the user name and password for the **Service Account** used by the Control Room.
9. Click **Service Account (retrieve credentials from external key vault)**, and then enter the **HashiCorp Secret Name** value.
The installer will query the HashiCorp server for the credential to validate the configuration.

Automation 360 -

Service Credentials

Control Room windows service credentials

Local System Account

Service Account (manually enter credentials)

Username Password

For ex. Domain\Username

Service Account (retrieve credentials from external key vault)

HashiCorp Secret Name

InstallShield

< Back Next > Cancel

Note: If the **Service Account** option to specify **HashiCorp Secret Name** is not available, then this indicates that the HashiCorp Vault was not previously configured properly. Contact your AAI Support team.

See: [Troubleshooting external key vaults](#) on page 1929.

10. Click **Next**.
11. From the **Database Server** dialog, select your **Database Server** and enter the name of your Control Room database, and then click **Next**.

12. From the **Database Authentication** dialog, select an option to specify the **HashiCorp Secret Name** from HashiCorp instead of manually entering the user name and password the Control Room uses to authenticate to the database.
- Click **SQL Server authentication (retrieve credential from external key vault)**, and then enter the **HashiCorp Secret Name** value.
 - Click **Next** to continue and complete the initial installation.

After you successfully complete the initial installation, the Automation 360 Control Room can access and retrieve credentials within the HashiCorp Vault.

On-Premises post-installation using HashiCorp Vault

You use the command-line interactive key vault utility during a scheduled system downtime where you must stop all running Control Room services. You should coordinate with the HashiCorp administrative team for any key vault configuration changes that might impact connectivity parameters (such as App ID, vault URL, port numbers, and certificate) during downtimes.

Note: If you use the key vault utility to disable HashiCorp Vault integration, you must first unmap any mapped credentials that are in use.

Using the post-installation method, you can perform these actions:

- Modify or configure the external key vault connection parameters.
- (If not configured during initial installation) Modify or configure the service account credential (Active Directory master password).
- (If not configured during initial installation) Modify or configure the database (bootstrap) credential identifier (retrieved when authenticating the database).

Note: Retrieving bootstrap credentials from an external key vault might cause the Control Room to fail if the external key vault is not accessible during boot-up; or if the external key vault is not accessible when the Control Room refreshes database connections and authenticates users with Active Directory.

- Recover the Control Room for these reasons:
 - If the external key vault connection parameters, the service account, and database credential safe and object identifiers were modified.
 - If the HashiCorp Vault connection parameters changes caused the Control Room to experience connectivity issues.
 - If credential identifiers for bootstrap passwords changed.

You can update any initial configuration settings that were not set correctly and recover the system.

Note:

You can configure and edit SMTP and AD credential identifiers to retrieve information from the external key vault from the Automation 360 Control Room by navigating to **Administration > Settings > Email** and **Administration > Settings > Active Directory**.

1. Run the key vault utility for the HashiCorp Vault.

Note: You must import the HashiCorp server certificate (the certificate issued to the HashiCorp server) to the Java truststore before invoking the dB utility commands. The certificate can be in .cer (PEM) format and does not contain a private key.

To run the key vault utility and update key vault connection settings:

- a) As the Control Room administrator, access the Automation Anywhere Control Room installation directory that was created during the initial Automation 360 installation. For example: C:\Program Files\Automation Anywhere\Enterprise
- b) Download the latest version of the key vault utility. To download the jar file used to update the directory, use the following instructions:
 1. Open a browser and access the A-People site: [A-People Downloads page \(Login required\)](#).
 2. Click the link to the latest On-Premises build.
 3. Click the **Installation Setup** folder.
 4. Download the `crutils.jar` file.

Note: If DB authentication is configured to use external key vault, the utility returns the following exception: Database currently configured to retrieve credentials from key vault. Update database authentication to WINDOWS/SQL to proceed further and exit.

The utility requests the user to confirm the action: Disable/update of key vault might impact functionalities using key vault (for example, Active Directory configuration, Email Settings configuration). Make sure to update these settings (if any). Are you sure you want to continue?

- c) Enter `Y` to continue.
- d) Enter the following:

```
> jdk11\bin\java -jar certmgr.jar -appDir . -importTrustCert <Full
path of the certificate>
```

e) Add these JVM arguments to the command to run the key vault utility:

1. `-Djavax.net.ssl.trustStore="C:\Program Files\Automation Anywhere\Enterprise\pki\trust\store.ks"`
2. `-Djavax.net.ssl.trustStorePassword=changeit --
module-path lib -jar crutils.jar -configPath "C:
\Program Files\Automation Anywhere\Enterprise
\config" -action [UPDATE_KEY_VAULT_CONFIGURATION or
UPDATE_DB_AUTHENTICATION_CONFIGURATION]`

You can update either of these configuration actions:

- Enter `UPDATE_KEY_VAULT_CONFIGURATION` to edit the HashiCorp key vault configuration.
- Enter `UPDATE_DB_AUTHENTICATION_CONFIGURATION` to change to database authentication using external key vault.

2. Based on the configuration action you used, select the appropriate action:

- Update key vault configuration for HashiCorp: If you entered `UPDATE_KEY_VAULT_CONFIGURATION` as the configuration action:
 - a) After the utility loads the current key vault configuration and properties, this prompt is displayed: `Enter key vault [AWS/CYBERARK/AZURE/HASHICORP/NONE] :.`
Enter `HASHICORP`
 - b) At the `Please enter Vault URL:` prompt, enter (for example): `https://services.uscentral.skytap.com:19516`
 - c) At the `Please enter Role Name:` prompt, enter (for example): `jenkins`
 - d) At the `Please enter Role ID:` prompt, enter (for example): `675a50e7-cfe0-be76-e35f-49ec009731ea`
 - e) At the `Please enter Secret ID:` prompt, enter (for example): `ed0a642f-2acf-c2da-232f-1b21300d5f29`
 - f) At the `Please enter Namespace:` prompt, enter (for example): `tenant1`

The key vault utility runs. If the configuration was successful (the utility was able to connect to the external key vault using the configured parameters), these messages are displayed on the console:

```
Connection configurations valid
Key Vault configurations successfully updated
```

- Update database authentication for HashiCorp: If you entered `UPDATE_DB_AUTHENTICATION_CONFIGURATION` as the configuration action:
 - a) After the utility loads the current database configuration information, this prompt is displayed:

```
Database authentication configurations loaded
Currently configured database authentication [SQL]
```

```
Change database authentication. Available options:
WINDOWS: Connect to database using windows authentication
SQL: Connect to database using SQL server authentication,
manually enter username and password
KEY_VAULT: Connect to database using SQL server
authentication, retrieve username and password from external
key Vault
```

```
Enter database authentication [WINDOWS/SQL/KEY_VAULT]:
```

```
Enter KEY_VAULT
```

b) At the Please enter Secret name: prompt, enter (for example): aadbuser

The key vault utility runs. If the database configuration was successful (the utility was able to connect to HashiCorp, retrieve the designated credential and then use the credential to connect to the database), these messages are displayed on the console:

```
Database Credentials are valid
Database authentication configurations successfully updated
```

On-Premises post-installation for secret ID rotation

The default secret ID rotation frequency is one hour. You can set the secret ID rotation frequency to less than an hour in your environment.

If you set the secret ID rotation frequency to less than an hour in your environment, then you must configure the following options:

1. Set an appropriate frequency for the following key in the `cv.properties` file located in the Automation Anywhere configuration directory:

```
rotate.hashicorp.secret.id.job.interval.milliseconds=300000
```

For example, if you set the secret ID expiry in your environment to 15 minutes, then set the key value to 180000 (3 minutes) or 240000 (4 minutes) so that you provide enough time for the scheduled job to run before the next secret ID rotation begins.

Note: You need to manually create the file and the key if they do not exist.

2. Update the new frequency value in the following database entry:

```
UPDATE QRTZ_SIMPLE_TRIGGERS set REPEAT_INTERVAL=300000 where
TRIGGER_NAME='HashiCorpAppRoleRotateSecretIdJob'
```
3. Manually trigger the scheduled job to enable the new frequency by updating the following database entry:

```
UPDATE QRTZ_TRIGGERS set NEXT_FIRE_TIME='1683733949000' where
TRIGGER_NAME='HashiCorpAppRoleRotateSecretIdJob'
```

Note: The `NEXT_FIRE_TIME` is a time stamp value in milliseconds.

Changing external key vault to another

If you did not integrate the external key vault during the initial installation and you want to configure it without re-installing, you must use the key vault utility. Also, to change the external key vault connection details or to change the bootstrap credentials, you must use the key vault utility.

You use the key vault utility for each of these scenarios:

- To initially configure the external key vault connection if it was not configured during initial installation and you do not want to re-install the external key vault.
- To change external key vault connection details:
 - Example 1: CyberArk Password Vault is migrating to a server with a different name
 - Example 2: CyberArk Password Vault authentication certificate is changing
 - Example 3: You want to change from one AWS Secrets Manager instance to another
 - Example 4: You want to change from one Azure Key Vault instance to another
 - Example 5: HashiCorp Vault authentication certificate is changing
- The Automation 360 Control Room is malfunctioning because the external key vault connection has changed, and the Control Room is no longer able to retrieve credentials from the external key vault.
- The Control Room is malfunctioning because the credentials defined for bootstrap or Active Directory integration have changed names.
- To change the KEY_VAULT from one external key vault to another, or to NONE, you must first manually set the database and service account credentials that are currently being retrieved from the external key vault.

For example, to change from an AWS Secrets Manager key vault to a CyberArk Password Vault, you must perform these actions:

1. Set the external KEY_VAULT attribute to NONE.
2. Set the external key vault to the new key vault type.

The following table provides guidelines on acceptable state changes for the KEY_VAULT attribute:

New key vault	Original key vault				
	AWS	CyberArk	Azure	HashiCorp	None
AWS	Yes	No	No	No	Yes
CyberArk	No	Yes	No	No	Yes
Azure	No	No	No	No	Yes
HashiCorp	No	No	No	Yes	Yes
None	Yes	Yes	Yes	Yes	Yes

- To change from an AWS Secrets Manager key vault to a CyberArk Password Vault (or vice-versa), you must first change the KEY_VAULT attribute to NONE.
- To change an AWS Secrets Manager key vault or a CyberArk Password Vault to NONE, ensure that the database is not connected with the KEY_VAULT attribute.

Verify external key vault configuration

Use the Automation 360 Control Room to verify external key vault configuration and database authentication changes you made using the key vault utility.

1. Log in to the Automation 360 Control Room as the administrator.
2. Go to **Administration > Settings > General > Configuration settings**.
3. Go to the **Control Room Database & Software** tab and scroll down to the Control Room database information to verify its details.
4. Navigate back to **Settings > External key vault** and review its configuration settings for external vault, vault URL, and Application ID.
5. Navigate back to **Settings > Email**, and click the **Edit** icon to open the **Notifications** pane.
6. Scroll down to verify that the external key vault settings reflect the SMTP credential identifier in the external key vault
7. Click **Close**.

Troubleshooting external key vaults

You can use the `keyvault.properties` file and application log files to review configuration and integration information for external key vaults.

Use the `keyvault.properties` file

You can use the `keyvault.properties` file to review configuration attributes for these external key vaults:

- CyberArk Password Vault
- AWS Secrets Manager
- Azure Key Vault
- HashiCorp Vault

The following `keyvault.properties` file shows an example with the CyberArk Password Vault:

```
keyvault.type=CYBERARK_PASSWORD_VAULT
keyvault.cyberark.ccp.url=https://services-uscentral.skvtap.com:19516/
keyvault.cyberark.ccp.appid=vb_test_app
keyvault.cyberark.ccp.client.certificate.path=D:\\CyberArk\\client_combined_cert_key_Adminat123.p12
keyvault.cyberark.ccp.client.certificate.passphrase=Password
```

To review the AWS Secrets Manager `keyvault.properties` file, enter these AWS attributes (for example):

- `keyvault.type=AWS_SECRETS_MANAGER`
- `keyvault.aws.region=us-west-2`

Note:

- The certificate passphrase attribute contains the encrypted Control Room certificate file passphrase. Do not modify the certificate passphrase attribute directly; instead, you should use the key vault utility.

- You can modify the `keyvault.properties` file. However, any modifications will require a service restart. So we recommend that you always use the key vault utility to make modifications.

For HashiCorp Vault, Vault servers are configured using a file that is in HashiCorp configuration language (HCL) or JSON format. For information about using the file, see [Vault Configuration](#).

Use the application log files

You can use these application log files to review external key vault integration information:

- `WebCR_CredentialVaultlog`
- `WebCR_RestException`

You can use these log messages to troubleshoot external key vault integration or configuration issues:

Log message description	Cause or reason
Unable to send an email Unable to connect to SMTP server because either your SMTP username or password is incorrect	Retrieved SMTP credential is incorrect.
Logs indicate failure connecting to LDAP	Failure to authenticate through Active Directory.
WebCR.1log file shows database connectivity error, and the Control Room fails to boot up correctly	Retrieved database password is incorrect.
Either your username or your password is incorrect	Retrieved auto-login credential is incorrect for the user (correlates to the bot deployment log for user ID).
Logs indicate connection failure to CyberArk	A possible certificate expiry issue exists if failure occurs after a period of proper functioning for (3, 6, or 12) months.
Unable to retrieve secret, and detail exception will have cause	A non-existent credential identifier (safe name, object name, or secret name) is in use. Might also indicate the credential identifier was removed from the external key vault (if it was previously working properly).
	Might also indicate that the key vault connection is down or unreachable. Or, connection details (API URL, AppID, certificate, region name, AWS keys) are incorrect, have been changed on the key vault, or expired.

Workload management

The workload management module enables users to upload Microsoft Excel and CSV files to the Control Room so that it feeds the records from the files into the bot deployments.

These records contain highly sensitive information, for example, PII, PCI, PHI, and more. This data is carefully protected by the data encryption key and is at rest in the file share and database.

Divide your automations into small, logical Work Items from the **Workload** page. Process the Work Items simultaneously to ensure that your automation goals are achieved with optimum resource utilization.

Prerequisites

To manage your workload automation, ensure that you are allocated a combination of any or all of the following roles and permissions:

Feature type	Privileges
User roles	<ul style="list-style-type: none"> AAE_Queue_Admin AAE_Pool_Admin
Activity permissions	<ul style="list-style-type: none"> View my in progress activity View my scheduled bots Schedule my bots to run View and manage all scheduled activity from my folders
Device permissions	<ul style="list-style-type: none"> View and manage my Bot Creator, Bot Runner, and device pools Create device pools Administer all device pools
Bots permissions	<ul style="list-style-type: none"> View my bots Run my bots
Workload permissions	<ul style="list-style-type: none"> View and manage my queues Create queues Administer all queues

Database

Workload automations are supported on the following databases:

- SQL
- PostgreSQL

- Oracle

Other resources

Related tasks

[Attach work item template to bot](#) on page 2224

Attach a work item template to a bot to use the bot in workload automation.

[Use Work Item variables](#) on page 2253

You can use the Work Item variables to pass the Work Item attributes or values to the Task Bot from the Control Room when you run the bot with the option **Run bot with queue**.

Related reference

[Workload package](#) on page 3054

The Workload package enables you to insert work items in a queue for workload automation. It also enables data chaining between multiple queues. You can orchestrate multiple bots, and enable optimal device utilization through the queueing mechanism of workload management.

Create workload queues

A queue is one of the main building blocks of Workload Management. A queue holds data known as Work Items for further processing. The system distributes these Work Items to individual unattended Bot Runners in a device pool for processing.

For workload automation create and attach a work item template to a bot, create device pools, add Bot Runners to the pool, create queues, add queue owners, participants, or consumers, define the work item structure, insert work items, and finally run the automation with the queue.

Note: In a multi-user environment, if there are two queues A and B, and multiple work items are in queue A, the device will process work items in queue A first, and then move to queue B. To process both the queues in parallel in a multi-user environment, you must perform one of the following actions:

- Add another device to the existing device pool.

- Create another device pool on the same device.

See the following table for details of the tasks you can perform as a queue owner, participant, or consumer.

Owners	Participants	Consumers
Can perform <ul style="list-style-type: none"> • View the queue • Edit the queue • Add other owners, participants, or consumers to the queue • Add work items to the queue 	Can perform <ul style="list-style-type: none"> • View the queue • Add work items to the queue 	Can perform <ul style="list-style-type: none"> • View the queue • Run bot with queue
Cannot perform: Run bot with queue	Cannot perform: Run bot with queue	Cannot perform: Add work items to the queue

Queue owners and participants: Note that queue owners can edit a queue (change the queue name, description, add or remove owners, participants, or consumers), but participants cannot edit the queue.

You can create a workload queue in one of the following modes:

- [Express mode](#)
- [Standard mode](#)

Express mode

To create queues in express mode with default parameters for workload automation in the Control Room. For more information, see [Create express queues using default workload parameters](#).

Standard mode

The following diagram describes the flow in which you can create a workload queue in standard mode.

To create a workload queue in standard mode,

1. [Create queues](#) on page 1935

Create queues that hold specific sets of data your bot is expecting for automation. To create queues, a Control Room administrator assigns the **AAE_Queue Admin** role with **View and manage my queues**, **Create queues**, **Administer all queues**, and **View my in progress activity** permissions.

2. [Add queue owners](#) on page 1936

Add queue owners who can create, edit, and view queues.

3. [Add participants to queue](#) on page 1936

Add queue participants from different roles defined in the Control Room. This is an optional step.

4. [Add consumers of queues](#) on page 1937

Add queue consumers from different roles defined in the Control Room. This is an optional step.

5. [Define Work Item structure](#) on page 1937

Define the Work Item structure for processing in a queue. This enables you to manually upload the Work Items from the system in the absence of ready data in a file.

6. [Insert Work Items](#) on page 1939

Add Work Items from a CSV file to the queue after you define the structure.

Related tasks

[Run bot with queue](#) on page 1940

Collectively process all work items of a queue across all the Bot Runners present in one or more device pools.

[Attach work item template to bot](#) on page 2224

Attach a work item template to a bot to use the bot in workload automation.

Create express queues

Create queues with default parameters for workload automation using the express queue option in the Control Room.

Ensure that you are logged in to the as the administrator.

You must have the **Create queues** permission to create queues using the express mode.

When you create a queue with default parameters, note the following:

- All .CSV file columns will be available in a workload bot.
- The first 10 columns of the .CSV file will be displayed in the queue.
- All data type will be text.
- Queue sorting will not be available.

1. Navigate to **Manage > Queues**.
2. To create queues with default workload parameters, click **Create express queue**.
3. Enter the queue name.
The queue name is the same as the workitem template name by default.
4. Optional: Enter the queue description.
5. To select a data file in .CSV format, click **Browse**.
6. Click **Create**.
The queue is saved and available for workload automation in the **Queues** list.

You can now view queue details, edit a queue, and run a bot with queue.

Related tasks

[View queue details](#) on page 1945

Use the **View queues details** page to view the details of a particular queue.

[Edit queues](#) on page 1946

Edit a queue using two methods - from the **Queues** list, or from the **View queue** page.

[Run bot with queue](#) on page 1940

Collectively process all work items of a queue across all the Bot Runners present in one or more device pools.

Create queues

Create queues that hold specific sets of data your bot is expecting for automation. To create queues, a Control Room administrator assigns the **AAE_Queue Admin** role with **View and manage my queues, Create queues, Administer all queues, and View my in progress activity** permissions.

Ensure that you are logged in to the as the administrator.

A queue is processed until all work items are completed. When new work items are added to the queue, the Reactivation Threshold value specifies the minimum number of new work items required to resume queue processing. Work items are those items with a **Ready to Run** status.

Create a queue by providing details such as the queue name, queue owners, participants, consumers, work item structure, and auto-retry for failed work items.

Note: You can choose to **Create draft of queue** and add the remaining information later.

1. Navigate to **Manage > Queues**.
2. Click **Create queue**.
3. Enter the **Name**.
4. Optional: Enter a description.
5. Set the **Reactivation Threshold** to resume queue processing.

Default threshold is **1** (one).

6. Optional: Select the average **Time required for a person to complete one work item**:
 - **seconds**
 - **minutes**
 - **hours**
 - **days**
7. To process the failed work items, specify the **Max auto retry attempt**.

The failed work items are processed for the specified number of times after all the work items in a queue are processed.

The default value of **Max auto retry attempt** is 0 which means the auto retry is not attempted by default. The maximum **Max auto retry attempt** value is 10.

Note: The failed work items are processed at the end of the staging queue for auto retry.

Based on the specified **Max auto retry attempt** number, the **Queues** page shows the remaining auto-retry attempts in the **Retries left** column.

8. Click **Next**.

[Add queue owners](#) on page 1936

Related tasks

[Edit queues](#) on page 1946

Edit a queue using two methods - from the **Queues** list, or from the **View queue** page.

[Delete queues](#) on page 1949

Delete a selected queue, multiple selected queues, or all queues of work items.

Add queue owners

Add queue owners who can create, edit, and view queues.

Ensure that you are logged in to the as the administrator.

Queue owners are allowed to edit the queue and add new work items to the queue.

The queue creator is the default queue owner and is able to add other Control Room users as queue owners, if required.

1. Select user(s) from the **Available Users** list from the **Owners** tab.
2. Click the right arrow (→) to add your selection.
3. Click **Next**.

[Add queue participants](#)

Add participants to queue

Add queue participants from different roles defined in the Control Room. This is an optional step.

Ensure that you are logged in to the as the administrator.

Participant roles can add new work items and view the queue. However, they are not allowed to edit other queue properties.

1. Select role(s) from the **Available Roles** list from the **Participants** tab.
2. Click the right arrow (→) to add your selection.
3. Click **Next**.

[Add consumers of queues](#) on page 1937

Add consumers of queues

Add queue consumers from different roles defined in the Control Room. This is an optional step.

Ensure that you are logged in to the as the administrator.

There are certain mandatory checks that are to be done for unattended bots to be deployed from Control Room to a device:

- The device where the bot is to be deployed should be set as a default device to only the specific bot runner account.
- Ensure that all necessary privileges have been granted to the Bot Runner.
- Ensure that nobody is signed into the device at the time of bot deployment with the Run As permission from a different device.
- Ensure that the console is currently inactive on default device.

Queue consumers can view the queue and all the work items in the queue. In addition, they can use this queue for running bots on Unattended Bot Runners.

1. Select role(s) from the **Available Roles** list from the **Consumers** tab.
2. Click the right arrow (→) to add your selection.
3. Click **Next**.

[Define Work Item structure](#) on page 1937

Define Work Item structure

Define the Work Item structure for processing in a queue. This enables you to manually upload the Work Items from the system in the absence of ready data in a file.

Define a Work Item structure using any one of the following methods:

1. Using an Excel/CSV file.
2. Using an existing work item template.
3. Manually

Note: The work flow to process Work Items differs for a queue based on the method that you choose in the **Define Work Item Structure** tab.

1. Select a method to add header columns for Work Item processing:
 - **Use an Excel/CSV file:** Add the header columns from an existing Excel or CSV file. You can point to the Excel spreadsheet or CSV file you are using in one or more Task Bots you will run in this queue.

- a) Enter a unique name for the Work Item structure in the **Work item template** field.
For example, if the queue contains employee information, you can specify the **Work item template** as Employee Data.
- b) Select a column for inclusion in the Work Item structure from the list of column names. The columns are defined based on the header rows of the selected Excel or CSV file. A maximum of ten (10) columns are allowed for selection and viewing in the Control Room.
For example, you can select column headers Employee Name, Employee ID, and Designation. You can then select the **Data Type - Text, Number, or Date** for that column. You can also choose to view these columns being processed in the **Activity** page.

Note:

- The system allows you to filter/sort Work Items on the columns for viewing the Work Item data in the Control Room.
[Actions allowed on view queue page](#) on page 1950
- When you upload work items from an xls or xlsx file with data type as text, the Excel file column populated with a date in any format (for example, 8/6/2019) is converted to its corresponding workload management date format (for example, Sat Jun 08 00:00:00) in the Control Room Work Item. However, the same is not applicable to a csv file.

-
- c) Select up to three columns for sorting in an ascending or descending order.
When the system processes the Work Items from the queue, it uses the sort criteria specified to retrieve the work items in that order. For example, to process payslips with first Employee ID followed by Employee Name from 1 to n and A to Z, specify Employee ID and Employee Name in an ascending order.

Note: Work items are processed on sorting order internally. For example, if you add 3 work items a, c, b to be sorted by name, then on the user interface they will be shown as a, c, b. However, the work items will be processed as per the sorting order a, b, c.

- **Use work item template:** Add header columns by searching for an **Existing work item template** or from the **Available work item templates**.

This allows you to pass the values or attributes from the template to a Task Bot with the help of Work Item variables when you use the option **Run bot with queue**.

Tip: Search for an existing Work Item template when there are a large number of templates available for selection.

[Use Work Item variables](#) on page 2253

- **Manually:** Define the Work Item structure manually. You do not have to select from an existing structure.
 - a) Type a name for the Work Item structure in the **Work item template** field.
For example, if the queue contains employee information, add the **Work item template** as Employee Data.

- b) Add column header names for the Work Item and select the data type for each column: **Text**, **Number**, or **Date**
- c) Select the display and sorting for the columns in the Control Room.

When the system processes the Work Items from the queue, it uses the sort criteria specified to retrieve the work items in that order. For example, to process payslips with first Employee ID followed by Employee Name from 1 to n and A to Z, specify Employee ID and Employee Name in an ascending order.

2. Click **Next** to add the Work Items.

[Insert Work Items](#) on page 1939

Related reference

[Work item status and actions](#) on page 1959

Based on the Work Item status, you can do only certain actions on a Work Item.

Insert Work Items

Add Work Items from a CSV file to the queue after you define the structure.

- Ensure that you are logged in to the Control Room as an administrator.
- The maximum number of characters you can insert in a work item value is 1000.
- Add Work Items from a CSV file to the queue.

Note: Adding work items from an Excel (xls orxlsx) file is not supported. We recommend that you convert the xls orxlsx file to CSV and then add work items from the CSV file.

- You can also add Work Items later by editing the queue, see [Edit queues](#) on page 1946.
- If the Work Item data type is defined as **Date**, the date format must be **ISO_INSTANT**. For more information on date formats, see [Datetime formats](#) on page 2402.

1. Click **Browse**.
2. Select the CSV file.
3. Optional: Select the **Disallow duplicates** check box.

Note:

- Only unique work items from the CSV file are added. If the CSV file contains any duplicate work items, then the entire CSV file is ignored.
 - This option is available only when you create a new queue.
-

4. Click **Create queue.**

- Now that you have created a queue, it is now ready for deployment from a bot.
[Run bot with queue](#) on page 1940
- Manage Work Items of a queue to fix the discrepancies before queue processing and reduce your automation-related errors.
[Manage Work Items](#) on page 1959

Run bot with queue

Collectively process all work items of a queue across all the Bot Runners present in one or more device pools.

To run a bot with queue, ensure that you are allocated a combination of any or all of the following roles and permissions:

Feature type	Privileges
User roles	<ul style="list-style-type: none"> • AAE_Queue_Admin • AAE_Pool_Admin
Activity permissions	<ul style="list-style-type: none"> • View my in progress activity • View my scheduled bots • Schedule my bots to run • View and manage all scheduled activity from my folders

Feature type	Privileges
Device permissions	<ul style="list-style-type: none"> View and manage my Bot Creator, Bot Runner, and device pools Create device pools Administer all device pools
Bots permissions	<ul style="list-style-type: none"> View my bots Run my bots
Workload permissions	<ul style="list-style-type: none"> View and manage my queues Create queues Administer all queues

To **Run bot with queue**, note the following:

- You can run bots only on unattended Bot Runners. You cannot run bots on attended Bot Runners from the Control Room.
- The bots have to be checked in to the public folder in order for the bots to qualify to be run with queue.
- Work item sorting is done on the batch added to the queue. For example, if you add 2 batches of work items a, c, b and a, c, b to be sorted by name, the work items will be processed for queuing as a, b, c and a, b, c.
- If you use the same device pool for inserting and processing work items for the same queue, you will see duplicate entries in the **In-progress activity** and **Historical** page. To resolve this issue, use one device pool to insert work items and a different device pool to process work items in a queue.

Use the **Run a bot with queue** option from any of the following pages:

- Activity > In progress**
- Manage > Scheduled**
- Manage > Devices**
- Manage > Device pools**
- Manage > Queues**

The procedure for running a bot with a queue is the same in all these pages.

- Select the bot to run with queue.
 - Latest version: Click **Latest version** tab to select the latest version of the bot.
 - Labeled version: Click **Production version** tab to select the labeled version of the bot.

Available bots are displayed along with any **Input values** and dependencies. If the production label option is selected for the parent bot, the corresponding dependent bots with the production label are also automatically selected. If any of the dependent bots do not have the production label applied, the latest version of the bot is selected.

- Optional: Select **Run with administrative privileges** if the bot has actions that require administrative privileges to run.

3. Select a queue with which to run the bot.

Note: Ensure the following to see the list of available queues:

- You do not have the AAE_Admin role
 - Your role is added to **Queue > Consumers**
 - The bot and queue work item templates are identical
-

4. Optional: Set the queue running time.

- a) Click **Add running time** in the **Processing time** tab.

- b) Select the days from **Days of the week** field.

- c) Enter the **Start time** and **End time**.

- d) Click **Add time** to add another time period for the days selected.

You can add up to three time periods which cannot overlap with each other.

- e) Click **Add running time** to add another running time and provide the day and time details.

You can add up to three running times. If the running time is not set, the queue runs for 24 hours.

- f) Optional: Click **Remove running time** to delete any running time.

5. Select the Bot Runner user from the **Available bot runners** list.

To enable a device, it must be connected to the Control Room.

Note: If a device does not appear in the list, ensure the user running the bots is assigned a role that provides access to the appropriate Run-As Users.

6. Optional: Select the option to run on bot running devices.

If you want to select Bot Runners that are mapped one-on-one with their default (single-user) devices, select the **Run on bot running devices** option. This option enables the Work Items to be deployed only to the user's default device, whereby the security policy does not allow a user to log in to any other device or when applications for automation are installed on the default device.

If you select this option, ensure that all the default devices are part of the same device pool when you select from the **Device Pool** tab.

Tip: Do not select this option if the run as users (Bot Runners) are configured to use multiple devices. In that configuration, if any device in the pool is processing an automation, the run as user can log in to another device, and the work items will be processed on that device. This enables optimal utilization of licenses (run as user) and devices.

For information on scenarios for choosing bot running devices for run as users, see [Considerations for running a bot](#) on page 2207.

7. Select **Device pools**.

Select the pool from the list of available device pools.

8. Optional: Click the up or down arrow to set the selected device pools in preferred order.

When a is deployed, the selects the first available device based on the order in which you organized the device pools. If none of the devices are available at the time of deployment, the is queued.

9. Select the **Automation priority** from the **General** tab.
Set the priority to high, medium, or low based on your requirements for resource optimization. The default permission is set to medium.
10. Click **Run bot with queue**.

Note:

- If a user who created the WLM automation using the **Run bot with queue** option is deleted, the automation is also affected and queues cannot be processed.
- Bots are not deployed when Bot Runners are mapped one-on-one with their default (single user) devices with **Run on bot running devices** option selected and one or more devices in the selected device pool is disconnected.
- If you have more number of resources (devices and run-as users) than the number of work items added, you might observe the proxy deployments on the **Activity > Historical** page. To view the appropriate work item status, refer [Work item status and actions](#) on page 1959.
- Historical activity displays only the bots that are processing the work items, while each bot deployment can include multiple work items processed as one activity.

The following video demonstrates how to run a bot with queue.

Related tasks

[View automation of a queue](#) on page 1952

Use the **View activity in progress** page to view the automation details of the selected queue, **Pause**, **Resume**, or **Stop** the in-progress automation.

Related reference

[Capacity and performance planning](#) on page 1126

Scale your automation by planning for capacity and performance requirements. To plan your capacity and performance for Control Room On-Premises, review the requirements, limits, and defaults that determine the number of simultaneous bots, user sessions, and processing rates.

Add Task Bots and dependent files

Add a Task Bot, and review the input values and dependent files for the automation.

1. Navigate to **Activity > Scheduled, Bots > My Bots**, or **Workload > Queues** page.
2. Click **Run bot with queue**
The **Activity > Run bot with queues Create** page is displayed.
3. Enter a name for the automation.
4. Optional: Enter a description.
For example, you can describe the purpose of running the Task Bot with a queue.
5. Go to the folder that contains the required Task Bot.
6. Select a Task Bot to process in the queue from the list.
 - Latest version: Click **Latest version** tab to select the latest version of the bot.
 - Production label: Click **Production label** tab to select the labeled version of the bot.

By default, the Bots folder is selected.

Tip: Use the search field to find a Task Bot quickly.

The **Input values** and **Dependencies** options are displayed at the bottom of the page.

If the production label option is selected for the parent bot, the corresponding dependent bots with the production label are also automatically selected. If any of the dependent bots do not have the production label applied, the latest version of the bot is selected.

7. Optional: Select the **Input values** check box to add the values of variables to the bot during runtime.

This is enabled only if the selected Task Bot has **Input values**.

Note: In workload automation, input to the bot is provided by the workload queue, the input type variable is not supported in workload automation.

8. Optional: Review the list of dependent files, if available.

This list is enabled only if the selected Task Bot has dependencies. The Task Bot dependencies that are uploaded in the Control Room are available only for review.

9. Click **Next** to add a queue, Bot Runner and device pool.

[Add queue, Bot Runner, and device pool](#) on page 1823

If the selected Task Bot does not contain a work item template, an error message appears at the top of the page. The Task Bot also shows an icon to indicate a missing work item template.

[Define Work Item structure](#) on page 1937

[Bot dependencies](#) on page 2268

Bots dependencies are files and other bots that are required to run that bot successfully.

Manage workload queues

For workload maintenance tasks such as view the details of queues to pause, stop, or resume its automation, edit the queues, manage the work items in the queue, and delete the queues.

Note: In a multi-user environment, if there are two queues A and B, and multiple work items are in queue A, the device will process work items in queue A first, and then move to queue B. To process both the queues in parallel in a multi-user environment, you must perform one of the following actions:

- Add another device to the existing device pool.
 - Create another device pool on the same device.
-

Workload maintenance tasks

For workload automation maintenance, do the following (in any order):

[View queue details](#) on page 1945

Use the **View queues details** page to view the details of a particular queue.

[Edit queues](#) on page 1946

Edit a queue using two methods - from the **Queues** list, or from the **View queue** page.

[Delete queues](#) on page 1949

Delete a selected queue, multiple selected queues, or all queues of work items.

[Manage Work Items](#) on page 1959

Manage Work Items of a queue to fix the discrepancies before queue processing and reduce your automation-related errors.

Related reference

[Actions allowed on view queue page](#) on page 1950

Use different actions such as sorting, searching, or filtering on the table view of the queues.

View queue details

Use the **View queues details** page to view the details of a particular queue.

Ensure that you are logged in to the as the administrator.

Permissions required:

1. **Queue Owner** or **Queue Participant** or **Consumer** rights
2. **View and manage my Queues** feature permission
3. A user with **AAE_Admin** role can view all the queues and manage (pause, resume, and stop) all the WLM automations.

Note: If you are not an owner, participant, or consumer of that queue, you can view only queue names and not the queue details.

The **View queues** page shows the following queue details:

- **New** when the work item is added to the queue recently.
- **On hold** when the work item is deferred from processing by a Queue owner, participant, or consumer.
- **Failed** when the work item processing failed on an unattended bot.
- **Completed** when the work item is successfully processed by a Bot Runner or marked Completed by a queue owner, participant or consumer.
- **Data error** when there is an error in loading data from the file.
- **Active** when the work item is currently being processed or staged for processing.
- **Ready to run** when the work item is successfully processed for execution does not have any data errors and can be staged for processing.

Queue contents in different tabs such as:

1. **Work items:** This is the default view. This allows you to view all work items in a tabulated form. You can use the filter to view specific work items. For example, all work items with status as **Completed**. You can **View**, **Edit**, or **Delete** the individual work items in each row. You can also change the status of the work items in bulk. For example, change the status of all the work items in **Data error** to **On hold**.

Note: When auto-purge setting is enabled, the **Work items** tab for queues in edit and view mode shows a message that informs days after which the completed work items will

be deleted. For example, Completed work items older than 30 days will be automatically purged.

- 2. General:** View the Reactivation Threshold and **Time** required to complete one work item.
 - 3. Owners:** View the user names of queue owners who can edit the queue and add new work items.
 - 4. Participants:** View the user names of queue participants who can add new work items and view the queue.
 - 5. Consumers:** View the user names of consumers who can view the queue and all the work items in the queue. In addition, they can use this queue when running bots.
 - 6. Work Item Structure:** View the work item structure that you defined when creating the queue.
-

Tip: Edit any of these details by either clicking the **edit this queue** link or the **Edit** button. Also, delete the queue by clicking the **Delete** button.

1. Navigate to **Manage > Queues**.
2. Hover over the **Actions** icon for the queue.
3. Click **View**.

Delete a selected queue, multiple selected queues, or all queues of work items.

Related reference

[Actions allowed on view queue page](#) on page 1950

Use different actions such as sorting, searching, or filtering on the table view of the queues.

Edit queues

Edit a queue using two methods - from the **Queues** list, or from the **View queue** page.

Ensure that you are logged in to the as the administrator.

Permissions required:

1. **AAE_Queue Admin** role.

2. **Queue Owner** rights to edit queues that you created.
3. **Queue Participant** rights to edit queues that are created by other queue owners.

You are allowed to edit a work item only if it is in **New**, **Data error**, **On hold**, **Ready to run**, or **Failed** state.

Edit a queue from the **View queue** page or from the **Queues** list.

1. Navigate to **Manage > Queues**.
2. Hover over the **Actions** icon for the queue.
3. Click the **Edit** icon. 
4. Click one of the following options to launch the **Edit Queue** page.
 - **edit this queue** link.
 - **Edit** button.
5. Edit the queue details, such as queue name (applicable only if in draft), description, work items, threshold and time values, auto retry attempt (applicable only if queue is not in use), owners, participants, and consumers.

Note:

- The Work Item structure cannot be edited after it is defined.
- When you edit a queue and set new auto retry number, the new number is only applicable to the new failed work items. If the queue owner changes the auto retry attempt value to a number less than the existing number, the work item will not be retried.
- The queue name must be unique and not be shared by another queue.

-
6. Upload a file for the work item that will be used for processing in this queue.
The **Work Items** tab is shown by default.

Tip: You can search for a work item quickly based either on **Status** or Status details using the search option.

-
7. Click **Browse**.
 8. Select the file to upload.

Note: You can upload only an Excel or CSV file.

-
9. Optional: Put work items on hold.
 - a) Select the work items and click **On hold** from the table level icons list.

- b) In the **To update** screen, select one of the following options:
- **Indefinitely**: The work item is put on hold until you manually move it for re-processing.
 - **Until**: The work item is put on hold until the specified date and time. Enter the **Date**, **Time**, and **Time zone** in their respective fields.

- c) Click **Yes, change**.
The selected work items are put on hold.

Note: The column **On hold until** in the **Edit queue** page displays the work item hold status (indefinitely or specific date and time). The status of the work items which are not on hold are shown as **N/A**.

10. Click **Save changes**.
11. Edit the name and save the changes made to the queue.
An edit successful message appears.

Related concepts

Use different actions such as sorting, searching, or filtering on the table view of the queues.

Delete queues

Delete a selected queue, multiple selected queues, or all queues of work items.

You must have the following rights and permissions to complete the task. Ensure you are logged in to the Control Room as the administrator. To complete the task, you must have **AAE_Queue Admin** role and **Queue Owner** permission assigned to you.

Note: You cannot delete a queue if it is being used for processing a work item. An error message appears for that particular queue.

1. Log in to the Control Room.
2. Go to **Manage → Queues**.
3. Select one of the following options to delete selected or multiple queues:

Option	Steps
Delete selected queue	<p>a) Hover over a queue that you want to delete.</p> <p>b) Click Actions and then click Delete</p> <p>A confirmation message to permanently delete the queue appears.</p>
Delete multiple selected or all queues	<p>a) Select the check box before the required queues.</p> <hr/> <p>Note: You can select the check box in the header to select all queues.</p> <hr/> <p>b) Click the Delete button above the header.</p> <p>A confirmation message to permanently delete multiple queues appears.</p>

Note: You cannot delete a queue that is in the **In use** status. An error message displays to indicate that only queues that are not in **In use** status can be deleted.

4. Click **Yes, delete** to confirm the selection. Otherwise, click **No, cancel** to discard the action. A confirmation message appears after you delete the queue.

Related tasks

[View queue details](#) on page 1945

[View automation of a queue](#) on page 1952

Use the **View activity in progress** page to view the automation details of the selected queue, **Pause, Resume, or Stop** the in-progress automation.

[Edit queues](#) on page 1946

Edit a queue using two methods - from the **Queues** list, or from the **View queue** page.

Actions allowed on view queue page

Use different actions such as sorting, searching, or filtering on the table view of the queues.

Searching and filtering

For ease of access, apply search parameters to **ID, Start Time, Work item result, Status, and Queue Name** columns.

- Specify the search parameters in the search bar for **Queue Name**. When you specify search parameters for the same column, the system searches using **OR** operator. When you specify search parameters for different columns, the system searches using **AND** operator.
- Choose the search parameters from a list in the search bar for Work Item **Status**.
- Apply filters to **Work Item Result** to quickly track the final status of the work item. For example if the work item was completed or skipped.
- Use the **Work Item ID** to search for specific work items and combine with the **Start Time** to monitor the progress of the work items that you search based on the **ID**. The **Start Time** filters the list of all work items that start between two given **Start Date** and **Start Time**. For example, all work items started between 01/08/2021 13:00 hrs. and 31/08/2021 15:00 hrs.

Note: Use a hyphen (-) as separator between IDs as any other symbol gives an error. For example, 100-250.

Table items

The following describes the list of items that can be viewed in the table:

Table Item	Description
ID	Shows the system generated id for a work item. When a work item is added to a queue, system generates an id for that work item.

Table Item	Description
Status	Shows Work item status: Use the View queues details page to view the details of a particular queue.
Start Time and End Time	Shows the work item's processing start/end time and date.
Modified by	Shows the name of the last user who had modified the work item.
Last Modified	Shows the time and date when the work item was modified last.

Note: Apart from the above system generated columns, the fields that you define in your work item are also displayed as columns.

Actions on table column

Use the following actions on a table column:

- Click a column to sort it in ascending and descending order. You can sort up to three columns by holding the Shift key when you click two more columns. This gives you the option of sorting two additional columns. This way the sorting is done on the entire table and not just the data that is currently visible to you. The last sorting is stored in memory applied by a user per session.
- Drag a column to the left or right
- Move your mouse cursor at the end of the column and drag to re-size

Actions on work items

Use the following tasks on specific work items:

Table Item	Description
Refresh	Allows you to refresh the table contents so that you can view the latest work item status
Delete	Allows you to delete one or multiple work items.
Mark complete	Allows you to mark one or more work items as Complete whose status is On hold , Data Error , or Ready to run.
New	Allows you to mark one or more work items as New whose status is On hold , or Data Error

Table Item	Description
On hold	Allows you to mark one or more work items as On hold whose status is New
Customize columns	Allows you to show or hide specific columns. By default, all columns are displayed including the ones defined in the work item.

Alternately, select work items and use the following actions. Note that these actions can be performed only at a table level and not on individual work items.

Table Item	Description
View	Allows you to view details of selected work item.
Edit	Allows you to edit details of selected work item. You can see this icon only if you are the Queue Owner or Participant or Consumer and the status of the work item is Unsuccessful, On hold, or Data error
Delete	Allows you to delete the selected work item. Note that if a work item is in Active state, you are not allowed to delete it.

Related tasks

[Define Work Item structure](#) on page 1937

Define the Work Item structure for processing in a queue. This enables you to manually upload the Work Items from the system in the absence of ready data in a file.

View automation of a queue

Use the **View activity in progress** page to view the automation details of the selected queue, **Pause, Resume, or Stop** the in-progress automation.

You must have the following permissions to view automation of a queue:

- **AAE_Queue Admin** role
- **Queue Consumer** or **Queue Participant** rights
- **Manage everyone's In progress activity** feature permission
- **View and manage all scheduled activity from my folders** activity permission (if you have access to the folder which has the WLM bot)
- **View and manage all scheduled activity** permission (if you do not have access to the folder which has the WLM bot)

Note:

- Though the **View automation** page is accessible from the **Workload** module, the page is launched from the **Activity** module.

- You cannot **Pause/Resume** or **Stop** actions directly from the **Activity > In progress** page. For these actions, the **Manage > Queues > View automation** action is used.
- Bots that are in the **Queued** status do not appear automatically on the **In progress activity** page. You must click the **Refresh table** button on the top-right corner of the activity table to view the queued bots.

1. Log in as administrator to the Control Room.
2. Go to **Manage → Queues**.
3. Hover over a queue with the **In use** status.
4. Click the Actions menu (vertical ellipsis) and select **View automation**. This launches the **Activity > Run bot with queue > View** page.
5. Choose one of the following options to view automation of a queue:

Options	Description
Automation details of the queue	<ul style="list-style-type: none"> • The Bot name, path, dependencies, and if it requires administrative privileges to run in the Task Bot tab. • The Queue used to run the automation in the Queue tab. • Bot Runner details such as username, device, and user status in the Run as tab. • Details of the device pool in use to run the automation in the Device pool tab. • Details such as number of work items that were active, failed, pending, or completed processing in the Run history tab.
Pause	<p>The system pauses the distribution of work items from this queue to available bot runners in the device pool.</p> <hr/> <p>Note: Until you resume this automation, any work items with Ready to Run status from this queue are not sent for processing.</p> <hr/>
Resume	<p>The system starts distributing the work items from this queue.</p> <hr/> <p>Note: Bots will fail to deploy if the WLM automation is paused and resumed when Bot Runners are mapped one-on-one with their default (single user) devices with Run on bot running devices option selected and one or more devices in the selected device pool is disconnected while the WLM automation is in paused state.</p> <hr/>

Options	Description
Stop	<ul style="list-style-type: none"> The system stops distributing the work items from the queue associated with this automation. Select No, cancel to return to the details page or Yes, stop to stop the work item processing and return to the Queues page.
Edit	Update the automation details such as processing time, queue, and device pool.

[Edit queues](#) on page 1946

Related tasks

[View queue details](#) on page 1945

Use the **View queues details** page to view the details of a particular queue.

[Delete queues](#) on page 1949

Delete a selected queue, multiple selected queues, or all queues of work items.

Edit workload management automations

You can edit a workload management (WLM) automation (in use queue) and update processing time, run-as users, and device pool details.

You must have the following permissions to edit the workload management automation (in use queue):

- **AAE_Queue Admin** role
- **Queue Consumer** or **Queue Participant** rights
- If you have access to the folder which has the WLM bot, ensure that you have the **View and manage all scheduled activity from my folders** permission
- If you do not have access to the folder which has the WLM bot), ensure that you have the **View and manage all scheduled activity** permission

When you select the **View and manage automation** option for the **In use** queues, you can edit a paused or active automation to update details.

When you edit a workload management automation:

- You cannot edit the **Bot and dependencies**, **Queue**, **Run history**, and **General** details.
- The automation ID does not change.
- You can edit any paused or active automation.

1. Log in as administrator to the Control Room.
2. Navigate to **Manage > Queues**.
3. Hover over or click the three dots icon next to the queue that is in the **In use** status and click **View and manage automation**.
The queue details are displayed.
4. Click **Edit** to update the following details:

- a) **Processing time:** Add or update the running time, days, and time slots for the selected queue.
- b) **Run as:** Select or update the Bot Runner devices for the selected queue.

Note: If you select the **Run on bot running devices** option, you must include all the run-as users' default devices in the same device pool (which will be available to select on the **Device pools** page).

- c) **Device pool:** Select or update the device pool for the selected queue.

Note:

- The workload management automation is processed based on the order of the automation queue. If the device pool has priority-based deployment, then the automation will be processed at the end of the priority.
 - If you do not change the device pool, then the order of the automation queue does not impact the automation deployment.
-

5. Click **Save**.

The existing automation is stopped and automation details are updated immediately.

Note:

- When you stop the existing automation, it does not impact bots which have been deployed on the Bot Runners.
 - When you edit the automation, the audit log entries are recorded on the **Administration > Audit log** page with the **Update automation** event type. You can view the old and new automation values in the audit log entries.
 - During the execution of the WLM automation, bots are not deployed when Bot Runners are mapped one-on-one with their default (single user) devices with **Run on bot running devices** option selected and one or more devices in the selected device pool is disconnected.
-

Export queues

Export queues for flexible usage that ensures efficient processing of WLM automations. With export queues feature, you can reuse queues across environments such as Dev, QA, and production.

- You must have the **AAE_Queue_Admin** role to export queues.
- Ensure that the target Control Room user has create users, create roles, and install license permissions.
- The source and target Control Room instances must be running the same version.
- The source and target Control Room instances must be of same setup type: SSO with SSO, AD with AD, and non-AD with non-AD.
- To receive an email notification on successful export of a queue, ensure that the following notification is selected in **Administration > Settings > Email: A BLM package is exported or imported, to the user who performed BLM export or import**.

For more information see [Edit email notifications](#) on page 1758.

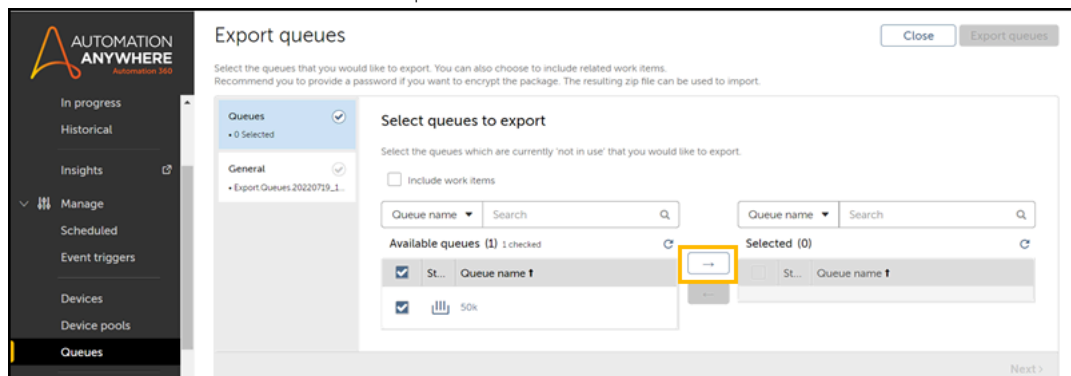

When exporting a queue, consider the following factors:

- You can export only the queues that are in the Not in use state. The queues in the New or Draft state cannot be exported.
- Before you export a queue, you must pause all the running WLM automations or queues.

To export a queue, perform the following steps:

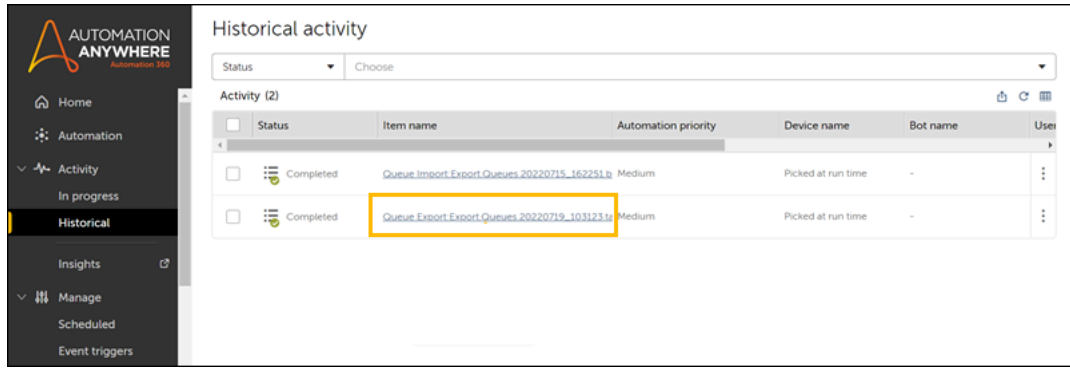

1. Navigate to **Manage > Queues**.
2. Select the required queue and click **Export queues**.
3. In the **Export queues** page, select a queue that you want to export, click the right arrow (→), and then click **Next**.

You can select the **Include work items** option to export work items along with the queues. By default, the **Include work items** option is not selected.

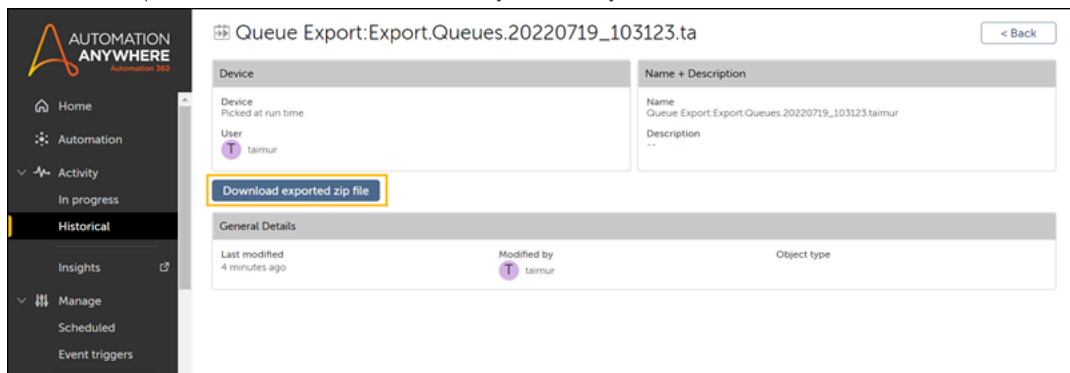

Note: When you export a queue along with a large number of work items, the export or import process might take time up to 30 minutes.

4. In the **General** section on the left pane, perform the following steps:
 - a) Required: Specify an **Export name** for the queue that you want to export.
 - b) Optional: Specify a password for the exported queue.
If you specify a password, confirm the password in the **Confirm password** field.
5. Click **Export queues**.
The selected queue is exported and available in the **Activity > Historical** page. The exported queue is in the following file format: Queue Export:Export.Queues.20220715_162251.<<username>>

Note: If Automation 360 is email-enabled and the **A BLM package is exported or imported, to the user who performed BLM export or import.** notification in **Settings > Email** is selected, an email notification is sent to your registered email ID. The email body contains a link to the **Activity > Historical** page to download the exported queue.

6. Select the queue and click **Download exported zip file.**

The exported queue zip file is downloaded to your local system, with details such as Queue general settings, Queue work item template, and Work items (if included during export).

Note: Data such as queue owners, consumers, and participants is not exported.

Import queues

Import queues for flexible usage that ensures efficient processing of WLM automations. You can also import queues along with work items.

- You must have the **AAE_Queue_Admin** role to import queues.
- Users and roles associated with the queues are imported, and the license assigned to the users is also imported.
- Ensure that the target Control Room user has create users, create roles, and install license permissions.
- Ensure that queue names are unique for importing. Queues with the same name are skipped and not imported in the target Control Room.
- The source and target Control Room instances must be running the same version.
- The source and target Control Room instances must be of same setup type: SSO with SSO, AD with AD, and non-AD with non-AD.

When importing a queue, consider the following factors:

- Before you import a queue, you must pause all the running WLM automations or queues.
- Users and roles associated with the queues are imported. Licenses (for example, Bot Creator and Bot Runner) that are assigned to the users associated with the queues are also imported.
- All the queue entities associated with the queue, for example, general settings, owners, participants, consumers, Work Item structure, and optionally Work Items are imported to your Control Room.
- When you import Work Items with the queues, the state of the Work Items (Completed, Failed, Data error, and so on) are maintained in your target Control Room.

To import a queue, perform the following steps:

1. Navigate to **Manage > Queues**.
2. Select the required queue and click **Import queues**.
3. In the **Import queues** page, click **Browse** to select the required queue from your local system.
4. Optional: Enter a password for the queue that you want to import.

If a queue already exists in your environment, you can select one of the following options:

- **Skip the queue (don't import it)**: The selected queue is skipped and is not imported.
- **Make a copy of the queue (a suffix of "copy" will be added to the queue name)**: A copy of selected queue is created and imported to your environment, with copy suffixed to the name of the queue.

5. Click **Import queues**.

The selected queue is imported and available in the **Manage > Queues**

Status	Queue name	My access	Automation name	Automation status
Not in use	50k	Queue owner	N/A	N/A
Not in use	50k-copy	--	N/A	N/A
Not in use	q1	--	N/A	N/A

page.

Manage Work Items

Manage Work Items of a queue to fix the discrepancies before queue processing and reduce your automation-related errors.

Permissions required

You need any of the following permissions to manage the work items:

1. **AAE_Queue Admin** role
2. **View and manage my Queues** feature permission
3. **Queue Owner, Queue Consumer,** and/or **Queue Participant** permissions

Work item status and actions

Based on the Work Item status, you can do only certain actions on a Work Item.

Work item - status and actions

The following table provides a description of each Work Item status and the action you can do on a Work Item having that status:

Work Item Status	Description	Actions
Data Error	Data type mismatch when adding Work Items to the queue	View, Edit, and Delete
New	New Work Item is added	View, Edit, and Delete
Ready to run	Work Item is successfully processed for execution	View, Edit, and Delete
On hold	Work Item is deferred for use by the Queue admin	View, Edit, and Delete
Active	Work Item is currently being processed	View and Edit
Completed	Work Item successfully processed by a Bot Runner	View and Delete
Failed	Work Item processing has failed to execute on unattended Bot Runners	View, Edit, and Delete

Work item lifecycle

You can create work items in bulk by uploading them through a CSV file or by using the REST API. When you upload a large number of work items using a CSV file, they are inserted in multiple

batches and status of newly inserted work items is marked as Draft until all of them are inserted from the file. Following is the work item lifecycle through various statuses:

- **Data error:** When work items fail while inserting from a CSV file, they are marked as **Data error**.
- **New:** When all the work items are inserted from the CSV file, the work item status marked as **New**.
- **Ready to run:** When a work item is cached and ready to process, the work item status changes from **New** to **Ready to run**.
- **On hold:** When a user does not want to process a work item, it is marked as **On hold**.
- **Active:** When work item is sent to the Bot Runner, the status is changed to **Active**.
- **Completed:** When work item is processed successfully, the status is marked as **Completed**.
- **Failed:** When a work item fails during processing, the status is marked as **Failed**.
- **Unknown:** When a device fails to report back on the status of work item processing, it is marked as **Unknown**.

Related tasks

[Edit work items](#) on page 1961

Use the **Queues** page or the **Work item** page to edit the work items of a queue.

[Define Work Item structure](#) on page 1937

Define the Work Item structure for processing in a queue. This enables you to manually upload the Work Items from the system in the absence of ready data in a file.

View work items

View work items with a status of Completed, Unsuccessful, On hold, Active, or Data Error in the **View work item** page.

Ensure that you are logged in to the as the administrator.

From the **Workload > Queues** page, you can perform the following actions on either one queue or multiple queues, including:

- **Delete:** This will delete the work item permanently.
- **Mark complete:** This will mark the work item as complete.
- **Re-process:** This will mark the work item in **New** state.
- **On hold:** This will mark the work item as **On hold**.

Note: The **Start time** and **End time** are shown when the work item is being processed.

Select a queue to **View**, **Edit**, or **Delete** a queue.

1. Navigate to **Manage > Queues**.
2. Hover over the **Actions** icon for the queue.
3. Click **View**.

[Edit work items](#) on page 1961

[Delete work items](#) on page 1961

Related reference

[Work item status and actions](#) on page 1959

Based on the Work Item status, you can do only certain actions on a Work Item.

Edit work items

Use the **Queues** page or the **Work item** page to edit the work items of a queue.

Ensure that you are logged in to the as the administrator.

You can edit a work item only if it is in a **New**, **On hold**, **Data error**, or **Failed** state.

1. Navigate to **Manage > Queues**.
2. Hover over the **Actions** icon for the queue.
3. Click the **Edit** icon. 
4. Select one of the following options to filter the work items.
 - **Status**
 - **Id**
 - **Name**
 - **Work item result**
5. Change the work item status to **Mark complete**, **Defer**, or **Re-process** in the Work item attributes and automation details section.

You can reprocess the failed Work Items by editing and modifying from **Failed** to **Re-process**. The system will set the status to **Data Error** during the data load if there is any issue with the data. For example, if a user enters a text value for a number field, or an invalid date string for an attribute of date type, the status will be displayed as **Data Error**.

[Work item status and actions](#) on page 1959
6. Click **Save changes**.

[Delete work items](#) on page 1961

Delete work items

Delete work items one at a time or **in bulk** in the **View work item** page.

Ensure that you are logged in to the as the administrator.

You can delete a work item only if it is in a **Data error**, **On hold**, **Ready to run**, **Complete**, or **Failed** state. For work items in the **Ready to run** state, the work item should not be in a queued state. To delete such work items, **Pause** the automation.

Note: You can also delete a work item one at a time or **in bulk** using the **Delete** option provided above the Work items table.

1. Navigate to **Manage > Queues**.
2. Select the queue.
3. Hover over the **Actions** icon for the queue.
4. Click **Delete**.

Confirm or cancel.

Related reference

[Work item status and actions](#) on page 1959

Based on the Work Item status, you can do only certain actions on a Work Item.

Export work items to CSV file

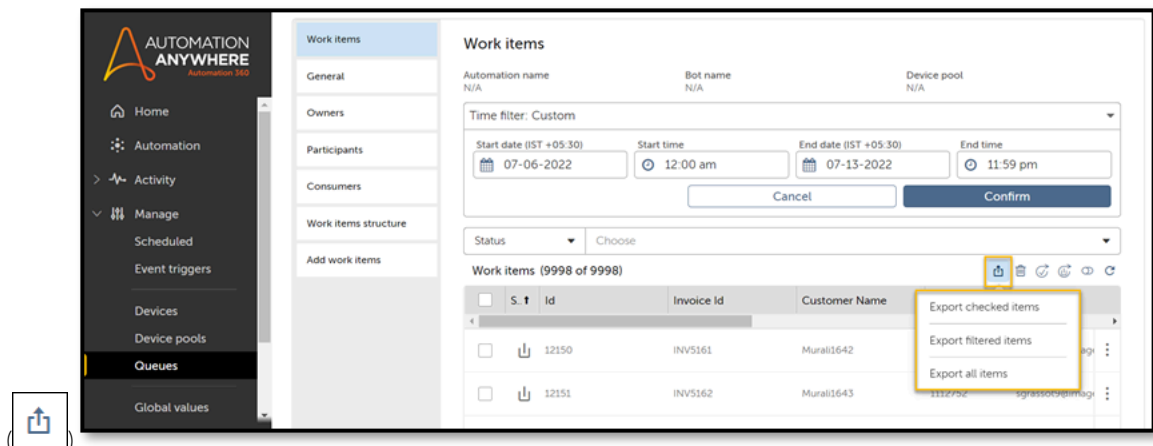

Export work items to a CSV file for offline audits and records. The CSV file with the exported work items is available for download in the **Activity > Historical** page.

- You must have the **AAE_Queue_Admin** role to export or import work items.
- The source and the target Control Room instances must be running the same version.
- The source and the target Control Room instances must be of the same setup type: SSO with SSO, AD with AD, and non-AD with non-AD.

You can export selected, filtered, or all work items to a CSV file by using the following options:

- **Export checked items**
- **Export filtered items**
- **Export all items**

1. Navigate to **Manage > Queues**.
2. Click the required queue and go to the **Work items**.
A list of available work items is displayed.
3. Click the **Export items to CSV** icon.

4. Click one of the following required options:
 - **Export checked items:** Exports only the selected work items

Note: You must select items to use this option.

- **Export filtered items:** Exports only the filtered work items
- **Export all items:** Exports all the available work items

A message is displayed, informing that the exported CSV file is available in the **Activity > Historical** page.

5. Navigate to the **Activity > Historical** page and search for exported work items activity.

Note: You can search for a work item activity by the username. The work item activity name is in the following format: Work items Export:cr-work-items-20220713-104704.csv. You can change the work item activity name by using **File > Save**.

6. Select the work item activity and click **Download exported CSV file**.
The CSV file is downloaded to your local system as a zip file.

Workload guidelines

To optimally use your work items and queues in Automation 360, review the guidelines.

Do's

- Ensure that the queue has at least 2 owners so that there is no deadlock if an owner is deleted or disabled.
- If work items are added frequently to a queue, set the reactivation threshold to 1 so that when a work item is added, the work item is added quickly.
- Up to 10 work item columns can be displayed in the Control Room. Use this feature to get maximum visibility in to your work item data.
- Optimally use work item values that can accept up to 1000 characters, especially for work item result values.
- To prioritize certain work items, ensure that you sort the work item data when you create queues.
- To insert work items in a loop, use the `v3/wlm/workitems` API because this API accepts a list of work items in JSON format.
- Ensure that the time (clocks) in all the machines in a cluster are synchronized. This is important for the Apache Ignite cache server to function properly.
- Persistent and continual database connectivity is critical for the functioning of workload automation. Therefore, ensure that you perform a periodic network scan or use tools that can detect or avoid network issues.
- Apply the pagination filter to retrieve more than 200 work items when you retrieve them using the work item API.

```
"page":  
    {  
      "offset":0,  
      "length":1000  
    }
```

Don'ts

- To ensure the system works efficiently, do not use the `v3/WLM/workitems` API in a loop to insert work items in bulk.
- If the Bot Runner is part of a device pool, do not create local schedules on that Bot Runner so that the Bot Runner runs only the work items.
- If a user has a queue in use, do not remove the **Run bot** permission from that user (role).
- If a work item is in progress, do not shut down a Bot Runner.

To take a Bot Runner offline for maintenance, ensure that you pause the queue and verify no work item is in progress on the Bot Runner.

- If a work item queue is being processed, do not stop or restart the Automation Anywhere Control Room Service. Instead, pause the queue automation, and then restart the service.

Understanding automation priority

The priority decides the processing order of the automations. You can set the automation priorities at the various levels:

- Bot: When you schedule a bot (**High, Medium, or Low**). For more information, see [Set automation priority for your bots](#).
- Queue (at device pool level): Define the order in which your automations run in the queues (**Round robin or Priority as shown in table**). For more information, see [Order of the automation queue](#) on page 1821.
- Work Item (at Queue level): Set the priority for **Work Item** column value. For example, **First Name** column ascending order and **Email** column descending order.

To understand how the automation priority works, let's see the following scenario:

Consider you have Q1 with 1st priority at the device pool level and Q2 with 2nd priority. Q1 has work items such as **InvoiceAmount** and **Total** with the following work item level priority:

- Q1 workitem level priority -> **InvoiceAmount** column ascending order
- Q2 workitem level priority -> **Total** column ascending order

When you add multiple workitems to Q1 and Q2 at the same time, Q1 workitem which has the lowest **InvoiceAmount** will run first.

In such scenario, queue priority at device pool level has precedence over the work item priority.

Bot Lifecycle Management

The Bot Lifecycle Management feature enables you to move a bot from one environment to another. For example, you can move a bot from the development or testing environment to the production environment.

Overview

Bot Lifecycle Management easily integrates with the DevOps workflow, which supports separate development, testing, acceptance, and production environments and enables you to move bots along with their dashboards from one environment to another.

Bot Lifecycle Management provides a framework for continuous testing and deployment of bots and their dependencies in separate software development life cycle (SDLC) environments, allowing bots to seamlessly transition between lifecycle stages defined by an organization before they are released to production.

You can use the feature to move bots within different environments and help you prevent failure or disruption of data. You have to export a bot from one environment and then import it to another environment or use the promote bot feature to move it between environments. You can also bundle all the dependencies of a bot when transitioning it through the different environments.

The following image shows a typical Bot Lifecycle Management workflow:

What is exported across environments

The following entities are included when you perform an export operation from one Control Room to another:

- Bot files
- Dependent files
- Action packages and dependencies
- Bot Insight dashboards

The following entities are not included when you perform an export from one Control Room to another:

- Credentials and credential lockers
- Workload management queues
- Bot Runner accounts and permissions

Permissions required to move bots across environments

To export bots from the Control Room, you must have the following permissions:

- **Export bot** and **View packages** feature permissions
- **Check in** or **Check out** folder permissions

To import bots to the Control Room, you must have the following permissions:

- **Import bot** and **Manage package** feature permissions
- **Check in** folder permission

To promote bots across environments you must have the following permissions:

- **Export bot** for the user performing the bot promotion in the source Control Room
- All folder level permissions (**Run and schedule**, **Check in**, **Check out**, **View content**, **Clone**, and **Delete from Public**) on the folders containing the bots which you want to promote in the source Control Room.
- The target Control Room user must have **Import bots** permission.

Importing Enterprise 11 bots when migrating to Automation 360

You can import your Enterprise 11 bots from the Enterprise 11 Control Room instance to Automation 360. This method enables you to consolidate the Enterprise 11 bots from multiple Control Room repositories to a single Automation 360 repository. After importing the bots to Automation 360, use the Bot Migration Wizard to convert the bots to the Automation 360 supported format (.bot).

Modes to move bots across environments

You can use one of the following two modes to move bots across different Control Room instances. Choose a method that best suits your environment and requirements.

Manual mode

- Involves exporting and importing bots using the user interface.

[Export bots](#) on page 1967 | [Import bots](#) on page 1969

- Use the promote bots feature.

[Promote bots](#)

Automated mode

Involves exporting and importing bots using Control Room APIs.

[BLM API](#)

Moving a bot

To move a bot from one environment to another, use one of the following options:

- Export and import bot
 1. Export the bot from the Control Room in the source environment.
 2. Import the bot into the Control Room in the destination environment.
- Promote bot

Note: You cannot copy a bot to a shared folder to move them between different Control Room environments. You must use either the export and import, or the promote bot feature to move bots across environments.

Guidelines for exporting and importing bots

Review the guidelines before you export or import bots.

Guidelines for exporting bots

- Export the action packages along with the bot because the packages in the target Control Room to which you are importing the bot might be different.
- Export the bots folder-wise by moving all the bots from one folder first before moving to the next folder. So do not select the bots from the different folders
- Ensure your SMTP (email) server is integrated with the Control Room so that you can receive a link to the exported package through email.

[Email server settings](#) on page 2442

- Ensure that the source and target Control Rooms have the same set of global values.
- Ensure that the source and target Control Rooms have the same set of lockers and credentials that are referred in the bots.

Guidelines for importing bots

- Recommended: When importing bot from the **Automation** page, use the **Skip the bot or file (don't import it)** option because you might want to check the bot first before overwriting it with the imported bot.
- Recommended:: First import the bots to your private repository (if you are a bot developer), verify the bot, and then check it in to the public workspace.
- The bot directory path is case-sensitive, so ensure that the export and import paths use the same letter case in the Control Room.
- Before importing a bot file of size 200 MB or more, check your load balancer configuration. In few environments, the bot import might fail with an error.

Export bots

You can export a bot from one Control Room to another.

- Only bots in the public workspace can be exported. If your bots are in the private workspace, check in the bots to the public workspace.
- Ensure that you have the `view` package permissions.
- Ensure that you have the `view content` rights at the folder level from which you want to export the bots.
- Ensure that the Control Room builds and packages in the source and target Control Room instances are the same for export as well as import.

Review the guidelines before you export bots.

[Guidelines for exporting and importing bots](#) on page 1967

1. On the left pane, click **Automation**.
A list of available and forms is displayed.

2. Click **Manage bots Export** in the public workspace.
3. Select the bot you want to export.
 - Latest version: Click **Latest version** tab to select the latest version of the bot.
 - Labeled version: Click **Production version** tab to select the labeled version of the bot.
4. Click **Next**.

The bot dependencies are displayed in the **Select dependencies** window. If the production label option is selected for the parent bot, the corresponding dependent bots with the production label are also automatically selected. If any of the dependent bots do not have the production label applied, the latest version of the bot is selected.
5. Select the dependencies to export and click **Next**.

All related packages are displayed.
6. Select the necessary packages associated with the bot to export.

Select **Exclude bot packages** to remove all packages from the export.
7. Optional: Create and confirm a password.

Password enhances the security for your bot or file when exporting from one Control Room to another.
8. Click **Export bots and files**.

All the selected bots are exported into a zip file.

Based on the result (failure or success) of the export bot functionality, a notification is also displayed in the Control Room **Notifications** icon. For more information, see [Automation events](#) on page 2132 event notification.

Note: If you have analytics bots in your Control Room, all the Bot Insight dashboards (default, custom, and published) associated with the bots are also exported into the zip file.

If you have configured SMTP, an email is sent that contains a link to the zip file of the exported package.

If you have not configured SMTP, perform the following steps to access the link to the zip file of the exported package:

- a) Navigate to **Activity > Historical**.
- b) Search and view the historical activity of the exported package.
- c) Click **Download exported zip file**.

A link to download the zip file is displayed.

9. Use the link to download the zip file and save it to a location for importing it to another Control Room.

Note:

- If you are exporting a large size bot or dependency, there might be a delay in the download of the export zip file from the **Activity > Historical** page.
 - All the exported zip files older than 30 days will be automatically deleted.
-

Import the bots into an Control Room.

Related tasks

[Import bots](#) on page 1969

You can import bots with their dependencies from one Control Room to another. The source environment can be Automation 360 Control Room, Enterprise 11 , or Enterprise 10 Control Room instance.

Related reference

[System roles](#) on page 1706

System roles are preconfigured with the permissions necessary to perform the tasks within the scope of that role. They cannot be modified or deleted. Administrators assign the roles to users to enable them to access features and perform operations in the Control Room.

Import bots

You can import bots with their dependencies from one Control Room to another. The source environment can be Automation 360 Control Room, Enterprise 11 , or Enterprise 10 Control Room instance.

- Ensure that the following rights are enabled to import bots:
 - Import bots permission
 - Create folder permission, if it is required
 - Check-in to public workspace permission if you are importing to the public workspace
- Ensure that the version of Control Room and packages in the source and target Control Room are same for export as well as import.
- You must have a Bot Creator license to import bots either into the private workspace or public workspace.

You can import bots into the public workspace if you have the required permissions, regardless of your license.

- To import the Enterprise 11 bots into your Automation 360 Control Room, consider the following additional requirements:
 - You must have the required `aapkg` package that you created using the Bot Lifecycle Management export feature in the Enterprise 11 Control Room instance.
 - The `aapkg` package must be present in the same Automation 360 machine where you want to import the Enterprise 11 bots.
 - You can import the password protected `aapkg` packages using the Bot Lifecycle Management Import API only. See Import repository bots in [BLM API](#)
- Review the guidelines before you import bots.

[Guidelines for exporting and importing bots](#) on page 1967

- To import bots from one Control Room to another, use the exported `zip` file (or `aapkg` file, in case of Enterprise 11 or Enterprise 10 bots). If the SMTP is configured, you will receive a link to download the `zip` or `aapkg` file on your configured email address. If SMTP is not configured, you can access the download link by navigating to **Activity > Historical** page.

Note: You can import the Enterprise 11 bots (.aapkg file) with or without the dependent MetaBots only into the public workspace. If you are importing the file into the private workspace, ensure that the dependent MetaBots dependencies are included.

1. On the left pane, click **Automation**.
A list of available and forms is displayed.
2. Click **Manage bots > Import**.
3. Browse and select the required zip file or aapkg file based on your source environment:

Source environment	Action
Automation 360 bots	Select the required zip file.
Enterprise 11 or Enterprise 10 bots	Select the required aapkg file.

4. Select the private workspace or public workspace based on your following source environment:

Source environment	Action
Automation 360 bots	<p>You can select either the private or public workspace as required.</p> <p>If you have analytics bots in your source Automation 360 environment, then all the associated Bot Insight dashboards are also imported based on the following selection:</p> <ul style="list-style-type: none"> • If you select the private workspace, you can view only default and custom dashboards. <p>To view published dashboards, you must check in the bots to the public workspace.</p> <ul style="list-style-type: none"> • If you select the public workspace, you can view only published dashboards. <p>To view default and custom dashboards, you must check out the bots to the private workspace.</p>
Enterprise 11 or Enterprise 10 bots	<p>Select the public workspace.</p> <p>This selection enables you to migrate Enterprise 11 or Enterprise 10 bots to the Automation 360 environment later during migration.</p>

5. Optional: Enter the password in the **Password** field.
If your exported bot or file is password protected, you will be prompted to enter a password. Obtain the password from the user who has exported this bot or file.
6. If some of the files that are being imported from the package are already available in your Control Room, choose one of the following options:
 - **Skip the bot or file (don't import it)**

- **Overwrite the bot or file with the imported one**

7. Click the **Import bots** option.

Based on the success or failure of the import bot, a notification also displays in the Control

Room **Notifications** with the () icon. For more information, see [Automation events](#) on page 2132 event notification.

8. After the import is complete, based on your source environment, navigate to the corresponding repository to find and use the imported bot:

Source environment	Action
Automation 360 bots	Navigate to the corresponding workspace (private or public, based on your selection in Step 4).
Enterprise 11 or Enterprise 10 bots	<p>Navigate to the public workspace in the Bots > My Tasks folder or Bots > My Metabots folder.</p> <hr/> <p>Note: Enterprise 11 and Enterprise 10 bots are imported in <code>.atmx</code> and <code>.mbot</code> format. Use the migration wizard to convert the Enterprise 11 and Enterprise 10 bots files to the <code>.bot</code> format, which is supported in Automation 360.</p> <p>Migrate Enterprise bots on page 1529</p> <hr/>

Related tasks

[Export bots](#) on page 1967

You can export a bot from one Control Room to another.

Related reference

[System roles](#) on page 1706

System roles are preconfigured with the permissions necessary to perform the tasks within the scope of that role. They cannot be modified or deleted. Administrators assign the roles to users to enable them to access features and perform operations in the Control Room.

Move bots across environments

You can move bots and files, their dependencies, and packages between Control Room instances in a single flow. The promote bot feature simplifies the process by avoiding the multi-step export and import process when moving bots across different Control Room environments (Dev to UAT).

- You must have the administrator license, or have a Bot Creator or Citizen Developer license with the following permissions:
 - **Export bots** for the user performing the bot promotion in the source Control Room.
 - All folder level permissions (**Run and schedule**, **Check in**, **Check out**, **View content**, **Clone**, and **Delete from Public**) on the folders containing the bots which you want to promote in the source Control Room.

- The target Control Room user must have **Import bots** permission.
- The target Control Room must have a valid URL.
- Add the list of approved target URLs.
 - a) Log in to the Control Room as an administrator.
 - b) Navigate to **Administration > Settings > Security settings > Bot promotion settings** and click **Next**.
 - c) Click **Edit**.
 - d) Enter the Control Room URL in the **Verified target Control Room URLs** field and click the **plus** icon.

Note: Only `https` URLs are accepted. You can add up to 25 target Control Room instances.

The validated target Control Room URLs will be displayed in the **validated URLs** field.

- e) Click **Save changes**.

Note: You can remove any URL by selecting the delete option in the three vertical ellipses next to the URL.

See the following video to understand how to add the list of approved target URLs.

- Move bots across Control Room instances.
 - a) Log in to the Control Room either as an administrator or a Bot Creator with the permissions previously described.
 - b) Navigate to the **Automation > Public** tab.
 - c) Click **Manage bots > Promote**.
 - d) In the **Promote bots and files** page, select the bots, files, processes, or forms you want to move and then click **Next**.
 - e) Select dependencies (if any) and click **Next**.
 - f) Select packages and click **Next**.

Note: To exclude packages, select the **Exclude bot packages** check box.

 - g) Provide a meaningful name for the promotion.
 - h) If some of the files that are being moved are already available in the target Control Room, select one of the following:
 - **Skip the bot or file (don't import it)**
 - **Overwrite the existing bot or file**
 - i) Click **Next**.
 - j) Select the target Control Room URL from the drop-down.
 - k) Enter the **Username** and **API key** for the target Control Room to authenticate.

Note:

- To prevent authentication errors, ensure that you provide the correct username and API key.
- If the API key you generate is of longer duration, you can re-use the same and need not generate the API key every time you promote a bot. If the API key expires, you must generate it again during bot promotion. Duration of the API key is configured by the admin.

For details about generating an API key, see [Create API key generation role](#) on page 1704.

l) Click **Promote bots and files.**

- The promoted bots and files appear in the target Control Room. If the Control Room is enabled for email notifications, you will receive an email regarding the bot promotion status.
- When bots are promoted, they are checked in to the target Control Room. If you choose the overwrite option, their version increments in the targetControl Room.

Note:

- Bots and files are promoted from and to the public workspace only.
 - You can promote up to 1000 bots.
 - You can promote bots from one Control Room to another if the source and target Control Room instances belong to the same domain such as AWS or GCP. You cannot promote a bot from AWS to GCP domain.
-

See the following video to understand how to move bots across Control Room instances.

Recover bots and files

You can recover the bots and files created in the private repository of a deleted user (Bot Creator or Citizen Developer) and transfer them to an existing user's repository. When users leave the organization, the automations they created are not lost and can be used by other users.

- You must be logged in to the Control Room as an administrator or a user with **Recover bots** permission.
- The target user must have the following permissions for the folders that are being transferred:
 - Clone
 - Check in
 - Check out
- The target user must have the same folder level permissions as the deleted user.
- The target user must be logged in and out of the Control Room at least once before the recovery process activity.
- The target user must have an empty private repository.

The recovery process is a one-time activity. Once you have transferred the bots and files from a deleted user, you cannot recover the private repository of the same user again.

1. Log in to the Control Room as an administrator.
2. Click **Manage bots > Recover**.
3. In the **Recover bots and files** page, select the deleted user whose private repository you want to recover and click **Next**.
4. Select the target user and click **Next**.
5. Provide a meaningful name for the recovery.
6. Click **Recover bots and files**.
 - The private repository of the deleted user is replicated in the private repository of the target user using the same folder hierarchy.
 - These automation details are retained: name, status (**New**, **Cloned**, **Checked out**, and **Checked out and edited**), source versions, code analysis results, size last modified, and modified by.
 - The audit log will contain details of the deleted user, new user, and the list of bots and files that are transferred.

Monitor Automation 360

Automation Command Center

In the constantly developing automation landscape, the role of data-driven decision-making is essential. Dashboards providing actionable insights are crucial for organizations to monitor, evaluate, and optimize automated processes.

The Automation Command Center (ACC) home page provides comprehensive visibility, actionable insight, and oversight capability into all aspects of automation domain.

Benefits and capabilities

The ACC home page provides the following benefits and capabilities:

- Effective monitoring of the automation landscape, leading to:
 - Improved reliability
 - Improved utilization
- Ensures compliance by highlighting results of code analysis
- Helps CoEs scale efficiently and achieve automation success
- Helps with informed decision making for process optimization
- Identifies bottlenecks and areas of improvement
- Easier navigation to other areas such as Automation Co-Pilot, CoE Manager, and Bot Insight

Components

ACC homepage consists of the following components:

- Visualization: Provides graphical visualization of data in the form of line charts, bar graphs, and pie charts.
- Widgets: Displays real-time information about automation status, utilization data, and compliance data.
- Filters: Provides ability to view data for specific time frame.
- Navigation: Provides easy navigation to various other components or domains.
- Resources: Provides easy access to development resources such as Automation Anywhere University and Pathfinder Community.

ACC - user roles

Automation Administrator

An automation administrator with **View operations data**, **View and manage ALL devices (s)**, and **View licenses** permission and

AAE_Queue_Admin role, can view operations-related widgets on the ACC home page. These widgets provide information on the automation statuses, license and device utilization. This enables the administrator to focus on the progress of the automation, drive optimal utilization of resources, and make efficient decisions.

[ACC home page for administrators](#) on page 1976

Professional developer or Citizen Developer

A Professional developer or a Citizen Developer has a personalized view of their recent work across repositories. In addition, help is just a click away with direct links to Pathfinder Community and Automation Anywhere University which also help improve developer productivity.

[ACC home page for Pro and Citizen Developers](#) on page 1978

ACC home page for administrators

As an automation administrator you can view operations-related widgets on the Automation Command Center (ACC) home page. These widgets provide information on the automation statuses, license and device utilization. This enables you to focus on the progress of the automation, drive optimal utilization of resources, and make efficient decisions.

Permissions

You must have the following permissions to access the operation-related widgets on the ACC home page.

- **View operations data**
- **View and manage ALL devices (s)**
- **View licenses**
- **AAE_Queue_Admin**

The ACC homepage provides you a holistic view of the automation landscape. The information is distributed within various specific sections.

- You can see the consolidated dashboard details which displays all the information at a single glance.
- The development details provides a quick glance at the automations run or scheduled by you. You can also view the automations which you have labeled or canceled the check-out operation.
- The operational insights provides you comprehensive and statistical information about automation metrics and the device and license statuses. By default, you can view these data for

the last 24 hours. The maximum time duration for which you can view automation details is for the last 90 days. For more details, see [Time filter](#) on page 2051.

Automation data

The various widgets provide you data that includes automation schedule and status, automation run time, most failed and most run automations, as well as the currently running automation details. You can use this information to:

- Analyze recent executions.
- Take corrective action for failed automations.
- Plan capacity for the upcoming scheduled automations.
- Work efficiently, improve reliability, and scale your automation program.
- Understand the impact of automations, ensure all operations are running as required.
- Monitor devices that are in use.

Device data

The widgets provide information about resource utilization of devices on which automations are executed. The information includes device status, device details, average utilization of each device, and insights on KPIs related to queues and work items such as queue status and the number of work items processed in a queue. You can use this information to:

- Plan the optimum usage of devices in the Control Room. For example, if the average utilization achieved over the last 24 hours on a set number of devices is very low, you can identify the total number of devices that are idle and deploy automations on those devices, thus improving their utilization.
- Plan you automation deployments thus improving the efficiency. For example, if the number of active queues at a given point differs from the data 24 hours ago, you can check for any issue and proactively take action. Similarly, with the help of this data, you can restart paused queues and delete inactive queues if they are not required.
- Understand the capacity available for additional automation scheduling, scaling automation program, and for planning the infrastructure budget.

- Distribute the load for better performance, thus reducing the wait time for devices.

License data

Provides license allocation information for all users and all Control Room instances. It also provides details on purchased license counts and available licenses.

This helps you realize the available capacity, drive optimal utilization of the licenses, and deliver value.

For more information, you can navigate to the licenses page. See [Manage licenses](#) on page 1720.

- You can view the compliance details in the form of a graphical insight. This helps you analyze the code quality of automations such as the total number of automations with high or low severity violations. It also shows the number of automations for which code analysis has not been performed.

You can use this information to improve code readability and quality and control the structure of your automation code. This helps you improve the productivity of the developer and also enable complex automations to be more accessible.

You can further navigate to manage policies page for more information. See [Manage policies | Configure and assign code analysis policy](#) on page 2115.

- You can use the links to quickly and easily navigate to other components or domains such as the pathfinder program, Automation Anywhere University, and pathfinder community. You can also use these links to navigate to other areas such as Automation Co-Pilot, CoE Manager, Bot Insight, and so on.

ACC home page for Pro and Citizen Developers

As an automation developer (Pro or Citizen Developer), you can have a centralized view of your automations on the Automation Command Center (ACC) home page. This quick access to the automations and other dev resources in the form of direct links to pathfinder community and Automation Anywhere University helps in improving the productivity.

The ACC homepage provides a comprehensive view of the automation landscape. The information is distributed within various specific sections.

- You can see the consolidated dashboard details which displays all the information at a single glance.
- The development details provides a quick glance at the automations you have been working on for the last 7 days. Clicking any of these automations opens them in the bot editor for further action.
- If code analysis is enabled, you can view the compliance details in a graphical format that provides insight on the code quality of automations created by you such as the total number of automations with high or low severity violations.
- You can navigate to other components or domains of Automation Anywhere such as the Automation Pathfinder Program, Automation Anywhere University, and pathfinder community. You can also use the quick links to navigate to other areas which you have access to such as Automation Co-Pilot, CoE Manager, and Bot Insight.

You can use this information to:

- Improve productivity. Easy and quick access to the automations you have been working on has a great impact on your productivity as it reduces navigation time, enhances focus, and streamlines your workflow.
- Maintain a higher standard of code quality by reducing the defects. Helps identify the issues earlier on and provide resolution. Helps maintain a standard code structure which makes the code easier to read and understand, especially when working in collaboration.
- Reduce the need to reinvent the wheel by providing efficient access to valuable information, knowledge, best practices, and solutions in the Pathfinder Community. Help is just a click away enabling faster resolutions to problems. Engaging with the developer community also helps inspire innovative ideas.

The following video shows the personalized ACC home page for a Pro and Citizen Developer user.

Automation program lifecycle with CoE Manager

CoE Manager and CoE Manager Plus provide capabilities that enable you to govern, track, and measure automation program performance.

Scaling automation programs requires expert-led guidance and planning, governance, and the ability to demonstrate and measure the value delivered. CoE Manager offerings help you maximize the value of your automation program with a tool that enables you to manage the end-to-end program lifecycle, centralize governance, increase collaboration, and provide a platform where growth can be measured.

CoE Manager

CoE Manager provides an out-of-the-box solution to manage the automation program lifecycle. You can measure program success, chart your automation path, and engage your workforce in building an automation pipeline with a purpose-built, plug-and-play suite to fuel center of excellence performance.

[CoE Manager](#) on page 1980

CoE Manager Plus

CoE Manager Plus provides all the capabilities of CoE Manager and in addition also offers advanced capabilities, customizations, and integrations to truly optimize automation program performance across any team, regardless of which automation platform you use. CoE Manager Plus can be tailored to track ROI and capture key insights from multiple automation program vendors, enabling a holistic view of your ROI across a more complex automation landscape.

[CoE Manager Plus](#) on page 1982

Comparing the CoE offerings

Capabilities	CoE Manager	CoE Manager Plus
Pipeline management and ROI	Yes	Yes
Seamless integration with Automation 360 Control Room instances	Yes	Yes
Template customizations	No	Yes
Advanced configuration capabilities for new modules and integrations	No	Yes
Integrations with Microsoft Power Automate	No	Yes
Count of supported orchestrators	3	Unlimited

CoE Manager

Automation Anywhere CoE Manager helps you achieve visibility into your end-to-end automation lifecycle while accelerating the pipeline generation. It helps scale the automation programs more quickly and efficiently, while maximizing the value realization from the investment in your automation program.

CoE Manager is available out of the box and requires minimal configurations for first-time use. In addition to program management capabilities, it provides a consistent and repeatable way of assessing automation opportunities in order to minimize variations and maximize return on investment (ROI). ROI can be measured in terms of time and cost saved as well as user-defined KPIs such as operational agility, cash flow, sustainability, and so on.

CoE Manager is powered by Shibumi platform, a leading provider of enterprise program management solutions.

Benefits

CoE Manager helps you in the following ways:

- Scale automation programs more quickly and efficiently.
- Forecast business results, identify metrics for success, and track them through the entire automation lifecycle.
- Create single view of portfolio status, risks, and interdependencies.
- Informed decision making with timely and accurate data.
- Assess all automation ideas across expected savings, strategy alignment and automation complexity to enable prioritization.
- Reduce manual effort on multi-level tracking, computing, and reporting.
- Maximize the value (ROI) from your automation investment.
- Boost the value of the pipeline of automation opportunities to build the business case for additional investment.

Capabilities

CoE Manager is a cloud-based platform which helps manage the automation pipeline and delivery.

Key capabilities of CoE Manager are:

- Accelerate the automation lifecycle journey with a purpose-built automation CoE management solution where everyone can share automation ideas.
- Enable the leadership team to make focused decisions by providing dashboards that help maximize the ROI from the automation program.
- Enable tracking and managing the pipeline by tracking automation program data, set targets, and tracking the progress. It helps manage the pipeline from idea to delivery to value realization.
- Track automation ROI via native integration with Automation Anywhere.
- Seamless reporting via dashboards and automated report creation.
- Efficient governance with role-based access control with in-built approval workflows and user notifications.

Components

The CoE Manager includes the following components:

- **Dashboard:** Provides graphical insight to help you view the adoption and progress of the automation program. It displays information on idea velocity, opportunities by stage, forecasted savings versus program target, value by stage, as well as benefits at various stages.
- **Opportunities:** Displays all opportunities across idea, pipeline, in-progress, and deployed stages.
- **Ideas:** Displays new opportunities submitted into CoE Manager.
- **Pipeline:** Displays approved opportunities.
- **In Progress:** Displays opportunities currently in design/build stage.
- **Deployed:** Displays opportunities that are live.
- **Risks:** Track program risks and their resolutions.
- **Reporting:** View and export the status of entire automation program or drill-down into each business unit.
- **Admin:** Configure program details and targets, questionnaire and weightages, cost estimates, benefit types, and so on.

CoE Manager Plus

CoE Manager Plus supports all capabilities of CoE Manager and in addition provides advanced capabilities, customizations, and integrations to optimize your automation program performance. You can track transaction-level ROI metrics and capture key insights regardless of the platform you use.

CoE Manager Plus provides you a holistic view of your ROI across a more complex automation landscape.

To have a consistent and reiterative idea for the implementation cycle, you require a scalable platform that provides association with multiple stakeholders and real-time visibility into your automation program. End-to-end automation requires interaction between people and processes to enable seamless execution flow. Opportunities can be sourced from a process intelligence tool or manually submitted by business users and COE team members. CoE Manager Plus supports all these scenarios.

CoE Manager Plus enables the opportunity lifecycle (**Idea > Prioritize > Build > Deploy**) and allows both COE team members and business users to collaborate to arrive at value realization. This results in a good quality opportunity pipeline and gives a real-time visibility into automation program status by tracking the automation success.

Once the opportunity is created and is in the Idea stage, navigate to the details tab to select the automation vendor (Automation Anywhere or Microsoft Power Automate).

Capabilities

Key capabilities of CoE Manager Plus are:

- Make value-focused decisions with a holistic view of ROI across the automation landscape with integrations to other automation vendors like Microsoft Power Automate.
- Connect to unlimited Control Room instances and track ROI from all of them.
- Make informed decisions with the information received from customized dashboards. For example, you can track which business unit is generating more value; Finance, Marketing, Sales, and so on and make decision based on that.
- Provision of two environments, production and development enables you to test before publishing to the live environment.

Getting started with CoE Manager

CoE Manager provides clear visibility into the backlog of automation ideas, their position in the lifecycle, and how much value they will deliver back to the business. The following is a high-level overview of how to get started with CoE Manager:

Add the following email domains to your email client's safe-senders list to ensure users receive the notifications generated by CoE Manager.

- APP environment (North America) - notifications come from @mail.app.shibumi.com
- EU environment (Europe and India) - notifications come from @mail.eu.shibumi.com
- AP environment (Asia-Pacific) - notifications come from @mail.ap.shibumi.com

As an administrator, you can perform the following tasks in CoE Manager.

Register and access CoE Manager

You must be invited to use CoE Manager. When you respond to your first invitation, you will set up a login account. You will use this account for all future use.

[Create and manage your account](#) on page 1984

Setting up CoE Manager for first-time use

- Configure CoE Manager: CoE Manager provides program-level administration tabs to tailor the solution for your use.

[Configure CoE Manager](#)

- Enable CoE Manager: You can enable access to the CoE Manager from the Control Room so that you can access the CoE Manager from the quick links section on the Control Room home page.

[Enable CoE Manager](#) on page 2006

- Integrate CoE Manager with Control Room: You can integrate the CoE Manager with the Control Room to monitor your automations and calculate the savings achieved. You can link up to three Control Room instances with one instance of CoE Manager.

[Integrate CoE Manager with Control Room](#)

- Add users: Add participants to specific roles within your CoE Manager.

[Participant window](#) on page 2007

- Export and import: You can bulk import previously created opportunities into a program in the CoE Manager.

[Export and import opportunities in CoE Manager](#) on page 1995

Link a Task Bot to an opportunity

You can review digital worker information from the **Deployed** tab and add automations directly on an opportunity. To register a digital worker with an opportunity, you can either use the **Opportunities** tab to search for the opportunity you would like to update or use the search option (magnifying glass icon) on the Navigation Sidebar.

[CoE Manager - Link automation to opportunity](#) on page 2021

Create and manage opportunity

All users can create and manager opportunity in the CoE Manager. You can submit an opportunity, build a business case for it, and track its progress through the approval stage gates.

[Create and manage opportunity](#) on page 2012

Create and manage your account

To get started with Shibumi, you will be sent an invite to join Shibumi when an admin adds you to an item in the system. Accept the invite, set up your profile, create a password, and you will be set to start achieving goals in Shibumi.

You can further customize your experience by adding favorites and tailoring your homepage to pull up items and dashboards that matter the most to you.

Set up account

After the Shibumi administrator has set up an app to support your client engagement, you will receive an email inviting you to collaborate. Click **Start Collaborating**. Shibumi helps organizations manage strategic business initiatives, measure performance, and ensure success.

If this is your first invitation, you will be prompted to set up an account. When you set up an account you must create a password. Once you log into Shibumi, the Shibumi workspace will be displayed. Your ability to view and collaborate on work items is determined by your participation access for the work items.

The image shows a registration form for Shibumi. At the top is the Shibumi logo in blue. Below the logo are four input fields: 'First Name *', 'Last Name *', 'Create Password *', and 'Confirm Password *'. The password fields have a small icon of a crossed-out eye, indicating a password strength indicator. Below the password fields is a text requirement: 'Password must be at least 10 characters, include at least 1 uppercase letter, 1 lowercase letter, 1 digit, and 1 symbol.' At the bottom of the form is a blue button labeled 'Create Account'.

Note:

- The registration link in your invitation email is only valid for 14 days.
- Passwords must be 10-20 characters and include at least 1 uppercase character, 1 lower case character, 1 special character, and 1 number.

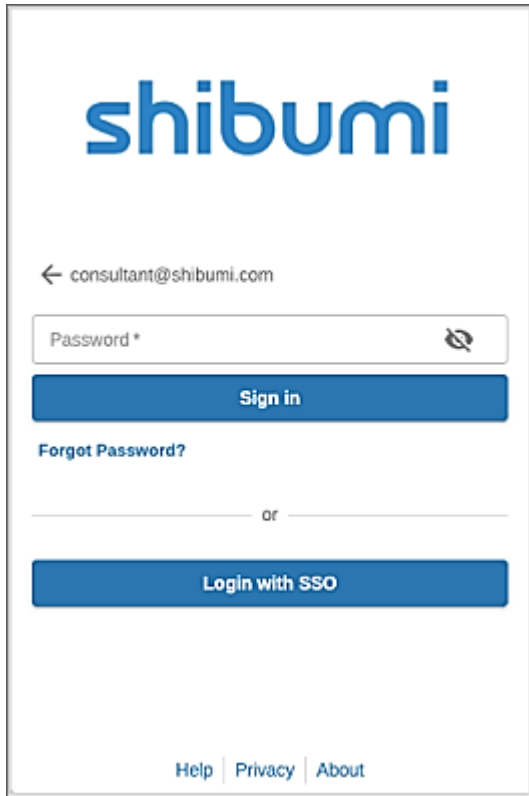

Log in to Shibumi

From the login page, enter your email address and password. If you forget your password, click **Forgot Password?** and Shibumi will send a link to your email with instructions on how to reset your password.

Log in with SSO

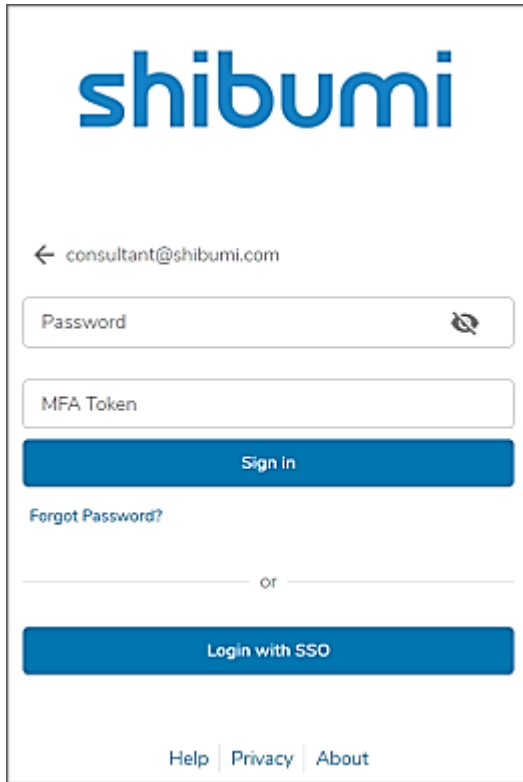

If your enterprise requires SSO login, you will be directed straight to your SSO Identity Provider after entering your email and clicking **Next**. If SSO login is optional in your enterprise, after clicking **Next**, you can click **Login with SSO** to access your SSO login flow.

The image shows a login form for Shibumi. At the top is the Shibumi logo in blue. Below it is a back arrow and the email address 'consultant@shibumi.com'. There is a password input field with a 'Password *' label and a toggle icon. Below the password field is a blue 'Sign in' button. Underneath is a link for 'Forgot Password?'. A horizontal line with 'or' in the center separates this from a blue 'Login with SSO' button. At the bottom are links for 'Help', 'Privacy', and 'About'.

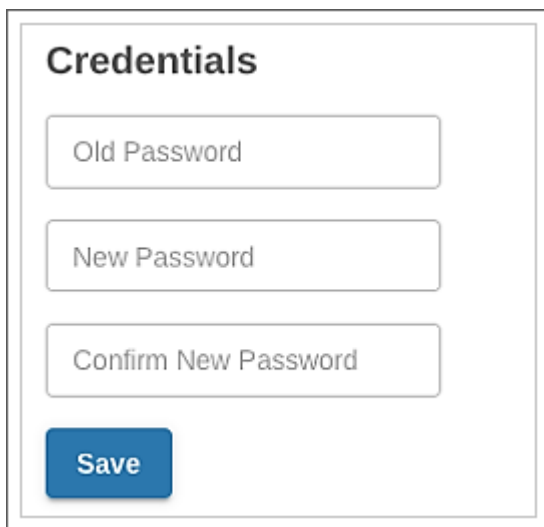

Log in with Multi-Factor Authentication

If you have previously configured Multi-Factor Authentication (MFA), you will see an MFA token field below the password field. Open a supported authenticator app on a mobile device and enter the 6-digit token for your Shibumi account.

The image shows the Shibumi login interface. At the top is the 'shibumi' logo in blue. Below it is a back arrow and the email address 'consultant@shibumi.com'. There are two input fields: 'Password' with a toggle icon and 'MFA Token'. A blue 'Sign In' button is below the fields. A link for 'Forgot Password?' is positioned below the button. A horizontal line with 'or' in the center separates the sign-in section from the SSO section. Below the line is a blue 'Login with SSO' button. At the bottom are links for 'Help', 'Privacy', and 'About'.

Change your password

The image shows a 'Change your password' form. It has a title 'Credentials' at the top. Below the title are three input fields: 'Old Password', 'New Password', and 'Confirm New Password'. At the bottom of the form is a blue 'Save' button.

To change your password:

1. Click the **User** icon from the navigation sidebar.
2. Click **Edit My Account**.
3. Navigate to the password section.
4. Enter your old password.

5. Enter your new password.
6. Enter your new password again.
7. Select the **Save** button to change your password.

Configure CoE Manager

The CoE Manager provides several program-level administration tabs to configure it as per your requirements. You must have an admin permission to configure the CoE Manager.

You can configure these various administration level tabs to define the following:

- The program level details such as the number format, currency, and start and end time for the program; define the weighted benefit at each stage; what should be displayed in your advanced views, complexity cost estimates; and creating opportunity and business unit sources.
- The complexity of an opportunity, its strategic alignment, and benefit types. You can also define how to configure the program dashboard, idea, pipeline, in-progress, and deployed tabs.
- Control Room integrations; Cloud or On-Premises.
- Opportunity and role assignments, you can view the participants associated with each opportunity.

The administration level tabs you can configure are given below:

- [Admin - Program](#)
- [Admin - Users](#)
- [Admin - Tech](#)
- [Admin - Advanced](#)

Admin - Program

You can configure the general settings for the overall program.

In the **Admin- Program** tab, you can define the start and end date of your program, the weighted benefits at each stage, the target values to use while calculating overall score for your opportunities, the complexity of cost estimates, and so on.

Program Details

Program Details
Cancel Save

Program Start Date

Currency Symbol

Number Format

Formatted Decimal Places

Track Program Risks?

Program End Date

Primary Benefit Measure

Number Suffix

Assign Intake Submitter as Opp Owner

Show Oppty Activities as

Indicate which target value(s) should be used in calculating the overall score for opportunities

Opp Target - Overall Score Calculation

Opp Target - Amount Saved

Opp Target - Hours Saved

The table below describes what can be defined in each option.

Option	Details
Program Start and End Dates	Displays the start and end dates for the program.
Currency Symbol	Displays the currency symbol alongside savings values. This setting applies to all opportunities.
Primary Benefit Measure	Displays the primary quantitative measure for the CoE Manager as either hours or currency. For example, if you select currency, the program dashboard tab displays forecasted savings on the top-left corner of the page. If you select hours, the program dashboard tab displays the forecasted hours saved.
Number Format	Controls how large numbers are abbreviated. The options are full number, thousands, and millions.
Number Suffix	Automatically assigned based on the number format selected, has a value of K for thousands and M for millions.
Formatted Decimal Places	Specifies how many decimal places to display in numbers formatted with M or K based on the number format selection described above.

Option	Details
Assign Intake Submitter as Opp Owner	Determines whether the system should create an account for the user submitting the opportunity. This is applicable for users who currently do not have an account with the CoE Manager. If set to Yes , the email address in the opportunity submission form is used to create the user account. Ensure the email domain is whitelisted within the CoE Manager.
Track Program Risks	Specifies whether or not to show the risks tab at the program level.
Show Opp Activities As	Specifies how opportunities activities are displayed on the activities tab. You can choose between a List and a Gantt-Chart.
Opp Target – Overall Score Calculation	Choose whether you want to use amount or hours to calculate opportunity targets.
Opp Target – Amount and Hours Saved	Specifies the target amount and hours saved for individual opportunities. For calculating the Overall Score for an opportunity, the percentage achievement toward these targets as well as the business alignment percentage is used.

Weighted Benefit per Stage

Weighted Benefit per Stage
Stage 1 Weight 0%
Stage 2 Weight 25%
Stage 3 Weight 50%
Stage 4 Weight 100%

Determines the weightings to calculate the weighted benefits for opportunities at each stage in CoE Manager. The weighted benefit is calculated by multiplying the estimated value for each opportunity with the corresponding factor to reflect the confidence of the benefit being achieved. Typically, opportunities in the idea stage are weighted lightly and gain in weighted value as they progress toward deployment. The weighted value is used to estimate total program savings.

Advanced Views

You can set the visibility of the below-mentioned admin tabs:

- Admin - Advanced
- Admin - Users
- Admin - Tech

Complexity Cost Estimates

Specifies the default implementation cost estimate to be assigned for an opportunity when either a low, medium, or high complexity assessment is specified for that opportunity. You can override the default cost estimate by typing a new value in the implementation cost field on the details tab for the opportunity.

Business Unit List and Opportunity Sources

Lists the business units and opportunity sources for the automation program. Use the Create Business Unit and Create Opportunity Source buttons at the top of the section tabs respectively to create the business unit and opportunity sources.

[Set up organization hierarchy and link opportunities](#) on page 1992

Monthly Targets

Lists the program and business unit targets. You can enter the targets for the program as a whole and individual business units in this list.

Set up organization hierarchy and link opportunities

You can set up an organization hierarchy by creating business units and their sub-level units and link opportunities to them. This provides a better understanding of how many opportunities were submitted from different areas of the organization, how many were automated, and measures the ROI generated from them.

You must have an administrator role.

- Create a business unit.
 - a) In the CoE Manager, navigate to the **Admin-Program** tab.
 - b) Click **Create Business Unit**.
 - c) Enter a name for the business unit.
 - d) Click **Create**.

A new business unit is created under the root folder which you can verify in the navigation pane on the left.
- Create a sub-level unit for the organization hierarchy structure.
 - a) In the CoE Manager, select the business unit for which you want to create sub-levels.
 - b) In the business unit details page, navigate to the **Org Hierarchy Admin** tab.
 - c) Click **Create Org Hierarchy**.

- d) Enter a name for the sub-level unit.
- e) Click **Create**.

Note: You can create an unlimited amount of business units and sub-levels units.

A sub-level is created under the business unit which you can verify in the navigation pane on the left. A new **Org Hierarchy Path** column in the **Opportunity** and **Org Hierarchy Admin** tab displays the path (including the business unit and its sub-levels) this opportunity belongs to.

- Map opportunity to the business unit or its sub-level unit.
 - a) Select the business unit or the sub-level unit for which you want to map an opportunity.
 - b) Navigate to the **Opportunities** tab.
 - c) Click **Create Opportunity**.
The intake form page is displayed.
 - d) Select the business unit or the sub-level unit from the drop-down to which you want to map this opportunity.
 - e) Enter the rest of the details in the intake form and click **Finish**.
After a page refresh, the opportunity is displayed under the business unit or its sub-level unit to which this opportunity is mapped.

Admin - Advanced

You can define the detailed prompts for additional benefits, complexity and strategic alignment questions for automation opportunities. You can also specify the display icons across the CoE Manager.

Label Settings

You can change the labels for workstream, complexity and strategic alignment attributes in the details section of an opportunity.

Label Settings	
Workstream Label Business Unit	Workstream Label (CAPS) BUSINESS UNIT
Complexity Label Complexity	Complexity Label (CAPS) COMPLEXITY
Strategic Alignment Label Alignment	Strategic Alignment Label (CAPS) ALIGNMENT

Opportunity - Addl Benefit Types

You can define up to five categories of benefits in the additional benefits section on the details tab for opportunities. You can track benefit amounts and comments for each benefit category for the opportunities.

Opportunity - Addl Benefit Types

Additional Benefit Type 1
Cost Avoided

Additional Benefit Type 2
Risk Avoided

Additional Benefit Type 3
Revenue Enabled

Additional Benefit Type 4
Productivity Improvement

Additional Benefit Type 5
--

Opportunity - Complexity

Defines up to five complexity questions, weighting for each question and the scoring scale. You can rate each opportunity on a scale from none to very high to drive a complexity score (based on the weightings) for the opportunity.

Opportunity - Strategic Alignment

Defines up to five strategic alignment questions and the weighting for each question. You can rate each opportunity on a scale from none to very high to drive an alignment score (based on the weightings) for the opportunity.

Export and Import

You can bulk import opportunities into a program. You can import your previously created opportunities into the CoE Manager.

See [Export and import opportunities in CoE Manager](#) on page 1995.

Export and import opportunities in CoE Manager

As an administrator, you can bulk import previously created opportunities into a program in the CoE Manager.

1. In the CoE Manager, navigated to **Admin - Advanced > Export / Import Opportunities**.
2. Download the opportunity template.
 - a) Click the **Export** button. An excel file is downloaded.

Note: This is a pre-filled template with existing opportunities in the CoE Manager. If there is no data in the CoE Manager, the exported excel file will only contain headers in it.

- b) Open the downloaded template and click **Enable Editing**.
 - c) For each row of new opportunity to be created, enter the data as outlined below:
 - Column A: Default to `Opportunity_t`
 - Column B: Do not fill
 - Column C: Enter the **Business Unit** for the opportunity being created
 - Column D through AE: Fill the details as required
 - d) Optional: Enter the submitter email address.
 - e) Save the excel file.
 3. Import the file.
 - a) Click the **Import** button.
 - b) Browse and choose the file to import and click **Import**.

Admin - Tech

You can manage the integration of automation platforms for the program. CoE Manager enables you to track process level return on investment (ROI) of your automations with real-time dashboards.

The ability to measure the ROI of automations helps you to:

- Create a robust pipeline of automations to move your business forward.
- Understand the impact of your automation program across the enterprise.
- Track both the transaction and the process ROI.

You can connect up to three Control Room instances with one instance of CoE Manager. These Control Room instances can be either Cloud or On-Premises.

Control Room Integrations		
Name	Automation Anywhere URL	Hosting Type
Cloud CR	aa-saleseng-v2-eu-1-1.my.automationanywhere.digi...	Cloud
Control Room EU	ssarkaraa.ae.dev.supremomono.com	On-Prem
QA on-prem CR	rscr003.automationanywhere.net	On-Prem

1-3 of 3 < >

For Cloud Integrations

Enabled integrations run every four hours starting at 2AM UTC. If any settings are missing (URL, Username, API Key) the integration will be automatically disabled.

For On-Prem Integrations

Download the Bot, install into your Control Rooms, configure with the generated URL provided and schedule the Bot to run.

Cloud Control Room integration

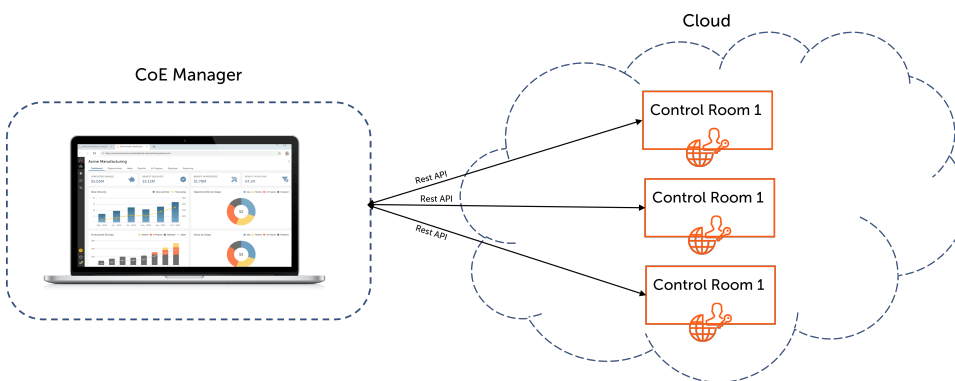

When you enable the integration between the CoE Manager and the Cloud Control Room, the enabled integrations run periodically. This ensures that the CoE Manager automatically pulls the automation data from the Cloud Control Room for ROI calculation.

To retain the enabled integration enabled without any disruption, enter the correct Control Room URL, username, and API key.

The enabled integration ensures that all the bot execution and transactional data is pushed from the Control Room to the CoE Manager every four hours. Each push includes the current day's data plus the previous day's data in full. This overlap of data is done to ensure there are no data gaps in the case of API call failures. All duplicate data is automatically corrected in the CoE Manager before publishing them on the dashboards.

Architecture

The following image shows the architecture of integrating CoE Manager with a Cloud Control Room:

On-Premises Control Room integration

To track the ROI of your automations on an On-Premises Control Room, you need to run a bot to push the automation data from the Control Room to CoE Manager on the Cloud. The bot checks the activity logs for the specified time and sends the data to CoE Manager. For the bot to execute successfully, you must provide the following information:

- Control Room URL - This is the URL of the Control Room instance on which the bot executes.
- API Key username - This is the Control Room user with **View everyone's activity** and **Generate API-Key** permissions and who creates the API key.
- API key - This is the key generated using the above credentials.
- CoE Manager URL - This is the destination URL which is retrieved from the **Admin - Tech** tab in the CoE Manager. The activity log data is sent to this URL.

Important: The data collected from the Control Room does not include any personally identifiable information (PII) or sensitive data.

Recommendation: Schedule your bot that pushes data to the CoE Manager to run at least once a day to avoid data gaps in the CoE Manager dashboards. Each data push will include the current day's data plus the previous day's data in full. This overlap of data is done to ensure there are no data gaps in case of API call failures or network issues. All duplicate data is automatically corrected in the CoE Manager before publishing them on the dashboards.

The following data is pushed from the Control Room to CoE Manager:

- Automation name
- File name
- File path
- Start date time
- End date time
- Status
- Progress
- Automation ID
- User ID
- Device ID
- Modified by
- Created by
- Device name
- Username
- Automation priority

Architecture

The following image shows the architecture of integrating CoE Manager with an On-Premises Control Room.

Setting up integrations

You can calculate the ROI for automations running both in the Cloud and On-Premises Control Room.

- [Cloud Control Room](#)
- [On-Premises Control Room](#)

Troubleshooting

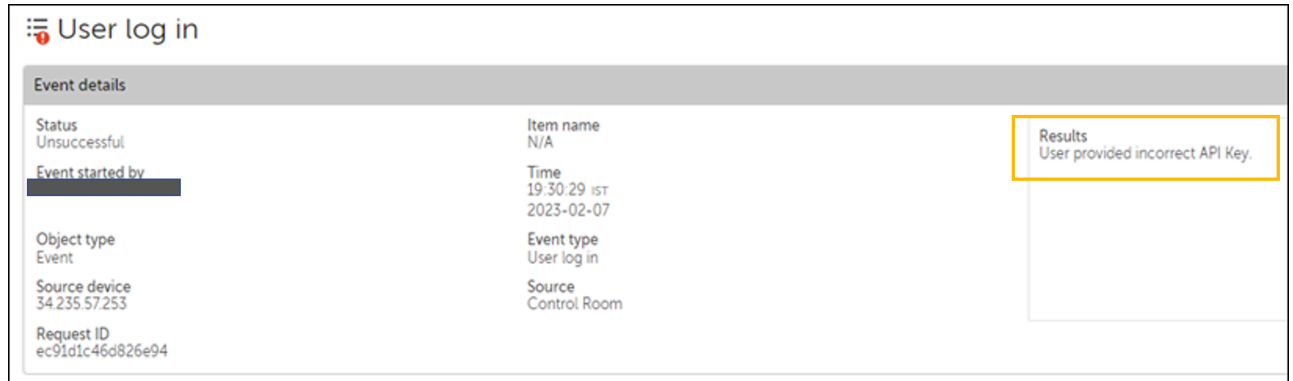

If you are unable to see the ROI or activity data in the **Opportunities > Execution Tracking** tab in CoE Manager, see below for possible reasons:

- There might be Control Room configuration setup issues in CoE Manager. Ensure that you have correctly set up the following:
 - The Automation Anywhere URL must be in `xyz...abc` format. It should not be in `https://xyz...abc/` format.
 - Automation Anywhere username and API Key are correctly set up in the Control Room and entered correctly in CoE Manager.
- There might be a problem with the Control Room user account or the API key. To troubleshoot, review the audit logs and the logs for the Control Room user account. See the following examples.

User log in

Event details	
Status	Item name
Unsuccessful	N/A
Event started by	Time
[redacted]@automationanywhere.com	23:30:34 IST 2023-02-07
Object type	Event type
Event	User log in
Source device	Source
3.225.63.178	Control Room
Request ID	
35ae00b2d6620f59	

Results
User does not exist in Control Room.

- Activity API is unable to retrieve the run data for Task Bots. You can verify this by running the activity API and checking whether it pulls data for your bot. If the activity API cannot find these bots, it cannot push their activity logs to CoE Manager. As a result, no ROI will be calculated.
- API key might have expired. Ensure that API key has not expired by checking the API key expiry duration in the Control Room settings.
- CoE Manager has not yet performed the batch extraction of activity data from the Control Room. Check the run schedule in the **Admin – Tech** tab and recheck the ROI data after the integration has run.

CoE Manager Plus - Integrate with Cloud Control Room

You can integrate the CoE Manager Plus with the Cloud Control Room to monitor your automations and calculate the savings achieved. There are no limitations on the number of Control Room instances you can link to with one instance of CoE Manager Plus.

- In the Control Room, perform the following steps:
 - a) Create a custom role with **View everyone's activity** and **Generate API-Key** permissions.
 - b) Create a user and assign the custom role created above.
 - c) Generate API Key for the user.
For details about generating API key, see [Create API key generation role](#) on page 1704.
- In the CoE Manager Plus, perform the following steps:
 - a) Navigate to **Admin - Tech** tab.
You must have RPA admin or RPA tech-admin role to access the **Admin - Tech** tab.
 - b) Click **Add Automation Integration**.
 - c) In the Create Control Room Integration screen, provide the following details:
 - a) Provide a name for your integration.
 - b) Select Automation Anywhere in the **Vendor** field.
 - c) Provide the vendor URL.
 - d) Enter the username in the **Vendor Username** field.
 - e) Enter the API key in the **Vendor API Key** field.
 - f) Click **Save**.

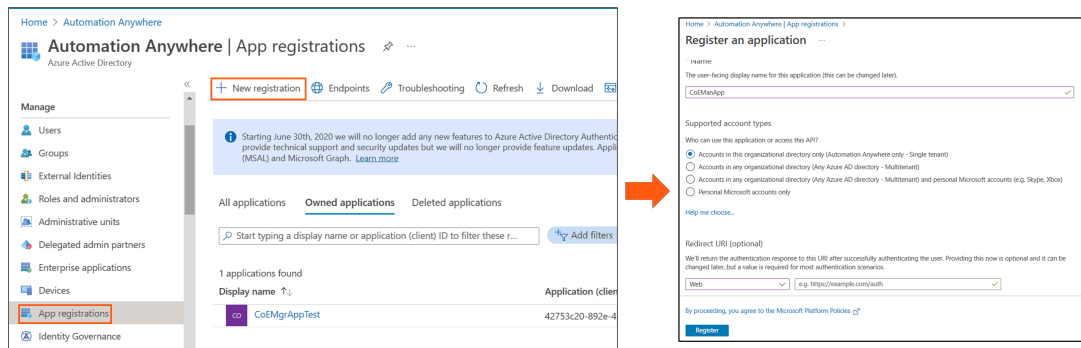

Note: For Cloud Control Room, the enabled integrations run every four hours and thus data is pushed from Control Room to the CoE Manager Plus periodically.

The **Enabled** column automatically changes to **Yes** when you save the URL, username, and API key.

CoE Manager Plus - Integrate with Microsoft Power Automate

You can integrate CoE Manager Plus with the Microsoft Power Automate environment to monitor your automations and calculate the savings achieved. There are no limitations on the number of Microsoft Power Automate environments you can link to with one instance of CoE Manager Plus.

1. In the Microsoft Azure, register a new application and generate client and tenant ID.
 - a) Navigate to **App registrations > New registration**.
 - b) Provide a name for the application.
 - c) For the supported account types, select the option **Accounts in this organizational directory only (Automation Anywhere only – single tenant)**.
 - d) In the redirect URI field, select **Web** as the platform.
Leave the URL blank. You must add the generated CoE Manager callback URL here.
 - e) Click **Register**.

- f) Copy the unique Client ID and tenant ID to clipboard.

2. Generate client secret.
 - a) Navigate to **Certificates & secrets**.
 - b) Click **new client secret**.
 - c) Enter a description.

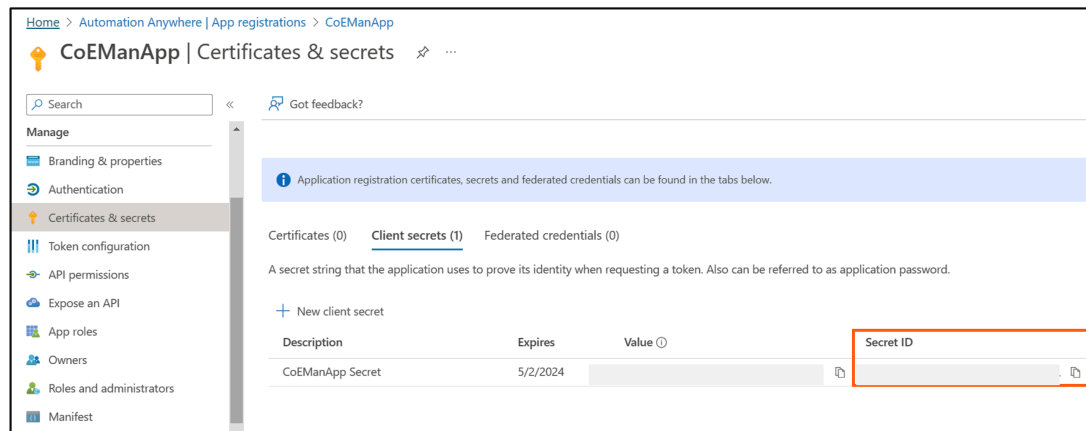

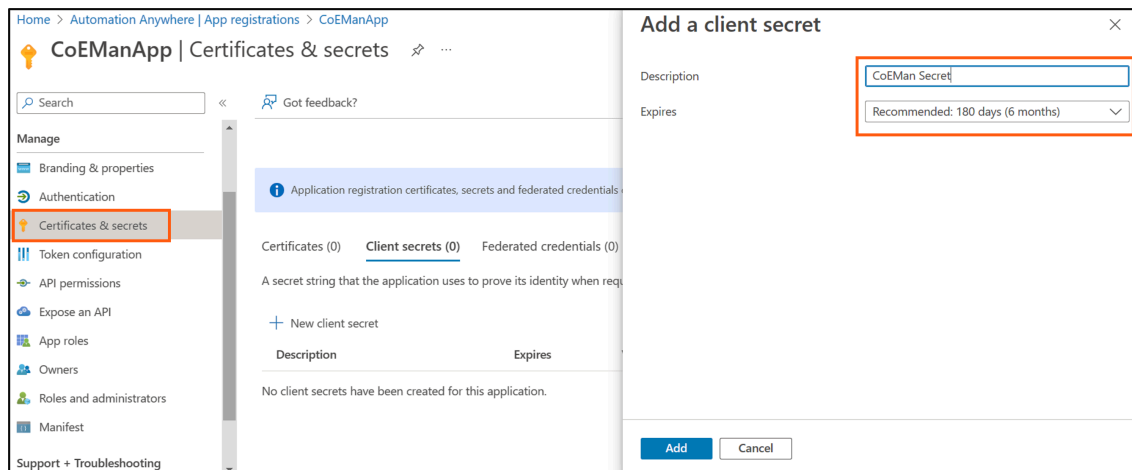

- d) Select the validity period of the client secret.

Recommendation: Choose 180 days (6 months).

- e) Click **Add**.

- f) Copy the generated client secret to clipboard.

Note: The client secret will not be available once you move away from this screen.

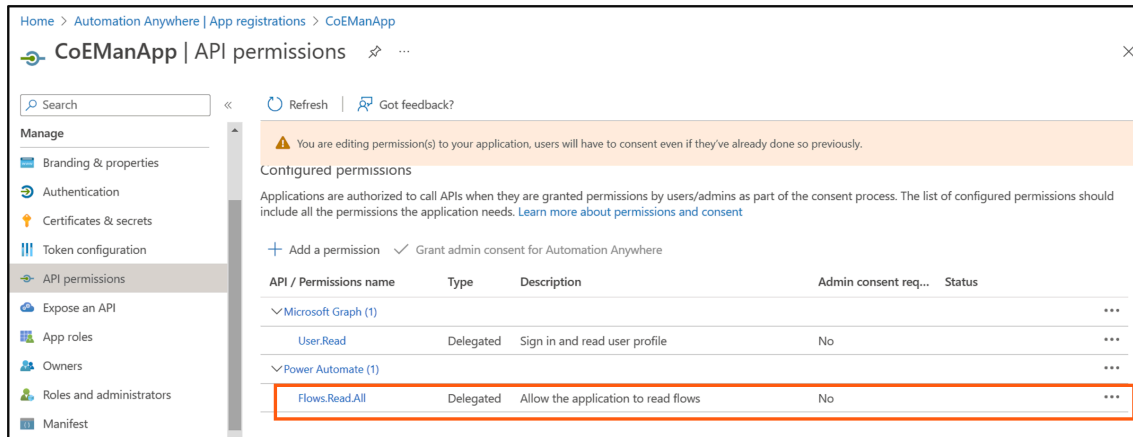

3. Set the API permissions.

- a) Navigate to **API permissions**.

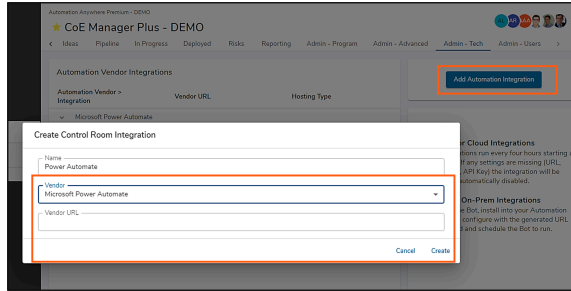

- b) Select **Power Automate** in the **Request API permissions** tab.

- c) In **Flows permission** field, select **Read All** permission.

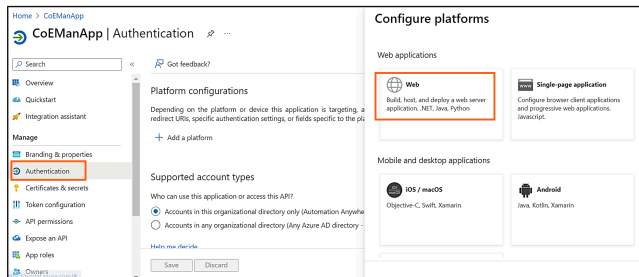

- d) Click **Add permissions**.

4. In CoE Manager Plus, navigate to **Admin-Tech** tab.
You must have RPA admin or RPA tech-admin role to access the **Admin - Tech** tab.
5. Click **Add Automation Integration**.
6. In the **Create Control Room Integration** screen, provide the following details:
 - a) Provide a name for your integration.
 - b) Select **Microsoft Power Automate** in the Vendor field.
 - c) Provide the vendor URL.
 - d) Click **Create**.

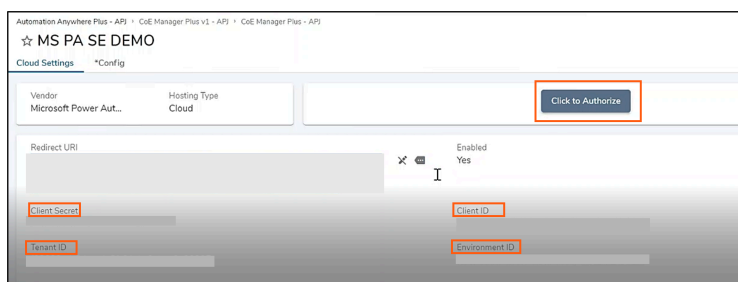

7. Copy the generated redirect URI to clipboard.
8. In the Microsoft Azure portal, navigate to **Authentication**.
 - a) In **Configuration platforms**, select **Web**.
 - b) Provide the redirect URI generated in CoE Manager Plus.

9. In CoE Manager Plus, enter the Client Secret, Client ID, and Tenant ID generated from Microsoft Azure portal.
10. Enter the Environment ID from your Power Automate environment.
11. Click the **Click to Automate** to authenticate.

Note: The enabled integrations run every four hours and thus data is pushed from the Power Automate environment to the CoE Manager Plus periodically.

A connection is now established between CoE Manager Plus and Power Automate, and a success screen displays confirming the successful connection. The **Enabled** column automatically changes to **Yes** when you save the Client secret, Client ID, Tenant ID, and Environment ID.

CoE Manager - Integrate with Cloud Control Room

You can integrate the CoE Manager with the Cloud Control Room to monitor your automations and calculate the savings achieved. You can link up to three Control Room instances with one instance of CoE Manager.

To link a Cloud Control Room to the CoE Manager, follow the steps mentioned below.

- In the Control Room, perform the following steps:
 - a) Create a custom role with **View everyone's activity** and **Generate API-Key** permissions.
 - b) Create a user and assign the custom role created above.
 - c) Generate API Key for the user.
- In the CoE Manager, perform the following steps:
 - a) Navigate to **Admin - Tech** tab.
You must have RPA admin or RPA tech-admin role to access the **Admin - Tech** tab.
 - b) Click the placeholder URL in the **Automation Anywhere URL** column.
 - c) Click **Edit** in the **Hosting Type** field and select **Cloud**.
 - d) Click **Edit** in the **Automation Anywhere URL** field and enter the Control Room URL.
 - e) Enter the username in the **Automation Anywhere Username** field.
 - f) Enter the API key in the **Automation Anywhere API Key**.
 - g) Click **Save**.
The **Enabled** column automatically changes to **Yes** when you save the URL, username, and API key.

Note: The enabled integration ensures that all the bot execution and transactional data is pushed from the Control Room to the CoE Manager every four hours. Each push includes the current day's data plus the previous day's data in full. This overlap of data is done to ensure there are no data gaps in case of API call failures. All duplicate data is automatically corrected in the CoE Manager before publishing them on the dashboards.

See the following video to understand how to integrate CoE Manager with Cloud Control Room.

If you do not see ROI or activity data in the **Execution Tracking** tab of your opportunity, see [Troubleshooting](#) on page 1998.

CoE Manager - Integrate with On-Premises Control Room

You can integrate the CoE Manager with the On-Premises Control Room to monitor your automations and calculate the savings achieved. You can connect up to three Control Room instances with one instance of CoE Manager.

To link an On-Premises Control Room to the CoE Manager, follow the steps mentioned below.

- In the Control Room, perform the following steps:
 - a) Create a custom role with **View everyone's activity** and **Generate API-Key** permissions.
 - b) Create a user and assign the custom role created above.
 - c) Generate an API Key for the user.
- In the CoE Manager, perform the following steps:

- a) Navigate to the **Admin - Tech** tab.
You must have RPA admin or RPA tech-admin role to access the **Admin - Tech** tab.
- b) Click the placeholder URL in the **Automation Anywhere URL** column.
- c) Click **Edit** in the **Hosting Type** field and select **On-Prem**.
- d) Click **Edit** in the **Automation Anywhere URL** field and enter the Control Room URL.
- e) Using the link in the **Bot Store Link** field, navigate to the Bot Store and download the bot.
- f) Follow the instructions in the ReadMe file to set up the bot.

Important: For an On-Premises Control Room, a bot deployment is required to push the data from Control Room to the CoE Manager. You must have a valid license such as a Bot Creator, Bot Runner, or a Citizen Developer to run the bot. To run this bot, you must also whitelist the CoE Manager URL. For whitelisting details, see [Add service URLs to trusted list for On-Premises](#) on page 1265.

Recommendation: Schedule your bot that pushes data to the CoE Manager to run at least once a day to avoid data gaps in the CoE Manager dashboards. Each data push will include the current day's data plus the previous day's data in full. This overlap of data is done to ensure there are no data gaps in case of API call failures or network issues. All duplicate data is automatically corrected in the CoE Manager before publishing them on the dashboard.

See the following video to understand how to integrate CoE Manager with On-Premises Control Room.

If you do not see ROI or activity data in the **Execution Tracking** tab of your opportunity, see [Troubleshooting](#) on page 1998.

Admin - Users

You can manage role assignments on individual opportunities.

Opportunity Role Assignments

Opportunity	Role	Participant
*Foster Human Resources Metrics	Owner	Doe, John
*Onboarding of temporary/part-time workers	Collaborator	Anywhere, Automation
	Collaborator	Dev, Citizen
	Owner	Doe, John
*Streamline Reviewing and Reconciling Transactions	Owner	Doe, John
*Weekly Data Reconciliation	Admin	Dev, Citizen
	Owner	Anywhere, Automation
Accounts Payable Automation	Collaborator	Dev, Citizen
	Collaborator	Doe, Jane
	Owner	Anywhere, Automation

Displays the list of opportunities and their participants along with the role of the participant (owner, admin, or collaborator) in that opportunity.

Enable CoE Manager

As an administrator, you can enable access to CoE Manager from the Control Room so that you can access CoE Manager from the quick links section on the Control Room home page.

1. In the Control Room, navigate to **Administration > Settings > CoE Manager**.
2. Click **Edit**.
3. Click **Enable**.
By default, this feature is disabled.
4. Select the relevant URL from the **Web URL being used to access CoE Manager** field.
5. Click **Save changes**.
The CoE Manager link appears in the **Home page > Quick links** section. Clicking this link redirects you to the CoE Manager login page.

Roles and user management

To interact (create, edit, view, delete) with a work item in Shibumi, you must be assigned a role that has permission to access the work item.

Overview

Permissions are inherited downwards, that is, a user assigned to a role on a work item will have access to the work item and all the descendent work items. The default permission (access level) that the user has on the work item is defined by the role assigned. Each role is assigned to one of three access levels: admin, edit, or view.

Five out-of-the-box roles are available on every template. The following table identifies these role and their associated access levels.

Role	Access level	Manage roles	Read	Edit	Create	Copy	Move	Delete
Owner, Sponsor, Admin	Admin	#	#	#	#	#	#	#
Collaborator	Edit	#	#	#	#	#	-	-
Viewer	View	-	#	-	-	-	-	-

Your solution can have additional custom roles. When creating the custom role, the app admin will select an access level for it.

For roles with the edit access level, when the app admin enables the role on a template, that is the role will be available on instances of the template, they can further define whether the role can manage role assignments. If the ability to manage roles is allowed, any user with this role will be able to assign users to any roles with access level of edit or view. They will not be able to manage assignments to admin access level roles.

You can see the access level of each role on the **Roles** tab of either the template or the app.

Note:

- The access level defines the default permission for the role on a work item. With additional configuration logic; however, the app admin can further restrict permissions. For example, the app admin can define tab visibility logic allowing only users holding the finance team role to see the finance tab. Even though users hold other roles with admin access level, if they do not hold the finance team role, they will not see the tab.
- Roles are multi-user. There is not a limit on the number of users that can be assigned to a role.
- Users can be assigned to multiple roles on a single work item.
- When a user holds multiple roles, the default access level for the user will be the highest level of their assigned roles. This logic applies to inherited roles as well. For example, if a user is assigned to an admin access level role at the program level and then assigned to an edit access level role to a descendent project within the program, the default access level for the user on the project will be the admin access level.

Participant window

The **Participant** window enables the management of role assignments on a work item.

Assign users to roles

1. Click the avatar icons to open the **Participant Window**.

2. Enter the email address of the user you want to add.
 - For first-time users, Shibumi will email an invitation to the user to set up an account and log in.
 - For existing users, when you start typing the user’s name or email, it will automatically complete.
3. Select one or more roles for the user. Roles that have been enabled on the template will be available in the drop-down list.
4. Select the blue **Add** option to add the user to the item.

Note:

- Pressing down the command or ctrl key on your device (Mac vs. PC) will allow you to select multiple roles without the drop-down closing.
- **Visible To** includes all users that do not directly have a role on the work item but that have inherited permissions to see the work item from an ancestor work item role assignment.

Permissions are inherited to descendent work items. For example, if a user is assigned to a role on a program that includes five projects, the user will have access to the program and all of the projects.

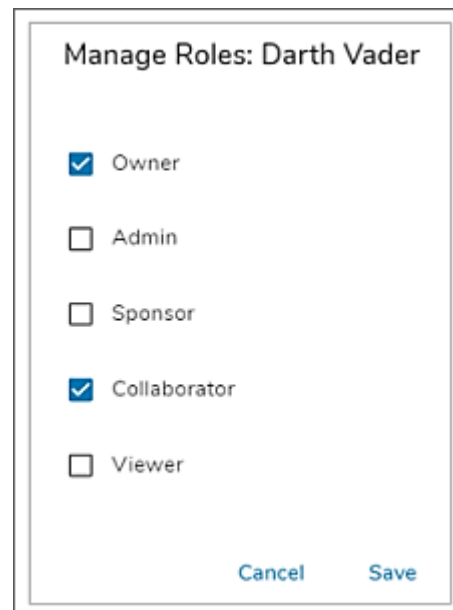

- Users can also be assigned from a role column included on a list, view, or table or from a role field on an edit or create form.

Manage role assignments

To manage role assignments for a user, open the **Participant** window and click the user name. A floating menu is displayed with three options: **Manage**, **Replace All**, **Remove All**.

Note: If you do not have a role with the ability to manage roles, you will not see the floating menu.

- Manage

- The **Manage Roles** window displays all roles enabled for the work item.

The roles provided to the user will be selected.

- Select or deselect roles to add or remove the user to or from roles on the work item and click **Save**.
- Replace All
 - The **Replace All** option replaces a user in all roles they hold on the current work item as well as on any roles they hold on descendant work items.
 - On the window, select another user to replace the current one in all roles. Click **Replace**.
- Remove All

The **Remove All** option removes the user from all roles on the current work item. It does not remove the user from roles provided for descendant items. A dialog box will ask you to confirm the removal. Click **Remove**.

Permissions

Permissions are inherited downwards. For example, a user assigned to an admin access level role on a program work item will have admin access to the program as well as on all descendent project work items.

Conversely, permissions are never inherited upwards. No users will have access to the items above the highest level to which they are directly assigned a role.

For example, in the following image, Jane Doe has been assigned as collaborator on the *IT workstream within the digital transformation program. Jane has access to all of the descendent projects and milestones within the workstream. When Jane opens the business logic development milestone, the breadcrumb trail above the title of the milestone will not extend past the *IT workstream level.

Note: The (unavailable) app name is listed to the left of the highest level the user has access to.

Name	Owner	Start Date	Due Date	Activity
Design LIX modification	Barbara Schuster	Aug 28, 2023	Aug 29, 2023	Milest

Additional role functionality

Owner role: Owner is an out-of-the-box, admin access level role. The creator of a work item will automatically be assigned to the owner role in the follow scenarios:

- The work item is created from a **List** section. For these sections, the owner field cannot be included on the **Add Item** dialog box so the creator is assigned by default.
- The work item is created using **Bulk Edit on a List** section and the owner role is not included on the bulk edit form or is on the form but is left empty.
- The work item is created through a create form or sidebar create and the owner role is not included on the form or is on the form but is left empty.

An owner is not automatically assigned for work items created through the following methods, but can still be assigned manually:

- Create work item business rule (can use an **Assign Role Action** to assign owner, if required)
- Import or export section (can include owner as a column to assign owner, if required)
- Child work items populated from a template
- Dashboards or presentations that came from a template
- The GraphQL API

Placeholders or open resources

- Shibumi provides the ability to define a placeholder role. This is referred to as an open resource and can be defined in the **Participant** window for any work item in the solution.

It allows for a placeholder role assignment on work items without assigning a user. Open resources are often used when the details for a work items are not yet ready to be shared with all users but it is valuable to understand which roles will be participating.

- Until the open resource is filled with values, it will be displayed with a gray background.
- To enter values in open resource, click the **Open Resource**, select the **Assign All** option, and select the user that will be assigned. This will apply to all roles the placeholder has on the current item as well as on all descendant items.

The screenshot displays the user management interface in Automation Anywhere. At the top, there is a header with user avatars for KP, DS, GS, JD, and +6. Below this, there are two input fields: 'Name or Email' and 'Role(s)'. A blue 'Add' button is positioned below these fields. The main area shows a list of users with their roles: 'Owner' (Ken Pellegrino), 'Collaborator' (owner, Sam Turnbull), 'RPA Admin', and 'RPA Approver'. A context menu is open over Sam Turnbull, showing options: 'Manage', 'Assign All', and 'Remove All'. A modal dialog titled 'Assign Open Resource in All Roles' is open, showing 'Assign owner to' and '4 items will be affected' with 'Cancel' and 'Assign' buttons.

Note: One common application of the open resource capability is for the program admin to assign roles to the open resource throughout the program. Only when the solution is fully defined, assign a user to the open resource. All items in the program assigned to the open resource are then assigned to the designated user and summarized into a single email invitation.

Create and manage opportunity

Submit and build a business case for an opportunity and track its progress through the approval stages. Measure the results of the opportunity after it has been automated.

Opportunity owner

As an Opportunity owner, you propose and build the business case for new opportunities, track the progress of opportunities through stage gates, and oversee opportunity implementations. When an opportunity has been delivered, you also track the benefit provided by the opportunity to ensure that the achieved benefit matches the anticipated benefit outlined in the business case.

It is important for you to provide up-to-date information about the opportunity to the automation CoE and your executive team. The investment made into each opportunity is justified by the anticipated value to be achieved when the opportunity is delivered. The opportunity information you provide helps your CoE and leadership team understand the current state and make strategic decisions.

Before you can access the RPA Accelerator to enter and update opportunity information, you must create an account. See [Create and manage your account](#) on page 1984.

Access the program

After creating an account, you will be authenticated into the RPA Accelerator with the program content displayed by default.

The program or the opportunity dashboard is defined as the homepage. In addition to the **Home** icon, you can use the navigation tree to view and access the opportunities. You can access these from any page (both routes are highlighted in the following image).

Note: when your automation lead sets up the RPA Accelerator, they will have invited you into the program level or into an opportunity that triggered the email prompting you to join Shibumi. Permissions are inherited downwards within the RPA Accelerator. If you were invited into the top-level Program, you have the ability to access and edit all unlocked data in the workstreams and opportunities. However, if you were invited into a specific, lower-level opportunity, you will be able to edit information specific to that opportunity.

Create an opportunity

To create a new opportunity, click **Create Opportunity** on the **Opportunities** tab or the **Opportunity** dashboard.

The screenshot shows the 'Shibumi Automation Accelerator v2' dashboard. At the top, there is a navigation bar with tabs for Dashboard, Opportunities, Ideas, Pipeline, In Progress, Deployed, Risks, and Reporting. A 'Create Opportunity' button is prominently displayed. Below this is a table titled 'RPA Opportunities' with the following columns: Opportunity Name, Workstream, Overall Score, Alignment, Total Savings, Total Costs, Complexity, Implementation Date, Stage, and Submitted Date. The table lists 14 different automation opportunities across various workstreams like HR, Sales, and Finance.

Opportunity Name ↑	Workstream	Overall Score	Alignme...	Total Savings	Total Costs	Complexity	Implementati...	Stage	Submitted

Call Meeting Scheduler	Sales	68%	92%	14,400	15,000	2 - Medium	Dec 13, 2022	2 - Pipeline	Aug 26, 2022
Consolidate Automate Payroll Tax Fil...	Finance	81%	72%	142,560	20,000	2 - Medium	Dec 9, 2022	3 - In Progress	Jul 30, 2022
Consolidate Preparing and Amendin...	HR	61%	48%	17,496	15,000	2 - Medium	Oct 28, 2022	3 - In Progress	Aug 26, 2022

When the create opportunity process is initiated, you will be prompted to answer questions used to categorize and define the anticipated value of your proposed opportunity.

After you have submitted the responses to the questions, a new opportunity is created and you are provided a link to it so that you can continue to edit opportunity information and monitor the approval process.

See an example of the questions included in the opportunity creation process in the following image:

The screenshot shows a form for creating an opportunity. It includes a dropdown menu for 'Workstream' with a '-- Select --' option. Below this are three text input fields with the following prompts: 'Let's start with the name of your idea', 'Now let's describe it in more detail', and 'Please provide your e-mail address'. At the bottom of the form is a blue 'CONTINUE' button with a right-pointing arrow.

Manage opportunity data

On the **Opportunity** window, key information is organized and grouped in tabs. You can access the tabs by clicking the tab names. The name of the currently displayed tab is highlighted in blue. By default, the **Opportunity Summary** tab is displayed.

The following table lists the tabs:

Tab	Description
Opportunity Summary	Monitor overall delivery status and advance the opportunity to new stages
Details	Review costs, benefits, and the alignment of the opportunity to the program's strategic goals
Activities	Create and track the status of activities required to implement the opportunity
Execution Tracking	View the automation process and digital worker information associated with the opportunity
Workflow	Review delivery status of opportunity, submit for approval/approve, retire and cancel the opportunity
History	Audit field edits, status changes, and stage approvals

Opportunity summary tab

The screenshot displays the Opportunity Summary tab for the project '*Onboarding of temporary/part-time workers'. The interface includes a navigation bar with tabs: Opportunity Summary (active), Details, Activities, Execution Tracking, Workflow, and History. A progress bar shows the stages: Idea, Pipeline, In Progress, and Deployed. Key performance indicators are shown as follows:

OVERALL SCORE 74%	% ALIGNMENT 52%	EXPECTED ANNUAL BENEFIT \$256,800	BENEFIT REALIZED TO DATE \$96,300
----------------------	--------------------	--------------------------------------	--------------------------------------

The Status section indicates: "Things are going well. - By Robert Aung on Sep 20, 2022" with an "Update Status" link. The Details section provides the following information:

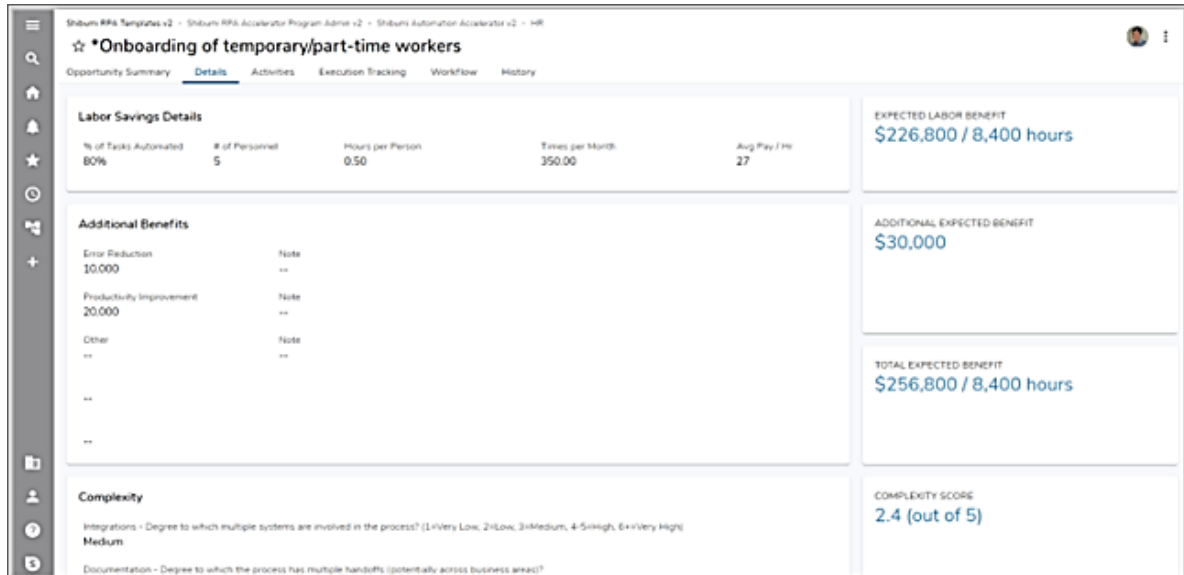

Submission Date	2022-05-16
Implementation Date	2022-08-16
Submitted By	Robert Aung

An "Approvals Complete" button is also present in the top right corner.

1. Edit the status message by clicking the **Update Status** hyperlink.

- Submit the opportunity for stage gate approval by clicking **Submit for Approval**.

Idea Pipeline In Progress Deployed

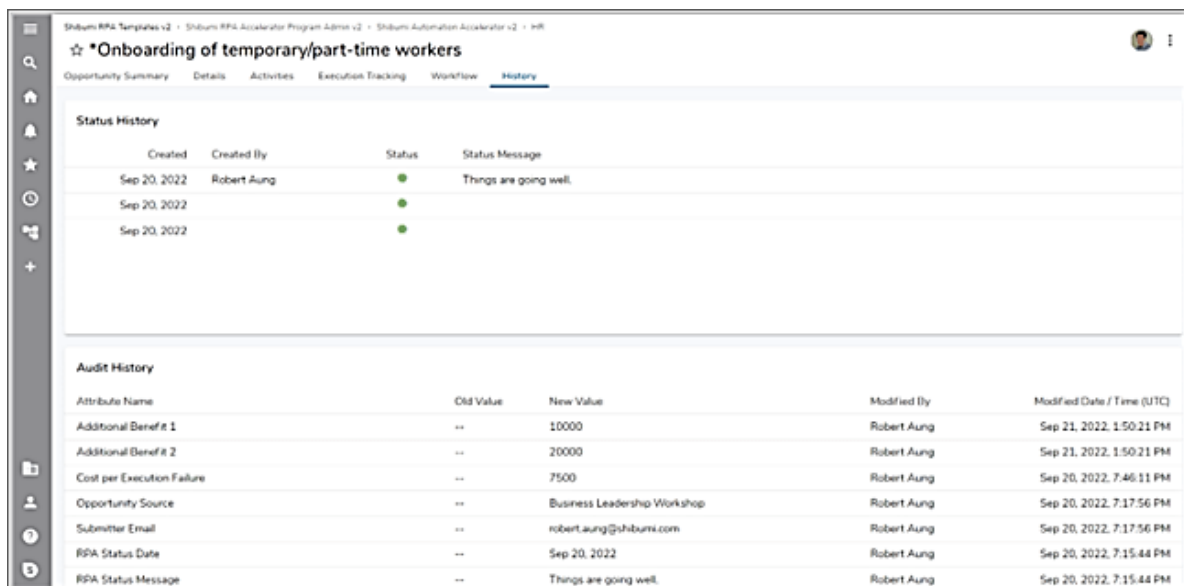

Approvals Complete Approval Not Pending Disapproval Reason Retire Opp Cancel Opp

The Workflow tab displays the following options (blue buttons):

- Submit for Approval:** This option notifies the approvers that the opportunity is ready for review and approval. After you have submitted the opportunity, the label on this option will change to **Approve**.

- **Approve:** If you have the permission to approve opportunities, you can click this option to approve the opportunity to move it to the next stage gate. Depending on which gate the opportunity currently resides, this might be disabled.
- **Disapprove:** This option is disabled until a disapproval reason is entered. When this option is clicked, the opportunity does not progress forward and a notification email is sent to the opportunity owner. The opportunity owner can then either address the disapproval reason or cancel the opportunity.
- **Retire Opp:** The retire and cancel options both set an inactive disposition for the opportunity. The retire option indicates that the automation opportunity was deployed but has now been retired.
- **Cancel Opp:** The retire and cancel options both set an inactive disposition for the opportunity. The cancel option indicates that the automation opportunity was not approved to be deployed.

History tab

The screenshot shows the 'History' tab for an opportunity titled '*Onboarding of temporary/part-time workers'. The interface includes a navigation menu on the left and a top navigation bar with tabs: Opportunity Summary, Details, Activities, Execution Tracking, Workflow, and History (selected). The 'Status History' section contains a table with columns: Created, Created By, Status, and Status Message. The 'Audit History' section contains a table with columns: Attribute Name, Old Value, New Value, Modified By, and Modified Date / Time (UTC).

Review the status history and modification made to the opportunity data on this tab.

Create and manage activities

After the opportunity is approved and moves to the in-progress stage, the automation implementation activities begin. While implementing, you can create, edit, and assign activities from the **Activities** tab.

1. Activities are created by navigating to the **Activities** tab and selecting the plus (+) icon (grey) located on the right-side of the opportunity name on the **Activities Gant** section.

2. Add the name, start date, and due date in the **Create a new Automation Activity** dialog box. When these updates are saved, the activity will be generated on the **Activities Gantt** section.
3. From the Gantt, you can hover over and select one of the activities to open the preview pane for the specific activity. The preview pane allows for quick tracking and editing of certain features of the activity, such as the completion date.
4. To delete an activity, select the blue hyperlink name for the intended activity. When the automation activity opens in a new tab, select the three dots on the top-right of the page and choose the **Delete** option.

Managing team members

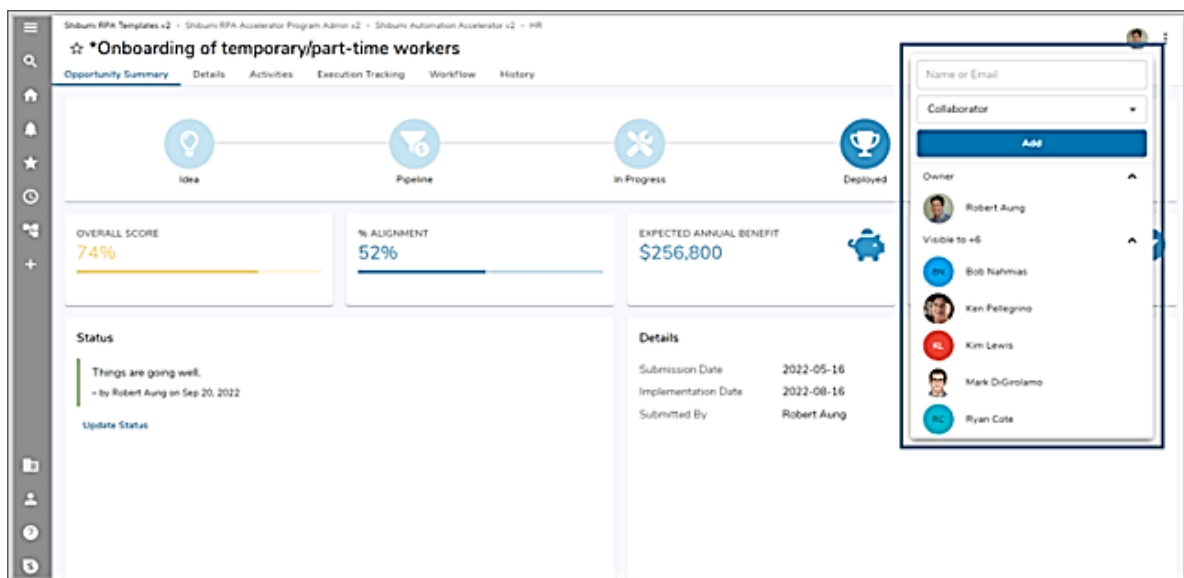

To invite people into the RPA Accelerator, use the **Participant** window. Start by navigating to the work item to which you want grant access, then click the person silhouette icon at the top right of the page.

From the **Participant** window, you can invite a user to a role on the opportunity.

- If you are adding an existing RPA Accelerator user,
 1. Type the user's name (the intelligent type ahead will propose matches).

2. Select the correct match.
 3. Select the role the person will fill.
 4. Click **Add**.
- If you are adding a new RPA Accelerator user,
 1. Type the user's email address.
 2. Select the role the person will fill.
 3. Click **Add**.

The new user will receive an email inviting them to set up an account. When the user has set up the account, they will have access to the work item.

CoE Manager Plus - Link automation to opportunity

As an administrator, you can review the automations information (in-progress or deployed) and link the automations directly to an opportunity.

1. In CoE Manager Plus, select the opportunity to which you want to link the automation by using one of the following methods:
 - a) Navigate to **Opportunities** tab.
A list of opportunities is displayed.
 - b) Click the search option (magnifying glass icon) on the navigation sidebar and search with the opportunity name.

Note: To link the automation to an opportunity, the opportunity should be in the **In Progress**, **Deployed**, or **Completed** stage.

Business Unit	Opportunity Name	Overall Score	Alignme...	Total Savings	Total Costs	Complexity	Implementati..
Finance	Financial VROI oppty	89%	96%	325,000	10,000	1 - Low	
Finance	Weekly Report	77%	88%	3,456,000	15,000	2 - Medium

2. Select the opportunity and navigate to the **Execution Tracking** tab.
This tab is only available for opportunities that are **In Progress**, **Deployed**, or **Completed** stage.
3. Click **Add Automation**.
The **Create Task Bot** screen is displayed.

Name	Automation Environment	Automation ID	Include in Successful Execution Count	Include in Failed Execution Count
SK Bot	Solution CR	65830	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>
SK Bot 2	Solution CR	71681	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>

- a) Enter the **Name**.
This can be the same name of the automation as in your automation environment or you can give a more relatable name.
- b) Enter the **Automation ID**.
- c) Optional: Select the Include in Successful Execution Count check box.
The count of successful executions are included in the KPIs in the execution metrics section.
- d) Optional: Select the Include in Failed Execution Count check box.
The count of failed executions are included in the KPIs in the execution metrics section.
- e) Click **Create**.

The associated KPIs are displayed in the **Execution Metrics** section.

Automation	KPI	Last 3 Months			This Month	Last 7 Days							Today
		May	Jun	Jul	Aug	Wed	Thu	Fri	Sat	Sun	Mon	Tue	Wed
Test Flow 5	Automation Duration	9,666	1,352	--	--	--	--	--	--	--	--	--	--
	Failed Executions	--	12	--	--	--	--	--	--	--	--	--	--
	Successful Executions	24,758	3,192	--	--	--	--	--	--	--	--	--	--
Test Flow 4	Automation Duration	14,272	1,608	--	--	--	--	--	--	--	--	--	--

	Successful Executions	24,758	3,193	--	--	--	--	--	--	--	--	--	--

- Navigate to **Automations** tab and click the name of the automation you just added. The **Automation** screen displays.
- Edit the **Automation Environment** tab and select the automation environment from the options in the drop-down.
- Click **Save**.

CoE Manager - Link automation to opportunity

As an administrator, you can review the deployed automations information and link the automations directly to an opportunity.

- Log in to the CoE Manager by providing your **Email Address** and **Password**.
- Select the opportunity to which you want to link the automation by using one of the following methods:
 - Navigate to **Opportunities** tab. A list of opportunities are displayed.
 - Click the search option (magnifying glass icon) on the Navigation Sidebar and search with the opportunity name.

Oppor...	Business ...	Overall Sco...	Alignme...	Total Savings	Total Costs	Complexity	Implementati...	Stage	Submitted

3. Select the opportunity and navigate to the **Execution Tracking** tab. This tab is only available for opportunities that are in-progress, deployed, or completed.

4. Click **Add Task Bot**. The **Create Task Bot** screen is displayed.
 - a) Enter the **Name**.
This can be the same name of the Task Bot as in Automation 360 or you can give a more relatable name.
 - b) In the **Control Room Instance** field, browse and select the Control Room where the Task Bot is located.
 - c) Enter the **Automation ID**.

Note: The Automation ID is same as Bot ID from Automation Anywhere (see example below).

5. Optional: Select the **Include in Successful Execution Count** check box. The count of successful executions are included in the KPIs in the execution metrics section.
6. Optional: Select the **Include in Failed Execution Count** check box. The count of failed executions are included in the KPIs in the execution metrics section.
7. Click **Create**. The associated KPIs are displayed in the Execution Metrics section.

ROI tracking

It is important to have current information about the opportunity so that the investment made into each opportunity is profitable when the opportunity is delivered. You can use the opportunity information to understand the status and make strategic decisions based on the status.

After the opportunity moves to the deployed state, you can track the benefit (ROI) provided by the opportunity. To track ROI for an opportunity, select the opportunity and navigate to any of the following tabs:

- **Opportunity Summary**
- **Execution Tracking > Execution Metrics**
- **Details**

You can track the ROI based on the number of bot executions or the number of transactions processed by the bot. You can select the ROI model by specifying it in the opportunity intake form or by editing it in the **Opportunity > Details** tab.

Execution-based ROI

Execution-based ROI evaluates the return on investment based on the successful execution counts of the automation. It calculates how many times the automation runs in a day and aggregates it based on week, month, quarter, and so on. It provides details such as successful and failed executions and the automation duration. It measures how many times an automation runs for a particular day and then calculates its benefit. The focus is on measuring the efficiency and effectiveness of the overall automation execution; not on the transactions processed.

With the execution-based ROI, you can perform the following:

- Prioritize improvement in the efficiency of the automation execution by streamlining workflows, reducing manual effort, and so on.
- Enhance operational effectiveness by identifying bottlenecks and areas to improve in the execution process.

Transaction-based ROI

Transaction-based ROI evaluates the return on investment based on the volume or the number of transactions processed by the automation. It calculates the total number of records processed for any given day, week, month, or quarter. This provides a more granular level of tracking so you can focus on the revenue generated from each transaction.

With the transaction-based ROI you can perform the following:

- Assess the cost savings and efficiency improvements for each transaction.
- Compare and measure success of each process based on the transactional outcome.

To effectively measure transaction-based ROI, you must orchestrate the automations using the Analyze package to identify the transactions to be counted. See [Analyze package](#) on page 2310.

For example, consider the scenario where you have parent bot calling a child bot, and the transactions are processed in the child bot. If total number of transactions processed within the child bot are 3, the bot logic for each transaction should be within the **Analyze > Open and Close** action. That means, you must use **Analyze > Open and Close** action three times to record the three transactions and so on.

Important: Once you set the method to track the ROI for your opportunity as either execution or transaction based, you must not make any further modification, that is you must not change it from execution based to transaction based or vice versa. Modifying the ROI tracking method is not supported, and the dashboard displays wrong data. Instead, create a new opportunity and choose the preferred method of ROI tracking.

Based on your business objectives, you can select either the execution-based or transaction-based ROI tracking. You can use both ROI tracking methods to assess the benefits achieved and the cost of implementing the automation solutions. Transaction-based ROI focuses on evaluating the overall impact of the automation on the organization, whereas transaction-based ROI focuses on individual transactions processed by the automation.

Configure transaction-based ROI

The volume ROI feature allows you to measure the realized automation value by how many business records or transactions have been completed. This feature allows you to measure the number of records processed on master or the child bot level.

- Configure the opportunity in CoE Manager.
 - a) Follow one of the following options to configure the opportunity to measure how many records or transactions are processed by a bot.
 - In the opportunity intake form, select **# of records processed** for **How is the process is measured** question.
 - In the **Opportunity > Details** tab, select **# of records processed** in **How is Processed Measured** option.
 - b) Specify the time (in minutes) required to process a single record and the number of records processed per month.
- Add Analyze package to your automation.

Consider a scenario where the automation consists of a parent and child bot, and the parent bot calls the child bot within it. The child bot processes some records for order processing.

- a) Create parent bot.
 - b) Use **Task Bot** > **Run** action to call the child bot.
 - c) In the child bot, use Loop action to count the number of transactions.
 - d) Include the bot logic inside the **Analyze** > **Open and Close** actions. This records the number of transactions.
 - e) In the **Variables** tab on the left pane, initialize the variables #SampleNumber and "SampleString with a default value.
 - f) Note down the automation ID of the child bot.
- Track the number of records processed and value realized in CoE Manager.
 - a) In the CoE Manager, select the opportunity.
 - b) Navigate to **Execution Tracking** tab.
 - c) Add the automation ID of the child bot to the opportunity.
 - d) You can see the number of records (orders) processed by the child bot in the **Execution Metrics** tab.
 - e) Navigate to **Opportunity Summary** tab to track the benefits achieved with this automation.

Configure CoE Manager for SSO

Use the single sign-on (SSO) option to enable the CoE Manager authentication through an identity provider (IdP) using Security Assertion Markup Language (SAML) 2.0 protocol.

SAML SSO login setup

Before configuring the CoE Manager, ensure you have completed the following requirements:

1. Download the Service Provider (SP) metadata for your respective CoE Manager region using the links provided below:
 - US environment: [Test](#) | [Prod](#)
 - EU environment: [Test](#) | [Prod](#)
 - AP environment: [Test](#) | [Prod](#)
2. Configure your Identity Provider (IdP) with the metadata obtained from the previous step and in SAML assertion, provide the following:
 - Email, First Name, Last Name, and NameID
 - Redirect URL for IdP-initiated login as a relay-state parameter
3. Provide the IdP metadata and the attribute names received from IdP (Email, Last Name, and First Name) to the Automation Anywhere support team.

Login workflow

SAML SSO login can be configured using one of the following methods:

- Service provider-initiated login: The SP-initiated login starts with the CoE Manager and is triggered when a user attempts to access the application through a URL. SP-initiated login requires a redirect to the appropriate IdP to ensure proper authentication before access is granted to the service or to any specific object. Depending on whether SSO is configured as mandatory or optional, your login workflow will vary. See below for more information.

- Mandatory SSO: After SSO is enabled, enter your email address in the CoE Manager login page and click **Next**.

As the CoE Manager is a multi-tenant application, you must use an email address to determine the IdP to be redirected to. This email address can be from any domain associated with your organization. CoE Manager will redirect to the IdP based on the entered email domain. For example, if your organization is Acme Corp, you might have acme.com and acmeent.com as associated domains. In this event, any address with @acme.com and @acmeent.com will redirect to the IdP when you click **Next**. You will be redirected back to the CoE Manager page after IdP authentication.

- Optional SSO: On the login page, enter the email address and click **Next**. Instead of being automatically redirected to the IdP, you will be prompted to either enter a password or select the option to log in with SSO, which will be sent to your IdP for authentication.

Note:

- CoE Manager supports deep linking with SSO. After clicking the link, you should enter your email address in the CoE Manager login page. You are then redirected to the IdP for authentication. After authentication, you are redirected to the URL initially requested.
 - CoE Manager creates a cookie after successfully logging in to the application using SSO. This ensures the subsequent logins to CoE Manager will bypass the username and password screen and redirects to the appropriate SSO login page automatically. You can also override the cookie by navigating directly to the CoE Manager login page, that is `https://<region>.shibumi.com/shibumi/login`.
 - A user account is automatically created after successfully logging in to the CoE Manager using SSO for the first time.
-
- IdP-initiated login: With IdP-initiated login, you can access the CoE Manager directly through the IdP (without a login page being displayed). When CoE Manager is launched using this method, you are taken directly to your organization's CoE Manager home page or to a URL provided by the IdP as a relay state parameter.

Account provisioning

CoE Manager provisions user accounts as needed for organizations with enabled SSO. Accounts are generated when:

- A user is assigned a role on an object in CoE Manager
- A user is invited to a CoE Manager work item
- A user first attempts to access CoE Manager

The typical account provisioning sequence would be for a user to be invited into a work item in CoE Manager by an existing user. This triggers the auto-provisioning of their account. If this is not done, when the user attempts to access CoE Manager the first time the account is provisioned, the user will not have access to any work items. This can be a confusing experience. Therefore, it is a recommended best practice to ensure that the users are invited to participate in a work item prior to the first access.

Note: User accounts are not imported in bulk from the IdP. Users are not automatically added or removed from the CoE Manager instance when a person joins or leaves the organization.

When a user is authenticated via an IdP, their first and last name are updated in CoE Manager to reflect the attribute values supplied in the SAML payload (the mapping of first name and last name to attributes is part of the SAML configuration in CoE Manager and in IdP).

Using CoE Manager

CoE manager provides a structured and consistent way of assessing all submitted opportunities, thereby increasing confidence in the quality of automation pipeline.

Work item basics

CoE Manager is composed of Opportunities, Business Units (referred to as workstreams by Shibumi), and a Program. In CoE Manager, these are all called work items. They are places to review and add information. Each of these work items are made up of tabs and sections.

[RPA work item basics](#) on page 2028

Roles and user management

Users are assigned to specific roles, and the role determines how the user interacts with CoE Manager. In CoE Manager, all users have inherited permissions, which means that the permissions extend below where they have access.

[Roles and user management](#) on page 2006

Workspace

CoE Manager workspace is divided into Navigation Sidebar, Header, and Work Area.

[RPA workspace overview](#) on page 2035

Personas and available actions

CoE Manager personas represent the people within your organization who participate in your automation program. The titles given to these personas might not match the job titles used within your organization. Use the goal descriptions to help you map your organization titles to the CoE Manager personas. Once you have mapped your positions to the CoE Manager personas, the topics to cover column (in Persona overview link below) highlights the solution activities most applicable to the persona. Persona-specific support site articles

are available through the persona column hyperlinks.

[Persona overview](#) on page 2040

Review automation program status

Review up-to-date program data in a single location to drive decision making.

[Review automation program status](#) on page 2042

RPA work item basics

The RPA Accelerator consists of opportunities, workstreams, and a program. In Shibumi, these are all called work items. They are places to review and add information. Each of these work items are made up of tabs and sections.

Tabs

Select a tab to view other pages within a work item. Select the left and right arrows to navigate through the available tabs. The first tab is the only tab available in the preview panel. Depending on your access or stage of your opportunity, you might see different tabs. The following image shows an example of tabs in an opportunity that has been deployed.

The tabs available in this example are **Opportunity Summary**, **Details**, **Activities**, **History**, and **Execution Tracking**.

Sections

Lists and views

Vast amounts of data can be hard to manage. Shibumi simplifies this management by enabling you to create and view this data. From lists and views, you can do the following:

Number	Option	Description
1	Refresh	Refresh a specific section to return new data. When new data is available, the refresh icon is blue.
2	Report view	Ability to view data in a table format.

Number	Option	Description
3	Gantt chart	Ability to view a time-based graphical representation of start and due dates (the colors are tied to the status).
4	Charts	Ability to view data in a variety of charts.
5	Filter	Ability to filter a list or view based on an attribute or role. Sort: Ability to sort a list or view by recently updated or by columns in the section.
6	Settings	Export and bulk edit options are available within the settings menu.
7	Create	Ability to add to a list by selecting the + (plus) icon and adding one or multiple items. This option is not available on views.

Section icons are available on hover of the upper-right corner of lists or views. The create (plus icon) option is always displayed on lists.

Report view

Status	Name	Description	Activity Type	Owner	Target		Actual			
					Start Date	End Date	Start Date	Due Date	Completed Date	
✓	Issue RFP		Activity	Rabin Gibb	Jul 1, 2020	Jul 31, 2020	Jul 1, 2020	Jul 31, 2020	Aug 20, 2020	
✗	Shortlist solutions		Milestone	Rabin Gibb	Jul 31, 2020	Jul 31, 2020	Jul 31, 2020			

Edit: Ability to edit an item (that you have permissions to edit) by selecting inside a cell and changing the value.

Status	Name	Description	Activity Type	Owner	Target		Actual			
					Start Date	End Date	Start Date	Due Date	Completed Date	
✓	Issue RFP		Activity	Rabin Gibb	Jul 1, 2020	Jul 31, 2020	Jul 1, 2020	Jul 31, 2020	Aug 20, 2020	
✗	Shortlist solutions		Milestone	Rabin Gibb	Jul 31, 2020	Jul 31, 2020	Jul 31, 2020			

Number	Option	Description
1	Export	Generates a CSV file that downloads immediately to your computer. The file will only include columns on the list or view. If the hide filter is on, it will not show the hidden columns.
2	Export On	Schedule an export to run on a recurring cadence. View all scheduled exports on your My account page.
3	Bulk Edit	Allows users to bulk edit large lists or views of data in the context specified for the type filter.

Chart view

Depending on the list and view type and configuration, different chart types are available. By toggling the chart icons on the upper-right part of a section, you can change the way you view your data.

In the following example, you can see the options for a line chart, bar chart, and a doughnut chart. The doughnut chart is displayed in this example.

Number	Type of chart
1	Stacked bar chart
2	Line chart
3	Bar chart

Number	Type of chart
4	Doughnut chart

Filters

In any list or view of data, a user can filter data by selecting the filter icon (located at the top-right of the section). Clicking the icons shows the filter bar where a user can type into or select values for unlocked filters. Typing text into a filter field will search for any items whose value contains that text.

- Dropdown filters

Filter name	Description
Limit	<ul style="list-style-type: none"> • Applies to individual rows when show or hide filter is set to show • Applies to grouped rows when show or hide filter is set to hide

- Toggle filters

Some attribute filters are displayed as toggles rather than text, numeric, or date fields.

Filter name	Description
Active/All	<ul style="list-style-type: none"> • Active items are those that have not been marked complete or canceled • All items include all items, regardless of the status
Show/ Hide	<ul style="list-style-type: none"> • When items are grouped, the ability to show or hide items will appear • Selecting hide will hide items that are grouped together

- Filter operations

Operators specify how filter criteria relate to one another. Review the following list of filter operators when setting filters on lists, views, dashboards, and some custom fields.

Action Operator	Description	Supported filter types
OR	Comma-separated values (,) Filters on any of the values entered	Text, numeric
AND	Plus sign separated values (+) Filters on a combination of values	Text, numeric
Exact Match	Surround values in quotes, for example "insert values" Returns results matching all entered values	Text, numeric
Empty Values	Enter double quotes for example "" Filters on fields containing no value	Text, numeric
Less Than	< Evaluates if a value is less than the value that follows this symbol	Numeric
Greater Than	> Evaluates if a value is greater than the value that follows this symbol	Numeric
Less or Equal	<= Evaluates if a value is less than or equal to the value that follows this symbol	Numeric
Greater or Equal	>= Evaluates if a value is greater than or equal to the value that follows this symbol	Numeric

Action Operator	Description	Supported filter types
Not Equal to	Excludes values from your results	Text, numeric

Sort

Users can sort their lists and views with the **Sort By** options. In the **Sort By** drop-down list, users can select one or more columns to determine the sort order. If you want to sort items by ascending or descending order, click the arrow next to the item to toggle the sort order direction.

Note:

- Column headers and updated date are available as **Sort By** options.
 - When sorting by ascending order, blank items will appear before alphabetized items (the opposite is true for descending order).
-

Create

Users can add items to a list by selecting the blue + (plus) icon in the upper-right corner. This option is not available on views. **Create New** enables you to create one item, while **Create Multiple** enables you to bulk create.

Export

You can easily export your data from Shibumi. To manually export data from a list or view section, select the **Settings** gear icon at the top-right of the section and select **Export** from the drop-down options.

The screenshot shows the 'RPA Program 2023' dashboard. At the top, there are navigation tabs: Dashboard, Opportunities, Ideas (selected), Pipeline, In Progress, Deployed, Risks, Reporting, *Dashboards, and *Metrics. Below the navigation are three summary cards: 'NEW IDEAS LAST MONTH' with a plus icon, 'TOTAL IDEAS' with the value '12', 'TOTAL IDEA VALUE' with the value '\$1,586.81K', and 'OLDER THAN 90 DAYS' with the value '12'. The main section is titled 'Ideas' and contains a table with columns: Workstream, Opportunity, Overall Score, Alignment, Complexity to Automate, Hours Saved, Total Savings, Total Costs, Submitted, and Action. The table lists several HR and Sales & Marketing opportunities with their respective scores and values. An 'Action' menu is open over the first row, showing options: Export, Export on, and Bulk Edit.

Data is exported based on filter and sort order configurations. All available results are returned, regardless of the limit filter configuration.

	A	B	C	D	E	F	G	H	I	J	K
1	Status	Name	Description	Activity Type	Owner	Target - Start	Target - End	Actual - Start	Actual - Due	Actual - Completed	Date
2	Completed	Issue RFP		Activity	Robin Gibb	7/1/20	7/31/20	7/1/20	7/31/20	8/20/20	
3	Delayed	Shortlist solutions		Milestone	Robin Gibb		7/31/20	7/31/20	7/31/20		
4	Delayed	Vendor Demonstrations		Milestone	Robin Gibb		10/1/20	10/1/20	10/1/20		
5	Delayed	Define requirements		Activity	Robin Gibb	10/1/20	10/31/20	10/1/20	10/31/20		
6	Delayed	Go Live		Milestone	Robin Gibb		11/1/20	11/1/20	11/1/20		
7											
8											
9											

When you open the exported file in excel, the structure of the columns will match the structure from the list or view.

Note: If you would like to export in a different format, change your account settings in **User preferences**.

To schedule an export, click **Export on** to open the scheduling dialog box. Select a start date, cadence (weekly or monthly), and frequency (for example, every 2 weeks on Friday). To cancel a scheduled export from the section, open the scheduling dialog box and select **Cancel Schedule** in the bottom-left corner.

Schedule Export

Starting

03/26/2021 08:30 PM 

Time is in Universal Coordinated Time (UTC)

Repeating

Every

On

[Cancel Schedule](#) [Cancel](#) [Save](#)

When a scheduled export runs, it only takes locked filters into account. Exports can only be scheduled when the type filter is locked. If a type filter is unlocked after scheduling, the export will not complete.

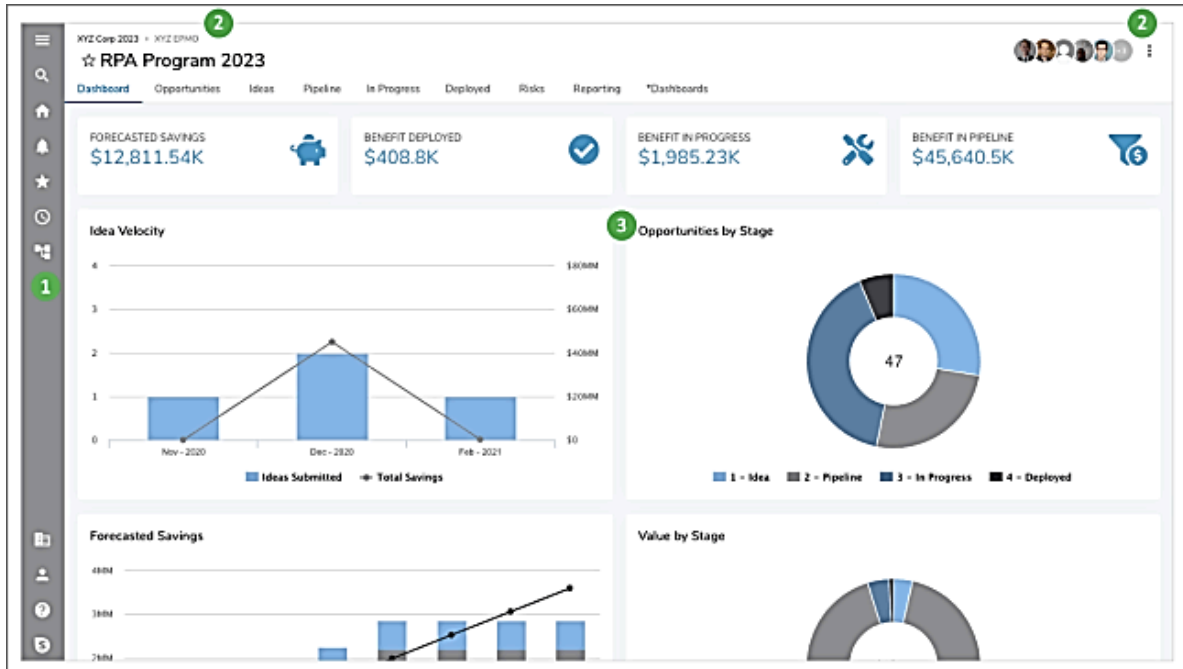

To view all of your existing scheduled exports, go to your account page by hovering over the user icon in the navigation sidebar and selecting **Edit My Account**.

Note: Exporting might be disabled in your solution.

RPA workspace overview

The RPA workspace dashboard provides visualization of metrics, navigation tools, and workitem-related information.

The workspace shows three areas:

Number	Option	Description
1	Navigation sidebar	Quick links to search, homepage, notifications, favorites, recently viewed, and navigation trees to help you navigate your App solution. Available on all pages.
2	Header	<p>Consists of the page name, breadcrumb trail, participant avatars, and action menu.</p> <ul style="list-style-type: none"> Breadcrumb trail indicates the page location in your solution. Participant avatars show who has access to view or edit the page. Action menu provides access to settings, rename the page, move/copy or print. <p>Header is available on all pages in your solution.</p>
3	Work area	<p>Contains tabs and sections that allow you to view and edit data.</p> <p>See RPA work item basics on page 2028 for details.</p>

Navigation sidebar

From the navigation sidebar, you can select the following:

Icon	Name	Definition
	Expand menu	Expands the navigation sidebar so you can view more details, or collapses to hide it for more workspace.
	Search	Search by item name or Shibumi ID number.
	Home	Navigates to the user's homepage.
	Notifications	Notification page where a user's notifications are grouped in an easy-to-navigate mailbox. The number of new notifications will appear on the notifications icon.
	Favorites	List of items a user has marked as favorites.
	Recently viewed	The last 10 items that a user viewed.
	Navigation	<ul style="list-style-type: none"> • Easily select and navigate through work items. • Carets indicate the item can be expanded to view its children. • Bullets indicate the item contains no children. • This feature is hidden until an administrator has defined a navigation structure.
	User preferences	Provides the ability to edit a user's account (that is, change password).
	Help	Directs the user to help center information.

Workitem action items

The following table describes the Header and Action menu icons:

Icon	Name	Definition
	Favorite	<ul style="list-style-type: none"> Click the star icon next to the page name to add it to the favorites list. <p>The star turns to a yellow color, and the page appears in the favorites list.</p> <ul style="list-style-type: none"> To remove it from the favorites list, click the star icon again. Select Manage Favorites at the bottom of the favorites list to edit favorites.
	Actions	Expands and collapses the actions menu.
	Settings	<ul style="list-style-type: none"> Displays if you have ownership or admin rights. Provides ability to set item-specific configuration.
	Rename	Allows you to rename the current page.
	Print	Prints the current tab of the item.
	Move or copy	Moves or copies the item.
	Delete	Deletes the current item and its children.

Participant window

Click the participant avatars to see all of the people that have been invited to collaborate on the currently displayed work item. If you have sufficient permission, this list also allows you to invite additional collaborators to participate.

Owner 

Program Owner

RPA Admin 

Bob Nahmias

Ken Pellegrino

Kim Lewis

Mark DiGirolamo

Robert Aung

Roles

Participants are assigned to specific roles. The role a user has determines how the user interacts with the system. In Shibumi, all users have inherited permissions, that is, the permissions extend to a below level where they have access. In the RPA Accelerator, if a user is added at a program level, their permissions extend to all workstreams and opportunities. If a user is added to an opportunity, they are only able to access that opportunity and related activities, not the program or workstream.

The following table lists the available RPA Accelerator roles. Note that the permissions of these roles extend to all items underneath where they are added.

Role	Type	Add Users	Read	Edit Unlocked Fields	Edit Locked Fields	Create	Delete	Update Opportunity Status	Approve
Owner, sponsor, admin	Admin	#	#	#	-	#	#	-	#
RPA Admin	Admin	#	#	#	#	#	#	#	#
RPA approver	Edit	-	#	#	-	#	-	-	#
Collaborator	Edit	-	#	#	-	#	-	-	-
Viewer	View	-	#	-	-	-	-	-	-
(Opportunity) owner	Admin	#	#	#	-	#	#	#	-

Persona overview

The Shibumi RPA personas represent the people within your organization that participate in your RPA program. The titles provided to these personas might not match the unique names assigned within your organization. Use the goal descriptions to help you map your organization’s titles to our Shibumi personas.

After you have mapped your positions to the Shibumi personas, the Topics to cover column in the following table highlights the solution activities most applicable to the persona.

For all personas, we recommend you review the following articles:

- [Create and manage your account](#) on page 1984
- [RPA workspace overview](#) on page 2035

Persona	Goal	Topics to cover
Stakeholder or executive	<ul style="list-style-type: none"> • Review my up-to-date program data in a single location • Use the program data to make time-sensitive decisions 	Navigate to and interpret the RPA dashboard

Persona	Goal	Topics to cover
CoE lead or head of automation program	<ul style="list-style-type: none"> • Manage the program in alignment with our methodology and in support of our KPI objectives • Prioritize and approve opportunities to achieve maximum ROI • Have real-time visibility into the opportunity pipeline and delivery status • Assess program status and progress over time 	<ul style="list-style-type: none"> • Navigate within the Accelerator to quickly find information • Approve (or reject) opportunities as they progress through review stage gates • Track top performing automation implementations to confirm expected value is achieved • Review program status and progress over time
Automation lead	<ul style="list-style-type: none"> • Introduce and enable the organization to use the RPA Accelerator • Add and remove participants to and from the program • Enable submission of opportunity ideas from anyone in the organization • Prioritize and approve opportunities to achieve maximum ROI • Have real-time visibility into the opportunity pipeline and delivery status • Assess status and progress over time, both at the program and workstream levels 	<ul style="list-style-type: none"> • Set up the program with opportunities, users, dates, and targets • Add users who need access to the program (and remove users who no longer need access) • Assist with assembly of the opportunity business cases • Approve or reject opportunities as they progress through review stage gates • Navigate within the Accelerator to quickly find information • Track implementation progress and achieved value • Review program, workstream, and opportunity status and progress over time
App or IT admin	<ul style="list-style-type: none"> • Provide exceptional IT support to the automation team • Facilitate integration of the various platforms being used by the Automation team • Optional: Configure SSO to the RPA Accelerator • Deploy automations 	<ul style="list-style-type: none"> • Set up SSO for Shibumi in accordance with your company guidelines • Define integration between the RPA Accelerator and one or more automation platforms • Register digital worker within the Accelerator • Ensure information sourced from the automation platform is up-to-date in the Accelerator

Persona	Goal	Topics to cover
Opportunity owner	<ul style="list-style-type: none"> Submit and build a business case for an opportunity and track its progress through the approval stage gates Measure the results of the opportunity after it has been automated 	<ul style="list-style-type: none"> Create and update an opportunity Add team members Manage activities to support the opportunity implementation
Automation team member	Collaborate on the activities and milestones for an opportunity implementation	<ul style="list-style-type: none"> Update and view an opportunity Manage activities to support the opportunity

Review automation program status

You can review and interpret the up-to-date program data in a single location. You can use this program data to make time-sensitive decisions.

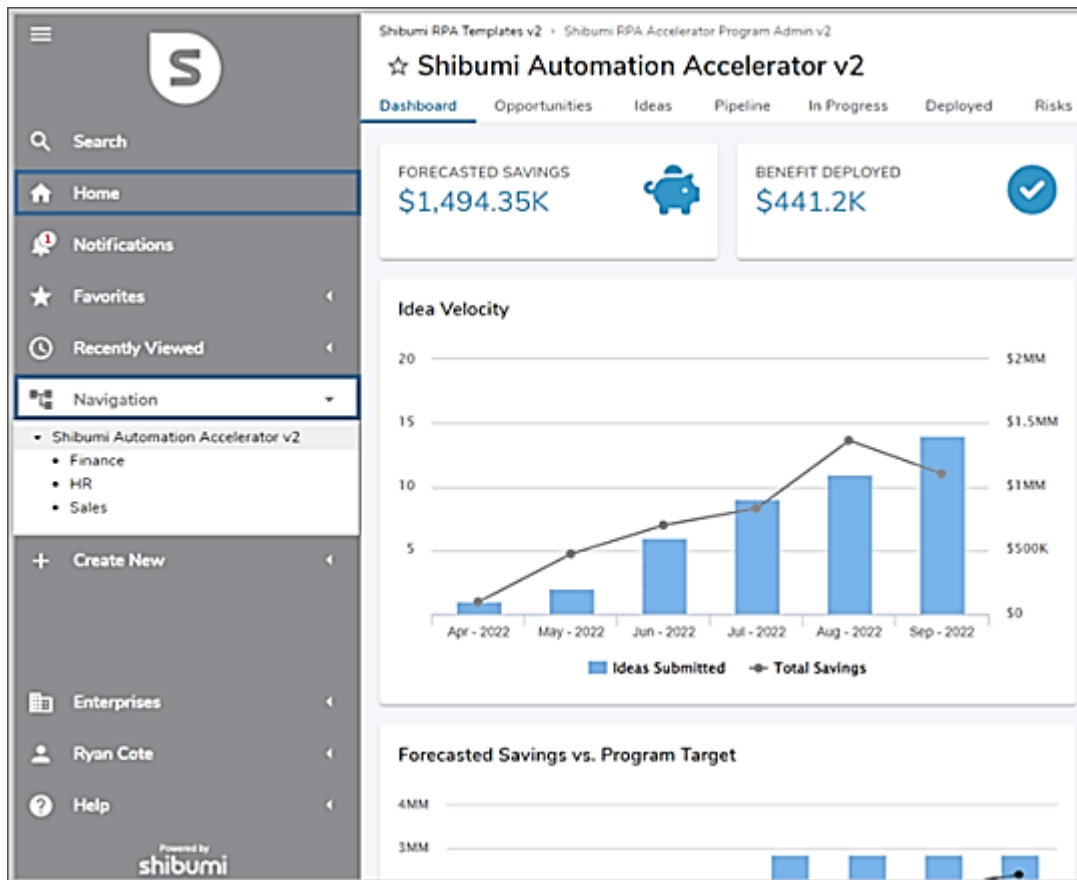

As a corporate executive (Shibumi RPA Accelerator stakeholder), you have the responsibility to define a path towards organizational success while simultaneously avoiding unhealthy risks and obstacles. Often, the automation program is critical to your success strategy. You need the real-time information being aggregated within the RPA Accelerator to ensure that you are able to make timely strategic decisions.

Before you can access the program information, you must create an account. See [Create and manage your account](#) on page 1984.

Access the program

After creating an account, you will be authenticated into the RPA Accelerator with the program-level content displayed by default.

The program is defined as the homepage. In addition to the home icon, you can use the navigation tree to view and access the program and workstreams. You can access these from any page (both routes are highlighted in the following image).

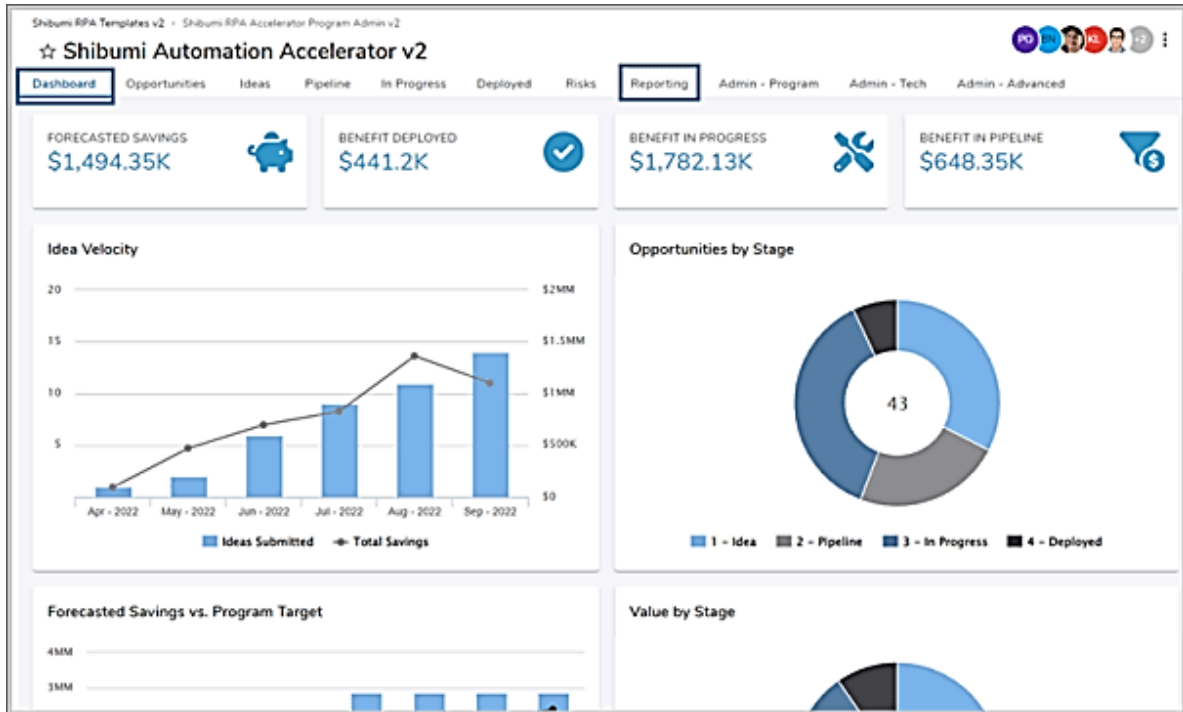

Note: When your automation lead sets up the RPA Accelerator, they will have invited you into the program level which triggered the email prompting you to join Shibumi. Permissions are inherited downwards within the RPA Accelerator. Because you were invited into the top-level program, you have the ability to access and edit all unlocked data. However, a user invited into a specific, lower-level opportunity will only be able to edit information specific to that opportunity.

Review program data

On the program, the dashboard and reporting tabs show key information. You can access the tabs by clicking the tab names (the name of the currently displayed tab is highlighted in blue). By default, you will view the Dashboard tab.

Both the dashboard and reporting tabs include aggregated data from all workstreams and opportunities. The following example shows the dashboard tab content and highlights the dashboard and reporting tabs on the tab bar.

CoE Manager FAQ

For details and questions on the CoE Manager powered by Shibumi platform, review this FAQ.

Overview

What is CoE Manager?

CoE Manager (powered by Shibumi) is a cloud-based solution to manage the automation pipeline, delivery, and benefits of the automation program.

Why do I need CoE Manager?

CoE Manager helps you take control of your end-to-end automation lifecycle while accelerating pipeline generation. It helps CoEs to scale automation programs more quickly and efficiently driving core Automation Anywhere deployments and maximize the value (ROI) from your automation investment. CoE Manager elevates the value of the pipeline of automation opportunities to build the business case for additional investment.

I already have an existing app for managing my automation pipeline. Do I still need CoE Manager?

CoE Manager is a purpose-built automation CoE management solution that provides advanced capabilities to drive automation success and comes with a native integration with Automation Anywhere. It eliminates the manual overhead required in a homegrown

	tool and allows CoEs to focus on accelerating the automation pipeline instead.
Is CoE Manager a SaaS solution?	Yes, CoE Manager is hosted in Shibumi's cloud infrastructure. Shibumi uses AWS as their cloud provider. Currently, CoE Manager/Shibumi RPA accelerator is hosted in the AWS zones in North America, Germany, and Australia.
Which compliance standards does CoE Manager support?	Automation Anywhere and Shibumi are committed to maintaining compliance with key global information security and regulatory standards, including: <ul style="list-style-type: none">• Service Organization Control (SOC) 2, Type 2 certification• CSA Cloud Controls Matrix standards compliance• EU Model clauses supported
What data retention policies, if any, are in place?	Shibumi retains customer information for as long as the account is active, or for as long as it is needed to provide a customer or sponsoring organization with specific requested services.
Do I need Automation Anywhere to use CoE Manager?	No. CoE Manager can work independent of Automation Anywhere. However, Actual ROI information cannot be recorded in COE Manager unless it is linked with an Automation Anywhere Control Room.
What is the Opportunity Lifecycle enforced by CoE Manager? Can it be modified?	All opportunities in CoE Manager follow a tollgate process comprised of 4 stages given below: <ul style="list-style-type: none">• Stage 1: Idea• Stage 2: Pipeline• Stage 3: In progress• Stage 4: Deployed These four stages are not configurable by an administrator or end user. However, they can be customized by Automation Anywhere for your implementation of CoE Manager if desired. Contact your Automation Anywhere representative to explore this.
Can I use CoE Manager to manage my automation pipeline outside of Automation Anywhere?	Yes.
Does CoE Manager support single sign-on?	Yes, the CoE Manager supports full SAML or SAMLv2 integration into any IDP or SSO solution such as Okta.

Get started

How do I activate CoE Manager?

Contact your Automation Anywhere representative if your organization has not yet purchased CoE Manager. Each SKU will represent a unit of one CoE Manager instance for an unlimited number of users per year.

How do I access CoE Manager?

Depending on the region from where CoE Manager was purchased, you can access CoE Manager through one of below links.

- [North America](#)
- [Europe](#)
- [APJ](#)

Note: Your account should already be setup in CoE Manager before you logging in. For the account setup process, refer to [Getting started with CoE Manager](#) on page 1983.

Is there an integration between CoE Manager and Automation 360?

Yes, you can link up to three Automation 360 Cloud Control Room to a CoE Manager enterprise instance. This allows CoE Manager to collect bot activity data to monitor automation executions and calculate achieved savings. For an On-Premises environment, a bot will be provided to push data from an On-Premises Control Room to the COE Manager cloud.

Which version of Automation Anywhere is CoE Manager compatible with?

CoE Manager integrates with Automation 360 Cloud Control Room out of the box and integrates with On-Premises environments through a digital worker. For further details, refer to [CoE Manager](#) on page 1980.

Does CoE Manager require any third-party software applications?

No.

What are the hardware requirements for CoE Manager?

CoE Manager is a cloud-based solution accessible via a browser and does not need any hardware setup.

Which browsers does the CoE Manager support?

Google Chrome, Mozilla Firefox, Microsoft Edge, and Safari.

Can CoE Manager integrate with third-party reporting tools?

Yes. Contact your Automation Anywhere representative to explore this.

Can CoE Manager integrate with third-party process/task mining tools?

Yes. Contact your Automation Anywhere representative to explore this.

Does CoE Manager support APIs?	Yes. CoE Manager/Shibumi exposes create, read, update, and delete capabilities through its GraphQL API.
Can I customize dashboards?	Yes. This feature will be enabled in a future product release.
Can I export the dashboard and reports?	Yes. You can export to Excel or CSV wherever applicable. Export to PDF will be enabled in a future release.
Can I add new business units to manage my automation opportunities?	Yes. You can create as many business units as you need. Ability to add sub-business units will be provided in a future release.
How do I assign opportunity to a user?	You can assign the opportunity to a user as given below: <ol style="list-style-type: none">1. Open the opportunity.2. Click the Avatar icon on the top right.3. Enter the email address of the user you want to add.4. Select the role and click Add.
I am unable to login into CoE Manager. What do I do?	Contact your CoE Manager administrator to start a password reset.
My organization already uses Shibumi. Can I use CoE Manager with Shibumi license?	No. A new license needs to be purchased from Automation Anywhere to use the CoE manager.
Can I do a bulk upload of automation opportunities?	Yes.
Where do I report a problem with CoE Manager?	For reporting any unexpected or deficient functionality, submit a support ticket to Automation Anywhere.
Can the email branding be changed to customer's requirements?	This feature is not currently available.
Can I rename, copy, move, or delete an opportunity?	Yes, you can access these options from the three vertical dots icon on the top right.
Can I assign the idea submitted by me to the operational manager for approval?	No. You can submit the idea for approval but cannot choose who can approve it. As a best practice, add the operational managers into the business unit as RPA approver. They can approve or reject any idea submitted into that business unit.
Can we add one or more users (developers) to the same opportunity?	Yes, you can add one or more users or developers to the same opportunity. To add users to an opportunity, follow the steps mentioned below: <ol style="list-style-type: none">1. In the CoE Manager, navigate to the Opportunities tab.

2. Click the **Opportunity Name** to open the opportunity.
3. Click the **Manage Participants** icon top right hand corner of the page.
4. Enter the email address of the user.
5. Select the role as **Collaborator** from the roles drop down.
6. Click **Add**.

Note: Repeat the above steps to add other users to the opportunity.

If the bots have error handlers so that whenever it encounters an error and the task fails, it sends an email notifying the failed status and the reason. The bot run is considered successful in the Control Room despite the error as the bot sends an email notification regarding the error. How are these tracked on the **Executive Tracking** page of the CoE Manager; under successful executions or failed executions?

For bot executions, how is the estimated execution time calculated? When the main tasks contain admin sub tasks for internal bot control, can these be excluded from this calculation as they are not part of the process automated?

When configuring an idea, the average pay per HR should be added in the CoE Manager to calculate the impact in value. There is a concern regarding the access of this information given to all users using CoE Manager. In order to limit access to only a few specific users, can we set up a role configuration so that only the users with this role can access sensitive information?

These are tracked as successful executions in the CoE Manager because the bot run itself is completed successfully, although it encountered an error.

If the main task is a scheduled automation, the run time is captured for the main task which will automatically include the admin subtasks' run time too. Currently, these cannot be differentiated from each other as only the **Bot Start Time** and **Bot End Time** is captured in the Control Room. A breakup by sub tasks is not provided.

This is currently not possible.

Activities

Monitor all ongoing automations and pause, stop, and resume them as required. Also, view the Bot Runner (attended or unattended) trigger deployments in queue.

In-progress activity

The progress details of a bot run contains information such as:

- The name of the bot.
- The action that is currently being performed.
- The line number that is being executed.
- The total number of lines in the bot.
- Status of the bot run (% completed).

The progress details are displayed only when a bot is run on a local device by a user with Attended Bot Runner license.

Note: From v.29 and later releases, you might see the following changes on the **In progress activity** page:

- You might view activities in the **Failed** status on the **In progress activity** page. Click the **Refresh table** option on the top-right of the table to move such activities to the **Historical activity** page.
- It might take few seconds to view activities in the **Active** status.
- If permissions for users is revoked and then reassigned, such users will be unable to view activities in the **Active** status.

For more information, see [Tips on bot status shown on In progress page](#).

Depending on the permissions granted by administrators, as a user, you can view and manage bots and bot folders. With specific permissions, you can perform the following:

View everyone's activity from my folders	With run or schedule permissions on folders, you can view all bot activity started by other users from those folders. This will be a super set in the View my activity output.
Manage everyone's activity from my folders	With run or schedule permissions on folders, you can perform management activities, such as Pause , Resume , and Stop on all bot activity started by various users from those folders.

Based on the administrative permissions, you can apply various search parameters to monitor and find the required in-progress activities.

The following table describes various search parameters, their description, and possible values or examples to search the in-progress activities:

Parameter	Description	Possible values and examples
Status	Search for an activity based on its status.	<ul style="list-style-type: none"> • Started • Active • Paused • Unknown • Paused for input • Pending execution • Queued

Parameter	Description	Possible values and examples
Automation priority	Search for an activity based on the priority assigned to the automation.	<ul style="list-style-type: none"> • Low • Medium • High
Current action	Search for an activity based on the current action.	User-specified action name
Current bot	Search for an activity based on the name of a bot that is currently running.	User-specified bot name
Bot	Search for an activity based on the name of a bot.	User-specified bot name
Activity type	Search for an activity based on the activity type selected to run a bot.	<ul style="list-style-type: none"> • Run Bot • Import queue files • Run bot with queue • Export bots
Device	Search for an activity based on the device name on which it is running.	User-specified device name

Note: For troubleshooting a bot that stuck on the **In progress activity** page, refer [BOT stuck in In Progress Stage and not able to move it to history](#) or ["BOT stuck in Pending execution Stage and not able to move it to history"](#) on Automation 360 CLOUD and On-Prem environments.

Actions

You can pause, resume, stop, move, export, and refresh the activities or items by using the actions in the **Historical** page. Hover over the actions icon (vertical ellipsis) to enable and use the following actions:

Pause checked items

To pause the selected items

Resume checked items

To resume the selected paused items

Stop checked items

To stop the selected items

Move checked items to history

To stop the selected items

Move checked items to history

To move the selected activity from **In progress** to the **Historical** page.

Note: For Workload automation, you cannot **Stop, Pause/Resume, or Move checked items to history** if the Task Bot status is **Active** or **Unknown**.

Export checked items to CSV

To export selected items to a CSV file based on the following parameters:

- Filters
- Selection

Refresh table

To refresh the table with updated activity details

Customize columns

To show or hide specific columns

Important: Multiple workload automation entries equaling the number of devices are shown on the **In-progress activity** page if the work items added to a queue are fewer than the number of devices available in a device pool. For details about a workload automation, see the **View queue details** page on the user device on which the workload automation is deployed.

Historical activity

You can search, view, and run previously created bots in the **Activity > Historical** page.

Prerequisites

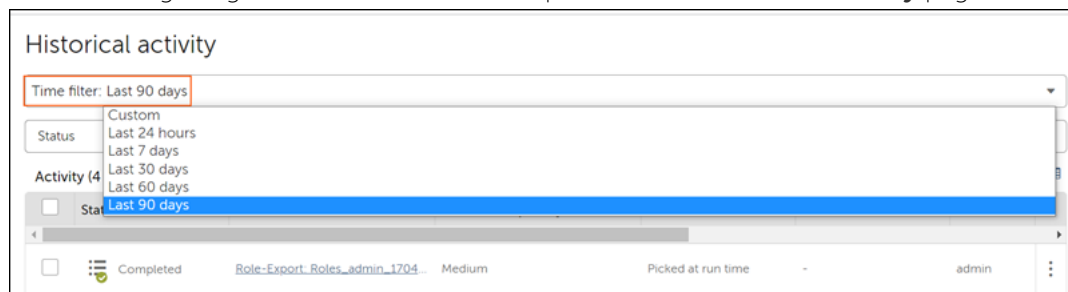

To view historical activities, ensure that you have the following permissions:

- **View my activity**
- **Manage my activity**
- **View activity from user's folder**
- **Manage activity from user's folder**
- **View everyone's activity**
- **Manage everyone's activity**

Time filter

As a Control Room user, you can use the **Time filter** option to search and view historical activities. You can select the required time duration from the list and view the specific details for the activity. Additionally, you can customize the specific time range to view historical activity details in a specific time range. This filter provides historical activity details based on custom settings, hours, or days (default is **Last 90 days**).

The following image shows the **Time filter** option on the **Historical activity** page:

For example, to view historical activities from May 10th to May 15th:

1. Log in to the Control Room with required [permissions](#).
2. Navigate to the **Activity > Historical** page.
The **Historical activity** page displays.
3. From the **Time filter** drop-down, select the **Custom** option.
By default, the **Historical activity** page shows the last 90 days of historical activities.
4. Set the date and time:
 - **Start date:** 05-10-2023
 - **Start time:** 10:00 AM
 - **End date:** 05-15-2023
 - **End time:** 10:00 PM
5. Click **Confirm** to confirm the date and time. Otherwise, click **Cancel**.

The historical activities for the set date and time display as:

Status	Item name	Started on	Ended on	Automation priority	Device name
Completed	OnHold_23.03.28.12.40.42.pqad	10:07:33 IST 2023-05-10	10:09:38 IST 2023-05-10	Medium	22-release-140
Completed	OnHold_23.03.28.12.40.42.pqad	10:22:34 IST 2023-05-10	10:24:39 IST 2023-05-10	Medium	22-release-140
Completed	OnHold_23.03.28.12.40.42.pqad	10:37:39 IST 2023-05-10	10:39:45 IST 2023-05-10	Medium	22-release-140
Completed	OnHold_23.03.28.12.40.42.pqad	10:52:35 IST 2023-05-10	10:54:38 IST 2023-05-10	Medium	22-release-140
Completed	OnHold_23.03.28.12.40.42.pqad	11:07:33 IST 2023-05-10	11:09:38 IST 2023-05-10	Medium	22-release-140
Completed	OnHold_23.03.28.12.40.42.pqad	11:22:33 IST 2023-05-10	11:24:38 IST 2023-05-10	Medium	22-release-140
Completed	OnHold_23.03.28.12.40.42.pqad	11:37:33 IST 2023-05-10	11:39:38 IST 2023-05-10	Medium	22-release-140
Completed	OnHold_23.03.28.12.40.42.pqad	11:52:33 IST 2023-05-10	11:54:38 IST 2023-05-10	Medium	22-release-140
Completed	OnHold_23.03.28.12.40.42.pqad	12:07:33 IST 2023-05-10	12:09:38 IST 2023-05-10	Medium	22-release-140
Completed	OnHold_23.03.28.12.40.42.pqad	12:22:35 IST	12:24:39 IST	Medium	22-release-140

Search parameters

Based on the administrative permissions, you can apply various search parameters to monitor and find the required historical activities. The following table describes various search parameters, their description, and possible values or examples to search the historical activities:

Parameter	Description	Possible values and examples
Status	Search for an activity based on its status.	<ul style="list-style-type: none"> • Completed • Failed • Stopped • Timed out • Unknown • Deploy failed • Run failed • Pending execution
Item name	Search for an activity based on triggered item.	<p>A generic name in specific system format with combination of your bot name, date and time when you run the bot, and username by which you run the bot.</p> <p>For example, recorder_Recorder_2.7.3-20220527-004608.2</p>
Automation priority	Search for an activity based on the priority assigned to the automation.	<ul style="list-style-type: none"> • Low • Medium • High
Device name	Search for an activity based on the name of the device on which the activity is running.	User-specified device name
Bot name	Search for an activity based on the name of a bot.	User-specified bot name
User	Search for an activity based on the name of the user who created the activity.	User specified name

Actions

You can export, refresh, and customize the activity details in the **Activity > Historical** page.

Export checked items to CSV

To export selected items to a CSV file based on the following parameters:

- Filters
- Selection

Refresh table

To refresh the table with updated activity details

Customize columns

To show or hide specific columns

Important:

- Multiple workload automation entries equal to the number of devices are shown on the **Historical activity** page, if the work items added to a queue are less than the number of devices available in a device pool. For workload automation details, refer to the **View queue details** page on the actual user device on which the workload automation was deployed.
- Historical activity displays only the bots that are processing the work items, while each bot deployment can include multiple work items processed as one activity.

View completed activity

You can view a list of all completed activities and corresponding information in the **Activity > Historical** page.

Completed activities

You can use the **Status** search parameter and view all the completed activities in the **Historical** page. You can export data in the table in CSV format, customize columns, and refresh the list in the table for the completed activities.

The retention period of bot execution information in the **Historical** page varies based on the deployment. The retention period for various deployments is listed in the following table:

Deployment	Retention period (Days)
Community Edition	30
Cloud	90
On-Premises	Unlimited (No automatic deletion)

Note:

- For On-Premises deployment, the bot execution information beyond the specified retention period is available in the audit log and these logs are not deleted.
- For Cloud deployment, see [Automation 360 Cloud Data Retention Policy](#).

Note:

- Specify search parameters for the same column using **OR** operator.
- Specify search parameters for different columns, the system searches using **AND** operator.

You can perform the following actions for a table of completed activities:

- Sort the column items in ascending or descending order.
- Drag-and-drop columns to move or change the column sequence.
- Resize the column width.

Activity details

The following table describes various details for completed activities:

Parameter	Description	Possible values and examples
Status	Search for an activity based on its status.	Completed
Item name	Search for an activity based on triggered item.	A generic name in specif system format with combination of your bot name, date and time when you run the bot, and username by which you run the bot. For example, recorder_Recorder_2.7.3-20220527-004608.2
Automation priority	Search for an activity based on the priority assigned to the automation.	<ul style="list-style-type: none"> • Low • Medium • High
Device name	Search for an activity based on the name of the device on which the activity is running.	User-specified device name
Bot name	Search for an activity based on the name of a bot.	User-specified bot name
User	Search for an activity based on the name of the user who created the activity.	User specified name
Started on	The date and time when the activity was started.	For example, 19:01:24IST 2022-06-06
Ended on	The date and time when the activity was ended.	For example, 19:01:40IST 2022-06-06
Last modified	The time when activity was last modified.	For example, 57 minutes ago or 3 weeks ago
Modified by	The name of the user who changes the activity.	User-specified name

Actions

You can view any individual item using the following action:

View

View details of the completed activity.

Scheduled activities

Schedule bots to run on unattended Bot Runners from the **Scheduled** tab in the Control Room.

Overview

Edit, view, activate, deactivate, delete a schedule, export selected activity details to a CSV file, and search by activity name.

Perform the following actions on a column:

- Click a column to sort it in ascending or descending order.
- Use a drag-and-drop operation to move the column left or right.
- Move the mouse cursor to the end of the column and drag to re-size.

Schedule Actions

Perform the following tasks on an individual Schedule by moving your mouse over the **Actions** icon.

Schedule a bot

Schedule a bot to run at a specific time.

Ensure you are logged in to the Control Room as the administrator or a user with the following permissions:

- Schedule my bots to run
- Schedule permission at folder level for specific bots and their dependencies
- Access to run-as users (Bot Runners) that you can add to the schedule

Note: Automation will fail in the following cases:

- If any of the bot dependencies are missing.
- If you do not have folder privileges on the dependencies.
- If you do not have the scheduling permissions.

-
1. Navigate to **Manage > Scheduled**.
 2. Click **Run bot**.
 3. Click **Schedule bot**.
 4. Add the scheduling details for the bot.

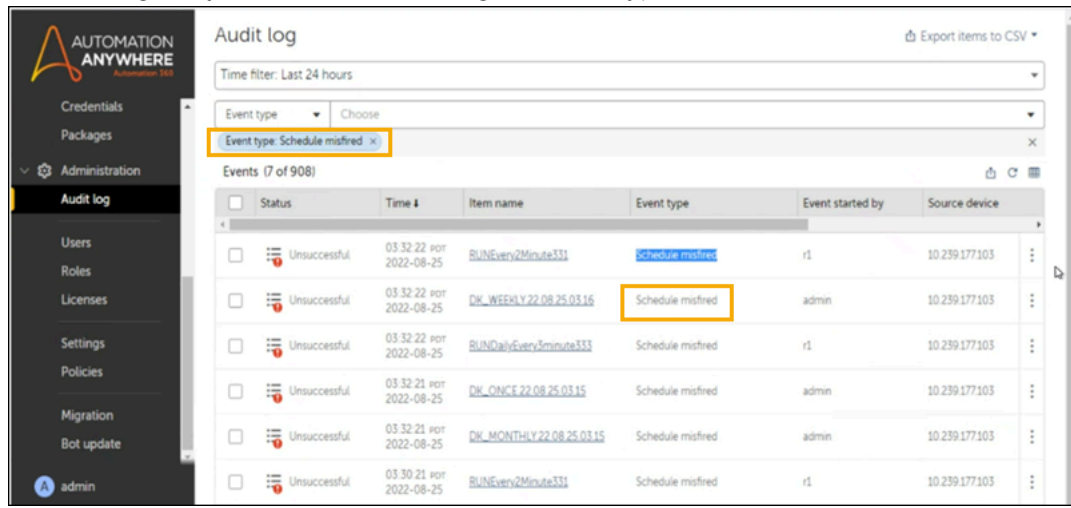

Note: The value of the **Start date** is always later than or equal to the current date. If the start date is the current date, the scheduled time cannot be less than the current time.

Option	Definition
<p>Run once</p>	<p>To run the bot at a specified time, enter the:</p> <p>Start date Default value is the current day.</p> <p>Start time Default value is roundup to the next half-hour.</p> <p>Time zone User's system time zone</p>
<p>Run repeatedly</p>	<p>To schedule a bot to run at specific time on a given day, enter the:</p> <p>Start date Default value is the current day.</p> <p>End date The default value field is blank.</p> <p>Start time Default value is roundup to the next half-hour.</p> <p>Time zone User's system time zone</p> <hr/> <p>Note:</p> <p>When the daylight saving is enabled and if the Start date is set for a schedule, the Start date is shown in the time zone to which it belongs to and not as per the user's current time zone. However, Next occurrence is shown in the time zone (user's system time zone) as per daylight saving time.</p> <p>For example, for a schedule created on 15th March in GMT time zone, the Start date is shown as Mar-15th which belongs to GMT time zone. Later, when daylight saving is ON and if you edit or view this schedule in the month of August in BST time zone, next occurrence is shown as current August month date which belongs to BST time zone.</p>

- In the **Missed schedule setting** section, select **Redeploy the schedule again** to redeploy a schedule that was missed because of Control Room shut down.

Note: To ensure a successful deployment when using the **Redeploy the schedule again** option, you must start the compiler service before you restart the Control Room services.

When the **Redeploy the schedule again** option is selected, schedules missed because of Control Room shut down are automatically redeployed after the Control Room is restarted. An audit log entry is also added showing the Event type as `Schedule misfired`.

6. Select the bot to schedule.
 - Latest version: Click **Latest version** tab to select the latest version of the bot.
 - Labeled version: Click **Production version** tab to select the labeled version of the bot.

Available bots are displayed along with any **Input values** and dependencies. If the production label option is selected for the parent bot, the corresponding dependent bots with the production label are also automatically selected. If any of the dependent bots do not have the production label applied, the latest version of the bot is selected.

7. Select the Bot Runner user from the **Available bot runners** list.

Use the following options to define the number of Bot Runners to use:

 - **All bot runners**: Select to use all the selected Bot Runners.
 - **Custom number of bot runners**: Select to customize the number of Bot Runners to use from the list of selected Bot Runners. The Control Room will then automatically select the configured number of Bot Runners from the list of available Bot Runners.

Note: If a run-as user (Bot Runner) does not appear in the list, ensure the user scheduling the bots is assigned a role that provides access to the appropriate run-as users.

8. Click the right arrow (→) to add your selection.
9. Optional: Select **Device Pools**.

Select the pool from the list of available device pools. If any of the selected run-as users does not have the bot running device, a device pool is required. You can select up to 25 device pools per schedule.
10. Optional: Click the up or down arrow to set the selected device pools in preferred order.

When a is deployed, the selects the first available device based on the order in which you organized the device pools. If none of the devices are available at the time of deployment, the is queued.
11. Enter the **Name**.
12. Optional: Enter a description.
13. Select the **Automation priority** from the **General** tab.

Set the priority to high, medium, or low based on your requirements for resource optimization. The default permission is set to medium.

14. Click [Schedule bot](#).

The **Schedule bot** option remains disabled until all the required items, such as bots, schedule details, and devices are selected.

The number of times a bot is deployed depends on the run-as users (Bot Runners) selected for the schedule. Consider the following scenarios:

- The number of run-as users selected is two, and both the users have the bot running device: The bot is deployed twice on the two run-as users and their bot running devices.
- The number of run-as users selected is three, and only one of the users has the bot running device. In this case, you must select the device pool. If the device pool has only two devices, the bot is deployed three times on both the devices in the device pool and also on the bot running device of the third user.
- The number of run-as users selected is three, and none of the three users has the bot running device: In this case, you must select the device pool. If the device pool has only two devices, the bot is deployed twice on both the devices in the device pool, and the third request for bot deployment is queued. The bot is deployed only when a device becomes available in the device pool.
- The number of run-as users selected is two, and none of the two users have the bot running device: In this case, you must select the device pool. If the device pool has four devices, the bot is deployed twice on any available two devices in the device pool.

Note: For schedules without a device pool, when one or more active run-as user devices are unavailable or disconnected, the bot deployment fails for all the run-as users in the schedule.

Delete a scheduled activity.

Change ownership of scheduled activity

A user who schedules an automation is the owner of that activity. If the user account of the owner is deactivated or is no longer available, change the ownership of that activity to ensure that it can be managed by another existing Control Room user.

Ensure you are logged in to the Control Room as the administrator or a user with the following permissions:

- Access to the selected bot (same as when the user tries to schedule a bot).
See [Schedule a bot](#) on page 2056.
- Access to the selected **Run as users** (same as when the user tries to schedule a bot).

- Access to the device pool (if it was selected in the schedule).
1. Navigate to **Manage > Scheduled**.
 2. From the **Activity** table, select the scheduled activity for which you want to change ownership.
You can select multiple activities or select the **Check all** check box to select all the available activities. For more information on how the change in ownership of multiple activities works, see [How changing ownership of multiple activities works](#) on page 2060.
 3. Click the **Change owner** icon at the top of the table.
 4. Click **Yes, change** to confirm.
 5. In the **Change owner** screen that opens with all the available users, select the user that you want to transfer the ownership to, and click the right arrow (→).
The following video shows how to change the owner of a scheduled activity:
 6. Click **Confirm**.
The ownership of the selected activity is changed or transferred to the specified user. You can verify the changes in the **Owned by** column (scroll across the table) and the audit log will contain the details of the original and changed owner of the scheduled activity.

How changing ownership of multiple activities works

A Control Room administrator or a user with the necessary permissions can change or transfer the ownership of multiple scheduled activities. However, ownership of multiple or all the selected activities cannot be changed at the same time.

An alert is displayed when the ownership of one or more of the selected activities cannot be changed. Review examples where the ownership of all the selected activities cannot be changed at the same time.

Multiple owners with a varied number of scheduled activities

Consider an example where you want to change the ownership of 10 scheduled activities from 3 different users:

- Jane: owns 3 activities
- Derek: owns 5 activities
- Bob: owns 2 activities

When you select all the activities on the **Scheduled activity** page and click **Change owner**, an alert is displayed that the ownership of activities owned by Derek will be changed while the ones owned by Jane and Bob will be skipped.

Multiple owners with equal number of scheduled activities

Consider an example where you want to change the ownership of 12 scheduled activities from three different users:

- Lara: owns 4 activities
- Chung: owns 4 activities
- Deb: owns 4 activities

When you select all activities on the **Scheduled activity** page and click **Change owner**, an alert is displayed that the ownership of activities owned by one of the three users will be changed while the ones owned by other two users will be skipped.

Edit a scheduled activity

Make changes to a schedule so that the automation is not skipped.

Ensure that you are logged in to the as the administrator.

Edit the scheduled activity in order to:

- Change the schedule type, date, or time.
- Add or remove Bot Runners from the schedule.
- Change the retry settings.

Note: The system redeploys the bots and dependencies only if there are updates to the bots or its dependent files.

1. Hover over the **Actions** icon for the scheduled in the Activity table.
2. Click the **Edit** icon. 
3. Make changes to the schedule details, bots, and devices, as required.

Option	Definition						
Run once	To run the bot at a specified time, enter the: <table> <tr> <td>Start date</td> <td>Default value is the current day.</td> </tr> <tr> <td>Start time</td> <td>Default value is roundup to the next half-hour.</td> </tr> <tr> <td>Time zone</td> <td>User's system time zone</td> </tr> </table>	Start date	Default value is the current day.	Start time	Default value is roundup to the next half-hour.	Time zone	User's system time zone
Start date	Default value is the current day.						
Start time	Default value is roundup to the next half-hour.						
Time zone	User's system time zone						

Option	Definition
<p>Run repeatedly</p>	<p>To schedule a bot to run at specific time on a given day, enter the:</p> <p>Start date Default value is the current day.</p> <p>End date The default value field is blank.</p> <p>Start time Default value is roundup to the next half-hour.</p> <p>Time zone User's system time zone</p> <hr/> <p>Note:</p> <p>When the daylight saving is enabled and if the Start date is set for a schedule, the Start date is shown in the time zone to which it belongs to and not as per the user's current time zone. However, Next occurrence is shown in the time zone (user's system time zone) as per daylight saving time.</p> <p>For example, for a schedule created on 15th March in GMT time zone, the Start date is shown as Mar-15th which belongs to GMT time zone. Later, when daylight saving is ON and if you edit or view this schedule in the month of August in BST time zone, next occurrence is shown as current August month date which belongs to BST time zone.</p>

- In the **Missed schedule setting** section, select **Redeploy the schedule again** to redeploy a schedule that was missed because of Control Room shut down.

Note: To ensure a successful deployment when using the **Redeploy the schedule again** option, you must start the compiler service before you restart the Control Room services.

When the **Redeploy the schedule again** option is selected, schedules missed because of Control Room shut down are automatically redeployed after the Control Room is restarted. An audit log entry is also added showing the Event type as `Schedule misfired`.

- Select **Device pools**.
Select the pool from the list of available device pools.
- Optional: Click the up or down arrow to set the selected device pools in preferred order.
- Optional: Change the **Automation priority** from the **General** tab.
- Click **Schedule bot**.

The **Schedule bot** option remains disabled until all the required items, such as bots, schedule details, and devices are selected.

The number of times a bot is deployed depends on the run-as users (Bot Runners) selected for the schedule. Consider the following scenarios:

- The number of run-as users selected is two, and both the users have the bot running device: The bot is deployed twice on the two run-as users and their bot running devices.
- The number of run-as users selected is three, and only one of the users has the bot running device. In this case, you must select the device pool. If the device pool has only two devices, the bot is deployed three times on both the devices in the device pool and also on the bot running device of the third user.
- The number of run-as users selected is three, and none of the three users has the bot running device: In this case, you must select the device pool. If the device pool has only two devices, the bot is deployed twice on both the devices in the device pool, and the third request for bot deployment is queued. The bot is deployed only when a device becomes available in the device pool.
- The number of run-as users selected is two, and none of the two users have the bot running device: In this case, you must select the device pool. If the device pool has four devices, the bot is deployed twice on any available two devices in the device pool.

Note: For schedules without a device pool, when one or more active run-as user devices are unavailable or disconnected, the bot deployment fails for all the run-as users in the schedule.

Make changes to a schedule so that the automation is not skipped.

Automatically select the number of Bot Runners users

Scale your automation by allowing Automation 360 to automatically select the Bot Runner users for specific tasks.

You can enable Automation 360 to automatically select the Bot Runner users for specific tasks:

- Scale automations easily
- Run bots concurrently
- Use resources efficiently

You can optimize Bot Runner users by selecting how many Bot Runners you want to use to run tasks concurrently. The system automatically selects the number of Bot Runner users that are available for the tasks. As a result, when you run or schedule an automation, the available run-as users are automatically selected from the specified list.

Let us consider the following example:

- You have three bots: Bot 1, Bot 2, and Bot 3.
- You have two Bot Runner licenses: bruser 1 and bruser 2.

You can use any of the Bot Runner users to run the three bots by performing the following procedure:

1. Create schedules to run these bots.
2. Select these bots to run.
3. Select both Bot Runner users.
4. Specify **Custom number of bot runners** to use as 1 so that one of the Bot Runners is used to run these bots.

The screenshot shows the 'Schedule bot' configuration interface. On the left, there are tabs for 'Schedule', 'Bot and dependencies', 'Run as', 'Device pools', and 'General'. The 'Run as' tab is active, showing 'Run As selected (1)'. The main area is titled 'Bot runners' and contains a search bar, a table of 'Available bot runners (0)', and a table of 'Selected (1)'. The 'Selected' table has one row with 'santhosh-v-migration' as the username, 'Picked at run time' as the device, and 'Autologin set' as the status. Below the tables, there is a section 'Define number of bot runners to use' with a dropdown menu set to 'Custom number of bot runners' and an input field containing the number '1'. A red box highlights this input field.

See the following video on how Automation 360 automatically selects the Bot Runner users for specific tasks:

To customize Bot Runners, see [Schedule a bot](#) on page 2056.

Event triggers

An event trigger is a predefined action that runs an associated bot. All the bots with event triggers are listed under the **Event triggers** tab.

Available role permissions for event triggers

A Control Room administrator must provide the required permissions to ensure the associated users can access event triggers. The following table lists the available permissions:

Permission	Description
View event triggers	Select this permission if the users can only view the event triggers but not run or delete them.
Manage event triggers	<p>The Manage event triggers permission is available only if View event triggers is enabled. Select this permission if the users can:</p> <ul style="list-style-type: none"> Add an event trigger <hr/> <p>Note: Users associated with the Bot Creator license cannot add event triggers in the private workspace.</p> <hr/> <ul style="list-style-type: none"> Run a bot with event trigger Delete event trigger Associate an event trigger with a Bot Runner (attended or unattended) user or a role that is associated with one or more Bot Runner (attended or unattended) users.

Supported actions

In Automation 360, click **Manage > Event triggers** to view the table that lists all the available bots with event triggers. The following actions are available for this table.

- Enter a keyword from the BOT PATH in the **Search** field to find an event trigger.
For example, if the bot path of an event trigger is `Bots\file--created--event--Salesinfo`, enter `Sales` in the **Search** field to find this event trigger.
- Use the **Run with event triggers** option to add event triggers.
[Adding event triggers](#) on page 2066
- User can also delete any associated (active or inactive) event triggers.
- View the trigger status, bot path, user name, role, and modification details.

Optional: On the specific device, to view trigger details:

- Open the **Task Manager > Details** tab.
- Right-click on the column in the list of app entries.
- Click **Select columns**.
- Click **Command Line** item to enable the column.

Verify that the following Java processes are running to confirm that the triggers are active:

- Bot agent or node manager

Note: The name for this is **NodeManager.exe**

- Trigger listener

Note: The name for this is **TriggerListener.exe**

Note: When you install or update the Bot Agent, you must whitelist the above-mentioned .exe files

Optional: To confirm that **NodeManager.exe** or **TriggerListener.exe** are associated with a node manager or trigger listener, respectively:

1. Copy the details of this task
Press **CTRL+C** after you clicked the task name.
 2. Paste the details to a notepad.
 3. Verify the jar files.
-

Note: Node manager is **node-manager.jar** and the trigger listener is **triggerlistener.jar**

Consider a scenario where triggers are associated with a Bot Runner user who logs off or signs out of a device. This Bot Runner user must log in to the Control Room on that device in order to activate the associated triggers.

Related concepts

[Adding a trigger to run a bot](#) on page 3233

Add triggers that can automatically run the selected bot whenever a specific event occurs. For example, clicking a specific button or using a combination of keystrokes.

Adding event triggers

Any bot with triggers can be associated with users or role to enable event trigger. Control Room user (or role) with **Manage event triggers** permission can add event triggers.

All the bots a user creates are displayed in the Private tab. When the user checks in a bot to a public folder, it is displayed in the **Public** tab.

A private event trigger is created when a user with the Manage event triggers permission adds a trigger to a bot but does not check in this bot to a public folder. Private event triggers are listed under the **Manage > Event triggers** page. However, if the user checks in the associated bot to a public folder, it is no longer displayed under the **Event triggers** page.

1. Click **Automation**.
2. Click **Run bot**.
3. Click **Run with event triggers**.
4. Select the bot.
 - Latest version: Click **Latest version** tab to select the latest version of the bot.
 - Latest version: Click **Production version** tab to select the labeled version of the bot.

If the production label option is selected for the parent bot, the corresponding dependent bots with the production label are also automatically selected. If any of the dependent bots do not have the production label applied, the latest version of the bot is selected.

5. Click the right arrow (→) to add your selection.
6. Click **Next**.
7. Select one of the following to link the bot:

Option	Description
Roles	Select the custom role you have created.
Users	Select the Bot Runner (attended or unattended) user who is associated with this custom role.

8. Click the right arrow (→) to add your selection.
9. Select the **Automatically deploy to unattended Bot Runners** option.

Note: When you select this option, triggers will automatically deploy for unattended Bot Runner users, eliminating the need for users to manually log into their default system. Additionally, if their default system or Bot Agent gets rebooted, the system will automatically log back as the user, and deploy the triggers.

10. Click **Next**.
11. Click **Run with event triggers**.

The selected bot is added to the **Event triggers** page under **Activity**.

Related concepts

[Working with bots](#) on page 2203

Depending on the license and permission assigned to you, you can perform various bot operations and access the private and public workspaces in the Control Room.

Linking event triggers to a Bot Runner

An Control Room administrator or users with **Manage event triggers** permission can add event triggers by associating users or roles with a bot. This enables Bot Runner users to trigger the bot when they perform a specified event.

When a user with a Bot Creator license creates a bot and checks it in a repository, the bot is available in the **Public** workspace. An Control Room administrator or user with **Manage event triggers** permission and access to that **Public** workspace can then link an event trigger.

A Bot Runner (attended or unattended) user must log into the Control Room to start the event trigger, and can choose to log out after that event trigger is activated.

Optionally, administrator can also enable the auto-login feature in the Control Room for unattended Bot Runner users.

See [Configure auto-login settings](#) on page 1742.

Note: Among all the triggers, you can associate any trigger only with a user who has a Bot Runner license. Also, for a user with unattended Bot Runner license, if you associate triggers such as **Hot key**, **Interface**, or **Window**, the following conditions apply:

- The default device must not be in the logged-off or locked state.
- The user must be logged in to the device to perform the predefined task that can trigger the bot.

-
1. On the left pane, click **Automation**.
 2. Click **Run bot**.
 3. Click **Run with event triggers**.
 4. Click the right arrow (→) to add your selection.

5. Click **Next**.
6. Select one of the following to link the bot:

Option	Description
Roles	Select the custom role you have created.
Users	Select the Bot Runner (attended or unattended) user who is associated with this custom role.

7. Click **Add event triggers**.

When the Bot Runner user logs in to Control Room and performs the trigger event, the bot is deployed. The event trigger will continue to work until one of the following changes occur:

- Associated bot is deleted from the public workspace.
- The linked Bot Runner user account is deleted.
- The default device is logged off.
- The default device enters the sleep or hibernate mode.

Audit log

View audit logs and details to record user activities.

Audit Log displays a read-only table of records of actions performed by users. These log records are searchable and exportable. Audit logs include both **Successful** and **Unsuccessful** actions attempted.

If multiple users with different language settings (English, Japanese, and so on) are using a single tenant, audit logs for such users are displayed in their preferred language setting. However, if you change the language after logging into the Control Room, the audit log will display in the language that you selected when logging into the Control Room. For example, if you selected the Japanese language when logging into the Control Room and then changed the language to Korean, the audit logs will be displayed in the Japanese language.

Actions

The following Audit log actions are enabled:

Note: Use your cursor to roll over the action button icons to identify specific functions.

Time filter

Users select from preset time filters or configure a custom time filter for log entries to view. The default time filter setting is **Last 24 hours**.

Search

Search the records. Select additional search filter criteria from the drop-down menu.

Tip: To search the exact phrase, enclose the search phrase within double quotes (for example, "Taylor-Finance-564").

Export checked items to CSV	Export the data to a CSV file based on filters and or selections.
Refresh	Refresh and view the updated status.
Customize columns	Show or hide specific columns.
View	To view details of a table entry, mouse over the entry to expand and click Audit details .

Audit log table

View the following audit details in the table.

Table item	Description
Status	Shows action status.
Time	Shows the date and time of the action performed.
Event Type	Shows the type of action performed.
Item Name	Shows the entity on which action was performed.
Event Started By	Shows the user that performed the action.
Source Device	Shows the device or machine name or IP address that was used to perform the action.
Source	Shows the component: Control Room, Enterprise Client or API, from where the action originated or was performed.
Request ID	Shows the unique identity number assigned to a specific set of user actions.

Bot life cycle audit logs

The entry shows the status of each stage of the bot life cycle.

Audit log entry	Success	Failure
Create automation	Bot was sent to the control room and was successfully compiled.	Check if the Control Room is up and running.

Audit log entry	Success	Failure
Bot Sent To Device	Control Room deployed the bot successfully on the specified device.	<p>Possible reasons for failure entry include:</p> <ul style="list-style-type: none"> • Check if you have configured the Node manager on the corresponding device correctly. • Check for the app Automation Anywhere Bot Manager in Add Remove Programs or in Control Panel > Uninstall a program. Try to reinstall by uninstalling and downloading the app again. • Try to reinstall by uninstalling and downloading the app again from Device Manager. • Ensure the device auto log in details are set correctly.
Run bot Deployed	The bot has started on the specified device.	<p>Possible reasons for failure entry include:</p> <ul style="list-style-type: none"> • Check if you have configured the Node manager on the corresponding device correctly. • Check for app Automation Anywhere Bot Manager in Add Remove Programs or in Control Panel > Uninstall a program. • Try to reinstall by uninstalling and downloading the app again from Device Manager. • Ensure device auto log in details are set correctly.

Audit log entry	Success	Failure
Run bot finished	Bot execution completed successfully.	Possible reasons for failure entry include: <ul style="list-style-type: none"> • Check for the bot execution progression in Activity In progress. • Check the code at the line where activity log has been paused for errors. • If it has paused at a message box, minimize all windows and check if the message box is in the background.
Bot Runner Session Continued	Control Room deploys the Task Bots in a sequence for the same RDP session.	
Bot Runner Session Released	When a task successfully completes the execution.	
Download file	Downloading to the Control Room.	
Upload file	Uploading a file to the Control Room.	
Bot Runner Session	Control Room gets the RDP session of Bot Runner machine.	

Syslog audit log

For on-premises deployments, the SysLog Configuration audit entry shows the Control Room server status when adding, editing, or deleting the system configuration. The Syslog details shows these attributes and their values:

- Syslog Server Hostname: Full qualified domain name (FQDN) or the IP address of the Syslog server used to deliver the log reports
- Port: Port used by the remote Syslog server to receive incoming Syslog records
- Protocol: TCP or UDP
- Use Secure Connection: TLS encrypted channel used to send Syslog records to the remote Syslog server

Audit log entry	Status	User action	SysLog details shows these attributes and their values
SysLog Configuration	Successful	Adds new values to an existing server	<ul style="list-style-type: none"> • Syslog Server Hostname • Port • Protocol • Use Secure Connection <p>For example: MyServer1.aa.com, 468, TCP, Enabled</p>
	Successful	Adds new values to multiple servers	<ul style="list-style-type: none"> • Syslog Server Hostname • Port • Protocol • Use Secure Connection <p>For example: MyServer1.aa.com, 468, TCP, Enabled</p> <p>MyServer2.aa.com, 333, TCP, Disabled</p>
	Successful	Edits existing server	<ul style="list-style-type: none"> • Syslog Server Hostname • Port • Protocol • Use Secure Connection <p>For example: Old Value MyServer1.aa.com, 468, TCP, Enabled</p> <p>New Value MyServer123.aa.com, 514, UDP, Disabled</p>

Audit log entry	Status	User action	SysLog details shows these attributes and their values
	Successful	Deletes existing server	<ul style="list-style-type: none"> Syslog Server Hostname Port Protocol Use Secure Connection <p>For example: MyServer1.aa.com, 468, TCP, Enabled</p>
SysLog Configuration	Unsuccessful	User attempted to save the system configuration; however, the Control Room was not able to save the configuration.	For an unsuccessful status, you can use the results to troubleshoot the issue. Examples: Invalid Protocol, Or Could not save SysLog settings. Invalid Host.

External key vault audit log

For cloud deployments, the External key vault configuration audit entry shows the type of external key vault configured (if any). Automation Anywhere supports these external key vaults:

- AWS Secrets Manager
- Azure Key Vault
- CyberArk Password Vault

Based on the type of external key vault configured, the external key vault configuration details shows different attributes and their values.

Audit log entry	External key vault	User action	Configuration details shows these attributes and their values
External key vault configuration	AWS Secrets Manager	Adds a new AWS Secrets Manager when there was previously no external key vault.	<ul style="list-style-type: none"> External key vault value: Changes from no external key vault to AWS Secrets Manager. AWS Secrets Manager value is Enabled Region value is set to (for example) us-east-1
	CyberArk	Adds a new CyberArk Password Vault when there was previously no external key vault.	<ul style="list-style-type: none"> External key vault value: Changes from no external key vault to CyberArk. CyberArk value is Enabled Vault URL is the CyberArk AIM server CCP API URL and is set to (for example) https://<hostname:port_num>/ Application ID is the CCP API AppID and is set to (for example) AAControlRoom

Audit log entry	External key vault	User action	Configuration details shows these attributes and their values
	Azure Key vault	Adds a new Azure Key vault when there was previously no external key vault.	<ul style="list-style-type: none"> External key vault value: Changes from no external key vault to Azure Key vault. Azure Key vault value is Enabled Vault URL is the Azure Key Vault URL and is set to (for example) <code>https://user-db-vault.vault.azure.net/</code> Client ID is the (application) ID of an App Registration in the tenant and is set to (for example)536145 Tenant ID is the Azure Active Directory tenant (directory) ID and is set to (for example)89D12L
External key vault configuration	Change from AWS Secrets Manager to CyberArk	User changes from one external key vault to another type.	External key vault value changes from AWS Secrets Manger to CyberArk

Automation Co-Pilot for Business Users (Automation Co-Pilot) Audit logs

The entry shows the status of events relating to requests, teams, scheduler, process setups, bot setups, human tasks, and bot tasks that you have created, deleted, updated, submitted, or recovered.

Audit log entry	Success
Automation Co-Pilot Team	<ul style="list-style-type: none"> • When a team is created by a user • When a team is edited by a user • When a team is deleted by a user
Automation Co-Pilot Request	<ul style="list-style-type: none"> • When a request is deleted by a user • When a request is recycled by a user • When a request is recovered by a user
Automation Co-Pilot Human Task	<ul style="list-style-type: none"> • When a task is edited by a user • When a task is submitted by a user • When a task is canceled by a user • When a task is assigned by a user to another user • When a task is canceled (using a cancel type of action by a user or by a bot (AARI Web package))
Automation Co-Pilot Bot Task	When the process launched a bot task
Automation Co-Pilot Process	<ul style="list-style-type: none"> • When a process is created • When a process is edited by a user
Automation Co-Pilot Bot Setup	<ul style="list-style-type: none"> • When a new bot is added to the bot setup management • When the bot setup management is modified • When a bot is deleted by a user
Process Scheduler	When the scheduler configuration is modified

Audit events list

Review the list of audit events to identify the type of audit entries that are logged in the Control Room for Automation 360.

General audit entries

The following table shows a list of general audit entries and their descriptions (listed alphabetically):

Audit entries	Description
Accept end user license agreement	This action is logged when the user accepts the license agreement.
Activate automation	This action is logged when the user activates the schedule.
Add credential	This action is logged when the user creates credentials.
Add Global value	This action is logged when the user creates a new global value.
Add locker	This action is logged when the user creates the locker.
Add manual dependency	This action is logged when the user adds manual dependency to a bot.
Add MFA token	This action is logged when the user adds the MFA (multi-factor authentication) token.
Allocate license	This action is logged when the user creates a user with a particular license (such as Bot Creator or Bot Runner) and when the user changes the license from Bot. This action is logged when the user creates a user with a particular license (such as Bot Creator or Bot Runner) and when the user changes the license from Bot Creator to Bot Runner and vice versa.
API-Key duration	This action is logged when the user changes the duration for how long a generated API-Key is valid to authenticate users.
Audit error	This action is logged when an audit error occurs.
Audit migration finished	This action is logged when migration is completed.
Audit migration started	This action is logged when migration is started.

Audit entries	Description
Audit unset activity type	This action is logged when there is an unset activity type.
Auto-login credentials not set	his action is logged when auto-login credentials have not been set for the user.
Automation complete	This action is logged when a schedule completes.
BOT_AGENT_BULK_INSTALLATION	This action is logged when the user changes the option to generate a registration key to perform bulk installation of Bot Agents on multiple devices.
Bot runner session	This action is logged when a Bot Runner session occurs.
Bot saved	This action is logged when a user saves a bot or modifies a bot that is checked in to a Git repository.
Bot sent to device	This action is logged when a bot is sent to a device.
Bot sent to device failed due to configuration update	This action is logged when a bot fails to be sent to a device because a device configuration upgrade is in progress.
Bot validation setting	This action is logged when a user sets the bot validation setting.
Callback request	This action is logged when a callback is requested.
Callback URL validation failed	This action is logged when the callback URL is invalid and does not appear on the white list.
Certificate authentication configuration create	This action is logged when a user creates certificate authentication settings.
Certificate authentication configuration update	This action is logged when a user modifies the certificate authentication configuration.
Certificate authentication TLS host configuration create	This action is logged when a user creates a certificate authentication TLS host server configuration.
Certificate authentication TLS host configuration reinstall	This action is logged when a user reinstalls a certificate authentication TLS host server configuration.
Certificate authentication TLS host configuration update	This action is logged when a user modifies a certificate authentication TLS host server configuration.
Change settings	This action is logged when the user changes any setting such as On to Off, or Off to On.

Audit entries	Description
Check in	This action is logged when a check in occurs.
Check in request	This action is logged when a check in is requested.
Check out	This action is logged when a checkout occurs.
Check out request	This action is logged when a check out is requested.
Client log in	This action is logged when a client logs in.
Clone	This action is logged when a user clones an object.
Cloud burst mode	This action is logged when a cloud burst occurs.
Cloud-enabled provisioning success	This action is logged when a cloud is successfully provisioned.
Cloud-enabled provisioning failure	This action is logged when cloud provisioning fails.
Configure credential vault	This action is logged when a user configures a credential vault.
Connect credential vault	This action is logged when a user connects a credential vault.
Control Room configurations	This action is logged when a user edits general configuration settings to the Control Room.
Control Room upgrade available	This action is logged when an upgrade to the Control Room is available.
Control Room upgrade email notification	This action is logged when an email has been sent to indicate a successful upgrade to the Control Room.
Control Room upgrade failure	This action is logged when an upgrade to the Control Room has failed.
Control Room upgrade success	This action is logged when an upgrade to the Control Room has completed successfully.
Create automation	This action is logged when the user creates a new schedule or runs a bot with a queue in workload management.
Create bot	This action is logged when the user creates a bot for the first time.
Create domain	This action is logged when the user creates a new domain.

Audit entries	Description
Create draft of queue	This action is logged when the user saves the work item as draft in workload management.
Create folder	This action is logged when the user creates a new folder.
Create learning instance	This action is logged when the user creates a new learning instance.
Create package	This action is logged when the user creates a new package.
Create proxy credentials	This action is logged when the user creates new proxy credentials.
Create queue	This action is logged when the user creates a new queue in workload management.
Create queue failed	This action is logged when a queue creation fails.
Create role	This action is logged when the user creates a new role.
Create user	This action is logged when a new user is created.
Create work item	This action is logged when new work items are added to a queue.
Create work item failed	This action is logged when new work items failed to add to a queue.
Credential vault settings	This action is logged when a user defines credential vault settings.
Deactivate automation	This action is logged when the scheduled automation is deactivated.
Delete automation	This action is logged when the user deletes the schedule.
Delete bot	This action is logged when the user deletes a bot.
Delete credential	This action is logged when the user deletes credentials.
Delete device	This action is logged when the user deletes a device.
Delete file	This action is logged when the user deletes a file.
Delete folder	This action is logged when the user deletes a folder.
Delete Git settings	This action is logged when the user deletes Git repository settings in the Control Room.

Audit entries	Description
Delete Global value	This action is logged when the user deletes the global value.
Delete learning instance	This action is logged when the user deletes an existing learning instance.
Delete locker	This action is logged when the user deletes a locker.
Delete MFA token	This action is logged when the user deletes the MFA (multi-factor authentication) token.
Delete package	This action is logged when the user deletes a package.
Delete proxy credentials	This action is logged when the user deletes proxy credentials.
Delete queue	This action is logged when the user deletes the queue in workload management.
Delete queue failed	This action is logged when the user fails to delete a queue.
Delete role	This action is logged when the user deletes roles from the system.
Delete tenant BLM clean up	This action is logged when the Bot Lifecycle Management (BLM) performs clean up for a deleted tenant.
Delete user	This action is logged when the user delete users from the system.
Delete work item	This action is logged when the user deletes the work item from the queue.
Delete work item failed	This action is logged when the user fails to delete work items in a queue.
Deployment automation	This action is logged when a bot is deployed to run.
Deployment queued	This action is logged when a deployment has been queued to run.
Device acquired by user	This action is logged when the device has been acquired by the user.
Device configuration update initiated	This action is logged when the user initiates the device configuration update.
Device details updated	This action is logged when the device details have been successfully updated.
Device not available to acquire	This action is logged when the device is unavailable to be acquired by the user.

Audit entries	Description
Device registered	This action is logged when the user registers a device.
Device update configured	This action is logged when the user changes the option to install or update the Bot Agent software.
Device type update settings	This action is logged when the settings of a device type are updated.
Disable package	This action is logged when the user disables a package.
Disable user	This action is logged when the user disables another user in the system.
Domain credential reset	This action is logged when the user resets or reconnects to the Active Directory domain from the settings page.
Download bot	This action is logged when a user downloads a bot.
Download bot finished	This action is logged when the Bot Store completes downloading a bot.
Download file	This action is logged when a user downloads a file.
Edit bot	This action is logged when the user renames a bot.
Edit domain	This action is logged when the user modifies a domain.
Edit learning instance	<p>This action is logged when the user edits any of the following settings of an existing learning instance:</p> <ul style="list-style-type: none"> • Edits the name • Edits or adds a description • Uploads staging documents • Adds new fields • Edits new group setting • Edits default validations groups setting
Edit role	This action is logged when the user modifies a role.
Edit role - folder permissions	This action is logged when a user changes the folder permissions of an existing role.
Edit settings	This action is logged when the user modifies settings.
Edit user	This action is logged when the user modifies another user.

Audit entries	Description
Elasticsearch backup	This action is logged when the user provides a backup IP address in the Elasticsearch disaster recovery backup cluster.
Elasticsearch delete index	This action is logged when the user deletes an index from the Elasticsearch.
Email notification	This action is logged when email notification connection or authentication fails.
Email notification settings	This action is logged when the user modifies email notification settings.
Empty pools	This action is logged when there are empty pool IDs.
Enable package	This action is logged when the user enables a package.
Enable user	This action is logged when the user enables another user in the system.
Execute automation	This action is logged when the user executes a bot.
Export bots	This action is logged when the user exports bots and is available for download on the Historical activity page.
Export domain	This action is logged when the user exports any of the domains from the IQ Bot application.
Export learning instance	This action is logged when the user exports a learning instance (.iqba file) through the migration utility.
Export queue	This action is logged when the user exports a queue from workload management.
Export request	This action is logged when the user submits a request to export automations.
Export to csv	This action is logged when the user exports data to a csv.
Failed to acquire user or device	This action is logged when the device or user is unavailable to be acquired.
Failsafe status updated	This action is logged when a failsafe status has been updated.
File upload settings	This action is logged when the user changes the file upload settings to restrict or allow the upload of executable files to a malicious file upload.

Audit entries	Description
First Administrator settings	This action is logged when a user configures the first Administrator user in the Control Room.
Force unlock bot	This action is logged when a user unlocks a bot.
GDPR report	This action is logged when a user enables GDPR (General Data Protection Regulation) reporting.
Generate API-Key	This action is logged when an Admin user generates an API key from the My Settings page, which can be used to obtain an authentication token. This audit entry shows the generate API key status as either Successful or Unsuccessful.
Git push	This action is logged when the user synchronizes information between the built-in Git repository and the remote Git host.
Git restore	This action is logged when the user restores all of their bots and associated dependent files from the Git repository to a new database.
Git restore abort	This action is logged when the user aborts to restore all of their bots and associated dependent files from the Git repository to a new database.
Git restore reset	This action is logged when the user resets to restore all of their bots and associated dependent files from the Git repository to a new database.
Import bot	This action is logged when the user imports a bot.
Import domain	This action is logged when the user imports any new domains to IQ Bot.
Import learning instance	This action is logged when the user imports a learning instance (.iqba file) through the migration utility.
Import queue	This action is logged when the user imports a queue into workload management.
Import request	This action is logged when the user generates an import request.
Install license	This action is logged when the user installs or changes the license from the license page.

Audit entries	Description
IP address access	This action is logged when the IP address has been accessed.
License migration	This action is logged when a license is migrated to another user.
License mode change	This action is logged when the user changes the license mode.
Load work items from file	This action is logged when the user selects a CSV or Excel file and uploads the work item in a queue.
Log in banner settings	This action is logged when an Admin configures banner text to display on the login page of the Control Room.
Migration finished	This action is logged when a migration completes.
Migration started	This action is logged when a migration begins.
Move automation to history	This action is logged when the user moves the selected activity to the Historical page.
No access to pool	This action is logged when a user has no access to a device pool.
Override Global value	This action is logged when users override a global value with their own private value.
Password settings	This action is logged when an Admin configures password settings for the Control Room.
Read credential	This action is logged when the logged-in user accesses the credentials of another user for which they do have permission for because the user is not a consumer for the credential or a credential owner.
Read locker	This action is logged when the logged-in user accesses the locker of another user for which they do not have permission because they are not part of a locker as a member (owner, manager, participant, or consumer).
Register app	This action is logged when the user configures IQ Bot.
Release license	This action is logged when the user changes the license from Bot Runner to Bot Creator or Admin.
Release user license	This action is logged when the user changes the user license.

Audit entries	Description
Remove manual dependency	This action is logged when the manual dependency is removed from a bot.
Rename folder	This action is logged when the user renames the folder.
Resend email verification	This action is logged when the email is resent for verification.
Reset password	This action is logged when the user resets the password.
Revert checkout	This action is logged when the user reverts a previous check out action.
Rollback	This action is logged when the user rolls back to a previous version.
Run as user in use	This action is logged when the user runs a bot as the user using the bot.
Run as user invalid	This action is logged when a user who tries to run a bot and use the bot is invalid.
Run automation	This action is logged when the user runs an automation.
Save allowed IP addresses	This action is logged when the allowed IP addresses have been saved.
Schedule misfired	This action is logged when the Control Room services starts or the server is available after more than 15 minutes of scheduled deployment time.
Security Settings - External key Vault - Configuration	For cloud deployments, this action is logged when a user makes a change to the external key vault configuration. Automation Anywhere supports these external key vaults: AWS Secrets Manager, Azure Key Vault, and CyberArk. This audit entry shows the status as either Successful or Unsuccessful.
Security Settings - Network settings	This action is logged when the user changes the configuration of the allowed IP address from where the authentication is restricted.
Send bot to production	This action is logged when the user moves the bot from staging to production.
Send bot to staging	This action is logged when the user moves the bot from production to staging.
Send email	This action is logged when an email is sent.
Send learning instance to production	This action is logged when the user moves the learning instance from staging to production.

Audit entries	Description
Send learning instance to staging	This action is logged when the user moves the learning instance from production to staging.
Session timeout settings	This action is logged when the settings of a session timeout is reached.
Set default device	This action is logged when the user sets the default device.
Set device credentials	This action is logged when the user sets the device credentials.
Set Git settings	This action is logged when the user sets remote Git repository settings in the Control Room.
Sync license	This action is logged when a license is synced.
SysLog Configuration	For on-premises deployments, this action is logged when a user adds, edits, or deletes Syslog server configuration. This audit entry shows the Control Room server recording the status as either Successful or Unsuccessful.
Temporary devices cleanup job	This action is logged when the temporary device runs its cleanup job.
Test proxy connectivity	This action is logged when proxy connectivity is tested.
Time out	This action is logged when an operation times out.
Train bot	This action is logged when the user creates a training bot.
Transfer credential ownership	This action is logged when the locker admin transfers the ownership of the credentials.
Trigger bot run	This action is logged when a bot runs due to a trigger.
Trigger bot run fail	This action is logged when a bot fails to run due to a trigger.
Trigger delete	This action is logged when a trigger is deleted.
Trigger delete failed	This action is logged when the deletion of a trigger fails.
Trusted CA key store update	This action is logged when a user modifies the trusted CA key store for certificate authentication.

Audit entries	Description
Unable to send bot device	This action is logged when a bot fails to be sent to a device.
Undo checkout	This action is logged when the user reverses a check out.
Unlock credential vault	This action is logged when the user unlocks the credential vault.
Unset default device	This action is logged when the user changes the default device.
Update app registration	This action is logged when the IQ Bot URL is updated in the settings page.
Update automation	This action is logged when the user edits the schedule automation.
Update callback URL failed	This action is logged when the callback URL list has failed to update.
Update callback URL successful	This action is logged when the callback URL list has been updated successfully.
Update credential	This action is logged when the user modifies the credentials.
Update device auto download packages	This action is logged when the device updates its auto download packages settings.
Update device credentials	This action is logged when the device updates its credentials.
Update device general settings	This action is logged when the device updates its general settings.
Update device log settings	This action is logged when the device updates its log settings.
Update device RDP settings	This action is logged when the device updates its RDP (Remote Desktop Protocol) settings.
Update device resolution settings	This action is logged when the device updates its resolution settings.
Update Git settings	This action is logged when the user updates remote Git repository settings in the Control Room.
Update Global value	This action is logged when the user updates an existing public global value.
Update locker	This action is logged when the user modifies the lockers.
Update MFA role	This action is logged when the user modifies the MFA (multi-factor authentication) role.

Audit entries	Description
Update MFA settings	This action is logged when the user modifies the MFA (multi-factor authentication) settings.
Update MFA token	This action is logged when the user modifies the MFA (multi-factor authentication) token.
Update MFA user	This action is logged when the user modifies the two-factor authentication for a user.
Update package	This action is logged when the user updates an existing package.
Update package settings	This action is logged when the user updates any package settings.
Update proxy credentials	This action is logged when the user updates existing proxy credentials.
Update queue	This action is logged when the user updates the existing queue (for example, adding new work items to the same queue).
Update queue failed	This action is logged when the user fails to update the existing queue (for example, adding new work items to the same queue).
Update settings	This action is logged when the user updates any setting in Control Room.
Update temporary devices auto delete settings	This action is logged when the temporary device updates its auto delete settings.
Update work item	This action is logged when the user edits a work item.
Update work item failed	This action is logged when work items fail to update.
UPDATE_DEVICE_ADVANCED_OPTIONS_SETTINGS	This action is logged when the user changes the device environment settings such as: global cache location, auto-login timeout duration, and so on.
UPDATE_DEVICE_THRESHOLD_SETTINGS	This action is logged when the user changes enables or disables the threshold settings such as: CPU utilization, device memory threshold values, and so on.
UPDATE_DEVICE_LOG_SETTINGS	This action is logged when the user changes the log collection settings such as: log collection, log size, and so on.
UPDATE_GLOBAL_AUTO_LOGIN_SETTINGS	This action is logged when the user changes the auto-login settings in the Control Room to either create user sessions, or reuse existing user sessions to reduce the bot startup time.

Audit entries	Description
Upload	This action is logged when a user imports a file.
Upload bot	This action is logged when a user uploads a bot.
Upload document	This action is logged when a user uploads a document.
Upload file	This action is logged when a user uploads a file.
Upload package	This action is logged when the user uploads a package.
Upload work items file	This action is logged when the user updates a queue and adds work items.
User Authentication configuration	This action is logged when the user changes the Control Room database or SAML user authentication configuration.
User multiple log in	This action is logged when the user logs in to the Control Room from different browsers with the same username.
User log in	This action is logged when the user logs in to the Control Room.
User log out	This action is logged when the user logs out of the Control Room.
Validate learning instance	This action is logged when the user validates (either corrects the document and saves it or invalidates the document) a document in the validator of a learning instance.
Version control settings	This action is logged when the user updates any version control settings.
Websocket proxy connection failure	This action is logged when the websocket proxy connection fails.

AD audit entries

The following table shows the list of AD audit entries and their descriptions (listed alphabetically):

Audit entries	Description
AD allowed domain not set	This action is logged when a user or an existing mapping belongs to one or more domains. Manage Active Directory role mapping on page 1712

Audit entries	Description
AD allowed domain set	<ul style="list-style-type: none"> This action is logged when the user adds a domain to the allowed domains list. This action is logged when the user removes a domain from the allowed domains list. Manage domain on page 1751
AD default domain set	This action is logged when the user configures a domain as the default domain. Manage domain on page 1751
AD group mapping created	This action is logged when the user creates an AD role mapping.
AD group mapping deleted	This action is logged when the user deletes an AD role mapping.
AD group mapping updated	This action is logged when the user updates an Active Directory role mapping.
AD sync role empty	This action is logged when an Active Directory role assigned with sync operations is empty.
AD sync role conflict	This action is logged when an Active Directory role assigned with sync operations is in conflict with another role.
AD sync role system assigned	This action is logged when new Active Directory roles are assigned with sync operations.
AD sync role system deleted	This action is logged when Active Directory roles are deleted with sync operations.
AD sync role system updated	This action is logged when Active Directory roles are updated with sync operations.
AD sync user count	This action is logged when the Active Directory user counts are synced.
AD sync user deleted	This action is logged when the Active Directory synced users are deleted.
AD sync user out of license	This action is logged when the Active Directory synced users run out of available licenses.

Bot Insight audit entries

The following table shows the list of Bot Insight audit entries and their descriptions (listed alphabetically):

Audit entries	Description
Bot Insight add user dashboard	This action is logged when a new user dashboard is added to Bot Insight.
Bot Insight BLM dashboard export	This action is logged when a user exports a BLM (Bot Lifecycle Management) dashboard from Bot Insight.
Bot Insight BLM dashboard import	This action is logged when a user imports a BLM (Bot Lifecycle Management) dashboard into Bot Insight.
Bot Insight create dashboard	This action is logged when a user creates a dashboard in Bot Insight.
Bot Insight copy dashboard	This action is logged when a user copies a dashboard in Bot Insight.
Bot Insight delete dashboard	This action is logged when a user deletes a dashboard from Bot Insight.
Bot Insight delete user dashboard	This action is logged when a user dashboard is deleted from Bot Insight.
Bot Insight end task	This action is logged when a task ends in Bot Insight.
Bot Insight get task data	This action is logged when task data is retrieved in Bot Insight.
Bot Insight get user dashboards	This action is logged when user dashboards are retrieved in Bot Insight.
Bot Insight load dashboard	This action is logged when a user loads a dashboard in Bot Insight.
Bot Insight operations	This action is logged when operations occur in Bot Insight.
Bot Insight publish dashboard	This action is logged when a user publishes a dashboard in Bot Insight.
Bot Insight registers dashboard	This action is logged when a user registers a dashboard in Bot Insight.
Bot Insight run data	This action is logged when data runs in Bot Insight.
Bot Insight save dashboard	This action is logged when a user saves a dashboard in Bot Insight.
Bot Insight search dashboard	This action is logged when a user searches a dashboard in Bot Insight.
Bot Insight start task	This action is logged when a task starts in Bot Insight.
Bot Insight update dashboard	This action is logged when a user updates a dashboard in Bot Insight.

Audit entries	Description
Bot Insight profile update	This action is logged when a user updates a data profile in Bot Insight.

Bot Store audit entries

The following table shows the list of Bot Store audit entries and their descriptions (listed alphabetically):

Audit entries	Description
Bot Store add to My bots	This action is logged when a user adds a bot to their My bots.
Bot Store clean up	This action is logged when clean up is performed for a deleted tenant.
Bot Store download	This action is logged when a user starts to download a bot from the Bot Store.
Bot Store log in	This action is logged when a user logs in to the Bot Store.
Bot Store submit bots	This action is logged when a user submits bots to the Bot Store.

Code analysis audit entries

The following table shows the list of code analysis audit entries and their descriptions (listed alphabetically):

Audit entries	Description
Automated code analysis completed	This action is logged when automated code analysis completes.
Automated code analysis started	This action is logged when automated code analysis starts.
Policy added	This action is logged when a user adds a new code analysis policy in the Policy Manager page.
Policy deleted	This action is logged when a user deletes a code analysis policy in the policy manager page.
Policy folder added	This action is logged when a user creates a policy assignment to a folder in the policy manage page.

Audit entries	Description
Policy folder removed	This action is logged when a user deletes a policy assignment to a folder in the policy manage page.
Policy updated	This action is logged when a user modifies and saves a code analysis policy in the policy manage page.
Run automated code analysis	This action is logged when automated code analysis starts and when automated code analysis completes.
Run code analysis	<p>This action is logged when a user performs the following actions:</p> <ul style="list-style-type: none"> • Runs code analysis from the automation page. • Opens an automation file in the Bot editor. • Saves an automation file in the Bot editor

Device pool audit entries

The following table shows the list of device pool audit entries and their descriptions (listed alphabetically):

Audit entries	Description
Device pool created	This action is logged when the user successfully creates a new device pool.
Device pool creation failed	This action is logged when the user fails to create a device pool.
Device pool deleted	This action is logged when the user successfully deletes a device pool.
Device pool deletion failed	This action is logged when the user fails to delete a device pool.
Device pool update failed	This action is logged when the user fails to update an existing device pool.
Device pool updated	This action is logged when the user edits an existing device pool (for example, add a new device or add a new customer role).

Device update audit entries

The following table shows the list of device update audit entries and their descriptions (listed alphabetically):

Audit entries	Description
Device update acknowledged	This action is logged when the device update has been acknowledged.
Device update already in progress	This action is logged when the device update is already in progress.
Device update completed	This action is logged when the device update has completed.
Device update disconnected	This action is logged when the device update has been disconnected.
Device update downloaded	This action is logged when the device update has been downloaded.
Device update failed and max retry reached	This action is logged when the device update has failed after the maximum number of retries has been reached.
Device update failed and max retry reset reached	This action is logged when the device update has failed but device will continue to retry the update.
Device update initiated	This action is logged when the user initiates the device update.
Device update settings	This action is logged when the settings of a device are updated.
Device update started	This action is logged when the device update has started.
Device update unavailable	This action is logged when the device update has already occurred and been updated.
Device update unsuccessful	This action is logged when the device update has been unsuccessful.
Device update waiting for deployments to complete	This action is logged when the device update is waiting for deployments to complete.

Discovery bot audit entries

The following table shows the list of Discovery bot audit entries and their descriptions (listed alphabetically):

Audit entries	Description
Discovery bot cancel recording	This action is logged when the discovery bot successfully cancels a recording.
Discovery bot convert to bot	This action is logged when the discovery bot successfully converts to a bot.

Audit entries	Description
Discovery bot create aggregated recording	This action is logged when the discovery bot successfully creates a new aggregated recording.
Discovery bot create opportunity	This action is logged when the discovery bot successfully creates a new opportunity.
Discovery bot create process	This action is logged when the discovery bot successfully creates a new process.
Discovery bot create process assignment	This action is logged when the discovery bot successfully creates a new process assignment.
Discovery bot create project	This action is logged when the discovery bot successfully creates a new project.
Discovery bot create recording	This action is logged when the discovery bot successfully creates a new recording.
Discovery bot create recording step	This action is logged when the discovery bot successfully creates a new recording step.
Discovery bot create recording step metadata	This action is logged when the discovery bot successfully creates metadata for a new recording step.
Discovery bot delete aggregated recording	This action is logged when the discovery bot successfully deletes an aggregated recording.
Discovery bot delete opportunity	This action is logged when the discovery bot successfully deletes an opportunity.
Discovery bot delete process	This action is logged when the discovery bot successfully deletes a process.
Discovery bot delete process assignment	This action is logged when the discovery bot successfully deletes a process assignment.
Discovery bot delete project	This action is logged when the discovery bot successfully deletes a project.
Discovery bot delete recording	This action is logged when the discovery bot successfully deletes a recording.
Discovery bot delete recording step	This action is logged when the discovery bot successfully deletes a recording step.
Discovery bot delete recording step metadata	This action is logged when the discovery bot successfully deletes metadata for a recording step.
Discovery bot export opportunity	This action is logged when the discovery bot exports an opportunity.
Discovery bot migrate opportunity	This action is logged when the discovery bot migrates an opportunity.

Audit entries	Description
Discovery bot update aggregated recording	This action is logged when the discovery bot edits an existing aggregated recording.
Discovery bot update aggregated recording json	This action is logged when the discovery bot edits an existing aggregated recording using json.
Discovery bot update opportunity	This action is logged when the discovery bot edits an existing opportunity.
Discovery bot update process	This action is logged when the discovery bot edits an existing process.
Discovery bot update process assignment	This action is logged when the discovery bot edits an existing process assignment.
Discovery bot update project	This action is logged when the discovery bot edits an existing project.
Discovery bot update recording	This action is logged when the discovery bot edits an existing recording.
Discovery bot update recording step	This action is logged when the discovery bot edits an existing recording step.
Discovery bot update recording step metadata	This action is logged when the discovery bot edits metadata for an existing recording step.

OAuth connection audit entries

The following table shows the list of OAuth connection audit entries and their descriptions (listed alphabetically):

Audit entries	Description
Bulk delete OAuth connection	This action is logged when multiple OAuth connections are deleted simultaneously.
Create OAuth connection	This action is logged when an OAuth connection is successfully created.
Delete OAuth connection	This action is logged when an OAuth connection is successfully deleted.
Update OAuth connection	This action is logged when an OAuth connection is successfully updated.

Run bot audit entries

The following table shows the list of run bot audit entries and their descriptions (listed alphabetically):

Audit entries	Description
Run bot disconnected	This action is logged when a user disconnects a running bot.
Run bot finished	This action is logged when a running bot finishes.
Run bot paused	This action is logged when a user pauses a running bot.
Run bot pre process failed	This action is logged when the pre-process to run the bot fails.
Run bot reconnected	This action is logged when a user re-connects a running bot.
Run bot resumed	This action is logged when a previously paused bot resumes to run.
Run bot stopped	This action is logged when a user stops a running bot.

Run bot local audit entries

The following table shows the list of run bot local audit entries and their descriptions (listed alphabetically):

Audit entries	Description
Run bot local hotkey finished	This action is logged when a running bot for a local hotkey finishes.
Run bot local hotkey paused	This action is logged when a running bot for a local hotkey pauses.
Run bot local hotkey resumed	This action is logged when a running bot for a local hotkey resumes.
Run bot local hotkey started	This action is logged when a running bot for a local hotkey starts.
Run bot local hotkey stopped	This action is logged when a running bot for a local hotkey stops.
Run bot local hotkey suspended	This action is logged when a running bot for a local hotkey is suspended.
Run bot local schedule finished	This action is logged when a running bot for a local schedule finishes.
Run bot local schedule paused	This action is logged when a running bot for a local schedule pauses.
Run bot local schedule resumed	This action is logged when a running bot for a local schedule resumes.

Audit entries	Description
Run bot local schedule started	This action is logged when a running bot for a local schedule starts.
Run bot local schedule stopped	This action is logged when a running bot for a local schedule stops.
Run bot local schedule suspended	This action is logged when a running bot for a local schedule is suspended.
Run bot local trigger finished	This action is logged when a running bot for a local trigger finishes.
Run bot local trigger paused	This action is logged when a running bot for a local trigger pauses.
Run bot local trigger resumed	This action is logged when a running bot for a local trigger resumes.
Run bot local trigger started	This action is logged when a running bot for a local trigger starts.
Run bot local trigger stopped	This action is logged when a running bot for a local trigger stops.
Run bot local trigger suspended	This action is logged when a running bot for a local trigger is suspended.

Run logic local audit entries

The following table shows the list of run logic local audit entries and their descriptions (listed alphabetically):

Audit entries	Description
Run logic local client finished	This action is logged when running logic for a local client finishes.
Run logic local client paused	This action is logged when running logic for a local client pauses.
Run logic local client resumed	This action is logged when running logic for a local client resumes.
Run logic local client started	This action is logged when running logic for a local client starts.
Run logic local client stopped	This action is logged when running logic for a local client stops.
Run logic local client suspended	This action is logged when running logic for a local client is suspended.

Run workflow local audit entries

The following table shows the list of run workflow local audit entries and their descriptions (listed alphabetically):

Audit entries	Description
Run workflow local client finished	This action is logged when running a workflow for a local client finishes.
Run workflow local client started	This action is logged when running a workflow for a local client starts.
Run workflow local client stopped	This action is logged when running a workflow for a local client stops.
Run workflow local schedule finished	This action is logged when running a workflow for a local schedule finishes.
Run workflow local schedule started	This action is logged when running a workflow for a local schedule starts.
Run workflow local schedule stopped	This action is logged when running a workflow for a local schedule stops.
Run workflow local trigger finished	This action is logged when running a workflow for a local trigger finishes.
Run workflow local trigger started	This action is logged when running a workflow for a local trigger starts.
Run workflow local trigger stopped	This action is logged when running a workflow for a local trigger stops.

Schedule bot audit entries

The following table shows the list of schedule bot audit entries and their descriptions (listed alphabetically):

Audit entries	Description
Schedule bot disconnected	This action is logged when a scheduled bot is disconnected.
Schedule bot ended	This action is logged when a scheduled bot ends.
Schedule bot paused	This action is logged when a scheduled bot pauses.
Schedule bot reconnected	This action is logged when a scheduled bot is reconnected.
Schedule bot resumed	This action is logged when a scheduled bot resumes.

Audit entries	Description
Schedule bot stopped	This action is logged when a scheduled bot stops.

Export audit data to CSV

Export Control Room log related data to a CSV file.

- You must have the View_user permission to export the basic information about other users to the CSV file.
- The source and the target Control Room instances must be running the same version.
- The source and the target Control Room instances must be of the same setup type: SSO with SSO, AD with AD, and non-AD with non-AD.

You can export selected, filtered, or all audit log data to a CSV file by using the following options:

- **Export checked items**
- **Export filtered items**
- **Export all items**

1. Navigate to **Administration > Audit log**.
A list of all the logs is displayed.
2. Click the **Export items to CSV** drop-down

3. Click one of the following required sub-menus:
 - **Export checked items:** Exports only the selected records.

Note: You must select items to use this option.

- **Export filtered items:** Exports only records that are available after applying filters like Status, Item name, Event type, and so on.
- **Export all items:** Exports all the available records.

Note: You can export a maximum of 100,000 records at a time.

The CSV file is exported and downloaded to your local system based on the selected option.

Note:

- If there is large number of audit logs to export, a message is displayed, informing that the export function is started and exported CSV file is available in the **Activity > Historical** page. For more information, see [Download exported CSV file](#) on page 2102.

- The time required to export data to a CSV file might vary based on the number of records being exported. A message appears on the screen if the time required to export the data is more than 2 seconds. The CSV file is available for download after it is generated.

Also refer to [Syslog server integration](#) on page 1752.

Download exported CSV file

When there is large number of audit log data to export, the export function starts and exported CSV file is available in the **Activity > Historical** page.

To download the exported CSV file,

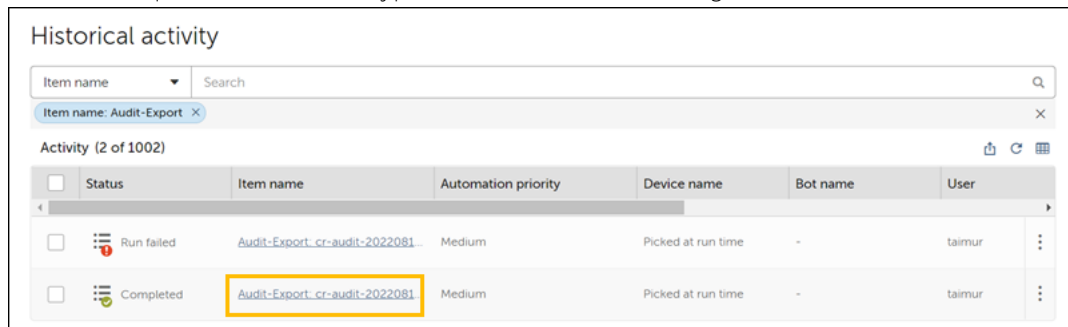

- Navigate to the **Activity > Historical** page and search for exported audit log by using the Audit-Export

keyword.

A list of all the exported audit log files is displayed.

- Click the required item name hyperlink to view the audit log details.

- Click **Download exported zip file**.

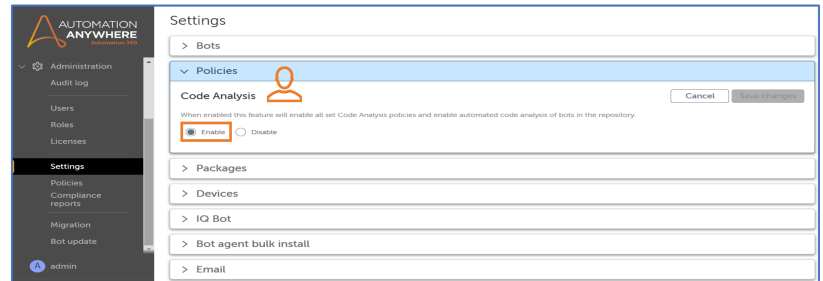

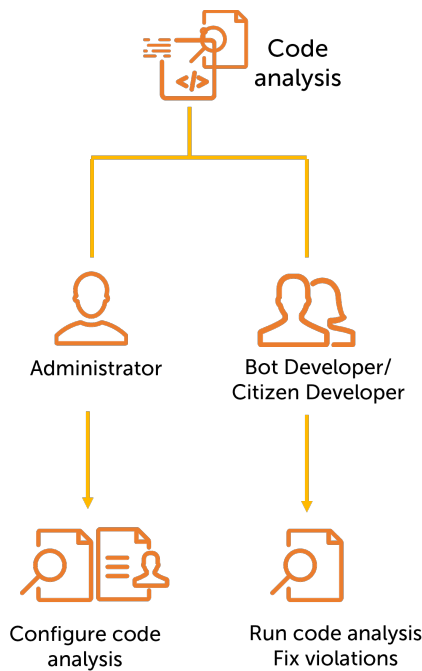

The CSV file is downloaded to your local system as a zip file.

Code analysis

Code analysis (code review) enables you to evaluate a program without running the code. When you review the code, a list of violations based on a set rules are displayed. You can review and fix any coding or stylistic errors for your automation.

Code analysis enables you to form certain code structures with which you can implement coding best practices and make the code maintainable, reliable, efficient, and secure.

Benefits

Code analysis provides you the following benefits:

- Implement coding best practices by enforcing certain coding conventions.
- Authorize Citizen Developer to introduce new automations.
- Enable complex automations to be more accessible.
- Improve code readability and quality.
- Control the structure of your automation code.
- Improve productivity of the developer and the platform as good coding practise improves the automation quality over time.

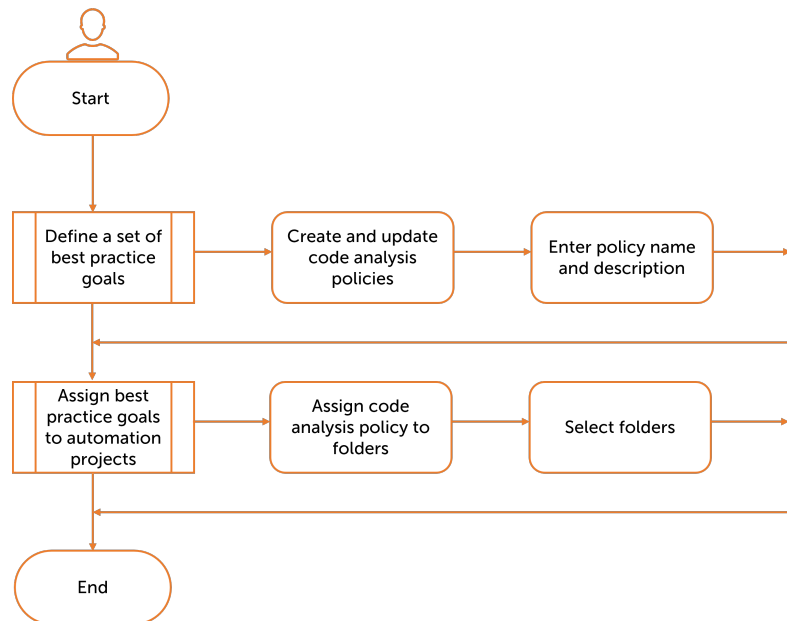

Code analysis for user roles

Lead RPA Developer (Administrator)

Configure code analysis policies that define coding best practices in the organization. Monitor and report the status of code quality based on adherence to these policies. Code analysis enables certain coding practices and

principles to be enforced which in turn helps with the following:

- Facilitate the development of automation by a larger pool of business personnel, for example, a Citizen Developer who might not have strong software development skills.
- Improve maintenance of automations by reducing code complexity and improving readability.
- Improve reliability of automations by reducing errors.
- Improve security and compliance of automations by enforcing secure coding practices.
- Reduce production time and costs of automation.

Citizen Developer or RPA Developer

Code analysis provides guidance to develop automations that meet organizational requirements for the following:

- Error reduction
- Code readability and maintenance
- Code security

Permissions

You require the following permissions to set up a code analysis policy.

- **View policies:** Allows you to view the code analysis policy that defines how developers can build automations.
- **Manage policies:** Allows you to view, edit, and assign policies that defines how developers can build automations. This permission allows the assignment of policies to folders for which you have access.

For code analysis enforcement, you require the permissions mentioned below. These permissions are active when code analysis is enabled in **Administration > Settings > Policies**

- **Enable enforcement for bot check-in:** A default permission in all roles which allows the user to check-in the automation file if it has no code analysis violations.
- **Allow check-in with low severity violations:** This optional permission allows the user to check-in the automation file if it has low severity code analysis violations.
- **Allow check-in with high severity violations:** This optional permission allows the user to check-in the automation file if it has high severity code analysis violations.

Important: Starting with Automation 360 v.29, all the system roles (such as AAE_Basic or AAE_Admin) will have only the permissions to check in bots with no violations. All the custom roles (user-defined roles) are updated to contain both the permissions to check in with low and high severity violations. For enforcement, you should edit your custom roles to restrict check-in. If

you use only system-defined roles for your users, to configure enforcement, you must create new roles to assign the appropriate permissions to check in bots with violations.

Components

- Policy editor: Contains multiple named policies for all Control Room users.
- Rules: As the foundation of code analysis, rules help to evaluate bot code. Rules can be simple or complex depending on the evaluation that is performed. Rules include coding practices that can be verified. They apply to packages and actions in the automation code. A rule consists of a unique RULE_CODE and a description to indicate the nature of evaluation to be performed on the code.

Code analysis policy management

Code analysis policies are a set of rules that you can apply to different projects allowing flexibility when introducing coding standards.

To improve the code quality, as an administrator you can:

- Create policies with different rules.
- Apply different policies to different folders on the **Automation** page.
- Easily access the policy rule details while managing code analysis policies.

Enable code analysis policy

As an administrator, you can enable code analysis policy by navigating to **Administration > Settings > Policies** tab. Click **Edit** to enable the code analysis policy. When you enable code analysis policy:

- Code analysis automatically runs on all the bots in the public workspace that have **Not Scanned** status and reside in folders which are assigned code analysis policy. This provides visibility on coding best practices for the bots in the public workspace. Code analysis runs every five minutes and scans 1,000 bot files in five minutes.
- Code analysis is invoked when you save a bot in the Bot editor.
- Code analysis results summary is visible on the **Automation** page.
- Code analysis results are displayed in the **Assistant** tab.
- Run code analysis icon is available from the row level action on the **Automation** page. Running code analysis from the **Automation** page enables you to download the code analysis violation report.

When you disable code analysis policy, the code analysis functions and features are not available.

Regardless of whether code analysis is enabled or disabled, you can still create multiple policies and assign those policies to different folders in the **Automation** page.

The following video displays how to enable the code analysis policy:

Create and assign code analysis policy

You can configure multiple named policies for code analysis. With this feature, you can create different policies with different rules configured with different settings and different severity levels. You can use these named code analysis policies to define different code quality standards and apply to different automation projects by assigning the policy to specific folders. This provides the flexibility to gradually introduce code quality standards on existing and older projects and also apply more firmer standards on newer projects.

You need the **View policies** and **Manage policies** permissions to set up a code analysis policy. These permissions allow you to view, edit, and assign policies that define how developers can build automations. The **Manage policies** permission allows the assignment of policies to folders for which you have access.

The **Administration > Policies** page has two tabs; **Policies** and **Assign**. You can create and name these policies in the **Policies** tab. You can create any number of policies. You can search for any policy using the search tool at the top. You can use either the policy name or description in the policy selector window to search for a policy. You can also view, edit, and delete any policies by clicking the actions menu (vertical ellipses) on the right and selecting the appropriate action.

Use the **Assign** tab to assign a policy to a folder on the **Automation** page. You can optionally remove the assigned policy on any folder by clicking the actions menu (vertical ellipses) on the right and selecting the **Unassign policy**.
