Automation 360 v.30 Release Notes.....	16
Automation 360 v.29 Release Notes.....	48
Automation 360 v.28 Release Notes.....	96
Automation 360 v.27 Release Notes.....	157
Automation 360 v.26 Release Notes.....	230
Previous Automation 360 Release Notes.....	273
Community Edition Release Notes.....	725
Automation 360 v.30 Community Edition Release Notes.....	726
Automation 360 v.29 Community Edition Release Notes.....	729
Automation 360 v.28 Community Edition Release Notes.....	732
Automation 360 v.27 Community Edition Release Notes.....	736
Automation 360 v.26 Community Edition Release Notes.....	743
Previous Community Edition Release Notes.....	749
Sandbox environment.....	806
Package updates overview.....	808
Periodic package updates - summary list.....	809
Periodic package updates - FAQ.....	811
Active Directory package updates.....	812
Advanced Classifier package updates.....	814
Apigee package updates.....	815
App Integration package updates.....	816
Application package updates.....	818
Boolean package updates.....	819
Bot Migration package updates.....	820
Browser package updates.....	821
Clipboard package updates.....	822
Comment package updates.....	823
Credential package updates.....	824
CSV/TXT package updates.....	825
Data Table package updates.....	826
Database package updates.....	827
Datetime package updates.....	829
Delay package updates.....	830
Dictionary package updates.....	831
DLL package updates.....	832
Document Extraction package updates.....	834
Email package updates.....	837
Email trigger package updates.....	841
Error handler package updates.....	842
Excel advanced package updates.....	843
Excel basic package updates.....	844
File package updates.....	845
Folder package updates.....	846
FTP/SFTP package updates.....	847
Generative AI package updates.....	849
Google Calendar package updates.....	851

Google Doc AI package updates.....	852
Google Drive package updates.....	853
Google Sheets package updates.....	854
Hotkey trigger package updates.....	855
If package updates.....	856
Image Recognition package updates.....	857
Interactive Forms package updates.....	858
Document Classifier package updates.....	859
IQ Bot package updates.....	861
IQ Bot Pre-processor package updates.....	861
JavaScript package updates.....	862
JSON package releases.....	863
Legacy Automation package updates.....	864
List package updates.....	865
Log To File package updates.....	866
Loop package updates.....	867
Message Box package updates.....	868
Microsoft 365 Calendar package updates.....	869
Microsoft 365 Excel package updates.....	870
Microsoft 365 OneDrive package updates.....	872
Microsoft 365 Outlook package updates.....	873
Migration package updates.....	876
Mouse package updates.....	877
Number package updates.....	879
OCR package updates.....	880
PDF package updates.....	881
PGP package updates.....	882
Ping package updates.....	883
Play Sound package updates.....	883
Printer package updates.....	884
Process Composer package updates.....	885
Prompt package updates.....	886
Python Script package updates.....	887
Record package updates.....	888
Recorder package updates.....	889
Rest Web Services package updates.....	895
Salesforce package updates.....	896
SAP BAPI package updates.....	898
SAP package updates.....	899
Screen package updates.....	900
Service package updates.....	901
ServiceNow package updates.....	902
SharePoint package updates.....	903
Simulate keystrokes package updates.....	905
SNMP package updates.....	906
SOAP Web Services package updates.....	907
String package updates.....	909
System package updates.....	910
Task Bot package updates.....	911
Terminal Emulator package updates.....	913
Text file package updates.....	915
V11 Task Bot package updates.....	916
VBScript package updates.....	917
Wait package updates.....	918

Window package updates.....	919
Workday package updates.....	920
XML package updates.....	921
Previous Package SDK Release Notes.....	922
Process Discovery Release Notes.....	930
Process Discovery version 1.76.0 release notes.....	930
Privacy Enhanced Gateway version 3.3.16 Release Notes.....	931
Privacy Enhanced Gateway version 3.3.15 Release Notes.....	931
Discovery Bot release notes.....	932
CoE Manager Release Notes.....	932
Browser extensions for Automation 360.....	933
Browser extensions for web applications.....	934
Previous versions of browser extensions.....	935
Automation 360 feature comparison matrix.....	937

In-product user assistance.....	1103
Set up Automation 360.....	1107
Get started with Automation 360 Cloud.....	1109
Automation 360 Cloud prerequisites.....	1110
Installing Control Room On-Premises.....	1121
Automation 360 On-Premises prerequisites.....	1124
Installing Control Room using Custom mode.....	1189
Installing Control Room using custom mode for Oracle installation.....	1211
Installing Control Room using Express mode.....	1213
Installing Control Room on Amazon Web Services.....	1216
Installing Control Room on Microsoft Azure.....	1222
Installing Control Room on Google Cloud Platform.....	1231
Installing Control Room on Linux.....	1237

Installing Control Room on Microsoft Windows Server using scripts.....	1251
Complete Control Room post-installation configuration.....	1258
Using the Control Room diagnostics utility.....	1267
Uninstalling Automation 360.....	1268
Get started with Community Edition.....	1269
Community capacity and limitations.....	1270
Get started with Bot Agent.....	1271
Bot Agent communication with Control Room.....	1273
Bot Agent compatibility.....	1274
Bot Agent device requirements.....	1282
Manage Bot Agent.....	1287
Install Bot Agent and register device.....	1288
Bulk install Bot Agent on devices.....	1296
Update Bot Agent.....	1302
Perform Bot Agent diagnostic checks.....	1306
Installing Control Room for Cloud-enabled deployment.....	1309
Naming guidelines for Control Room URLs.....	1311
Post-installation user management.....	1312
Configure Control Room as a service provider.....	1313
Configure Control Room authentication options.....	1314
Preparing for users.....	1330
Installed Control Room directories and files.....	1338
Licenses and cloud services.....	1344
Update Automation 360 to latest version.....	1363
Update Automation 360 on Microsoft Windows Server using scripts.....	1364
Install and update Automation 360 IQ Bot.....	1366
IQ Bot installation prerequisites.....	1369
Installing IQ Bot in Express mode.....	1379
Installing IQ Bot in Custom mode.....	1380
Installing IQ Bot in Cluster mode.....	1384
Installing IQ Bot in Cluster mode on Amazon EC2.....	1388
Postinstallation checklist.....	1389
Updating Automation 360 IQ Bot.....	1416
Uninstalling IQ Bot.....	1419
High Availability and Disaster Recovery overview.....	1420
Log in to Automation Anywhere Control Room.....	1428
Create your first bot.....	1429
Run your first bot.....	1433
Moving from Automation 360 On-Premises to Cloud.....	1434
Moving data using Control Room operations.....	1435
Migrate using Control Room APIs.....	1435
Migrate.....	1436
Migration best practices.....	1443
Check migration readiness.....	1445
Prepare new Control Room for migration.....	1485
Migrate and validate bots.....	1525
Migrate Community Edition bots.....	1656
Migrate to Automation 360 IQ Bot.....	1657
Configure Automation 360.....	1676
Users.....	1676
Create a user.....	1678
Reset user password.....	1686
Roles.....	1687

Create a role.....	1687
Assign a role.....	1706
System roles.....	1706
Export roles.....	1712
Manage Active Directory role mapping.....	1712
Manage licenses.....	1720
View license details.....	1722
Installing additional licenses.....	1725
Create your users and assign their licensed roles.....	1726
Settings.....	1728
Manage device settings.....	1735
Switch device registration between Control Room instances.....	1744
Add access public IP addresses.....	1745
Set callback URLs.....	1746
Two-factor authentication.....	1747
Configure forward proxy settings.....	1749
Configure Credential Vault Connection mode.....	1750
Manage domain.....	1751
Editing SQL user information.....	1752
Syslog server integration.....	1752
Edit email notifications.....	1758
Version control in Automation 360.....	1760
Integrating Control Room with Git repositories.....	1762
Usage statistics.....	1773
Set up instances for Cloud-enabled deployments.....	1773
Generate registration key to install Bot Agent in bulk.....	1774
Configure integration with SIEM.....	1776
Use AuthConfig App to enable OAuth2 services.....	1783
Edit My settings.....	1793
Edit profile settings.....	1793
Set up your bot repository.....	1794
Working with repositories, credentials and roles.....	1794
Manage user credentials.....	1795
Credentials and lockers in the Credential Vault.....	1796
Set up lockers and credentials in Credential Vault.....	1797
Set up locker and assign credentials.....	1798
Create credential.....	1798
Create locker.....	1801
Credential Vault email notifications.....	1804
Manage Automation 360.....	1806
Devices.....	1808
About multi-user devices.....	1811
Edit multiple devices simultaneously.....	1814
About device pools.....	1816
Create device pools.....	1818
View device pool details.....	1819
Edit device pools.....	1820
Delete device pools.....	1822
Add queue, Bot Runner, and device pool.....	1823
Integrate OAuth with Control Room.....	1824
Configure enterprise applications.....	1827
Create OAuth connection.....	1827
Use OAuth connection.....	1830

Packages.....	1832
RBAC on packages.....	1833
Updating packages in Control Room.....	1839
Add packages to the Control Room.....	1842
Updating package versions.....	1843
Manage Control Room packages.....	1847
External key vaults for Automation 360.....	1848
Integrating external key vault with Control Room.....	1850
External key vault naming conventions.....	1855
CyberArk Password Vault integration.....	1860
Azure Key Vault integration.....	1882
AWS Secrets Manager integration.....	1898
HashiCorp Vault integration.....	1914
Changing external key vault to another.....	1928
Verify external key vault configuration.....	1929
Troubleshooting external key vaults.....	1929
Workload management.....	1931
Create workload queues.....	1932
Run bot with queue.....	1940
Manage workload queues.....	1944
Manage Work Items.....	1959
Workload guidelines.....	1963
Bot Lifecycle Management.....	1964
Guidelines for exporting and importing bots.....	1967
Export bots.....	1967
Import bots.....	1969
Move bots across environments.....	1971
Recover bots and files.....	1973
Monitor Automation 360.....	1975
Automation Command Center.....	1975
ACC home page for administrators.....	1976
ACC home page for Pro and Citizen Developers.....	1978
Automation program lifecycle with CoE Manager.....	1979
CoE Manager.....	1980
CoE Manager Plus.....	1982
Getting started with CoE Manager.....	1983
Configure CoE Manager for SSO.....	2025
Using CoE Manager.....	2027
CoE Manager FAQ.....	2044
Activities.....	2048
Historical activity.....	2051
Scheduled activities.....	2056
Event triggers.....	2064
Audit log.....	2068
Audit events list.....	2077
Export audit data to CSV.....	2101
Code analysis.....	2103
Code analysis policy management.....	2106
Code analysis rules.....	2108
Checking out code analysis results.....	2109
Code analysis reports.....	2112
Code analysis enforcement.....	2113
Configure and assign code analysis policy.....	2115

Run code analysis.....	2116
Upgrade changes in code analysis policy for Automation 360 v.28 or later versions.....	2118
Notifications.....	2118
Getting started with Notifications.....	2120
Administer notifications for Control Room.....	2129
Enable or disable event categories.....	2131
Capabilities supporting notifications.....	2132
Control Room log files.....	2133
Build automations.....	2135
Templates.....	2136
Create template.....	2139
Edit a template.....	2141
Create automation from a template.....	2142
Copy a template.....	2143
Delete a template.....	2144
Check in a template.....	2145
Check out a template.....	2146
View version history of template.....	2149
View template dependencies and references.....	2149
Import templates.....	2150
Export templates.....	2151
Templates- Known behavior.....	2152
Bot editor for creating bots.....	2152
Using Bot editor.....	2156
Keyboard shortcuts to expand or collapse elements in bot logic.....	2158

Working with bots.....	2203
Variables overview.....	2235
Debug tool.....	2262
Bot dependencies.....	2268
Actions to build bots.....	2272
Advanced search option in Bot editor.....	2275
Search and replace option in Bot editor.....	2278
Active Directory package.....	2283
Advanced Classifier package.....	2299
Analyze package.....	2310
Apigee action package.....	2311
App Integration package.....	2321
Application package.....	2326
AWS Comprehend NLP package.....	2327
Boomi action package.....	2328
Boolean package.....	2343
Bot migration package.....	2346
Browser package.....	2348
Clipboard package.....	2360
Credential package.....	2361
CSV/TXT package.....	2362
Comment package.....	2365
Data Table package.....	2365
Database package.....	2379
Datetime package.....	2397
Delay package.....	2405

Dictionary package.....	2406
DLL package.....	2411
Document Classifier package.....	2420
Document Extraction package.....	2425
Email package.....	2431
Error handler package.....	2466
Excel basic package.....	2472
Excel advanced package.....	2479
File package.....	2513
Folder package.....	2523
FTP / SFTP package.....	2530
Fuzzy match package.....	2537
Generative AI packages.....	2538
Genesys package.....	2555
Google Calendar package.....	2587
Google Drive package.....	2591
Google Document AI package.....	2601
Google Sheets package.....	2603
IBM Watson Authentication package.....	2617
IBM Watson Speech to Text package.....	2618
If package.....	2619
Image Recognition package.....	2626
Interactive forms package.....	2633
IQ Bot Pre-processor package.....	2636
IQ Bot Extraction package.....	2644
IQ Bot package.....	2653
JavaScript package.....	2655
Json package.....	2657
Legacy Automation package.....	2660
List package.....	2669
Log To File package.....	2676
Loop package.....	2679
Message box package.....	2691
Microsoft LUIS NLP package.....	2692
Mouse package.....	2693
Number package.....	2697
OCR package.....	2699
Microsoft 365 Calendar package.....	2706
Microsoft 365 Excel package.....	2715
Microsoft 365 OneDrive package.....	2733
Microsoft 365 Outlook package.....	2741
PDF package.....	2763
PGP package.....	2772
Play Sound package.....	2775
Printer package.....	2775
Process Composer package.....	2777
Process package.....	2786
Prompt package.....	2787
Python Script package.....	2789
Record package.....	2794
Recorder package.....	2798
REST Web Service package.....	2834
Salesforce package.....	2846
SAP package.....	2863

SAP BAPI package.....	2876
Screen package.....	2884
Service package.....	2889
ServiceNow package.....	2891
SharePoint package.....	2907
Simulate keystrokes package.....	2941
SNMP package.....	2943
SOAP Web Service package.....	2955
Step package.....	2956
String package.....	2957
System package.....	2976
Task Bot package.....	2980
Terminal Emulator package.....	2988
Text file package.....	3005
Trigger loop package.....	3007
V11 Task Bot package.....	3019
VBScript package.....	3023
Wait package.....	3025
Workday package.....	3032
Window package.....	3044
Workload package.....	3054
XML package.....	3056
Get started building bots.....	3067
Build a Go be Great bot.....	3068
Build a basic bot that uses a desktop application.....	3069
Example of extracting data from a web table.....	3071
Examples of building bots.....	3072
Common automation tasks and examples.....	3072
Example of entering data into a web form from a spreadsheet.....	3074
Example of passing a value between bots.....	3076
Example of using a conditional statement.....	3078
Example of using Python script to join a list.....	3079
Example of using the DLL package.....	3081
Example of transferring data from CSV file to Excel worksheet.....	3083
Run TaskBot to merge Excel sheets.....	3087
Example of migrating data from Excel to a database.....	3088
Example of reading data from a spreadsheet.....	3092
Example of using the Run action.....	3095
Example of using the SOAP web service action.....	3097
Example of using Get structure command from SAP BAPI package.....	3101
Example of writing data to SAP using SAP BAPI package.....	3103
Example of using Run standard workflow from SAP BAPI package.....	3105
Example of using the VBScript package in a resilient bot.....	3107
Build a Bot Insight dashboard bot.....	3110
Example of using multiple analyze actions in a task.....	3113
Example of updating default package version across bots.....	3116
Example of using remote function call in SAP.....	3119
Example of using JSON package actions in a bot.....	3124
Example using Email actions in a bot.....	3129
Example using user account actions from Active Directory package.....	3131
Example of using Custom column option in Data Table package.....	3135
Example of using a file variable.....	3137
Example of using Custom selection option in Log variables to file action.....	3138
Create dictionary type variables.....	3141

Attended and unattended automation.....	3143
Automation Co-Pilot for Business Users.....	3144
Embed automations in your application using Automation Co-Pilot for Business Users.....	3147
Using Automation Co-Pilot for Business Users on desktop.....	3206
Automation Co-Pilot for Business Users on the web interface.....	3253
Approvals in Automation Co-Pilot.....	3282
Automation Co-Pilot status and notifications.....	3286
Users and team roles for Automation Co-Pilot.....	3288
Create users for Automation Co-Pilot.....	3291
Configure scheduler user for Automation Co-Pilot.....	3293
Configure deployment type for bots.....	3296
About Process Composer.....	3297
Supported behaviors for tasks and elements in Process Composer.....	3299
Supported variable types in Process Composer.....	3308
Create a process automation in Process Composer.....	3312
Add Bot Task to a process automation.....	3314
Add Form Task to a process automation.....	3315
Add input variables to a process automation.....	3318
Add Filter Task to a process automation.....	3320
Add Process Task to a process automation.....	3320
Add Approval Task to a process automation.....	3321
Add Document Validation to a process automation.....	3326
Add End Point to a process automation.....	3327
Example: Upload and view PDF file.....	3328
Example: Use Select File element to upload and download files.....	3330
Manage process automations in Process Composer.....	3333
Check in a process automation.....	3334
Check out a process automation.....	3335
Run a process automation.....	3335
Import a process automation.....	3336
Export a process automation.....	3339
Delete a process automation.....	3340
Display child process automation output.....	3340
Process Composer and Co-Pilot for Business Users.....	3341
Preprocessing error messages.....	3342
Build advanced bots and packages.....	3342
Package SDK.....	3343
Using Python to parse JSON response.....	3417
Use JavaScript to build a bot to take user input.....	3428
Bot developer recommendations.....	3429
Bot Store submissions checklist.....	3429
Building reusable bots.....	3429
Building reusable packages.....	3436
Troubleshooting and debugging.....	3439
Troubleshoot bot run issue.....	3439
Bot Agent log files.....	3440
Bot Store.....	3440
Access Bot Store from the Control Room.....	3441
Submit bots or packages to Bot Store.....	3442
Directly import bots and packages from Bot Store to Control Room.....	3443
Download locally and import bots and packages from Bot Store to Control Room.....	3444
Private Bot Store.....	3445
Getting started with Private Bot Store.....	3445

Automation Scenarios.....	3450
Scenario: Generating insurance quote with Automation Co-Pilot and Process Composer.....	3450
Architecture and tasks flow.....	3451
Scenario walkthrough.....	3452
Scenario summary and benefits.....	3453
Document Processing.....	3454
Document Automation.....	3455
Document Automation architecture.....	3458
Document Automation FAQ.....	3460
Intelligent Document Processing solutions feature comparison matrix.....	3464
Set up your Document Automation environment.....	3466
Create a learning instance in Document Automation.....	3472
Connect learning instance.....	3492
Integrate third-party parser in Document Automation.....	3494
Publish the learning instance to production.....	3503
Using the Automation Co-Pilot Task Manager Validator for Document Automation.....	3511
Export/Import learning instances.....	3514
Create custom models in Document Automation using Standard Forms.....	3516
Document Automation support for Google Custom Document Extractor (CDE)...	3527
Document Automation data extraction using Generative AI.....	3531
Community Edition.....	3533
Create a learning instance in Community Edition.....	3534
Process documents in Community Edition.....	3537
Automation 360 IQ Bot.....	3538
IQ Bot architecture diagram.....	3541
Using Automation 360 IQ Bot On-Premises.....	3541
Using Automation 360 IQ Bot Cloud.....	3542
IQ Bot user personas and roles.....	3543
Languages supported in Automation 360 IQ Bot.....	3547
About the Classifier.....	3551
Create a learning instance.....	3554
Train a learning instance.....	3564
Manage learning instances.....	3595
Rotate the external key.....	3597
Use the IQ Bot Validator.....	3597
Review the dashboard.....	3601
Custom domains in IQ Bot.....	3604
Using IQ Bot for standard forms.....	3606
Process Discovery.....	3623
Overview of Process Discovery.....	3625
Process Discovery user roles.....	3626
Create Process Discovery users and assign roles.....	3627
Create your event reporting password.....	3628
Create a URL and application list.....	3628
Configure Observer activity.....	3629
Create a cycle.....	3631
Classify application screens and create web applications.....	3632
Applications with auto-assigned screen signatures.....	3634
Review Events and filter data.....	3634

Mining for processes.....	3638
Create a Mining Run.....	3639
Flow Graph.....	3640
Create a Path-based mining run.....	3644
Create a Butterfly mining run.....	3646
Export Mining Runs.....	3649
Analyze and prioritize processes.....	3649
Creating groups for the process and generate a PDD.....	3651
Getting started with Privacy Enhanced Gateway.....	3652
Install PEG.....	3652
Update PEG.....	3664
Configure PEG image redaction.....	3666
Manage disk space.....	3675
Manage PEG events.....	3676
Using Bulk delete.....	3676
Renew and replace certificates and keys using PEG.....	3677
Process Discovery Sensor application.....	3679
Installing Process Discovery Sensor.....	3679
Uninstalling Process Discovery Sensor.....	3680
Installing Process Discovery Sensor in a VDI environment.....	3680
Verify Process Discovery Sensor Installation.....	3681
Event Recording.....	3682
Enable and disable the users recording.....	3684
Process Discovery FAQ.....	3684
Process discovery by using Discovery Bot.....	3687
Get started with Discovery Bot.....	3689
Discovery Bot users.....	3690
Supported licenses for Discovery Bot.....	3692
Prerequisites for Discovery Bot.....	3695
Upgrade Discovery Bot from Enterprise A2019.15 to later versions.....	3697
Create users for Discovery Bot.....	3697
Create a Discovery Bot process.....	3704
Supported applications and browsers for Discovery Bot.....	3707
Record a Discovery Bot business process.....	3709
Record a Discovery Bot process using Automation Co-Pilot Desktop Assistant.....	3713
Analyzing opportunities for automation.....	3714
Review opportunities, convert to bot, and generate PDD.....	3715
Bot Insight.....	3724
Business analytics through Bot Insight.....	3724
Accessing Bot Insight.....	3725
Access Bot Insight from the Control Room.....	3725
Roles to access Bot Insight.....	3726
Role-based access control in Bot Insight.....	3727
Bot Insight dashboards.....	3728
Using Bot Insight.....	3747
Business analytics.....	3748
Using widgets.....	3749
Adding a dashboard widget.....	3750
Editing a dashboard widget.....	3753
Drilling down information in dashboard widget.....	3754
Renaming a dashboard widget.....	3754
Exporting data from a dashboard widget.....	3755
Data connector for Power BI.....	3755

Deploy Power BI connector.....	3756
Configure Power BI connector.....	3756
Example: Retrieve information in Power BI using business information API.....	3757
Configure Tableau web data connector in Bot Insight.....	3758
API References.....	3760
Control Room APIs.....	3760
Filtering, pagination, and sorting.....	3761
API response codes.....	3767
Comparing Automation 360 and Enterprise 11 APIs.....	3768
Configure the Control Room.....	3772

Release Notes

Learn about our releases, as well as the software policies and feature deprecations for Automation Anywhere products.

Learn about what's new, changed, fixed, or the issues (limitations) in Automation 360 releases:

- [Automation 360 Release Notes](#) on page 16
- [Community Edition Release Notes](#) on page 725
- [Previous Package SDK Release Notes](#) on page 922
- [Process Discovery Release Notes](#) on page 930
- [CoE Manager Release Notes](#) on page 932

Comparison matrices

Compare features between products to review feature parity and understand compatibility in order to update or move to our latest product release.

- [Automation 360 feature comparison matrix](#) on page 937
- [Automation 360 IQ Bot feature comparison matrix](#) on page 952
- [Automation 360 IQ Bot version compatibility](#) on page 957

Software lifecycle policy

The Automation Anywhere software lifecycle policy aims to provide predictability, quality, and importantly nondisruptive access to the latest innovations and enhancements so that you can control when and how you want to adopt these enhancements.

See [Automation 360 software lifecycle policy](#) on page 1023.

Cloud Service status

Our Automation 360 Cloud Service Status site shows real-time operational status, historical operational status, maintenance information, and incident history for all Automation 360 Cloud services worldwide, across all hosting regions.

See [Automation 360 Cloud Service Status site](#) on page 1013.

Feature deprecations

Learn about features and capabilities (from Automation Anywhere or third party) that are deprecated or nearing deprecation to understand how they affect your automation and what action is required.

See [Feature deprecations affecting Automation Anywhere products](#) on page 1030.

Automation 360 Release Notes

Review the new capabilities, changes, fixes (resolved issues), security fixes, deprecated features, and limitations in each release.

Note:

The following products are renamed:

- AARI is called Automation Co-Pilot for Business Users, and RPA Workspace is called Automation Workspace from Automation 360 v.28 release. Although release notes earlier than v.28 will show the new name, the content in these release notes is applicable and relevant to AARI and RPA Workspace.
- Enterprise A2019 is now called Automation 360. Although the release notes for releases earlier than Automation 360 v.21 release reference the old product name, the content in these release notes is applicable and relevant to Automation 360.

Use the links to view the release notes updates for each release.

Automation 360 v.30 Release Notes

Release date: 3 October 2023

Review the top 5 features in this release and view other new features and exciting enhancements for Automation 360 v.30 release.

- Build 19621: Automation 360 (Cloud-Sandbox)
- Build 19621: Automation 360 (On-Premises) and IQ Bot (On-Premises)

Cloud-Sandbox users: We have released an updated build for a fix after the Automation 360 v.30 Cloud-Sandbox Build 19596. For information about the fix in the updated build, see [Updated release builds](#) on page 19.

Highlights of this release

Here are the top 5 features in the v.30 release:

Data extraction using Generative AI

Extract data using generative AI's out-of-the-box solution: Generative AI's data extraction provides an easy-to-implement solution that simplifies the process of building custom models. With enhanced accuracy and seamless integration, a Document Automation admin can extract data from a supply chain and free-form text documents to streamline operations and improve efficiency.

See [Document Automation data extraction using Generative AI](#) on page 3531.

Generative AI packages

Use our new Generative AI package containing native integrations with hyperscaler LLMs: With the Generative AI package, developers can easily use large language models (LLMs) within Automation 360 to build out their automations. Supported LLMs include:

- Google Vertex AI
- Azure OpenAI
- OpenAI

See [Generative AI packages](#) on page 2538.

Developer experience enhancements

Use automation templates to quickly build automations: Professional and Citizen developers can quickly and easily build automations by selecting from a list of predefined templates. Additionally, Professional developers can create custom templates to build automations for specific business use cases.

See [Templates](#) on page 2136.

Use the Automation Command Center personalized homepage: Professional and Citizen developers can now use the Automation Command Center (ACC) to quickly access automations from a personalized homepage. Automation information is presented on a concise and easily accessed dashboard, which also includes direct links to the Pathfinder Community and AAU for any additional help.

See [Automation Command Center](#) on page 1975 | [ACC home page for Pro and Citizen Developers](#) on page 1978.

	<p>Improve troubleshooting with ability to log user-defined variables: Professional developers can now log user-defined variables to a log file to quickly diagnose and fix any automation issues that might occur.</p> <p>See Log variables to file action on page 2678 Example of using Custom selection option in Log variables to file action on page 3138.</p>
Multi-user processes with approvals	<p>Automate complex processes with hand-offs and approvals in a single process: Using Process Composer, process builders can easily automate complex processes that span across multiple users and require complex hand-offs (such as group approval) in a single process.</p> <p>See Approvals in Automation Co-Pilot on page 3282.</p>
Enterprise security updates	<p>Customize system roles for increased cybersecurity protection: Based on your organization's requirements, you can now define and configure customized roles with greater granularity to align permissions using the principles of least privileges. You are no longer restricted to using predefined system roles provided by Automation 360.</p> <p>See Roles on page 1687.</p> <p>Configure network proxy for outgoing communication from the Control Room: The Control Room now supports the ability to configure a network proxy. For example, a Control Room admin can configure a network proxy to enable communication between the license module in the Control Room and a Cloud-hosted license server.</p> <p>See Configure forward proxy settings on page 1749.</p> <p>OAuth 2.0 support for SaaS application: With centralized token lifecycle management and OAuth connections, shared or user-specific OAuth tokens are securely stored in credential vaults. These tokens are retrieved during automation runtime when you configure OAuth-based authentication. The Control Room validates the refreshed tokens before the automation runs.</p> <p>See Integrate OAuth with Control Room on page 1824.</p> <p>OAuth 2.0 support for REST Web Services: The REST Web Services package now supports OAuth 2.0 authentication using a</p>

centralized OAuth token from the Control Room. Professional developers can integrate any third-party applications requiring OAuth 2.0 authentication using REST APIs while complying with the organization's security standards and policies.

See [REST Web Service package](#) on page 2834.

Updated release builds

We have released updated Build 19621 (Cloud-Sandbox) which contains the following:

- When you start debugging a bot, the **Actions** panel on the left side of the Bot editor automatically collapses. This provides more horizontal area to view the actions added in the Bot editor while debugging. After debugging completes, the **Actions** panel expands again.
- You can now set the Control Room browser session time-out duration to a maximum of seven days. However by extending the time-out session, this might pose a security risk and enable unauthorized access. Ensure that you understand the security risk before extending this duration.

(Service Cloud case ID: 00658277, 00755230, 00658277, 01258466, 01961046, 01964607)

- Fix for an issue where bots were queued when deployed on the default device of an unattended Bot Runner user.

(Service Cloud case ID: 01985724, 01985720, 01985778, 01994082, 01994111, 01994155)

- Fix for an issue when (for a few instances) queued workitems were not getting processed after 10 to 15 minutes of insertion.
- Fix for an issue when (for a few instances) importing processes and bots from a previous version to the latest version and during process editing, the path of the bot and process in the private space was broken.

Note: For documentation on previous builds of this release, see the PDFs available on this page: [Automation 360 Release Notes \(build versions\)](#).

What's new and changed in each product

Automation Workspace v.30 release

Review what's new and changed, and the fixes and limitations in Automation Workspace for the v.30 release.

Note: Information about updates (such as what's new, changed, fixes, and limitations) is available on -specific pages. To access these pages, navigate to [Package updates overview](#) on page 808 > <-name> updates.

For a consolidated list of packages updated in this release, see [Packages updated in v.30](#) on page 33.

What's new

Control Room, devices, and Bot Agent
<p>New permissions for roles</p> <p>The following new roles have been added:</p> <ul style="list-style-type: none"> • Administration <ul style="list-style-type: none"> • View Settings: Allows users to view all the settings in the Control Room. However, users cannot edit the settings. • Manage Settings: Allows users to edit the settings in the Control Room. • View and manage compliance reports: You can grant permissions to users to view, create, and download compliance reports for users. • OAuth connections <ul style="list-style-type: none"> • View connections: Allows users to view the configured OAuth connections and their attributes. • Manage connections: Allows users to create, edit, and delete OAuth connections. • Global values <ul style="list-style-type: none"> • View and manage global values: Allows users to view, create, edit, and delete global values. • Devices <ul style="list-style-type: none"> • View all bot runner users: Allows users to view all run-as-users (unattended Bot Runner users) to add when creating a role, running bots, or scheduling bots. • Bots <ul style="list-style-type: none"> • Download exported files: Allows users to download exported bot files. • Restore from git: Allows users to restore bots and files from Git. <p>Feature permissions for a role on page 1688</p>
<p>Windows Server 2022 is now supported for On-Premises installation</p> <p>You can now successfully install the Windows Server 2022 Datacenter edition (with all the existing functionalities) on the Automation 360 On-Premises Control Room.</p> <p>Operating system, environment, and platform supported for Control Room on page 1138 Bot Agent device requirements on page 1282</p>
<p>Integrate CyberArk properties in bot automation (Service Cloud case ID: 01852428)</p> <p>You can enter the property set in credential attributes using the CyberArk properties to integrate the attributes in the bot automation. For example, if you want to use a username in the format <code>domain\username</code> where the domain is stored in the CyberArk property called Address and the username is stored in the CyberArk property called UserName, you can then enter the property set in the format <code>\$\$Address\$\$\\$\$UserName\$\$</code> in the credential attribute and use this attribute in the bot automation. The domain and username values in this property set will be replaced with the corresponding values from the secret response.</p> <p>Create locker on page 1801 Create credential on page 1798</p>

Control Room, devices, and Bot Agent
<p>Select Control Room services to run at startup in Linux environment</p> <p>You can optimize application process utilization on your device by selecting the Control Room services that you want to run automatically at startup during the On-Premises installation in a Linux environment.</p> <p>Additionally, you can use this option to disable the dependent services. For example, Automation Co-Pilot uses the storage service. By disabling the storage service, you are also effectively disabling Automation Co-Pilot.</p> <p>Installing Control Room on Linux on page 1237</p>
<p>Easily reference team or group with User group variable type</p> <p>You can use the new User group variable type to reference a team or a role inside a process and share it across different environments without having to edit the process.</p> <p>Global values on page 2260 Create a global value on page 2261</p>
<p>Automatically purge audit log entries on On-Premises deployments</p> <p>Configure your Control Room settings to automatically purge (delete) audit log entries that are older than a specified period. By default, audit logs older than 15 months are automatically deleted for new On-Premises deployments. This feature is disabled when you update from a previous release to v.30 or later releases. For example to save storage space, you can automatically delete audit log entries for a limited period or delete any historical audit log entries.</p> <p>Settings on page 1728 Audit events list on page 2077</p>
<p>French language support for notifications</p> <p>As a Control Room administrator, you can now set French as a secondary language for notifications and view information in your local language. With this enhancement, the Control Room sends all notification emails (instant and email reports) in both primary (English) and secondary (French) languages.</p> <p>Manage languages for notifications</p>
<p>API key expiry information to manage your automations seamlessly (Service Cloud case ID: 01904811, 01960297)</p> <p>To run your automation seamlessly, you can use the API key expiry information to renew the API key before it expires.</p> <p>Create API key generation role on page 1704 Users on page 1676</p>

Control Room, devices, and Bot Agent
<p>Notifications for your Document Automation license consumption</p> <p>If you have enabled notifications, you will receive notification for your Document Automation license consumption when the following criteria are met:</p> <ul style="list-style-type: none">• When 90% of your licenses are consumed• When 95% of your licenses are consumed• When 99% of your licenses are consumed• When 100% of your licenses are consumed <p>This feature allows you to plan for additional licenses.</p> <p>Understanding licenses in Document Automation on page 1350</p>
<p>Import intermediate certificates in Control Room installed on Linux</p> <p>You can import intermediate certificates when you install the Control Room on Linux.</p> <p>Intermediate certificates on page 1326 Installing Control Room on Linux on page 1237</p>
<p>Audit log events for OAuth connections</p> <p>The following audit log events are logged for OAuth connections:</p> <ul style="list-style-type: none">• Bulk delete OAuth connection• Create OAuth connection• Delete OAuth connection• Update OAuth connection <p>Audit events list on page 2077</p>
<p>Automation Command Center for Pro and Citizen Developers</p> <p>Automation Command Center (ACC) is now available for Pro and Citizen Developers. As a key component of automation lifecycle management, Pro and Citizen Developers now have a personalized and centralized view to quickly access their automations. Additionally, help is available with direct links to other developer resources, such as Pathfinder Community and Automation Anywhere University.</p> <p>ACC home page for Pro and Citizen Developers on page 1978</p>

Control Room, devices, and Bot Agent

Code analysis visibility enhancements in Bot editor

The following enhancements have been added to code analysis to improve the visibility of code quality in the Bot editor for Pro and Citizen Developers.

- A new indicator for the flow and list canvas views shows which command actions have code analysis violations, enabling Pro and Citizen Developers to quickly see and correct violations in their automations. Code quality is enhanced when developers can easily determine violations and adhere to best practices when they are developing automations.
- A new code analysis policy option on the Bot editor drop-down menu (access from the three vertical ellipses in the upper right of the Bot editor) allows the developer to view the code analysis policy that is applicable to the automation file. This assists the developer because they can see all applicable best practice rules without needing to leave the Bot editor and to view the policy in the Policy Manager page.

[Checking out code analysis results](#) on page 2109 | [Bot editor for creating bots](#) on page 2152

Packages, actions, and Bot editor

Accelerate and simplify the development of automation using templates

Automation 360 provides templates that you can use to build new automations quickly. These templates contain prebuilt automation code structures that you can select based on your business processes. Prebuilt code structures reduce errors and enforce coding best practices. Using predefined templates, Citizen Developers can jumpstart creating automations for their business use cases, and professional developers can develop more complex business cases. Additionally, developers can perform various operations:

- Manage templates (check-in, check-out, save, edit, and delete)
- Review version history, dependencies, and references
- Import and export templates
- Access private and public workspaces in the Control Room

[Templates](#) on page 2136

Packages displayed in sorted order in Bot editor

When you use the actions menu (vertical ellipsis at the top-right) to select **Packages** in the Bot editor, packages now display in sorted order, making it easier to identify them. Packages are sorted on the **Name** field instead of the **Short name** field.

Packages, actions, and Bot editor

Packages sorted alphabetically within Bot editor (Service Cloud case ID: 01766378)

For easier navigation, professional developers can quickly find packages and actions that are now sorted alphabetically at the following places in the Bot editor:

- Actions pane
- When you use the actions menu (vertical ellipsis at the top-right) to select **Packages**, the list of used and available packages displays alphabetically.
- When you use an **If**, **Else if**, **Loop**, or **Wait** for condition in a bot, the conditions and the iterators display alphabetically.

Use Microsoft 365 Outlook as trigger to start a bot

You can use Microsoft 365 Outlook as a trigger to start a bot when you send or receive emails.

[Add Microsoft 365 Outlook trigger](#) on page 3241

New Legacy Loop behavior option

For bots that were created using the Loop action in Automation 360 v.26 or earlier releases, you can now enable the **Legacy Loop behavior** option from the **Administration > Settings** to iterate the loop based on the specified value. When you enable this option and either increment or decrement the variable value in the end condition, loop iterations will not vary dynamically based on the new value generated.

[Settings](#) on page 1728

Debug enhancements

- To follow the standard Debug convention across different integrated development environments, the Debugger tool has been renamed to Debug.
- When you start debugging, in the Bot editor, you can now see a header bar below the bot name that displays the name of the bot being debugged. The header bar displays **Now debugging** and the bot name afterward. For example: **Now debugging: MSGBot5**
- When you start debugging a bot, the **Actions** panel on the left side of the Bot editor automatically collapses. This helps in providing more horizontal area to view the actions added in the Bot editor while debugging.

Note: Once the debugging stops, the **Actions** panel expands again.

Building and running bots

Auto-purge setting in workload management (Service Cloud case ID: 01978674)

You can now delete the completed or successful work items automatically. You can set the number of days of when to automatically delete the processed work items thereby freeing up Control Room space to process more work items (non-completed).

[Purge work items](#) | [View queue details](#) on page 1945

Building and running bots
<p>Automatically purge exported work items (Service Cloud case ID: 01288234, 01972944, 01755832, 00910693, 00802309, 01948250, 01981477)</p> <p>The Control Room automatically deletes exported zip files which are older than 30 days freeing up valuable Control Room space. When you export a bot or work item, these exported zip files are available on the Historical activity page as download links (which require a lot of Control Room space to store).</p> <p>Export bots on page 1967</p>
<p>Change scheduled activity ownership</p> <p>You can change or transfer the ownership of a scheduled activity to any other Control Room user.</p> <p>Change ownership of scheduled activity on page 2059</p>
<p>API Tasks for creating automations</p> <p>You can now create API Task automations in Automation 360 Cloud. API Tasks interact with an application directly via API. These API Tasks run on Cloud devices to provide better latency and faster processing time.</p> <p>API Task is a new feature in v.30 and has limited availability in the United States (US East, US West, and US Sandbox) regions. To enable this feature, contact your customer support manager (CSM).</p> <p>#unique_60</p>

APIs and integrations
<p>Manage activity API</p> <p>Use the new <code>/v3/activity/manage</code> API to stop, pause, or resume an execution by specifying the execution ID.</p> <p>Bot Execution Orchestrator API</p>

What's changed

Control Room, devices, and Bot Agent
<p>Administer lockers</p> <p>You can grant permissions to roles to view all lockers and edit some of the locker settings. For example, users can change the owner of a locker.</p> <p>Feature permissions for a role on page 1688</p>
<p>Enhancement to system-defined roles</p> <p>You can create your own roles based on your organizational requirements instead of using system-defined roles. You are no longer restricted to using the system-defined roles.</p> <p>System roles on page 1706 Feature permissions for a role on page 1688</p>

Control Room, devices, and Bot Agent
<p>Enhanced session time-out setting (Service Cloud case ID: 00658277, 00755230, 00658277, 01258466, 01961046, 01964607)</p> <p>You can now set the session time-out value based on your requirements to one of the following values: 10 minutes, 20 minutes, 30 minutes, 40 minutes, 50 minutes, 1 hour, 2 hours, 4 hours, 8 hours, 12 hours, 24 hours, or 7 days. Users are automatically signed out from the Control Room browser session after the specified minutes of inactivity.</p> <p>Settings on page 1728</p>
<p>View audit log entries in the user-preferred language</p> <p>If multiple users with different language settings (English, Japanese, and so on) are using a single tenant, audit logs for such users are displayed in their preferred language setting. However, if you change the language after logging into the Control Room, the audit log will display in the language that you selected when logging into the Control Room. For example, if you selected the Japanese language when logging into the Control Room and then changed the language to Korean, the audit logs will be displayed in the Japanese language.</p> <p>Previously, the audit logs were displayed only in English for such users.</p> <p>Audit log on page 2068</p>
<p>Workload management roles and permissions (Service Cloud case ID: 01945003, 01979884, 02005334)</p> <p>You no longer need to use system-defined administrator roles with Workload management roles and permissions. You can create custom roles with limited or no access to administrative permissions while adhering to your organization's security policies.</p> <p>Feature permissions for a role on page 1688 Workload permissions on page 3786</p>
<p>Change in Document Automation license name</p> <p>The Classifier (Number of pages) license is renamed to Document Classifier (Number of pages).</p> <p>Understanding licenses in Document Automation on page 1350 Manage licenses on page 1720</p>
<p>Disabled package alert</p> <p>If you have used an action from a package that is disabled or you no longer have access to, an alert is displayed on the bot editor screen.</p> <p>Packages on page 1832</p>
<p>Enhanced device roles and permissions</p> <p>You no longer need to use system-defined administrator roles to manage device pools. You can create custom roles with limited or no access to administrative permissions while adhering to your organization's security policies. Users with the custom role containing the Administer ALL device pools permission can now manage device pools.</p>

Fixes

<p>In a window variable, when you select a browser window with its title as case-insensitive, add the same variable to the watched variables list in the Debugger, and invoke the debugger, the Case sensitive option for the browser title remains deselected.</p> <p>Previously, when the debugger was invoked, the Case sensitive option was selected by default.</p>
<p>An expression or property related to a specific type of variable in an action is now displayed in the drop-down list. Previously, the last property or expression in the list was hidden.</p>
<p>When you use two separate loop or If actions, one with a VBScript condition and the other with a JavaScript condition, respectively, and run the bot, the bot now runs successfully.</p> <p>Service Cloud case ID: 01954473</p>
<p>When you update your Control Room version to Automation 360 v.30 with Bot Agent at v.28 build 21.240.20182, the actions now successfully recognize the window titles even if capital letters were used in window variables with Case sensitive option disabled.</p> <p>Service Cloud case ID: 01994346</p>
<p>A bot no longer encounters an error when you view Dictionary type variables in debug mode.</p> <p>Service Cloud case ID: 01994177, 01986284, 01986574</p>
<p>Schedules now run correctly during the Daylight Saving Time (DST) time zone.</p> <p>Previously, weekly schedules ran every minute, resulting in multiple triggers during DST, and in turn impacted the actual schedules.</p> <p>Service Cloud case ID: 01961418, 1961463, 1961447, 1961464, 1961221, 1961111, 01961464, 01961471, 01961517, 01961418, 01961119, 01961236, 01963106, 01961071</p>
<p>When the number of schedules listed on the Scheduled activity page is less (for example, 5 or 6 schedules), the Scheduled tab no longer shows a query timeout error message.</p> <p>Previously, the Scheduled tab displayed the following error message: An unexpected problem occurred.</p>
<p>When you disable a package, the Update -Package Version page (Administration > Bot Update > Update Bots > Package version) no longer shows an error message. Additionally, you can check out the process and process document in private mode.</p> <p>Previously, when you disabled a package, the Update -Package Version page showed an error message during check out.</p>
<p>Administrators can now configure the <code>rdp.legal.disclaimer.max.attempts</code> setting for the Legal Disclaimer timeout screen. Therefore, RDP-based deployment sessions will now retry device access based on this configured setting.</p> <p>Service Cloud case ID: 01968771, 01964881</p>

When you configure auto-login settings and select the **Reuse an existing session, if available** option, the bot is now deployed through an existing session, and the connected device is no longer logged off.

You will see correct start and end timestamps for bot failures on the **Historical activity** page.

Previously, the timestamps were displayed incorrectly in such scenarios.

Service Cloud case ID: 01925919

You will no longer view the **Unlock locked bots** and **Set production version of bots** permissions in your Control Room instances that are using Single sign-on (SSO) or Active Directory authentication.

Previously, you were able to view these permissions in such Control Room instances.

Service Cloud case ID: 01952796

When your server repository path (be it on file system or network drive) is unreachable, the version history remains intact and is no longer deleted.

Previously, if the repository path was unreachable, the version history was force deleted.

Service Cloud case ID: 01963136, 01991452, 01992999, 01996226

You can now import bots and packages from the Bot Store with the Bot StoreBot Store import feature successfully.

Previously, the import failed and remained in the **In progress** status in the Bot Store downloads page.

Service Cloud case ID: 02001442, 02002465, 02000881

For schedules without a device pool, when one or more active run-as user devices are unavailable or disconnected, the bot deployment fails for all the run-as users in the schedule. In such a scenario, you will only see a detailed error message.

Previously, you were seeing two error messages: generic and detailed.

When you add a Work Item to the WLM queue which is already in a running state, the Work Item is processed immediately.

Previously, the Work Item took longer time (10-15 minutes) to be processed.

Service Cloud case ID: 02001406, 02001459

If you have SSO enabled and when you sign out of the Control Room, you will no longer see a message about duplicate sign in.

Previously, a message was displayed that a duplicate sign in was detected.

Service Cloud case ID: 01954039

The license expiry timestamp shows proper translations for Japanese users.

Previously, the timestamp displayed improper translations.

Service Cloud case ID: 01963189, 02076565

<p>When you create a Workload management (WLM) automation, the corresponding audit log displays the correct Started On timestamp.</p> <p>Previously, Unix timestamp was displayed.</p> <p>Service Cloud case ID: 01964914</p>
<p>The bots now run successfully and are no longer queued when they are deployed on the default device of an unattended Bot Runner user.</p> <p>Service Cloud Case ID: 01985724, 01985720, 01985778, 01994082, 01994111, 01994155</p>
<p>The Current action status on the In progress activity page displays the correct status after updating to the latest release.</p> <p>Previously, the Current action status displayed incorrect information.</p> <p>Service Cloud case ID: 01996522</p>
<p>You can now create and assign a code analysis policy even it does not contain any rules within it.</p> <p>Previously, policy creation would fail with an error.</p>
<p>When you schedule multiple bots for deployment, bot deploys successfully without any issue.</p> <p>Previously, sometimes bot deployment failed with null pointer exception while retrieving the login settings of the user.</p> <p>Service Cloud case ID: 01975690, 01989463</p>
<p>You can now successfully connect to Oracle Database with SSL certificate in the Linux environment.</p> <p>Previously, connection to Oracle Database with SSL certificate would fail with an error.</p>

Limitations

<p>When you rename a bot in the Bot editor and then start debugging, the updated bot name might not display in the header bar.</p> <p>Workaround: Close the Bot editor and then open it again.</p>
<p>When a user with view and manage settings permissions edits the remote Git repository integration settings, an insufficient privileges error is displayed. However, the user can still edit the remote Git integration settings.</p>

When you use the bulk package update feature to update the package version in bots, you might see errors in some actions used in the bot. However, the bot executes successfully even with these errors when deployed from Control Room or as an attended or unattended Bot Runner.

Workaround: Revert back the package version for the bots which show errors and update the package manually.

Service Cloud case ID: 01984578, 01991720, 01983265, 01994192, 02048170, 01990994, 01992484

The total notification count is displayed incorrectly in the alert summary report, that is the total notification count does not match the sum of attention needed and information notification counts.

The alert summary report displays incorrect start and end date and time.

In an On-Premises Windows environment, when you install the Control Room with any database with SSL certificate, the installation fails with an error if the keytool finds duplicate alias in the cacerts file.

Workaround:

1. List all the aliases using the keytool.
2. Find the duplicate aliases.
3. Delete the duplicate aliases using keytool command.
4. Install the Control Room.

Limitations from previous releases

While running a bot in debug mode, the bot will fail if the variable size is greater than 3 MB. An error message appears with the information that a variable has exceeded the 3 MB limit.

Updates to the interface

See the following video for the updates in the interface for Automation 360 v.30 release:

The **Purge older than 15 months** option is introduced to automatically delete audit log entries that are older than 15 months.

[Automatically purge audit log entries on On-Premises deployments](#)

The **API Key details** field displays the **Expiration information** to indicate the date and time when the API key expires. Use this information to renew the API key so that you can run your automation seamlessly.

[API key expiry information to manage your automations seamlessly](#)

The **FTP/SFTP Session name** field has been renamed to **Create FTP/SFTP session**.

[New capabilities added to FTP/SFTP package](#)

Enable the **Legacy Loop behavior** option from the **Administration > Settings** to iterate the loop based on the specified value.

[Enable legacy loop behavior action](#)

Create an **OAuth connection** and store it in the Control Room. You can use this OAuth connection for the Apigee, Genesys, Rest Web Services, Salesforce, ServiceNow, and SharePoint packages.

Code analysis visibility enhancements in the Bot editor.

[Code analysis visibility enhancements](#)

Updating to v.30 release

Review requirements and support information about updating your Control Room and Bot Agent for the v.30 release.

Bot Agent updates

Note: This release includes an optional Bot Agent update. You can continue to run your existing bots without updating the Bot Agent. However, if you want to use the new features in Automation 360 v.30, you must update the Bot Agent available with this release.

For more information on updating to this release, see these resources:

- [Automatically update the Bot Agent](#) on page 1302 | [Manually update the Bot Agent](#) on page 1303
- [Compatibility with release builds](#) on page 1275

Certified Control Room builds for direct update

You can update to the latest version of Automation 360 from the previous three releases (that is, from n–3 releases, where n refers to the latest release).

The following previous releases are certified for update to Automation 360 v.30:

- v.29 (Build 18371)
- v.28 (Build 17571, 17566, 17542, 17506)
- v.27 (Build 16685, 16667)

If you are on one of these previous releases, for information about updating, see [Update Automation 360 to latest version](#) on page 1363. If you are not on an n–3 release, update Automation 360 to one of the n–3 releases before updating to Automation 360 v.30.

Migration updates for v.30 release

Review the fixes for migrating from Enterprise 11 and 10 versions to Automation 360 v.30.

Fixes

In Enterprise 11, if a bot was using the Send Email command in a loop to send attachments to email address that was using username as a variable, you can migrate such a bot and execute it to send email with the correct attachment.

Previously, such a bot was sending additional attachment with each iteration.

Service Cloud case ID: 01947234

You can migrate a bot that uses the Database command to read data from excel and execute it successfully.

Previously, such a bot was reading data from excel with additional newline characters at the end of the line.

Service Cloud case ID: 01953984

When you migrate a bot that uses variables in expressions, the variables are no longer tagged as unused variables.

Previously, such variables were tagged as unused variables.

Service Cloud case ID: 01972750

In Enterprise 11, if a bot is using Image Recognition commands and uses **If**, **Else if**, and **Loop** commands, you can migrate the bot using the Bot Migration Wizard without encountering error.

In Enterprise 11, if a bot is using the String Operation command and includes a backslash (\) in the **Replace** string, after migration, the bot executes properly. Previously, such a bot encountered an error when a backslash (\) was used in the **Replace** string.

Remote agent 2.3.3.29 updates

Important: Starting from this release, we have moved information about updates in the Remote agent (such as what's new, changed, fixes, and limitations) to this page: [Remote agent updates](#) on page 894.

Packages updated in v.30

Review updates to the packages in Automation 360 v.30, including the compatible Control Room and Bot Agent versions.

September 2023 package updates

We have updated specific packages in September, after the v.30 Sandbox release. For a list of these packages, see [September 2023 updates](#).

Packages updated in v.30

The following table lists packages updated for this release. Click the package version to view updates (what's new, changed, or fixed) in the package.

Package name	Version	Bot Agent version	Control Room version
Active Directory	3.9.0 on page 812	20.11 or later	8750 or later
Apigee	2.0.1 on page 815	21.222 or later	15422 or later
App Integration	4.13.0 on page 816	21.88 or later	10195 or later
Browser	3.10.1 on page 821	21.210 or later	14140 or later
Database	5.1.0 on page 827	21.88 or later	10204 or later
DLL	6.10.2 on page 832	21.22 or later	15238 or later
Document Classifier	3.30.1 on page 860	21.98 or later	10520 or later
Document Extraction	3.30.24 on page 834	21.252 or later	19223 or later
Email	3.18.2 on page 837	21.210 or later	13980 or later
Excel advanced	6.16.4 on page 843	21.112 or later	11307 or later
Folder	6.8.0 on page 846	20.11 or later	8750 or later
FTP / SFTP	2.11.0 on page 848	20.11 or later	8750 or later
Genesys	2.0.0	21.210 or later	14199 or later
Google Sheets	2.13.0 on page 854	20.11 or later	8750 or later
Generative AI	1.1.0 on page 850	21.240 or later	17445 or later
Image Recognition	3.16.0 on page 857	21.210 or later	14100 or later
Legacy Automation	6.3.2 on page 864	21.200 or later	13279 or later
Log To File	3.8.0 on page 866	21.134 or later	19321 or later

Package name	Version	Bot Agent version	Control Room version
Mouse	2.15.0 on page 878	21.210 or later	14100 or later
Microsoft 365 Calendar	2.13.3 on page 869	20.11 or later	8750 or later
Microsoft 365 Excel	2.13.3 on page 871	20.11 or later	8750 or later
Microsoft 365 OneDrive	2.13.3 on page 872	20.11 or later	8750 or later
Microsoft 365 Outlook	1.1.5 on page 874	21.210 or later	13980 or later
Recorder	2.13.6-20230802 on page 890	21.210 or later	14068 or later
REST Web Service	3.15.0 on page 895	20.11 or later	8750 or later
Salesforce	2.0.1 on page 897	21.222 or later	15422 or later
SAP	3.12.1 on page 899	21.88 or later	10195 or later
ServiceNow	2.0.1 on page 902	21.230 or later	16455 or later
SharePoint	2.1.2 on page 904	21.250 or later	18000 or later
Simulate keystrokes	4.3.0 on page 905	21.200 or later	13297 or later
SOAP Web Service	3.17.0 on page 907	21.240 or later	17571 or later
String	5.8.0 on page 909	20.18 or later	9130 or later
Task Bot	2.8.0-20230530 on page 912	20.517 or later	8750 or later
XML	3.11.0 on page 921	20.11 or later	8750 or later

Packages not updated in v.30

The following table lists packages that have not been updated in the v.30 release but are compatible with this release.

Package name	Version	Bot Agent version	Control Room version
Advanced Classifier	2.1.1	21.250 or later	17953 or later
Analyze	2.8.0-20230420-11621	20.11 or later	8750 or later
Application	3.8.0	20.11 or later	8750 or later
Boolean	2.9.0	20.11 or later	8750 or later
Bot Migration	10.6.2	21.220 or later	15224 or later
Clipboard	3.7.0	20.11 or later	8750 or later
Comment	2.14.0	20.11 or later	8750 or later
Credential	1.6.0	20.11 or later	8750 or later
CSV/TXT	2.12.0	20.11 or later	8750 or later
Data Table	4.8.0	20.11 or later	8750 or later
Datetime	2.12.1	20.11 or later	8750 or later
Delay	3.8.0	20.11 or later	8750 or later
Dictionary	3.12.0	20.11 or later	8750 or later
Error handler	2.11.3-20230316-11621	20.11 or later	8750 or later
Excel basic	6.15.0	21.112 or later	11307 or later
File	6.7.0	21.98 or later	10789 or later
Google G Suite	2.8.0-20220426-11621	20.11 or later	8750 or later
Google Calendar	2.11.2	20.11 or later	8750 or later
Google Drive	2.12.2	20.11 or later	8750 or later
Hot keys	1.5.0-20230325-05620	20.11 or later	8750 or later
If	3.6.2-20230326-11621	20.11 or later	8750 or later
IQ Bot Pre-processor	3.30.1	21.98 or later	10520 or later
IQ Bot	3.30.3	21.98 or later	10520 or later
JavaScript	2.15.0	20.11 or later	8750 or later
JSON	1.4.1	21.98 or later	10520 or later
List	2.11.0	20.11 or later	8750 or later
Loop	3.7.5-20230326-11621	20.11 or later	17208 or later

Package name	Version	Bot Agent version	Control Room version
Message Box	3.6.0	20.11 or later	8750 or later
Number	3.8.0	20.18 or later	9130 or later
OCR	2.12.1	21.118 or later	8750 or later
PDF	3.9.0	21.31 or later	9300 or later
PGP	3.6.0	21.88 or later	10195 or later
Ping	3.5.0	20.11 or later	8750 or later
Play Sound	2.6.0-20220420-07615	20.11 or later	8750 or later
Printer	2.6.0	20.11 or later	8750 or later
Prompt	2.7.1	20.11 or later	8750 or later
Python Script	2.15.0	20.11 or later	8750 or later

VBScript	2.19.0	21.210 or later	14100 or later
V11 Task Bot	1.14.0	20.11 or later	8750 or later
Wait	4.9.0	20.11 or later	8750 or later
Window	5.10.0	20.11 or later	8750 or later
Workday	1.2.0	21.231 or later	17076 or later

Related reference

[Periodic package updates - summary list](#) on page 809

We will be updating specific packages in the Control Room to enable you to get early access to critical updates and fixes.

[Package updates overview](#) on page 808

Packages are typically updated in Automation 360 releases as part of new Control Room builds. We also plan to release some updates between these releases for early delivery of critical updates and fixes as package-only updates.

CoE Manager v.30 release

Review what's new in CoE Manager v.30 release.

What's new

<p>Change opportunity to a previous or hold status</p> <p>There might be a business requirement to change the status of an opportunity back to a previous state or put an opportunity on hold for a certain period of time. This could be due a change in priorities or requirements or due to scope creep for a project. With this capability, you can move an opportunity forward to its next state, move it back to its previous state, or put the opportunity on hold until it is feasible to move it forward.</p>
<p>Track changes to deployed opportunities with change request</p> <p>You can track changes to deployed opportunities by creating a change request for that opportunity. Using change requests, you can update the automations associated with the opportunity or fix any issues. Additionally, you can view or modify these change requests. You can specify if the change request is an enhancement or an issue, provide a description, and set a priority to address the critical or high priority requests immediately.</p>
<p>Track and report automated application types in an automation program</p> <p>You can track and report on what types of applications are automated within your automation program. To maintain inventory of the applications used in the automations associated with your opportunity, you can add an application with these details: application name, version, owner, automation approach (user interface, API, database), and the automation complexity.</p>

Automation Co-Pilot for Business Users v.30 release

Review what's new and changed, and the fixes and limitations in Automation Co-Pilot for the v.30 release.

Note: Information about updates (such as what's new, changed, fixes, and limitations) is available on -specific pages. To access these pages, navigate to [Package updates overview](#) on page 808 > <-name> updates.

For a consolidated list of packages updated in this release, see [Packages updated in v.30](#) on page 33.

What's new

Approval task element added to Process Composer

The approval task is a new element in the Process Composer that dedicates a step to the process where a selected or default user must review and approve the process before completion. By adding an approval task, a single process can streamline contributions from multiple users and complex hand-offs (such as group approvals).

- You can configure one or multiple users to approve a task. [Add Approval Task to a process automation](#) on page 3321.
- In Automation Co-Pilot, users receive relevant notifications as the status and assignment changes.
- In Automation Co-Pilot, the improved task view displays the status and contributors of tasks to quickly filter and view requested and pending approvals.

[Approvals in Automation Co-Pilot](#) on page 3282

New User group variable type

You can use the new User group variable type to configure a single role or team into a single global value.

Ability to start a process using input variables in Process Composer

As a Pro developer, you can create and add input variables to start a process without having to build a form as the point of entry. You define input variables directly within the process itself which is particularly useful if your process requires complex variable types such as a dictionary, table, or list.

[Add input variables to a process automation](#) on page 3318

What's changed

When local desktop automations are run from Automation Co-Pilot, the progress bar on the activity page now displays an accurate completed percentage for the executing automation. Previously, an indeterminate progress indicator was used.

Improved form capabilities of the Automation Co-Pilot embedded widget

The Automation Co-Pilot embedded widget has been enhanced to allow data mapping for processes and attended task bots using Javascript PostMessage API to facilitate the communication.

The embedded widget transfers data as expected with the addition of `referrerPolicy="origin"` in the `iFrame` tag. Previously, some HTTP requests were missing `Referer` header data that blocked data mapping.

[Map host data to Automation Co-Pilot forms](#) on page 3167

Reference IDs available for all tasks

All tasks now have reference IDs that are visible in the URL which you can use to share the task with another user. The ID also allows users to access a task directly in a request, even if that task is already completed. Previously, only the last pending task of a request was accessible directly.

The Automation Co-Pilot Desktop experience now displays unattended and attended automation in the familiar interface. The style and experience is the same as the Automation Co-Pilot embedded widget, where interactive tasks, forms, and progress can be accessed in the convenient workspace.

For various users accessing Automation Co-Pilot Desktop, the following changes occur:

- If the user has only an AARI license, then processes are visible.
- If the user has only an Attended license, then bots are visible.
- If the user has both AARI and Attended license, then both processes and bots are visible.
- For other users, such as creators and unlicensed, an error will display. Log out and log in as a licensed user.

Fixes

Upon logging in to Automation Co-Pilot in Microsoft Teams, pop-ups close as expected. This is because of an added parameter in the URL used for setup of the embedded app. Previously, the pop-up would remain open, for some users, even after credentials were entered.

[Integrate Automation Co-Pilot with Microsoft Teams](#) on page 3204

After saving a process in the Process Composer, check box options persist upon a page refresh. Previously upon refreshing, the check box option would not display in the Go To node when setting a check box input in the List of Options setting.

Adding a trigger to a multi-select drop-down element in Automation Co-Pilot on desktop works as expected. Previously, when the trigger was added the bot.execution.error would occur.

In multi-user deployments, trigger listener logs are now created for all bot deployments. Previously, the log was not capturing the multiple users activity.

When you deploy a bot, the initial start date and time of the bot show the correct date and time details. Previously, the correct date and time only displayed when the bot progressed.

Service Cloud case ID: 01982920

When running a process in Automation Co-Pilot the correct time displays in requests and end time. Previously, the time displayed inaccurately.

Service Cloud case ID: 01976950

PDF documents now render properly in forms. Previously in Automation 360 v.28 build 17566, when validating extracted information from Document Automation in Automation Co-Pilot the PDF did not display properly in a form.

Service Cloud case ID: 01981946

The file element is working as expected. Previously when using Automation Co-Pilot desktop, a file that had been uploaded in .xlsb format would be downloaded as a zipped file.

Service Cloud case ID: 01968194

For some processes, during the process editing phase in the **Private** space, the bot or form path breaks sometimes after importing or updating from a previous version. In such situations, we recommend using a workaround to reselect the path in case the path breaks, and save the process editor page before moving on.

Limitations

When selecting the **Show only tasks assigned to me** option, Automation Co-Pilot does not display a list of tasks. This is currently being fixed.

In Automation Co-Pilot desktop, the expected behavior for bot deployment triggers does not include an unattended user that has selected the setting **Always create a new session** for auto-log in.

After selecting **Open in new window** from the embedded widget and submitting a form, the pop-up window will close and the task in the main window will stay in the same initial step. This is being fixed. The current workaround is to manually proceed by clicking on the next step in the task sequence.

Updates to the interface

See the following video for the updates in the interface for Automation 360 v.30 release:

Automation Co-Pilot

For desktop automations, the progress bar on the activity page now displays an accurate completed percentage for the executing automation. [Progress indicator](#)

The Task view has been improved to display contributors of approval tasks. [Improved Task view](#)

A task reference ID is displayed in the URL of each task. [Task reference ID](#)

Document Automation and IQ Bot v.30 release

Review what's new and changed, and the fixes in IQ Bot and Document Automation for the v.30 release.

Note: Information about updates (such as what's new, changed, fixes, and limitations) is available on -specific pages. To access these pages, navigate to [Package updates overview](#) on page 808 > <-name> updates.

For a consolidated list of packages updated in this release, see [Packages updated in v.30](#) on page 33.

Document Automation

What's new
<p>Data extraction in Document Automation using Generative AI</p> <p>Create learning instances in Document Automation for Cloud with an integrated Generative AI extraction capability that requires minimal configuration. This feature provides improved document processing of unstructured and semi-structured documents with high accuracy.</p> <p>Document Automation data extraction using Generative AI on page 3531</p>
<p>Integration of third-party parser in Document Automation</p> <p>Using Document Automation SDK, you can now create and connect a custom Automation 360 package as a parser and use it to extract documents. After creating and uploading a custom package to Automation 360, configure the parser with a learning instance and process documents with it.</p> <p>Integrate third-party parser in Document Automation on page 3494</p>
<p>Custom data manipulation and validation through Document Extraction package (01936705)</p> <p>The Document Extraction package now provides the Get Document Data and Update Document Data actions to allow customization of document fields. With the Get Document Data action, you can retrieve extracted data through a dictionary or JSON file, and use all the available packages to read values and customize them. After manipulating the extracted data, you can use the updated dictionary or JSON string (extracted values or coordinates) as input by using the Update Document Data action and update the documents on the server. This feature helps maximize straight-through processing (STP) and reduce manual verification efforts.</p> <p>Get document data action on page 2426 Update document data action on page 2427</p>
<p>Copy learning instance option added to Document Automation</p> <p>Copy an existing learning instance to reuse the learning instance fields, parser information, document type, language, and local associations in the learning instance copy. Additionally, you can copy the heuristic feedback training and validation rules, as required.</p> <p>Create a learning instance in Document Automation on page 3472</p>

What's new

Notifications for your Document Automation license consumption

If you have enabled notifications, you will receive notification for your Document Automation license consumption when the following criteria are met:

- When 90% of your licenses are consumed
- When 95% of your licenses are consumed
- When 99% of your licenses are consumed
- When 100% of your licenses are consumed

This feature allows you to plan for additional licenses.

[Understanding licenses in Document Automation](#) on page 1350

What's changed

Create custom roles and permissions in Document Automation

You are not required to use the system-defined administrator roles for Document Automation roles and permissions anymore. You can create custom roles with limited or no access to administrative permissions while adhering to your organization's security policies.

[Document Automation users](#) on page 3469

Enhanced use of Google Document AI learning instances

Add custom fields for Google Document AI learning instances and use them to extract data similar to other existing pre-trained fields. With this enhancement, you can use pre-trained models from Google with custom fields to extract data from documents.

[Create a learning instance in Document Automation](#) on page 3472, step 9.

Enhanced language support for Google Custom Document Extractor (CDE)

Use Google CDE for any document type in 20 additional languages. With this enhancement, you can:

- Create learning instances in different languages
- Add field names
- Set up Bring Your Own Key (BYOK) license

[Document Automation support for Google Custom Document Extractor \(CDE\)](#) on page 3527

Change in Document Automation license name

The **Classifier (Number of pages)** license is renamed to **Document Classifier (Number of pages)**.

[Understanding licenses in Document Automation](#) on page 1350 | [Manage licenses](#) on page 1720

What's changed
<p>Changes in IQ Bot Classifier package (01955258)</p> <p>The IQ Bot Classifier package has been enhanced to improve its usability:</p> <ul style="list-style-type: none"> The package name has been changed to Document Classifier package. You can track consumption on the license administration page for processed documents in the Document Classifier package. <p>Document Classifier package updates on page 859</p>
Fixes
<p>If you have custom table fields in a learning instance, the table values are now extracted correctly from the specified line item.</p>
<p>If you have used Google CDE for creating a learning instance, the documents are now processed successfully for all the supported languages such as: Albanian, Croatian, Finnish, Icelandic, Slovenian, and Vietnamese.</p>
<p>Document extraction is now successful using proxy in the bring your own key (BYOK) use case.</p>
<p>When you try to create or edit a learning instance, the Create button is no longer disabled if you select the Extract field using pattern check box, and then subsequently clear the check box without entering a value in the Regular Expression field.</p>
<p>When you modify and upload a custom JSON file to the Validator, you can access the file in the Validator without any error messages.</p> <p>Service Cloud Case ID: 01936705</p>
<p>Table names in the Microsoft Form Recognizer Studio interface exceeding 99 characters are now handled without any error messages.</p>
<p>While creating a learning instance, the Create Learning instance button is no longer disabled if you clear the values from any other field.</p>
<p>Use the latest version of the Document Automation package on the previous three (n-3) versions of the Control Room to create a learning instance and process documents successfully. For example, if you are using the Control Room from the Automation 360 v27 version, you can use the Document Automation v30 package to create a learning instance and process the documents successfully.</p>
<p>The name of the downloaded file is now retained even if the name of the learning instance that you have used to process the documents has an empty space.</p>
<p>For the new document level rules, the expected outcome is now reflected correctly in the Validator when the condition is based on a Form Field and the resulting action affects a Table Field.</p>
<p>After you import a learning instance, the Import learning instance from field is now cleared and the imported .dw file is no longer displayed in the field.</p>
<p>When you use the does match regex condition and the show error action to create a validation rule, the fields without any extraction no longer display errors.</p>

Fixes
If a field name in the Validator has more than 100 characters, the scroll bar appears and you can see the value of the form field. Previously, the form field name was not displayed.
When Extract field using pattern is chosen in the learning instance and a document is processed, the field is validated on entering valid data. Here, only the respective field is affected, and its extraction is based on the provided regular expression input. This was a limitation in builds 18332, 18302, 18277 (Cloud-Sandbox) and build 18324 (On-Premises).
You can now save the documents in French language that are processed through heuristic feedback even when they contain special characters. Service Cloud Case ID: 01995135

Limitations
During validation, when a user clicks on a field, it should open the page in the document with the relevant information for that field or search query. However, for unstructured documents, clicking on a field to validate the value, opens the wrong page.
When you export a learning instance in Firefox browser, you cannot download the .dw file from the download link notification. Workaround: Use Google Chrome or Microsoft Edge-based Chromium to download the .dw files. For more details, see Browser requirements for Automation Workspace on page 1154.
The message for updating document data in the package does not localize according to the selected language. Additionally, the localized custom message does not translate according to the selected language for Google Document AI support.
The validation user interface shows a stacked view and you are not able to change the view.
When a user configures a parser and selects the Japanese language, the Locale field does not reflect this and continues to show the English (united states) value. The user has to manually select the Japanese locale, if required.
While creating a parser, if a user does not enter the mandatory field values (such as Provider , Document type , and Language), the system does not display any error message to notify the user. Since entering mandatory field values is required to proceed to the next step, the Next button is not enabled, hence requiring the user to enter all required field values to enable the Next button and create the parser.
While configuring a parser if a user uploads a JSON file with incorrect parser field values, the upload process fails and does not show an error message.
When a user edits a learning instance that is created with a third-party parser, the Custom aliases option should be disabled, which does happen.
When a user clicks the Language field during parser configuration, the languages do not display in the correct order.

Limitations
During parser configuration, the Configure parser page does not display page content in the selected language.
When a user clicks the Create button while creating a learning instance and adds a field, on entering a field name with the same case, an error message displays.
When a user processes a multi-page document containing header less tables with Google Document AI as the provider, it extracts only the first page from the document.
Sorting does not work when a user clicks the provider name in the Parser Configuration page.
In the validation user interface when a user deletes a table row that lies in-between and tries to re-process the same document, the system removes the last row from the extracted table.
While creating or editing a learning instance, when a user updates any field label value, the system lets the user enter a value of more than 200 characters, in spite of the character limitation. However, on trying to save the updates, the user could see an error message for the character limit.

IQ Bot

Fixes
Invoices in Japanese language that contain any text in Greek language are now classified correctly by the IDC Classifier and errors are no longer displayed. Service Cloud Case ID: 01967610

Updates to the interface

See the following video for the updates in the interface for Automation 360 v.30 release:

Document Automation
Create learning instance with the Generative AI capability to extract data from unstructured and semi-structured documents in Document Automation. Data extraction in Document Automation using Generative AI.
With the Configure parser option, you can connect a third-party parser with a learning instance in Document Automation. Integration of third-party parser in Document Automation
The Get document data and Update document data actions are new in the Document Extraction package. Custom data manipulation and validation through Document Extraction package

Document Automation
<p>The Copy option in a learning instance lets you copy a learning instance to reuse its information in a new learning instance.</p> <p>Copy learning instance option added to Document Automation</p>
<p>The Add a field option lets you add custom fields for learning instances with Google Document AI.</p> <p>Enhanced usage of Google Document AI learning instances</p>
<p>The Classifier (Number of pages) license is renamed to Document Classifier (Number of pages).</p> <p>Change in Document Automation license name</p>
<p>The IQ Bot Classifier name is changed to Document Classifier package.</p> <p>Changes in IQ Bot Classifier package</p>

Bot Insight v.30 release

Review what's changed and limitations in Bot Insight for the v.30 release.

Note: Information about updates (such as what's new, changed, fixes, and limitations) is available on -specific pages. To access these pages, navigate to [Package updates overview](#) on page 808 > <-name> updates.

For a consolidated list of packages updated in this release, see [Packages updated in v.30](#) on page 33.

What's changed

<p>Enhanced Bots dashboard</p> <p>The Bots dashboard is now enhanced such that the Total Bot Runs count matches the total count when the Total Completed (Success), Total in Progress, and Total Failed counts are added together.</p>

Limitations

<p>For all dashboards, the Download PDF function does not work in the Safari browser.</p> <p>Workaround: To download PDF reports, use other browsers such as Google Chrome, Mozilla Firefox, and Microsoft Edge.</p>

Package SDK v.30 release

Review what's new in the Automation 360 Package SDK for the v.30 release.

What's new

SDK download link: [A360-package-sdk-2.9.0.zip](#)

Docs download link: [A360-package-sdk-2.9.0-javadoc.zip](#)

New NoLoggingAttributes attribute added

A new attribute **NoLoggingAttributes** has been added for `DesktopOperationRequest` used to stop trace logs for mentioned fields.

For example:

```
@Request(NoLoggingAttributes = {"loginUser", "secureText"})
private DesktopOperationButtonRequest request;
```

Package SDK built with Gradle version 7.6.2

The current Package SDK is built with Gradle version 7.6.2 because the previous version had vulnerabilities.

Automation 360 v.29 Release Notes

Release date: 21 June 2023

Review the top 5 features in this release as well as other new features and exciting enhancements for the Automation 360 v.29 release.

- Build 18361: Automation 360 (Cloud and Cloud-Sandbox)
- Build 18371: Automation 360 (On-Premises) and IQ Bot (On-Premises)

We have released an updated build for a fix after the Automation 360 v.29 builds, which were On-Premises Build 18345 and Cloud-Sandbox Build 18277. For information about the fix in the updated build, see [Updated release builds](#) on page 50.

Highlights of this release

Here are the top 5 features in the v.29 release:

Center of Excellence

Accelerate your journey to automation success with CoE Manager Plus Package: Use the CoE Manager Plus Package to track and manage multiple automation programs across multiple vendors, such as Power Automate and ServiceNow, and integrate with other systems, such as Jira. Gain deeper transaction-level ROI metrics as you simultaneously recover lost

productivity as stakeholders exert minimal effort to report data through business leadership dashboards and automated report creation.

See [CoE Manager](#) on page 1980.

Automation lifecycle management

View and scale automation across your organization: The Automation Command Center is a personalized action center and home page where you can quickly gain a clear understanding of automation operations and device dashboards. Easily view operational details and metrics for scheduled automations, automation run statuses, and license and device utilization. With RBAC, admins can create personalized views for different types of users, including developers.

See [Automation Command Center](#) on page 1975.

Resilient automation

Ensure automation is resistant to pop-ups: To minimize system pop-up interruptions that can occur during a bot run, enable the **Handle unexpected pop-ups** option in the **Run Task Bot** wizard to automatically detect and manage these pop-ups.

Note: The handle unexpected pop-ups functionality is not available as part of the standard Control Room installation (or update) and must be enabled separately. Contact your Automation Anywhere Customer Success Manager (CSM) for assistance.

See [Automation resiliency](#) on page 1028.

Improve developer productivity: Use the debugger tool to troubleshoot and focus on correcting automation issues. While in debug mode, the automation user can change or edit variable values for basic data types to run the automation successfully.

See [Debugging your automations](#) on page 2263.

Reliably automate your remote applications running on VMware Horizon VDIs: Use our Next-Gen Recorder to easily exchange data between your applications running on local and remote machines. Citizen and professional developers can automate remote applications without making any configuration changes on their local machines.

Business governance

See [Automate applications running on remote machines](#) on page 2826.

Strengthen governance for automation creation: With code analysis and enforcement, you can ensure your developers are creating reliable, maintainable, and secure automations according to best practices. The platform enables the business to define and enforce coding best practices as developers are creating automations, and enables different code quality thresholds to be enforced across different sets of users.

See [Code analysis enforcement](#) on page 2113.

Simplify automation promotion: Use our new Promotion wizard to avoid the multistep export-import process. Leveraging a single tool, developers can move automations, forms, processes, and their dependencies easily across the Dev-Test-Prod environments.

See [Move bots across environments](#) on page 1971.

Process visualization and flow

Graphically gain actionable insights quickly: The Process Discovery Flow graph enables you to easily visualize commonalities among variants and loops within your business processes. Provide your business analysts a clear view to identify what processes are the best candidates for optimization or automation to generate the greatest ROI.

See [Using the Flow Graph to find common steps and loops](#) on page 3643.

Updated release builds

- We have released updated Build 18361 (Cloud and Cloud-Sandbox) and Build 18371 (On-Premises) for the following:
 - Fix for an issue that impacts the ability to check-in bots that were cloned by other users in specific cases.

Unable to check-in a bot when you perform the following steps:

- 1.** Clone a bot created by another user.
- 2.** Change the structure of the bot which is different from the cloned bot.
- 3.** Check-in the bot.

(Service Cloud case ID: 01991263, 01991795, 01993056, 01993801, 01993825, 01992732, 01993655, 01994102, 01994336, 01993388, 01994525, 01994710, 01994569, 01994217, 01994263, 01994843, 01995026, 01994542, 01994223, 01994971)

- Fix for an issue when using the Emailpackage that was using credentials stored in a locker whose name started with oAuth_ (case insensitive).

(Service Cloud case ID: 01993661)

- Fix for an issue where the purchased details for Control Room license is displayed incorrectly on the **Licenses** page when the Citizen Developer feature is not purchased in the file license.

(Service Cloud case ID: 01994512)

- We have released updated Build 18345 (On-Premises and Cloud-Sandbox) for the following:
 - Fix for an issue in Document Automation when table fields are sed in Validator where validation is now performed on individual fields.
 - Fix for an issue in the learning instance that is using the **Extract field using pattern** option which no longer displays the **Value cannot be empty error** when using empty fields.
 - Fix for an issue in the Automation Co-Pilot for MS Teams integration where the Auth pop-up now closes after the correct credentials are entered.
- We have released updated Build 18332 (Cloud-Sandbox) to include a fix for an issue related to recorder session management in the Control Room.

Note: For documentation on previous builds of this release, see the PDFs available on this page: [Automation 360 Release Notes \(build versions\)](#).

What's new and changed in each product

Navigate to the following pages for details on all the updates (what's new, changed, fixed, and limitations) in each product:

<p>Automation Workspace v.29 release on page 52</p> <ul style="list-style-type: none"> • Updating to v.29 release on page 69 • Migration updates for v.29 release on page 69
<p>CoE Manager v.29 release on page 81</p>
<p>Automation Co-Pilot for Business Users v.29 release on page 82</p>
<p>Document Automation and IQ Bot v.29 release on page 86</p>
<p>Bot Insight v.29 release on page 92</p>
<p>Package SDK v.29 release on page 93</p>
<p>Process Discovery Release Notes on page 930</p>

Automation Workspace v.29 release

Review what's new and changed, and the fixes and limitations in Automation Workspace for the v.29 release.

Important: Starting from this release, we have moved information about updates in each (such as what's new, changed, fixes, and limitations) to -specific pages. You can access these pages by navigating to [Package updates overview](#) on page 808 > <-name> releases.

For a consolidated list of packages updated in this release, see [Packages updated in v.29](#) on page 72.

What's new

Control Room, devices, and Bot Agent
<p>Introducing Help Center: In-app help used to search for automation information</p> <p>Help Center is a centralized location that contains all the information developers need to develop automations. When you log in to the Control Room, the Help Center will show suggested topics related to the Home and Bot editor page in the widget. Developers can leverage the suggested topics or search for specific packages, actions, or information they need help with. Additionally, the documentation link from contextual help loads the content directly within the Help Center. This feature eliminates the developer from having to switch back and forth between the Bot editor and the documentation portal providing a distraction-free experience.</p> <p>In-product user assistance on page 1103</p>

Control Room, devices, and Bot Agent

Enhancement to Bot Agent installer (Service Cloud case ID: 01857405)

We have enhanced the Bot Agent installer by including new .exe files for the **Bot launcher**, **Node manager**, **Triggers**, and **Child session launchers**. When you create and run a bot using actions from the File, Folder, or Excel advanced packages, and if your organization has configured security policies such as Document Security Solution (NASCA) DRM (Digital Rights Management), the files will be encrypted and secured by the security program.

The following changes occur in the installer when you:

- Install the Bot Agent, `java.exe` will be replaced by `NodeManager.exe`.
- Run a bot, `javaw.exe` will be replaced by `BotLauncher.exe`.
- Configure a trigger, the trigger will be activated with `TriggerListener.exe` instead of `javaw.exe`.
- Run a bot with Automation Co-Pilot(integrations) (AARI), `javaw.exe` will be replaced with `ChildSessionLauncher.exe`.

Note:

- If your bots or scripts use `java.exe` or `javaw.exe` in the Bot Agent installer folder, we recommend that you modify your bots or scripts using the new .exe files.
- Ensure that the Bot Agent version installed on your system is the version that is released with Automation 360 v.29.

[Install Bot Agent and register device](#) on page 1288

Enhanced operational insights in Automation Command Center

As an administrator, you can have a comprehensive view of the automation landscape in your homepage. The Automation Command Center (ACC) homepage combines all of the different functional areas onto a single page thereby increasing productivity efficiency.

The homepage provides operational insights into automation and device statuses, license utilization, and code analysis policy compliance metrics. You can navigate to automation and device dashboards to review details for automation executions and related key performance indicators, and gain actionable insights for devices. Additionally, you can review total automation run hours, device utilization, and KPIs related to queues and work items. ACC provides the ability to navigate to specific functional areas, such as Policy management.

[ACC home page for administrators](#) on page 1976 | [ACC home page for Pro and Citizen Developers](#) on page 1978 | [Configure and assign code analysis policy](#) on page 2115

Control Room, devices, and Bot Agent
<p>Enforce code analysis for bots check-in</p> <p>As an administrator, you can enforce code analysis during check-in of bots to the public workspace. You can restrict the RPA developers or Citizen Developers from checking in bots that contain code analysis violations. This is based on the permissions assigned to the developer in a custom role.</p> <p>When you create a custom role, you can use the following three new code analysis enforcement permissions:</p> <ul style="list-style-type: none">• Enable enforcement for bot check-in• Allow check-in with low severity violations• Allow check-in with high severity violations <p>All system roles only have the permission to check in bots without violations. If you only use system defined roles you must create new roles to assign the permissions to check in with violations.</p> <p>Code analysis enforcement on page 2113</p>
<p>View license details (drill down) for users and Control Room instances</p> <p>You can view license allocation details by users and license usage across different Control Room instances. From the Licenses page, you can click a license type to view the License details page that provides the following information:</p> <ul style="list-style-type: none">• View the license allocation details by users in the Control Room where you are viewing the license information.• View the usage details for the license type across other Control Room instances. <p>Manage licenses on page 1720 View license details on page 1722</p>
<p>Notifications for invalid login attempts</p> <p>As a Control Room user, you are now notified for invalid login attempts. When you exceed the maximum number of allowed invalid login attempts (set by your Control Room administrator), the Control Room sends an instant email notification to your registered email address. With this instant notification, you can trace the Control Room authentication and restrict invalid access by resetting the Control Room password.</p> <p>Platform events on page 2127</p>
<p>Time filter for historical activities</p> <p>As a Control Room user with appropriate permissions, you can use the Time filter option to search for and view specific historical activities based on time duration. Additionally, you can customize the date and time to view these activities.</p> <p>Time filter on page 2051</p>
<p>Integrate HashiCorp Vault to retrieve credentials (Service Cloud case ID: 00833916, 01275490, 01762964, 01839196)</p> <p>Integrate HashiCorp Vault with the Control Room to retrieve credentials from the HashiCorp Vault. The credentials are securely stored and managed on the HashiCorp Vault.</p> <p>HashiCorp Vault integration on page 1914</p>

Control Room, devices, and Bot Agent
<p>Automation capabilities for safe members from multiple CyberArk safes (Service Cloud case ID: 01834131)</p> <p>You can add multiple CyberArk safes on the Auto login settings page to enable safe members to deploy bots for unattended Bot Runners.</p> <p>CyberArk credential retrieval use cases on page 1876</p>
<p>Audit log events for Active Directory default and allowed domains</p> <p>The following audit log events are logged for Active Directory:</p> <ul style="list-style-type: none">• When a user or an existing mapping belongs to one or more domains• When a user configures a domain as the default domain• When a user adds a domain to the allowed domains list• When a user deletes a domain from the allowed domains list <p>Audit events list on page 2077</p>
<p>Edit multiple devices</p> <p>As a Control Room administrator or a user with View and manage all devices role, you can select and edit multiple devices at the same time. Additionally, Control Room users can change Lifespan, Device type, and Log collection configuration settings across all registered devices at the same time.</p> <p>Edit multiple devices simultaneously on page 1814</p>
<p>Run bot in elevated mode</p> <p>After updating to this release, an administrator can use the <code>A360Elevator.exe</code> application to run a bot in an elevated or administrative mode. This enables the Control Room users to run bots that might access any application that requires administrator credentials.</p> <p>Run a bot in elevated mode on page 2209</p>

Control Room, devices, and Bot Agent

Change variable values while debugging

You can use the **Debugger** tool to edit the values of the following variable types added to the **Watched variables** list when you pause in debug mode during a bot run:

- Number
- String
- Boolean
- Datetime

This enables you to troubleshoot and fix any bot related errors, determine the correct value to use during bot execution, and resolve the issue without stopping the debugger.

Note:

- You cannot edit constant variables.
- Ensure that the Bot Agent version installed on your system is the version that was released with Automation 360 v.29.

[Debug tool](#) on page 2262 | [Debugging your automations](#) on page 2263

On-Premises Control Room diagnostic utility

Use the On-Premises Control Room diagnostic utility to collect logs to troubleshoot any Control Room related issues.

[Using the Control Room diagnostics utility](#) on page 1267

Building and running bots

Ability to edit workload management automations

You can now edit a workload management (WLM) automation to add more run-as users and switch device pools for faster processing time. You can update the processing time, run-as users, and device pool details for queues that are currently being used.

[Edit workload management automations](#) on page 1954

Move bots across environments

As an administrator or a user with **Import bots**, **Export bots**, and all folder level permissions, you can move bots and files, their dependencies, and packages between Control Room instances in a single flow. The promote bot feature simplifies the process by avoiding the multi-step export and import process when moving bots across different Control Room environments (Dev to UAT).

[Move bots across environments](#) on page 1971

Building and running bots

Recover private repository of a deleted user (Service Cloud case ID: 01854109, 01956050)

As an administrator, you can recover the bots and files created in the private repository of a deleted user (Bot Creator or Citizen Developer). You can transfer the recovered bots and files to an existing user (Bot Creator or Citizen Developer). Whenever users leave an organization, any automations they created are not lost and can be used by others in the organization.

[Recover bots and files on page 1973](#)

Improved searchability for bots and files in subfolders (Service Cloud case ID: 01759969, 01838997, 01858215, 01888077)

You can quickly search and locate bots, files, processes, and forms within a folder and its subfolders in public and the private workspaces even if your repository contains multiple folders and subfolders. To enable this enhanced search feature, select the **Include items within sub-folders** check box. A new column, **Folder path**, is displayed which contains the location of the folder and subfolders for the bot.

View references for non-bot file dependencies (Service Cloud case ID: 01793080)

You can view the references (immediate parents) for non-bot file dependencies such as: CSV, PDF, JPG, GIF, XLS, DOC, and PPT in public and private workspaces. You can use this feature to identify the bots, processes, or forms that refer to a non-bot file dependency. When you have many automations dependent on various file dependencies, it is easier to modify or delete the dependencies when you understand the impact of this change on the automations. You can efficiently check the effect of either modifying or deleting the dependency on the automations that refer to it.

APIs and integrations

New delete device API (Service Cloud case ID: 01805692, 01822981)

To remove a registered device from your Control Room, use the new `DELETE /v1/devices/id` API. Before deleting a user, you can use this API to remove the device connected to the user, and then re-connect the device to another user.

[Device API](#)

What's changed

Control Room, devices, and Bot Agent
<p>Permissions for users to view only scheduled activities (Service Cloud case ID: 01885651, 01875383, 00788548, 00823729, 01776437, 01793759)</p> <ul style="list-style-type: none"> You can use the View ALL scheduled activity option to view all the schedules in the system. You can use the View ALL scheduled activity from my Folders option to view all scheduled activities for the bot folders to which users have access. <p>Feature permissions for a role on page 1688</p>
<p>Audit log events for secure recording</p> <p>Audit log entries are logged when you configure the following Secure recording options:</p> <ul style="list-style-type: none"> Enable or disable the option to preview image in the Bot editor. Change the role-based access control (RBAC) configuration on secure recording. <p>Audit events list on page 2077</p>
<p>Enhanced workload management capacity and performance</p> <p>You can process more number of queues and work items in workload management automations than previously. With this enhancement, you can improve your automation goals with optimum utilization of resources.</p> <p>Capacity and performance planning on page 1126</p>
<p>Simplified notifications categories</p> <p>The in-app notification panel displays all the notifications as a single list without categorizing them by severity. You can use the Attention needed filter to view the high-risk and cautionary event notifications which require immediate action. Otherwise, all the notifications are visible as a simple list of events.</p> <p>Notifications filter</p>
<p>Optimized audit log entries for automated code analysis</p> <p>The audit event logs generated for automated background code analysis scanning are optimized to include the following two audit events when code analysis runs automatically:</p> <ul style="list-style-type: none"> Automated code analysis started Automated code analysis completed <p>The audit log entries contain consolidated information about the code analysis events. The audit entry also contains information for any change made to the existing policy.</p>

Control Room, devices, and Bot Agent
<p>Upload workitems to a queue API (Service Cloud Case ID: 01945087)</p> <p>The <code>/queues/id/workitems/upload</code> API was changed to the <code>/queues/id/file</code> API because the previous version of the API was reporting a status of N/A. You can continue to add workitems to your workload management (WLM) queue using the <code>/queues/id/file</code> API.</p> <p>Workload Management API</p>
<p>More visibility of variable types</p> <p>Now the currentValue and current Key variables of all types are displayed in the variable picker. Previously these variables had to be of string type to be visible.</p>
<p>Enhancement to Bot Scanner utility</p> <p>We have enhanced the Bot Scanner utility and it now includes the option to scan bots that contain any of the Email package actions and Triggers that use the EWS option.</p> <hr/> <p>Note: Microsoft has deprecated EWS API for Exchange Online and has recommended that users move to Graph API. We recommend that you update the impacted bots by replacing each email-related action with the equivalent new action in the Microsoft 365 Outlook package (based on Graph API).</p> <p>Microsoft 365 Outlook package updates on page 873 Microsoft 365 Outlook package on page 2741</p> <hr/> <p>Running Bot Scanner to scan bots for EOL features on page 1077</p>
<p>Notification on package update in On-Premises Control Room</p> <p>If you have disabled the automatic update option for packages (Administration > Settings > Packages > Package update > Disable), a notification icon is displayed for these packages installed in your Control Room when a more recent version is available.</p> <p>Automatic package updates for On-Premises Control Room on page 1840</p>

Fixes

Build 18361: This build includes the following fixes (along with fixes from the previous builds):

The purchase details for Control Room license is now displayed correctly on the **Licenses** page when the Citizen Developer feature is not purchased in the file license.

Previously, purchase details was incorrectly displayed.

Service Cloud case ID: 01994512

After you update to Automation 360 v.29, the bot check-in no longer fails when you have cloned bots from other users and add a new directory for the dependency. Additionally, it shows accurate folder structure and dependencies for the cloned bots from its public bots.

Previously, from the older version of Automation 360 v.29, when you checked in a bot with cloned bots from other users and added a new directory for its dependency, it failed with an error message.

Service Cloud case ID: 01991263, 01991795, 01993056, 01993801, 01993825, 01992732, 01993655, 01994102, 01994336, 01993388, 01994525, 01994710, 01994569, 01994217, 01994263, 01994843, 01995026, 01994542, 01994223, 01994971, 01995404, 01995479, 1993255

Build 18324: This build includes the following fixes:

You no longer see audit log entries for the **Run bot pre processing failed** event type for users and devices that are not active in the Control Room.

Previously, such entries were displayed in the audit logs.

Service Cloud case ID: 01983909

For users (excluding the users who are assigned the AAE_Admin role) who do not have any license assigned to them (Bot Creator, UnattendedBot Runner, Attended Bot Runner, or Citizen Developer), the **Audit log** page no longer displays unsuccessful entries related to the **Default device set** event for any activity performed by the users on the Control Room.

Previously, multiple unsuccessful entries were displayed for such users.

Service Cloud case ID: 01969726, 01970583, 01970990, 01971435, 01971171, 01970869, 01971854, 01970915, 01970523, 01971411, 01971788, 01971827, 01971482, 01971736, 01970333, 01972128, 01970497, 01972025, 01971459, 01971561, 01971068, 01972148, 01975216, 01975980, 01977479, 02001122

After you update Automation 360 to v.28, the Control Room no longer shows the Out of Memory error message and blocks the device connection.

Previously, in such cases, you were not able to access the Control Room and bot deployments were stopped when device was disconnected.

Service Cloud Case ID: 01976841, 01976847

Bot deployments no longer fail or no Control Room slow down issue due to Control Room notifications.

Previously, Control Room performance was impacted due to notifications storage leading to bot deployment issues.

Service Cloud case ID: 01978739, 01978768, 01978794, 01978812, 01978787, 01978826, 01978840, 01978851, 01978849, 01978816, 01978764, 01978782, 01978124, 01978837, 01978833, 01978820, 01978854, 01978780, 01978859, 01978790, 01978679, 01978831, 01978108, 1979121, 1979174, 1979190, 1979191, 1978957, 1977677, 01977677

When you sort the schedules data on the **Scheduled activity** page by the **Next occurrence** column, the schedules are sorted correctly.

Previously, the schedules on each page were sorted individually instead of sorting all the schedules collectively. As a result, schedules were sorted and displayed incorrectly.

Service Cloud case ID: 01936672, 01948336

The BotInsight API- Get Task Log Data will retrieve automation execution information for all automations in public folders, irrespective of whether they pre-existed in a private folder or not. Additionally, the API expected an automation name and returned data only for that automation.

Previously, the GetTaskLogData API retrieved information only for the following:

- If a bot pre-existed in a private folder and will not work for bots directly uploaded to the public folder.
- When the bot name (optional parameter) is specified in the request.

Service Cloud case ID: 01805000, 01965480, 01804312, 01854057, 01861154, 01905063, 01901693, 01932388, 01943438, 01911251, 1946327

You can renew and install licenses using your Control Room GUID without encountering an error.

Previously, an error occurred in such a case.

Service Cloud case ID: 01958580

After you update Windows Server 12 with [Update for Universal C Runtime in Windows](#) patch, the Automation Anywhere Control Room Discovery Bot ML Service no longer fails during Automation 360 installation.

When you uninstall the Bot Agent, it no longer affects the Enterprise 11 Google Chrome plugin.

Previously, in such cases, Google Chrome plugin was uninstalled when you uninstall the Bot Agent. As a result, you had to install the Enterprise 11 Google Chrome plugin again to proceed with Enterprise 11 bot execution.

Service Cloud case ID: 01967916

An active directory user can export roles without encountering failure.

Previously, such a user was unable to export roles.

Service Cloud case ID: 01954961

When you create or edit a locker, you can add multiple roles when updating the **Consumers** option.

Previously, you were unable to add multiple roles.

Service Cloud case ID: 01946827

You can use the **User authentication** setting when enabling SSO authentication without encountering an error.

Previously, an error was displayed when you clicked the **Edit** button for the **User authentication** settings.

Service Cloud case ID: 01946770, 01958619, 01984261, 01977599, 01962097, 01980940, 01964711, 01966644, 01971461

On the **In progress activity** page, the details page of an activity displays the **Last modified** date consistently.

Previously, this date was displayed inconsistently.

Service Cloud case ID: 01943780

In an Oracle Database environment, when you update from Automation 360 v.26 to later versions, the new package versions that are shipped through the installer are now enabled and set as the default version.

Previously, you must have enabled each updated or new package manually and set it as default version.

When you run an active bot with queue, the **Activity > In progress** page shows appropriate behavior for **Pause**, **Stop**, and **Resume** options in the top actions panel.

Previously, when an active bot was paused using the **Pause** option in the top actions panel, the **Activity > In progress** page displayed an error message and not working properly.

Service Cloud case ID: 01941227

With the **bot.dependency.timeout = <value in seconds>** property, network connections no longer stuck. Also, a scheduled bot no longer remains in the **Pending execution** status. As a result, Bot Agent can download the dependencies and the bot executes successfully.

Previously, during dependency download phase, the downloads were stuck due to unreliable network. As a result, Bot Agent could not download the dependencies and the bot did not execute.

Service Cloud case ID: 00951927, 01822836, 01801869, 01874596

You can edit and save device credentials on the **My Settings** page without encountering errors.

Previously, you were unable to save the device credentials.

Service Cloud case ID: 01941151, 01943701, 01958822, 01858205, 01867974, 01862001, 01867845, 01921703, 01905028

Audit log details page displays complete text for all fields.

Previously, text that was displayed for some of the fields were truncated.

Service Cloud case ID: 01908673

On the **Historical** page, the activities details page displays the correct status for bots that are stopped from executing.

Previously, the status for such bots was displayed as failed.

Service Cloud case ID: 01835612, 01962900

When an AAE_Admin tries to delete a user, a prompt is displayed with the list of resources that the user is associated with. This list includes resources such as licenses, schedules, pools, lockers, queues, and credentials. This information helps the administrator to disassociate the user from the resources before deleting the user.

Previously, a generic message was displayed before a user was deleted.

Service Cloud case ID: 01255043, 01761442, 01764557, 01800227, 01807149, 01927012, 01804960, 01949491, 01970079

Bot Agent can now successfully download the packages to device during bot deployment even if the repository path is a Distributed File System (DFS) path.

Previously, if the repository path was set to a DFS path, Bot Agent was not able to download the packages to device and bot deployment failed.

Service Cloud case ID: 01940976

When Bot validation feature is enabled and if you pass a **File** type variable from the parent to child bot, you no longer encounter the preprocessing error during runtime. As a result, you can run the bot successfully.

Previously, a **File** sub-type was handled incorrectly and validated against string rule during bot validation. As a result, you were unable to run the bot when file variable was used in the Task Bot.

Service Cloud case ID: 01969744

When you update the cloned bots by replacing older dependencies with the new ones and check in these bots to the public workspace, the update is retained when another user checks out this updated bot.

Previously, when another user checked out this updated cloned bot, the older dependency remained along with the new one.

Service Cloud case ID: 01948590

When you restore your bots and their dependent files from Git to your server repository, the version information is retained in the correct order. When the Git restoration process is complete, the bots and files contain the same version as the source.

Previously, version information was not restored in the correct order. The bot restored was not of the same version as its source.

Service Cloud case ID: 01924034

When you update to Automation 360 v.24 or later and the Control Room server repository is on a user network file path, if you import bots that contain a large number of bot or non-bot file dependencies, the bot now imports successfully.

Previously, the bot import failed with an error.

Service Cloud case ID: 01807824, 1815889, 01831729

When a large number of users perform concurrent bot check-in operations and if the bot contains multiple dependencies, the concurrent check-ins are completed without delay.

Previously, the check-in operation was slow, affecting other repository actions and the Control Room performance.

Service Cloud case ID: 01944887, 01964122

<p>When you update to Automation 360 v.29, code analysis rules are now retained for configured policies.</p> <p>Previously, code analysis rules were not retained in the active policy after the update.</p>
<p>When you update to Automation 360 v.29, you can now seamlessly view and execute bots without encountering any issues.</p> <p>Previously, there was a delay and error in displaying the view and run bot functionality due to an inconsistency in the global database configuration.</p> <p>Service Cloud case ID: 01978351, 01978355, 01978359, 01978371, 01978389, 01978376, 01978393</p>
<p>When you update to Automation 360 v.29, bot check-in works properly without any issue even when Git has an older configuration.</p> <p>Previously, bot check-in failed displaying an error with older version of Git because of the missing <code>auth_type</code> record in the database.</p> <p>Service Cloud case ID: 01983953</p>
<p>On the Audit log page, when you select the source type as Event type or Source, the corresponding drop-down values are sorted in alphabetical order.</p> <p>Previously, the order was random for these source types.</p> <p>Service Cloud case ID: 00805794, 01908670, 01766369</p>
<p>The Automation 360 installer shows an appropriate warning message when Elasticsearch service is not running.</p> <p>Previously, the warning message was not clarifying the issue.</p> <p>Service Cloud case ID: 01967255</p>
<p>On the Create Active Directory role mappings page, the Active Directory domain option lists domain names as NetBIOS names.</p> <p>Previously, domain names were displayed as fully qualified domain names (FQDN).</p>
<p>API Task is designed for Automation 360 cloud deployments only and is not available for On-Premises deployments.</p> <p>Previously, during the beta release, API Task was made available in the On-Premises deployments for a brief period.</p>
<p>You no longer encounter issues when you create a bot and disable any action (the disabled action has no data or contains errors) in the code.</p> <p>Previously when you executed such bots, it failed with an error.</p> <p>Service Cloud case ID: 01952661</p>
<p>If Auto update is enabled for Bot Agent in the Control Room, the registered devices running Windows10 Enterprise no longer restart after the Bot Agent update.</p> <p>Service Cloud Case ID: 01950021</p>

<p>After a successful installation of the Bot Agent on a device, the Bot Agent service is registered correctly and is displayed on the Windows Services page.</p> <p>Service Cloud Case ID: 01797914</p>
<p>After updating to this release, you can delete a registered device from the Control Room without any issues.</p> <p>Service Cloud Case ID: 01903472, 01914698</p>
<p>Security vulnerability issue fixed in the <code>crutils.jar</code> file.</p> <p>Service Cloud case ID: 01955093</p>
<p>Automation Co-Pilot (AARI) end points include the HTTP Strict Transport Security (HSTS) response headers.</p> <p>Previously, the response headers were missing in the Automation Co-Pilot end points.</p> <p>Service Cloud case ID: 01926041</p>
<p>In a form with a text field that has a max character limit, when a value from a previous task is inherited an error will display. This was fixed in Cloud build 17557 and On-Prem build 17571.</p> <p>Service Cloud case ID: 01969999</p>
<p>After you update to Automation 360 v.29, no error messages are shown as separated characters.</p> <p>Previously, when you update to Automation 360 v.29 and system language was set as non-English language, for example Japanese, error messages were shown as separate characters.</p> <p>Service Cloud case ID: 01986699, 01988909</p>
<p>The format of date data passed from bot to form now transfers accurately. Previously, the date format was changed during transfer.</p>
<p>You can now manually enter any time value between 00:00 to 00:45 when entering time (24-hour format) in forms. Previously, the values entered defaulted to the nearest 15-minute interval.</p> <p>Service Cloud case ID: 01963769</p>
<p>In the Bot editor, the Create a request action in the Process Composer package now supports table variables. This allows you to pass the data of a table to the initial form during run time in Automation Co-Pilot.</p>
<p>If an error is present in a mandatory field the submit button is disabled. Previously, when using forms in build 16667 the button remained enabled during first attempts.</p> <p>Service Cloud case ID: 01949368</p>
<p>Check box values render as expected in web forms. Previously, an inconsistency occurred from designing the form, causing the rendered check box value to be inaccurate.</p> <p>Service Cloud case ID: 01951738</p>

When you navigate through page numbers on the **Average time to spent to create a Task Bot** tab, the dashboard sorts and shows the bots list correctly.

Previously, when you navigate through page numbers, the dashboard showed inconsistent data even if the same page was clicked.

Service Cloud case ID: 01820655

Build 18345: This build includes the following fix.

When a user clicks the cancel button of a form, in a **Cancel Human task** action, the form validation is ignored and the process moves to the endpoint to cancel the task. Previously, when a user clicked the button the form validation was considered and mandatory fields or errors could cause the form to not be submitted.

Limitations

For a queue in draft mode, when you edit the general settings such as **Max auto retry attempt**, you cannot save the changes. Additionally, it generates an error message.

For users with more than 1000 schedules (active or inactive), the **Scheduled activity** page might not load properly. At times, you might encounter an error message while browsing the schedules across pages.

Workaround: To view the list of schedules, you can filter and sort the schedules by status.

Process Discovery (Discovery Bot) has been removed from the Community Edition, but there is a non-functional link to Process Discovery (Discovery Bot) on the home page that needs to be ignored.

Workaround: Ignore the non-functional link in the Community Edition.

There might be a mismatch in the Bot Agent update required data in device dashboard with that of the **Devices** page. This mismatch is because the **Devices** page shows the data about only online devices whereas the device dashboard shows the data about all devices (online and offline).

When you export or promote bots or files that are checked in before January 2021, you might encounter an export or bot promotion error.

Workaround:

1. Check out the bot.
2. Check in the bot without making any changes to it. A new version of the bot is created.
3. Export or promote the bot.

After you update to Automation 360 v.29, the bot check-in fails with an error message.

To fix this issue, perform one of the following steps:

- Delete all the cloned bot copies (if multiple users cloned the bot, delete them from all users) and check in the bot.
- Create the same folder structure under other users who cloned this bot and does not have the new folder structure (that has been modified during the check out).

Trigger listeners is not supported when you use an auto login that is configured from an external key vault.

Importing bots and packages from the Bot Store does not work in Automation 360 v.29 for all users. The Bot Store import action fails, and the import remains either in **IN_PROGRESS** or in **FAILED** status in the Bot Store downloads page.

Workaround: See [A360.29 | Importing bots and packages from Bot Store does not work \(A-people login required\)](#).

Service Cloud case ID: 02001442, 02002465, 02000881

Limitations from previous releases

While running a bot in debug mode, the bot will fail if the variable size gets greater than 3 MB. An error message appears showing that a variable has exceeded the 3 MB limit.

After you update Automation 360 to v.28, when you cancel the update process after removing all the services, the rollback of the services does not happen. As a result, you will encounter an error message, when you attempt Automation 360 update.

Bots that are in the **Queued** status do not appear automatically on the **In progress activity** page.

Workaround: Click the **Refresh table** button on the top-right corner of the activity table to view the queued bots.

Feature deprecations

Review features and capabilities (from Automation Anywhere or other third-party vendors) that are deprecated or nearing deprecation to understand how they impact your automation.

The user interface for the Automation 360 product will no longer support Italian, Russian, and Simplified Chinese languages. In addition, updated release documentation will no longer be available in these three languages though English documentation will be accessible.

For a complete list of deprecations, see [Feature deprecations affecting Automation Anywhere products](#) on page 1030.

Microsoft has deprecated EWS API for Exchange Online and has recommended that users move to Graph API. See [Upcoming API Deprecations in Exchange Web Services for Exchange Online](#).

Note: We recommend that you update the impacted bots by replacing each email-related action with the equivalent new action in the Microsoft 365 Outlook package (based on Graph API).

[Microsoft 365 Outlook package updates](#) on page 873 | [Microsoft 365 Outlook package](#) on page 2741

Updates to the interface

Review the updates to the interface in this release.

See the following video for the updates in the interface for Automation 360 v.29 release:

The **External Key Vault Integration** page is simplified to easily select and configure key vaults when installing the Control Room.

[Integrate HashiCorp Vault to retrieve credentials](#)

The **Licenses** page is simplified to segregate the licensing information.

[View license drill down for users and Control Rooms](#)

The **Attention needed** filter is added in the notification panel to simplify the notification categories.

[Simplified notifications categories](#)

The **Time filter** field is added to search, view, and customize the historical activities based on the selected time duration.

[Time filter for historical activities](#)

The **Edit** option is added for in-use queues to update the queue details and process queues faster.

[Ability to edit workload management automations](#)

Move bots across environment easily with bot promotion.

[Move bots across environments](#)

The icon for a process has been updated in the Bot editor.

Variables for currentValue and currenKey are now visible in the variable picker, regardless of variable type.

[More visibility for variables](#)

Updating to v.29 release

Review requirements and support information about updating your Control Room and Bot Agent for the v.29 release.

Bot Agent updates

Note: This release includes an optional Bot Agent update. You can continue to run your existing bots without updating the Bot Agent. However, if you want to use the new features in Automation 360 v.29, you must update the Bot Agent available with this release.

For more information on updating to this release, see these resources:

- [Automatically update the Bot Agent](#) on page 1302 | [Manually update the Bot Agent](#) on page 1303
- [Compatibility with release builds](#) on page 1275

Certified Control Room builds for direct update

You can update to the latest version of Automation 360 from the previous three releases (that is, from n–3 releases, where n refers to the latest release).

The following previous releases are certified for update to Automation 360 v.29:

- v.28 (Build 17571, 17566, 17542, 17506)
- v.27 (Build 16685, 16667)
- v.26 (Build 15450, 15459, 15439, 15436)

If you are on one of these previous releases, for information about updating, see [Update Automation 360 to latest version](#) on page 1363. If you are not on an n–3 release, update Automation 360 to one of the n–3 releases before updating to Automation 360 v.29.

Migration updates for v.29 release

Review what's changed and fixed in Automation 360 v.29.

What's changed

Migrate botsbots with greater than 10 nested loops

You can successfully migrate bots than contain more than 10 nested loops without any issues. The maximum number of nested loops supported is 97.

Service cloud case ID: 01936674

Fixes

<p>When you migrate MetaBots that include large content variables using the Bot Migration Wizard, a new text file is generated and the filename for the text file is correctly displayed in the Target Name field on the migration wizard Results page.</p> <p>Previously, the filename was not displayed.</p>
<p>You can successfully migrate an Enterprise 11 bot created using the nested email loop condition (the first loop is not commented, whereas the second loop action is commented or vice versa), having an Email Automation command.</p> <p>Previously, migration of such bots showed nested email loop conditions (first and second loop), as commented.</p>
<p>You no longer encounter issues when you run an Enterprise 11 bot in Automation 360 containing the SAP Standard BAPI command. The scalar parameter now maps to Automation 360 variables even if you have not enabled the Write to CSV check box in the SAP Standard BAPI command.</p>
<p>You can successfully migrate an Enterprise 11 bot when it is using an array variable within a Loop While condition and the index position of the variable is greater than the size of the array.</p> <p>Previously, such a bot encountered an error if the index position of the variable was greater than the size of the array.</p>
<p>After updating to this release, errors are no longer displayed when you select the Excel contains charts check box in the Open action of the Excel advanced package to open an Excel file that contains a graph sheet.</p>
<p>After updating to this release, actions from the App integration package that uses Windows SDK will timeout when the target application stops responding or is in 'Not responding' state.</p>
<p>When you migrate a bot from Enterprise 11 that contains the Run standard workflow action from the SAP BAPI package, the scalar parameters are assigned to the corresponding variables correctly.</p>
<p>When you migrate an Enterprise 11 bot that uses the Loop action with File exists condition and if the variable value inside the condition changes, then the bot picks up the latest value of the variable with every loop iteration.</p>
<p>When you migrate an Enterprise 11 bot that uses the Comment action, the action will always remain in the enabled state even if it consists of variables as the variables will now be represented as \$\$\$. For example, when you add \$vArray\$ variable in the Comment action and migrate the bot, after migration it will be represented as \$\$vArray\$.\$.</p>
<p>You can migrate bots that use the Delay package in a loop where the delay value is set to 0.</p> <p>Previously, such bots encountered an error during bot execution.</p>
<p>When you migrate an Enterprise 11 bot which has Object Cloning command with Image play mode, the migration no longer fails for the currently selected active window. Also, it does not generate any error message.</p> <p>Service Cloud case ID: 01947195</p>

When you use the **String > Before or after** command in Enterprise 11 and if the number specified in the **No. of characters to be extracted** field is greater than the actual number of characters available before or after the specified text, the output shows consistent results. Additionally, it does not generate any error message.

When you migrate a bot that contains disabled if-else commands inside any active if-else block, the entire code in the bot is migrated without any issues.

Previously, when you opened the migrated bot in Automation 360, some lines of code were found missing. This issue occurred because when you migrated the bot, the disabled if-else code in the bot was skipped, and no error or warning was displayed in the migration wizard.

Service Cloud case ID: 01885648

Remote agent v.2.3.2.24 updates

A new version of the Remote agent is released with Automation 360 v.29. This section includes the fixes for Remote agent version 2.3.2.24.

Fixes

Automate business applications on remote devices accessed over VMWare VDIs

By installing our native Remote Agent on VMware server, you can now automate your business applications that are running on remote devices and are accessed over VMware VDIs. Our native Remote Agent enables secure communication between VMware server and and provides the object level information for automation creation and play back. This enhances the automation coverage to new use cases while providing a reliable native desktop user experience.

VMware-based automation is supported for all VMware protocols, viz VMware Blast, PCoIP, and Microsoft RDP. This eliminates the requirement for any security exceptions by IT administrators. VMware-based automation is supported for Web applications, Java applications and applications built on Microsoft Active Accessibility or UI Automation technologies.

You can now use the Recorder to capture and automate objects with a specific technology on Citrix XenApp applications. You can capture objects with the following technologies:

- Microsoft Active Accessibility (MSAA)
- UI automation

Packages updated in v.29

Review updates to packages in Automation 360 v.29 including the compatible Control Room and Bot Agent versions.

August 2023 package updates

We have updated specific packages in August, after the v.29 release. For a list of these packages, see [August 2023 updates](#).

July 2023 package updates

We have updated specific packages in July, after the v.29 release. For a list of these packages, see [July 2023 updates](#).

CoE Manager v.29 release

Review what's new in CoE Manager for the v.29 release.

What's new

Accelerate your automation success with CoE Manager Plus

Get advanced capabilities, customizations, and integrations to optimize your automation program performance with CoE Manager Plus. You can track transaction-level ROI metrics and capture key insights regardless of the platform you use. CoE Manager Plus provides you a holistic view of your ROI across a more complex automation landscape.

[CoE Manager Plus](#)

Expand organization hierarchy for focused ROI tracking

You can expand the existing business units in CoE Manager to create multiple sub-level units (geographies, business units, departments, and teams) and link opportunities to these sub-level units. For example, consider the business unit Finance. You can build sub-level units of Accounts Receivable and Accounts Payable under Finance. You can further build sub-levels such as Invoicing, Credit and Collections, Debt Management, and Cash Application under Accounts Receivable. This hierarchy capability provides a clear understanding of how many opportunities were submitted from different areas of the organization, how many were automated, and measures the ROI generated from each area. At every level, the ROI is rolled up from sub-levels to provide a comprehensive view of how each department or business unit is performing.

[Set up organization hierarchy and link opportunities](#) on page 1992

Standardize activity types with predefined activities template

Based on their organizational standards, an administrator can define additional activity types to add to the following predefined activity types:

- Business Case
- Requirements
- Design
- Infrastructure Setup
- Build
- Test
- Deploy

To maintain consistency across all opportunities, users can select activities from these predefined templates to build automation projects. Using predefined templates drives standardization and provides better visibility and reporting capabilities.

Calculate ROI based on individual transactions

In addition to execution count-based tracking, CoE Manager now facilitates volume or transaction count-based value tracking. You can calculate the return on investment (ROI) based on the number of transactions a bot performs for any given day, week, month, or quarter. Transaction-based ROI provides a more granular level of tracking that you can use to assess cost savings and improvement changes affected by processing multiple transactions.

[#unique_207/unique_207_Connect_42_roi-tracking](#)

Automation Co-Pilot for Business Users v.29 release

Review what's new and changed, and the fixes and limitations in Automation Co-Pilot for the v.29 release.

Important: Starting from this release, we have moved information about updates in each (such as what's new, changed, fixes, and limitations) to -specific pages. You can access these pages by navigating to [Package updates overview](#) on page 808 > <-name> releases.

For a consolidated list of packages updated in this release, see [Packages updated in v.29](#) on page 72.

What's new

Queue automations

In the Automation Co-Pilot Desktop Assistant, you can view multiple bot deployments in a queue. You can refer to the **Queue** page to view pending bots that are sorted by progress, including bots with trigger events that were initiated. This also grants you more control over each bot instance, with your ability to remove queues individually or bulk, and to start or stop any bot progress.

[Queue automations](#) on page 3212

Dropdown Multi-Select form element

In the form composer, you can use the new Dropdown Multi-Select form element to create a drop-down menu with values in your forms. This element will enable you to specify more than one value in a drop-down menu that another user can select in a form.

[Using the Dropdown Multi-Select element](#) on page 3218

Map host data with input variables

You can use attended bots with input variables to map data in a host application. When you run your automations in the embedded widget, the values of input variables will be populated based on data of the host application that you configured.

[Map host data using bot inputs](#) on page 3171

<p>Set supported language as URL parameters</p> <p>You can set specific language settings to your URL for host applications using Automation Co-Pilot. This provides you with instant localization for supported languages without the need for you to access language options in a settings menu. For instance, you can add lang=en_US or lang=fr_FR at the end of your URL to localize your contents to a specified language.</p> <p>Automation Co-Pilot for Business Users supported features on page 3162</p>
<p>View hidden elements in form composer</p> <p>In form composer, when you define hidden elements, you will be able to view the hidden element as URL parameters in your URL address. For example, if a hidden element is set to a language value, the URL will reflect this and show as hiddenelement0=EN_US in the URL. This gives you a quick reference of your defined hidden elements when you view the URL.</p> <p>Automation Co-Pilot for Business Users supported features on page 3162</p>
<p>Attention toggle in notifications</p> <p>The Need Attention toggle in the notifications tab enables you the ability to filter between all notifications and notifications that requires action, for your embedded widget. When you select this toggle, only notifications that require your attention is filtered. This helps you focus and prioritize on the important notifications. You can also refresh to load new notifications.</p> <p>Automation Co-Pilot for Business Users supported features on page 3162</p>
<p>Search and filter in an embedded widget</p> <p>You can search and filter your automation list in your embedded widget. When you filter, you can use the name toggle to organize by ascending or descending names. You can also search for specific keywords to quickly identify your automation.</p>
<p>Assign a process to roles</p> <p>Processes can now be assigned to roles. Adding a role to a process makes it available to cross-functional team members, regardless of their assigned team. A process can still be added to a team. However, managing a process by role can make common business tasks consistent and accessible for all users with a set role.</p> <p>Manage a process in Automation Co-Pilot on page 3259</p>

What's changed

<p>Improvements for running processes</p> <p>Documentation has improved to provide clarity on running a sub-process containing a form within a parent process.</p> <p>Service Cloud case ID: 01966950</p> <p>Run a process automation on page 3335</p>
--

Delete requests by any status

For easier storage clean up of processes in a private folder, you can now delete requests (by users with permission) regardless of what status the request is in. Previously, you could not delete requests in open status.

Service Cloud case ID: 01959212

Fixes

Build 18371 (On-Premises): This build includes the following fixes (along with fixes from the previous builds):

After you update to Automation 360 v.29, no error messages are shown as separated characters in the AARI request field.

Previously, when you update to Automation 360 v.29 and system language was set as non-English language, for example Japanese, error messages were shown as separate characters.

Build 18345 (On-Premises): These builds includes the following fix (along with fixes from the previous builds):

When you select a date in the date field after a form is submitted, the date value now accurately shows the correct date and time. Additionally, no error messages will prompt you of the date and time.

Service Cloud case ID: 01978996

When you specify the source date time variable in your bot, to pass to your bot, the time field now correctly displays the time.

Service Cloud case ID: 01980392

When starting the Automation Co-Pilot for Microsoft Teams integration, the Auth pop-up window closes, as intended, after credentials are entered for users with an AARI license.

The **Duplicate Row** option is available when you use the **Table** element.

In a host application, you can deploy your bots and processes in the embedded widget without issues. Previously, the bots and processes would not deploy when host data was unavailable. This has been fixed to allow a bot and process to run regardless if there is no host, with or without listeners, and, with or without data inputs.

The date values in your form will now correctly display the time zone when the data is passed to the bot.

Service Cloud case ID: 01979645, 01978931, 01980392, 01982621, 01986377

In historic activity, when you view bots that have encountered an error, you can view the error message details in the **Error message** section. Previously, error messages would not generate.

Service Cloud case ID: 01850454, 01908923

When you use a date element in your forms, and you generate a date data in the date field and then delete the data, the date data will be removed or updated if you specified a different data.

Service Cloud case ID: 01944363

In Automation Co-Pilot Desktop Assistant, when you use the search and replace feature for form variables, you are now able to search and replace your form variables.

Attended bot runner users that are running Automation 360 v.29 build 18361 should have the permission View Users and Roles basic information assigned in the role settings. An error message might display upon logging in for users without this permission assigned.

Service Cloud case ID: 01997194

Limitations

When you deploy a bot, the initial start date and time of the bot will show the wrong date and time details. The correct date and time will be updated when the bot is progressed.

Service Cloud case ID: 01982920

When you log in to the Salesforce application, you will be able to run your bots and processes through the your embedded widget without issues. However, if your session expires and you re-authenticate, you will not be able to run your automation.

Workaround: Refresh the current page and it will function normally.

In Automation Co-Pilot Desktop Assistant, when you log in as an attended user, but you do not have access to a child bot, and you attempt to run a parent bot instead, an error message will prompt and notify you that you no longer have permission to access the child bot and will not return to a normal state. This error message still persists when you log in again.

Workaround: You can press the F5 key to refresh the page and it will load to a normal state.

When you use a Table element in your forms, the **Duplicate row** option is not available for you to select. Though there are no workarounds for this limitation, you can continue to add rows to your table, and duplicate rows that were previously created are not effected.

The authentication pop-up window does not close when launching Automation Co-Pilot for Microsoft Teams desktop client for two types of users:

- The first Admin user created after a Control Room installation
- Users with out an AARI license associated

The pop-up window asks for credentials. However, after entering and submitting credentials the window remains open. We are currently working to resolve this issue.

Updates to the interface

Review the updates made to the interface for Automation Co-Pilot v.29 release.

<p>Requests in a private folder can now be sent to the recycle bin or hard deleted (by users with permission).</p> <p>Delete any request</p>
<p>When completing a form, a search field is now available in drop-down menus with ten or more options.</p> <p>Service Cloud case ID: 01875095</p>
<p>A process can now be added to roles.</p> <p>Assign process to role</p>
<p>View the queue of your attended bot automation.</p> <p>Queue automations</p>
<p>Use the Dropdown Multi-select Element in form composer.</p> <p>Dropdown Multi-Select element</p>
<p>Specify a supported language as a URL parameter.</p> <p>Supported language URL parameter</p>
<p>Use the Need attention toggle to filter your notifications that requires attention.</p> <p>Need attention toggle</p>

Document Automation and IQ Bot v.29 release

Review what's new and changed, and the fixes and limitations in IQ Bot and Document Automation for the v.29 release.

Important: Starting from this release, we have moved information about updates in each (such as what's new, changed, fixes, and limitations) to -specific pages. You can access these pages by navigating to [Package updates overview](#) on page 808 > <-name> releases.

For a consolidated list of packages updated in this release, see [Packages updated in v.29](#) on page 72.

Document Automation

What's new
<p>Validate table data quicker using auto fill</p> <p>You can use the Auto fill button in the validation interface to extract hundreds of rows of data from multipage tables. After you manually validate three cells in a column, auto fill extracts the remaining values from that column in the document.</p>
<p>Use Advanced Classifier package in Document Automation</p> <p>You can use the Document Automation Advanced Classifier package to classify documents and pages, and split documents into a folder structure. You can upload documents from the folders to their respective learning instance to extract content in Document Automation. You must set up a Skillja license in a credential vault to run a bot containing actions from this package.</p> <p>Advanced Classifier package on page 2299</p>
<p>Document Automation support for Google Custom Document Extractor</p> <p>You can now create a user-trained learning instance in Document Automation and extract it using a Google Custom Document Extractor (CDE) processor. You can use this new capability to train a model using Google CDE for any document type, and it supports 30 languages. After you deploy a model, you can embed the processor URL within the Document Automation extraction process. To use this capability, you must have an Automation Anywhere Document Workspace license and a valid subscription to Google CDE.</p>
<p>Improved heuristic feedback with form and table extraction</p> <p>Document Automation provides an improved extraction through heuristic feedback with a focus on complex scenarios, such as multi-tables. Additionally, there are extraction improvements for both form fields and out-of-the-box performance (specifically for table fields).</p>
<p>Document-level data validation in Document Automation</p> <p>With document-level data validation, you can create rules to ensure the accuracy of extracted data across multiple fields in your documents. You can define various conditions, such as pattern matching or equality checks. When those conditions are met, you can effortlessly take action to flag errors or warnings, clean up or replace values, or set new values.</p> <p>Validation rules in Document Automation on page 3484</p>

What's changed
<p>In Standard Forms, you can create and train new models in Microsoft Form Recognizer v3.0 only. You can use existing models in Microsoft Form Recognizer v2.1, however, you cannot create new models.</p>
<p>Microsoft Form Recognizer Studio integrated with Document Automation is compatible only with v.3.0 model for all future model creations.</p>

What's changed
<p>As of Automation 360 v.29, Document Automation Standard Forms supports the check box type for forms and table fields. The Standard Forms learning instance has an additional check box field data type and the extraction result can be one of the following:</p> <ul style="list-style-type: none"> • Checked • Unchecked • Not found (if the system is unable to extract the result) <p>For any Standard Forms learning instance that was created before Automation 360 v.29 and has a check box field, you must update the data type for the check box field at the learning instance level.</p>
<p>Enhancements were made in the Validator to improve the validation process in Document Automation.</p>
<p>For Automation 360 v.29 release and later releases, the learning instance export and import functionality has been enhanced to include the ability to copy heuristic feedback data with the configuration. You can seamlessly move your feedback data from one environment to another without any data loss. As a result, this feature significantly reduces the need for rework, ultimately saving valuable time</p>

Build 18345: This build includes the following fixes (along with fixes from the previous builds):

Fixes
<p>In Validator, if you enter a valid entry or data in the field, and click outside of it, the field is validated.</p> <p>This was a limitation in previous builds 18332, 18302, 18277 (Cloud-Sandbox) and build 18324 (On-Premises).</p>
<p>When Extract field using pattern is chosen in the learning instance and the document is processed, the field is validated on entering valid data. Here, only the respective field is affected, and its extraction is based on the provided regular expression input.</p> <p>This was a limitation in previous builds 18332, 18302, 18277 (Cloud-Sandbox) and build 18324 (On-Premises).</p>

Build 18277: This build includes the following fixes:

Fixes
<p>If a table name in the Validator has more than 50 characters, the field name in the table is now displayed when you hover over it. Previously, the table name was not displayed.</p>
<p>If a field name in the Validator has more than 100 characters, the scroll bar appears and you can see the value of the form field. Previously, the form field name was not displayed.</p>
<p>The run analysis result is displayed in Standard Forms when creating a v3.0 model with multiple pages.</p>
<p>You can now use the advanced check-out options for bots that contain actions from the Document Extraction package.</p>

Fixes
If you upload documents to a custom process instead of a Document Automation auto-created process, the Download bot now successfully downloads the CSV of extracted data and deletes the uploaded files from temporary storage.
The Automation Anywhere Control Room now tracks Document Automation license consumption in newly-installed cluster Linux environments.
Imported learning instances now have pattern-based validation enabled by default.
You can now submit a document that has a pattern validation rule with a regular expression that contains the pipe symbol ().
In the Bot Insight, the Unknown option under OCR Engine attribute for Google Document AI provider has been removed from the Document Workspace dashboard. Now the filter displays ABBYY as the OCR engine, ensuring better clarity and accuracy in filtering options.
Extraction is now successful when creating a learning instance in Document Automation using a custom domain. Previously, uploading a document for the learning instance using a custom domain would result in extraction failure, but this issue has been resolved. Service Cloud case ID:01967442
Documents with Windows OS user-names containing more than 17 characters can now be processed successfully in the latest package of Document Automation. Previously, attempting to process such documents would trigger an error message stating, <code>The File cannot be processed, it may be corrupted. Please contact technical support if the file is valid.</code> Service Cloud case ID:01951382, 01950245
The Document Extraction package now successfully extracts documents when the option to store the output files on the server is chosen in a stand-alone setup. Previously, selecting the option to upload the output to the server would result in a failure of the Extraction action, accompanied by the error message <code>DW_EXTRACT_FAILURE 500</code> . Service Cloud case ID:01943058, 01972932

Limitations
The check box feature (in preview mode) might result in inconsistent extraction for the check boxes field, which could lead to inconsistent results. In such cases, if the system is unable to accurately extract the check box field value, it will be labeled as Not Found .
If a learning instance name contains a space, then the downloaded file name will have the space replaced with the encoded value %20. For example, if the exported learning instance name is <code>Test 123</code> , then the file name is displayed as <code>Test%20123</code> .
With the implementation of new document level rules, if the condition is based on a Form Field and the resulting action should affect a Table Field , the expected outcome is not reflected in the Validator.
You will not be able to use the Extract field using pattern for a table field with a custom alias. Workaround: On removing the regular expressions (regex), the extraction works as expected with the custom alias.

Limitations
<p>When the table name in the Microsoft Form Recognizer Studio UI exceeds 99 characters, the UI does not handle it properly.</p>
<p>On creating a validation rule with does match regex condition and show error action, a custom error is shown for a field with no extraction.</p> <p>Workaround: If condition is does match regex, add another AND along with is not empty condition to use the action show error. This will not display any error over fields with no extraction.</p>
<p>While creating or editing a learning instance, if you select the Extract field using pattern check box and then subsequently clear it without entering a value in the regular expression field, the Create button remains disabled even if all other mandatory fields have been entered.</p> <p>Workaround: Enter value in the regular expression field, and then clear the Extract field using pattern check box.</p>
<p>If you select the Chinese language in AARI interface, the auto-fill button label does not update to reflect the selected language during validation.</p>
<p>If you process a document with Google Custom Document Extractor, the extraction is failing for the below languages:</p> <ul style="list-style-type: none"> • Albanian • Croatian • Finnish • Icelandic • Slovenian • Vietnamese
<p>(Service Cloud Case ID: 01981332, 01981088) During extraction, the heuristic feedback does not provide values for certain fields in cases where the previous mappings contain non-English characters, such as Arabic characters or text with single quotes (').</p>
<p>While editing a learning instance, if you use the Up or Down buttons to change the value of the Confidence level and click the Update button, the changes are not retained.</p> <p>Workaround: Ensure that you enter the value that you want to increase or decrease for the Confidence level.</p>
<p>For the Community Edition:</p> <ul style="list-style-type: none"> • Google Vision OCR will not be displayed as it is not supported. • Document extraction using Google CDE or Google Document AI (User-defined) is not supported.

IQ Bot

Fixes
The first time you click a learning instance connected from Automation 360 IQ Bot, you are directed to the details page for that learning instance. Previously, you were redirected to the IQ Bot home page instead.
Automation 360 IQ Bot now shows the correct error message if you upload a corrupted document to a manual group.
You can now use more than 54 categories for the Train and Retrain actions. This allows classification according to the provided training model files. Previously, the Classifier was unable to classify the files into categories if the number exceeded 54 categories.
You can now create and run the Document Classifier package with a variable in the child task bot. Previously, when you ran the task bot command with a variable to call the child task bot, it displayed an error.
You can now view the full Python script that is added to the Python Logic tab when you navigate from fullscreen to smallscreen after a test run. All the options such as Test Run , Clear Box, fullscreen , and Save are also visible. Previously, when you navigated from fullscreen to smallscreen, you could not view the Python script and the other options were hidden.
Healthcheck for an IQ Bot instance shows the correct OK status even if the instance is idle or accessed after a day. Previously, healthcheck showed a status of NOT_OK when the IQ Bot instance was idle or accessed after one day.
You can now export, import, upload, and download an IQ Bot archive (IQBA) file with a maximum file size of 5 GB. Previously, if the IQBA file size was greater than 268 MB, then the file storage did not upload the exported file from the output folder to the desired location.
You can now import an IQBA file successfully into the learning instance. Previously, IQBA import was failing when the exported learning instance had certain training embedded in it with line break characters.

Updates to the interface

Review the updates to the interface made to the interface in Document Automation for Automation 360 v.29 release.

With document-level data validation, you can create rules to ensure the accuracy of extracted data across multiple fields in your documents.

[Document-level rules for improved extraction](#)

You can leverage export and import functionality with the ability to copy heuristic feedback data with the configuration.

[Validation feedback in export and import of learning instances](#)

Create a user-trained learning instance in Document Automation and extract it using a Google Custom Document Extractor (CDE) processor.

[Support for Google Custom Document Extractor \(CDE\)](#)

You can create and train new models using Microsoft Form Recognizer v3.0 only.

[Standard Forms support for v3.0 model](#)

Bot Insight v.29 release

Review the fixes in Bot Insight for the v.29 release.

Important: Starting from this release, we have moved information about updates in each (such as what's new, changed, fixes, and limitations) to -specific pages. You can access these pages by navigating to [Package updates overview](#) on page 808 > <-name> releases.

For a consolidated list of packages updated in this release, see [Packages updated in v.29](#) on page 72.

Fixes

Bot Insight dashboards now show complete operational data without an administrator role. With appropriate folder permissions to view and access the bots, you can view the data for the bot in the dashboard.

Previously, you needed an administrator role to access all bots in the Bot Insight dashboard. Thus, the dashboard showed no data or incomplete data for non-administrator roles.

Service Cloud case ID: 00667473, 00687154, 01037867, 01250792, 01753449, 01767903, 01894821, 01969251, 00687154, 01867608, 01903290, 01923256, 01948171, 01940999, 01970902, 01940999

Bot Insight dashboards now sort all the widgets data and show it in correct sort order (ascending or descending).

Previously, the sort order setting was not working accurately and impacted the widgets data for all the domain dashboards. As a result, it always showed the old datasets only.

Service Cloud case ID: 01942061

When you hover over the charts x-axis, the device utilization widget in the Bot Insight device dashboard now shows the correct tooltip text for the **Device Name** label.

Service Cloud case ID: 01941392

When you use the **Analyze** command in loop to run for higher number of times (For example, 113764), the number of documents pushed into Elasticsearch are matching correctly with the input record count. As a result, the business dashboard shows the correct data.

Previously, the input records count did not match with the number of records count in dashboard and you were not able to view the correct data in the business dashboard.

Service Cloud Case ID: 01959930, 01961929, 01962535

Package SDK v.29 release

Review what's new in the Automation 360 Package SDK for the v.29 release.

What's new

SDK download link: [A360-package-sdk-2.8.0.zip](#)

return_Direct attribute

A new attribute return_Direct= true is added at the action level. It will show only a single option to select the Record type variable in the output.

For example:

```
@BotCommand
@CommandPkg (
    return_label = "[[AddColumn.return_label]]",
    node_label = "[[AddColumn.node_label]]",
    label = "[[AddColumn.label]]",
    description = "[[AddColumn.description]]",
    name = "addColumn",
    icon = "record.svg",
    return_type = DataType.RECORD,
    return_Direct = true,
    return_required = true,
    minimum_controlroom_version = "17917",
    minimum_botagent_version = "21.134",
    documentation_url = RECORD_ADD_COLUMN_URL,
    documentation_widget_page = RECORD_ADD_COLUMN_WIDGET,

    allowed_Agent_Targets = AllowedTarget.HEADLESS)
```

OAUTHCONNECTION attribute

A new attribute type, OAUTHCONNECTION, is added to get an access token from the Control Room's preconfigured OAuth Connection value.

For example:

```
@Idx(index = "1", type = AttributeType.OAUTHCONNECTION)
@Pkg(label = "[[OAuthConnectionTypeDemo.connection.label]]")
OAuthConnection connection
```

A new rule **VariableMapAllowedDataTypes** is added to the **VARIABLEMAP**

VariableMapAllowedDataTypes allows you to filter the UI for a particular variable type. **VariableMap** is a control that allows you to add variable selection for any action (in the bot editor UI). With the **VariableMapAllowedDataTypes** filter, you can restrict the datatype of variables that can be used in an action. For instance, if you set the **VariableMapAllowedDataTypes** to **String**, it will list only string variables within an action.

```
@Idx(index = "4", type = VARIABLEMAP)
  @Pkg(label = "[[LogVariables.selectVariable.label]]")
  @NotEmpty
  @VariableType(DataType.VARIABLEMAP)
  @VariableMapAllowedDataTypes({
    DataType.STRING,
    DataType.NUMBER,
    DataType.BOOLEAN,
    DataType.DATETIME
  })
  Map<String, Value> variables
```

@DesktopOperationContext annotation

The new annotation `@DesktopOperationContext` is used to inject the `DesktopOperationContext` in `DesktopOperation`, similar to `GlobalSessionContext`.

This annotation is applied on property with the setter method so that the generated file can set `DesktopOperationContext` to the target file.

By injecting `DesktopOperationContext`, the following property can be accessible in `DesktopOperation` from the `GlobalSessionContext`:

1. `getUserToken`
2. `getCrUrl`
3. `resolveResource`
4. `getExternalEnvironment`
5. `getProxyConfig`
6. `botId`
7. `getResources`

```
@BotCommand(commandType =
    BotCommand.CommandType.DESKTOP_OPERATION_BUTTON)
@CommandPkg(name = "RESTRRecorder", desktop_operation_name =
    "RESTRRecorder")
public class RecorderOperation {

    private static final Logger LOGGER =
    LogManager.getLogger(RecorderOperation.class);

    @Request private DesktopOperationButtonRequest request;

    @DesktopOperationContext private
    com.automationanywhere.toolchain.runtime.operation.context.DesktopOperationCont
    context;

    public void setRequest(DesktopOperationButtonRequest request)
    {
        this.request = request;
    }

    public void setContext(
    com.automationanywhere.toolchain.runtime.operation.context.DesktopOperationCont
    context) {
        this.context = context;
    }
}
```

Automation 360 v.28 Release Notes

Release date: 5 April 2023

Review the top 5 features in this release as well as other new features and exciting enhancements for Automation 360 v.28 release.

- Build 17566: Automation 360 (Cloud and Cloud Sandbox) and IQ Bot (Cloud)
- Build 17571: Automation 360 (On-Premises) and IQ Bot (On-Premises)

We have released updated builds for fixes after the Automation 360 v.28 GA builds, which were Cloud Build 17524 and On-Premises Build 17506. For information about the fixes in these updated builds, see [Updated release builds](#) on page 98.

Highlights of this release

Here are the top 5 features in the v.28 release:

Document Automation and Google Document AI

Validation-based improvement on Google Document AI extractions: Empower your employees to save time and automate more documents using Document Automation and Google Document AI validation feedback, which in turn provides improved extraction accuracy for Document AI learning instances.

Leverage integration update with the latest Google Document AI parsers: Improve extraction accuracy and enable 7 additional languages (including Italian and Portuguese) for Document AI invoices, and Japanese for Document AI expense receipts.

See [Create a learning instance in Document Automation](#) on page 3472.

CoE Manager: Value tracking for On-Premises automations

Calculate ROI for automations running on an On-Premises Control Room by running a bot to push automation-run data to CoE Manager. View your ROI data in real-time dashboards and create a healthy pipeline of automations that will help propel your business forward.

See [CoE Manager - Integrate with On-Premises Control Room](#) on page 2004.

Empower business users with Automation Co-Pilot and Microsoft Teams

Bring automation to your employees in their favorite collaboration tool Microsoft Teams. Employees can be in a chat or team channel,

or open Automation Co-Pilot from the Apps menu to view a list of the Automation Co-Pilot processes and desktop automations they have access to. They can start and monitor these automations, without having to leave Teams.

See [Integrate Automation Co-Pilot with Microsoft Teams](#) on page 3204.

Workday package

Easily automate your Workday processes such as reporting, data upload/download, or triggering workflows with our new point-and-click experience. Our new package provides deep API-level integration with Workday that enables you to build automations easily, without having to code.

The following video shows how you can automate processes in ServiceNow and Workday using API integration.

See [Workday package](#) on page 3032.

Enhance developer productivity

Next-gen Recorder: Improve automation reliability for web applications when the UI element is not visible on the screen. The Recorder will automatically work around this without any developer intervention.

See [Recorder package](#) on page 2798.

Quickly search and replace any text or variables in the action properties of the bot: Save time and improve developer productivity with an automatic search and replace tool in Bot Assistant. Users can quickly search for any specific text or variable, navigate through the search results, and selectively replace each occurrence of the text or variable in the automation.

See [Search and replace option in Bot editor](#) on page 2278.

Email automation through a shared mailbox: Automate email tasks over a shared mailbox in Microsoft 365 Outlook using IMAP or EWS protocols and Client Credential flow or PKCE flow with Exchange Online. This feature saves you money, time, and effort in maintaining individual personal mailboxes.

See [Email package](#) on page 2431.

Enhancement to bulk package update: As an automation administrator, update multiple packages in bulk or perform updates to specific

bots and view outcomes of these applied updates in a system-generated report.

See [Updating package versions](#) on page 1843 | [Update bots to default package version](#) on page 1844.

Bot runtime alerts: Gain visibility into your automations with notifications on various platform events and take actions based on these notifications. Get notified on events such as automation runtime and device pools from within the application (default) or through email reports based on your preference.

See [Automation events](#) on page 2126 | [Platform events](#) on page 2127

The following video shows the developer enhancements available in this release:

Updated release builds

- We have released the updated Build 17571 (On-Premises) for the following:
 - Fix for users (excluding users assigned the AAE_Admin role) who do not have a license assigned to them: the **Audit log** page no longer displays unsuccessful entries for any activity performed by these users on the Control Room. (Service Cloud case ID: 01969726, 01970583, 01970990, 01971435, 01971171, 01970869, 01971854, 01970915, 01970523, 01971411, 01971788, 01971827, 01971482, 01971736, 01970333, 01972128, 01970497, 01972025, 01971459, 01971561, 01971068, 01972148, 01975216, 01975980, 01977479)
 - Fix for an issue when multiple users try to check-in bots simultaneously, the Control Room UI might become unresponsive due to a database connection issue. (Service Cloud case ID: 01944887)
 - Fix for an issue when the access lock in Git causes the lock not to be released. (Service Cloud case ID: 01944887)
 - Fix for a critical security vulnerability present in the Credential Vault module of v.28 and earlier releases. The vulnerability allows a user who has permission to modify a locker to access credential attributes in another locker.
 - Fix for an issue where the Automation Co-Pilot (AARI) request page does not load correctly due to AARI form not rendering table data when the data variable assigned to the form has more columns than the columns specified in the table.
 - Fix for an issue in the Automation Co-Pilot form where the form does not display an error when a textbox inherits a value from a previous task and the value exceeds the maximum character limit of the textbox.
- We have released the updated Build 17566 (Cloud) for the following:
 - Fix for an issue when multiple users try to check-in bots simultaneously, the Control Room UI might become unresponsive due to a database connection issue. (Service Cloud case ID: 01944887)

- Fix for an issue when the access lock in Git causes the lock not to be released. (Service Cloud case ID: 01944887)
- Fix for a critical security vulnerability present in the Credential Vault module of v.28 and earlier releases. The vulnerability allows a user who has permission to modify a locker to access credential attributes in another locker.
- We have released the updated Build 17557 (Cloud) for the following:
 - Fix for an issue where the Automation Co-Pilot (AARI) request page does not load correctly due to AARI form not rendering table data when the data variable assigned to the form has more columns than the columns specified in the table.
 - Fix for an issue in the AARI form where the form does not display an error when a textbox inherits a value from a previous task and the value exceeds the maximum character limit of the textbox.
- We have released the updated Build 17542 (Cloud and On-Premises) for the following:
 - Fix for an issue when bot preview is unavailable when you check out a bot that is using metadata in actions (for example, Image Recognition, Recorder, and Screen Capture).
 - Fix for an issue where editing a bot from a folder fails when a policy is assigned to the folder and its subfolders and one of the subfolders is deleted.
- We have released the updated Build 17533 (Cloud) to include a fix for an issue found when exporting a bot.

Exporting a bot fails when you perform the following steps:

1. Log in to the Control Room.
2. Create a main bot and child bot using the Recorder actions.
3. Check in the bot.
4. Check out the bot and delete the Recorder actions from the main bot.
5. Check in the bot.
6. Export the bot.

What's new and changed in each product

Navigate to the following pages for details on all the updates (what's new, changed, fixed, and limitations) in each product:

Automation Workspace v.28 release on page 100
CoE Manager v.28 release on page 145
Automation Co-Pilot for Business Users v.28 release on page 146
IQ Bot and Document Automation v.28 release on page 150
Bot Insight v.28 release on page 155

Automation Workspace v.28 release

Review what's new and changed, and the fixes and limitations in Automation Workspace for the v.28 release.

What's new

Control Room, devices, and Bot Agent
<p>Select the Control Room services to run at startup (Service Cloud case ID: 00781074, 00804237, 00799057, 01260425, 01271130, 01793867, 01966120, 0200222)</p> <p>You can optimize application process utilization on your device by selecting the Control Room services that you want to automatically run at startup during the On-Premises installation.</p> <p>Select Control Room services to automatically run at startup on page 1197</p>
<p>Improved notifications administration to manage user access</p> <p>A Control Room administrator can manage a user's access to the event categories set in the Administration > Settings > Notification settings section. A Control Room administrator can lock the required preferences and notifications only for those enabled event categories that are sent to the end users.</p> <p>Lock event categories on page 2131</p>
<p>Monitor bot runtime, device pool, and license events through notifications</p> <p>Through notifications, you can monitor all:</p> <ul style="list-style-type: none"> • Bot runtime events: Bot runtime event notifications are sent to the respective users based on bot access permissions. • Device pool related events: Device pool-related event notifications are sent to users based on their user role and permission in the Control Room. • License events (such as license over subscription or consumption): Email notifications are sent for license over subscription or consumption events. <p>Automation events on page 2126 Platform events on page 2127</p>
<p>Monitor Automation Co-Pilot events through Control Room notifications</p> <p>With the Process events category, the Control Room notifies you about various Automation Co-Pilot events related to requests and tasks through notifications. The task and request event notifications are sent to the task owner and request creator team, respectively.</p> <p>Process events on page 2128</p>
<p>Audit log event when a package is deleted (Service Cloud case ID: 01780700, 01885638)</p> <p>An audit log event is logged when a user deletes a package.</p> <p>Audit events list on page 2077</p>

Control Room, devices, and Bot Agent
<p>Import intermediate certificates for secure access to Control Room (Service Cloud case ID: 00673966, 01889608)</p> <p>An intermediate certificate is used to determine if a certificate was issued by a valid and trusted root CA (certificate authority). If the intermediate certificate is not installed on the server where the TLS certificate is installed, applications might not trust the TLS certificate. To have clients trust the TLS certificate, you must make the intermediate certificates available on the server.</p> <p>You can import the intermediate certificates when you install the Control Room or after you install the Control Room using the Windows command prompt.</p> <p>Intermediate certificates on page 1326 Configure application Transport Layer Security on page 1193 Import HTTPS, intermediate, and CA certificates on page 1327</p>
<p>Validate remote deployments to avoid unauthorized device access (Service Cloud case ID: 01608589)</p> <p>Prior to assigning a device for bot deployment, you can reset the bot running device for Bot Creator, Citizen Developer, and attended Bot Runner users to prevent unauthorized deployments. This enhancement enables you to clear an existing bot running device when users log into the Control Room and there is no Bot Agent available on the local device.</p> <p>Switch device registration between Control Room instances on page 1744</p>
<p>Configure username for different Automation 360 services using the CyberArk secret response (Service Cloud case ID: 01852428, 00675147, 01950039, 00819460, 00830696, 00822765)</p> <p>You can configure usernames for auto-login, Lightweight Directory Access Protocol (LDAP), and service credentials using the CyberArk secret response. Usernames can be a combination of values from the secret response or string literals. The CyberArk secret response contains field values that you must enclose within dollar signs (\$\$) to construct the username. For example, to configure the username in the format <code>domain\username</code>, you must enter: <code>\$\$domain\$\$\\$\$username\$\$</code>. The domain and username values in this expression will be replaced with the corresponding values from the secret response.</p> <p>External key vault naming conventions on page 1855 CyberArk credential retrieval use cases on page 1876 On-Premises initial installation using CyberArk Password Vault on page 1870</p>
<p>Customize device registration settings</p> <p>Control Room administrator can customize the device registration settings while adding a device. For example, if there are multiple users who will log into a single device, an administrator can change the Device type to Multiple users.</p> <p>Configure device registration on page 1736</p>
<p>Minimize security risk for trigger-based bot deployment</p> <p>Prior to deploying a trigger-based bot, you can select to validate the device credentials for Bot Creator, Citizen Developer, and attended and unattended Bot Runner users. This provides users additional security for trigger-based bot deployment.</p> <p>Switch device registration between Control Room instances on page 1744</p>

Control Room, devices, and Bot Agent
<p>Auto-connect to non-UI triggers for unattended users</p> <p>As an unattended user who uses non-UI triggers (such as File/Folder trigger that do not require user session) you can auto-connect to the Automation Workspace when the machine is rebooted. You do not need to log in to ensure the triggers are running.</p> <p>Service Cloud case ID: 00758775, 01754312, 01754887, 01803179, 01844357, 01845563, 01568082, 01866287, 01920491, 01951355, 01951355, 01957771</p>
Packages, actions, and Bot editor
<p>Workday package</p> <p>You can use the new Workday package from Automation 360 to automate your Workday processes such as reporting, data upload/download, or triggering workflows with our new point-and-click experience. The package provides deep API-level integration with Workday that enables you to build automations easily, without having to code.</p> <p>Workday package on page 3032</p>
<p>Apigee package</p> <p>You can use the new Disconnect and Resume Integration features in the Apigee package. You can disconnect from your Apigee instance and clear the session using the Apigee Disconnect action. You can resume an integration that is suspended in Apigee using the Apigee Resume Integration action.</p> <p>Apigee Disconnect on page 2314 Apigee Resume Integration on page 2319</p>
<p>Goto package</p> <p>You can migrate bots from other vendors into Automation 360.</p> <hr/> <p>Important: The Goto package was specifically designed for migrating bots from other vendors into Automation 360 and is only available on request. This package is not available as part of the standard Automation 360 installation as it cannot be used to build any bots.</p> <hr/> <p>Goto</p>
<p>Salesforce package</p> <p>You can retrieve the entire result set in the response of the Salesforce Execute SOQL actions. In the previous version, the response was limited to retrieve the first 2000 records and this limit has been removed.</p>
<p>View mode supports the ability to copy</p> <p>You can use the Copy to shared clipboard functionality to copy actions, triggers, and metadata from a bot in a private repository that is in View mode. You can then use the Paste from shared clipboard to paste the information to an editable bot.</p> <p>Actions to build bots on page 2272</p>
<p>Credential Picker listing enhancement</p> <p>For easier navigation when you pick a credential, the Credential Picket option displays the Locker, Credential, and Attributes items alphabetically across the bot packages.</p>

Packages, actions, and Bot editor
<p>Extended attributes supported in the Terminal Emulator Package (Service Cloud case ID: 01870633, 01928396, 01809815)</p> <p>The TN3270E terminal type supports extended attributes. To enable extended attributes for TN3270E terminals, select the Extended Attribute check box in the Connect action.</p>
<p>Enhanced Packages landing page</p> <p>The Package Manager landing page has been enhanced to provide more clarity with consolidated rows. When all versions of a package are disabled the status displays as Disabled. All related fields, such as recommended Control Room version, Bot Agent version, and Last modified, will show the status as Not Available.</p> <p>The Version column has been renamed to Default version.</p>
<p>Enhanced error messages display errors from the child bots (Service Cloud case ID: 01264352)</p> <p>When you create a bot where the parent bot calls a child bot, and if an error occurs in the child bot, the error message provides the following details:</p> <ul style="list-style-type: none"> • Line number of the parent bot which ran the child bot. • Line number of the child bot where the error occurred. • Error message details, such as what went wrong with that line number and the corresponding corrective action. <p>Using Bot editor on page 2156</p>
<p>Timeout option in Database Connect action (Service Cloud case ID: 00753858)</p> <p>We added a timeout option in the Connect action of the Database Package. When you connect with Microsoft SQL Server to automate database-related tasks, and if the database is down or experiences any network issues, the automation will time out and fail if the database connection is not established in the specified time.</p> <p>Using Connect action for database on page 2382</p>
<p>Improved readability with new formatting capabilities in XML document (Service Cloud case ID: 01886455, 01925386)</p> <p>When you insert, update, or delete nodes, the XML package does not remove carriage return characters between nodes but does remove all blank text nodes from the XML document. By using Prettyprint to format XML files, developers can easily improve the readability of a document. Developers can save time by using the following new options that have been added to the XML Package:</p> <ul style="list-style-type: none"> • Use Prettyprint: The Save session data action supports the Prettyprint format in the XML document. When you select the Use Prettyprint check box and use the Insert node, Update node, or Delete node actions and then save the XML document, the code is formatted with proper indentation as per Prettyprint. • Remove text nodes that contain only white space: The Start Session action provides an option to remove blank text nodes when you parse the XML document. <p>Save session data action in XML on page 3061 Start session action in XML on page 3061</p>

Packages, actions, and Bot editor

New features added to the Email Package (Service Cloud case ID: 01835214, 01846425, 01756713, 01882482)

To support extensive process automation, we added the following action-related features to the Email Package:

- Ability to use the **Reply All** action.
- Enhanced the **Delete all** action to delete all emails from a specific folder. Additionally, you can apply filter parameters to emails such as:
 - All, Read, and Unread
 - Subject
 - From a specific sender
 - Before, on, or after a received date
- The dictionary variable for email properties includes a new variable, `emailNoOfAttachments`, used to retrieve the attachment count.

[Reply All action](#) on page 2447 | [Example using Email actions in a bot](#) on page 3129 | [Delete all action](#) on page 2436

Automate controls using Microsoft UI Automation (COM) technology

You can use the Microsoft UI Automation (COM) technology to automate the following scenarios:

- Capture and automate link controls
- Capture and automate tree controls

[Capture using specific technology](#) on page 2824 | [Actions performed on objects captured with Universal Recorder](#) on page 2804

Insert Custom column in Data Table

A new **Custom column** option has been added to the **Data Table > Insert column** action that enables you to insert a new column at a specified index in a data table. When you read an Excel spreadsheet and assign it to a data table, you can modify the table by adding a new column and entering any required data.

[Insert column action](#) on page 2369

New Label option in Loop package

A new **Label** option has been added to the Loop package that enables you to break or continue a specific loop from the nested loops.

[Loop package](#) on page 2679

Add and configure If action conditions

You can add and configure a maximum of 32 conditions in a single **If** action.

Packages, actions, and Bot editor
<p>Improved automation reliability for web applications</p> <p>When you use the Recorder > Capture action to automate web pages running on Google Chrome and Microsoft Edge browsers, the Recorder > Capture action no longer scrolls down the web page if the target object is visible on the screen. This feature improves the user experience and reliability of automation when there is a fixed top pane on the web page and if some physical actions such as mouse clicks do not work as expected.</p> <hr/> <p>Note: Ensure that you install the browser extension (version 3.0.8.0) and use the Recorder package (version 2.10.2) to capture the control.</p> <hr/>
<p>Preferred view retained as default view in the Bot editor</p> <p>As a bot developer, you no longer have to manually select the preferred view when you open the Bot editor. To improve the developer's productivity and user experience, when creating bots in the Bot editor, your preferred view (List, Flow, or Dual) in the Bot editor will persist across user sessions and browsers. When you navigate in the Control Room or after your next log in, the Bot editor will retain your last used or selected view.</p> <p>Using Bot editor on page 2156</p>
<p>Line markers for collapsible sections of code in the Bot editor</p> <p>When you create bots using Loop, If/If-else, Step, Trigger-loop, Try, Catch, and Finally statements, the Bot editor clearly shows the collapsible sections. When building automations, developers can use these visual indicator line markers at the beginning and end of the collapsible section to improve their productivity.</p> <hr/> <p>Note: The visual indicator line marker for the collapsible section applies only to the List view in the Bot editor.</p> <hr/> <p>Using Bot editor on page 2156</p>
<p>Enhanced user experience through refreshed and intuitive icons</p> <p>With the new and intuitive icons for actions in the Bot editor, Citizen Developers and RPA developers can quickly locate the correct action while creating automation for a day-to-day task. These unique and renewed icons are developed according to brand and global standards.</p>
<p>Update to the Capture text of window action</p> <p>The Capture text of window action in the App Integration package can be used to capture a text from a window on two different user sessions.</p> <p>Capture text of window action on page 2325</p>
<p>Search and replace in Bot editor (Service Cloud case ID: 00792784, 01943783)</p> <p>Use the Search and replace feature in the Bot editor to search for any text or variables, string within an action and replace it.</p> <p>Search and replace option in Bot editor on page 2278</p>

Packages, actions, and Bot editor

The experience of building a process has improved.

- Copy, cut, and paste behaviors are the same in Process Composer as in the Bot editor.
 - [Supported behaviors for tasks and elements in Process Composer](#) on page 3299
- You can access hidden variables for all applicable conditions, through the variable picker in the Process Composer.
 - [Create hidden variables in a form](#) on page 3311

The Process Composer supports Global Values. You can enter Global Values as variables and select them from the variable picker.

Upload Storage file action added to Process Composer package

You can use the new **Upload Storage file** action in a task bot to upload data to storage for further consumption in a process. This makes Automation Co-Pilot requests more versatile by enabling bots to process files rather than requiring users to upload at request creation.

[Process Composer package](#) on page 2777

Building and running bots

Notification for bot import

You are informed through **Notifications** when you import a bot from the Control Room. However, this notification is sent only to the user who imported the bot.

[Capabilities supporting notifications](#) on page 2132 | [Import bots](#) on page 1969

Bulk update of multiple packages to default version for multiple bots (Service Cloud case ID: 00712719, 00728499, 00737694, 00803673, 01255722, 00838604, 00772147, 01760236, 01762679, 01771416, 01761859, 01782588, 01778220, 01784255, 01789551, 01809167, 01818690, 01831969, 01813413, 01287311, 01923711, 01927867, 01945464, 01946912, 01819540, 01945315)

You can update multiple packages to default version for multiple bots. This feature enables you to update multiple package versions across all available bots with one action thereby increasing the efficiency of a bulk package update. Additionally, you can review the bots and dependencies before a bulk update.

[Updating package versions](#) on page 1843 | [Update bots to default package version](#) on page 1844 | [Example of updating default package version across bots](#) on page 3116

Building and running bots

Enhancements to code analysis

- You can access the new administration settings tab for policy management. The enable or disable functionality of code analysis has been moved from **Administration > Policies** to **Administration > Settings > Policies**.
- You can define multiple named policies with different rules that have different severity levels.
- You can apply different policies to different folders in the **Automation** page. When you run code analysis on a file, it uses the applicable policy for the folder (assigned or inherited) where the file is located.

[Code analysis policy management](#) on page 2106 | [Configure and assign code analysis policy](#) on page 2115

Notifications integration in embedded automations

Notifications in embedded automations (such as Workday, Salesforce) provide you information about automations initiated from these applications and remote bot executions. It enhances the user experience by notifying you about the remote bot executions in their respective applications, thereby increasing the notifications effectiveness.

[Capabilities supporting notifications](#) on page 2132

Enhanced Automation Command Centre home page

The Automation Command Center (ACC) home page provides comprehensive visibility, actionable insight, and oversight capability into all aspects of your automation domain. The ACC home page provides operational insights such as automation and device status, license utilization information, and code analysis policy compliance metrics.

This enhanced home page provides the following benefits and capabilities:

- Effective monitoring of the automation landscape, leading to:
 - Improved reliability
 - Improved utilization
- Ensures compliance by highlighting results of code analysis
- Helps CoEs scale efficiently and achieve automation success
- Easier navigation to other areas such as Automation Co-Pilot, CoE Manager, and Bot Insight

[Automation Command Center](#) on page 1975

APIs and integrations

Export repository bots by version or label (Service Cloud case ID: 01805699, 01838251)

Use the new `POST /v2/blm/export/version` API to export repository bots by specifying the label or version of the files. These bots are exported to an archived file.

[BLM API](#)

APIs and integrations

Process composer APIs

Use the **Process Composer** APIs to create a new request from AARI processes. You can also retrieve the initial form and request by specifying the reference ID. You can use the following endpoints in the process composer APIs:

- `/requests/create`: Create a new AARI request.
- `/requests/ref/{refId}`: Retrieve a request.
- `/processes/{id}/form`: Retrieve initial form.

[Process Composer API](#)

What's changed

Control Room, devices, and Bot Agent

Improved secure registration for Community Edition or Automation 360 users

When a user registers for the Community Edition or Automation 360 account, the registration email sent to the user contains a temporary registration link used to create the user credentials. This registration method is more secure than sending the user their password in plain text.

Licenses page enhancements

To provide easy access to license usage and availability, the **Licenses** page includes information for the following elements:

- License mode
- Control Room expiration date and time
- Date when the **Licenses** page was last updated
- List of products with license availability
- License total details and where used

[Manage licenses](#) on page 1720

Upgrade changes in code analysis policy from Automation 360 v.28 or later versions

If you have configured a policy for code analysis prior to upgrading to Automation 360 v.28, this policy is migrated to Automation 360 v.28 and is named default policy. This policy is applied to the **Automation** root folder and is applicable for all bots prior to Automation 360 v.28 release.

[Upgrade changes in code analysis policy for Automation 360 v.28 or later versions](#) on page 2118

Control Room, devices, and Bot Agent
<p>Active Directory enhancements for configuring domains (Service Cloud case ID: 00733422, 01853744, 01862164, 01794663)</p> <p>The following enhancements were made for administrators who configure domains for Active Directory (AD):</p> <ul style="list-style-type: none"> • The Control Room login and the Create user pages automatically select the default domain that is configured. You can select a different domain by either entering the letters of the domain or selecting the domain from the drop-down list. • You can configure the domains listed on the Control Room login, the Create user, and the Create an Active Directory role mappings pages to hide domains. <p>Create an Active Directory user on page 1679 Configure Control Room for Active Directory: manual mode on page 1315 Manage domain on page 1751</p>
<p>Support for multiple roles in Active Directory role mappings (Service Cloud case ID: 01133364, 01133364, 01929400, 01776684)</p> <p>When you create multiple Active Directory (AD) role mappings for multiple security groups, the roles used in the mappings are combined for the users who belong to the security groups.</p> <p>Manage Active Directory role mapping on page 1712</p>
<p>Users who have an Attended Bot Runner license can no longer add Bot deployments to a queue. However, there are no changes for triggers.</p>
<p>As part of the OpenSearch service adoption, when you upgrade nodes in a stand-alone or cluster setup, you must perform a workaround to fix an installation issue.</p> <hr/> <p>Note: This behaviour is applicable to all the customers who are on the Elasticsearch multi-node cluster and are upgrading to the OpenSearch cluster.</p> <hr/> <p>Automation 360 On-Premise Edition A360.28 – Upgrade Considerations Update nodes in a cluster setup on page 1208</p>
<p>To accommodate multiple package updates, the <code>/v2/repository/files/packageVersionUpdate</code> API name was modified to <code>/v2/repository/files/packagesVersionUpdate</code> from the v.28 version. The change in file name will be reflected in Swagger from the v.29 version. The <code>/v2/repository/files/packageVersionUpdate</code> API will no longer work and will instead show a flag disable message.</p>
<p>Automatically deploy event triggers (Service Cloud case ID: 00758775, 01754312, 01754887, 01803179, 01844357, 01845563, 01568082, 01866287, 01920491, 01951355, 01957771)</p> <p>You can use the Automatically deploy to unattended Bot Runners option when you add an event trigger to automatically deploy triggers. When you reboot your system or Bot Agent, this option will continue the trigger deployment with the current user.</p>

Packages, actions, and Bot editor

The name of the AARI Web package has been changed to Process Composer.

Fixes

Build 17566: This build includes the following fixes (along with fixes from the previous builds):

When you check-in or check-out a bot, the automation page loads successfully without any delay. Also, there is no impact on the bot create and commit process.

Previously, the automaton page was not loading during bot check-in and check-out due to database connection. This behavior caused poor user experience and impact on the bot create and commit process.

Service Cloud case ID: 01963796, 01959945

Build 17542: This build includes the following fixes (along with fixes from the previous builds):

When you check out a bot that contains metadata in actions (for example, **Image Recognition**, **Recorder**, or **Screen Capture**), you no longer encounter an error and a broken image. As a result, the image preview of bots renders properly.

Previously, in such cases, image preview failed and generated an error. As a result, you were not able to check out, copy, or clone the bot.

Service Cloud case ID: 01971324, 01972601, 01977090, 01976820, 01976757, 01976571, 01976597, 01976629, 01977130, 01976845, 01977497, 01976639, 01977546, 01976736, 01977054, 01977392, 01978707, 01978097, 01969070, 01976549, 01978951, 01978955, 01979180, 01977511, 01979014, 01979687, 01979741, 01975299, 01980410, 01980114

Build 17533: This build includes the following fixes (along with fixes from the previous builds):

Bot export now completes successfully when you export a bot containing actions that store an image, such as actions from **Recorder**, **Image Recognition**, or **Screen** package.

Previously, bot export failed when it contained actions that stored an image, and the export error was displayed in the audit log and the historical activity page.

Control Room now sends email notifications when a scheduled bot fails prior to its execution for example, when the Bot Runner machine is not available.

Service Cloud case ID: 01768120

The **Schedule** column on the **Scheduled activity** page shows the frequency of a scheduled bot in your local language.

Previously, the frequency of a scheduled bot was not translated and not shown in the user's local language, for example, Japanese.

Service Cloud case ID: 01936850

When you restart the Control Room services and execute a bot, the bot deployment no longer fails on the connected devices nor generates an error on the **In progress** and **Audit log** pages.

Previously, the `AtmosphereResource Cancelled` error displayed on the **In progress** page and the error was registered on the **Audit log** page.

Service Cloud case ID: 01937388

You no longer see duplicate deployments (current and previous) for the same device on the In Progress page.

Previously, duplicate deployments were displayed.

Service Cloud case ID: 01954716

On the **In progress activity** page, the **Activity type** column displays the correct bot activity type.

Previously, the column displayed inconsistent activity types.

Service Cloud case ID: 01958801

When you create a locker, the **Create locker** page displays tabs such as **Credentials**, **Owners**, **Managers**, and so on.

Previously, tabs were not displayed.

Service Cloud case ID: 01949499

Attended Bot Runner users can view the **Schedule bot** menu on the following pages:

- **Automation (Run bot > Schedule bot)**
- **In progress activity**
- **Scheduled activity**
- **Devices**
- **Device pools**

Previously, this menu was not displayed on these pages.

Service Cloud case ID: 01085127, 01805063

You can run bots in **Debug** mode even when the data table variables contain a large amount of data (up to 3 MB for a single data table variable that is being watched only). Previously, the browser stopped responding.

Service Cloud case ID: 01949707, 01955034

The query parameters URLs are now parsed even with empty values, resulting in the API server executing them successfully.

Previously, an exception error occurred in such cases.

Service Cloud case ID: 01903082

If you deploy a task with a Bot Runner that has a disconnected default device and no device pool is selected, an error message displays in your local language.

Previously, an error message displayed in English even when the user's local language (for example, Japanese) was selected.

Service Cloud case ID: 01919213

The Bot Runner device will unregister from the Control Room only if there is a valid authentication error.

Previously, during the Bot Runner authentication, the device was unregistered from the Control Room after two unsuccessful authentication attempts. The reason for the error could be due to a valid unsuccessful authentication attempt or any other error.

Service Cloud case ID: 01947943, 01946249, 01956026, 01945438

When a bot is deployed with multiple run-as users and if one or more devices disconnect from the Control Room during the bot execution, reconciliation of reconnecting devices no longer triggers the `NonUniqueResultException` error.

Previously, when you select X number of run-as users (where $X > 1$), the query returned X number of entries from the table, which results in the `NonUniqueResultException` error. As a result, reconciliation failed and also the bot execution was terminated.

You no longer encounter issues when you create a bot using the DLL **Open** and **Close** actions and then use the **If > Dll session exists** condition to check whether a DLL session is closed in a bot.

Previously when you used the **If > Dll session exists** condition, it failed to check a closed DLL session and displayed an error.

Service Cloud case ID: 01868691

When you use the **Get node value** to retrieve the JSON object in the JSON package, it returns the JSON value in the correct format.

Previously, the **Get node value** action displayed the output in the wrong format.

Service Cloud case ID: 01864551

You can use the **Connect** action to establish a connection with the FTP/SFTP server with keyfile authentication and automate a task.

Previously, the bot could not automate the FTP/SFTP operations if the SFTP keyfile server was installed on a Windows machine.

Service Cloud case ID: 01858323

You no longer encounter any errors when you create a bot using the **Create workbook** action from the Google Sheets package.

Service Cloud case ID: 01918952

When you use the **Connect** action in the Active Directory package, you can select objects in the **Object Explorer** window successfully.

Previously, an error was displayed when you selected objects in the **Object Explorer** window.

Service Cloud case ID: 01925109

In the Email package, you can use the **Email > Send** action to send an email without issues.

Previously, when you used Email package version 3.14.3-20220923-220748 or later, an issue occurred when using the **Email > Send** action.

Service Cloud case ID: 01912097, 01931592, 01934137, 01940215, 01932494, 01942202, 01942055, 01946339, 01949164

You can create bots using the **Run stored procedure** action of the Database package even when you include a large amount of data as an **Input** parameter.

When you use the **Connect** action of the Terminal Emulator package with the prompt value and then the **Wait** action, the **Wait** action waits for the prompt value to appear on the terminal screen.

When a new package (first version) is added to the Control Room and you select **Disable** setting for the new version of the package, the package will show the status as **Disabled**.

Previously, it showed the status as **Enabled and set as default**.

In the **Datetime > Add** action, you can now specify a fraction value in the **Time value to add** field to increase the value in the Datetime variable by that specific fraction value.

When you use any browser action to automate a browser window or a tab, and run the bot, the browser action now waits for the time specified in the **Time out after** field to execute action on the browser tab before the bot fails. Previously, the browser action failed after 30 seconds when the bot did not execute successfully, regardless of the wait time set in the **Time out after** field was less than or greater than 30 seconds.

Note:

- As a result of this fix, if the **Time out after** field has a value other than 30 seconds, you might have to change the value for your existing bots. This will ensure that your bots continue to run properly with the latest Browser package.
- This fix does not apply for the **Find broken links** action.

Service Cloud case ID: 01880159

When you perform the following sequence of actions and then rename the variable that was used in these actions, the name of the variable will now be updated for the **Group** conditions and the conditions in the **Condition** tab:

- Use the If package
- Add a specific condition with a variable
- Add a specific condition with a variable
- Save the bot.

In the **Datetime > Subtract** action you can now specify a fraction value in the **Time unit to subtract** field to decrease the value in the Datetime variable by a specific time value and unit.

When you use the **Capture** action with the Recorder package (version 2.9.x or earlier) to navigate to another web page in the Google Chrome browser (version 105.0 or later), and then use another **Capture** action to automate objects in the navigated web page, the bot no longer encounters an error.

In any package, when you select the **Add argument** option, select **String** or **Number** as the **Argument type**, and try to insert a value, you can now use the mouse to scroll or click the scroll bar to navigate through the options.

When you use multiple Recorder actions in a bot to automate a specific web page running in Microsoft Edge with IE mode, and then run the bot, the second Recorder action now works properly, and the bot no longer encounters an error.

Service Cloud case ID: 01848824, 01868337

You can now use the **Folder > Unzip** action to extract compressed files and folders from an AES-256 encrypted zip file.

Service Cloud case ID: 01854767

When you try to automate web applications, the **Click** action in the Recorder now works properly with the MV3 extension on Google Chrome and Microsoft Edge browsers. Previously, when the object on a web page contained inline JavaScripts and the document to be automated was secured, the Recorder failed to perform the **Click** action.

Service Cloud case ID: 01927058, 01951022

When you use the **Click** action in the Recorder to automate applications running on Microsoft Edge with IE mode, the bots now time out automatically and no longer freeze when a pop-up appears during bot execution.

Service Cloud case ID: 01790352

When you assign a **Production** label to a Task Bot and deploy it, the bot no longer encounters an error at the **Image Recognition > Find window in window** action and runs successfully.

Service Cloud case ID: 01825541

When you use the Recorder package (version 2.10.2 or later) to capture a control on a web page, select **Currently active** window from the **Application** tab and then run the bot in a loop, the bot now captures the target control accurately and runs through all the loop iterations successfully even if the control appears behind the bot runtime window.

Service Cloud case ID: 01904537

When you use any of the following actions to determine if a window does not exist, select the web page opened in the Google Chrome browser from the list of active tabs in the **Browser** tab, and then run the bot, the following actions now wait for the specified time value to close the browser tabs before the bot fails.

- **Window does not exist** condition in the **If** and **Loop** packages
- **Window with same title does not exist** condition in the **If** and **Loop** packages
- **Window does not exist** condition in the **Wait > Wait for condition** action
- **Window with same title does not exist** condition in the **Wait > Wait for condition** action
- **Wait > Wait for window** action

Note: When you run the bot, the actions might wait for an additional two to three seconds later than the specified time out value to execute actions before the bot fails.

Service Cloud case ID: 00790336, 00822573, 00832864, 01268577, 01586174, 00790336, 01778857, 01804828, 01809565, 01791209, 01848262, 01867832, 01877740, 01959172, 01959278

When you create or delete a folder (or form) that contains . . characters in the folder (or form) name, the folder structure no longer affected.

Previously, when you deleted a folder (or form) that contained . . characters in its name, the parent folder was deleted which caused issues with the folder structure.

Service Cloud case ID: 01886058

The resiliency of the **File/Folder** trigger has been improved to continue listening after a network disruption has occurred. Previously, a network error caused the trigger to lose connection with the Bot Agent.

Service Cloud case ID: 01769532, 01773584, 01834098, 01867418

When you check in a bot that contains the string "bot_" in its name and some recorder metadata, the metadata is no longer deleted. As a result, you can check out a bot without generating an exception or error message.

Previously, the recorder metadata was deleted and you were blocked from making recorder changes to any of the bots that contain "bot_" in its name. The bot checkout failed and generated an exception or error message.

Service Cloud case ID: 01915726, 01933409, 01939124, 01944665, 01939124

When you upgrade the Control Room to Automation 360 v.27, the work items are deployed successfully for all scenarios.

Previously, when you upgraded the Control Room to Automation 360 v.27, the work item failed to deploy when queues were paused or stopped.

Service Cloud case ID: 01948038, 01950948

When you run a bot with a queue and select the queue category, the task bot (that contains a TABLE type variable and no row data) no longer fails and shows the `Missing work item template` error message.

Previously, when there was no row content for a TABLE type variable, you could not select the queue category while running a bot with a queue. As a result, the `Missing work item template` error message was shown even if a template was mapped.

Service Cloud case ID: 01922641

When you import a BLM package (zip file) to the Control Room, the Automation Anywhere Control Room Messaging service restarts and you no longer get an error message. Additionally, the bot import and export operations complete successfully.

Previously, when the **ActiveMQ broker** service is stopped, the broker is stopped but the process did not exit due to which the Automation Anywhere Control Room Messaging service was not restarted. As a result, when you import a BLM package, the `JMSException: failover time 5000ms exceeded` error was displayed.

Service Cloud case ID: 01924119

When you compare bot versions from the **View history Task Bot** page in the public workspace, the **Compare versions** displays any modifications made in the latest two versions of your bot without any error.

Previously, an error was displayed if you used the **Compare versions** feature through the **View history Task Bot** page.

Service Cloud case ID: 01949094, 01946533

After you update the Bot Agent to the 21.240.19897 version, you can deploy multiple bots using the API without any failure caused by the `AA-DB` file size.

Previously, when you deployed multiple bots using the API the `AA-DB.mv.db` and `AA-DB.trace.db` file sizes continued to increase and eventually caused the bots to fail. Additionally, the **device configuration refresh initiated** message continuously displayed.

Service Cloud case ID: 01776544

The following issues were fixed on the **In progress activity** page:

- Active bot deployments no longer disappear after a page refresh.
- Duplicate bot entries were removed whose status was displayed as active.

Service Cloud case ID: 01937581

Variables that you configure as input type are encrypted in the log files generated for Control Room.

Previously, input type variables were not encrypted and displayed as plain text in the log files.

Service Cloud case ID: 01768904

<p>Users can only view activities to which they have permission on the Activity > In progress page.</p> <p>Previously, some users were able to view the activities of other users even though they did not have permission.</p> <p>Service Cloud case ID: 01839276, 01919244, 01940793, 01941503</p>
<p>In attended and unattended automation, if a bot fails to run and generates the "Node Manager went Down unexpectedly and could not complete this bot execution." error, the start time on the Historical and Audit log pages display correctly.</p> <p>Previously, the start time was displayed incorrectly.</p> <p>Service Cloud case ID: 01881736</p>
<p>All users can view the scheduled activities on the Scheduled activity page.</p> <p>Previously, some users were unable to view the scheduled activities.</p> <p>Service Cloud case ID: 01885890, 01848429</p>
<p>The Control Room Access URL length is set to a maximum of 4,000 characters.</p> <p>Previously, the URL length was not set.</p> <p>Service Cloud case ID: 01923035</p>
<p>Sorting users using the Last login option on the Users page sorts users correctly.</p> <p>Previously, sorting users by last login was not sorting the users correctly.</p> <p>Service Cloud case ID: 01813134</p>
<p>If you created a bot using the REST API command, the REST GET command is parsed without any errors even when the response body is empty.</p> <p>Service Cloud case ID: 01922332</p>
<p>Japanese characters are supported in the REST API commands with the multipart/form-data option and the output PDF name is rendered correctly.</p> <p>Service Cloud case ID: 01909753</p>
<p>All files in the specified OneDrive location are downloaded successfully when you use the Download file action from the Microsoft 365 OneDrive package.</p> <p>Service Cloud case ID: 01886501</p>
<p>If you selected the Read cell value option in the Read row action of the Excel advanced package, the data from the next sheet of the specified Excel file is extracted correctly using the Switch to sheet action.</p> <p>Service Cloud case ID: 01904504</p>
<p>If a bot contains Get multiple cells or Get single cell action from the Excel advanced package to retrieve the underlying scientific values, the values from the specified Excel file are successfully extracted when you run this bot.</p> <p>Service Cloud case ID: 01882225, 01938812</p>

Exception errors are no longer displayed for the following actions in the Excel advanced package:

- **Get single cell**
- **Get cell color**
- **Get multiple cell**
- **Get number of cells**
- **Get worksheet as data table**
- **Insert/Delete rows/columns**
- **Read cell formula**
- **Read column**
- **Read row**
- **Remove blank row**
- **Rename worksheet**
- **Replace**
- **Select cells/rows/columns**
- **Set call**
- **Switch to sheet**
- **Close**

Service Cloud case ID: 01780178, 01926325

If there are many (more than 500) bots deployed in one of the device when there are multiple devices connected to a Control Room, bot deployments across other devices are no longer blocked.

Service Cloud case ID: 01791784, 01950118, 01904686, 01795862, 01945357, 01941048

If you create a folder with the same name as an existing folder in the private workspace, an error message is now displayed, and the folder is not created.

Previously, a false successful folder creation message was displayed, but the last modified date of that particular folder remained the same as that of the previously existing folder.

When you create, view, or edit roles and then navigate to the **Bots** section, the folder list is sorted alphabetically making it easier to find a specific folder.

Previously, the folders were not sorted alphabetically, and it was difficult to find a particular folder when there were many folders in the repository.

Service Cloud case ID: 01762755, 01843015, 01874823

When you import a bot using the overwrite option and do not have permission to access one or more dependent folders, the import dependency is not broken because of the import failure on the dependent folder.

Previously, importing the bot when you had no permission to access the dependent folder resulted in a break in the dependency if the file or folder was already present.

Service Cloud case ID: 01929592, 01946078

When you import a bot that has more than 2,100 manual dependencies, the import is successful without any issues.

Previously, the bot import failed when the bot contained more than 2,100 manual dependencies. You had to reduce the number of dependencies to import the bot successfully.

Service Cloud case ID: 01913648, 01942373

When you have large number of processed work items, the new work items are processing in expected time without any delay.

Previously, in such cases, new work items were taking long time due to the query time out error. As a result, you were not able to deploy the bot with queue.

Service Cloud case ID: 01846496, 01939581

The group Managed Service Account (gMSA) provides functionalities such as install, update and perform LDAP authentication within a domain, and also extends those functionalities across multiple servers.

When you update Automation 360 to the v.28 release, the Elasticsearch service is replaced with OpenSearch service as the underlying technology for core product capabilities such as audit, Bot Insight, and so on.

Automation 360 for auto-login and RDP-based deployment supports the user name in the User Principal Name (UPN) format (username@domain.com).

Service Cloud Case ID: 01816116, 01906692

An error no longer displays when you click your trigger in the event trigger page.

You no longer encounter random bot deployment issues in the Bot editor.

Previously, during bot deployment, the `LockAcquisitionException` error was observed randomly, and the bot execution status remained as **Pending execution** in the **In progress activity** tab. As a result, the user had to retry deployment for it to succeed.

Limitations

Bots that are in the **Queued** status do not appear automatically on the **In progress activity** page.

Workaround: Click the **Refresh table** button on the top-right corner of the **Activity** table to view the queued bots.

For users (excluding the users who are assigned the AAE_Admin role) who do not have any license assigned to them (Bot Creator, UnattendedBot Runner, Attended Bot Runner, or Citizen Developer), the **Audit log** page displays multiple unsuccessful entries related to the **Default device set** event for any activity performed by the users on the Control Room.

Workaround: See [A360.28 On-Prem & Cloud | After upgrading to A360.28, multiple events are getting created in Audit logs 'Default device set Unsuccessful'](#).

Service Cloud case ID: 01969726, 01970583, 01970990, 01971435, 01971171, 01970869, 01971854, 01970915, 01970523, 01971411, 01971788, 01971827, 01971482, 01971736, 01970333, 01972128, 01970497, 01972025, 01971459, 01971561, 01971068, 01972148, 01975216, 01975980, 01977479, 02001122

(Service Cloud case ID: 01833352)

When you want to move emails from one folder to another, and if you apply multiple filters such as **Subject**, **From specific sender**, **When received date is on or after**, or **When received date is before**, you cannot move an email when its sender id is: noreply@**.com.

Note: You might observe this issue when you use **Save All attachments**, **Delete All**, **Move All**, and **Loop** actions.

Workaround: Use only the **From specific sender** filter to move emails.

The **Create User** audit log entry page shows a valid device license even when the license allocation for a user had failed.

(Service Cloud Case ID: 01976942)

Duplicate entries of the same activity are listed in the **Activity > In progress** screen for the users who are assigned the same role and permission.

In a clustered environment, when you update bots to the default package versions, the **Bot update list** page shows **Failed** status and bots are auto-checked out even if they are updated with the latest default packages.

In an Oracle environment, the **Bot update list** page shows an Code : `db.connection.exception` error message.

Workaround:

1. Log in as an administrator.
2. Navigate to **Manage > Packages** and set the required package version as the default version.
3. Log in as a Bot Creator, and then check out and edit the bot.
4. In the Bot editor, click the three vertical ellipses at the top right corner.
5. Select required Packages and update the package version manually.

While updating bots to the default package version, when you select the **Production label** bots, the package update is applied for the latest version of bots instead of the **Production label** bots.

When you check out and edit a bot after the bot updates to the default package version, an error is displayed in the System Date for these commands: **SystemsDate**, REST Web Service, and Number.

Workaround:

1. Edit the bot and navigate to **Manage > Packages**.
2. Set the Date and Time for the non-default package, and then set it back to the default Date and Time.

Note:

- If previous version of the package does not exist, then upload the package and assign the default Date and Time.
 - If previous version of package is available, then edit the bot, assign it to the previous package and save. Then, re-assign the bot to the new default package.
-

When a user (who created the workload automation) is deleted, work items are not processed even if they are available to process. As a result, you must delete and re-create the automation.

If you select the **Search type** as **Variable name** in the **Search and replace** feature, the content is not replaced when you use a number variable in the expression.

Workaround: To replace a specific variable in a number expression, open that action and change the variable manually.

(Service Cloud Case ID: 01950021)

If **Auto update** is enabled for the Bot Agent in Control Room, registered devices running Windows10 Enterprise might restart intermittently after the Bot Agent update has completed.

Bot deployments might fail if the **Log collector** and **Sync log collector** options are enabled while updating Automation 360 to v.28.

Workaround: Before updating Automation 360 to v.28 from any of the previous versions (such as v.25), ensure that the **Log collector** option within **Administration > Settings > Devices > Advanced options** and **Sync log collector** option within **Administration > Settings > Devices > Log collection configuration** are disabled.

Note: For information on resolving bot deployment issues caused when the **Log collector** or **Sync log collector** options were enabled while updating Automation 360 to v.28 release, see [.Troubleshoot bot deployment issue caused if Log collector is enabled \(A-People login required\)](#)

API Task is a beta feature in the v.28 release and is designed for Automation 360 cloud deployments only.

However, after you upgrade your On-Premises deployment to v.28, users with a Bot Creator license can create an API Task and users with either Device pool owner or Device pool admin permission can create an API Device pool. But you will not be able to execute the API Tasks. In an upcoming update, the API Task feature will be fully turned off on On-Premises deployments and will be available only on the upcoming Automation 360 cloud deployments.

Bot export fails when you export a bot that contains actions that store an image, such as actions from **Recorder**, **Image Recognition**, or **Screen** package. You can view the export error in the audit log and the historical activity page.

Workaround: Contact Automation Anywhere Support.

After you update Automation 360 to v.28, when you cancel the update process after removing all the services, the rollback of the services does not happen. As a result, you will encounter an error message, when you attempt Automation 360 update.

Limitations from previous releases

While running a bot in debug mode, the bot will fail if the variable size gets greater than 3 MB. An error message appears showing that a variable has exceeded the 3 MB limit.

When you create a device pool with a temporary (disconnected) device, the device deletion job does not complete successfully. Additionally, the **Audit log** page shows the device is deleted, whereas the **Device list** page shows the deleted device in the list.

Feature deprecations

Review features and capabilities (from Automation Anywhere or other third-party vendors) that are deprecated or nearing deprecation to understand how they impact your automation.

Deprecated weaker Transport Layer Security protocols: TLS 1.0 and TLS 1.1

Automation Anywhere has deprecated weaker communication protocols TLS 1.0 and TLS 1.1, and their corresponding ciphers (Cryptographic algorithms) in Automation 360 Cloud deployments (AWS and GCP). Automation 360 Cloud deployments support TLS 1.2 and later versions only.

[Feature deprecations affecting Automation Anywhere products](#) on page 1030

Manifest V2 extensions for Google Chrome and Microsoft Edge

From Automation 360 v.26 and later releases, we have published new Google Chrome and Microsoft Edge Manifest V3 extensions. Starting on October 23, 2023, we will deprecate support for Manifest V2 extensions on Automation 360 v.26 and later releases. After this date, we will not address any issues relating to Manifest v2 extensions. If you are on Automation 360 v.26 or a later release and still using Manifest V2 extensions for Google Chrome and Microsoft Edge, we recommend that you upgrade your Google Chrome and Microsoft Edge browser extensions to Manifest V3 extensions before October 23, 2023.

Note: If you are on Automation 360 v.25 or earlier releases, then you will not be impacted.

Updates to the interface

Review the updates to the interface in this release.

See the following video for the updates made to the interface for Automation 360 v.28 release:

The **Enter property set to your CyberArk username** option is introduced on the **Service Credentials** page to configure usernames using the CyberArk secret response.

[Configure username for different Automation 360 services using the CyberArk secret response](#)

You can import intermediate certificates when installing Control Room On-Premises.

[Import intermediate certificates for secure access to Control Room](#)

The **Control Room Service Startup Options** page is introduced when installing the Automation 360 Control Room to select the services to run at Control Room startup.

[Select the Control Room services to run at startup](#)

The bot updates to default package version functionality is enhanced and moved from **Manage > Packages** to **Administration > Bot update** page.

[Bulk update of multiple packages to default version for multiple bots](#)

The **Allow users to control notifications settings** option is added to control and lock the user preferences for notifications.

[Improved notifications administration to manage user access](#)

The **Process events** notifications category is introduced to monitor Automation Co-Pilot events.

[Monitor Automation Co-Pilot events through Control Room notifications](#)

A check box is added to clear the existing default device for the logged-in Bot Creator, attended Bot Runner, or Citizen Developer/Citizen developer users.

[Validate remote deployments to avoid unauthorized device access](#)

<p>Updated and intuitive icons for all the actions and contextual help for various actions within packages. For example, contextual help is available for all the actions within the Excel advanced package.</p> <p>Enhanced user experience through refreshed and intuitive icons</p>
<p>The enable or disable functionality of code analysis is moved from Administration > Policies to Administration > Settings > Policies.</p> <p>Enhancements to code analysis</p>
<p>The visual indicator line marker for the collapsible section helps you see where in the bot you are and editing.</p> <p>Line markers for collapsible sections of the code in the Bot editor</p>
<p>We provide implicit preference to retain the default view in the Bot editor, and the system will display the same view upon your subsequent login.</p> <p>Default view in the Bot editor</p>
<p>You can now copy, cut, and paste the entire node in the Process Composer. These actions apply to all properties and attributes of the node, including child and branch elements.</p> <p>Copy, cut, and paste actions</p>
<p>The Process Composer supports Global Values in variables.</p> <p>Global values as variable</p>

Updating to v.28 release

Review requirements and support information about updating your Control Room and Bot Agent for the v.28 release.

Bot Agent updates

Note: This release includes an optional Bot Agent update. You can continue to run your existing bots without updating the Bot Agent. However, if you want to use the new features in Automation 360 v.28, you must update the Bot Agent available with this release.

For more information on updating to this release, see these resources:

- [Automatically update the Bot Agent](#) on page 1302 | [Manually update the Bot Agent](#) on page 1303
- [Compatibility with release builds](#) on page 1275

Certified Control Room builds for direct update

You can update to the latest version of Automation 360 from the previous three releases (that is, from n–3 releases, where n refers to the latest release).

The following previous releases are certified for update to Automation 360 v.28:

- v.27 (Build 16685, 16667)
- v.26 (Build 15450, 15459, 15439, 15436)
- v.25 (Build 15112, 15118, 15097)

If you are on one of these previous releases, for information about updating, see [Update Automation 360 to latest version](#) on page 1363. If you are not on an n–3 release, update Automation 360 to one of the n–3 releases before updating to Automation 360 v.28.

Important: Before you update to Automation 360 v.28 On-Premises from any of the earlier versions, review the following article: [Automation 360 On-Premise Edition | A360.28 – Upgrade Considerations \(A-People login required\)](#). This article is applicable only to On-Premises customers who started using Automation 360 from v.15 or previous versions. To successfully update to Automation 360 v.28, you must perform the pre-upgrade steps in the KB article.

Packages updated in v.28

Review updates to the packages in Automation 360 v.28, including the compatible Control Room and Bot Agent versions.

The following table lists the updates in the packages for this release:

Note: For information about packages related to previous releases, see the PDFs for these releases: [Automation 360 previous release versions](#).

Migration updates for v.28 release

Review what's new, changed, and the fixes and limitations to migrating from Enterprise 11 and 10 versions to Automation 360 v.28.

What's changed

Migration of new formatting capabilities in the XML package (Service Cloud case ID: 01886455, 01925386)

- When you migrate bots from Enterprise 11 to Automation 360 that are using the **Start session** action, the **Remove text nodes that contain only white space** check box is selected by default.
- When you migrate bots from Enterprise 11 to Automation 360 that are using the **Save session data** action, the **Use Prettyprint** check box is selected by default.

[Start session action in XML](#) on page 3061 | [Save session data action in XML](#) on page 3061

Fixes

You can migrate bots with filenames that contain up to 160 characters, and might use an action with an encrypted value or Credential Value (CV) type variable.

Previously, these bots failed when migrating to Automation 360.

Service Cloud case ID: 01813733

You can successfully run the migrated bots in the following scenarios:

- If there is more than one xmlns (default XML namespace) defined in the XML document.
- If the root element does not have a namespace and the child element of the XML package has a default namespace.

Service Cloud case ID: 01798339

You can migrate the MetaBots that are using `Microsoft.Exchange.WebServices.dll` as the dependency DLL, use the **Get DLL details** option during bot design, and then execute the **DLL Run function** action without encountering an error.

Previously, an error was encountered when the `Microsoft.Exchange.WebServices.dll` was used as a dependency DLL of a bot.

Service Cloud case ID: 01819485, 01857278

You can migrate MetaBots that are using multiple logics without using the overwrite option even if some of the logics already exist in Automation 360.

Previously, such MetaBots encountered an error during migration.

Service Cloud case ID: 01905986

You can migrate MetaBots which include logic that calls another logic whose file name includes a dollar sign (\$).

Previously, such MetaBots were displaying a review message on the migration results page.

If you set the **Set production version** permission in Enterprise 11, after migration to Automation 360, the **Label bots** permission is selected and replaces the previous **Set production version** permission. If you are upgrading from a previous Automation 360 release to v.28 (or later release) and you selected the **Set production version** permission, then the **Label bots** permission is selected as the default.

Service Cloud case ID: 01868097

In Enterprise 11, if a bot is using the String Operation command and includes a backslash (\) in the **Replace** string, after migration, the bot executes properly.

Previously, such a bot encountered an error when a backslash (\) was used in the **Replace** string.

Note: This fix is currently not available in Automation 360 v.28 and v.29. We plan to provide a fix in an upcoming release. For more information, contact your CSM.

In Enterprise 11, if a bot was using the **Normal**, **Gray-Scale**, or **Monochrome** comparison mode in the Image Recognition command, after migration, the performance of the bot run is improved.

Previously, the performance of such a bot was impacted during a bot run.

Service Cloud case ID: 01889347, 01922609, 01920990

In Enterprise 11, if bots are using the recorder commands, some unused hidden properties remain in Enterprise 11 only after you migrate to Automation 360.

Previously, some unused hidden properties were migrated.

Service Cloud case ID: 01608928

<p>You can migrate a bot that contains a Database with a Loop command and run it successfully in Automation 360.</p> <p>Previously, when you ran the bot in Automation 360 using the Read from action with append and UTF-8 encoding with the loop, after the first iteration, the retrieved data would show a double quote for the first cell value in the CSV file.</p> <p>Service Cloud case ID: 01911654</p>
<p>When you migrate a bot that contains the XML > Get single node command , after migration, when you run the bot in Automation 360, it retrieves the value of a single node and no longer displays an error on execution.</p> <p>Previously, if the XPath started with open brackets, and you ran the bot in Automation 360, the bot encountered the following error: No node found at XPath while executing the Get Single node command.</p> <p>Service Cloud case ID: 01854326</p>
<p>You can migrate bots that are using the If Variable command with the following conditions:</p> <ul style="list-style-type: none">• Includes multiple Excel Cell variables.• Includes one or more AND or OR operators for comparison.• The Excel Cell variables are compared with array type variables. <p>Previously, such bots failed to migrate.</p> <p>Service Cloud case ID: 01856986</p>
<p>You can migrate bots that are using commands that include the Session Name field that contains the year (\$year\$) system variable.</p> <p>Previously, such bots failed to migrate.</p> <p>Service Cloud case ID: 01867380</p>
<p>When you migrate bots that are using Table type variables and then call those migrated bots from another Task Bot, the input variables are displayed on the Set input variables window.</p> <p>Previously, when migrated bots containing Table type variables were called from another Task Bot, the input variables did not display.</p> <p>Service Cloud case ID: 01920824, 01931439, 01945917, 01910787, 01930540, 01923133, 01931439, 01923133, 01934727</p>
<p>You can successfully migrate bots when you provide a clipboard value as a parameter to a VBScript file without any issues.</p> <p>Previously, if you provided a clipboard value as a parameter in a bot, the bot migration failed with an error message indicating there was no proper variable selection for the clipboard.</p>

In Automation 360, when you use the **SOAP Web Service** command in a bot, you can access the specific XML node from the XPath expression which has a namespace declaration from the SOAP response.

Previously, XPath expressions containing a namespace could not be parsed.

Service Cloud case ID: 01907999

When you migrate a bot that uses the **Send Email** command with the **HTML** option and run the migrated bot in Automation 360, the output is displayed in the appropriate format.

Previously, if you had used a variable in the HTML code section of the email body and ran the migrated bot in Automation 360, the code was not converted to HTML format. As a result, the output was displayed in an incorrect format.

Service Cloud case ID: 01908010

The **Review Required** count in the Bot Scanner report and Bot Assistant display consistent information.

Previously, there was inconsistency in the count.

Service Cloud case ID: 01816554, 01856822

Remote agent v.2.2.0 updates

A new version of the Remote agent is released with Automation 360 v.28. This section includes the fixes for Remote agent version 2.2.0.

Fixes

Improved automation reliability for web applications

When you use the **Recorder > Capture** action to automate web pages running on Google Chrome and Microsoft Edge browsers, the **Recorder > Capture** action no longer scrolls down the web page if the target object is visible on the screen. This feature improves the user experience and reliability of automation when there is a fixed top pane on the web page and if some physical actions such as mouse clicks do not work as expected.

Note: Ensure that you install the browser extension (version 3.0.8.0) and use the Recorder package (version 2.10.2) to capture the control.

When you use the Recorder package (version 2.10.2 or later) to capture a control on a web page, select **Currently active** window from the **Application** tab and then run the bot in a loop, the bot now captures the target control accurately and runs through all the loop iterations successfully even if the control appears behind the bot runtime window.

Service Cloud case ID: 01904537

When you use multiple Recorder actions in a bot to automate a specific web page running in Microsoft Edge with IE mode, and then run the bot, the second Recorder action now works properly, and the bot no longer encounters an error.

Service Cloud case ID: 01848824, 01868337

When you use the **Click** action in the Recorder to automate applications running on Microsoft Edge with IE mode, the bots now time out automatically and no longer freeze when a pop-up appears during bot execution.

Service Cloud case ID: 01790352

When you use the **Capture** action with the Recorder package (version 2.9.x or earlier) to navigate to another web page in the Google Chrome browser (version 105.0 or later), and then use another **Capture** action to automate objects in the navigated web page, the bot no longer encounters an error.

CoE Manager v.28 release

Review what's new and changed, and the fixes and limitations in CoE Manager for the v.28 release.

What's new

Access CoE Manager from the Control Room

As an administrator, you can enable access to CoE Manager from the Control Room. This enhances the user experience because the user no longer needs to open CoE Manager through a separate browser tab. Once CoE Manager is enabled, users can directly access the CoE Manager login page from the quick link section on the Control Room home page.

[Enable CoE Manager](#) on page 2006

Support for ROI tracking in On-Premises Control Room

You can integrate both the Cloud and the On-Premises Control Room with the CoE Manager. This enables you to monitor your automations and analyze the savings achieved. You can connect up to 3 Control Room instances in your CoE Manager.

For the On-Premises Control Room, to upload the bot activity data from the Control Room to the CoE Manager, download and run the CoE Manager bot available in the Bot Store. To run this bot, you must have a valid license such as a Bot Creator, Bot Runner, or a Citizen Developer.

[CoE Manager - Integrate with On-Premises Control Room](#) on page 2004

What's changed

Plan delivery for your opportunities from the pipeline stage

The **Activities** tab is available in the pipeline stage enabling you to start the delivery planning of an opportunity when it moves into the pipeline stage.

Previously, you could plan delivery of an opportunity using the **Activities** tab only after the opportunity had moved into the in-progress stage.

Automation Co-Pilot for Business Users v.28 release

Review what's new and changed, and the fixes and limitations in Automation Co-Pilot for the v.28 release.

What's new

Enhanced automation experience for Automation Co-Pilot

We have improved the automation experience for your automation activities to run attended bots:

- As a prerequisite, you must have the **Manage my activity** permission to use the bot controls.
- When you run your attended automation, its progress, execution status, and controls for pause, start (resume), and stop, are located on the new progress page inside the Automation Co-Pilot application.
- You can easily switch between the **Automation** tab to execute additional automations and navigate back to the progress view, to monitor the running automations.

[Automation Co-Pilot for Business Users supported features](#) on page 3162

Platform alerts and notifications

You will be notified with real-time message alerts based on recent automation events that occurred in Automation Co-Pilot.

- The **Notifications** tab in the Automation Co-Pilot will alert you of your automation outcomes (failed, successful) and provide as detailed information for each bot, such as the start and end times.
- When required, there is a short message describing if any specific issues occurred.
- The **New task assigned** message will notify you if any new tasks were assigned to you, and you can click that alert message to be redirected to the newly assigned tasks.
- Similarly, if you receive multiple new notifications, you can click the Load New Notification message, located at the top of the notification list, to load additional unread notifications.

[Automation Co-Pilot for Business Users supported features](#) on page 3162

Stationary action buttons

While completing forms in Automation Co-Pilot, action buttons are positioned in the fixed footer of the form. The footer and its contents are responsive to the size of your window and adjust to fit buttons and minimize the footprint.

[Add Form Task to a process automation](#) on page 3315

What's changed

<p>Enhancements to tags</p> <p>When you configure a process, tag improvements provide a more accurate tag selection when you look for available tags:</p> <ul style="list-style-type: none">• You can select and manage up to 500 tags at a time, in tag selector.• Your search results will vary depending on the number of search terms you use with the most recently created tags always showing at the top.• You can use the search all tags option to search for all available tags. <p>Configure a process on page 3278 Automation Co-Pilot for Business Users supported features on page 3162</p>
<p>Process level URL parameters</p> <p>These process level URL improvements make it easier for you to pass URL data to your requests:</p> <ul style="list-style-type: none">• You can pass custom data from applications to requests.• Supported data types include: dates, time, number, text box, check box, radio button, text area, and drop-down.• Hidden variable types in a form are supported to receive URL data. <p>Automation Co-Pilot for Business Users supported features on page 3162</p>
<p>Improved formatting options for Label element</p> <p>The Label element has been improved with new formatting properties where you can configure the font sizes, colors, and text alignments in a form.</p> <p>Using the Label element on page 3220</p>
<p>The name of the Process Editor has been changed to Process Composer to better reflect its comprehensive capabilities.</p>
<p>Forms have improved responsiveness due to this next generation of form rendering technology.</p>
<p>Users receive a notification in the Warning tab when a task is assigned or reassigned to them.</p> <p>Service Cloud case ID: 01869263</p>

Fixes

Build 17571 (On-Premises) and Build 17557 (Cloud): These builds includes the following fix (along with fixes from the previous builds):

When you open a request, that is in an open status, the request page will now render properly. Previously, when you use a form that contains a table and you pass a data variable to more than the column numbers that was specified, this caused the form to not render properly. This issue has been fixed.

Service Cloud case ID: 01970938, 01970524, 01969797, 01973370

When you use a table element in your form which contains a text area data type, the text area generates data from the database without issues.

Service Cloud case ID: 01905252

In a table cell field, when you enter Chinese, Japanese, and Korean characters, the characters renders correctly.

Service Cloud case ID: 01914818

When you create a form with a column width that is less than 20% in Automation 360 v.26 and you open the form in the current version, the will now render without issues.

Service Cloud case ID: 01944387

In an Automation Co-Pilot process, when you use the **if/else** condition, a process error no longer occurs when you add the **else if** condition after the **if** condition.

Service Cloud case ID: 01949808

In Automation Co-Pilot Web forms, the text area size renders as specified. Previously, the height did not render as designed.

Service Cloud case ID: 01911488, 01910936, 01914476, 01924252, 01929268, 01946479, 01958805, 01961238, 01997996

When filtering Automation Co-Pilot requests by date, the date displays correctly.

Service Cloud case ID: 01915259

Automation Co-Pilot forms works as expected when adding a new rule to an existing form.

Service Cloud case ID: 01925778

When a required field has not been completed, the process prevents users from submitting the task.

Service Cloud case ID: 01932933, 01958556

When a parent process in a private folder references a child process in a public folder the Process Composer alerts the user to the missing dependency with a local error. Previously a process with this dependency would fail when run, throwing a global error.

Service Cloud case ID: 01849502

In Automation Co-Pilot Desktop Assistant, the last runtime information no longer causes performance issues.

Limitations

When you view your bot details in the **Historical Activity** page, the description for the bot errors are not populated.

Workaround: To access the description of the bot error, you can access the error log from the **Audit Logs** panel.

Service Cloud case ID: 01850454, 01908923

When you use the Search and Replace option to replace a form variable in a bot, the Search and Replace option does not function properly and cannot locate the form variable.

When using a form with an image, users require the View permission to access the image and have it render in forms.

In Automation Co-Pilot Desktop Assistant, when you use the Email Automation command with the email server option and set Google Chrome as the default browser, and you run your bot, the browser does not open to generate email details. This issue does not occur if you select a non-interactive mode of authentication.

Updates to the interface

Review the updates to the interface in this release. Use the following video to orient yourself to these changes.

While completing forms in Automation Co-Pilot, action buttons are positioned in the fixed footer of the form.

[Stationary action buttons](#)

The **Label** element has been improved with new formatting properties where you can configure the font sizes, colors, and text alignments in a form.

[Label element](#)

IQ Bot and Document Automation v.28 release

Review what's new and changed, and the fixes and limitations in IQ Bot and Document Automation for the v.28 release.

Document Automation

What's new
<p>Standardize the format of extracted numbers and dates</p> <p>You can configure your learning instances to convert extracted dates and numbers to a standard format. This ensures consistency and accuracy in your databases and other systems of record.</p> <p>For example, if you select to standardize dates to MM/DD/YYYY and a processed document contains a date that appears as 12 Feb 2023, the learning instance will reformat the date to 02/12/2023.</p> <p>If you select to standardize numbers to the English (United States) locale and a processed document contains a number that appears as 100,00, the learning instance will reformat the number as 100.00.</p> <p>Create a learning instance in Document Automation on page 3472</p>
<p>The new Document Workspace license tracks consumption for customers who brought their own license for Google Document AI or Standard Forms.</p>
<p>New Google Document AI features</p> <ul style="list-style-type: none"> Validation feedback is available for new and existing learning instances that use Google Document AI to extract data. <p>Improving extraction accuracy through validation on page 3477</p> <hr/> <p>Note: You must manually enable validation feedback for existing learning instances</p> <hr/> <ul style="list-style-type: none"> The invoices document type supports these additional languages: Estonian, French, German, Latvian, Lithuanian, Portuguese (Continental), Romanian, Spanish, and Swedish. The receipts document type supports Japanese language documents and can extract two new fields: payment type and last four digits of credit card.
<p>New features for the Document Workspace dashboard in Bot Insight</p> <ul style="list-style-type: none"> Create custom widgets The <code>validator performance by # of documents validated</code> widget includes invalid documents. <p>Document Workspace dashboard on page 3736</p>

What's changed
<p>Download bots have the highest priority in a queue</p> <p>To optimize system performance, the Control Room prioritizes running the download bot of one process before running the extraction bot for another process. Previously, the system was configured with the extraction bots at equal priority to the download bots, which created a large queue of extracted data waiting to download.</p> <hr/> <p>Note: For users with Control Room environments configured prior to v.28: The Control Room admin must edit the <code>aari-document-processor</code> custom role to assign the new Set automation priority to high permission.</p> <p>Create a custom role for Document Automation on page 3468</p> <hr/>
<p>Important: New Community Edition users will have access to Document Automation but not IQ Bot</p> <p>As of Automation 360 v.27 release and later, only Document Automation will be provisioned to new Community Edition users. New users will not have IQ Bot permissions, however, IQ Bot will be available for existing, registered users.</p> <hr/>

Fixes
<p>When you create a learning instance, the interface allows field names that start with a letter only. Previously, the interface allowed field names to start with a number, which caused processing errors.</p>
<p>The Test regular expression field supports a maximum of 100 characters.</p>
<p>You can create a learning instance with custom fields that do not have a field name and field label, as long as the custom fields are unselected.</p>
<p>Document Automation extracts multiline fields without adding an extra space after each line.</p>
<p>Document Automation supports document processing on devices configured with an authenticated or unauthenticated Proxy Auto-Configuration (PAC) file.</p>
<p>The Document Workspace dashboard shows the correct page consumption metrics for On-Premises Control Room instances.</p>
<p>The "Average validation time" and "Validator performance by number of documents" widgets show the correct values when you mouse over the data points.</p>
<p>In Document Automation, the correct error message is displayed while fetching a Standard Forms model that is missing configuration settings. Previously, an incorrect error message was displayed.</p>
<p>While reconfiguring a table, you can add a table name within the 99 character limit and a table field name within the 154 character limit. Previously, you could add more characters than the default limit of 100 characters and 155 characters, respectively.</p>

Fixes
You can create a new project for Standard Forms in the Linux environment. Previously, the ability to create a project using Create project for Standard Forms was not supported in Linux.
Limitations
Document Automation supports a device username of 17 characters or fewer.
Pattern-based validation is not enabled by default in imported learning instances. You must edit the learning instance and select the Validation option in the Validation rules section.
Bots containing actions from the Document Extraction package do not support the advanced check-out options.
For a public learning instance, if you delete a learning instance and then try to create a new learning instance using that same name, an error is displayed. Workaround:If you delete a learning instance as well as the learning instance folder, then you can create a new learning instance using the same name.
When you create a learning instance with Google Document AI , an UNKNOWN option is displayed under the OCR Engine filter in the Document Workspace dashboard.
If you apply a filter that includes User Name , Status , or OCR Engine , the Accuracy% by field widget does not show the correct results.
If you submit a document that contains a validation error due to a regular expression, the page keeps loading and you must refresh the page to continue. You cannot submit a document that has a pattern validation rule with a regular expression that contains pipe symbol (). For example, the following expression has () characters and will show an error: <code>(^0[1-9] [12][0-9] 3[01])-(0[1-9] 1[0-2])-(\d{4}\$)</code> However, you can edit the regular expression in the learning instance and reprocess the document to continue with validation.
As of Automation 360 v.28, document extraction fails via proxy in the bring your own key (BYOK) use case.
If you process a document by uploading it through the default or customized process instead of processing it through Document Automation learning instances, then Download CSV remains in the In progress state during validation. Workaround:You must update the Download Bot task bot by unchecking Delete files associated to this document from the server after downloading .
For Document Automation, the license consumption is not tracked on a fresh cluster Linux environment.

IQ Bot

Fixes
<p>If you test an invalid Python script when configuring custom logic, the system displays an error message without any file path. Previously, the error message included the execution file path.</p>
<p>When you upload high-resolution or invalid documents to a custom group, if the document is not processed, it is either moved to the validator folder or the fail folder. You can eventually download the files from the fail or invalid folder.</p> <p>Previously, the validator or the fail folder did not receive the uploaded files. You had to transition the learning instance from production to staging and back again to move the file to the output folder.</p> <p>Service Cloud case ID: 01926196</p>
<p>The ability to create or edit a bot for a manual group has been fixed. You can now create a bot with a manual group that has invalid or corrupted documents. You can also move the created bot from staging to production and back again.</p> <p>Previously, after creating a manual group for a learning instance with an invalid or corrupted document, you were unable to create a bot.</p> <p>Service Cloud case ID: 01878143</p>

Limitations
<p>If the IQ Bot archive (IQBA) file size is above 268 MB, then the file storage does not upload the exported file from the output folder to the desired location. You should restart the Project Services from IQ Bot Services if the system is stuck and you are unable to perform any actions.</p>
<p>If IQ Bot Cloud is configured with a proxy server, learning instances cannot access Google Vision API or Microsoft Azure Computer Vision OCR engine.</p>
<p>The maximum upload file size limit is set to 2 GB when importing and exporting files in the IQ Bot archive (IQBA) file. If the file size is greater than 2 GB, then you must delete unwanted groups to decrease the file size and migrate successfully. Earlier, maximum upload file size limit was 5 GB.</p>
<p>When you change from full screen mode to small screen mode in the Logic window, the Python scripts and these options are hidden: Test Run, Clear Box, Fullscreen, and Save.</p> <p>Workaround:</p> <ol style="list-style-type: none"> 1. Click Logic to minimize the window 2. Click Logic to expand the window and view the Python scripts. 3. Place a cursor inside the Python script screen and click Enter.
<p>For an existing Community Edition user, the Help icon is not available on IQ Bot interface.</p>

Limitations

If you are an Automation Anywhere free trial version user and you upgrade to Automation 360 v.28, the Community Edition logo displays on the homepage. However, the functionality is not impacted.

The size of the toggle icon for **Set to production** is not consistent with all the other icons displayed on the learning instance details page.

Updates to the interface

Review the updates to the interface made to the interface for Automation 360 v.28 release.

IQ Bot and Document Automation

Bot Insight v.28 release

Review what's new and changed, and the fixes and limitations in Bot Insight for the v.28 release.

What's new

Enhanced Bot Insight filters and widget setting for Document Workspace dashboard

In a Document Workspace dashboard, you can use the custom dashboard filters to build custom widgets. Additionally, you can edit the widget settings for an effective data visualization.

[Document Workspace dashboard](#) on page 3736 | [Edit widget settings](#) on page 3738

What's changed

RBAC applied to `/data/api/gettasklogdata` and `/data/api/gettaskvariableprofile` APIs to secure business data (Service Cloud case ID: 01870469)

Role-based access control (RBAC) is applied to the `/data/api/gettasklogdata` and `/data/api/gettaskvariableprofile` APIs to access the Business dashboard data. With this role restriction, you cannot access the business data using the `/data/api/gettasklogdata` and `/data/api/gettaskvariableprofile` APIs when you do not have access to the folders.

Fixes

For Bot Insight business analytics reporting, you can use the Bot Insight APIs to export all the available data records from the Operations Bots dashboard's **DataTable** widget.

Previously, you could export a maximum of 100 records at a time from the Operations Bots dashboard's **DataTable** widget.

Service Cloud case ID: 00760252, 01819244, 01857905, 01945720

Bot Insight Operations dashboard (which includes links to the Audit, Bots, and Device dashboards) now retrieves and shows the complete volume count for a bot run.

Previously, due to a maximum volume count limit in KPI charts, the Bot Insight Operations dashboard could not retrieve the complete volume count. Additionally, a maximum count of 10,000 was shown as the total bot run in the Bots dashboard which led to incorrect results.

Service Cloud case ID: 01825287

A user with the **AAE_Bot Insight Consumer** role can only view a published analyze dashboard. The **Delete** dashboard action is greyed out and no longer available.

Previously, the **Delete** action was available and when the user tried to delete a dashboard, an error message was displayed preventing the user from deleting the dashboard.

Service Cloud case ID: 01870477

Limitations

In the Bots dashboard, the **Total Bot Runs** count does not match what the total count should be when the **Total Completed (Success)**, **Total in Progress**, and **Total Failed** counts are added together.

Automation 360 v.27 Release Notes

Release date: 11 January 2023

Review the top five features in this release and view other new features and exciting enhancements for Automation 360 v.27 release.

- Build 16701: Automation 360 (Cloud and Cloud Sandbox) and IQ Bot (Cloud)
- Build 16685: Automation 360 (On-Premises) and IQ Bot (On-Premises)

We have released updated builds for fixes after the Automation 360 v.27 GA build, which was Build 16667. For information about the fixes in these updated builds, see [Updated release builds](#) on page 158.

Highlights of this release

Here are the top 5 features in the v.27 release:

Embedded smart forms and dynamic data mapping for embedded widgets

Faster design and use of your embedded automation: You can now design your forms using a responsive and real-time canvas that automatically adjusts to the desired form size. This feature provides a faster way to create embedded interfaces that interact with any web applications. You can also configure these forms in your business applications, such as Workday or ServiceNow, to securely retrieve data when embedded as an iFrame widget.

Eliminate data re-entry and save time: Use our new PostMessage API to map and prepopulate data from business applications in embedded widgets. Dynamic data mapping provides safe and secure communication of data from your business (host) applications to initial process forms in the widget.

See [Smart embedded forms and dynamic data mapping](#) on page 3166.

Enhanced citizen developer experience

Our updated and intuitive icons enable citizen developers to quickly select actions and use the Help for contextual information about actions, providing a more seamless development of automations. We have also enhanced the AISense Recorder user experience so that you can use anchors easily and automate UI objects that are not detected by the recorder automatically.

See [AISense recorder enhancements](#).

Strengthen governance and management

Notifications: Our new notifications capability provides a centralized, consistent, and proactive medium for users to stay informed on their automation estate and to take actions based on the events they are alerted on. Alerts on various platform events, bot events, and other automation lifecycle events are delivered via in-app (default) and email (based on user preference).

See [Notifications](#) on page 2118.

Automatically pick available Bot Runner users: Scale your automations easily by selecting all the Bot Runner users that can run a given automation and the number of Bot Runners to use. This capability ensures that when you run or schedule an automation, the system automatically picks the available run-as users from the specified list.

Standard forms

Standard forms is now integrated in Document Automation with the other document processing capabilities. With enhanced accuracy, this feature enables you to extract data from densely structured forms including those with handwritten input. Use cases for structured documents include tax forms, mortgages, vehicle registration address, and so on.

See [Create custom models in Document Automation using Standard Forms](#) on page 3516.

PEG enhancements

We continue to improve our Privacy Enhanced Gateway (PEG) for sensitive information redaction with a new configuration UI so you can easily change the configurations in the UI instead of the command line. We have also recently released a new PEG serverless architecture for higher-scale data collection use cases.

See [Configure PEG image redaction](#) on page 3666.

Updated release builds

We have released the following updated builds:

- Build 16701 Service Cloud case ID: 01829572, 01947340, 01949323, 01950696, 01944637, 01951100, 01953055, 01950639, 01951722, 01949415, 01949033, 01949372

- Fix for bots that were failing when all of these conditions were met:
 - Bot contained more than 2,000 steps
 - Bot had one or more nested actions (such as IF or loop)
 - At least one of the nested actions contained more than 250 steps
- Fix for inconsistencies that were observed on the **In-progress activity** page.
- Fix for bots that were failing because of file dependency or interactive form that included multibyte characters in file names.
- Changes to Automation Co-Pilot on the desktop Assistant to manage and clear automations with start, stop, and resume actions.
- Build 16685 (for US West, Canada, and Japan regions only) Service Cloud case ID: 01947340
This updated build includes a fix for this issue: If a bot has a file dependency and the file name contains multibyte characters, then when the Bot Agent downloads the file, the download will fail during run time causing the bot to fail as well.

Automation Workspace v.27 release

Review what's new and changed, and the fixes and limitations in Automation Workspace for the v.27 release.

What's new

Control Room, devices, and Bot Agent
<p>Windows 365 Cloud PC now supported as Bot Runner (Service Cloud case ID: 01792699)</p> <p>We support Windows 365 Cloud PC as a Bot Runner to create and run bots on Windows 365 Cloud PC.</p> <p>Bot Runner device requirements on page 1111</p>
<p>Oracle Database is now supported on Linux (Service Cloud case ID: 00726728)</p> <p>We now support Control Room with Oracle Database on Linux, so you can now choose to install the Control Room with Oracle Database on Linux.</p> <p>Installing Control Room on Linux on page 1237 Database requirements on page 1132</p>
<p>Microsoft Edge offline extension is supported (Service Cloud case ID: 01829649, 01880289)</p> <p>You can now install the Microsoft Edge offline extension for Microsoft Edge Enterprise browser users even when the device is offline.</p> <p>When the Bot Runner machines do not have Internet connectivity, you can use these features with the Microsoft Edge offline extension:</p> <ul style="list-style-type: none"> • Automation of web apps • User interface triggers • Device registration <p>The Microsoft Edge offline extension is transparent and works similarly to the Microsoft Edge online extension for users.</p> <p>Install Bot Agent and register device on page 1288 Browser extensions for Automation 360 on page 933</p>

Control Room, devices, and Bot Agent
<p>Centralized notifications repository for various events and capability updates</p> <p>You can now track all the platform and automation events through a centralized repository. With this feature, you can identify the severity of events, consider possible actions based on the severity of events, and then take appropriate actions. You can also be notified about platform updates, such as bot export and package updates. Thus, it improves platform and user productivity.</p> <p>Notifications on page 2118</p>
<p>Automatically select the number of Bot Runners (Service Cloud case ID: 00821020, 00715598, 00723191, 00784822, 01830238, 01870817)</p> <p>You can enable Automation 360 to automatically select the Bot Runner users for specific tasks to:</p> <ul style="list-style-type: none"> • Scale automations easily • Run bots concurrently • Use resources efficiently <p>This capability ensures that when you run or schedule an automation, the system automatically picks the available run-as users from the specified list.</p> <p>Automatically select the number of Bot Runners users on page 2063 Schedule a bot on page 2056</p>
<p>Manage domain accounts using gMSA (Service Cloud case ID: 00731119)</p> <p>You can use a group Managed Service Account (gMSA) to manage and run Control Room and other Automation 360 services.</p> <p>Configure service credentials on page 1195</p>
<p>View keyboard shortcuts in Bot editor</p> <p>In Bot editor, you can now open a menu to view the available keyboard shortcuts.</p> <p>Keyboard shortcuts list on page 2159</p>
<p>Validate device credentials prior to bot deployment</p> <p>Prior to bot deployment, you can select to validate the device credentials for Bot Creator, attended Bot Runner, Citizen Developer, and unattended Bot Runner users. This provides users additional security for bot deployment.</p> <p>Switch device registration between Control Room instances on page 1744</p>
<p>Export roles to view users and their permissions (Service Cloud case ID: 01804955)</p> <p>You can export selected roles and their permissions to CSV files to view the following information:</p> <ul style="list-style-type: none"> • User information • Run-as user information • User permissions • Folder permissions <p>Export roles on page 1712</p>

Control Room, devices, and Bot Agent
<p>TLS 1.3 encryption support for a more secure connection to Control Room services (Service Cloud case ID: 00549240, 00606859, 01925085)</p> <p>Automation 360 On-Premises supports both TLS 1.3 and TLS 1.2 cryptographic protocols for HTTPS and TCP communications between our components.</p> <p>Support for secure protocols on page 993 Configure application Transport Layer Security on page 1193</p>
<p>Enhanced Automation Anywhere Debugger tool</p> <p>The Automation Anywhere Debugger tool is available in the Bot Assistant utility to provide a better user experience. When you invoke the Debugger tool from the Bot editor, you can add, update, or delete actions and variables in a bot.</p> <p>By default, the Watched variables lists is empty. With a single click, you can add all the used variables in a bot. These variables display in a pop-up window where you can select or deselect, one or more variables, from the list.</p> <p>Debugger tool</p>
<p>Google Chrome and Microsoft Edge certification for operating systems</p> <p>Google Chrome and Microsoft Edge extensions are certified for the following operating systems:</p> <ul style="list-style-type: none"> • Microsoft Windows Server 2012 Standard R2 • Microsoft Windows Server 2016 • Microsoft Windows Server 2019

<p>Notification for package updates</p> <p>When you add or update a package or upload a custom package to the Control Room, you are now notified about this platform event. This notification is displayed to all the Control Room users through the Notifications repository.</p> <p>Capabilities supporting notifications on page 2132 Add packages to the Control Room on page 1842 Add custom package to your Control Room on page 3415 Upload custom package to your Control Room on page 3352</p>
<p>ServiceNow package</p> <p>You can use the ServiceNow package from Automation 360 to authenticate and perform several actions with records and attachments in ServiceNow tables.</p> <p>ServiceNow package on page 2891</p>
<p>ServiceNow triggers</p> <p>You can use ServiceNow triggers to call an action when there is a new or updated record.</p> <p>ServiceNow New Record trigger on page 3244</p>

Packages, actions, and Bot editor
<p>Cut, copy, paste keyboard shortcuts added for TN3270 and TN5250 Terminal Emulator</p> <p>In the Terminal Emulator package, the following keyboard shortcuts are now available specifically for TN3270 and TN5250:</p> <ul style="list-style-type: none"> • Shift + Control + A = Select all • Shift + Control + C = Copy • Shift + Control + X = Cut • Shift + Control + V = Paste <p>Using Send text action on page 3000</p>
<p>Quick assistance at hand for the developers in the Bot editor</p> <p>The accessibility and usability of the Bot editor, actions, and packages have been improved. As a citizen developer or an RPA developer, when you are creating bots, you can quickly look up information about the actions without navigating outside the Bot editor. Under the Actions pane, quick help is enabled with contextual information about actions. Additionally, an icon is configured with a link to the documentation. If you want more information about an action, you can click the link, which redirects you to the relevant page in the documentation portal. This feature is currently available in the following actions and packages.</p> <ul style="list-style-type: none"> • Database • Email
<p>Enhanced user experience through refreshed and intuitive icons</p> <p>With the new and intuitive icons for actions in the Bot editor, citizen developers and RPA developers can quickly locate the correct action while creating automation for a day-to-day task. These unique and renewed icons are developed according to brand and global standards.</p>
<p>Seamless package updates</p> <p>When a package version is added to the Control Room, either from a Cloud download or Control Room upgrade, as an administrator, you have the flexibility to disable the new version of packages. This feature helps you to restrict users from using the new package version until it is verified.</p> <p>Updating packages in Control Room on page 1839 Automatic package updates for On-Premises Control Room on page 1840 Automatic package updates for Cloud Control Room on page 1841</p>
<p>New option in Read from action of Database package (Service Cloud case ID: 01263940)</p> <p>A new check box is available when you use the Read from action to retrieve records from the database and save the retrieved data in a CSV file. When you select this check box, no CSV file is created if the executed SQL query does not return any data.</p>
<p>Proxy support for EWS-OAuth2 (Service Cloud case ID: 00771400, 01574715, 01815888)</p> <p>When you create a bot with the Email package that uses EWS OAuth2 for authentication and the Bot Runner machine is configured behind the firewall, then all outbound requests are routed through the proxy server configured on the Bot Runner machine.</p>

Packages, actions, and Bot editor

64-bit ODBC driver now supported in Database package (Service Cloud case ID: 01256142, 01829360, 01849908)

We now support connecting to databases by using the 64-bit ODBC driver. This option is available when the connection mode is the default. Organizations transitioning to Office 365 will benefit from leveraging this enhancement and can sustain automation build with 32-bit ODBC drivers.

[Using Connect action for database](#) on page 2382

OAuth 2.0 support in Email and Email trigger packages (Service Cloud case ID: 01798311, 01803702, 01791859, 01828526)

Microsoft is deprecating the ability to use Basic authentication in Exchange Online for these specific protocols:

- IMAP
- POP3
- EWS

We support OAuth 2.0 authentication for these protocols in the Email and Email trigger packages. For enhanced security, you can maintain the business continuity of your email automations by switching the authentication type from Basic to OAuth 2.0, (as recommended by Microsoft).

[Using Connect action for Email](#) on page 2437

Retry mechanism supported in credential variables (Service Cloud case ID: 01786319, 01887182)

The credential variables support the retry mechanism. When you create a bot that uses credential variables, if the bot fails during run time to retrieve those variables from the Credential Vault because the Control Room is disconnected or the Control Room services stop intermittently, then the bot tries three times to retrieve the credential variables from the Credential Vault.

Note: Ensure that the Bot Agent version installed on your system is the version that is released with Automation 360 v.27.

Packages, actions, and Bot editor

Support of other domain name in the Active Directory package (Service Cloud case ID: 01807358, 01910765)

We now support Active Directory user operations by logon name with domain and can provide the domain name to extract user details. When you retrieve the user property or perform any user operation based on the logon name (userPrincipalName), and if the user domain name differs from the domain specified in the LDAP path, the user properties are now successfully retrieved with or without a domain name.

For example, LDAP Path: LDAP://ADServer/DC=automation, DC=net

User	Logon name
userPrincipalName: kim@aaengg.net	User can provide logon name as kim@aaengg.net.
userPrincipalName: shaun@aasales.net	User can provide logon name as shaun@aasales.net.
userPrincipalName:sarah@automation.net	user can provide a logon name as either sarah or sarah@automation.net.

The following list of actions supports logon name with domain.

- Update user details
- Rename user
- Delete user
- Enable user account
- Disable user account
- Set user property
- Get user property

[User account operations](#) on page 2293

Shared mailbox support for Email automation (Service Cloud case ID: 00797231, 01816574, 01829499, 01854615, 01871861, 01933058, 01834152, 01829684, 01853949, 01880386, 01869636, 01894591, 01867553, 01911371. 01925438)

The Email package supports the email automation of a shared mailbox in Outlook for Office 365/Microsoft 365 using IMAP/EWS protocols, and OAuth 2.0 authentication using Client Credentials and Authorization Code with PKCE grant flows. You can automate emails retrieved from a shared mailbox and perform all email-related tasks by accessing each folder(s) and its subfolder(s) in the shared mailbox.

Packages, actions, and Bot editor
<p>New action in Text file package</p> <p>You can use the new Read variables action in the Text file package to read the values of variables from the text file.</p> <hr/> <p>Note: The Import string from text file action in the String package has been deprecated and will not be available for new bots. We recommend that you use the new Read variables action with enhanced capabilities. This deprecation does not impact any existing bots or bots which were migrated previously and they will continue to run properly. See Support and deprecation policy for packages on page 1026 for package lifecycle and deprecation policy.</p> <hr/> <p>Read variables action on page 3006</p>
<p>Call an existing JavaScript function in a webpage</p> <p>You can use the new Call a JavaScript function action in the Browser package to call an existing JavaScript function directly in a webpage or in an iFrame within a webpage in Google Chrome and Chromium-based Microsoft Edge browsers. In the bot, you can also pass one or more input parameters to the JavaScript function and process the return value from the function.</p> <p>Call a JavaScript function action on page 2349</p>
<p>Automate controls using Microsoft UI Automation (COM) technology</p> <p>You can use the Microsoft UI Automation (COM) technology to automate the following scenarios:</p> <ul style="list-style-type: none"> • Capture and automate client controls • Capture and automate password text controls • Capture and automate page tab controls <p>Actions performed on objects captured with Universal Recorder on page 2804 Capture using specific technology on page 2824</p>
<p>Capture objects on applications running in administrator mode</p> <p>You can use the Recorder to capture objects on applications running in administrator mode. To capture the object, select the Capture and run with admin privileges option from the Bot editor.</p> <p>Recorder package on page 2798</p>
<p>Enhanced bot performance when using global values across bots</p> <p>When you use global values across a parent bot and a child bot, the bot performance is enhanced by reducing the bot execution time. To enable enhanced bot performance, you must set the Bot compatibility version to 3 in the Advanced settings page of the Bot editor.</p> <hr/> <p>Note: Ensure that the Bot Agent version installed on your system is the version that is released with Automation 360 v.27.</p> <hr/> <p>Bot compatibility version on page 2231</p>

Packages, actions, and Bot editor

Enhanced user interface for Define functionality in AISense Recorder

- We have enhanced the user interface of **Define** window in the AISense Recorder that enables you to use anchors easily and automate UI objects that are not detected by AISense Recorder automatically. To improve functional clarity, the following object types are renamed:
 - **Active text** is renamed to **Link**
 - **Passive text** is renamed to **Text value**
- If you unintentionally click the screen or click before the highlighter appears, the AISense Recorder provides visibility into it. You must confirm to capture the object again or use the **Define** functionality to define the object on the screen.
- In the **Define** window, the AISense Recorder shows embedded help for each of the control types so you can select the correct control types for custom objects.

[Use variable anchor](#) on page 2197 | [Capture Textbox, Radio, Checkbox, and Combobox](#) on page 2192 | [Capture text value through AISense Recorder](#) on page 2191 | [Capture link button through AISense Recorder](#) on page 2190 | [Capture Image button through AISense Recorder](#) on page 2188

New virtual key added to the Simulate keystrokes package

In the **Simulate Keystrokes > Keystrokes** action, a new key named **Return** has been added to the virtual keyboard for Enter functionality and the Enter key in the Number pad has been renamed to **Num Enter**. As a result, the **Return** key is the main Enter key on the keyboard. This enhancement keeps the keyboard in sync with the physical keyboard. The nomenclature has been changed to avoid confusion between the Enter key on the keyboard and the Enter key on the Number pad.

Support for global variable for all Datetime actions

In the Datetime package, you can use the Datetime global variable across all **Datetime** actions. You can select to use either **String** variable or a **Global** variable in the **Source date and time variable** option. This avoids creating multiple local variables and reduces the total number of actions used in a bot.

[Datetime package](#) on page 2397

The resiliency of the File/Folder trigger has been improved to continue listening after a network disruption has occurred. Previously, a network error caused the trigger to lose connection with the Bot Agent.

Service Cloud case ID: 01769532, 01773584, 01834098, 01867418

Important: For information about the supported packages for this release, see [Packages updated in v.27](#) on page 189.

Building and running bots
<p>Notification for bot export</p> <p>When you export a bot in the Control Room, you are now informed through the Notifications repository. This notification is sent only to the user who exported the bot.</p> <p>Capabilities supporting notifications on page 2132 Export bots on page 1967</p>
<p>Code analysis runs automatically for all unscanned bots in public workspace</p> <p>Code analysis now runs automatically on all the bots with the Not Scanned status in the public workspace. This ensures visibility on the coding best practices for policies configured in the Control Room and will show the results of code analysis for all the bots in the public workspace without the need to run code analysis on each bot one by one.</p>
<p>Check out multiple bots and files (Service Cloud case ID: 00628344, 00822352)</p> <p>You can now select multiple bots and their dependent files from different folders that belong to the same process and check them out from the public to the private workspace. You can check out a maximum of 10 parent bots, but there is no limitation on the number of dependent child bots.</p> <p>Check out multiple bots on page 2215</p>
<p>Choose specific version of non-bot dependency to check out with parent bot</p> <p>When you check out a parent bot, you can now choose the version of a non-bot file dependency to check out. Every version of a parent bot can have different versions of non-bot file dependencies.</p> <p>With this feature, you can roll back the dependencies while rolling back the parent bot. You can make changes to a specific version of the dependent non-bot file.</p> <p>Check out non-bot file dependencies on page 2271</p>
<p>Compare bot version in private workspace (Service Cloud case ID: 01761840, 01771389, 01763432, 01904500, 00798356, 01780116)</p> <p>You can now see the changes made to your bot logic in the private workspace before checking in your bot. As a Bot Creator, it was difficult to identify the changes made to the bot logic, input, and output parameters. With this functionality, you can now easily identify where you have made the modifications to the bot logic, variables, triggers, dependencies, and packages compared to the latest version or any other previous version of the bot.</p> <p>Compare bot versions on page 2222</p>
<p>Edit non-empty folder description in public workspace (Service Cloud case ID: 01820406)</p> <p>You can edit the description of non-empty folders in the public workspace. Meaningful descriptions provide more insight of the bots contained in that folder. This feature enables an administrator or a user with rename folder permissions to better manage the repository when it contains many folders.</p> <p>Create and rename folders on page 2234</p>

Building and running bots

Specify queue running times in workload automations (Service Cloud case ID: 01816260, 00331357, 01924895, 01274769)

You can set the specific time period when to run a workload automation. When creating the workload automation, you can set the queue running days and time to ensure that the automation does not run during these scenarios:

- Applications are not available
- During scheduled upgrades
- Non-working days (holidays, weekends)

[Run bot with queue](#) on page 1940

Check for duplicates when adding work items (Service Cloud case ID: 00825850, 01792046, 01806516)

You can check for duplicate work items before adding them to the queue. This feature prevents re-processing the same work items multiple times, thus saving time and resources. You can either move the work items marked as duplicate for re-processing or discard them.

[Insert Work Items](#) on page 1939

Generation of API Key is audited

The generation of the API key is now audited and will display the expiry time of the api-key in the audit logs.

APIs and integrations

Workato Integration

You can integrate the Automation 360 platform and Workato by using the Automation Anywhere connector. You can establish a connection with the Automation Anywhere Control Room and perform various operations using the Control Room APIs.

[Workato integration](#)

SnapLogic Integration

You can now integrate the Automation 360 platform and SnapLogic. You can establish a connection with the Automation Anywhere Control Room and perform various operations by using the Control Room APIs.

[Snaplogic integration](#)

RPA Bots for Salesforce

Now when creating new connections, you have the option to include an API Gateway certificate.

What's changed

Control Room, devices, and Bot Agent
<p>Automated reprocessing of failed WLM work items (Service Cloud case ID: 00825872)</p> <p>When you create or edit a queue, you can now use the Max auto retry attempt option to ensure that failed WLM work items are reprocessed automatically. With this option, you can specify the number of times for which the automatic reprocessing of failed work items will be attempted.</p> <p>Automatic reprocessing of failed work items is attempted after all the work items in a queue are processed.</p>
<p>Better device management with improved device permissions (Service Cloud case ID: 01264963, 01871530)</p> <p>You can now view and manage Bot Agent devices even if you have not registered them by using the enhanced Edit the device(s) permission. The Edit the device(s) permission is improved as follows:</p> <ul style="list-style-type: none"> • Device(s) from my device pools: To edit devices from device pools • Run as users default device(s): To edit Run as user(s) default device <p>The Control Room administrator grants you access to a specific set of devices based on your role. When the Edit the device(s) permission with the Device(s) from my device pools and Run as users default device(s) options is selected, you can view and manage all (registered and non-registered) devices from a specific accessible group.</p>
<p>Enhanced bot Compare versions page</p> <p>The bot Compare versions page shows changes in the dependencies between two versions of the bot. It shows changes for the first level of dependencies only and displays those dependencies sorted in alphabetical order.</p>
<p>Specify time period to put work item on hold (Service Cloud case ID: 00825875)</p> <p>You can put a work item on hold for a specific date and time. This ensures that the work item moves automatically to processing (new state) on the specified date and time and no longer requires you to manually move it for re-processing. A new column in the Edit queue page displays the hold status of the work item, either date and time or indefinite if you do not specify the date and time.</p> <p>Edit queues on page 1946</p>
Packages, actions, and Bot editor
<p>Control Room version compatibility check with specific packages</p> <p>When you manually upload a package or a bot in the Control Room, the system now checks if the specific packages used in the bot are compatible with the Control Room version.</p>

Packages, actions, and Bot editor

Analyze button renamed in Bot editor

The analyze button of Bot Insight (**Analyze Task Bot**) has been renamed to **Bot Insight "Analyze" dashboard** in the Bot editor page.

Fixes

Build 16701: This build includes the following fixes (along with fixes from the previous builds):

Fix for inconsistencies that were observed on the **In-progress activity** page.

Service Cloud case ID: 01949323, 01950696, 01944637, 01951100, 01953055, 01950639, 01951722, 01929156, 01954486, 01954920

Build 16694: This build includes the following fixes (along with fixes from the previous builds):

If the **Manage my activity** feature is enabled for a user role, then the user can view the pause, resume, and stop status on the **In progress activity** page. If this feature is disabled, then the user cannot view these statuses.

Previously, users were able to view these statuses even when the feature was disabled.

Service Cloud case ID: 01937106

Build 16667: This build includes the following fixes:

When synching with the Active Directory (AD), the user mapping no longer overwrites the **Description** field in the Control Room with blanks.

The Automation 360 Control Room no longer generates an error in the User Management log when a mapped security group has no members.

The **In progress activity** page no longer shows bots after they are run.

Previously, the page incorrectly showed bots in the active state even after execution.

Service Cloud case ID:

01914651, 01924866, 01923265, 01928088, 1918956, 01922321, 01931985, 01921849, 01938985, 01939812, 01940084, 01940585, 01940258, 01938868, 01934451, 01940222, 01941187, 01940900, 01941742, 01939639, 01941503, 01941496, 01939639, 01942720, 01942430, 01943379, 01943617, 01938885

When a user is assigned an admin role to create schedules and later the admin access is removed for that user, an audit log will be logged when the schedule is canceled because of the user not having the admin privileges.

Previously, when such schedules were canceled, no audit logs were logged indicating that the schedule was canceled because the user did not have the required privileges.

Service Cloud case ID: 01830359

<p>The Administration > Licenses page and the Control Room banner displayed on the same licenses page now display correct information about license expiry.</p> <p>Previously, the correct information about license expiry was not displayed.</p> <p>Service Cloud case ID: 01807324</p>
<p>When you edit a role, the Edit role audit log page now displays the correct old, new, and run-as user values.</p> <p>Previously, these values were not displayed.</p> <p>Service Cloud case ID: 01759116</p>
<p>When you edit your first or last name on the My profile page, the description and auto login values on the Edit user audit log page will not be updated.</p> <p>Service Cloud case ID: 01846878</p>
<p>You can correctly filter the status for activities on the Activity > Historical page.</p> <p>Previously, some filters were not displaying the correct status for activities.</p> <p>Service Cloud case ID: 01869361, 01875216</p>
<p>Users without permission cannot view the activities of other users on the In progress activity page.</p> <p>Previously, some users were able to view the activities of other users even though they did not have permission.</p> <p>Service Cloud case ID: 01911289, 01910582</p>
<p>If you configured the log collection level as Debug, the logs collected from some packages do not include customer data.</p> <p>Previously, the logs collected from some packages included customer data.</p> <p>Service Cloud case ID: 01862053, 01870001</p>
<p>If the CPU utilization and device memory threshold values are outside the percentage range defined by the Control Room administrator in the Administration > Settings > Devices > Threshold settings for multi-user devices, a clear error message now indicates the device unavailability and provides an appropriate action.</p> <p>Previously, when the CPU utilization and device memory thresholds values exceeded the defined value, bot deployment failed with an unknown error message.</p>
<p>Device shows an accurate status when the Bot Agent is disconnected from the Control Room.</p> <p>Previously, due to the default time (15 minutes) of the WebSocket connection, a device was shown as connected even when the Bot Agent was disconnected from the Control Room.</p> <p>Service Cloud case ID: 01843990</p>
<p>In the Oracle Database environment, a checked-in bot is now automatically refreshed and can be viewed in the Public folder.</p> <p>Previously, to view a checked-in bot in the Public folder, you had to manually refresh the Automation page by using the Refresh button.</p>

<p>When a Stop Task command is used, WLM work items are now marked as completed successfully and show the correct status in the Control Room.</p> <p>Previously, WLM work items were marked as failed even if the bot was executed successfully.</p> <p>Service Cloud case ID: 01841320, 01840748</p>
<p>When you run WLM automations, if the Control Room restarts during deployment, the WLM deployment continues without delay when Control Room services are active.</p> <p>Previously, after the Control Room restarted, there was a delay of 15 minutes before the WLM deployment continued.</p>
<p>When you run a bot by using the Run bot with queue option, the correct value of the work item is now selected, irrespective of the modification source. Previously, when the value of a work item was modified through the API or bot setting, the older value was selected by the bot</p> <p>Service Cloud case ID: 01786785</p>
<p>In an Oracle Database environment, when you select the number format and sort order for the work items in a queue and then run bot by using the Run bot with queue option, the queues are now deployed successfully. Also, the correct log entry is shown in the Audit log or Activity page.</p> <p>Previously, queues were not deployed, and no errors were shown in the Audit log or Activity page.</p>
<p>In a clustered environment, the bot deployment progress is no longer stuck and the Bot Runner device connects to the Control Room successfully.</p> <p>Previously, the bot deployment progress would get stuck sometimes and show an error message <code>Waiting for user: <username> and/or device: <device-name></code> on the In progress > In progress activity page.</p> <p>Service Cloud case ID: 01830285</p>
<p>When a bot keeps running for a few hours, an error no longer occurs due to high memory usage with the Recorder package version 2.9.2 or later.</p> <p>Previously, an increase in memory usage caused the bot to fail after a few hours with a <code>Java heap space</code> error.</p> <p>Service Cloud case ID: 01911565</p>
<p>When you read emails within a loop using a Microsoft Outlook Client connection with a subject filter, use the Delete action and run the bot, the bot now completes the set iteration and deletes the emails from the specified folder. Additionally, the variable that was used to display the count of total emails versus deleted emails now displays the correct counts in the message box.</p> <p>Service Cloud case ID: 01845642,01857791,01880424</p>

When you establish a connection with the **EWS** server, and emails are read within a loop to filter and move all emails from a subfolder created within the custom folder, the bot now executes without an error.

Previously, an error occurred because the bot could not read the emails from the folders created outside the predefined folder, such as Inbox, Junk, or Draft.

Service Cloud case ID: 01823238

You can now successfully create a bot by using the **Upload file** action from the Microsoft 365 OneDrive package.

Previously, the bot displayed an error when you used the **Upload file** action and if the file name had special characters such as brackets [].

Note: Brackets [] are now supported in the file name.

Service Cloud case ID: 01798568

When you choose the variable option to perform a task and during bot creation process you delete the variable you created (Your variables), and when you click the **Add** option in the variable field to insert a variable (such as global variable), the option is now enabled.

Previously, the **Add** option for inserting the variable was disabled.

Service Cloud case ID: 01869139

When you create a bot, you can now use the **Update node** action of the XML package to update the value of a node. Previously, the attributes were removed when you updated the text value of an XML element.

Service Cloud case ID: 01805643

In the Email package, connect to the **EWS** server and use **Loop > For each mail in mail box**. If the source mail is sent on behalf of some other user, for example, user `xyz@aa.com` sent mail on behalf of user `abc@aa.com`, the email dictionary variable `emailFrom` now returns the correct sender ID, which is `abc@aa.com`.

Previously, the email dictionary variable `emailFrom` returned the sender ID as `xyz@aa.com`.

Service Cloud case ID: 01856149

When you run a stored procedure in Oracle and it returns `SYS_REFCURSOR`, the **Run stored procedure** action closes the cursors.

Previously, the **Run stored procedure** action was not closing the cursor after the maximum cursor limit was reached.

Service Cloud case ID: 01842046, 01898572

In the Active Directory package, when you perform a user account operation such as **Add users to group**, **Delete user**, **Disable user account**, or **Rename user**, and if the username has an asterisk (*), open parenthesis, or close parenthesis, you can now add a user without any error.

Previously, the username did not support the following special characters: asterisk (*), open parenthesis, and close parentheses.

Service Cloud case ID: 01884962

When you create a folder in Outlook with a percentage (%) in its name (for example, Clients%ClientA), create a bot using the **Connect** action from the Email package and then use the **Folder exists or Folder does not exist** condition, the bot finds the Clients%ClientA and retrieves mail from it.

Previously, the bot was not able to retrieve mails from the folder because percentage (%) was not supported in the folder name.

When you connect to the Microsoft Access Database with JDBC and specify the database path, if you use the following specific aggregation functions in the query, an error is no longer encountered when you run the bot:

```
ASC, ATN, SQRT, CBOOL, CCUR, CDATE,
CDBL, CDEC, CDATE, CDBL, CINT, CLONG, CLNG,
CSIGN, CSTR, CVAR, DATEADD, DATEDIFF, DATEPART,
DATESERIAL, DATEVALUE, FORMAT, IIF, INSTR, INSTRREV,
ISDATE, IsNull, ISNUMERIC, LEFT, LEFTS, LEN, MID,
MONTHNAME, DATE, NOW, NZ, SIGN, SPACE, STR, TIME, VAL,
WEEKDAYNAME, WEEKDAY, STRING, TIMESERIAL, CONCAT
```

When using the Task Bot: Run action, you can search dictionary and session variables to use as input parameters. Previously, no results displayed when using this Advanced search feature.

Service Cloud case ID: 01879539

A Task Bot no longer fails when you debug or run it when any **in_Window** input variable is set.

Previously, in edit mode, when you debugged or ran a Task Bot with an input variable by selecting the **Use as input** check box, the bot failed.

Service Cloud case ID: 01919263

When you use the **Save** action in the Email package, and if the email subject includes a comma (,), the emails are saved successfully.

Previously, if the email subject included a comma (,) and you saved the email, the comma (,) was replaced with an underscore (_).

Service Cloud case ID: 01786211

When you select the **Package** details page, and select the **Availability** tab, if the package (all users or selected roles) is changed, then the **Package** details page displays the last modified information of the user who made the changes, and the changes made at the access level (all users or selected roles).

You can create bots using the **Download file** action of the Google Drive package.

Previously, when you used the **Download file** action and marked the **Overwrite existing file** option to overwrite the file of the same name, the downloaded file became corrupted. If you then used the **Excel advanced > Open** action to open this file, or manually tried to open the Excel file, an error message displayed indicating that the Excel file was corrupted.

Service Cloud case ID: 01833815

<p>You no longer have an incorrect starting date when you create an event using the Google Calendar package.</p> <p>Previously, when you created an event in Google Calendar and entered the value in the Start Date field with the event type set to All Day, the Google Calendar package decremented the day value by one when you selected the All Day option.</p> <p>Service Cloud case ID: 01815644</p>
<p>When you use the Excel advanced > Open action to open an Excel spreadsheet which did not exist and then run the bot, the bot now displays the correct error message in Japanese.</p> <p>Service Cloud case ID: 01857992, 01925567</p>
<p>You can successfully extract fields from a PDF file when you use the PDF > Extract field or Extract text actions.</p> <p>Service Cloud case ID: 01818304</p>
<p>When you use the 3.6.1-20220428-010115 version of the Simulate keystrokes package to enter keystrokes against specific webpages running in the Microsoft Edge browser with IE mode, the bot processes the keystrokes faster.</p> <p>Service Cloud case ID: 01820418</p>
<p>When you use the PDF > Split document action to split multiple PDFs into various folders and then use the For each file in folder iterator to run the bot in a loop to split each file in the specified folder, the bot no longer encounters an error.</p> <p>Service Cloud case ID: 01803983</p>
<p>When you use the File > Copy Control Room file action and choose the dynamic file path option to select a file from the Control Room repository, the bot no longer encounters an error. Previously, even if the uploaded file was available in the Control Room, the bot failed and displayed this error message: <code>Get Resource failed: Error: Could not find the file at the Control Room path. Check the file path and try again.</code></p> <p>Service Cloud case ID: 01805364</p>
<p>When you use the File > Rename action to rename and overwrite an existing file, the bot no longer shows an incorrect error message. Previously, when you tried to rename an existing file, the bot showed an incorrect file name in the error message.</p> <p>Service Cloud case ID: 01845943, 01858350</p>
<p>You can successfully rename the file and remove an extension from the file name by using the File > Rename action. Previously, when used the Rename action to remove an extension from the file name, the bot trimmed the last character from the file name instead.</p> <p>Service Cloud case ID: 01842995</p>
<p>When you use the Recorder to capture objects on an application that is installed on a virtual machine, finish the recording after the objects are captured, and then relaunch the Recorder, the bot successfully launches the Recorder and no longer inserts any actions that were recorded earlier.</p>

When you use the **Recorder > Capture** action to automate Citrix virtual apps running on Google Chrome and Microsoft Edge browsers, add a delay of 60 seconds and run the bot, then if the object does not exist, the bot waits for the specified time (60 seconds) in the **Keep trying for (seconds)** field before executing the next steps.

When you run the bot using the following sequence of actions, the bot shows accurate data for each loop iteration:

1. Use the **Database > Connect** action to connect to the database
2. Use the **Database > Read** action to read the values from the database
3. Use the **For each row in a SQL query dataset** iterator to run the bot in a loop
4. Use the **Database > Disconnect** action to disconnect from the database and select the **Keep database schema in cache until bot finishes running** option.

Previously, during the second loop iteration, the action picked up data from the previous loop.

Service Cloud case ID: 01817192, 01853717, 01880154, 01940546

An error no longer occurs when you use Recorder package 2.8.6 and later versions to perform a click operation on a link element that opens a pop-up window on a web page running in Microsoft Edge with IE mode.

Service Cloud case ID: 01845776, 01858872, 01923003

When you install the AARemoteAgent_2.0, the DLL files are now copied to the correct **A360 Remote Agent** folder and the AARemoteAgent_2.0 runs properly. Previously when you installed the AARemoteAgent_2.0, the DLL files were copied to an incorrect **A360 Remote Agent\Java** folder.

Service Cloud case ID: 01935630

You can now successfully use the **PDF > Extract field** action to extract values from a PDF that contains a string data type with the dollar sign (\$).

Service Cloud case ID: 01848220

You can now successfully run all migrated web actions of the Legacy Automation package in multiple steps of a bot in Microsoft Edge with IE mode.

Service Cloud case ID: 01853563, 01865846

In the **File > Copy Desktop file** action, when you use a variable that contains a number sign (#) instead of a file path to locate the file that you want to copy, the bot no longer encounters an error.

Service Cloud case ID: 01808009, 01845923

When exporting data to Excel CSV files, Boolean values return accurately. Previously, a bug caused values to return as -1 while using OLE DB Driver for SQL Server (version 18 or later).

Service Cloud case ID: 01826530

Updating the Bot Agent version sometimes failed. However, when you select the **Automatically update all bot agents** option, the Bot Agent updates to the latest version without failures.

<p>Control Room now supports Windows NT in French.</p> <p>Service Cloud case ID: 00682337</p>
<p>All <code>DELETE /v1/configurations</code> endpoints are not accessible anymore.</p> <p>Service Cloud case ID: 01920980</p>
<p>While installing Automation 360 on a three-node cluster, the installer prompts you to enter the Elasticsearch password for the first node only and replicates this data across the other two nodes.</p>
<p>Bots that are running for longer duration display correctly on the In progress activity page. Previously, these bots displayed only after bot updates and were removed after the page refresh.</p> <p>Service Cloud case ID: 01921149</p>
<p>You can now update Internet Explorer bots created in Automation 360 to Microsoft Edge with IE mode using the Update Bot wizard even if these bots (or its dependencies) contain a '.' (dot) character in its name.</p> <p>Service Cloud case ID: 01809003, 01814904, 01822014, 01858820</p>
<p>If you selected the Log off windows session post bot execution option under Auto-login settings in the Control Room, data in the resource folder is cleared after the bot run.</p> <p>Service Cloud case ID: 01795752, 01778828, 01804711,01864871,01923299, 01823515</p>
<p>If you delete a device entry from Manage > Devices in the Control Room, the device registration properties are removed. This enables you to reregister the device.</p> <p>Service Cloud case ID: 01808450</p>
<p>You can successfully log in to Automation 360 using Active Directory credentials when the Auto-login users into Control Room option is enabled, without encountering any issues..</p> <p>Service Cloud case ID: 01808170, 01826805</p>
<p>The generated Control Room operational log files contain readable characters.</p> <p>Service Cloud case ID: 01872473</p>
<p>The Repository Management (<code>/v2/repository/files/<file_id>/content</code>) API now returns file contents only for the files the logged-in user has permission to view. The content of these files cannot be updated using a different API.</p> <p>Previously, this Repository Management API returned file contents for the files that the logged-in user did not have permission to view. And the user could update the content of these files.</p> <p>Service Cloud case ID: 01819101</p>
<p>Bot deployment now resumes and completes without any issue when the Task Bot > Pause action executes before or while the runtime window is loading.</p> <p>Previously, the resume option was not displayed in the runtime window, and the bot deployment was not completed.</p> <p>Service Cloud case ID: 01835794</p>

<p>You can create a folder within the Bots folder in the public workspace.</p> <p>Previously, folder creation failed with an error in the public workspace.</p> <p>Service Cloud case ID: 01257981</p>
<p>You can now successfully compare different versions of your bots and dependencies in both the public and the private workspaces.</p> <p>Previously, comparing the bot versions failed with a timeout error.</p> <p>Service Cloud case ID: 01770115, 01905037</p>
<p>When you export the user data to a CSV file, it now shows the correct user type and device license information for all users.</p> <p>Previously, user data exported to the CSV file showed incorrect information.</p> <p>Service Cloud case ID: 01840507</p>
<p>You can now check in a bot successfully to the public workspace.</p> <p>Previously, the bot check in failed because the audit trial was processed unsuccessfully.</p> <p>Service Cloud case ID: 01860361</p>
<p>The BLM export is an asynchronous call and when used with the existing API endpoint <code>/v2/blm/status/{requestId}</code>, there is a delay associated with the API call. Due to this delay, you cannot retrieve the current status of the export if there is not enough time gap between the export and the status call. To bypass this limitation, a new API endpoint has been added <code>GET /v2/blm/status/{requestId}/timeout/{timeout}</code> which introduces a time delay that waits for the export process to complete and then retrieves the status.</p> <p>Service Cloud case ID: 01806109</p>
<p>Upgraded Swagger UI and Swagger Editor to version 4.15.5 to fix a security vulnerability.</p> <p>Service Cloud case ID: 01843148</p>
<p>When you create bots that use the Excel advanced > Select cells/rows/ column action and set the Cell Range with an expression (such as <code>B1 : \$SampleNumber.Number : toString\$</code>), the Bot editor no longer displays an error and the action now works properly.</p> <p>Service Cloud case ID: 01941537</p>
<p>When you use the File trigger to modify a BAT or VBS file, the trigger is generated once.</p> <p>Previously, the trigger would generate twice when you enabled the file modified scenario.</p> <p>Service Cloud case ID: 01816589, 01877498</p>
<p>You no longer encounter issues with bot check-in or cancel check-out after the bulk package update operation. When you try multiple bulk updates of packages, now an appropriate error message indicates to perform bulk updates of one package at a time.</p> <p>Previously, when you performed multiple bulk updates of packages, it resulted in check-in or cancel check-out errors.</p> <p>Service Cloud case ID: 01849828, 01881950</p>

Bots with a large number of automations complete successfully without any pre-processing issues or errors.

Service Cloud case ID: 01949415, 01949372, 01949033

Security fixes

The version of Springframe Work is updated to 5.3.22 and does not exhibit the security vulnerability.

Service Cloud case ID: 01850811

Limitations

When you create a device pool with a temporary (disconnected) device, the device deletion job does not complete successfully. Additionally, the **Audit log** page shows the device is deleted, whereas the **Device list** page shows the deleted device in the list.

When you check out bots in bulk, you cannot check out the bots for which you have the required permissions. This is because bots for which you have the required permissions are also excluded along with the bots for which you do not have the required permissions.

The bot checkout fails in the following scenarios:

- If a bot with same name (but different case) exists in your private workspace with the same path.

Note: In such cases, the bot checkout or overwrite fails even when an overwrite confirmation message displays.

- If a folder with the same name exists in your private workspace with the same path.

When you compare bot versions from the **View history** page in a **Public** workspace, the **Compare versions** page shows an error message.

Workaround: To fix this error, perform one of the following actions:

- In a **Public** workspace, click the three dots icon next to the required bot in the **Action** menu and click **Compare versions**.

Note: You cannot compare the bot versions when only one bot version is available.

- If you check out a bot to a **Private** workspace and then modify and save it, click the three dots icon in the **Action** menu and click **Compare versions**.

Service Cloud case ID: 01949094, 01946533

In Windows and Linux operating system, notifications are not working with the Oracle Database.

We use a third-party parser to convert from HTML format to plain text. As a result, when you convert an email from HTML format to plain text, you will see that, sometimes, the text is not converted into plain text and is not displayed in the correct format. For example, you might see that some lines are added or skipped.

Service Cloud case ID: 01822614

In any package, when you select the **Add argument** option, select **String** or **Number** as the **Argument type**, and then try to insert a value, you might not be able to navigate through the options using the scroll functionality.

When you use the **System > Get environment variable** action to select the list of environment variables to return the system parameters of the device, some environment variables might not be visible.

After you upgrade to Automation 360 v.27, if a new package (first version) is added to the Control Room and in the setting for packages you selected **Disable** for the new version of package, you will see that the package will have status as **Enabled and set as default** instead of **Disable**.

In an Oracle Database environment, when you upgrade to Automation 360 v.27, the new package versions that are shipped through the installer remain in the disabled state and are not set as the default version.

Workaround: You must enable each updated or new package manually and set the package as the default version.

In the **Automation** page, column customizations made on the **Files and folders** are not retained when you navigate away from that page. For example, if you customize the columns in the private workspace, move out, and navigate back to the private workspace, the previous customization is not retained. It returns to the default view.

Similarly, searches and customizations such as filters, sort orders, custom columns, and partially completed edits are not retained when you navigate away from the page.

When you run the `v1/audit/messages/list` API in Control Room swagger, the following error message is displayed:

```
Please correct the following validation errors and try again.  
propKeyfilterErrorValue must be a string.  
PropKeypageerrorValue must be a string.
```

Workaround: Run the `v1/audit/messages/list` API using Postman application to avoid the error.

Service Cloud case ID: 01988096

you

Limitations from previous releases
<p>When you run a bot in the Google Chrome or Microsoft Edge browser, use the If, Loop, or Wait action, select the webpage from the list of active tabs in the Browser tab, close the browser window, and then run the bot, the bot might take two minutes to open the webpage in the browser irrespective of the timeout value mentioned.</p> <p>Workaround: Move the If, Loop, or Wait action inside the If block and use the Application is running condition with same browser application to check whether the browser is running.</p>
<p>You will encounter an error when you run a standard workflow in the SAP BAPI package.</p> <p>Workaround: To execute SAP BAPI, use the Run Function call (RFC) with a combination of Create function, Set or Get field value, Set or Get structure, and Set or Get table actions.</p> <p>A360 : SAP BAPI functions - Run Standard Workflow - Error while selecting BAPI_SALESORDER_CHANGE (A-people login required)</p>
<p>When you migrate a bot that contains XML command > Get single node, after migration, the bot encounters the following error: No node found at XPath while executing the Get Single node command Workaround: If the XPath expression is not starting with (/) , apply XPath starting with “/” so that at the time of execution, the modification can be skipped or the XPath expression can be designed to get the desired result.</p>
<p>When you use the Capture action with the Recorder package (version 2.9.x or earlier) to navigate to another web page in the Google Chrome browser (version 105.0 or later), and then use another Capture action to automate objects in the navigated web page, the bot might encounter an error.</p> <p>Workaround: Before you use the Recorder > Capture action in the bot, maximize the Google Chrome window .</p>
<p>When you use the If package, add a specific condition with a variable, then add specific conditions within a group, save the bot, and if you rename the variable that was used, the name of the variable might not update for the Group conditions but is only updated for the conditions in the Condition tab.</p>
<p>Command prompt API allows you to switch the device registration even if the Allow devices (single user) to be switched to another Control Room without reinstalling bot agent option is disabled.</p>
<p>When you upgrade from Automation 360 v.25 to a later version, although you enabled code analysis in the Control Room, the rules set in the policy are not retained after the upgrade.</p> <p>Workaround: Before upgrading, we recommend that you keep a note of the rules enabled in Automation 360 v.25 and then re-enable them after upgrading to a later version.</p>
<p>When you uninstall Automation 360 from the Control Panel, the name of the file is displayed incorrectly (for example, 3e592 .msi) on the User Account Control window.</p>
<p>While running a bot in debug mode, the bot will fail if the variable size gets greater than 3 MB. An error message appears showing that a variable has exceeded the 3 MB limit.</p>

Limitations from previous releases

When you set the default package version using the **Update bots to default package version** option for bots in the public workspace that are using the **Excel Advanced > Open** action, the Task Bots do not display the session name and file path values.

Workaround: Perform one of the following workarounds:

- Update the **Excel Advanced** package manually to use the latest version of the package. See [Select the package version used in your bot](#) on page 2231
- Check out the bot and revert to the previous version of the **Excel Advanced** package. Then, check in the bot to use the latest version of the package. See [Update bots to default package version](#) on page 1844

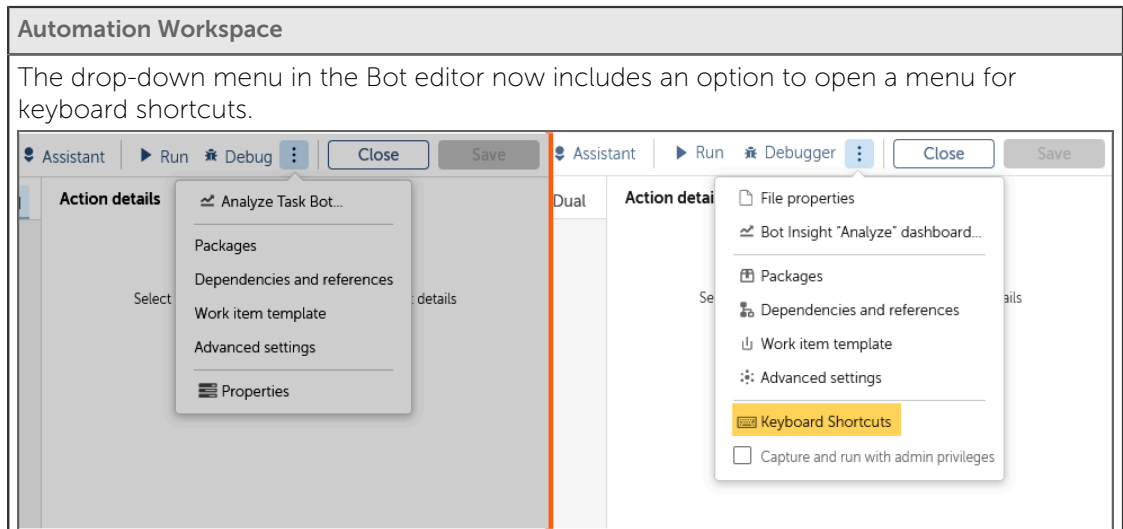

Updates to the interface

Automation Workspace

The **Max auto retry attempt** option is added to reprocess the failed WLM work items automatically.

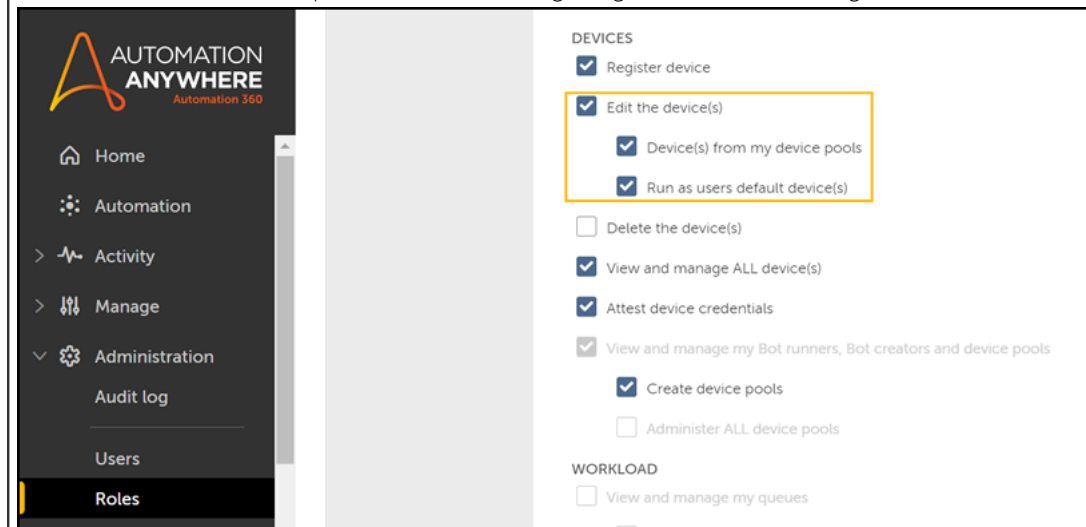

The screenshot shows the 'Create queue' wizard in Automation Workspace. The 'General settings' tab is active, and the 'Max auto retry attempt' field is highlighted with a yellow box. The field contains the value '2' and is labeled 'times'. Below the field, it says 'Number of times the failed work items have to be re-processed'. Other fields include 'Queue name' (Auto-retry-q1), 'Reactivation Threshold' (1 work items), and 'Time it takes for a person to complete 1 work item (optional)' (seconds).

[Automated reprocessing of failed WLM work items](#)

[Keyboard shortcuts](#)

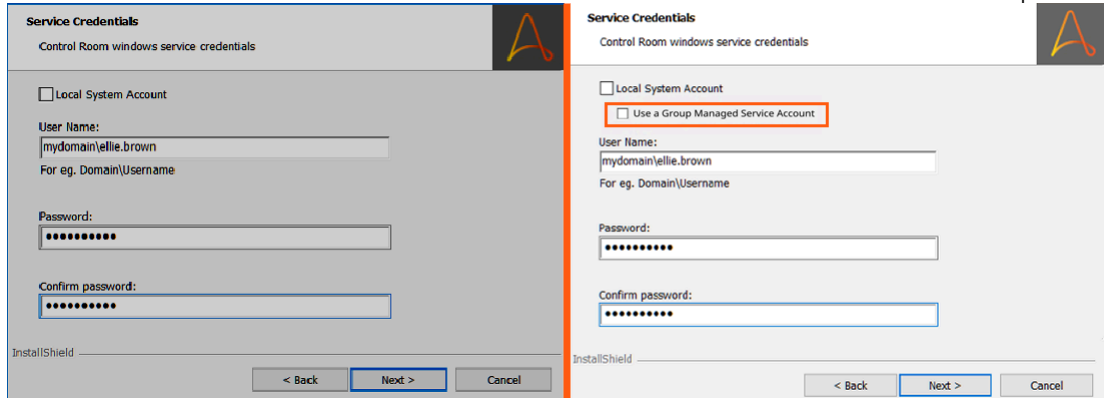

The **Device(s) from my device pools** and **Run as users default device(s)** options are added in the **Edit the device(s)** permission to manage registered and non-registered devices.

[Better device management with improved device permissions](#)

Automation Workspace

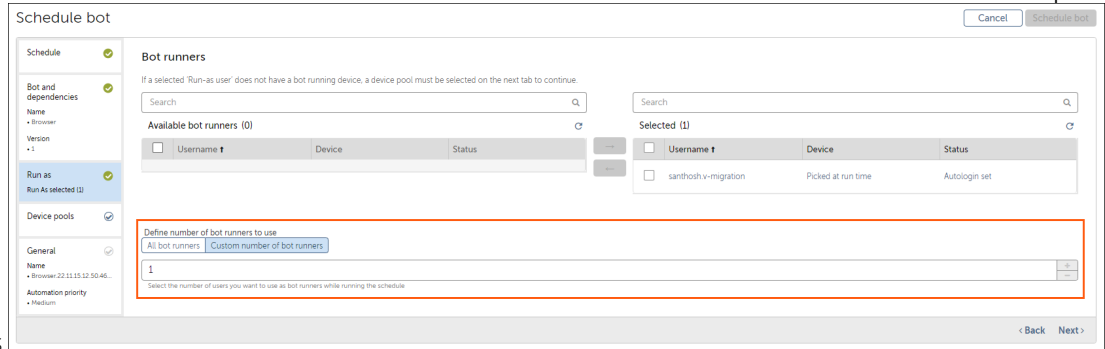

The gMSA option enables you to manage your domain accounts across multiple

servers.

Manage domain accounts using gMSA

The **Custom number of bot runners** option allows you to choose the number of Bot Runners that you want to use to run

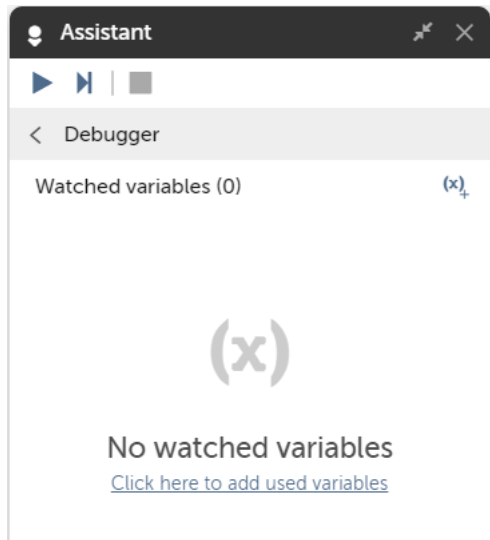

bots.

Customize the number of Bot Runners

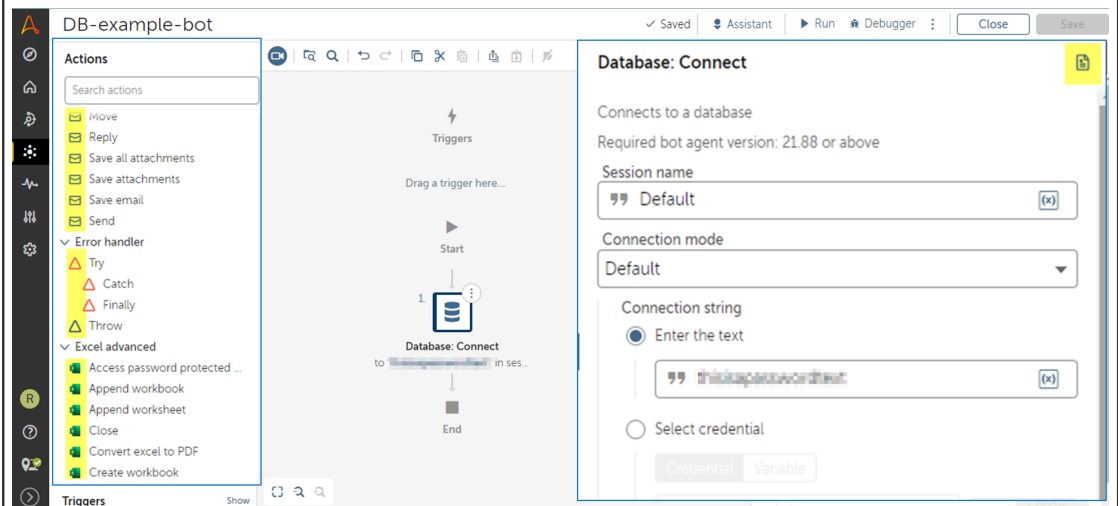

Automation Workspace

The Automation Anywhere **Debugger** tool is now available within the Bot Assistant utility to provide a better user experience.

Enhanced Automation Anywhere Debugger tool

Updated and intuitive icons for all the actions and contextual help for Database and Email actions.

Enhanced user experience through intuitive icons | Quick assistance at hand for the developers in the Bot editor

Updating to v.27 release

Review requirements and support information about updating your Control Room and Bot Agent for the v.27 release.

Bot Agent updates

Note: This release includes an optional Bot Agent update. You can continue to run your existing bots without updating the Bot Agent. However, if you want to use the new features in Automation 360 v.27, you must update the Bot Agent available with this release.

For more information on updating to this release, see these resources:

- [Automatically update the Bot Agent](#) on page 1302 | [Manually update the Bot Agent](#) on page 1303
- [Compatibility with release builds](#) on page 1275

Certified Control Room builds for direct update

You can update to the latest version of Automation 360 from the previous three releases (that is, from $n-3$ releases, where n refers to the latest release).

The following previous releases are certified for update to Automation 360 v.27:

- v.26 (Build 15450)
- v.25 (Build 15112)
- v.24R2 (Build 13343) and v.24 (Build 12350)

If you are on one of these previous releases, for information about updating, see [Update Automation 360 to latest version](#) on page 1363. If you are not on an $n-3$ release, update Automation 360 to one of the $n-3$ releases before updating to Automation 360 v.27.

For the latest updates to the Automation 360 extensions for Google Chrome, Microsoft Edge, and Mozilla Firefox, see [Browser extensions for Automation 360](#) on page 933.

Migration updates for v.27 release

Review what's new, changed, and the fixes and limitations to migrating from Enterprise 11 and 10 versions to Automation 360 v.27.

What's new

Enterprise 11 and Enterprise 10
<p>Scan Automation 360 bots that use Basic authentication in Email action</p> <p>This release introduces an option to use the Bot Scanner to scan all Automation 360 bots and identifies those that use Basic authentication in the Email package and Email trigger action so that you do not have to identify them manually.</p> <p>You can use the Bot Scanner report to analyze the impact to the bots due to the Basic authentication and the estimated effort required to switch the authentication mode from Basic to OAuth 2.0.</p> <p>For more information, see Running Bot Scanner to scan bots for EOL features on page 1077 Basic authentication scanning messages on page 1081</p>
<p>Variables created automatically after migration</p> <p>In the Bot Scanner utility, bots that contain the following non-referenced system variables are no longer flagged as Action Required or Review Required:</p> <ul style="list-style-type: none"> • \$Excel Column\$ • \$Filedata Column\$ • \$Dataset Column\$ • \$Table Column\$ • \$XML Data Node\$ • \$PDFTitle\$ • \$PDFSubject\$ • \$PDFFileName\$ • \$PDFAuthor\$ <p>After migration, the system automatically creates these variables based on the Automation 360 naming convention, and the migrated bots run successfully.</p>
<p>Support for SMTP server type with Send Email command</p> <p>When you migrate bots with the Send Email command, you can select the Use outgoing Email server settings option in the Bot Migration Wizard to identify and select the server type for the Enterprise 11 bots. You can configure required server details using a new SMTP server type option.</p> <p>See Migrate Enterprise bots on page 1529.</p>

Enterprise 11 and Enterprise 10

Improved automated editing ability for legacy bots

When you migrated legacy bots that contained the Log To File command, the Carriage Return and Line Feed (CRLF) characters were converted to LF characters automatically. In Automation 360, the text is displayed in a single line with no line feed, whereas in Enterprise 11, the CRLF is added at the end of each line as a line feed. As a result, you had to add the **\$String:Newline\$** variable to insert a CRLF in the migrated bot.

The new **Convert \n characters to \r\n Log to File action** option in the Bot Migration Wizard enables you to add a new CRLF automatically to migrated bots and avoid manual edits. Migrated bots that use the Log To File sub-commands to log files can use the CRLF characters in a string.

See [Migrate Enterprise bots](#) on page 1529

Enterprise 11 only

Migration enhancement to packages and actions

- When you migrate Enterprise 11 bots with variables whose values are read from a text file, the system adds the **String: Import string from text file** subcommand to import the variables from the text file into a string variable. As a result, extra lines are added in the migrated bots.

The **Read variables** action has been added in the Text filepackage to address the extra lines.

You can use this action to read the values of all variables in a text file as a single line in a migrated bot which simplifies the post-migration efforts and reduces the number of lines added in a migrated bot.

See [Read variables action](#) on page 3006

- Microsoft is removing the capability to use Basic authentication in Exchange Online for the following protocols:
 - RPC
 - MAPI
 - Offline Address Book (OAB)
 - Exchange Web Services (EWS)
 - POP
 - IMAP
 - Exchange ActiveSync (EAS)
 - PowerShell

For those customers running bot for Email automation that connect to Exchange Online using the IMAP, POP3, or EWS protocol with Basic authentication, we have added authentication options to support **OAuth2** authentication.

You can migrate Enterprise 11 bots with the authentication type set to the **OAuth2** option with **Authorization code with PKCE** or **Client credentials**.

- In the **Read from** action of the Database package, the following option is introduced: **Don't create file if no data is found**. This option is selected by default for migrated bots with the Database package, and the migrated bots now follow the same behavior as Enterprise 11. If the executed SQL query does not return any data, the behavior is as follows:
 - If this option is selected, no CSV file is created.
 - If this option is not selected, a 0 KB CSV file is created.

For more information, see [Using the Read from action](#) on page 2388.

- Migrated bots support the newly added **Return** key in the **Simulate Keystrokes > Keystrokes** action. These bots will continue to display the **Enter** key (which has been renamed to **Num Enter**) and the newly added **Return** key.
- Migrated bots support access to the Datetime global variable across all actions in the Datetime commands.

Enterprise 11 only

You can successfully migrate Task Bots that contain references to multiple MetaBots which include DLLs with same name. The session name of the first DLL is created using the name of the DLL. When the subsequent DLL with the same name from another MetaBot is migrated, the ID of the folder in which the DLL resides is used as a session name.

For example: `M_DLL_Session-<MetabotFolderId>_<DLLName>`.

Fixes

If the Enterprise 11 bots used the Send Email command without configuring authentication, now after migration the **Email server host**, **Email server port**, and **My server requires authentication** values are set to the appropriate values.

Previously, after migration, these values were set to null variables and authentication failed.

Service Cloud case ID: 01849475

After migration, bots that are using Visual Basic script or JavaScript in the Run Script legacy automation action and using multiple parameters that include spaces without quotation marks will now display the correct output after execution.

Previously, such bots were displaying incorrect output.

Service Cloud case ID: 01901882

An error no longer occurs during migration when the Select Query bot runs validation. Previously, the following error randomly occurred with text drivers.

[Microsoft][ODBC Text Driver] Object invalid or no longer set.

After migrating to Automation 360, if the **Application** window does not exist for the bots that use the If, IF/ELSE, or Loop in Windows control, then these bots no longer encounter errors during bot run.

Service Cloud case ID: 01846262

The **Stored Procedure** parameters are set correctly with **Nvarchar** when you migrate bots to Automation 360.

When a bot that contained the **File** and **Folder** loop was migrated to Automation 360, an error was displayed if the corresponding folder did not exist. You can migrate such bots like the corresponding legacy bot as the **If** condition is now added before the **File** and **Folder** loop to check if the folder exists.

You can migrate bots that contain the **Substring** command from the String package to Automation 360, even if the optional **Length** attribute is blank.

When you migrate a bot that has **\$counter** variable within a nested loop to Automation 360, the child loop counter is now set to the parent loop counter and the child loop iteration is processed correctly.

When you run a **Select** query inside a Loop package, and you reiterate its result set further, the resultant Loop now reiterates the latest record as expected.

Service Cloud case ID: 01799961

<p>You can successfully migrate bots that have the Wait for object to exist value option set to 0 seconds in the Object Cloning command.</p>
<p>When you use the Run Logic command with an IF/ELSE condition that uses a Credential variable, all credential variables migrate successfully.</p>
<p>When you migrate Enterprise 11 bots with string variables that have static values, variable parsing through legacy expressions is no longer performed. This avoids unnecessary parse expressions from being added to the migrated bots.</p> <p>Service Cloud case ID: 01819830</p>
<p>You can successfully run migrated bots that contain multiple Clipboard variables as an output. Automation 360 adds the Clipboard:Copy to action after every variable so that migrated bot is run properly.</p> <p>Service Cloud case ID: 01815938</p>
<p>When you migrate Enterprise 11 bots that use the Connect action with the Terminal Emulator command, and if the Hostname field contains a Credential Variable, then the field is mapped correctly after migration.</p> <p>Service Cloud case ID: 01861600</p>
<p>When you run migrated bots that contain the Legacy Automation > Manage web controls > Select Item by Text action, the list that contains variables is now displayed as expected.</p> <p>Service Cloud case ID: 01782998</p>
<p>You can now change, reallocate, or delete the license of a Bot Runner user in a migrated Automation 360 Control Room, even if the Bot Runner user had logged in to Enterprise 11 Client at least once.</p> <p>Previously, an error was displayed in such cases.</p> <p>Service Cloud case ID: 01829547</p>
<p>You can run migrated bots successfully on SMTP servers when you include the Send Email command inside a Loop, and that loop iterates more than 100 times.</p> <p>Service Cloud case ID: 01792886</p>
<p>Migrated bots do not create duplicate variables when the <code>Error_description</code> variable is case-sensitive.</p> <p>Service Cloud case ID: 01861530</p>
<p>You can now successfully migrate audit logs using the audit log export utility on a multi-node setup from the Enterprise 11 Control Room.</p> <p>Previously, the audit log export utility displayed an exception error in such cases and the audit logs could not be migrated.</p> <p>Service Cloud case ID: 01912835</p>

Limitations

In Enterprise 11, if bots were using certain keys (such as: Ctrl, Shift, Caps Lock, Num Lock, and so on) in the Insert Keystrokes command, the keys were reset when an error was encountered during the execution of child bots. However; after migration, these keys are not reset when an error is encountered during the execution of child bots. As a result, different output or behavior might occur during the execution of the other subsequent child bots or the main bot.

Service Cloud case ID: 00773679

When you migrate a bot that uses the **Send email** command and run the bot in Automation 360, the predefined placeholders in the email body are not replaced with their actual content.

For example:

```
Task Name: <taskname>
Repeat: <repeat>
Status: <status>
Last Run Time: <lastruntime>
```

Whereas when you run the bot in Enterprise 11 with these placeholders, the following output is generated:

```
Task Name: PLACEHOLDER_SEND.atmx
Repeat: Do not Repeat
Status: Failed
Last Run Time: 11/29/2022 13:04:22
```

Service Cloud case ID: 01908010

When you run a migrated bot with an XML package that contains an **Xpath** expression, the running bot might fail and generate this error message: No node found at XPath

This issue might occur for these specific scenarios:

- If the root element does not have a namespace, and the child element of the XML package has a default namespace.
- If there are more than one xmlns (the default XML namespace) defined in the XML document.

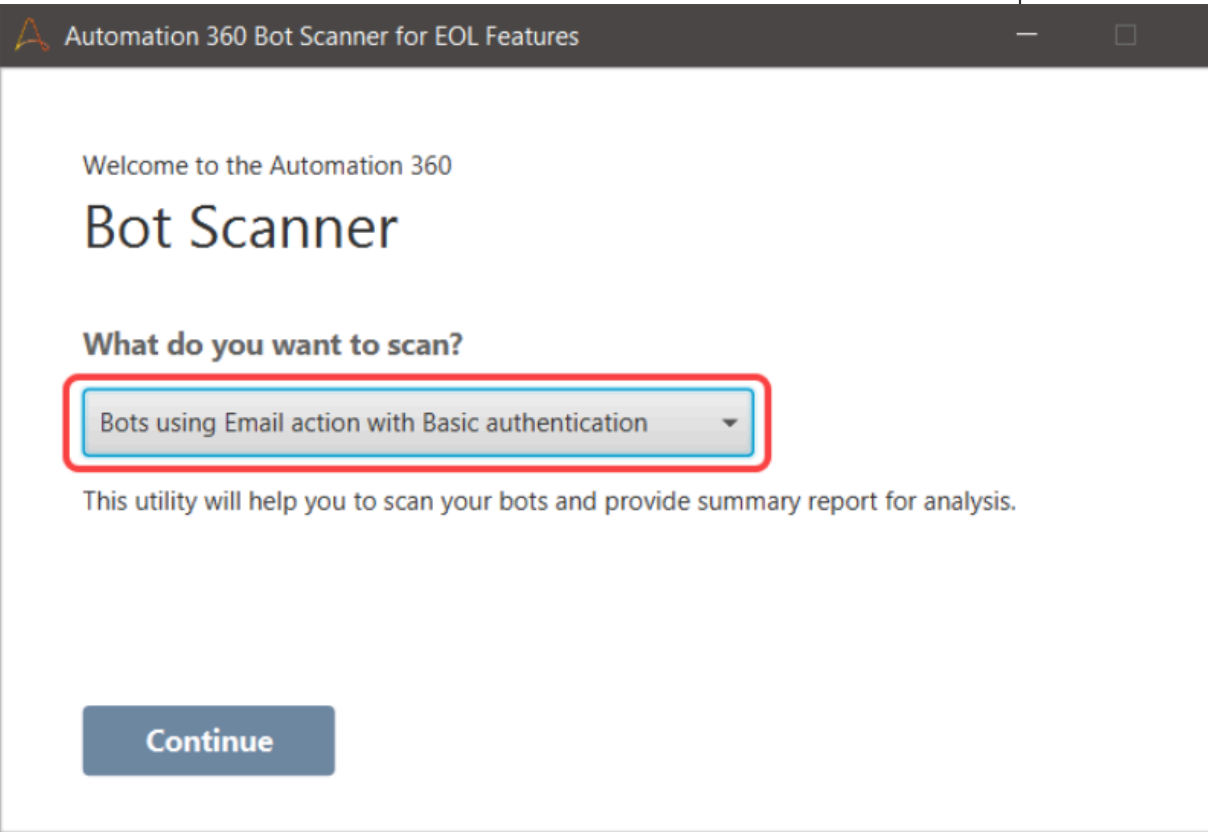

Service Cloud case ID: 01874203, 01798339

See [XML path is not working which works fine in Enterprise 11](#)

Updates to the interface

Migration

The **Bots using Email action with Basic authentication** option is added to the Bot Scanner to scan bots that use basic authentication in the Email package and Email

The screenshot shows a window titled "Automation 360 Bot Scanner for EOL Features". The main content area says "Welcome to the Automation 360 Bot Scanner". Under the heading "What do you want to scan?", there is a dropdown menu with the option "Bots using Email action with Basic authentication" selected. Below the dropdown, it says "This utility will help you to scan your bots and provide summary report for analysis." and a "Continue" button is visible at the bottom.

Bot Migration settings

Overwrite if a bot with the same name exists

Exclude bot dependencies
If this option is selected, all the bot dependencies will be excluded while migrating.

Bot behaviour configuration

Use 'Excel Cell Row' legacy behavior
If you are migrating from 11.3.0 and below, we recommend selecting this option.

Use outgoing Email server settings
If this option is selected, settings will be applicable to bots that contain send email action. You may need to update the global value if required.

SMTP email server

Server uses secure connection (SSL/TLS)

Server requires authentication

EWS email server

Include web services settings
This allows you to migrate along with the web services proxy host and port. If this value is selected, pre-created global values will be available to the bot for connecting with web services proxy.

Convert bots built using Internet Explorer to Edge with Internet Explorer mode
If you are migrating bots built on Internet Explorer, we recommend selecting this option to convert them to Edge with Internet Explorer mode.

Convert \n characters to \r\n in 'Log to File' action
This allows you to convert \n characters (LF) into \r\n characters (CRLF), which automatically take new line in bots using Log to File action.

Bot Insight configuration

Tag bots and variables for analytics
This allows you to tag bots and variables for analytics through Bot Insight. If you are not using Bot Insight in legacy bots, we recommend you not to select this option.

Next >

Support for SMTP server type with Send Email command

Migration

The **Convert \n characters to \r\n Log to File action** option is added to the Bot Migration Wizard to provide you an option to not have to edit the bots manually and a new line is added automatically in migrated

Review requirements and support information about updating your Control Room and Bot Agent for the v.27 release.

Remote agent v.2.1.0 updates

A new version of the Remote agent is released with Automation 360v.27. This section includes the fixes for Remote agent version 2.1.0.

Fixes

When a bot keeps running for a few hours, an error no longer occurs due to high memory usage with the Recorder package version 2.9.2 or later.

Previously, an increase in memory usage caused the bot to fail after a few hours with a `Java heap space` error.

Service Cloud case ID: 01911565

An error no longer occurs when you use Recorder package 2.8.6 and later versions to perform a click operation on a link element that opens a pop-up window on a web page running in Microsoft Edge with IE mode.

Service Cloud case ID: 01845776, 01858872, 01923003

When you install the AARemoteAgent_2.0, the DLL files are now copied to the correct **A360 Remote Agent** folder and the AARemoteAgent_2.0 runs properly. Previously when you installed the AARemoteAgent_2.0, the DLL files were copied to an incorrect **A360 Remote Agent\Java** folder.

Service Cloud case ID: 01935630

In the Recorder package, you can now use the **Left click**, **Right click**, and **Set Text** with delay actions for cross-domain IFrames to automate web pages on Google Chrome and Microsoft Edge browsers with Manifest V3 extensions. Previously, these actions were not working for cross-domain IFrames with Manifest V3 extensions.

In the Recorder package, you can now use the **Click** action for the Link and Form tag controls that have inline scripting with JavaScript using Manifest V3 extensions.

When you use the **Recorder > Capture** action to automate Citrix virtual apps running on Google Chrome and Microsoft Edge browsers, add a delay of 60 seconds and run the bot, then if the object does not exist, the bot waits for the specified time (60 seconds) in the **Keep trying for (seconds)** field before executing the next steps.

Process Discovery v.27 release

Review what's new in Process Discovery for the v.27 release.

What's new

PEG Serverless

With support of up to 100 simultaneous sensors, businesses can easily redact sensitive data at scale before the data is sent to the Process Discovery platform. Businesses can run Process Discovery data collection across multiple teams simultaneously, while still providing one interface for IT Admins to manage the configuration, and one interface for the business to review the redactions.

PEG Configuration UI

IT Admins can easily manage forwarding configurations, redaction configurations, and export logs from a web UI instead of having to run commands on the command line.

[Configure PEG image redaction](#) on page 3666

Fixes

Discovery Bot admins can now view all created processes without having the Discovery Bot recorder license.

Previously, if a Discovery Bot admin did not have a Discovery Bot recorder license and was using version A360.24, A360.25, or A360.26, all created processes did not display on the Processes page.

Service Cloud case ID: 01859123, 01877311, 01860901

Automation Co-Pilot for Business Users v.27 release

Review what's new and changed, and the fixes and limitations in Automation Co-Pilot for the v.27 release.

What's new

Smart embedded forms and dynamic data mapping for embedded widgets

You can now design your forms using a responsive and real-time canvas that can automatically adjust to the desired form size. This enables a faster way for you to create an embedded interface for use in any web application. You can also use these forms in your business applications to securely retrieve data when embedded as an iFrame widget.

To save time and eliminate data re-entry, you can use the postMessage API to map and pre-populate data from business applications in embedded widgets. Dynamic data mapping provides a safe and secure communication from your business (host) applications to the initial process forms in the widget.

[Smart embedded forms and dynamic data mapping](#) on page 3166

Build forms easily by dragging elements to form builder

You can now build your forms by just dragging your elements to a blank form builder. As you add elements to the form builder, it automatically adjusts without your input, letting you focus on the form-building experience. You can also re-size the columns of your elements.

[Create a form](#)

Map data in host web applications for Automation Co-Pilot (integrations)

You can now map your host applications data to your AARI forms so that when you create a request, the initial form field will be automatically populated with the mapped data.

[Map host data to process](#) on page 3169

URL parameters support for iFrame widget

You can use URL parameters to pass data types (date, time, number, and text box) through query parameters for your initial forms in the iFrame widget. Because the iFrame URL allows you to modify the URL to add data types, you can now directly populate data from a host application for form elements without having to keep re-entering the data.

[Deploy automations in web application](#) on page 3161 | [Construct URL parameters for supported elements](#) on page 3303

Virtual window support for iFrame widget

You can now run your bots in a virtual window (picture-in-picture view) for Automation Co-Pilot using embedded widget. With this option, you can run an attended bot in a small virtual window on your screen (instead of another desktop page or application) simultaneously while you complete tasks on the same page without obstructing your automation experience.

[Deploy automations in web application](#) on page 3161 | [Configure a bot](#) on page 3277

Select tags in widget setup

When you configure your widget in the **Integrations** page, the **Filter automations** option allows for you to select existing tags that can be added to your widget. You can now reference tags with the corresponding widgets in the **widgets** tab for easier reference in the **tags** column.

[Setup iFrame widget using Automation Co-Pilot](#) on page 3153

View status and run time details in automation list

You can now view the status and run time of your bots and processes in the automation list. The status and run time are based on your bots and processes last activities. You can quickly review whether a bot was completed in x amount of days or time ago, or shows no activity at all.

[Deploy automations in web application](#) on page 3161

AARI shortcut link

You can now access Automation Co-Pilot directly from your Automation Workspace. The **Explore AARI** link in the new **AARI** tab from the homepage is a shortcut that redirects you to the Automation Co-Pilot portal. This is an easier way for you to access Automation Co-Pilot if you forget how to access AARI or need to modify the URL to access Automation Co-Pilot.

[Deploy processes](#) on page 3256

New actions in the Process Composer

In the Process Composer, you can now use a set of actions when you build out your process. For example, you can double-click a task, such as **Bot Task** and **Human Task**, and the task will be updated in your process flow automatically. With this, you can save time because you do not need to task specific tasks to your process. In addition, you can now copy, cut, and paste using **CTRL + C**, **CTRL + X** and **CTRL + V**, respectively to retain, reuse, or replace data.

[Supported behaviors for tasks and elements in Process Composer](#) on page 3299 | [Create a process automation in Process Composer](#) on page 3312

Use a reference ID meta type in Process Composer

You can now use a reference ID with a **Meta** variable type for your variables in the Process Composer. When you set a reference ID as a meta variable type, you can now use your reference ID data when you run your tasks in the web interface. This simplifies your references because you only need to rely on using the reference ID instead of relying on other variable types or references.

[Create a process automation in Process Composer](#) on page 3312

Center your forms in preview

You can now preview your forms in the new preview window and get an accurate assessment on how your form will look when it is rendered. You can select the **Make form preview centered** option to enable the preview window. You can also set the appropriate display resolution, x and y coordinates, and even center your form.

[Create a form](#)

Upload images directly to the form composer

You can now upload images directly to the form composer by using the **Image** element. This saves you time to view the images in the form without a file reference, rather than in the initial step, where the image requires a file reference to be viewed.

Note: Image files are limited to 150 kb (like a logo).

[Using the Image element](#) on page 3219

Change label action for Button element

The change label action in the form rules now applies to the **Button** element. When you use the change label action in form rules and apply it to the buttons in your form, the changes will be automatically applied to the buttons where you set the rules. This keeps the flow consistent with the elements that you are using because all the buttons inherit the same rule.

[Add rules to form elements](#) on page 3229

Rules editor for Table element

The rules editor is now applicable to the **Table** element. When you use the rules editor for your tables, the rules conditions are applied for each individual columns while any actions that you set are applied for each row in the row level. This makes things consistent for each new or existing row that you use because all the rows inherit the same rule.

[Add rules to form elements](#) on page 3229

What's changed

Build 16701: This build includes the following enhancement:

Enhanced automation experience in Automation Co-Pilot Desktop Assistant

We have improved the automation experience for your automation activities in Automation Co-Pilot Desktop Assistant.

- You must have the **Manage my activity** permission as a prerequisite to use the bot controls.
- When you run your automation, the bot, its progress page, controls for pause, start (resume), and stop, are all unified inside Automation Co-Pilot Desktop Assistant. Previously, there was a separate window for the bot run and its controls. (This will still be seen in this version but will be hidden in future releases.)
- You can view the status of your bot progress and its details, and is reflected on the activity page.
- You can view and manage pending automation that have been initiated and users can navigate between bot list view and progress view. If you have multiple Automation Co-Pilot Desktop Assistant instances or disconnect and then reconnect to a different instance, the pending automation will be visible from the progress page for you to control.

Service Cloud case ID: 01793119, 1815462

[Automation Co-Pilot Desktop Assistant automation activities](#) on page 3208

Build 16667: This build includes the following enhancements:

Define tags in process configuration

When you edit a process, you can use the **Tags** field to search and specify tags based on keywords, to define your process. You can add tags from new or existing tags and use them to reference specific tags related to your process.

[Configure a process](#) on page 3278

Fixes

Build 16701: This build includes the following fixes (along with fixes from the previous builds):

In Automation Co-Pilot Desktop Assistant, you can continue your pending automation in different Automation Co-Pilot Desktop Assistant instances. Automations are no longer stuck, and you can run bots as usual.

Service Cloud case ID: 01829572

Note: This fix was first included with Build 16694 for Cloud Sandbox and Community Edition. Build 16701 now includes this fix for Cloud, Cloud Sandbox, and Community Edition.

Build 16685: This build includes the following fixes (along with fixes from the previous builds):

When bots have a file dependency or an interactive form that includes any multibyte character in its name, the bots run as expected. Previously, having the multibyte character in a form name caused an error.

Service Cloud case ID: 01947340

Build 16667: This build includes the following fixes:

You can now view signatures when you preview files using the AARI document viewer. Previously, signatures could be viewed only when files were opened in a separate tab.

Service Cloud case ID: 01879533

Bots are no longer triggered when you modify a file in an authenticated network. Previously, bots would trigger when you modified a bot in a network that required authentication.

Service Cloud case ID: 01256344, 01756709, 01854164, 01888188

The resiliency of the **Create > Request** action has improved in the Process package.

Service Cloud case ID: 01886231

You can add, delete, and change values to the column cells when you create forms using the Column Filter function. Previously, an error altered the accuracy of this operation by sometimes changing rows or filtering newly edited values.

Service Cloud case ID: 01854490, 01941416

<p>When scrolling past 100 task bots in Automation Co-Pilot Desktop Assistant page, fresh bots now load to successfully complete the list of bots not yet displayed.</p> <p>Service Cloud case ID: 01804139, 01845208, 01881927</p>
<p>You can select Reference ID as a Meta variable type from the Variable drop-down list.</p> <p>Service Cloud case ID: 01861551</p>
<p>When you enter data in a password field in the initial form, the password field retains your data after you submit the form without requiring you to re-enter the data.</p> <p>Service Cloud case ID: 01846222</p>
<p>When you use a file element to select multiple files, the file element functions properly without having to reset the form.</p> <p>Service Cloud case ID: 01840888</p>
<p>Buttons in forms work as expected. Previously, some users encountered an exception error and were unable to click Confirm to submit their form.</p> <p>Service Cloud case ID: 01846856</p>
<p>When you run a bot in Automation Co-Pilot, you can edit the auto-populated fields after you select an option from the drop-down menu.</p> <p>Service Cloud case ID: 01853623</p>
<p>When you use a number element and enable the Use comma to separate thousands format option, the bot will run without issues. Previously, some users encountered an exception error.</p> <p>Service Cloud case ID: 01869566</p>
<p>When you use the File modified trigger option to modify the contents or files, the trigger works properly.</p> <p>Service Cloud case ID: 01812596</p>
<p>When you use a document element in your form to upload PDF files, the PDF files that are uploaded renders the contents properly.</p> <p>Service Cloud case ID: 01802898, 01833266</p>

Known Limitations

<p>Image files uploaded to forms for access in the Process Composer are limited to 150 kb.</p> <p>Example: Use Select File element to upload and download files on page 3330</p> <p>Service Cloud case ID 01922815</p>
--

Updates to the interface

Automation Co-Pilot

The form builder now automatically adjusts the size for each form element you drag into the canvas. The sizes can also be manually adjusted.

The screenshot displays a form builder interface with a dark header containing the Automation Anywhere logo and the text "Form title". Below the header, several form elements are arranged vertically:

- Date:** A text input field with a calendar icon and the placeholder text "MM/DD/YYYY".
- Button:** A dark blue rectangular button with the text "Button".
- Image:** A light gray rectangular area with a placeholder image icon and the text "Label".
- Rich Text Editor:** A text editor with a toolbar containing icons for text alignment, indentation, bulleted and numbered lists, bold, italic, underline, and link. Below the toolbar, it shows "Paragraph" as the selected format and "12 pt" as the font size. The text area is currently empty.
- Select a file:** A blue-bordered box containing a dashed-line drop area with the text "Drop file here or browse" and a dark blue "Button".

At the bottom of the interface, it says "Powered by Automation Anywhere".

Build forms easily by dragging elements to form builder

Automation Co-Pilot

The **Tags** field in the Edit Process page now has a drop-down menu for you to create new or select from existing tags.

IQ Bot and Document Automation v.27 release

Review what's new and changed, and the fixes and limitations in IQ Bot and Document Automation for the v.27 release.

Document Automation

What's new
<p>Standard forms integrated with Document Automation</p> <p>You can create and manage learning instances entirely within Document Automation. Previously, you had to create standard form learning instances in IQ Bot and then process them through the Connect Learning Instance feature in Document Automation. With standard forms integrated with Document Automation, you benefit by having an entire workflow consolidated into a single system.</p> <p>Create custom models in Document Automation using Standard Forms on page 3516.</p>
<p>Support for Microsoft Form Recognizer v3.0 models in Document Automation</p> <p>Microsoft Form Recognizer v3.0 provides additional capabilities to the existing model creation, including options to select Template and Neural. While training a model, you can select either 2.1 or 3.0 version.</p>
<p>New Document Automation product licenses</p> <p>Document Automation now offers the following licenses to enable users to process documents and track metrics for learning instances in production:</p> <ul style="list-style-type: none"> • Document Automation Standard Forms (Number of pages): Required to create a model and process documents in a Standard form in Document Automation. • Document Automation 360 Extraction (Number of pages): Required to process documents in an Automation Anywhere (Pre-trained) model, including the User-defined document type. <p>Also, there are updates to license consumption tracking.</p> <p>License tracking release note</p>
<p>Extract data with Google Vision OCR</p> <p>If you are a user with a Cloud Control Room, you can process documents using Google Vision OCR technology by creating or updating a learning instance.</p>

What's new
<p>Improved table extraction in Automation Anywhere models</p> <p>You can use validation feedback to train a learning instance to extract data from a cell that contains more than one field.</p> <p>For example, if a product description column also includes item number, you can outline the item number in the Validation interface. When the learning instance processes subsequent documents, it will extract the item number and ignore the product description.</p> <p>Using validation feedback to extract specific values in a table on page 3478</p>
<p>Visualize performance metrics with a new Document Automation widget</p> <p>You can view data visualizations on Validator user performance. This new widget is a horizontal bar chart that shows the weighted average time each Validator user spent performing manual validation per document.</p> <p>Document Workspace dashboard on page 3736</p>
<p>Document Automation supports regular expression pattern-based extraction</p> <p>When configuring fields that the learning instance will extract, you can specify a regular expression (regex) pattern to help the extraction engine find the field. After entering the regex pattern you can test the expression using sample content within the Create Learning instance window. You can use regex pattern extraction for values that follow a specific pattern, such as a VAT number or a PO number.</p>
<p>Validation interface support for shortcut keys</p> <p>Zoom in and out on documents in the Validation interface by holding the Alt key and scrolling with your mouse wheel.</p>

What's changed
<p>The following updates impact how the Control Room tracks license consumption:</p> <ul style="list-style-type: none"> • The Control Room checks enough product licenses prior to deploying the bot. • The IQ Bot Pages license and the Standard Forms Pages license track documents that are processed through learning instances created in Automation 360 IQ Bot. This includes documents processed in the learning instance in Automation 360 IQ Bot and learning instances connected to Document Automation. • In the Licenses page, the Document AI license is called the Google Document AI (number of documents) • The Control Room also tracks documents processed in Google Document AI for users who brought their own license. Previously, the Control Room only tracked such documents for users who bought their licenses through Automation Anywhere.
<p>You can now configure Oracle Database with on-premises and Linux installations of Document Automation.</p>
<p>When you import a learning instance created in previous versions of Document Automation, the check box to send validation feedback to the system is now not selected by default. You must edit the learning instance to select the check box.</p>

Fixes
Build 16694: This build includes the following fixes (along with fixes from the previous builds):
Now users with either the Standard Forms for Document Automation or the Standard Forms (for IQ Bot) licenses can create a Standard Forms model in Document Automation.
Build 16685: This build includes the following fixes:
The Bot Agent now clears out the resources folder after running actions from the Document Extraction package.
When you import a learning instance created in a previous version of Document Automation, the Improve accuracy using validation check box is now unselected by default.
Document Automation now correctly tracks license consumption in all On-Premises installations, irrespective of the port number.
You can now add formula validation to learning instances with the user-defined document type.
Standard forms in Document Automation is now supported in a fresh installation or upgraded multi-tenant Control Room. Previously, Standard forms in Document Automation was only supported on a fresh installation of a multi-tenant Control Room.
When you refresh the Validator page, the Validator displays the last document you worked on. Previously after a page refresh, the Validator sometimes displayed the first document you had validated.
Bot Runner devices configured with a proxy can successfully run actions from the Document Extraction package.
Service Cloud case ID: 01856276, 01862174, 01911425

Limitations
Standard forms only support unique field extraction for any document. If there are fields with the same name on multiple pages, then the document must be trained with different tag names in the model creation tool. For example, if there is a field named <code>date</code> on two different pages, then you must use <code>date1</code> and <code>date2</code> to make the tag names unique in the model creation tool for training.
You cannot use spaces in model names when you create models for Standard forms v3.0. If the model name contains any spaces, then an <code>InvalidParameter</code> error message is generated.
There is no average accuracy for standard forms v.3.0 from the Microsoft Azure Form Recognizer service. As a result, the standard forms training displays the average accuracy as 0.00% for the v.3.0 service.
When fetching a Standard Forms model, an incorrect error message displays when no configurations are available in Document Automation.

Limitations
The resizing functionality is not working properly for the model list table. As a result, you cannot resize the table header or column in Standard Forms.
The run analysis result does not display in standard forms when creating a v.3.0 model with multipages.
There is a default character limit of 100 characters for the table name, and 155 characters for the field name of the table. However, if you reconfigure the table, you can add more characters than the default limit.
The System-Identified Regions (SIRs) for checkboxes or radio buttons are not generated for the standard forms v.3.0 model.
Standard forms is not supported on Linux.
Any re-mapping or re-drawing in the System-Identified Regions (SIRs) in the Validator results in detection of an incorrect check box. However, you can enter the check box value as checked or unchecked after changing the auto-generated mapping.
When migrating a learning instance from one Control Room to another, the same user must export and import the .dw file.
If the learning instance extracts data from a multi-line field and transfers it to a CSV file, an extra space is added at the end of each line.
When you mouse over data points in the "Average validation time" and "Validator performance by number of documents" widgets, the correct values do not immediately display in the pop-up window.
Document Automation prevents you from creating a learning instance if you create a custom table field without providing a field name and field label, even if you have unselected the field.
If you click Test regular expression and replace the value in the Regular expression field, the field now has a limit of 50 characters. Workaround: Click Cancel to leave the Test regular expression window and make the revisions in the Regular expression field.
The Table icon is not generated on the Form OCR Testing Tool (FOTT) for the Standard form v3.0 Model.
If a field name contains more than 100 characters, the scroll bar does not appear and you cannot see the value of the form field.
If a table name contains more than 50 characters, you cannot expand the table size. Additionally, the field name in the table does not display when you hover over it.
If you test an invalid Python script when configuring custom logic, the system returns an error message that contains the Python execution path.

Limitations
Sometimes document extraction fails and one of the following error messages appear in the Automation Co-Pilot request status: Extraction bot failed. Please check activity/audit logs for more detail or Download bot failed. Please check activity/audit logs for more detail with this message in the audit log: Existing deployment in progress for this user session. If this happens, restart the Bot Agent on the impacted device.
The Document Workspace dashboard sometimes shows incorrect page consumption metrics if the Control Room is installed On-Premises.
Documents cannot be processed with Google Vision OCR if your proxy is configured with a Proxy Auto-Configuration (PAC) file.
When you create or edit a Learning Instance, if a field name starts with a numerical value, then the formula validation for that field fails. This issue applies to form fields and table fields.
If you import a learning instance with the validation feedback option disabled, the validation feedback option becomes enabled and you must manually edit the learning instance to disable the option.
For Standard Forms, when a document with multiple pages is processed and enters into validation, one page is being duplicated in the Validator even when the System-Identified Regions (SIRs) in the Validator are correct.

IQ Bot

What's changed
If you are using an older version of Microsoft SQL Server that does not support TLS 1.2, then you must keep an IQ Bot database backup and update to a Microsoft SQL Server version that supports TLS 1.2.
IQ Bot now uses the latest version of Python (3.11.0) for custom logic validation. To use the latest version, you must upgrade from cx_Oracle 8.3 to python-oracledb. See Upgrading from cx_Oracle 8.3 to python-oracledb

Fixes
IQ Bot now performs post-processing on fields with Python custom logic that contain single quotation marks, such as <code>print('Test')</code> .
In IQ Bot, when a document is either corrupted, deleted, or is not loading in Validator or Designer, a placeholder image is displayed. The applications will not be consistent until you upload new documents. Service Cloud case ID: 00792976, 00835371

Fixes
<p>During the production process, you must not move the learning instances or bots from Staging to Production, or vice-versa.</p> <p>Service Cloud case ID: 01808931, 00821541, 01253373, 00836954, 01271722</p>
<p>When you upload any invalid document in manual or custom groups, then the document gets processed. However, the System Identified Region (SIR) will not be generated for the unsupported pages.</p> <p>Previously, when an invalid document was uploaded with a valid document and processed for extraction, the See extraction page kept loading.</p> <p>Service Cloud case ID: 01786098</p>
<p>In Healthcheck API, the output shows the proper branch name convention, for example: RC-A360.27. Previously, improper health information was displayed when the branch name convention was heads/RC-A360.27.</p>
<p>If an error or exception is encountered during document validation, the error or exception is processed, and the files are displayed consistent in the output.</p> <p>Service Cloud case ID: 00827940</p>
<p>In IQ Bot, if the RabbitMQ v3.8.17 and v3.8.18 is not working, then the log directory location can now be changed by updating the system environment variable as RABBITMQ_LOG_BASE. If this variable is provided manually with the required directory location, then the logs are created and updated in a new location. Previously, the configuration given for the log.dir variable in rabbitmq.conf file did not support RabbitMQ v3.8.17 and v3.8.18.</p> <p>Service Cloud case ID: 01844995</p>
<p>The system-identified regions (SIRs) are now generated for manual groups when the PDFBox is enabled. Previously, when the PDFBox was enabled, during Learning Instance creation the SIRs for some vector PDFs were not generated for manual groups.</p> <p>Service Cloud case ID: 01844223, 01849638</p>
<p>You cannot import an IQ Bot archive (IQBA) file when the designer for the same Learning Instance is open in another window. Previously, the import was failing because the LockedTimestamp field in the visiobotDetails table had a value at the time of IQBA export. This caused an error because the LockedTimestamp field was expecting a null value.</p> <p>Service Cloud case ID: 01818474</p>

Limitations
<p>During the express installation upgrade of IQ Bot, an error message is shown in the installation steps. You must click OK to proceed further.</p>
<p>The maximum upload file size limit is set to 5 GB when importing and exporting files in the IQ Bot archive (IQBA) file. If the file size is greater than 5 GB, then you must delete unwanted groups to decrease the file size and migrate successfully.</p>

Limitations
If the IQ Bot archive (IQBA) file size is above 2,147,483,647 bits, then the File Storage does not upload the exported file from output folder to the desired location.
Sometimes, the PDFBox is unable to detect PDF (Portable Document Format) documents accurately. We recommend that you use Adobe Acrobat to convert the documents to PDF before you upload it to IQ Bot.

Updates to the interface

IQ Bot and Document Automation

The Create learning instance window now contains a drop-down menu to select an OCR provider.

Create Learning Instance Cancel Next

Bot Insight v.27 release

Review the fixes in Bot Insight for the v.27 release.

Fixes

In the Bot Insight **Operations > Bots Dashboard**, the bot duration shows the correct data. Previously, there was a mismatch between the bot duration data and the manual calculation of the bot duration from the historical menu because of a start time mismatch.
Service Cloud case ID: 01796106

When you upgrade to Automation 360 v.27 and launch the Control Room, no kernel bootup failure occurs due to a failed Elasticsearch initialization. Thus, it does not show the **Bad Gateway** error. As a result, the Control Room service is available and you can access the Control Room URL.
Previously, Elasticsearch initialization failed during startup which was causing the kernel bootup failure. As a result, the Control Room service was showing the **Bad Gateway** error.
Service Cloud case ID: 01908667, 01919727, 01919309, 01911464, 01921747, 01926887, 01925309, 01924168, 01929814, 01930226, 01931125, 01925270, 01934212, 01938106

You can check out and republish the dashboard with a new name for a specific bot after import it into the public workspace.

Note: In case of public import, you must run the bot at least one time before you export it.

Previously, you could not publish the dashboard for a specific bot even if it was checked in.
Service Cloud case ID: 01763067

Updates to the interface

Bot Insight
<p>The Bot Insight user interface is changed as per Common Frontend Component (CFC) standards. Only the look and feel of the components (such as colors, fonts, icons, paddings, borders, buttons, and so on) is changed, while the underlying functionality remains the same. You can view these changes from the following user interface elements:</p> <ul style="list-style-type: none">• All Bot Insight pages• Table pagination position at the center of the page• The Create widget dialog back drop with the Close button• Add Widget title in the Create widget dialog• The Switch Widget button position in the Add widget window for all charts

Automation 360 v.26 Release Notes

Release date: 6 October 2022

Review the top 5 features as well as other new features, enhancements, fixes, and limitations in the Automation 360 v.26 release. Automation 360 and IQ Bot are on Build 15459 (for On-Premises and Cloud).

We have released updated builds for fixes after the Automation 360 v.26 GA build, which was Build 15436. For information about the fixes in these updated builds, see [Updated release builds](#) on page 233.

Note: The release builds include Manifest V3 browser extensions for Google Chrome and Microsoft Edge browsers. For more information, see:

- [Chrome and Edge Manifest V3 extensions](#) on page 1082
- [Support for Manifest V3 extensions](#)

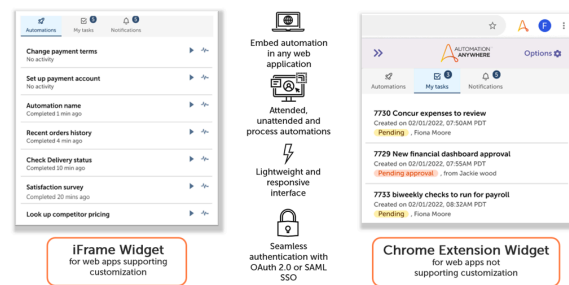

- [Browser extensions for Automation 360](#) on page 933

Highlights of this release

Here are the top 5 features in the v.26 release:

Embedded automation with OAuth 2.0

Business users can directly access authorized automation from within their favorite business applications, without having to open a new interface or learn a new app. OAuth 2.0 enables seamless authentication across systems, reducing complexities of system-specific sign-ins.

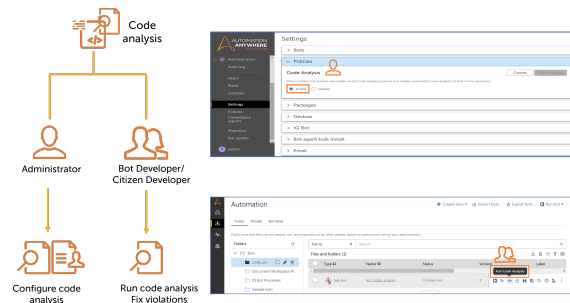

Learn more: [Embed automations in your application using Automation Co-Pilot for Business Users](#) on page 3147.

Coding standards through code analysis

Administrators can establish coding best practices by setting a code analysis policy and improve their team's code to quickly find and correct rule violations. They can select which rules to check for and enable summary reports for a snapshot of all bots within a project.

Bot builders can quickly check the status of their bots and receive feedback on what to fix, speeding up bot development and deployment and promoting coding best practices.

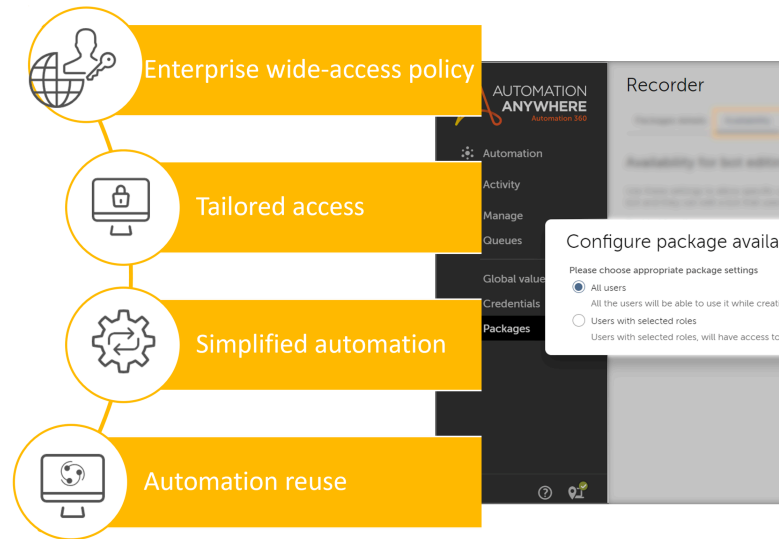

Learn more: [Code analysis](#) on page 2103.

Package role-based access (RBAC)

Administrators can tailor package access to the business needs and expertise of bot developers and enforce access policies for custom groups. They can maintain policy control and ensure confidence and ease-of-use for developers by providing group-based package access with clear policies.

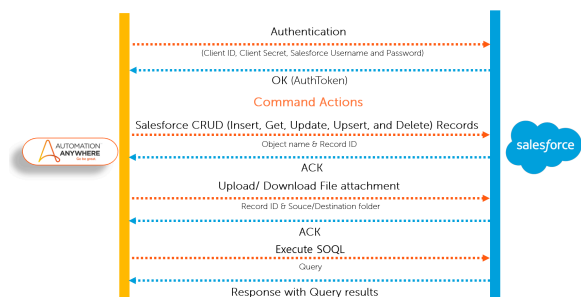

Citizen developers can access simpler packages and build easy-to-complete automation, and professional developers can access a broader set of complex packages.

Learn more: [RBAC on packages](#) on page 1833.

Salesforce integration with command package

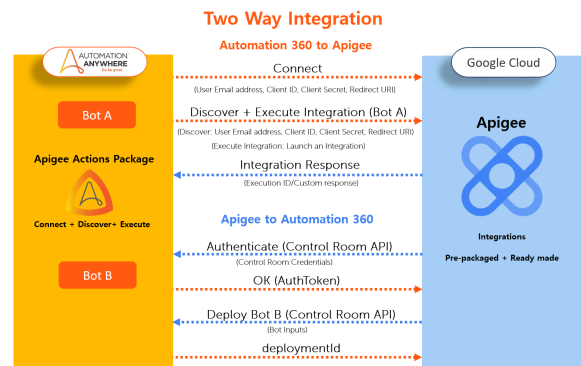

RPA developers can build robust integrations with Salesforce through direct API interaction. They can automate repetitive processes involving access and updates to Salesforce data, enabling business users to focus on high-value business tasks such as strategic planning and optimization. Commands available include authentication, database querying, record updates, and file processing.

Learn more: [Salesforce package](#) on page 2846.

Automation 360 integration with Google Cloud Apigee

RPA developers can fast-track end-to-end automation development by combining API components from Apigee and RPA bots from Automation 360 to access any data in the enterprise. Our prebuilt integration packages make the integration seamless, enabling you to drive more value from reusing existing assets created by your organization's automation teams.

Learn more: [Apigee integration](#).

Updated release builds

We have released the following updated builds:

- Build 15459 Service Cloud case ID: 01941769, 01945068

This build is updated to include a critical security fix for the issue related to Multi-Factor Authentication (MFA) when used with database authentication. This vulnerability is not applicable when using SAML or AD authentication. For more information on this security fix, see [Unexpected behavior observed with Two Factor Authentication post A360.26 upgrade, where a valid authenticator code alone is sufficient to login to CR, in spite of an incorrect password](#).

Note: This issue exists only in Automation 360 v.26 release. For v.26 On-Premises customers using or planning to use MFA with database authentication, we recommend that you install this update at your earliest convenience. No action is required from customers on other Automation 360 releases.

- Build 15450 with fixes for the following issues:
 - When you import a bot or file that is a manual dependency of other bots using the overwrite option, the import process no longer removes the dependencies from the other bots (Service Cloud case ID: 01911410, 01920508).
 - When you have large and complex bots with many dependencies and if the size of the deployment messages that are sent from the Control Room to the Bot Agent is more than 2 MB, the bots run successfully. (Service Cloud case ID: 01882630).
 - The following IQ Bot issues were fixed:

- IQ Bot can now perform post-processing on a field if the custom logic uses Python script containing single quotes, such as `print ('Test')`.
- If your IQ Bot custom logic uses the Pandas library, the script no longer needs to have the `import Pandas` statement.
- IQ Bot can now perform post-processing on a field if the custom logic uses Python script containing characters from non-Latin languages (Unicode characters), such as äöüñž.
- Security fixes for Cross-Site Scripting (XSS) vulnerabilities (Service Cloud case ID: 01843148).
- Build 15443 (for US-East and US-West regions only) Service Cloud case ID: 01911410, 01920508

This build is updated to include a fix for the issue related to the manual dependency file that is shared between multiple parent bots upon export and import. If one of the child bot files is exported and imported into the Control Room with overwrite options in the import process, then links to the manual dependency are unlinked from other parent bots. Use Bot Agent version 21.222 for this issue.

- Build 15439 (Japan region only) Service Cloud case ID: 01911093, 01911209, 01911190, 01911116, 01911259

This build is updated to include a fix for the following issue: `Cannot retrieve values assigned to global values having Japanese characters after upgrading Automation 360`. Build 15439 is available for download for On-Premises customers who need this fix.

Automation Workspace v.26 release

Review what's new and changed, fixes and limitations, and the feature deprecations in Automation Workspace for the v.26 release.

What's new

Control Room, devices and Bot Agent
<p>Microsoft Windows 11 Enterprise now supported (Service Cloud case ID: 01252605, 1252605, 1253745, 01255134, 01379865, 01801610, 01810148)</p> <p>We now support Microsoft Windows 11 Enterprise, so you can now install and update the Bot Agent and run bots on the Windows 11 Enterprise operating system.</p> <p>Bot Agent compatibility on page 1274</p>
<p>Support for Manifest V3 extensions</p> <p>Automations that use Google Chrome Manifest V2 based extensions will stop working sometime after June 2023. The deprecation timelines of Manifest V2 based extensions are currently under review and subject to change by Google.</p> <ul style="list-style-type: none"> • For Google Chrome Manifest V2 extensions timelines, see Manifest V2 support timeline. • For Microsoft Edge Manifest V2 extensions timelines, see Overview and timelines for migrating to Manifest V3. <p>This might impact your existing automations that use Manifest V2 based extensions for Google Chrome and Microsoft Edge browsers. Automation 360 v.26 and later includes Manifest V3 extensions by default to support features that use Google Chrome and Microsoft Edge browsers.</p> <p>You can automatically enable Manifest V3 based extensions for Google Chrome and Microsoft Edge on all the Bot Runner devices by enabling the Browser extensions option from the Control Room. Enabling this option applies the browser extension settings on all the registered Bot Agent devices.</p> <hr/> <p>Note: We will continue to support Manifest V2 based extensions for Google Chrome until June 2023. To know about Microsoft Edge Manifest V2 based extensions timelines, see Overview and timelines for migrating to Manifest V3.</p> <hr/> <p>Note: Manifest V3 extension is supported on Google Chrome and Microsoft Edge browsers version 91 and later only.</p> <hr/> <p>Configure browser extensions on page 1737 Chrome and Edge Manifest V3 extensions on page 1082</p>

Control Room, devices and Bot Agent

Bot Agent updates by using installation file from local drive

You can now download the Bot Agent installation file to your local drive as a one-time activity and then update the Bot Agent on several devices by providing the local drive path to the installation file. This way, you can avoid downloading the installation file multiple times from the Control Room for several devices.

Important: This functionality is implemented in v.26 and can be used from v.27. That is, after you update your Bot Agent to v.26, future updates can be performed from the local drive.

[Automatically update the Bot Agent](#) on page 1302 | [Update the Bot Agent from a local drive](#) on page 1305

Oracle Database now supported (Service Cloud case ID: 00726728)

We now support Oracle Database, so you can now choose to install the Control Room on Oracle Database.

Note: Oracle database for Control Room installation is supported only in Custom mode and not in Express mode. Oracle Database support on the Control Room starts with the v.26 release.

[Installing Control Room using custom mode for Oracle installation](#) on page 1211 | [Configure Oracle database type and server](#) on page 1201 | [Database requirements](#) on page 1132

Active Directory mappings filters stored in the database

When you update to a newer version of the Control Room, you no longer have to define the Active Directory mapping filters again after installation. This is because the Active Directory mapping filters defined in the `um.properties` file are now stored in and can be referenced from the database. However, if you define new filters in the `um.properties` file, the Control Room references the filters defined in the `um.properties` file and overwrites the ones stored in the database.

Packages, actions, and Bot editor
<p data-bbox="329 245 558 275">RBAC on packages</p> <p data-bbox="329 296 1390 420">Based on your business requirements, you can now control the access that Bot Creators have to packages in the Control Room. As an administrator or user with the Manage package permission, you can restrict access to packages to either all the users or users with specific roles.</p> <p data-bbox="329 438 1321 499">Depending on the access that is configured by the admin, Bot Creators and Citizen Developers can view and use specific packages:</p> <ul data-bbox="329 518 1419 646" style="list-style-type: none"> • Bot Creators can access a broad set of complex packages and create bots, which can be reused. • Citizen Developers can access simpler and easy-to-use packages and build automations quickly. <p data-bbox="329 682 1284 714">RBAC on packages on page 1833 Configure RBAC for packages on page 1836</p>
<p data-bbox="329 741 695 770">Salesforce command package</p> <p data-bbox="329 789 1354 850">You can now authenticate from Automation 360 to access Salesforce and run several command actions by using the new Salesforce command package.</p> <p data-bbox="329 869 737 900">Salesforce package on page 2846</p>
<p data-bbox="329 930 1419 1020">SAP GUI 770 version now supported (Service Cloud case ID: 01793132, 01792775, 1776805, 01792623, 787725, 01805482, 01805479,01792623, 01810356, 01822839, 01851451, 01853577, 01860050)</p> <p data-bbox="329 1039 1357 1071">SAP GUI 770 (patch 6) is now certified and supported with Recorder and SAP package.</p> <p data-bbox="329 1089 1117 1121">Recorder actions supported in various SAP versions on page 2828</p>
<p data-bbox="329 1146 1357 1207">Configure and use custom proxy configuration in REST Web Service package (Service Cloud case ID: 01271527, 01765084, 01839282)</p> <p data-bbox="329 1226 1357 1350">REST Web Service package is now enhanced to support custom proxy configuration for each Delete, Get, Patch, Post, and Put action. This provides you more flexibility in calling REST APIs with different proxy configuration and allow you to create hybrid API automation.</p> <p data-bbox="329 1369 829 1400">REST Web Service package on page 2834</p>
<p data-bbox="329 1425 794 1455">Keyboard shortcuts to reduce scrolling</p> <p data-bbox="329 1474 1406 1564">When developing large bots, you can now use keyboard shortcuts to expand and collapse individual or all sections and move through the lines of code quickly instead of scrolling and minimizing sections individually.</p> <p data-bbox="329 1583 1256 1614">Keyboard shortcuts to expand or collapse elements in bot logic on page 2158</p>
<p data-bbox="329 1642 1419 1703">Set value in any editable control field to be blank in SAP application (Service Cloud case ID: 00821861, 01807129)</p> <p data-bbox="329 1722 1414 1812">When you use the Set text action of the SAP package, you can now set the value in any editable control field in the SAP application to be blank. For example, you can set the value in the text field or the date field to be blank.</p>

Packages, actions, and Bot editor
<p>Loop through emails and move them one at a time (Service Cloud case ID: 00749763, 01807189, 01840743)</p> <p>You can now loop through all the emails in a mailbox and move one email at a time to a destination folder by using the Move action in the Email package.</p> <p>Move action on page 2446</p>
<p>Configure p12 certificate for SOAP-based automations (Service Cloud case ID: 00757213)</p> <p>In the SOAP Web Service action, you can now select the p12 certificate file and provide a password for user authentication. With this enhancement, you can now access web services that use the p12 certificate-based authentication (a more secure type of SSL certificate).</p> <p>Example of using the SOAP web service action on page 3097</p>
<p>Improved accessibility, usability of content on Terminal Emulator window (Service Cloud case ID: 01609467)</p> <p>You can now have improved accessibility and usability of the content displayed on the Terminal Emulator window. When you use the enhanced Get text action of the Terminal Emulator package, you can now view and extract all the lines and text present in the Terminal Emulator window and perform an operation based on your requirement.</p> <p>Using Get text action for Terminal Emulator on page 2996</p>
<p>Run bots with or without window title matching in letter case</p> <p>You can now run bots even when the title of a captured window does not match the letter case. For a bot to identify a static window or browser titles and titles with a wildcard character, you can opt for a case-sensitive match if you want the letter case to be matched, or a case-insensitive match otherwise, by using the Case sensitive option.</p>
<p>Control image preview and storage in Control Room during secure recording</p> <p>You can now choose whether or not the object images are available for preview and stored in the Control Room during secure recording by enabling the Recorder preview image setting. When you enable the setting, the image is previewed in the Bot editor and stored in the Control Room for 60 minutes. If you choose not to preview, images are not captured.</p> <p>Secure recording on page 990 Secure recording mode on page 2179 Settings on page 1728</p>
<p>Automate Microsoft Excel spreadsheets from SharePoint</p> <p>You can now automate Microsoft Excel spreadsheets that are uploaded and shared on SharePoint. Use Excel advanced > Open action to open the Microsoft Excel spreadsheets from SharePoint location.</p> <p>Using the Open action for Excel advanced on page 2485</p>
<p>Automate Citrix Virtual Apps in Edge with IE mode</p> <p>When using the Recorder, you can now automate Citrix Virtual Apps running on Microsoft Edge Chromium with IE mode.</p>

Packages, actions, and Bot editor

Automate controls using Microsoft UI Automation (COM) technology

For automation, you can now use the Microsoft UI Automation (COM) technology in the following scenarios:

- Capturing controls with secure recording mode
- Capturing and automating combo box and list view controls
- Using **Object exists** and **Object does not exist** Recorder conditions in If, Loop, and Wait packages

[Capture using specific technology](#) on page 2824 | [Actions performed on objects captured with Universal Recorder](#) on page 2804

Seamless automation of Citrix Virtual Apps and other Citrix applications

With the new Automation 360 remote agent for Citrix, you can now seamlessly automate all types of Citrix Virtual Apps and other Citrix applications that are supported on desktop applications using the Recorder.

The new Automation 360 remote agent for Citrix supports the following browsers and technologies:

- Google Chrome
- Internet Explorer
- Microsoft Edge
- Microsoft Edge with IE mode
- Mozilla Firefox
- Java
- Electron apps
- Microsoft Active Accessibility (MSAA)
- Microsoft UI automation

[Installing Automation Anywhere remote agent on Citrix servers](#) on page 1171 | [Using the Recorder on Citrix Virtual Apps servers](#) on page 1166

Important: For information about the supported packages, see [Automation 360 previous release versions](#).

Building and running bots

Implement coding standards with code analysis

You can now implement best coding practices by configuring coding rules in the Control Room. This feature helps you prevent potential errors, improve bot reliability, and makes the code more uniform, accessible, reliable, and efficient.

- As an administrator or a user with **View policies** and **Manage policies** permission, you can configure the code analysis policy for all users.
- As a Citizen Developer, you can run code analysis to analyze your bots against readability, maintenance, security, and compliance best practices.

[Code analysis](#) on page 2103

Building and running bots
<p>Choose specific version of child bot to check out with parent bot (Service Cloud case ID: 01771388)</p> <p>When you check out a parent bot, you can now choose the version of the child bot to check out. Every version of a parent bot can have different versions of child bot dependencies. With this feature, you can roll back the dependencies while rolling back the parent bot. You can make changes to a specific version of the dependent bot.</p>
<p>Easily move bots and files between folders in the private workspace (Service Cloud case ID: 00733125)</p> <p>You can now move bots and files effortlessly and without requiring any permissions from one folder to another in the private workspace. With this feature, if a bot is placed in an incorrect folder, you no longer have to clone it in the correct folder and then delete it from the incorrect folder.</p> <p>Move a bot on page 2210</p>
<p>Better organization with bulk checkin of related bots and files</p> <p>You can now select multiple bots or dependent files from different folders that belong to the same process and check them in, in bulk, from private to the public workspace with the same check-in message. You can check in a maximum of 10 parent bots, but there is no limitation on the number of dependent child bots.</p>
<p>Email notifications for failed checkins (Service Cloud case ID: 01598642)</p> <p>As an administrator, you can now configure sending email notifications to bot developers whenever their checkins fail. Without such email notifications, bot developers will be unaware of their failed checkins because although the checkin status is always logged in the audit log, they cannot access the audit log access without permission. With email notifications, bot developers can know about their failed checkins and retry immediately.</p>
<p>Export work items for offline records (Service Cloud case ID: 01769378, 01798514)</p> <p>You can now export work items to a CSV file for offline audits and records. With this feature, you can export selected, filtered, or all work items to a CSV file.</p> <p>Export work items to CSV file on page 1962</p>
<p>Export and import queues for efficient and flexible usage</p> <p>You can now export and import queues across development, testing, and production environments. This way, you can create a queue in the development environment, test it in the testing environment, and then promote it to the production environment to efficiently execute business process workload. You can also include work items when importing a queue.</p> <p>Export queues on page 1955 Import queues on page 1957</p>

APIs and integrations
<p>Connect Bot Agent to Control Room through v1/registration/auto API</p> <p>You can now use the v1/registration/auto API to register and connect your device to a Control Room automatically. You must specify the Control Room URL and the userName properties in the API Request.</p> <p>Bot Agent API: Auto registration on page 3787</p>
<p>Fetch execution details for specific execution IDs with new Control Room API</p> <p>You can now fetch the execution details, such as botOutVariables and CallbackInfo, for a specific execution ID by using the new API endpoint, v3/activity/execution/<id> API.</p>
<p>Authorization with bearer token</p> <p>Automation 360 supports the Authorization header with a Bearer token for API requests to the Control Room. This header was previously unsupported and ignored on API requests. Obtain the Bearer token from our OAuth services. All API calls must contain either an authentication token from Authentication API (generates JSON Web token) or a bearer token from OAuth services. You cannot use both together in an API.</p>

What's changed

Control Room, devices, and Bot Agent
<p>Missed schedules redeployed automatically</p> <p>You can now ensure that schedules missed because of Control Room shut down (Control Room maintenance or upgrade) are automatically redeployed.</p> <p>When you use the Redeploy the schedule again option, an audit log entry identifies the event type as <code>Schedule misfired</code>, and the bot is automatically redeployed after the Control Room is restarted.</p>
<p>Low disk space issues resolved with automatic deletion of temp files</p> <p>Automation 360 now supports automatic clearing of the files in the temp folder, thereby resolving low disk space issues.</p> <p>During bot import operations, temporary files were written to the following path, leading to increased usage of disk space and resultant low disk space issues: <code>C:\Users\<aa_cr_admin_account>\AppData\Local\Temp</code>. As a result, the bots failed, and the temp files had to be cleared manually.</p>
<p>Enhanced Active Directory role mappings page</p> <p>The Active Directory role mappings page no longer has default validation of mappings.</p> <p>Validating all the role mappings can take a longer time on slow networks and with a higher number of mappings because it requires communication between the Control Room database and the Active Directory server. Also, changes in security groups and roles are infrequent and do not require frequent validation on this page. The Active Directory role mappings page now displays only the list of mappings which loads at a faster speed as validation of mappings is not done.</p>

Control Room, devices, and Bot Agent
<p>Enhanced autologin functionality for Bot Agent (Service Cloud case ID: 01788805)</p> <p>Bot Agent autologin now works successfully even if the Interactive logon: Do not require CTRL+ALT+DEL group policy is disabled.</p> <p>Previously, for the Bot Agent to autologin successfully, you had to enable this group policy, which was not possible due to the security policy. As a result, Bot Agent autologin failed.</p>
<p>Improved administration for WLM automations</p> <p>You can now view all the queues with the AAE_Admin role. Also, you can pause, resume, and stop all WLM automations.</p> <hr/> <p>Note: If you are not an owner, participant, or consumer of that queue, you can view only queue names and not the queue details.</p> <hr/>

Packages, actions, and Bot editor
<p>Run DLL file without namespace (Service Cloud case ID: 01765712)</p> <p>You can now run a DLL function even if the namespace is not specified because the Enter the namespace field in the Run Function action of the DLL package is now optional.</p> <hr/> <p>Note: The package versions are now automatically added when DLL or Excel session variables are created. Previously, an issue in Automation 360 v.25 prevented package versions from being added automatically when DLL or Excel session variables were created.</p> <hr/>
<p>Casing and format changes in Technology and Control types</p> <p>When you use the Recorder to capture objects, you can now read and identify the names of technology types and control types easily because the names of the properties now use a more user-friendly casing and format. For example, MS_ACTIVE_ACCESSIBILITY is renamed Microsoft Active Accessibility.</p>
<p>Loop condition evaluated with every iteration</p> <p>When you run a sequence of actions repeatedly for a specific number of times within a loop, the end condition within the loop is now evaluated in every iteration.</p> <p>For example, when you loop through a Data Table that has 10 columns, enter dynamic values of column count for the end condition in the loop, use the Data Table > Delete column action to delete the column of index 0 inside the loop body, and then run the bot, the bot deletes a column in every iteration. Hence it reduces the iteration count because the loop end condition is evaluated in each iteration.</p>

Fixes

Build 15459: This build includes the following fixes (along with fixes from the previous builds):

A critical security fix for the issue related to Multi-Factor Authentication (MFA) when used with database authentication. This vulnerability is not applicable when using SAML or AD authentication. For more information on this security fix, see [Unexpected behavior observed with Two Factor Authentication post A360.26 upgrade, where a valid authenticator code alone is sufficient to login to CR, in spite of an incorrect password.](#)

Service Cloud case ID: 01941769, 01945068

Build 15450: This build includes the following fixes (along with fixes from the previous builds):

If you have large and complex bots with many dependencies and if the size of the deployment messages that were sent from the Control Room to the Bot Agent is up to 5 MB, then the bots will run without failure.

Previously, bots were failing to execute when the size of the deployment messages that were sent from the Control Room to the Bot Agent was more than 2 MB.

Service Cloud case ID: 01882630

When you import a bot or file that is a manual dependency of other bots using the overwrite option, the import process no longer removes the dependencies from the other bots.

Previously, manual dependencies were removed for the overwrite option from the other bots during bot import.

Service Cloud case ID: 01911410, 01920508

You can select a path containing a dollar sign (\$) in a folder trigger for a file and folder, and the bot will execute successfully. Previously, the bot failed when you selected a path containing a \$ in a folder trigger for a file and folder.

Service Cloud case ID: 01829534

Build 15443 (for US-East and US-West regions only): This build includes the following fixes (along with fixes from the previous builds):

When you import a bot or file that is a manual dependency of other bots using the overwrite option, the import process no longer removes the dependencies from the other bots.

Previously, manual dependencies were removed for the overwrite option from the other bots during bot import.

Service Cloud case ID: 01911410, 01920508

Build 15439 (Japan region only): This build includes the following fixes (along with fixes from the previous builds):

You can now successfully retrieve values assigned to Global values with Japanese characters after upgrading the Control Room to the Automation 360 v.26 release.

Service Cloud case ID: 01911093, 01911209, 01911190, 01911116, 01911259

Build 15436: This build includes the following fixes:

<p>You can now successfully delete a device from the device pool without any error.</p> <p>Previously, when you deleted a device from the device pool, it was deleted from the Control Room but remained in the DEPLOYMENT_ALLOCATION_QUEUE table. Hence, the device could not be deleted and an error was shown.</p> <p>Service Cloud case ID: 01791502, 1840575</p>
<p>If you run a bot from the Bot editor workspace for debugging using the Run from here option and if the bot contains packages that use the session (Local or Global session), the following compiler error no longer occurs: <code>Unable to find any open session</code></p> <p>Service Cloud case ID: 01080318, 01759454, 01785168, 01790014, 01786670</p>
<p>In a multi-user environment, for simultaneous bot deployments, bot launcher logs are now generated for all the users.</p> <p>Previously, in such cases, bot launcher logs were not generated for all the users.</p> <p>Service Cloud case ID: 01759506</p>
<p>You can now successfully list a scheduled task, and the following error no longer occurs: <code>Unknown timezone ID:US-Pacific-New</code></p> <p>Previously, an unsupported time zone could be selected, which resulted in this error.</p> <p>Service Cloud case ID: 01759074</p>
<p>If a device is shared between a Bot Creator and a Bot Runner, when you try to edit a schedule, the following updated message is now displayed: <code>UNKNOWN: All runAsUser(s) should have default device as no pool is provided. RunAsUser(s): [dprunner] does not have a default device or that device is shared with a bot creator</code></p> <p>Previously, if a device was shared between a Bot Creator and a Bot Runner, when you tried to edit a schedule, the following incorrect message was displayed: <code>Automation failure due to deploy failure</code></p>
<p>When you update the Bot Agent from user level to system level, you can now capture objects using the Recorder actions or from a window list in a Google Chrome browser. You no longer have to manually delete the registry entry in Windows from the current user level (HKEY_CURRENT_USER).</p> <p>Service Cloud case ID: 00731155, 00778022</p>
<p>After connecting to a device, when you set the global cache location to an invalid path, an audit log entry is generated against the device, and the default global cache path is now used.</p> <hr/> <p>Note: Depending on the device used and the path you specified on your drive, validation of the default cache path might not be supported.</p> <hr/>
<p>When you want to edit a DataTable variable in debug mode, you can now scroll horizontally to view all the columns in the DataTable variable.</p> <p>Service Cloud case ID: 01818834</p>

In the FTP / SFTP package, you can now create bots using actions such as **Delete files**, **Put files**, and **Get files** even if the file name contains characters such as the comma (,) and the colon (:).

Previously, characters such as the comma (,) and the colon (:) were not supported in file names.

Service Cloud case ID: 01772186

You can now run an Enterprise 11.3.3 bot from Automation 360 in the Enterprise 11 Control Room by using the **Run** action.

Previously, the **Run** action did not work for v.11.3.3 because the device V1 API was not working with an empty filter for release 11.3.3.

Service Cloud case ID: 00825696, 01747999

You can now successfully connect to the Excel or Access (Microsoft Office 2016 or later) engines with ODBC drivers.

Previously, if you tried to connect frequently to the Excel or Access (Microsoft Office 2016 or later) engines with ODBC drivers, bot execution failed intermittently.

Service Cloud case ID: 01762290, 01755335, 01778149, 01778899, 01793064, 01788154, 01810754, 01806851, 01811703, 1815437, 01807133, 01799364, 01755642, 01749480, 01767869, 01807133, 01818989, 01815300, 01826839, 01804882, 01842384, 01846477, 01762300, 01331003

When you send an email with multiple file attachments and if attachment size exceeds 24 MB, the bot now waits for 120 seconds before encountering a timeout error.

Previously, when you sent emails with a large file attachment, bot execution failed after 30 seconds if the attached file exceeded the file size.

Service Cloud case ID: 01763214

When you use the **Connect** action to connect with the **EWS** protocol, the **Send** email action and read email now print the email message body in a new line character in the following scenarios:

- When you create a bot and connect with the **EWS** server, then use the **Loop** action to read email as a plain text messages, and then use the **Log to file** action to log text into a file.
- When you use the **Send** email action and connect with the **EWS** server with **OAuth authentication** to send email.

Service Cloud case ID: 01770645, 01780628

In the Email package, when you use the **Move all** action and establish a connection with the EWS server, if the destination folder contains any of the following special characters in the folder name, then use a backslash (\) as escape character before the special character:

, + , * , ? , ^ , \$, (,) , [,] , { , } , | , \

For example, if the destination folder name is "4) folder name", enter it as "4\ folder name".

Service Cloud case ID: 01803958

If your bot contains an error, **Bot error** now shows the correct line number of the error within the **Finally** block in the following scenario: When you add the **Try/Finally** block around the corresponding action, then insert more actions in the **Finally** block, and then save and run the bot.

You can now successfully upload files whose file names are in the Japanese language by using the **Rest web service** action with multipart form data.

Previously, file upload did not work for files whose file names were in the Japanese language.

Service Cloud case ID: 01801767

You can now use the Terminal Emulator package to perform tasks associated with the terminal without any issues. We now provide support for the Start PC Command (STRPCCMD), so when you run the bot, the terminal now successfully opens the application with the STRPCCMD command.

Previously, when you passed the appropriate key on the Terminal Emulator, the bot did not open the expected application because the STRPCCMD command was not supported in the Terminal Emulator.

Service Cloud case ID: 01816577

In the Terminal Emulator package, you can now use the **Connect** action to connect with a host machine on which you want to automate a task.

Previously, when you used the **Connect** action, a black screen was displayed for a few terminal hosts.

Service Cloud case ID: 01823081, 01841800

After migration, when you open a **Load Add-ins**-enabled Excel file using the **Excel advanced > Open** action and run a bot, the bot now runs successfully without any error.

Previously, the bot failed because some Excel files with the **Load Add-ins** option enabled stopped functioning and the workbook was closed unexpectedly.

Service Cloud case ID: 00950745, 01835066

When you use the **PDF > Merge documents** action and select **All pages** option in the **Pages** field to merge all pages of multiple PDF documents into a single PDF document, the output PDF now retains and merges all the attributes such as bookmarks, links, layers, attachments, and signatures from the individual source documents.

Service Cloud case ID: 01792105

When the Recorder fails on a computer where the operating system language is not English, the error message for the bot runtime failure is now shown in the same language as that of the operating system.

Previously, the error message was shown in English even on computers where the operating system language was not English.

Service Cloud case ID: 01813050

You can now successfully extract text from within the captured area of a window using the App Integration package even if the screen resolution is more than 100 percent.

<p>Automate and capture window authentication dialog boxes in the Google Chrome browser using a specific technology with the Recorder.</p>
<p>Bots are no longer stuck when you work with Microsoft Access database queries.</p> <p>Service Cloud case ID: 01756390</p>
<p>You can now open local files by using the New window option in the Browser > Open action even if Microsoft Edge is your default browser.</p> <p>Service Cloud case ID: 01799784</p>
<p>At bot runtime, when you assign a new window title to a window variable, the window variable now detects the correct window.</p> <p>Service Cloud case ID: 01788466, 01791773</p>
<p>You no longer encounter a compilation error in the UI in the following scenario:</p> <ol style="list-style-type: none">1. Use the Datetime package released with Automation 360 v.23 or earlier to create a bot that uses the Datetime > Assign action.2. Then, select the Variable option to add the variable value.3. Then run the bot with the package released with Automation 360 v.24 or later.
<p>You can now successfully capture objects from applications that are launched from a Citrix machine.</p> <hr/> <p>Note: This fix is available only with the new Automation 360 remote agent, which you can use with the upgraded Recorder package (version 2.8.6-20220823-160834).</p> <hr/>
<p>Service Cloud case ID: 00831939</p>
<p>When you assign a window title to a window variable, if the variable field has an empty regular expression value, the bot no longer passes it without scrutiny. Instead, the following error message is now displayed: <code>Unable to find the window '<window_name>'. The provided regular expression '<regular_expression>' is invalid. Please provide a valid regular expression for the variable '<variable_value>'.</code></p>
<p>When you merge multiple PDF documents by using the PDF > Merge documents action, all the form field attributes in Adobe Acrobat are merged and the output PDF document is now rendered properly.</p> <p>Service Cloud case ID: 01760279, 01792301</p>
<p>When you use the If > Folder does not exist condition to determine whether a folder does not exist, if the specified folder exists, the bot now successfully recognizes the folder and does not attempt to create it again.</p> <p>Previously, because of the presence of leading and trailing spaces in the input folder path, the bot failed to recognize an existing folder and hence attempted to create the folder, leading to an error.</p> <p>Service Cloud case ID: 01466067</p>

If you migrate a bot and select the **HTML Tag**, **HTML InnerText**, and **HTML type** properties and then select HTML-type properties in **Search Criteria**, the bot now successfully locates and identifies the object and performs the selected action.

Service Cloud case ID: 00829817, 01757049, 01761452, 01822711

When you use the Recorder package for the **Get property** action, the correct values are now displayed for the top, left, height, and width properties.

Note: The **Get property** action does not display correct values for cross-domain iFrames elements.

Service Cloud case ID: 01251758

The AISense Recorder package now works as expected when you use the Windows 10 operating system in the Japanese language. Because UTF-8 is now enabled, you no longer need to use any workaround.

Service Cloud case ID: 01821267, 01822433

When you use 2.8.0-20220601-034227 and later versions of the Recorder package, the automated bot now returns the correct value for the HTML InnerText property in Google Chrome and Microsoft Edge browsers.

Service Cloud case ID: 01257098 , 01754795, 01791073, 01787461, 01813080, 01846403

For WLM queues, the date is now displayed in the correct format as YYYY-MM-DD.

Previously, this date was shown in the years ago format, which did not match the date format in the CSV file and was confusing.

In a multitenant environment, when you upload a work item file to a queue in one of the tenants, the **In progress** tab now displays the correct file upload status only in the corresponding tenant.

Previously, the **In progress** tab displayed the upload status for all the tenants.

When a WLM automation is in progress, an administrator can no longer delete the user who created that automation.

Previously, the user who created an automation could be deleted, after which that automation could not be paused or resumed by another user.

When you stop a WLM automation, work items are no longer stuck in the ready-to-run state and are now moved to the **New** state.

Previously, when you stopped a WLM automation, a few work items were stuck in the ready-to-run state and could not be deleted.

After you change any configuration field in the **Administration > Settings > Devices > Advanced options** settings in versions prior to v.25, if the Control Room is updated to v.25, the **Global Cache Location** is now set to the default `C:/ProgramData/AutomationAnywhere/GlobalCache` value.

Previously, in such cases, no value was shown for the **Global Cache Location** field, which was confusing.

Service Cloud case ID: 01869048

<p>When you use the Run bot option to run a bot in the Activity > Historical > View page for any activity, the bot now runs successfully.</p> <p>Previously, in such cases, bot execution failed with an error.</p>
<p>When you import a bot that contains manual dependencies, for the overwrite option, the import process now removes the manual dependencies.</p> <p>Previously, during bot import, the manual dependencies were not removed for the overwrite option.</p> <p>Service Cloud case ID: 01813452</p>
<p>When you import a bot into a folder, if a folder with the same name but different letter case already exists in the repository, bot import now fails with an error.</p> <p>Previously, in such cases, bot import was successful, but the imported bot failed at the time of execution because of the wrong folder path.</p> <p>Service Cloud case ID: 01270324, 01816507</p>
<p>You can now successfully access all the folders in the public workspace without any issues.</p> <p>Previously, when you imported and cloned a bot under a folder in the public workspace and then tried to access that folder, sometimes an error occurred, and the folder could not be accessed. This occurred some times when there were more than 2100 folders under the bots directory.</p> <p>Service Cloud case ID: 01852748</p>
<p>When you update from Enterprise 11 to Automation 360 or upgrade from an earlier version of Automation 360 to a later version, the earlier defined group mappings are retained, even when the Distinguished Name (DN) column of the mapping entries are empty in the database.</p> <p>Previously, some of the earlier-defined group mappings were deleted due to the empty value for the DN column.</p>
<p>After you update to Automation 360 v.22 or later, the Repository Management (v2/repository/file/list) API now returns the correct file size as response output.</p> <p>Previously, the Repository Management (v2/repository/file/list) API returned the file size as zero in the response output.</p> <p>Service Cloud case ID: 01151460</p>
<p>The Azul Zulu JDK is now updated to version 11.0.15+10. The previous version, 11.0.14+9, contained some vulnerabilities.</p> <p>Common Vulnerabilities and Exposures (CVEs) for this version are as follows: CVE-2022-34169, CVE-2022-21540, CVE-2022-21541, CVE-2022-21549, and CVE-2022-34169</p> <p>Service Cloud case ID: 01854652, 01868897, 01857973, 01854652, 01887083</p>

Limitations

When you connect to the Microsoft Access Database with JDBC and specify the database path, and if you use the following specific aggregation functions in the query, an error occurs when you run the bot.

```
ASC, ATN, SQR, CBOOL, CCUR, CDATE,
CDBL, CDEC, CDATE, CDBL, CINT, CLONG, CLNG,
CSIGN, CSTR, CVAR, DATEADD, DATEDIFF, DATEPART,
DATESERIAL, DATEVALUE, FORMAT, IIF, INSTR, INSTRREV,
ISDATE, IsNull, ISNUMERIC, LEFT, LEFTS, LEN, MID,
MONTHNAME, DATE, NOW, NZ, SIGN, SPACE, STR, TIME, VAL,
WEEKDAYNAME, WEEKDAY, STRING, TIMESERIAL, CONCAT
```

Workaround:

1. Go to **Administration > Settings > Devices > Advanced options > Bot launcher JVM options** and set the value as follows: –
`Dhsqldb.method_class_names=net.ucanaccess.converters*`
2. Restart the Automation Anywhere Bot Agent service.

External key vault integrations are not supported on Oracle Database.

Not all missed recurring schedules are redeployed with the **Redeploy the schedule again** option. Also, only one entry is shown for the missed recurring schedules in the **In progress** tab.

As an IQ Bot user, you can check out only the latest version of a process. You cannot check out previous versions of a process because version check is performed based on the Automation Anywhere file version and not the Git version.

The OAuth2 configuration settings in the Control Room will not enable you to connect to the OAuth2 service at this time. Customers planning an OAuth2 integration with our partner application should expect the service to be available by November.

In the Oracle Database environment, you cannot view a checked-in bot in the **Public** folder because version check is performed based on the Automation Anywhere file version and not the Git version.

Workaround: To view a checked-in bot in the **Public** folder, you must refresh the **Automation** page manually by using the **Refresh** button.

In an Oracle Database environment, when you select the number format and sort order for the work items in a queue, and then run bot using the **Run bot with queue** option, the queues are not deployed. Also, no errors are shown in the **Audit log** or **Activity** page.

For regular or scheduled automations using the unattended Bot Runners, bot deployments remain in the queued state and accumulate on the **In progress** page for these following scenarios:

- If the devices are down or not available.
- If a run-as user is busy executing the bot.

For devices not in the deployment state, if the number of queued bots reaches 500, it blocks the bot deployments for all devices or for all run-as users.

Workaround: To run the blocked deployments, perform one of the following actions:

- Select the queued jobs on the **In progress** page and move it to the **Historical** page
- Reconnect the Bot Runner devices.

When you set the default package version using the **Update bots to default package version** option for bots in the public workspace that are using the **Excel Advanced > Open** action, the Task Bots do not display the session name and file path values.

Workaround: Perform one of the following workarounds:

- Update the **Excel Advanced** package manually to use the latest version of the package. See [Select the package version used in your bot](#) on page 2231
- Check out the bot and revert to the previous version of the **Excel Advanced** package. Then, check in the bot to use the latest version of the package. See [Update bots to default package version](#) on page 1844

Service Cloud case ID: 01905290, 01882083, 00712719, 00728499, 00737694, 00803673, 01255722, 00838604, 00772147, 01760236, 01762679, 01771416, 01761859, 01782588, 01778220, 01784255, 01789551, 01809167, 01818690, 01831969, 01813413, 01287311, 01923711, 01927867

You will encounter an error when you run a standard workflow in the SAP BAPI package

Workaround: To execute SAP BAPI, use the Run Function call (RFC) with a combination of **Create function**, **Set** or **Get field value**, **Set** or **Get structure**, and **Set** or **Get table** actions.

When you use 2.6.1-20220428-010714 or later versions of the Recorder package to automate a web page on Microsoft Edge browser, the Recorder might not be able to perform **Click** or **Left click** actions on the JavaScript alert, prompt, and confirmation pop-up windows.

Workaround: For performing the click actions successfully, downgrade the Recorder package to 2.5.4-20220309-151830 version or earlier.

When you use the **Browser > Close** action to close a tab or a window opened in the Microsoft Edge browser, if only one Microsoft Edge browser window is open, the bot encounters the following error: `Error occurred while closing the tab`

Workaround: See [Configure Microsoft Edge browser settings when Close action of Browser package encounters an error \(A-people login required\)](#)

When you run a bot in the Google Chrome or Microsoft Edge browser, use the If, Loop, or Wait action, select the webpage from the list of active tabs in the **Browser** tab, close the browser window, and then run the bot, the bot might take two minutes to open the webpage in the browser irrespective of the timeout value mentioned.

Workaround: Move the If, Loop, or Wait action inside the **If** block and use the **Application is running** condition with same browser application to check whether the browser is running.

When you run a stored procedure in Oracle and it returns SYS_REFCURSOR, the **Run stored procedure** action is not closing the cursors. As a result, after the maximum cursor limit is reached, this action results in an error.

When you migrate a bot that contains **XML command > Get single node**, after migration, the bot encounters the following error: No node found at XPath while executing the Get Single node command

Workaround: If the XPath expression is not starting with (/) , apply XPath starting with “/” so that at the time of execution, the modification can be skipped or the XPath expression can be designed to get the desired result.

While running a bot in debug mode, the bot will fail if the variable size gets greater than 3 MB. An error message appears showing that a variable has exceeded the 3 MB limit.

When you use the **Browser > Open** action to automate a browser window running on Google Chrome and Microsoft Edge browsers, then from the browser window, select **More tools > Name window** option to update the title of this window during bot run and then when you try to run the bot with the updated window title, the bot might fail.

When you use the actions in the App Integration package to extract text from a window, the bot might not be able to detect the new UI of the Windows 11 operating system and capture the text.

Workaround: Enable the old classical UI in Windows 11 operating system. See [Restore Old Classic Notepad in Windows 11](#)

When you use the `/v2/repository/file/list`, the response lists bots restricted by user role. If you use this API as an AAE_Admin, you can view bots from the private repository in the response. Whereas if you use this API as a bot creator, you can view system bots (recorder) in the response.

Workaround: Use the `/v2/repository/workspaces/{workspaceType}/files/list`.

Command prompt API allows you to switch the device registration even if the **Allow devices (single user) to be switched to another Control Room without reinstalling bot agent** option is disabled.

When you upgrade from Automation 360 v.25 to a later version, although you enabled code analysis in the Control Room, the rules set in the policy are not retained after the upgrade.

Workaround: Before upgrading, we recommend that you keep a note of the rules enabled in Automation 360 v.25 and then re-enable them after upgrading to a later version.

Feature deprecations

Review features and capabilities (from Automation Anywhere or other third-party vendors) that are deprecated or nearing deprecation to understand how they impact your automation.

Automation Anywhere Mobile app deprecated

The Automation Anywhere Mobile app is deprecated as of July 2022 and will not be updated to subsequent versions of iOS and Android. The mobile app is no longer available and no further support will be offered. A replacement product is currently not available.

Tesseract OCR v3 deprecated

Tesseract OCR version 3 is deprecated as of September 2022. If you have created learning instances using Tesseract OCR version 3, we recommend that you plan to train your learning instances with alternative OCRs (including Tesseract4 OCR) before you update to Automation 360 v.26.

[Deprecation of Tesseract OCR v3](#) on page 1096

Deprecation of IQ Bot Extraction package

The IQ Bot Extraction package has been deprecated as of September 2022. As part of Automation 360 v.26, IQ Bot will no longer support pretrained machine learning models for invoice data extraction.

To move your bots from the IQ Bot Extraction package to Document Automation, see [IQ Bot Extraction package](#) on page 2644.

Automation Anywhere for Excel deprecated

Automation Anywhere for Excel has been deprecated as of January 2022. The plug-in is no longer available to download as a product. However, support will be offered to current customers already using the product.

A replacement product as a plug-in for Microsoft Excel is not available. In Automation Anywhere for Excel, this action was triggered from within the Excel application. However, as an alternative, new customers can develop bots for Excel within Automation 360 Automation Workspace and use input variables to allow specifying file names, worksheets, and ranges for bots to operate on. In Automation Anywhere for Excel, this action was triggered from within the Excel application, whereas now this action is taken from the Automation Anywhere Control Room.

G-Suite Apps package deprecated

The G-Suite Apps package has been deprecated as of September 2022 and it no longer supports using the **Connect** and **Disconnect** actions to establish a connection with the Google server and automate tasks.

Recommended: For specific G-Suite applications, the functionality of the G-Suite Apps package is available in the following G-Suite packages:

- Google Drive
- Google Calendar
- Google Sheets

To automate tasks, in the appropriate G-suite package, use the corresponding **Connect** and **Disconnect** actions.

Related concepts

[Packages available in Automation 360](#) on page 2225

Actions are grouped into version-specific packages. Bot Creators can select which package version to use for a specific bot.

Updating to v.26 release

Review requirements and support information about updating your Control Room and Bot Agent for the v.26 release.

Control Room update

If you are updating to this release, ensure that the Server audit is not enabled on SQL Server Database. If the server audit is enabled, use SQL administrator user account to turn off the SQL Server audit before initiating the update.

Bot Agent updates

Important: This release includes an optional Bot Agent update. You can continue to run your existing bots without updating the Bot Agent. However, if you want to use the new features in Automation 360 v.26, you must update the Bot Agent available with this release.

For more information on updating to this release, see these resources:

- [Automatically update the Bot Agent](#) on page 1302 | [Manually update the Bot Agent](#) on page 1303
- [Compatibility with release builds](#) on page 1275

Supported Control Room builds for direct update

You can update to the latest version of Automation 360 from the previous three releases (that is, from $n-3$ releases, where n refers to the latest release).

The following previous releases are certified for update to Automation 360 v.26:

- v.25 (Build 15112, 15097)
- v.24R2 (Build 13343), and v.24 (Build 12350, 12342)
- v.23 (Build 11513)

If you are on one of these previous releases, for information about updating, see [Update Automation 360 to latest version](#) on page 1363. If you are not on an $n-3$ release, update Automation 360 to one of the $n-3$ releases before updating to Automation 360 v.26.

For the latest updates to the Automation 360 extensions for Google Chrome, Microsoft Edge, and Mozilla Firefox, see [Browser extensions for Automation 360](#) on page 933.

Migration updates for v.26 release

Review what's new, changed, and the fixes and limitations to migrating from Enterprise 11 and 10 versions to Automation 360 v.26.

What's new

Enterprise 11 and Enterprise 10
<p>Migrate parent bots independently, avoiding overwrites and loss of updates (Service Cloud case ID: 01258572, 01778107, 01275417, 01880168)</p> <p>You can now migrate a parent bot independently even if it has associated child bots. You now have a choice to select whether you want to migrate a parent bot independently or along with its dependent child bots.</p> <p>This helps in avoiding overwrites and loss of updates that might happen when child bots that are migrated to Automation 360 are updated after migration.</p> <p>Migrate Enterprise bots on page 1529</p>
<p>Migrate more bots with specific features</p> <p>You can now successfully migrate bots in the following cases:</p> <ul style="list-style-type: none"> • Bots that use spreadsheets residing in SharePoint by using the Excel advanced > Open action. • You can now migrate bots with REST commands with custom proxy configuration at the Action level. For custom proxy configuration support, in the Bot Migration Wizard, select the Include web service settings option. <p>When you select this option, the REST commands are migrated with custom proxy configurations that use the following global variables:</p> <ul style="list-style-type: none"> • <code>AAProxyHost</code> for Hostname • <code>AAProxyPort</code> for Port <p>Migrate Enterprise bots on page 1529</p> <ul style="list-style-type: none"> • Bots in which the user interface or window extends beyond the screen on the top-left corner (truncated) for the following actions: Object Cloning, If, Loop, Web Recorder, and Manage Web Control. <p>Now, migrated bots support windows with negative coordinates (truncated windows).</p>

Enterprise 11 only

Migrate bots independent of Bot Insight migration

Before migration of legacy bots, you can now declare whether these bots were using the Bot Insight option in Enterprise 11 by selecting the Tag bots and variables for analytics option in the **Bot Migration Wizard**. The Bot Insight **Open** and **Close** actions are created only for such migrated bots where this option is selected.

[Migrate Enterprise bots](#) on page 1529

What's changed

Assess migration readiness of processes with Bot Scanner

The Bot Scanner scans your repository for processes that can be migrated to Automation 360 and provides information under the following categories:

Note: A process is a bot that is not used in any other bot and can include child bots.

- **All:** List of all the processes.
- **Action required:** List of processes that require action after migration to Automation 360. A process is flagged as **Action Required** even if one of its child bot requires action.
- **Review required:** List of processes that require review after migration to Automation 360. A process is flagged as **Review Required** even if one of its child bot requires review.
- **No review required:** List of processes that can be migrated. All the bots in the process can be migrated.
- **Non Migratable:** List of processes that cannot be migrated. All the bots in the process cannot be migrated.

Note: For generating processes summary report, the maximum repository size that is supported is up to 10 GB.

[Analyze Bot Scanner report for migration](#) on page 1474

Direct link to migration resource portal and upgrade launchpad in Bot Scanner

Bot Scanner report now also contains direct links to:

- Enterprise Migration Resources: Use the information on this page to plan for migrating to Automation 360.

[Enterprise Migration Resources | Cloud RPA | Automation Anywhere](#)

- Upgrade Launchpad: Use the information provided on this page for a self-guided experience that is customized for your migration requirements.

Note that we'll be decommissioning the Upgrade Launchpad by August 2023.

[Analyze Bot Scanner report for migration](#) on page 1474

<p>Direct link to corresponding migration messages</p> <p>With a direct link to migration messages in Bot Assistant, you now have quicker access to information about migrated bots that require action or review.</p>
<p>Validate letter case in window titles</p> <p>You can now validate the letter case in window titles in window variables. By using the Case sensitive option, you can now decide whether to match or not match the letter case in window titles that have the same titles but differ in letter case.</p> <p>With this option, you can ensure that the migrated bots produce the same output as that of their corresponding Enterprise 11 bots.</p>
<p>Review bots more efficiently with exact line number in Bot Scanner report</p> <p>The Bot Scanner report now displays the exact line number in the bots that need review or action even in cases where some of the commands used in Enterprise 11 bots are not available in Automation 360.</p>

Fixes

<p>When you migrate bots with the Select item by index action of the SAP package, the index is now displayed correctly. The migrated bot selects items according to the correct index, and no error is displayed.</p>						
<p>MetaBots that were captured using the following configurations will now be migrated to Legacy AISense in Automation 360:</p> <table border="1"> <thead> <tr> <th>Linked object play mode</th> <th>Main object play mode</th> </tr> </thead> <tbody> <tr> <td>Text</td> <td>Text</td> </tr> <tr> <td>None</td> <td>Text</td> </tr> </tbody> </table> <p>Previously, bots that used such MetaBot configurations failed to migrate. Service Cloud case ID: 01774261</p>	Linked object play mode	Main object play mode	Text	Text	None	Text
Linked object play mode	Main object play mode					
Text	Text					
None	Text					
<p>You can now migrate Task Bots that use MetaBot Logic whose DLL file contains classes without a namespace.</p> <p>Previously, an error occurred when you ran such Task Bots. Service Cloud case ID: 01765712</p>						

When you migrate from Enterprise 11 to Automation 360, capturing MetaBot screen commands is changed as follows:

Enterprise 11	Automation 360
<ul style="list-style-type: none"> Main objects captured with the Object play mode Linked objects captured with the Coordinate play mode 	Record capture actions with the Object play mode

You can now use commas in the filenames of bots that use FTP actions and use colons in the filenames of bots that use Delete files and Delete folder FTP actions.

Previously, such bots encountered an error during bot run.

Service Cloud case ID: 01772186

When you migrate bots that use the same window titles but have different letter case in window variables, the bots now run successfully.

Previously, bots that used the same window titles but had different letter case in window variables failed to run successfully after migration.

Service Cloud case ID: 00825181

You can now successfully run migrated bots that use the Email Received Date variable twice in subactions inside the Email Loop action.

Previously, a parse error occurred in such cases.

Service Cloud case ID: 01275815

In migrated bots, when you use the Recorder package, you can now use the **Click** action on **Client Control** in **HTML technology** without any issues.

Previously, the **Click** action button on **Client Control** did not work as expected.

Service Cloud case ID: 01713357

You can now successfully re-edit a migrated bot with the **Record > Dataset** variable.

Service Cloud case ID: 01807170

When you want to open web pages, in the Browser package, when you use the **New window** option of the **Open** action, you can now specify a URL without the protocol information, such as http, https, or file.

Previously, when protocol information was not provided in the URL, some web pages did not open properly.

You can now successfully migrate Enterprise 11 bots with analytics flags.

Previously, migration failed when variables with analytics flags were checked.

Service Cloud case ID: 01768545

When you click the **Back** button in the migration details page for a migration run, you are now redirected to the **Migration runs** tab.

Previously, when you clicked the **Back** button, you were redirected to the **Overview** tab.

Service Cloud case ID: 01816558

When you migrate a bot that uses the **Manage Window Controls** action, the height value is now set correctly after migration.

Previously, after migration, the last digit of the height value was not available.

Service Cloud case ID: 01756996

When you run a bot to automate spreadsheet data, all the requests are now processed successfully in the following scenario:

When an Excel session is active in SAP and a corresponding Excel process starts in the background, Automation 360 creates a separate Excel process other than the one that SAP started, and the correct window is now activated for all the subsequent requests.

Previously, only the first request was processed successfully because the correct window was not activated for automating the spreadsheet data for the subsequent requests.

Service Cloud case ID: 00815159

When you migrate bots from Enterprise 11, the automation priority of each bot is now adjusted to match its equivalent priority level in Automation 360, as follows:

- In Enterprise 11, if the automation priority for a bot was set to low, after migration, the automation priority for the bot is changed to medium.
- In Enterprise 11, if the automation priority was set to medium, the automation priority in the migrated bot is set to high.

Note: There is no change in automation priority when it is set to high.

Previously, the automation priority of migrated bots remained the same as in Enterprise 11.

You can now migrate bots even if the properties value of the Manage Window Controls action is set to 65536 or more.

Previously, when the properties value was set to 65536 or more, the bots encountered an error during bot run.

Service Cloud case ID: 01768555, 01825071

After migration, you can now get all the lines of text from the Terminal Emulator by using the **Get text > All lines** action.

Previously, you could get only 24 lines of text from the Terminal Emulator.

Service Cloud case ID: 01609467

In the Bot migration wizard, the Bot Scanner and the Bot migration report now display the correct status for bots that are flagged for the R134 migration message.

Previously, in the Bot Scanner and the Bot migration report, the status of bots that required review was incorrectly displayed as **No review required**.

You can now successfully migrate bots whose queue category name contains a space.

Previously, migration of such bots failed because Enterprise 11 bots whose queue category name contained a space went into an infinite loop until the loop timed out at 90 minutes.

Service Cloud case ID: 01850864

After you migrate a bot that uses the Terminal Emulator package, when you run the bot, the terminal window is now activated and remains in the front. This is because the **Show terminal window in the front** option in the **Connect** action is now enabled by default.

Previously, when you ran such a bot, the terminal window was not activated and remained minimized because the **Show terminal window in the front** option was not present in the **Connect** action.

When you run a bot with the Database package, the bot no longer becomes stuck at the **Insert** or the **Update** command when run for a long duration.

Previously, in such cases, the bot became stuck intermittently.

Service Cloud case ID: 01836733

Limitations

In Enterprise 11, if bots were using the **String > Replace** action to find a carriage return line feed (CRLF) character and replace it with another character, after migration, the output might not be the same as the output seen in Enterprise 11.

Workaround: In the **Find string** option, instead of the **Enter** (LF) variable, use the **Newline** (CRLF) variable.

Service Cloud case ID: 01808878

In Enterprise 11, if bots were using the If, IF/ELSE, or Loop While command in Windows Control and if the Application window does not exist, after migration, the bots will encounter an error during bot run.

Service Cloud case ID: 01846262

When the **Select** query is used inside a Loop command and its result set is further iterated, if the query returns no record, the result set Loop reiterates the previous record.

Service Cloud case ID: 01799961

What's new

<p>Embedded automation with OAuth 2.0</p> <p>Embedded automation streamlines access to the automation experience.</p> <p>Embed automations in your application using Automation Co-Pilot for Business Users on page 3147</p> <ul style="list-style-type: none">Automation Co-Pilot Integrations embeds in web applications as a widget, so if you are an end user, you can access automated processes and bots without leaving your environment.Automation Co-Pilot Extensions offers further adaptability through Chrome browser extensions, enabling automation directly in any web scenario. Business users can now access automations through a widget, available through an extension in their web browser.With an OAuth 2.0 connection, existing access to automations in the Control Room are now shared with the Extensions to offer you a seamless user experience. <p>Automation Co-Pilot for Business Users using embedded widget and Chrome extension on page 3149</p>
<p>Oracle Database support</p> <p>We now support Automation Co-Pilot on Oracle Database. When you install or update to this release, you can now choose Oracle Database to work with Automation Co-Pilot.</p>
<p>Delete files permanently from Automation Co-Pilot cloud storage</p> <p>You can now delete files permanently from Automation Co-Pilot cloud storage. When you delete a request, the associated file is also permanently deleted now and not just sent to the recycle bin.</p> <p>Cloud storage usage on page 3333</p>
<p>Append or overwrite operations in your form</p> <p>Append or overwrite operations in your form by using the Assign form rules for the web, with the Checkbox and Radio Button elements, which now support form rules.</p>
<p>Assign dynamic values with support for new elements in your forms</p> <p>When you use the interactive forms package, you can now assign dynamic values with the Assign action, which now supports Checkbox and Radio Button elements in your form.</p> <p>You can also change the label of the selected form elements with the Change label action for the Button element.</p> <p>Interactive forms package on page 2633</p>

Run processes more seamlessly by setting expiration time for human tasks (Service Cloud case ID: 00806522)

You can now run your process more seamlessly even when a human task takes longer to run. You can achieve this by setting an expiration time for your tasks in **Human Task** in a process.

When you set an expiration time, if a human task takes longer to address, the task times out and the process moves to the next step to ensure there is no break to the flow.

You can set the expiration time by number of days, hours, and minutes, depending on your requirement.

[Create a process automation in Process Composer](#) on page 3312

What's changed

Simplify your workflow by grouping multiple conditions in form rules

You can now group multiple conditions for your form rules by using the **And** logic with the **Or** logic. Previously, you could group only the **And** logic or the **Or** logic. This change, which is similar to the **If-Then-Else** logic, facilitates grouping multiple conditions and helps simplify your workflow.

Fixes

You can now have greater security validation because it is no longer possible to upload files that have double extensions, such as File.PDF.PDF, to your web application.

Previously, uploading files with double extensions was possible, which represented a significant risk to applications.

Service Cloud case ID: 00828289

Clean up operations now include recursive request files to prevent spam in audit logs. Previously, an Unsuccessful Request alert appeared repeatedly in the audit log, from root error:

```
org.hibernate.exception.ConstraintViolationException: could not execute statement
```

Service Cloud case ID: 01816489, 01839604

When you use the **Has Errors** rule to show the number of errors in your form, the error message now shows the correct number of errors.

When you update from Automation 360 v.24R2 to Automation 360 v.25, the bot setup now correctly shows the number of bots and assigned teams.

Document Automation

What's new
<p>Improve extraction by providing changes to the Validator</p> <p>You can now improve extraction by providing learning instances with validation feedback for Automation Anywhere models. You can achieve this by enabling the Validation feedback option in the Create learning instance and Edit learning instance windows.</p> <p>Data extraction in Document Automation on page 3477</p>
<p>Search for form or table fields</p> <p>When creating a learning instance, when you are configuring fields, you can now search for fields by field name, field label, or data type.</p>
<p>Process invoice-like documents with user-defined document type</p> <p>You can now process documents that are visually similar to invoices, such as purchase orders and sales orders, which contain key-value pairs and a table structure. You can achieve this by create learning instances with the user-defined document type, using which you can also achieve the following results:</p> <ul style="list-style-type: none"> • Extract from English, Dutch, French, German, Italian, Portuguese (Brazilian), and Spanish language documents. • Define exactly which values to extract from a field, such as when a date of birth field also contains the age. • Use the Address data type for form fields, which identifies and extracts the structure of an address.
<p>Enhancements to the Validator</p> <ul style="list-style-type: none"> • The Validator now shows the group number for documents processed in a learning instance connected from Automation 360 IQ Bot • You can now configure a list of valid values when creating learning instance. • When you click a field that requires validation, a message now appears with the confidence level determined by the system and the threshold set in the learning instance.

What's new
<p>Monitor document processing metrics in Bot Insight dashboards</p> <p>You can now visualize data, such as the number of documents uploaded per day, extraction time per document by learning instance, and STP percentage by learning instance, by using the customizable dashboards in the Document Workspace tab.</p> <p>Document Workspace dashboard on page 3736</p>
<p>Document Automation now supports the bring your own key (BYOK) use case for the Google Document AI product license</p> <p>Users can now configure their Control Room environment with Google Document AI licenses purchased from Google. This allows the learning instance to send documents to Google Document AI for extraction and for the Control Room to track consumption in the All licenses page.</p> <p>Configure key for Google Document AI on page 3471 Automation 360 licenses on page 1347</p>
<p>View Document Automation user activities in the audit log</p> <p>With the AAE_Admin role or a custom role with the View audit log permission, you can now view the status of events related to learning instances, domains, and documents.</p> <p>Audit log on page 2068</p>
<p>Create and train standard forms within the Control Room</p> <p>Users with the AAE_IQ Bot Admin or AAE_IQ Bot Services roles can now create new standard forms in Document Automation. It is no longer necessary to leave the Control Room and open a third-party service to create or modify a standard form. The interface to configure the extraction model is launched from the Learning instances page.</p> <hr/> <p>Note: To process documents in a learning instance which uses the standard forms model in Document Automation:</p> <ol style="list-style-type: none">1. Create the standard form in Document Automation.2. Create and train the learning instance in Automation 360 IQ Bot.3. Connect the learning instance to Document Automation. <hr/> <p>Create standard form in Document Automation on page 3522</p>

What's changed
<p>To connect a learning instance from Automation 360 IQ Bot, you must have one of the following roles:</p> <ul style="list-style-type: none">• AAE_IQ Bot Admin• AAE_IQ Bot Services• A custom role with the Connect learning instance permission

What's changed
<p>Uploaded documents and extracted data are now removed after 90 days even if a document has not completed processing, except in the following cases:</p> <ul style="list-style-type: none"> • If data is downloaded and deleted, the source documents are immediately deleted. • If the document is manually validated, the document is stored for 90 days from the date of extraction.
<p>If a document is renamed to a new file extension and uploaded to a Google Document AI pretrained model, the document will fail processing.</p> <p>Workaround: Rename the document to the correct file extension.</p>

Fixes
<p>Beside the Validate documents link, the value that reflects the number of documents awaiting validation is no longer hidden, and you can now view it without adjusting the width of the Actions column.</p> <p>Previously, you had to adjust the width of the Actions column to see the value.</p>
<p>You can now successfully draw a box, zoom in, fit the box to match the screen size, and then redraw the box without any issue.</p> <p>Previously, when you drew a box, zoomed in, clicked Fit to screen, and then tried to redraw the box, the box appeared at a different location from where you clicked.</p>
<p>In the Validator, you can now adjust the system-identified region (SIR) by dragging the corners of the SIR when you zoom in or zoom out.</p> <p>Previously, you could drag the corners of the SIR but not when you zoomed in or zoomed out.</p>
<p>When you connect to a learning instance from Automation 360 IQ Bot, if the learning instance has an optional field with a set default value and some fields that are unmapped, when you process documents in that learning instance in Document Automation, the default value now appears only in the mapped fields.</p> <p>Previously, the default value appeared incorrectly in the unmapped fields.</p>
<p>In Community Edition, when you try to delete a learning instance, the following, correct message is now displayed and you can successfully delete the learning instance: Community edition users are limited to 5 learning instances</p> <p>Previously, although you could delete the learning instance, the following, incorrect message was displayed: Community edition users are limited to 5 learning instances and will not be able to delete.</p>
<p>Fixed an issue where Document Automation sometimes failed to extract data from tables that span across multiple pages. Document Automation now supports data extraction from tables that span across multiple pages for Automation Anywhere models.</p>

Fixes
<p>You can now use the Document Extraction > Download action in a standalone bot that is not part of an Automation Co-Pilot process.</p> <p>Previously, this action could be used only in the Downloadbot within the Automation Co-Pilot process that was automatically generated when a user created a learning instance.</p>
<p>After the Validator times out because of inactivity, when you refresh it, instead of showing the most recent document that you validated, the Validator shows the first document that you validated.</p>
Limitations
<p>Document Automation does not support Cloud-enabled (SDS) deployment.</p>
<p>Formula validation does not support numbers that contain delimiters. For example, 1,000 and 2.0 are not supported.</p>
<p>In some cases, the Bot Agent does not clear out its resources folder. Until the disk space is freed, the production documents in processing will be affected. This issue occurs intermittently.</p> <p>Workaround: Based on the issue, you must create a task scheduler to clean out the resources folder every day or every week.</p>
<p>There is no notification when the product license is about to expire. When the product license expires, the Learning Instances tab is removed from the Control Room.</p>
<p>Learning instances that use Google Document AI models do not reliably extract all the fields in a table, if the table that spans multiple pages.</p>
<p>In On-Premises installation in Linux environments, document processing sometimes fails because of a storage service error.</p> <p>Workaround: In the command prompt, run the following script:</p> <pre>cd /opt/automationanywhere/automation360/appdata/Server Files/ sudo chown -R crstorage:controlroom storageservice</pre>
<p>Document Automation does not support Oracle Database for On-Premises installations.</p>
<p>Document Automation supports only the following standard ports for On-Premises installations:</p> <ul style="list-style-type: none"> • For HTTP: Port 80 • For HTTPS: Port 443
<p>Sometimes, files uploaded to train a standard form appear corrupted although the data is still usable.</p>
<p>Standard forms in Document Automation is not supported in a multi-tenant Cloud Control Room that was upgraded from v.25. This limitation does not occur on a fresh installation of a multi-tenant Cloud Control Room.</p>
<p>Learning instances with the user-defined document type do not support Dutch language documents.</p>

Limitations
The first time you click a learning instance connected from Automation 360 IQ Bot, you are redirected to the IQ Bot homepage instead of the details page for that learning instance.
Formula validation is not supported for custom fields if the field name contains a space.
When you import a learning instance created in a previous version of Document Automation, the check box to send validation feedback to the system is unselected by default. You must edit the learning instance to select the check box.
Document Automation does not perform post-processing on connected learning instances that contain Python custom logic with either of the following: <ul style="list-style-type: none"> • Single quotes, such as <code>print ('Test')</code>. Ensure the Python script uses only double quotes. • Characters from non-Latin languages (Unicode characters), such as äöüñž.
Formula validation is not supported in learning instances with the user-defined document type.
When you process documents using the IQ Bot Extraction package, the Python scripts are not applied properly on the form fields for the classic learning instances connected on Document Automation. This results in improper data extraction in the output CSV files and the Validator.
When you click the Table icon on Form OCR Testing Tool (FOTT) editor, the text appearing on the pop-up window is not readable.
If IQ Bot, Control Room, and Bot Agent are installed on the same Windows Server 2012, then data extraction fails for any Classic learning instances connected in Document Automation.

IQ Bot

What's new
<p>When user logs out, lock released immediately on documents in Validator</p> <p>When a user logs out of IQ Bot, the lock on the documents in validation is now released immediately so that other users can view or validate the documents. Previously, when a document was in the Validator queue, if the logged out, the lock on the document in the validator was not released immediately, as a result of which other users could not view or validate the document.</p> <p>Use the IQ Bot Validator on page 3597</p>
<p>IQ Bot Database Migration Assistant Tool now supports Windows Authentication</p> <p>When you migrate from Enterprise 11 to Automation 360 by using the Database Migration Assistant Tool, you can now use Windows Authentication for connecting to the IQ Bot database server.</p>

What's new

Choose classification type while creating learning instance

When you create a learning instance, you can now choose which aliases and fields are considered for classification by using the **Disable classification changes on domain modification (fields, alias)** check box.

- When this check box is selected, the classification process uses only the aliases or fields that were present in the domain when the learning instance was created. Aliases and fields added to the domain after the learning instance was created are not considered for classification.
- When this check box is cleared, the classification process uses all the aliases or fields that are part of your domain. Aliases and fields added to the domain after the learning instance was created are also taken into consideration for classification.

This feature classifies the document to the same group even if there are any updates in the domain.

What's changed

Upgraded machine learning models

IQ Bot now uses an upgraded machine learning model for detection of check boxes and Advanced tables.

Python libraries upgraded to 64-bit

All the Python libraries provided in IQ Bot by Automation Anywhere for this release are now upgraded to 64-bit from 32-bit. If you are using third-party libraries, ensure that you upgrade to 64-bit libraries. After upgrading the third-party libraries, ensure that these libraries work successfully.

Fixes

When you download an unclassified document, click **Delete from the server**, and then toggle the learning instance from production to staging and back, the document no longer appears in the untrained folder. Previously, when you downloaded an unclassified document from the untrained groups, even after you deleted it, the document still reappeared in the folder.

Service Cloud case ID: 01781935

When you upload documents, the Classifier no longer halts or becomes stuck. Documents that are not classified are now cleared from the queue, allowing smoother processing of subsequent documents. If these documents fail to be processed within the timeout limit, they are now categorized as unclassified and you can download these unclassified documents.

Service Cloud case ID: 01762844, 01272642, 01750753

You can now install IQ Bot by using Windows authentication and CyberArk Vault and then rotate the key. Previously, when you tried to rotate the Vault key, the following error message was displayed: **Error occurred while setting up the new key. Please check the logs**

Fixes
<p>You can now select multiple learning instances for backup by using the Search drop-down list. Previously, after you clicked the Create Backup option on the Migration Management page, if you selected a learning instance and then used the Search drop-down list to select another learning instance, the previously selected learning instance became deselected.</p>
<p>The value displayed in the My totals > Accuracy field now matches the value in My learning instances > Field accuracy for the available learning instances.</p>
<p>You can now add documents to manually created groups and upload documents to staging.</p> <p>Previously, when you edited a manually created group or tried to upload a document, you encountered an error and the following error message was displayed: <code>Failed to update manual group: Duplicate label found.</code></p> <p>Service Cloud case ID: 01849616, 01845590</p>
<p>You can now use the migration utility to successfully migrate learning instances created for a custom domain. When you import IQBA files with duplicate fields (even through an API), the following message is displayed alerting you to the existence of duplicate fields: <code>Error: Duplicate field found Invoice number.</code> Previously, the migration utility could not be used to migrate learning instances created for a custom domain.</p> <p>Service Cloud case ID: 00729627</p>
<p>During migration, you can now successfully import and export IQBA files. Previously, the import and export of IQBA files failed because the content classification table contained duplicate training fields.</p> <p>Service Cloud case ID: 00826891</p>
<p>When a document is successfully downloaded, it is now placed in the Success folder. Previously, documents that were successfully processed were sent to the untrained folder, causing inconsistencies in the download process.</p> <p>Service Cloud case ID: 00780227,00842077</p>
<p>When there is an update in the domain, IQ Bot now classifies a document to the same group.</p> <p>Previously, whenever there was any update in the domain, IQ Bot created new groups for the same document.</p> <p>Service Cloud case ID:01622981</p>
<p>If a document without content is uploaded to a learning instance in production, the following message is logged in the bot_launcher.log file: <code>Unable to upload file <filename> to the Learning Instance. No content in file, size 0" whenever there is a 0 KB file is uploaded.</code></p>

Fixes
<p>The security vulnerability related to Unquoted Service Path has been fixed. Previously, the Windows host referred to an installed service that used an unquoted service path containing whitespace Automation Anywhere Cognitive Console: D:\Program Files (x86)\Automation Anywhere IQ Bot\Portal\node_modules\winser\bin\nssm64.exe, which resulted in the vulnerability.</p> <p>Service Cloud case ID:01880370</p>

Limitations
<p>You cannot create a bot in IQ Bot when an invalid document is uploaded to a custom or manual group. Also, when an invalid document is uploaded along with a valid document and processed for extraction, the See extraction page keeps loading.</p>
<p>IQ Bot does not support Oracle Database for on-premises installations.</p>
<p>During production processing, if a learning instance is switched from Production to Staging or the other way around, for any documents processed during this switch, the production document that appears in Validator is blurred and not in human-readable form.</p>
<p>IQ Bot does not perform post-processing on a field if the custom logic uses Python script containing single quotes, such as <code>print('Test')</code>. Ensure the Python script uses only double quotes.</p> <p>Custom Logic Python script challenges in A360.26 IQBot (A-people login required)</p>
<p>If your IQ Bot custom logic uses the Pandas library, the script must have the <code>import Pandas</code> statement.</p>
<p>IQ Bot does not perform post-processing on a field if the custom logic uses Python script containing characters from non-Latin languages (Unicode characters), such as äöüñž.</p>
<p>In IQ Bot, when you run a script created on versions prior to Automation 360 v.26, you might see a warning. However, this does not impact the script execution and the functionality.</p>

Bot Insight v.26 release

Review what's changed and the limitations in Bot Insight for the v.26 release.

What's changed

With the expanded user interface, you can now gain more insights into the Document Workspace. A new dashboard is available that delivers insights to Document Automation activity and trends, such as number of uploaded documents, pages and average extraction time. See more information in the following topic.

[Document Workspace dashboard](#) on page 3736

Limitations

DataTable widgets for Bot Insight dashboards currently show a maximum of 100 records.
Service Cloud case ID: 01820004, 01851999, 00760252, 00806950

To avoid errors from occurring during bot lifecycle management, the private workspace dashboards will be imported only when the bot is imported directly to the private workspace.

Importing a bot to the public workspace and checking the bot out to the private workspace will not import the associated private workspace dashboards.

Service Cloud case ID: 00760022, 01803726, 01794757, 01777561, 01780407, 01842554, 01874606

Connectors for Bot Insight, such as Tableau or Power BI, work only with the following authentication mechanisms:

- Authentication based on Control Room database
- Authentication based on Active directory

Service Cloud case ID: 01863601, 01909212

Review what's new and changed, and the fixes and limitations in the Automation 360 v.25 release.

- Control Room: Cloud Build 14304 (replaces Build 14298) and On-Premises Build 15112 (replaces Build 15097)
- IQ Bot: Cloud Build 14304 (replaces Build 14298) and On-Premises Build 15112 (replaces Build 15097)

Important: Manifest V3 based extensions - Google will deprecate Manifest V2 based extensions for Google Chrome by January 2024. . To know about Microsoft Edge Manifest V2 based extensions timelines, see [Overview and timelines for migrating to Manifest V3](#). The deprecation might impact your existing automation that use current Manifest V2 based extensions in Google Chrome and Microsoft Edge browsers. Use the Automation 360 v.25 Build 15118 and Bot Agent version 21.211 for the latest Manifest V3 based extensions updates to support features that use Google Chrome and Microsoft Edge browsers. This build is available for download in the link provided in the following article: [Everything about the Chrome/Edge Manifest V2 Deprecation](#). See [Chrome and Edge Manifest V3 extensions](#) on page 1082 and [Everything about the Chrome/Edge Manifest V2 Deprecation](#).

If you want to continue using the earlier builds of Automation 360 v.25 (Build 15112 or 15097) but want to upgrade to Manifest V3, you can manually upgrade to Manifest V3. See [Manifest extension manual upgrade](#).

Important: We have updated the Cloud Build 14304 and On-Premises Build 15112 to include fixes for the following issues. Fixes specific to On-Premises or Cloud builds are indicated.

- When you created or deleted new users, multiple, duplicate audit log entries were generated for a single user (Service Cloud case ID: 01836296).
- When you logged in to the Control Room with bot export permissions, when you exported a task, no corresponding entry was immediately visible in historical activity (Service Cloud case ID: 01834139, 01839933, 01841993, 01839817, 01834108, 01846407, 01845706, 01843349, 01846220, 01846819, 01845547, 01847028, 01847024, 01847094, 01847114, 01847115, 01846998, 01847840, 01846757, 01848123, 01846944, 01848104, 01848294, 01848905, 01846596, 01849748).
- When you updated to Automation 360 v.25 and attempted to use the previous settings with instance names, the previous settings were not allowing an update (Service Cloud case ID: 01838276, 01835897).
- (On-Premises only) When you deployed a task On-Premises without direct Internet access, the compilation slowed down (Service Cloud case ID: 01841448, 1839118, 1844817, 01846153, 01846332, 01839254).

- When the wait for condition package was used with any command package, the set timeout value for the wait was not met (Service Cloud case ID: 01842547, 01846156, 01847338, 01846324, 1842368, 01847054, 01848080, 01848789, 01848151, 01848963, 01847054, 01847121, 01848236, 01848260, 01849016, 01848248, 01848572, 01847828, 01847055, 01848826, 01848191, 01848944, 01851181, 01849792, 01852057, 01846152).
- When you update from any build to Automation 360 v.25, if changes were made to the If/Else logic in nest and saved, a new Go to End point element was added, which created a process error (Service Cloud case ID: 01848192).
- (On-Premises only) When an Automation Co-Pilot process was checked in and then checked out, the mapped variables did not persist and were lost (Service Cloud case ID: 01847675).

Top 5 developer features in this release

View the following video on the top 5 developer features:

Updating to this release

If you are on the previous build (Build 15097) of Automation 360 v.25, you must update to the latest Build 15112.

You can update to the latest version of Automation 360 from the previous three releases (that is, from $n-3$ releases, where n refers to the latest release).

The following previous releases are certified for update to Automation 360 v.25:

- v.24R2 (Build 13343), and v.24 (Build 12350, 12342)
- v.23 (Build 11513)
- v.22 (Build 10526)

See also [A360 | Upgrading to A360.23, A360.24, A360.25 from A360.22 \(A-People login required\)](#).

When updating from previous releases to v.25 (Build 15097), ensure that you review the information in the following article: [Error parsing the SQL instance name while upgrading to Automation 360 v.25 \(A-People login required\)](#).

If you are on one of these previous releases, for information about updating, see [Update Automation 360 to latest version](#) on page 1363. If you are not on an $n-3$ release, update Automation 360 to one of the $n-3$ releases before updating to Automation 360 v.25.

Important: This release includes an optional Bot Agent update. You can continue to run your existing bots without updating the Bot Agent. However, if you want to use the new features in Automation 360 v.25, you must update the Bot Agent available with this release.

For more information, see these resources:

- [Automatically update the Bot Agent](#) on page 1302 | [Manually update the Bot Agent](#) on page 1303
- [Compatibility with release builds](#) on page 1275

For the latest updates to the Automation 360 extensions for Google Chrome, Microsoft Edge, and Mozilla Firefox, see [Browser extensions for Automation 360](#) on page 933.

Migration

Enterprise 11 and Enterprise 10 features
<p>Migrate Task Bots when the referred MetaBot Logic is renamed</p> <p>You can now successfully migrate Task Bots where referred MetaBot Logic name is renamed or has changed the relative path after mapping.</p> <p>If a MetaBot Logic is renamed or changed the path after being mapped in the Task Bot then the Task Bot is now migrated with the new MetaBot Logic name or path.</p> <p>The command path in the Task Bot is updated with the renamed name or with the updated path.</p> <p>Changing the relative path is applicable in the following scenarios:</p> <ul style="list-style-type: none">• Logic is moved from one folder to another.• Logic is moved from a MetaBot root level folder to a sub folder.• Logic is moved from a sub folder to a folder at MetaBot root level.• The folder that has the Logic is renamed. <p>This enhancement applies to the following commands:</p> <ul style="list-style-type: none">• Run Logic• If > Logic Successful• If > Logic Unsuccessful• Error Handling
<p>Enhanced Bot Scanner output report</p> <p>In the Bot Scanner output report, when you click the name of a bot that requires corrective action, you can now view the Line number of commands instead of the Total message count (frequency).</p>
<p>Migration support for Send Email action with multiple attachments</p> <p>You can now migrate bots that have the Send Email command with a filepath in a variable for the following scenarios:</p> <ul style="list-style-type: none">• A single file is sent as an attachment.• Multiple attachments are sent in a single email.• Files are attached from a network drive.

Enterprise 11 and Enterprise 10 features

Migration support for Work Item variable (Service Cloud case ID: 01270496)

You can now migrate bots with the Work Item variable for scenarios in which the Work Item variable includes the following:

- A number
- Both number and string, for example, a message box
- A date
- A combination of Datetime and string, for example, a message box

Note: If the Work Item variable is a Datetime type, the action **Record:Assign** is added automatically, which then gets converted to Datetime type string variable, before applying the Work Item variable.

Variables created automatically after migration

In the Bot Scanner utility, bots that contain the following non-referenced variables are no longer flagged as **Action Required** or **Review Required**:

- \$FileName\$
- \$Error Description\$
- \$Error Line Number\$
- \$Extension\$
- \$Folder Name\$

After migration, the system automatically creates these variables according to the Automation 360 naming convention, and the migrated bots run successfully.

Migration enhancement to packages and actions

- If the migrated bots use the **PDF Extract Text > Structured Text** action, the new **Reduce Data Loss** option ensures that characters are retained in the extracted text and the bots run successfully.
- If you have bots with a specific Xpath expression in the SOAP Web Service package, ensure that the SOAP command output for **Selected Response** is returned accordingly by selecting **String Delimited** or **List of Strings**. For migrated bots, the **String delimited by None** option is selected by default.
- If migrated bots use the Terminal Emulator, the **Set cursor position to the beginning** option now enables you to edit the Terminal Emulator screen manually, and the focus is set to the beginning of the editable field. Note that this option is selected by default only when the **Show terminal** option is selected for these bots. (Service Cloud case ID: 00812730, 01252363, 01804623)

Enterprise 11 and Enterprise 10 features

Support for 7-Zip

We have certified 7-Zip, a third-party tool, to handle backing up the Control Room repository with lengthy file names, bot names, and folder names. You can now back up and restore the repository of bots even when the length of the filepath to the repository of bots exceeds 256 characters. You can run either 7z.exe commands using the command line interface or run the 7.Zip as an application.

The 7-Zip tool support is available on the following Automation Anywhere certified Windows operating systems:

- Microsoft Windows Server 2016
- Microsoft Windows Server2019

You can download the 7-Zip tool from [7-zip Download page](#).

New **Update window title** action to update browser name in window title

When you are migrating Enterprise 10 or Enterprise 11 bots that use the Internet Explorer browser, the **Update window title** action now converts the window titles of these bots to Microsoft Edge with IE mode. The window titles are updated based on browser used by the bots. For example, consider bots that use Internet Explorer and have `Internet Explorer` in the window title. After migration, the new action updates the window title to reflect the new browser, Microsoft Edge, and the format of the text as `*Microsoft*Edge`.

[Using legacy Web actions](#) on page 2665

Enterprise 11 only features

Automate objects that appear behind bot runtime window (Service Cloud case ID: 00710929)

For the following commands, when you run a bot, you can now automate objects that appear behind the bot runtime window:

- **Image Recognition > Find window in window**
- **If/Else > Image Recognition > Window is found in window or not**
- **Mouse > Click**
- **OCR > Capture area or window**

Automation Workspace

What's new

Support for Azure Application Gateway

On Microsoft Azure cluster environment for On-premises, Azure Application Gateway is now a supported load balancer..

[Supported data center component versions on Microsoft Azure](#) on page 1225

What's new
<p>Install Bot Agent on devices that have Enterprise 11 Enterprise Client</p> <p>When you are creating a bot in Automation 360, you can now install the Bot Agent on a device with an existing Enterprise 11 Enterprise Client. You can create or run bots from both the Control Room instances.</p> <p>Install Bot Agent and register device on page 1288</p>
<p>IE 11 EOL notification banner displayed in Control Room</p> <p>Starting from the Automation 360 v.25 release, if you use the Microsoft Internet Explorer browser to access the Control Room, you will be prompted to use an alternative supported browser, such as Google Chrome or Microsoft Edge (Chromium). When you log in to the Control Room, a notification banner is displayed indicating that support for Internet Explorer 11 is ending.</p> <p>Log in to Automation Anywhere Control Room on page 1428</p>
<p>Switch Bot Agent to another Control Room without reinstalling the Bot Agent</p> <p>You can now enable a single-user device to be switched to another Control Room without reinstalling the Bot Agent. Log in as an administrator and select Enabled and the Allow fast switching check box from the device settings.</p> <p>Switch device registration between Control Room instances on page 1744</p>
<p>Configure the VM instance to delay Bot Agent registration</p> <p>You can now configure the VM instance (golden image) to delay the Bot Agent registration until the user logs in to the Control Room from that instance. You can also configure up to 20 Control Room URLs so that you can use the same golden image to connect to any Control Room from that list.</p> <p>Bulk install Bot Agent on devices on page 1296</p>
<p>Automation 360 support for Amazon Linux 2 on AWS EC2 environment</p> <p>Automation 360 now supports the Amazon Linux 2 operating system for Automation 360 On-Premises Control Room installation on the AWS Elastic Compute Cloud (EC2) environment.</p> <p>Amazon Linux 2</p>
<p>Out-of-sync licenses and Control Room license expiry</p> <p>When licenses are oversubscribed, the Control Room enters the fail-safe state and continues to operate in fail-safe mode for 30 days, after which the Control Room becomes locked.</p> <p>When a Control Room license is within 30 days of expiration, a warning message is displayed in a banner until the license either expires or is renewed.</p> <p>Control Room fail-safe status on page 1340 Control Room license expiry notifications on page 1361</p>

What's new
<p>Support for integration with SIEM</p> <p>The Automation 360 Cloud Control Room now supports integration with security information and event management (SIEM) to forward the audit logs.</p> <p>Configure integration with SIEM on page 1776</p>
<p>Enforce coding standards with code analysis</p> <ul style="list-style-type: none">• Code analysis enables you to define and enforce coding standards to improve automation coding practices. You can set different rules that will govern how you code. With code analysis, you can implement coding best practices and make the code more uniform, accessible, reliable, efficient, and secure.• Two new permissions, View policies and Manage policies, are introduced in the Control Room for code analysis policy. <p>Code analysis on page 2103</p>
<p>Two-factor authentication for Control Room users</p> <p>If you are a Control Room administrator, you can now enable two-factor authentication (2FA) for users logging in to the Control Room. 2FA provides an additional security layer for all logins to the Control Room, which can be set either for all users or for users with specific roles.</p> <p>Two-factor authentication on page 1747</p>
<p>View version history of non-bot file dependencies (Service Cloud case ID: 01615105)</p> <p>You can now view the version history of your non-bot file dependencies. This helps to identify relevant changes made to your file by other users during a specific date and time along with the check-in messages.</p> <p>View version history of non-bot file dependencies on page 2272</p>
<p>Edit non-empty folder names in private workspace (Service Cloud case ID: 00535388, 00730075, 00786633, 00791528, 01615295, 01820406)</p> <p>You can now edit your non-empty folder names in the private workspace. With this feature, you can now manage folders more easily. Ensure the following when you rename a folder:</p> <ul style="list-style-type: none">• It does not contain checked-out or cloned bots even at subfolder levels.• It does not contain more than 100 items including subfolders and files. <p>Create and rename folders on page 2234</p>
<p>View dependency maps for bots</p> <p>You can now view the dependency map for your bot in both the public and private workspaces. The dependency map shows the immediate parent and child bots for any selected bot. If you are an RPA developer, you can use the dependency map to better understand where a bot is invoked and which child bots are invoked by the bot. With this information, you can gauge the impact of the change in a bot, use the bot effectively, maintain better bot code and reusability, and prevent conflicts.</p> <p>View bot dependency map on page 2224</p>

What's new

Support to automate applications supported on Citrix Workspace app (Service Cloud case ID: 01758063)

The Citrix Workspace app is now supported on Automation 360. You can now automate applications that are accessed through the Citrix Workspace app by using the **Recorder > Capture** action or the **Start recording** option.

AI Sense Recorder: Support for Korean language and complex table operations

- You can now use AI Sense Recorder to automate applications that use Korean and a combination of Korean and English interfaces.

[AI Sense for recording tasks from remote applications](#) on page 2180

- With AI Sense Recorder, you can now extract tabular data from complex tables. You can capture and automate tables with wider columns and tables that have columns with controls such as check boxes and options. You can also capture specific columns from tables.

Note: If the table is not detected automatically, use the **Define** option to detect the table.

[Table data extraction through AI Sense Recorder](#) on page 2194

Enhancements to Recorder

- When you run a bot, you can now automate objects that appear behind the bot runtime window by using the **Recorder > Capture** action. (Service Cloud Case ID: 00684306, 00770636, 01146672)
- You can now use the Recorder to capture and automate objects with a specific technology. The **Capture object** tab now has the option to select a specific technology and capture using that technology. You can capture objects with the following technologies:
 - Microsoft Active Accessibility (MSAA)
 - UI automation
 - Microsoft (MS) COM UI Automation

[Capture using specific technology](#) on page 2824

(Service Cloud Case ID: 01760871, 01865823)

- You can now use the Recorder to automate third-party plug-in window objects on Google Chrome or Microsoft Edge browsers by using a specific technology.

Reduce Data Loss option in PDF package

In the **PDF > Extract text** action, for the **Structured text** type field, a new **Reduce Data Loss** option is now available. When you use this option, you can extract the complete text with minimal overlap of characters.

[Using Extract text action from PDF](#) on page 2766

What's new
<p>Enhancement to the String package (Service Cloud case ID: 00770822)</p> <p>In the String > Extract text action, a new When extracting option is now available. You can use this option to specify whether the case of the text in the extracted substring must match that in the source string.</p> <p>Using Extract text action of String package on page 2960</p>
<p>Download files from URLs that require NTLM authentication (Service Cloud case ID: 01189873)</p> <p>With the enhanced Browser package, you can now download files from URLs that require NTLM authentication by using the Browser > Download file action.</p>
<p>New option in Connect action of the Terminal Emulator package (Service Cloud case ID: 00812730, 01252363, 01804623)</p> <p>You can now edit the screen of the Terminal Emulator session manually by selecting the Set cursor position to the beginning check box. By selecting this option, you can now set the focus to the first editable field. By default, this option is not selected.</p>
<p>Bulk update to default package version across bots (Service Cloud case ID: 00712719, 00728499, 00737694, 00803673, 01255722, 00838604, 00772147, 01760236, 01762679, 01771416, 01761859, 01782588, 01778220, 01784255, 01789551, 01809167, 01818690)</p> <p>Use Update bots to default package version to update bots to use the default version for any package. User with the View Packages and the permission to edit the bots can now update bots in bulk to use the default package version. This feature provides you with an efficient way to securely update all the bots in the Control Room repository that you have access to with the default package version in a few clicks.</p> <p>Update bots to default package version on page 1844 Example of updating default package version across bots on page 3116</p>
<p>Advanced search feature in the Bot editor (Service Cloud case ID: 01615310, 01780115)</p> <p>The Bot Assistant now provides Advanced search capabilities to enhance the overall search experience in the Bot editor. This helps improve the productivity of the Bot Creator. The Advanced search page allows you to enter a search text, select the search filter criteria, and navigate through the search results. You can use the filter criteria to narrow down the search results and quickly locate the search text. When you edit or view a bot, you can use the advanced search feature to find the exact line of action and the corresponding action details where the search text appears, that is, as a string, text value, or a variable name.</p> <hr/> <p>Note: Find in this bot is now renamed to Search in this bot.</p> <hr/> <p>Advanced search option in Bot editor on page 2275</p>

What's new
<p>Enhancement to multiple attachments option in Send email action (Service Cloud case ID: 00800976, 00817136, 00821405, 00936080, 01256523, 01256320, 01262069, 01259369, 00936080, 01801928)</p> <p>When you send email from bots, you can now send multiple attachments as a list of files or a variable that contains the list of file objects. With this feature, you can attach files such as data files, spreadsheets, and word processor documents to your email. You can attach multiple filepaths from a local drive or a network drive, or you can use a variable that contains a filepath.</p> <p>Using the Send action on page 2454</p>
<p>Enhancement to SOAP Web Service package</p> <p>When you build a SOAP response for an Xpath expression in the SOAP Web Service package, the result of the Xpath expression can be stored as a list of strings.</p> <p>Example of using the SOAP web service action on page 3097</p>
<p>Common table expression supported in Export to data table action (Service Cloud case ID: 00655318)</p> <p>You can now simplify complex joins and subqueries by using common table expressions (CTE) in SQL-compliant databases. Use CTEs in the Export to data table action of the Database package by using the WITH keyword.</p>
<p>Enhancement to OCR package</p> <p>When you use actions from the OCR package, such as Capture area or Capture window, the bot now identifies the controls even if the controls are behind the bot runtime window. It also extracts the text behind the Automation 360 bot runtime window from any application window.</p>
<p>New package SDK version</p> <p>You can now set up the default value for a global session by using default_session_value in CommandPkg in the newly released package SDK version.</p>
<p>Configure packages for On-Premises</p> <p>On-Premises administrators can now disable the latest package version from becoming the default version automatically. Administrators can also enable a feature that fetches and installs new package versions as and when they are released even without a Control Room upgrade.</p> <p>Automatic package updates for On-Premises Control Room on page 1840</p>
<p>Workload automations supported on PostgreSQL and Oracle databases</p> <p>Workload automations are now supported on the PostgreSQL and Oracle databases, as well. All the workload automations work well with both the databases.</p> <p>Workload management on page 1931</p>

What's new
<p>Trigger API</p> <p>Map triggers to users or roles for an attended Bot Runner user by using the Trigger API. With the Trigger API, you can also create and delete event triggers.</p> <p>Trigger API</p>
<p>Enhancement to the Authentication using apikey</p> <p>With .24 or previous versions, you must replace any escape character '\' with '\\\' in the API key. With .25 or later versions, the API key will no longer have any escape characters('\').</p>
<p>Newly implemented Activity List API</p> <p>With the newly implemented Activity List API (<code>v3/activity/list</code>) you can return the job executions without call back and bot output information. The old Activity List API (<code>v2/activity/list</code>) is now deprecated.</p> <p><code>v3/activity/list</code> Bot Execution Orchestrator API</p> <hr/> <p>Definition: Deprecation refers to features or capabilities available in the current (latest) release that will be removed or unsupported from a future release.</p> <p>You can use the specified alternatives or updated versions when they are made available.</p> <hr/>
<p>Migrate from Enterprise 11 Control Room version 11.3.4.7 to Automation 360 On-Premises</p> <p>We now support migrating from Enterprise 11 Control Room version 11.3.4.7 to Automation 360 On-Premises v.25 and later releases.</p> <p>Supported Control Room versions for migration on page 1446</p>

What's changed
<p>Enhancement to the String package (Service Cloud case ID: 00770822)</p> <p>After migrating bots, when you are extracting a text string based on a source string, the default option is set to not match the case of the source string. For new bots, the default option is set to match the case of the source string.</p>
<p>Enhancement to the Browser package</p> <p>In Enterprise 11, if a bot is using the Launch Website action to open a URL in Internet Explorer and when migrating the bot to Automation 360, if you select the Convert bots built using Internet Explorer to Edge with Internet Explorer mode option in the Settings panel of the Bot Migration Wizard, the URL is automatically set to open in Microsoft Edge after migration.</p>
<p>Option to change the global cache location (Service Cloud case ID: 00745395, 00781135, 00831182, 01124360, 01764952)</p> <p>As an administrator, you can now change the default location for global cache according to your requirements by going to Administration > Settings > Devices > Advanced options.</p> <p>Manage device settings on page 1735</p>

What's changed
<p>Enhancement to database server for Control Room instance</p> <p>To set up the connection and authentication for your database server, use the port number of your database server instance (default port number, 1433) instead of the instance name.</p> <p>Configure Microsoft database type and server on page 1198</p>
<p>For user credential changes, add new configuration for LDAP settings without causing in-progress authentication to fail</p> <p>When a user's credential is changed or updated, an LDAP settings page is now provided so that the Control Room administrator can add the new configuration for the LDAP settings without causing the in-progress authentication to fail.</p>
<p>Support for exact match in the subject field for email triggers (Service Cloud case ID: 00953823)</p> <p>When you connect the Control Room to one of the email services on your system and trigger a bot when you receive a new email, the email trigger is now executed depending on the following subject conditions:</p> <ul style="list-style-type: none"> • When the subject line is provided within double quotation marks (""), for example, "ABC spreadsheet", the trigger is executed only when the email subject has an exact match for the string provided within quotation marks. • When multiple subject lines are separated by semicolons, for example, ABC spreadsheet; ABC project logs, the trigger is executed when the email subject matches any of the subject lines mentioned.
<p>Import Enterprise 11 bots with or without MetaBots (Service Cloud case ID: 01261325)</p> <p>You can now import the Enterprise 11 bots (.aapkg file) with or without the dependent MetaBots into the public workspace. If you are importing the .aapkg file into the private workspace, ensure that the dependent MetaBots are included.</p>

Summary of changes in packages

The following table summarizes the new and updated features in the Control Room packages:

Name of package or action	New or changed feature	Version number	Bot agent version
AI Sense Recorder	Support for Korean language and complex table operations Korean language and complex table support	2.7.3-20220527-004608	1.210 or later

Name of package or action	New or changed feature	Version number	Bot agent version
Browser package	Support to download files from URLs that require NTLM authentication NTLM authentication	3.5.1-20220527-17203121	21.210 or later
Database package	Support for common table expression in Export to data table action CTE support in Export to data table	4.8.0-20220504-1302021	21.88 or later
Email package	Support for sending mail with multiple attachments through bots Send email with multiple attachments	3.12.3-20220516-1148521	21.210 or later
OCR package	Support to identify and capture controls behind bot runtime window Support to capture controls that appear behind the runtime window	2.10.0-20220502-204321	21.118 or later
PDF package	Support to extract complete text with minimal overlap of characters Extract text accurately	3.5.2-20220414-1018442	21.31 or later

Name of package or action	New or changed feature	Version number	Bot agent version
Recorder	<ul style="list-style-type: none"> • Support to automate objects that appear behind bot runtime window Automate objects behind bot runtime window • Support to automate objects with specific technology Automate objects with a specific technology • Support to automate applications accessed through Citrix Workspace app Automate applications on Citrix Workspace app 	2.7.3-20220527-004608	21.210 or later
SOAP Web Service package	<p>Support to store output of Xpath expression as list of strings Store Xpath expression output as a list of strings</p>	3.11.3-20220426-064423	21.90 or later
String package	<p>Support to match case of text in extracted substring to that in source string Match case of substring to that of source string</p>	5.4.2-20220412-134724	20.18 or later

Important: For information about the packages supported with this release, see also [Packages available in Automation 360](#) on page 2225.

Fixes		
Build	Service Cloud case ID	Description
15112	01838276, 01835897	When you update to Automation 360 v.25, an error no longer occurs when the database server includes the instance name.
Builds 14304 and 15112	01834139, 01839933, 01841993, 01839817, 01834108, 01846407, 01845706, 01843349, 01846220, 01846819, 01845547, 01847028, 01847024, 01847094, 01847114, 01847115, 01846998, 01847840, 01846757, 01848123, 01846944, 01848104, 01848294, 01848905, 01846596, 01849748	When you successfully export a bot, the latest bot export activity is now displayed on the Historical activity page. Previously, the latest export event was not displayed as the Ended on column was displaying the value as N/A.
Builds 14304 and 15112	01836296	When you delete a user or a role, only one entry is now generated for each action in the audit log. Previously, multiple duplicate audit log entries were generated for a single action, affecting the user management workflows.

Fixes		
Build	Service Cloud case ID	Description
Build 14304 and 15112	01842547, 01846156, 01847338, 01846324, 1842368, 01847054, 01848080, 01848789, 01848151, 01848963, 01847054, 01847121, 01848236, 01848260, 01849016, 01848248, 01848572, 01847828, 01847055,01848826, 01848191, 01848944,01851181, 01849792, 01852057	When you use the Wait > Wait for condition action with conditions that have specific timeout values set, the bot now waits only for the specified waiting time then runs the subsequent action. Previously, even when you specified a timeout value, the bot waited indefinitely.
15097	01274643, 01812436	If you have a function in a DLL that uses a credential variable as an input parameter and if the credential variable is not available in Automation 360, you will see the A108 migration message. Previously, you used to see the E153 migration message. Migration messages on page 1617
15097	--	You can now migrate bots even if the date and month are in single-digit or double-digit format and the year is in single-digit, double-digit, or quadruple-digit format for the Modified before and Modified between dates in the File and Folder action. Previously, you had to specify the dates in the MM/DD/YY format before migrating the bots.
15097	01260742	After migration, when the system passes a Credential Value (CV) type variable from a parent bot to a MetaBot Logic's non-CV variable, the temporary string-type variable that is created to hold the CV now does not exceed 50 characters or include an invalid space character.

Fixes		
Build	Service Cloud case ID	Description
15097	00796546	The Bot Insight pre-migration utility can now resolve corrupted dashboard IDs that are present in the BI tables and generate the dashboards.zip file for the migration. Previously, when corrupted dashboard IDs were detected in the BI tables, the Bot Insight pre-migration utility encountered an error and closed.
15097	01758427, 01805913	<p>In the SAP application, when you use the Click action control, the tabs are now selected precisely.</p> <hr/> <p>Note: The Type value in Enterprise 11 is renamed as Role in Automation 360.</p> <hr/> <p>When you migrate from Enterprise 11 to Automation 360, the Role value is automatically set to the value that was the SAP Control Type value under SubType if the Type value in Enterprise 11 was set to GuiShell. For example, in Enterprise 11, if the Type value was set to GuiShell and the SubType value was set to Gridview, in Automation 360, the Role value is automatically set to GridView.</p>
15097	01376353, 01449535, 01713118, 01627144, 01762404	When you update your Control Room from Automation 360 v.21 or v.22 to Automation 360 v.25, the installation now completes successfully without any issues. Previously, the installation failed when users who created migration schedules lost the permissions after migration.
15097	01257547, 01722892, 01291187, 01770716, 01777450	You can now edit or delete a schedule because you can no longer delete an .atmx file that is associated with a schedule from the Automation 360 Control Room. Previously, the .atmx file could be deleted, which resulted in an error that prevented you from editing or deleting a schedule.
15097	01255723, 01252824, 01260677, 01608653	<p>When you migrate Enterprise 11 bots with the Comment command enabled, the command now remains enabled after migration.</p> <hr/> <p>Note: If the Comment command contains a variable or a \$ symbol, the command is disabled after migration.</p> <hr/>

Fixes		
Build	Service Cloud case ID	Description
15097	01755175	You can now migrate bots with system variables (such as date, month, or year) as an Export Data to CSV option without encountering an error. Previously, a preprocessing error was displayed in such cases.
15097	01261863	You can now migrate bots with system variables or expressions that include array variables without an error. Previously, a preprocessing error occurred in such cases.
15097	01758814	You can now migrate bots when the MetaBots Logic call each other and another, third Logic calls one of these in recursion. Previously, in such cases, bot migration failed with an "An unexpected error occurred" message.
15097	01255810	When you perform the Send Text action two times for the same value in the Terminal Emulator and the first field is protected, when the Terminal Emulator screen is loaded for the second time, it now works properly after the migration. Previously, when the Terminal Emulator screen was loaded for the second time, an incorrect behavior was observed.
15097	01770547	In Automation 360 commands, expressions in which a variable is included within parentheses and is preceded by a \$ character are now migrated properly, with the variable inside parentheses prefixed and suffixed with the \$ character.
15097	01258964	After migration, the Capture action can now identify popup windows that use the same title as that of a main window in the SAP GUI. Previously, the Capture action could not identify popup windows that used the same title as that of a main window.
15097	00745395, 00781135, 00831182, 01124360, 01764952	If the path for global cache exceeds 256 characters, Automation 360 automatically changes the path to the default location although the path in the UI displays the path configured by the user. Previously, when the path for global cache exceeded 256 characters, Automation 360 displayed an error when downloading packages.

Fixes		
Build	Service Cloud case ID	Description
15097	01767018, 01755092, 01765551, 01764245, 01778477, 01782790, 01795043	If a user does not have access permission for a trigger or a folder with trigger under the public tab, no error message is now displayed on the event triggers page. Previously, if a user did not have access permission, the event trigger page for the user displayed an error under the public tab.
15097	01765445,01759831, 01779960, 01799422	When you log in to the Control Room as an administrator, you can no longer delete users that have active schedules.
15097	01255678	In the Manage > Devices page, the Modified by column now correctly displays the username of the latest user to modify the details. For example, if user1 registers a device and later user2 modifies the device details, such as Deployment type , the username of user2, instead of the username of user1, is displayed in the Modified by column.
15097	--	When you are installing the Control Room (On-Premises), even if an external key vault is configured, you can now manually enter the database credentials and configure them for database authentication in the Windows installer Database Server page.
15097	01753671	When you update to this release, in the View history Task Bot page, the Checked In and Checked In By columns now display the correct information.
15097	--	Now when you run bots that have the Get Total Rows command in the SAP GUI, the values are returned as Integer data type. Previously, such commands returned values as a Float string type.
15097	01212822	During workload automation, you can now view and use queues even if the name of a work item template contains leading or trailing spaces. Although the spaces are displayed in the queue name, they are automatically removed when the work item template is created. Also, leading or trailing spaces in queue names are ignored during execution. Previously, queue names and template names with leading or trailing spaces were not displayed and hence were unavailable for selection.

Fixes		
Build	Service Cloud case ID	Description
15097	01772061	When you update to this release, Automation 360 does not allow multiple license-sync jobs to run concurrently. Previously, when multiple license-sync jobs were running, the audit logs displayed Licenses synced errors.
15097	01754415	When you update from Automation 360 v.21 or later, the Bot Agent devices are no longer shown as disconnected in the Control Room Manage > Devices page. When you try to update Bot Agent in versions prior to Automation 360 v.21, a message now indicates that the device is not compatible.
15097	01780460	<p>When you update to this release, the Control Room Advanced options for devices (Administration > Settings > Devices), such as Autologin timeout, Maximum simultaneous downloads, and Bot response wait time, no longer revert to default values.</p> <p>For example, if you set the Autologin timeout to 70, after updating to this release, the value remains at 70 and does not change back to the default value.</p> <p>Previously, when you upgraded the Control Room, for example, from Automation 360 v.22 to Automation 360 v.23, the Advanced options for devices reverted to default values.</p>
15097	01762582, 01808698, 01815446	The Control Room Activity page now displays the total number of scheduled activities correctly. Previously, when you had more than 200 scheduled activities, the Control Room Activity page displayed only 200, and you had to sort by the Activity name , Automation priority , or Modified by columns to view the correct number of scheduled activities.
15097	01764492	When you install Automation 360 Control Room, the installer-generated log file no longer displays the password in clear text.

Fixes		
Build	Service Cloud case ID	Description
15097	--	In the Administration > Settings > Email page, if the Require verification option is not selected, you no longer receive a verification link in the email notification to verify you as a user. You can now log in to the Control Room without verifying the email ID and setting the login credentials. Previously, an email notification with verification link was sent to verify the email address even if you did not select the Require verification option.
15097	01783110	When you launch a bot, if the bot fails during the run, the Activity > Historical page in the Control Room now shows the correct Started on time, that is, the time when the bot started running. Previously, when a bot run failed, the Started on time incorrectly showed the time when the bot failed. As a result, the Started on and Ended on columns displayed the same time, which was incorrect and confusing.
15097	01826944, 01828683	When you log in to the Control Room, the Activity > Historical page now loads without error. For the historical data in the JOBEXECUTION table, a new Cloud data retention policy of 90 days is implemented, whereby the Cloud historical data is deleted along with the rollout of Automation 360 v.25 to the different regions. Previously, when you logged in to the Control Room, the Activity > Historical page did not load because of a large number of records, and the following error message was displayed: <code>An unexpected problem has occurred</code> <ul style="list-style-type: none"> • View completed activity on page 2054 • Automation 360 Cloud FAQ on page 1006
15097	01753337, 01785865	On the Activity > In progress page, when you use the sort function to list the items in the Started on column in ascending or descending order, the items are listed correctly now.

Fixes		
Build	Service Cloud case ID	Description
15097	--	You can now successfully establish a secure SQL connection in the Linux environment by choosing the Enable option in the Database Configuration > Secure Configuration > Secure Connection field. The Linux installer now successfully imports the SSL certificate, and the connection is established. Previously, the Linux installer failed to import the SSL certificate and the connection was not established.
15097	00781974	In the Linux environment, you will no longer encounter issues with services stopping due to disk storage issue. Previously, some of the Control Room log messages were stored in the /var/log/messages file instead of the /var/log/automationanywhere directory, leading to low disk space.
15097	01260701	When you run bots on user devices, bots no longer become stuck in queues. Also, the following messages are no longer displayed: <ul style="list-style-type: none"> • Waiting for user <i>username</i> • Picked at runtime
15097	01760032	Domain names are no longer case-sensitive, and you can now create users by using the Active Directory group mapping and map a role to a user in the Control Room. Previously, because some Active Directory servers were returning domain names in uppercase whereas others were in lowercase, domain names could not be found and there was an issue with the group mapping feature.
15097	00828289	The Global Value fields are now validated and have a maximum length of 4000 characters.
15097	00828289	When you navigate to My settings > My Profile > Edit in the Control Room and provide a link, for example, <code>LinkInjection</code> , the email sent contains a link, and the email text sent is validated against HTML injection and you will no longer see a functional link.

Fixes		
Build	Service Cloud case ID	Description
15097	01754431, 01773662, 01789555, 01791065, 01784255, 01785653, 01780070	<p>When you use the Recorder to capture an object, set the waiting time for detecting the object to fewer than 30 seconds in the Keep trying for (seconds) field, and run the bot, the Recorder now waits for the specified time to detect the object and waits for the page to load completely. Previously, the Recorder waited for a minimum of 30 seconds to detect the object regardless of the time specified.</p> <hr/> <p>Note: This fix is applicable only to Google Chrome and Microsoft Edge Chromium browsers.</p> <hr/>
15097	01614810	<p>You can now use a blank space as the delimiter in the Specify delimiter (optional) field. In the Open action of the CSV/TXT package, when you browse the filepath to open a file, add a blank space as the delimiter in the Specify delimiter (optional) field, and run the bot, the blank space is now treated correctly as a delimiter and the bot no longer fails.</p>
15097	01387738	<p>When you use the Browser > Open action to open a new window in Google Chrome, the new window is now activated and displayed in front of the other open windows. Previously, when you ran a bot, the window remained in the minimized state.</p>
15097	01273095	<p>When you enter a decimal value with 16 or more decimal points in a cell of a Microsoft Excel spreadsheet and when you use the Read cell value option in the Excel advanced > Get single cell, Get multiple cells, or Get worksheet as data table actions to retrieve the decimal value from the cell, the format of the cell value no longer changes from General to Scientific.</p>
15097	01144509, 01767881	<p>When you connect to an SAP session, use the If > Object exists Recorder condition to identify and capture objects on the SAP application, disconnect the SAP session, and then run these actions in a loop, the bot now detects the objects correctly in every iteration of the loop. Previously, when the bot was run in a loop, it captured the objects correctly only during the first iteration and failed during subsequent iterations.</p>

Fixes		
Build	Service Cloud case ID	Description
15097	01769573	If you use the App integration > Capture text of window action to capture the text in a command prompt window, when you run the bot, the bot now captures all the characters in each line correctly. Previously, the bot failed to capture the last characters in each line.
15097	01628448, 01766957, 01788709, 01788801, 01789538, 01803156, 01781597, 01810230, 01811694, 01802054, 01815687, 01823526,01814962, 01833962, 01835418, 01835382, 01837832,01830790	The Excel advanced package now works as expected and without any issues. Previously, the package threw a generic exception error intermittently.
15097	00824995, 01451063, 01274854	In the PDF > Extract field action, when you select the Open PDF viewer option, select a PDF file from the Control Room or Desktop, click Load , and open the PDF viewer, you can now view the PDF document. Previously, when you selected the Open PDF viewer option to view the selected PDF document, a blank page was shown, and you could see the value in the PDF document only when you selected a specific rectangular area in the blank field.
15097	00957308	In the File > Copy Desktop file action, when you specify a source filepath where the folder name contains a number sign (#) character or the filename contains a wildcard character, specify a destination filepath to copy the file, and run the bot, the bot now detects the source filepath and copies the file to the specified destination location successfully. Previously, when you ran the bot, the bot failed to detect the source filepath and hence did not copy the file to the destination folder.

Fixes		
Build	Service Cloud case ID	Description
15097	01685239	You can now use the Recorder to capture objects on the Citrix Xenapp application, use the If > Object does not exist condition to verify whether a specific object exists in the application, and successfully run a bot from a parent bot. Previously, when you tried to do this, an error occurred.
15097	01260387	A password-protected Microsoft Excel file is no longer corrupted when you open the file manually after successfully running a bot using the Excel basic package. Previously, when you used the actions in the Excel basic package to open a password-protected Excel file, made some updates to the file, and closed the file by selecting Save changes when closing file in the Excel basic > Close action, the password-protected Excel file became corrupted when you opened it manually from its location.
15097	00920617	When you connect to your mailbox through the IMAP protocol, use For each mail in mail box as email loop iterator to retrieve all email message received before date filter, and run the bot, the bot now retrieves all the email messages received before the specified date, including the email messages received on the specified date before the specified time.
15097	--	In Google Chrome, Microsoft Edge, and Mozilla Firefox browsers, you can now successfully open network URLs that start with two backslash (\) characters by using the Browser > Open action.
15097	01015001	When you specify the total number of packages that you want to view per page under the Manage > Package section in the Control Room, the page now displays the correct number of packages specified. Previously, all the packages were displayed on a single page even if you chose to view only a specific number of packages.
15097	01711629	In the Recorder > Capture action, when you select a specific browser window whose title matches another browser window from the Browser tab and run the bot, the bot now accurately opens the selected browser window. Previously, when the title of two browser windows matched, the bot randomly opened a browser window with a matching title.

Fixes		
Build	Service Cloud case ID	Description
15097	--	You can now use the Browser > Run JavaScript action to successfully run JavaScript on web pages that have iFrames.
15097	01075660, 01273111	The Excel advanced > Open and Create workbook actions now display the Default session value under the Local session field.
15097	01252773, 01278029, 01772301, 01765017	An error no longer occurs when you use the Excel advanced > Open action to open a worksheet that is a type of hidden chart or a macro. You can specify the sheet name to open the worksheet of type macro. Note: When you open the default sheet, ensure that the active sheet is an Excel Worksheet. If the active sheet is of type chart, the following error message is now displayed: The Excel file does not contain an active sheet to open. Please make sure the Excel file you want to open has at least one active sheet.
15097	--	After migration, when you run the bots that use File and Folder packages, the year under the Date option now accepts the value 00 as input, which is considered as year 2000.
15097	01257829	In the REST Web Services package actions, you can now add a Custom content type, using which you can add content that does not fall under a standard content type.
15097	--	In the REST Web Services package actions, you can now perform Add Substitution , using which you can enter variables in the REST request body.
15097	01784553, 01794924	In the SOAP Web Service package actions, the ampersand character (&) is now automatically escaped. Previously, the ampersand character (&) which is a reserved control character, was not automatically escaped, which resulted in invalid XML files.
15097	01767571	In the REST Web Services package actions, new lines in the request body are no longer altered at runtime. For example, when the request body contains a new line, it is no longer replaced by a space at runtime. Previously, when a request body contained a new line, it was replaced by a space.

Fixes		
Build	Service Cloud case ID	Description
15097	00773353, 00787270	In the REST Web Services package actions, you can now use the user token option to access the Control Room APIs. When you log in to the Control Room, a token is generated, which is used by the bot to access the endpoints of the Control Room API used within the bot.
15097	01372460	You can now run bots by using the RunScript action of the Legacy Automation package. When you pass multiple arguments to replace values from a Microsoft Word document, the bot now runs the function and replaces and displays the text on a new line. Previously, the text was displayed on the same line.
15097	01758458	When you use the Connect action to establish a connection with an email server, use the Disconnect action to close the connection with the same session name. You will then not encounter any issue when you establish a new connection again with the same or different credentials.
15097	01273357	You can create a bot to run a standard workflow in SAP BAPI , and the output is now generated correctly as a .CSV file. Previously, when you ran a standard workflow in SAP BAPI , the generated output was varied.
15097	01342887	When you run a process by using the Terminal Emulator package, the terminal window is now activated and remains in the front. Previously, when you ran a process, the terminal window was not activated and stayed minimized.
15097	01251933	In the Terminal Emulator package, when you use the Connect action to establish a connection with TN3270E, an error no longer occurs. Previously, an error occurred, and the following error message was displayed on the mainframe screen: ISPP904 Panel ISR@PRIM error - x'0E' or x'0F' is invalid as an attribute character
15097	01432885	When you run a bot, the Task bots run metric on the Home dashboard page of the Control Room now displays the correct count. Previously, the metric displayed an incorrect count. For example, on the Home dashboard page, if the Task bots run count showed 39, when you ran the bot, the count displayed was 42 instead of 40.

Fixes		
Build	Service Cloud case ID	Description
15097	00742840	When you use actions such as Open and Run function from the DLL package, you no longer encounter any issues. The bot now opens the DLL file even if the DLL filepath length is fewer than 256 characters.
15097	01261786, 01615115	When you edit a bot and disable any action within it, you can now use the Ctrl+Z keyboard shortcut to undo an action. Previously, the Ctrl+Z keyboard shortcut did not work as expected.
15097	01080067	In the Active Directory package, when you use usernames with special characters, the bot now runs successfully. Previously, when you added a user to a group, if the username had special characters, when you tried to remove the user from the group, the bot failed.
15097	00962414	You no longer encounter an issue when you connect to a puTTY application through Terminal Emulator. Previously, when the terminal was connected to the host, the host prompted for a password. Subsequently, the terminal screen went blank, and the bot displayed the following error: <code>Unable to connect to a terminal. Please check connection details</code>
15097	00829259	In Active Directory, you can now successfully create a user with one of the following options: Require password change at next login or Do not require password change at next login . Previously, when you used the Connect action to establish a connection, if the LDAP connection path contained the oU attribute with a space value such as <code>oU=aa unit</code> , an error occurred when you ran the bot.
15097	00961069	When you are using the Send text action from the Terminal Emulator package, you can now send numeric keyboard minus (-) keys using Simulate keystrokes action [ALT DOWN] - [ALT UP] keys to the mainframe application. For more information, see A360 : How to send hyphen(-) in Terminal Emulator TN5250E (A-people login required) .

Fixes		
Build	Service Cloud case ID	Description
15097	00825675	When you delete the variables mapping from parent and child bots and then run the parent bot, the bot no longer encounters an error. Previously, when you deleted the variables mapping from parent and child bots and then ran the parent bot, the bot failed.
15097	00798604	When you use the Run Function action from the VBScript package, the bot no longer encounters an error. You can now specify the function name to run and pass arguments that contain brackets (()). Previously, the Run Function action failed to run if an open or close bracket was included in any position in a string parameter.
15097	--	When you use a DLL file that is available in the Control Room, and if the DLL filepath is fewer than 260 characters, the bot now retrieves the DLL file successfully.
15097	01149730	You can now connect to an email server, select the IMAP protocol, use Loop > For each mail in mail box iterator, and successfully download attachments from an email message and save them to a specified folder. Previously, if the attachments had a <code>bin</code> file, the attachments were not downloaded or saved to a folder.
15097	00919896	When you use actions such as Send text or Send key from the Terminal Emulator package, the bot launcher no longer stops working. Previously, bots created using actions from the Terminal Emulator package sometimes stopped working at random when a double-byte character set (DBCS) was enabled and the host screen had a wrapped field.
15097	00950682	You can now use the Open spreadsheet action in the Google Sheets package without any issue, even if you use a Proxy Auto-Configuration (PAC) file or a proxy-enabled environment.
15097	01257464	When you connect to an email server with the IMAP configuration and use the Move all action with a filter for all mail received before a certain date, all email messages that meet the criterion can now be moved from one folder to another without any issue.

Fixes		
Build	Service Cloud case ID	Description
15097	01753270	In the Google Drive package, you can now use the Create file permission action with the File ID option. Previously, when you used Create file permission , if no other Google Drive action was placed before it, an error occurred.
15097	01276141	In the email package, when you use the Move all action or the Loop > For each mail in mail box iterator, you can now add any number of email addresses in the From specific sender field. Previously, the email loop did not work if the From specific sender field had more than two email addresses.
15097	01689348	You can no longer import bots with incomplete package files from one Control Room to another because the system now disallows and rejects the import of incomplete package files.
15097	01763262, 01762153	You can now create a bot and run stored procedures successfully. Previously, if you had two stored procedures in different databases, for example, Database_A.dbo.SP_A and Database_B.dbo.SP_B, in the SQL Server, if you were connected to Database_A and wanted to run the stored procedure in Database_B, the execution failed because the fully qualified stored procedure name was not supported in the Run stored procedure action.
15097	--	You can now successfully download exported bots by navigating to Activity > Historical > Bot Export: Export.<date_name > Download exported zip file .
15097	01762348	Bots that are deployed from the Control Room on user devices are no longer stuck in a queue after the unattended Bot Runners are added from a device pool.
15097	01151181	If you have the required permissions, you can now successfully delete an inactive schedule from the Manage > Scheduled > Scheduled activity page. Previously, even if you had the required schedule permissions, when you tried to delete an inactive schedule, you encountered an error message about permissions.

Fixes		
Build	Service Cloud case ID	Description
15097	00917927, 01255618	The Modified by field in the Manage > Scheduled page now displays the correct username for recurring schedules. Previously, when schedules were imported from one environment to another, the Modified by field showed the username of the original Bot Creator or administrator.
15097	01778350, 01803570	When you create a schedule in the Control Room, the Manage > Scheduled > View activity > Schedule page now displays the correct end time for the End date field. Previously, when an end date was selected for a schedule, the end time shown for the End date field was incorrect.
15097	--	In the Kubernetes environment, when you try to create a queue, you no longer encounter an error.
15097	00716776, 00778659, 01820190, 01856732	If you check out an item at certain time T1 and then cancel the checkout later at time T2, the canceled checkout is not considered as a modification to the item. Also, the last modified time is rolled back to time T1 that is when the bot was checked-out last time from the Public folder. Previously, the canceled checkout at certain time T2 was incorrectly considered as a modification to the item. Also, the last modification time was incorrectly shown as time T2 that is when checkout was canceled. Thus, it was difficult to keep track of actual modification dates of items.
15097	--	In the Kubernetes environment, you can now delete work items even after pausing a queue. Previously, when you paused a queue and tried to delete a work item, an error sometimes prevented you from deleting the work item.
15097	01255617	The WLM filters in the Queue > Work items page now return accurate results. Previously, filters were not working accurately when you combined them.
15097	01806221, 01805371, 01818356, 01828330	After you update to Automation 360 v.24, WLM tasks no longer fail. Previously, after an update, bot execution processes or actual bot execution sometimes failed, resulting in the failure of WLM tasks as well.

Fixes		
Build	Service Cloud case ID	Description
15097	01769740	Bot descriptions are now displayed even after you check in or check out bot. Previously, after you checked in or checked out a bot for the first time, the bot descriptions stopped being displayed.
15097	01764336	An appropriate error message is now displayed when you try to change the work item status from Ready to run to On hold or Complete . The error message now informs you that because the queue is already in use, you must either pause or stop a queue automation to change the status of the work item. Previously, the error message displayed did not help with rectifying the issue.
15097	01273374	The <code>gettasklogdata</code> API now shows real-time data, whereby local time values are converted to UTC values for that API request.

The following table lists the limitations identified in the current release:

Limitations
<p>Bots whose queue category name contains a space (for example, Input – Emails) cannot be migrated because during migration, such bots enter and remain in an infinite loop until the loop times out at 90 minutes. (Service Cloud case ID: 01850864)</p> <p>Workaround: You can migrate to Automation 360 v.26 release where this issue is fixed or remove the space in the queue category name and then migrate the bots.</p>
<p>After you migrate your bots, an error occurs in the following situations:</p> <ul style="list-style-type: none"> • When you use FTP actions on bots with commas in filenames • When you use the Delete files and Delete folder FTP actions on bots with colons in filenames <p>Workaround:</p> <ul style="list-style-type: none"> • For bots that use FTP actions, ensure that you remove commas from the filenames. • For bots that use the Delete files and Delete folder FTP actions, ensure that you remove colons from the filenames.
<p>When you try to migrate bots in which the If condition is used for more than 95 times in a single line, migration fails with the following error message: <code>Unexpected response status: 500</code> (Service Cloud case ID: 01830793)</p> <p>Workaround: Divide the bot into multiple logical sub-bots.</p>
<p>(Service Cloud case ID: 01773164) If the number of cells in a table object exceeds 300,000, the Control Room might become unresponsive.</p> <p>Workaround: Ensure that the number of cells in a table object does not exceed 300,000.</p>

Limitations
Even if the Control Room path is invalid or does not exist, the invalid path is still displayed instead of the default path: C:\ProgramData\AutomationAnywhere\GlobalCache\
When you run a migrated bot with the Recorder package, the Click Action on Client Control might not work. This issue occurs because some Microsoft Windows operating systems might not be activated properly on a few Windows applications. Workaround: Use the Left Click action.
When you try to re-edit a migrated bot with the Record > Dataset variable, an error occurs, and the following error message is displayed: An unexpected problem occurred. If the problem persists, please contact your system administrator. Workaround: Refresh the Bot editor page to reload the details.
A parse error occurs when you run a migrated bot with the Email Received Date variable used twice in subactions inside the Email loop action.
When you create a bot by using the Send email action, if the attachment includes the less-than symbol (<) as a special character in the filepath, the special character will be removed after bot execution. The Windows operating system does not support this special character.
In a bot, when you create a List variable with the File subtype, select the value as a Control Room file, and add the List package, the bot execution fails when you run the bot.
If your bot has an error, you add the Try/Finally block around the corresponding actions, and insert more actions in the Finally block, when you save and run the bot, the Bot error dialog shows the wrong error line number within the Finally block. Workaround: If you are using Try and Finally without using the Catch action, the Bot error dialog does not show the correct line number. Instead, use Try/Catch . The Try action handles the error and sends execution to Catch with line number and description. This gives the correct line number within the Finally block.
When you frequently connect to the Excel or Access (Microsoft Office 2016 or later) engines with ODBC drivers, bot execution fails intermittently.
When you use the Connect action to connect with the EWS protocol, read email skips the newline characters and prints the email message body on a single line. This issue is also observed in the Send email action. Following are the scenarios where these issues are observed: <ul style="list-style-type: none"> • Create a bot and connect with the EWS server. Use the Loop action to read emails as a plain text message and use the Log to file action to log text into a file. • Use the Send email action and connect with the EWS server with OAuth authentication to send the email.
In a device pool, when you select the Run bot now option for a WLM bot, the WLM bot run is triggered and an error message is also displayed. Workaround: To run a WLM bot in a device pool, ensure that you select the Run bot with queue option.

Limitations
<p>In a multitenant environment, when you upload a work item file to queue in one of the tenants, the In progress tab displays the same work item file for all the other tenants, as well.</p>
<p>In a device pool, when you stop a WLM automation, a few work items are still in the ready-to-run state. As a result, these work items cannot be deleted.</p> <p>Workaround: To delete work items that are in the ready-to-run state, perform one of the following actions:</p> <ul style="list-style-type: none"> • Pause and stop the automation. • Rerun, pause, and then stop the automation.
<p>After migration, when you use the Excel advanced > Open action to open a file with the Load Add-ins option enabled and the system has COM add-ins enabled, when you run the bot, the bot might fail with an error.</p> <p>Workaround: Disable the Load Add-ins option to run the bots successfully.</p>
<p>When you use the If > Folder does not exist condition to determine that a folder does not exist, even if the folder exists, the bot might fail to identify it due to the leading and trailing spaces in the input folder path. As a result, the bot might throw an error.</p>
<p>When you update the Control Room to the latest version, you might see some packages with two default versions.</p> <p>Recommendation: Sometimes, you might notice the duplicate packages a few weeks after the Control Room is updated. Hence, we recommend that you compress and save the Control Room logs dir that contains all the WebCR*.log files 30 minutes after the Control Room is updated. This way, if you discover the issue later, these logs from the time of update will be available and help in investigating this issue.</p>
<p>In the Data Table > Assign action, when you select the Table with values option, select the Edit table (1 X 1) option to edit a table, enter variables in the rows and columns and then run the bot, the output still shows the input \$variable\$ instead of the evaluated value of the variable.</p>
<p>When you try to upload packages to the Control Room manually, the system does not check for the minimum required version of the Control Room that is compatible with the packages before they are uploaded. It allows the packages to be uploaded in the Control Room even if the version of the packages is not compatible with the currently installed version of the Control Room.</p>
<p>When you use the Run bot option to run a bot in the Activity > Historical > View page for any activity, the bot execution fails with an error.</p>
<p>(Service Cloud case ID: 01784401) To ensure that multiple Git processes are not modifying the same repository at the same time in the Control Room, Git lock is implemented for a short interval. After the lock is released, repository-related operations are resumed without any issues. However, in some instances, the Git lock is not released, and new Git operations cannot be processed. As a result, repository-related operations, such as edit, save, import, and check-in, are delayed and eventually time out.</p> <p>Workaround: Contact Automation Anywhere Support.</p>

Limitations
When you use the If package, add a specific condition with a variable, then add specific conditions within a group, save the bot, and if you rename the variable that was used, the name of the variable might not update for the Group conditions but is only updated for the conditions in the Condition tab.
When you use AISense Recorder to automate applications on a Windows 10 Japanese operating system, the bot might encounter an error. Workaround: Enable UTF-8 encoding and restart the Bot Agent machine.

Limitations from previous releases
When you migrate a bot that was using the Manage Window Controls action, the last digit of the height value is not available after migration. However, the bot will execute successfully. (Service Cloud Case ID: 01756996)
When an Excel session is active in SAP, a corresponding Excel process starts in the background. In such a scenario, Automation 360 uses the same Excel process that SAP started. When you run a bot to automate spreadsheet data, Automation 360 processes the first request successfully. However, during execution, if the Excel is closed and a subsequent request is sent for automating the spreadsheet data, Automation 360 does not process the request because the Excel process is still being accessed by SAP. Therefore, the correct window is not activated for automating the spreadsheet data. (Service Cloud Case ID: 00815159)
<ul style="list-style-type: none"> • If you are updating from Automation 360 On-Premises v.21, remove the following Bot Agent files and folders: <ul style="list-style-type: none"> • C:\Windows\System32\config\systemprofile\AppData\Local\AutomationAnywhere\AA-DB.mv.db • C:\ProgramData\AutomationAnywhere\GlobalCache\embedded-resources • Before you update from Automation 360 On-Premises v.22, refer to the upgrade considerations in Update Automation 360 to latest version on page 1363.
(Service Cloud case ID: 00837271) If you are migrating from Enterprise 11 with a database that has a large amount of repository data, the installation might fail. This issue occurs because Liquibase update for a few SQL queries is not completed during migration. Workaround: Contact Automation Anywhere Support.
When you try to automate any process in a Java application that uses version 11.0.8 of AdoptOpenJDK, the Recorder might not capture the drop-down elements on the application.
When you use the Recorder to capture an object, select HTML Tag , HTML InnerText , and HTML type properties in Search Criteria , or migrate a bot with similar properties selected in Search Criteria , the bot fails to identify or locate the object and perform the selected action. Workaround: Modify the DomXPath according to the controls you capture, or add more properties in Search Criteria .

Limitations from previous releases

When you use the **Browser > Close** action to close a tab or a window opened in the Microsoft Edge browser, if only one Microsoft Edge browser window is open, the bot encounters the following error: `Error occurred while closing the tab`

Workaround: See [Configure Microsoft Edge browser settings when Close action of Browser package encounters an error \(A-people login required\)](#)

Internet Explorer EOL updates

Note: This release (Automation 360 v.25) includes features from Automation 360 v.24R2 (Build 13331). For information about what's available in the v.24R2 release, see [Automation 360 v.24R2 Release Notes for Internet Explorer 11 EOL](#) on page 323.

Features

Packages and actions

You can now migrate Internet Explorer bots from Enterprise 11 and Enterprise 10 to Automation 360 and convert the bots to **Microsoft Edge with IE mode** for the following actions and commands in the Web Recorder package:

- **Navigate URL**, **Go Back**, and **Search by Caption** actions.
- **Open Browser** and **Close Browser** commands. These commands are mapped to the **Legacy Automation > Open Page** and **Close Page** actions in **Microsoft Edge with IE mode**.

To launch Internet Explorer bots, in the **Legacy Automation** package, select the **Launch Internet Explorer in Edge compatibility mode** option.

To migrate and convert Internet Explorer bots, in the Control Room, from **Administration > Migration > Migrate bots**, select the **Convert bots built using Internet Explorer to Edge with Internet Explorer mode** option.

Automation Co-Pilot for Business Users

Note: For Automation 360 v.25, Automation Co-Pilot does not support an Oracle Database. You can continue to use Automation Co-Pilot with Microsoft SQL Server.

What's new

Use Bot Task labels to identify bot version to run

In **Bot Task**, you can now select the version of a bot for deployment by choosing between the **Latest version** and **Production label** options. When you deploy the bot, the version of the bot that you selected is run.

[Create a process automation in Process Composer](#) on page 3312

What's new
<p>Bot priority reference</p> <p>In Bot Task, you can now refer to the priority level of your bots. For bots that were set to a priority level, the Bot priority section now displays a Low, Medium, or High read-only label.</p> <p>Create a process automation in Process Composer on page 3312</p>
<p>Create request in new tab</p> <p>You can now open and run your new requests in a separate tab when you select the Open request in New Tab option in the initial form. With this option, you can create requests concurrently without changing your current page navigation.</p> <p>Create a request and complete a task on page 3264</p>
<p>Invalid scheduler</p> <p>An invalid scheduler is when a scheduler user has their role removed or when they cannot access a file because of missing permissions. Users who are notified of the invalid scheduler are the Control Room admin, the Automation Co-Pilot admin, and the Automation Co-Pilot user. Now, the Control Room admin will see an audit log change, the Automation Co-Pilot admin will see an error message to reassign a new scheduler user, and the Automation Co-Pilot user will see an error message in their process.</p> <p>Assign a scheduler user to a process on page 3294</p>
<p>Duplicate rows for Table element</p> <p>In the web interface, when you are adding rows to your form by using the Table element, you can now save time by duplicating a row in the table with the new Duplicate row option. The duplicated row will now be placed under the highlighted row that you had selected.</p>
<p>Interface triggers support more technologies</p> <p>You can now use interface triggers with the following technologies:</p> <ul style="list-style-type: none">• Windows native• SAP Desktop• Google Chrome and Edge Chromium browsers <p>Add an interface trigger on page 3240</p>

What's new

Enhancements to form rules

- Use custom formatting

When you are adding a rule, if you use the **If** menu to set the rule conditions on certain elements such as **Text Box** or **Text Area**, you can now select **Is** from the drop-down menu to enable additional options. Select the **Custom** option and click **Add regular expression** to apply custom formatting requirements on the selected element.

Consider a scenario where the user IDs of all your employees have AV as prefix. For example, for an employee whose name is Adam, the user ID is AVAdam. Use the **Add regular expression** option to set the value in the **Regular expression** field as ^AV. If a user enters Adam in the user ID field, an alert is displayed.

- Set custom value or append element value

When you are adding a rule, use the **Then** menu to select a form element. For this form element, you can set one of the corresponding actions using **Set Value** or **Append value**:

- **Value**: Data entered in the **Enter value** field is applied to the selected element.
- **Form element**: Data from the form element selected in the **Select element** drop-down menu is appended.

Consider a scenario where a user registration form has 'First name' and 'Employee ID' fields. You can set one of the following rules for the value in the Employee ID field:

- Select **Value** and enter Emp1013 as preset value.

This value is displayed in the 'Employee ID' field when the bot runs.

- Select **Form element** and set 'First name' element in the **Select element** drop-down menu.

The value from the 'First name' field is appended to the 'Employee ID' field when the bot runs.

You can use elements in the same way that variables are used in the Bot editor. You can enter **\$** to view a list of elements.

[Add rules to form elements](#) on page 3229

What's changed

Request reference for AARI web package

The Automation Co-Pilot web package now supports reference IDs. A reference ID is a combination of a prefix and a number that is created from a process key and is incremented every time a request is created. **Request ID** is replaced by **Request Reference**, and **Team ID** is replaced by **Team Reference**.

[Process Composer package](#) on page 2777

What's changed
<p>Process and package version changes in Get Storage file action</p> <p>The Get Storage file action now requires the matching of versions between the version of the process and the version of the package. Processes created before Automation 360 v.25 must be used with package versions from before Automation 360 v.25. Similarly, processes created after Automation 360 v.25 must be used with package versions after Automation 360 v.25.</p> <p>Process Composer package on page 2777</p>

Fixes		
Build	Service Cloud case ID	Description
15112	01841448, 1839118, 1844817, 01846153, 01846332, 01839254	When you download a series of packages from the bot compilation, the download is now faster.
15112	01847675	After you update to Automation 360 v.25, when you modify a process in a private workspace, you can now save your changes successfully, without encountering an error. Previously you will get a process error when you attempt to modify and save your process, or when you open the same process again.
15112	01848192	After you update to Automation 360 v.25, you can now insert or modify conditions, such as the If/Else logic, to your process without any issues. Previously when you made changes or add the If/Else element to the process logic, a Go to element would be added to the logic which caused a process error.
15097	01807181, 01809192, 01816444	Cloud users: You can now successfully upload a file for your requests. This applies to some scenarios when you upload a file and the request creation fails.
15097	01771877	In the process editor, at the end of your process, you can now drag Go To and add it to your End Point .
15097	01774331	When you use the Row before scrolling option from the Table element and specify a number of rows, the web interface now renders the correct number of rows that you specified.
15097	--	When you use the Document element and click the Fit option to fit your document in request view, the document is now scaled to fit the frame entirely.

Fixes		
Build	Service Cloud case ID	Description
15097	--	If you design a form with a drop-down rule applied to it, when you view the drop-down in read-only mode in the web interface, you can now view the changed data.
15097	--	After you are disconnected, when you log back in to the web interface, the next= parameter is no longer shown in the URL and you are now redirected to the page that you were on before you were disconnected.
15097	--	For the Text Box element, the Does not contain form rule now works correctly.
15097	--	For the Rich Text Editor element, the Contains form rule is now working correctly.
15097	--	When you create a form with the Document and Dropdown elements, you can now submit your form without issues.
15097	--	You can now use Request Reference as a parameter in the AARI web package.
15097	01803846	You can now use Request Reference in the AARI web package, for example, as an output for the Create a Request action. Request ID is now replaced by Request Reference .
15097	--	You can now successfully submit an initial form that has a table with no content, data, or rows.
15097	01803019	When you open and view a task, the task assignment now correctly shows the user assigned to that task.

Limitations
When you attempt to delete a request that is associated with more than one file, the deletion fails.
After you create a request from a private process, when you attempt to open and run the request in a new tab, a new tab is generated but it fails to run the request and the URL is not correct.

Discovery Bot

Fix	
Service Cloud case ID	Description
00971940, 01018262, 01255326, 01829662	<p>You can now successfully record a process without encountering an error because when you log in to the Control Room, the proxy settings now support the following scenarios:</p> <ul style="list-style-type: none"> • No proxy is enabled. • Proxy is entered with username and password. • Proxy is entered without username and password. <p>Previously, when you recorded a process, if there was no proxy and if you entered a username and password with proxy enabled, an error occurred.</p>

Limitations from previous releases
<p>Depending on the memory available in your system, the PDD (in PDF or Microsoft Word format) can support up to 250 recorded steps captured in the document. If a process is recorded with more than 250 steps, the PDD generation periodically stops functioning.</p> <p>Workaround: Regenerate the PDD and click Download.</p>

Document Automation

New capability: Document Automation is the new Cloud-native intelligent document processing solution that business users can set up to automatically read and process documents quickly using pretrained models and validation feedback.

Document Automation is fully integrated into Automation 360: Document Automation is installed as part of the Control Room. RPA bots are used to extract semi-structured or unstructured data to automate document-centric business processes, and Automation Co-Pilot for Business Users manages the end-to-end extraction process and validation tasks.

[Document Automation](#) on page 3455

Limitations
<p>Although the v.26 Document Extraction package appears in the .v25 On-Premises Control Room, features will not work as expected.</p> <p>Workaround if the package version is auto-synced: Manually change the Document Extraction package version to v.25. See Update bots to default package version on page 1844.</p>
<p>Document Automation does not support SDS deployment.</p>
<p>Google Document AI pretrained models are available only for Cloud customers who purchased licenses through Automation Anywhere.</p>

Limitations
Customers who install Document Automation on Linux must separately download the Document Extraction package.
Document Automation supports a device username of 21 characters or fewer.
The value beside the Validate documents link, which indicates the number of documents awaiting validation for a learning instance, sometimes does not appear.
Learning instances that use Google Document AI models do not reliably extract tables that span multiple pages.
When you are validating a document in public mode, if you zoom in or out, you cannot drag the corners of the system-identified region (SIR) selection.
When you are validating a document, if you draw a box, zoom in, and then click Fit to screen , the box appears at a different location from where you clicked.
If you connect to a learning instance from Automation 360 IQ Bot with an optional field that has a set default value and some fields that are unmapped, when you process documents in that learning instance in Document Automation, the default value appears in the unmapped fields.
There is no notification if the product license is about to expire. When the product license expires, the Learning Instances tab is removed from the Control Room.
You might encounter extraction issues when you process documents with tables that span multiple pages. Workaround: Contact your Customer Success Manager to download a patch for the Document Extraction package.
When a bot runs an action from the Document Extraction package, the Activity > In progress page shows the item name as IQBotAutoExtract.
The Bot Agent does not verify whether the Document Extraction package version is compatible with the Control Room version prior to running a bot.
Document Automation cannot process documents in Automation Anywhere pretrained models if the Bot Agent runs through a proxy. Workaround: <ul style="list-style-type: none"> • With authentication: Create a Windows environment variable HTTP_PROXY with a value of <code>http://<username>:<password>@<proxyhost>:<proxyport></code>. • Without authentication: Create a Windows environment variable HTTP_PROXY with a value of <code>http://<proxyhost>:<proxyport></code>.
If a document is renamed to a new file extension and uploaded to a Google Document AI pretrained model, the document will fail processing. Workaround: Rename the document to the correct file extension.
Bots containing actions from the Document Extraction package must be deployed as part of an Automation Co-Pilot process. Standalone bots are not supported.

Limitations

In some cases, the Bot Agent does not clear out its resources folder. Until the disk space is freed, the production documents in processing will be affected. This issue occurs intermittently.

Workaround: Based on the issue, you must create a task scheduler to clean out the resources folder every day or every week.

IQ Bot

Note: For Automation 360 v.25, IQ Bot does not support an Oracle Database. You can continue to use IQ Bot with Microsoft SQL Server.

What's new

Migrate the roles associated with a learning instance

You can now retrieve a list of custom roles with access to a learning instance in a source environment and grant users in a destination environment access to the learning instance by using the Roles migration API.

[IQ Bot roles migration APIs \(A-People login required\)](#)

Track the number of pages processed in standard forms separately from IQ Bot

The Control Room Licenses page now shows the number of pages processed in standard forms, the Classifier, and through IQ Bot. If the licenses are added to the Control Room from the Cloud, the Licenses page also shows the number of pages processed in other Control Room instances.

[Automation 360 licenses](#) on page 1347

What's changed

Reinstall IQ Bot services using a new script

You can now reinstall all the IQ Bot services together in a batch or choose to reinstall them individually by using the reinstall-allservices.bat script.

[Postinstallation checklist](#) on page 1389

Fixes

Service Cloud case ID	Description
00780662	A round-off error no longer causes documents to fail formula validation. Previously, these documents were manually validated.
01763658	For the Concatenate Images action in the IQ Bot Pre-processor package, if a filename does not exceed 256 characters, the output is now successfully generated.

Fixes	
Service Cloud case ID	Description
01795651	When you export the IQBA file from a learning instance of a custom domain type with manual groups to another learning instance, the manual Group Label is now exported successfully. Previously, without a manual Group Label , it was difficult to distinguish between system-generated groups and manual groups for new learning instances.
00780712	When you import IQBA files using VisionBot data, among the learning instances, you can now see new groups created. Previously, new groups were not created when documents were uploaded.
--	An error message is no longer displayed when you change the display language of any learning instance that has a document in Validator. Previously, even if the selected display language was applied successfully to a learning instance, the system showed an error.
--	When you use the Overwrite option to import a learning instance, the Default validations group is now successfully overwritten. Previously, the Default validations group was not overwritten, and you needed to manually edit the learning instance after importing the IQBA file and then change the default group.
--	When you use the IQ Bot Extraction package, you can now view your document count on the Details page of the learning instance. Previously, if you processed documents that did not belong to any created groups, they were not displayed on the Details page of the learning instance.
--	You can now sort the PagesUpload column in the Learning instance > Document Group tab. Previously, the following error message was displayed: <i>System error, please try again after some time</i>
--	On the Designer, when you resize the system identified region (SIR) of an automapped field, the values from the resized selection are now captured accurately in the corresponding value field.
--	Database Migration Assistant Tool now notifies with an error if there are any environmental issues (such as missing DLL). Previously, the tools and logs indicated that migration was complete, even if a unified database was not created.
--	When a non-English filename is uploaded using the Invoice domain and processed using the AutoExtract command, system identified regions are now generated. Previously, to process the documents successfully, you had to convert the non-English filename to English characters.

Fixes	
Service Cloud case ID	Description
--	If you import a learning instance with a set default validation group to an environment where the learning instance was previously deleted, the default validation group setting stays intact. Previously, the imported learning instance appeared without the default validation group.
--	The column header name for the Default validations group now appears in the <code>Projectdetails.csv</code> file obtained from exporting a learning instance.
--	For a standard forms learning instance, if you try to process a large number of documents (more than 10,000) by using the Process documents action from the IQ Bot Extraction package, some of the documents might not be processed.
--	During IQ Bot Extraction package updates, even when you use the Tesseract4 OCR, there is no delay in the document processing time and throughput results.
--	In standard forms learning instances, you can now set a default value for optional fields. If extraction fails for an optional field, the system uses the default value you set.
--	You can now access standard forms learning instances created in earlier IQ Bot versions that were installed with the CyberArk vault key.

Limitations
<p>IQ Bot Cloud: If you do not access IQ Bot within the configured Ideal time out value set on the IQ Bot server, the following things happen:</p> <ul style="list-style-type: none"> • A message to restart IQ Bot is displayed. • Bots that use IQ Bot APIs fail when the server is restarted. <p>Refresh the IQ Bot web page after some time (more than 5 minutes) to log in to IQ Bot.</p>
<p>On the Validator screen, if incorrect values are used to update a field on which you have applied validations, an alert is not displayed when the focus is lost from that field.</p>
<p>If you use the Process documents action from the IQ Bot Extraction package to extract content from a large number of documents (more than 1 million), an error message is displayed and IQ Bot might stop responding.</p>

Limitations
<p>When you access the IQ Bot application on Internet Explorer11, the following functions do not work as expected:</p> <ul style="list-style-type: none"> • Export option on the dashboard • Icons in the menu list • Actions list on the Bots page • Action icon for learning instance • Validator functionality, such as the following: <ul style="list-style-type: none"> • Add rows • Delete rows • Search functionality • Hide icon • Data type for form fields
<p>In the IQ Bot Community Edition, when you use a Cloud OCR to create a learning instance, if you use the IQ Bot Process document action from the IQ Bot Extraction package, the values from the uploaded invoices or documents are not processed successfully.</p> <p>Workaround: If you use the Cloud OCR to create a learning instance, use the IQ Bot Upload Document action from the IQ Bot package.</p>
<p>When you click the Create Backup option on the Migration Management page and select the learning instances to be backed up by using the Search drop-down list, the learning instances selected become deselected. As a result, you cannot take a backup of the learning instances.</p> <p>Workaround: Instead of using the Search drop-down list, select learning instances from the list on the Backup Learning Instance page.</p>
<p>In a Native Validator learning instance, when you try to enter data into or modify the data in a child table that does not exist in the parent table, no error is prompted, which leads to documents being saved with incorrect values.</p>
<p>When you use the IQ Bot Extraction package along with other OCR-based commands (such as IQ Bot Pre-processor, Document Classifier, AISense Recorder, and OCR) in a single bot, the bot fails.</p> <p>Workaround: Ensure that you create separate bots for IQ Bot Extraction, and do not run IQ Bot Extraction in conjunction with other packages that include the 12.2 Abbyy OCR.</p>
<p>When you install IQ Bot with Windows authentication and CyberArk Vault, it is not possible to rotate the key, and the following error message is displayed: <code>Error occurred while setting up the new key. Please check the logs</code></p>
<p>In some cases, the Bot Agent does not clear out its resources folder. Until the disk space is freed, the production documents in processing will be affected. This issue occurs intermittently.</p> <p>Workaround: Based on the issue, you must create a task scheduler to clean out the resources folder every day or every week.</p>

Limitations
If you have a document with more than 100 pages, an error message is displayed intermittently when you click See extraction results for an existing learning instance.
If you use the ABBYY FineReader Engine version 12.4 instead of version 12.2, the MICR feature does not support data extraction from documents in Japanese language.
When you download an unclassified document, click Delete from the server , and then toggle the learning instance from production to staging, and vice versa, as a consequence, the same document starts reappearing in the untrained output folder, and when you download the document from untrained groups, the same document reappears even though it has been deleted.
<p>When you upload documents to production using IQ Bot Upload > Run the command, toggle the learning instance from production to staging, and then toggle back to production, all unprocessed documents appear blurred.</p> <p>Workaround: Upload documents to Staging using an API. Upload document to Staging API (A-People login required)</p>
<p>As a result of upgrading Control Room and IQ Bot from A360.21 to A360.25, you are unable to edit groups in the learning instances, and move groups from Staging to Production.</p> <p>Workaround:</p> <ol style="list-style-type: none"> 1. Restore the latest IQ Bot database backup. 2. Run the delete query. 3. Delete from EncryptionKey. 4. Run the following query: <code>INSERT INTO EncryptionKey ([Key], [Type]) VALUES ('xDxQoAhIc/R0nF+bFXHuo6/UGnnm6Hqs/uBVxYpz1IdU6UAEUUVYf5vnFJU6qkBcnCAvdQOUjdwrJWwWW4LdKA=','data')</code> 5. Start the A360.25 installer.Post upgrade checklist: 6. Ensure that following logs details are not available in installion-helper.log file: [INFO]: main/com.automationanywhere.cognitive.installationhelper.infrastructure.datarotation.DataRotationServiceImp - Rotation starts. 7. Run the API, and ensure that the filename has proper value (it should not be "fileName" : "THIS STRING IS NOT ENCRYPTED",). http://localhost:9996/organizations/1/projects/%7BLearningInstanceID%7D/categories/%7BgroupNumber%7D/files <hr/> <p>Note: Replace the value of {LearningInstanceID} and {groupNumber} properly. Also, GroupNumber should belong to same learning instance.</p> <hr/>
There is no notification if the product license is about to expire. When the product license expires, the Learning Instances tab is removed from the Control Room.

Bot Insight

What's changed
<p>Dashboards now require the use of the Analyze package version 2.3.0-20210922-121532 or later. This version of the package is available from Automation 360 v.23.</p> <p>Bot Insight dashboards on page 3728</p>

Fixes	
Service Cloud case ID	Description
01755186	When you use a filter on an individual widget, the filter is now correctly applied only to that filter, as expected. Previously, a filter meant for a specific widget was sometimes applied to other widgets, as well.

Automation Anywhere for Genesys

What's new
<p>Automate tasks for Genesys platform with Genesys package for Automation 360</p> <p>Use the actions in this package for onboarding and updating records in the repository. Each action palette offers single and bulk record creation and delete/remove actions for records. You can list or search records for referencing the IDs required for updating other records. You can also organize the records for communication purposes and contextual insight. The action palettes in this package include the following:</p> <ul style="list-style-type: none"> Record creation: User, Division, Phone, External contacts Organize records: Group, Queue, External organization Record attributes: Language, Role, Skill <p>Genesys package on page 2555</p>

Feature deprecations

Review features and capabilities (from Automation Anywhere or other third-party vendors) that are deprecated or nearing deprecation to understand how they impact your automation. For more information, see also this page: [Feature deprecations affecting Automation Anywhere products](#) on page 1030.

Human-Bot Collaboration 11.3.x deprecated

The Human-Bot Collaboration (HBC) 11.3.x was deprecated from August 2020 with the release of Enterprise A2019.15, after which the product has not been actively developed or maintained. Customers that are using HBC 11.3.x are required to migrate to the Automation 360 platform to use Automation Co-Pilot for Business Users (Automation Co-Pilot), Web or Desktop. For this migration, there is no automated migration path because of an absence of parity between the two products (including sets of features). Any path that you take to migrate from HBC 11.3.x to the Automation 360 platform will involve significant manual steps to convert and map bots and other assets (such as forms, teams, and tasks) to Automation Co-Pilot assets (such as bots, forms, processes, teams).

[Feature deprecations affecting Automation Anywhere products](#) on page 1030

Basic authentication in Exchange online

Microsoft has announced that starting October 1, 2022 Basic authentication will be permanently disabled in Exchange Online. This change will impact bots used for email automation that connect to Exchange Online with Basic authentication using IMAP, POP3, or EWS protocols. Hence, Microsoft recommends customers to switch from Basic authentication to OAuth 2.0.

To maintain business continuity of the impacted bots, Automation 360 customers and partners can leverage the OAuth 2.0 feature support in Email package and Email trigger that will be delivered in the week of Aug 29th, 2022.

[Deprecation of Basic authentication in Exchange Online](#) on page 1066 | [Everything about Basic Authentication deprecation in Microsoft Exchange online \(A-People login required\)](#)

Manifest V2 extensions for Google Chrome and Microsoft Edge

As Google will deprecate Manifest V2 extensions by June 2023, this might impact your existing automations that use our current MV2 extensions in Google Chrome and Microsoft Edge browsers. You can choose to use the enterprise group policy to continue to use Manifest V2 extensions until June 2023([Manifest V3 transition timeline](#)). However, post this date, you have to switch to Manifest V3 extensions for your automations to work.

We plan to provide Manifest V3 extensions for Google Chrome and Microsoft Edge with our next release Automation 360 v.26. We recommend that you now start planning to switch to Manifest V3 extensions.

[Chrome and Edge Manifest V3 extensions](#) on page 1082

Tesseract v3 OCR planned change from October 2022

Tesseract is an open source OCR engine leveraged by Automation 360 IQ Bot as part of document processing and extraction. Tesseract v3 has not been updated since 2018, and it will no longer be packaged with Automation 360 IQ Bot from the next release v.26 (planned for October 2022).

Tesseract 3 OCR was removed as an option from the IQ Bot learning instance creation user interface about 2 years back (in our v.13 release). However, we continued to package this older OCR version, which ensured that learning instances previously created on Tesseract 3 can function.

Starting from our next release Automation 360 v.26, Automation 360 IQ Bot will no longer package Tesseract 3. From v.26 release, document processing against learning instances with Tesseract 3 will result in an error, indicating that this OCR version is not available. However, the learning instances will remain in the system, allowing customers to view their details and train with alternative OCR options (including Tesseract v4 OCR).

For all existing learning instances trained using Tesseract v3 OCR, we recommend that you plan to train them with alternative OCRs (including Tesseract v4), before you update to v.26. Note that Automation 360 IQ Bot Cloud customers will receive v.26 release by default from October.

IQ Bot Extraction package deprecation from October 2022

As part of Automation 360 v.25, IQ Bot Extraction package will no longer support pre-trained machine learning model for invoice data extraction, but will continue to support learning instance group based-training extraction.

We have released a new set of capabilities on pre-trained models with Document Automation as part of v.25 release, including a new command package called Document Extraction. IQ Bot Extraction package will be deprecated starting from the next release Automation 360 v.26, so we recommend our customers to start leveraging this new Document Extraction package.

For more information about Document Extraction package and instructions on how to move learning instances to Document Automation, see [Move from IQ Bot Extraction package to Document Automation](#) on page 2647.

Automation 360 v.24R2 Release Notes for Internet Explorer 11 EOL

Release date: 17 May 2022

This release notes applies to the Automation 360 v.24R2 patch release for Cloud, On-Premises, Sandbox, and Community Edition users impacted by the Internet Explorer end-of-life (IE EOL) and who have therefore chosen to convert IE bots.

Cloud, On-Premises, IQ Bot, Sandbox, and Community Edition are on Build 13343.

Note: The IQ Bot build does not include any specific updates and is available to match the Control Room build.

Why this release

Microsoft has announced end-of-life (EOL) for Internet Explorer beginning June 2022 and recommends Microsoft Edge or Microsoft Edge in IE mode. This release contains packages certified on Edge in IE mode and an IE Update Bot wizard to help you update bots in bulk to work with Edge in IE mode. The upcoming IE EOL might affect your deployments based on the operating system you are currently using where the bots are run.

See the following table for details:

Microsoft operating system	Automation 360 bots
Windows 10 Semi-Annual Channel	Upgrade the bots to use a compatible browser. For a list of supported browsers, see Browser requirements for Automation Workspace on page 1154.
All other supported operating systems	No immediate impact

Starting from the upcoming Automation 360 v.25 release, you will be prompted to access the Control Room through an alternative supported browser, such as Google Chrome or Microsoft Edge (Chromium) instead of Internet Explorer. Your Control Room will no longer be accessible on Internet Explorer. By aligning with Microsoft's strategy for browser support, we can provide you with enhanced functionality that latest browsers such as Google Chrome and Microsoft Edge make technologically possible.

Updating to this release

You can update to Automation 360 v.24R2 On-Premises from the following previous releases that are certified for update:

- v.24 (Build 12350)
- v.23 (Build 11513)
- v.22 (Build 10526)
- v.21 (Build 9664, 9642, 9595)

As Community Edition and Sandbox are Cloud deployments, no manual upgrade is required. These environments are automatically updated to Automation 360 v.24R2 Build 13343.

If you are not on any of the above certified releases, update Automation 360 to one of the certified releases (listed previously) before updating to this release.

For information on updating to this release, see these resources:

- [Update Automation 360 to latest version](#) on page 1363
- [Automatically update the Bot Agent](#) on page 1302 | [Manually update the Bot Agent](#) on page 1303
- [Compatibility with release builds](#) on page 1275

For the latest updates to the Automation 360 extensions for Google Chrome, Microsoft Edge, and Mozilla Firefox, see [Browser extensions for Automation 360](#) on page 933.

Bot Agent updates

This release includes an optional Bot Agent update. To use the features in Automation 360 v.24R2 patch, update the Bot Agent available with the following builds:

- Bot Agent version 21.200 for Build 13343
- Bot Agent version 21.1000.14009 for Build 13331 (On-Premises pre-GA)

Note that if you want to run your existing bots, you do not have to update your Bot Agent to this release.

If you have installed the Automation 360 v.24R2 pre-GA patch (Build 13331) with Bot Agent version 21.1000.14009, perform the following steps.

1. Uninstall the pre-GA Bot Agent version 21.1000.14009.
2. Install Bot Agent version 21.200 for Automation 360 v.24R2 (Build 13343).

Important: If you have moved your bots from the user acceptance testing (UAT) environment and deployed them in a production (PROD) environment with Bot Agent version 21.1000.14009, you must update the packages with the latest Bot Agent version 21.200.

Community Edition features

Packages
<p>Microsoft Edge browser support for Browser package and window variables</p> <ul style="list-style-type: none"> • The following actions of the Browser package now support Chromium-based Microsoft Edge browser: <ul style="list-style-type: none"> • Close • Get source code • Go back • Open • Run JavaScript • In the Browser option, you can now select the Microsoft Edge tabs from the list of active tabs.
<p>Support for last used browser tab in Browser > Open action for Microsoft Edge and Google Chrome</p> <p>You can now open a web page on a new tab or an existing tab using the Last used browser tab preset in the following browsers:</p> <ul style="list-style-type: none"> • Microsoft Edge • Microsoft Edge with IE mode • Google Chrome

Packages
<p>Automate Java web applications</p> <p>You can now automate Java web applications that run on Microsoft Edge Chromium with IE mode by using the Recorder > Capture or the Start recording option.</p>
<p>Default wait time for loading page in Microsoft Edge browser with IE mode</p> <p>When you automate any web applications in Microsoft Edge browser with IE mode, the Recorder now waits for 30 seconds by default to allow the web page to load completely before recording any objects on the page, thereby making object detection more reliable.</p>

Cloud, On-Premises, and Sandbox features

Control Room and Packages
<p>New Update Bot wizard for Internet Explorer</p> <ul style="list-style-type: none"> Use the new Update Bot wizard in the Control Room to convert your existing Internet Explorer bots to Microsoft Edge with IE mode to ensure that these converted bots continue to run after IE EOL. <ul style="list-style-type: none"> Update Bot wizard for converting IE bots on page 1061 As an administrator, you can enable a user to use the Update Bot wizard by assigning the new Bot update feature permissions to access and convert a bot from Internet Explorer to Microsoft Edge with IE mode. <ul style="list-style-type: none"> Feature permissions for a role on page 1688 Use the View Bot update action in a bot conversion instance to view the summary and status of each bot conversion. You can review action details at the individual line numbers and take action if required for the bots that are in failed status, or in completed with action or review required status. <ul style="list-style-type: none"> View conversion details for IE bots
<p>Automate Java web applications</p> <p>You can now automate Java web applications that run on Microsoft Edge Chromium with IE mode by using the Recorder > Capture or the Start recording option.</p>

Control Room and Packages

Convert Automation 360 bots with browser-specific packages using Internet Explorer to Microsoft Edge with IE mode

You can convert bots that use Internet Explorer to Microsoft Edge Chromium with IE mode for the following packages:

- Recorder
- Browser
- Application
- Simulate keystrokes
- Screen
- Mouse
- Window
- OCR
- App Integration
- Image Recognition
- If
- Loop
- Wait

To convert these bots, use the Update Bot wizard in the **Administration > Bot update** tab in the Control Room.

[Update Bot wizard for converting IE bots](#) on page 1061

The following properties of browser-based packages and actions are updated from Internet Explorer to Microsoft Edge browser with IE mode:

- Bots created using the browser or application-based window, window title, and application path
- Window variable's default value, window title, and window application path
- Browser variables and browser title

Microsoft Edge browser support for Browser package and window variables

- The following actions of the Browser package now support Chromium-based Microsoft Edge browser:
 - Close
 - Get source code
 - Go back
 - Open
 - Run JavaScript
- In the **Browser** option, you can now select the Microsoft Edge tabs from the list of active tabs.

Control Room and Packages

Support for last used browser tab in **Browser > Open** action for Microsoft Edge and Google Chrome

You can now open a web page on a new tab or an existing tab using the **Last used browser tab** preset in the following browsers:

- Microsoft Edge
- Microsoft Edge with IE mode
- Google Chrome

Default wait time for loading page in Microsoft Edge browser with IE mode

When you automate any web applications in Microsoft Edge browser with IE mode, the Recorder now waits for 30 seconds by default to allow the web page to load completely before recording any objects on the page, thereby making object detection more reliable.

Migration features

Scan bots that use Microsoft Internet Explorer

You can now use the Bot Scanner to scan and identify Internet Explorer bots. You can also analyze the report generated by the Bot Scanner to get usage statistics about Internet Explorer used in your bots.

[Bot Scanner for EOL features](#) on page 1471 | [Analyze report for Internet Explorer bots](#) on page 1059 | [Internet Explorer conversion or scanning messages](#) on page 1654

Migration features

Packages and actions

You can now migrate and convert Internet Explorer bots from Enterprise 11 or Enterprise 10 to Automation 360 with Microsoft Edge with IE mode for the following packages and actions:

- App Integration
- Delay
- IF/ELSE and Loop
- Image Recognition
- Launch Website
- Manage Window Controls
- MetaBot Screen
- Mouse
- Object Cloning

Image Play mode and **Coordinates Play** mode are supported. **Coordinates Play** mode supports the mouse click action with keystrokes after it.

- OCR
- Open Program/File
- Screen
- Simulate keystrokes
- Wait

Support for **Wait for condition**, **Wait for screen change**, and **Wait for window** actions

- Web Recorder
- Windows Actions

For more information, see [Package mapping for migration](#) on page 1559.

To migrate and convert bots, go to **Administration > Migration > Migrate bots** and select the **Convert bots built using Internet Explorer to Edge with Internet Explorer mode** option in the Control Room.

The following properties of browser-based commands and actions are updated from Internet Explorer to Microsoft Edge with IE mode:

- Bots created using the browser or application-based window, window title, and application path
- Window variable's default value, window title, and window application path

Note: Bots that use value type variables are not updated to Microsoft Edge. You must first enable the configure settings in the Legacy Automation package to open bots built using Internet Explorer to Microsoft Edge compatibility mode.

- Browser variables and browser title

Migration features
<p>Convert IE bots to Microsoft Edge with IE mode</p> <p>When you migrate your bots from Enterprise 10 or Enterprise 11, you can use the new Convert bots built using Internet Explorer to Edge with Internet Explorer mode option in the Bot Migration Wizard to convert your bots from Internet Explorer to Microsoft Edge with IE mode.</p> <p>Migrate Enterprise bots on page 1529</p>
<p>History and version updated for migrated bots</p> <p>In the Bot Migration Wizard, when you migrate your Enterprise 10 or Enterprise 11 bots, the version history is now updated to show that it is a migrated bot (the check-in comment shows that the bot is migrated from Enterprise 10 or Enterprise 11 version). You can use this check-in comment to identify which version of the bot is migrated.</p> <p>Bot Migration Wizard on page 1526</p>

Fixes

The following fixes are available for Cloud , On-Premises , and Sandbox:

Service Cloud case ID	Description
01784593	You can now run migrated bots successfully even when a \$ (dollar sign) is present as a value in the User Variables field. The Bot Scanner no longer displays a preprocessing error.
--	When you automate web applications running on Microsoft Edge Chromium with IE mode or Internet Explorer, the Recorder now captures the object from the currently selected browser tab. Previously, the Recorder captured the object from the last used tab.
01189873	<p>After migration, when you use the Browser > Open action to open a URL that has a space character, use the Browser > Download files action to download the file from the specified URL, and then run the bot, the bot now opens the URL in a single tab and downloads the file from the specified URL.</p> <p>Previously, when the specified URL had a space character, the bot split the URL and opened it in two separate tabs.</p>

Known behavior and limitations

The following limitations apply to Cloud , On-Premises , and Sandbox:

- When you execute a stored procedure with name parameter arguments that resides in another database in the SQL Server, the bot displays an error because of the JDBC driver issue with

executing a stored procedures with name parameters of another database in the same SQL instance.

Workaround: When you add parameters to provide an input parameter or configure an output parameter, ensure you do not enter any value in the **Parameter name** field. The bot will not encounter any error when executing the stored procedure because the Database package considers blank values as indexing.

- Note that even when the number of schedules listed on the Control Room **Schedules** page is less (for example, five or six schedules), you might see the following error because of a query timeout: `An unexpected problem occurred`. This is an existing Control Room database performance related issue.
- There are other limitations and behavior that apply to bots migrated from Enterprise 11 to Automation 360 and to Automation 360 bots that run on Internet Explorer and are converted to Microsoft Edge with IE mode. For more information, see [Known behavior and limitations](#) on page 1051.
- When you use the **Browser > Close** action to close a tab or a window opened in the Microsoft Edge browser, if only one Microsoft Edge browser window is open, the bot encounters the following error: `Error occurred while closing the tab`

Workaround: See [Configure Microsoft Edge browser settings when Close action of Browser package encounters an error \(A-people login required\)](#)

- When you use the **Browser > Open** action to open network URLs that start with two backslash (\\) characters in the Google Chrome, Microsoft Edge, or Mozilla Firefox browser, the URLs might not open properly.

Workaround: Replace the two backslash (\\) characters with file:// protocol.

- When you use the **Browser > Open** action, select **New tab** or **Existing tab** option to open a specific webpage in Microsoft Edge with IE mode, the bot might throw an error after opening the webpage.

Workaround: Use any of the following workarounds based on specific scenarios:

- Option 1: Add **Try/Catch** block around the **Open** action and ignore the exception as the website opens.
- Option 2: In the **Browser > Open** action, select the **New window** option instead for such websites.
- When you use the **New window** option in the **Browser > Open** action with the 3.4.x version of the Browser package to open a URL with arguments, the bot might not perform the specific action as the 3.4.x version of the Browser package does not support argument flags.

Workaround: Use any version other than the 3.4.x version of the Browser package to automate.

Automation 360 v.24 Release Notes

Release date: 08 April 2022

Review what's new and changed, and the fixes and limitations in the Automation 360 v.24 (Build 12350) release.

Important: We have updated the Automation 360 v.24 (Build 12350) to include fixes for the following issues:

- After migration, when you ran the migrated bots, they displayed an error for variables within double quotation marks (" ") (Service Cloud case ID: 01802575, 01803323, 01803800, 01804121, 01804820).
- When you clicked the Automation Co-Pilot icon, the Control Room was displayed instead of the Automation Co-Pilot Desktop Assistant sign-in screen (Service Cloud case ID: 01803979).

Updating to this release

You can update to Automation 360 v.24 from the previous three releases (that is, from n–3 releases, where n refers to the latest release). The following previous releases are certified for update to this release:

- v.23 (Build 11513)
- v.22 (Build 10526)
- v.21 (Builds 9664, 9642, 9595)

You can directly update to v.24 from any of these builds (see [Update Automation 360 to latest version](#) on page 1363). If you are not on an n–3 release, update Automation 360 to one of the three certified releases (listed previously) before updating to this release.

- If you are directly updating to this release from Automation 360 On-Premises v.21, remove the following Bot Agent files and folders:
 - C:\Windows\System32\config\systemprofile\AppData\Local\AutomationAnywhere\AA-DB.mv.db
 - C:\ProgramData\AutomationAnywhere\GlobalCache\embedded-resources
- Before you update to this release from Automation 360 On-Premises v.22, refer to the upgrade considerations in [Update Automation 360 to latest version](#) on page 1363.

Important: This release includes an optional Bot Agent update. To use the new features in v.24 (including updates to Bot Migration, Browser, DLL, Process Discovery, and Recorder packages), update the Bot Agent available with this release. However, note that if you want to run your existing bots, you do not have to update your Bot Agent to this release.

For information on updating to this release, see these resources:

- [Automatically update the Bot Agent](#) on page 1302 | [Manually update the Bot Agent](#) on page 1303
- [Compatibility with release builds](#) on page 1275

For the latest updates to the Automation 360 extensions for Google Chrome, Microsoft Edge, and Mozilla Firefox, see [Browser extensions for Automation 360](#) on page 933.

Important: This release includes new command packages in which the Apache log4j2 library is no longer bundled. However, older command packages, from Automation 360 v.23 and earlier, might continue to have the log4j2 library bundled within. If you want to use command packages without the log4j2 bundled within, we recommend that you use the newer Automation 360 v.24 packages in your tasks.

Migration

Enterprise 11 and Enterprise 10 features
<p>Self-service Control Room migration</p> <p>You can now manage the migration provisioning process with self migration capabilities. You can also choose between manual and automated migration.</p> <p>Self-service Control Room Migration on page 1358</p>
<p>Enhancement to migration of Credential Vault variables</p> <p>Migration is now supported when Credential Vault variables are passed from one MetaBot Logic to another MetaBot Logic for the following commands:</p> <ul style="list-style-type: none"> • IF > Logic Successful • IF > Logic Unsuccessful • Begin Error Handling > Run Logic

Enterprise 11 and Enterprise 10 features
<p>You can now successfully migrate Enterprise 11 bots that use the 32-bit <code>wscript.exe</code> to the 64-bit architecture, without exception errors. This enhancement helps you to successfully execute VBScript.</p>
<p>Migrate MetaBot with parent and child Logic with renamed Logic</p> <p>You can now migrate a MetaBot with a Logic (parent) that includes a renamed Logic (child). If a child Logic is renamed after it is mapped to the parent Logic, this parent Logic mapping is now migrated with the new name.</p> <p>This enhancement applies to the following commands:</p> <ul style="list-style-type: none">• IF > Logic Successful• IF > Logic Unsuccessful• Else If > Logic Successful• Else If > Logic Unsuccessful• Error Handling > Run Logic• Run Logic
<p>Migrate when MetaBot and Logic have the same name</p> <p>You can now successfully migrate your Enterprise 11 bots when the name of the MetaBot and the assets folder or the Logic name inside that MetaBot are the same. The Logic name is suffixed with <code>-bot</code>. The name is appended only when the Logic or the folder is on the same hierarchy as the MetaBot.</p> <ul style="list-style-type: none">• If an existing bot has the renamed Logic or assets folder, the Logic is then renamed with the next available number. For example, <code>-botn</code>, where <code>n</code> indicates the next available number. Additionally, an action required message is displayed.• If a MetaBot or a Logic calls a renamed Logic or Task Bots, the command path is updated to include the new name.• If a Logic, MetaBot, or a folder name exists with a new name, the existing bot is overwritten. <p>Migration messages on page 1617</p>
<p>Consolidated view of migrated bots and their status</p> <p>Use the Overview tab in the Control Room to get a consolidated view of the status of the migrated bots. View the overall status of bot migration for all the bots that are successfully migrated, those that failed to migrate, and those that require review or action. You also have the option to rerun migration on selected bots and view the history of each bot that has gone through multiple migrations.</p> <p>Bot Migration Wizard on page 1526</p>

Enterprise 11 only features

Update to AAApplicationPath, CurrentDirectory, and AAInstallationPath variables

If your migrated bot contains \$AAApplicationPath\$, \$CurrentDirectory\$, or \$AAInstallationPath\$ variables in any file or folder path, a validation check for the absolute path is no longer performed during migration. Also, a temporary variable (\$m-string-start-in-path\$) is not created and assigned to the migrated bot for validation. As a result, the size of a migrated bot is now reduced and the bot performance is enhanced.

Enhancement to migrate bots with Email Connect command

When you migrate Enterprise 11 bots that contain the **Email > Connect** and **Email > Send** commands configured for EWS server, the **Azure Cloud** field is set to **Azure Global** and the **Authentication type** is set to **OAuth2-Silent** which was previously called OAuth2.

Note that **OAuth2** now supports two modes: **Silent** and **Interactive**.

[Using Connect action for Email](#) on page 2437

Migrate bots with timeout configured to send REST and SOAP request

The timeout value configured in Enterprise 11 to send REST and SOAP requests is now migrated to Automation 360 as part of the global values (AARestTimeOut and AASoapTimeOut). The default timeout value is set as 60000 ms in Automation 360. You can update this value if the REST Web Service takes more time to receive a response.

[REST Web Service package](#) on page 2834 | [Example of using the SOAP web service action](#) on page 3097

Enterprise 10 only features

Migrate new or modified Enterprise 10 bots to Automation 360 (Service Cloud case ID 00719524)

You can now migrate new or modified Enterprise 10 bots to Automation 360 after an earlier migration. A new export utility is now available that enables you to export such new and modified bots from the Enterprise 10 Control Room repository. You can then import the exported bots later to Automation 360 using Bot Lifecycle Management (BLM) and then finally migrate them using the Bot Migration Wizard.

[Migrate new or updated Enterprise 10 bots to Automation 360](#) on page 1523

Automation Workspace

What's new
<p>Bot Agent updates and early availability of packages</p> <p>Starting from this release, you can choose or skip some Bot Agent updates and start using packages as soon as new package versions become generally available regardless of your region.</p> <p>Bot Agent updates that support new packages or updates to packages will be made available quarterly, with updates alternating between mandatory and optional.</p> <p>Previously, Bot Agent updates were available automatically across user device pools without affecting bot execution. In some large and complex deployment scenarios, these updates were cumbersome but could not be skipped. (Examples include deployments where the device pools were deployed using standard device Amazon Machine Image (AMI) on separate schedules requiring greater coordination, change management processes, and approvals in the user environment for the Bot Agent update.) Now, you can skip an optional update and update to the next mandatory Bot Agent update as Automation 360 will start providing reverse compatibility with Bot Agent for a release every six months.</p> <p>Also, with every release, you can start using the latest packages as soon as new package versions are released. For Automation 360 Cloud users, package updates are now available asynchronously across all regions, so you can start using the latest packages on the current Control Room version even before the Control Room update is made available for your region.</p> <p>Compatibility with release builds on page 1275</p>
<p>Create multi-login users</p> <p>You can now create a multi-login user. A multi-login user is allowed multiple sessions to the Control Room through the API.</p> <p>Multi-login user on page 1685 </p>
<p>Do more with Microsoft Edge Chromium</p> <p>You can now use the Microsoft Edge Chromium browser extension for the following:</p> <ul style="list-style-type: none">• Bot Agent proxy configuration• Automatic population of device credentials <p>Browser requirements for Automation Workspace on page 1154</p>
<p>Reduce turnaround time</p> <p>You can now reduce the turnaround time for collecting information on issues by capturing log files from the Bot Runner device. You can save the log files by using the new <code>-collectlogs</code> command with the Bot Agent diagnostic utility.</p> <p>Perform Bot Agent diagnostic checks on page 1306</p>

What's new
<p>Google Chrome policy change impact on Bot Agent</p> <p>From Google Chrome version 101, Google Chrome is deprecating direct access to private network endpoints from public websites as part of the Private Network Access (PNA) specification for URLs using <code>https</code>. To mitigate its impact, starting from this release, response headers are added to the Bot Agent that enable the Bot Agent to communicate with Control Room on Google Chrome browsers. This will ensure that operations such as device registration, bot recording, playback, and deployment are not adversely affected because of this change.</p>
<p>Enhancement to AISense Recorder</p> <p>You can now use AISense Recorder to automate applications that use Japanese and a combination of Japanese and English interfaces.</p> <p>AISense for recording tasks from remote applications on page 2180</p>
<p>Wait time option in SOAP Web Service and REST Web Service packages (Service Cloud case ID: 00756730, 00792793, 01255869, 01753287)</p> <p>When you create a bot, you can now set a time-out value for actions in REST and SOAP requests. To indicate how long a bot should wait for a response from the server before timing out, you can set a wait time (in milliseconds) in the Wait for actions to complete field. You can enter a number or a variable or provide a global value.</p>
<p>Format text with new HTML editor in Email package</p> <p>In the Email package, when you use the Send, Reply, and Forward actions, you can now create and customize your email layout and body by using the new HTML design editor. Use the editor toolbar to make various changes to your text, such as applying bold, italic, and other formatting effects, inserting links, and changing the font and size of the text. You can copy the content from the design editor and paste it to other windows.</p>
<p>Task Bot package now supports passing Window variable to child bot (Service Cloud case ID: 00691890, 00804359, 01258948, 01764292)</p> <p>In the Run action of the Task Bot package, when you select Input values fields and enter the values or variables to pass to the child bot, you can now choose the <code>Window</code> type variable and pass it from parent bot to child bot.</p>
<p>New option in Content type field of REST Web Service package (Service Cloud case ID: 00666852, 00789910, 00771194, 00785116, 00825945, 01762199)</p> <p>You can now use the multipart/form-data option to upload files and data through REST Web Service. The content type <code>multipart/form-data</code> can be used to submit form elements containing files, non-ASCII data, and binary data. This option is available for actions such as POST, PUT, and PATCH.</p>
<p>Custom delimiter option in SOAP Web Service package</p> <p>For responses specific to XPath, you can now use the custom delimiter option to delimit the return content from the SOAP response. In the Custom Delimiter field, you can provide a character or a variable, and the output of the delimited response will be a complete string.</p>

What's new
<p>New option in Run function action of DLL package (Service Cloud case ID: 00830568, 01063654, 01259336, 01767965)</p> <p>In the Run function action of the DLL package, when the C# DLL interacts with the Windows API to perform system-related operations, such as keystroke, mouse click, or window switching, an intermediate window (AAZeroSizeForm) is displayed occasionally and interrupts the user's operation when the bot is running. In some cases, the DLL function does not interact with the Windows API to perform actions, such as keystroke, mouse click, or window switching, on the operating system UI through the DLL function. In such cases, you can now select the Run function in background check box to bypass the intermediate window (AAZeroSizeForm) and run the C# DLL in the console application without the form. This feature also helps to improve the performance of the DLL execution if the Run function in background check box is selected.</p>
<p>Autoscroll supported in Bot editor (Service Cloud case ID: 00730747)</p> <p>When you are creating or editing bots with a large number of lines of code and when you drag actions up or down the page, the page now automatically scrolls up or down accordingly. This feature is supported in both Flow and List views.</p>
<p>Configure session timeout in Control Room settings (Service Cloud case ID: 00765320)</p> <p>You can now ensure that your web session does not time out, such as when you are creating a bot, by configuring a suitable session timeout duration in the Control Room settings. Depending on the timeout duration configured, you will be timed out only after the specified number of minutes of inactivity, which prevents loss of work due to early timeout.</p>
<p>New JSON package</p> <p>Use the JSON package to automate JSON data. You can now extract the required information from JSON text or file and directly use the values in the bot.</p> <p>Json package on page 2657</p>
<p>New option in Catch action of Error handler package (Service Cloud case ID: 00766117)</p> <p>In the Error handler package, you can now ignore errors from actions inside the Catch block by using the Catch > On error, continue with next action option. When you select the On error, continue with next action check box, even if there is an error from an action in the Catch block, no exception is thrown and the bot ignores the error and continues to the next action.</p> <hr/> <p>Note: This enhancement applies to all nested actions in the Catch block. For example, if you have a Try/Catch action inside a main Catch action, if the check box is selected on the main Catch action, any error from actions within the nested block will also be ignored.</p> <hr/>
<p>Enhancements to the Connect action of the Email package (Service Cloud case ID: 00830611, 01264796, 00788467)</p> <ul style="list-style-type: none">You can now connect to an EWS server hosted on Azure US GCC high cloud.The action now enables Federated Azure users to connect to an EWS server in Attended Automation mode. <p>Using Connect action for Email on page 2437</p>

What's new
<p>Enhancement to String package</p> <p>In the Extract text action of the String package, when you use the After or Before and/or after option, you can now extract a substring from a specified source string that occurs in the range of 1 through 999999 times in a file.</p>
<p>Search for files by specific date</p> <p>You can now search for files created or modified on a specific date by using the new On a date option available in the File Date condition of various packages.</p> <p>You can use this feature with the following packages and actions:</p> <ul style="list-style-type: none">• File package<ul style="list-style-type: none">• Copy Desktop files action• Delete action• Print action• Print multiple files action• Rename action• Folder package<ul style="list-style-type: none">• Copy action• Delete action• Rename action• If > File date condition• Loop > While > File date condition
<p>New action in Excel advanced package (Service Cloud Case ID: 01263892, 01782290)</p> <p>When you perform actions in a Microsoft Excel worksheet, you can now disable or enable real-time screen update by using the new Disable or enable real-time screen update action of the Excel advanced package. This action is useful to improve the performance of Excel-based automations at run time when dealing with large data sets.</p> <p>Worksheet operations in Excel advanced on page 2488</p>
<p>Support for copying metadata from one bot to another</p> <p>You can now copy image and metadata files from one bot to another by using the Copy to shared clipboard option.</p>
<p>Add document extraction capabilities to bots</p> <p>You can now make bots connect to your Google Cloud service account, send documents to a specific processor, and retrieve the extracted data in JSON format by using the actions in the Google Document AI package.</p> <p>Google Document AI package on page 2601</p>

What's new
<p>Use Recorder conditions in Chromium-based Microsoft Edge with Internet Explorer (IE) mode</p> <p>You can now use the Object exists and Object does not exist Recorder conditions in Chromium-based Microsoft Edge with IE mode for the following packages:</p> <ul style="list-style-type: none">• Loop > While condition• Wait > Wait for condition• If package
<p>Use custom datetime formats</p> <p>Use the following conventions to specify custom datetime formats and convert a datetime value:</p> <ul style="list-style-type: none">• D: Specify a day in a year as D or DD.• a: Specify an AM/PM marker for the 12-hour time format. <p>Datetime formats on page 2402</p>
<p>Internet Explorer browser support for Browser package and window variables</p> <ul style="list-style-type: none">• The following actions of the Browser package now support the Internet Explorer browser:<ul style="list-style-type: none">• Open• Close• Go back• Get source code• In the Browser option, you can now select the Internet Explorer tabs from the list of active tabs. <p>Browser package on page 2348</p>
<p>Enhancement to Datetime package</p> <p>The Variable option in the Datetime > Assign action is now enhanced and divided into two options:</p> <ul style="list-style-type: none">• Datetime: Enables you to select the date and time along with the time zone manually and assign it to a Datetime variable.• Variable: Enables you to select the Datetime variable or other variables that can have Datetime as a subtype, such as the Dictionary, Record, and list variables. <p>Using the Assign action on page 2399</p>

What's new
<p>Enhancement to Recorder package</p> <p>You can now capture and automate objects inside a cross-domain IFrame that has multiple IFrames with the same frame source and IFrames that are loaded at run time in Google Chrome and Microsoft Edge Chromium browsers. You can do this by using the Recorder > Capture or the Start recording option. This support is also available for offline Google Chrome extensions.</p> <p>Recorder package on page 2798</p>
<p>Support for pop-up windows and dialog boxes in Google Chrome, Microsoft Edge Chromium, and Mozilla Firefox browsers (Service Cloud Case ID: 00762207, 00769773, 00781196, 00786646, 00777907, 00795677, 00785995,00808600, 00811044, 00767486, 01282172, 01286665, 01256750, 01762040)</p> <p>When you are automating a web page on the supported browsers, you can now capture the pop-up windows, alert dialog boxes, confirmation dialog boxes, and prompt dialog boxes that appear. You can do this by using the Recorder > Capture or Start recording option.</p> <p>Recorder package on page 2798</p>
<p>Retrieve source code of an iFrame in Google Chrome browser</p> <p>You can now retrieve the source code of an iFrame in the Google Chrome browser by using the Browser > Get source code action. You can use the new Capture object option to capture these iFrames.</p> <hr/> <p>Note: The Capture object feature is optional and is only used to retrieve the source code of an iFrame.</p> <hr/>
<p>Run JavaScript inside an iFrame in Google Chrome browser</p> <p>You can now run JavaScript in a page that contains iFrames in the Google Chrome browser by using the Browser > Run JavaScript action. You can use the new Capture object option to capture iFrames on which you want to run JavaScript.</p> <hr/> <p>Note: The Capture object feature is optional and is only used to run JavaScript inside an iFrame.</p> <hr/>
<p>Global session support for Excel basic package</p> <ul style="list-style-type: none">• The Global session option is now supported for the Excel basic package. Use the Global session option to share a Microsoft Excel session across multiple bots so that you can use the same Excel worksheet across these bots.• The Session name field is now renamed Create Excel session. <p>Using the Open action for Excel basic on page 2477</p>

What's new
<p>Default variable to hold number type data</p> <p>When you are building or testing a bot, you can now use the default number variable <code>SampleNumber</code>, which is included in the Variables palette.</p> <hr/> <p>Note: The default number variable is only available in new bots.</p> <hr/>
<p>Export and import password-protected files</p> <p>To improve security by providing protection against unauthorized access and malicious editing and also to protect privacy, the export and import features are now enhanced to include the password option. With this feature you can now perform the following:</p> <ul style="list-style-type: none">• Set a password for the files that you want to export from your Control Room.• Import the password-protected exported file into your Control Room. <p>Export bots on page 1967 Import bots on page 1969</p>
<p>New options in Git configuration (Service Cloud case ID: 00782957, 00837059, 00687394, 00783715, 00714059, 00659476, 00749755, 00786233, 00748166, 00776417)</p> <p>You can now perform the following actions for Git configuration:</p> <ul style="list-style-type: none">• Choose either the HTTPS or SSH authentication method to set up the Git configuration. The SSH authentication method is more secure as the authentication is based on a public and private key pair.• Specify the branch to which you want to push your Git commits. This helps with team coordination and workflow management.• Connect to your Git repository by using a proxy server. <p>Configure a remote Git repository in Control Room on page 1762 Restore bots from Git repository on page 1770</p>
<p>Force push now a configuration setting for Git Integration in the Control Room (Service Cloud case ID: 00683762)</p> <p>You can now configure the Git push to be with or without the force push flag. Previously, updating a remote Git from the Control Room exclusively functioned as a force push. This force push is the recommended and optimal setting.</p>
<p>Support for Azure DevOps (On-Premises or Cloud) Git for SSH authentication (Service Cloud case ID: 00652012, 00690526)</p> <p>You can now use either the SSH or the HTTPS authentication method to connect to Azure DevOps (On-Premises or Cloud) Git through the Control Room to check in a bot and its dependent files to the remote Azure DevOps Git repository.</p> <p>Connect to Azure DevOps Git from Control Room on page 1766</p>
<p>Spring core vulnerability - CVE-2022-22965 (01793279, 01793398, 01793497,01793679,01794189)</p> <p>Updated to the Spring Framework which has the patch for CVE - CVE-2022-22965 vulnerability.</p>

What's changed
<p>Migration validation checks for default device settings</p> <p>The prerequisites validation for migration now validates whether Bot Runners selected for bot migration have the default device set. If the default device is not set, then bot migration cannot proceed and the validation report lists a validation error. The report also shows the specific Bot Runner devices that do not have a default device.</p> <p>Note that bot migration cannot use devices that are selected at runtime.</p>
<p>Bot migration report shows migrated bot with action and review required</p> <p>The bot migration report now separately lists bots that might require an action or review after migration. This feature enables you to view the list of bots that will require action or review and to plan post-migration steps accordingly.</p>
<p>Migrate 11.x bots with forward slash in file and folder path (Service Cloud case ID 00808534)</p> <p>You can now migrate Enterprise 11 bots that include a forward slash in the path used within the File and folder action. Previously, only the backslash was supported in the path and so the user could not create a folder on SharePoint.</p>
<p>You can now manually migrate Enterprise 11 bots even when the My MetaBots folder is not present in the Control Room because this folder is no longer validated during migration.</p>
<p>Enhanced user management</p> <p>You can now view the activity of bots started by other users from the folders for which you have run and scheduling permissions.</p>
<p>Enhancement to API key validity setting (Service Cloud case ID: 00543590, 00719480, 01373359)</p> <p>You can now increase the duration of validity for API keys to 9999 days from the Control Room settings for authentication. Previously, the duration of validity for API keys was 45 days. With this enhancement, a Control Room admin need not regenerate the API key every 45 days to authenticate Automation 360 APIs.</p>
<p>Enhanced security in Image Recognition package</p> <p>You now have enhanced security when you use any of the Image Recognition actions from the Image Recognition package. Image logging is now disabled to ensure that if a bot fails while running one of the Image Recognition actions, the captured source and target images are no longer stored in the log folder.</p>
<p>Enhancement to subject filter in Email package (Service Cloud case ID: 00776374, 00953823, 975605)</p> <p>When you connect to an Exchange Web Services (EWS) server, to repeat a set of actions on all the email messages that meet a set of criteria, use the Move all action from the Email package or use Loop > Iterator > For each mail in mailbox. The When subject contains field is now case sensitive. When you enter text inside a pair of double quotation marks (") in the When subject contains field, the bot retrieves all the email messages whose subject exactly matches the text and the case that you entered inside a pair of double quotation marks.</p>

What's changed
<p>Change to default variable name</p> <p>The name of the default string-type variable is now changed from <code>prompt-assignment</code> to <code>SampleString</code>.</p> <hr/> <p>Note: This change only impacts new bots.</p> <hr/>
<p>Change in activity information on Historical page</p> <p>The information about bot execution activity is retrieved for 90 days in the Control Room Historical activity page. Information older than 90 days can be viewed in the audit logs.</p> <p>View completed activity on page 2054</p>
<p>Enhanced Secure Recording mode control</p> <p>If you are an administrator, you can now enable or disable the Secure Recording mode based on assigned user roles (permissions) for more granular control of the Control Room.</p> <p>Secure recording on page 990</p>

The following table lists fixes alongside the build in which each issue was fixed. Build 12350 is the latest build and includes fixes from the previous builds.

Fixes		
Build	Service Cloud case ID	Description
12350	01768021, 01803781	After the upgrade, the Control Room is no longer unresponsive and behaves normally. Previously, the Control Room was unresponsive after the upgrade due to Java deadlocks.
12350	01802575, 01803323, 01803800, 01804121, 01804820	<p>After you update from a previous release to this release, when you run the bots, the migrated bots no longer show an error for variables within double quotation marks (" "). You do not have to remove the double quotation marks as a workaround to run the bots.</p> <p>For example, after you update from Automation 360 v.23, you can run a bot with the Excel advanced package that contains the following variable: "\$HeaderCounter\$"</p>
12342	00827504, 00788652, 00827730, 01259452	With the required permissions, you can now view the correct information in the Historical Activity page. Previously, a "Do not have sufficient permissions" error sometimes prevented even users with administrative permissions from viewing some of the entries in the Historical Activity page.

Fixes		
Build	Service Cloud case ID	Description
12342	00823799, 01623586	<p>When you migrate Enterprise 11 MetaBots with Input, Output, and None variable parameter types, these are now correctly mapped to the respective parameter type in Automation 360 after migration.</p> <p>Previously, the Enterprise 11 Input, Output, or None variable types were mapped to Input/Output type after migration.</p>
12342	00819756	<p>After migration, when you run a bot that contains Switch to sheet action and the action is performed, the worksheet is now visible and is activated for further operations.</p>
12342	01773270, 01781001	<p>The Cloud Migration Utility can now connect successfully to the database even when the database credentials contain the following special characters:</p> <p>⌘ # @ % \$</p>
12342	00988580, 01200161	<p>After you migrate from Enterprise 11 to Automation 360, you can now Check out bots and dependent files to the Control Room Public workspace.</p> <p>Previously, the dependent files were not available for Check out in the Control Room Public workspace. The parent bots had to be checked out first so that the dependent files could be automatically cloned and available for Check out.</p>
12342	00788046	<p>When you run a bot with the Wait, File, Folder as Actions or If/Loop as Conditions and if the Start Date and End Date options are set to the same date, these bots now execute the respective action or conditions based on the end date that is set.</p>
12342	01598462	<p>The Run Logic command now works correctly when MetaBots contain Logic with different parameters assigned to each Logic. If you disable one Logic in a MetaBot, the other Logic and its command will work correctly.</p> <p>Previously, if one Logic in a MetaBot was disabled, commands related to another Logic were disabled.</p>

Fixes		
Build	Service Cloud case ID	Description
12342	01251985, 01264753, 01272804	In the SAP BAPI package, the Get Table command for the Table subtype now successfully retrieves results for the Import , Export and Table parameters. Previously, if you ran the Get Table command for the Table subtype for Import or Export parameters, the command failed.
12342	01262390	When you migrate Enterprise 11 bots that use the IF > File exists condition with a wildcard in the file name, they now run successfully irrespective of whether the parent folder is available in the path. Previously, if the parent folder was not present in the condition path, the bot stopped running and encountered an error. If you are on this release or an earlier one, you can use IF > File exists condition with the parent folder, along with current IF > File exists condition with wildcard.
12342	--	A migrated that includes the File and folder command has the Include start and end dates check box enabled by default. As a result, Enterprise 11 bots no longer fail in Automation 360 when the file rename operation is performed, even if the start and end dates specified are the same for comparison using the Is between condition.
12342	01751462	When the Run Task command with a variable path is disabled and the variable used in the path is deleted, the Task Bot can now be migrated, without any error. Previously, migration failed and a preprocessing error was displayed.
12342	00824337	The migration result no longer shows an error message when you migrate a bot with the credential name in Japanese.
12342	00783883	The HTML technology-based action (for example, GetProperty) now supports the retry mechanism, which enables you to migrate bots that include the recorder command with an inner text.
12342	--	You can now successfully migrate Enterprise 11 bots that have negative values for x and y coordinates for top and left fields.

Fixes		
Build	Service Cloud case ID	Description
12342	00827997	Bot Scanner now allows the migration of bots with multiple expression conditions that include a disabled line of code and no longer shows an error.
12342	00834597	Bot Scanner now successfully analyzes a MetaBot screen and no longer shows an error for the preprocessing of the source file.
12342	01213241	All plug-ins now successfully load when you open an Excel sheet using the Excel > Open action.
12342	01504682	Bot Scanner no longer shows an internal error even if a bot contains any of these special characters: .
12342	--	<p>You can now successfully migrate Enterprise 10 bots that have roles with folder permissions. Previously, such permissions were not migrated.</p> <hr/> <p>Note: The Run and Schedule role is not migrated.</p> <hr/>
12342	01632298	You can now successfully migrate bots with the Analytics variable through the Bot Migration Wizard, and after migration the status is displayed as successful. Previously, these bots were stuck in the In Progress state and therefore the bots did not run.
12342	00828781, 01258567, 01273170, 01469879	Bots now complete their execution faster than previously when a proxy is enabled through a PAC file in Cloud deployments.
12342	01385567, 01749465	The Control Room now correctly shows the information for Display intranet sites in Compatibility View in Compatibility View Settings . Previously, in Automation 360 v.23, a blank page was displayed because of an internal issue.
12342	00807226, 01148097	<p>If an IP subnet address contains the numeral 80 (for example, 192 . 30 . 80 . 25), you can now configure the Control Room port to 80 in the installer.</p> <p>Previously, if the subnet address contained the numeral 80, the Control Room port could not be configured to 80. A different port number that did not contain 80 had to be configured for the IP.</p>

Fixes		
Build	Service Cloud case ID	Description
12342	00836549	When you copy a role by using Create Role within a Control Room, user and bot permissions are now correctly retained. Previously, editing the associated role caused all associated bot permissions to be lost.
12342	01434341, 01755003, 01755713, 01756244, 01757083, 01756871, 01758346	You can now successfully search for Japanese characters within bots by using the Find in this bot search box. Previously, the Japanese characters typed through the keyboard were not entered correctly and you had to use a workaround to search for Japanese characters. Japanese language search support
12342	--	If you Check in a bot to the Control Room Public workspace after filtering any dependency data, when you export the bot, only the filtered data is displayed now. Previously, even after filtering the dependency data, all data was displayed.
12342	00819477	You can now view dependent files when you open a bot in the bot editor. Previously, the dependent files were listed only in view mode.
12342	--	When a device pool name includes the underscore character (_), the MSI Installer now completes autoregistration of device pool properties, resulting in device pool names with underscores to populate. Previously, the MSI Installer did not complete autoregistration of a device if the device pool included an underscore character.
12342	01758029, 017596611	You can now use Azure AD authentication to connect to Azure database server when you install the Control Room using Windows installer and installation script. Previously, if Azure AD authentication was selected on the Database server window, Control Room installation failed.
12342	--	After you install or upgrade Automation 360 from a previous release, the Control Room Installation summary page now displays the correct version number. Previously, the page displayed an incorrect version number.

Fixes		
Build	Service Cloud case ID	Description
12342	00796190, 00827493, 01251725	When you deploy a bot, the run-time window now displays the correct line number and package name for the capture desktop action of the Error Handling package. You can find the exact line number that caused the error by using a variable in the Error handler: Catch > Assign line number to option.
12342	00800990	<p>You can now rename a bot by changing the text from uppercase to lowercase or from half-width to full-width characters. For example, you can rename a bot from Automate to automate.</p> <p>Previously, the text in the bot name could not be changed. When the text was changed, the following error message was displayed:</p> <pre>Unable to create a file with the name <filename>. That name is already in use. To continue, please rename your file. Code: repository.exception.file.exists</pre>
12342	01258242	When you run a bot that contains multiple conditions and a missing operator in one of the conditions through the Bot editor, an error message is now displayed about the missing operator. When you update an action and save the changes and if there is a missing operator, an AND operator is now added by default. Previously, bots with multiple conditions failed intermittently with a preprocessor error.
12342	00805738	An error message is now displayed and you can no longer check in or check out files whose filepaths are identical except for differences in case. Previously, when the filepath had different cases and was checked in or checked out, there were issues during bot deployment.
12342	01753711	You no longer encounter any issue when you check out a folder that contains tasks with dependencies. Previously, casing-related issues occurred in string comparison operations, which caused errors in check-in and check-out operations.
12342	01271474, 01761856	When you assign a production label to a child bot that has more than one version, the production version is now displayed during bot operations. Previously, instead of the production version, the latest version of the child bot was displayed.

Fixes		
Build	Service Cloud case ID	Description
12342	01270601, 01260628, 01255632, 01758499, 01775489,01773778	When you connect with Microsoft Outlook, IMAP, or POP3 , you can now create a bot and save all emails to a folder even if the email subject line contains slash (/) or backslash (\) characters. When you save the emails, the slash (/) and backslash (\) characters in the subject line are now replaced by an underscore (_) character.
12342	01755993, 01782945, 01775161, 01792954	In the Email package when you connect to Microsoft Outlook to automate an email-related task, you can now use the Move all action followed by Loop action to move unread emails from one folder to another folder. Previously, when you ran the bot, the bot failed to move the unread emails because of an error.
12342	01264563	You can now create a bot using the Global session option in the Open action of the DLL package and choose DLL session does not exist for the If condition. Previously, an error was encountered when the Open action of the DLL package and the If (DLL session does not exist) condition were called multiple times in a sequence.
12342	01258059	In the XML package, when you create a bot to retrieve the data by using the Get single node action and if the XML file has some lines that are commented out, the output no longer shows those lines. Previously, the output displayed the lines that were commented out.
12342	--	In SOAP Web Service, when you select Raw data parameter and use the Build Xpath option, you can now successfully extract values from the SOAP response and store the XML output in a variable. Previously, you could not extract values from the SOAP response because the Build Xpath option did not work as expected.
12342	01071731, 01762875	When you open a CSV or TXT file, read data from that file, and write data from a Table type variable to the file, the bot no longer fails if the CSV or TXT file contains large data sets. The bot now runs successfully even when the Create folders/files if it doesn't exist and Override existing file check boxes are selected in the Write to file action.

Fixes		
Build	Service Cloud case ID	Description
12342	00968574	An error no longer occurs when you create a bot by using the Open action of the VBScript package and select a <code>vbscript</code> file from the desktop with the file extension in uppercase. Previously, if the file extension was in uppercase, the bot failed because the file was considered an invalid script file.
12342	00831463	Using the Email package, you can now send emails with the email subject containing a combination of Japanese half-width characters and katakana characters. Previously, if email subject contained a combination of Japanese half-width characters and katakana characters, the output displayed was garbled in the mail received.
12342	00822222	When you connect to the EWS server to automate an email-related task, you can now send multiple emails without providing any value in the subject field when you use the Send email action in a loop. Previously, when there was an empty value in the subject field, the bot failed to read such mails.
12342	00823283	In the FTP / SFTP package, you no longer encounter an error when you provide the folder name as a dot (.) in the Get folders action. When you run the bot, it downloads all the folders from the current directory to the local folder path provided in the action.
12342	00824379	In the Google Sheets package, when you open a spreadsheet and use the Go to cell with the cell option as Specific cell and if the spreadsheet has more than 40000 rows and you select the One cell below option, the bot now executes successfully. Previously, an error occurred on bot execution.
12342	00788970	The bot name is now translated correctly in Chinese (Simple Chinese) in the Bot running window. Previously, the bot name was displayed as garbled in the Bot running window.
12342	01270344, 01767148	When you use the Google Sheets package and open a Google spreadsheet, you can now use the Get all sheet names action to successfully retrieve the names of all the sheets. Previously, if the Google spreadsheet had more than five sheets in it, the bot encountered an error.

Fixes		
Build	Service Cloud case ID	Description
12342	01709026, 01755897, 01768689, 01761434, 01554474	An error no longer occurs when you establish a connection by using the ODBC driver in the Database package. For Microsoft SQL Server, the blank value is now inserted as 0 in the database table for the <code>int</code> column.
12342	01602081	When you use actions from the REST Web Service package to send requests and receive responses from a REST API and to store the response status of the API in a dictionary variable, REST now returns headers and empty body content in response even if the API does not have response body.
12342	01758733	When you migrate from Enterprise 11 to Automation 360, after you edit or add some actions to a bot that does not exist in a parent bot, when you save the bot, it is now saved without any delay. Previously, it took some time to save the bot.
12342	01254323	An error no longer occurs when you use the Create workbook action of the Excel advanced package to create a workbook inside a folder in a network drive path.
12342	01036851	When you open a file with <code>.xlsx</code> extension by using the Open action of the Excel advanced package, the bot no longer fails even if an intermediate parent folder does not have access privileges. For example, the Open action can open the file from <code>\\share\a\b\c\file.xlsx</code> if the <code>\\share\a\b\c</code> folder has access privileges even if the <code>\\share\a</code> or <code>\\share\a\b</code> folder does not have access privileges.
12342	00827204	On computers that use the Japanese and Chinese versions of operating systems, an error no longer occurs when you try to return a tab to the first web page it opened by using the Go back action of the Browser package and deselect the Throw an error if step exceeds history option.
12342	00777283, 00829912	When you use the Open action of the Excel advanced package to open a Microsoft Excel worksheet, use the Replace action of the Excel advanced package to replace a string in the worksheet, and then run the bot, the bot now runs as expected and is not stuck even if the string to be replaced is not present in the Excel worksheet.

Fixes		
Build	Service Cloud case ID	Description
12342	00835312	An error no longer occurs when you create a shortcut to a folder by using the Open program/file action of the Application package to open a file and then using the Create shortcut action of the Folder package.
12342	00757943, 00787404, 00788421, 00807528, 00822941, 01018972	You can now use the AI Sense action in a parent bot and the OCR action in a child bot, or both actions together, to successfully run your bot. Previously, this caused an ABBYY FineReader Engine 12 error.
12342	01212753, 01470071	When the current session of an application on Citrix is closed and the application is restarted, the Recorder now identifies the object and successfully performs the correct action. Previously, the Recorder failed to identify the object.
12342	00742936, 00808117	You can now convert a datetime value by specifying custom datetime formats (for example, <code>hh:mm:ss</code>). Previously, an error occurred when you used the <code>hh</code> convention to specify a custom datetime format.
12342	01266752	When you use the 6.2.0-20210903-141520 version of the Excel advanced package to run a macro on a Microsoft Excel worksheet, the values in the referenced cells in the Excel worksheet are now updated correctly.
12342	01755439	An error no longer occurs when you use the 2.5.3-20220304-010651 version of the Recorder package to capture an object. Previously, when you used the 2.4.0-20211118-080716 version of the Recorder package, the bot failed with the following error message: <code>The bot could not be executed due to an error in setting up the execution environment</code>
12342	01276429	After migration, you can now call a reusable bot with the new package version from the same parent bot with which it shared a session. You can do this by inserting a session variable initialized with a value to a key in the dictionary with the Dictionary > Put action.
12342	00805417, 00815023, 01049408	You can now use the Recorder to successfully run keystrokes and capture objects on a new tab opened in the Google Chrome browser.

Fixes		
Build	Service Cloud case ID	Description
12342	--	In the Browser > Open action, when you select the Last used browser tab preset for the Internet Explorer window under the Existing tab option, the corresponding tab and window are now activated.
12342	01755590	In Automation Workspace, when you navigate to Automation > Bot Store and log in, you can now access the Bot Store without issues.
12342	--	When you add or remove a consumer role from the locker, role values are no longer changed when you sort the table. Previously, the values in the Modified By and Last Modified columns were inadvertently modified.
12342	01272058, 01752731	You can now pause or stop your in-progress workload automations and the Internal server error no longer occurs. Previously, the workload automation could not be paused or stopped after the user who created the automation was deleted from the Control Room.
12342	01181402, 01260706	When you run your workload automations, you no longer have to pause and then resume to run the queued bots that are stuck in the In progress state.
12342	00790086	The incorrect Japanese translation for schedule description of the daily and monthly frequency fields for the Run repeatedly option (Manage > Schedules > Schedule a bot) is now fixed. The correct Japanese description is now available on the Schedule a bot page.
12342	00852637	When you edit a bot schedule in the Control Room, the schedule column on the Scheduled page now displays the correct schedule date instead of the previous day. Previously, for example, if a bot was scheduled for 01-Oct-2021, the Scheduled page displayed the schedule date incorrectly as 30-Sep-2021.
12342	00821057, 01188160	If a file is exported after the bot name and folder path are changed, the bot name now reflects the new name. Previously, the bot was exported with the old name.
12342	01252294	You can now successfully import the zip files in the zip64 format from the development environment to the production environment.

Fixes		
Build	Service Cloud case ID	Description
12342	--	You can now run multiple queues without any delay in between queues. Previously, when you ran multiple queues, a delay of 5 to 15 minutes sometimes occurred between queues.
12342	00800831, 00815411, 00826054, 00826058	When you use the Export checked items to csv option, the schedule data in a .csv file is now saved correctly. Previously, when you exported the schedule data to a csv file from the Control Room Scheduled activity page, the file data was saved incorrectly. For example, the schedule type was saved as Recurring in the csv file instead of One time .
12342	01754721, 01753460, 01767806 01759361, 01763327, 01764201, 01767827, 1770574	If the system locale setting is changed, the weekly scheduled bots now run as scheduled from the Control Room. Previously, when the system locale setting was changed, the bots did not run according to schedule.
12342	00714546, 00759029, 01257992	The Control Room can now integrate a Git repository that rejects force push. Previously, some security protocols rejected all force push updates making the git integration incompatible without a configuration for the force push flag. You can now change the configuration of the Git push from the Control Room to disable the force push flag.

The following table lists the limitations identified in the current release:

Limitations
<p>(Service Cloud case ID: 01765712) If a MetaBot Logic was using a DLL file that used classes without namespaces, after migration, any Task Bot that uses the MetaBot Logic does not work.</p> <p>Workaround: Manually update the DLL file to include namespaces for classes.</p>
<p>If you created the Active Directory role mapping in previous releases, when you update to Automation 360 v.24, some previously defined group mappings are deleted because the Distinguished Name (DN) column of the mapping entries in the database contains empty rows, with no values. Before you update to Automation 360 v.24, run a script to populate the DN column. (Service Cloud case ID: 00751756)</p> <p>For support on this issue, contact the support team: Open a support case (A-People login required)</p>

Limitations
<p>The Bot Insight premigration utility encounters an error and closes when it detects corrupted dashboard IDs in BI tables. (Service Cloud case ID: 00796546)</p> <p>Workaround: Download and install the latest Bot Insight premigration utility from the Automation Anywhere Support site.</p>
<p>When you build bots by using drag actions from the Actions palette, the bot workflow shifts to the right side in the Flow view.</p> <p>Workaround:</p> <ul style="list-style-type: none"> When you create or edit a bot in the Bot editor, add new actions from the Actions palette by double-clicking the action that you want to use. <p>For example, if you are editing a bot and you want to add an action after line 7, place the insertion point after line 7, and then, from the Actions palette, double-click the action that you want to add.</p> <ul style="list-style-type: none"> If you want to use the drag option, ensure that when you drag the actions, you move them a little faster on the canvas.
<p>(Service Cloud case ID: 01798098) When you update Automation 360 from a previous release to this release on a Windows machine, you might see the following error message about an invalid digital signature:</p> <pre>Error 1330: A file that is required cannot be installed because the cabinet file E:\AA\....\Data1.cab has an invalid digital signature.</pre> <p>Workaround: A360.24 Installation Failure "Error 1330 Invalid Digital Signature" (A-People login required)</p>
<p>If the Automatically update all bot agents option is selected and if you update to this release, some Bot Agent might fail to automatically update to the latest version.</p> <p>Workaround:</p> <ol style="list-style-type: none"> Manually uninstall the existing version of the Bot Agent. Install the latest version of the Bot Agent.
<p>When you migrate Enterprise 11 bots with the Comment command enabled, the command is disabled after migration. (Service Cloud case ID 01255723, 01252824, 01260677, 01608653)</p>
<p>When you log in as an administrator after migration and then start a bot migration, the Audit Logs pane intermittently displays an unsuccessful message with a Bot Launcher has crashed error.</p>
<p>When you migrate bots with system variables (such as date, month, or year) as an Export Data to CSV option, a preprocessing error is displayed. (Service Cloud case ID 01755175)</p>
<p>When you update your Control Room from Automation 360 v.21 or v.22 to Automation 360 v.23 or v.24, the installation might fail because of schedule migration issues. (Service Cloud case ID: 01376353, 01449535, 01713118, 01627144, 01762404)</p> <p>Workaround: Open a support case (A-People login required).</p>

Limitations
<p>Administrators can export data, up to 100,000 entries, to a CSV file. Downloaded audit .csv files are stored in the C:\Windows\TEMP\ folder in the On-Premises environment temporarily. Files in this folder with names starting with cr-audit should not be deleted for at least 90 days and can be downloaded from the Control Room.</p> <p>See .Export audit data to CSV on page 2101</p>
<p>When you autoupdate the Bot Agent simultaneously on 500 to 1000 devices in the Control Room (On-Premises), the autoupdate fails.</p> <p>Workaround: Manually update the Bot Agent on a few devices at a time from the Control Room Devices page.</p>
<p>In browsers such as Microsoft Edge (Chromium) and Mozilla Firefox, when the Bot Agent installer file is downloaded, the download information is shown at the top-right corner although the download arrow points to the bottom-left corner of the browser's taskbar.</p> <p>The download arrow points to the correct direction only for the Google Chrome browser, in which the download information is shown at the bottom-left corner of the browser's taskbar.</p>
<p>For a Control Room installed on Linux operating system, the AutomationAnywhereBotAgent.msi file is not available for download with the Download installer option from the Control Room > Administration > Settings page.</p> <p>Workaround: To install the Bot Agent, use the AutomationAnywhereBotAgent.msi file from the <application filepath>\crui\asset folder of a Control Room (On-Premises) installed on Windows operating system. For more information, see Sample steps to create Bot Agent golden image (A-People login required).</p>
<p>In the Email package, when you use the HTML design option to create and customize your email layout and body and then paste content copied from another source, such as Outlook or Notepad++, the font style, size, and color are currently not retained for the following actions:</p> <ul style="list-style-type: none">• Send• Reply• Forward
<p>When you create a bot using actions such as Send, Reply, or Forward from the Email package, choose an option from Plain text, HTML design, or HTML code to format your email body. When you switch between these tabs (Plain text, HTML design, or HTML code), the previously set value in the message body is not retained, and the message body is blank.</p>

Limitations
<ul style="list-style-type: none"> Nested IFrames are not supported in the Google Chrome and Microsoft Edge Chromium browsers. Support to capture window authentication pop-ups is not available when automating Google Chrome browser. After performing an action in an application or page, if a frame is added at run time to the application or page, and if any pop-up windows, alert dialog boxes, confirmation dialog boxes, or prompt dialog boxes appear on that frame, then the pop-up windows and dialog boxes are not captured. <p>Workaround: Use the actions in the Image recognition package or the Mouse > Click action instead to run the bot.</p>
<p>On computers where SystemLocale is set to a non-English language, when you open multiple tabs in a browser, try to execute any action on a new tab that is currently inactive, and run the bot, the inactive new tab does not become activated.</p>
<p>In Internet Explorer, to activate one among multiple web pages with no titles, only the fully qualified domain names (FQDN) are compared. If pages that have no titles but have the same FQDN are opened in Internet Explorer, any tab that matches the FQDN is activated.</p>
<p>In Internet Explorer, when you use the Close action to close a tab or a window, it is closed only if it does not have an alert dialog box.</p>
<p>Note: An Internet Explorer tab or window with an alert dialog box is closed only when the alert dialog box is closed manually.</p>
<p>When you use the Open action of the Excel advanced package to open files with <code>.x1sm</code> extension that have charts, the bot fails with an error.</p> <p>Workaround: Provide the Excel sheet name in the Specific sheet name field and then run the bot. If there are any hidden sheets, unhide the specific sheet and make it as the active sheet.</p>
<p>When you automate web applications running on Microsoft Edge Chromium with IE mode or Internet Explorer, the Recorder sometimes fails to capture the object from the currently selected browser tab and captures from the last used tab instead.</p> <p>Workaround: Refresh the Bot editor and then start recording again.</p>
<p>When you use the Recorder to capture an object, select HTML Tag, HTML InnerText, and HTML type properties in Search Criteria, or migrate a bot with similar properties selected in Search Criteria, the bot might fail to identify or locate the object and perform the selected action.</p> <p>Workaround: Modify the DomXpath according to the controls you capture or add more properties in Search Criteria.</p>
<p>When you use the Datetime package released with Automation 360 v.23 or earlier to create a bot that uses the Datetime Assign action, then select the variable option to add the variable value and try to run the bot with package released with Automation 360 v.24 or later, the UI shows a compilation error, and the user must select the variable value again.</p>

Limitations
In the Recorder package, the Run in background option that enables an automation to run in the background is not supported for applications running on Google Chrome, Microsoft Edge, and Mozilla Firefox browsers for any of the Recorder actions.

The following table lists limitations from previous releases that are also applicable to this release:

Limitations from previous releases
When you migrate a bot that was using the Manage Window Controls action, the last digit of the height value is not available after migration. However, the bot will execute successfully. (Service Cloud Case ID: 01756996)
When an Excel session is active in SAP, a corresponding Excel process starts in the background. In such a scenario, Automation 360 uses the same Excel process that SAP started. When you run a bot to automate spreadsheet data, Automation 360 processes the first request successfully. However, during execution, if the Excel is closed and a subsequent request is sent for automating the spreadsheet data, Automation 360 does not process the request because the Excel process is still being accessed by SAP. Therefore, the correct window is not activated for automating the spreadsheet data. (Service Cloud Case ID: 00815159)
<p>If you are directly updating from Automation 360 On-Premises v.21 to this release, you might face issues updating your Bot Agent on some Bot Runner machines in the following scenarios:</p> <ul style="list-style-type: none"> • After a Control Room update, the device status keeps changing and the Bot Agent fails to update automatically. • If the <code>embedded_resources</code> file is missing, the Recorder does not recognize the user interface elements or does not capture a single object in the Google Chrome browser. <p>Workaround: Before updating to this release, remove the following Bot Agent files and folders:</p> <ul style="list-style-type: none"> • <code>C:\Windows\System32\config\systemprofile\AppData\Local\AutomationAnywhere\AA-DB.mv.db</code> • <code>C:\ProgramData\AutomationAnywhere\GlobalCache\embedded-resources</code> <p>For more information, see Bot agent auto update fails post the Control Room Upgrade with 'device.connection.lost' (A-People login required) The recorder is not able to recognize the GUI elements in Google Chrome browser (A-People login required)</p>
<p>When you use the Terminal Emulator command with the Send Text action that contains the LF key (Enter), the command might fail if the LF key is not supported by the Terminal Emulator.</p> <p>Workaround: Ensure that you replace the LF key with supported characters such as the space character.</p>
After migration, a user is able to delete an <code>.atmx</code> file even when the file is associated with a schedule from the Automation 360 Control Room.

Limitations from previous releases
<p>If you configure an external key vault in External Key Vault Integration and select the SQL authentication mode for database authentication in the Windows installer Database Server page to install Control Room (On-Premises), the installation fails, and the following error message is shown: <code>Control Room database tables fail to create</code>.</p> <p>Workaround: Add the database credentials in the external key vault and use those credentials for database configuration.</p>
<p>Newly created Control Room users on Windows for On-Premises Google Cloud Platform VMs cannot change their password. The security questions option is not available on the Change password screen and as a result the Control Room displays an error when they try to save the password.</p> <p>Workaround: Refresh the page and change the password again.</p>
<p>(Service Cloud case ID: 01768545) Update status stuck as IN_PROGRESS during migration from Enterprise 11 to Automation 360</p> <p>When you migrate from Enterprise 11 to Automation 360, even if bot migration is successful, Bot Insight does not update the status to the Control Room. Until version 11.3.2, the analytical flag was historically enabled by default, so all created bots are identified as analytical bots. Some bots identified as analytical bots have no processed data available to the Bot Insight dashboard. As a result, the migration status becomes stuck as IN_PROGRESS even if bot migration is successful.</p>
<p>When you try to automate any process in a Java application that uses version 11.0.8 of AdoptOpenJDK, the Recorder sometimes does not capture the drop-down elements on the application.</p>

Automation Co-Pilot for Business Users (Automation Co-Pilot)

What's new
<p>Microsoft Edge Chromium and Safari supported for Automation Co-Pilot</p> <p>You can now create forms and processes in the Automation Workspace and run your requests, tasks, and bots in the web interface on Microsoft Edge Chromium and Safari browsers.</p> <p>Browser requirements for Automation Workspace on page 1154</p>
<p>Create password fields and hide sensitive information (Service Cloud case ID: 00714159, 01063512)</p> <p>In the Automation Workspace, you can now create password fields by using the Password element in your form builder. You can use the Password element in the web interface to add masked text to your password fields in the initial forms to hide sensitive information.</p> <p>About Process Composer on page 3297 Password element behavior on page 3304</p>

What's new
<p>Configure a scheduler user for each team</p> <p>You can now access the Process page in the web interface to edit a process and assign a scheduler user for each team. This ensures that the bots in the process are deployed on the devices assigned to a team and that these devices are not used by another team. The Team scheduler user is set by default, but if a scheduler user is undefined, then the Process scheduler user is selected. The Global scheduler user will be selected only if the Team or Process scheduler users are not selected.</p> <p>Assign a scheduler user to a process on page 3294</p>
<p>Configure scheduler deployment type (Service Cloud case ID: 00814885, 01276257)</p> <p>You can now configure the scheduler deployment type for bot tasks in your process setup and determine how the bots in the process will be deployed. You can define the mapping between run-as user and the device that helps take care of constraints, such as credential constraints that require one-to-one mapping between the run-as user and the device.</p> <p>Configure deployment type for bots on page 3296</p>
<p>Reference ID enhancement to requests</p> <p>You can now view the reference ID associated with your process in the Reference column of the Requests page. The reference ID is a combination of a prefix and a number that is created from a Process Key that you can enter when you edit your process for the first time. This reference ID is incremented whenever a request is created from the corresponding process.</p> <p>Reference ID properties on page 3260 Configure a process on page 3278</p>
<p>Request retention settings</p> <p>When you edit a process, you now have the option to set when your completed requests are moved from the Requests page to the Recycle bin. With this feature, you can avoid manually moving completed requests individually to the Recycle bin. You can choose to disable the settings to move completed requests to the Recycle bin. You can also set the number of days after which requests are deleted from the Recycle bin.</p> <p>Configure a process on page 3278</p>
<p>Default team assigned to process</p> <p>You can now edit a process to display the default team that the process is assigned to in the Default team field. The first team that a process is assigned to is automatically set as the default team. With this feature, you can view the default team that a process is assigned to without viewing each individual team.</p> <p>Configure a process on page 3278</p>
<p>View status of queued bots</p> <p>You can now view the status of your bots that are queued and are not actively running. The request view page now shows the In Queued label next to your queued bots that are not active.</p>

What's new
<p>Cancelled status for tasks</p> <p>You can now filter tasks by the Cancelled status in the Tasks page. This status will show a Cancelled label next to the filtered results to inform you of the tasks that were cancelled by a user. You can filter by this status from the drop-down menu in the status bar.</p> <p>Filter and search for a task on page 3273</p>
<p>Fill initial form elements by URL parameters</p> <p>When you create a request, you can now fill initial form elements by creating query scripts that enter specific parameters in the initial form URL. These parameters are applicable only for Date, Number, Text Box, and Time elements.</p> <p>Construct URL parameters for supported elements on page 3303</p>
<p>Storage service enhancement (Service Cloud case ID: 00768394)</p> <p>As a tenant admin, you can now set a configuration option to block upload of executable files to prevent a security breach. You can block the upload of files with the following extensions: .acm, .ax, .cpl, .dll, .drv, .efi, .exe, .mui, .ocx, .scr, .sys, and .tsp.</p>
<p>Run virtual window in bot configuration</p> <p>If you are an Automation Co-Pilot Admin, you can configure bots in the Bots page and enable the Run your bot in virtual window option. With this option, an attended user in Automation Co-Pilot Desktop Assistant can run bots in a virtual window without losing their user experience.</p> <p>Configure a bot on page 3277</p>
<p>Add rules to Button element</p> <p>You can now add rules to the Button element.</p> <p>Using the Button element on page 3215</p>
<p>Customize text in forms using updates to Label element</p> <p>You can now customize the text in your forms in various ways, such as applying bold, italic, underline, and other formatting effects, changing the font size and color, and so on, by using the Label element. With these options, you can highlight specific messages or texts, such as next steps, warnings, or errors, when they are rendered in the initial form in the web interface.</p> <p>The Label element now provides the following formatting options:</p> <ul style="list-style-type: none">• Emphasis• Font color• Font size• Text alignment <p>Using the Label element on page 3220</p>

What's new
<p>Search and filter columns in a table</p> <p>On the form builder screen, if you select the Enable column filtering check box for the Table element, users can search and filter the content for all the available columns when the bot is running.</p> <p>When you use the Table element to render a table in your initial forms, you now have the enhanced ability to search each column of your table by value.</p> <p>Using the Table element on page 3226</p>
<p>Additional options for rules</p> <p>With additional options included for rules in the form builder, you can now perform the following:</p> <ul style="list-style-type: none">• Find a rule but using the search bar. In the search bar, enter the name of the rule or the element label that is associated with any condition or action in the rule.• Create a copy of a rule by using the Duplicate rule option.• For multiple rules, you can use the following options to rearrange the order in which these rules are executed at bot run time:<ul style="list-style-type: none">• Move up• Move down• Move to top• Move to bottom <p>Add rules to form elements on page 3229</p>
<p>Apply an action to multiple elements</p> <p>If you are adding or editing a rule, when you are adding an action, you can now apply an action to more than one element by selecting multiple elements in the Then menu.</p>
<p>Additional If conditions for some elements</p> <p>When you are creating or editing a rule, you can now select additional If conditions for the following elements:</p> <ul style="list-style-type: none">• Dropdown• Checkbox• Radio Button• Date• Time• Hyperlink
<p>Use Assign for updating the value of the Dropdown element</p> <p>When you are adding a rule, if you select the Dropdown element as an action item from the Then menu, you can now use the Assign drop-down menu to append or overwrite values when the bot is running.</p> <p>Add rules to form elements on page 3229</p>

What's new

Elements in If condition are available in Then action

All the elements that are used as part of the **If** condition are now available as part of **Then** action.

Multiple lines supported for Text Area and Rich Text Editor

Text across multiple lines is now supported for **Text Area** and **Rich Text Editor** elements within **If** and **Then** options.

[Add rules to form elements](#) on page 3229

What's changed

Enhancements to importing process to public folder

When you import your process to a public folder, the process is now automatically published in Automation Co-Pilot. Previously, you were required to check in the imported processes in the private repository and then check in the process again for it to be published in Automation Co-Pilot.

[Import a process automation](#) on page 3336 | [Import process automation dependencies](#) on page 3337

Process page layout updated

The layout of the **Process** page has now been updated to be consistent with the **Bot** and **Team** pages. The changes include columns for reference ID, key, name, description, tags, and teams. You can now filter your results in the search bar for faster sort and quickly reference the current global scheduler user on the page.

Active bot status

In the request view page, you can now view the exact status of your bots by referring to the **In Progress** label next to your active bots that are currently running. Previously, the **In Progress** label showed both active bots and queued bots that were not running.

What's changed
<p>Reference to replace Request ID in Automation Co-Pilot on the web</p> <ul style="list-style-type: none"> You can now filter or query your requests in the Requests and Recycle bin tabs and tasks in the Tasks tab (Table View and Detail View) using the new Reference instead of the Request ID. The Requests, Team, Process, and Bots URL is now changed to <code>entity/ref/:ref</code> from <code>entity/:id</code>. If you open any request using Request ID, the URL now redirects using Reference. For example, consider the Request ID as 896 and Reference as 2-34 for a request. If you view the request using the Request ID (<code>/aari/#/requests/all#/requests/896</code>), the URL will redirect using the Reference (<code>/aari/#/requests/all#/requests/ref/2-34</code>). <p>Reference is a unique key that helps you identify your related processes and requests in the Requests, Team, Process, and Bot pages. Reference is easier to use and more meaningful than Request ID as it provides a logical sequence of referential number incremented per tenant. Reference is unique within a tenant, but it can be the same for two tenants.</p> <p>Reference ID properties on page 3260</p>

The following table lists fixes alongside the build in which each issue was fixed. Build 12350 is the latest build and includes fixes from the previous builds.

Fixes		
Build	Service Cloud case ID	Description
12350	01788376	You can now launch AARI using the Bot Agent (version 21.133) connection without errors.
12350	01803979	If you have Control Room configured with SAML and you click the AARI icon on the Windows Desktop, you are now redirected to the Automation Co-Pilot Desktop Assistant web page instead of the Control Room home page.
12342	01759135	When you use the Date element and select the Use the local system date when this form is loaded option, the date is now correctly displayed, with the local system date.
12342	01766579	If you are a Bot Creator, after creating a request using your Automation Co-Pilot process, you can now submit the initial form and complete tasks without being stuck on the request view page.
12342	--	For Automation Workspace with SDS setup, when you enter data or upload files in your initial forms after selecting a process to run the request, you no longer encounter an exception error message.

Fixes		
Build	Service Cloud case ID	Description
12342	--	When you use the Checkbox element to create a CheckBoxGroup in your form and set form rules and conditions for each box in this group (C1, C2, C3, and so on), the selections now function properly in the initial form as defined your form rules.
12342	--	If you are a Bot Creator and an Automation Co-Pilot manager, you no longer encounter an error when you run a bot by using the Team Members action from the AARI Web package to access teams.
12342	--	If you are a member of a team by role (that is, if you were first added to a role in the Control Room and the role was then synced to a team), you will now be able to view updated information for your requests and tasks. The page now automatically refreshes the latest request and task details.
12342	--	In the web interface, when tasks are completed in the request view, and you confirm by clicking Finish , Cancel , or any other primary or secondary option, these types of events are now captured in the Audit log history in Automation Workspace, as an Automation Co-Pilot Human Task type of event.
12342	--	In Linux environment, you can now use the file upload functionality of Automation Co-Pilot on the web without any issues. Previously, the file upload functionality failed with an access denied error because the <code>filestorage</code> directory was not automatically created to store the files.
12342	--	The Edit button no longer appears enabled for processes that are checked in, checked out, or cloned. Previously, you could edit the names of processes that were checked in, checked out, or cloned although the changes were not saved.
12342	--	For any element in a form, if you use the Mark field uneditable option on the form builder or disable it when you run the associated bot, form validations applied to that element are overruled.

Limitations
<p>In some scenarios, when you launch a bot that was configured to run in a virtual window, the virtual window starts and you are prompted to log into the window with your credentials.</p> <p>Workaround: Reboot your system and launch the bot again.</p>
<p>When you design a form, you can create references for hidden elements by using the Hidden elements option from the form properties. However, after you have designed the form, you cannot view or change the variables among hidden elements.</p>
<p>After you design a form with a drop-down rule assigned to your form, if you view the drop-down in read-only mode, you will not be able to view the changed data in read-only mode.</p>
<p>If you have Select file element in the form, then you cannot upload a file that has special characters (such as , () & ; - =) in the filename when you run the bot.</p>
<p>In the web interface, when you are on a page other than the main page and your login session disconnects and returns you to the login page again, the next= parameter is shown in the URL indefinitely. This can be an issue as the next= parameter is used to redirect the URL to a previous page but is currently not supported.</p>
<p>For the Text Box element, the Does not contain form rule is not working.</p>
<p>For the Rich Text Editor element, the Contains form rule is not working.</p>
<p>For the Table element, the Rows before scrolling option can support only up to four rows. If you specify five or more rows, this option is not supported and you must scroll instead.</p>
<p>If you create a form with the Document and Dropdown elements, when you attempt to submit this form, an error occurs. This error is due to the dynamic form schema, such as a drop-down field filled by a process that is present in the form with the document field and causes an error.</p>

Discovery Bot

What's new
<p>Save the recording with a name</p> <p>After recording a process, you can now save the recording with a name. The name of the recording is displayed on the Recordings page for that process.</p> <p>Record a Discovery Bot business process on page 3709</p>
<p>Share a description of the recording</p> <p>You can now provide a description for a recording of a process by using the Recordings page for that process. In the Recordings page, use the Description field to share the context and the purpose of the recording with the analyst. The description provided is also displayed in the PDD.</p> <p>Record a Discovery Bot business process on page 3709</p>

What's new
<p>Delete a recording</p> <p>After you record a process, if you do not want to submit the recording data to an analyst for review, you can delete the recording by using the Recordings page for that process. In the Recordings page, use the Delete option to delete the recording.</p> <p>Record a Discovery Bot business process on page 3709</p>
<p>Record business processes using Automation Co-Pilot Desktop Assistant</p> <p>You can now use Automation Co-Pilot Desktop Assistant to record business processes without signing in to the Control Room. To record a business process, start Automation Co-Pilot Desktop Assistant by double-clicking the Automation Co-Pilot icon on your desktop.</p> <p>Record a Discovery Bot process using Automation Co-Pilot Desktop Assistant on page 3713</p>
<p>Enhancements to custom opportunities</p> <p>You can now update the potential cost and savings for custom opportunities and save your changes to the process diagram. The potential cost and potential savings can be updated at any time as you review the steps from various recordings and make changes within the process diagram.</p> <p>Review opportunities, convert to bot, and generate PDD on page 3715</p>
<p>Enhancement to PDD</p> <p>You can now view the entire process diagram from within Discovery Bot by clicking the URL link provided in the PDD. The PDD does not display the process diagram if more than 100 steps are selected.</p> <p>Review opportunities, convert to bot, and generate PDD on page 3715</p>

What's changed
<p>The process discovery document (PDD) now displays Chinese Unicode characters in both Word format and PDF.</p>

Fixes	
Service Cloud case ID	Description
--	Cloud users: When you capture more than 250 steps, you can now create a customized opportunity for automation and generate a PDD.
--	You can now download a PDD for custom opportunities and recordings without any issue. Previously, an error occurred intermittently and the following error message was displayed: <code>Error generating PDD</code>

Fixes	
Service Cloud case ID	Description
--	An error message is now displayed when you cannot connect to the Control Room. For example, this occurs when a signed or wildcard certificate is used for the Control Room setup for On-Premises deployments and you have not pre-installed the certificate. The Processes page fails to load. Follow the instructions in the message to connect to the Control Room.
00829246	Cloud users: You can now download a PDD for an automation opportunity with 200 or more steps. Previously, when you created an opportunity with 200 or more steps, clicking Download PDD returned an error.
--	For autogenerated and custom opportunities, the Recordings table now works as expected. Previously, it encountered an error intermittently.
00827381	When you search for the Recorder package in the Japanese UI, you can now view the correct package name for the Recorder.

The following table lists the limitations identified in the current release:

Limitations
In rare situations when a device CPU is busy, the recording screenshot might not be captured from the Recordings page for a process. However, user actions, such as text selection, are displayed on the Recordings page.

The following table lists limitations from previous releases that are also applicable to this release:

Limitations from previous releases
When you add branches to the left and right sides of a main branch, the Recording flow chart section of the PDD might not capture the entire process workflow, including all the branches.
Depending on the memory available in your system, the PDD (in PDF or Microsoft Word format) can support up to 250 recorded steps captured in the document. If a process is recorded with more than 250 steps, the PDD generation periodically stops functioning. Workaround: Regenerate the PDD and click Download .

Feature deprecation for Discovery Bot

Review the deprecated feature to understand how it can impact your automation.

Discovery Bot red highlight

In the recording session, the red outline that highlights when you move the mouse over the area to capture the action has been deprecated as of June 2021. The red outline is displayed in the screenshot images when you review your captured steps from the Recordings page.

IQ Bot

What's new

Document Automation limited availability release

A select group of early adopters can now use Document Automation to automate processing business documents in the new Automation Anywhere Cloud-native intelligent document processing solution.

Document Automation is integrated into the Control Room. When you create a learning instance, IQ Bot automatically creates RPA bots to extract and download the data and an Automation Co-Pilot process to manage the entire process. Learning instances do not require training. Instead, Document Automation uses pre-trained models to process invoices and receipts.

[Document Automation](#) on page 3455 | [Intelligent Document Processing solutions feature comparison matrix](#) on page 3464

Total number of pages uploaded for Process Documents action

In Automation 360 IQ Bot, when you use the **Process documents** action from the IQ Bot Extraction package to process documents, you can now view the total number of pages uploaded displayed under **Dashboards > My totals**

[Using IQ Bot Process documents action](#) on page 2652

Role-based access control (RBAC) available

Automation 360 IQ Bot now offers role-based access control (RBAC). You can use RBAC to handle the following user permissions:

- Edit learning instance
- Delete learning instance
- Send learning instance to production
- Import domain

[Defining a custom role for IQ Bot](#) on page 3545

Rotate encryption key as **AAE_IQ Bot Admin**

With the **AAE_IQ Bot Admin** role, you can now rotate the encryption key by changing the object name in the new **Administration > Key rotation** page.

[Rotate the external key](#) on page 3597

What's new
<p>New model for Cognitive MLWeb Service</p> <p>In On-Premises installations of Automation 360 IQ Bot, you can now achieve improved check box and table detection when you use the new model of the Cognitive MLWeb Service.</p>

What's changed
<p>For on-premises installations of IQ Bot, the MLScheduler Service in the Microsoft Windows services window is now disabled, by default, to free up system resources.</p>

Fixes	
Service Cloud case ID	Description
00764550, 00765854	When you migrate from Enterprise 11 to Automation 360, any learning instance with custom domain that has Chinese language fields is now displayed correctly. Previously, these fields were populated with incorrect values in place of Chinese characters.
00758208, 00632965, 00727063, 00715124, 00828988, 01251514	The MLScheduler service is now disabled on IQ Bot On-Premises, and the system no longer slows down or stops responding. Previously, the autocorrection and autosuggestion features, which are part of the MLScheduler service, used system resources extensively and caused the system to slow down or stop responding.
01757917	Documents are now successfully classified using Microsoft Azure 3.2 OCR. Previously, due to deprecation of the Microsoft Azure preview OCR v3.2-preview.2, the documents remained unclassified.
--	Documents extracted using the Auto Extract command are now successfully processed. Previously, when documents were extracted using the Auto Extract command, validations from the default validation group were not applied to them.
01261531	When you create a learning instance and use the IQ Bot upload command, the display is now stable, without any issues. Previously, this caused resizing and toggling between larger and smaller fonts, making the display flicker.
--	To manually create a group, you require only the IQBot_admin role now. Previously, to manually create a group, you required both the aae_basic and IQBot_admin roles.
--	In the IQ Bot UI, for groups that were created manually, you can now see the Group label in its entirety. Previously, you could see only a part of the Group label .

Fixes	
Service Cloud case ID	Description
--	Documents whose file names begin with a special character, such as a hyphen (-), are now properly classified and processed. Previously, such documents were held up in the classification queue or remained unprocessed.
01063054	You can now import a learning instance that has a lengthy name, with more than 50 characters, without any errors because the Label field now supports more than 50 characters.
--	For a standard forms learning instance, if you upload a document that contains a table with an empty cell, the document is now sent to IQ Bot Validator. Previously, documents with empty table cells were sent to the Failed folder.
--	An error no longer occurs when you run a bot that contains actions from IQ Bot Pre-processor, Document Classifier and OCR packages. Previously, in such cases, an 'Assertion failed' error occurred.
01777853	You can now create standard forms learning instances using pretrained models that have long field names (up to 250 characters). Previously, pretrained models that had lengthy field names caused an error.

Limitations
When you upload vector PDF documents to a new learning instance, a few documents are identified as unclassified. Alternatively, if you convert the documents from PDF to TIFF and upload them, the documents are processed successfully.
When you are running IQ Bot using service account credentials, if the password contains a space, IQ Bot logs will not be updated.
In some cases, even if the correct number or amount is accurately reflected, some documents still fail the validation rule because of a round-off error and are sent for manual validation.
In formulas, if you use delimiters, such as commas or periods as thousand separators, formula validation fails. Workaround <ul style="list-style-type: none"> For English language: Remove all delimiters, such as commas used as thousand separator. For other European languages: Remove all delimiters, such as periods used as thousand separator. Use the English number convention for formula validations.
If you use the ABBYY FineReader Engine version 12.4 instead of version 12.2, the MICR feature does not support data extraction from documents in Japanese language.

Limitations
<p>After you back up the databases and run the DB Migration Assistant tool, the tool and the logs indicate that migration is successfully completed even if the unified database is not created.</p> <p>Workaround: Ensure that you install both the x86 and x64 versions of the Microsoft Visual C++ 2015-2019 Redistributable package.</p>

Bot Insight

What's changed
<p>startDateTime data now in standard format</p> <p>When you export data to Microsoft Excel, the date format will be exported based on the date format of the widget.</p>

Fixes	
Service Cloud case ID	Description
--	Now when you are using a proxy network, when you click Analyze , the network dashboard generates an analysis. Previously, this dashboard did not generate an analysis.
--	When you run a bot that was checked in to a public folder and then checked out into a private folder, the last refreshed date is now displayed accurately. Previously, the last refreshed date was displayed as invalid.
01252869, 01259449	The Business Dashboard is now visible to users assigned the BI Admin Role and BI User License. Previously, users with this role and license were not able to access this dashboard.

Limitations
<p>Cannot drill down for data used in group by duration</p> <p>When Group By is selected as duration (time/date) in the widget, the drill down is applicable only to a single level. If you try to drill down for data at the second level or further, you might encounter the following error: No data found.</p>

Limitations
<p>(Service Cloud case ID: 00777595) When you attempt to refresh the data in a Microsoft Excel worksheet, an authentication error can occur from multiple simultaneous attempts through open windows and tabs.</p> <p>Workaround</p> <ol style="list-style-type: none"> 1. In the Power BI desktop application, navigate to File > Options and settings > Options. 2. From the Current File section, select Data Load. <hr/> <p>Note: Do not select Data Load from the Global section.</p> <hr/> <ol style="list-style-type: none"> 3. Disable the check box Enable parallel loading of tables.

Automation 360 v.23 Release Notes

Release date: 30 December 2021

Review what's new and changed, and the fixes and limitations in the Automation 360 v.23 (Build 11513) release. Build 11513 replaces Builds 11499 and 11486.

Important:

- This build includes the Apache Log4j2 library version 2.17.1 to address the exposure to CVE-2021-44832, CVE-2021-45105, CVE-2021-44228, and CVE-2021-45046 vulnerabilities.

Though the command packages are not upgraded to Apache Log4j2 library version 2.17.1, the Bot Agent is upgraded to Apache Log4j2 library version 2.17.1. At runtime, the packages will use Apache Log4j2 library version 2.17.1 through the Bot Agent and hence will not be exposed. As an additional security measure, the Automation 360 v.23 Bot Agent installer also disables the Apache Log4j2 library look-up feature by default.

Third-party security scans might find traces of earlier versions of the Apache Log4j2 library. However, with the upgrade to Automation 360 v.23 and the mitigation in place, there will be no exposure to vulnerabilities. For more information, see [FAQs related to Automation Anywhere Releases regarding zero-day vulnerabilities \(CVE-2021-44228, CVE-2021-45046\) \(A-People login required\)](#).

- This build also includes fixes for the following issues:
 - When you update from Automation 360 v.22 to v.23, background jobs related to cloud license server sync-ups were deleted because of incorrect license job name.
 - When you install or update to Automation 360 v.23 for On-Premises deployments, log files were not updated for a few additional services.
 - If you did not have the **View Package** permission, bot deployments failed when you scheduled or ran a bot.

Updating to this release

The updated Build 11513 for Automation 360 v.23 includes Log4j2 library version 2.17.1 and fixes. If you are on the previous v.23 Build 11499 (with Log4j2 library version 2.17.0) or Build 11486 (with Log4j2 library version 2.16.0), update to Build 11513 for the updated Log4j2 library version and the fixes.

You can also update to Automation 360 v.23 from the previous three releases (that is, from n–3 releases, where n refers to the latest release). The following previous releases are certified for update to this release:

- v.22 (Build 10526)
- v.21 (Builds 9664, 9642, 9595)
- v.20 (Build 8815)

You can directly update to v.23 from any of these builds (see [Update Automation 360 to latest version](#) on page 1363). If you are not on an n–3 release, update Automation 360 to one of the three certified releases (listed previously) before updating to this release.

If you are directly updating to this release from Automation 360 On-Premises v.20 or v.21, remove the following Bot Agent files and folders:

- C:\Windows\System32\config\systemprofile\AppData\Local\AutomationAnywhere\AA-DB.mv.db
- C:\ProgramData\AutomationAnywhere\GlobalCache\embedded-resources

Important: To use the new features in v.23 (including updates to Recorder packages) and for the Log4j2 vulnerability fix, update the Bot Agent for this release. Note that the Bot Agent update from the previous release is not required if you want to run your existing bots as Bot Runners.

For information on updating to this release, see these resources:

- [Automatically update the Bot Agent](#) on page 1302 | [Manually update the Bot Agent](#) on page 1303
- [Compatibility with release builds](#) on page 1275

For the latest updates to the Automation 360 extensions for Google Chrome, Microsoft Edge, and Mozilla Firefox, see [Browser extensions for Automation 360](#) on page 933.

Migration features

Enterprise 11 and Enterprise 10 features
<p>MetaBots containing linked objects</p> <p>Migrate MetaBots that contain a text play type linked object that is linked with the object play mode object, an image play type linked object linked with the image play type object, and a coordinate play type linked object linked with the coordinate play type object.</p>
<p>Migrate bots with the following attributes:</p> <ul style="list-style-type: none"> • Bots with variables that contain data larger than 64 KB (Service Cloud case ID: 00716311,00756449,00819149) <p>The migration process stores the data in a text file. The text file is uploaded to the Cloud Control Room and is used in the migrated bot.</p> <ul style="list-style-type: none"> • MetaBots with DLLs that return list and array type values with any delimiters combination and store these values in the clipboard • You can now migrate MetaBots with image play mode that use the action GetVisibility • You can now migrate bots with the GetSelectedIndex and GetSelectedText actions for the UI Automation technology used in the Object Cloning command and MetaBot screens. • You can now migrate bots which automate applications with Java technology Type using the Object Cloning command with the action GetDataofAllchildren.
<p>Bots with different variable casing</p> <p>When you migrate a bot that has passed a variable from a Task Bot to a MetaBot Logic or from a MetaBot Logic to a Task Bot and if the casing of the variable name is modified in the MetaBot Logic, the migration process updates the variable name with the same casing as that of the bot corresponding to the migrated MetaBot Logic in the parent Task Bot.</p>
<p>Migrate bots with locator image (Service Cloud case ID: 00754508, 00776192)</p> <p>You can now migrate bots that contain images that are captured using the Object Cloning command.</p>
<p>MetaBots as dependencies are not downloaded</p> <p>The migration process does not download MetaBots that are available as dependencies. This restriction is to avoid downloading MetaBots and creating multiple copies of the same MetaBots because they are already available in the Control Room repository.</p>
<p>New action in Legacy Automation package for migration (Service Cloud case ID: 00797140, 00849161)</p> <p>Use the Get keystrokes delay action to match the duration of delay defined in Enterprise 11 bots for the Insert keystrokes command and simulate the same value in Automation 360 for the Simulate keystrokes action.</p>
<p>Notification about bots with issues in Bot Scanner report</p> <p>The Bot Scanner report now flags Enterprise 11 or Enterprise 10 bots that have issues and therefore require action or review. For example, bots that have security issues or bots that refer to non-existent variables are flagged with an icon in the action or review message.</p>

Enterprise 11 and Enterprise 10 features

Improved validation of migrated bots

- Additional compile time validations are now available to validate a bot at run-time. For example, if a parent bot calls a child bot and the child bot has compilation errors, these errors are displayed when you try to run the parent bot. This ensures that an error does not occur in the middle of an automation or make it an incomplete automation.

This feature enables you to proactively identify all migrated bots that have compilation errors. Migrated bots with compilation errors are shown in **Successful with Review** section of the **Migration Report** and ensures that you can get a list of bots that require your attention.

To enable the bot validation feature, navigate to **Administration > Settings > Bots > Bot validation** and set it to **On**. See [Settings](#) on page 1728.

- The Bot Migration Wizard now displays validation error details for each bot in the bot migration results. Details about the errors help you to review and take action on the migrated bots, thereby saving time.

[Migrate Enterprise bots](#) on page 1529

Enhanced bot migration assistant

The migration assistant is now merged with the error assistant to provide a comprehensive view of all the lines in a bot that require review or action by you, or which have errors in these and therefore require you to address them. This feature helps you to quickly identify the areas of bots that require your attention.

Support for 32-bit driver to connect database (Service Cloud case ID: 00757466)

To enable migration of Enterprise 11 bots with VBScript, 32-bit drivers are now supported in Automation 360 to connect the database.

Enterprise 11 only features

Migrate bots with the following attributes:

- Bots that include images that are captured using the **Object Cloning** command, **OCR > Capture area** command, **App Integration > Capture area** command, and **Mouse click** action.
- Bots that contain an HTML email body with local image references if the referenced images are available on the Bot Runner machine (Service cloud case ID: 00780065, 00790657, 00827527, 00822092, 00928116, 01181845)
- Bots that contain Microsoft Excel commands with file extensions such as **.ods**, **.htm**, **.html**, **.mht**, **.mhtml**, **.slk**, and **.pdf** to open an Excel file (Service Cloud case ID: 00799071)
- MetaBots that use the credential variable of non-string type to pass a numeric value as an input to a DLL function

Automation Workspace

What's new
<p>Enhanced administrator capabilities Properly licensed Automation Anywhere Control Room administrators can now create valid RPA users based on authentication with username and password and select not to require live authentication via email response. This feature enables administrators to resend "Welcome" authentication emails without having to reset the credentials assigned to RPA users.</p>
<p>Microsoft Edge (Chromium) supported for Control Room and Bot Agent You can now perform Control Room operations, and install and register your Bot Agent device using the Microsoft Edge based on Chromium browser. Browser requirements for Automation Workspace on page 1154</p>
<p>Support for Azure Key Vault Automation 360 now supports Azure Key Vault, and you can now retrieve the following from the external key vault:</p> <ul style="list-style-type: none"> • Active Directory (AD), services account, and SMTP credentials • Auto-login credentials • Credentials by automations
<p>Bot Validation Bot validation check happens for new bots and when you run a bot. Control Room administrators can now turn the Bot Validation feature on or off. By default, this feature is turned off for every Control Room. Migrate Enterprise bots on page 1529</p>
<p>Credential Vault variable supported in Run function action of the DLL package As a Bot Creator, you can now use the Credential Vault variable or credential type variable for the <code>Number</code> data type and pass it as an input parameter in the DLL function. Using the Run function action on page 2419</p>
<p>File ID supported in Check permission action of Google Drive package (Service Cloud case ID: 00777716) The Check permission action of the Google Drive package now supports the File ID option to refer to files available in the <code>Shared with me</code> folder of Google Drive. By providing the File ID, you can now verify the Read, Write, or Delete access granted to you in the <code>Shared with me</code> folder of the Google Drive files. Google Drive package on page 2591</p>
<p>New Credential package You can now use the Assign action in the Credential package to assign an insecure string or a variable directly to the credential variable. Credential package on page 2361</p>

What's new
<p>Web Services security supported in SOAP Web Service package (Service Cloud case ID: 00481836)</p> <p>As a Bot Creator, you can now provide credential variables in the raw data of the SOAP Web service action. You can create a credential variable, map the credential with a reference name in the credential mapper, and use the reference name in the raw data. Because this ensures that all security-related data can be defined in the Credential Vault and the credentials can be used in bots, you can safely deploy tasks without compromising security.</p> <p>Example of using the SOAP web service action on page 3097</p>
<p>New option in SOAP Web Service package</p> <p>Use the Build Xpath option in the SOAP Web Service package to extract values from the SOAP response. You can now specify the Xpath expression or select the appropriate node from the response body and store the output in a variable.</p>
<p>Outlook server supported in Change status, Save email, and Delete actions (Service Cloud case ID: 00544534, 00557623, 00642506, 00659724, 00763565, 00680801, 00803975, 00818304, 00819362)</p> <p>In the Email package, to automate a task you can now establish a connection with the Outlook server for the Change status, Save email, and Delete actions.</p>
<p>Read email from shared mailbox in Microsoft Outlook (Service Cloud case ID: 00728579, 00831622)</p> <p>To automate email-related tasks, you can now select a shared account in Microsoft Outlook so that email messages can be read from the shared mailbox.</p>
<p>New encoding types supported in the Write to file action of Data Table package (Service Cloud case ID: 00767158)</p> <p>When you use the Write to file action to write data from a Table type variable to a CSV or TXT file, you can now use the following encoding types from the encoding list:</p> <ul style="list-style-type: none">• UTF-8: Works as UTF-8 without BOM• UTF-8 with BOM (called UTF-8 previously)• UTF-16LE• Shift-JIS (Japanese encoding)

What's new

Auto-save functionality in Bot editor

In the Bot editor, when you use actions to build an automation, when a bot is not manually saved, an auto-save is performed and the bot now automatically saves the changes for specific events.

Note: The auto-save functionality is currently available only for specific events.

Some of the events that support auto-save functionality are as follows:

- Recorder: When you create a bot with certain actions and click **Recorder**, the event is saved, and when the recording is complete, the event is automatically saved.
- Variable manager: When you create or edit a variable to insert it in an action, the changes are saved.

Note: The auto-save functionality is not supported when you delete a variable or insert it by pressing F2 to open the variable list.

- Actions menu (vertical ellipsis): When you select any action from this menu, for example **Packages**, the event is saved automatically. When you make any change to the **Packages** page and return to the Bot editor, the event is saved.
- Find a file: When you click the **Find a file** icon, the bot is saved if it is not manually saved. Also, after you click the **Add** option, the bot is automatically saved.
- Dialog boxes: When a dialog box is opened, it is automatically saved if any changes are made.

Note: Auto-save is triggered only for top-level dialog boxes and not for nested dialog boxes.

- Deleting variables: When you delete unused variables, the event is saved.
- Bot name change: If you edit the name of a bot, the event is saved.

New option in FTP / SFTP package (Service Cloud case ID: 00792346)

Use the **Credential** option when you connect with the **Secure FTP** server type to automate a task. You can now use username and password for authentication.

[Connect action](#) on page 2532

Enhancement to AISense Recorder

AISense Recorder now supports automation of applications that use Brazilian-Portuguese and a combination of Brazilian-Portuguese and English interfaces.

[AISense for recording tasks from remote applications](#) on page 2180

Support for Capture anchor in AISense Recorder

The AISense Recorder now supports the **Capture Anchor** option. When you run a bot to search for an object in an application in which the anchor changes frequently, you can use **Capture anchor** to override the default anchor and manually select an anchor to detect the object.

[Edit a task recorded using AISense](#) on page 2183

What's new

Enhanced support when selecting Object property in Recorder package

After you capture an object using the **Recorder > Capture** action, you can now select a particular object property name from the list of available properties in order to retrieve the value of the object property using the **Get property** action. The list includes suggested property names from the search criteria in the **Object Properties** table.

[Recorder package](#) on page 2798

Enhancements to Number package

- In the **Random** action of the Number package, you can now specify and limit the number of decimal digits required in the random number generated in the output.
- The existing **Save the outcome to a number variable** field is now renamed as **Save the outcome to a variable**.

[Number package](#) on page 2697

Enhancements to Wait package

Use the new **Capture region** feature in the **Wait for screen change** action of the Wait package to capture a specific region on an application by drawing a rectangle around it so that the bot automatically captures the coordinates of this region. You can perform the following actions:

- Capture a specific region on a Windows application.
- Preview the captured image in the **Preview** window.
- Recapture a region if the image in the **Preview** window is not per user requirement.

The coordinates are renamed as follows:

- **Left** is now **X**
- **Top** is now **Y**
- **Right** is now **Width**
- **Bottom** is now **Height**

[Using Wait for screen change action](#) on page 3027

Enhancement to String package

In the **Extract text** action of the String package, you can now extract a substring from a specified source string that occurs more than 1000 times in a file and up to a maximum limit of 999999.

Enhancement to File conditions in If package

You can now use the new **File extension** condition from the **Condition** list in the **If** package to check the extensions of files and then execute actions based on the results.

What's new
<p>Support for cross-domain IFrames in Google Chrome and Microsoft Edge Chromium browsers (Service Cloud case ID: 00825656)</p> <p>You can now capture and automate objects inside a cross-domain IFrame in Google Chrome and Microsoft Edge Chromium browsers by using Recorder > Capture or the Start recording option. After you capture an object inside a cross-domain IFrame, the path to the frame is stored in the FrameDOMXPath property, by default.</p> <p>The new FrameDOMXPath property identifies the path to the frame in which the object is located. You must select this property to run the bot successfully to capture objects on a cross-domain IFrame.</p> <hr/> <p>Note: This feature is available for the bots you create using the 2.4.0-20211016-070100 version of the Recorder package starting from this release.</p> <hr/> <p>Recorder package on page 2798</p>
<p>Support to automate Microsoft Edge Chromium with Internet Explorer compatibility mode (Service Cloud case ID: 00767502, 00787186)</p> <p>You can now automate web applications running on Microsoft Edge Chromium, by enabling the Internet Explorer compatibility mode, using the Universal Recorder where the objects are captured using HTML technology.</p> <p>Record a task with the Universal Recorder on page 2164</p>
<p>Global session support for loop iterator based on Excel advanced</p> <p>You can now use the Global session option when you loop through each row in an Excel advanced worksheet. Use the Global session option to share a Microsoft Excel session across multiple bots so that you can use the same Excel worksheet across these bots.</p> <p>Using the Open action for Excel advanced on page 2485</p>
<p>Enhancement to Excel advanced package (Service Cloud case ID: 00799071)</p> <p>Use the Open action of the Excel advanced package to open files with <code>.ods</code>, <code>.htm</code>, <code>.html</code>, <code>.mht</code>, <code>.mhtml</code>, <code>.slk</code>, and <code>.pdf</code> extensions.</p> <p>Excel advanced package on page 2479</p>
<p>Check out a specific version of a bot</p> <p>To edit a bot in the Control Room Automation page, when you check out a bot from the Public to a Private workspace, you can now choose a specific version of the bot along with its dependencies by using the new Advanced options.</p> <p>Check out a single bot on page 2214</p>
<p>New APIs for devices</p> <p>You can now allocate default devices by using the new APIs introduced in the <code>v1/Devices</code> section. Choose to set or not set a specific device as the default deployment device for a specified user by using the following APIs respectively:</p> <ul style="list-style-type: none">• <code>/runasusers/default</code>• <code>/runasusers/default/unset</code>

What's new
<p>Configurable API-key validity (Service Cloud case ID: 00763420)</p> <p>You can now configure the validity of the API-key using the API-Key Duration feature available in the Administration > Setting > Security Configuration in Automation 360. You can set validity minimum of 1 minute or maximum of 45 days.</p>
<p>Bot version comparison</p> <p>You can now compare various versions of the bots in your public workspace. You can use the Compare versions option to select two versions of a bot and compare them for differences, and any modifications in your work flow are highlighted for your reference. You can also view the differences in the actions, packages, triggers, and variables between the versions.</p> <p>Compare bot versions on page 2222</p>
<p>Production label support in bot development work flow</p> <p>You can now assign a Production label to a particular version of a bot. After you assign a label, you can run or export bots with a bot version of your choice. You can select the version associated with a production label to schedule, run, queue, and trigger bot development work flows.</p> <p>Assign label to a bot on page 2221</p>
<p>Access to Automation Anywhere RPA Training & Certification</p> <p>A direct link to Automation Anywhere RPA Training & Certification is now added in the Automation 360 Help Center.</p> <p>Automation Anywhere University: RPA Training and Certification (A-People login required)</p>

What's changed
<p>Bot Scanner recommendation</p> <p>The Bot Scanner now recommends to proceed with migration (with or without review or action) when 95% or more than 95% of your bots can be migrated.</p>
<p>Assign credential variable to non-credential type variables for migrated bots</p> <p>For migrated bots, Automation 360 no longer restricts you from assigning the credential variable to a non-credential type variable in an insecure (non-secure) way. So you can now successfully run migrated bots that use the Run Logic command to pass the credential variable to a non-credential type variable in an insecure manner.</p>

What's changed

Enhancement to Recorder package

The search algorithm for the Recorder package is now enhanced so that when you run a bot an object is captured only if its properties match the exact search criterion that you selected in the **Object properties** table. If the properties of the object do not match the search criterion exactly, then the bot fails with an error message. However, if the search criterion includes a wildcard character, then the bot captures the first object that matches the criterion.

For example, to capture a text box from an application that has three text boxes named **firstname1**, **firstname2**, and **firstname3**, if you select **HTML name** as the search criterion, enter the value `firstname` in the HTML name field, and run the bot, then the bot fails with an error message because a text box with the HTML name `firstname` does not exist. However, in the **HTML name** field, if you enter `firstname*`, and run the bot, then the bot captures the first text box that matches the criterion.

Previously, if there were no objects whose properties matched the search criterion exactly, instead of failing, the bot captured the first object whose properties matched the search criterion partially. For instance, in the previous example, if you selected **HTML name** as the search criterion, entered the value `firstname` in the **HTML name** field, and ran the bot, then instead of failing, the bot captured the first text box that matched the criterion partially.

Note: This enhancement is available for the bots you create using the 2.4.0-20211016-070100 version of the Recorder package starting from this release. To use this functionality in the bots created using a previous version of the package, you must recapture the objects.

What's changed

Enhancement to File package (Service Cloud case ID: 00755631, 00780237)

- In the **Copy Control Room file** action of the File package, the new **Dynamic file path** option in the **Control Room file** field now enables you to use variables in the file path to copy a file from the Control Room repository where the file path is dynamic.
- Some actions and properties in the File package are now updated, as follows:
 - The **Copy** action is now renamed **Copy Desktop file**.
 - The **Download CR file** action is now renamed **Copy Control Room file**.
 - In the **Copy Control Room file** action, the following fields are renamed:
 - The **Select a Control Room file** field is now renamed **Control Room file**.
 - The **Save CR file to location** field is now renamed **Target file path**.
 - In the **Copy Control Room file** action, the **Control Room file** field now has two new options: **Static file path** and **Dynamic file path**.

The **Static file path** option is an existing feature in the **Control Room file** field that enables you to browse the Control Room repository and select the file. When you browse the repository using **Static file path**, files with **.bot** extension are no longer displayed.

Note: The renaming of actions within the File package does not impact existing bots that use these actions.

[File package](#) on page 2513

Changes to Connect action in FTP / SFTP package (Service Cloud Case ID: 00792346)

The following changes are made to the **Connect** action:

- **SSH FTP** server type is now renamed **Secure FTP**.
- When you select the server type **FTP Secure**, the **User credentials** authentication type is now renamed **Username & Password**.

Note: From this release, if you use the Secure FTP credentials in FTP Secure, the bot will fail. Instead, we recommend you to use the **Credential** option available in **Secure FTP** to connect with the Secure FTP server.

- Change in **Connect** action: If you created bots using the **Connect** action using Automation 360 v.22 and earlier releases and you update to v.23, the bots display some of the **Connect** action settings as deprecated due to changes in the interface. However, your existing bots will continue to run successfully. For new bots, we recommend that you create them using the **Connect** action available from this release.

Support for copying one or more variables (Service Cloud case ID: 00549368, 00751052, 01260498)

You can now copy one or more variables from one bot and then paste them in another bot. Previously, the copy operation also copied the actions along with the variables.

What's changed
<p>Support for reserved characters in Distinguished Names (DN) for Active Directory Control Room (Service Cloud case ID: 01133364, 00952301)</p> <p>You can now use reserved characters, such as the comma (,), in the DN or the username of a Control Room configured for Active Directory users.</p>

The following table lists the fixes and the builds in which they were fixed. Build 11513 is the latest build and includes fixes from the previous builds.

Fixes		
Build	Service Cloud case ID	Description
11513	00797196, 00818347	<p>Updates to the Private workspace API (/v2/repository/workspaces/{workspaceType}/files/list):</p> <ul style="list-style-type: none"> • Only private workspace authorized users can list the bots from the private workspace. • Admin cannot list the private workspace bots. • Only public workspace authorized users cannot list the private bots. • One private workspace authorized user cannot list another user private workspace files.
11513	00808478, 00814198, 01260666	<p>If you are a Control Room administrator, when you change the viewing permissions of some bot folders so that they can be viewed only by specific users, the change is now correctly applied. Previously, changes made to the viewing permissions of bot folders were not applied correctly.</p>
11513		<p>When you update from Automation 360 v.22 to v.23, background jobs related to cloud license server sync-ups are no longer deleted because of incorrect license job name.</p>
11513	01753484, 01754939	<p>You can now deploy (both schedule and run) bots from the Control Room without any issue if you have the View Package permission.</p> <hr/> <p>Note: The View Package permission is required to deploy (both schedule and run) bots from the Control Room.</p> <hr/>

Fixes		
Build	Service Cloud case ID	Description
11513	--	When you install or update to Automation 360 v.23 for On-Premises deployments, the log files are now updated for all the services without any issue. Previously, the log files for a few additional services were not updated with any information or time stamp of the activities.
11486	00793800	When you migrate to this release, issues related to JRE while installing the Control Room on machines using Microsoft Hyper-V servers are now fixed. The following error no longer occurs: Unknown Failure . Please check the database login credentials and check if this machine has a network connection to the database server.
11486	00815340	User folder names given similar leading portions or naming conventions no longer display folders that share naming conventions but not the assigned or specific user permissions.
11486	00836898, 01259938	The Cloud Migration Utility now includes enhanced logic to enable you to successfully upload data even when the network is connected through a proxy server.
11486	00817173	You can now perform a Run DLL function when both the input and output parameters are set to a String value, and the Date and Time value is now passed as a String parameter successfully. Previously, the Date and Time value was converted and not displayed as expected.
11486	00754305, 00769128	The configuration tagging works properly now, based on the settings configured in the nodemanager-logging.xml file. Previously, the node manager and bot launcher logs were purged either after two days or if the log count was increased by specific amounts due to tagging issues with tags such as the following: "IfLastModified age" and "DirectWriteRolloverStrategy"
11486		When you decide to select or deselect all the bots and dependencies, you can now select or clear the Select All check box without any issues. Previously, after selecting the Select All check box, when you cleared the check box, it did not work as expected, and you had to deselect the bots and dependencies individually.

Fixes		
Build	Service Cloud case ID	Description
11486	00798037, 00814184	The Manage and Administration labels in the navigation pane are now updated to ensure that roles and permissions are distinct in the following languages: Simplified Chinese, Traditional Chinese, Japanese, and Korean.
11486	01218053	You can now import parent and child bots with dependencies even if you do not have permissions to all folders. Previously, if a user with no folder permissions imported parent and child bots with dependencies, the dependency between them was lost.
11486	01046249	When you migrate from Enterprise 11 to Automation 360, duplicate entries are no longer created for any of the existing commands.
11486	--	You can now migrate an Enterprise 11 bot that uses the Run Task command successfully even if the Upon error, continue with next repeat option is not selected. Previously, the parent bot stopped running if the child bot encountered an error. Now, when this option is not selected, an error handler ensures migration is successful even if the child bot encounters an error.
11486	--	If you used the Go to cell action from the Excel advanced package in an Enterprise 11 bot, the setting is now retained when you migrate it to Automation 360.
11486	00779016	You can now use the XML package to open any <code>xml</code> files without any issue after migrating to Automation 360.
11486	00794202	You can now migrate Enterprise 11 bots with If command to Automation 360 without any issues.
11486	00790245	You can now use the SOAP Web Service action of the SOAP Web Service package without any issues after migrating to Automation 360.
11486	00795518, 00832462	If you used the Delete cells action from the Excel advanced package in an Enterprise 11 bot, correct cell addresses are now displayed when you migrate it to Automation 360.

Fixes		
Build	Service Cloud case ID	Description
11486	00808601	Migrated bots that include Extract and Substring actions of the String Operation no longer encounter an error if the input string is empty.
11486	00807945, 01258127	When you migrate Enterprise 11 bots using the Error Handling command, an error no longer occurs if the file path value in the variable is missing the file extension from the Snapshot and the Log to file . After migration, the Snapshot file now saves files with .png extension and Log to file with .txt extension.
11486	00777395, 00807705, 00814087	The migration process now adds the Window > Set title action for all the Elself-window exists conditions. This setting enables you to make the window title dynamic, eliminating the need for you to recapture the window title when it changes.
11486	00820094, 01019195	After you migrate to Automation 360 from Enterprise 11 or Enterprise 10, the Error Handler snapshot error is now logged to the Snapshot image path. If the snapshot image path is provided as a variable, then the snapshot error is logged to the default application path.
11486	00810389	You can now migrate bots with variables whose names start with or contain <code>arrayRows</code> . You no longer encounter a stack overflow error and the bots are successfully migrated.
11486	00795347	The DLL Run action now successfully copies your data from one Excel sheet to another even if the .Net DLL uses the OLE mechanism (for example, clipboard) to copy data. Previously, when data was copied from one Excel sheet to another, a threading-related exception occurred.
11486	00787562	After migration to Automation 360, an Enterprise 11 large bot (with 2000 or more commands) no longer encounters the <code>Code too Large for try statement preprocessing</code> error when the bot is used in Automation 360. However, if the migrated bot includes a Loop or Trigger Loop command with Continue or Break as a child command, a preprocessing error might still occur when the bot is run.

Fixes		
Build	Service Cloud case ID	Description
11486	00782594, 00786968	When you migrate to Automation 360, an Enterprise 11 bot with large array sizes no longer encounters Java heap errors. If the total size of the arrays in one bot exceeds the threshold value of the array size, then the arrays variables are migrated as is till it breaches the threshold value. However, the remaining array variables are migrated as table variables with no default value using the Database > table action.
11486	00792346	If your Enterprise 11 bot was configured with Secure FTP without Key File Authentication , the migration process now appropriately configures the bot with the Secure FTP server type in Automation 360. Previously, the migration process incorrectly configured the bot with the FTP secure server type.
11486	--	Users with the AAE_Bot Migration Admin role no longer encounter an issue when they migrate bots using the Bot Migration Wizard.
11486	--	The Bot Migration Wizard now displays the correct number of MetaBots on the Select bots to migrate screen.
11486	--	Enterprise 11 bots that are migrated no longer encounter an error when a variable that is mapped between the parent bot and a child bot is not available in either of the bots.
11486	00729719, 00959356	You can now add or update SAP automation using the Capture action of the Recorder package when the SAP scripting is disabled in the Enterprise 11 bot.
11486	00639940, 00770561	If the migration process fails, the All migration screen now shows the status as unsuccessful . Previously, when the migration process failed because of invalid device credentials, the screen showed that the migration process is in progress but the Audit log displayed the correct status.
11486	00840456	The migration process no longer encounters an error when you migrate a MetaBot that contains a logic that has an extra space character at the end of its name.
11486	00786646, 00808600, 00822029	Migrated bot no longer encounter an error when they contain commands that perform an action on a pop-up window of a browser.

Fixes		
Build	Service Cloud case ID	Description
11486	00777467	Migrated bots no longer encounter an error when they are checked out in Automation 360 and they contain an invalid expression that is added by the migration process.
11486	00786002	You can now delete <code>.atmx</code> and <code>.mbot</code> files from the Control Room if you have all the required permissions.
11486	00796725	The Bot Scanner no longer encounters an error when it scans a bot in which the window title is specified using a variable within brackets.
11486	00790861, 00836849	Migrated Enterprise 11 or Enterprise 10 bots no longer encounter an error when they use the Run Logic command to run a MetaBot logic and the location of the logic is specified up to the folder that contains that logic. For example, consider that you have a MetaBot named <code>Finance1</code> and you want to run <code>Logic1</code> that is available in the MetaBot at the <code>Metabots\Logics\Finance</code> location. Previously if you specified only <code>Metabots\Logics\Finance</code> instead of the complete path (<code>Metabots\Logics\Finance\Logic1</code>) of the logic, an error occurred.
11486	00804550	You can now import bots from an Enterprise 11 production environment to an Automation 360 development environment even if these bots include the user ID of the user who had checked out the bot in Enterprise 11.
11486	--	When you search for bots with the following characters, the bots are now displayed in the search results: <code>r\${@1&#klu%}({,!'~`\$^&()_ - += []</code>
11486	00729393	After you migrate from Enterprise 11 to this release, you can now view the bot subfolders in your Control Room Public workspace on the Automation page.
11486	--	After you migrate from Enterprise 11 to this release, you can now check in bots to the Control Room Public workspace from a folder for which you have the Check in permission using the Repository Manager API. The API response code no longer shows the following: <code>"upload": false.</code>

Fixes		
Build	Service Cloud case ID	Description
11486	01032367, 01066099	An issue with the bot deployment progress window is now fixed. Previously, even after the bot completed the run, the window was displayed for a long time (for example, for more than 10 seconds in some cases).
11486	00826923, 01081380, 01259907	After you migrate from Enterprise 11 to this release, you can now add work items to queues using the Workload API through AWS Lambda. A StackOverflow error no longer occurs in the Control Room logs.
11486	00801810	When you update Automation 360 On-Premises to this release, Bot Agent devices now remain in connected state. WebSocket errors are no longer generated in the C:\ProgramData\AutomationAnywhere\BotRunner\Logs\node_manager.log file. Previously, when you updated from Automation 360 v.19 (Build 8147) to Automation 360 v.21 (Build 9664), some issues were reported where the Bot Agent devices remained in disconnected state and WebSocket errors were generated even without any proxy configuration changes.
11486	00831028, 00830336, 00827031, 00832413, 00833089, 00833436, 00832850, 00839997, 00849904, 00857296, 00831062, 00833436, 01140913, 01145306, 01252819, 01127960, 01256324, 01257414, 01258281, 01263606	When you update your Control Room that is configured with Active Directory to this release, you can now use the log in with Windows option and the following error no longer occurs: <code>java.lang.NoSuchMethodError</code> .

Fixes		
Build	Service Cloud case ID	Description
11486	00719407	For On-Premises deployments, when you configure multiple IP addresses for Control Room nodes in a cluster, the primary IP address is now automatically configured. You no longer have to manually configure the primary IP addresses in the <code>cluster.properties</code> file.
11486		<p>When you are installing the Bot Agent, if you run out of disk space and click OK on the Out of disk space window, the wizard returns you to the previous Setup type window so that you can cancel the Bot Agent installation.</p> <p>Previously, when you clicked OK on the Out of disk space window, the wizard displayed multiple windows.</p>
11486	--	When the Bot Agent is updated automatically from a previous release to this release, you can perform various operations simultaneously, such as running bots, configuring device settings in the Control Room, and updating the Control Room. You no longer have to restart the Bot Agent service from the Task Manager.
11486	00781135	After you install the Bot Agent on a user device, when you restart the Bot Agent, the global cache folder (<code>C:\ProgramData\AutomationAnywhere\GlobalCache\</code>) is no longer deleted.
11486	00709309, 00766163	You can now upgrade the Control Room installed on Linux to this release and the Elasticsearch service now starts successfully. Previously, the upgrade failed because the service did not start and the following message was displayed: <code>Elasticsearch service fail to start during certificate retrieval process.</code>
11486	00742074	License allocation for users configured to use multi-user devices is now honored for concurrent bot deployments on unattended Bot Runners.
11486	00822176	On multi-user devices, you can now create an RDP session that uses a custom port. Previously, if you configured a multi-user device to use a custom port for RDP-based deployments, the deployments failed.

Fixes		
Build	Service Cloud case ID	Description
11486	00806583, 00805381	When you perform RDP-based deployments on a device, FreeRDP no longer fails when connecting to a Windows server for per-device RDS licensing.
11486	--	If you deploy bots using event triggers and install the Bot Agent on a device as a non-admin user for yourself or a local admin user, the Bot Agent is now updated automatically. The device is no longer shown as disconnected in the Control Room.
11486	00803434	Issues with the change in Jetty HTTP client behavior on load balancers with custom rule for host headers to route a request are now resolved. Device registration now does not fail and the port numbers are added to the host when default ports are used.
11486	00815334	Performance issues related to logging in to the Control Room and editing and running bots in the Cloud Control Room are now fixed.
11486	00543141, 00674098, 00714238, 00744991, 00750325	With Splunk integration and enhancements to syslog, you can now forward audit logs to remote Splunk servers and view audit logs on Splunk dashboards.
11486	00776569	When a bot you run encounters an error, an appropriate preprocessing or runtime error message is now shown. Previously, a preprocessing or runtime error message was shown even if the bot did not contain an error or if the bot was empty.
11486	00781638, 00805371, 00804784	Issues with a checked-out bot and its clone are now resolved. When one user checks out a bot, makes changes to it, and checks in the bot, the clone of the bot in another user's Private workspace is now updated with the changes.
11486	00784252	If you do not have Control Room admin privileges and you check in bots to the Cloud Control Room Public workspace in subfolders, the bot folders no longer take time to load in the Control Room.

Fixes		
Build	Service Cloud case ID	Description
11486	00786716, 00801631, 01189873	An error no longer occurs when you use the Download action in the Browser package to download a file from a web URL. Previously, if a web URL had a backslash at the end or space characters at the beginning or end, the bot failed to download the file.
11486	00783197, 00818698, 00820666	When you use the Assign action of the Number package to assign decimals to an existing number variable, an error no longer occurs irrespective of the device locale settings on the machine.
11486	00778496	You can now successfully import the bot archive into the public workspace even if the archive creates a folder named System in the Bots folder.
11486	00774026	You no longer encounter an issue when you use the CSV/TXT > Open action and the Task Bot > Run action to search for a file or a bot with a name that contains Japanese characters.
11486	00761035, 00786113	You can now use the Recorder > Capture action to capture an object on a window that has a tree view and also retrieve the Item name property of that object by using the Get property action. Previously, when you ran a bot, the recorder captured the object on the window successfully but failed to retrieve the item name of that object in the output.
11486	00763925	An error no longer occurs when you use the Split action of the String package to split a source string that has any combination of Unicode characters.
11486	00767074	In Internet Explorer, when you use the Browser > Open action to open a new window or tab, the new window or tab is now displayed in front of the other, non-admin open windows.
11486	00819664	You can now create bots using the SOAP Web Service action. XML calls no longer return corrupted data when the SOAP response has an XML document as an inner element.

Fixes		
Build	Service Cloud case ID	Description
11486	00748494, 00829735, 01018622	You no longer encounter any issues when you deploy a bot containing email triggers. Now, each time an email message is sent, the bot is triggered and runs successfully. Previously, the email trigger worked only for the first time an email message was sent, and for subsequent email messages, the bot was not triggered and did not run.
11486	--	The Task bots runs metric on the Home dashboard page of the Control Room now displays the correct count. Previously, the Task bots runs metric displayed the count as zero even if you have run bots from the same Control Room.
11486	00824309	In the Run stored procedure action of the Database package, when you click Add parameter to provide an input or output parameter, the label for the parameter type field now displays as Parameter type . Previously, the label for the parameter type field was not displayed correctly.
11486	00810212	When you use the Run action of the Task Bot package and select the Multiple variables option in the Save outcome to a variable field, the variable name is now displayed in the correct case. Previously, the variable name was displayed in lowercase even if the variable name was created using uppercase.
11486	00796913, 00836389	You can now use the Move all action from the Email package to move multiple email messages from Inbox to another folder. Previously, the Move all action was not able to process a large number of email messages because disk storage ran out of space.
11486	00798673, 00815700	An error no longer occurs when you use the Database Connect action, enter the connection string that uses Windows authentication, and run the Run stored procedure action that has an input parameter value of more than 36 characters. Previously, an error was displayed when the length of the input parameter value exceeded 36 characters.

Fixes		
Build	Service Cloud case ID	Description
11486	00799450	When an excel spreadsheet is opened in the SAP editor and simultaneously you use Open action of the Excel advanced package to open an excel file, any error no longer occurs when the bot is run and the Excel file is opened successfully. Previously, an Excel file opened in the SAP editor was considered the default window and therefore when you ran the bot, an error was displayed stating that the Excel file could not be opened.
11486	00794102	In the REST Web Service package, the description below the Assign the output to a variable field is now translated correctly for the following languages. <ul style="list-style-type: none"> • Japanese • French • Italian • Portuguese (Brazil) • Simplified Chinese <p>Previously, the description was not correctly translated for these languages.</p>
11486	00788920, 00796452	In the Email package, when you use Connect action to connect to the Outlook or IMAP server, you can now successfully download the email attachment in .eml file format. Previously, if you had email attachments in .xlsx and .eml file formats, only .xlsx files were downloaded.
11486	--	If you create a Dictionary variable with the Any subtype and select Datetime as the default value, when you click the time icon, you can now see the time values displayed in the drop-down list. Previously, when you clicked the time icon to select the time from the drop-down list, the values were not displayed.
11486	00746630	You can now create a new task using Excel advanced with Loop and you select the For each row in worksheet (Office 365 Excel) option from the Iterator list, create a Record type variable, and run the bot. An error no longer occurs when you edit the same bot and select the For each row in worksheet (Excel basic or Excel advanced) option from the Iterator list. Previously, a preprocessing error was displayed on bot execution.

Fixes		
Build	Service Cloud case ID	Description
11486	00762978	If you use the Windows > Close action and select Currently active as the window title to close active windows, when you run the bot, the Shut Down Windows pop-up is no longer activated even if there are no active windows on the machine.
11486	00805654	The Split action of the String package now allows you to select the Any variable type to hold the output values. Previously, you could select only the list variable.
11486	00761189, 00764563, 00785751, 00794273, 00835194	Performance issues related to the Run macro action in the Excel advanced package are now fixed.
11486	00796120	When you use the Data table > Sort action to sort a column, if the column does not contain any value, the bot now runs as expected and does not get stuck. Previously, you had to stop the bot manually.
11486	00830011	In the Excel advanced package, when you perform the Go to next empty cell action on an Excel sheet, the system no longer runs out of memory.
11486	00765210, 00790641	An error no longer occurs when you use the Excel advanced > Open action to open an Excel file that contains a pivot table.
11486	00776021	When you use the Open action of the Excel advanced package to open an Excel workbook, even if the workbook has invalid links, the bots now run as expected.
11486	00692220, 00785965, 00798035	Performance issues related to the Write from data table action of the Excel advanced package are now fixed, and the action now performs better on Excel sheets with large amounts of data.

Fixes		
Build	Service Cloud case ID	Description
11486	00808137	<p>The format of Start date and End date under the Date condition is now updated to MM/dd/YY for the following actions of the File and Folder packages, where dd now correctly shows the date:</p> <ul style="list-style-type: none"> • File package <ul style="list-style-type: none"> • Copy Desktop files action • Delete action • Print action • Print multiple files action • Rename action • Folder package <ul style="list-style-type: none"> • Copy action • Delete action • Rename action <p>Previously, the format of Start date and End date was MM/DD/YY, where DD gave the day count of the year instead of date.</p>
11486	--	<p>When you run a bot with the following sequence of actions, the file is now successfully deleted at the end of the sequence:</p> <ol style="list-style-type: none"> 1. CSV/TXT > Open action to open a .csv file 2. A loop action within another loop action to retrieve values from the .csv file 3. CSV/TXT > Close action to close the file Here, all the actions are using the same, default session. 4. File > Delete action to delete the file <p>Previously, the file was not deleted because the bot failed to close the default session.</p>

Fixes		
Build	Service Cloud case ID	Description
11486	01164436, 01209626, 00975390, 01080879, 01254846, 01256132, 01255004, 01263774,01253240	An error no longer occurs when you use the 2.4.0-20211118-080716 version of the Recorder package to capture a control using HTML technology in the Google Chrome or Microsoft Edge Chromium browser and run the bot. Previously, when you used the 2.3.0-20210806-215200 version of the Recorder package, the bot failed with the following error message:Unable to find control. Search Criteria did not match
11486	00818990	The capture anchor option in the Recorder package is now supported for the Citrix XenApp application. You can now select an anchor to search for an object in a user interface during bot run and execute actions based on it.
11486	00782962	An error no longer occurs when you loop through multiple Excel sheets and use keystrokes inside the loop to copy and paste the retrieved values into another Excel sheet. Previously, when you opened and closed multiple Excel sheets within a loop, the bot did not identify the correct Excel sheet for performing the keystroke action.
11486	--	You can now use the String > Import string from text file action to read values from a text file when a bot runs if the text file encoding was set to any of the following encodings: <ul style="list-style-type: none"> • UTF-16BE • UTF-8 • ANSI • Window-1251 • UTF-16LE • Shift-JIS
11486	--	When you update the Control Room on Linux from any earlier version to Automation 360 v.21, the Control Room now displays the updated interface. Previously, when you updated to Automation 360 v.21, the Control Room continued to display the old interface from the previous version.

Fixes		
Build	Service Cloud case ID	Description
11486	00816941	You can now run bots with a queue based on the sorting order that was selected for the work item column in the work item template. Previously, the bots were deployed based on the sequence in which work items were inserted into the queue.
11486	00804330, 00822092	After a bot is deployed on a user device, the Run History page (Manage > Scheduled) now shows the correct details about the run history of the bot.
11486	--	When you pause and resume a workload automation after using the run bot with queue in the Control Room, the audit entries are now captured on the Audit logs page.
11486	00803717	In the Control Room Historical activity page, the Modified by column now shows the name of the user (Bot Creator or Bot Runner) who scheduled a bot on a user device. Previously, the column displayed the username of the latest bot user.
11486	--	When you deploy workload bots from the Control Room, you can now run workload automation with elevated privileges by using the Run as administrator option.
11486	00780635, 00791587, 00795559, 00795632, 00797130, 00797113, 00791783, 00765770, 00826805, 01859661	When you update from a previous release, schedules no longer disappear from a Control Room configured on a single-node or multi-node environment. Also, previously deactivated schedules no longer disappear and become reactivated automatically after the update.
11486	00974353	You can now deploy workload bots on Bot Runner devices because the bots associated with a queue cannot be deleted. Previously, user had permission to delete the workload bots while running with queue.
11486	00830546, 01181402	When work items are inserted for workload automations, an Apache Ignite StackOverflow error no longer occurs, and the Control Room server no longer stops running.

Fixes		
Build	Service Cloud case ID	Description
11486	01021889	When you schedule or deploy a bot from the Control Room, if a bot fails to run, an email notification is now sent. Previously, even if the Control Room administrator enabled the A Task Bot stops running because it is unsuccessful setting in the Control Room, an email notification was not sent.
11486	00949288	Scheduled bots are no longer stuck in the pending execution status intermittently on the Activity page, and subsequent bots scheduled for execution are not stuck in queue.
11486	01253045, 01256337	Each scheduled bot is now deployed on Bot Runner device one time in a day. Previously, some scheduled bots were deployed twice on Bot Runner device.
11486	00750399	You can now capture objects from Microsoft Internet Explorer running as XenApp on a Citrix Server that has multiple Citrix applications installed.

The following table lists the limitations identified in the current release:

Limitations in this release
<p>In Enterprise 11, if bots were using windows variable where the window title value did not use the exact case as that of the application window title, after migration, the bots will fail to execute.</p> <p>Workaround: You can migrate to Automation 360 v.26 release where this issue is fixed or ensure that you change the case of the window titles in windows variables to match the case of the window titles and then migrate the bots.</p>
<p>When you migrate a bot that was using the Manage Window Controls action, the last digit of the height value is not available after migration. However, the bot will execute successfully. (Service Cloud Case ID: 01756996)</p>
<p>When an Excel session is active in SAP, a corresponding Excel process starts in the background. In such a scenario, Automation 360 uses the same Excel process that SAP started. When you run a bot to automate spreadsheet data, Automation 360 processes the first request successfully. However, during execution, if the Excel is closed and a subsequent request is sent for automating the spreadsheet data, Automation 360 does not process the request because the Excel process is still being accessed by SAP. Therefore, the correct window is not activated for automating the spreadsheet data. (Service Cloud Case ID: 00815159)</p>
<p>When you run the bot, the Task bots run metric on the Home dashboard page of the Control Room does not display the correct count. For example, the task bot run count shows 39 on the Home dashboard page, but when you run the bot, the count is displayed as 42 instead of 40.</p>

Limitations in this release
(Service Cloud case ID: 01753337) In the "In progress" table, the column sort function cannot be used to list items in ascending or descending order.
After migration, when you run a parent-child bot that share a session and use different DLL package versions, the bot fails with a run-time error message.
<ul style="list-style-type: none"> • Nested IFrames are not supported in Google Chrome and Microsoft Edge Chromium browsers. • After performing an action in an application or page, if a frame is added during run time to the application or page, and the frame is populated and page is not refreshed or reloaded, elements in the application frame or page cannot be captured or played until you manually refresh that page.
<p>(Service Cloud case ID: 00988580, 01200161) After you migrate from Enterprise 11 to Automation 360, you might not be able to Check out some bots and dependencies to the Control Room Public workspace.</p> <p>Workaround: Check out the parent bots to the Control Room Public workspace. The dependencies are then automatically cloned.</p> <p>For more information, see Cannot Check Out With Child Dependencies Due To No Versions (A-People login required).</p>
<p>If you are directly updating from Automation 360 On-Premises v.20 or v.21 to this release, you might face issues updating your Bot Agent on some Bot Runner machines in the following scenarios:</p> <ul style="list-style-type: none"> • After a Control Room update, the device status keeps changing and the Bot Agent fails to update automatically. • If the <code>embedded_resources</code> file is missing, the Recorder does not recognize the user interface elements or does not capture a single object in the Google Chrome browser. <p>Workaround: Before updating to this release, remove the following Bot Agent files and folders:</p> <ul style="list-style-type: none"> • <code>C:\Windows\System32\config\systemprofile\AppData\Local\AutomationAnywhere\AA-DB.mv.db</code> • <code>C:\ProgramData\AutomationAnywhere\GlobalCache\embedded-resources</code> <p>For more information, see Bot agent auto update fails post the Control Room Upgrade with 'device.connection.lost' (A-People login required) The recorder is not able to recognize the GUI elements in Google Chrome browser (A-People login required)</p>
In some cases, if you Check in a bot to the Control Room Public workspace after filtering any dependency, when you export the bot, all the dependencies are displayed instead of the filtered data.
<p>(Service Cloud case ID: 00773700) The migration process fails to migrate bots that contain more than 96 conditions in a single If command.</p> <p>Workaround: Split the If command into two If commands in Enterprise 11 and then migrate the updated bot.</p>

Limitations in this release

If you create a bot that has invalid JSON tags with an Error Handling action (Try/Catch) in it, and if the **Bot validation service** is enabled (ON) in the **Settings > Bots** page, when you run the bot, the bot fails because of a preprocessing error.

Workaround: In the Bot editor, open the bot that displays the error. Select and click any line of code, edit it, and save it. For example, if you have created a bot using the **Comment** action, select and click the **Comment** action, edit it by entering a space in the comment box, and then click **Save**. When you run the bot now, it no longer displays a preprocessing error.

In SOAP Web Service, selecting the **Raw data** parameter and using the **Build Xpath** option to extract values from SOAP response to store the XML output in a variable does not work.

Workaround: Enter the Xpath expression manually instead of using the **Build Xpath** option in the selected response.

When you try to establish a secure SQL connection in the Linux environment by choosing the **Enable** option in the **Database Configuration > Secure Connection** field, the Linux installer fails to import the SSL certificate, and the connection fails.

Workaround: Select the **Disable** option in the **Database Configuration > Secure Connection** field. The Linux installer successfully establishes a secure SQL database connection.

In Linux environment, the file upload functionality of Automation Co-Pilot on the web fails with an access denied error. This error occurs because the `filestorage` directory is not automatically created to store the files.

Workaround: Create the filestorage directory in the Automation 360 repository path and assign the appropriate permissions as outlined in the following steps:

1. Navigate to the Automation 360 repository path: `/opt/automationanywhere/automation360/appdata/Server Files`
2. Enter the following commands in the Linux console:
 - a) `sudo mkdir storageservice`
 - b) `sudo chown -R crkernel:controlroom storageservice`
 - c) `sudo chmod -R 775 storageservice`

When you upgrade the Control Room from the previous version, the **Task bots runs** metric on the **Home** dashboard page does not display the historical count of tasks bot that ran in the earlier version. It shows only the count of task bot runs from the upgraded Control Room.

Limitations in this release
<p>When you use the Recorder to capture objects on applications running on Microsoft Edge Chromium with Internet Explorer mode, use Recorder conditions in the bot to check whether the element exists in the application, try to capture UI elements in the application based on the result of the condition, and run the bot, then the bot always goes to the next action because the Recorder condition is unable to locate the UI element in the application.</p> <p>Workaround: Use the Image Recognition condition instead to locate a UI element in an application.</p>
<p>Copying Form variables across bots by using the Copy to shared clipboard option is not supported.</p>

The following table lists limitations from previous releases that are also applicable to this release:

Limitations from previous releases
<p>If you configure an external key vault in External Key Vault Integration and select the SQL authentication mode for database authentication in the Windows installer Database Server page to install Control Room (On-Premises), the installation fails, and following error message is shown: <code>Control Room database tables fail to create</code>.</p> <p>Workaround: Add the database credentials in the external key vault and use those credentials for database configuration.</p>
<p>Newly created Control Room users on Windows for On-Premises Google Cloud Platform VMs cannot change their password. The security questions option is not available on the Change password screen and as a result the Control Room displays an error when they try to save the password.</p> <p>Workaround: Refresh the page and change the password again.</p>
<p>(Service Cloud case ID: 00837271) If you are migrating from Enterprise 11 with a database that has a large amount of repository data, the installation might fail. This issue occurs because Liquibase update for a few SQL queries is not completed during migration.</p> <p>Workaround: Contact Automation Anywhere Support.</p>

Security fixes	
Service Cloud case ID	Description
00836486, 00942844, 01264029	Disabled the module for caching that was using credential authentication.

Automation Co-Pilot (Automation Co-Pilot for Business Users)

What's new
<p>New query filter in Query Requests and Query Tasks actions</p> <p>Use the new filter now available in the Query Requests and Query Tasks actions of the AARI Web package to filter query requests and tasks by team name in the Automation Co-Pilot web interface.</p>
<p>Team name filter</p> <p>You can filter your tasks and requests by team name in the Task and Request pages in the web interface, respectively. Select the Team label from the filter and search by team name to view the teams assigned to a task or request.</p> <p>Filter and search for a request on page 3271 Filter and search for a task on page 3273</p>
<p>Support for audit logs (Service Cloud case ID: 00801166)</p> <p>You can now view the audit logs and refer to events relating to requests, teams, scheduler, process setups, bot setups, human tasks, and bot tasks that you have created, deleted, updated, submitted, or recovered.</p> <p>Audit log on page 2068</p>
<p>Enhancement to user task assignment in Human Task</p> <p>In the process editor, the Auto-assign this task option in Human Task provides the following alternatives:</p> <ul style="list-style-type: none">• The user who created the request: The task is automatically assigned to the user creating the request in the web interface.• The user who opens this task: The task is automatically assigned to the user who opens the task in the web interface. <p>This feature helps to reduce conflicts in assigning a task to oneself, particularly in case of specialized users such as Validator for whom the action of opening a task is equivalent to assigning the task to oneself.</p>

What's new

Enhancement to team setup

You can now simultaneously add multiple users with similar roles (custom role) to the Automation Co-Pilot team in the web interface. The custom role in the Control Room is now aligned with a team in the Automation Co-Pilot web interface, and the enhanced team setup works as follows:

- The users added with the role are assigned a **Member** role in the team. The role cannot be changed to **Owner** or **Admin**.
- You cannot view these users in the **Users** tab of the **Team** page.
- If a user is both part of a role and added manually to the team, their role in the team will be the same as the role assigned to them manually. For example, if a user is a member, they will continue to have the **Member** role whereas if the user is an owner, they will be assigned the **Owner** role in the team.
- If the user is no longer part of a role, the user will also not be a part of the team.

Also, the **Team** page is now enhanced with navigation options at the top so that you can navigate through the various tabs (**General**, **Users**, **Roles**, **Processes**, and **Bots**). Use the **General**, **Users**, and **Roles** tabs to create teams and add users to them. The **Processes** and **Bots** tabs display the processes and bots assigned to teams, respectively.

[Team management](#) on page 3258 | [Create a team and assign roles to team members](#) on page 3267

Bot setup support

The Automation Co-Pilot Admin can use the **Bot Setup** page to view the bots that are assigned to a team, assign teams to a bot, and edit bots to remove or reassign teams. Attended Bot Runners who can view all the bots that are checked in to the **Public** workspace can now view the bots that are assigned to teams in Automation Co-Pilot Desktop Assistant.

[Bot setup for Bot Runner users](#) on page 3270

Enhancement to the form logo

You can now use the **Logos in footer** field to select up to two separate logos that are displayed in the footer of the form during bot runtime.

What's new

Add rules to various form elements

When you are creating or editing a form in the form builder, you can now add rules to the following form elements by using the **Form rules** tab:

- **Checkbox**
- **Date**
- **Document**
- **Dropdown**
- **Label**
- **Number**
- **Password**
- **Radio Button**
- **Rich Text Editor**
- **Text Area**
- **Text Box**
- **Time**

For the **Checkbox** and **Radio Button** elements, the rules are triggered only if the corresponding presets are selected. For example, if a form has two mutually exclusive options, such as **Yes** and **No**, the rules associated with these options are triggered only when you select one of the two options.

[Add rules to form elements](#) on page 3229

What's new

Updates to triggers

The following triggers are now available to run a bot:

- **Process trigger:** Starts a bot when the status of the specified process in Microsoft Windows meets one of the following preset conditions:

- **Starts**
- **Stops**

[Add a process trigger](#) on page 3242

- **Service trigger:** Starts a bot when the status of the specified service in Microsoft Windows meets one of the following preset conditions:

- **Starts**
- **Stops**
- **Resumes**
- **Pauses**
- **Is running**
- **Has stopped**
- **Is paused**

[Add a service trigger](#) on page 3243

- **Window trigger:** Starts a bot when the specified application window meets one of the following preset conditions:

- **Opens**
- **Closes**

[Add a window trigger](#) on page 3243

What's changed

Enhancement to Create a Request package

In the **Create a Request** package, you can now browse and choose the public process for which you want to create a request. With this enhancement, you can choose the public process without having to contact the Automation Co-Pilot admin for the URI of the public process and enter the URI manually. This feature also simplifies mapping process inputs for initial form fields.

[Process Composer package](#) on page 2777

Fixes

Service Cloud case ID	Description
00800192	You can now use an email trigger to start a bot without any issues, even when the email server is POP3.
00801428	You can now add an email trigger to a Gmail account to start a bot for new email messages.

Fixes	
Service Cloud case ID	Description
00736309, 00765069, 00784362	For documents that are in the .csv, .xlsx, or .xls format, you can now use a file trigger to start a bot when a document is modified.
00796697	When you check in a bot, the associated private event trigger is now retained.
00802427	With the Bot Creator license, you can now view all the requests and tasks regardless of your role or other licenses assigned to you.
00829282	When you create a request in the web interface, your bot now runs properly and does not encounter any processing issues, such as an idle status that prevents progress on your bot.
--	When more than four text box elements of a form are populated in a process, the document is now displayed correctly on the document viewer irrespective of the state of the text box elements. Previously, the document was not displayed.
--	When you delete a request from the Request tab and it is sent to the recycle bin, the related task from the Task tab is now removed.
--	When you use the Date and Boolean type If/Else conditions, there is now parity in validating conditions between a bot and a process. Also, the String type If/Else condition now allows the target values to be empty. Previously, validation for Date and Boolean type conditions were not supported when used in a process and the target values could not be empty.
--	Issues with the Hyperlink element in the Human Task are now fixed. The Hyperlink element now works correctly with the following behaviors: <ul style="list-style-type: none"> • If the hyperlink URL is empty, either at design time or when passed from the process, the hyperlink is now unavailable. Previously, the hyperlink was set to the Control Room domain. • If the Hyperlink element is used in a Human Task that is read-only, data is now passed from the process editor to the form. Previously, the data from the process editor was ignored.
--	For Time element in forms, when the Use the local time when form is first displayed and Make field required options are selected, the time element now treats the system time as the default value and can be modified in the initial form.

The following table lists the limitations identified in the current release:

Limitations in this release
The web interface lacks the Set Warning action and the Set Error action for the Checkbox, Dropdown, Radio Button, and Rich Text Editor elements.
For the Date and Time elements, when the date and time are included in a rule, changes made to the rule format are not reflected in the rules section. As a result, when you try to process a rule that contains that date and time, bot execution fails. Workaround: Open the rules editor, expand the corresponding rules, and select a respective data value from the calendar before saving. Do not change the format after the date and time element are included as part of any rule. You can also delete older date and time elements.
When you use the Select File element in your forms and select the Make field uneditable option, the element can still be edited.
When you run a bot using the Team Members command from the AARI Web package, you will be prompted with an exception error.
In Automation Co-Pilot on the web interface, if you create a variable by using the Form type in a bot, you cannot copy that variable to another bot even when you select the Keep or Overwrite option.
When a user is a member of a team by role (the user was added to a role in the Control Room then the role was synced to the team), the user will not be able to view updated information on the user interface of the request or task details. This is due to the Request page not automatically refreshing. Workaround: Refresh the Request page to view the updated request or task details.

The following table lists limitations from previous releases that are also applicable to this release:

Limitations from previous releases
In an SDS setup, when you create a request to upload a file, the upload fails and a <code>SecurityTokenInvalidException</code> error message is displayed.

Discovery Bot

What's new
<p>Install Bot Agent seamlessly</p> <p>If you have not already installed the Bot Agent, you are now prompted to install the Bot Agent from the Processes tab. Follow the screen instructions to install the Bot Agent. After the installation, you are prompted to enable a Chrome plug-in in order to proceed with your recording tasks.</p> <p>Prerequisites for Discovery Bot on page 3695</p>

What's new	
<p>Enhancement to auto-generated opportunities</p> <p>You can now begin reviewing an auto-generated opportunity from the Opportunities tab when at least one process recording is submitted for review. Review the auto-generated opportunity and choose to create a custom opportunity from an auto-generated opportunity, as required.</p> <p>Review opportunities, convert to bot, and generate PDD on page 3715</p>	
<p>New recordings for review for custom opportunity</p> <p>You can now review new recordings submitted by a Discovery Bot user for a custom opportunity. You can choose to accept or dismiss the recording updates as part of the custom opportunity work flow. This option allows you to quickly and easily review new recordings in real time as the recordings are submitted by the user for that process.</p> <p>Review opportunities, convert to bot, and generate PDD on page 3715</p>	
<p>Enhancements to Opportunities page</p> <p>The opportunities page is now updated to include an opportunities evolution map, along with other graphs, to help you review and analyze data for a potential opportunity for automation. Use the opportunities evolution map to help guide you on which opportunities to automate first.</p> <p>Analyzing opportunities for automation on page 3714</p>	
<p>Download PDD document from the Recordings page</p> <p>You can now download and export a PDD document from the Recordings page. After you submit a recording for an analyst to review, the PDD begins processing in the background automatically. When the PDD is generated, the field changes from Processing PDD to Download. You can now choose to download the document in Word format, PDF, or both. An email notification to the business user is also sent to the email address on file. The Download PDD for Word or PDF document is also available for a custom opportunity from the Opportunities list table.</p> <p>Review opportunities, convert to bot, and generate PDD on page 3715</p>	

Fixes	
Service Cloud case ID	Description
--	You will now receive one email notification for a PDD generated in Automation 360 v.21. Previously, when you upgraded to Automation 360 v.22, you might have received multiple email notifications about the PDD generated in Automation 360 v.21.

The following table lists the limitations identified in the current release:

Limitations in this release
<p>During upgrade the PDD documents are not getting generated intermittently, for both recordings and opportunities.</p> <p>Workaround: Edit the flowchart for the custom opportunity that displayed an error, and save. Or alternatively, create a new opportunity from the existing opportunity.</p>
<p>Depending on the memory available in your system, the PDD (in PDF or Microsoft Word format) can support up to 250 recorded steps captured in the document. If a process is recorded with more than 250 steps, the PDD generation periodically stops functioning.</p> <p>Workaround: Regenerate the PDD and click Download.</p>
<p>The PDD PDF document for business users and analysts does not display Unicode characters when entered in the opportunity name and step description fields.</p>
<p>Cloud users: For an auto-generated or custom opportunity, an error is displayed from the Recordings table intermittently.</p> <p>Workaround: Refresh the page to update the Recordings table.</p>
<p>After you save your changes, if you update a process workflow by adding or removing steps, the values from the Overview pane might not be updated to include the recent changes.</p> <p>Workaround: Refresh the page to update and include the recent changes made to the opportunity values in the Overview pane.</p>
<p>Cloud users: Creating a custom opportunity with more than 250 steps is not supported.</p>
<p>Linux users: The recording flowchart section is not displayed in the PDD.</p>
<p>For On-Premises deployments, when a self-signed or wildcard certificate is used for the Control Room setup, the Processes page fails to load.</p> <p>Workaround: Update or add the Control Room certificate to the Java Credential Store on all your Bot Runner machines for the Processes page to load.</p> <p>Add Control Room certificate to Windows certificate stores on page 1328</p>
<p>For custom opportunities and recordings, there is an intermittent issue and error generating PDD message. You will not be able to access and download a PDD and instead see an Error generating PDD error message.</p> <p>Workaround: Only for custom opportunities, you can either create a new opportunity in your workflow using the Save As option OR edit the your workflow chart with any small change and save it. After doing this, the PDD generation will work properly.</p>
<p>Discovery Bot supports bot conversion to template only. To generate the automation task, you must manually update or enhance the template generated by Discovery Bot in the RPA workspace. (Service Cloud case ID: 01840856, 01822803, 01860950)</p>

Feature deprecation for Discovery Bot

Review the deprecated feature to understand how it can impact your automation.

Discovery Bot Aggregated and Comparison options

The Discovery Bot Aggregated and Comparison tabs from the Processes page has been deprecated as of June 2021. You can use the Opportunities tab to view processes in an aggregated workflow.

IQ Bot

What's new

Document Automation released in Community Edition

Community Edition now offers limited features from the Document Automation version. This version is integrated with the Community Control Room. When you create a learning instance, IQ Bot automatically creates RPA bots to extract and download the data and an Automation Co-Pilot process to manage the end-to-end process. Validation now takes place in Automation Co-Pilot tasks.

Use IQ Bot Community Edition to extract data from invoices in English.

[Community Edition](#) on page 3533

IQ Bot standard forms enhancements

IQ Bot now provides the following enhancements related to standard forms:

- You can now extract data from tables.
- You can now use container deployment.

[Using IQ Bot for standard forms](#) on page 3606

CyberArk support

The On-Premises installation process now enables users to connect to CyberArk to store their custom keys for encrypting and decrypting IQ Bot data.

Note: This feature is only available for new installations.

[Installing IQ Bot in Custom mode](#) on page 1380

Classifier enhancements

You can now create custom document groups in a learning instance. This reduces the possibility of an OCR failing to detect fields in a document, which will cause the Classifier to create a document group unnecessarily or send the document to a wrong group.

[About the Classifier](#) on page 3551

What's new
<p>View the number of pages purchased and uploaded</p> <p>The IQ Bot dashboard now shows the number of pages purchased and uploaded in the current license period.</p> <p>Review the dashboard on page 3601</p>

What's changed
(Service Cloud case ID: 00656822) Credential Vault integration is now available for passwords in IQ Bot.

Fixes	
Service Cloud case ID	Description
00727633	When you import or export learning instances, duplicate classification entries no longer occur.
00768600, 00783773, 00815546, 00795424 , 00788180	When you import an existing IQ Bot archive (IQBA) file, you can now use the Overwrite option without any issues.
00786305	When you import an IQ Bot instance and select the Remove All Existing Instances option, a warning message now appears to confirm deletion of all learning instances. Previously, in such case, no confirmation message was shown and it might led to data loss.
00770638, 00746545, 00827208, 00746545, 00827208	When you import the IQ Bot archive (IQBA) file, you will no longer see duplicate group entries.
00773631	(On-Premises) After you install, restart the IQ Bot services using a different Windows user. Prior to this release, IQ Bot services could not be run with a different account post-installation, resulting in an incompatible FilePath for Liquibase changesets.
--	You can now access IQ Bot > Explore IQ Bot with a refined user experience. Previously, a user could not navigate back to the Control Room landing page. Users can now access the landing page by clicking the back button.
00766454	The Manage your IQ Bots no longer displays the incorrect UI for trained bots currently in production. Previously, it displayed a link to create a bot.
00804476	When you update the classification report, you can now successfully classify the documents in IQ Bot. Previously, because the classification report field name was longer than 75 characters, document classification failed.
--	On the Learning Instance summary page, the number of unclassified documents and the number of documents uploaded are now accurately displayed.

Fixes	
Service Cloud case ID	Description
00695159	An internal exception in the RemoveLines module that caused documents to remain unprocessed has now been fixed, and documents no longer remain unprocessed due to this error.
00806557	You can now successfully assign a group to a bot, and move the bot to production. Previously, in a few instances, the IQBA contained multiple bots for the same group, making the state of the bot inconsistent.
-	You can now download output files without any issues even if API requests are sent frequently to the database during download for any standard forms learning instance.
-	You can now use the IQ Bot Extraction action without any issues even if you selected the Only for me option when you installed the Bot Agent.
--	For bots associated with standard forms learning instances, you can now successfully upload a large number of documents.
00776423, 00829915, 00949561	You can now use a custom port (apart from port 1433) to run the Migration Assistant tool on the database server.
--	When documents with lengthy non-English (for example, Japanese) file names fail, the issue is now logged in the bot_launcher.log file.
00814577, 00812300, 00823120	An unexpected error that occurred due to large unnamed RabbitMQ message queues has been fixed and the user can now navigate to the Learning instances page.
--	The MLScheduler service is now disabled on IQ Bot Cloud, and the system no longer slows down or stops responding. Previously, the auto-correction and auto-suggestion features, which are part of the MLScheduler service, used extensive system resources and caused the system to slow down or stop responding.
--	The Process Document action in IQ Bot Extraction package now fetches the ABBYY pre-processing settings from the IQ Bot server and applies these settings to the classic side of processing during bot runtime.

The following table lists the limitations identified in the current release:

Limitations in this release
When a bot is moved to production, documents become unavailable in the validator output folder or the following error is displayed: <code>Project not found/No documents found.</code> Workaround: Ensure that the length of the filename does not exceed 100 characters.

Limitations in this release
<p>In a cluster setup, sometimes, a specific document in production becomes unavailable. Also, an incorrect learning instance summary is displayed.</p> <p>Workaround: Upload again and reprocess documents that are not successfully processed.</p>
<p>In the Designer, some documents for the user-created group and their extraction results do not load.</p> <p>Workaround:</p> <ol style="list-style-type: none"> 1. Reload the Designer. 2. To obtain extraction details on On-Premises, go to the <code>Settings.txt</code> file and increase the value for See extraction timeout.
<p>On the learning instance details page, because of the 150-character limit, the group labels for user-created groups are not displayed completely.</p>
<p>When you create an IQ Bot administrator user, if you do not include the AAE_Basic role along with the AAE_IQ Bot Admin role, that administrator user cannot add a new group to a learning instance.</p> <p>Workaround: Ensure that you include the AAE_Basic role along with AAE_IQ Bot Admin role in the Control Room.</p>
<p>For a standard forms learning instance, if you upload a document that contains a table with an invalid field, that document is sent to the Failed folder.</p>
<p>For the Concatenate Images action in the IQ Bot Pre-processor package, no output is generated if a filename contains more than 256 characters.</p> <p>Workaround: Use English language characters and number convention.</p>
<p>When you use the IQ Bot Extraction package along with other OCR-based commands (such as IQ Bot Pre-processor, Document Classifier, AISense Recorder, and OCR) in a single bot, the bot fails.</p> <p>Workaround: Ensure that you create separate bots for IQ Bot Extraction, and do not run IQ Bot Extraction in conjunction with other packages that include the 12.2 Abbyy OCR.</p>
<p>From a learning instance of custom domain type with manual groups, when you export the IQBA file to another instance, the manual Group Label is not exported. Without a manual group label, it is difficult to differentiate between system-generated groups and manual groups in new learning instances.</p>

The following table lists limitations from previous releases that are also applicable to this release:

Limitations from the previous releases
<p>If you have a document with a large number of pages (> 100), an error message is displayed intermittently when you click See extraction results for an existing learning instance.</p>

Bot Insight

What's changed
To change the language in Bot Insight, you must apply the language settings from either your browser or operating system that is configured to the language of your choice. Internationalization, localization, and language support on page 1158

Fixes	
Service Cloud case ID	Description
00799262, 00826862	An error no longer occurs when you run a bot that includes special characters in the name and the analyze command. Previously, bots with an ampersand (&) in the name and the analyze command included encountered an error.
	The calculation in the device dashboard is now corrected to show an accurate maximum of 100 percent for daily utilization. Previously, a calculation error caused the device dashboard to display over 100 percent.

The following table lists the limitations identified in the current release:

Limitations in this release
Bot Insight is not compatible with Microsoft Internet Explorer 11. For a list of alternative browsers, see Browser requirements for Automation Workspace on page 1154.

Important: For information about the packages supported with this release, see [Packages available in Automation 360](#) on page 2225.

Automation 360 v.22 Release Notes

Release date: 21 September 2021

Review what's new and changed, and the fixes and limitations in the Automation 360 v.22 release. Build 10535 is for Cloud and Build 10526 is for On-Premises. For Automation 360 IQ Bot, Cloud is on Build 10535 and On-Premises is on Build 10520.

Important: We have updated the Automation 360 Cloud build to include additional fixes for the Apache Log4j2 component vulnerability. The build includes the new Log4j2 library version 2.16.0.

Updating to this release

You can update the Automation 360 v.22 release from the previous three releases (that is, from n–3 releases, where n refers to the latest release).

The following previous releases are certified for update to this release:

- v.21 (Builds 9664, 9642, 9595)
- v.20 (Build 8815)
- v.19 (Builds 8147, 8145, 8122, 8098)

You can directly update to v.22 from any of these builds. For details on how to update, see [Update Automation 360 to latest version](#) on page 1363.

Recommendation: If you are not on an n–3 release, update Automation 360 to one of the three certified releases before updating to this release.

Important: This release includes a required update to your . Ensure that you complete the update to continue with your automation activities when upgrading from a previous release to this release.

[Automatically update the Bot Agent](#) on page 1302 | [Manually update the Bot Agent](#) on page 1303

To verify which version is compatible with this release, see [Compatibility with release builds](#) on page 1275.

For information about the latest updates to the Automation 360 extensions for Google Chrome, Microsoft Edge, and Mozilla Firefox, see [Browser extensions for Automation 360](#) on page 933.

Migration features

Enterprise 11 and Enterprise 10 features

Migrate bots that use Credential variables (Service Cloud case ID: 00705937, 00761271, 00776189)

You can now migrate bots that use Credential variables that are not available in the Cloud Control Room. However, you must create the required credentials after migration in the Credential Vault and use them in the migrated bots to run these bots successfully.

Enterprise 11 and Enterprise 10 features

Migration support for Browser, Java, and Java Applet applications for App Integration command

You can now migrate bots that contain the App Integration command with application types such as Browser, Java Applet, and Java applications.

New Action Required tab in Bot Scanner report

In the Bot Scanner report, we have introduced the **Action Required** tab within the **Bots that can be migrated now** section to provide advance notification about bots that require manual intervention after migration so that they can run successfully in Automation 360. View messages associated with the bot that requires action to understand the cause and the specific action you must perform in Automation 360.

[Analyze Bot Scanner report for migration](#) on page 1474

Action required, Review required, and Error messages for migration

Migration messages are now classified into the following categories: Action required, Review required, and Error messages:

- Action required and Review required messages are displayed for bots that contain unsupported commands but which you can still migrate and run after migration by performing specific actions. The messages provide specific actions you have to perform or information that you have to review to ensure that these bots run successfully after migration to Automation 360.
- Error messages are displayed when a specific bot is not migrated successfully. The messages also include the cause for the failure.

[Migration messages](#) on page 1617

Enterprise 11 only features

Migrate bots with the following attributes:

- Bots with timeout specified in their property
- Bots that contain the **GUI Automation** command with the **Restore Window** or the **Execute Script** option selected
- Bots that open a session for Terminal Emulator and Microsoft Excel in the parent bot and close that session in the child bot
- Bots that automate email-related tasks on Microsoft Exchange 2013
- Bots that use SAP BAPI standard and custom workflows to automate tasks on SAP applications
- Bots that contain the Window command with the **Close All Open Windows** selected to close all multiple active windows (Service cloud case ID: 00773227)

Automation Workspace

What's new
<p>Save bandwidth on devices through preloaded offline bot packages</p> <p>Customized or most commonly used bot packages in a bot are now saved offline on a user device to the following new folder: <code>AAPreloadedPackages</code>. When a bot is deployed on a user's device, the packages are used from this <code>AAPreloadedPackages</code> folder instead of downloading them from the Control Room.</p> <p>When a specific version of the package is available, you can download it from the Control Room repository to save the time required to download the package during bot execution.</p> <p>Preload packages on page 2219 Devices on page 1808</p>
<p>Introducing Text file package</p> <p>A new Text file package is now available and includes the Get text action. Use this action to extract text from files that have Japanese characters with Shift-JIS encoding and then save the content in the files to a string variable.</p> <p>Text file package on page 3005</p>
<p>New actions in Window package</p> <ul style="list-style-type: none"> • Use the Close all action to close all windows or programs running on the system, except the windows added in the Add window field. • Use the Restore action to restore the size of a maximized or a minimized window or application running on the system. <p>Window package on page 3044</p>
<p>Share session across bots</p> <p>Share a DLL, Excel, and Terminal Emulator session across multiple bots using the Global session option. You can also share a session with specific child bots using the Variable option and share a session with only the current bot using the Local session option.</p> <p>Sharing sessions across bots on page 2417</p>
<p>Enhancements to Excel advanced package</p> <ul style="list-style-type: none"> • Open files with <code>.xml</code> and <code>.txt</code> extensions using the Open action. • Use the wildcard character (*) in the Open action for file names to search based on the wildcard pattern. • When you use the Run macro action and specify an argument that has a blank value, this blank value can now be passed to the macro.
<p>New option in Database: Disconnect action</p> <p>In the Database: Disconnect action, you can now use the Keep database schema in cache until bot finishes running option to enable the Loop action to iterate the dataset by using cached schema after disconnecting from the database.</p>

What's new
<p>TNS name supported for Oracle Database connection</p> <p>TNS (Transparent Network Substrate) name is now supported in the Oracle Database. You can connect to the Oracle Database by specifying the TNS name and path of the <code>tnsnames.ora</code> configuration file.</p>
<p>New Exchange version supported in Email package</p> <p>In the Email package, when you choose an EWS server to establish a connection, you can now use the Exchange2013 option in the Exchange Version field.</p>
<p>Enhancement to AISense Recorder</p> <p>AISense Recorder now enables automation of applications that use Russian and a combination of Russian and English interfaces.</p> <p>AISense for recording tasks from remote applications on page 2180</p>
<p>Enhancements to recorder conditions for packages</p> <ul style="list-style-type: none">• Use the new Object does not exist condition from the Condition list of any package to verify whether a specific object in a window exists and then execute actions based on the result. This condition works with SAP technology as well.• The existing Object condition is now renamed as Object exists. <p>Loop package on page 2679</p>
<p>Enhanced support for SOAP Web Service URI (Service Cloud case ID: 00759811)</p> <p>In the SOAP Web Service package, if the input to the Address location field is empty, the bot now retrieves the address location from the WSDL file.</p>
<p>New option in SOAP Web Service package</p> <p>Use the Build SOAP request option in the SOAP Web Service package to retrieve SOAP request details from the SOAP URI or the WSDL file. You can now select any operations from the list of services and ports available in the SOAP Request to automatically populate data in the fields of the SOAP Web Service action.</p> <p>Example of using the SOAP web service action on page 3097</p>
<p>New option in REST Web Service (Service Cloud case ID: 00764198, 00800287)</p> <p>In the REST Web Service package, you can now use the Allow insecure connection when using https option to skip SSL certificate validation and to allow non-secure connections.</p>

What's new
<p>Relative click and occurrence supported in packages (Service Cloud case ID: 0055643,00754173)</p> <p>When you capture a target image using the Image Recognition package, you can now use the Preview option to select a specific captured occurrence and position your click location relative to the image.</p> <p>The feature is supported in the following packages and actions:</p> <ul style="list-style-type: none"> • Image Recognition > Find image in window • Image Recognition > Find window in window • If > Image Recognition condition • Loop > While > Image Recognition condition • Wait for condition action > Image Recognition condition <p>Using Find image in window action on page 2627 Using the Find window in window action on page 2630</p>
<p>Wait time option in Google Sheets package (Service Cloud case ID: 00738249, 00817449, 00814775)</p> <p>When you use the Connect in the action in the Google Sheets package to establish a connection with the Google server, you can now set a wait time in the Wait for actions to complete field when performing actions such as Get, Set, or Delete. For example, if you have a large file that takes a long time to open, you can now set the wait time for the file to open before the system executes the next set of actions.</p>
<p>New option for Put action in Dictionary package</p> <p>You can now assign a static value to a key for a dictionary variable by using the Static value option in the Put action in the Dictionary package.</p> <p>Dictionary package on page 2406</p>
<p>Java applications supported in App integration package</p> <p>The App integration package now supports Java applications that are based on the Standard Widget Toolkit and Abstract Window Toolkit, which can draw text using Windows text-drawing APIs.</p>
<p>Use regular expressions in File > Open action (Service Cloud case ID: 00737614)</p> <p>Use regular expressions (regex) in the Open action of the File package to support pattern-based search.</p>
<p>Specify timeout for bots (Service Cloud case ID: 00667049, 00690892, 00699158, 00706491, 00739420, 00739415, 00741590, 00769795)</p> <p>You can now specify the amount of time by which the execution of a bot must be completed. The system stops the bot execution if it is not completed within the time you specified.</p> <p>Configure timeout for bot execution on page 2233</p>

What's new
<p>New option to search text within bot content in Bot editor (Service Cloud case ID: 00735685, 00736201, 00739122, 00740481, 00733885, 00748970, 00746459, 00738181,00756441,00759037,00761453,00764478)</p> <p>In the Bot editor, use the search box in the Flow, List, or Dual view to search for text, variables, or actions in the entire bot content such as package name, action name, string name, or variable name. This feature helps you to view or edit a bot with long code lines to determine where the searched text, such as variables, strings, or actions, is used and in which line.</p> <p>Actions to build bots on page 2272</p>
<p>Enhancements to the bot structure</p> <p>We have enhanced the overall readability of the bot structure and updated the node labels of the bot to show selected properties and parameters of each action in detail in the Flow, List, and Dual views. You no longer have to expand each action to view these details.</p> <p>The Flow, List, and Dual views display the following properties of actions:</p> <ul style="list-style-type: none">• The value you enter for actions such as Set text for all supported technologies• Names of objects on which actions such as Set text, Click, Left click, Get property, and Select item by index are performed• Name of the object property mentioned in the action• Name of the return variable if some value is assigned to a variable• List of properties for the Get property action
<p>Enhanced network security control</p> <p>As a Control Room administrator, you can now configure and audit specific, permitted URLs for more granular control of the network access points.</p> <p>Set callback URLs on page 1746</p>
<p>Enhanced proxy support</p> <p>Connections to the internet are often run through proxy servers. Automation 360 provides enhanced support for proxy configuration for packages, such as REST and SOAP packages, for building and running bots.</p> <p>Connect Bot Agent to a device with a proxy on page 1293</p>
<p>Connect to Azure DevOps (Cloud) Git from Control Room</p> <p>You can now connect to Azure DevOps (Cloud) Git through the Control Room to check in a bot and its dependent files to the remote Azure DevOps (Cloud) Git repository.</p> <p>Connect to Azure DevOps Git from Control Room on page 1766</p>
<p>Work item ID and time filters for workload automations</p> <p>Combine the work item ID and start time of a queue to search for specific work items and monitor the progress of these work items. The start time filters the list of all work items that start between specified start date and start time.</p> <p>Actions allowed on view queue page on page 1950</p>

What's new
<p>Enhancements to execution type key in AATaskExecutor variable</p> <ul style="list-style-type: none">When you schedule a bot to run, the <code>Execution_Type</code> key in the <code>AATaskExecutor</code> variable now returns information about the execution type with schedule type (frequency) such as <code>Run as schedule Daily</code>, <code>Run as schedule Weekly</code>, or <code>Run as schedule Monthly</code>.When you use a trigger in a bot, the <code>Execution_Type</code> key can be accessed through the trigger data. The <code>Execution_Type</code> key returns the <code>Run through Trigger</code> as a string for triggers.
<p>Language support for variable names</p> <p>Variable names now support Greek and Japanese languages. You can now create variable names using the following characters:</p> <ul style="list-style-type: none">Greek uppercase and lowercase charactersJapanese Katakana full-width and half-width characters.
<p>ML services support in Linux package installer</p> <p>The python package in the Linux installer package is now updated to support ML services. When you download and install Control Room on Linux, ML services are up and running as part of the installation process.</p> <p>Installing Control Room on Linux on page 1237 Stop and start Control Room services on Linux on page 1250</p>
<p>Direct download support in Bot Store</p> <p>Users who cannot connect their Control Room to the internet can now directly download Automation 360 bots and packages locally from Bot Store and then import them to their Control Room.</p> <p>Download locally and import bots and packages from Bot Store to Control Room on page 3444</p>
<p>MS-SQL database management enhancement</p> <p>Administrators are no longer required to re-install Automation 360 to have the ability to change MS-SQL configuration related settings. The editable settings include username, password, database server name, database server IP and port numbers.</p>

What's changed
<p>Changes to Runtime Window</p> <p>The title on the Runtime Window is now changed to Bot running from the previous Automation Anywhere.</p> <p>If any issue occurs in your automation due to this title change, see this article on how to resolve it: A360.22 Runtime Window: Minimize Command Fails Due to Title Change (A-People login required)</p>

What's changed
<p>Changes to Run DLL package</p> <ul style="list-style-type: none">The Run function (Legacy) action is no longer available in the Run DLL package. We recommend that you use the Run Function action from the Run DLL package because this action is an improved version of the Run function (Legacy) action. <p>Note that existing bots that use the Run function (Legacy) will continue to run successfully without any issues.</p> <ul style="list-style-type: none">The Set session variable action is no longer available in the Run DLL package. Instead, we recommend that you create a new DLL session using the Variable option in the Open action of the Run DLL package. <p>Note that existing bots that use the Set session variable action will continue to run successfully without any issues.</p>
<p>Messages for migrated bots for which referenced MetaBot logic is not available</p> <p>Bot Scanner and Migration Assistant now display action required messages for Enterprise 11 or Enterprise 10 bots for which the referenced MetaBot logic is not available.</p>
<p>Migration of bots with missing variable is blocked</p> <p>The migration process does not migrate Enterprise 11 bots that use a variable which is no longer available and that variable is used in the If, Loop, Variable Operation, or Clipboard command. Previously, these bots were successfully migrated but an error occurred when the bots were run.</p>
<p>Update to MetaBots that use same DLL in multiple logic (Service Cloud case ID: 00684185, 00730248, 00742840, 00742840, 00779629, 00779788, 00727977, 00743986, 00764872)</p> <p>Migrated bots that use the same DLL in multiple MetaBot logic now work as expected without any modification. Previously, you had to update the migrated bots to run them successfully.</p>
<p>Migrated bots run successfully when mapped variables are not available (Service Cloud case ID: 00746651, 00785703)</p> <p>Migrated bots now run successfully when mapped variables are not available in the child bot or the parent bot.</p>
<p>Enhancements to Bot Agent device settings</p> <p>To easily access local and remote devices, a user can now change the Bot Agent device settings from the My Settings page in the Control Room pane below your username. You can perform the following actions:</p> <ul style="list-style-type: none">Update device credentialsChange the default Bot Runner deviceView local device name, status, and Bot Agent version <p>Set user device credentials on page 1295 View and update Bot Agent device settings on page 1295</p>

What's changed
<p>Enhancement to auto discovery for multiple domains</p> <p>You can now configure the maximum number of sites that can be discovered across the domain in the <code>um.properties</code> file for a Control Room set up for auto discovery across multiple domains in different locations.</p> <p>Configure Control Room for Active Directory: auto mode on page 1318</p>
<p>Enhancement to OpenDistro for Elasticsearch</p> <p>As part of enhanced security, OpenDistro (cron-utils) is now upgraded to v.1.13.2 for Elasticsearch v.7.10.2</p>
<p>Update to Printer package</p> <p>In the Remove and Set default actions of the Printer package, you can now select a specific printer from the list of available printers.</p> <p>Printer package on page 2775</p>
<p>Insert recorded actions in the middle of a bot</p> <p>You can now insert any recorded actions that are newly captured at a specified location in an existing bot. Previously, recorded actions were added to the existing bot at the end by default and users had to drag the action to the specified location.</p> <p>Universal Recorder for object-based automation on page 2163</p>
<p>Migration: system variable behavior outside a loop (Service Cloud case ID: 00761281)</p> <p>When you migrate bots that use system variables outside a Loop package, the variables are now converted to record type or string type user-defined variables as applicable and assigned to a record action. As a result, when bots that contain these variables are run, data from the last row is displayed. Previously, an empty value was displayed after migration.</p> <p>The following system variables are converted to record type variables:</p> <ul style="list-style-type: none">• \$Filedata Column\$• \$Excel Column\$• \$Dataset Column\$• \$Table Column\$ <p>The system variable \$XML Data Node\$ is converted to a string type variable.</p> <p>Variable mapping for migration on page 1593</p>
<p>Support removed for Redirect URI attribute in Google Sheets package (Service Cloud case ID: 00777287)</p> <p>The Redirect URI attribute in the Connect action of the Google Sheets package is now removed. After updating to this release from previous Automation 360 releases, you can continue to successfully execute your bots by entering the fixed redirect URL in Google Cloud Platform: <code>http://localhost:8888/Callback</code></p>

What's changed
<p>Updates to device credentials recorded in audit log (Service Cloud case ID: 00691511)</p> <p>You can now view audit log entries if your device credential is updated either manually through the Bot Agent device or through the Control Room API. Activity details such as the user name updating the device credentials and the time of the update are logged.</p>
<p>Enhancement to Image Recognition package</p> <p>When secure recording is enabled, the target image that is captured using the actions in the Image Recognition package is now hidden after the initial capture to enhance security. Previously, the user was able to view the target image even when secure recording was enabled.</p> <p>Image Recognition package on page 2626</p>
<p>Enhancement to File and Folder package</p> <p>Users with a valid role permission can now create a shortcut to a selected source file at a specified location using the Create shortcut action in the File and Folder package.</p>
<p>Support for HTTP method HEAD (Service Cloud case ID: 00754096)</p> <p>The HTTP method HEAD is now supported as an API call to connect to the load balancer of a Control Room configured for high availability.</p>
<p>Update to Linux installation and log path</p> <ul style="list-style-type: none">• Installation files<ul style="list-style-type: none">• If you are on a version earlier than Automation 360 v.22 or if you have updated from an earlier version to v.22, the installation files are now stored in this path <code>/opt/automationanywhere/enterprise</code>• If you perform a new installation of v.22, the files are stored in this path: <code>/opt/automationanywhere/automation360</code>• Log files<ul style="list-style-type: none">• If you are on a version earlier to v.22 or if have updated to v.22 from an earlier version, the log files are stored in this path: <code>/var/log/automationanywhere/enterprise</code>• If you perform a new installation of v.22, the log files are stored in this path: <code>/var/log/automationanywhere/automation360</code>
<p>Check out a Task Bot with specific version</p> <p>If a bot has multiple versions, you can now select and check out the specific version of the bot. As a Bot Creator, this enables you to roll back to an earlier version of the bot.</p>

What's changed
<p>Signed DLLs for bots and packages</p> <p>Automation 360 now signs all DLLs, including third-party DLLs, for bots and packages.</p> <p>The following are exceptions:</p> <ul style="list-style-type: none"> • The IQ Bot Pre-processor package does not have a new version in this Automation 360 v.22 release. The v.21 package version is copied to v.22 without modification, including a few unsigned DLLs. • The Process Discovery package in this v.22 release does not have the signing applied. • Automation Anywhere • Azul Systems (Java JRE in Bot Agent) • TeamDev Ltd. (third-party library)

Fixes	
Service Cloud case ID	Description
00712808, 00765752	In previous releases, Automation Anywhere related files were sometimes generated in C:\Windows\Temp. This issue is now fixed.
00800392	An error no longer occurs when you migrate from a Enterprise 11 version where a database is stored on Google Cloud Platform.
00811887	The Cloud Migration Utility no longer encounters an error when you use a custom port number to connect to the Enterprise 11 database.
00815097	Enterprise 11 bots that are checked out by a user are now successfully migrated to Automation 360 Cloud.
00802360	You can now update the value of Enterprise 11 credential attributes after they are migrated to Automation 360 Cloud. Previously, the system encountered an error when you updated the value of a credential attribute that was added or updated by a user in Enterprise 11 and that user was no longer available when Enterprise 11 data was migrated to Automation 360 Cloud.
--	When you migrate from Enterprise 11 to Automation 360 Cloud, an error no longer occurs when a locker is deleted in Enterprise 11 but its related permissions are still used in other entities.
--	An error no longer occurs when you update from Version 11.3.5.2 to any Enterprise 11 version and then migrate from that Enterprise 11 version to Automation 360 Cloud.
--	The Refresh and Back options are now available on the Summary screen of the Cloud Migration Utility when enough disk space is not available to store the backup of Enterprise 11 Control Room data.
00787240, 00781349	Migrated bots no longer encounter an error when a parent bot and its child bot are opened through Internet Explorer and the child bot extracts a table from Internet Explorer.

Fixes	
Service Cloud case ID	Description
--	There is no limitation now on the number of ActiveMQ connections that are allowed when running an automation that is looped 5 times, with each loop running over 20 bots. In previous releases, the automation sometimes failed after the fourth loop.
0074312	You can now successfully migrate bots that contain Trim operation of the String and the output is assigned to an Array variable.
00760963	Migrated bots that contain the Go To Cell command now work properly in Automation 360 after migration.
--	Bot Scanner now loads the modified <code>cache.properties</code> file from the <code>conf</code> folder. Previously, you had to place the modified <code>cache.properties</code> file in the executable file location of the Bot Scanner for the file to be loaded.
00754003	Bots that contain the SOAP Web Service command now successfully run after migration without encountering any error. Previously, an unexpected error occurred when the SOAP Web Service with WSDLs defined with external dependencies were not invoked.
00790360	In the Terminal Emulator package, when you send any key to the terminal with the Send text or Send key action, if the terminal is in a busy state or the keyboard is in a locked state, these actions now wait for 5 seconds for the terminal to return to a normal state. After 5 seconds, the system moves to execute the next action without any exception.
00742000	Migrated bots that contain the Prompt > For value command with the Don't write in any windows option selected now work as expected in Automation 360 after migration and no text is written in the file if any window is open. Previously, even if this option was selected, if any text file window was open, the text was written in the file.
00781072	When bots are migrated using the Bot Migration Wizard, migration no longer fails if the bot name includes a special character. Previously, an internal error occurred when the bot name included an apostrophe (') character.
00780713, 00778164	A migrated bot is no longer unresponsive when that bot uses the App Integration package to capture text from a target application and the target application becomes unresponsive.
--	Migrated Enterprise 11 bots that use the Terminal Emulator command to clear the terminal screen of the VT and ANSI type terminals no longer encounter an error when they are executed.

Fixes	
Service Cloud case ID	Description
00748647	Migrated Enterprise 11 bots that use two-dimensional array and the Variable Operation command no longer encounter an error. Previously, the migration process used to set the number of rows and columns for the two-dimensional array to 1x1 irrespective of the values set in Enterprise 11.
--	The migration process continues to migrate bots if the connection between the Control Room and the Bot Agent is lost and then reestablished. Previously, the migration process failed when the connection between the Control Room and the Bot Agent was lost.
00764441	In the Excel: Get single cell action of the Excel advanced package, you can now access the value of a specific cell defined in the cell address. Previously, migrated bots encountered a Must match pattern error when a Japanese character was entered in the Cell address field.
00757713, 00764985, 00820376	The Excel advanced package now enables you to read from a protected sheet. Previously, migrated bots encountered an error when you retrieved a cell from a protected sheet using the Excel advanced: Open action.
00761911	You can now migrate bots using the Excel column system variable where the key is the column name ; an error is no longer encountered.
00769321	Migrated bots no longer encounter an error when the Run Excel Macro command is included in the bots. Migrated bots now run properly using the Run macro action of the Excel advanced package.
00790858	You can now migrate a bot when there is a variable mismatch and the respective command is disabled. Previously, when the bot was assigned a certain variable type and the Variable Operation command in that variable was disabled, Bot Scanner displayed an error for the variable when the type was later changed.
00744318, 00744326, 00745318	You can now download an exported bot file with Japanese characters in the filename through email. Previously, when an exported file with a Japanese name was downloaded using the email link, an error occurred or the characters in the exported zip filename were garbled and .zip was appended to the filename.
00762975	After you migrate Enterprise 11 bots that use the Error handling command with the Send email function and the Attach variable and Attach snapshot option, the bots now correctly send error emails with attachments containing a snapshot or variable text file.

Fixes	
Service Cloud case ID	Description
00731577, 00746226, 00760649, 00759973, 00767618, 00789545, 00821824	The <code>includePackages</code> parameter of the Export API now works as expected. If you set the value of the parameter as True the packages are included in the exported file, and if the value is set to False the packages are not included in the exported file.
--	You can now migrate bots with variable names that include full-width and lowercase characters. Previously, migration of bots with a variable name that included full-width and uppercase characters was not supported because the variable was mistakenly converted to a half-width character.
00759189	Migrated bots now use the date format specified in the <code>AADefaultDateFormat</code> global value for email-related automation. You must create the <code>AADefaultDateFormat</code> global value before migrating the bots and specify the date format you want to use in the migrated bots. Recommended: Specify the same date format in the <code>AADefaultDateFormat</code> global value that is used in Enterprise 11.
00784001	Enterprise 11 bots that are migrated now contain all the properties of an object captured from a SAP application.
00786362, 00802274	Enterprise 11 bots that are migrated no longer encounter an error when the child bot and parent bot use different versions of the If package.
00807986	Enterprise 11 bots that are migrated no longer encounter an error when a variable that is mapped between a child bot and the parent bot is not available in the child bot.
00808026	Enterprise 11 bots that are migrated no longer encounter an error when they use a shared session for Terminal Emulator related tasks when a session is shared between nested child bots and an intermediate child bot does not contain any Terminal Emulator actions. For example, consider that you have three bots: Bot1, Bot2, and Bot3, where Bot1 calls Bot2 and Bot2 calls Bot3. Bot1 and Bot3 share a session for Terminal Emulator related tasks; however, Bot2 does not contain any actions from the Terminal Emulator package. When you share a session between Bot1 and Bot3, an error is no longer encountered.
00762368	Previously, when bots were migrated using Oracle database processes with passwords containing the symbol, an issue occurred. The issue is now fixed and passwords using the "@" symbol are now supported.
00768466, 00769099	An error no longer occurs when you migrate MetaBots that contain logic that are available within a folder.
00772885	The system now retrieves all rows in a table in a SAP application when the last page of the table contains a single row.

Fixes	
Service Cloud case ID	Description
00801733	An increase in CPU usage no longer occurs when the Control Room is in an idle state.
00774821	An error no longer occurs when you run migrated bots that contain a Loop action within another Loop action.
00786732	For Enterprise 11 bots that use the Extract Table command along with other commands within the Error Handling command and only the Extract Table command is disabled, only the equivalent action for the Extract Table command is disabled after migration. Previously, all the actions within the Error Handling action were disabled in the migrated bot.
00743892	An error no longer occurs when you run migrated bots that use DLLs that return a value of user-defined type. Such values are converted to the string type in the migrated bots.
--	Enterprise 11 bots that use variable operations to re-initialize an array type variable to contain more than 160,000 cells (for example, 400 rows and 400 columns, or 800 rows and 200 columns) no longer encounter an error when they are executed after migration.
00737025	Enterprise 11 bots that pass system variables such as Month, Year, and Day as an input variable to a MetaBot no longer encounter an issue after they are migrated.
00773407	Previously, historical activity reports exported to CSV did not display the Last Modified information correctly because some of the Modified On and Modified By information was not accurately processed. The error is now fixed and historical activity reports can now be correctly exported to CSV files.
00767597	The Last Modified (date) value displayed in the historical activity and bot page reporting was previously not translated correctly when the Control Room language was changed from English to non-English, and then back to English. This error is now fixed, and the data is preserved when the language is changed in the Control Room.
00762975	Japanese language text is now updated in the interface for recent user experience (UX) changes. Previously, there were some errors in the translated text in the interface, which are now fixed.
00763228, 00776154	Database constraints, such as foreign key constraint violations, previously prevented users from deleting bots after migration. This limitation is now fixed and users can delete migrated bots (.atmx files) without any issue.
00749375,00763262	After migration, if text file encoding was set to UNICODE or UTF8 , you can now use the String: Import string from text file key to read values from the text file during bot runtime.

Fixes	
Service Cloud case ID	Description
00739268	You can now migrate bots that have large html data associated with the Object Cloning command without any issues.
00674147, 00682390	The Stop service action of the Service package now enables you to stop all child and dependent services of a selected window or application. Previously, the dependent service did not stop automatically when a user tried to stop any window or application service.
00754835	Temporary devices are now automatically deleted if the auto-delete option is enabled for device settings in the Control Room.
00751058, 00761099	When you use the Database Connect action for workload automation, work items from the second iteration are now executed for automation. Previously, only the first work item in the workload automation was executed.
00771098	After you edit a schedule from the Scheduled activity page and save the schedule, the correct page (Scheduled activity) is now opened instead of the In progress activity page.
00733614, 00741358	You can now use the Extract image action of the PDF package to convert a PDF file that contains JPX images to any other image format. Previously, the action failed to extract image from the PDF file because the JPX image reader was not supported.
00765851	Recorder actions now work properly and do not cause any delay when the Set text value contains brackets or [] (which enables you to run a migrated bot without delay). Previously, it took a longer time to run the bot when Set text contained [] (brackets).
00771197	In the Open action of the Browser package, the description below the Time out after (seconds) (optional) field is now translated correctly as Min= 9 seconds in the Japanese language. Previously, the description was translated as Max= 9 seconds .
00761395	In the Database package, when you connect with the Oracle Database and use the Read from action option in a loop to retrieve records from the database, the bot is now executed successfully. Previously, bot execution failed with an error.
00727530	The Move all action in the Email package now works properly and does not encounter any issue.
00739978	An error no longer occurs when you choose the Manual input option to open a VB Script file.
00728180	The issue with event triggers when creating folders in bulk is now resolved. If you configure an event trigger to start a bot whenever a folder is created and then create folders in bulk, the bot is now deployed for every folder that you create. Previously, the bot was not deployed for all the folders created.

Fixes	
Service Cloud case ID	Description
00711134, 00750164, 00847916	If you configure multiple triggers to start bots based on file events and if all the files reside in the same folder, the bots associated with all the triggers are now deployed. Previously, only some bots were deployed.
00719612	When you log in to the Control Room as an unattended Bot Runner, you can now execute bots using the Run as self option. Previously, an unattended Bot Runner could not run the bot with the Run as self option even when the device was set as the default device.
00745095	In the Database package, when you connect to the Microsoft Access database using the JDBC connection, the select query now extracts the file name for the Attachment data type. Previously, an error was displayed.
00772194	Data from any database type is now exported correctly in CSV format. Previously, if the data had special characters such as double quotation marks, the output was displayed in a new line.
00773961	When you create a new worksheet by name in the Google Sheets package, an error no longer occurs when you execute the bot.
00762029	An error no longer occurs when you execute a bot using the Google Calendar package. Previously, when the Disconnect action was used to terminate the connection, the email address attribute was stored in the session name instead of the user session name attribute. As a result, bot execution failed with an error.
00758333	If all versions of a particular package are disabled, then the package is no longer listed in the Actions palette of the Bot editor. Previously, when a package was disabled, the Bot Creator still displayed it in the Actions palette and users were able to use the package when creating a bot. However, these bots failed on execution because the package was disabled.
00780221	A bot created using the Run function action in the Run DLL package now executes without any issues. Previously, an error was displayed on bot execution due to the unavailability of some embedded resources such as satellite assembly.
--	An error no longer occurs when you create a bot using the Send text action of the Terminal Emulator package and pass a variable with an empty value. Previously, the bot failed to execute when any variable options (Credential, Variable, Insecure String) that had no value was selected.

Fixes	
Service Cloud case ID	Description
00776430	When you connect to the Terminal type TN3270E in the Terminal Emulator package, select any of the Terminal model options from the list, and execute the bot, the correct screen resolution is now displayed. Previously, a wrong value was sent for each Terminal model and a screen with incorrect resolution was displayed.
00773415, 00781487	When you open a spreadsheet in the Google Sheets package and select the Beginning of the row option in the Go to cell action, the output is now displayed correctly. Previously, the output was displayed at the column level.
00773415, 00781493	An error no longer occurs when you open a new or blank spreadsheet in the Google Sheets package and you select an action such as Go to cell or Set cell to perform an operation. Previously, bot execution failed with an error.
00779561	In the System package, when you use the Get environment variable action in view mode, the environment variables are now always displayed in the list. Use the refresh option to retrieve all the environment variables in the list. Previously, the environment variables were sometimes not displayed in the list.
00775073	In the Excel advanced package Get worksheet as data table > Read option, the description for the Read cell value option now reads correctly as 50% will be read as 50 when it is translated to the Japanese language. Previously, the description was translated as 50% will be read as 50%.
00767246	The SOAP Web Service package now works for URIs, where the service endpoint can be passed as a URI parameter. Previously, an error was displayed for such requests.
00734463, 00754570, 00766456	When the Connect action of the Database package is used to establish a connection with the Microsoft SQL Server using Windows authentication, the bot now executes successfully even when the parent and child bots use different versions of the Database package. Previously, the bot failed if the parent and child bots used different versions of the Database package.
00780921	An error no longer occurs when you use the PDF extract text action to extract text from a PDF file. Previously, when structured text was extracted from a PDF file, an error was displayed because the index exceeded the 1000 range.
--	In the Excel advanced package, when you use the same session name to open multiple Excel spreadsheets, the bot now displays an error on execution. Previously, if the same session name was used in multiple spreadsheets, the bot overwrote the existing open session when the second Open action was executed.

Fixes	
Service Cloud case ID	Description
00785198	In the Data Table package, when you now use the Write to file action to extract data from a table with large records, 1000 rows of data are read in batches and written to a CSV file. Previously, a Java heap space error was displayed because the configured Java heap memory ran out of space. As a result, data could not be retrieved from a table with large data and written to a CSV file.
00757593	In a Cloud deployment, child bots can now be migrated using the Migrate Bot action from the Bot Migration package. Previously, child bots were not migrated but a migration successful message was displayed.
00731012, 00747385, 00746320	If you install the Control Room in the default location in C:\ and configure the logs directory in another location (for example, E:\), WebCrx logs are now generated dynamically in the custom location.
00768318, 00760835	An error no longer occurs when you try to capture objects using AISense Recorder on any version of Windows that does not have the default media feature pack. Previously, the AISense Recorder did not highlight the objects on a page.
00737710	In the Capture action of the Recorder package, when you select the Set Text action and enter a string variable with a delay set for each keystroke, the output is now displayed correctly on a new line for all Microsoft applications. Previously, on bot execution, the output was shown on one line when a delay was set in the Keystroke .
--	If you deploy bots using event triggers and you install the Bot Agent on a device as a non-admin user for self or a local admin user, the Bot Agent is now updated automatically. The device is no longer shown as disconnected in the Control Room.
00782596	You can now migrate workload automation bots from Enterprise 11 to this release. A client protocol exception message is no longer displayed.
00743810, 00785703	You can now map variables with different letter cases between parent and child bots when you run bots after migrating them from Enterprise 11 to this release. For example, if the variable name in Enterprise 11 is var1 and the variable name is changed to VAR1 after migration, you can map the variables and continue to run the bots.
--	Bot deployments on Bot Agent devices no longer fail when you close a terminal window using the close Window action from the Window package or manually close the Terminal Emulator window.

Fixes	
Service Cloud case ID	Description
00767587	You can now run bots from the In progress activity page. Previously, bots were stuck in the Pending execution state and as a result other bots did not run. You had to manually move the bots stuck in this state to the Historical activity page to run the other queued bots.
00789682, 00798933	You can now delete, reset, or place on hold workload automations because work items are no longer stuck in the ready to run status. Also, the following message is no longer displayed: <i>Work item cannot be deleted in this state.</i>
00720471	An error no longer occurs when you use the Recorder package to capture an object and perform the click action on the capture coordinates. Previously, when you captured the object properties and if the download bar in Google Chrome was open, object properties in the browser could not be captured.
00754651	In the If action of the If package, when you select any condition from the Condition list, and drag any other action inside the If action, the condition is no longer deleted from the Condition list and the action no longer disappears from the List and Flow view.
00768354	An error no longer occurs when you use the AISense Recorder in child bots when running them in a loop. Previously, when the AISense Recorder was used in a child bot and the bot was executed, external processes were not terminated, causing the system to run out of memory.
--	Previously, when bot migration was performed, the process sent various, occasionally multiple, email notifications to all existing Control Room users, even if the administrator had disabled email notifications. An option is now added to enable the administrator to disable email notifications when Credential Vault data is created during bot migration.
00762368	Previously, when bots were migrated using Oracle Database processes with passwords containing the "@" symbol, an issue occurred. The issue is now fixed and passwords using the "@" symbol are now supported.
--	Previously, during migration, a parent bot was successfully processed even if associated child bots did not exist. This created errors during runtime. In this release, if associated child bots do not exist for the parent bot, a message notifies the user of the required action before migration can continue.
00762975	Bots that used the Error Handling action to capture screenshots were incorrectly modified and appended as .PNG files. Migrated bots are no longer modified and appended in this manner.
00751496	Attended Bot Runner devices now show an improved time performance when running bots on Microsoft Edge browser.

Fixes	
Service Cloud case ID	Description
00753673	When you run a migrated bot that contains the Excel Advanced > Delete cell > Specific cell option with comma-separated input cell values such as A1, B1 , the migrated bot now runs successfully and displays the output correctly.
00736473	Fixed an issue where a migrated bot containing the Excel Advanced > Open action did not load the Excel add-ins even when the Load Add-ins check box was selected. Now, the Excel add-ins are loaded successfully.
00767917	You can now run bots with a queue on single user devices that were previously configured for multiple users.
00712719	An error no longer occurs when you run bots that contain actions from the Terminal Emulator package on your device. Previously, bots could not be run due to a synchronization issue with the terminal.
00753121	An error no longer occurs when you use the Convert excel to PDF action of the Excel advanced package to save a converted PDF to a shared network drive.
00763746, 00773924	When you select the Keystrokes action in the Simulate keystrokes package and enter a variable or static text containing half-width Japanese characters, the output now displays the correct Japanese characters. Previously, on bot execution, the output displayed incorrect characters.
00774872, 00807106, 00824486	When you use the Close action of the Browser package to close the last Chrome browser window, the last tab of a Chrome browser window, or all Chrome browsers, the bot no longer encounters an error. Previously, when the Close action was used to close the last Chrome browser window, the last tab of a Chrome browser window, or all Chrome browsers, bot execution failed because the Chrome communication channel was shut down.
00762178	When you deploy bots using RDP on unattended user devices configured for multiple users, a black screenshot is no longer captured.
00800573, 00796393, 00804854	When you select a run-as user to deploy a bot, you can add a Bot Runner user back from the list of Selected Bot Runners to the list of available Bot Runners on the Run bot now page.
00744929	When incorrect Git credentials are entered, the credentials are now hidden and not recorded in the <code>WebCR_Commons.log</code> file. Previously, incorrect Git login credentials were recorded and not hidden in the log file.
00751304	The error model in Swagger docs is now updated to display all the fields appearing in the API response body. Previously, there was a mismatch between the fields displayed in the API response body and the error model in Swagger docs.

Fixes	
Service Cloud case ID	Description
00763398	An error no longer occurs when multiple Excel files are opened and you use the Run macro action in the Excel advanced package. Previously, an error was displayed when a macro was run with multiple sessions.
00759183	The Open action of the File package now opens any file using the default application set by the user. For example, if Microsoft Paint is set as the default application for all .jpg files, the action now opens these files without any error. Previously, bot execution failed with an error.
00750185	An error no longer occurs when you run a migrated Enterprise 11 bot containing the Object Cloning command even if it contains some Unicode 8964 characters in some of its properties. The bot now captures objects after migration without any error. Previously, the bot failed to capture objects after migration if it contained Unicode characters in its properties.
00774091	All object properties of the Object Cloning command are now migrated without any errors. Previously, bot execution failed with an error because the HTML ID and HTML name properties were changed after migration.
00796322, 00823082	When you insert a variable as a parameter in any action of a package, add additional text to this variable, save the bot, and then edit the name of the variable from the variable list, the additional characters added to the variable are no longer deleted.
00731066	The Capture action in the Recorder package now works properly, and you no longer encounter any delay when creating and running new bots to extract any data from a DataGridView control in certain UI automation applications.
00784177	A bot deployment error is no longer displayed when you edit and run a bot using Run bot now from the Bot editor of a Cloud Control Room.
00782307, 00787807, 00811404, 00788178	Bot deployments are no longer stuck in a queue and now display the error <code>Picked at runtime</code> after Automation 360 On-Premises is updated from the previous release to this release.
00786786, 00806775	You can now capture a single object using a recorder from Google Chrome browser, and the following message is no longer displayed: <code>Error performing single capture</code> .
00780202, 00798826, 00808779	When you deploy bots using RDP on unattended user devices configured for multiple users and you set the RDP screen resolution to 1366x768, the resolution no longer changes to 1368x768 during bot execution.

Fixes	
Service Cloud case ID	Description
00769647, 00767674, 00773115, 00777239, 00778972, 00777752, 00792839, 00804603, 00806606, 00815687, 00829496	The View historical activity page now shows the correct run details of start date and time for bots that fail during execution.

Limitations
<p>If you configure an external key vault in External Key Vault Integration and select the SQL authentication mode for database authentication in the Windows installer Database Server page to install Control Room (On-Premises), the installation fails, and the following error message is shown: <code>Control Room database tables fail to create</code>.</p> <p>Workaround: Add the database credentials in the external key vault and use those credentials for database configuration.</p>
<p>The Task bots runs metric on the Home dashboard page of the Control Room displays the count as zero even if you have run bots from the same Control Room.</p>
<p>(Service Cloud case ID: 00837271) If you are migrating from Enterprise 11 with a database that has a large amount of repository data, the installation might fail. This issue occurs because Liquibase update for a few SQL queries is not completed during migration.</p> <p>Workaround: Contact Automation Anywhere Support.</p>
<p>When you are installing the Bot Agent, if you run out of disk space and click OK on the Out of disk space window, the Bot Agent installation wizard might display the previous installer windows.</p> <p>Workaround: In the Setup type window, click Cancel and relaunch the Bot Agent installation wizard.</p>
<p>(Service Cloud Case ID: 01021889) In this release, when you schedule or deploy a bot from the Control Room, you will not receive an email notification if the bot fails to run.</p>
<p>(Service Cloud Case ID: 00780635, 00791587, 00795559, 00795632, 00797130, 00797113, 00791783, 00765770, 00826805, 01859661) When you update from the previous release, schedules disappear from Control Room instances configured on a single-node or multi-node environment. In some cases, after the update, previously deactivated schedules disappear and are reactivated automatically.</p> <p>Workaround: Divide large schedules into smaller schedules or reduce the schedule frequency.</p> <ul style="list-style-type: none"> • Divide large scheduled automations into smaller schedules of two hours each. For example, divide an automation schedule that runs for a 12-hour period, such as 9 AM to 9 PM daily, into two-hour intervals, such as 9 AM to 10:59 AM, 11:00 AM to 12:59 PM, and 1:00 PM to 2:59 PM. • Reduce the schedule frequency to 10 minutes.

Limitations
<p>Migration of Enterprise 10 MetaBots with the password type variable with null value is not yet supported. To migrate successfully, provide a default value to the password variable when creating MetaBots in Enterprise 10.</p>
<p>When you attempt to log in to the Control Room configured with Active Directory, using the Log in with Windows option is not currently supported in this release. Selecting this option can generate a <code>java.lang.NoSuchMethodError</code> error.</p> <p>Recommended: Enter the domain credentials directly.</p>
<p>(Service Cloud case ID: 00831886) As a Bot Creator, you cannot run bot tasks through the Automation Co-Pilot process. Although human tasks appear fine, the Activity page displays the In Progress state and seems stuck on the Waiting for user and/or device action.</p> <p>Workaround: Remove the process discovery license - recorder from the Automation Co-Pilot Bot Creator user. Please refer to AARI process discovery license assignment for more information.</p>
<p>You cannot use the Global session option to share a Microsoft Excel session using the Excel advanced package with the Loop package.</p> <p>Alternate solution: Use the Get multiple cells action and save the data into a datatable variable. Then, use the Loop package with the Data Table option selected.</p>
<p>The migration process successfully migrates bots that contain brackets or [] but the process fails when you migrate the same bots again to migrate the delta changes even when the overwrite option is selected.</p> <p>Workaround: Delete existing bots from Automation 360 that contain brackets or [] before migrating them again.</p>
<p>Users with the AAE_Bot Migration Admin role are not able to run migrated bots because the Run my bots and Create folders permissions are not available in this role. As a result, these users can start the migration process, convert the bots but cannot run the migrated bots.</p> <p>Workaround: Create a custom role with the Run my bots and Create folders permissions and assign this role to the users with the AAE_Bot Migration Admin role.</p>
<p>When Enterprise 11 MetaBots that use a DLL that returns a two-dimensional array of type single as output and stores the value to a file using the Log To File command are migrated as Task Bots to Automation 360, these Task Bots encounter an error when they are executed.</p>
<p>Migrated bots that are used to automate tasks using RDP encounter an error when the DPI of the remote device is different from the current device.</p>
<p>Newly created Control Room users on Windows for On-Premises Google Cloud Platform VMs cannot change their password. The security questions option is not available on the Change password screen and as a result the Control Room displays an error when they try to save the password.</p> <p>Workaround: Refresh the page and change the password again.</p>

Limitations
<p>(Service Cloud case ID: 00770816) When you connect to an Exchange Web Services server, multi-factor authentication (MFA) must be disabled, including in all organizational level security policies where multi-factor authentication might be enabled. If multi-factor authentication is not disabled completely, users might encounter connection and or authorization errors.</p>
<p>Automation 360 does not support the Kibana version in Elasticsearch for which a privilege escalation error is shown in the Black Duck report.</p>
<p>The Bot Agent is not updated automatically from a previous release to this release when you perform different operations simultaneously such as running bots, configuring device settings in the Control Room, and updating the Control Room.</p> <p>Workaround: Restart the Bot Agent from the Task Manager.</p>
<p>A file is not deleted when you execute the bot with the following sequence of actions:</p> <ol style="list-style-type: none"> 1. You use the CSV/TXT > Open action to open a <code>.csv</code> file. 2. You use a loop action within another loop action to retrieve values from the <code>.csv</code> file. 3. You use the CSV/TXT > Close action to close the file. Here, all the actions are using the same Default session. 4. You use the File > Delete action to delete the file. <p>The issue (file is not deleted) occurs because the bot fails to close the Default session.</p>
<p>Bot execution can fail with an error when you execute the bot with the following sequence of actions inside a loop:</p> <ol style="list-style-type: none"> 1. You use the Browser > Open action to open a window. 2. You use the Recorder > Capture action to capture required objects on the window. 3. You use the Browser > Close action to close the window. <p>Workaround: Use the Window > Close action to close the window instead.</p>
<p>If you update the device information from the Administration > Settings > Devices page, only the first update is captured in the Audit Log page. Subsequent updates to the device are not captured.</p>
<p>When you register a new Bot Agent user device from the bot editor after creating and running a bot, the following message is intermittently displayed: <code>Device is either disconnected or it needs to be upgraded.</code></p> <p>Workaround: Click Run to deploy the bot on the new Bot Agent user device.</p>
<p>When you use the Universal Recorder to record multiple tabs in a SAP application, the Set text action in the Client control of SAP does not work because it is currently not supported.</p>
<p>When multiple users check in their bots simultaneously, some of the check-ins fail although Git is not corrupted and no data is lost.</p>

Limitations
<p>When you use the 2.3.0-20210806-215200 version of the Recorder package to capture any control using HTML technology in Google Chrome or Microsoft Edge Chromium browser and run the bot, the bot might fail with the following error message: <code>Unable to find control. Search Criteria did not match</code></p> <p>Workaround: Use the 2.2.0-20210722-211132 version of the Recorder package instead.</p>
<p>When you try to automate any process in a Java application that is using version 11.0.8 of AdoptOpenJDK, the Recorder might not be able to capture the drop-down elements on the application.</p>

Automation Co-Pilot (Automation Co-Pilot for Business Users)

What's new
<p>Output variables support in Process Editor</p> <p>The Output variables section in the process editor enables you to create a user-defined variable that can be set as an output to any process. This helps you pass the output from the child (sub) process, which was called in the Process Task, to the parent (main) process.</p> <p>Display child process automation output on page 3340</p>
<p>Select File element input supported for Create a Request action</p> <p>The Create a Request action in the AARI Web package now supports passing input in the request creation forms for the Select File element. You can now use bots to create a request and upload or download files as input with the Select File element. These input files are uploaded to the storage service to be available for further processing in the request.</p>
<p>Detail view in Tasks page</p> <p>The new Detail view option in the Tasks page provides better insight into individual tasks for better task management. The detail view previews each task in its respective request view page without opening another page, which helps organize and correspond your tasks with the available requests. Users can interact with their tasks as well.</p>
<p>Additional support for interface triggers on Google Chrome</p> <p>You can use the following additional actions for interface triggers on the Google Chrome browser during bot runtime:</p> <ul style="list-style-type: none"> • Hyperlink element: Click, Set focus, or Lost focus actions • Checkbox element: Select, cleared, Set focus, Lost focus, or Selection changed actions • Radio Button element: Select, deselect, Set focus, Lost focus, or Selection changed actions <p>Add an interface trigger on page 3240</p>

What's changed
<p>Font size retained during bot runtime</p> <p>When you create a form, the font size that you selected in the Formatting > Font size drop-down menu is retained on the form during bot runtime.</p>
<p>Cancel option in the process and team setup page</p> <p>When a user edits a process or team in the Process setup and Process setup pages, the Cancel option replaces the previous X option to provide better clarity for the user to cancel the current page.</p>

Fixes	
Service Cloud case ID	Description
00781358	You can now add bots with table variables that do not have a default value to a process without encountering any errors.
00791703	When you use the desktop tray icon to open Automation Co-Pilot Desktop Assistant, dependent files are no longer displayed along with the application.
--	In the process editor, the Go To option now shows the Filter Task and Process Task options.
--	When you enter data in a form of your process that contains a hyperlink, the process data is no longer ignored and now works correctly.
--	When you use Process Task in the process editor, you can now use the Public folder option in the Select process file field.
--	In Bot Task and Human Task , when you select a box, the input is now accurately selected.
--	The Requests page is now correctly updated with the latest request events (such as completion of tasks) for users with an Attended license.
--	When you update to this release, a built-in scheduler now periodically checks for any disconnected or temporary devices and clears these entries.
--	When you open a form in the public folder, it cannot now be edited by changing the term View to Edit in the URL.
--	When a user logs in to Automation Co-Pilot Desktop Assistant, all the triggers associated with that user name are now available.

Limitations
<p>Users cannot edit a form or process in a public workspace, they must check out a form or process in order to edit in a private workspace. However, when users attempt to edit a form or process in a private workspace, they receive an Access denied error message due to the cache not being refreshed.</p> <p>Workaround: Navigate to the your private workspace, refresh the page to clear the cache, then edit your form or process.</p>
<p>An Automation Co-Pilot user with the AAE_Robotic Interface User license who is not apart of an assigned team can view all requests and tasks from other teams in the web interface. However, when the user attempts to access a request or task, they are prompted with an error message.</p>
<p>When a form is opened during bot runtime, the automated focus on the first form element is lost. For example, consider that Form A has various elements, and a Text Box element called Name is the first one. When Form A is opened during bot runtime, the focus is lost from the Name element and you cannot enter any values.</p> <p>Workaround: When a form is opened during bot runtime, click the form element to enter or change the value.</p>
<p>When you log in to the web interface as an administrator, for certain languages, the translated text on the left navigation pane is truncated (not displayed completely).</p> <p>Workaround: Hover over the menu item to view the tooltip, which displays the completely translated text.</p>
<p>In the Google Cloud Platform instance of the Automation Co-Pilot on the web interface, when you open a request that contains previously uploaded files, you might intermittently experience an error while downloading the files.</p> <p>Workaround: Retry downloading the file.</p>
<p>If a form has a table element and you use the Set action from the Interactive forms package during bot runtime, values are not applied to the table element.</p>
<p>If you selected the action trigger as Changed value for a Dropdown element within a trigger loop, any associated event is triggered during bot runtime even when there is a Reset action.</p>
<p>In an SDS setup, when you create a request to upload a file, the upload fails and a <code>SecurityTokenInvalidException</code> error message is displayed.</p>
<p>The Override output variable option in the End Process endpoint is not currently functional for users to override a variable definition.</p>

Discovery Bot

What's new
<p>View Groups of steps</p> <p>When reviewing a process view, you can now use the group option or icon to display groups of steps that belong to the primary level action and secondary level action (and subgroup level actions) used during the recording session.</p> <p>Use the group icon to help you decide what groups of steps to select for a task you want to automate. For example, a primary level action displays Microsoft Outlook, a secondary level action displays Outlook mail notification, and subgroup level actions display terms such as Email -Add To, Email – Add Subject.</p> <p>Create a process view with branches and opportunities</p>
<p>Use Dynamic option for system-generated views</p> <p>You can now use the Dynamic option from the Model options to view recordings where groups of steps display a set of repeating patterns that belong to the same application or same primary level action used during the recording session.</p> <p>Use this option to decide the context of the process or the task you want to automate. Groups of steps that are labeled belong to supported applications such as Microsoft (Excel, Outlook, and Notepad), Notepad++, text editors, most windows use cases, and Chrome browser functionality.</p> <p>Create a process view with branches and opportunities</p>
<p>Enhancements to PDD Word document</p> <p>The PDD Word document now includes a process recording flow chart and the time on each individual step in hours, minutes, and seconds.</p> <p>Review opportunities and convert to</p>

Fixes	
Service Cloud case ID	Description
--	The Control Room installer for Red Hat Enterprise Linux (version 7.7 or 7.9) now includes the Discovery Bot package. Previously, you had to log in to the Control Room as admin, select Manage > Package > Upload , and upload the Discovery Bot package.

Limitations
<p>In a Linux environment, when you record a process using the Discovery Bot recorder, the recorder window opens for 4 seconds and then disappears. The error occurs because the <code>ProcessDiscovery</code> folder is missing in the following directory: <code>/var/automationanywhere/enterprise/appdata/Server Files/</code>.</p> <p>Workaround: Perform the following steps to create an empty <code>ProcessDiscovery</code> folder manually and provide write access to the folder:</p> <ol style="list-style-type: none"> 1. Navigate to the following path in the Control Room directory: <ol style="list-style-type: none"> a) If you have updated from an earlier version to v.22, navigate to <code>/opt/automationanywhere/enterprise/appdata/Server Files</code> b) If you perform a new installation of v.22, navigate to <code>/opt/automationanywhere/automation360/appdata/Server Files</code> 2. Run the <code>sudo mkdir ProcessDiscovery</code> command to create an empty folder for <code>ProcessDiscovery</code> in the specified Control Room directory. 3. Run the following command to provide the required read and write permission for the newly created <code>ProcessDiscovery</code> folder: <ol style="list-style-type: none"> a) <code>sudo chown -R crkernel:controlroom ProcessDiscovery/</code> b) <code>sudo chmod -R 775 ProcessDiscovery/</code>
<p>When you upgrade to A360 v.22, you might receive multiple email notifications about the PDD generated in A360 v.21.</p>
<p>When you add branches to the left and right sides of the main branch, the Recording flow chart section of the PDD might not capture the entire process work flow, including all the branches.</p>

IQ Bot

What's new
<p>IQ Bot standard forms integration with IQ Bot Extraction</p> <p>You can now use the IQ Bot Extraction package for data extraction from standard forms documents.</p> <p>Using IQ Bot Process documents action on page 2652</p>
<p>Confidence threshold applicable on standard forms learning instance</p> <p>For a standard forms learning instance, if the Confidence threshold value that you have set does not match any field, the document is moved to the Validator and a notification icon is displayed. This update now enables you to validate the document for the learning instance and also save the document.</p>

What's new

Additional OCR engines for IQ Bot Extraction package

In addition to the existing OCR engines, IQ Bot Extraction package now supports the following OCR engines:

- Microsoft Azure 2.0
- Google Vision API

[IQ Bot Extraction package](#) on page 2644

Export IQ Bot dashboard data

A user with the **AAE_IQ Bot Admin** role can now export the following data from the dashboard to a CSV file using the **Export** icon:

- Documents processed
- Pages uploaded
- Straight-Through Processing
- Accuracy

The CSV file is saved to the local Downloads folder.

IQ Bot support for self-signed certificates

You can create a self-signed certificate with Subject Alternative Name (SAN) to use an SSL certificate for multiple domains.

[Creating a self-signed certificate with Subject Alternative Name](#) on page 1393

What's changed

IQ Bot package supports external proxy server settings (Service Cloud case ID: 00727414, 00725235, 00757568, 00753560, 00753560, 00786609)

The **Download all documents** and **Upload Document** actions in the IQ Bot package now support external proxy server settings.

IQ Bot Python library upgrade (Service Cloud case ID: 00756943, 00791511)

IQ Bot now uses Python version 3.9.5 for data extraction.

What's deprecated
<p>IQ Bot [Local Device] package</p> <p>The IQ Bot [Local Device] package is deprecated from this Automation 360 v.22 (Build 10526). Instead, use the IQ Bot Extraction package, which provides the same capabilities as the IQ Bot [Local Device] package, along with additional improvements.</p> <p>IQ Bot [Local Device] package replaced by IQ Bot Extraction package (A-People login required)</p>
<p>Note: Before using the IQ Bot Extraction package, update the bots associated with the IQ Bot [Local Device] package and restructure the output folders.</p>
<p>IQ Bot Extraction package on page 2644</p>

Fixes	
Service Cloud case ID	Description
--	If you delete a .csv file from the Success folder, you can now download the remaining files from that folder.
--	When you use the IQ Bot Extraction package for processing a large set of documents, you no longer encounter any document processing issues with Bot Agent.
--	If an incorrect value was used in the <code>providerVersion</code> field when you uploaded standard forms configurations to IQ Bot, an error notification is now displayed when you select this configuration when creating a standard forms learning instance.
00806805	You can now import a learning instance using the Migration Utility feature as the <code>Invalid Group</code> error message is now resolved.
--	When you creating a learning instance using standard forms, all the available pre-trained models are now listed in the Select Model drop-down menu.
00703856	IQ Bot now correctly extracts table rows with numeric values even when they are within parenthesis.
--	The File Download API now returns a correctly formatted JSON response with a colon (:) separating the key-value pairs.
00694656	IQ Bot now successfully extracts values from the documents that have new table fields added after training.
00636887	<p>An error notification is now displayed if you upload documents with file names longer than 150 Asian language characters in the staging environment.</p> <hr/> <p>Note: This is not applicable to a production environment.</p> <hr/>
--	IQ Bot cloud data query is now optimized to prevent overloading of the Amazon Relational Database Service.

Fixes	
Service Cloud case ID	Description
00782994	When you use the Migration Utility to move a learning instance between environments, unclassified data is no longer exported.
00747137	You can now import learning instances using the Migration Utility feature without any issues.

Limitations
The value displayed in the My totals > Accuracy field sometimes does not match the value in the My learning instances > Field accuracy for the available learning instances.
If you try to import a learning instance into an IQ Bot environment that has a deleted learning instance with the same name, the following message is displayed even though the learning instance is not imported: <code>Import process initiated</code>
If you access IQ Bot without the correct permissions, they are redirected to an Access denied page, where the back button does not work. Workaround: Close the current tab and open the Control Room.
When you select Other domain in the learning instance creation page, the tooltips for the table and form fields state that these fields are optional. However, these fields are required to create a learning instance.
IQ Bot installation sometimes fails and the following message is displayed: <code>Failed to upgrade the DB: -1</code> . When this issue occurs, retry the installation.
(Service Cloud case ID: 01016516, 00757943, 00787404, 00788421, 00807528, 00822941, 01018972) If you add multiple ABBY OCR based commands (such as IQ Bot Pre-processor, Document Classifier, AISense Recorder, OCR) in a single bot, an error message is displayed when you run the bot. Workaround: Ensure that you do not add multiple commands in a single bot.
(Service Cloud case ID: 01063054) You cannot import a learning instance with a long name (>50 characters) because IQ Bot only supports up to 50 characters in the Label field.
If you use the Process documents action from IQ Bot Extraction package to upload documents, the validation rules from the default the validation group that you set are not applied. As a result, the failed documents are not classified into any of the existing groups and are moved to Validator.
In the IQ Bot Community Edition, when you use a Cloud OCR to create a learning instance, if you use the IQ Bot Process document action from the IQ Bot Extraction package, the values from the uploaded invoices or documents are not processed successfully. Workaround: If you use the Cloud OCR to create a learning instance, use the IQ Bot Upload Document action from the IQ Bot package.

Limitations
<p>After you train a bot and click Save and go to next group, the system fails to load the next group. Instead, it reloads the same group.</p> <p>Workaround: Perform the following steps:</p> <ol style="list-style-type: none"> 1. Refresh the page. 2. Navigate to Learning Instances and click Bots to edit the Learning Instances.
<p>System identified regions are not generated when a non-English filename is uploaded using the Invoice domain and processed with the AutoExtract command.</p> <p>Workaround: To process the document, convert the non-English filename to English characters.</p>

Bot Insight

Fixes	
Service Cloud case ID	Description
00788583	In the Profile tab, when you edit, save and generate a business dashboard and the dashboard is not saved, the error message description is now translated correctly in the Chinese language. Previously, if an error occurred when you saved the edits in the Profile tab of the Business dashboard, the error message description displayed garbled text.
00729920	When you migrate a task from a source (UAT) to a target (production) environment, a Published dashboard copy is no longer deleted from the source environment.
00742260	You can now export data from operational or custom dashboards after applying a non-metric variable in the filter. Previously, the data was not exported when you toggled between different chart types.
00738228	Multiple dashboards are no longer created for a Task Bot when you update and execute a bot that is checked out from the public workspace. Previously, when a bot was executed after an update, multiple dashboards were created.
00757992	A user with the Bot Creator license can now access all the Bot Insight dashboards (Operations and Business tabs) irrespective of their assigned role. Previously, if the user had the Bot Creator license with the AARI Admin role, they were not able to access these dashboards.

Limitations

(Service Cloud case ID: 00733555, 01912503) In a dashboard, the data labels in the pie chart overlap if it contains many slices. As a result, the labels in pie chart are not clear and shown only when you hover over the slices.

Workaround: To view the data labels in a pie chart in clear and readable format, export the dashboard data to Excel file.

Note: Due to a limitation within the third-party recharts library, you might observe labels overlapping issue with data in downloaded PDF as well.

Important: For information about the packages supported with this release, see [Packages available in Automation 360](#) on page 2225.

Automation 360 v.21 Release Notes

Release date: 09 June 2021

Review what's new and changed, and the fixes and limitations in the Automation 360 v.21 release. Automation 360 (Cloud and On-Premises) is on Build 9664. Automation 360 IQ Bot Cloud is on Build 9664 and On-Premises is on Build 9642.

Patch release updates

We have updated Automation 360 Build 9664 (Cloud and On-Premises) for the following fixes:

- Process deployments containing forms with empty table, check box, or text box are failing after the Automation Co-Pilot Cloud build is updated from the previous release to this current release (Service Cloud case ID 00788255).
- The layout of the request view page changes when another language other than English is selected (Service Cloud case ID 00772925).
- Warning messages in the process editors render garbled characters due to missing UTF-8 encoding (Service Cloud case ID 00781891, 00784947).
- Users (with the attended license) are not redirected to the Automation Co-Pilot Desktop Assistant application due to users (without the attended license) trying to connect to the Automation Co-Pilot Desktop Assistant application beforehand on the same device.
- Not able to capture keystroke actions on an application using the Universal recorder (Service Cloud case ID 00785310).
- Files were missing from the embedded resource folder, causing issues in using the Recorder package (Service Cloud case ID 00767315, 00777786, 00775209, 00788523, 00797261, 00795511, 00785246).
- Bot deployments are getting stuck in a queue after Automation 360 Cloud is updated from the previous release to this release (Service Cloud case ID 00784333, 00784890, 00784382, 00784338).
- Cloned bots are losing their dependency when they are checked-in (Service Cloud case ID 00780756).

- The recording duration was not updated correctly under **Process Cycle** on the process card, and the recorded steps were not captured by the recorder (Service Cloud case ID 00790884, 00781022).

Updating to this release

You can update the Automation 360 v.21 release from the previous three releases (that is, from n – 3 releases, where n refers to the latest release). The following previous releases are certified for update to this release:

- v.20 (Build 8815)
- v.19 (Builds 8147, 8145, 8122, 8098)
- v.18 (Build 7560)

You can directly update to v.21 from any of these builds. For details on how to update, see [Update Automation 360 to latest version](#) on page 1363.

Note: If you are not on an n–3 release, update Automation 360 to one of the three certified releases before updating to this release.

Important: This release includes a required update to your . Ensure that you complete the update to continue with your automation activities when upgrading from a previous release to this release.

[Automatically update the Bot Agent](#) on page 1302 | [Manually update the Bot Agent](#) on page 1303

To verify which version is compatible with this release, see [Compatibility with release builds](#) on page 1275.

Enhancements to browser extensions: The Automation 360 extensions for Google Chrome (version 1.2.0.0), Microsoft Edge (version 1.2.0.0), and Mozilla Firefox (version 1.2.0.2) now include the following enhancements:

- Support for HTML buttons and text actions in Interface trigger
- Enhancements to the default search criteria for text boxes and check boxes using Recorder package.
- Fixes for capturing objects with characters not valid in XML using the Recorder package.

- Fixes to the Discovery Bot recorder with default browser (Google Chrome) search page.

Migration features

Enterprise 11 and Enterprise 10 features
<p>New system role to perform migration</p> <p>Assign the AAE_Bot Migration Admin system role to the user who will perform migration. This role contains all the permissions required to view and manage the bot migration process. Using this role eliminates the manual effort of creating custom roles, selecting the required permissions, and assigning them to the users who perform the migration.</p>
<p>Enhanced bot runtime window</p> <p>When you migrate bots using the Bot Migration Wizard, the bot runtime window now shows the name of the Enterprise 11 or Enterprise 10 bot file that is currently migrated.</p>
<p>You can now migrate bots with the Open webpage in a new window and Open a webpage in an existing window settings.</p>
<p>You can now migrate Enterprise 11 and Enterprise 10 bots with multiple versions of a DLL.</p>

Enterprise 11 only features
<p>MetaBot screens: Custom objects and play mode enhancements</p> <ul style="list-style-type: none"> • Custom objects within the Image play mode are now fully supported. • Linked objects are now captured.
<p>Enhanced Hide/Show option in Control Room</p> <p>For bots available in the Control Room (the <code>My bots</code> folder), a filter is available to hide or show older <code>.mbot</code> and <code>.atmx</code> files displayed in the window.</p>
<p>Global values for SAP</p> <p>The migration process creates the <code>JcoDllPath</code> and <code>JcoJarPath</code> global values of type string to support migration of SAP BAPI.</p>
<p>Enhanced Database action functionality</p> <p>The Database action now supports connecting to Oracle databases using <code>SID</code> and or <code>Service_name</code>. In previous releases, only connecting with <code>SID</code> was supported.</p>
<p>New email variable strings</p> <p>New email sent and received string variables are available for the Loop, Import DataSet, and Export Dataset actions to insert sent values for date and time.</p>
<p>Enhanced Microsoft Exchange Web Services support</p> <p>The Send function in the Email package supports EWS OAuth2.0, improving backward-compatibility.</p>

Enterprise 11 only features

Manually migrate from Enterprise 11 to Cloud-enabled environment

You can now manually migrate from Enterprise 11 to a Cloud-enabled environment. In this migration, you must create all the entities such as users, roles, and credentials manually, except bots. All Enterprise 11 versions are supported for this migration.

[Prepare for Enterprise 11 to Automation 360 Cloud-enabled migration](#) on page 1513

Enterprise 10 only features

Migrate MetaBots screen with Password type variable

You can now migrate Enterprise 10 bots based on the MetaBot screen, which uses the **Password** type variable. During the migration, the logic (.logic file) in the .mbot file is migrated as a new Task Bot within the MetaBot folder. Also, the **Password** type variable is migrated as a credential variable and is assigned to a predefined locker.

Migrate Task Bots based on MetaBot Screen and DLL assets without using Logic

You can now migrate a Task Bot that references the Run MetaBot action for the MetaBot Screen and DLL assets directly, without using the MetaBot Logic. So you can migrate a Task Bot that contains MetaBot Screen and DLL assets.

Automation Workspace

What's new

Automation 360 navigation enhancements

We have enhanced the overall readability and accessibility of the Automation 360 interface. To make navigation easier, menus and views are organized based on frequently used features and related tasks.

The interface includes the following updates:

- The Device, Profile, and Help icons are now located at the bottom of the navigation menu, consolidating all controls on the left for easy access.

When you click these icons, flyout panels of content and actions are shown.

- The side navigation menu can be collapsed to a slim bar to maximize the main workspace area.

You can continue to use the side navigation in collapsed mode, with flyouts for each section.

[Automation 360 navigation updates](#)

What's new
<p>Authenticate database connection with Microsoft Azure Active Directory credentials (Service Cloud case ID 00676448)</p> <p>You can now authenticate the Control Room database connection using Microsoft Azure Active Directory credentials when you install the Control Room on Microsoft Azure.</p> <p>Configure Microsoft database type and server on page 1198</p>
<p>External Key Vault enhancements</p> <p>External Key Vault support for AWS Secrets Manager and CyberArk for Auto-login and Automation credentials has been added to Automation 360. Auto-login credentials and Automation credentials (credentials used by bots) can now be retrieved from the configured external key vault.</p> <p>Integrate external key vaults on page 1193</p>
<p>Deploy workload automation on a multi-user Windows terminal server</p> <p>To optimize workload automation and multi-user devices, you can deploy workload automations on a multi-user Windows terminal server so that a single device can process multiple work items concurrently.</p> <p>About multi-user devices on page 1811 About device pools on page 1816</p>
<p>Control Room and Bot Agent compatibility checks for automation</p> <p>To manage the lifecycle of your automation, you can view dependency information about minimum compatible Control Room and Bot Agent versions when you create and deploy automations. You can then update your automation and reduce runtime errors caused by an incompatible Control Room or Bot Agent version.</p> <p>Actions to build bots on page 2272</p>
<p>New actions in the SAP BAPI package</p> <p>Use the following new actions:</p> <ul style="list-style-type: none">• Run standard workflow: Runs a standard workflow in SAP BAPI.• Run custom workflow: Runs a custom workflow in SAP BAPI. <p>SAP BAPI package on page 2876</p>
<p>New actions in File package</p> <p>Use the following new actions:</p> <ul style="list-style-type: none">• Get name: Reads a file name and stores it to a string.• Get path: Reads the path of the file and stores it to a string. <p>File package on page 2513</p>
<p>Common table expression supported in Database package</p> <p>You can now use common table expression (CTE) in the Read from action using the <code>WITH</code> keyword in SQL-compliant databases such as Oracle and MySQL. Use CTE statements within a SQL query to simplify complex joins and subqueries.</p> <p>Using the Read from action on page 2388</p>

What's new
<p>Support for large numbers in Number package (Service Cloud case ID:00557619)</p> <p>You can now perform mathematical operations for large numbers with more precision in the Number package.</p> <p>Number package on page 2697</p>
<p>Snowflake database support using ODBC driver (Service Cloud case ID:00761695)</p> <p>Snowflake ODBC driver is now supported in the Database package. You can connect to the Snowflake database using ODBC-based client applications.</p> <p>The following actions support this feature:</p> <ul style="list-style-type: none"> • Connect • Disconnect • Read from • Export to data table • Insert/Update/Delete
<p>Variables: new features and enhancements (Service Cloud Case ID:00740585)</p> <ul style="list-style-type: none"> • Edit the variable name after the variable is created. • Delete all or a specific selection of unused variables from a bot.
<p>Universal Recorder new features and enhancements</p> <ul style="list-style-type: none"> • Record object interactions in applications built on the Electron framework. • Perform double-click in all supported applications and browsers.
<p>Limit credential attribute use to password fields only (Service Cloud Case ID:00740585)</p> <p>When you create or edit a credential attribute, ensure that bots input the attribute value only in fields that are identified as password fields by selecting the Set this attribute as a password option.</p>
<p>Organize device pools to check for available devices in a preferred order</p> <p>If you select multiple device pools (either in the Run now or Schedule window), you can now arrange the device pools in the order of preference. When a bot is deployed, the Control Room selects the first available device based on the order in which you organized the device pools. If none of the devices are available at the time of deployment, the bot is queued.</p>
<p>Default names for output variables</p> <p>When you configure an output variable for the actions in the Error handler and Python Script packages, the Control Room automatically generates a descriptive default variable name. If you create more than one output variable for an action, the subsequent variable names are appended with a -1, -2, -3, and so on to avoid a variable name conflict.</p>

What's new
<p>New string action to support nested variables</p> <p>Use the String > Evaluate value action to compare a user-specified string variable with the string variables in the bot. If a match is found, the action returns the value of the matching variable.</p> <p>String package on page 2957</p>
<p>Delete Global values</p> <p>A user with the AAE_Admin role can delete a global value from the All global values page.</p> <p>Global values on page 2260</p>
<p>High availability support</p> <p>For Cloud-enabled users, high availability is supported through three-node deployments.</p>
<p>String package enhancement</p> <p>A new option to support local numbering styles is now available in the String package. You can now select your local format, represented by ISO-3166.</p>
<p>Dependent files and package information in Export package audit details</p> <p>In the Audit details of an exported package, you can now view the list of dependent files and packages associated with the exported package. This feature enables you to analyze what the exported package contains and identify any discrepancies. If you chose to include packages during an export, then only the package information is included in the audit details.</p>
<p>ODBC driver support for all connection strings (Service Cloud Case ID: 00748887, 00777676)</p> <p>An Open Database Connectivity (ODBC) driver is now available to support all the ODBC connection strings in the same way it was used in the Enterprise 11 version. Using SQL as a standard for accessing and managing data, you can connect to MySQL, Google BigQuery, Snowflake, and other databases using the ODBC driver.</p>
<p>Share a DLL session</p> <p>You can now share a DLL session between bots.</p>
<p>New CredentialAllowPassword annotation</p> <p>Use the new CredentialAllowPassword annotation in the package SDK to allow the selection of a credential attribute marked as a password. You can use this annotation when creating a new SDK package or when modifying an existing one.</p> <p>Configure and use credential allow password annotation on page 3401</p>

What's new

Enhancements to check-in, check-out, and cloning permissions (Service Cloud Case ID: 00645904, 00720237, 00752197, 00760306, 00764684)

- When performing a check-in, you can now choose the dependencies to check in along with the bot. Directly referenced dependencies will be automatically checked in with the bot.
- When a bot is checked in along with a cloned bot and there are no other bots dependent on the clone, the cloned bot is now deleted.
- When performing a check-out, you can now choose the dependencies you want to check out with the bot. The dependencies that are not selected during the check-out are now cloned.
- During check-out, you can now overwrite or replace a cloned bot.

Bot Agent installer includes shortcut for Automation Co-Pilot Desktop Assistant

A shortcut to access Automation Co-Pilot Desktop Assistant easily is added on the desktop and Windows menu when you install a Bot Agent.

[Install Bot Agent and register device](#) on page 1288

What's changed

Bot Scanner shows invalid bots in "cannot be migrated" list

The Bot Scanner is updated to show invalid bots as blocked from migration because these invalid bots were failing before and after migration. For example, Enterprise 11 or Enterprise 10 bots that referenced non-existent variables failed. So some bots will no longer be shown in the can be migrated list of bots but will instead be shown in the cannot be migrated list in the output report. This can decrease the number of bots that can be migrated to Automation 360.

Change in names of file locations and folders

File locations and folder names are now updated for the change in product name (from Enterprise A2019 to Automation 360). For example, the file location for the default installation path is changed from C:\Program Files\Automation Anywhere\Enterprise\ to C:\Program Files\Automation Anywhere\Automation360. We will be updating these locations and names on our documentation pages soon.

Source string is optional in Split action (Service Cloud case ID: 000687257, 00702258)

In bots (including bots migrated from Enterprise 11), when you use the **Split** action in the String package, the **Source string** field is now optional. You can run the bot without providing a source string value. Migrated bots that contain empty input strings now execute successfully.

What's changed
<p>Mandatory prerequisites validation before migrating bot</p> <p>When you migrate bots using the Migrate bots option in the Bot Migration Wizard, a prerequisite validation message appears with a checklist of all the validation items. The system now validates these prerequisites automatically to ensure that all prerequisites are met before you start the bot migration. Previously, validating prerequisites was optional.</p> <p>If the prerequisite validations are completed with a failure, a validation report appears with the list of items for which validation failed. If the prerequisite validations are completed without any failure, the bot migration is started.</p>
<p>Change in default Control Room database name</p> <p>The default Control Room database name is now changed from AAE-Database to Automation360-Database.</p> <p>If you are upgrading from an earlier release to this release, enter your existing Control Room database name to preserve your data.</p>
<p>Microsoft SQL Server clustering for high availability</p> <p>You can now use Microsoft SQL Server clustering for automatic and graceful failover of high availability deployments in Control Room clusters.</p> <p>Database requirements on page 1132</p>
<p>Bot Agent nickname is hidden</p> <p>The nickname of a Bot Agent (added during installation) is now hidden when you switch the registration of a user device from one Control Room instance to another.</p>
<p>User interface change in the Open action of Excel packages</p> <p>In the Excel basic and Excel advanced packages, the Sheet contains header check box now appears below the Select file field.</p>
<p>User interface change in the Variables palette</p> <ul style="list-style-type: none"> • The User-defined variables list is now named Your variables • System, String, and Clipboard variables are organized within Predefined variables
<p>Digits with comma considered a valid number (Service Cloud case ID: 00623458)</p> <p>In migrated bots, a set of digits that uses a comma is now considered a valid number. This change enables you to successfully verify mathematical operations and If, Elseif, and Loop variable conditions containing various operators.</p>
<p>Date comparison works with dates in different formats (Service Cloud case ID: 00723479)</p> <p>Date condition actions are now successfully migrated to the equivalent date conditions in On-Premises. The date condition now works with multiple subformats of the main format (MM/dd/yyyy). Therefore, you do not have to manually change the date format per the source format of the migrated bots that contain date strings.</p>
<p>Use string value with numeric operators</p> <p>Migrated bots that contain If or While actions that use string values or a variable containing a string value with <, <=, >, and >= numeric operators now run successfully.</p>

What's changed
<p>Enhancement to Extract field action in PDF package</p> <p>Use the PDF viewer in the Extract field action to extract all the form field data and selected text, and store the form data to variables.</p> <p>Using the Extract field action on page 2765</p>
<p>Connect automatically to SQL server for Windows authentication (Service Cloud case ID: 00691554)</p> <p>When you upgrade the Bot Agent, you no longer have to add d11 files manually to connect to the Microsoft SQL Server using Windows authentication.</p> <p>Previously, users had to manually add d11 files to configure devices and use the Connect action from the Database package to connect to the Microsoft SQL Server with Windows NT authentication.</p>
<p>Enhancement to Active Directory mapping</p> <p>You can now create AD groups using commas in the naming on the AD server side and the Control Room side. Previously, this caused an error.</p>
<p>Enhancement to the Split action of String package</p> <p>Migrated bots now run successfully when the Split action is used to split a string available in an input variable and that variable is empty.</p>

The following table lists the fixes and the builds in which they were fixed. Build 9664 is the latest build for Cloud and includes fixes from the previous builds. On-Premises is on Build 9664.

Fixes		
Build	Service Cloud case ID	Description
9664	00803314	<p>The following issues are fixed in the latest version of the Cloud Migration Utility:</p> <ul style="list-style-type: none"> The utility checks the current version of your Enterprise 11 Control Room and proceeds only if that version is supported for migration to Automation 360. The utility displays the target tenant information on the successful validation screen when you navigate to the migration code screen. An error is no longer encountered when access is provided to: <code>https://aws.amazon.com</code> and <code>https://aa-provsvc.globalservices.automationanywhere.</code> The utility uploads all the required data to Automation 360 Cloud.

Fixes		
Build	Service Cloud case ID	Description
9664	00790884, 00781022	The recording duration for a process is now correctly displayed under Process Cycle on the process card. Previously, you were not able to view the recording duration because of a delay in the network connectivity. You can now view all recorded steps captured by the recorder from the Recordings page.
9664	00785310	You no longer encounter any issue when you use Universal Recorder to record keyboard actions on an application. The Universal Recorder now captures the value of keystrokes properly. Previously, the Universal Recorder captured only the first value of the keystroke.
9664	00767315, 00777786, 00775209, 00787736, 00797261, 00795511, 00796245, 007956217, 00798533, 00795084	You no longer face issues because of global cache expiry and partially deleted files in the embedded-resources folder (C:\ProgramData\AutomationAnywhere\GlobalCache\embedded-resources) when you install a Bot Agent for this release and capture objects in Google Chrome using the Recorder package. Note that, if the Bot Agent device has embedded resources folder partially deleted, you must first delete the global cache and update the Bot Agent.
9664	00796598	When you run workload bots with queue on Bot Runner devices, the bots do not fail intermittently after Automation 360 Cloud is updated from the previous release to this release.
9642	--	Control Room instances configured with Active Directory for authentication with the retrieval of credentials from an external key vault were unsuccessful due to incorrectly prepending domain names in object names (CyberArk) and secret names (AWS) and caused authentication to fail. This issue is now fixed and object names (CyberArk) and secret names (AWS) are now properly formatted.

Fixes		
Build	Service Cloud case ID	Description
9637	00784333, 00784890, 00784382, 00784338, 00780635, 00791587, 00795559, 00795632, 00797130, 00797113, 00791783	Bot deployments are no longer stuck in a queue after Automation 360 Cloud is updated from the previous release to this release.
9637	00780756	You can now check in bots that have a shared dependency with other bots successfully. Previously, check-in failed because of an issue with the cloned bots losing the dependency during check-in, irrespective of their existing parent bots.
9595	00733638, 00756399	Bots that use a variable to specify the child bot to run no longer encounter an error because the variablized path contains a backslash.
9595	00711390	The retry mechanism now enables you to migrate large .atmx files. Previously, when a large .atmx file was migrated, the connection with the Control Room became stale or unauthenticated, resulting in a <code>NoHttpResponseException</code> error. With the retry mechanism, the Migration utility attempts to build a connection with the Control Room 5 times until the connection is successfully rebuilt.
9595	00730369, 00747866	Recorder actions now work properly, which enable you to run the migrated bot without any delay. Previously, it took a longer time to run the bot due to a long delay.
9595	00733383, 00754559	The Loop counter variable now works properly for migrated bots. The variable is now migrated as part of the XML and the Data Table commands.
9595	--	When updating the SQL queries on a migrated bot using the Read from and the Insert/Update/Delete actions of the Database package, the existing format of the query is no longer automatically modified. Previously, when editing the SQL queries on a migrated bot, the characters were being misplaced.

Fixes		
Build	Service Cloud case ID	Description
9595	00721238	You can now use the Browser action to access a URL with parameters using the Microsoft Edge browser. Previously, when a URL with parameters through the Browser action was accessed using Microsoft Edge, the URL parameters were truncated from the & (ampersand) character after the bot was run.
9595	00721488	Enterprise 11 bots that use the Get multiple nodes command no longer provide a different output after migration. Previously, the migrated bot returned output per the structure of the XML file, while the Enterprise 11 bot provided output in a single line.
9595	--	You no longer encounter an issue when you run bots migrated from Enterprise 11 that use identical names for variables differentiated by a hyphen or an underscore (for example, L-Lower and L_Lower). The variable name that contains a hyphen is now appended with some keywords (for example, variable Arr-val is updated to Arr-val-MIG-SPL-25). Previously, bots failed to execute after migration.
9595	00729931	After migration, when the bot file is generated, the correct DOMXPath is now migrated. Previously, an incorrect DOMXPath was migrated.
9595	00738643	The If and Loop conditions when used in a combination of multiple AND or OR conditions now works properly. Previously, using the If and the Loop conditions with multiple conditions resulted in a bot logic error.
9595	00743808, 00754554	Migrated bots that use the If command with a variable in the HH:MM format now work properly and no longer encounter any issue.

Fixes		
Build	Service Cloud case ID	Description
9595	00678059	You can now download exported packages if the bot name contains Japanese characters and an underscore (_). Previously, if the name contained such characters, an unexpected error occurred that restricted the user from downloading the package.
9595	--	When you run a migrated bot that contains the Excel Advanced > Find action, the found cell is now active and subsequent actions can perform operations on that active cell.
9595	00731512	You can no longer edit a bot and change the bot repository file path from the public to private folder by updating the Control Room URL and repository path in the browser.
9595	00734059	INFO type messages are no longer duplicated in the Control Room WebCR.1 log file.
9595	--	When you install a Bot Agent at the user level, the user device is now registered as admin.
9595	00744663, 00747831, 00737488, 00752613	You can now successfully export a bot that contains the Recorder package.
9595	00726433	Fixed an issue with Microsoft Graph APIs that caused errors when a bot downloaded files from OneDrive. Bots can now successfully run the Office 365 OneDrive > Download file action.
9595	00703553	When a new user is created, the Audit API now returns the correct values for the eventDescription and userName parameters.
9595	00729563	The atmx file extension is no longer case-sensitive. You can now migrate tasks that include uppercase or lowercase letters in their file extensions. Previously, tasks with uppercase letters in their file extensions were not migrated by the Bot Migration Wizard.

Fixes		
Build	Service Cloud case ID	Description
9595	00740548	Bot status is now correctly displayed after a process is executed. Previously, scheduled bots were occasionally mislabeled as <code>In progress activity</code> even though the bot had completed the process.
9595	00731508	You can now enter Nordic characters in the credential attribute and credential variable values.
9595	00695176, 00692676	Newly copied bots containing an event trigger now run when the triggering event occurs.
9595	00759742	When you insert a variable in a text string, the variable is now inserted at the cursor position. Previously, the variable was inserted at the end of the string and not at the cursor position.
9595	--	You can now successfully deploy bots from the Bot editor. Previously, when the Bot Creator or Bot Runner (attended or unattended) user logged in to the Control Room and if the package download option was enabled, the package download took priority and bot deployment had to wait until the package download was completed.
9595	00730211	When you use the Recorder package > Get property action to extract the path property of the object, the recorder now retrieves the value of the height and path attributes of the captured object. Previously, the height and path attributes of the recorded object were not retrieved by the bot.
9595	00716793	An issue is no longer encountered when you execute a bot using the SOAP Web Service package with unformatted input parameters. Previously, bot execution failed with an error because the unformatted input parameters were not formatted in XML format by the bot.

Fixes		
Build	Service Cloud case ID	Description
9595	00706709	In the Email package, when you use the Outlook connection to retrieve emails with the date filter, all emails are now retrieved correctly. Previously, all the emails were not retrieved from the application when the date filter was applied.
9595	00714292	To support double backslashes (\\) in the file location for actions that use file input, you must now set the Bot compatibility version as 2 in the Advanced settings page of the Bot editor. Previously, the bot execution failed because the double backslash (\\) in the file location was replaced with a forward slash when you select a network path using Browse option.
9595	00697460	When you select the recorder in the If condition, the recorder now locates the object in the Oracle EBS application and captures the correct object properties without any error. Previously, the recorder failed to find the object when captured in the If condition.
9595	--	In Microsoft Edge or Firefox, when a bot opens a website inside a loop, the Recorder Capture action now works properly after the launch website operation is executed. Previously, the action failed after launch website was executed.
9595	00710257	In the Recorder package, the Capture action now works without encountering any issues. Previously, the Recorder failed with a timeout error because the network proxy details were not retrieved.
9595	00735480	A Task Bot now performs better when you use the Loop action to execute a bot. Previously, the Task Bot took a long time to complete execution.

Fixes		
Build	Service Cloud case ID	Description
9595	00559868	When you use Datetime package > Assign action to convert a DateTime variable using the custom format dd-MMM-yyyy, the bot now executes without any errors. Previously, the bot execution failed due to case-sensitive characters in the DateTime format.
9595	--	Migration of PaaS database (Azure SQL) connection strings by using an ODBC driver is now supported.
9595	00733651	You can now view the average time spent to create a Task Bot metric in the Control Room on different pages when you click a page number.
9595	00742305	When you turn off one node on a three-node cluster and log in to the Control Room, the following error is no longer displayed: <code>Cluster group is empty</code> .
9595	00712190, 00698197, 00700574	When you deploy a bot with string values that exceed the allowed limit of 2 - 4 MB, the Control Room recognizes it as an exception and now shows the following error message: <code>400 Bad Request</code> .
9595	00754585, 00755448	When you run a bot, dependencies including the child bots are now downloaded. The bot no longer shows an unknown status and session as expired.
9595	--	When you now migrate the Database command, no additional configuration is required.
9595	00745046	You can now check in your bots without encountering any issues. Previously, bot check-in failed because the Git repository was corrupted intermittently.
9595	00677638	When you add a user device as the default device in the Control Room, the Devices page now automatically displays it as the default device. You no longer have to re-log in to the Control Room or refresh the Control Room page.

Fixes		
Build	Service Cloud case ID	Description
9595	00733370	Users signed in to temporary (non-persistent) shared devices can now sign in to the Control Room after a previous session on the temporary device is deleted by the Control Room administrator.
9595	00736950	MetaBots using Japanese characters (double-byte string) as the output variable can now be successfully saved and executed after the MetaBots are migrated to On-Premises using the migration wizard.
9595	00723924	The Terminal Emulator type ANSI now accepts a password that contains braces or {}. Previously, when braces were used in the password, an invalid username and password error message was shown in the terminal screen.

Limitations
<p>(Service Cloud Case ID: 00797199) If multiple instances of Bot Agent in Google Chrome browser are displayed and multiple Google profiles (accounts) are open in the browsers, you might not be able to use the Recorder > Capture command. You might see an error message that informs you that the Google Chrome plug-in not installed.</p> <p>Workaround: Automation 360 supports only a single profile for automation. Therefore, we recommend that you either configure a single Google profile in Google Chrome or, if you are using multiple profiles simultaneously in Google Chrome and want to automate one profile, enable the Automation 360 extension for Chrome on only one of the Google profiles.</p>
<p>(Service Cloud Case ID: 01071731) When you open a CSV or TXT file, read data from that file, and write the data from a Table type variable to the file, the bot fails with an error if the CSV or TXT file contains large data sets. Also, Create folders/files if it doesn't exist and Override existing file check boxes are selected in the Write to file action.</p> <p>Workaround: Perform one of the following:</p> <ul style="list-style-type: none"> • In the task, when you use the Open action for a CSV or TXT file, select the Contains header check box to prevent your bot from failing. • Use the Excel advanced Open action to open a CSV file and then use the Write from data table action to write data into the file.

Limitations
<p>(Service Cloud case ID: 00793818) If you edit a large number of schedules simultaneously (for example, more than 40) in the Control Room from the Scheduled activity page, the schedules will not be activated.</p> <p>Recommendation: Use the edit option for each schedule to avoid overwhelming the scheduler.</p>
<p>(Service Cloud case ID: 00805571) When the Bot Agent is automatically updated for Cloud deployments, the status of the Bot Agent flickers (changes) between Connected and Updating on the Devices page. The Bot Agent logs indicate that the auto-update process is initiated, but the device does not connect to the WebSocket server.</p> <p>Workaround: Delete the local database file <code>AA-DB.mv.db</code> from <code>C:\Windows\System32\config\systemprofile\AppData\Local\AutomationAnywhere</code> and restart the Bot Agent service. If auto-update is enabled in the Control Room settings, the Bot Agent will be updated automatically. Note that if the setting is disabled, you have to update the Bot Agent manually.</p>
<p>If a device or Bot Agent service restarts when you are running bots, the bots are shown as Active in the Activity page instead of Failed because of response schema changes in the product.</p> <p>Workaround: Delete the <code>AA-DB.mv.db</code> file from <code>C:\Windows\System32\config\systemprofile\AppData\Local\AutomationAnywhere</code> and restart the Bot Agent service. The deployments stuck in Active state will be moved to the Historical page and will be marked as Failed so that subsequent deployments can continue to run.</p>
<p>Intermittent issues occur with the execution of scheduled bots where some existing schedules behave inconsistently or some newly created schedules disappear. The new feature to set the priority to High has been reverted to address this occurrence. For users who have used this feature in Build 9637 or earlier and have updated to Build 9664, the schedules work without the relevance of the priority setting.</p> <p>Workaround: If you encounter these issues, split large scheduled automation to smaller schedules of 2 hours each to run throughout the day. For example, reconfigure an automation that is scheduled for a 12-hour period such as 9 AM to 9 PM daily to two-hour intervals such as 9 AM to 10:59 AM, 11:00 AM to 12:59 PM, and 1:00 PM to 2:59 PM. We strongly recommend that you use 2-hour intervals in such deployments. Further recommendations for schedules and time intervals: any schedules with a lower time frequency (< 10 minutes) should be spaced out to at least 10 minutes (Service Cloud case ID 00792385, 00785679, 00795915, 00793147, 00794555).</p>
<p>Known behavior for configured ports on multiple instances</p> <p>When you install the Control Room and configure the database, the ports for multiple instances should match the TCP ports configured in TCP/IP properties. For example, for the first instance if the configured TCP port is 1434 and for the second instance the configured TCP port is 1435, ensure you add 1434 as the port for the first instance and 1435 as the port for the second instance during Control Room installation.</p>

Limitations
<p>The Universal Recorder has the following limitations when capturing objects in Electron apps:</p> <ul style="list-style-type: none"> The Check action in a check box is not currently supported. Workaround: Use Toggle, Click, or Left click instead. The Universal Recorder cannot capture tabular data. Workaround: When the Universal Recorder captures an object control of <code>Client</code>, select the GetAllChildrenNames action and store the data to a list variable. The Universal Recorder might capture the window containing Microsoft Teams as a Client technology, instead of the intended object. Workaround: Close and reopen Microsoft Teams. The Universal Recorder only supports object capture from Electron apps in a computer that has the display scale configured to 100% or has a DPI awareness setting.
<p>If the maximum number of allowed activeMQ connections is exceeded, an AMQ failure can occur when running a RunTask automation that is looped 5 times, with each loop running 20+ bots after the fourth loop.</p>
<p>External key vault</p> <p>The Create/Edit User configure options still include the field permitting the administrator to enter the device credentials for the user. When auto-login is configured for the external key vault, these fields are still viewable and appear editable; however, the credentials added have no effect on the auto-login credential retrieval from the external vault.</p>
<p>You might observe an increase in CPU usage by about 10 percentage when the Control Room is in an idle state (Service Cloud case ID 00801733).</p>
<p>When you update the Control Room on Linux from Automation 360 v.19 or v.20 to Automation 360 v.21, the Control Room continues to display the interface from the previous version.</p> <p>Workaround: Refresh the browser to load the user interface in the new version.</p>

Automation Co-Pilot for Business Users (Automation Co-Pilot)

What's new
<p>Automation Co-Pilot Desktop Assistant for attended Bot Runners</p> <p>The Automation Co-Pilot Desktop Assistant application enables users with the attended Bot Runner license to access their bots without logging in to the Control Room. Automation Co-Pilot web users can use the Automation Co-Pilot Desktop Assistant when the attended Bot Runner license is enabled along with their Automation Co-Pilot User license without impacting their existing functionality.</p> <p>Automation Co-Pilot Desktop Assistant on page 3207</p>

What's new
<p>Download, delete, or view files in browser in initial forms or tasks</p> <p>Users can now use the Select File element to download files that are uploaded to the initial forms or tasks, and they can also delete files or access the hyperlink file to view the file in within the browser. The uploaded file can be accessed as a hyperlink, and new icons are available for download and delete.</p>
<p>Enhancement to team roles</p> <p>The Automation Co-Pilot team consists of three roles:</p> <ul style="list-style-type: none"> • Member: Can create, view, and delete their own requests. All the tasks are automatically assigned to the member when they create the request in a private team. In a shared team, the member can assign tasks to other members. • Owner: Can create, view, delete, and assign all the requests from the members in the team. • Admin: Can create, view delete, and assign all the requests from the members in the team. The admin can also modify the team. <p>An Automation Co-Pilot admin or manager can edit their teams and update their team members' roles. They also have the option to add or remove team members. The Automation Co-Pilot manager is the team admin by default when they create a team.</p>
<p>Enhancement to creating requests</p> <p>A request can now be created either by a user or by a bot in the Edit Process page.</p> <ul style="list-style-type: none"> • Choose the by user option to view the process in the Processes page. • Choose the by bot option so that the request is created either by a bot or by another process using the Process Task. <p>You cannot view the process or create a request with this option. Because the request is created from within a team, specify the default team in the Default team to take the bot created request field in the Edit Process page.</p> <p>Assign a team to a process on page 3269</p>
<p>Assign to me feature in tasks</p> <p>When a task is unassigned and users access the tasks, use the Assign to me option to allow the tasks to be assigned to the current user so that they can immediately access the form.</p> <p>Assign or unassign a task on page 3270</p>
<p>New Bot page</p> <p>When Automation Co-Pilot team members with attended Bot Runner licenses access the web interface, they are automatically redirected to Automation Co-Pilot Desktop Assistant. Users can view all the bots created by them on this page. They can also pin, search, and sort their assigned bots.</p>
<p>New team reference in Request and Process pages</p> <p>The user can now reference the team from which a request is created by referring to the new Team column in the Request page or the team name added in the process tile in the Process page, to help guide their team assignment.</p>

What's new
<p>New Request Visibility field (Service Cloud case ID: 00718119)</p> <p>Request visibility enables users to allow or restrict access to a request they created to other team members. When the Request Visibility field is set to Shared, all the requests are accessible by all members, owners, and team admins. If the field is set to Private, the requests are available only to the user who has created the request, owner, and the team admin.</p>
<p>Enhancement to the Processes page</p> <p>The following enhancements are available on the Processes page:</p> <ul style="list-style-type: none">• Sort the processes by name, in ascending or descending order.• Toggle the pinning of a process.• Use the responsive view to adjust the display to the screen size.
<p>Cloud storage usage</p> <p>Based on the maximum file and storage sizes, users who upload files can use cloud storage. The quota for storage is as follows:</p> <ul style="list-style-type: none">• The size of the file uploaded using the Select File element cannot exceed 25 MB.• By default, the storage can store a maximum of 100 MB of data.• It is extended to an additional 1 GB for every Automation Co-Pilot user license allocated.
<p>Copy process to URI feature</p> <p>The Automation Co-Pilot admin can use the new Copy process to uri to clipboard feature in the Process setup page to obtain the URI data and share with team members as reference when they enter the URI data to the Create a Request action.</p> <p>Process Composer package on page 2777</p>
<p>Add rows from header row context menu</p> <p>Only the header row is displayed when a form that has a table is launched during bot runtime. Use one of the following methods to add new rows to the table:</p> <ul style="list-style-type: none">• Header row context menu of the table Using the Table element on page 3226• The Set action in a bot Set action on page 2950
<p>Support for interface triggers on Google Chrome</p> <p>Interface triggers are now supported on the Google Chrome browser for the following actions during bot runtime:</p> <ul style="list-style-type: none">• When you click a button element in a form• For Got focus and Lost focus actions in a text box• When a preconfigured hot key is used with the Got focus action in a text box <p>Add an interface trigger on page 3240</p>

What's changed
<p>Upgrade changes to teams and processes</p> <p>For users who had access to processes, when they upgrade to the latest Automation 360 version, their existing teams remain the same but is now set to a shared team type, regardless of their existing team assignment. Automation Co-Pilot users and managers, are now converted to member and admin team roles, respectively. While any existing processes assigned to your team are shown as Team Migrated for Process after the upgrade.</p> <p>For Automation Co-Pilot managers (process manager) who could create requests without assigning process to teams. After the upgrade, the Automation Co-Pilot managers must create teams, ask the Automation Co-Pilot admin to assign teams to a process in order to create new requests.</p> <p>Processes have the by user option set by default for teams to view a process. You must choose the by bot option to have request be created by bots or another process.</p> <p>Automation Co-Pilot for Business Users on the web interface on page 3253 Assign a team to a process on page 3269</p>
<p>Update to Auto Assign feature</p> <ul style="list-style-type: none"> In the Human Task, you can no longer use the auto-assign feature to assign the task automatically to the manager. You can auto-assign the task to the user who created the request. The option to assign the target task to the manager is now removed from the Go to element. <p>You can now override the previous auto-assign setting by selecting the Override task assignment setting option in the Go to panel by either unassigning the task or assigning the task to the user who created the request.</p>

The following table lists the fixes and the builds in which they were fixed. Build 9664 is the latest build for Cloud and includes fixes from the previous builds (including Build 9604). On-Premises is on Build 9664.

Fixes		
Build	Service Cloud case ID	Description
9664	00788255	After upgrading from v.19 to this release version, processes containing forms with the Table , Checkbox , or Text Box element now execute successfully. Previously, if the process contained a form with an empty table, check box, or text box, it failed during execution if no changes were made in the form.
9664	00772925	The layout of the request view page no longer changes when the user selects a language other than English.
9664	00781891, 00784947	Warning texts in the process editor now render correctly with UTF-8 encoding.

Fixes		
Build	Service Cloud case ID	Description
9664	--	Users with the attended license are now correctly redirected to the Automation Co-Pilot Desktop Assistant application when they log in from the same device where a user without the attended licenses tried to access the application beforehand.
9604	00765406	When you enter more than four number values with a comma in a Number element field in the initial forms or tasks, the field can now accept the large number value without issues.
9595	00719862	In the Team Setup page, you can now view the members of your team and check if the member count is consistent with the number of team members.
9595	00738934	Users can now view, upload, download, or delete their files when they add the Select File element to forms to complete tasks in the web interface.
9595	00767008	When you upload a file with the Select File element in your tasks, the bot now downloads your file through the Get Storage file action without issues.
9595	--	Long text for the label name of Radio button and Checkbox elements in a form is now displayed completely.

Limitations
<p>(Service Cloud case ID: 00831376) When you use the storage service to upload or download files from the web interface, the download is redirected to an AWS and GCP presigned URL. You will not be able to download files unless you whitelist the AWS and GCP URLs.</p> <p>Workaround: You must whitelist the following URL in order to download:</p> <ul style="list-style-type: none"> • AWS: <a href="https://<bucket-name>.s3.<region>.amazonaws.com/">https://<bucket-name>.s3.<region>.amazonaws.com/ • GCP: <a href="https://storage.googleapis.com/<bucket-name>/">https://storage.googleapis.com/<bucket-name>/
<p>(Service Cloud case ID 00789181) When a bot is deployed in Automation Co-Pilot and the deployment is not completed even after an hour, the bot fails and the status changes to failed in Automation Co-Pilot. However the same bot still executes in the Control Room.</p> <p>Workaround:</p> <p>Choose one or both of the following options:</p> <ul style="list-style-type: none"> • Define an adequate duration for your bot execution. • Increase the size of your device pool.

Limitations
<p>For On-Premises, when you log in to Automation Co-Pilot Desktop Assistant application as a non-attended user, it shows an error as expected. However if you use that same credentials, or credentials from another non-attended user, and log in again to the application, it takes you to the web interface page.</p> <p>Workaround:</p> <ol style="list-style-type: none"> 1. Log in to the Automation Co-Pilot Desktop Assistant application as an attended user. 2. First, log in to the web interface (aari/#/assistant URL) then log out without changing anything in the browser. Second, navigate to the Automation Co-Pilot Desktop Assistant application on your desktop and log in as an attended user.
<p>The Teams column in the Process setup page is not automatically updated when the Automation Co-Pilot admin adds or removes their team in a process.</p> <p>Workarounds: Use the following options on the Process setup page:</p> <ul style="list-style-type: none"> • Click the Refresh the list option. • Click the browser's refresh option to reload the page. • Navigate to another tab then return to this page.
<p>When you use the Process Task in the process editor, you cannot use the Public folder option in the Select process file field because adding a public process as a dependency to the private process is not supported.</p>
<p>When users use the Image element to render images, the images does not render external images in the request view when users run their tasks.</p>

Discovery Bot

What's new
<p>Sort for a process tile from the Processes page</p> <p>You can now use the sort field to help you locate a process tile quickly. From the Processes page, use the drop-down menu to sort on a process tile based on the process name in alphabetical order. Alternatively, you can sort in the order of the newest process created to the oldest process and vice versa.</p> <p>Create a Discovery Bot process on page 3704</p>

What's new
<p>Enhancements to opportunities</p> <p>You can now review and analyze automatically generated (or system-generated) opportunities immediately from the Opportunities page. Auto-generated opportunities are created when at least two recordings are approved by the user. You can create a custom opportunity from an auto-generated opportunity and apply the Model and Filter options to target a specific opportunity for automation.</p> <p>You can now prioritize opportunities based on a simple formula for all recordings in a process. From the Opportunities table, you can view the cost without automation and savings for an opportunity. The system automatically calculates the cost and potential savings for each opportunity generated. You can customize these metrics based on your organization's model for cost and savings.</p> <p>Review opportunities and convert to</p>
<p>Generated PDD files are available on your local server</p> <p>The generated PDD file for an opportunity is now stored locally on your server for On-Premises deployments. The existing PDD files are automatically moved to the new location and are not deleted when a re-installation or upgrade is performed in the Control Room.</p> <p>Prerequisites for Discovery Bot on page 3695</p>

Fixes	
Service Cloud case ID	Description
--	Double-click, drag-drop, click and hold, and text select are now supported when you are recording a business process.
--	When you record a process with more than 1000 steps, the Recordings page now displays the process without any delay. Previously, the Recordings page took some time to load.

Limitations
<p>The Control Room installer for Red Hat Enterprise Linux (version 7.7 or 7.9) does not include the Discovery Bot package.</p> <p>Workaround: Log in to the Control Room as an admin, select Manage > Package > Upload and upload the Discovery Bot package. The package is included in the list of default packages.</p>
<ul style="list-style-type: none"> • Cloud users: When an opportunity is created with 50 steps, the Download PDD option is disabled and the PDD is not available for download. • On-Premises users: When an opportunity is created with 100 steps, the Download PDD option is disabled and the PDD is not available for download.

IQ Bot

What's new
<p>IQ Bot standard forms</p> <p>Create learning instances using the standard forms, which use an existing pretrained model and classification for extracting a large number of data fields from structured documents that typically have less or no variations in the layout.</p> <hr/> <p>Note: Standard forms are currently available only as a beta feature.</p> <hr/> <p>Using IQ Bot for standard forms on page 3606</p>
<p>Additional learning instances for IQ Bot Process documents action</p> <p>Use the new Azure 3.2 and japanese_Tegaki learning instances for the IQ Bot Process documents action in the IQ Bot Extraction package.</p> <p>Using IQ Bot Process documents action on page 2652</p>
What's changed
<p>IQ Bot file paths</p> <p>File locations and folder names are updated to use the new product name. For example:</p> <ul style="list-style-type: none"> The default installation path is changed from C:\Program Files (x86)\Automation Anywhere IQ Bot A2019\ to C:\Program Files (x86)\Automation 360 IQ Bot\. The default log path is changed from C:\Users\Public\Documents\Automation Anywhere IQ Bot A2019 to C:\Users\Public\Documents\Automation 360 IQBot Platform.
<p>Provider column on Learning Instances page updated</p> <p>The Provider column in the Learning Instances > My learning instances page is now updated to display a list of all available OCR engines associated with the corresponding learning instance.</p>
<p>Enhancements to IQ Bot Extraction package</p> <p>IQ Bot Extraction package now supports the following OCR engines:</p> <ul style="list-style-type: none"> Microsoft Azure Computer Vision OCR engine 3.2 This significantly improves the OCR extraction from Chinese language documents. Tegaki API OCR engine <p>IQ Bot Extraction package on page 2644</p>

What's changed
<p>Enhancement to IQ Bot security (Service Cloud Case ID: 00677507)</p> <p>You can now further improve security in IQ Bot by configuring RabbitMQ v3.8.18 communication through a secure SSL/TLS channel. Set <code>secureRabbitMQCommunication = true</code> in the <code>system.properties</code> file and then restart all IQ Bot services, including RabbitMQ v3.8.18. By default, this flag is set to <code>false</code>.</p> <p>This enhancement also fixes an issue that caused a RabbitMQ v3.8.18 security vulnerability.</p>
<p>Reuse the name of a deleted learning instance Automation 360 IQ Bot On-Premises</p> <p>While creating or editing a new learning instance, you can now reuse the name of a learning instance that was deleted. Ensure you backup the documents in your Output folder before deleting a learning instance. You can then clear the documents of the Output folder before creating or editing a new learning instance with the same name.</p> <p>If you have not cleared the documents from the Output folder for the deleted learning instance, you cannot download the contents. However, you can download only the documents processed by the new learning instance.</p>
<p>Support for Microsoft Azure SMB</p> <p>IQ Bot now supports Microsoft Azure files storage system using the SMB (Server Message Block) protocol. You can now also install IQ Bot using the shared folder configured with SMB and access the output files from the same directory.</p>
<p>Switch between databases without re-installing IQ Bot</p> <p>You can now switch between configured databases without re-installing IQ Bot using the <code>SwitchDBServer.bat</code> utility.</p> <p>To use this utility, perform the following steps:</p> <ol style="list-style-type: none"> 1. Download and extract the <code>SwitchDBServer.bat</code> utility from the <code><IQBot installation Dir>\Configurations</code> folder, and then open the command prompt in this directory. 2. Run the batch (.bat) file with an IP address or hostname of the destination DB server. Example: <code>SwitchDBServer 171.xx.xx.11</code>

The following table lists the fixes and the builds in which they were fixed. Build 9642 is the latest build for On-Premises and includes fixes from the previous build.

Fixes		
Build	Service Cloud case ID	Description
9596	00777932, 00766332	While you update to this IQ Bot release, the output path from the previous version is now retained during installation.

Fixes		
Build	Service Cloud case ID	Description
9595	00686444	When exporting learning instances from one environment to another, IQ Bot now updates the <code>visionBotId</code> in the exported data. So you can now edit bots in the destination environment without any errors.
9595	--	Duplicate table row entries in the Validator are now significantly reduced due to the improved table extraction logic.
9595	00651057	IQ Bot can now connect to Control Room Ignite cache without any errors. This fixes an issue where all learning instances were not displayed.
9595	00616038	When you update or restart Control Room, error messages are no longer displayed when you use the link or click Explore IQ Bot to open IQ Bot.
9595	00668412, 00644948, 00717414	When you now upload a document in production, deadlocks no longer occur in the system and documents are correctly sent to the Validator.
9595	00651572, 00650959	If no files are available in the <code>Output \Successful</code> folder and you click the Download all documents action, IQ Bot now displays the correct error message.
9595	--	Documents in Chinese (Simplified) language are now processed successfully without any issues.
9595	--	If you add a blocked library to a custom Python logic and click Test Run for any field, an error message is no longer displayed on the Designer page.
9595	--	The Enterprise 11 IQ Bot command can now be migrated to the Upload Documents action in Automation 360 IQ Bot. Therefore, you no longer have to manually create bots when you migrate the learning instances.

Limitations
<p>IQ Bot Cloud: If you do not access IQ Bot within the configured Ideal time out value set on the IQ Bot server:</p> <ul style="list-style-type: none"> • A message to restart IQ Bot is displayed. • Bots using IQ Bot APIs fail when the server is restarted. <p>Refresh the IQ Bot web page after some time (more than 5 minutes) to log in to IQ Bot.</p>
<p>When you create a learning instance, if the PDF that you upload contains small fonts, the document is classified as an image. If you use the PDFBox OCR to create a learning instance for a multipage document, the segments are not displayed.</p> <p>Workaround: Turn off the PDFBox OCR.</p>
<p>For a standard forms learning instance, when you try to download output files and at the same time send frequent API requests to that database, the system might stop responding.</p> <p>Recommended: When using the standard forms learning instance, wait for the files to be downloaded. After the download, ensure you allow some time (> 60 seconds) between the API requests.</p>
<p>If an incorrect configuration is used to create the <code>providerVersion</code> file of a standard forms learning instance, an error message is displayed when you move this learning instance to production.</p> <hr/> <p>Note: Ensure you use valid configurations.</p> <hr/>
<p>If you use a bot associated with a standard forms learning instance to upload a large number of documents, some of the documents are not processed.</p> <p>Workaround: Because this issue might be caused due to a timeout, try to upload the documents after some time.</p>
<p>If you have used an earlier version of IQ Bot (11.x) to move documents to the Validator, you cannot download these documents when you migrate to this Automation 360 IQ Bot version.</p> <p>Workaround: If you are migrate to this version, ensure you clear all the documents in Validator.</p>
<p>When you use the Download all documents or Upload Document actions from the IQ Bot package, the upload and download can fail as the proxy settings specified in the Control Room are not used.</p>
<p>If you manually delete any <code>.csv</code> file from the <code>Success</code> folder, other files in the folder might not be downloaded when you use the Download option.</p> <p>Ensure you do not manually delete any files from the <code>Success</code> folder.</p>
<p>Only SQL authentication is supported when you use the Migration Assistant tool to migrate from IQ Bot 11.x to Automation 360 IQ Bot.</p>
<p>If you have a document with a large number of pages (> 100), an error message is displayed intermittently when you click See extraction results for an existing learning instance.</p>

Limitations
The unclassified documents count in Staging results and Production results in the Summary tab of a learning instance might be displayed incorrectly.
On the Validator screen, if incorrect values are used to update a field on which you have applied validations, an alert is not displayed when the focus is lost from that field.
If any of the available number fields include parenthesis or (), the selected system identified region (SIR) on the document panel changes to a hyphen (-) when you click the extracted value.
<p>If you use the name of a deleted learning instance when creating a new learning instance, both the instances are listed in the Learning instance name drop-down menu of the Upload document action when a bot is created.</p> <p>Workaround: Click the new learning instance to remove the old learning instance from the list.</p>
If you use the Tesseract4 OCR during IQ Bot Extraction package updates, there is a delay in the document processing time and throughput results.
<p>For a learning instance created with standard forms, if the extraction is not successful for the Field options > Optional field, the value set in Default value is not assigned to that form field.</p> <p>Workaround: Use Python script from the Logic tab to set the value that must be assigned as the Default field.</p>
(Service Cloud case ID: 00601790) For documents processed using the IQ Bot Extraction package, document details such as Documents processed and Pages uploaded are not displayed correctly in the Dashboard page.
<p>As the Preview2 version of the Microsoft Azure 3.2 is deprecated, if you have used the Microsoft Azure 3.2-Preview2 OCR engine to create a learning instance, the documents will be unclassified.</p> <p>Workaround: Ensure that you replace all occurrences of Microsoft Azure 3.2-Preview2 with Microsoft Azure 3.2:</p> <ul style="list-style-type: none"> <li data-bbox="331 1331 1370 1423">• In <code>Azure3OCREngineSettings.json</code> file, change Version: v3.2-preview.2 to Version: v3.2. You can then update the OCR engine version by uploading this file to database using API How to change OCR Settings in IQ Bot (A-People login required) <li data-bbox="331 1478 1349 1570">• In the IQ Bot Installation > Configurations folder, update <code>Azure3ContainerOCREngineSettings</code> with Microsoft Azure 3.2. This is for the containerized deployment of Microsoft Azure 3.2 OCR engine.

Limitations

(Service Cloud case ID: 00799842) When you process vector-based PDF documents in IQ Bot, the OCR results are sometimes inaccurate. For instance, in some cases, spaces between words are missed in the extracted data. This might happen because of reasons related to the document that you uploaded or the tool that you used to generate the PDF file.

Workaround: To process your vector-based PDF document successfully, perform either of the following steps:

1. Convert your vector-based PDF document again to a vector-based PDF document by using a tool such as Adobe Acrobat.
2. Convert your vector-based PDF documents to a raster file format, such as TIFF.

Important: For information about the packages supported with this release, see [Packages available in Automation 360](#) on page 2225.

Enterprise A2019.20 Release Notes

Release date: 20 April 2021

Review what's new and changed, and the fixes and limitations in the Enterprise A2019.20 release. Build 8846 is for Cloud and Build 8815 is for On-Premises. IQ Bot A2019 is on Build 8815.

Important: We have updated the Cloud build to include the following fixes:

- Migrated bots failing to execute due to preprocessing error (Service Cloud case ID 00760877, 00761211)
- Unable to deploy bots because the resource path exceeds the maximum length supported by Microsoft (Service Cloud case ID 00764731, 00763373, 00765172, 763334)

Updating to this release

You can update to this release from the previous three releases (that is, from $n-3$ releases, where n refers to the latest release). The following builds are certified for update to this release:

- Build 8147 (v.19)
- Build 7560 (v.18)
- Build 7103 (v.17)

For details on how to update, see [Update Automation 360 to latest version](#) on page 1363.

Recommendation: If you are not on an $n-3$ release, update to one of the three certified releases before updating to this release.

Important: This release includes a required update to your . Ensure that you complete the update to continue with your automation activities when upgrading from a previous release to this release.

[Automatically update the Bot Agent](#) on page 1302 | [Manually update the Bot Agent](#) on page 1303

To verify which version is compatible with this release, see [Compatibility with release builds](#) on page 1275.

Migration features

Enterprise 11 and Enterprise 10 features
<p>Select folders for migration (Service Cloud case ID: 00689307)</p> <p>In the Bot Migration Wizard, you can now select folders that contain bots (Task Bots and MetaBots) that you want to migrate to Enterprise A2019. As a result, you no longer have to migrate individual bots from that folder.</p>
<p>Migrate MetaBots with screens</p> <p>Migrate MetaBots that contain screens as assets. You can migrate screens based on HTML, MSAA, Java, .Net technologies and use credential variables.</p>
<p>Migrate bots with the following attributes</p> <ul style="list-style-type: none"> • Bots that contain the IF > Logic successful or IF > Logic unsuccessful command and these commands return a variable as output • Bots that contain the Run Task command with the Repeat until I stop it option to the Run action in the Task Bot package • Bots that use the \$Clipboard\$ system variable as input and output variables to pass the value to the MetaBot logic

Enterprise 11 only features
<p>Migrate bots that use SAP BAPI to automate SAP-related tasks</p> <p>Migrate bots that use SAP BAPI to automate the SAP-related tasks. The SAP commands are migrated to equivalent actions of the SAP BAPI package, and the username, password, and hostname attributes used to connect to the SAP server in the Enterprise 11 bots are migrated as credential variables in Enterprise A2019.</p>
<p>Retain legacy behavior of \$Excel Cell Row\$ system variable</p> <p>Use the Use "Excel Cell Row" legacy behavior option in the Bot Migration Wizard to retain the legacy behavior of the \$Excel Cell Row\$ system variable used in bots created in versions earlier than Version 11.3.1 after they are migrated to Enterprise A2019.</p>
<p>Migrate bots with the following attributes:</p> <ul style="list-style-type: none"> • Bots that use the Delete or Get All Messages command to delete or download attachment from all emails that use Exchange Web Services (EWS) using OAuth authentication. • Bots that contain objects captured using the Object Cloning command that are based on Firefox and Silverlight technologies • Bots that use the Modify user command with the Update Account Options and the Change Password option in the Active Directory command • Bots that use the Create user option in the Active Directory command • Bots that use the Variable Operation command and the Decimal configuration option is selected • Bots that use the \$AATaskExecutor\$ system variable • Bots from Version 11.3.5 or later that use the Get Single Cell command with the Specific cell and Get Cell Value options selected to retrieve value from a cell in a Microsoft Excel file.

Enterprise A2019

What's new
<p>Support for IPv6 addresses</p> <p>You can install Enterprise A2019 in distributed load balancer cluster mode in an IPv6 network to comply with your organization's infrastructure and information security requirements.</p> <p>The following are not supported:</p> <ul style="list-style-type: none"> • Geo location is not available for IPv6 addresses. • Link-local addresses for IPv6 addresses are removed from the Enterprise A2019 installer's IPv6 list. <p>Configure IP cluster on page 1204</p>

What's new
<p>Switch device registration between Control Room instances</p> <p>You can now switch your device registration between multiple instances of the Control Room without reinstalling the Bot Agent. This setting is applicable to single user devices installed at the system or user level.</p> <p>Switch device registration between Control Room instances on page 1744 Switch Bot Agent to a different Control Room on page 1291</p>
<p>New permission to attest device user name (Service Cloud case ID: 00576058)</p> <p>Use the new permission to assign a default device to a user name to bypass credential validation when you deploy a bot on unattended Bot Runners. The permission is applicable to default device users with an unlocked and active user session.</p> <p>Feature permissions for a role on page 1688</p>
<p>Resource threshold settings to optimize bot deployments</p> <p>Configure resource threshold settings in the Control Room so that the system deploys the next bot only when the system resources on the device are within the specified thresholds. Specify the settings at the Control Room level for all devices, and customize these settings at each device level.</p> <p>Manage device settings on page 1735</p>
<p>Reduce bot startup time</p> <p>You can now reduce the bot startup time using settings in the Control Room to preload the most frequently used packages in the automation on all user devices when they connect to the Control Room.</p> <p>Automatic package updates for Cloud Control Room on page 1841</p>
<p>Express queue in workload automation</p> <p>You can now quickly create workload automation queues with default parameters in the Control Room by using the Create express queue option in the Queues page.</p> <p>Create express queues on page 1934</p>
<p>Group filters for Active Directory users</p> <p>You can provide additional filters for the <code>Users</code> directory as part of the <code>um.properties</code> file. As a result, you can filter the security groups that are in the <code>Users</code> directory for role mapping in the Control Room.</p> <p>Manage Active Directory role mapping on page 1712</p>
<p>Automate SAP-related tasks using SAP BAPI</p> <p>Use the actions available in the SAP BAPI package to automate SAP-related tasks using SAP BAPI.</p> <p>SAP BAPI package on page 2876</p>

What's new
<p>Default names for output variables</p> <p>When you configure an output variable for the following packages, the Control Room shows a descriptive default variable name. If you create several output variables, subsequent variable names are appended with a -1, -2, -3, and so on to avoid duplication.</p> <ul style="list-style-type: none">• Browser• CSV/TXT• Email• Excel advanced• JavaScript• Loop• Recorder• VBScript• Window
<p>PDF split with blank pages supports scanned image documents (Service Cloud case ID: 00683923)</p> <p>Use the PDF Split action to separate a blank page from pages with scanned images. With pixel-based split, you can now use Split document to split a PDF with blank page separators for scanned (image-based) documents.</p>
<p>SMTP port range expanded to include ports 1 through 65535</p> <p>The Email package now supports ports in the range of 1 through 65535 for the SMTP server. You can use the Send email action by configuring the SMTP port in this range.</p>
<p>New actions in the Active Directory package</p> <ul style="list-style-type: none">• Update account options: Sets account attributes for the user.• Change user password: Use this option to change a user's password. <p>User account operations on page 2293</p>
<p>Enhancement to Create user action in Active Directory package</p> <p>You can now use the Create user action to create an Active Directory user with password.</p> <p>Using the Create user action on page 2295</p>
<p>Universal Recorder expanded support and new features</p> <p>Use the Universal Recorder to perform the following:</p> <ul style="list-style-type: none">• Automate clicks and data retrieval in drop-down lists and combo boxes in Oracle EBS applications such as Compass.• Link an object that the bot cannot reliably identify to a nearby object (such as a link or button) that is easier for the bot to find. Use this feature in MSAA, UI Automation, or Java applications.

What's new
<p>Support for new languages in variable names</p> <p>You can now use Czech, Danish, Dutch, Finnish, French, German, Hungarian, Italian, Norwegian, Polish, Portuguese, Romanian, Spanish, and Swedish characters in variable names.</p> <p>Unicode range supported in variables on page 2251</p>
<p>Search and add child bot in the parent bot</p> <p>Search for a child bot in the public and private workspaces so that you can add it in the parent bot. You can search for the child bot from the Bot editor and the Run action of the Task Bot package.</p> <p>Using the Run action on page 2982 Bot editor for creating bots on page 2152</p>
<p>Obtain information about user that deployed the bot</p> <p>Use the AATaskInvoker system variable to return the username, first name, last name, and email of the user that ran or scheduled the bot. If the bot is deployed to an attended Bot Runner, this variable returns information about the logged-in user. If the bot is deployed by a trigger, this variable returns information about the user who set the trigger.</p> <p>System settings and parameters on page 2239</p>
<p>Git restoration enhancements</p> <ul style="list-style-type: none">• If your database is deleted or corrupted, as an administrator you can now restore files from the Git repository to a repository that is not fully empty.• You can also overwrite or skip the files if you have duplicate files in the Git repository.• If you are restoring files in an empty repository, you can choose to use either your existing credentials (configured with Control Room) or the credentials of any other repository. <p>Restore bots from Git repository on page 1770</p>
<p>View version history of Task Bots</p> <p>You can now view the version history of your Task Bots to identify relevant changes performed by other users to your Task Bots during a specific date and time along with the check-in messages.</p> <p>View Task Bot version history on page 2220</p>
<p>External key vault support</p> <p>Use external key vaults to securely store and retrieve credentials using a third-party key manager such as CyberArk and AWS Secrets Manager. External Key Vault support for AWS Secrets Manager and CyberArk for Bootstrap (database credentials,) and System (Service account credentials, Active Directory service account credentials, and SMTP credentials).</p> <p>Integrate external key vaults on page 1193</p>

What's new
<p>New condition in If package (Service Cloud case ID: 00536088, 00690073,00717514, 00737243, 00702383)</p> <p>Use the new Window with same title does not exist or Window with same title exist condition available in the If package to verify whether a window with the same title exists or whether the window title has changed.</p> <p>If package on page 2619</p>
<p>Google packages are now generally available</p> <p>Google Calendar, Google Drive, and Google Sheets packages are now generally available in Enterprise A2019, with a major change to the authentication method:</p> <ul style="list-style-type: none">• Each Google package contains a Connect action to authenticate your account before adding other actions from that package to your automation. This action replaces the deprecated OAuth action from the G-Apps package.• Each Google package contains a Disconnect action to terminate the connection. <p>Using the Connect action for Google packages on page 2589</p>

What's changed
<p>Bots wait for Internet Explorer to fully render in Mouse package</p> <p>Bots (including bots migrated from Enterprise 11) that use the Mouse package now wait for the Internet Explorer to finish loading the page before executing the Click action. This prevents the bots from failing while the page is loading.</p>
<p>Interface change in the Edit variable window</p> <p>When editing a variable, if you deselect the Use as input, Use as output, or Constant (read-only) check box, a message now informs you of the impact of this change and requests you to confirm this update.</p>
<p>Enhancement to audit log entries (Service Cloud case ID: 00656155)</p> <p>The audit log entries are now enhanced to display the Item Name and Event Type for import, export, check-in, and check-out requests.</p>
<p>The .atmx file not downloaded during migration</p> <p>The migration process does not download the <code>.atmx</code> file if the associated bot is used as a child bot in the parent bot. The Download CR file action from the File package is no longer added in the migrated bot to download the depended bot (<code>.atmx</code>) file during migration.</p>

What's changed
<p>Option to either upgrade Recorder package version or downgrade to older Google Chrome extension</p> <p>Bots that use the Recorder package version 2.0.5 or older to automate in the Google Chrome browser, now need to be updated to use a Recorder package version that is newer than 2.0.5. This is only necessary for Bot Runner devices that have the new Google Chrome extension (ID:kammdlphdfejlpoonbapgbgkimokm) installed, and have not previously run bots that use the Recorder package version 2.0.5 or older.</p> <p>If you do not want to upgrade the Recorder package, you can manually install the old Google Chrome extension. See Google Chrome extension troubleshooting on page 2175.</p>

The following tables lists the fixes and the builds in which they were fixed. Build 8846 is the latest build for Cloud and includes fixes from the previous builds. On-Premises is on Build 8815.

Build 8846	
Service Cloud case ID	Description
00764731, 00763373, 00765172, 763334	You can now deploy bots and dependent files stored in a repository with a file path that exceeds the maximum supported character length (256 characters) for your Windows operating system.
00714248	Only those Bot Runners and Bot Creators expressly configured as credential vault consumers for a given bot can use that bot.
00751728	When you migrate Enterprise 11 bots that use the String Operation command with the space character as a delimiter, the extracted value now retains the space and works properly. Previously, after migration, the space from the String Operation command was removed.
00760877, 00761211	Bots that are migrated, modified, and scheduled now successfully deploy without a preprocessing error. Previously, migrated bots failed to execute due to the following preprocessing error: <code>Attribute type ANY is not supported.</code>

Build 8840	
Service Cloud case ID	Description
00747869, 00750571, 0744918	When you create a bot using a loop with the Recorder Capture action to perform operations on the Chrome browser, the bot now executes without any disruption. Previously, the bot failed to run and displayed an error.

Build 8840	
Service Cloud case ID	Description
00733635, 00743082, 00750865	When you run a bot that contains the Excel Advanced > Find action, the found cell is now active and subsequent actions can perform operations on that active cell.
00723075, 00717920	When a bot encounters a workbook that contains links to cells in other workbooks, the system suppresses the Excel pop-up message so that the bot can run without interruption.
00746651, 00757879	After migrating bots, you can successfully run the bots without any preprocessing error. Previously, using variables inside brackets failed to process the task.
00742159, 00743092	The Excel Advanced Set cell and Delete cell actions now select the correct cells when the cell address column name contains more than one letter.
00743636	The Excel Advanced Set cell, Delete cell, and Go to cell actions now support all ranges. Previously, the actions encountered errors with ranges greater than AB1 : AB100.
00726030	Bots can now use the Recorder to capture objects that contain characters that are not valid in XML.

Build 8815	
Service Cloud case ID	Description
00750668	A workload bot is no longer stuck in a queue, and the device does not display a Pick up at run time status.
00733227	Control Room database tables are now created when you use the restored 11.x database while installing Enterprise A2019.
00733720	Bot Migration Wizard no longer encounters an error when processing a large bot for migration. Previously, this issue was encountered when a large bot was downloaded to the Bot Runner device for migration from the Control Room and the connection between the Bot Runner device and Control Room was reset.

Build 8815	
Service Cloud case ID	Description
--	Bot Scanner is now updated to include scenarios that were previously failing after migration. As a result, some bots might be moved from the list of bots that can be migrated to the list of bots that cannot be migrated in the output report. This can decrease the number of bots that can be migrated to Enterprise A2019.
00703679, 00711398, 00729399	Enterprise 11 or Enterprise 10 bots that use the string variable or an object captured from Internet Explorer whose property is null or empty no longer encounters an error after these bots are migrated.
00667326	Bot Scanner no longer becomes unresponsive when scanning bots for any of the following reasons: <ul style="list-style-type: none"> Scanning a corrupted .atmx file of a bot Bots that contains the If, IF/ELSE, or Loop command and that command is commented out Bot that contains an object that is captured using the Object Cloning command using the Coordinate play mode and the Click action is performed on that object
00731068, 00737025	An error is no longer encountered when you run a bot that contains multiple variables that return a number value in the same command after that bot is migrated.
00720261	An error is no longer encountered when you run a migrated bot that contains a special character.
00713303	In a migrated bot that uses the Run Task command, when you run a subtask within the main task and the subtask name contains Unicode characters, the bot now executes successfully without any error. Previously, the bot failed and displayed an error message.
00691133	You can now successfully delete migrated bots in your private workspace without encountering any issue. Previously, an error message was displayed when a migrated bot was deleted in the private workspace.
00736166	Previously, when the migration process was initiated, the process sometimes remained in the In progress status in the Bot Migration Wizard. Now the process starts running.

Build 8815	
Service Cloud case ID	Description
00730131	Bots that use the Run Script command with the \$Clipboard\$ system variable as an input or output variable no longer encounter errors when you run these bots after they are migrated to Enterprise A2019.
00726833	Enterprise 11 Work Items and queues that are associated with bots that use the Variable Operation command no longer encounter an error after the first item in the queue is processed successfully after migration to Enterprise A2019.
--	Bot Scanner no longer encounters an error when scanning MetaBots that contain the Object Cloning command that is commented out and the MetaBot is trying to find the play mode from those commented out commands.
00716557	An error is no longer encountered when you run a MetaBot in Enterprise A2019 that was created in Enterprise 10, migrated to Enterprise 11, and then migrated to Enterprise A2019.
00710569	When you migrate a MetaBot that contains screens as assets from Enterprise 11 to Enterprise A2019, Japanese characters in the object properties are now displayed correctly in the migrated bots. Previously, the Japanese characters in the object properties were garbled in the migrated bots.
00702262	The Historical activity page now shows a detailed error message that specifies the cause of the error and the line where the error is encountered for bots that are migrated from Enterprise 11 and use the Error Handling command.
00703513, 00708988	Parent bots that use the Run action of the Task Bot package with the Upon error, start next repetition option selected no longer encounter an error if their child bots encounter an error at runtime and do not return the output variable to the parent bot. Previously, parent bots encountered an error if the child bots did not return the output variable to the parent bots because the child bots encountered an error during runtime.

Build 8815	
Service Cloud case ID	Description
00702601	A bot that uses an array variable that contains a system variable and which returns an integer no longer encounters an error after that bot is migrated.
00707801	You can now migrate an Enterprise 11 bot that contains Mouse Click to capture the coordinates of a maximized window. Previously, the bot with a Mouse Click encountered an issue during migration because the window left and top parameters were set to negative values for maximized windows.
00710315, 00728228, 00729082, 00744242	Migrated bots that use the Object Cloning command with legacy technology to capture objects with multiple lines of text now work properly, without any issues.
00716650	When you migrate an Enterprise 11 bot that contains an Excel command with two Excel sessions in it, the Get column name or Get row number actions now displays the correct values in the output. Previously, the actions set the wrong session values in the migrated bot if it contained two Excel sessions.
00711148	Enterprise A2019 installation no longer fails if there is a space in the data and log path (for example, D:\Automation Anywhere \ProgramData). And, the following error message is no longer displayed: Control Room database tables fail to create.
00708902	You can now use the Google Drive package to upload files in the Google Shared Drive. Use only the Folder ID option to upload files to a shared folder in the drive and enter the ID of the shared folder. Previously, an error occurred when a user tried to upload a file in the shared folder in the Google Drive.
00735479	When you create a bot that has a dependency with a long repository path that exceeds the maximum limit of 256 characters and when you run the bot on the Bot Runner machine, the bot now displays a message, prompting you to reduce the length of the file path. Previously, the bot execution failed without any message providing the reason for the failure.

Build 8815	
Service Cloud case ID	Description
00727406	You can now successfully send an email in HTML format with an HTML attachment using the Email server . Previously, when an email was sent in HTML format along with an attached HTML file, the email body content and the content of the attached file were merged. As a result, only the attachment was seen in the mail without the body content.
00707734	In the App Integration package, when you use the Capture text of window action in a Japanese browser, the window title now displays properly for Japanese language. Previously, the output was not displayed correctly in the Japanese text format.
00699149,00707670	You can now use the Unzip action of the Folder package and execute your bots on a Windows 10 server. Now, if two Windows users with different device credentials try to deploy a bot on the same machine, the deployment does not fail. Previously, if a user deployed the bot on the same machine with a different user profile, the bot failed to execute.
00695224, 00730472, 00739431	When you use the Find Image in a Window action in the Image Recognition package, image files are now deleted from the Temp location and storage space is freed after bot execution. Previously, the image files were not deleted from the Temp location and as a result disk storage ran out of space.
00709162	The CSV/TXT Open action now works without encountering any issue even if there are blank values in the last row of the .txt file. Previously, if there were blank values in the last row of the file, the bot encountered an issue.
00711124	In the Email package, when you use the Connect action, add a loop, and select For each in mail box to read emails as the Iterator option, a new line is no longer deleted and correctly displays the email content. Previously, the new lines were deleted when the mail was sent and received in plain text format.

Build 8815	
Service Cloud case ID	Description
00673049	In the SAP package, if an error is encountered when the Connect action is used to connect with a SAP system, the error is now captured in the Try and Catch blocks. Previously, the connection issue was not captured in the Try and Catch blocks in the action.
00697215	A bot now executes successfully when you use the Throw action with an expression. Previously, when an expression such as <code>\$number.ToString\$</code> was used in the Exception message field of the Throw action, the bot encountered a preprocessing error.
00714260	Runtime errors are no longer displayed when you use the following: <ul style="list-style-type: none"> • A MetaBot with run DLL migration function that takes more than one parameter type as Array or any type other than String • A Task Bot with run logic calling a child bot that takes more than one input parameter of type Array, which is mapped to a List variable in the parent bot run logic migration function
00704547	The Pause action of the Task Bot package now works properly when you use it as the last task in the bot. Previously, the bot did not wait for the task to complete if the Pause action was used as last task in the bot.
00675344	A Task Bot now performs better when you use the Terminal Emulator Send text and Send key actions to execute a bot. Previously, the Task Bot took a long time to complete the execution.
00699650,00716648	When you use Image Recognition actions to execute a bot and if the bot fails during execution, the captured source and target images are stored in <code>C:\ProgramData\AutomationAnywhere\BotRunner\Logs\IR</code> with a maximum of 10 source and target image pairs. Now, when the maximum limit is reached, the oldest image pairs are overwritten with new images. Previously, the image logs were not overwritten.
00716817	A bot now executes successfully when you use the PDF Extract text action to extract structured text from PDF files. Previously, bot execution failed to extract structured text if it contained Thai characters.

Build 8815	
Service Cloud case ID	Description
00717204	You can now use a credential from the Credential Vault in the URI field of the REST Web Service actions.
00682726, 00678580, 00695359, 00684985	You can now use the Universal Recorder to automate in Oracle Fusion Middleware applications. Previously, an issue with the Java API caused the Recorder to select the entire window instead of the specific object.
00693770	Fixed an issue where numbers extracted from an SQL database to a data table variable were automatically converted to scientific notation.
00669959	You can now select the same start date and end date when you schedule bots with the Run repeatedly option (Activity > Scheduled > Schedule bot) in the Control Room.
00702841, 00700915	Disconnected devices are now displayed in the Control Room (Devices > My Devices) when you filter the devices list by Status as Disconnected .
00707318, 00711529	Work items in an active queue are now processed and you no longer have to delete the active queue and create another queue after you upgrade from a previous release to this release.
00705046	Bots that include embedded dependent files instead of a zipped folder are no longer queued intermittently for deployment on Bot Runner devices.
--	Disabled tenant IDs or removed tenants that are later reused on the same deployment with a different tenant might produce a licensing error. This conflict is now removed and deboarded tenants in later reuse no longer generate the error.
00685926	When you import an exported bot into the private workspace and check in the imported bot, the bot is now checked in successfully without any issues. Previously, the check-in failed due to a metadata validation error.
00682025	When a bot or a file is modified in the public workspace, the cloned dependent file in the private workspace now reflects the changes and the bot executes successfully. Previously, the cloned dependent file did not reflect the changes and the bot execution failed.

Build 8815	
Service Cloud case ID	Description
00726018	The Google Drive Upload file action now uploads files to subfolders.
00715080, 00731152	You can now perform concurrent unattended bot deployment on a multi-user device with multiple user sessions running simultaneously.
--	A non-admin Bot Agent user now remains connected to the Control Room and is not disconnected frequently.
00709737	Actions in the Google Sheets package now support worksheets that contain empty cells.
00710354	A hibernate exception error is no longer displayed when you log in to the Control Room as an admin user.
00732178	<p>You can now check out bots from folders with similar names but in different letter cases and edit the bots in your private workspace in the Control Room.</p> <p>For example, if there is a folder named <code>Automation1</code> in the public workspace and a folder named <code>automation1</code> folder in the private workspace, you can now check out bots from the <code>Automation1</code> folder in the public workspace.</p>
--	Bots are now deployed on a multi-user device in a non-admin user session when another admin user session is also active on the device if auto-login setting in the Control Room is set to lock the session after the bot finishes executing from an existing unlocked session.
00719407	During a cluster installation of Enterprise A2019 on Red Hat Enterprise Linux, the installer now uses the same user ID across all cluster nodes.
00703325	The log file permission for an Control Room installed on Linux now maps to the <code>crkernel</code> user. Previously, it was mapped to the <code>root</code> user.
--	When you access the Control Room with the Login with Windows option selected, you must now enter the FQDN to log in successfully.
00732141, 00722919,00743006	When you preload a package, after the download is complete, the completion status updates in the Activity > Historical activity page and the pending record is no longer displayed in the Activity > In progress page.

Build 8815	
Service Cloud case ID	Description
00731376	When you migrate MetaBot logic, if there is case mismatch in the variable name and the mapping variable, variables are no longer created twice. As a result, a preprocessing error does not appear when you execute the task.
	Now, the migration of run logic with CV variables is supported.
	Now, when using the Date system variable in the File folders command, a migrated bot is no longer failing.
	When migrating bots (v11.x to A2019) with OC properties more than 64KB, such properties will be truncated and the bot will be migrated.

The following table lists the fixes and the builds in which they were fixed. Build 8846 is the latest build for Cloud and includes fixes from the previous builds. On-Premises is on Build 8815.

Fixes		
Build	Service Cloud case ID	Description
8846	00764731, 00763373, 00765172, 763334	You can now deploy bots and dependent files stored in a repository with a file path that exceeds the maximum supported character length (256 characters) for your Windows operating system.
8846	00714248	Only those Bot Runners and Bot Creators expressly configured as credential vault consumers for a given bot can use that bot.
8846	00751728	When you migrate Enterprise 11 bots that use the String Operation command with the space character as a delimiter, the extracted value now retains the space and works properly. Previously, after migration, the space from the String Operation command was removed.
8846	00760877, 00761211	Bots that are migrated, modified, and scheduled now successfully deploy without a preprocessing error. Previously, migrated bots failed to execute due to the following preprocessing error: <code>Attribute type ANY is not supported.</code>
8840	00747869, 00750571, 0744918	When you create a bot using a loop with the Recorder Capture action to perform operations on the Chrome browser, the bot now executes without any disruption. Previously, the bot failed to run and displayed an error.
8840	00733635, 00743082, 00750865	When you run a bot that contains the Excel Advanced > Find action, the found cell is now active and subsequent actions can perform operations on that active cell.

Fixes		
Build	Service Cloud case ID	Description
8840	00723075, 00717920	When a bot encounters a workbook that contains links to cells in other workbooks, the system suppresses the Excel pop-up message so that the bot can run without interruption.
8840	00746651, 00757879	After migrating bots, you can successfully run the bots without any preprocessing error. Previously, using variables inside brackets failed to process the task.
8840	00742159, 00743092	The Excel Advanced Set cell and Delete cell actions now select the correct cells when the cell address column name contains more than one letter.
8840	00743636	The Excel Advanced Set cell, Delete cell, and Go to cell actions now support all ranges. Previously, the actions encountered errors with ranges greater than AB1 : AB100.
8815	00750668	A workload bot is no longer stuck in a queue, and the device does not display a Pick up at run time status.
8815	00733227	Control Room database tables are now created when you use the restored 11.x database while installing Enterprise A2019.
8815	00733720	Bot Migration Wizard no longer encounters an error when processing a large bot for migration. Previously, this issue was encountered when a large bot was downloaded to the Bot Runner device for migration from the Control Room and the connection between the Bot Runner device and Control Room was reset.
8815	--	Bot Scanner is now updated to include scenarios that were previously failing after migration. As a result, some bots might be moved from the list of bots that can be migrated to the list of bots that cannot be migrated in the output report. This can decrease the number of bots that can be migrated to Enterprise A2019.
8815	00703679, 00711398, 00729399	Enterprise 11 or Enterprise 10 bots that use the string variable or an object captured from Internet Explorer whose property is null or empty no longer encounters an error after these bots are migrated.
8815	00667326	Bot Scanner no longer becomes unresponsive when scanning bots for any of the following reasons: <ul style="list-style-type: none"> Scanning a corrupted .atmx file of a bot Bots that contains the If, IF/ELSE, or Loop command and that command is commented out Bot that contains an object that is captured using the Object Cloning command using the Coordinate play mode and the Click action is performed on that object

Fixes		
Build	Service Cloud case ID	Description
8815	00731068, 00737025	An error is no longer encountered when you run a bot that contains multiple variables that return a number value in the same command after that bot is migrated.
8815	00720261	An error is no longer encountered when you run a migrated bot that contains a special character.
8815	00713303	In a migrated bot that uses the Run Task command, when you run a subtask within the main task and the subtask name contains Unicode characters, the bot now executes successfully without any error. Previously, the bot failed and displayed an error message.
8815	00691133	You can now successfully delete migrated bots in your private workspace without encountering any issue. Previously, an error message was displayed when a migrated bot was deleted in the private workspace.
8815	00736166	Previously, when the migration process was initiated, the process sometimes remained in the In progress status in the Bot Migration Wizard. Now the process starts running.
8815	00730131	Bots that use the Run Script command with the \$Clipboard \$ system variable as an input or output variable no longer encounter errors when you run these bots after they are migrated to Enterprise A2019.
8815	00726833	Enterprise 11 Work Items and queues that are associated with bots that use the Variable Operation command no longer encounter an error after the first item in the queue is processed successfully after migration to Enterprise A2019.
8815	--	Bot Scanner no longer encounters an error when scanning MetaBots that contain the Object Cloning command that is commented out and the MetaBot is trying to find the play mode from those commented out commands.
8815	00716557	An error is no longer encountered when you run a MetaBot in Enterprise A2019 that was created in Enterprise 10, migrated to Enterprise 11, and then migrated to Enterprise A2019.
8815	00710569	When you migrate a MetaBot that contains screens as assets from Enterprise 11 to Enterprise A2019, Japanese characters in the object properties are now displayed correctly in the migrated bots. Previously, the Japanese characters in the object properties were garbled in the migrated bots.
8815	00702262	The Historical activity page now shows a detailed error message that specifies the cause of the error and the line where the error is encountered for bots that are migrated from Enterprise 11 and use the Error Handling command.

Fixes		
Build	Service Cloud case ID	Description
8815	00703513, 00708988	Parent bots that use the Run action of the Task Bot package with the Upon error, start next repetition option selected no longer encounter an error if their child bots encounter an error at runtime and do not return the output variable to the parent bot. Previously, parent bots encountered an error if the child bots did not return the output variable to the parent bots because the child bots encountered an error during runtime.
8815	00702601	A bot that uses an array variable that contains a system variable and which returns an integer no longer encounters an error after that bot is migrated.
8815	00707801	You can now migrate an Enterprise 11 bot that contains Mouse Click to capture the coordinates of a maximized window. Previously, the bot with a Mouse Click encountered an issue during migration because the window left and top parameters were set to negative values for maximized windows.
8815	00710315, 00728228, 00729082, 00744242	Migrated bots that use the Object Cloning command with legacy technology to capture objects with multiple lines of text now work properly, without any issues.
8815	00716650	When you migrate an Enterprise 11 bot that contains an Excel command with two Excel sessions in it, the Get column name or Get row number actions now displays the correct values in the output. Previously, the actions set the wrong session values in the migrated bot if it contained two Excel sessions.
8815	00711148	Enterprise A2019 installation no longer fails if there is a space in the data and log path (for example, D: \Automation Anywhere\ProgramData). And, the following error message is no longer displayed: Control Room database tables fail to create.
8815	00708902	You can now use the Google Drive package to upload files in the Google Shared Drive. Use only the Folder ID option to upload files to a shared folder in the drive and enter the ID of the shared folder. Previously, an error occurred when a user tried to upload a file in the shared folder in the Google Drive.
8815	00735479	When you create a bot that has a dependency with a long repository path that exceeds the maximum limit of 256 characters and when you run the bot on the Bot Runner machine, the bot now displays a message, prompting you to reduce the length of the file path. Previously, the bot execution failed without any message providing the reason for the failure.

Fixes		
Build	Service Cloud case ID	Description
8815	00727406	You can now successfully send an email in HTML format with an HTML attachment using the Email server . Previously, when an email was sent in HTML format along with an attached HTML file, the email body content and the content of the attached file were merged. As a result, only the attachment was seen in the mail without the body content.
8815	00707734	In the App Integration package, when you use the Capture text of window action in a Japanese browser, the window title now displays properly for Japanese language. Previously, the output was not displayed correctly in the Japanese text format.
8815	00699149,00707670	You can now use the Unzip action of the Folder package and execute your bots on a Windows 10 server. Now, if two Windows users with different device credentials try to deploy a bot on the same machine, the deployment does not fail. Previously, if a user deployed the bot on the same machine with a different user profile, the bot failed to execute.
8815	00695224, 00730472, 00739431	When you use the Find Image in a Window action in the Image Recognition package, image files are now deleted from the Temp location and storage space is freed after bot execution. Previously, the image files were not deleted from the Temp location and as a result disk storage ran out of space.
8815	00709162	The CSV/TXT Open action now works without encountering any issue even if there are blank values in the last row of the .txt file. Previously, if there were blank values in the last row of the file, the bot encountered an issue.
8815	00711124	In the Email package, when you use the Connect action, add a loop, and select For each in mail box to read emails as the Iterator option, a new line is no longer deleted and correctly displays the email content. Previously, the new lines were deleted when the mail was sent and received in plain text format.
8815	00673049	In the SAP package, if an error is encountered when the Connect action is used to connect with a SAP system, the error is now captured in the Try and Catch blocks. Previously, the connection issue was not captured in the Try and Catch blocks in the action.

Fixes		
Build	Service Cloud case ID	Description
8815	00697215	A bot now executes successfully when you use the Throw action with an expression. Previously, when an expression such as <code>\$number.ToString\$</code> was used in the Exception message field of the Throw action, the bot encountered a preprocessing error.
8815	00714260	Runtime errors are no longer displayed when you use the following: <ul style="list-style-type: none"> • A MetaBot with run DLL migration function that takes more than one parameter type as Array or any type other than String • A Task Bot with run logic calling a child bot that takes more than one input parameter of type Array, which is mapped to a List variable in the parent bot run logic migration function
8815	00704547	The Pause action of the Task Bot package now works properly when you use it as the last task in the bot. Previously, the bot did not wait for the task to complete if the Pause action was used as last task in the bot.
8815	00675344	A Task Bot now performs better when you use the Terminal Emulator Send text and Send key actions to execute a bot. Previously, the Task Bot took a long time to complete the execution.
8815	00699650,00716548	When you use Image Recognition actions to execute a bot and if the bot fails during execution, the captured source and target images are stored in <code>C:\ProgramData\AutomationAnywhere\BotRunner\Logs\IR</code> with a maximum of 10 source and target image pairs. Now, when the maximum limit is reached, the oldest image pairs are overwritten with new images. Previously, the image logs were not overwritten.
8815	00716817	A bot now executes successfully when you use the PDF Extract text action to extract structured text from PDF files. Previously, bot execution failed to extract structured text if it contained Thai characters.
8815	00717204	You can now use a credential from the Credential Vault in the URI field of the REST Web Service actions.
8815	00682726, 00678580, 00695359, 00684985	You can now use the Universal Recorder to automate in Oracle Fusion Middleware applications. Previously, an issue with the Java API caused the Recorder to select the entire window instead of the specific object.
8815	00693770	Fixed an issue where numbers extracted from an SQL database to a data table variable were automatically converted to scientific notation.

Fixes		
Build	Service Cloud case ID	Description
8815	00669959	You can now select the same start date and end date when you schedule bots with the Run repeatedly option (Activity > Scheduled > Schedule bot) in the Control Room.
8815	00702841, 00700915	Disconnected devices are now displayed in the Control Room (Devices > My Devices) when you filter the devices list by Status as Disconnected .
8815	00707318, 00711529	Work items in an active queue are now processed and you no longer have to delete the active queue and create another queue after you upgrade from a previous release to this release.
8815	00705046	Bots that include embedded dependent files instead of a zipped folder are no longer queued intermittently for deployment on Bot Runner devices.
8815	--	Disabled tenant IDs or removed tenants that are later reused on the same deployment with a different tenant might produce a licensing error. This conflict is now removed and deboarded tenants in later reuse no longer generate the error.
8815	00685926	When you import an exported bot into the private workspace and check in the imported bot, the bot is now checked in successfully without any issues. Previously, the check-in failed due to a metadata validation error.
8815	00682025	When a bot or a file is modified in the public workspace, the cloned dependent file in the private workspace now reflects the changes and the bot executes successfully. Previously, the cloned dependent file did not reflect the changes and the bot execution failed.
8815	00726018	The Google Drive Upload file action now uploads files to subfolders.
8815	00715080, 00731152	You can now perform concurrent unattended bot deployment on a multi-user device with multiple user sessions running simultaneously.
8815	--	A non-admin Bot Agent user now remains connected to the Control Room and is not disconnected frequently.
8815	00709737	Actions in the Google Sheets package now support worksheets that contain empty cells.
8815	00710354	A hibernate exception error is no longer displayed when you log in to the Control Room as an admin user.

Fixes		
Build	Service Cloud case ID	Description
8815	00732178	<p>You can now check out bots from folders with similar names but in different letter cases and edit the bots in your private workspace in the Control Room.</p> <p>For example, if there is a folder named <code>Automation1</code> in the public workspace and a folder named <code>automation1</code> folder in the private workspace, you can now check out bots from the <code>Automation1</code> folder in the public workspace.</p>
8815	--	Bots are now deployed on a multi-user device in a non-admin user session when another admin user session is also active on the device if auto-login setting in the Control Room is set to lock the session after the bot finishes executing from an existing unlocked session.
8815	00719407	During a cluster installation of Enterprise A2019 on Red Hat Enterprise Linux, the installer now uses the same user ID across all cluster nodes.
8815	00703325	The log file permission for an Control Room installed on Linux now maps to the <code>crkernel</code> user. Previously, it was mapped to the root user.
8815	--	When you access the Control Room with the Login with Windows option selected, you must now enter the FQDN to log in successfully.
8815	00732141, 00722919, 00743006	When you preload a package, after the download is complete, the completion status updates in the Activity > Historical activity page and the pending record is no longer displayed in the Activity > In progress page.
8815	00731376	When you migrate MetaBot logic, if there is case mismatch in the variable name and the mapping variable, variables are no longer created twice. As a result, a preprocessing error does not appear when you execute the task.
8815		Now, the migration of run logic with CV variables is supported.
8815		Now, when using the Date system variable in the File folders command, a migrated bot is no longer failing.
8815		When migrating bots (v11.x to A2019) with OC properties more than 64KB, such properties will be truncated and the bot will be migrated.

Limitations
<p>(Service Cloud case ID: 00822176) When you create an RDP session on multi-user devices and enter a custom port, RDP-based deployments will fail.</p> <p>Recommended: Use the default port 3389 for RDP sessions.</p>
<p>When you create a bot with Open and Close browser actions in a loop and select the Window option to close the selected tab, an error might occur when you execute the bot.</p> <p>Workaround: Use the Close action of the Window package instead of the Close action in the Browser package to close the window.</p>
<p>If you deploy bots using event triggers, and you install the Bot Agent on a device as a non-admin user for self or a local admin user, the Bot Agent will not be updated automatically. The device is will be shown as disconnected in the Control Room.</p> <p>Workaround:</p> <ol style="list-style-type: none"> 1. End the trigger listener Java process (javaw.exe) from the Task Manager. 2. Re-install the Bot Agent to reconnect the user device in the Control Room.
<p>Configuring multiple IP addresses for Control Room nodes in a cluster is not supported during installation in On-Premises deployments. You must manually configure the primary IP address in the <code>cluster.properties</code> file.</p> <p>Add primary IP address for cluster on page 1263 Configure additional IP address for a new cluster node on page 1264</p>
<p>Bot deployment on multi-user sessions is not supported for workload automation.</p>
<p>Using an Enterprise A2019.20 SDS On-Premises Control Room with an Enterprise A2019.19 SDS Cloud Control Room is not supported.</p>
<p>When you run a bot containing a Capture action that uses the anchor object feature, your device DPI settings must match the settings at which you configured the anchor object.</p>
<p>The Control Room does not allow hyphens and underscores to be used interchangeably when creating and calling global value names.</p>
<p>When you migrate an Enterprise 11 bot that uses Object Cloning command with Silverlight technology and execute that bot in Enterprise A2019, the bot might fail with an error due to a play reliability issue. The same play reliability is also seen in Enterprise 11 when you use Object Cloning command with Silverlight plugins.</p>
<p>For actions that use file input, when you select a network path using Browse, bot execution fails because the double backslash (\\) in the file location is replaced with a forward slash.</p> <p>Workaround: Do not use the Browse option to select the file location. Instead, manually enter the complete file path.</p>
<p>When a Bot Creator, attended Bot Runner or unattended Bot Runner user logs in to the Control Room from their Bot Agent machine and if the package download option is enabled, the package download takes priority, and bot deployment waits until the package download is complete. This occurs only when the package is downloaded for the first time.</p>

Limitations
When a bot runs an automation in the Microsoft Internet Explorer browser, the Microsoft API responsible for the browser delay might encounter an exception, causing the bot to fail and a Chrome-related error message to appear in the Control Room.
(Service Cloud case ID: 00712808) Automation Anywhere related files are sometimes generated in C:\Windows\Temp. These files can be safely deleted.
For Enterprise 11 bots that contain an object that is captured using the Object Cloning command using the Image or the Coordinate play mode, the Set Text is performed on that object and the credential variable is used to set text for the object. The credential variable for these bots is not migrated when the bots are migrated to Enterprise A2019.
<p>If you use the Set text action in the Recorder > Capture action to enter data into a text box, when you run the bot, the data appears over the old data in the text box and is not entered. The old data is not cleared from the text box because the application requires a physical event to clear the old data.</p> <p>Workaround: To ensure that the data is entered into the text box, along with the Set text action, add a value greater than 0 in the Time between keystrokes field.</p>
When you use the Recorder to capture an object, set the waiting time for detecting the object to less than 30 seconds in the Keep trying for (seconds) field, and run the bot, the Recorder waits for a minimum of 30 seconds by default to detect the object.
<p>When you use the Recorder to capture objects on an application that is installed on a virtual machine, finish the recording after the objects are captured, and relaunch the Recorder, the bot inserts the actions recorded earlier instead of launching the Recorder.</p> <p>Workaround: Refresh the Bot editor or run the bot to launch a new session to start recording again.</p>

Automation Co-Pilot for Business Users (Automation Co-Pilot)

What's new
<p>Get Storage file action</p> <p>The new Get Storage file action in the Automation Co-Pilot Web package enables you to download storage files to a bot device.</p> <p>Process Composer package on page 2777</p>
<p>Upload files in initial forms or tasks</p> <p>Add the Select File element to forms to enable users to select and upload files in the initial forms or tasks in the web interface. Users can browse to upload a new file or replace an existing file. The uploaded file is shown as a hyperlink and redirects users to a new tab when opened.</p> <p>About Process Composer on page 3297</p>

What's new
<p>Hyperlinks support for initial forms or tasks</p> <p>Use the new Hyperlink element to add links to forms and access them in initial forms and tasks.</p> <p>About Process Composer on page 3297</p>
<p>Configure a scheduler user for each process (Service Cloud case ID: 00713786)</p> <p>As an Automation Co-Pilot administrator, you can now configure a scheduler user for each process to allocate the Control Room resources (devices and unattended Bot Runners) on the web interface. By default, the Global scheduler user is selected if a scheduler user is not configured for individual processes.</p> <p>Configure scheduler user for Automation Co-Pilot on page 3293</p>
<p>Update to properties panel for human task (Service Cloud case ID: 00718109)</p> <p>As a Bot Creator, you can choose to not configure any actions in the human task by selecting the Make the form read-only check box in the Properties panel. The human task does not require any input and it is executed automatically to the next task.</p>
<p>Bookmark any page as landing page for Automation Co-Pilot on the web</p> <p>The web interface is now enhanced to a new multiple page system so that you can directly bookmark any page (Requests, Tasks, or Recycle Bin) as your landing page. Also, the tabs in the web interface have been removed so that the requests are opened one at a time and not simultaneously. To perform multiple tasks, you can open the requests pages in different browser tabs.</p>
<p>Navigation enhancement in Automation Co-Pilot on the web</p> <p>The web interface is now enhanced with a side navigation pane so that you can easily navigate to various pages (Processes, Requests, Recycle Bin, and Tasks).</p>
<p>New processes page (Service Cloud case ID: 00694786)</p> <p>As an Automation Co-Pilot user, navigate to your assigned processes and create new requests by using the new Processes page in the web interface. Use the navigation bar to quickly access the page.</p>
<p>Enhancements to the Button element</p> <ul style="list-style-type: none"> • Use the Disallow button click when this form is first loaded option to disable the Button element in a form when it is displayed for the first time during bot runtime. • Use the Subtle option in the Button type drop-down menu if you want the button element to appear as a link during bot runtime. <p>Using the Button element on page 3215</p>
<p>Enhancement to the form logo</p> <p>You can now use the Logos in footer field option to select up to two separate logos that are displayed in the footer of the form during bot runtime.</p> <p>Create a form</p>

What's changed	
<p>Enhancement to the delete process</p> <p>An Automation Co-Pilot administrator or a user with the Delete from Public permission can now delete a process in the public workspace. When the process is deleted from the public workspace, it is removed from the process management page in the web interface. Additionally, if the process is already assigned to any Automation Co-Pilot user or team, access is removed after the process is deleted.</p> <p>Delete a process automation on page 3340</p>	
<p>Variable selector window update</p> <p>The variable selector is now organized by Variable Source, Variable Type, and Variable sections. The variable source contains a request or task. The variable type is now an interface option for you to select an input, output, or meta types. The variable option specifies the variable names and type.</p>	
<p>Request variable source</p> <p>The variable selector now enables users to select a Request variable source with an Input (previously InitialData) and Meta variable types.</p> <p>Create a process automation in Process Composer on page 3312 Supported variable types in Process Composer on page 3308</p>	
<p>Insert variables to existing text</p> <p>You can use the variable selector in the process editor to insert or add variables without replacing the existing texts.</p> <p>Create a process automation in Process Composer on page 3312</p>	
<p>Filter update</p> <p>In the web interface, when you filter or search for keywords, the filter user interface now updates and reflect the filter criteria accordingly. For example, if you search for the ending status of requests, the filter shows <code>Status: Pending</code>.</p>	

Fixes	
Service Cloud case ID	Description
00702607	If you have a Message box action within a trigger loop, you can now use the Run from here option to run the bot without any error messages.
00725237	Error messages are no longer displayed when the Dropdown element in the form is populated with dynamic values during bot runtime.
00733978	Forms with read-only elements can now be submitted successfully without any issues when the value of the form field exceeds 100.

Fixes	
Service Cloud case ID	Description
-	If you select any of the Advance behavior options in the Dropdown element, error messages are no longer displayed during bot runtime.
--	A Bot Task can now pass data to the next task (Human Task or Bot Task) if it contains Japanese characters in its output variable name. Previously, English characters had to be used for the variable name in the Bot Task .
--	In a cloud environment, the Automation Co-Pilot web interface now displays the correct screen for the selected locale. Previously, the screen was not displayed correctly for the selected locale.

Limitations
<p>In the process editor, the If/Else condition of string type does not allow the source and target values to be empty. As a result, you cannot validate if a string variable is empty.</p> <p>Workaround: Create an empty string output variable for the bot. Use this variable as the target value to compare with a form or bot source variable so that the validation in the If/Else condition does not fail.</p>
<p>When you enter data in a form of your process that contains a hyperlink, the data is ignored when you try to submit the form. The hyperlink instead displays the following behaviors:</p> <ul style="list-style-type: none"> • When the hyperlink URL is configured at a designed time (the process of designing the interface or setting properties), the URL remains unchanged by the process. • When the hyperlink URL is not configured at a designed time, then the URL is set to the Control Room domain.

Discovery Bot

What's new
<p>Search for a business process from the Processes page</p> <p>You can now use the search field to help you locate a specific process by name. The field is not case-sensitive. The search field is available from the Processes page.</p> <p>Create a Discovery Bot process on page 3704</p>

What's new
<p>View all captured images from the screenshot modal window</p> <p>You can now navigate across all captured screenshots when you click an image in full size from the modal window. Click the pagination located below the image to select a step number or use the right or left arrows to quickly display all captured images.</p> <p>Record a Discovery Bot business process on page 3709</p>
<p>Process Discovery package is included in default packages</p> <p>The Process Discovery package is now included in the default packages. You can preload the default package when you connect to your device. Preloading the package helps to speed the start time of the recorder the first time you begin recording a process</p> <p>Prerequisites for Discovery Bot on page 3695</p>
<p>Recorder enhancements</p> <p>You can now perform actions such as double-click, drag-drop, click and hold, and text select when recording a business process. Actions performed using keyboard strokes are displayed in the Data field. Double-click is captured by the recorder and displayed in the screenshot from the Recordings page.</p> <hr/> <p>Note: The Discovery Bot recorder does not capture the drag-drop and click and hold actions from the Recordings page. To include these actions performed during the recording, you can document the individual steps in the Step description text field for the analyst.</p> <hr/> <p>Record a Discovery Bot business process on page 3709</p>
<p>Support for IPv6 addresses</p> <p>IPv6 addresses are now supported for Discovery Bot.</p>
<p>Linux support</p> <p>Discovery Bot is now supported on Red Hat Enterprise Linux and Linux CentOS platforms.</p> <p>Installing Control Room on Linux on page 1237</p>
<p>Support for high availability</p> <p>Discovery Bot now supports high availability deployment.</p> <p>High availability deployment on page 1179</p>

What's changed
<p>Changing default repository path for custom installation</p> <p>For custom installation, you can now change the default repository path location to a new location on your server after installation.</p> <p>Prerequisites for Discovery Bot on page 3695</p>

Fixes	
Service Cloud case ID	Description
--	You can now export a PDD for an opportunity with 2000 steps by using the Download PDD option from the Opportunities page.

Limitations
When Tab is used to move across fields to a password-type field, the entered data is displayed as clear text, for example, when you move from the Username to Password field. Review the text in the Data field for confidential information before you submit the process.
Some actions might not be supported during a recording session, for example, when you click through the Network tab in Inspect mode using Chrome. For such unsupported actions, pause the recorder, complete the action, and then resume the recording.
When you record a process with 1000+ steps, the Recordings page takes some time to load. Workaround: Depending on your environment, you can perform one of the following actions: <ul style="list-style-type: none"> • Split the recording into multiple recording sessions. For example, you can divide 1000 steps into 10 separate recordings. • Wait for all the steps to load on the page before submitting the process for review.

IQ Bot

What's new
Enhancement to the Document Classifier package The Train Classifier action now provides an option to retrain the documents using an existing model file. Using Train Classifier action on page 2424

What's changed
IQ Bot Pre-processor actions renamed The names of all the available actions in the IQ Bot Pre-processor package are now changed. For example, the Get barcodes action is now renamed as GetBarCodes . IQ Bot Pre-processor package on page 2636

What's changed
<p>Download all processed documents without any timeout (Service Cloud case ID: 00587817)</p> <p>You can now download all your processed files from the Amazon S3 server to your local machine without causing any timeout, irrespective of the number of files. Even when you choose the Delete files from the server after downloading option and if your download fails, a compressed .zip file containing the failed documents is available for downloading again.</p> <p>Download all documents action on page 2653</p>
<p>Enhancements to IQ Bot APIs (Service Cloud case ID: 00688683, 00688678, 00688675)</p> <ul style="list-style-type: none"> • <code>File upload</code> API now returns the file ID of the uploaded file. • <code>File status</code> API now accepts a file ID and returns its status as a status code. • <code>File download</code> API now returns the extracted data in JSON format for a successfully uploaded file. <p>APIs to upload files, check file status, and downloading CSV file (A-People login required)</p>
<p>IQ Bot license renamed</p> <p>The license required to run IQ Bot is now renamed to IQBot Platform from the previous Cognitive Platform.</p> <p>Licenses overview</p>

Fixes	
Service Cloud case ID	Description
00708806	You can now save documents of up to 20 MB after validating, without any issues.
00662968	Fixed an issue that caused the gateway service to become unresponsive.
00644948	When you now upload a document in production, deadlocks no longer occur in the system and documents are correctly sent to the Validator.
00707965	When you now migrate from IQ Bot Enterprise 11 to A2019 using the Migration Assistant tool, all database tables are correctly migrated, without any errors.
00715124	IQ Bot now deletes temporary files downloaded from Amazon S3 server in the <code>C:\windows\temp\</code> folder when they are no longer required. As a result, storage is no longer consumed by these temporary files.

Fixes	
Service Cloud case ID	Description
--	Logs are now available for the IQ Bot node servers in the C:\Users\Public\Documents\Automation Anywhere IQBot Platform\Logs\ folder.
--	IQ Bot now displays the correct error message when you refresh the extraction results page for a learning instance when its associated bot is moved to production.
--	When creating a table on the Designer page, if you click See Extraction results without completing the table creation, the correct error message is now displayed. Previously, the following incorrect message was displayed: <i>Preview will be opened in a new tab.</i>
--	When a bot is deleted and you click the Test bot option on the Bots listing page, the following correct error message is now displayed: <i>Bot not found.</i>
--	Python logic is now correctly applied on all the tables. Previously, IQ Bot failed to execute Python logic for tables other than the default one.
--	You can view more granular logs for troubleshooting RabbitMQ v3.8.18 issues. These logs are now stored in the C:\Users\Public\Documents\Automation Anywhere IQBot Platform\Logs\RabbitMQ folder, depending on the log level, log size, and the rotation limit. If any error occurs in the RabbitMQ v3.8.18 connection, those crash logs are stored in C:\Users\Public\Documents\Automation Anywhere IQBot Platform\Logs\RabbitMQ\log folder.
--	When you now create a user role with 2-byte non-English characters, services no longer fail to execute.
--	If there is an existing database, IQ Bot installer now does not check for the db_creator role for that user.

Fixes	
Service Cloud case ID	Description
--	A user with <code>AAE_IQ_Bot_Validator</code> role and <code>AAE_Basic</code> role can now successfully launch and validate documents in the IQ Bot Validator.

Limitations	
IPv6 addresses are not supported for IQ Bot, so ensure that you use IPv4 addresses only.	
If you try to apply Python logic to a linked column between two tables, an error message is displayed for the linked column in the second table and the applied logic fails.	
If you add a blocked library to a custom Python logic and click Test Run for any field, an error message is displayed on the designer page. Workaround: Remove the blocked library from the Python logic.	
If you use the Overwrite option to import a learning instance, all the available bots and groups are imported.	
When you use the Process documents action from the IQ Bot Extraction package to run a bot through workload management, the Current Action tab displays <code>Downloading additional resources</code> along with your command instead of <code>IQ Bot extraction</code> in the In progress activity page.	
Average processing time increases when you use the IQ Bot Extraction package on a document with more than 30 pages.	
Running existing bots that use the IQ Bot Pre-processor package might fail after you upgrade to this release. Workaround: Because the names of the available actions in the IQ Bot Pre-processor package have changed, delete the existing actions in the bots and update them with the new names before running the bot.	
(Service Cloud case ID: 00601790) You cannot register IQ Bot when the Control Room is installed on a Linux machine.	
When you run a bot that has the IQ Bot Extraction package, the activity information under In progress > Current Action does not display the details correctly.	
If you use the File Download API option, the <code>json</code> response you receive does not have a valid format. Workaround: This issue occurs because the <code>:</code> (colon) is replaced by <code>=</code> (equal sign) in the <code>json</code> key value. After you receive the <code>json</code> response, use these options: <ul style="list-style-type: none"> • Replace <code>=</code> with <code>:</code> • Add <code>"</code> (double quotation marks) in each text 	
When you try to sort the PagesUpload column in the Learning instance > Document Group tab, an error message is displayed.	

Limitations

On the Designer, if you resize the system identified region (SIR) of an auto-mapped field, the values from the resized selection are not captured in the corresponding value field.

Workaround: To update the content of an auto-mapped field:

1. Select the entire SIR region.
2. Draw a bigger bounding box around the region.

Bot Insight**What's new**

AAE_Admin role access to operations API from Power BI connector

The Power BI connector now provides the **AAE_Admin** user role access to the botrundata operational API. With this role, you can connect to the botrundata API and extract operational metrics to be analyzed and visualized within Power BI.

Enhancements to the publish (production) dashboard

Users with the **AAE_Bot Insight Admin** and **AAE_Bot Insight Expert** role can now edit the published dashboard. You can use the save as option to save the production dashboard as a custom production dashboard and add widgets to your custom dashboard. You can also delete a default production dashboard and a custom production dashboard.

[Save a published dashboard](#) on page 3746 | [Delete a published dashboard](#) on page 3746

Important: The supported packages information is moved to this topic: [Packages available in Automation 360](#) on page 2225.

Enterprise A2019.19 Release Notes

Release date: 11 February 2021

Review the new features, changed features, fixed features, security fixes, deprecated features, and known limitations in the Enterprise A2019.19 release. Enterprise A2019.19 Build 8147 is available for On-Premises and Build 8145 is available for Cloud. IQ Bot is on Build 8098.

Important: We have updated the Enterprise A2019.19 builds to include fixes for the following issues:

- System variables that are displaying blank in the action field (Service Cloud case ID 00737695, 00737698)
- Editing the table size when creating a new table variable in On-Premises (Service Cloud case ID 00725978, 00727695, 00736105)
- Issues editing a bot in the Bot editor and opening the packages listing page that includes special characters (Service Cloud case ID 00733529, 00739634)
- Assigning a bot from the private workspace to a file variable (Service Cloud case ID 00727695)

- Actions in the Image Recognition package not allowing the use of files with .PNG extension and files with uppercase letters in the extension (Service Cloud case ID 00734972, 00734266)
- Variable names in uppercase changing to lowercase, hyphen changing to underscore, and variable not being displayed if it contained an uppercase character (Service Cloud case ID 00734784, 00734842, 00734999)
- Bots not getting deployed on a multi-user device when the user session is signed out and no active session existed (Service Cloud case ID 00727228, 00722888, 00732830, 00732835, 00733877, 00733362, 00726489, 00733070, 732959, 733160, 733269,733321, 733391, 733435, 733438, 733451, 733680, 733765, 733770, 733790, 733940, 00734067)
- Child bots encountering an error if they contained the **Find window in window** action of the Image Recognition package (Service Cloud case ID 00727031, 00730358, 00733607, 00733544, 0073464)
- Use of variables with camel case names in the Data Table, List, and Loop packages (Service Cloud case ID 00733263,00733459, 00733007, 00733988, 00734168, 00733141, 00733074, 00733087, 00733001,00734019)

For more information, see the Fixed features sections for Enterprise A2019 and Automation Co-Pilot.

Migration features

Enterprise 11 and Enterprise 10 features
<p>Review messages in Migration Assistant</p> <p>The Migration Assistant displays review messages for migrated bots. Open the migration assistant for a bot to review messages for that bot.</p> <p>View changes to migrated bots using Bot Assistant on page 1616</p>
<p>Migrate MetaBots with screens</p> <p>Migrate MetaBots that contain screens as assets. You can migrate screens based on UI Automation technology and captured using the Object play mode.</p> <p>How MetaBots are migrated on page 1535</p>
<p>Review messages in Bot Scanner report</p> <p>The Bot Scanner report shows review messages about the behavior change in commands that are used in bots that can be migrated to Enterprise A2019.</p> <p>Analyze Bot Scanner report for migration on page 1474</p>

Enterprise 11 and Enterprise 10 features

Stop, or pause and resume migration

You can stop, or pause and then resume the migration process from the bot launcher and the **Activity > In progress** page.

[Stop bot migration](#) on page 1557 | [Pause and resume bot migration](#) on page 1556

Migrate bots that use capture scrollable text action in App Integration command

Enterprise 11 and Enterprise 10 App Integration commands that capture text from an application window with a vertical scroll bar are migrated to the **App integration > Capture scrollable text** action in Enterprise A2019.

[Package mapping for migration](#) on page 1559

Enterprise 11 only features

Map output of PDF integration command to multiple variables

The output of an Enterprise 11 bot that uses the PDF integration command is mapped with multiple variables in the equivalent actions of the PDF package after the bot is migrated to Enterprise A2019.

Migrate bots that use the following attributes:

- Bots that send Japanese text in the VT100 terminal using the **Send Text** command
- Bots that use the **Get Single Node** or the **Get Multiple Nodes** command to extract nodes that contain namespaces from an XML file
- Bots that contain the **Connect** command of the Terminal Emulator command and the value in the **Wait Time Out** field that is less than hundred milliseconds

Migrate bots that use the following options in the Active Directory command:

- The **Modify Object** command with the Rename, Delete, Move, and Set Property actions for the **Computer** and **Organizational Unit** object type.
- The **Modify Group** command with the **Add users to a group** and **Remove users from a group** actions.

[Package mapping for migration](#) on page 1559

Enterprise 10 only features

Migrate latest version of Enterprise 10 bots enabled with version control

You can now migrate the latest version of bots from your Enterprise 10 Control Room configured with SVN version control to Enterprise A2019. Use the **Copy 10.x data** option to copy the latest version of the Enterprise 10 bots to Enterprise A2019 and then use the Bot Migration Wizard to migrate the bots to Enterprise A2019.

[Copy Enterprise 10 data](#) on page 1520 | [How Enterprise 10 data is copied to Automation 360](#) on page 1517

Enterprise A2019

Important: This release includes a required update to your . Ensure that you complete the update to continue with your automation activities when upgrading from a previous release to this release.

[Automatically update the Bot Agent](#) on page 1302 | [Manually update the Bot Agent](#) on page 1303

To verify which version is compatible with this release, see [Compatibility with release builds](#) on page 1275.

New features
<p>Auto-login settings</p> <p>Use the auto-login configuration in the Control Room to reduce bot startup time by reusing an existing user session. Configure auto-login in the Administrator settings for all devices or customize it from the Devices page for each device.</p> <ul style="list-style-type: none"> • Configure the auto-login settings for a user session to create a new session or reuse an existing session • Keep user sessions unlocked • Log off from a user session after the bot completes execution <p>Configure auto-login settings on page 1742 Devices on page 1808</p>
<p>New CPU utilization and device memory settings</p> <p>Configure the CPU utilization and device memory threshold value in the Control Room settings to determine whether to deploy bots on devices or not.</p> <p>Configure threshold settings for user devices on page 1741</p>
<p>Install Bot Agent on devices without administrator privileges</p> <p>You can now choose to install the Bot Agent on user devices with either local user privileges (without administrator privileges) at the local user level or administrator privileges at the system level.</p> <p>Install Bot Agent and register device on page 1288 Create device pools on page 1818 Users on page 1676</p> <p>When you install the Bot Agent at the user level, the device will not be available as a default device for another user or for device pool selection during bot deployment. For more information, see Bot Agent known limitations.</p>
<p>New diagnostic utility for Bot Agent</p> <p>Use the Bot Agent diagnostic utility to perform diagnostic checks on Bot Runner devices and to resolve Bot Agent connectivity issues.</p> <p>Perform Bot Agent diagnostic checks on page 1306</p>

New features
<p>New features in Data Table package (Service Cloud case ID: 00656843, 00707635)</p> <ul style="list-style-type: none">• Use the Change column type action in the Data Table package to perform operations on the column of a data table. Use this action to change the column data type to Boolean, Datetime, Number, or String.• Sort the data in the data table in Number, Datetime, Boolean, or String format. <p>Data Table package on page 2365</p>
<p>New action in App Integration package</p> <p>Use the Capture scrollable text action to extract text from the selected window or any control within the selected window and save it to a variable. If you click any control within the window, then text from that specific control is extracted. If you click outside the window, then all the text from that window is extracted.</p> <p>App Integration package on page 2321</p>
<p>New encoding combo box option in Terminal Emulator for VT Series</p> <p>To send and receive Japanese text, you can now use the Encoding and CodePage combo boxes when you connect to the Terminal Emulator for the VT series terminal type.</p> <p>Using Connect action for Terminal Emulator on page 2990</p>
<p>New actions in Active Directory package</p> <p>Use the following actions in the Active Directory to automate a task:</p> <ul style="list-style-type: none">• Move a computer Using the Move computer action on page 2286• Move an organizational unit Using the Move organizational unit action on page 2292• Add users to a group Using the Add users to group action on page 2294• Remove users from a group Using the Remove users from group action on page 2297
<p>New system variable for new line character (Service Cloud case ID: 00669232, 00672775, 00673578)</p> <p>Use the <code>\$String:Newline\$</code> system variable to add a new line character. This variable adds a new line character in various applications regardless of the operating system of the device.</p>
<p>Zero-size form for Enterprise A2019 (Service Cloud case ID: 00677611)</p> <p>The Run action uses the zero-size form with name <code>AAZeroSizeForm</code> that can be used by DLLs to identify zero-size forms created by Enterprise A2019.</p>

New features
<p>Enhancement to define parent path in Active Directory</p> <p>When you establish a connection with an LDAP server, you can now select the LDAP path by connecting to the server.</p> <p>Using Connect action for Active Directory on page 2289</p>
<p>Obtain information about Run-As user after bot deployment</p> <p>Use the AATaskExecutor system variable to return the username, first name, last name, and email of the user that ran the bot. If the bot is deployed on an attended Bot Runner, this variable returns information about the logged-in user. If the bot is deployed by a trigger, this variable returns information about the user associated with that Bot Runner license.</p> <p>System settings and parameters on page 2239</p>
<p>Enhancements to the Recorder</p> <ul style="list-style-type: none"> • Universal Recorder now supports object capture in Mozilla Firefox. <ul style="list-style-type: none"> You must install the A2019 extension from Mozilla Firefox browser add-ons. • Capture table, grid view, and main window objects from SAP applications. <p>Universal Recorder supported applications and browsers on page 2172 Actions performed on objects captured with Universal Recorder on page 2804</p>
<p>Multi-user device supported on Citrix Windows 10 Enterprise (Service Cloud case ID: 00526001)</p> <p>Multi-user device sessions are now supported on Windows 10 Enterprise on Citrix, enabling multiple users to access the same device at the same time.</p>
<p>Event triggers on unattended Bot Runners (Service Cloud case ID: 00681548)</p> <p>Ensure that you select the Reuse an existing session option for auto-login settings in the Control Room to use event triggers on unattended Bot Runners when a device is locked or is in a disconnected state (such as RDP).</p> <p>Configure auto-login settings on page 1742</p>
<p>Auto Login support on Citrix VDI (Service Cloud case ID: 00680200)</p> <p>Auto Login is now supported on Citrix VDI, which enables bot deployment in unattended mode.</p> <p>Configure auto-login settings on page 1742.</p>
<p>Restore bots from Git repository</p> <p>If your database is deleted or corrupted, the admin user can restore all your bots and the associated dependent files from the Git repository to your new empty database.</p> <p>Restore bots from Git repository on page 1770</p>

New features
<p>Bot Deploy API checks for available devices in the order of listed pool IDs</p> <p>If you enter multiple pool IDs in the request body, the API checks the pools for available devices in the order that you listed the pool IDs. If none of the devices are available at the time of deployment, the automation is queued.</p> <p>Bot deploy API</p>
Changed features
<p>Enhanced security for multi-user Bot Agent devices (Service Cloud case ID: 00695858)</p> <p>The Bot Agent configured on multi-user devices for RDP-based deployments now uses the updated version of <code>wfreerdp.exe</code> for enhanced security.</p>
<p>Deployment API enhancement (Service Cloud case ID: 00655548)</p> <p>When you invoke a regular deployment API, if a RunAsUser is being used to deploy a bot, the deployment API will not deploy other bots until the RunAsUser is free to run the other bots.</p>
<p>Status change initiates workload automation deployment</p> <p>When you change the status of a Work Item from Failed to New in the Control Room (Queues), the deployment of a workload automation in queue is initiated.</p>
<p>Install Google Chrome Enterprise extension offline with Bot Agent (Service Cloud case ID: 00623511, 00689623, 00715413)</p> <p>You can now install the extension for Google Chrome Enterprise offline from the Bot Agent setup and MSI files.</p>
<p>ANSI as default encoding in Data Table package</p> <p>For text write operations, Data Table package > Write to file action supports ANSI as default encoding type.</p> <p>Bots created in the previous version of Enterprise A2019 with UTF-8 is not impacted by this change.</p>
<p>Enhancement to PDF package</p> <p>In the PDF package, when you enter an incorrect page range in the Page range field and execute the bot, an error message is now displayed, requesting you to provide the correct page range. The message is displayed for the following actions:</p> <ul style="list-style-type: none">• Merge document• Split document• Extract text• Extract image

Changed features
<p>Bots wait for Google Chrome web page to load</p> <p>When automating a task in the Google Chrome browser, bots now wait up to 30 seconds for the web page to load, and then run the subsequent Recorder > Capture action. When the page loads, bots search for the object for the duration specified in the Wait for control field. Waiting for the web page to fully render increases the bot's ability to identify the target object in the web page.</p>
<p>Enhancement to desktop operations</p> <p>When you create a bot and select an option for desktop operations, the data selected from the drop-down list now persists even when you navigate to other fields.</p>
<p>Flow view updates in the Bot editor (Service Cloud case ID: 00701626)</p> <ul style="list-style-type: none"> The Flow view is disabled when you create or edit a bot and the bot exceeds 500 lines of code. Use the Show list view option to navigate to the list view. In the Bot editor Flow view, a warning message is displayed when the bot exceeds 400 lines of code or if the bot has more than 100 variables.

The following table lists the fixed features and the builds in which they were fixed (Build 8147 is the latest build, and builds 8145, 8134, 8122, and 8098 are the previous builds). These fixes are cumulatively available in the latest build.

Fixed features		
Build number	Service Cloud case ID	Description
8147	00737695	When you insert a system variable into an action field, the variable now appears in that field.
8147	00725978, 00727695	When you create a table variable in On-Premises, the table expands to the full size of the window. Previously the table only showed three rows at a time.
8147	00733529,00739634	You no longer encounter any issues when you edit a bot in the Bot editor and open the packages listing page. Previously, if an installed package had an object name with a space (' ') character in it, the package listing page displayed an error.
8145	00727695	You can now assign a bot from your private workspace to a file variable.
8145	--	When you create a variable in an action, the variable automatically appears in the field for which you created the variable.
8145	--	You can now use .png files in actions in the Image Recognition package.

Fixed features		
Build number	Service Cloud case ID	Description
8145	00734972, 00734266	You can now select a Control Room file with uppercase letters in the file extension in the Image Recognition > Find image in window action.
8145	00734784	Variables names are now displayed correctly in the Bot editor List view; uppercase letters in the variable name are no longer changed to lowercase letters and hyphens are not changed to underscores.
8145	00734842, 00734999	Actions now display Boolean, date time, or list type variables if the variable name contains uppercase letters.
8145	00727228, 00722888, 00732830, 00732835, 00733877, 00733362, 00726489, 00733070, 732959, 733160, 733269, 733321, 733391, 733435, 733438, 733451, 733680, 733765, 733770, 733790, 733940, 734067	You can now deploy bots on a multi-user device when the user session is signed out and no active session (signed in, locked, or disconnected) exists either for that user or any other user. The following error message is no longer displayed on the View historical activity (Activity > Historical) page: Unable to perform auto-login for user <username>.
8145	--	The Cloud migration utility no longer keeps running in the background if you close the utility when the Enterprise 11 data is being uploaded.
8134	00727031, 00730358, 00733607, 00733544, 00734642	You can now successfully execute bots when you use Image Recognition with the Find window in window action in a child bot. Previously, bot execution failed when you used Image Recognition with this action in the subtask.
8134	00733263, 00733459, 00733007, 00733988, 00734168, 00733141, 00733074, 00733087, 00733001, 00734019	The Data Table, List, and Loop packages now support variables with camel case names.
8122	00713867	Variables are now listed in alphabetical order in the Variables palette and in the Insert a value window that appears when you press the F2 key.

Fixed features		
Build number	Service Cloud case ID	Description
8122	--	The Control Room now does not take time to launch, and the following error message is no longer displayed: An Unexpected Problem Occurred.
8098	00689022, 00697417, 00697420, 00697079	A Bot Agent device no longer disconnects from the Control Room that is configured on Microsoft Azure. The following error message is no longer displayed: disconnecting due to outstanding pong.
8122	00719167, 00721731	Tasks such as scheduling bots and connecting to user devices are not delayed in an Control Room hosted on Cloud.
8098	00626595, 00680433	The actions in the Image Recognition package no longer return an incorrect error message about the target image data type.
8098	00698201	Fixed an issue where bots were stuck in the preprocessing mode when the bot was used as a child bot in several running bots or was deployed back to back using the Deploy API. Now bots are deployed from the cache and fewer calls are made to the database, thus avoiding a database deadlock.
8098	--	The Bot Scanner now displays the correct message for the MetaBot logic that contains credential variables that cannot be migrated to Enterprise A2019.
8098	00687223	An Enterprise 11 bot that passes a blank value as an input to the string, list, one-dimensional array, and two-dimensional array of string type variable used in a DLL no longer encounters an error when you run that bot after migrating to Enterprise A2019.
8098	00677231	A bot is no longer unresponsive if it contains an action to close the Google Chrome browser followed by an action to open the Google Chrome browser.

Fixed features		
Build number	Service Cloud case ID	Description
8098	00687207	When an Enterprise 11 bot contains objects captured using the Object Cloning command and that object has a property that contains an expression within the \$ character, the Enterprise 11 bot no longer encounters an error after migration.
8098	00689286	The Bot Scanner no longer encounters an error when you scan an Enterprise 11 bot that contains the If command with the Windows control condition selected and is automating a task on a Microsoft Excel file.
8098	00706438	An error is no longer encountered when you are installing Enterprise A2019 and: <ul style="list-style-type: none"> You are migrating from Enterprise 11 to Enterprise A2019 Active Directory is configured on the Enterprise 11 Control Room The restored Enterprise 11 database contains the AAE_Meta Bot Designer role
8098	00708522	An error is no longer encountered when you clone a dependent file of an Enterprise 11 bot after it is migrated to Enterprise A2019. The error is encountered only when the migrated bot contains a null description.
8098	00626664	You can now migrate bots that automate tasks in BMC applications. The migrated bots use the Legacy automation > Manage web controls action to automate interactions with objects.
8098	--	You can now select the regular expression Case insensitive option in actions that contain a window title field and successfully perform a recapture in the application window.
8098	00688134	In the Database package, Korean characters are now displayed properly when you use the Insert/Update/Delete action in an Excel file. Previously, the Korean characters were not displayed properly when the action was used.

Fixed features		
Build number	Service Cloud case ID	Description
8098	00675749	In the Email package, you can now forward an email using groupId or Alias. Previously, the mails were not sent by the SMTP server if the email address contained groupId or Alias in the To address field.
8098	--	You can now use a double backslash (\ \) in the Send text action of the Terminal Emulator and execute bots. Previously, when a double backslash (\\) was used in this action and the bot was executed, the terminal displayed a single slash (\).
8098	00688692	When you connect to the EWS server to read mails using Loop, the retrieved email now displays the content correctly per the selected mode (HTML or plain text formats). Previously, when connecting to the EWS server to read an email in HTML format, the email body displayed a blank output.
8098	00659456	In the Loop package, when you select For each file in folder as the Iterator option, the Note below the Assign file name and extension to this variable field now displays the key name in English. Previously, the key name in the Note was translated to the languages you selected.
8098	--	A bot no longer runs intermittently when the focus changes from one window to another window and does not display the Type_015 Google Chrome plug-in error.
8098	00683528	In the Database package, single entries are now inserted in the database when you execute a store procedure to add rows in the table and the option Export data to CSV is selected. Previously, duplicate entries were added in the database.
8098	00693664	Fixed an issue where Japanese characters did not display correctly when input into a field that contained a variable.
8098	00677167	The locker Participants tab now shows only the assigned participants for that specific locker. Previously, the tab displayed the participants of the previously viewed locker, requiring the user to refresh the browser to see the correct participants.

Fixed features		
Build number	Service Cloud case ID	Description
8098	--	The Control Room services can now be run using the non-administrator service account users. The Bad Gateway error message is no longer displayed.
8098	00691232	Fixed an issue that did not allow users to update the value of a file type input variable after saving the bot.
8098	--	The Save option is now correctly enabled when users make any changes to the metadata, unique entity, or SAML assertion mode.
8098	--	The username is no longer saved in the login window after the user logs out unless the user has selected the Remember my username option.
8098	00682021	When you check in a bot that has cloned bots as dependencies, the dependent files are no longer lost from the private workspace. Also, after the check-in, if you create a new bot using the same dependencies as in the earlier bot, the new bot executes successfully.
8098	--	Work Items are now processed for workload automation after you add more Work Items to an existing queue.
8098	--	Work Items are now reprocessed for workload automation after you change the status from failed to new.
8098	00711410	You can now migrate workload automations in an Control Room configured to use a manual mode for Credential Vault.
8098	00667047, 00673289	Auto-login for a user session no longer fails for bots deployed on virtual machines when the VDI session is disconnected or is in a locked state, and the following token error message is no longer displayed: <code>An attempt was made to reference a token that does not exist.</code>
8098	00560593, 00585092	Universal Recorder is now aligned with the Bot Agent, so the recorder can capture objects on devices with any proxy server configuration.

Fixed features		
Build number	Service Cloud case ID	Description
8098	00675695	When you use the Excel advanced package, the bot now opens an Excel file without any issues. Previously, the bots failed to open an Excel file in some scenarios due to internal hardware components.
8098	00678567	CSV formulaic entries are no longer permitted in data fields of web applications, such as device names. These fields are limited to accept alphabetic characters, numbers, hyphen, and underscore entries only.
8098	00691551	Turkish characters are now supported in user names.

Known limitations
<p>When you update the Bot Agent from user level to system level, the user is unable to capture objects using recorder actions or from a window list in a Google Chrome browser.</p> <p>Workaround: Remove the registry entry for the user. Ensure the registry entry is in HKLM: Computer\HKEY_CURRENT_USER\SOFTWARE\Google\Chrome\NativeMessagingHost\Automation*.</p>
<p>When you uninstall the Bot Agent, the Bot Agent service and registry entry are not removed. Therefore, subsequent Bot Agent reinstallations fail.</p> <p>Workaround:</p> <ol style="list-style-type: none"> 1. Stop the Bot Agent service from the Task Manager. 2. Delete the Bot Agent registry key from Computer\HKEY_LOCAL_MACHINE\SYSTEM\ControlSet001\Services\Automation Anywhere Bot Agent. 3. Reinstall the Bot Agent.
<p>When you install a Bot Agent at the user level, the user device is not registered as admin.</p> <p>Workaround: Before installing the Bot Agent, ensure that the user has write permission to the user profile folders (for example, C:\Program Files).</p>
<p>When you deploy a bot using a custom package and if the package has an object name with a semicolon (;) or percentage (%) character in it, the bot execution fails.</p> <p>Workaround: Do not use special characters such as a semicolon (;) or percentage (%) in the custom package name.</p>

Known limitations
<p>Limitation for multi-user deployments with auto-login</p> <p>If the auto-login setting in the Control Room is set to lock the session when the bot finishes executing from an existing unlocked session, deployments will fail when you deploy a bot on a multi-user device with non-admin user session and another admin user session is also active on the device.</p> <p>Workaround: Restart the Bot Agent service from the Windows Start menu and log off from the admin user session.</p>
<p>Bot Agent installation</p> <p>Starting from this release, when you install the Bot Agent at the local user level, keep the following in mind:</p> <ul style="list-style-type: none">• You cannot install the Bot Agent at the user level if you log in to the device as the root administrator.• Auto-login is not supported for local users and unattended Bot Runners.• The auto-update feature for the Bot Agent will be applicable from the subsequent release because the option to install the Bot Agent at the local user level is introduced in this release.• You cannot configure multi-user devices.• Enterprise A2019 recorders for third-party applications:<ul style="list-style-type: none">• No separate setup is required for JRE 6 and 7.• Citrix XenApp is not supported because administrator privileges are required to set up Citrix.• You must upgrade to the Enterprise A2019.19 Recorder package to use Discovery Bot.• You must have write permission to AISense Recorder logs.
<p>Bots encounter a Java heap space error when they use the Excel basic package to open an Excel file that is 20 MB or larger.</p> <p>Workaround: Increase the Java virtual machine heap space to 8 GB:</p> <ol style="list-style-type: none">1. Navigate to <code>C:\Program Files\Automation Anywhere\Bot Agent\config</code>.2. If it does not already exist, create a new text file named <code>nodemanager.properties</code>.3. Open the file and copy the following text and paste it in the file: <code>bot.launcher.jvm.options=-Xmx8092m</code>4. Open Windows Services and restart the Bot Agent.
<p>Bots wait a maximum of 30 seconds for an object to appear in the Google Chrome browser, regardless of the value in the Wait for control field in the Recorder > Capture action.</p>

Known limitations
<p>Limitations in Cloud migration</p> <ul style="list-style-type: none"> • The backup of the Enterprise 11 data created by the Cloud migration utility is not deleted when you close the Cloud migration utility after the Enterprise 11 data is uploaded to Cloud. • Enterprise 11 bots that contain Japanese characters in their name encounter an error when you run these bots after they are migrated to Cloud. • The Cloud migration utility does not show a validation error when you run the utility and the Automation Anywhere Control Room Reverse Proxy service is running if you have reinstalled Enterprise 11 Control Room using the same database that you have used in the previous Enterprise 11 instance.
<p>(Service Cloud case ID: 00737669) When you upgrade to this release, the Bot Agent is also updated. As a result, all the event triggers associated with Bot Runner (attended or unattended) users are stopped.</p> <p>Workaround: Bot Runner (attended and unattended) users must re-login to the Control Room to activate the associated event triggers.</p>
<p>Enterprise 11 bots that use identical names for variables that are differentiated by a hyphen or an underscore (for example, L-Lower and L_Lower) encounter an error when you run them after migrating to Enterprise A2019.</p> <p>Workaround: Update the name of one of the variables to a different name before migrating the bot.</p>
<p>String system variables do not function in Email action fields when the format is set to HTML.</p> <p>Workaround: Use HTML tags that perform the same function as the string variables. For example, instead of <code>\$String:Enter\$</code> or <code>\$String:Newline\$</code>, you can use the HTML tag <code>
</code>. Similarly, for the string variable <code>\$String:Tab\$</code>, you can enter <code>&nbsp;</code>.</p>
<p>When you insert a variable into an action field that contains other content, the variable appears at the end of the content, regardless of the cursor position.</p> <p>Workaround: Highlight the variable name, and then cut and paste it to the correct position in the action field.</p>
<p>(Service Cloud case ID: 00781974) In a Linux environment, some of the Control Room log messages are stored in the <code>/var/log/messages</code> file instead of the <code>/var/log/automationanywhere</code> directory. As a result, disk space increases, and the services might stop when the disk space is full.</p> <p>Workaround: Clear the messages file regularly to avoid a disk storage issue.</p>

Automation Co-Pilot for Business Users (Automation Co-Pilot)

New features
<p>New filter task in the process editor</p> <p>In the process editor, the Filter Task enables users to filter variables such as human or bot task output with a specific filter criterion.</p> <p>Create a process automation in Process Composer on page 3312</p>
<p>New process task in the process editor</p> <p>Use the new Process Task option in the process editor to call a subprocess within the main process. This feature enables you to separate tasks into different processes instead of including all the tasks in a single process. Multiple teams can now work at the same time on different tasks within the main process and remain segregated, without any conflicts.</p> <p>Create a process automation in Process Composer on page 3312</p>
<p>Hide a task or view a hidden task</p> <p>With a Bot Creator license, you can now perform the following:</p> <ul style="list-style-type: none"> • Hide the display of human and bot tasks by selecting the Hide this task after completion option in the process editor. • View a hidden human or bot tasks by selecting the View hidden tasks option in the tasks view page. <p>Create a process automation in Process Composer on page 3312</p>
<p>Edit title in process editor</p> <p>Users can now edit the title in the process editor.</p>
<p>Rich-text editor updates (web interface)</p> <p>In the web interface, you can use rich-text editor features such as bold text, italics, underline, alignment, formatting, color, and size in tasks.</p>
<p>Table element updates (web interface)</p> <p>In the web interface, the Table element now supports the use of date, number, drop-down, and text values in tasks.</p>
<p>Updates to elements in form builder</p> <p>The form builder now includes the following new elements:</p> <ul style="list-style-type: none"> • Select Folder element: Add an upload folder option in the form. Using the Select Folder element on page 3225 • Hyperlink element: Assign a URL in the form. Using the Hyperlink element on page 3219

New features
<p>Enhancement to the Checkbox action trigger</p> <p>If a form with a Checkbox element is used within a trigger loop package, you can now use the Value selected and Value unselected trigger actions.</p> <p>Trigger loop package on page 3007</p>

Changed features
<p>Create and view requests (Automation Co-Pilot manager)</p> <p>An Automation Co-Pilot manager can create and view requests from processes that are assigned to the team they belong to or own. They can also create and view requests from processes that are assigned to themselves but not to the team.</p>
<p>Same device cannot be assigned to Bot Creator and unattended Bot Runner for triggers</p> <p>After you update to this Enterprise A2019 version from an earlier version, a default device that is assigned to a Bot Creator or an attended Bot Runner cannot be assigned to an unattended Bot Runner for deploying triggers.</p> <p>Recommended action: Use separate devices or device credentials (auto-login) for a Bot Creator and an attended Bot Runner as deployments can overlap or override across licenses.</p>
<p>Create a Request action URI</p> <p>The process selector in the Create a Request action is replaced with a public repository uniform resource identifier (URI).</p> <p>Process Composer package on page 2777</p>

Fixed features		
Build number	Service Cloud case ID	Description
8134	--	The table element now renders properly even when the Row before scrolling parameter value does not match the number of rows. Previously, the table did not render properly and displayed empty cells.
8122	--	When you check out a process, and add, modify, or remove tasks in the process editor, the dependencies are now correctly updated when the process is checked in.
8098	00707684, 00707688, 00707192, 00706781, 00707900, 00709109	All event triggers are now retained when you update to this version from an earlier version.

Fixed features		
Build number	Service Cloud case ID	Description
8098	--	In the process editor, undo and redo functions are now available for both canvas and properties panel interactions by default. Previously, the undo and redo functions were only available for canvas interactions.
8098	--	Previously during bot runtime, if you deleted all the existing rows from a table before adding a new row, the columns and rows of the table were misaligned. You can now drag and resize any column to reset the table alignment.
8098	--	All the trigger events within a form are now retained and no longer fail when the form is closed and reopened during bot runtime.
8098	--	In the process editor, if you replace the Go to option with an End process , the End process icon now displays the correct status (Completed, Failed, Canceled). Previously, the status was not displayed correctly and had to be changed manually by using the End process option.
8098	--	When you delete a request from the Request tab and it is sent to the recycle bin, the related task from the Task tab is now removed.
8098	--	When you filter your tasks in the Task tab, the results shown in the tab now retain the information when you navigate between different tabs.

Deprecated features
<p>Support removed for device pool configuration</p> <p>An Automation Co-Pilot administrator can no longer use the device pool configuration to deploy bots in a process. After upgrading to Enterprise A2019.19 from an earlier version, verify that the scheduler user configuration is set up in order to successfully execute your bots in the process.</p> <p>Configure scheduler user for Automation Co-Pilot on page 3293</p>

Known limitations
<p>When you create a request from a process (public or private) and enter all the required information in the initial form, the initial form cannot be submitted because the Submit option does not work. This issue occurs for all initial forms with at least one mandatory field.</p> <p>Workaround: Make all fields optional.</p>
<p>When you submit an initial form or task in a request view that contains a check box with at least two options and at least one option is selected, the check box value is not changed and defaults to a false Boolean value.</p>
<p>If the Set action is used immediately after a Get action, the value assigned to a variable using the Get action is not retrieved in the specified form element of the Set action during bot runtime.</p>
<p>An Automation Co-Pilot manager can create a request from a process that is assigned to them but not to their team. They can create and complete the request if the process contains only bot tasks. If the process contains a human task, the manager cannot assign the human task to themselves.</p> <p>Workaround: Assign the process to both the manager and their team.</p>
<p>In the process editor, the Go To option shows only the Human Task and Bot Task, it does not show the Filter Task or the Process Task.</p>
<p>(Service Cloud case ID: 00736309, 00765069, 00784362) If you use a file trigger for a document that is in .csv, .xlsx, or .xls format, the corresponding bot is not triggered when that document is modified.</p>

Discovery Bot

New features
<p>View the duration of each recorded step</p> <p>A recorded step is now displayed in minutes and seconds for the business user and analyst. Use this information to understand which steps are a bottleneck in the current process and will provide most benefit from automation. The step duration is displayed from the Recordings page (below the screenshot image), and from the View process and View opportunities page from the Preview pane window.</p> <p>Record a Discovery Bot business process on page 3709</p>

Changed features
<p>Enhancement to the screenshot</p> <p>The screenshot image of the recorded step is now increased to full size for a more clear, detailed view of the recorded step.</p>

Fixed features	
Service Cloud case ID	Description
--	You can now click the Screen icon to display an image that you have hidden and saved. Previously, you had to click Screen and then click Save to display the image again.
--	When an opportunity is created for a system-generated view with filters applied, the filter now persists across the view displayed in the Aggregated tab from the Opportunities page. The filter is not reapplied on the view from the Opportunities page and the No recording data message is no longer displayed.
--	When you now cancel a recording, the recording is not displayed on the process tile in Process Cycle .
--	You can now approve a recording with 2000 steps. The Recording status is displayed as approved.

Known limitations
Actions such as double-click, drag-drop, click and hold, and text select are not supported when you are recording a business process.

IQ Bot

New features
Support for variables in IQ Bot actions (Service Cloud case ID: 00511178) IQ Bot On-Premises and Cloud You can now use variables in the Download all documents and Upload Document actions in the IQ Bot package. Create a variable on page 2246 IQ Bot package on page 2653

Changed features
Rename a learning instance (Service Cloud case ID: 00675803) You can now rename a learning instance in staging in IQ Bot.

Changed features
<p>Sequential document processing (Service Cloud case ID: 00662968, 00665331)</p> <p>When you click See Extraction Results, IQ Bot now opens that request in a new browser tab where its number in the queue is displayed. This number keeps decreasing as the previous requests in queue are processed.</p>
<p>Dutch language support</p> <p>IQ Bot now supports the Dutch language with ABBYY FineReader Engine.</p>
<p>Configure OCR settings using REST APIs</p> <p>A user with AA IQ Bot Administrator role can now use the <code>appConfigurations</code> API to read and update the OCR settings.</p> <p>Select an OCR engine</p>

Fixed features	
Service Cloud case ID	Description
00639117	Numeric format in the Polish language is now accepted in the IQ Bot Validator.
--	When you upload a document immediately after deleting a bot it was associated with, extraction results are now displayed irrespective of when the bot was deleted. Previously, an interval of 3 minutes was required to view the extraction results of the deleted bot.
00636899, 00683451	When you create a learning instance using the custom domain, the field names now appear correctly, irrespective of the custom domain language.
00459301, 00677204, 00532325, 00658245	Custom Python logic now displays extraction results in the Designer without any errors.
00657928, 00679540	Exported IQ Bot archive (.iqba) files no longer contain any unclassified records in the .csv files.
00704365	If documents uploaded during production have fewer pages than the staging documents that the bot was trained with, these production documents are now processed without any errors.
00703560, 0062442	When you migrate learning instances using the append option, all records are now correctly migrated, irrespective of the number of records in the IQBA file.

Fixed features	
Service Cloud case ID	Description
00715124	IQ Bot now deletes temporary files downloaded from Amazon S3 server in the C:\windows\temp\ folder when they are no longer required. As a result, storage is no longer consumed by these temporary files.
00686297	IQ Bot machine learning services are now correctly installed when you install IQ Bot.
00657928, 00679540, 00727633	You can now migrate learning instances to production, even if they contain unclassified documents.

Known limitations	
IQ Bot On-Premises and Cloud	If you click See Extraction results multiple times, the Learning instances listing page is opened instead of the extraction results.
IQ Bot On-Premises and Cloud	When creating a table on the Designer page, if you click See Extraction results without completing the table creation, extraction results are not displayed. Workaround: Create the table first and then click See Extraction results .
IQ Bot On-Premises and Cloud	An error message is displayed when you refresh the extraction results page for a learning instance when the associated bot is moved to production.
IQ Bot On-Premises and Cloud	When a bot is deleted, an incorrect error message is displayed when you click the Test bot option on the Bots listing page.
IQ Bot On-Premises and Cloud	If you rename a learning instance in production and download the files, all the files associated with the original learning instance are also downloaded. For example, if you rename a learning instance from Sales1 to Sales2, all the files associated with Sales1 are also downloaded when you download Sales2.
IQ Bot On-Premises and Cloud	If you have multiple learning instances and you click See Extraction results for all of them, the extraction results are not processed in the order of their request.
IQ Bot On-Premises and Cloud	When you create a learning instance with check box fields and run a Python script associated with the check box, an error message is displayed on the Designer page.

Known limitations
<p data-bbox="329 247 704 275">IQ Bot On-Premises and Cloud</p> <p data-bbox="329 296 1417 426">When you upload staging or production documents to a learning instance, temporary files are created in the C:\Windows\Temp folder, and the folder size might increase over a period of time. Therefore, manually delete the files from this folder because it can cause IQ Bot to stop responding.</p>
<p data-bbox="329 447 704 474">IQ Bot On-Premises and Cloud</p> <p data-bbox="329 495 1396 558">If you select the Only for me option when installing the Bot Agent, the IQ Bot Extraction action has the following issues:</p> <ul data-bbox="329 579 1109 642" style="list-style-type: none"><li data-bbox="329 579 927 606">• Takes a very long time to process a document.<li data-bbox="329 611 1109 642">• Some of the documents might not be processed successfully. <p data-bbox="329 678 1393 741">Workaround: During Bot Agent installation, choose the Anyone who uses this computer (all users) option.</p>
<p data-bbox="329 768 574 795">IQ Bot On-Premises</p> <p data-bbox="329 816 1396 911">(Service Cloud case: 00762174) Using the Database Migration Assistant to migrate from IQ Bot 11.x (five databases) to A2019 (unified database) in Microsoft Azure Database is not supported.</p>
<p data-bbox="329 936 704 963">IQ Bot On-Premises and Cloud</p> <p data-bbox="329 984 1378 1079">When you change the display language of any learning instance that has a document in Validator, although the selected display language is successfully applied to the learning instance, an error message is still displayed.</p>
<p data-bbox="329 1104 488 1131">IQ Bot Cloud</p> <p data-bbox="329 1152 1360 1247">The auto-correction and auto-suggestion features, which are part of the MLScheduler service, use system resources extensively and cause the system to slow down or stop responding.</p>
Deprecated features
<p data-bbox="329 1375 1159 1402">IQ Bot On-Premises is no longer supported on Windows Server 2012.</p>

Bot Insight

Fixed features	
Service Cloud case ID	Description
00669196	When you apply date filters on a dashboard and then apply an attribute filter in the widget, the system now filters by a specific date. Previously, the date filter applied at the dashboard level was ignored when the attribute filter was selected at the widget level. As a result, historical data was also displayed.

Important: The supported packages information is moved to this topic: [Packages available in Automation 360](#) on page 2225.

Enterprise A2019.18 Release Notes

Release date: 11 January 2021

Review the new features, changed features, fixed features, known limitations, and supported packages in the Enterprise A2019.18 (Build 7560) release. For IQ Bot, Build 7553 is available for Cloud customers and Build 7554 is available for On-Premises customers. There are no security fixes in this release.

Important: We have updated Enterprise A2019.18 to Build 7560 to include fixes for issues with workload management (Service Cloud case IDs 00696614 and 00703339) and SSO authentication on Automation Anywhere Cloud (Service Cloud case IDs 00706042, 00706074, 00706201, 00706195, 00706134, 00706022, and 00707033). See the [Fixed features](#) section for more information.

- [Migration features](#) on page 543
- [Enterprise A2019](#) on page 544
- [AARI](#)
- [Discovery Bot](#) on page 556
- [IQ Bot](#) on page 558
- [Bot Insight](#) on page 561
- [Supported packages](#) on page 561

Migration features

Enterprise 11 and Enterprise 10 features
<p>Migrate MetaBots with screens</p> <p>Migrate MetaBots that contain screens as assets. You can migrate screens based on HTML, MSAA, and .NET technologies and captured using the Object, Image, and Coordinate play modes.</p>
<p>Configure timeout in Bot Migration package</p> <p>When migrating bots, you can now set a timeout value in the range of 3 through 90 minutes (default value is 90 minutes). If the migration of any specific bot is not completed within the set time, a timeout message is displayed and the migration process moves to the next bot.</p>
<p>Use regular expressions in variables (Service Cloud case ID: 00628227)</p> <p>Use regular expressions (regex) in value type variables to specify the entity on which you want to perform an operation. For example, actions in the File, Folder, String, and Window packages allow use of regular expression in variables.</p> <p>When Enterprise 11 or Enterprise 10 bots with commands that use regular expressions in variables are migrated, if their equivalent actions in Enterprise A2019 do not support regular expressions, the regular expression is converted to string in the migrated bots.</p>
<p>Migrate MetaBot that returns a list variable</p> <p>You can now migrate MetaBots that contain logic that return a list variable to the parent bot.</p>
<p>Migrate bots that use functional keys</p> <p>Migrate bots that use functional keys such as F1, F2, and F3 in the Send Text command.</p>
<p>Migrate bots that extract information from PDF</p> <p>Migrate bots that use the Extract Form Fields command to extract data from the fields in a PDF file.</p>

Enterprise 11 only features
<p>Migrate bots to Enterprise A2019 Cloud</p> <p>You can now migrate to Enterprise A2019 Cloud by using the Cloud Migration Utility. Use the utility to upload your Enterprise 11 data to Automation Anywhere Cloud.</p> <p>Migrate from 11.x to Cloud</p>
<p>Migrate to Enterprise A2019 on Linux CentOS (Service Cloud case ID: 00654757)</p> <p>You can now migrate from Enterprise 11 to Enterprise A2019 installed on Linux CentOS.</p> <p>Migrate to Linux CentOS</p>

Enterprise 11 only features
<p>Migrate imported Enterprise 11 bots to Enterprise A2019</p> <p>You can now migrate Enterprise 11 bots that you imported using the Bot Lifecycle Management feature or the Import API to Enterprise A2019 by using the migration wizard.</p>
<p>Migrate bots that use the following attributes:</p> <ul style="list-style-type: none"> • Bots that use regular expression (regex) to search for the string and title of an application window on which you want to perform an operation • (Service Cloud case ID: 00616115) Bots for which custom format is configured for system dates <p>The system uses the AADefaultDateFormat global value to store the format of the date.</p> <ul style="list-style-type: none"> • Bots that use the Search Field command to search a field index or field name by using text in the Terminal Emulator

Enterprise A2019

Important: This release includes a required update to your . Ensure that you complete the update to continue with your automation activities when upgrading from a previous release to this release.

[Automatically update the Bot Agent](#) on page 1302 | [Manually update the Bot Agent](#) on page 1303

To verify which version is compatible with this release, see [Compatibility with release builds](#) on page 1275.

New features
<p>Create a Citizen Developer user</p> <p>Administrators can now use the Citizen Developer license to create Citizen Developer roles and users in the Control Room. Users with this license can create and run bots (including bots with triggers) on their devices.</p> <p>Automation 360 licenses on page 1347 Create a Citizen Developer role on page 1703 Create a Citizen Developer user on page 1684</p>
<p>Recorder enhancements</p> <ul style="list-style-type: none"> • Use the AISense Recorder Define option to record an interaction, such as click active text, with an object that is only visible when you hover the mouse over the object. • If you record a click and keystrokes in a text box with a Control Type of <code>PASSWORD_TEXT</code>, the Recorder does not capture the keystrokes entered into the field. Instead, the action selects the Set text option and offers users the option to select a credential from the Credential Vault, enter a credential variable, or enter an insecure string.

New features
<p>Export and import Bot Insight dashboards using Bot Lifecycle Management</p> <p>The Bot Lifecycle Management feature now enables you to export and import Bot Insight dashboards (default, custom, and published) associated with analytics bots from one Control Room instance to another. You can also export and import Bot Insight dashboards using the Bot Lifecycle Management export and import APIs.</p> <p>Export bots on page 1967 Import bots on page 1969</p>
<p>Support for non-persistent VDI</p> <p>Non-persistent virtual desktop infrastructure (VDI) is now supported for temporary devices so that you can configure settings for temporary devices in the Control Room or during Bot Agent installation.</p> <p>The feature includes the following capabilities:</p> <ul style="list-style-type: none"> • Automatically register a device. • Automatically mark a device as default for the logged-in user. • Automatically add a device to an existing pool. • Delete offline devices from a list of devices. • Add parameters for temporary devices in the Bot Agent MSI file. <p>Manage device settings on page 1735 Configure temporary devices on page 1741 Bulk install Bot Agent on devices on page 1296</p>
<p>Efficiently map input and output variables between parent and child bots (Service Cloud case ID: 00537090, 00698697)</p> <p>For input variables, use the Quick map option to select the variables and set the values for the parent bot to pass. For output variables, use the Multiple variables tab to associate each dictionary key with a variable. This feature eliminates the need to use actions to extract the output dictionary values.</p> <p>Task Bot package on page 2980 Using the Run action on page 2982</p>
<p>Support for PowerBuilder application in App Integration package (Service Cloud case ID: 00680703)</p> <p>The App Integration package now supports PowerBuilder to capture and extract text from a window application. The Capture text of window action enables you to open a PowerBuilder screen to capture all the data and verify the captured text.</p>
<p>Enhancements to check-out option in the private workspace</p> <ul style="list-style-type: none"> • The My bots page in the private workspace displays a new status Checked out edited for bots that are checked out and edited. • Use the Revert edits option to cancel any changes you made to the checked-out bot in the private workspace.
<p>Programmatically delete bots, files, and folders</p> <p>Use the <code>Delete files/folders</code> API to delete objects from the private or public workspace.</p> <pre>DELETE <control_room_URL>/v2/repository/files/{id}</pre>

New features
<p>Manage scheduled bots using APIs</p> <p>Use the Bot Scheduler APIs to create, update, and view details, and delete bot schedules. Bots can be scheduled to run at a specific date and time on an unattended Bot Runner, or on a recurring basis.</p>
<p>New action in Terminal Emulator package</p> <p>Use the Search Field action in the Terminal Emulator package to search for a field based on the text it contains. This action returns the name or index of the field based on the option selected.</p> <p>Terminal Emulator package on page 2988</p>
<p>New action in PDF package</p> <p>Use the Get Property action in the PDF package to retrieve the properties of a PDF file and assigns the properties to a dictionary variable.</p> <p>Using the Get property action on page 2769</p>
<p>New actions in Browser package</p> <p>Use the following actions in the Browser package:</p> <ul style="list-style-type: none">• Close: Closes a Google Chrome browser window or tab.• Get source code: Retrieves the source code of a web page and saves it to a string variable.• Go back: Returns to a web page that you previously visited in the current tab.• Open: Opens the browser to a specific web page in an existing tab, new tab, or window.• Run JavaScript: Executes JavaScript in a web page. <p>Browser package on page 2348</p>
<p>Specify application window dimensions</p> <p>Use the Resize windows option to set the window height and width to specific dimensions or to the dimensions at which it was captured. This feature enhances the bot's ability to identify the target object.</p> <p>The following packages support this feature:</p> <ul style="list-style-type: none">• App Integration• If Image recognition condition• If Legacy Automation > Window Control condition• Image Recognition• Simulate keystrokes• Legacy Automation Desktop > Manage windows controls action• Loop While > Image recognition condition• Loop While > Legacy Automation > Window Control condition• Mouse• OCR• Screen

New features
<p>Support for function keys in Terminal Emulator package</p> <p>Function keys (F1 through F24) are now supported to automate processes using ANSI and VT100 terminals in the Terminal Emulator package.</p>
<p>Use regex case insensitive flag for Window title</p> <p>Enable the regex Case insensitive flag to identify a Window title field as not case-sensitive. This feature enables you to successfully run the bots even if the letter case does not match the captured window title.</p> <p>The following packages and actions support this feature:</p> <ul style="list-style-type: none"> • Wait • Image Recognition • Simulate keystrokes • Mouse > Click action • Legacy Automation Desktop > Manage windows controls • OCR > Capture window, Capture area • Screen > Capture window, Capture area • Recorder > Capture • Window: Activate, Close, Maximize, Minimize, Resize
<p>Unattended Bot Runner supported on Citrix devices</p> <p>You can now deploy bots on unattended Bot Runners on virtual machines on Citrix XenDesktop and Citrix VDI Windows 2016.</p>

Changed features
<p>Only Bot Scanner related files and folders are deleted</p> <p>The Bot Scanner now deletes only Bot Scanner related files and folders from the destination folder.</p> <p>Scan Enterprise 11 or 10 bots using Bot Scanner on page 1471</p>
<p>Enhanced transport layer security (Service Cloud case ID: 00677546, 00681830)</p> <p>The default Elasticsearch ports (47599, 47600) now use the more secure TLS version 1.2 and later as the communication channel between the Control Room and Elasticsearch server.</p>
<p>Enhanced Update node action in XML package (Service Cloud case ID: 00663089)</p> <p>When you edit and save an XML node, the bot updates the required attributes and their values in an alphabetical order, without removing any existing attributes of the node.</p> <p>For example, consider two existing attributes in an XML node such as <code>Name=Peter</code> and <code>Phone=9829xxxxxx</code>. If you change the value of the phone attribute as <code>9887xxxxxx</code> and add a new attribute <code>Gender</code> with value as <code>Male</code>, the bot updates the phone value and adds the gender as a new attribute, without removing the existing name attribute.</p>

Changed features
<p>Interface change in Excel basic and Excel advanced packages</p> <p>The session name field is now the last field in actions in the Excel basic and Excel advanced packages.</p>
<p>Access at subfolder level in Control Room repository (Service Cloud case ID: 00634847, 00681221, 00685654)</p> <p>An administrator can now allow access at the subfolder level in the Control Room by assigning the Run, Check-in and Check-out permissions to the subfolder. You can only access the contents of the subfolder and not the other bots or files in the parent folder.</p>
<p>Increased working area in the Bot editor</p> <p>More horizontal and vertical screen area is available in the Bot editor for developing bots. You can hide or display the Actions and Details panels to maximize the working area in the Bot editor.</p>

The following table lists the fixed features and the builds in which they were fixed (Build 7560 is the latest build, and Build 7554 is the previous build). The fixes are cumulatively available in the latest build.

Fixed features		
Build number	Service Cloud case ID	Description
7560	00696614	Bot deployment is no longer delayed after you insert Work Items if idle devices are available for the deployment in queues.
7560	00703339	The post Work Item insertion flow is now improved so that bot deployments are not delayed.
7560	00706042, 00706074, 00706201, 00706195, 00706134, 00706022, 00707033	An issue with Control Room login page not supporting SAML for SSO and reporting an errant IPD response has been addressed. The SSO function of the Control Room login works as expected.
7554	00659336	Enterprise 11 bots that use the Image Recognition command or Image Recognition condition of the If command now run successfully after migration.
7554	00647634	The Bot Scanner no longer becomes unresponsive when scanning a large repository.
7554	00678614	An error is no longer encountered when you migrate a bot with a credential name that contains a space character or a special character.

Fixed features		
Build number	Service Cloud case ID	Description
7554	00669247	An error is no longer encountered when you download a file from a URL that contains a Unicode character using the Download files action of the Browser package.
7554	00685916	If you have used the Date system variable as an input variable in a MetaBot, the Date system variable is now available after migration.
7554	00674594	The Bot Scanner no longer encounters an error when scanning a bot that uses the Excel Column system variable after the Loop command and the column name specified in that variable contains a space character.
7554	00691905	An error is no longer encountered when you edit a user after migrating to Enterprise A2019 from Version 11.3.3.
7554	00691072	An error is no longer encountered because of the bypass configuration of proxy settings when you use the Bot Migration Wizard.
7554	00689910	You can now import more than 2100 bot files without any SQL exception error.
7554	00669927	When you execute the Bot Insight Business Data and Operations Data APIs, only information limited to the logged-in tenant is now retrieved in the API response.
7554	00639779	After you log in to the Control Room and connect manually to a VPN, the Bot Agent now reconnects automatically. You do not have to restart the Bot Agent service to reconnect.
7554	00622075	When you run a bot on a user device that has an extended display, the runtime window is now completely visible on the main display. Previously, the window was partially visible between the main and extended display.
7554	00678454	In Excel advanced, you can now use the Set cell action to write more than 4100 characters in the excel file. Previously, the bot execution failed when the cell value had more than 4100 characters.

Fixed features		
Build number	Service Cloud case ID	Description
7554	00675333	In the Number package, the field in the Assign action is now corrected as Select the source number variable/ value . Previously, the Select the source string variable/ value field was incorrect.
7554	00674315, 00677925, 00684201	When you create a Task Bot using the If and Else if actions and change the placement of the Else if block action, there is improved visibility in the Flow view. Previously, the Task Bot was not displayed properly on a low contrast display when the Else if block placement was changed.
7554	00662072, 00674336	In the Terminal Emulator package, you can now correctly page up using the KEY_PGUP function key and page down using KEY_PGDOWN for the TN5250 terminal type.
7554	00658261	The PDF Extract image action now supports CMYK (cyan, magenta, yellow, black) images format when you extract and save a CMYK image to an RGB (red, green, and blue) image. Previously, if PDF files contained CMYK images, the bot could not extract them and displayed an error.
7554	00675749	When you receive emails using the EWS server option, the <code>emailCc</code> and <code>emailTo</code> variables now return the proper value. Previously, these variables returned blank values.
7554	00663610	In the Ftp/Sftp package, you can now connect to <code>ftp.box.com</code> and use the Get folder action. Previously, the Get folder action downloaded files in the folder, causing the bot to run in an infinite loop.
7554	00675710	In the Data Table package, the Remove duplicate rows action now removes all duplicate rows rather than a single duplicate row.
7554	00539762	In the For value action of the Prompt package, characters are no longer visible during keystrokes of masked values.
7554	00679370, 00673085, 00674546, 00676912, 00678852, 00678796, 00692420, 00695390	An unknown error is no longer encountered when you run the Open Excel file action from a network drive.

Fixed features		
Build number	Service Cloud case ID	Description
7554	00672719, 00673048	Audit log entries in the Control Room are now retained even if the Elasticsearch data is configured to a file path other than c:\ (C drive) during installation.
7554	--	You can now insert Work Items from one queue to another queue for workload automation.
7554	--	You no longer have to pause and resume queues because Work Items are now processed and not randomly skipped when you use the priority queuing or round-robin method for workload automation.
7554	--	The Recorder package no longer takes time to upload to a remote application repository path of an On-Premises Control Room deployed on Microsoft Azure.
7554	00683744	You can now capture objects from the Google Chrome browser using the Recorder capture action. The plug-in not installed or disabled error is no longer displayed.
7554	00672446, 00671782, 00671065, 00683870	When you upgrade to this release from an earlier release (for example, Enterprise A2019.16), the Elasticsearch OpenDistro error message is no longer displayed. Also, the previous <code>application_log</code> indices from Elasticsearch are deleted to free up disk space for the upgrade.
7554	00690003	You can now use the Terminal Emulator package without any change in the screen resolution for the mainframe terminal type TN3270. Previously, the screen resolution was not supported for terminal type TN3270.
7554	00679244	In Dictionary and List packages, you can now use the Datetime data type in the source dictionary variable field of the Assign action. Previously, an error was encountered during bot execution if you used Datetime data type in the source dictionary variable field.
7554	00673591	Fixed an issue in the Task Bot package where the system selected all the input variable options when the user clicked away from and returned to the action.

Fixed features		
Build number	Service Cloud case ID	Description
7554	00684905, 00703481	A Task Bot now runs as scheduled and no longer shows the device status as Picked at runtime on the View task in progress (Activity) page when the Task Bot is running.
7554	00573081	The audit log page in the Control Room now records all entries related to bot deployment. Also, when a parent task with many child bots is deployed, the audit log now shows correct entries. Previously, some audit log entries were missing for bot deployment and if a parent task with many child bots was deployed, the entries displayed were incorrect.

Known limitations
Enterprise A2019 does not yet support the counter behavior of the \$Excel Cell Row\$ system variable in Enterprise 11 when the variable is used in the Loop command and the Each row in Excel Dataset option is selected. This behavior is available in 11.3.0 and earlier versions by default, and in the Version 11.3.1.2 and later versions when the <code>retainexcelcellrowlegacybehavior</code> tag in the <code>AASettings.xml</code> file is set to true.
A bot fails when it runs an action that reloads the web page, such as the Recorder > Capture action when it is used to click a link or the Browser > Open action, followed by a Browser > Run JavaScript or Browser > Extract source action. You must add a delay of at least 5 seconds to give the browser time to load.
A bot fails when it runs the Browser > Close action to close the last Google Chrome window and the window contains only one tab. Use the Tab or All browsers options instead.
A bot can return only a maximum of 3 MB to an output variable. Workaround: Store the bot output on the device, such as in a .txt file. If the output must be shared across multiple Bot Runners, store the output in a shared drive.
The AISense Recorder fails if you manually upgrade the Recorder package version, such as by importing a bot that contains a Recorder package version from a more recent build than the destination Control Room. Always upgrade the Recorder package through the Control Room.
If you install the Google Chrome extension in the Microsoft Edge browser, it causes recording and runtime errors in bots that interact with the Google Chrome browser. Even if you did not manually install the Google Chrome extension, the auto-sync settings in the Microsoft Edge browser might have automatically installed the extension. If the Google Chrome extension is installed in the Microsoft Edge browser, you must remove the Google Chrome extension from the <code>edge://extensions</code> page.

Known limitations
<p>When the regex Case insensitive flag is enabled for actions that include the window title, a recapture of the application window fails.</p>
<p>The input parameters for DLLs are not automatically passed from the parent bot to the child bot in Enterprise A2019 for migrated MetaBots.</p>
<p>Workload automation limitation for manual Credential Vault mode (Service Cloud case ID: 00711410)</p> <p>You might face issues when migrating your workload automation if the Control Room is configured to use a manual mode for Credential Vault.</p> <p>Workaround: As the Control Room administrator, perform the following steps:</p> <ol style="list-style-type: none"> 1. Change the Credential Vault mode to express from manual in the Control Room database configuration table. 2. Add the credential vault key to the <code>CredentialVault.dat</code> file in the Control Room server repository. 3. Restart the Automation Anywhere Control Room Service. 4. Re-register the Bot Agent or restart the Bot Agent service.
<p>Cloud migration limitations</p> <ul style="list-style-type: none"> • The Cloud migration utility keeps running in background if you close the utility when the Enterprise 11 data is being uploaded. • If you have configured Enterprise 11 Control Room in cluster mode, you must stop the Automation Anywhere Control Room Service on all the nodes available in the cluster. • If the Cloud migration utility is installed on a different device than the device on which the Enterprise 11 Control Room you want to migrate is installed, an Elasticsearch unavailable error occurs. • If you have SSO configured on the Enterprise 11 Control Room, an error is encountered after migration to Cloud if you change the authentication from database to SSO. • If you provide the validation code within double quotation marks, the utility successfully validates the code but fails when uploading the Enterprise 11 data.
<p>If you open a table variable for editing and then open another table variable and click Cancel in the Edit table window, the schema of that table reverts to the same schema of the first table. This occurs only in the interface; it does not impact the bot.</p> <p>Workaround: Refresh the window containing the Control Room.</p>
<p>If you use different versions of a package in a parent bot and a child bot, the capability to share a session across bots is currently not supported in the following packages: DLL, Excel advanced, Excel basic, and Terminal Emulator</p> <p>To share a session across parent and child bots, ensure that you use the same version of the package in both the parent and child bots.</p>

Automation Co-Pilot for Business Users (Automation Co-Pilot)

New features
<p>New Automation Co-Pilot on the web package</p> <p>Use the Automation Co-Pilot on the web package to perform actions such as assign, query, and cancel tasks; create and query requests; and retrieve a list of team members.</p> <p>Process Composer package on page 2777</p>
<p>Filter by time</p> <p>You can now filter your requests and tasks by time:</p> <ul style="list-style-type: none"> • Requests tab: Use the Created and Updated options in the Filter window to select any dates. • Tasks tab: Use the Task created and Task updated options in the Filter window to select any dates. <p>Filter and search for a request on page 3271 Filter and search for a task on page 3273</p>
<p>View updated dates</p> <ul style="list-style-type: none"> • Use the new Updated column in the Requests tab to view the dates and time of a request that was last updated. • Use the new Task Updated column in the Tasks tab to view the date and time of a task that was last updated.
<p>Variable options</p> <p>In the Insert a variable window, the Variable field now shows child elements of available references, which include Dictionary, List, Record, and Table variable types.</p>
<p>Delete a request</p> <p>Automation Co-Pilot administrators, managers, and users can now delete requests created by the Automation Co-Pilot process. The Automation Co-Pilot administrator can delete any requests. Automation Co-Pilot managers can delete requests of the team for which they are the owner. Automation Co-Pilot users can delete only the requests they have created.</p> <p>Delete a request on page 3265</p>
<p>Automatically assign managers and users</p> <p>Users can now select the Auto assign this task option in the Human Task to assign managers or users to the task. Users can also select the Auto assign the target task to option in the Go to element to assign managers to the task.</p> <p>Create a process automation in Process Composer on page 3312</p>

New features

Enhancements to elements in the form builder

- **Time** element: Includes the time element in a form.
[Using the Time element](#) on page 3228
- **Date** element: Set the date format of the user machine as the default format for the date element in the form.
[Using the Date element](#) on page 3216
- **Select file** element: Drag the selected file into the form during bot runtime.
[Using the Select File element](#) on page 3224
- **Password** element: View the password you enter in this field during bot runtime.
[Using the Password element](#) on page 3222

Updates to interactive forms

- Use the **Change Form Title** to edit or change the title of the selected form during bot runtime.
- Use the **Validate form** option now for the **Table** element.

[Interactive forms package](#) on page 2633

Changed features

Process package renamed to Automation Co-Pilot on the web package

The **Process** package is now renamed to the Automation Co-Pilot on the web package, which includes the **Create a Request** action and additional new actions.

[AARI web package](#)

Enhancement to process management page

In the process management page, the Automation Co-Pilot admin can now edit the **Process Title** and **Process Description** metadata. You can now add a title and provide a short description for the process.

Enhancement to the activity page

All the Bot Runner (attended or unattended) trigger deployments in queue are now displayed in the **Activity > In progress** page.

[Activities](#) on page 2048

Edit check box, radio button, and drop-down form elements in process editor

In the process editor, you can now edit and update the **List of options** and **Default value** fields for the following form elements: **Checkbox**, **Radio button**, and **Dropdown**.

Fixed features	
Service Cloud case ID	Description
00678572	You can now view the strict-transport-security header when using the Automation Co-Pilot on the web interface. This attribute informs the web browser to automatically convert websites requesting HTTP to load HTTPS instead in order to comply with the HTTP Strict-Transport-Security (HSTS) policy.
--	The Display message field in the If/Else pair action now displays the status message in request view. Previously, the status message was not displayed in the request view.
--	When you access Automation Co-Pilot through the web interface, the Request ID and Task ID now correctly identify the data as numeric data type and sort it accordingly. Previously, the data was considered as string type and the sorting was not appropriate.
00646148	A bot is no longer deployed multiple times when the files and folders triggers are used.

Known limitations
When a user with a Citizen Developer license deletes an event trigger, this activity is not captured in the Audit log tab.
When you delete a request from the Request tab, the tasks associated with the request are not deleted and they are displayed in the Tasks tab.
If you click the refresh option in the Tasks tab and navigate away and back to the tab, the task filter applied does not remain the same. The filter always switches to Pending status.

Discovery Bot

New features
<p>Use Model option for system-generated views</p> <p>You can now use the Model option to compare and find the best aggregated view for your recordings. Use this option to save as many views with different combinations as required.</p> <p>You can also save the view as a manual view to further customize your view and compare side-by-side. Select either an Easy or Strict model so that you can view recordings where the steps are the same versus recordings with different results with more branches in the process path.</p> <p>Create a process view with branches and opportunities</p>

New features
<p>Use Filter option for system-generated views</p> <p>You can now use the Filter option to use a set of values to compare different sections of a process across various recordings by selecting a specific path and step filter. Used along with the Model option, the path and step filter options for a system-generated or manual view can help you to determine and decide on a good candidate for automation.</p> <p>Create a process view with branches and opportunities</p>
<p>Use toggle frequency counter option for system-generated views</p> <p>You can now use the toggle frequency counter to display the number of recordings that a particular path takes in the flow in a system-generated view. Use this option to help you understand the frequency of the path compared to other recordings or views.</p> <p>Create a process view with branches and opportunities</p>
<p>Remove recording screenshot for data privacy</p> <p>Use the Screen option (icon) to display or hide the recording screenshot before submitting the recording for the analyst to review. Use this option when you do not want to share personal image details with the analyst.</p> <p>Record a Discovery Bot business process on page 3709</p>
<p>Download PDD from the Opportunities table</p> <p>You can now download a process definition document (PDD) for an opportunity directly from the Opportunities table listed on the Opportunities page. The PDD is automatically generated when the opportunity is created. After the PDD is generated, the field changes from generating PDD to Download PDD. You can then download and save the document.</p> <p>Review opportunities and convert to</p>

Changed features
<p>Screenshot image is increased</p> <p>The screenshot image is now increased to allow for better readability of captured steps. You can now use the scroll wheel to get a zoomed-in view of the step.</p>
<p>The Export to Word option now supports 2000 steps.</p>
<p>The Convert to Bot option now supports 2000 steps.</p>

Fixed features	
Service Cloud case ID	Description
--	The Delete icon is now properly visible in the edit recordings screen in Internet Explorer.

Fixed features	
Service Cloud case ID	Description
--	You can now change the zoom level in any canvas using the two-finger swipe on the trackpad of the Aggregated and Comparison tabs.
--	The red highlight is now visible on the captured screenshots from the Recordings page and from the preview pane from the Aggregated and Opportunity tabs for analyst review.

Known limitations
When upgrading to this release, you must regenerate all PDDs created in Enterprise A2019.17. Click Retry PDD Generation to regenerate the PDDs.
If you want to display an image that you have hidden and saved, you must first click the Screen icon and then click Save to display the image again.
In the Opportunities table, the search field and filter drop-down option are not available for the Process and Owner columns.
When an opportunity is created for a system-generated view with filters applied, the filter is reapplied on the view displayed within the Aggregated tab from the Opportunities page. The filter incorrectly displays No recording data. The Convert to Bot and the Download PDD options are not affected.
When a recording is canceled, the recording is incorrectly incremented and displayed on the process tile in Process Cycle .
You cannot approve a recording with more than 500 steps.

IQ Bot

New features
<p>New IQ Bot Extraction package</p> <p>On-Premises and Cloud</p> <p>IQ Bot now includes the IQ Bot Extraction package for processing invoices. The package uses Bot Runners on your local device instead of an IQ Bot server for processing.</p> <p>IQ Bot Extraction package on page 2644</p>

Changed features
<p>Enhancement to Migration Utility</p> <p>When you now export an IQ Bot archive (.iqba) file, only a single document associated with every available bot (group) training is exported.</p>
<p>Enhancement to Document Classifier package</p> <p>The Document Classifier package now supports all languages supported by ABBYY FineReader Engine. Previously, only English language was supported.</p> <p>ABBYY FineReader Engine OCR supported languages</p>

Fixed features	
Service Cloud case ID	Description
00668625	When you upload documents containing digital signatures to learning instances, the Designer now displays the correct success or error message.
00619139, 00695157	When you now run a bot and try to edit it while it is still running, the following correct message is displayed: <code>Staging Documents for this Vision bot is in progress. Please try after some time.</code> Previously, the following incorrect message was displayed: <code>Learning instance not found.</code>
00408482	You can now successfully export a custom domain created using Korean or other Asian languages.
00669197, 00681599	Node.js is now upgraded to version v10.22.1 to fix a security vulnerability.
--	Fixed an issue that caused the following error: <code>failed to upgrade DB -1.</code> You can now install IQ Bot in express mode without any errors.
00633197	During validation, if there is an error in the validation pattern, the validation process now fails, the correct message is displayed, and error logs are generated.
00689326	You can now view the extraction results correctly even when the bot is trained with check box fields.
00666456	IQ Bot machine learning services are now correctly installed when you install IQ Bot.

Known limitations
<p data-bbox="329 245 704 275">IQ Bot On-Premises and Cloud</p> <p data-bbox="329 296 1092 325">The following limitations apply to the IQ Bot Extraction package:</p> <ul data-bbox="329 344 1406 541" style="list-style-type: none"> <li data-bbox="329 344 1341 405">• If you process documents that do not belong to any created groups, they are not displayed in the Details page of the learning instance. <li data-bbox="329 411 967 441">• The Checkbox extraction option is not supported. <li data-bbox="329 447 1406 508">• Some of the input invoices are not processed when you set up workload management with shared input and output folders. <li data-bbox="329 514 1065 543">• Pre-processing settings from IQ Bot server are not applied.
<p data-bbox="329 588 704 617">IQ Bot On-Premises and Cloud</p> <p data-bbox="329 638 1401 699">When creating learning instances, IQ Bot sometimes does not restrict users from creating duplicate fields.</p>
<p data-bbox="329 726 704 756">IQ Bot On-Premises and Cloud</p> <p data-bbox="329 777 1360 806">Occasionally IQ Bot fails to execute Python logic for tables other than the default one.</p> <p data-bbox="329 825 1125 854">Workaround: Retry after you perform one of the following actions:</p> <ul data-bbox="329 873 711 934" style="list-style-type: none"> <li data-bbox="329 873 621 903">• Click Save and close. <li data-bbox="329 909 711 938">• Click See Extraction results.
<p data-bbox="329 982 704 1012">IQ Bot On-Premises and Cloud</p> <p data-bbox="329 1033 1325 1094">In PDF documents containing multiple pages, at times the segments do not display correctly on all pages.</p> <p data-bbox="329 1113 1036 1142">Workaround: Use PDFBox OCR to process the documents.</p>
<p data-bbox="329 1167 704 1197">IQ Bot On-Premises and Cloud</p> <p data-bbox="329 1218 1398 1310">For the Get page content action of the IQ Bot Pre-processor package, if you select the Create variable option from the List of strings extracted from page menu, you can only use Any from the Subtype drop-down menu.</p>
<p data-bbox="329 1339 951 1369">IQ Bot Community Edition, On-Premises and Cloud</p> <p data-bbox="329 1390 1300 1482">If you use Internet Explorer version 11.0.973.17763 to log in to IQ Bot and open See extraction results for a learning instance, you cannot open or download the <code>Preview.csv</code> file.</p>
<p data-bbox="329 1512 573 1541">IQ Bot On-Premises</p> <p data-bbox="329 1562 1195 1591">You must be a service account user to install IQ Bot on a fresh machine.</p>
<p data-bbox="329 1612 699 1642">IQ Bot On-Premises and Cloud</p> <p data-bbox="329 1663 1360 1755">The auto-correction and auto-suggestion features, which are part of the MLScheduler service, use system resources extensively and cause the system to slow down or stop responding.</p>

Bot Insight

New features
<p>Access Bot Insight data from Tableau</p> <p>Use the Tableau connector in Bot Insight to access business and operational information. The Tableau connector connects to the Bot Insight APIs to create various business and operational metrics that you can analyze and visualize within Tableau.</p> <p>Configure Tableau web data connector in Bot Insight on page 3758</p>
<p>Assign Bot Insight license (Service Cloud case ID: 00651973)</p> <p>Assign the Bot Insight license to users to enable them to view and perform tasks on the Business dashboard. You can now assign the license on a per-user basis, irrespective of the assigned roles.</p> <p>Automation 360 licenses on page 1347</p>

Fixed features	
Service Cloud case ID	Description
00689802	You no longer encounter an issue when you create and view default dashboards in a development (dev) environment. Previously, an error was displayed when you open the bot and clicked Analyze to create the default dashboard.

Migration features

Important: Migration to Enterprise A2019 (currently available only to customers in the Migration Early Adopter Program)

Migration to Enterprise A2019 is currently only available to select customers through our Migration Early Adopter Program. If you are interested in learning more about this program or a timeline for when migration will be available to all customers, contact your Automation Anywhere representative.

The following features apply to both Enterprise 11 and Enterprise 10 :

Obtain information about upcoming support for commands and variables	Bot Scanner provides information about the upcoming Enterprise A2019 release in which a specific command or variable will be supported or available.
Migrate MetaBots with screens	Migrate MetaBots that contain screens as assets. You can migrate screens based on the Java technology and captured using the Object , Image , and Coordinate play modes. How MetaBots are migrated on page 1535
View progress of bot migration	A progress bar is displayed in the migration results tab when the system starts migrating the bots.
Migrate bots that use SAP command	You can migrate Enterprise 11 bots that use the GUI Automation command to capture various objects from an SAP application. Package mapping for migration on page 1559
Migrate bots that use the following attributes:	<ul style="list-style-type: none"> • Regular expression to search for files on which you want to perform an operation. • Variable to specify the child bot you want to run. • System variables to retrieve information about a device's settings and its performance. • The Save header To option and containing array and dictionary variables in the REST Web Service command to store the response header. • Bots that contain failure responses from the REST Web Service command by using the Capture failure response option in Enterprise A2019. For Enterprise 11 bots, this option is enabled by default. REST Web Service package on page 2834 • Variables with names containing Arabic or Russian characters, or Japanese double-byte numbers. Unicode range supported in variables on page 2251

The following features apply to Enterprise 11 only:

Increment loop counter value by 1	The \$Counter\$ variable used in loop in Enterprise 11 bots is replaced with the \$Condition-Counter\$ variable in the migrated bots and value for the variable set to 1.
-----------------------------------	---

View audit log migration reports	<p>Service Cloud case ID: 00659314</p> <p>View the status of audit log migration and other related information in the All migrations page. View additional information by using the View migration option for each audit migration instance.</p> <p>Migrate Enterprise 11 audit logs on page 1508 View migration reports on page 1614</p>
Migrate Enterprise 11 Bot Insight data and dashboards	<ul style="list-style-type: none">• Migrate Enterprise 11 Bot Insight data and published dashboards of bots enabled for analytics by using the Bot Insight pre-migration utility and Bot Migration Wizard. <p>Export Enterprise 11 Bot Insight dashboards for migration on page 1507 Migrate Enterprise bots on page 1529</p> <ul style="list-style-type: none">• View Bot Insight migration reports from the new Bot Insight results tab on the Administration > Migration > View migration page. <p>View migration reports on page 1614</p>
Migrate bots that use the following attributes:	<ul style="list-style-type: none">• MetaBots with DLLs that use credential variables of string, character, or byte data type.• The Launch website action of the Browser package to open a website in the Microsoft Edge browser.• Shared session to establish a connection with a terminal server or open a Microsoft Excel spreadsheet and close the shared session from the child bot.• IBM 5555 B01 and C01 models for TN5250 terminal types and the Default terminal for the VT100 terminal type.

Enterprise A2019

Important: This release includes a required update to your . Ensure that you complete the update to continue with your automation activities when upgrading from a previous release to this release.

[Automatically update the Bot Agent](#) on page 1302 | [Manually update the Bot Agent](#) on page 1303

To verify which version is compatible with this release, see [Compatibility with release builds](#) on page 1275.

New features
<p>Connect to EWS server with OAuth authentication</p> <p>A new authentication is available for the Exchange Web Services (EWS) protocol with OAuth. You can use the OAuth authentication and enable your EWS-managed API applications to access Exchange online in Office 365.</p> <p>Using Connect action for Email on page 2437</p>
<p>Google Cloud Platform supported for On-Premises deployment</p> <p>You can now host the Control Room, and create and deploy automation on devices configured to use the Google Cloud Platform environment.</p> <p>Operating system, environment, and platform supported for Control Room on page 1138</p>
<p>LDAP channel binding for enhanced network security in On-Premises deployment</p> <p>Control Room supports LDAP channel binding in order to comply with a security release from Microsoft. LDAP channel binding provides enhanced security for network communications between an Active Directory and its clients. It provides a more secure LDAP authentication over SSL and TLS.</p> <p>Configure LDAP channel binding on page 1317</p>
<p>Use Bot Agent with AWS WorkSpaces (Service Cloud case ID: 00652474, 00676112)</p> <p>You can now deploy bots on Bot Agent devices that are configured on AWS WorkSpaces.</p> <p>Bot Agent compatibility on page 1274</p>
<p>VT220 terminal type supported in Terminal Emulator</p> <p>To establish a connection and communicate with another machine, you can now use the VT220 terminal for sending and receiving text.</p> <p>Using Connect action for Terminal Emulator on page 2990</p>
<p>Permission to cancel checkout in Control Room</p> <p>Use the Cancel checkout permission to cancel checked-out Task Bots or files from the public or private workspace.</p> <ul style="list-style-type: none">• In the public workspace, the status of the bot changes to public.• In the private workspace, the status of the bot changes to new if any changes were made to the bot. If there are no changes, the bot is replaced with a clone. <p>Check out a single bot on page 2214</p>

New features
<p>Enhancements to the Recorder</p> <ul style="list-style-type: none"> Record a task using the Universal Recorder or AISense Recorder from a single point of entry. Both recorders are now managed through a single package, which enables faster and more efficient updates. You can now record tasks in a Microsoft Edge browser that runs on Chromium (versions 79 and later). Use the AISense Recorder Define option to capture an object that is only visible when you hover the mouse over the object. Use the Resize window option in the Recorder > Capture action to set the window width and height. <p>This option delivers a more reliable bot. It resizes the window to the dimensions at which the task was recorded, thus increasing the likelihood that the bot identifies the target object.</p> <p>Get started with recorders on page 2162 Universal Recorder supported applications and browsers on page 2172 Using the Capture action on page 2818</p>
<p>Use shared session in Terminal Emulator</p> <p>Use the new Shared session option to pass the exact state of an application to a concurrently occurring Task Bot or MetaBot logic. For example, instead of connecting to the same application multiple times for different tasks, you can use the option to connect to the application using a single task, thus optimizing your automation logic in the long run.</p> <p>Share session between Task Bot logic on page 3004</p>
<p>Share an Excel session between bots</p> <p>Use the Set session action from the Excel basic or Excel advanced package to assign an Excel session to a variable, and then pass that variable from a parent to a child bot. This enables the child bot to access the worksheet opened in the parent bot.</p> <p>Excel basic package on page 2472 Excel advanced workbook operations Example for sharing an Excel session between bots on page 2985</p>
<p>New option for Run Task</p> <p>In the Task Bot package, you can now use the Run action with an option to repeat the selected task until you choose to stop it.</p>
<p>New search for roles in User Management API</p> <p>Use the new <code>search_for_roles</code> API in the User Management APIs in Swagger to obtain a list of all the roles or details for a specific role.</p>
<p>Capture response status of REST API</p> <p>In the REST Web Service package, you can capture the response status of the REST API in the dictionary variable. The dictionary variable now shows the response key with its value.</p>
<p>New option for REST Web Service (Service Cloud case ID: 00489741, 00646436)</p> <p>Use the Capture failure response action in the REST Web Service package to capture response details in the response body.</p>

New features

Use regular expressions in packages

You can use regular expressions (regex) in certain actions to support pattern-based search in a file, folder, or Windows title. Regular expressions are supported in the actions of the File and File and Folder packages such as **Copy**, **Delete**, **Rename**, **Print Multiple files**, and **Zip**.

You can also use regular expressions in some packages that support the wildcard character in their window titles.

The following packages and actions support regular expressions:

- Wait
- Image Recognition
- Simulate keystrokes
- Mouse > **Click** action
- Legacy Automation > **Manage windows control**
- OCR
- Screen
- Recorder > **Capture**
- Run DLL > **Run function (Legacy)**, **Run function**
- Window: **Activate**, **Close**, **Maximize**, **Minimize**, **Resize**

[Using Copy Desktop file action for file](#) on page 2514 | [Using the Capture action](#) on page 2818

Support for overloaded functions in DLL package

The **DLL > Run function** action can now handle .dll files that contain multiple functions of the same name. The action calls the function based on the number of parameters passed.

[Using the Run function action](#) on page 2419

New actions for SAP captured objects

Use new actions that are available for **Tree**, **Tab**, and **Label** controls to perform operations for the various objects captured from an SAP application.

[Recorder actions supported in various SAP versions](#) on page 2828

New features

Enhancements to elements in the form builder

- **Image** element: Upload image files to the form using this element.
[Using the Image element](#) on page 3219
- **Button** element: Validate all the fields in a form using the **Validate all form fields when this button is clicked** option.
[Using the Button element](#) on page 3215
- **Password** element: Use one of the following formatting options:
 - **Standard**: set the character limit and choose additional security options.
 - **Custom**: add a custom password on the **Regular expression** page.
[Using the Password element](#) on page 3222
- **Rich Text Editor** element: Use this element in the **Set** action when creating a bot in order to add or overwrite the value of a variable.
- **Table** element: Includes the following updates:
 - New data types for **Column settings**:
 - Date
 - Number
 - Dropdown
 - The following actions, which you can use during bot runtime:
 - **Set** action to add rows to the table.
 - Trigger events to add rows and delete rows.
 - Sort table columns.
- **Text Box** element: Choose one of the following formatting options:
 - **Standard**: set the character limit for this field.
 - **Custom**: add a custom password on the **Regular expression** page.
[Using the Text Box element](#) on page 3227
- **Select file** or **Snapshot** element: When you click **Preview** during bot runtime, the system default application is used to display the selected file.
[Using the Select File element](#) on page 3224 | [Using the Snapshot element](#) on page 3225

Enhancement to List view of bots

In the **List** view of the Bot editor, you now drag a selected action to the task logic.

New features
<p>Import Enterprise 11 bots to Enterprise A2019 (Service Cloud case ID: 00512847)</p> <ul style="list-style-type: none">• Bot Lifecycle Management Import feature: The Bot Lifecycle Management import feature enables you to import Enterprise 11 bots from multiple Enterprise 11 Control Room instances to a single Enterprise A2019 instance by using the <code>aapkg</code> file. Bot Lifecycle Management on page 1964 Import bots on page 1969• Bot Lifecycle Management Import API: You can also use this API to import Enterprise 11 bots to the Enterprise A2019 instance by uploading the <code>aapkg</code> file. However, you can import a password-protected <code>aapkg</code> package only by using the Import API. BLM API see Import repository bots in BLM API
<p>New endpoint in License API</p> <p>Use the List details of Control Room licenses endpoint to retrieve metadata including the license type, number of available licenses, number of licenses used in a specific Control Room instance, and number of licenses used in all Control Room instances.</p> <p>License API</p>
<p>Programmatically manage device login credentials</p> <p>Use the Login setting endpoint of the Credential Vault API to set or update the device login credentials to allow bots to run on the device.</p>
<p>Store multiple lines of text in a string variable</p> <p>You can use a string variable containing multiple lines of text in the following actions:</p> <ul style="list-style-type: none">• String > Assign• String > Extract text• String > Compare• String > Lowercase• String > Replace• String > Reverse• Log to file• Message box• The string condition in the If, Wait, and While actions
<p>Arabic, Japanese, and Russian characters supported in variable names</p> <p>You can now create variables with names containing Arabic or Russian characters, or Japanese double-byte numbers.</p> <p>Unicode range supported in variables on page 2251</p>

Changed features
<p>Configure granular security for Bot Agent (Service Cloud case ID: 00653807)</p> <p>Starting from this release, only registered Bot Agent device IP addresses that are added in the Allowed IP addresses list of the Network Settings can connect to the Control Room. In previous releases, devices from all subnets and IP addresses within the corporate network were allowed to connect to the Control Room URL.</p> <p>Add access public IP addresses on page 1745</p>
<p>Update to Excel advanced package</p> <p>The Open action in the Excel advanced package now opens a Microsoft Excel spreadsheet even when a file extension is not provided.</p>
<p>Disable clone and view content permissions for check-in (Service Cloud case ID: 00656157)</p> <p>When the Check in permission is selected, the Clone and View content permissions are also automatically selected. As a Control Room administrator, you can now disable the Clone and View content permissions when required.</p>
<p>Associate triggers with unattended Bot Runners</p> <p>Ensure that the default device is not in locked state if you are associating triggers with unattended Bot Runners.</p>
<p>Additional license support enhancements</p> <p>Control Room administrators are enabled to install a new GUID license before an existing license expires.</p>
<p>Change in edit device permission</p> <p>Starting from this release, the permission to edit devices is not available in the system-created AAE_Basic role by default in the Control Room. A user has to select the Edit the device(s) permission separately.</p> <p>Devices on page 1808</p>

The following table lists the fixed features and the builds in which they were fixed (Build 7103 is the latest build, and Build 7096 is the previous build). The fixes are cumulatively available in the latest build.

Fixed features		
Build number	Service Cloud case ID	Description
7103	00684905, 00703481	A Task Bot now runs as scheduled and no longer shows the device status as Picked at runtime on the View task in progress (Activity) page when the Task Bot is running.

Fixed features		
Build number	Service Cloud case ID	Description
7103	00676476	An error is no longer encountered when you run a child bot that contains a Japanese full-width space character in the name.
7103	00689935, 00689381, 00690368, 00690217, 0069053	License server syncing error generated when control room licenses and licenses stored on a server are updated on different schedules. This issue has been fixed. Should an error message appear, click "Sync licenses from Server" for any new licenses in production to manually sync the licenses.
7096	00667396, 00670001, 00653771, 00671553	Bot Scanner no longer encounters an error when scanning bots with non-ASCII characters in their name.
7096	00659334	The Offset from match option in the Image Recognition package now works correctly in migrated bots.
7096	00669166	You can now migrate large bots (for example, with 30+ dependencies and 500+ lines) using the Bot migration package. The system no longer encounters an error when migrating a bot that contains a large number of nested IF/ELSE commands.
7096	00659349	You can now migrate bots with special characters in their names.
7096	00670985, 00674145	The system no longer encounters an error due to Bot Store credentials when you migrate from Version 11.3.3 or a later version to Enterprise A2019.
7096	00679817	An unknown error is no longer displayed when you are migrating a bot that the Bot Scanner listed as ready for migration.

Fixed features		
Build number	Service Cloud case ID	Description
7096	00457898, 00488494	<p>You can now register a device with a username that contains non-ASCII characters such as Korean language characters.</p> <hr/> <p>Note: Before upgrading the Bot Agent to the current version, ensure that the registered device is configured to use non-ASCII characters.</p> <hr/> <p>Configuring post-installation settings on page 1258</p>
7096	00611887	<p>You can now download an exported bot package using the Internet Explorer browser by opening the download link received in the email. You can also do this from the Activity > Historical page.</p>
7096	00647932	<p>When you create a bot using the Get method action in the REST Web Service package, the UTF-8 character set is now supported. Therefore, Korean characters are processed correctly in the REST API response. Previously, UTF-8 characters were not supported.</p>
7096	00641126	<p>You can now use the Get single cell action in the Excel basic package to extract the date correctly for the Japanese date format. Previously, the Japanese date was displayed in double quotation marks.</p>
7096	00634102	<p>You can now use the Simulate keystrokes package with the Alt +F4 key and set a longer delay value between each keystroke. Previously, the bots displayed an error when a longer delay value was set with the Alt+F4 key.</p>

Fixed features		
Build number	Service Cloud case ID	Description
7096	00655739	In REST Web Service, the Rest API Get call now works properly even when the encoded URL string has special characters such as double quotation marks. Previously, the Rest API Get call failed when the URL string had double quotation marks.
7096	00653944	The String package now shows the correct output when you use the loop action to read a file name that does not have an extension. Previously, when the file did not have any extension, the filename extracted using the loop displayed an incorrect output.
7096	00677941	When an optional field (Mark field required is not selected) is now left blank, a form is validated without any error messages during bot runtime.
7096	00662011	When using the files and folders trigger, you can now use any available network drive to start a bot.
7096	00666441, 00673888	For a folder trigger, you can now select a folder name containing a space character and the bot runs successfully without encountering any issues. For example, you can select a folder called 'Sales chart'.
7096	00622100	When Simulate keystrokes is enabled for a hot key trigger, you can now start a bot multiple times using the associated hot keys without encountering any issues.
7096	--	If an element is marked as Read-only on the form builder screen, a validation error is no longer displayed for that field during bot runtime.

Fixed features		
Build number	Service Cloud case ID	Description
7096	00570660	You can now use Windows forms with the Run function action of the DLL package.
7096	00624644	The system no longer encounters an error when you upgrade from an earlier version of Enterprise A2019 to a later version when the settings are preserved and the installation path is not the default location.
7096	00670008	You can now pause or resume a task from the Activity > In progress page.
7096	00667210, 00672875	In the Excel advanced package, you can now use the Go to cell action even if the Excel sheet does not have any data or an active cell is out of the worksheet range. Previously, an issue was encountered when you used the Go to cell action and chose the cell option as Active cell with the Beginning of the row, End of the row, Beginning of the column, or End of the column option.
7096	00659098, 00669437	You can now edit the Start date of an existing schedule to today's date, provided the start time is set before the bot is scheduled to run.
7096	00671392	You can now stop a bot that is in progress using the Stop option from the In progress (Activity) page or the Stop option on the runtime window that appears when the bot is being executed.
7096	00647761	You can now define a list variable of subdata type Boolean or datetime within an action. Previously, the bot encountered an error in this scenario.

Fixed features		
Build number	Service Cloud case ID	Description
7096	00671478	Fixed an issue in the Task Bot > Run action where the value of an input variable disappeared when the user clicked Save . This issue only occurred when the Current Task Bot option was selected.
7096	00663719, 00635437	Fixed an issue where the OCR package was missing from Control Room instances hosted on Microsoft Azure. The connection with the Microsoft Azure database timed out before the OCR package .jar file could complete the upload.
7096	00631133, 00636174	In the Wait package, the Wait for condition action in the recorder object no longer waits indefinitely during bot execution. If the required window or its control does not exist, the bot waits for the required window or its control for the time specified in the Wait for control field. If the required window or its control is not found within this specified time, the bot continues to perform the next set of actions.
7096	00628863	Bot files or dependencies are no longer lost when you check in or check out a bot from the private or public workspace when the Elasticsearch service is running and not in index read-only mode. Previously, an error occurred when a bot was either checked in or checked out, and the bot files or dependencies were lost and could not be recovered.
7096	00673520	When a bot is deployed through RDP with a predefined screen resolution, the RDP resolution settings are now applied correctly during bot execution. Previously, the bot was executed with an interchanged resolution (the height and width pixels were interchanged).

Fixed features		
Build number	Service Cloud case ID	Description
7096	00670346	After you edit a bot schedule, the input value of a variable in the bot no longer has to be reinitialized and the bot does not show the default output value for the variable when it is executed.
7096	00653056, 00651853, 00647949, 00657465,00670024	The In progress activity is now displayed correctly for bots deployed on Bot Runners by any user.
7096	--	<p>When developing custom packages, you can now set your name in the vendor column. To set the name, update the <code>author</code> property of the <code>build.gradle</code> file, as shown below:</p> <pre>packageJson{ artifactName = project.name group = "\$groupName" author = "<entername>" }</pre> <p>Leaving the field empty shows the vendor name as unspecified.</p>
7096	--	Multiple users can now simultaneously run a bot associated with a form without encountering any issues on the same Bot Runner machine.
7096	--	You can now migrate Enterprise 11 bots that contain variables that are in a different letter case (uppercase or lowercase) than those in Enterprise A2019. Variables are case-sensitive in Enterprise A2019 but not in Enterprise 11, which previously resulted in an error.
7096	00592758	You can now create a variable with a name that starts with a numerical character.
7096	00670994	You can now register with the Control Room from a multiple-user device configured for Active Directory users.

Fixed features		
Build number	Service Cloud case ID	Description
7096	00677479	The deployment time of a priority queue no longer takes a long time (for example, more than 1 hour) to process Work Items required for workload automation.
7096	00667110	You no longer have to restart the Automation Anywhere Bot Agent service to resume queued Work Items that are stuck in in-progress state.
7096	00673043	When you specify a value in the numOfRunAsUsersToUse parameter of the Bot Deploy API, the weighted system algorithm now assigns tasks to the Bot Runners with the least number of tasks queued and currently running. Previously, the algorithm did not correctly calculate the weight of queued and running tasks, which resulted in an inefficient task allocation to the same one or two Bot Runners.

Known limitations
<p>When a bot opens a website inside a loop, the Recorder Capture action fails after the execution of Launch Website.</p> <p>Workaround: Add a delay of a few seconds in the loop between the Launch Website and Recorder Capture action.</p>
<p>The Recorder Capture action does not support object recapture for the AISense technology type.</p>
<p>The system does not display a value for a session variable when the variable is selected as Watched variables in Debug mode.</p>
<p>The session variable returns a blank value when it is used as output in a bot and the bot is deployed using the Bot Deploy API.</p>
<p>After an upgrade to the latest version of Enterprise A2019, the bot might encounter an error if you are using the Close action of the Window package version 2.1.0-20200813-181240 or earlier.</p> <p>Workaround: Add a delay of 50 milliseconds after the Close action in the bot.</p>

Known limitations
<p>The Recorder package takes a long time (for example, approximately 6 hours) to upload to a remote application repository path of an On-Premises Control Room deployed on Microsoft Azure.</p> <p>Workaround:</p> <ol style="list-style-type: none"> 1. Before you install or upgrade to this version, configure the repository path in a local directory of the Control Room node to upload the package. 2. After installing or upgrading, verify that all packages are available in the Packages page of the Control Room. 3. Change the repository path to a remote file share.
<p>The AISense Recorder fails if you manually upgrade the Recorder package version, such as by importing a bot that contains a Recorder package version from a more recent build than the destination Control Room. Always upgrade the Recorder package through the Control Room.</p>

Automation Co-Pilot for Business Users (Automation Co-Pilot)

New features
<p>Run a process in private workspace</p> <p>You can now run a process in your private workspace by using the Run option in the process editor. The bots in the process are then executed on the default device of the Bot Creator.</p> <p>About Process Composer on page 3297</p>
<p>Use the Data Privacy tag field</p> <p>The Data Privacy tag enables users to generate hidden custom output in their process tasks (Start panel, Human Task, and Bot Task). Users can enter the variables for this field during runtime with values. In the web portal, the Automation Co-Pilot admin can use this tag to check for requests or tasks by using personal user data. The admin can also filter using this field.</p> <p>Create a process automation in Process Composer on page 3312 Filter and search for a request on page 3271 Filter and search for a task on page 3273</p>
<p>Use variables types</p> <p>You can now use new variables in the process editor such as createdOn and updatedOn (DateTime), id (Number), and title (String). These variables are part of a data flow (workflow engine) that moves data between each step of a process and requires variable input for the process to run properly.</p> <p>Supported variable types in Process Composer on page 3308</p>

New features
<p>View previous selected tasks</p> <p>Automation Co-Pilot users can now reference selected actions of their tasks. When they view a submitted task in request view, a check mark indicator is now displayed next to the buttons that are selected.</p>

Changed features
<p>Configure scheduler user to allocate device pool to Automation Co-Pilot on the web interface</p> <p>In the AARI Settings page, the Automation Co-Pilot administrator can now configure a scheduler user to allocate the Control Room resources (devices and unattended Bot Runners) to Automation Co-Pilot on the web interface.</p> <p>The scheduler user must have View my bots and Run my bots permissions and have access to a device pool and Bot Runners. The Automation Co-Pilot process can then use those resources for each bot deployment.</p> <p>Configure scheduler user for Automation Co-Pilot on page 3293</p>
<p>End point display</p> <p>In the Completed panel, the End point has a new display option Update request title that enables the user to update the request title. When the user updates the Display message field, the update is now reflected in request view.</p> <p>Create a process automation in Process Composer on page 3312</p>
<p>Use F2 to insert variables</p> <p>You can now use the F2 keyboard shortcut to insert variables in the process editor.</p>

Fixed features	
Service Cloud case ID	Description
--	The Task display name option in the Start panel is now set to Request Creation by default. Any name changes by the user is now reflected in the request view.
--	The Feed data into form table in the process editor now works properly and users can now edit the field.
--	In a form that contains a Number field set to a 10-character limit, when you enter the maximum character limit (for example, 1234567890) in the number field in request view, the number values are now accepted.

Fixed features	
Service Cloud case ID	Description
--	When you create a process with a form that contains a Date element, the Condition option in the If/Else pair action now allows you to enter a variable. Previously, the option did not allow you to enter a variable.

Known limitations	
In the process editor, if a bot contains an incorrect input variable, the properties panel highlights the wrong element: Browse in the Select Task Bot field is highlighted instead of the incorrect variable. Workaround: Hover your mouse over the red icon next to the Bot Task in the process editor to see the error.	
In the process editor, if you replace the Go to option with an End Process , the End Process icon does not display the status (Completed, Failed, Canceled) correctly. Workaround: Click the End Process icon and change the status.	
A Bot Task cannot pass data to the next task (Human Task or Bot Task) if it contains Japanese characters in its output variable name. Workaround: Use English characters for the variable name in the Bot Task .	
If a scheduler user has multiple sets of configurations (device pools and Bot Runners), due to a mismatch in the selection of the device pool and the Bot Runners, the bot deployment fails. Workaround: Set Bot Runners in the Run As section of the consumer role. Ensure the scheduler user has access to only one device pool and one consumer role that has run-as users.	
When you access Automation Co-Pilot through the web interface, the Request ID and Task ID consider the data as string type instead of numeric data type and sorts it accordingly. For example, if a Request ID or Task ID starts from 1 through 30, the IDs are sorted as string data type (1, 10, 11, 12, 13, ..., 2, 22, 23, ..., 30) instead of numeric data type (1, 2, 3, 4, ..., 30).	
In some bot development failure scenarios, for example, files are not found or the scheduler user does not have access to the bot file, bot development fails by timing out after one hour instead of displaying an error.	
If an Automation Co-Pilot manager creates a team with the same name as a team created by any other manager, no error message is displayed and two teams are created with the same name.	

Known limitations
<p>When you access Automation Co-Pilot through the web interface, the task and case list pages do not display the following words in the localized languages:</p> <ul style="list-style-type: none"> • Search task • Results • Request title
<p>In the process editor page, the following words are not displayed in the localized languages:</p> <ul style="list-style-type: none"> • Process entry • Run • Undo • Redo • Data privacy tag • Auto assign this task to • InitialData • Update request title (optional) • Update task name (optional) • Boolean condition

Discovery Bot

New features
<p>Column headers updated in Recordings page</p> <p>The Recordings page now displays labeled column headers when you review captured steps for recordings. The following headers are displayed for the associated text field:</p> <ul style="list-style-type: none"> • Screenshot • Application • Data • Step description <p>Record a Discovery Bot business process on page 3709</p>
<p>Highlight where you click or enter data when recording processes</p> <p>The system now displays the area, component, or control where you click or enter data with a red highlighted box at the time of recording.</p> <hr/> <p>Note: The red highlight is only shown in the captured screenshot in the generated bot. The highlight is not shown on captured screenshots from the Recordings page for review and after submission to the analyst. The highlight is also not shown from the preview pane from the Aggregated and Opportunity tabs for the analyst review.</p> <hr/> <p>Supported applications and browsers for Discovery Bot on page 3707</p>

New features
<p>Condition and value displayed for each branch in Aggregated view</p> <p>For the System generated view, the condition and its value for each branch are automatically retrieved and displayed as part of the auto-generated Aggregated view.</p>
<p>System-generated aggregation</p> <p>You can now merge multiple recordings into a single aggregated view automatically by selecting the required set of recordings.</p> <p>Create a process view with branches and opportunities</p>
<p>Convert system-generated aggregated view to a manual view</p> <p>You can now convert a system-generated aggregated view to a manual view using the Save as [manual] option or the Convert to Manual option from the Views table. This option enables you to add more recordings or steps from other recordings to your process view.</p> <p>Create a process view with branches and opportunities</p>
<p>Create an opportunity, including all steps and branches</p> <p>You can now use the Select all steps option to create an opportunity that includes all steps, branches, and sub-branches.</p> <p>Create a process view with branches and opportunities</p>
<p>Download a process definition document (PDD) (previously, Export to Word)</p> <p>The Export to Word option is now renamed as Download Process Definition Document (PDD). When an opportunity is created, the PDD begins processing in the background automatically. When the PDD is ready for download from the Control Room, an email notification is sent to the email address on file to the opportunity owner.</p> <hr/> <p>Note: You must be the owner of the opportunity to be able to download the PDD.</p> <hr/> <p>Review opportunities and convert to</p>
<p>Receive email notification when your bot is converted successfully</p> <p>You can now receive an email notification when your bot is successfully converted. Click the hyperlink in the email to take you to your folder in which the bot was generated.</p> <p>Review opportunities and convert to</p>
Changed features
<p>Zoomed-in view of captured steps is increased</p> <p>The zoomed-in view in the Screenshot field is now increased from x4 to x8 for better readability of captured steps.</p>

Changed features
<p>Permissions layout</p> <p>The layout of the permissions for Discovery Bot is now changed to separate the individual and "all" permissions to easily manage access control.</p>

Fixed features	
Service Cloud case ID	Description
--	<p>When you create a branch in a view, typically a single step from the current branch is moved into the left branch while a new branch with an empty box is added to the right branch. You can add steps from a different recording only into the empty box in the right branch. Typically, only one step from the original branch is included in the left branch. If the branch is created following the last step in the flow, then no steps will be included in the left branch. You can now add new steps to the left branch in case it was the last step. You can also move the endpoint of the newly created branch lower or higher in the process to include additional steps in the left branch.</p>

Known limitations
In the Opportunities tab, the process and owner column does not allow you to sort in ascending or descending order, or when you sort for both process and owner.
In the Opportunities tab, the search field and the filter drop-down option do not work when you search for the Process or Owner columns.
The Download PDD option is disabled if you are not the owner of the opportunity.
The Delete icon is not properly visible in the edit recordings screen in Internet Explorer. Two-finger swipe on the track pad does not change the zoom level in any canvas of the Aggregated and Comparison tabs.
Discovery Bot is currently not supported on Linux.
The red highlight is only shown in the captured screenshot in the generated bot. The red highlight is not shown on captured screenshots from the Recordings page for review and after submission to the analyst. The highlight is also not shown from the preview pane from the Aggregated and Opportunity tabs for analyst review.

IQ Bot

New features
<p>Support for Arabic language</p> <p>When creating a learning instance, you can now choose the Arabic language from the Primary language of documents drop-down menu, with the following limitations:</p> <ul style="list-style-type: none">• Advance table extraction is not available.• Search field on the is not supported.• Arabic numerals are not supported. <p>For example, if the document has date or time in Arabic language, it is extracted as text and validations can fail.</p> <hr/> <p>Note: You can still use string-based validation checks (such as regular expressions) for Arabic numerals.</p> <hr/> <ul style="list-style-type: none">• Arabic is only supported on ABBYY FineReader Engine 12.4. <p>Creating a learning instance</p>
<p>Default validations for a group</p> <p>When editing a learning instance, you can now use the Select the default validations group drop-down menu to select an available group. This allows all the new group documents in production to be extracted based on the custom logic and validations defined in this selected group, before it goes to the Validator.</p> <p>Edit a learning instance</p>
Changed features
<p>Automatically detect check box</p> <p>IQ Bot can now automatically detect check boxes and radio buttons in a document. You can enable this feature when creating a learning instance.</p> <p>Creating a learning instance</p> <ul style="list-style-type: none">• With this feature enabled, during training, if you select check box from the data type drop-down list and then you select the field value, only the check box segments are displayed.• This feature does not work with the PDFBox option enabled. <p>Disable PDFBox option</p>

Changed features
<p>Tegaki API OCR improvements</p> <p>IQ Bot now uses enhanced Tegaki API OCR segmentation to improve accuracy in the following scenarios:</p> <ul style="list-style-type: none"> • Multiple fields are merged into a single SIR • Segmentation on empty spaces • Overlapping SIRs • Incorrectly located SIRs • Partial or incorrectly captured values from SIRs <p>IQ Bot Tegaki API OCR engine</p>
<p>Updated versions of RabbitMQ v3.8.18 and Erlang/OTP</p> <p>The IQ Bot installation package now includes RabbitMQ v3.8.18 version 3.8.8 and Erlang/OTP version 23.0.4.</p> <p>RabbitMQ and Erlang/OTP upgrade</p>
<p>PyArabic removed from Python installation</p> <p>PyArabic is one of the Python libraries that was used in content extraction for Arabic language (right to left). Because Arabic language is now supported by default with IQ Bot installation, PyArabic is removed from Python installation.</p> <p>List of Pandas Libraries which are supported and not supported on Automation 360 IQ Bot (A-People login required)</p> <hr/> <p>Note: Ensure you update any bot that you have deployed using PyArabic.</p> <hr/>
<p>Performance improvement (Service Cloud case ID: 00629302)</p> <p>IQ Bot now takes significantly less time to create a bot for groups containing only production documents.</p>

Fixed features	
Service Cloud case ID	Description
00500914	<p>The <code>TesseractLog.log</code> file is now available in the following directory: <code>C:\Users\Public\Public Documents\Automation Anywhere IQBot Platform\Logs\Engine\</code>.</p> <p>The log level is set to <code>error</code> by default. You can change this setting in the <code>CognitiveServiceConfiguration.json</code> file.</p>

Fixed features	
Service Cloud case ID	Description
00430923, 00618234, 00636422, 00478986, 00414921	All uploaded documents are now rendered correctly, irrespective of their content orientation while uploading, which enables you to train them without encountering any issues. Previously, when you created a learning instance, documents that did not have the correct content orientation (they were upside down or tilted) could not be trained.
00653929	IQ Bot On-Premises: With segmentation improvements, you can now train documents in the Korean language using the Tegaki API OCR engine without any system-identified region (SIR) errors.
--	The system no longer creates any unnecessary folders for successfully classified documents that are uploaded using the IQ Bot [Local Device] package.
--	You can now use the designer page when creating a learning instance to test all the documents, without any error messages.
00590165	For a learning instance, you can now use the See extraction results option to browse all the documents in the selected group.
00672470	After validating the fields of production documents, you can now use the Save current document option to save all the validated document, without any error messages.
--	Check box fields are now extracted with better accuracy. You can use the Checkbox auto-detection feature so that IQ Bot automatically detects the check box fields and radio buttons.
00652269, 00619139	When you now run a bot and try to edit it while it is still running, the following correct message is displayed: <code>Staging Documents for this Vision bot is in progress. Please try after some time.</code> Previously, the following incorrect message was displayed: <code>Learning instance not found.</code>
00601401	When creating a learning instance, you can now use the Thai language for form and field names without encountering any issues.
00624416	When you migrate a learning instance, group descriptions are now migrated without any errors.
--	If you select any field on the Validator screen, the focus from that field is no longer lost when you now click or draw to select SIR.

Fixed features	
Service Cloud case ID	Description
00662968	Sometimes, when you click See Extraction Results and the preview fails, IQ Bot now correctly displays the following error message after a timeout of 2 minutes: <code>Error occurred while extracting the document. Please re-check the training/document.</code> Previously, when the preview failed, the page kept loading indefinitely.
00674110	Production documents are now moved to the without any errors, irrespective of how the bot was trained (number pages, number of segments in each page, or number of tables and fields extracted).

Known limitations	
IQ Bot On-Premises and Cloud	In the table area of the Validator, if you add a new row, enter a value, and then delete this row, the value of the next row is replaced by the content you entered in the deleted row.
IQ Bot On-Premises and Cloud	In the Validator, when you click any validated field and then click any other cell, the value in the validated field is deleted.
IQ Bot On-Premises and Cloud	When you upload a document to production immediately after deleting a bot it was associated with, extraction results are not displayed. Workaround: Use one of the following options: <ul style="list-style-type: none"> • Select the Disable cache option in the Network tab. • Ensure you wait at least 3 minutes between deleting the bot and uploading the document. • Empty the cache and reload the page.
IQ Bot On-Premises and Cloud	You cannot use Express mode to install IQ Bot.
IQ Bot On-Premises and Cloud	Numerals in the Polish language are not accepted or validated in the Validator.
IQ Bot On-Premises and Cloud	If you create a user role with 2-byte non-English characters, services fail with an <code>invalid characters</code> message.
IQ Bot On-Premises and Cloud	If the name of a learning instance has both English and Arabic characters, the time stamp of the backup file is appended in between the filename.

Known limitations
<p data-bbox="329 245 704 275">IQ Bot On-Premises and Cloud</p> <p data-bbox="329 294 1305 352">You cannot use the draw functionality to generate an SIR when you zoom in on a document in the Validator.</p>
<p data-bbox="329 384 573 413">IQ Bot On-Premises</p> <p data-bbox="329 432 1008 462">After installing IQ Bot, MLWeb services stops responding.</p> <p data-bbox="329 480 1044 510">Workaround: Manually stop and restart the MLWeb services.</p>
<p data-bbox="329 537 573 567">IQ Bot On-Premises</p> <p data-bbox="329 585 1409 644">If you add a new language after upgrading to IQ Bot A2019, the Learning Instance page is not displayed due to Language API cache issues.</p> <p data-bbox="329 663 1044 693">Workaround: Clear the cache and restart the IQ Bot service.</p>
<p data-bbox="329 726 704 756">IQ Bot On-Premises and Cloud</p> <p data-bbox="329 774 1382 833">If you try to process a PDF document with pdfboxOCR enabled, the SIRs are not placed correctly on the check boxes.</p> <p data-bbox="329 852 1227 882">Workaround: Disable the pdfbox OCR when you create a learning instance.</p>
<p data-bbox="329 909 704 938">IQ Bot On-Premises and Cloud</p> <p data-bbox="329 957 1398 1016">If you create a learning instance with Auto Checkbox Detection enabled, check box SIRs cannot be selected.</p> <p data-bbox="329 1035 1409 1064">Workaround: Draw on top of the check box SIR instead of selecting the identified SIR field.</p>
<p data-bbox="329 1092 704 1121">IQ Bot On-Premises and Cloud</p> <p data-bbox="329 1140 1419 1266">Starting with IQ Bot A2019.17, the default OCR engine is changed to ABBYY FineReader Engine 12.4 from the previous 12.2 version. Therefore, if you have migrated learning instances from earlier versions, you might have to retrain your bots because there could be a change in segmentation.</p>
<p data-bbox="329 1295 704 1325">IQ Bot On-Premises and Cloud</p> <p data-bbox="329 1344 1393 1402">The Default validations group is not overwritten on the imported learning instance even when the Overwrite option is used when you import that learning instance.</p> <p data-bbox="329 1421 1419 1480">Workaround: Edit the learning instance after importing the IQBA file and change the default group.</p>
<p data-bbox="329 1514 704 1543">IQ Bot On-Premises and Cloud</p> <p data-bbox="329 1562 1419 1654">A learning instance is exported as an IQBA file that contains <code>Projectdetails.csv</code>. When you extract this <code>.csv</code> file, the column header name for the Default validations group in the table is not available. However, the corresponding value in that column is available.</p>

Known limitations
<p>IQ Bot On-Premises and Cloud</p> <p>If you re-import an IQBA file for a deleted learning instance, the Default validations group setting available in that IQBA file is not applied to the learning instance.</p> <p>Workaround: Edit the learning instance after importing the IQBA file and change the default group.</p>

Bot Insight

New features
<p>New Automation Co-Pilot dashboard in Bot Insight</p> <p>Use the Automation Co-Pilot dashboard to view various widgets that provide information about requests created from published processes in Automation Co-Pilot. The dashboard also provides statistics on the status of created requests.</p> <p>Automation Co-Pilot dashboard on page 3739</p>

Security fixes	
Service Cloud case ID	Description
--	The Allow Header HTTP header is removed from Bot Insight.

Enterprise A2019.16 Release Notes

Release date: 28 September 2020

Review the new features, supported packages, changed features, fixed features, security fixes, and known limitations in the Enterprise A2019.16 (Build 6463) release. IQ Bot is on Build 6443.

Important: We have updated Enterprise A2019.16 to Build 6463 to include fixes for issues with checking in and checking out bots (Service Cloud case ID 00666880, 00670899, 00672441,

00670455, 00672346), and Universal Recorder (Service Cloud case ID 00664020). See the [Fixed features](#) section for more information.

- [Discovery Bot](#) on page 611
- [IQ Bot](#) on page 615
- [Bot Insight](#) on page 616
- [Automation Co-Pilot for Business Users \(Automation Co-Pilot\)](#) on page 617

Enterprise A2019

Note: Starting with this release, if you are installing the Control Room in Linux environment, ensure that Python 3.6 is installed.

Important: This release includes a required update to your . Ensure that you complete the update to continue with your automation activities when upgrading from a previous release to this release.

[Automatically update the Bot Agent](#) on page 1302 | [Manually update the Bot Agent](#) on page 1303

To verify which version is compatible with this release, see [Compatibility with release builds](#) on page 1275.

New features

Migration to Enterprise A2019 ([currently available only to customers in the Migration Early Adopter Program](#))

Enterprise A2019

Migration to Enterprise A2019 is currently only available to select customers through our Migration Early Adopter Program. If you are interested in learning more about this program or a timeline for when migration will be available to all customers, contact your Automation Anywhere representative.

- Enterprise 11 only
 - Migrate audit logs to Enterprise A2019.
[Migrate Enterprise 11 audit logs](#) on page 1508
 - Migrate bots that contain disabled commands that have validation errors.
 - Migrate bots that contain **Delete**, **Delete All Messages**, and **Get All Messages** commands to automate an email-related task on Exchange Web Services (EWS).
- Enterprise 10 only

Migrate user credentials to the Enterprise A2019 Credential Vault.
[How Enterprise 10 data is copied to Automation 360](#) on page 1517
- Enterprise 11 and Enterprise 10
 - Migrate bots that contain the **Variable Operation** command, which re-initializes the row and column index of an array variable using a variable.
 - Migrate bots that run MetaBot Logic and return the values to a dictionary variable.
 - Migrate MetaBots that contain DLLs that use lists, values, arrays, and two-dimensional arrays as input and output.
[How MetaBots are migrated](#) on page 1535
 - Migrate bots that contain **Send Email** with **Attach Variable** option from the Error Handling command to the Enterprise A2019 Error handler package.
[Package mapping for migration](#) on page 1559
 - Migrate bots that contain the **Image** and **Coordinates** play modes from the Object Cloning command to the Recorder package in Enterprise A2019.
[Package mapping for migration](#) on page 1559
 - Migrate bots that contain credential variables in select commands such as Active Directory, Excel, REST Web Service, and Terminal Emulator to Enterprise A2019.
For the complete list of commands, see [Variable mapping for migration](#) on page 1593.

Support for using CSV and TXT files as databases

Enterprise A2019 and Community Edition

Use the actions from the Database package to connect with and perform create, read, and update operations on the file.

[Using Connect action for database](#) on page 2382 | [Database package](#) on page 2379

New features
<p>Universal Recorder support for standard Microsoft controls in Microsoft Silverlight Enterprise A2019 and Community Edition</p> <p>The Universal Recorder can now capture calendars, buttons, check boxes, combo boxes, date pickers, labels, links, list views, radio buttons, sliders, tabs, tables, text boxes, and trees from applications running Microsoft Silverlight version 5.</p>
<p>Use variable to specify a child bot to run</p> <p>Enterprise A2019</p> <p>Use the Control Room path in the Run action of the Task Bot package to use a string variable to specify the child bot you want to run.</p> <p>Task Bot package on page 2980</p>
<p>Install Bot Agent in bulk using registration key (Service Cloud case ID: 00616591)</p> <p>Enterprise A2019</p> <p>As an Control Room administrator, you can generate a registration key from the Control Room settings to install Bot Agent in bulk on multiple devices. You can use the registration key in an installation script or as part of the Active Directory group policy for configuring the Control Room users.</p> <p>Generate registration key to install Bot Agent in bulk on page 1774</p>
<p>Automatically detect proxy settings for Bot Agent installation to support NTLM authentication (Service Cloud case ID: 00446932, 00639773)</p> <p>Enterprise A2019 and Community Edition</p> <p>The proxy settings for a Bot Agent are automatically detected if the Automatically detect settings option is selected in the LAN settings for a System user and Current user on the machine where the Bot Agent is installed. This allows Control Room users to be authenticated using NTLM.</p>
<p>Restrict network access to Cloud Control Room URL</p> <p>Enterprise A2019</p> <p>System administrators can restrict access to the Cloud Control Room URL from only those IP addresses within the corporate network for more granular security. The Automation Anywhere Control Room provides the ability to specify a list of IP addresses or IP subnets that are allowed for Cloud Control Room URL and API access. Enterprise A2019 users with Control Room administrator privileges, such as to access Administration > Settings, can view, add, or edit this list.</p> <p>Add access public IP addresses on page 1745</p>

New features
<p>Add Elasticsearch credentials for enhanced monitoring and alerting</p> <p>Enterprise A2019</p> <p>An option to provide Elasticsearch credentials is now available in the installer because the updated Elasticsearch version 7.8 configured for Control Room uses Open Distro version 1.9.0. This feature enables the server to deploy an enhanced monitoring and alerting system.</p> <p>Add Elasticsearch credentials on page 1203</p>
<p>Support for Chinese, Japanese, and Korean characters in variable names</p> <p>Enterprise A2019 and Community Edition</p> <p>You can now create variables with names containing Chinese, Japanese, or Korean characters. You can also migrate bots that contain variables named using these characters.</p> <p>Unicode range supported in variables on page 2251</p>
<p>Support for Chinese language for Terminal Emulator (Service Cloud case ID: 00500324)</p> <p>Enterprise A2019</p> <p>You can now use the simplified and traditional Chinese language with 5250E terminal DBCS models such as IBM 5555-C01 and IBM 5555-B01.</p>
<p>New Services package available</p> <p>Enterprise A2019 and Community Edition</p> <p>Use the new Services package to automate operations and application services. You can start, stop, pause, resume, or to get the status of a Windows or application service.</p> <p>Service package on page 2889</p>
<p>Enhancements to the Excel advanced package</p> <p>Enterprise A2019 and Community Edition</p> <p>In the Excel advanced package, you can now use Read value from a cell. You can choose the Read option to read either visible text or the value from the cell. The default option is set to Read visible text in cell.</p> <p>For example, if the cell has \$50 as the value, then the Read cell value option reads the value as 50, ignoring the currency format. The Read visible text option reads the content along with currency format as \$50.</p> <p>This option is available for the following actions:</p> <ul style="list-style-type: none">• Get single cell• Get multiple cells• Read row• Read column• Get worksheet as datatable• Loop <p>Cell operations in Excel advanced on page 2500 Row and column operations in Excel advanced on page 2495 Loop package on page 2679</p>

New features
<p>Automate a task on a range of cells in an Excel worksheet (Service Cloud case ID: 00651299)</p> <p>Enterprise A2019 and Community Edition</p> <p>In the Excel advanced package, you can perform operations on the range of cells for Go to cell and Set Cell actions.</p> <p>Cell operations in Excel advanced on page 2500</p>
<p>New condition in the If and Loop packages</p> <p>Enterprise A2019 and Community Edition</p> <p>Use the Service is running or Service is not running condition to execute actions based on whether a particular service is running or not. For example, when you send a mail using this condition, the bot can verify if the SMTP service is running or not.</p> <p>If package on page 2619 Loop package on page 2679</p>
<p>Capture hidden objects using AISense Recorder</p> <p>Enterprise A2019</p> <p>Use AISense Recorder to capture hidden image buttons on the application screen.</p> <p>Edit a task recorded using AISense on page 2183</p>
<p>New operations on SAP captured objects</p> <p>Enterprise A2019</p> <p>Use new options that are available to perform operations such as Set Focus and Select item by key for the various objects captured from an SAP application.</p>
<p>Pass parameters of various types to a DLL function</p> <p>Enterprise A2019</p> <p>Use the new Run function action to pass parameters of various types to a DLL function. The Run function that was available in earlier versions is now renamed to Run function (Legacy) and enables you to pass only dictionary variable as parameter to a DLL function.</p> <p>Using the Run function action on page 2419 Using the Run function (Legacy) action on page 2418</p>
<p>Form builder updates</p> <p>Enterprise A2019</p> <p>The form builder now includes the following new elements:</p> <ul style="list-style-type: none">• Rich text editor- Enables you to add a customizable element to the form.• Table- Enables you to add tables to a form. <p>Create a form</p>

New features
<p>Enhancements to the form preview</p> <p>Enterprise A2019</p> <p>When you click the Preview option in the form builder screen, you can drag the form. The corresponding X and Y coordinates are updated automatically.</p>
<p>Enhancement to the Snapshot element</p> <p>Enterprise A2019</p> <p>You can now create a folder if the filepath is not available or change the destination folder of the snapshot file during bot runtime.</p> <p>Using the Snapshot element on page 3225</p>
<p>Update to the Interactive forms package</p> <p>Enterprise A2019</p> <p>Use the Validate form action to validate all the elements of a selected form.</p> <p>Interactive forms package on page 2633</p>
<p>New permission to view basic information about users and roles (Service Cloud case ID: 00491694)</p> <p>Enterprise A2019</p> <p>The View Users and Roles basic information permission enables you to view the names of users and roles when you are performing various tasks in the Control Room. For example, a user must have this permission to view the roles that can be assigned to a user when creating or editing that user. After you upgrade from an earlier version to this release, this permission is granted to all existing roles.</p>
<p>Securely pass values in header and parameters of calls to a REST or SOAP web service</p> <p>Enterprise A2019 and Community Edition</p> <p>Credential variables enable users to retrieve sensitive values from the Credential Vault and pass them to the web service. Use credential variables in the header or parameter fields of actions from the REST Web Service or SOAP Web Service package.</p> <p>Credentials and credential variables in the Bot editor on page 2254 REST Web Service package on page 2834 SOAP Web Service package on page 2955</p>
<p>Return system parameters of the device on which a bot is running</p> <p>Enterprise A2019 and Community Edition</p> <p>Use the Get environment variable action from the System package to return the system parameters, including HomePath, ProgramData, ProgramFiles, SystemRoot, and UserDomain.</p> <p>Get environment variable action on page 2977</p>

New features
<p>Remove Git integration configuration (Service Cloud case ID: 00633948)</p> <p>Enterprise A2019</p> <p>You can now remove or disable a Git integration configuration from your Control Room when the bot information stored in your Control Room does not have to be synchronized with the remote Git host.</p> <p>Remove Git integration configuration on page 1767</p>
<p>Expanded data type support in DLL package</p> <p>Enterprise A2019 and Community Edition</p> <p>The DLL package now accepts table variables as input parameters or to hold action output.</p> <p>Using the Run function (Legacy) action on page 2418</p>
<p>Create variable within Dictionary > Assign and List > Assign actions</p> <p>Enterprise A2019 and Community Edition</p> <p>The Assign action from the Dictionary and List packages now offers users the option to create a new variable within the Select source variable field. Previously, users could only select a variable from a list of existing variables.</p>
<p>New API for license management</p> <p>Enterprise A2019</p> <p>The License API contains endpoints to retrieve Control Room license details (such as the expiration date and license mode) and to update the Control Room after license reallocation or renewals.</p> <p>License API</p>
<p>New expression in the Legacy Automation package</p> <p>Enterprise A2019</p> <p>The List to table expression supports migrated bots containing a variable that has to be converted from a list type to a table type.</p> <p>Legacy Automation package on page 2660</p>

New features
<p>Multi-user device sessions on terminal servers</p> <p>Enterprise A2019</p> <p>Multi-user device sessions are now supported on terminal servers. You can perform the following actions:</p> <ul style="list-style-type: none"> • Set screen resolution at either the device or Control Room level. • Set a multi-user device as the default device for Bot Creator users and attended and unattended Bot Runner users. • As a licensed user (with a default device), set another device as your default device using the Make default device option from the device menu. • View and edit the device settings on the device landing page. <p>The device landing page shows additional information about the user-provided device name (device nickname), device type, and the default user.</p> <ul style="list-style-type: none"> • Convert an existing device to a multi-user device in order to share the same device between Bot Runner and Bot Creator users who can then coexist in different sessions simultaneously. (Service Cloud case ID: 00624046) <p>About multi-user devices on page 1811 Convert an existing device to a multi-user device on page 1814 Configure RDP-based deployment for multi-user devices on page 1812</p>

Supported packages

Changed features
<p>Enhanced Capture area action in OCR package</p> <p>The Capture area action now captures text from the visible area of the screen even if the target area is below the visible screen. Previously, the bot showed an error when the captured area was below the visible screen.</p> <p>Using Capture area action from OCR package on page 2704</p>
<p>Bot Scanner update</p> <p>The Bot Scanner now displays error messages for bots that cannot be migrated to Enterprise A2019 in the summary report.</p> <p>Analyze Bot Scanner report for migration on page 1474</p>
<p>Flow view update</p> <p>A line number is now displayed for each action in the Flow view of the Bot editor.</p>

Changed features
<p>CSV/TXT package update</p> <p>The CSV/TXT package processes a space as character. For example, if your CSV or text file includes <code>January, "March, April"</code>, then the output is displayed in the following format:</p> <p>January "March (space before the double quotation mark) April"</p> <p>If the CSV or text file contains the same information but without a space between January and March (for example, <code>January, "March, April"</code>), then the output is displayed in the following format:</p> <p>January March, April</p>
<p>Upgrade for resilient bot deployment</p> <p>After you upgrade the Control Room and Bot Agent to Enterprise A2019.16, scheduled and queued bots are not terminated. This is part of the resiliency improvements where the Control Room and Bot Agent are set in a consistent state. As a result, the device reconnects to the Control Room if there are any network disruptions, and scheduled and queued bots are deployed.</p> <hr/> <p>Important: During the upgrade to Enterprise A2019.16, all bots that are running will be terminated. After the upgrade, if the system is in an inconsistent state, restart the Bot Agent so that the system is in a consistent state.</p> <hr/>
<p>Internet Explorer waits for completion before initiating Recorder action</p> <p>When you use the Recorder package, the bot now waits for the Internet Explorer browser to finish loading the page before executing any action. This enhances the reliability of the bot by preventing it from failing while the page is loading. For example, the Recorder does not try to search the object before the web page is fully loaded.</p> <p>Using the Capture action on page 2818</p>
<p>High availability enhancement</p> <p>Starting from this release, configure the required minimum three Control Room nodes in an Enterprise A2019 data center cluster for high availability deployment.</p> <p>High availability deployment on page 1179</p>

The following table lists the fixed features and the builds in which they were fixed (Build 6463 is the latest build, and Build 6453, and Build 6448 are previous builds). The fixes are cumulatively available in the latest build.

Fixed features		
Build number	Service Cloud case ID	Description
6463	00644915	The Bot Agent now checks for additional SSL certificate from the Windows CERT_SYSTEM_STORE_LOCAL_MACHINE system stores in addition to the Java Credential Store. This allows the Bot Agent to be updated automatically from an earlier release to this release.
6463	00666880, 00670899, 00672441, 00670455, 00672346	Bot files or dependencies are no longer lost when you check in or check out a bot from the private or public workspace. Previously, an error occurred while either checking in or checking out a bot, and the bot files or dependencies were lost and could not be recovered.
6463	00664020	You can now successfully run a bot that contains the Capture action from the Recorder package with both the HTML InnerText and InnerHTML object properties selected.
6463	--	Fixed an issue where the Universal Recorder failed to perform a click, set text, or append text action on the correct control in Google Chrome when a debug window or download bar was open.
6453	00669040, 00669164, 00668923, 669332, 00669473, 00671509, 00669178	The Automation Anywhere Elastic Search Service now restarts during the certificate retrieval process when you upgrade from Enterprise A2019.15 to Enterprise A2019.16. However, if you encounter any issues with the Automation Anywhere Elastic Search Service during the restart, see Automation 360 v.16 upgrade error: Elasticsearch Service fail to start during certificate retrieval process (A-People login required) .
6448	00573048	You can now preview table variables in debug mode and validate the bot logic. Previously, watch variables containing Japanese and Chinese characters did not display values in the table variable.
6448	00656475	The Bot Deploy API call now consecutively executes all the runAs users that are set in the runAsUserIds parameter.

Fixed features		
Build number	Service Cloud case ID	Description
6448	00569832, 00628474, 00656267	The device registration issue due to Bot Agent version extraction is now fixed. The exception of "for input string null" no longer occurs.
6448	00609073	You can now successfully integrate your Control Room with your remote Git repository without any error. Previously, the Git integration failed because of a 404 error.
6448	00632444, 00626829, 00667531	When you import a main task containing subtasks using the overwrite option, the dependent subtask references are no longer deleted for other existing main tasks that use the same subtasks. As a result, the execution of other main tasks containing the same dependent subtasks does not fail.
6448	00501208, 00572346	For the Create user event name, the audit log now properly displays the username who created that user in the Event Started By column. Previously, the same column did not display any value.
6448	00616202, 00637626, 00653919, 00664039, 00664744	When the debug log is enabled in logs configuration and you use the For each row in a SQL query dataset option from the Loop action to iterate each row, the iteration now completes without any error. Previously, the iteration failed because of a change in the debug log configuration.
6448	00653064	After the caching service is restarted, the bot execution no longer fails. The caching client instances are reconnected and reinitialized after the restart.
6448	00577612	In a bot with dependencies, if you check out and edit a child bot in your private workspace and later check out the parent bot, you will no longer lose the changes made to the checked-out child bot. Previously, changes made to the child bot were overwritten.

Fixed features		
Build number	Service Cloud case ID	Description
6448	00623154	When a Bot Creator that does not have create folder permission tries to check in a bot to the public workspace, an appropriate error message is now recorded in the audit log, indicating the specific reason for the failure. Previously, the audit log recorded an <code>unexpected error occurred</code> message.
6448	00622977	In the Edit role page, file permissions are now correctly aligned in Internet Explorer. Previously, the Delete from Public option was displayed below the Select all option. As a result, the folder and permissions were not placed next to each other.
6448	00615437	You can now migrate MetaBots that contain input and output type variables with a description containing unsupported characters such as quotation marks (") and forward slash (/).
6448	00636169	The Control Room now disables a user account when the number of consecutive failed login attempts specified in the Control Room settings is reached or exceeded.
6448	00530550	A variable now returns the correct value when the regional setting of the device is set to the Brazilian metric system.
6448	00604893	A bot no longer encounters an error when the system cannot finish pre-processing the bot due to an ignite cache issue.
6448	00578277	An error is no longer encountered when the Connect and Disconnect actions of the SAP package are used in a loop and the iteration is set to more than 500 times.
6448	00635890	The Bot Scanner now scans all the bots in a repository and displays the correct count of child bots.
6448	00634238	You can now use the form builder in Internet Explorer (version 11 or later) to add more items to the Checkbox and Radio Button elements without encountering any issues.
6448	--	For the Select file element, you can now upload a file with a dot (.) in the filename. For example, <code>Sales.March.jpg</code> .

Fixed features		
Build number	Service Cloud case ID	Description
6448	--	Software version notification for Cloud was not always displayed in the UI. This issue is now fixed.
6448	00633793	You can run a bot when the operational parameter is used in the SOAP Web Service action. Previously, the bot encountered errors when the operational parameter was used in the action and the corresponding <code>wsdl</code> file did not have the <code>elementFormDefault</code> attribute.
6448	00630975	Captured images in a nested If action are now retained when you check in a bot to the public repository. Previously, when using any action that used an image in a nested If action, the image nested was missing after the check-in.
6448	00630004	When loop is used to read all Unread emails, the emails are now marked as Read only after emails are read. Previously, all unread emails were marked as read when a Loop Break action was used.
6448	00612913	In Excel Advanced > Remove blank rows , when you select the Specific row option and set A1 as the beginning cell, an error is no longer encountered when you run the bot.
6448	00608265	In the CSV/TXT package, when you use Japanese OS ANSI (Shift-JIS) as encoding to read text file content, the Japanese Shift-JIS characters are now displayed correctly.
6448	00568718	Japanese language supported pop-up messages no longer appear truncated when multiple bots are deleted.
6448	00598023, 00611480	In the DLL package, Run function now works properly and does not display an error or show broken characters when the parameter includes Japanese characters.
6448	00638120	When you upgrade from an earlier version of Enterprise A2019 to a later version and change the If package version to the latest one, multiple conditions now appear in If/Else If after the If package is upgraded. Previously, some of the conditions did not show in the logic.

Fixed features		
Build number	Service Cloud case ID	Description
6448	00632228, 00649606	You can now use the Send Email action when the package version is different in the task and subtask. Previously, the Send Email action in the Email package had issues when the task and subtask had a different package version.
6448	00544219, 00635206	The Get cell action in Excel Advanced can now be used without any error. You can use the Read option to read visible data or the exact value of the cell.
6448	00646254, 00650712, 00653137, 00658122, 00666883	You can now change the package version of the If package. Previously, if there were multiple conditions in the If action, the system did not allow you to change the package version.
6448	00613453	Version 11.3 bots that used the Object Cloning command to find interface objects using coordinates or image recognition are now migrated to Enterprise A2019 with the Mouse > Click action, Simulate keystrokes action, OCR > Capture area action, or Image recognition > Find window in window action.
6448	--	When you run migrated bots that perform mathematical operations on values containing decimals or commas, the output from Enterprise A2019 now matches the output from Version 11.3.5. Previously, an operation that resulted in an output of 0.999 in Version 11.3 resulted in an output of 0.9899999 in Enterprise A2019.
6448	00467664	Fixed an issue where the Universal Recorder entered characters in a text box incorrectly when the user configured the Keystrokes field using a Japanese keyboard.
6448	00630545, 00631418, 00621875	You can now assign input values from a parent bot in the Task Bot > Run action. Previously, an issue caused input values to disappear when a bot containing more than two input values was saved.
6448	--	The Workload In progress activity page now displays the Workload bot name instead of the automation name.

Fixed features		
Build number	Service Cloud case ID	Description
6448	00635306	Fixed an issue where a red error screen appeared if a bot attempted to pass a file variable to another bot.
6448	00635326	You can now run bots built using Recorder package versions from earlier builds.
6448	00616261	You can now pass credential values to the main bot when you deploy it from the Run bot now page.
6448	00647135, 00647652, 00647665, 00647144, 00648742, 00646535, 00648883, 00648980, 00654937, 00657039, 00664049, 00663797, 00664138, 00667384	When you upgrade to the latest version of Enterprise A2019, bots in queued state now run without any issues because a new token is automatically generated when an existing session expires.
6448	00611109	Fixed an issue where the <code>\$System:CPUUsage\$</code> system variable returned an inaccurate value.
6448	00647239	In the Data Table package, when you use the Merge action to merge two data tables, the data is now properly merged and the merged content stores the correct data in the result data table. Previously, the Merge action had issues when no header data in a table was extracted, resulting in incorrect data export to CSV file.
6448	00444907, 00556374, 00582469, 00628801, 00624681, 00632668	A bot launcher error for a user session is no longer displayed when you run a bot on a Bot Agent device registered to a user who is assigned developer privileges.

Security fixes	
Service Cloud case ID	Description
00552076	The vulnerabilities found in Elasticsearch in Enterprise A2019 are now addressed.
00631233	In the Database package, when you connect to the database, the username and password are no longer visible in the logs.

Known limitations
<p>When you are upgrading from an earlier version of Enterprise A2019 to the current version, the system displays the error message <code>Self Sign Certificate Failure</code>, and the installation process is rolled back if both the following conditions occur:</p> <ol style="list-style-type: none"> <li data-bbox="329 365 1417 491">1. The earlier version was installed on a non-default installation path instead of the default path (C:\Program Files\Automation Anywhere\Enterprise). For example, the previous version was installed on D:\Program Files\Automation Anywhere\Enterprise. <li data-bbox="329 506 1417 600">2. You also select Yes to retain the current installation parameters during upgrade in the message window that appears after the Welcome screen when the installation wizard detects an earlier version. <p>Workaround: Select No so that you can choose to enter the installation parameters during the upgrade.</p> <p>Control Room upgrade fails with self signed certificate failure error (A-People login required)</p>
<p>Service Cloud case ID: 00672719, 00673048</p> <p>When you are upgrading the Control Room to the current version, the installer uses an existing or creates a new Elasticsearch data folder in the default path (C:\ProgramData\AutomationAnywhere\elasticsearch\data) if the Elasticsearch data from the earlier version is saved to a non-default path. Therefore, the earlier Elasticsearch data and audit logs will not be available after the upgrade.</p> <p>Workaround: Before upgrading to the current version, copy the existing Elasticsearch data from the non-default path to the default path.</p>
<p>When an Automation Anywhere package is manually uploaded using the Control Room interface, the Vendor column should show Automation Anywhere. Instead, the interface displays <code>Unspecified</code>. Automation Anywhere packages that are installed on a server as a part of an upgrade show the Vendor as Automation Anywhere, which is expected.</p>
<p>For existing device sessions, you cannot use the option to enforce the resolution set at either the device or Control Room level. The screen resolution set at these levels only work for new device sessions.</p>
<p>When attended and unattended Bot Runners are run concurrently, attended Bot Runner users are queued until the unattended Bot Runner session becomes available. This occurs even when the number of allowed concurrent sessions is not exceeded. For an attended Bot Runner user deployment, use a single user session to stop them from being queued.</p>
<p>When a user connects to a multi-user device and sets it as their default device, they are taken through the device registration wizard to enable the Google Chrome plug-in. During the registration process, users are allowed to select the device type and the concurrent sessions value. Users must ensure that they set the same value for the concurrent sessions as set by the administrator. If there is a difference in the value, other users will be impacted.</p>

Known limitations
<p>When a bot is deployed through RDP with a predefined screen resolution, the RDP resolution settings are not applied correctly during bot execution. The bot is executed with an interchanged resolution (the height and width pixels are interchanged). For example, if the resolution for bot deployment is set as 1366x768, the bot is deployed with the resolution 768x1366.</p> <p>Workaround: For information about how to resolve this issue, see Automation 360 v.16 - RDP based deployment does not run bot with pre-defined set screen resolution (A-People login required).</p>
<p>The element label or text appears distorted during bot runtime when you add it in Japanese or any other non-English language, and the Font name is set to System default.</p>
<p>Service Cloud case ID: 00667210</p> <p>In Excel advanced, you cannot use the Go to cell action if the Excel sheet does not have data or if an active cell is out of the worksheet range. This issue is encountered when you use the Go to cell action and choose the cell option as Active cell with the Beginning of the row, End of the row, Beginning of the column or End of the column option.</p> <p>Workaround: Use the earlier version of the Excel advanced package 4.0.0-20200723-234413 released with Enterprise A2019.15.</p>
<p>HTTP authenticated proxy is not supported for On-Premises users.</p>

Discovery Bot

New features
<p>Discovery Bot installer integrated with Enterprise A2019 installer</p> <p>Enterprise A2019</p> <p>The Discovery Bot installer is now integrated with the Enterprise A2019 installer. No separate installation is required for Discovery Bot On-Premises users. Discovery Bot supports custom installation for Windows.</p> <p>Prerequisites for Discovery Bot on page 3695</p>
<p>Create multi-role users</p> <p>Enterprise A2019</p> <p>Combine up to three Discovery Bot system-generated roles and two process discovery licenses to provide additional functionality for your users.</p> <p>Create multi-role users for Discovery Bot on page 3699</p>

New features
<p>Create custom role user</p> <p>Enterprise A2019</p> <p>Create a unique custom role using the permissions from the Discovery Bot standard user roles (Admin, Business user, or Analyst roles).</p> <p>Create a custom role for Discovery Bot on page 3701</p>
<p>Manual aggregated view integrated with Dashboard tab</p> <p>Enterprise A2019</p> <p>The Manual aggregated view is now integrated with the Dashboard tab. You can now select and display recordings and views from the Dashboard, Aggregated, and Comparison tabs, enabling you to make a change in one tab that will persist across all tabs. This feature enables a synchronized representation of your metadata for views and recordings.</p>
<p>Internalization, localization, and language support for Discovery Bot</p> <p>Enterprise A2019</p> <p>Internalization and localization is now supported for Discovery Bot. For example, you can automate and translate the UI for your region in French, Spanish, and Italian, among other languages supported.</p> <p>Internationalization, localization, and language support on page 1158</p>

Fixed features	
Service Cloud case ID	Description
--	You can now sort on the recording ID. The recent recording (ID) created now displays at the beginning of the list in the Recordings table.
--	When editing the aggregated view, you can now move the endpoint upward in the path flow to change the selection of the steps. You can also move the branch endpoint lower in the path flow to include more than one step.
--	You can now select partial steps in a branch, and create and save an opportunity from the Opportunities tab.
--	The copy field now displays the correct view information from the view (view ID) that it is copied from.
00673381	If you are using an instance in an AWS special region, you can now view recordings for users that are successfully completed (not canceled by the user).

Known limitations
<p>When manually editing an aggregated view, if you create a branch in the process flow where a step was deleted, the step will be missing on the left side of the branch. To add a step on the left side, you can drag the branch endpoint (small circle) down (below the next step) in the process flow to add a step back in the branch.</p> <p>Missing step observed in aggregated view while using A2019.16 Discovery Bot (A-People login required)</p>
<p>When an opportunity is created with 300+ steps, exporting the opportunity to Microsoft Word will fail.</p>
<p>The Convert to Bot option fails when an opportunity contains 140 or more steps.</p>

IQ Bot Community Edition

The IQ Bot Community Edition is available for this release and has feature parity with IQ Bot Version 11.3.4.2.

[Automation 360 IQ Bot feature comparison matrix](#) on page 952

[Automation 360 IQ Bot version compatibility](#) on page 957

Important: This new Community Edition includes a preview of IQ Bot with Auto-extraction.

Community Edition for IQ Bot is a special version of our product in the Cloud, available for all users who want to try RPA and IQ Bot at no cost. Users are not required to purchase a license, and there are no time limitations. However, there are some functionality constraints as follows:

- Users can create learning instances using pre-trained Invoices in English only.
- Users can create up to a maximum of 5 learning instances per user account.
- In the Learning Instance list, users can see and access only those learning instances and data created by them.
- Users can process up to a 100 pages per month for each user account.

[Community Edition](#) on page 3533

New features (using auto-extraction)
<p>Create a learning instance</p> <p>Use a pre-trained invoice (document type) to process and validate your documents in English (only).</p> <p>Create a learning instance in Community Edition on page 3534</p>
<p>Extract data from documents</p> <p>Create a bot to extract data from documents using the learning instance you created.</p>
<p>Validate documents</p> <p>Validate failed documents manually using the validator form.</p> <p>Process documents in Community Edition on page 3537</p>

New features (using auto-extraction)
<p>Bot Insight integration</p> <p>View learning instance dashboard metrics that is integrated with Bot Insight.</p>
<p>Use the IQ Bot (Preview) package</p> <p>Use the IQ Bot (Preview) package to process and validate documents using Enterprise A2019.</p>

Changed features
<p>For the Custom Logic feature, the identified list of Python libraries now includes an additional set of safe libraries for IQ Bot Community Edition. Go to Automation Anywhere support for a list of the safe libraries you can use.</p> <p>List of Pandas Libraries which are supported and not supported on Automation 360 IQ Bot (A-People login required)</p>

Fixed features (using Auto-extraction)	
Service Cloud case ID	Description
00628958	The Task Bot now successfully processes all documents without displaying any error messages.

Known limitations (using Auto-extraction)
<p>PDF documents with raster format or JBIG2 encoding are not supported.</p> <p>Workaround: Convert such documents to one of the supported formats before processing your documents for data extraction.</p> <hr/> <p>Note: Digital PDFs, JPEG, JPG, and PNG are supported formats.</p> <hr/>
<p>Rotated documents are not supported.</p> <p>Workaround: Pre-process such documents to correct their orientation before data extraction.</p>
<p>Only a predefined set of form and table fields are supported. The table header does not support multiple fields in a single column.</p>
<p>During the validation process, if a user deletes all rows from a table, the user is unable to add a new row.</p> <p>Workaround: Perform these steps:</p> <ol style="list-style-type: none"> 1. Cancel the validation user form and open the document again. 2. Create a new row before deleting the unwanted rows.

Known limitations (using Auto-extraction)
<p>Documents that are pending review from Enterprise A2019.15 cannot be validated in Enterprise A2019.16 using the Review documents option.</p> <p>Workaround: Create a Task Bot using the IQ Bot Validation action in the Enterprise A2019.15 package, and validate the review pending documents.</p>

IQ Bot

New features
<p>Updates to IQ Bot Pre-processor package</p> <p>On-Premises and Cloud</p> <p>You can now perform the following tasks using the new actions in the IQ Bot package:</p> <ul style="list-style-type: none"> • Link or combine two images using Concatenate image • Adjust the size of the selected image file using Edit image • Enhance the image resolution and other aspects using Enhance image • Change the image orientation such as angle using Orient image <p>IQ Bot Pre-processor package on page 2636</p>
<p>IQ Bot [Local Device] package enhancements</p> <p>The IQ Bot [Local Device] package now enables you to add custom logic (Python scripts) in the Designer to extend text extraction and validation capabilities.</p> <p>Add custom logic in IQ Bot to improve extraction</p>

Fixed features	
Service Cloud case ID	Description
00590165	You can now train the selected document because error messages are no longer displayed when you click Learning instances > See extractions for a group.
--	If you remove a bot (Delete a bot) associated with a document from the staging environment, you must create a group before uploading this document to the production environment. After deleting the bot from the staging environment, you can now create or edit the group when you upload the same document to the production environment.
00601840	You can now view a public bot without any errors when you click BOTS > My bots > PUBLIC in Enterprise A2019.
00672482	You can now validate documents with a large number of fields (more than 100) and navigate between multiple documents without any issues on the .

Fixed features	
Service Cloud case ID	Description
00648013, 00670191	You can now migrate, export, import, or download IQ Bot learning instance backup (.iqba) files of up to 1.4 GB. The previous limit was 600 MB.

Known limitations	
Migration of learning instances does not get completed if the IQBA file size is more than 2 GB. Workaround: Migration of learning instance is not getting completed if the IQBA is more than 2GB (A-People login required)	
In the IQ Bot Designer, sometimes while training documents when the user clicks See extraction results , an error message appears and the user cannot proceed with the task.	
You cannot access Cloud OCR through a proxy server in IQ Bot.	
In IQ Bot Community Edition, when you click New instance to create a learning instance, the My learning instances page appears and then automatically reloads after a few seconds. Workaround: Wait until the page reloads before you start entering the details to create a learning instance.	

Bot Insight

New features	
Power BI connector available as part of Microsoft Power BI desktop Enterprise A2019 and Community Edition The Automation Anywhere connector for Bot Insight is now certified and officially a part of the Microsoft Power BI Desktop August release. Data connector for Power BI on page 3755	
Business analytics support for attended Bot Runners Enterprise A2019 and Community Edition Business analytics data is now logged when bots are run with attended Bot Runners licenses. Also, a new attribute User Name is available in the Business Dashboard in Transaction Data . This attribute shows the user who is running the bot.	

Changed features

Convert bot duration metric to percentage

In the **Device** dashboard, when you select the metric as **Bot Duration**, you have an additional option to convert the bot duration to percentage. This option appears only if a selected group or subgroup is of date type variable.

[Operations dashboard](#) on page 3731

Known limitations

Due to security reasons, you cannot access the following Bot Insight APIs and a 403 forbidden error is displayed.

```
GET/v2/botinsight/data/api/gettasklogdata
GET/v2/botinsight/data/api/gettaskvariableprofile
DELETE/data/api/deletetasklogdata
GET/data/api/getbotrundata
GET/data/api/getaudittraildata
```

Automation Co-Pilot for Business Users (Automation Co-Pilot)

Important: This Automation Co-Pilot version is available for all users starting from Enterprise A2019.16.

New features

Assign tasks

Enterprise A2019

Automation Co-Pilot managers and users can now assign tasks. Managers can assign and reassign tasks to any users from teams with an assigned process. Users can assign tasks to other users of the same team.

[Assign or unassign a task](#) on page 3270

Filter and search tasks

Enterprise A2019

Automation Co-Pilot users can now perform the following tasks:

- Filter, sort, and search tasks for quick results
- Search task names using **Search Title**
- Sort by completed, pending, and unassigned tasks using the **Filter** option
- Configure results based on assignee or title using **Advanced filter**
- Click a column to sort by ascending or descending orders

[Filter and search for a task](#) on page 3273.

New features
<p>Summarized information of tasks</p> <p>Enterprise A2019</p> <p>The Tasks tab in the main page shows statistical insight for the numbers of completed, pending, and unassigned tasks.</p>
<p>Process package</p> <p>Enterprise A2019</p> <p>The Process package enables users to create a request inside a specified process from a bot.</p> <p>Process package on page 2786</p>
<p>Preview bot</p> <p>Enterprise A2019</p> <p>Human Tasks and Bot Tasks now include the Preview bot option, which enables users to quickly preview relevant bot or forms information.</p>
<p>Process editor metadata</p> <p>Enterprise A2019</p> <p>Human Tasks and Bot Tasks now accept username and email metadata. Users can enter the name and email values to their process workflow such as <code>\$Task.assignedTo{username}\$</code> and <code>\$Task.assignedTo{email}\$</code>.</p>
<p>Enhancements to roles</p> <p>Enterprise A2019</p> <p>The Automation Co-Pilot admin can now assign a process to a team they created and become the manager assigned to that process. The admin can also assign a process to a team they did not create and the manager of that team is assigned to the process.</p>
<p>Administration permission</p> <p>Enterprise A2019</p> <p>The Automation Co-Pilot admin and manager are now assigned a new Administration permission by default called View Users and Roles basic information. The admin can now view the process management page to assign or unassign managers.</p>

Changed features
<p>Process management page</p> <p>The process management page in Automation Co-Pilot on the web is now removed for managers.</p>
<p>Password field in request view</p> <p>The Password element is now removed when viewed in the request tab.</p>

Fixed features	
Service Cloud case ID	Description
--	A team name is no longer limited to 20 characters.
--	When you open many request tabs, the navigation bar now functions properly and allows you to navigate to your tabs by using the arrow icon.
--	When you view tasks in the request view, the request and task now show the correct status.
--	The manager can now be removed in the process management page.
--	The bot status in the request view is now represented as a progress bar.
--	The Element name field in the process editor now shows the correct error message when the field contains spaces.
--	When you select the Make field uneditable option for the Checkbox, Date, Dropdown, Number, Password, Radio Button, Text Area, and Text Box elements, the values can no longer be edited.
--	The team management page now shows the Owner column.
--	When number values are entered in a number field, such as a phone number box, the values are now accepted.
--	In the device pool configuration page, the Bot Runner users check box is now selected.
--	The Checkbox and Radio Button elements now support horizontal format.
--	The Document element can now access the Open the doc in browser link.
--	The Number element values are no longer limited to 8 characters and can now be rendered properly when the values contain trailing zeroes, commas, and decimals.
--	When you select the Insert a variable option in the process editor, the Variable field now shows specific variable names.
--	The redo functions now works properly in the process editor.
--	The Text Box element now accepts number-only inputs.
--	The timestamp of the closing step now shows the timestamp of the last step in request view.
--	When you access a public process, the existing variable in the field can no longer be changed.

Fixed features	
Service Cloud case ID	Description
--	The Masked data option is now fully supported for all elements.
--	When you edit a checked-out process that contains conditional steps with variables, you can now edit and save these conditional steps.
--	When a process is configured with two forms that contain a Dropdown element, the process creation shares the Dropdown element data between the forms. The Dropdown element in the second form now receives data from the first form.
--	The manager can now access their team without encountering any errors.
--	You can now update values in a prepopulated text field in request view.
--	When you create a request and encounter a preprocessing error, the request creation ends and the request view now shows the failed status.
--	The Go To option in the process editor now shows the Human Task or Bot Task name.
--	Users with the Automation Co-Pilot manager and user roles are now automatically redirected to the web interface when they access the Control Room URL.

Known limitations
When you provide your Bot Task and Human Task the same element name, an error occurs for the Go to element, but the process editor does not prompt an error. Workaround: Create unique element names for your Bot Task and Human Task .
When you create a form that contains a Document element and access your Human Task in the process editor, you cannot assign your variable because the Add element option is not available.
The Display message field in the If/Else pair action does not function correctly when displaying a message in request view.
The titles (Title field) of completed requests in Automation Co-Pilot on the web are replaced by endpoint display names.
When you create a form that contains a Number field set to a 10-character limit and you enter 1234567890 in the number field in request view, the number values are not accepted.
When you create a process with a form that contains a Date element, the Condition option in the If/Else pair action does not allow you to enter a variable.

Enterprise A2019.15 Release Notes

Release date: 14 August 2020

Review the new features, supported packages, changed features, fixed features, security fixes, and known limitations in the Enterprise A2019.15 (Build 5933) release. IQ Bot and Discovery Bot are on Build 5931.

- [Enterprise A2019](#) on page 621

Changed features
<p>User validation for change in authentication type (Service Cloud case ID: 00602788)</p> <p>Enterprise A2019</p> <p>The username is now validated when an admin user updates the Control Room authentication configuration from Database to SAML (Administration > Settings > User Authentication). An error message appears if the username already exists.</p> <p>Set up SAML authentication on page 1330</p>
<p>The Before and After fields in the String > Extract action are now optional (Service Cloud case ID: 00617151)</p> <p>Enterprise A2019 and Community Edition</p> <p>Users can now build and run bots that do not have a value in the Before or After fields. This ensures migrated bots that contain the String > Extract action can run without disruption.</p>
<p>Improved debugging for Image Recognition actions</p> <p>Enterprise A2019 and Community Edition</p> <p>When a bot fails while running one of the Image Recognition actions, the captured source and target images are stored in the log folder. Users can review the images to identify issues such as the application image not captured correctly or low quality of the image due to differences in the Bot Creator and Bot Runner devices.</p> <p>Image Recognition package on page 2626</p>

Fixed features	
Service Cloud case ID	Description
00609293	The AATaskName system variable now uses a backslash (\) to support the migration of Enterprise 11 bots that use this variable to Enterprise A2019.
00600367, 00620149	When calling REST APIs for using the REST Web Service command, the API now returns the correct status and the response code.
--	When Work Items are processed for automation in the Bot Agent, you can now view the workload automation name in the Workload > Queue > View Activity in progress and Run bot with queue > View pages, even when the workload automation ID and schedule automation ID are the same in the Control Room database.
00606636	The migration of 11.3.x bots that read a date from a file to an Enterprise A2019 variable now results in the correct date format: dd/mm/yyyy. Previously, a series of numbers were displayed in Enterprise A2019.
00576004	Fixed an issue where some emails were retrieved with HTML tags, even when the user selected the Plain text option.

Fixed features	
Service Cloud case ID	Description
00585830	Fixed an issue where the Loop > For each meeting in calendar iterator only returned details for the first meeting of the day. Now, the output variable refreshes after each iteration and returns details for each meeting.
00505228, 00576757	When the browser language is set to Japanese, error messages from the Control Room > Administration > Settings > Email page are now displayed correctly. The distorted Japanese character issue is now fixed.
--	You can now check in any forms or bots in the Public folder that were created using any of the earlier versions of Enterprise A2019.
--	You can now use the Get action without any errors for an empty dynamic element of a form during bot runtime.
00575400, 00597633	You can now use Email trigger to start a bot even when Microsoft Office is set to a non-English language.
--	If you are using the Snapshot element, the form is no longer minimized even if you set an invalid file path to save the snapshot during bot runtime.
00566225	If you add a form with a Japanese name, error messages are not displayed during bot runtime.
00571773	If you have added element label or text in Japanese and set Font name > System default , the form elements are now displayed without any distortion during bot runtime. Create a form
00620911	For the Select file element in a form, the file path is now displayed correctly when you select a file with a Japanese name during bot runtime.
--	If a form has a Dynamic field, any errors within any of the available elements are now displayed immediately during bot runtime.
--	An error is now displayed if you use the Tab key to navigate out of the Dropdown element in a form during bot runtime.
00616251	If a Bot Runner (attended or unattended) user is running a bot and an event trigger that is associated with this user starts, the event trigger is now queued and deployed after the current bot has completed.
00557617	The Simulate keystrokes action now supports ASCII characters when the device language is set to Russian.
--	Installing cloud-based license files is now supported on Control Room deployments using Linux CentOS 7.

Fixed features	
Service Cloud case ID	Description
00615038	All packages and actions now work with the “Portuguese (Brazil)” browser language. Previously, some packages and actions caused an unresponsive Control Room when “Portuguese (Brazil)” was selected as the browser language.
--	You can now reset the password successfully when the service credential expires or is disabled. Previously, users intermittently experienced issues while resetting the password.
--	The default logging for Bot Agent is no longer in debug mode. Previously, debug mode was the default logging, which caused an increase in the number of logs and resulted in high storage space and decreased system performance.
00588077	If you create a copy or edit the content of an existing CSV file, the modified content that is uploaded in the Control Room will now display correctly and will not cause any run-time error when the bot is executed.
00541524,00531540	You can now run bots even when the path of the bot location is more than 255 characters. Previously, the bot failed with an error.
00615106	The Bot Scanner now analyzes large bots within a few minutes.
00610366	Keyboard shortcuts such as Ctrl+C, Ctrl+V, and Ctrl+X work as expected on Internet Explorer.
00577850, 00608065, 00597132, 00596397, 00619463	The Control Room now does not become unresponsive after a period of inactivity.
00608824	An error is no longer encountered when a bot opens the Excel application after it is forcefully terminated.
00542144	The wait option in various packages now works as expected for applications based on HTML technology. Previously, the wait option used to wait for a period in multiples of 15 seconds based on the value provided. For example, if the wait value was in the range of 1-14, the system waited for 15 seconds.
00508478, 00504802, 00569822	An error is no longer encountered when a bot is running and an application window is closed when the bot is performing the find window operation.
00494857	A user that does not have the Register device permission can no longer register a device by creating a custom Bot Creator role.

Fixed features	
Service Cloud case ID	Description
00501619, 00614130, 00620198	An error is no longer encountered when a user deletes a device after upgrading to a later version of Enterprise A2019.
00616786	Fixed an issue where periodic scheduled bot deployments failed with the following error message (even though the credentials provided by the bot is correct): Either your username or your password is incorrect. This might be due to a misspelling, your Caps Lock might be on, the password might have expired, or the domain might be required. To continue, retype your username and password.
00494893	Fixed an issue where the Error handling > Catch action was not handling a runtime error with the record variable. Previously, the Catch action did not capture an index out of bounds error when the record variable was entered in a Message box action with the index specified by name.
--	The Get Property datetime format within the Active Directory package now displays the information using the system datetime format.
--	When you edit a bot using a previous package version (for example, Enterprise A2019.13 version) and the Desktop session automatically starts, if you exit the Bot editor while the Desktop session is trying to launch, the current package version will now be displayed when you open a new Bot editor instance. Previously, the previous package version (for example, Enterprise A2019.13 version) was displayed.
00563346	Credentials with non-ASCII characters are now allowed to be stored in the Credential Vault in the Control Room. Therefore, when you run Task Bots to open files that are protected using passwords containing non-ASCII characters, the application does not respond with an HTTP 500 error.
00525552, 00470841	The Run task no longer fails when the child bot name contains allowed special characters. Previously, when the child bot name contained allowed special characters, the run task displayed an error message.
00501212	Fixed an issue in the SMTP settings where the Control Room was sending notification emails for all of the conditions, including the disabled conditions.

Fixed features	
Service Cloud case ID	Description
00607005	A security scan of Enterprise A2019 no longer reports the Recorder package as a malicious software. Previously, the security scan reported it as a malicious software because the <code>check.exe</code> file was missing the root identification certificate.
00564129	On an operating system configured for Japanese, the Roles pages in the Control Room now shows English text as expected when you select English in the Control Room language selection.
00629523	When you upgrade from an earlier version of Enterprise A2019 to a later version and change the If package version to the latest one, conditions combined with the AND or OR condition now appear in the logic. Previously, except for the first condition, the rest of the conditions with the AND or OR condition were not shown.
00631477	When Work Items from multiple queues are processed for Workload automation from one device pool with the round-robin method for a time slice of 5 minutes, the Workload automation does not run in a loop and thereby causing an increased CPU usage.
00633829	As system admin permissions for Workload automation are verified by the application when you run a bot with queue from a single device pool to process multiple Work Items concurrently, CPU usage does not increase drastically.
00615086	Fixed an issue where the Java Application Launcher continued to run after a user stopped the Bot Scanner, which caused device performance issues for some users.
--	Variables of the List type are now available for migration from Enterprise 10 and Enterprise 11 to Enterprise A2019.
00607949	Disabled packages will not be enabled when you upgrade from an earlier version of Enterprise A2019 to a later version. Previously, packages that were disabled were enabled after an upgrade.
--	You can now debug a bot with watch variables that contain Japanese characters. Previously, watch variables containing Japanese characters did not output a value.
00623186, 00624876, 00624060, 00627123, 00629873, 00639523, 00630880, 00634577, 00636166	The correct status of a deployed bot now appears instead of <code>Device yet to be determined</code> in the Control Room Activity page, and the user is allowed to delete the device that has completed running a bot. The following message no longer appears: <code>Device is part of active deployment.</code>

Fixed features	
Service Cloud case ID	Description
00573461	Fixed an issue where a bot was failing in preprocessing mode if the user had inserted and then disabled the Error Handler > Catch action without also disabling the Finally or Catch actions.
00629046	In the Database package, when you use Microsoft Excel as a database, the bot launcher now executes properly. Previously, the bot launcher stopped working when reading data from an Excel sheet that had some empty rows.

Security fixes	
Service Cloud case ID	Description
00491697	The Transport Layer Security (TLS) protocol using CBC mode of encryption for configuring the network security of the Control Room is now secured from man-in-the-middle or cyrstallographic timing attack.

Known limitations
When you add a form with the Dynamic element to a bot, click Add element , select Dropdown or Radio group as the Type , and leave the Default value/ Default path field blank, the elements appear as labels during bot runtime.
You can move a form around by dragging the title bar during bot runtime.
When you copy and paste the filepath for the Select file element of a form during bot runtime, invalid characters are displayed.
When the Set focus action is assigned to a disabled form element, an error icon is displayed when the focus is lost during bot runtime.
When you enable any of the disabled fields during bot runtime, error icons are not displayed.
Error messages during bot runtime are not displayed in the language selected in the Control Room.
If email trigger is used to start a bot, the status of the most recent email that you have viewed is changed to Unread every time any bot is triggered based on the trigger interval set in the Check every drop-down menu.
In an Control Room configured for Active Directory users, the following message appears after the first admin user is created: <code>Do you want to leave this page?</code> Workaround: Click Stay on page so that you can go to the Control Room login page.
If the device is already registered by a user other than the Bot Creator and the Bot Creator has the Register device permission, then when you run a bot from the Bot editor window, the deployment fails at the <code>Connecting your computer to Enterprise Control Room</code> step.

Known limitations
The migration process does not migrate manual dependency files added in the Enterprise 11 Control Room using the API. Bots associated with these dependencies will be migrated successfully but will fail during execution because the system cannot find these dynamically added dependency files at runtime in Enterprise A2019.
When a bot execution is in progress and the Control Room server refreshes, the progress status of the In-Progress activity will not be displayed even though the bot execution continues without interruption.

Discovery Bot

Introduction

Discovery Bot enables process automation by capturing document processes, identifying automation opportunities from business processes, and prioritizing opportunities based on ROI. Users can convert these opportunities into automated processes.

[Process discovery by using Discovery Bot](#) on page 3687

Known limitations
<p>Discovery Bot is not supported in high availability (HA) mode. When two Control Room instances are used in a cluster configuration, the recording artifacts are split between the two Control Room instances and the recording might fail to process.</p> <p>Workaround: To enable Discovery Bot in HA mode, you must update the <code>processdiscovery.properties</code> file to point to the repository path specified in the Control Room:</p> <ol style="list-style-type: none"> 1. From the Control Room, go to Administration > Settings > General. 2. Select the Control Room Database and Software tab. 3. Scroll to the Control Room Repository section. 4. Copy the path specified in the Repository path field. 5. Go to <code>C:\Program Files\Automation Anywhere\Enterprise\config</code>. 6. Open the <code>processdiscovery.properties</code> file. 7. In the <code>processdiscovery.data.staging</code> path, paste the repository path in the <code><yournetworkshareddrive></code> here: <code>\\<yournetworkshareddrive>\Processdiscovery\staging\data</code> 8. Restart the Discovery Bot service.
When HTTP proxy is installed in a cloud environment, you can use the Discovery Bot recorder to record processes.
Custom role setup for Discovery Bot is currently not supported.

Known limitations
The Discovery Bot recorder continues to record your steps even after you have logged out of the Control Room.
Note: Manually stop the recorder to end the recording session.
The Discovery Bot recorder displays an internal error message when accessing Google Apps. Pause the recording and then resume the recording again to recapture the steps.
The recent recording (ID) created is displayed at the end of the list in the Recordings table. You cannot sort on the recording ID at this time.
The recording count for a process is incremented by one even if a user stops or cancels a recording session. The incremented number is displayed in the Recordings section in the tile for a process.
By default, you cannot move the endpoint in an upward direction in the path flow to change the selection of the steps. You can move the branch endpoint lower in the path flow to include more than one step.
You must add at least one step to a branch for you to select the branch and create an opportunity.
You must select all steps in a branch to create an opportunity. Selecting partial steps in a branch will result in branch being dropped in the opportunity that is displayed from the Opportunities tab.
Currently, the copy of field does not display the correct view information from the view (view ID) that it is copied from.
If the Control Room is not installed in the C:\ drive (C:\Program Files\Automation \Enterprise), the Discovery Bot installer fails to install correctly. If the Control Room is not installed in the C:\ drive, then perform the instructions provided in this article: A2019.15 Discovery Bot installation issue with non-OS drive (A-People login required) .
The Export to Word option supports a maximum of 500 steps.
The Convert to Bot option supports a maximum of 500 steps.

Changed features
.

IQ Bot

Review the compatibility of the IQ Bot On-Premises version with the corresponding Control Room On-Premises version.

[Automation 360 IQ Bot version compatibility](#) on page 957

For feature information about IQ Bot, see [Automation 360 IQ Bot feature comparison matrix](#) on page 952.

The IQ Bot Cloud version provides users with automatic provisioning for up to three environments such as Development, Test, and Production.

Note: IQ Bot Build 5931 is compatible with Enterprise A2019 Build 5933.

New features
<p>New IQ Bot Pre-processor package</p> <p>On-Premises and Cloud</p> <p>The following new actions are available as part of the IQ Bot package:</p> <ul style="list-style-type: none"> • Convert image to PDF • Get barcodes • Get document info • Get page content <p>IQ Bot Pre-processor package on page 2636</p>
<p>Search by filename in Validator</p> <p>On-Premises and Cloud (Service Cloud case ID: 00372981)</p> <p>Use the Search by filename field in the Validator screen to search a document in IQ Bot.</p> <p>IQ bot Validator enhancements</p>
<p>IQ Bot [Local Device] package (currently available on request only)</p> <p>On-Premises and Cloud</p>
<p>Important: Contact your Automation Anywhere representative to request the On-Premises package. For Cloud, it is available as a pre-installed package.</p>
<p>Use the IQ Bot [Local Device] > Process documents action to process documents using Task Bots created in the Control Room. You can scale by processing documents on multiple devices simultaneously without setting up a separate IQ Bot cluster. You can set this up using workload management in the Control Room.</p> <p>Workload management on page 1931</p> <p>The validation is done using the current IQ Bot Validator and usage metrics on the dashboards, which is available with the installed IQ Bot server.</p>
<p>Note: You can create validators using interactive forms if they do not want to send data to the IQ Bot server.</p>
<p>IQ Bot [Local Device] package (Archived PDF)</p>

New features	
<p>Document Classifier package (currently available on request only)</p> <p>On-Premises and Cloud</p> <p>The Document Classifier package enables you to group documents into appropriate learning instances for content extraction.</p> <p>This package is not available as part of the standard IQ Bot installation.</p> <hr/> <p>Important: Contact your Automation Anywhere representative to request the package.</p> <hr/> <p>Document Classifier package on page 2420</p>	
<p>Migrate learning instances using Migration Utility</p> <p>On-Premises and Cloud</p> <p>Use the Migration Utility feature to migrate learning instances from one environment to another. Additionally, you can back up, restore, download, delete, and upload learning instances.</p> <p>Migrate learning instances on page 1664</p>	
<p>Control creation of groups</p> <p>On-Premises and Cloud</p> <p>Use the New groups creation setting section in the Learning Instance > Edit page to limit creating groups when uploading training documents to IQ Bot. Use the Threshold to create new groups value and Never create new groups check box to define the parameters.</p> <p>Bots</p>	

Changed features	
<p>For the Custom Logic feature, the identified list of Python libraries now includes an additional set of trusted libraries for IQ Bot On-Premises and Cloud. Go to Automation Anywhere support for a list of the safe libraries you can use.</p> <p>List of Pandas Libraries which are supported and not supported on Automation 360 IQ Bot (A-People login required)</p>	

Fixed features	
Service Cloud case ID	Description
00376179	The Automation Anywhere Cognitive Project is now created without any errors even when you use the IQ Bot batch files to install or uninstall IQ Bot.
00560185	The Download Document in IQ Bot now runs without any errors, irrespective of the language in which the learning instances are saved.

Fixed features	
Service Cloud case ID	Description
00574815	You can now use the Google Vision API engine to classify the selected PDF files without creating any unclassified groups.
--	Documents are now classified correctly by the Google Vision API, irrespective of the display limitations set. Previously, an incorrect resolution limitation created unclassified documents.
--	You can now use Internet Explorer to save a document or mark it as invalid in the learning instances validator screen, without any error messages.
00620237, 00623175	After logging in to the Control Room as an IQ Bot administrator, the IQ Bot tab is no longer displayed in the navigation bar.
--	The <code>Output.csv</code> file generated for a validated document and validated data are now displayed without any error messages.
00605607	When you click Save current document in the validator screen, the document is saved without any errors and the corresponding <code>.csv</code> file is created in the output folder.
--	IQ Bot deletes learning instances from Community Edition if they have not had activity in 60 days.

Known limitations
<p>IQ Bot On-Premises and Cloud</p> <p>When you click the Save and go to next group option, the available groups or the learning instances are sometimes not displayed.</p>
<p>IQ Bot On-Premises and Cloud</p> <p>A validation error message along with the corrected field is displayed in the output (<code>.csv</code>) file for documents validated using ValidatorURL.</p>
<p>IQ Bot Cloud (Service Cloud Case ID: 00647700, 00657619, 00656643)</p> <p>The output (<code>.csv</code>) files are not downloaded even when you click Download all documents button, and an error message is displayed.</p> <p>Contact Automation Anywhere support for more information.</p>

Bot Insight

New features	
<p>Date Interval option Enterprise A2019</p> <p>When you create new widgets that support date fields for a group or subgroup, the Date Interval option is enabled with the default option set to Month.</p> <p>Configuring a Line Bar Chart query on page 3752</p>	
<p>New clustered line bar chart widget Enterprise A2019 and Community Edition</p> <p>The Clustered Line Bar Chart widget enables you to view and analyze information about your metrics and attributes. You can provide two metrics and two attributes in your clustered line bar chart. Now when two attributes are selected, a clustered graph grouped by primary and secondary attributes is displayed.</p> <p>Bot Insight visualizations on page 3751</p>	
<p>New Device dashboard in the Operations dashboard Enterprise A2019 and Community Edition</p> <p>The Bot Insight Device dashboard displays various widgets that provide information about the utilization of the machines on which the bots are executed. You can analyze the device utilization and activity history of different Bot Runner machines.</p> <p>Operations dashboard on page 3731</p>	

Fixed features	
Service Cloud case ID	Description
00540647	Dates are now displayed correctly on the dashboard after the data is grouped based on the date. Previously, incorrect dates were shown on the dashboard.

Deprecated feature
The Widget Event Distribution by workbench is removed and will no longer be displayed in the Audit Dashboard .

Automation Co-Pilot for Business Users

Introduction

Automation Co-Pilot for Business Users (Automation Co-Pilot) enables users to design a process workflow to address their business requirements. The processes incorporate human and bot tasks using forms to define parameters and render supported UI elements on the web. When using

Automation Co-Pilot on the web, users create requests to use their created process workflow for process instances (case) and run their tasks.

Automation Co-Pilot is available as a part of the Enterprise A2019 installer. You can view the Automation Co-Pilot components in the **Administration** page.

[Configure roles for Automation Co-Pilot](#)

Important: This Automation Co-Pilot version has limited availability and is available only to sales and internal users.

Known limitations
<p>When you edit a checked-out process that contains conditional steps with variables, you cannot edit and save these conditional steps. The steps will revert any new variables you add.</p> <p>Workaround: Delete and add a new condition.</p>
<p>The If, Else If, and Else actions cannot be placed before another bot logic in your workflow. You can only place these actions at the end of the bot logic.</p> <p>Workaround: Make a clear boundary on the conditional block.</p>
<p>In a process, when you use a date format such as 2020/07/04 in the input_date field in Bot Task, the bot does not accept the date input.</p> <p>Workaround: Create a separate date variable to use an input.</p>
<p>Form elements that are not supported and are deleted by the process editor include: Button, Dynamic, Select File, and Snapshot.</p> <p>Workaround: Instead of using the Button element, add a form action.</p>
<p>The Import bots and Export bots user interface labels do not match for a process but are still applicable to importing or exporting a process.</p>
<p>When you access a public process, the Request display name field in Process entry is not locked and can be edited. The existing variable in the field can be changed but not saved.</p>
<p>The Task display name option in Process entry has a field set to initialData that cannot be edited in the process editor.</p>
<p>The Feed data into form table in the process editor does not allow editing.</p>
<p>The Element name field in the Bot Task and Human Task cannot contain spaces.</p>
<p>When you create two forms and assign the data of the first form to the second form using <code>FormStep.input []</code>, the second form data is not evaluated.</p>
<p>Redo functions are only available for canvas interactions. The redo functions are not available by default until your first canvas interaction. The functions are available again when you interact with your second canvas.</p>
<p>A team name that has a length of 20 characters or more is not accepted.</p>

Known limitations	
Limitations in Automation Co-Pilot on the web	
Navigation bar	When you open too many request tabs, the tabs are hidden in the navigation bar.
Timestamp	The timestamp of the closing step shows a duplicate timestamp of the starting step in request view.
Imported process	<p>When you export a process from an Control Room and import that process as public to another Control Room, the imported process cannot be viewed.</p> <p>Workaround: You can check in and then check out the process, or import the process as private and then do a check-in.</p>
Configuration page	<p>In the device pool configuration page, the Bot Runner users check box cannot be deselected.</p> <p>Workaround: Double-click the check box in the header.</p>
Process management page	A check-in process that is deleted from the Control Room repository is still visible in the process management page.
Form rendering	<ul style="list-style-type: none"> • The Masked data option is not fully supported for all elements. When this option is added to hide data, the data is visible. • The Checkbox and Radio Button elements do not fully support horizontal format. When these elements are configured to display horizontally, the elements are displayed vertically instead. • The Document element is not fully supported. When this element is configured to a Default file path, the entire document is not rendered. • The Number element encounters issues with large numbers. When this element is configured to contain three number fields and number values with trailing zeroes, commas, and decimals, these values are not honored and are not rendered. When number values are entered in a number field, such as a phone number box, the number values are not accepted. • The Text Box element encounters issues with number-only input. When this element is configured in a form to submit data, the Submit option is not

- The **Password** element encounters issues with maximum character limits. The maximum limit is not enforced

Enterprise A2019.14 Release Notes

Release date: 9 July 2020

Review the new features, supported packages, changed features, fixed features, and known limitations in the Enterprise A2019.14 (Build 5322) release. There are no security fixes in this release.

- [Enterprise A2019](#)
- [IQ Bot A2019](#)
- [Bot Insight A2019](#) on page 654

Enterprise A2019

To verify which version is compatible with this release, see [Compatibility with release builds](#) on page 1275.

New features
<p>Migration from Enterprise 11 and Enterprise 10 to Enterprise A2019 (currently available only to those in the Migration Early Adopter Program)</p> <p>Enterprise A2019</p> <p>Migration to Enterprise A2019 is currently only available to select customers through our Migration Early Adopter Program. If you are interested in learning more about this program or a timeline for when migration will be available to all customers, contact your Automation Anywhere representative.</p> <ul style="list-style-type: none"> • Workload management data is automatically migrated to Enterprise A2019 when you install Enterprise A2019 and point the Control Room to the restored Enterprise 11 database. <ul style="list-style-type: none"> • How workload management data is migrated on page 1512 • Version 11.3.1 and Version 11.3 are certified for migration to Enterprise A2019. <ul style="list-style-type: none"> • Migrate to Automation 360 on page 1436 • Additional support is provided for packages and variables. <ul style="list-style-type: none"> • Package mapping for migration on page 1559 Variable mapping for migration on page 1593 • Migrate Task Bots and MetaBots created in Enterprise 10 to Enterprise A2019 using APIs. <ul style="list-style-type: none"> • Migration API
<p>Bypass legal disclaimer</p> <p>Enterprise A2019</p> <p>When you allocate a device license to a user, the Bypass legal disclaimer option is automatically enabled to allow the user to run bots on the device without having to manually acknowledge a disclaimer.</p> <p>Create a user on page 1678</p>

New features
<p>Choose to automatically update Bot Agent (Service Cloud case ID: 00497873)</p> <p>Enterprise A2019 and Community Edition</p> <p>An Control Room administrator can now choose to automatically update the Bot Agent to a later version (Administration > Devices) using the auto-update capability. In the earlier version, each Bot Agent had to be updated manually after logging in to a device, resulting in more downtime.</p> <hr/> <p>Note: In this release, Bot Agent users have to update each Bot Agent manually. From subsequent releases, the auto-update setting will be applied and each Bot Agent will be updated automatically.</p> <hr/> <ul style="list-style-type: none">• For Cloud and Community Edition, the auto-update option is enabled by default.• For On-Premises, the default update option is set to manual. <p>Automatically update the Bot Agent on page 1302</p>
<p>Universal Recorder new features</p> <p>Enterprise A2019 and Community Edition</p> <ul style="list-style-type: none">• The Universal Recorder can now capture objects in SAP versions 730, 740, and 760 patch 5.• You can build automations in an SAP application using multiple connections (user accounts) and several sessions per connection at one time.• You can now record and run bots to capture objects from a Google Chrome browser that does not have a zoom level setting of 100%.
<p>Capture active text, passive text, image button, and scroll in combo box in AISense Recorder</p> <p>Enterprise A2019</p> <p>You can now capture active text, passive text, image button, and scroll in a combo box from a remote application when recording a task with AISense Recorder.</p> <p>Record a task with AISense Recorder on page 2181</p>
<p>New Database package features (Service Cloud case ID: 00537047)</p> <p>Enterprise A2019 and Community Edition</p> <ul style="list-style-type: none">• The Connect action now enables you to connect to an Excel database.• Use the Export to data table action to retrieve records from the database and store the retrieved data in a table variable.• You can now store the output of the Run stored procedure action in a dictionary variable. <p>Using Connect action for database on page 2382 Using the Export to data table action on page 2393 Using the Run stored procedure action on page 2389</p>

New features
<p>New Active Directory package available</p> <p>Enterprise A2019 and Community Edition</p> <p>Use actions from the Active Directory package to manage users across a group or organization. You can perform operations such as create, modify, and delete users, groups, or organizational units with centralized control.</p> <p>Active Directory package on page 2283</p>
<p>Log in securely when connecting to Active Directory server</p> <p>Enterprise A2019 and Community Edition</p> <p>You can use the Connect action from the Active Directory to enter your credentials (username and password). You can either insert the credentials from the Credential Vault or insert a variable that holds a credential type value.</p> <p>Using Connect action for Active Directory on page 2289 Credentials and credential variables in the Bot editor on page 2254 Your variables (user-defined) on page 2241</p>
<p>Support for Excel cell formats, including Number, Percentage, Currency, Scientific, and Date</p> <p>Enterprise A2019 and Community Edition</p> <p>Use the Get single cell and Get multiple cell actions from the Excel basic package and the For each row in worksheet Loop iterator to retrieve values in the format set in the Excel worksheet. For example, a value from a cell of Currency formatting retains the currency symbol when passed to a table or record variable.</p> <p>Excel basic package on page 2472 Loop package on page 2679</p>
<p>Automate a task on a range of cells in an Excel worksheet</p> <p>Enterprise A2019 and Community Edition</p> <p>Specify a cell range in the Delete cells action to perform the operation on the cells in the range.</p> <p>Excel advanced cell operations</p>
<p>New PDF package action</p> <p>Enterprise A2019 and Community Edition</p> <p>Merge multiple PDF files into a single PDF file using the Merge documents action.</p> <p>Using the Merge documents action on page 2770</p>
<p>Support for Czech and United States 2 code pages in Terminal Emulator package</p> <p>Enterprise A2019 and Community Edition</p> <p>The TN3270E and TN5250E terminal types support the Czech and United States 2 code pages. Use the Connect action to select the terminal type and code page.</p> <p>Using Connect action for Terminal Emulator on page 2990</p>

New features
<p>Proxy support for packages</p> <p>Enterprise A2019</p> <p>If a device is configured with a proxy, all outbound requests from the following packages are routed through the proxy server:</p> <ul style="list-style-type: none">• Recorder• REST Web Service• SOAP Web Service
<p>Form builder enhancements</p> <p>Enterprise A2019</p> <p>The form builder now includes the following new elements:</p> <ul style="list-style-type: none">• Dynamic - Enables dynamic rendering of the selected area.• Snapshot - Enables you to take a snapshot of the form.
<p>Enhancements to actions in Interactive forms</p> <p>Enterprise A2019</p> <ul style="list-style-type: none">• Enhanced highlight action <p>The Highlight action in the Interactive forms includes a Highlight type drop-down menu. You can use Warning or Error to highlight the selected form element during the bot runtime.</p> <ul style="list-style-type: none">• New Change label action <p>Use this action to change the label or title of the selected element of a specific form.</p> <ul style="list-style-type: none">• Dynamic area action<ul style="list-style-type: none">• The Add row in Dynamic area action enables you to append or overwrite a dynamic element of a form.• The Clear action enables you to remove the dynamic elements. <p>Interactive forms package on page 2633</p>
<p>Retrieve trigger event data</p> <p>Enterprise A2019</p> <p>You can now retrieve the trigger event data during bot runtime by defining a variable as the input type.</p> <p>Add a file and folder trigger on page 3238</p>
<p>Record variable support for schema</p> <p>Enterprise A2019 and Community Edition</p> <p>You can create a new record variable with a schema to set the order of the fields and the type of data that can be entered into each field.</p> <p>Record variable on page 2250</p>

New features
<p>Product interface now available in Russian language</p> <p>Enterprise A2019</p> <p>Enterprise A2019 is now available in Russian.</p> <p>Internationalization, localization, and language support on page 1158</p>
<p>Clone and view content in Control Room</p> <p>Enterprise A2019</p> <p>The Control Room now includes the following new permissions:</p> <ul style="list-style-type: none">• View content: This permission allows you to view the contents of a cloned bot. This permission applies to both public and private workspaces.• Clone: This permission allows you to create a read-only copy of the bot from the public workspace. The same bot can be cloned by multiple users. This permission applies only to the public workspace. <p>Bot permissions for a role on page 1702</p>
<p>New condition in the If and Loop packages</p> <p>Enterprise A2019 and Community Edition</p> <p>Use the Dictionary > Check key condition to execute actions based on whether the value of the specified key is Equal to or Not equal to, or Contains or Does not contain the target value.</p> <p>If package on page 2619 Loop package on page 2679</p>
<p>New encoding type in CSV/TXT and Log To File packages</p> <p>Enterprise A2019 and Community Edition</p> <p>The UTF-16LE encoding option provides support for files that contain the byte order mark (BOM) Unicode character. In the CSV/TEXT > Open action, selecting this option causes the BOM character to be ignored when data is retrieved from the file using a subsequent Read or Loop action. In the Log to file action, this option inserts a BOM character at the beginning of the file.</p> <p>Using the Open action for CSV/TXT file on page 2363 Using Log text to file action on page 2677</p>
<p>Retrieve a list of available users using Device API</p> <p>Enterprise A2019</p> <p>Use the Device API to identify all available users with unattended Bot Runner licenses, or to filter for users by name. This API returns details of each user, including the user ID, username, and device name.</p> <p>Device API</p>

New features
<p>Manually configure time interval value of database connection retries property (Service Cloud case ID: 00573167)</p> <p>Enterprise A2019 and Community Edition</p> <p>You can manually configure the time interval value of the database connection retries in the <code>cluster.properties</code> file. If the database is reconnected within the time specified in the <code>cluster.properties</code> file, the Apache Ignite cache node in the cluster setup will not restart the Apache Ignite server, keeping the device and the Control Room user connected. The default value of the time property <code>ignite.max.duration.db.connection.retries</code> in the <code>cluster.properties</code> file is 10000. The recommended maximum time for this property is up to 5 minutes (300000 msec).</p> <hr/> <p>Note: Restart the Control Room services on each node for the manually configured value of the time property to work effectively. Also, set the time in milliseconds.</p> <hr/>
<p>Run as user to default device mapping in Workload automation (Service Cloud case ID: 00563115)</p> <p>Enterprise A2019 and Community Edition</p> <p>Workload automation now allows one-to-one (1:1) mapping of the Run As user with default devices when these devices are part of a device pool. Therefore, you can select default devices that are mapped to a Bot Runner to avoid auto-login failures in environments where the security policy does not allow a user to log in to any other device or devices.</p> <p>Add queue, Bot Runner, and device pool on page 1823</p>
<p>Authentication proxy support</p> <p>Support is now available for proxy authentication servers where any application going through the proxy is authenticated and authorized before accessing the internet.</p>

Supported packages

Changed features
<p>Changes in the Database > Run stored procedure action</p> <ul style="list-style-type: none"> It is now optional to enter an input or output parameter name. You must specify the data type of an input parameter. Choose from Boolean, date, number, or string date type.
<p>The terminal screen for ANSI and VT100 terminals now displays 24 rows, instead of 25 rows as in earlier versions.</p>

Changed features
<p>Email > Send action interface changes</p> <p>For the Use secure connection (SSL/TLS) and My server requires authentication fields, you must now select True or False, or insert a Boolean variable. Previously, the fields were activated by selecting a check box.</p>
<p>Import bots in public or private workspace</p> <p>Service Cloud case ID: 00456712</p> <p>Users can now import bots into the public workspace if they have the required permissions, regardless of their licenses. Additionally, users with a Bot Creator license can now import the bots either into the public or private workspace.</p> <p>Import bots on page 1969</p>

Fixed features	
Service Cloud case ID	Description
00554068	In the Community Edition, when you upgrade your Bot Agent to a later compatible version, Task Bots created with system variables of numeric type now run successfully. The Control Room does not show a preprocessing error when you deploy the Task Bots.
00443421	The Run stored procedure action in the Database package runs as expected with Oracle Database when you use input and output parameters.
00557374	The Universal Recorder now consistently captures objects from an SAP application and identifies the technology for those objects as SAP when all prerequisites are met.
00611874	An error is no longer encountered when a variable containing Japanese characters is used in the Write to file action of the Data Table package.
00564534	A modified dependency file with the same name as the original file and a new size is now successfully checked in from the private to the public repository. The old file that was previously checked in is no longer referenced after the modified file is checked in to the public repository, thereby preventing a bot execution failure.
00570537	When you clone a bot with or without dependency files, the cloned bot now displays the actual file size for the bot and its dependency files.
00577247, 00587976	Fixed an issue where the Email > Move all action did not move emails when a bot ran the action on an OS configured with the Japanese language setting.
00552729	The PGP > Decrypt action now works for PDF files.

Fixed features	
Service Cloud case ID	Description
00487805	You can now access the TN3270 terminal without the terminal screen displaying all text with strike lines. Before using any type of terminal to execute terminal commands, install the latest VC ++ package. Latest supported Visual C++ downloads
00584051	Python 3 script now supports using Unicode characters in input variables. Bot error messages are no longer displayed when Python 3 is used to pass Japanese characters to a variable.
00540651, 00587963, 00593302	You can now use the Assign, Join, Merge, and Sort actions from the Data Table package when you change the default language from English to Simplified Chinese. You can also use the Assign action when you change the default language from English to Japanese, Korean, and other non-English languages.
00577284	The Split document action in the PDF package now executes correctly for a horizontal PDF file, and the large-width output file is not cut off from the sides.
00595357	You can now export and import two different bots (with the same name) in different folders from a staging environment into a production environment.
00569527	You can now perform a check-in and check-out of bots with dependencies.
00574309	You can now update or remove Cluster ip addresses from the Elastic search disaster recovery backup cluster setting from the Control Room Administration page.
00525854	When a file type variable is used to open an Excel, CSV, or Java script file, bots can now be executed successfully when the file variable is used as an input.
00609184	After the existing license expires, the admin user can now successfully install a new Control Room license for a Control Room hosted on Linux CentOS.
00576202	You can now insert a user-defined string variable in a message box display when the string variable is included in the expression for multi-line values.
00560706	You can now view the actions menu (vertical ellipsis) to edit or delete the variable string name when the character length is more than 35 characters.
-	For the Checkbox element, changes made to the check box names in the Checkbox content field are now updated when you enable Advance behaviors > Make default selections .

Fixed features	
Service Cloud case ID	Description
-	You can now set the default selection in Advance behaviors for the Radio button element in a form.
00557395	You can now check in bots that use the variable <code>\$prompt-assignment\$</code> without receiving an error message. Previously, when you opened the bot in List view, an error icon was displayed next to the actions that contain the variable.
00560356	Previously, when a task that consisted of one or more subtasks was run, the In Progress entry for the task was moved into a historical report with the completion of the first subtask, not the entire governing task. Now, the In Progress tasks are not moved to historical status until the completion of the entire task.
00556113	In Community Edition opened in Google Chrome, you can now select the device icon in a non-English language, and the <code>[link]</code> and <code>[icon]</code> tags are no longer displayed.
00559360	You can now re-import a bot that has failed previous imports. The <code>query did not return a unique result: 2</code> displayed during re-import attempts is now fixed.
00443590	Fixed an issue where after a bot is deployed on a Bot Runner device, that device is in a different state compared to the state before the bot deployment. For example, if a Bot Runner device is locked before bot deployment, after it is unlocked to deploy the bot, it will now be moved back to lock status.
00559507, 00594149	Support for scheduling bots with Internet Explorer version 11 is now improved. Users in the Control Room can scroll through multiple pages of scheduled bots without issues with scrolling through the interface.

Known limitations
<p>In Enterprise A2019 On-Premises, a security scan might report the Recorder package as malware because the <code>check.exe</code> file is missing the root identification certificate.</p> <p>You can contact Automation Anywhere Support to get an updated package with the signature fix and upload it to your Control Room.</p> <p>Add packages to the Control Room on page 1842</p>

Known limitations
<p>Version Enterprise 10 or Enterprise 11 bots containing commands that have white space in the credential attributes cannot be migrated to Enterprise A2019. The migration process stores some credential attributes in global values in Enterprise A2019. Global values do not support white spaces.</p> <p>To migrate bots that use credential attributes, you can remove the white spaces or replace them with characters.</p>
<p>If you use the Get action for an empty dynamic element of a form, errors are displayed during bot runtime.</p>
<p>If you use Trigger loop: Handle within a bot, link it to a form with Select File element, and set the Select action trigger > Lost focus, the next event is not triggered when you click Browse.</p>
<p>The Set focus action in Interactive forms does not work when you use it to link the fields between two different forms.</p>
<p>In the form builder screen, text is displayed in English even when you change the display to non-English language.</p>
<p>You might see the schedule automation name instead of the Workload automation name in the Workload > Queue > View Activity in progress and Run bot with queue > View pages when Work Items are processed for automation in the Bot Agent. This occurs if the Workload automation ID and schedule automation ID are the same in the Control Room database.</p>
<p>The Task bot > Run action only supports files selected from the Control Room repository. Also, this action only supports file type variables with a set default value and the input option disabled. You cannot modify the file variable value using the File > Assign action.</p>
<p>When you edit a bot using a previous package version (for example, an Enterprise A2019.13 version) and the Desktop session automatically starts, if you exit the Bot editor while the Desktop session is trying to launch, the previous package version will be displayed when you open a new Bot editor instance. However, you should see the Enterprise A2019.14 package version associated with the new Bot editor instance. If you close and reopen the new Bot editor instance, the Enterprise A2019.14 package version will be displayed.</p>

Known limitations
<p>There is an issue for a specific, manually generated license key file supplied by Automation Anywhere to upgrade from Enterprise A2109.13 to Enterprise A2019.14.</p> <p>This issue applies only to customers who are in the following specific category (all must be true):</p> <ol style="list-style-type: none"> 1. Control Room is at the customer premises 2. Control Room is running Enterprise A2019.13 or earlier 3. Installed a license file that was provided to them in July 2020 (not self-generated through the customer self-service license portal) 4. User has upgraded the On-Premises Control Room to Enterprise A2019.14. <p>For this issue, contact Automation Anywhere for updated license files.</p>
<p>Important: Users who self-generated their license files through the A-People License portal are not affected by this issue. Cloud customers are also not affected by this issue.</p>
<p>A bot that contains the Capture action from the Recorder package fails when both the HTML InnerText and InnerHTML object properties are selected.</p> <p>Workaround: Select only one of the object properties.</p>
<p>The Universal Recorder fails to perform a click, set text, or append text action on the correct control when a debug window or download bar is open. This occurs only in the Google Chrome browser with the device display set to 100%.</p> <p>Workaround: Disable the Google Chrome download bar.</p>
<p>When you create, edit, or run a bot from the Bot editor window, close the Bot editor window when the socket connection has just been established, and then navigate to the My bots page, the Recorder window opens for a moment and then closes.</p>

Known limitation

IQ Bot

The IQ Bot A2019 On-Premises version supports all the features and functionality available in IQ Bot Version 11.3.4.2.

[Automation 360 IQ Bot feature comparison matrix](#) on page 952

Review the compatibility of the IQ Bot On-Premises version with the corresponding Control Room On-Premises version.

[Automation 360 IQ Bot version compatibility](#) on page 957

The IQ Bot A2019 Cloud version is available for this release and supports all features and functionality available in IQ Bot Version 11.3.4.2. This version provides users with automatic provisioning for up to three environments such as Development, Test, and Production. Users can migrate learning instances between environments using APIs.

New features
<p>Delete bot option in IQ Bot Designer (Service Cloud case ID: 00096258, 00595526)</p> <p>IQ Bot On-Premises and Cloud</p> <p>Users with Edit bot permission can view and use the Delete bot option in the Designer. After a bot is deleted from the system, it will not be displayed in the Learning Instance or Bots listing pages.</p> <p>IQ Bot removes all document details from staging, and all unprocessed production documents are moved to the Validator.</p> <hr/> <p>Note: The Migration Utility > Import/Export functionality is not affected in any way by the Delete bot feature.</p> <hr/> <p>Bots</p>
<p>Extract data from a table that spans across multiple pages (Service Cloud case ID: 00371795)</p> <p>IQ Bot On-Premises and Cloud</p> <p>IQ Bot can now extract data successfully from an entire table that spans across multiple pages and has a table header only on the first page.</p>
<p>Add fields and field alias to custom domain (Service Cloud case ID: 00471075)</p> <p>IQ Bot On-Premises and Cloud</p> <p>You can now add additional fields (form or table) and field aliases to a custom domain for an existing learning instance.</p>
<p>Alert for successful or pending document validations</p> <p>IQ Bot On-Premises and Cloud</p> <p>Document validation status is now displayed on the Learning instances page. A green icon is used for all successful document validations, and a red icon shows any pending validations.</p>

Changed features
<p>Import custom domains from the staging to the production server in any order (Service Cloud case ID 00472445)</p> <p>You can now edit and update an existing custom domain multiple times and import them to the production server multiple times, and in any order, before importing the learning instances. After importing the learning instances, the system classifies all documents in the production server correctly, allowing for successful processing of documents.</p> <p>Custom domains in IQ Bot</p>

Changed features
<p>Validator enhancements (Service Cloud case ID: 00470258)</p> <p>Some of the Validator enhancements are as follows:</p> <ul style="list-style-type: none"> You can now hide the Skip to next file and Mark as Invalid options using configuration settings. The options are currently enabled by default. <p>To enable the option to hide them, contact Automation Anywhere Support.</p> <ul style="list-style-type: none"> You can now hide the Hide successful fields and Hide optional fields options using configuration settings. The options are enabled by default. <p>To enable the option to hide them, contact Automation Anywhere Support.</p> <hr/> <p>Note: Selecting the Hide successful fields and Hide optional fields check boxes hides all the valid fields and reduces the display of a large number of fields, thus making correction easier. However, if there is an invalid field, it continues to be displayed because the invalid field requires correction.</p> <hr/> <ul style="list-style-type: none"> Clicking in any column field expands the column width to accommodate the text entry. The Validator shows the value of the field that is being validated, in the document. Draw an area around single or multiple values in the document image to automatically populate a field in the Validator. This function is similar to the Designer.

Fixed features	
Service Cloud case ID	Description
00552830	You can now use the unique validation link to access the documents without any errors.
-	When you use table extraction from a document with multiple tables, the data from the specified table is now extracted correctly.
00551886	Unicode issue with table validation for Asian languages is now resolved.
00538480	The Options method is now disabled for HTTP requests.
00538480	Cross origin resource sharing is now restricted in IQ Bot.
00421067	The activities time stamp is now captured correctly in the Control Room Audit Logs tab.
00522817	The TestRun output of a custom logic now displays the characters without any distortion, irrespective of the language you select.
00605420, 00605741, 00606561	After upgrading to IQ Bot Cloud if you restart the Control Room, you can now view or create learning instances immediately without restarting the IQ Bot service.

Known limitations
<p>IQ Bot On-Premises and Cloud</p> <p>If you create a learning instance and click Learning instances > Edit, a blank page is displayed.</p> <p>Workaround: Clear your browser cache and try to edit the learning instances.</p>
<p>IQ Bot On-Premises and Cloud</p> <p>If you log in to the Control Room as an IQ Bot administrator, a 502 <code>system error</code> is displayed when you click the IQ Bot tab in the navigation bar.</p>
<p>IQ Bot On-Premises and Cloud</p> <p>You can view the <code>ValidatorURL</code> error message for a validated document along with the corrected field in the <code>.csv</code> output file.</p>
<p>IQ Bot On-Premises and Cloud</p> <p>In Internet Explorer, you cannot save a document or mark it as invalid in the learning instances validator screen.</p> <p>Workaround: Use the Google Chrome browser to access the learning instances validator screen.</p>
<p>IQ Bot Community Edition</p> <p>If you remove a bot (Delete a bot) associated with the document from the staging environment, you must create a group before uploading this document to the production environment. However, after deleting the bot from the staging environment, you cannot create or edit the group when you upload the same document to the production environment.</p>

Bot Insight A2019

New features
<p>Line Bar Chart widget available</p> <p>Enterprise A2019</p> <p>The Line Bar Chart widget enables you to view and analyze information about your metrics and attributes. You can input two metrics and one attribute and display a bar graph when only one attribute is selected or display a clustered graph when two or more attributes are selected. You can use Date types as interval options, grouped by Day, Week, Month, and Year.</p> <p>Bot Insight visualizations on page 3751</p>

New features

Advanced settings for a query

Enterprise A2019

You can use the **Advanced Settings** option to configure more of your queries when you create a new widget. You can now set limits to your attribute values as grouped by **10**, **20**, **50**, and **100** values. You can also sort your data by ascending or descending order.

[Configuring a Line Bar Chart query](#) on page 3752

Enterprise A2019.13 Release Notes

Release date: 15 June 2020

Review the new features, supported packages, changed features, fixed features, and known limitations in the Enterprise A2019.13 release. There are no security fixes in this release.

A2019.13 Build 4701 is available for Cloud customers, and Build 4705 is available for On-Premises customers. Community Edition remains on A2019.12 and will be upgraded to A2019.14 upon availability.

- [Enterprise A2019](#)
- [IQ Bot](#) on page 664
- [Bot Insight](#) on page 667

Enterprise A2019

To verify which version is compatible with this release, see [Compatibility with release builds](#) on page 1275.

New features

Migration from Enterprise 11 and Enterprise 10 to Enterprise A2019 ([currently available only to those in the Migration Early Adopter Program](#))

Migration to Enterprise A2019 is currently only available to select customers through our Migration Early Adopter Program. If you are interested in learning more about this program or a timeline for when migration will be available to all customers, contact your Automation Anywhere representative.

- The Insert work item command, workload management queues, and device pools are now migrated to Enterprise A2019.
- Schedules are migrated when you copy Enterprise 10 data to Enterprise A2019 or update Enterprise 11 data to Enterprise A2019. You then have to remap some dependencies to enable the migrated schedules.

[Enable schedules after migration](#) on page 1555

- Additional support is provided for packages and variables.

[Package mapping for migration](#) on page 1559 | [Variable mapping for migration](#) on page 1593

New features
<p>Record tasks with a device display setting of 125% or 150%</p> <p>You can now record tasks using Universal Recorder in Java, Microsoft Active Accessibility, and Microsoft UI automation applications on a computer that has a device display setting configured at 125% or 150%, in addition to the existing setting of 100%.</p>
<p>Export bots without enabling SMTP in Bot Lifecycle Management</p> <p>When you export a bot, you can now download the exported package even when SMTP is not enabled. The link to download the exported package is available in the ACTIVITY > Historical page.</p> <p>Export bots on page 1967</p>
<p>Export and import files using Bot Lifecycle Management APIs</p> <p>Use the Bot Lifecycle Management export and import APIs to move bots from one environment to another based on your organization's automation requirements.</p> <p>You can export bots with dependent files and command packages from the public workspace of one Control Room and import them to a private workspace in another Control Room, and check them into a public workspace. To export and import bots, you must have the Export bots, Import bots, View and Manage packages, and Check in and Check out permissions to the necessary folders and have the Bot Creator license.</p> <p>BLM API</p>
<p>Capture scroll action and table using AISense Recorder</p> <p>You can now capture the scroll action in an application window and table control from a remote application when recording a task with AISense Recorder.</p> <p>Record a task with AISense Recorder on page 2181</p>
<p>Form builder enhancements for interactive forms</p> <p>The form builder includes the following elements:</p> <ul style="list-style-type: none">• Select File: To enable file upload in the form.• Dropdown: To create a drop-down menu in the form. <p>Create a form</p>
<p>Extract text from a specific area in a window</p> <p>Use the App Integration > Capture area action to extract text from within the captured area of a window and save it to a string variable.</p> <p>App Integration package on page 2321</p>
<p>Read string variable values from a text file</p> <p>Use the String > Import string from text file action to read values from a text file and save them to a string variable.</p> <p>String package on page 2957</p>

New features
<p>Automate in IBM-5555 terminals using the Terminal Emulator package</p> <p>The TN5250E terminal type now supports the IBM-5555-C01 and D01 terminal models.</p> <p>Terminal Emulator package on page 2988</p>
<p>Specify events within email trigger</p> <p>For email triggers, specify an event within the server type (Outlook, Email, or EWS server) to trigger a bot.</p> <p>Add an email trigger on page 3234</p>
<p>Use hot key for interface trigger</p> <p>For interface triggers, you can select hot key as one of the conditions to trigger the bot</p> <p>Add an interface trigger on page 3240</p>
<p>Assign action in interactive forms package</p> <p>The interactive forms package now includes an Assign action that you can use to assign values dynamically in the Dropdown element of a form.</p> <p>Interactive forms package on page 2633</p>
<p>Create a shortcut of a file or folder</p> <p>Use the Folder > Create shortcut or File > Create shortcut action to create a shortcut in the specified destination file path. The shortcut is dependent on the source file or folder. If you make changes to the source file or folder, the changes will also apply to the shortcut.</p> <p>File package on page 2513 Folder package on page 2523</p>
<p>New conditions in the If and Loop packages</p> <ul style="list-style-type: none">• Use the Data table > Data table is empty condition to execute actions based on whether the specified table contains values.• Use the Data table > Number of columns and Data table > Number of rows conditions to execute actions based on whether the number of columns or rows is Equal to, Greater than, or Less than the specified value. <p>If package on page 2619 Loop package on page 2679</p>
<p>Generate a random string of a user-specified number of characters and assign it to a string variable</p> <p>Use the String > Random action to generate a string of uppercase and lowercase alphanumeric characters. You can specify the number of characters that the generated string consists of, with a maximum of 300 characters.</p> <p>String package on page 2957</p>

New features
<p>Upgrading Enterprise A2019 enables pre-filling installation parameters</p> <p>If you are upgrading from one Enterprise A2019 version to another, you have the option to pre-fill the installation parameters with existing installation content. Existing installation parameters include, for example, the installation path, HTTPS ports, database names, IP addresses, and TLS configuration. The username and password have to be manually entered.</p> <p>Note that this is applicable only to a Windows-based installation.</p> <p>Run Control Room installer on page 1191 Installing Control Room on Linux on page 1237</p>

Changed features
The Dictionary > Put action is now the Dictionary > Set value action. When you provide the key name, if the key does not already exist, this action creates a new key-value pair. In addition, you can now manually enter a value; previously, you had to select from a list of variables.
In the Excel advanced > Get worksheet as data table action, the Tick if the first row is the header option is now the Sheet contains header option. There is no change in functionality.
The File > Rename and Folder > Rename actions now accept the full file path in the New file name and New folder name fields. Previously, these fields only accepted the new file or folder name.
When you select a file from the desktop for the JavaScript, Python Script, or VBScript packages, it is no longer necessary to isolate that file in a separate folder. Previously, when you selected a file with the Open action, all the files in that folder were selected too.
The Database > Run stored procedure action now has a different interface that enables you to configure input parameter values and output parameter data types. This action is not backward-compatible because the user interface controls and input data type have changed. You must modify the Run stored procedure action fields in the bots that contain previous versions of this action.
The Cloud License feature is now enabled by default in the Control Room.

Fixed features	
Service Cloud case ID	Description
00492377, 00511639	Bots using the Image Recognition action can now recreate the recorded activity and run successfully.

Fixed features	
Service Cloud case ID	Description
00599586, 00600149, 00601142, 00599483	The <code>Processing failure</code> error encountered when using the Wait for condition action is now fixed. Bots using this action now run successfully.
00583248	During Work Item consumption, a running task is no longer canceled when the next bot is deployed.
00548456	The Workload Management v3 APIs are now successfully executed in Swagger and do not fail because of a case-sensitive issue.
00601083	For Cloud deployment, users can now successfully export bot files and download them without any errors.
00568664	The Git integration option is now displayed for admin users when they navigate to ADMINISTRATION > Settings in the Control Room.
--	The minimum length value of a form element cannot be 0. If you set the value as 0 in Character limit > Min field, the Make field required is disabled.
00571125	When you check in a non-bot file by itself, the file is now checked in without any error. Older files that exist in Build 4111 are also unlocked and checked in after upgrading to Build 4705.
--	The form preview feature is now consistent across the Internet Explorer and Google Chrome browsers.
--	A blank page is no longer displayed when you paste content into any of the existing form elements on the form builder.
--	A form that is linked to a bot through the Display action of interactive forms is now displayed in front of all other windows when the Always display form window in front option is selected.
--	When a user login failed due to a Global Catalog (GC) availability issue, the response only indicated a communication error. The process now checks for errors and exceptions in the GC and processes the authentication with appropriate messages, so users can take appropriate action.
00520394	The VBScript package actions now support Unicode characters.
00536881	When you delete a bot, any trigger that is associated with it is also deleted and is not listed in the Activity list page.
00506169	You can now use the interface trigger to run a bot without any errors in the Japanese operating system.

Fixed features	
Service Cloud case ID	Description
00537640, 00538369	When you check out a bot from the Control Room and add a trigger, you can now use Run with triggers to run this bot without any errors.
00531912	JavaScript package actions can now be used to parse the values in a list.
00475183	Double-byte characters returned unreadable ANSI characters in the bot Log To File text. This issue is now fixed and ANSI encoding takes the system default charset.
00475129	You can now use double-byte characters in a variable name.
00511675	The Excel advanced > Find action now searches for values in merged cells when the By rows search option is used.
00468103, 00475142	Bot names using Unicode characters, such as German umlaut, Japanese characters, and others, display correctly in the pop-up window at runtime.
00552701, 00558919	You can now select multiple actions from the Bot editor and drag them into a Step, Loop, or If action.
00507240	Fixed an issue where a running parent bot could not be stopped after it ran a child bot. Now you can stop a bot at any time.
00482810	VBScript actions can now run scripts that contain Unicode characters.
00472684, 00541922, 00551632, 00534508, 00570602	The Email > Send action now supports a user-input port number for sending emails from an SMTP server, such as AWS Simple Email Service. Previously, the action only used port 25, even if the user entered a different port number.
00475230	Fixed an issue where the String > Replace action did not support an empty string in the Replace with field. You can now use the action to replace a specific string with an empty string.
00472665	When a child bot shows an error, the parent bot now handles the exception by running the Error Handler > Catch action. Previously, the parent bot was also showing an error, even when it contained Error handler actions.
00566476, 00560339	Fixed an issue where bots that contain the Capture action stopped working when running the action during deployment, or they could not be checked out after they were checked-in for editing.

Fixed features	
Service Cloud case ID	Description
00537139	A bot running the Capture action can now capture specific objects from a Google Chrome browser on a device running the Windows 10 operating system. In some cases, bots running the Capture action from Version A2019.11 On-Premises could only capture the entire browser window.
00421864	The Create a bot screen now displays properly in Internet Explorer. Previously, some display issues occurred where the screen was cut on the right side and the screen could not be moved.
00584341	Fixed an issue where some of the historical activity entries were incorrectly displayed. These entries are now displayed correctly when a user drills down for more information.

Known limitations
When you create a Dictionary/Table variable and use it in the <code>name</code> field of the PROPERTIES control, the bot does not deploy successfully. This issue occurs because Dictionary/Table variables are not supported for the <code>name</code> field in the PROPERTIES control. You can pull the <code>name</code> value into a String or Number variable before using it in the PROPEPTIES control, and then use that String or Number variable in it.
You can use Swagger to export bots but not to download exported bots. You have to use the REST Client to download exported bots.
When you run a bot, the runtime window is minimized after you preset the desktop.
The OSS Disclosure report provided in the A2019 installer is outdated. Starting from this release, you can log in to Automation Anywhere Support site and download the updated report: A-People Downloads page (Login required) .
When you capture a table control from an application using the AISense Recorder, you cannot set text using the Set text option from the Actions list. You can set text in the table by capturing a cell from the table as a text box and then using the Set text option from the Actions list.
When upgrading from one Enterprise A2019 version to another, you have the option to pre-fill the installation parameters with existing installation content, but only if you used the default installation path <code>C:\Program Files</code> .
Note: This is applicable only to a Windows-based installation.
Based on the permission assigned by an administrator, users can only view the Public tab that lists the available forms and bots. However, users can edit an available form or bot by replacing View with Edit in the Control Room URL.

Known limitations
When you create a bot and link a form to it, the bot is included only when you check in the form; it is not available on form check-out.
When you click multiple icons (Copy, Cut, and Paste) at the top of the form builder or bot creator page, the tooltips overlap.
<p>Issues in the form builder:</p> <ul style="list-style-type: none"> • If you drag any form element into a specific position on the form builder, it always appears at the bottom of the available elements. • If you drag form elements around in the form builder screen in Internet Explorer, the mouse pointer flickers continuously. • For the Radio button element, you cannot set the default selection in Advance behaviors. • For the Checkbox element, changes made to the check box names in the Checkbox content field are not updated when you enable Advance behaviors > Make default selections.
When a bot runs Terminal Emulator package actions in an IBM-5555 terminal, the terminal window does not display double-byte characters, including Chinese and Japanese characters.
If you used the Universal Recorder to capture a menu item from a Microsoft Active Accessibility application on a computer that has a display scale setting configured to 100%, at runtime the bot does not click the correct menu item on a computer that has a display scale setting configured to 125% or 150%.
During GUID provisioning, License Sync is called internally after a successful installation. If the internal License Sync fails but the installation is successful, users can log in and continue to work.
When a task that consists of one or more subtasks is run, the In Progress entry for the task is placed into a historical report upon completion of the first subtask, not the entire governing task.
An error occurs if the parent bot contains actions for objects captured using the AISense Recorder and the child bot contains actions for objects captured using the Universal Recorder, or vice versa.

IQ Bot

The IQ Bot On-Premises version supports all the features and functionality available in IQ Bot Version 11.3.4.2.

[Automation 360 IQ Bot feature comparison matrix](#) on page 952

Review the compatibility of the IQ Bot On-Premises version with the corresponding Control Room On-Premises version.

[Automation 360 IQ Bot version compatibility](#) on page 957

The IQ Bot Cloud version is available for this release and supports all features and functionality available in IQ Bot Version 11.3.4.2. This version provides users with automatic provisioning for up to three environments such as Development, Test, and Production. Users can migrate learning instances between environments using APIs.

For the Custom Logic feature, there is an identified list of Python libraries and packages that are safe to use for IQ Bot Cloud. Use only these packages to ensure security for your cloud infrastructure, file systems, databases, and network resources.

[List of Pandas Libraries which are supported and not supported on Automation 360 IQ Bot \(A-People login required\)](#)

New features
<p>Migrate data to a unified database</p> <p>IQ Bot On-Premises and Cloud</p> <p>The Database Migration Assistant enables you to migrate data from IQ Bot Version 6.5 or later databases to a unified database in IQ Bot A2019.</p> <p>Migrate earlier IQ Bot versions to Automation 360 IQ Bot On-Premises on page 1661</p>
<p>Support for custom validation Python scripts</p> <p>IQ Bot Cloud</p> <p>You can use custom logic in Python to modify intermediate extracted data in IQ Bot.</p> <p>Add custom logic in IQ Bot to improve extraction</p>
<p>Select an OCR engine when creating a learning instance</p> <p>IQ Bot On-Premises and Cloud</p> <p>You can select different OCR engines directly from the UI based on your requirements for data extraction from specific document types, when creating a new learning instance. You do not have to stop and restart IQ Bot services for implementing the engine change.</p> <p>Select an OCR engine</p>
<p>Enable or disable PDFBox option</p> <p>IQ Bot On-Premises and Cloud</p> <p>You can enable or disable the My PDF documents do not have images check box directly in the UI when creating a learning instance.</p> <p>Disable PDFBox option</p>

Changed feature
<p>The draw box icon for document values is no longer available. However, you can still click and drag a box on the document to draw boxes for the labels along with the values.</p>

Fixed features	
Service Cloud case ID	Description
--	A new REST API is now available that contains the IQ Bot validator URLs of all the available documents that are not locked by any users. A validator URL retrieved from the REST API can be used in any browser to navigate directly to that specific document.
00343034	You are now redirected to a specific document using the validator URL after a successful login.
00471068, 00339407	The draw box functionality for field labels now ensures that the selected value is treated as an entire word rather than distinct characters. You can now select multiple system identified regions (SIRs) or a specific part of a single SIR from a field label, which enables accurate data extraction.
--	The PDF Box feature now enables you to generate an SIR for a PDF file that contains content in multiple formats.
00481720	The Service account user password can now include special characters. The service account will not be locked and all the IQ Bot services will start successfully after an installation, irrespective of whether the password has special characters.
00510286, 00548393	When the Automation Anywhere Cognitive Application service restarts after installing IQ Bot Build 4705, the user login information is now captured without any duplication. However, if you upgrade from any earlier version of IQ Bot to IQ Bot A2019.13 (Build 4705), you must deregister and register IQ Bot services.
00522978	When you now install IQ Bot, the user account is not locked even when the password has special characters, and all the IQ Bot services start without any issues.
00581425, 00581949, 00604394, 00602630	You can now register IQ Bot with child tenant using API, which enables you to view all the available domains and learning instances.
00575939, 00417631, 00423076	The <code>.csv</code> file is now displayed in the Output folder when you upload a document with a long filename (more than 60 characters) using IQ Bot Upload .

Known limitations
<p>IQ Bot On-Premises</p> <p>The OSS Disclosure report provided in the IQ Bot A2019 installer is outdated. Starting from this release, you can go to Automation Anywhere support site to download the updated report:</p> <p>A-People Downloads page (Login required).</p>

Known limitations
<p>IQ Bot On-Premises and Cloud</p> <p>Images on the Designer in IQ Bot appear distorted while scrolling in Internet Explorer.</p>
<p>IQ Bot On-Premises and Cloud</p> <p>Installation errors are displayed for the Database Migration Assistant.</p> <p>Workaround: Install the <code>MsSqlCmdLnUtils</code> utility and <code>Microsoft ODBC Driver 17</code> for SQL Server before installing the Database Migration Assistant.</p>
<p>IQ Bot On-Premises and Cloud</p> <p>Logs are not captured if the Database Migration Assistant installation fails.</p>
<p>IQ Bot Cloud</p> <p>System suggestions are not updated when documents are validated by the user.</p> <p>Workaround: Users must update the correction manually in the validator for IQ Bot Cloud if the system suggestions are not displayed.</p>
<p>IQ Bot Community Edition</p> <p>The Create new learning instance page refreshes automatically, which causes the user to lose data from the General information fields.</p>
<p>(Service Cloud case ID: 00737991)</p> <p>When you are creating a learning instance and training your document, IQ Bot system cannot extract data from tables with the same Header Name and Column Value.</p> <p>Workaround: Try combining Header Name or Column Value with the adjacent column. Additionally, you can provide a Python postprocessing script to separate the values during extraction.</p>

Bot Insight

New features
<p>Compare mode widget filter</p> <p>The Bot Insight compare mode introduces widget filters that you can apply to your existing dashboards. A new Filter option shows a Filter window with the Attributes, Numeric, and Time widgets.</p> <p>Comparing dashboards on page 3743</p>
<p>Hourly support for widgets</p> <p>The Bot Insight widgets include an Hour interval option in the Group By field for Date type. The analytics for this widget groups your data by hourly intervals and displays the chart accordingly.</p> <p>Using widgets on page 3749</p>

Changed features
<p>Power BI connector</p> <p>You can access the AABotInsightV3.mez data connector file from C:\Program Files\Automation Anywhere\Enterprise\Connectors\PowerBI and copy it to C:\Users\<your user="">\Documents\PowerBI Desktop\Custom Connectors to deploy the Power BI connector.</your></p> <p>Deploy Power BI connector on page 3756</p>
<p>Bot Insight APIs</p> <ul style="list-style-type: none">• All of the parameters are now optional.• The botname parameter in the Get task log data API supports multiple bot names, separated with a comma.• There are no time period limitations now on the data retrieved. <p>Bot Insight API</p>

Enterprise A2019.12 Release Notes

Release date: 18 May 2020

Review the new features, supported packages, changed features, fixed features, and known limitations in the Enterprise A2019.12 (Build 4111) release. IQ Bot Build 4088 is compatible with Enterprise A2019.12 Build 4111. There are no security fixes in this release.

- [Enterprise A2019](#)
- [IQ Bot A2019](#)
- [Bot Insight A2019](#)

Enterprise A2019

Important: This release includes a required update to your . Ensure that you complete the update to continue with your automation activities when upgrading from a previous release to this release.

[Automatically update the Bot Agent](#) on page 1302 | [Manually update the Bot Agent](#) on page 1303

To verify which version is compatible with this release, see [Compatibility with release builds](#) on page 1275.

New features

Migration from Enterprise 11 and Enterprise 10 Task Bots and MetaBots to Enterprise A2019 (currently available only to those in the Migration Early Adopter Program)

Enterprise A2019

Migration to Enterprise A2019 is currently only available to select customers through our Migration Early Adopter Program. If you are interested in learning more about this program and requirements, contact your Automation Anywhere representative.

- Migrate Task Bots and MetaBots created in Enterprise 10 to Enterprise A2019.
[Migrate Enterprise bots](#) on page 1529
- The summary report generated by the Bot Scanner now provides information about the number of bots that can or cannot be migrated to Enterprise A2019.
[Analyze Bot Scanner report for migration](#) on page 1474
- (Enterprise 11 only) Additional support is provided for packages and variables.
[Package mapping for migration](#) on page 1559 | [Variable mapping for migration](#) on page 1593
- (Enterprise 11 only) Migration APIs enable you to migrate a single Enterprise 11 bot or entire folders of bots to Enterprise A2019. Use the Repository Management API to identify bots and folders for migration.
[Migration API](#) | [Repository Management API](#)

Integrate Control Room with a remote Git repository

Enterprise A2019

Integrate the Control Room with remote Git repositories to manage bot version controls, and back up and restore bots and the dependent files. The integration ensures one-to-one mapping of bots between the Control Room and the remote Git file structure. When you perform a bot check-in, a Git commit is performed at the remote Git host.

[Integrating Control Room with Git repositories](#) on page 1762

Additional actions in the Interactive forms package

Enterprise A2019 and Community Edition

The Interactive forms package includes the following actions:

- **Set focus:** Sets the focus on the selected form element.
- **Highlight:** Highlights the selected element of a form.
- **Unhighlight:** Removes the highlight from the selected element of a form.

[Interactive forms package](#) on page 2633

New features
<p>Form builder enhancements for interactive forms</p> <p>Enterprise A2019 and Community Edition</p> <p>The form builder includes the following elements:</p> <ul style="list-style-type: none"> • Document: Use this element to render an image (.jpg) or PDF file along with the form. • Password: Use this element for a field that requires masking of the input data. <p>Create a form</p>
<p>Run Task Bot option for attended Bot Runner (Service Cloud case ID: 00453797)</p> <p>Enterprise A2019 and Community Edition</p> <p>If the default device is mapped to the Bot Agent, a user with an attended Bot Runner license in the Control Room can now use the Run Task Bot option from the bot context menu (vertical ellipsis) to run the bot.</p> <p>Considerations for running a bot on page 2207</p>
<p>New features in Universal Recorder and actions that use the recorder feature</p> <p>Enterprise A2019 and Community Edition</p> <ul style="list-style-type: none"> • Secure recording mode ensures that sensitive data is not stored in the bots. When secure recording mode is enabled, the bots do not capture application images or values. <p>Actions in the Image Recognition, Mouse, OCR, Screen, and Recorder packages support this feature.</p> <ul style="list-style-type: none"> • JRE 6 is supported on both 32-bit and 64-bit systems. • After you capture an object, you are returned to the window containing the Bot editor. <p>Actions in the Image Recognition, Mouse, OCR, Screen, and Recorder packages support this feature.</p> <p>Recording tasks in applications that run on JRE on page 2180 Secure recording mode on page 2179</p>
<p>Insert a work item action</p> <p>Enterprise A2019 and Community Edition</p> <p>The Insert work item action provides you the flexibility to insert a work item from an existing queue to another queue as part of the bot execution. You can orchestrate multiple bots, enabling optimal device utilization through the queueing mechanism of workload management.</p> <p>Workload package on page 3054</p>
<p>View error details of a work item</p> <p>Enterprise A2019 and Community Edition</p> <p>You can view the reason for a workload automation failure in the new Error section on the View work item details page.</p> <p>View work items on page 1960</p>

New features
<p>Extract text from windows</p> <p>Enterprise A2019 and Community Edition</p> <p>Use the Capture text of window action to extract text from a window and save it to a string variable. You can capture text from UNIX shells and Windows applications.</p> <p>App Integration package on page 2321</p>
<p>Store string values securely in a credential variable</p> <p>Enterprise A2019 and Community Edition</p> <p>Configure a credential variable to hold a user-provided value or a credential from the Credential Vault. A credential variable cannot be converted to another data type, and the value cannot be displayed in a message box or written to a file.</p> <p>User-defined variables: Credential</p>
<p>Preload packages for improved bot performance</p> <p>Enterprise A2019 and Community Edition</p> <p>Preload packages on your local device to shorten the bot runtime. When you preload packages used in a bot, the system skips the package download process at bot runtime, thereby improving the bot performance.</p> <p>Preload packages on page 2219</p>
<p>New features in the If and Loop packages</p> <p>Enterprise A2019 and Community Edition</p> <ul style="list-style-type: none">Execute actions based on whether the value of the source datetime variable is Equal to or Not Equal to, or is Greater than or Equal to, or is Lesser than or Equal to the value of the target datetime variable.Execute actions on migrated bots based on whether Web control exists or is active.Configure a Loop action with multiple conditions. Specify whether all or either of the conditions must be met. <p>If package on page 2619 Loop package on page 2679</p>
<p>Run a bot by inserting a file variable in the Run action</p> <p>Enterprise A2019 and Community Edition</p> <p>The Task Bot > Run action now supports a file variable input in the Task Bot to run field.</p>
<p>Configure a table variable using the Assign action in Data Table package</p> <p>Enterprise A2019 and Community Edition</p> <p>You can use this action to manually enter values, assign column names, specify the column data type (string, number, datetime, or Boolean), and move columns and rows.</p> <p>Data Table package on page 2365</p>

New features
<p>Configure Wait package actions to terminate a running bot if a condition is unsatisfied</p> <p>Enterprise A2019 and Community Edition</p> <p>Select the Throw an exception option in the Wait for screen change and Wait for window actions to show an error message and terminate a bot if the screen does not change or the window does not open or close within the specified amount of time.</p> <p>Using Wait for screen change action on page 3027 Using Wait for window action on page 3030</p>
<p>Email trigger for new emails</p> <p>Enterprise A2019 and Community Edition</p> <p>Use email triggers to start a bot when a new email message is received in the specified email service. Supported email services are:</p> <ul style="list-style-type: none"> • Microsoft Outlook • Email Server • EWS Server <p>Add an email trigger on page 3234</p>
<p>Generate a random integer from a user-specified range and assign it to a number variable</p> <p>Enterprise A2019 and Community Edition</p> <p>Use the Random action from the Number package to generate an integer in the range of -9,223,372,036,854,775,808 through 9,223,372,036,854,775,807.</p> <p>Random number action</p>
<p>Enterprise A2019 Bot Agent OS support</p> <p>Enterprise A2019</p> <p>Enterprise A2019 Bot Agent is now supported for single users on Windows Server 2019, Windows Server 2016, Windows Server 2012, Windows 8, and Windows 7 SP1.</p> <p>Bot Agent compatibility on page 1274</p>
<p>Return the Bot Agent installation path using the system variable AAInstallationPath</p> <p>Enterprise A2019 and Community Edition</p>
<p>Copy and paste actions and triggers between bots (Service Cloud case ID: 00455116)</p> <p>Enterprise A2019 and Community Edition</p> <p>Use the Copy to shared clipboard and Paste from shared clipboard icons at the top of the Bot editor to duplicate actions, triggers, and metadata at a time.</p>

New features
<p>GDPR self-reporting</p> <p>Enterprise A2019 and Community Edition</p> <p>General Data Protection Regulation self-reporting enables the Control Room administrator to run reports that include the following data elements (sensitive data will be masked in the output):</p> <ul style="list-style-type: none"> • User Bot Runner device access. • User data in associated credential vault. • Devices registered by the user. • All documents (artifacts) uploaded or updated to public or private repositories by the user. • All bots associated to the user. • Bot Insight dashboard report includes a list of all dashboards associated to this user ID.

Changed features
<p>Build 4105 replaced with Build 4111</p> <p>Build 4105 has been deprecated and replaced with Build 4111. If you have installed Build 4105 on Windows, perform a regular upgrade to get the new build. If you have installed Build 4105 on Linux, you must uninstall it and reinstall Build 4111. After you are on Build 4111, an update to Bot Agent 7.0.4789 is also required.</p> <p>Update Automation 360 to latest version on page 1363</p>
<p>User interface changes in Excel basic and Excel advanced packages</p> <p>The text field titled Cell name is now Cell address in the actions from the Excel basic and Excel advanced packages.</p>
<p>Specify the column title in the Get cell address action in the Excel advanced package</p> <p>The Specific cell option is now the Based on header option, which accepts the column title as either the column heading or the default column title.</p> <p>Using the Get cell address action on page 2502</p>
<p>Edit a work item without changing its status</p> <p>You no longer have to change the status of a new work item for editing. You can now edit work items that are in New status. Previously, you were allowed to edit the work item attribute values after changing the state of the attributes so that the edits to the work item could be saved.</p> <p>Edit work items on page 1961</p>

Changed features
<p>Mark work items for reprocessing</p> <p>The Ready to run action is now updated to Re-process so that you can mark work items that are in Failed, Data error, or On hold state to New status for reprocessing.</p> <p>View work items on page 1960 Edit queues on page 1946</p>

Fixed features	
Service Cloud case ID	Description
00560339	You can now do a second checkout of the same bot, make updates (for example delete a command) , and check it back in. The "File Not Found" error that prevented subsequent checkouts of the same bot and data deletion not actually getting deleted has been fixed.
--	Devices running an older version of the Bot Agent can now connect to A2019.12 Control Room.
--	Secure Data Store (SDS) installation on Enterprise A2019.12 is now working.
00530388	Multiple bot updates and check-ins succeed irrespective of the Enterprise A2019 version used to import the bot. Bot check-in on Cloud deployments used to fail when the bot was imported multiple times and overwritten. This issue is now fixed.
00521691	After Excel files are extracted from a .zip file, common tasks such as renaming and deleting the Excel files failed. This issue is now fixed.
00519528	Bot Scanner version 2.0.0 now works as expected. The crash issue is now fixed.
00517040	When the Email package is used in Exchange Web Services, the action loop exited after processing 10 emails. This early exit is fixed. Now all specified emails are processed before the loop exits.
00504163	When bots are run using the Open and Close actions from the DLL package in a loop, the Bot Agent window now functions correctly. The Bot Agent service does not require a manual restart after a bot is run.
00494267	Actions from the DLL package can now be run inside and outside a loop.
00494273	The Create worksheet action in the Excel advanced package now supports default sheet names for all the supported languages in Enterprise A2019.
00492554	The Sort table action in the Excel advanced package now supports OS setting for the Swedish region.

Fixed features	
Service Cloud case ID	Description
00446956	The Open action in the CSV/TXT package can now read values from files encoded with UTF-8.
00503230	The SOAP Web Service action now supports responses with non-English characters.
00522147	The <code>StringVar.String:trim</code> shorthand now trims leading and trailing spaces in a string when used in the Message box package.
--	You can now deploy bots on selected Bot Runner devices with the Run as option from the My bots page in an Control Room configured on Microsoft Azure.
--	Scheduled bots now run as expected and do not get stuck in the queue in an Control Room configured on Microsoft Azure.
--	<p>After you capture an object in a browser or application window, the browser window containing the Bot editor is now reactivated. Previously, users had to manually return to the Bot editor.</p> <p>Actions in the Image Recognition, Mouse, OCR, Screen, and Recorder packages support this feature.</p>
00475070	Exporting a report to CSV from Activity > Historical now correctly outputs the data.
00516331	You can now build a bot that contains more than one Database > Read from action that is followed by a Loop action, within the same database session. Each time the bot runs the Read from action, the query results are refreshed, and the loop will only iterate on the current results.
00509735	Auto Login now works when you deploy a bot as an unattended Bot Runner on a Horizon Virtual Desktop Infrastructure (VDI) session.
00509831	Prompt package actions now support long inputs. The user interface displays up to 512 characters. If the input is longer than 512 characters, the rest appear as a tooltip when the user hovers over the prompt box.
00518566	You can now use the recorder feature within actions to select window titles and file paths on a device that has proxy authentication enabled. Previously, users had to manually enter this information because they could not access the device through actions while building a bot.
00475107	The Japanese language now supports column names when using CSV-related actions.

Fixed features	
Service Cloud case ID	Description
00532894 00532253 00539241	When you reimport a bot using exported files from a different Control Room of the same version (from version A2019.12 onward) and choose to overwrite the bot, you can now check-in that bot. The error generated when you choose the overwrite option that prevented check-in of the reimported bot is now fixed only for version A2019.12 onward. Reimporting bots on A2019.11 and older releases are not supported at this time.
00521222, 00525635, 00529274, 00526613, 00526489, 00530609, 00530787, 00533445, 00535366, 00530900, 00538070	The progress of a Task Bot is not stalled at line 0 and does not remain in queue to run when you deploy the bot on a Bot Runner. The status of the device reflects Yet to Be Determined until the device is available to process the items.
00421195	You can now create a work queue by providing details such as the queue name, queue owners, participants, consumers, and work item structure. This feature is available from Workload > Queues > Create Queue .
00533465	When you delete any action from an existing bot, the corresponding metadata for the deleted action is now removed from the bot.

Known limitations	
If you are running A2019.12 Enterprise On-Premises with build 4105 on Linux and want to use Build 4111, then you must uninstall Build 4105 and do a fresh installation of Build 4111. You cannot perform an upgrade to get Build 4111. See Uninstall Automation 360 On-Premises from Linux server on page 1245. A2019.12 Enterprise On-Premises on Windows can be upgraded as normal.	
The Send reset password email functionality (from the Administration > User page) to help users reset their password is not working and returns a 401 error. Users should use the "Forgot password?" flow to reset their password.	
Folders created using the Folder > Create action cannot have names that contain system actions or device references such as AUX, CON, LPT, NUL, and PRN.	
Mouse click with key combo for preset triggers in SAP application is currently not supported.	

Known limitations
<p>The following are known limitations in the form builder:</p> <ul style="list-style-type: none"> • If the character limit is set to 0 and the field is marked necessary for the Password element in a form, an error message is displayed when you run the bot. • An invalid file path associated with the Document element in a form displays an error message when the Get and Set actions of the interactive forms are used. • A blank page is displayed on the form builder when you paste content into any of the existing form elements. • A form that is linked to a bot through the Display action of interactive forms is displayed in front of all other windows, even when the Always display form window in front option is not selected.
<p>Cloud-enabled deployments only support local authentication.</p>
<p>Linux is not supported for Cloud-enabled On-Premises installations.</p>
<ul style="list-style-type: none"> • Work items might be queued on the View queues page as the number of devices in the device pool increase. This should not affect the bot execution because the queues are cleared when the work items are processed. • You cannot simultaneously insert work items from multiple devices in a queue. • You cannot create a draft queue. • When you insert a number value using the Insert work item to a queue, the system shows an incorrect value. For example, if you insert 023456789, the system shows 2.3456789E7. • When you add more devices to a device pool that is processing workload management automations, the newly added devices might not immediately pick up the pending work items. <p>Workaround: Pause and resume the workload management automation.</p>
<p>If a device goes idle while processing workload management work items in a device pool, it will not process the work items. However, those work items can be processed by other devices in the pool.</p>
<p>When you create a form with using the Document element and provide an incomplete file path, your bot will not run successfully.</p>
<p>When you create a form and specify that a password is required, the password length can be set to 0.</p>

IQ Bot (Build 4088)

Enterprise A2019.12 Build 4111 is compatible with IQ Bot A2019 (Build 4088).

The IQ Bot On-Premises version supports all the features and functionality available in IQ Bot Version 6.5.2.

[IQ Bot feature comparison matrix](#)

Review the compatibility of the IQ Bot On-Premises version with the corresponding Automation Anywhere Control Room On-Premises version.

[Automation 360 IQ Bot version compatibility](#) on page 957

The IQ Bot Cloud version is available for this release and supports all features and functionality available in IQ Bot Version 6.5.2. This version provides users with automatic provisioning for up to three environments such as Development, Test, and Production. Users can migrate learning instances between environments using APIs.

The IQ Bot Community Edition and the free trial version are available for this release. Both versions have feature parity and are based on IQ Bot Version 6.5.2.

Known limitations
<p>IQ Bot On-Premises</p> <p>IQ Bot registration is not supported for Cloud-enabled On-Premises installations.</p>

Bot Insight

New features
<p>View filtered data of the dashboard widgets</p> <p>Enterprise A2019 and Community Edition</p> <p>The Bot Insight dashboard widget filter enables you to apply filters across the widgets in the dashboard to display filtered data. While the dashboard filters enable you to view different combinations of information from a single dashboard, the widget filters enable you to drill down to information from the already filtered data. You can also save and publish the custom dashboards with the preset widget filters.</p> <p>Bot Insight dashboard filter on page 3741</p>
<p>Retrieve information from the Bot Insight API, and generate and visualize data analytics on Microsoft Power BI</p> <p>Enterprise A2019 and Community Edition</p> <p>The Automation Anywhere custom connector enables you to establish a secure connection to Microsoft Power BI, and generate and visualize data analytics. You can select the Bot Insight APIs in Microsoft Power BI and apply specific parameters for each of the APIs. The custom connector transforms the Bot Insight API responses to data model visualizations in Microsoft Power BI.</p> <p>Data connector for Power BI on page 3755</p>
<p>Preview and analyze business information in the default business dashboard</p> <p>Enterprise A2019 and Community Edition</p> <p>The Data Preview menu in the Bot Insight default business dashboard displays information that is logged for multiple Analyze Open and Close commands used in the bot. The Preview Data menu does not appear when you perform a comparison between the default dashboards.</p>

New features

API enhancements

Enterprise A2019

The `deletetasklogdata` API is updated to include the `runId` parameter. The `getbotrundata` API retrieves information about the vital statistics of the bot. The `getaudittraildata` API retrieves information about the audit data that is logged for all users.

[Bot Insight API](#)

Related concepts

[Migrate to Automation 360](#) on page 1436

Migration (upgrade) is the process of moving your data and bots from Enterprise 11 or Enterprise 10 to Automation 360. Migration includes but is not limited to replicating and updating your existing database and repository, converting your bots to the Automation 360 format, and migrating learning instances for IQ Bot and dashboards for Bot Insight.

Related tasks

[Update Automation 360 to latest version](#) on page 1363

Update Automation 360 On-Premises to the latest version to get new features and enhancements that help improve and scale your automation programs.

[Updating Automation 360 IQ Bot](#) on page 1416

Update Automation 360 IQ Bot On-Premises to the most recent version for all the latest features and enhancements.

Enterprise A2019.11 Release Notes

Review the new features, supported packages, changed features, fixed features, and known limitations in the Enterprise A2019.11 (Build 3337) release. There are no security fixes in this release.

- [Enterprise A2019](#)
- [IQ Bot](#)
- [Bot Insight](#)

Enterprise A2019

Important: This release includes a required update to your . Ensure that you complete the update to continue with your automation activities when upgrading from a previous release to this release.

[Automatically update the Bot Agent](#) on page 1302 | [Manually update the Bot Agent](#) on page 1303

To verify which version is compatible with this release, see [Compatibility with release builds](#) on page 1275.

New features

Migrate 11.x Task Bots and MetaBots to Enterprise A2019

Enterprise A2019

- Additional support is provided for packages and variables.
[Package mapping for migration](#) on page 1559 | [Variable mapping for migration](#) on page 1593
- You can now migrate MetaBots (with DLLs) and their components from Enterprise 11 to Enterprise A2019. You cannot migrate screen-based MetaBots.
[How MetaBots are migrated](#) on page 1535
- Use the Bot Scanner to analyze MetaBots to determine if they can be migrated.
- Verify the list of certified Enterprise 11 bot versions available for migration: [Supported Control Room versions for migration](#) on page 1446

Bot Store integration with the Control Room

Enterprise A2019

You can now access the Bot Store from within the Control Room. You can install, configure, and run the Bot Store bots within the Control Room.

As a registered user, you can log in to the Bot Store from the Control Room and access all your downloads. You can install bots and packages from your downloads to the Control Room private repository. You can also submit your existing bots and packages from the Control Room to the Bot Store.

[Bot Store](#) on page 3440

Use interactive forms in a bot

Enterprise A2019

Interactive forms provide a form builder experience for users to build interfaces for submitting and regrouping data being used to send and receive data from various applications within their attended automation process. Users with Bot Creator and Bot Runner license can use the interactive forms package to control and manage the form flow within a bot during runtime. Actions performed by users on the interactive forms can be monitored to execute logic using subtasks.

Interactive forms are first-class citizens within the bot repository and have the same workflows for moving forms between public and private workspaces, and for export or import actions. No additional licenses or permission are required to use interactive forms.

Action items in the interactive forms can be used to manage various forms within a bot.

[Using interactive forms](#) on page 3214

New features
<p>Reuse an identical value between bots by configuring a global value in the Control Room Enterprise A2019 and Community Edition</p> <p>A global value enables users to reuse an identical value between bots instead of creating a new variable for each bot. Global values remain constant for all users and bots in an Control Room instance. A user with the <code>AAE_admin</code> role can configure a global value with a default value and enable non-admin users to overwrite the value to use in their bots.</p> <p>Global values on page 2260 Create a global value on page 2261 Overwrite the default value on page 2262</p>
<p>Workload enhancements</p> <p>Enterprise A2019 and Community Edition</p> <ul style="list-style-type: none">• Monitor the progress of ongoing workload automations. You can also pause, resume, or stop the automations as required.• Configure and edit workload automations to ensure that the automations are deployed seamlessly to unattended Bot Runner devices. Execute the workload automations with priority or round-robin mode from the Devices > Edit Device pool page.• Set the output status of the work item processed in the Control Room on the Queues and Work item details page using the <code>\$workItemResult\$</code> variable in a Task Bot.• Edit work items that are in Ready to run, On hold, Data error, or Failed state.• Set the individual work item status to Mark complete, Defer, or Re-process from the Edit work item page or in bulk from the View queues page. <p>View automation of a queue on page 1952 Edit device pools on page 1820 Edit work items on page 1961 Use Work Item variables on page 2253</p>
<p>Download a file from the Control Room to your device</p> <p>Enterprise A2019 and Community Edition</p> <p>Use the Download CR file action from the File package to download a file from the Control Room to your device.</p> <hr/> <p>Note: You cannot use this action to download a bot or a file from the <code>My Scripts</code> folder.</p> <hr/> <p>File package on page 2513</p>

New features

Clone a bot or files

Enterprise A2019 and Community Edition

Create a read-only copy of a selected bot or file from the public repository to the private repository. The clone is a local copy for the same user and will not be updated with the public repository copy automatically. This provides a testing environment experience for Bot Creators to make and validate changes locally and take advantage of reusable Task Bots in concurrent developments by reusing an existing bot or file as a dependency.

- Cloned bots and files cannot be edited, renamed, or moved.
- Cloned bots and files can be deleted from a private repository.
- Users can create a copy of the cloned bot.
- A cloned bot can be used in Run Task action in another bot.
- Cloned bots and files can be added as a manual dependency for another bot.

New features in the If package

Enterprise A2019 and Community Edition

- Configure an **If** action with multiple conditions.
Specify whether all or either of the conditions must be met.
- Verify whether JavaScript, Task, or VBScript ran successfully or not.
- Verify whether a string variable is empty or not.
- Execute actions only if two strings have matching uppercase and lowercase letters.

[If package](#) on page 2619 | [Example of using a conditional statement](#) on page 3078

Universal Recorder enhancements

Enterprise A2019 and Community Edition

Universal Recorder now enables you to:

- Automate in Java applications that run using Java Runtime Environment (JRE) 9, 10, and 11.
- Capture objects in tables in Oracle EBS applications.
- Automate interactions with user interface objects in the taskbar, desktop, or currently active window. This option is available in the window selection drop-down list in the following packages:
 - Image Recognition
 - Mouse
 - Recorder
 - Screen
 - Simulate keystrokes
 - Window

Changed features
<p>Change in the Dictionary > Remove action</p> <p>The Dictionary > Remove action offers the option to assign the removed value to a variable.</p> <p>Dictionary package on page 2406</p>
<p>The Update migration status permission name has been changed to Allow a bot-runner user to run migrations. All functionalities remain the same.</p>
<p>When multiple bots are scheduled to run on the same user or device, the bots are now queued and run whenever the previous bots completes its run.</p> <p>Service Cloud case ID: 00440072</p> <p>Scheduled activities on page 2056 Workload management on page 1931</p>

Fixed features

Service Cloud case ID	Description
00483976	When the copy function is used, nested subfolders were not visible when users clicked browse to search through directories. This issue has been fixed.
00457550	When a user checks out a bot that uses the Run action to run child bots, the child bots are now cloned from the public repository to the private.

Service Cloud case ID	Description
00492706	When a user exports a bot from another Control Room and imports that same bot to a new Control Room, the imported bot and enabled packages now show all required actions.
00482934	Bot deployments and website launches are now optimized for quicker process.
00421864	When a user is viewing historical activity details in Historical activity , the run option is no longer displayed.
00505120	When bots fail the check-in process, the contents are now restored in the Private repository.
00488504	Bots with more than 100 dependencies are now exported successfully without an error, even if the parent bots are in the list of those 100 dependencies.
00444902	When the Control Room is used in Internet Explorer 11, the Bot Agent is now compatible and the UI is rendered properly.
00454079	When the Capture action in the Recorder package is used, content in the browser is captured successfully.
00460530	In a developer Control Room, a user can now successfully import a bot with cyclic dependency.
00493605	In the Run action in the Task Bot package, the Assign the output to variable (optional) option now functions properly when an assigned variable is removed.
00486734	When the Set cell action in the Excel advanced or Excel basic package is used with multiple Microsoft Excel files, the values of the Active cell operation now activate and set the cells accordingly in the respective Microsoft Excel file.
00530915	Migration is not advisable for Enterprise 11 customers using Workload Management due to known issues.
--	You can now add date variables in the Vertical Bar Graph widget in the Bot Insight Business dashboard.
00475173	All fields of the Recorder > Capture action have been translated to Enterprise A2019 supported languages.
00476820	When a Bot Runner machine is logged off, the device shows the state as Disconnected in the Control Room. Previously, the device showed the state as Connected in the Control Room.

Known limitations
MetaBot logic that uses a DLL function call with one or more parameters migrates successfully. However, when you run the migrated bot, an error is shown.

Known limitations
Global values of the Date time data type cannot be used in actions.
The Enterprise A2019 On-Premises Control Room installation does not support the semicolon (;) special character in the Windows user password. The installation fails if you use this special character.
When data is exported into a CSV file from User Management, Audit Logs, and Roles Management for all locales except English, the respective language is not displayed correctly. Workaround: Export to a CSV file and access a Microsoft Excel file. Import and save that CSV file as a CSV with UTF-8 encoding.
Users must explicitly enable the feature flag for the forms feature in the On-Premises build. Note: Go to Automation Anywhere support site for more information: Interactive forms not available in Automation 360 v.11 On-Premises (A-People login required)
Forms with many radio buttons and check boxes in the same row are not rendered correctly.
Only the Form Events and UI Triggers event types are supported by event loop as the file or folder triggers and hot keys have issues.

IQ Bot

The IQ Bot On-Premises version is available for this release with additional features or updates since the last release. This IQ Bot version supports all the features and functionality available in IQ Bot Version 6.5.2.

[IQ Bot feature comparison matrix](#)

Review the compatibility of the IQ Bot On-Premises version with the corresponding Automation Anywhere Control Room On-Premises version.

[Automation 360 IQ Bot version compatibility](#) on page 957

The IQ Bot Cloud version is available for this release and supports all features and functionality available in IQ Bot Version 6.5.2. This version provides users with automatic provisioning for up to three environments such as Development, Test, and Production. Users can migrate learning instances between environments using APIs.

The IQ Bot Community Edition and the free trial version are available for this release. Both versions have feature parity and are based on IQ Bot Version 6.5.2 .

New features
Upgrade from earlier versions of IQ Bot to the latest IQ Bot On-Premises IQ Bot On-Premises If you are using any of the earlier versions of IQ Bot (5.3.x or 6.5.x), you can upgrade to IQ Bot A2019 Build 3337 On-Premises. Updating Automation 360 IQ Bot on page 1416

New features
<p>Use API to migrate learning instances between environments</p> <p>You can use an API to migrate learning instances in IQ Bot On-Premises.</p>
<p>Access IQ Bot from the Control Room dashboard</p> <p>Enterprise A2019 and Community Edition</p> <p>You can access IQ Bot from the Control Room through a link, provided you have registered IQ Bot in the Control Room. Otherwise, the IQ Bot section remains hidden.</p>

Known limitations
<p>IQ Bot On-Premises</p> <p>IQ Bot installation fails if the user password contains any of these special characters: single quotation mark ('), quotation mark ("), or semicolon (;).</p>
<p>IQ Bot Cloud</p> <ul style="list-style-type: none"> • ABBYY FineReader Engine is the default OCR for data extraction in IQ Bot Cloud. • Data validation using Python script is not supported. • IQ Bot extensions for custom extraction are not available.
<p>IQ Bot On-Premises and IQ Bot Cloud</p> <p>When you upload vector PDF documents to a new learning instance, a few documents are identified as unclassified. Alternatively, if you convert the documents from PDF to TIFF and upload them, the documents are processed successfully.</p>

Bot Insight

New features
<p>View filtered data of Bot Insight dashboards</p> <p>Enterprise A2019</p> <p>The Bot Insight dashboard filter enables you to apply filters across dashboards to display filtered data on the dashboard widgets. The filter enables you to view different combinations of information from a single dashboard, thereby eliminating the need to maintain separate dashboards for different sets of users.</p> <p>Bot Insight dashboard filter on page 3741</p>

New features

View business analytics for multiple transactions simultaneously

Enterprise A2019

The **Multiple Transaction Names** menu displays transactional information about bots with multiple **Analyze- Open** and **Close** commands. Each **Analyze- Open** and **Close** command is considered as a transaction, and each transaction is displayed as a unique block in the data preview section. The number of rows for each unique transaction block is limited to 100.

AI Sense Recorder to capture objects from remote applications

This is a Beta release on Enterprise A2019 (Cloud deployment only) and Community Edition

Record a task and capture objects using the AI Sense Recorder from applications that are usually accessed remotely and with a complex user interface (UI).

[Record a task with AI Sense Recorder](#) on page 2181

New features
<p>Manage your automation as Work Items for resource optimization and workload automation</p> <p>Enterprise A2019 and Community Edition</p> <p>Divide your automation into small, logical modules called Work Items using the new feature. Process these Work Items simultaneously using queues to ensure that your organization's automation goals are achieved with optimum resource utilization.</p> <p>Use the workload module to create and manage workload queues and run bots on unattended Bot Runners through the workload queues. Also, pass the Work Item attributes or values to the bot from the Control Room when you Run bot with queue with the help of Work Item variables.</p> <p>Workload management on page 1931</p>
<p>Install Control Room on Red Hat Enterprise Linux 7.7 and Linux CentOS 7.7</p> <p>Enterprise A2019</p> <p>Use the command line to install your Control Room on your Linux servers in the datacenter.</p> <p>Installing Control Room on Linux on page 1237</p>
<p>Use wildcard characters in folder and file path fields in the Encrypt and Decrypt actions</p> <p>Enterprise A2019 and Community Edition</p> <p>Substitute an asterisk (*) for one or more unknown alphanumeric characters or symbols. This maximizes the search results by returning all folders and files that contain the string that you have specified.</p> <p>Encrypt Decrypt</p>
<p>Use system variables to return data from the computer that is connected to the running Bot Agent</p> <p>Enterprise A2019 and Community Edition</p> <p>You can use the following system variables:</p> <ul style="list-style-type: none">• AAControlRoom: Returns the URL of the Control Room.• CPUUsage: Returns the percentage utilization of the CPU.• RAMUsage: Returns the RAM usage in megabytes.• OSName: Returns the operating system.• TotalRAM: Returns the total amount of RAM available.

New features
<p>Automate tasks in Oracle EBS and Forms with the Universal Recorder Enterprise A2019 and Community Edition</p> <p>Open Oracle EBS applications in a browser as Java Web Start applications or as a thick client. The Universal Recorder can capture the following objects:</p> <ul style="list-style-type: none"> • Window/Tab • Button • Text box • Label (read-only) • Radio button • Check box • Table/Grid • Scroll bar • Menu • Combo-box/Drop-down list

Changed features
<p>Updated layout for the summary report generated by Bot Scanner</p> <p>The layout of the summary report is updated to provide information about the number of bots scanned, and the commands and variables used in the scanned bots that are supported in Enterprise A2019.</p> <p>Analyze Bot Scanner report for migration on page 1474</p>
<p>Python script and VBScript packages return output without quotation marks</p> <p>The actions in the Python script and VBScript packages now return output without any quotation marks. For example, if the action previously returned "ABC" as the output, now the action returns only ABC.</p>
<p>Use Microsoft SQL Server address as alias for database</p> <p>Service Cloud case ID: 00401484</p> <p>The Control Room now supports using a Microsoft SQL Server address as alias for a database during installation.</p> <p>Automation 360: Steps to change database server post Control Room installation (A-People login required)</p>

Fixed features

Service Cloud case ID	Description
00463210	In a virtual machine using Remote Desktop Protocol, the Keystrokes action now functions properly without prompting a special characters error.
00455359, 00466407, 00475122	When the Control Room is used in Google Chrome, renaming a folder in the My bots section no longer causes the browser to crash.
00440659	In the Data Table package, the Create folders/files if it doesn't exist option in the Write to file action now functions properly and does not create a file when the option is not selected.

Service Cloud case ID	Description
00377861, 00466104	When you install Enterprise A2019 On-Premises with Amazon Relation Database Service (RDS) and there is no internet connectivity, the installation now completes successfully.
00472738, 00496476	In the Control Room, the bot now runs successfully without prompting an interactive bot error message in any circumstance.
00472655	In the Loop action, selecting the Cell range in the Loop through option now functions properly with the For each row in worksheet in the Iterator option.
00475040	When a bot is developed in Google Chrome, the pause and resume options now function correctly.
00445671	The time taken to connect to the Control Room is now less than 2 minutes after you restart the Control Room services.
00421864	You can now configure your Bot Agent using the Google Chrome browser. The following error message is no longer displayed: <code>Please use Chrome to configure your bot agent.</code>
00462095	Bot compilation time has decreased, so it takes less time for the bot to run. Previously, some bots took up to 40 seconds in pre-processing mode.

IQ Bot

The IQ Bot On-Premises version is available for this release with additional features or updates since the last release. This IQ Bot version supports all the features and functionality available in IQ Bot Version 6.5.2.

New features
<p>IQ Bot On-Premises unified database</p> <p>IQ Bot Build 2545 On-Premises now supports a unified database. You have to run a migration script to migrate the databases of Builds 1089, 1598, and 2079 to Build 2545.</p> <p>Run IQ Bot On-Premises database migration script on page 1416</p>

Note: The version number in the IQ Bot installer is incorrect and will be fixed in the next release.

Bot Insight A2019

New features
<p>New Bot Insight homepage</p> <p>The new homepage displays all the available dashboards in a single page and enables you to directly access the dashboard of your choice. The smart search functionality enables you to search for dashboards in the Search text field. The homepage also enables you to bookmark your favorite dashboards and to sort the dashboards based on the following parameters:</p> <ul style="list-style-type: none"> • Dashboard Name • Type • Total Views • Last Refreshed <p>Bot Insight dashboards on page 3728</p>
<p>Operations dashboard</p> <p>View information about the bots that are deployed on different Bot Runner machines and their statistics based on the performance from the Bot Insight Operations dashboard. You can use this information to enhance productivity and take measures based on real-time information for RPA deployments.</p> <p>You can directly access the Bots and Audit dashboards from the hyperlinks in the Operations dashboard.</p> <p>Operations dashboard on page 3731</p>
<p>Transaction data</p> <p>View data that is aggregated and logged by the bots when they are deployed in the Bot Runner machines by using the Transaction data feature in the Profile menu. You can access this feature from the Business dashboard.</p> <p>Business dashboard on page 3734</p>
<p>Exporting data from widgets</p> <p>Export data that is generated by the various smart widgets to comma-separated value (CSV) files on your local drive from the Custom Business dashboard. The export file for all the widgets, except the Data Table Chart and the US Map, contains the following headers:</p> <ul style="list-style-type: none"> • Group • Subgroup • Metric • Volume <p>The Data Table Chart export file contains all the headers that are present in the Data Table Chart. The US Map export file contains the state codes, metric values, and the volume headers.</p> <p>Exporting data from a dashboard widget on page 3755</p>

New features

Visualization updates

Customize the widgets on the Bot Insight dashboards to gain insights for specific scenarios. The following widgets are added to Bot Insight:

- **Heat Map**
- **Data Table Chart**

[Bot Insight visualizations](#) on page 3751

Known limitations

Using the Universal Recorder in Oracle EBS applications:

- The **Select item by text** action does not retrieve the value of a selected **ListView** object.

Workaround: Manually enter the item value after capturing the object control or use the **Select item by index** action.

Note: Item index count starts at 1.

- At runtime, the **Select item by text** and **Select item by index** actions do not appear to select the item specified in a **PageTab** object, but the bot successfully executes the action.
- At runtime, the **Select item by text** and **Select item by index** actions do not appear to select the item specified in a **ComboBox** object, but the bot successfully executes the action.

In Enterprise A2019 On-Premises, the following activities are currently not logged in the workload logs:

- Create a queue
- Create a device pool
- Create a bot
- Run a bot with a queue

You can access the logs from the C:\ProgramData\AutomationAnywhere\Logs folder.

Enterprise A2019 (Build 2094) Release Notes

These release notes describe new features, changed features, fixed features, security fixes, deprecated features, and known limitations in Enterprise A2019 (Build 2094).

To verify which version is compatible with this release, see [Compatibility with release builds](#) on page 1275.

Enterprise A2019 Build 2094

Build 2094 contains updates for the following:

- [Enterprise Community Edition](#)
- [Bot Insight A2019](#)
- [IQ Bot A2019](#)
- [On-Premises](#) (Build 2079)

New features in Build 2094

Feature	Description
Migration	<p>Migrate Enterprise 11.3.x Task Bots to Enterprise A2019.</p> <ul style="list-style-type: none"> • Run the Bot Scanner (previously called the pre-migration utility) to analyze if your Enterprise 11.x bot (currently only 11.3.1, 11.3.2, and 11.3.2.x versions are supported) can be migrated to Enterprise A2019. The utility generates a summary report in HTML format and a separate report for each bot in XML format. Bot Scanner for migration on page 1469 • Migrate multiple Task Bots with dependent Task Bots using a single Run-as user. Migrate Enterprise bots on page 1529 • As part of the bot migration process, you can identify previously migrated Task Bots on the bot selection page and preview a list of the dependent Task Bots before finalizing the migration. Migrate Enterprise bots on page 1529 • Analyze the status of individual bot migrations and identify any unsupported commands or attributes associated with the migrated bot and its dependencies. View migration reports on page 1614 • Additional support is provided for packages and variables. Package mapping for migration on page 1559
SAML 2.0	<p>Switch an authenticated environment Control Room database to a SAML identity provider (IDP). Set up SAML authentication on page 1330</p>

Feature	Description
Bot Deploy API	<p>The Bot Deploy API now includes / automations/deplo y and is introduced to support the runAs user feature for Bot deployment.</p> <ul style="list-style-type: none"> • The Bot Deploy API works only in Enterprise public accounts, and not in Community Edition. • The API supports callback URL for environments that have both the Control Room and callback server on the same network.
Geo Presence	<p>The Geo Presence feature is a multi-tenant, secure, scalable, Cloud Control Room enhancement to securely communicate with users and Bot Runners over a customer network.</p>
Exchange Web Services support	<p>Actions in the Email package enable users to automate email-related operations using Exchange Web Services#(EWS).</p> <p>Email package on page 2431</p>
Variables in place of an index or key value	<p>Data table, dictionary, list, and record type variables can express index and key values as variables.</p> <p>Variable types on page 2242</p>
Copy bot	<p>The copy bot functionality retains the metadata of the original bot, including captured images, recorded objects, called files, and child bots.</p> <p>Copy a bot on page 2220</p>
Excel actions to retrieve cell, column, or row location	<p>The following actions enable users to retrieve location information from an Excel sheet and save it to a variable.</p> <ul style="list-style-type: none"> • Get cell address • Get column • Get row
Recorder enhancements	<p>Users can discard the most recently captured object while the Recorder is running.</p>

Changed features

Feature	Description
Office 365 packages authorization	<p>Authorize each Office 365 package separately through the Connect package in each package.</p> <p>Using Connect action in Microsoft 365 Calendar package on page 2709</p>

Fixed features

Feature	Description
Bot Agent	In the Control Room, upgrading to the latest Bot Agent version now successfully executes the bot without any prompted error messages. See Switch Bot Agent to a different Control Room on page 1291.
Excel advanced package	In the Excel advanced package, the Close action now terminates only a specific open session as defined by the session name .
Keystrokes	The Keystrokes command now functions properly with the Japanese keyboard layout.

Security fixes

The security fixes in this release have not changed since the previous release. For a list of these fixes, see [Enterprise A2019 \(Builds 1598 and 1610\) Release Notes](#) on page 706.

Deprecated features

The deprecated features in this release have not changed since the previous release. For a list of these deprecations, see [Enterprise A2019 \(Builds 1598 and 1610\) Release Notes](#) on page 706.

Known limitations in Build 2094

Migration

- When selecting a bot for migration, values for the **Last Migrated** and **Migrated By** columns might differ for the same bot in the **Available Files** and **Selected** tables.
- The "System" value in the **Migrated By** column indicates that the bot has not been migrated previously.
- When viewing commands and variables associated with each migrated bot, you should only see the unsupported commands and variables. Currently, all commands and variables are shown.

IQ Bot Build 2079

IQ Bot On-Premises version is available for this release with no additional features or updates since the last release. This version is based on IQ Bot Version 6.5.2 feature and functionality.

[IQ Bot feature comparison matrix](#)

IQ Bot On-Premises version is compatible with the corresponding Automation Anywhere Control Room On-Premises version.

[Automation 360 IQ Bot version compatibility](#) on page 957

For a fresh Control Room installation, the user has to upload the IQ Bot package manually. See [Add packages to the Control Room](#) on page 1842 for details.

Go to Automation Anywhere support site to download the package:

[A-People Downloads page \(Login required\)](#).

IQ Bot fixed features

The fixed features in this release have not changed since the previous release.

IQ Bot security fixes

The security fixes in this release have not changed since the previous release.

IQ Bot deprecated features

The deprecated features in this release have not changed since the previous release.

IQ Bot known limitations

There are no new known limitations in this release.

Bot Insight new features in Build 2094

Feature	Description
Visualizations	The Visualization widget in the Bot Insight dashboard provides a host of highly customizable widgets that you can use to gain insights on specific scenarios. Vertical and horizontal Clustered and Stacked bars are added. Adding a dashboard widget on page 3750

Bot Insight changed features

The changed features in this release have not changed since the previous release.

Bot Insight fixed features

The fixed features in this release have not changed since the previous release.

Bot Insight deprecated features

The deprecated features in this release have not changed since the previous release.

Bot Insight known limitations

The known limitations in this release have not changed since the previous release.

Enterprise A2019 (Builds 1598 and 1610) Release Notes

These release notes describe new features, changed features, fixed features, security fixes, deprecated features, and known limitations in Enterprise A2019 (Builds 1598 and 1610).

To verify which version is compatible with this release, see [Compatibility with release builds](#) on page 1275.

Enterprise A2019 Builds 1598 and 1610

Build 1598 contains updates for the following:

- [Enterprise Community Edition](#)
- [Bot Insight](#)
- [IQ Bot](#)

Build 1610 contains updates for the following:

- [On-Premises](#)
- [Bot Insight](#)
- [IQ Bot](#)

New features in Builds 1598 and 1610

Feature	Description
Pre-migration utility for On-Premises	<p>The Automation Anywhere pre-migration utility evaluates your 11.x bots for migration to Enterprise A2019.</p> <p>Run the pre-migration utility to verify whether your existing 11.x bots can be migrated to Enterprise A2019. Use the summary report generated by the utility to identify the bots that can and cannot be migrated and decide if you want to start the migration.</p> <hr/> <p>Note: This is an initial version of the pre-migration utility. We plan to include updates to the utility in upcoming releases to help migrate most of your bots.</p>
On-Premises Windows installer	Enterprise A2019 On-Premises Windows installer is certified for Azure.
Bot Creator and Bot Runner on Azure Cloud	Users can create and execute bots for devices on Azure Cloud.
Action localization	Labels, buttons, and tooltips are localized to the supported language set.
Updated action packages	<ul style="list-style-type: none"> • Additional REST Web Service error codes for better troubleshooting of API calls • PGP package for encrypting and decrypting files • Improvements to SAP actions
Control Room to a SAML-based, SSO-authenticated Control Room	Enterprise A2019 integrates with SAML identity providers (IDPs). Post installation, administrators can switch the Control Room to a SAML-based, SSO-authenticated Control Room.
Move email messages to different folder	The Move message command enables the user to move all the filter-matched emails to a different folder.

Fixed features

The fixed features in this release have not changed since the previous release. For a list of these features, see [Enterprise A2019 \(Builds 1082 and 1089\) Release Notes](#) on page 712.

Security fixes

The security fixes in this release have not changed since the previous release. For a list of these fixes, see [Enterprise A2019 \(Builds 1082 and 1089\) Release Notes](#) on page 712.

Deprecated features

The deprecated features in this release have not changed since the previous release. For a list of these deprecations, see [Enterprise A2019 \(Builds 1082 and 1089\) Release Notes](#) on page 712.

Known limitations in Builds 1598 and 1610

- IQ Bot is not supported in Automation Anywhere Cloud and users cannot register any IQ Bot instance with the Cloud Control Room.
- If a bot is deployed on a device, no other bots can be deployed on that device until the first bot has completed the deployed task.

- When deploying a bot using Unattended Bot Runner on a virtual machine with Windows 10 desktop, users have to enable remote access to the device (**Control Panel > System Properties > Allow Remote Access**).
- Deploying a bot with Bot Runner on a locked device will leave that device in an unlocked state.
- A Bot Creator is not able to view devices as assigned by the Control Room administrator. With this release, changes to the basic role has removed the **View and manage all devices** permission so that unless this permission is expressly granted by the Control Room administrator, the Bot Creator will no longer be able to see other devices in the Control Room. Bot Creators can register their devices directly; however, they will not be able to see the other devices in the Control Room.
- Unable to deploy bots from a private workspace using the wizard. Bot Creators can deploy bots from the editor.
- If users have set up Active Directory for Control Room authentication, changing to SAML or Control Room Database is not supported.
- Device pool administrators can delete a device pool after automation is scheduled and assigned to the pool.
- Users without SMTP can still import bots and packages.
- When users delete a bot from the Public workspace, the same bot is deleted from the Private workspace as well.
- Elastic Search Disaster Recovery backup is not supported.
- Using the Run Task action with the child task using triggers is not supported.
- User cannot export a bot with dependencies if that user does not have access to any of the related dependencies.
- Users cannot check out bots if they are linked through circular dependencies.
- Minimizing the window for some Microsoft Active Accessibility apps, such as Notepad, Calculator, or Remote Desktop Applications, can cause the operation to fail.
- UI Automation, such as Snagit Editor Window for example, will not work in the background unless expressly minimized.
- UI Triggers are not generating events with Snagit Editor or Inflow app.
- Applications such as calculator use different technologies on Windows 10 vs. Windows 2012 or other servers. In these cases, when a bot is created in one server configuration, the bot cannot be carried to another server. User triggers in these cases will not trigger bot deployment and there are no errors in the trigger listener or node manager logs.
- UI Triggers that are configured with multiple triggers are taking as much as 25 seconds to complete.
- UI Triggers with a single capture and a filter do not work with files larger than 2 MB.
- Button events where a user is switched from one window to a new window of an application fail to deploy a bot when listening for UI Triggers.
- For Automation Anywhere Elastic Search Service users, the `C:\ProgramData\AutomationAnywhere` folder has to be removed before installing Enterprise A2019.
- Users cannot enable SMTP with TLS for the On-Premises version of the Control Room (On-Premises only).
- User credentials are not editable (On-Premises only).
- Even when a newly added device is registered correctly, the indication icon does not turn green.
- **Activity - In Progress** table is not cleaning event records until the user performs a hard refresh (F5) of the browser.
- Domains are not shown for the **Device/Run as** tab when creating a role. This option is also missing when running a bot.

- Node manager is not able to establish a handshake SSL connection to the Control Room running on SSL certificate (On-Premises only).
- Repository Management API is incomplete; there is only one URL in the Swagger file.
- Device pools display completed automations, not scheduled automations.
- If a user is not the device pool administrator, the devices are not correctly displayed when editing a device pool.
- For an Unattended Bot Runner, with a device assigned and auto-login credentials set, and **Run as self** selected, the **Run now** option is disabled.
- When a user is running a bot from the Run Wizard and the Bot Agent requires an update, after the user has updated the agent from the pop-up box, the user cannot deploy the bot until the user navigates back to the previous page and returns to the workflow to run the wizard.
- Folder triggers do not deploy bots when a folder change event occurs.

IQ Bot Builds 1598 and 1610

IQ Bot On-Premises version is available for this release with no additional features or updates since the last release.

IQ Bot changed features

IQ Bot is compatible with A2019 Builds 1598 and 1610.

IQ Bot fixed features

The fixed features in this release have not changed since the previous release.

IQ Bot security fixes

The security fixes in this release have not changed since the previous release.

IQ Bot deprecated features

The deprecated features in this release have not changed since the previous release.

IQ Bot known limitations

There are no new known limitations in this release.

Bot Insight new features in Builds 1598 and 1610

Feature	Description
Operation dashboard	<p>The Operation dashboard in Bot Insight displays the Audit dashboard.</p> <p>You can search for the dashboards using the Search text box. You can also customize the dashboards based on your requirements. Role-based access control and permissions are applied to the dashboards so that the dashboard shows data only a specific user is authorized to view.</p> <p>See Operations dashboard on page 3731.</p>
Analytic visualization widgets	<p>The following new widgets are added:</p> <ul style="list-style-type: none"> Stacked Bar Chart Clustered Bar Chart <p>See Adding a dashboard widget on page 3750.</p>

Bot Insight changed features

The changed features in this release have not changed since the previous release.

Bot Insight fixed features

The fixed features in this release have not changed since the previous release.

Bot Insight deprecated features

The deprecated features in this release have not changed since the previous release.

Bot Insight known limitations

The deprecated features in this release have not changed since the previous release.

Enterprise A2019 (Builds 1082 and 1089) Release Notes

These release notes describe new features, changed features, fixed features, security fixes, deprecated features, and known limitations in Enterprise A2019.

To verify which version is compatible with this release, see [Compatibility with release builds](#) on page 1275.

Enterprise A2019 Builds 1082 and 1089

Build 1082 contains updates for the following:

- [Enterprise Community Edition](#)
- [Bot Insight](#)

Build 1089 contains updates for the following:

- [On-Premises](#)
- [IQ Bot](#)
- [Bot Insight](#)

New features in Builds 1082 and 1089

Feature	Description
Universal recorder support for SAP	The universal recorder now supports the SAP graphical interface for fast and accurate control and ease of editing generated scripts.
Citrix support	Citrix agent enables remote application recording for object cloning on Citrix servers and leverages ICA to create user sessions.
Enhanced code editing	Select multiple lines of code in editor to copy, move, disable, enable, as well as disable/enable a line of an action in a bot script. Users can run bots from a particular line of code or action inside the bot.
Bot import and export	Users can export bots with dependencies into a common zip file, including all actions. Users can manually exclude packages from the export process. All imported action packages will be automatically installed into the target Cloud Control Room and the bots placed inside the user private workspace.
Background processing	Background processing for Citrix Virtual Apps and Windows native applications. Excel packages inherently support background processes.
REST package	Support for GET, POST (text, XML, and HTML), PUT, and DELETE methods. Authentication types supported include Basic, Logged-in AD user, and NTLM.
OCR Action	Users can capture window and capture image by path.

Feature	Description
Active Directory integration for On-Premises	Allowing auto-discovery of sites and domains, Enterprise A2019 On-Premises integrates Active Directory to support multi-domain as well as multi-forest deployments.

Changed features

Changed features	
Task Bot	All rich features of MetaBot, such as DLL and code protection using execute permission, are now part of a standard TaskBot. This also includes inline scripting using Python, VBScripts, and more to help reduce the learning curve for new users and provides a uniform bot development experience.

Fixed features

The fixed features in this release have not changed since the previous release. For a list of these features, see [Enterprise A2019 \(Build 550\) Release Notes](#) on page 720.

Security fixes

The security fixes in this release have not changed since the previous release. For a list of these fixes, see [Enterprise A2019 \(Build 550\) Release Notes](#) on page 720.

Deprecated features

The deprecated features in this release have not changed since the previous release. For a list of these deprecations, see [Enterprise A2019 \(Build 550\) Release Notes](#) on page 720.

Known limitations in Builds 1082 and 1089

- IQ Bot is not supported in Automation Anywhere Cloud and users cannot register any IQ Bot instance with Cloud Control Room.
- To create database tables in Cloud Control Room where internet access is restricted and deploying Liquibase, users are required to unblock the Java process to connect to www.liquibase.org in order to download the schema and allow java.exe to have internet access.
- The Folder trigger has the following event options: create, modify, and delete. The File trigger only has the modify and delete event options.
- A bot cannot have duplicate Triggers that point to the same directory.
- Using the action Run Task with the child task using triggers is not supported.
- Activity - In Progress is not cleaning the event record until user does hard refresh (F5) of the browser.
- User cannot export a bot with dependencies if that user does not have access to any of the related dependencies.
- Users cannot checkout bots if they are linked via circular dependencies.
- Minimizing the window for some Microsoft Active Accessibility apps, such as Notepad, Calculator, or Remote Desktop Applications, can cause the operation to fail.
- UI Automation, such as Snagit Editor Window for example, will not work in the background unless expressly minimized.
- If the system Citrix plugin is not updated, the Recorder will not launch.
- If the user renames a previously saved recorder bot, a download error is generated and results in loss of images.
- For Elasticsearch users, remove the C:\ProgramData\AutomationAnywhere folder prior to installing Enterprise A2019.
- Users cannot enable SMTP with TLS for the on-premises version of the Control Room (On-Premises only).
- User credentials are not editable (On-Premises only).
- Installer fails to create credentials using Windows Authentication. Use SQL Authentication service credentials (On-Premises only).

- In an On-Premises environment, creating credentials with the Credential Vault is not supported in this release.
- When using the Recorder with Citrix in an On-Premises deployment, the Citrix Agent could generate an internal server error during the recording process.

IQ Bot Builds 1082 and 1089

IQ Bot Community Edition is available for this release. IQ Bot is not yet available on Automation Anywhere Cloud.

See [IQ Bot Community Edition quick start guide](#) .

IQ Bot changed features

IQ Bot is compatible with Enterprise A2019 Build 1089.

IQ Bot fixed features

The fixed features in this release have not changed since the previous release.

IQ Bot security fixes

The security fixes in this release have not changed since the previous release.

IQ Bot deprecated features

The deprecated features in this release have not changed since the previous release.

IQ Bot known limitations

For On-Premises, if IQ Bot and Control Room are installed on the same machine, on restarting the machine, IQ Bot does not work, and displays an error message.

Note: We recommend restarting Automation Anywhere Control Room Reverse Proxy service to resolve the issue.

Bot Insight new features in Builds 1082 and 1089

Feature	Description
Smart data profiling for country, state, and zip codes	<p>Bot Insight analyzes information provided in the variables to automatically identify information based on the country, state, and zip or postal code. You can use this information to create the World and US Map widgets.</p> <p>See Editing a data profile on page 3740.</p>
Business data delete API	<p>Use this API to delete logged data from either the production mode or the development mode for a particular Control Room instance.</p> <pre>DELETE <control_room_url>/v2/botinsight/data/api/deletetasklogdata.</pre>
Business data profile API	<p>Use this API to extract the business data profile logged in Bot Insight.</p> <pre>GET <control_room_URL>/v2/botinsight/data/api/gettaskvariableprofile</pre>
Business data API	<p>Use this API to extract the business data logged in Bot Insight.</p> <pre>GET https://{ControlRoomURL}/v2/botinsight/data/api/gettasklogdata?botname=<botname></pre>
Resize dashboard widgets	<p>You can resize and save the widgets in the Bot Insight dashboard based on your requirements. When you resize a dashboard widget, other widgets in the dashboard are automatically adjusted to fill in the available layout.</p> <p>See Editing a dashboard widget on page 3753.</p>
US map widget	<p>The US Map widget enables you to visualize and analyze information about Country, State, City, and Zip Code.</p> <p>See Adding a dashboard widget on page 3750.</p>

Feature	Description
World map widget	The World Map widget enables you to visualize and analyze information about Country, State, Zip Code, Latitude, and Longitude. See Adding a dashboard widget on page 3750.
Parent child dashboard	When you create a new bot, Bot Insight automatically creates a default dashboard. If you have a parent bot and a child bot, Bot Insight creates a separate dashboard for each of the bots. See Bot Insight dashboards on page 3728.
Notification of variable updates in the standard dashboard	Data profile updates are highlighted with a red dot in the standard dashboard. See Customizing a dashboard on page 3744.
Data logging	When you deploy and run a bot on the Bot Runner machine, Bot Insight aggregates all the information about that bot. The published dashboard for that bot displays the aggregated bot information. See Bot Insight dashboards on page 3728.
Bot Insight	The Analyze package provides the following functions to enable business analytics in the Bot Insight dashboard: <ul style="list-style-type: none"> • Analyze Open • Analyze Close

Bot Insight changed features

The changed features in this release have not changed since the previous release.

Bot Insight fixed features

The fixed features in this release have not changed since the previous release.

Bot Insight deprecated features

The deprecated features in this release have not changed since the previous release.

Bot Insight known limitations

The known limitations in this release have not changed since the previous release.

Enterprise A2019 (Build 550) Release Notes

These release notes describe new features, changed features, fixed features, security fixes, deprecated features, and known limitations in Enterprise A2019 (Build 550).

New features in A2019 Build 550

Feature	Description
On-premises installer	The on-premises installation application for Enterprise A2019.
IQ Bot supports IE11	IQ Bot (Build 550) supports Internet Explorer version 11 (IE11).
Download all documents action	Use the Download all documents action to download the extracted results from an IQ Bot server that was created by running a Task Bot, using the Upload Document action.

Supported packages in Build 550

The supported packages in this release have not changed since the previous release. For a list of these packages, see [Enterprise A2019 \(Build 543\) Release Notes](#) on page 721.

Changed features

IQ Bot (Build 550) Changed Features	
Issue	Description
Language toggle UI redesigned	<p>On the IQ Bot landing page, user can click the language toggle at the top right corner, to select a language from the drop-down list. The UI displays in the selected language.</p> <p>User can select a language from either the Control Room or IQ Bot language toggle icon.</p> <hr/> <p>Note: After logging out of the system, the system performs a reset. This requires the user to select the language again at login.</p> <hr/>

IQ Bot (Build 550) Changed Features	
Issue	Description
Upload document action	The Upload document action lets you to upload documents for processing with IQ Bot, using a Task Bot.

Fixed features

IQ Bot (Build 550) fixed features:

- Japanese documents using Microsoft Azure Computer Vision OCR engine get classified correctly.
- In the Designer window, during document training, user is able to move from one page to the other successfully along with mapping of form and table fields.
- Download API can download successfully processed documents after moving the bot and learning instance to production.

Security fixes

No security features are introduced in this build.

Deprecated features

No deprecated features are introduced in this build.

Known limitations

IQ Bot (Build 550) known limitations:

- When using Internet Explorer (IE) 11, icons disappear after a page refresh. A hard refresh (Ctrl plus F5) helps fix the issue.
- When using Internet Explorer (IE) 11, if user imports a domain, the system shows an error message. However, the feature works as expected.
- User is unable to migrate IQBA files from other versions of IQ Bot.
- IQ Bot portal does not launch after a machine restart. User has to restart Automation Anywhere Control Room Reverse Proxy Service as well.

Enterprise A2019 (Build 543) Release Notes

These release notes describe new features, changed features, fixed features, security fixes, deprecated features, and known limitations in Enterprise A2019 (Build 543).

To verify which version is compatible with this release, see [Compatibility with release builds](#) on page 1275.

New features in A2019 Build 543

Feature	Description
Next generation bot workbench	<p>Create bots from any device, from anywhere through a web browser. The intuitive new design for applying multiple personas with varying bot building skills and a redesigned work area for simple assembly and deployment. These include:</p> <ul style="list-style-type: none"> • A universal recorder to simplify capturing processes • List and Flow views for Task Bot creation • Powerful bot code management capabilities • Rich variable passing with no cross-language mapping required
Bot Runner	Access and run bots from the cloud. When bots are deployed to Bot Runners, any dependent actions are also deployed. When updates to Actions are available, the updates are also automatically pushed.
Package manager	The package manager centralizes control over bundled actions to enable users to deploy and upgrade only those targeted actions being used.
Advanced variable types	Access expanded variables and array types for enhanced action implementation, including DateTime, numbers, list, Boolean, dictionary, multi-dimension arrays for reading Microsoft Excel documents, and file data column for .CSV files.
Inline scripting	Native support for Python and VBScript inline scripting languages enables simple data passing between scripts and bots.
New UX	The new user experience provides assistance for users who are getting started and includes step-by-step guidance for common tasks.
Excel automation	Configure Microsoft Excel Task Bot automation without installing Microsoft Office on the Bot Runner machine.
Recording of automation	Record automation, even from a remote device.
IQ Bot	Enterprise A2019 will fully support IQ Bot, the only AI-driven solution for users to automate processing of complex documents.

Feature	Description
Bot Insight	<p>The Analyze package provides the following functions to enable business analytics in the Bot Insight dashboard:</p> <ul style="list-style-type: none"> • Analyze Open • Analyze Close

Changed features

This build does not include any changed features.

Fixed features

No fixed features are introduced in this build.

Security fixes

No security fixes are introduced in this build.

Deprecated features

No deprecated features are introduced in this build.

Known limitations

Feature	Limitation description
Recorder	.NET Framework 4.6.1 is required for the Recorder package.
Bot agent	Users of build 543 are required to download and install the latest agent.
Bot Insight	<p>Bot Insight has the following limitations:</p> <ul style="list-style-type: none"> • Bot Insight dashboard does not support Drag and Drop to move and arrange the dashboard widgets within the dashboard. • The Date widget in the dashboard displays the Unix time stamp. • Bot Insight does not support the Aggregate By feature in the Table widget, if the table contains a Timestamp. • Once the bots run successfully, the default dashboard is generated after 5 to 10 seconds.

Community Edition Release Notes

Review the new capabilities in different Automation 360 Community Edition releases.

Important:

The following products are renamed:

- AARI is called Automation Co-Pilot, and RPA Workspace is called Automation Workspace from Automation 360 v.28 release. Although release notes earlier than v.28 will show the new name, the content in these release notes is applicable and relevant to AARI and RPA Workspace.
- Enterprise A2019 is now called Automation 360. Although the release notes for releases earlier than Automation 360 v.21 release reference the old product name, the content in these release notes is applicable and relevant to Automation 360.

Note: For information about Automation 360 v.24R2 patch for Community Edition, see [Automation 360 v.24R2 Release Notes for Internet Explorer 11 EOL](#) on page 323.

Follow the links to view the release note updates for the respective release.

Related concepts

[Automation 360 Release Notes](#) on page 16

Review the new capabilities, changes, fixes (resolved issues), security fixes, deprecated features, and limitations in each release.

Automation 360 v.30 Community Edition Release Notes

Release date: 21 September 2023

Review what's new in the Community Edition of the Automation 360 v.30 (Build 19621) release.

Note: When a Bot Agent update is required, the Bot Agent is automatically updated to the compatible version.

For more information on updating to this release, see these resources:

- [Automatically update the Bot Agent](#) on page 1302 | [Manually update the Bot Agent](#) on page 1303
- [Compatibility with release builds](#) on page 1275

Automation Workspace

What's new
<p>Automation Command Center for Pro and Citizen Developers</p> <p>Automation Command Center (ACC) is now available for Pro and Citizen Developers. As a key component of automation lifecycle management, Pro and Citizen Developers now have a personalized and centralized view to quickly access their automations. Additionally, help is available with direct links to other developer resources, such as Pathfinder Community and Automation Anywhere University.</p> <p>ACC home page for Pro and Citizen Developers on page 1978</p>
<p>Packages displayed in sorted order in Bot editor</p> <p>When you use the actions menu (vertical ellipsis at the top-right) to select Packages in the Bot editor, packages now display in sorted order, making it easier to identify them. Packages are sorted on the Name field instead of the Short name field.</p>
<p>Packages sorted alphabetically within Bot editor (Service Cloud case ID: 01766378)</p> <p>For easier navigation, professional developers can quickly find packages and actions that are now sorted alphabetically at the following places in the Bot editor:</p> <ul style="list-style-type: none"> • Actions pane • When you use the actions menu (vertical ellipsis at the top-right) to select Packages, the list of used and available packages displays alphabetically. • When you use an If, Else if, Loop, or Wait for condition in a bot, the conditions and the iterators display alphabetically.

What's new
<p>New Legacy Loop behavior option</p> <p>For bots that were created using the Loop action in Automation 360 v.26 or earlier releases, you can now enable the Legacy Loop behavior option from the Administration > Settings to iterate the loop based on the specified value. When you enable this option and either increment or decrement the variable value in the end condition, loop iterations will not vary dynamically based on the new value generated.</p> <p>Settings on page 1728</p>
<p>Debug enhancements</p> <ul style="list-style-type: none">• To follow the standard Debug convention across different integrated development environments, the Debugger tool has been renamed to Debug.• When you start debugging, in the Bot editor, you can now see a header bar below the bot name that displays the name of the bot being debugged. The header bar displays Now debugging and the bot name afterward. For example: Now debugging: MSGBot5• When you start debugging a bot, the Actions panel on the left side of the Bot editor automatically collapses. This helps in providing more horizontal area to view the actions added in the Bot editor while debugging. <hr/> <p>Note: Once the debugging stops, the Actions panel expands again.</p> <hr/>
<p>API Tasks for creating automations</p> <p>You can now create API Task automations in Automation 360 Cloud. API Tasks interact with an application directly via API. These API Tasks run on Cloud devices to provide better latency and faster processing time.</p> <p>API Task is a new feature in v.30 and has limited availability in the United States (US East, US West, and US Sandbox) regions. To enable this feature, contact your customer support manager (CSM).</p> <p>#unique_60</p>

Automation Co-Pilot for Business Users

What's new
<p>Ability to start a process using input variables in Process Composer</p> <p>As a Pro developer, you can create and add input variables to start a process without having to build a form as the point of entry. You define input variables directly within the process itself which is particularly useful if your process requires complex variable types such as a dictionary, table, or list.</p> <p>Add input variables to a process automation on page 3318</p>

What's changed

When local desktop automations are run from Automation Co-Pilot, the progress bar on the activity page now displays an accurate completed percentage for the executing automation. Previously, an indeterminate progress indicator was used.

Reference IDs available for all tasks

All tasks now have reference IDs that are visible in the URL which you can use to share the task with another user. The ID also allows users to access a task directly in a request, even if that task is already completed. Previously, only the last pending task of a request was accessible directly.

Document Automation**What's new**

Custom data manipulation and validation through Document Extraction package (01936705)

The Document Extraction package now provides the **Get Document Data** and **Update Document Data** actions to allow customization of document fields. With the **Get Document Data** action, you can retrieve extracted data through a dictionary or JSON file, and use all the available packages to read values and customize them. After manipulating the extracted data, you can use the updated dictionary or JSON string (extracted values or coordinates) as input by using the **Update Document Data** action and update the documents on the server. This feature helps maximize straight-through processing (STP) and reduce manual verification efforts.

[Get document data action](#) on page 2426 | [Update document data action](#) on page 2427

Copy learning instance option added to Document Automation

Copy an existing learning instance to reuse the learning instance fields, parser information, document type, language, and local associations in the learning instance copy. Additionally, you can copy the heuristic feedback training and validation rules, as required.

[Create a learning instance in Document Automation](#) on page 3472

What's changed

Create custom roles and permissions in Document Automation

You are not required to use the system-defined administrator roles for Document Automation roles and permissions anymore. You can create custom roles with limited or no access to administrative permissions while adhering to your organization's security policies.

[Document Automation users](#) on page 3469

What's changed

Changes in IQ Bot Classifier package (01955258)

The IQ Bot Classifier package has been enhanced to improve its usability:

- The package name has been changed to Document Classifier package.
- You can track consumption on the license administration page for processed documents in the Document Classifier package.

[Document Classifier package updates](#) on page 859

Automation 360 v.29 Community Edition Release Notes

Release date: 6 June 2023

Review what's new in the Community Edition of the Automation 360 v.29 (Build 18361) release. Build 18361 replaces Build 18345.

Note: When a Bot Agent update is required, the Bot Agent is automatically updated to the compatible version.

For more information on updating to this release, see these resources:

- [Automatically update the Bot Agent](#) on page 1302 | [Manually update the Bot Agent](#) on page 1303
- [Compatibility with release builds](#) on page 1275

Automation Workspace

What's new

Introducing Help Center - In-app help used to search for automation information

Help Center is a centralized location that contains all the information developers need to develop automations. Wherever you navigate to in the , the Help Center will show suggested topics related to the page you are on in the widget. Developers can leverage the suggested topics or search for specific , , or information they need help with. Additionally, the documentation link from contextual help loads the content directly within the Help Center. This feature eliminates the developer from having to switch back and forth between the and the documentation portal providing a distraction-free experience.

[In-product user assistance](#) on page 1103

What's new

Enhancement to the `aiinstall` Installer (Service Cloud case ID: 01857405)

We have enhanced the `aiinstall` installer by including new `.exe` files for the **Bot launcher**, **Node manager**, **Triggers**, and **Child session launchers**. When you create and run a `bot` using `aiinstall` from the `bin`, `bin64`, or `binarm64`, and if your organization has configured security policies such as Document Security Solution (NASCA) DRM (Digital Rights Management), the files will be encrypted and secured by the security program.

The following changes occur in the installer when you:

- Install the `bot`, `java.exe` will be replaced by `NodeManager.exe`.
- Run a `bot`, `javaw.exe` will be replaced by `BotLauncher.exe`.
- Configure a trigger, the trigger will be activated with `TriggerListener.exe` instead of `javaw.exe`.
- Run a `bot` with (AARI), `javaw.exe` will be replaced with `ChildSessionLauncher.exe`.

Note:

- If your `bot` or scripts use `java.exe` or `javaw.exe` in the `aiinstall` folder, we recommend that you modify your `bot` or scripts using the new `.exe` files.
- Ensure that the `aiinstall` version installed on your system is the version that is released with v.29.

[Install Bot Agent and register device](#) on page 1288

Time filter for historical activities

As a `user` with appropriate permissions, you can use the **Time filter** option to search for and view specific historical activities based on time duration. Additionally, you can customize the date and time to view these activities.

[Time filter](#) on page 2051

Run `aiinstall` in elevated mode

After updating to this release, an administrator can use the `A360Elevator.exe` application to run a `bot` in an elevated or administrative mode. This enables the `users` to run `bot` that might access any application that requires administrator credentials.

[Run a bot in elevated mode](#) on page 2209

What's new

Change variable values while debugging

You can use the **Debugger** tool to edit the values of the following variable types added to the **Watched variables** list when you pause in debug mode during a run:

- Number
- String
- Boolean
- Datetime

This enables you to troubleshoot and fix any related errors, determine the correct value to use during execution, and resolve the issue without stopping the debugger.

Note:

- You cannot edit constant variables.
- Ensure that the version installed on your system is the version that was released with v.29.

Improved searchability for and files in subfolders (Service Cloud case ID: 01759969, 01838997, 01858215)

You can quickly search and locate , files, processes, and forms within a folder and its subfolders in public and the private workspaces even if your repository contains multiple folders and subfolders. To enable this enhanced search feature, select the **Include items within sub-folders** check box. A new column, **Folder path**, is displayed which contains the location of the folder and subfolders for the .

View references for non- file dependencies (Service Cloud case ID: 01793080)

You can view the references (immediate parents) for non- file dependencies such as: CSV, PDF, JPG, GIF, XLS, DOC, and PPT in public and private workspaces. You can use this feature to identify the , processes, or forms that refer to a non- file dependency. When you have many automations dependent on various file dependencies, it is easier to modify or delete the dependencies when you understand the impact of this change on the automations. You can efficiently check the effect of either modifying or deleting the dependency on the automations that refer to it.

Enhancement to the Bot Scanner utility

We have enhanced the utility and it now includes the option to scan that contain any of the and Triggers that use the EWS option.

[Running Bot Scanner to scan bots for EOL features](#) on page 1077

Document Automation

What's new
<p>Validate table data quicker using auto fill</p> <p>You can use the Auto fill button in the validation interface to extract hundreds of rows of data from multipage tables. After you manually validate three cells in a column, auto fill extracts the remaining values from that column in the document.</p>
<p>Improved heuristic feedback with form and table extraction</p> <p>provides an improved extraction through heuristic feedback with a focus on complex scenarios, such as multitable. Additionally, there are extraction improvements for both form fields and out-of-the-box performance (specifically for table fields).</p>
<p>Document-level data validation in</p> <p>With document-level data validation, you can create rules to ensure the accuracy of extracted data across multiple fields in your documents. You can define various conditions, such as pattern matching or equality checks. When those conditions are met, you can effortlessly take action to flag errors or warnings, clean up or replace values, or set new values.</p>

Automation 360 v.28 Community Edition Release Notes

Release date: 22 March 2023

Review what's new in the Community Edition of the Automation 360 v.28 (Build 17566) release. Build 17566 replaces Build 17557.

Important: This release includes an optional Bot Agent update. You can continue to run your existing bots without updating the Bot Agent. However, if you want to use the new features in Automation 360 v.28, you must update the Bot Agent available with this release.

For more information on updating to this release, see these resources:

- [Automatically update the Bot Agent](#) on page 1302 | [Manually update the Bot Agent](#) on page 1303
- [Compatibility with release builds](#) on page 1275

Automation Workspace

What's new
<p>Workday package</p> <p>You can use the new Workday package from Automation 360 to automate your Workday processes such as reporting, data upload/download, or triggering workflows with our new point-and-click experience. The package provides deep API-level integration with Workday that enables you to build automations easily, without having to code.</p> <p>Workday package on page 3032</p>
<p>Apigee package</p> <p>You can use the new Disconnect and Resume Integration features in the Apigee package. You can disconnect from your Apigee instance and clear the session using the Apigee Disconnect action. You can resume an integration that is suspended in Apigee using the Apigee Resume Integration action.</p> <p>Apigee Disconnect on page 2314 Apigee Resume Integration on page 2319</p>
<p>Extended attributes supported in the Terminal Emulator Package (Service Cloud case ID: 01870633, 01928396, 01809815)</p> <p>The TN3270E terminal type supports extended attributes. To enable extended attributes for TN3270E terminals, select the Extended Attribute check box in the Connect action.</p>
<p>Enhanced error messages display errors from the child bots (Service Cloud case ID: 01264352)</p> <p>When you create a bot where the parent bot calls a child bot, and if an error occurs in the child bot, the error message provides the following details:</p> <ul style="list-style-type: none"> • Line number of the parent bot which ran the child bot. • Line number of the child bot where the error occurred. • Error message details, such as what went wrong with that line number and the corresponding corrective action. <p>Using Bot editor on page 2156</p>
<p>Timeout option in Database Connect action (Service Cloud case ID: 00753858)</p> <p>We added a timeout option in the Connect action of the Database Package. When you connect with Microsoft SQL Server to automate database-related tasks, and if the database is down or experiences any network issues, the automation will time out and fail if the database connection is not established in the specified time.</p> <p>Using Connect action for database on page 2382</p>

What's new

Improved readability with new formatting capabilities in XML document (Service Cloud case ID: 01886455, 01925386)

When you insert, update, or delete nodes, the XML package does not remove carriage return characters between nodes but does remove all blank text nodes from the XML document. By using **Prettyprint** to format XML files, developers can easily improve the readability of a document. Developers can save time by using the following new options that have been added to the XML Package:

- **Use Prettyprint:** The **Save session data** action supports the Prettyprint format in the XML document. When you select the **Use Prettyprint** check box and use the **Insert node**, **Update node**, or **Delete node** actions and then save the XML document, the code is formatted with proper indentation as per Prettyprint.
- **Remove text nodes that contain only white space:** The **Start Session** action provides an option to remove blank text nodes when you parse the XML document.

[Save session data action in XML](#) on page 3061 | [Start session action in XML](#) on page 3061

New features added to the Email Package (Service Cloud case ID: 01835214, 01846425, 01756713, 01882482)

To support extensive process automation, we added the following action-related features to the Email Package:

- Ability to use the **Reply All** action.
- Enhanced the **Delete all** action to delete all emails from a specific folder. Additionally, you can apply filter parameters to emails such as:
 - All, Read, and Unread
 - Subject
 - From a specific sender
 - Before, on, or after a received date
- The dictionary variable for email properties includes a new variable, `emailNoOfAttachments`, used to retrieve the attachment count.

[Reply All action](#) on page 2447 | [Example using Email actions in a bot](#) on page 3129 | [Delete all action](#) on page 2436

Automate controls using Microsoft UI Automation (COM) technology

You can use the Microsoft UI Automation (COM) technology to automate the following scenarios:

- Capture and automate link controls
- Capture and automate tree controls

[Capture using specific technology](#) on page 2824 | [Actions performed on objects captured with Universal Recorder](#) on page 2804

What's new
<p>Insert Custom column in Data Table</p> <p>A new Custom column option has been added to the Data Table > Insert column action that enables you to insert a new column at a specified index in a data table. When you read an Excel spreadsheet and assign it to a data table, you can modify the table by adding a new column and entering any required data.</p> <p>Insert column action on page 2369</p>
<p>New Label option in Loop package</p> <p>A new Label option has been added to the Loop package that enables you to break or continue a specific loop from the nested loops.</p> <p>Loop package on page 2679</p>
<p>Add and configure If action conditions</p> <p>You can add and configure a maximum of 32 conditions in a single If action.</p>
<p>Improved automation reliability for web applications</p> <p>When you use the Recorder > Capture action to automate web pages running on Google Chrome and Microsoft Edge browsers, the Recorder > Capture action no longer scrolls down the web page if the target object is visible on the screen. This feature improves the user experience and reliability of automation when there is a fixed top pane on the web page and if some physical actions such as mouse clicks do not work as expected.</p> <hr/> <p>Note: Ensure that you install the browser extension (version 3.0.8.0) and use the Recorder package (version 2.10.2) to capture the control.</p> <hr/>
<p>Preferred view retained as default view in the Bot editor</p> <p>As a bot developer, you no longer have to manually select the preferred view when you open the Bot editor. To improve the developer's productivity and user experience, when creating bots in the Bot editor, your preferred view (List, Flow, or Dual) in the Bot editor will persist across user sessions and browsers. When you navigate in the Control Room or after your next log in, the Bot editor will retain your last used or selected view.</p> <p>Using Bot editor on page 2156</p>
<p>Line markers for collapsible sections of code in the Bot editor</p> <p>When you create bots using Loop, If/If-else, Step, Trigger-loop, Try, Catch, and Finally statements, the Bot editor clearly shows the collapsible sections. When building automations, developers can use these visual indicator line markers at the beginning and end of the collapsible section to improve their productivity.</p> <hr/> <p>Note: The visual indicator line marker for the collapsible section applies only to the List view in the Bot editor.</p> <hr/> <p>Using Bot editor on page 2156</p>

What's changed

Improved secure registration for Community Edition or Automation 360 users

When a user registers for the Community Edition or Automation 360 account, the registration email sent to the user contains a temporary registration link used to create the user credentials. This registration method is more secure than sending the user their password in plain text.

Automation Co-Pilot for Business Users**What's new**

Stationary action buttons

While completing forms in Automation Co-Pilot, action buttons are positioned in the fixed footer of the form. The footer and its contents are responsive to the size of your window and adjust to fit buttons and minimize the footprint.

[Add Form Task to a process automation](#) on page 3315

Forms have improved responsiveness due to this next generation of form rendering technology.

Document Automation**What's changed**

Important: New Community Edition users will have access to Document Automation but not IQ Bot

As of Automation 360 v.27 release and later, only Document Automation will be provisioned to new Community Edition users. New users will not have IQ Bot permissions, however, IQ Bot will be available for existing, registered users.

Automation 360 v.27 Community Edition Release Notes

Release date: 15 December 2022

Review what's new in the Community Edition of the Automation 360 v.27 (Build 16701) release. Build 16701 replaces Build 16667.

Note: This release includes an optional Bot Agent update. You can continue to run your existing bots without updating the Bot Agent. However, if you want to use the new features in Automation 360 v.27, you must update the Bot Agent available with this release.

For more information on updating to this release, see these resources:

- [Automatically update the Bot Agent](#) on page 1302 | [Manually update the Bot Agent](#) on page 1303
- [Compatibility with release builds](#) on page 1275

Updated release build

The updated Build 16701 includes fixes for the following issues (Service Cloud case ID: 01937106, 01947340, 01829572):

- Bots were failing because of file dependency or interactive form that included multibyte characters in file names.
- Changes to Automation Co-Pilot Desktop Assistant to manage and clear automations for start, stop, and resume actions.

Automation Workspace

What's new
<p>Windows 365 Cloud PC now supported as Bot Runner (Service Cloud case ID: 01792699)</p> <p>We support Windows 365 Cloud PC as a Bot Runner to create and run bots on Windows 365 Cloud PC.</p> <p>Bot Runner device requirements on page 1111</p>
<p>View keyboard shortcuts in Bot editor</p> <p>In Bot editor, you can now open a menu to view the available keyboard shortcuts.</p> <p>Keyboard shortcuts list on page 2159</p>
<p>Enhanced Automation Anywhere Debugger tool</p> <p>The Automation Anywhere Debugger tool is available in the Bot Assistant utility to provide a better user experience. When you invoke the Debugger tool from the Bot editor, you can add, update, or delete actions and variables in a bot.</p> <p>By default, the Watched variables lists is empty. With a single click, you can add all the used variables in a bot. These variables display in a pop-up window where you can select or deselect, one or more variables, from the list.</p> <p>Debugger tool</p>
<p>ServiceNow package</p> <p>You can use the ServiceNow package from Automation 360 to authenticate and perform several actions with records and attachments in ServiceNow tables.</p> <p>ServiceNow package on page 2891</p>
<p>ServiceNow triggers</p> <p>You can use ServiceNow triggers to call an action when there is a new or updated record.</p> <p>ServiceNow New Record trigger on page 3244</p>

What's new
<p>Quick assistance at hand for the developers in the Bot editor</p> <p>The accessibility and usability of the Bot editor, actions, and packages have been improved. As a citizen developer or an RPA developer, when you are creating bots, you can quickly look up information about the actions without navigating outside the Bot editor. Under the Actions pane, quick help is enabled with contextual information about actions. Additionally, an icon is configured with a link to the documentation. If you want more information about an action, you can click the link, which redirects you to the relevant page in the documentation portal. This feature is currently available in the following actions and packages.</p> <ul style="list-style-type: none">• Database• Email
<p>Enhanced user experience through refreshed and intuitive icons</p> <p>With the new and intuitive icons for actions in the Bot editor, citizen developers and RPA developers can quickly locate the correct action while creating automation for a day-to-day task. These unique and renewed icons are developed according to brand and global standards.</p>
<p>New option in Read from action of Database package (Service Cloud case ID: 01263940)</p> <p>A new check box is available when you use the Read from action to retrieve records from the database and save the retrieved data in a CSV file. When you select this check box, no CSV file is created if the executed SQL query does not return any data.</p>
<p>64-bit ODBC driver now supported in Database package (Service Cloud case ID: 01256142, 01829360, 01849908)</p> <p>We now support connecting to databases by using the 64-bit ODBC driver. This option is available when the connection mode is the default. Organizations transitioning to Office 365 will benefit from leveraging this enhancement and can sustain automation build with 32-bit ODBC drivers.</p> <p>Using Connect action for database on page 2382</p>
<p>OAuth 2.0 support in Email and Email trigger packages (Service Cloud case ID: 01798311, 01803702, 01791859, 01828526)</p> <p>Microsoft is deprecating the ability to use Basic authentication in Exchange Online for these specific protocols:</p> <ul style="list-style-type: none">• IMAP• POP3• EWS <p>We support OAuth 2.0 authentication for these protocols in the Email and Email trigger packages. For enhanced security, you can maintain the business continuity of your email automations by switching the authentication type from Basic to OAuth 2.0, (as recommended by Microsoft).</p> <p>Using Connect action for Email on page 2437</p>

What's new									
<p>Retry mechanism supported in credential variables (Service Cloud case ID: 01786319, 01887182)</p> <p>The credential variables support the retry mechanism. When you create a bot that uses credential variables, if the bot fails during run time to retrieve those variables from the Credential Vault because the Control Room is disconnected or the Control Room services stop intermittently, then the bot tries three times to retrieve the credential variables from the Credential Vault.</p> <hr/> <p>Note: Ensure that the Bot Agent version installed on your system is the version that is released with Automation 360 v.27.</p> <hr/>									
<p>Support of other domain name in the Active Directory package (Service Cloud case ID: 01807358, 01910765)</p> <p>We now support Active Directory user operations by logon name with domain and can provide the domain name to extract user details. When you retrieve the user property or perform any user operation based on the logon name (userPrincipalName), and if the user domain name differs from the domain specified in the LDAP path, the user properties are now successfully retrieved with or without a domain name.</p> <p>For example, LDAP Path: LDAP://ADServer/DC=automation, DC=net</p> <table border="1"> <thead> <tr> <th>User</th> <th>Logon name</th> </tr> </thead> <tbody> <tr> <td>userPrincipalName: kim@aaengg.net</td> <td>User can provide logon name as kim@aaengg.net.</td> </tr> <tr> <td>userPrincipalName: shaun@aasales.net</td> <td>User can provide logon name as shaun@aasales.net.</td> </tr> <tr> <td>userPrincipalName:sarah@automation.net</td> <td>User can provide a logon name as either sarah or sarah@automation.net.</td> </tr> </tbody> </table>		User	Logon name	userPrincipalName: kim@aaengg.net	User can provide logon name as kim@aaengg.net.	userPrincipalName: shaun@aasales.net	User can provide logon name as shaun@aasales.net.	userPrincipalName:sarah@automation.net	User can provide a logon name as either sarah or sarah@automation.net.
User	Logon name								
userPrincipalName: kim@aaengg.net	User can provide logon name as kim@aaengg.net.								
userPrincipalName: shaun@aasales.net	User can provide logon name as shaun@aasales.net.								
userPrincipalName:sarah@automation.net	User can provide a logon name as either sarah or sarah@automation.net.								
<p>The following list of actions supports logon name with domain.</p> <ul style="list-style-type: none"> • Update user details • Rename user • Delete user • Enable user account • Disable user account • Set user property • Get user property <p>User account operations on page 2293</p>									

What's new
<p>New action in Text file package</p> <p>You can use the new Read variables action in the Text file package to read the values of variables from the text file.</p> <hr/> <p>Note: The Import string from text file action in the String package has been deprecated and will not be available for new bots. We recommend that you use the new Read variables action with enhanced capabilities. This deprecation does not impact any existing bots or bots which were migrated previously and they will continue to run properly. See Support and deprecation policy for packages on page 1026 for package lifecycle and deprecation policy.</p> <hr/> <p>Read variables action on page 3006</p>
<p>Call an existing JavaScript function in a webpage</p> <p>You can use the new Call a JavaScript function action in the Browser package to call an existing JavaScript function directly in a webpage or in an iFrame within a webpage in Google Chrome and Chromium-based Microsoft Edge browsers. In the bot, you can also pass one or more input parameters to the JavaScript function and process the return value from the function.</p> <p>Call a JavaScript function action on page 2349</p>
<p>Automate controls using Microsoft UI Automation (COM) technology</p> <p>You can use the Microsoft UI Automation (COM) technology to automate the following scenarios:</p> <ul style="list-style-type: none">• Capture and automate client controls• Capture and automate password text controls• Capture and automate page tab controls <p>Actions performed on objects captured with Universal Recorder on page 2804 Capture using specific technology on page 2824</p>
<p>Capture objects on applications running in administrator mode</p> <p>You can use the Recorder to capture objects on applications running in administrator mode. To capture the object, select the Capture and run with admin privileges option from the Bot editor.</p> <p>Recorder package on page 2798</p>
<p>Enhanced bot performance when using global values across bots</p> <p>When you use global values across a parent bot and a child bot, the bot performance is enhanced by reducing the bot execution time. To enable enhanced bot performance, you must set the Bot compatibility version to 3 in the Advanced settings page of the Bot editor.</p> <hr/> <p>Note: Ensure that the Bot Agent version installed on your system is the version that is released with Automation 360 v.27.</p> <hr/> <p>Bot compatibility version on page 2231</p>

What's new
<p>Enhanced user interface for Define functionality in AISense Recorder</p> <ul style="list-style-type: none">• We have enhanced the user interface of Define window in the AISense Recorder that enables you to use anchors easily and automate UI objects that are not detected by AISense Recorder automatically. To improve functional clarity, the following object types are renamed:<ul style="list-style-type: none">• Active text is renamed to Link• Passive text is renamed to Text value• If you unintentionally click the screen or click before the highlighter appears, the AISense Recorder provides visibility into it. You must confirm to capture the object again or use the Define functionality to define the object on the screen.• In the Define window, the AISense Recorder shows embedded help for each of the control types so you can select the correct control types for custom objects. <p>Use variable anchor on page 2197 Capture Textbox, Radio, Checkbox, and Combobox on page 2192 Capture text value through AISense Recorder on page 2191 Capture link button through AISense Recorder on page 2190 Capture Image button through AISense Recorder on page 2188</p>
<p>New virtual key added to the Simulate keystrokes package</p> <p>In the Simulate Keystrokes > Keystrokes action, a new key named Return has been added to the virtual keyboard for Enter functionality and the Enter key in the Number pad has been renamed to Num Enter. As a result, the Return key is the main Enter key on the keyboard. This enhancement keeps the keyboard in sync with the physical keyboard. The nomenclature has been changed to avoid confusion between the Enter key on the keyboard and the Enter key on the Number pad.</p>
<p>Support for global variable for all Datetime actions</p> <p>In the Datetime package, you can use the Datetime global variable across all Datetime actions. You can select to use either String variable or a Global variable in the Source date and time variable option. This avoids creating multiple local variables and reduces the total number of actions used in a bot.</p> <p>Datetime package on page 2397</p>
<p>Workato Integration</p> <p>You can integrate the Automation 360 platform and Workato by using the Automation Anywhere connector. You can establish a connection with the Automation Anywhere Control Room and perform various operations using the Control Room APIs.</p> <p>Workato integration</p>
<p>SnapLogic Integration</p> <p>You can now integrate the Automation 360 platform and SnapLogic. You can establish a connection with the Automation Anywhere Control Room and perform various operations by using the Control Room APIs.</p> <p>Snaplogic integration</p>

Automation Co-Pilot for Business Users

What's new
<p>Build forms easily by dragging elements to form builder</p> <p>You can now build your forms by just dragging your elements to a blank form builder. As you add elements to the form builder, it automatically adjusts without your input, letting you focus on the form-building experience. You can also re-size the columns of your elements.</p> <p>Create a form</p>
<p>New actions in the Process Composer</p> <p>In the Process Composer, you can now use a set of actions when you build out your process. For example, you can double-click a task, such as Bot Task and Human Task, and the task will be updated in your process flow automatically. With this, you can save time because you do not need to task specific tasks to your process. In addition, you can now copy, cut, and paste using CTRL + C, CTRL + X and CTRL + V, respectively to retain, reuse, or replace data.</p> <p>Supported behaviors for tasks and elements in Process Composer on page 3299 Create a process automation in Process Composer on page 3312</p>
<p>Use a reference ID meta type in Process Composer</p> <p>You can now use a reference ID with a Meta variable type for your variables in the Process Composer. When you set a reference ID as a meta variable type, you can now use your reference ID data when you run your tasks in the web interface. This simplifies your references because you only need to rely on using the reference ID instead of relying on other variable types or references.</p> <p>Create a process automation in Process Composer on page 3312</p>
<p>Center your forms in preview</p> <p>You can now preview your forms in the new preview window and get an accurate assessment on how your form will look when it is rendered. You can select the Make form preview centered option to enable the preview window. You can also set the appropriate display resolution, x and y coordinates, and even center your form.</p> <p>Create a form</p>
<p>Upload images directly to the form composer</p> <p>You can now upload images directly to the form composer by using the Image element. This saves you time to view the images in the form without a file reference, rather than in the initial step, where the image requires a file reference to be viewed.</p> <hr/> <p>Note: Image files are limited to 150 kb (like a logo).</p> <hr/> <p>Using the Image element on page 3219</p>

What's new
<p>Change label action for Button element</p> <p>The change label action in the form rules now applies to the Button element. When you use the change label action in form rules and apply it to the buttons in your form, the changes will be automatically applied to the buttons where you set the rules. This keeps the flow consistent with the elements that you are using because all the buttons inherit the same rule.</p> <p>Add rules to form elements on page 3229</p>
<p>Rules editor for Table element</p> <p>The rules editor is now applicable to the Table element. When you use the rules editor for your tables, the rules conditions are applied for each individual columns while any actions that you set are applied for each row in the row level. This makes things consistent for each new or existing row that you use because all the rows inherit the same rule.</p> <p>Add rules to form elements on page 3229</p>

Document Automation

What's new
<p>Document Automation supports regular expression pattern-based extraction</p> <p>When configuring fields that the learning instance will extract, you can specify a regular expression (regex) pattern to help the extraction engine find the field. After entering the regex pattern you can test the expression using sample content within the Create Learning instance window. You can use regex pattern extraction for values that follow a specific pattern, such as a VAT number or a PO number.</p>
<p>Validation interface support for shortcut keys</p> <p>Zoom in and out on documents in the Validation interface by holding the Alt key and scrolling with your mouse wheel.</p>

Automation 360 v.26 Community Edition Release Notes

Release date: 22 September 2022

Review what's new in the Community Edition of the Automation 360 v.26 (Build 15450) release. Build 15450 replaces Build 15439.

Note: The v.26 build supports Manifest V3 browser extensions for Google Chrome and Microsoft Edge browsers. For more information, see [Chrome and Edge Manifest V3 extensions](#) on page 1082.

This release includes an optional Bot Agent update. You can continue to run your existing bots without updating the Bot Agent. However, if you want to use the new features in Automation 360

v.26, you must update the Bot Agent available with this release. For more information on updating to this release, see these resources:

- [Automatically update the Bot Agent](#) on page 1302 | [Manually update the Bot Agent](#) on page 1303
- [Compatibility with release builds](#) on page 1275

Automation Workspace

What's new
<p>Community Edition users provisioned to closest region</p> <p>Registered Community Edition users are now provisioned to a region that is closest to their country (either in the US or EU). Provisioning is based on the country of the users account.</p>
<p>Support for Manifest V3 extensions</p> <p>Automations that use Google Chrome Manifest V2 based extensions will stop working sometime after June 2023. The deprecation timelines of Manifest V2 based extensions are currently under review and subject to change by Google.</p> <ul style="list-style-type: none"> • For Google Chrome Manifest V2 extensions timelines, see Manifest V2 support timeline. • For Microsoft Edge Manifest V2 extensions timelines, see Overview and timelines for migrating to Manifest V3. <p>This might impact your existing automations that use Manifest V2 based extensions for Google Chrome and Microsoft Edge browsers. Automation 360 v.26 and later includes Manifest V3 extensions by default to support features that use Google Chrome and Microsoft Edge browsers.</p> <p>You can automatically enable Manifest V3 based extensions for Google Chrome and Microsoft Edge on all the Bot Runner devices by enabling the Browser extensions option from the Control Room. Enabling this option applies the browser extension settings on all the registered Bot Agent devices.</p> <hr/> <p>Note: We will continue to support Manifest V2 based extensions for Google Chrome until June 2023. To know about Microsoft Edge Manifest V2 based extensions timelines, see Overview and timelines for migrating to Manifest V3.</p> <hr/> <p>Note: Manifest V3 extension is supported on Google Chrome and Microsoft Edge browsers version 91 and later only.</p> <hr/> <p>Configure browser extensions on page 1737 Chrome and Edge Manifest V3 extensions on page 1082</p>
<p>Microsoft Windows 11 Enterprise now supported (Service Cloud case ID: 01252605, 1252605, 1253745, 01255134, 01379865, 01801610, 01810148)</p> <p>We now support Microsoft Windows 11 Enterprise, so you can now install and update the Bot Agent and run bots on the Windows 11 Enterprise operating system.</p> <p>Bot Agent compatibility on page 1274</p>

What's new
<p>Salesforce command package</p> <p>You can now authenticate from Automation 360 to access Salesforce and run several command actions by using the new Salesforce command package.</p> <p>Salesforce package on page 2846</p>
<p>SAP GUI 770 version now supported (Service Cloud case ID: 01793132, 01792775, 1776805, 01792623, 787725, 01805482, 01805479, 01792623, 01810356, 01822839, 01851451, 01853577, 01860050)</p> <p>SAP GUI 770 (patch 6) is now certified and supported with Recorder and SAP package.</p> <p>Recorder actions supported in various SAP versions on page 2828</p>
<p>Configure and use custom proxy configuration in REST Web Service package (Service Cloud case ID: 01271527, 01765084, 01839282)</p> <p>REST Web Service package is now enhanced to support custom proxy configuration for each Delete, Get, Patch, Post, and Put action. This provides you more flexibility in calling REST APIs with different proxy configuration and allow you to create hybrid API automation.</p> <p>REST Web Service package on page 2834</p>
<p>Keyboard shortcuts to reduce scrolling</p> <p>When developing large bots, you can now use keyboard shortcuts to expand and collapse individual or all sections and move through the lines of code quickly instead of scrolling and minimizing sections individually.</p> <p>Keyboard shortcuts to expand or collapse elements in bot logic on page 2158</p>
<p>Set value in any editable control field to be blank in SAP application (Service Cloud case ID: 00821861, 01807129)</p> <p>When you use the Set text action of the SAP package, you can now set the value in any editable control field in the SAP application to be blank. For example, you can set the value in the text field or the date field to be blank.</p>
<p>Loop through emails and move them one at a time (Service Cloud case ID: 00749763, 01807189, 01840743)</p> <p>You can now loop through all the emails in a mailbox and move one email at a time to a destination folder by using the Move action in the Email package.</p> <p>Move action on page 2446</p>
<p>Configure p12 certificate for SOAP-based automations (Service Cloud case ID: 00757213)</p> <p>In the SOAP Web Service action, you can now select the p12 certificate file and provide a password for user authentication. With this enhancement, you can now access web services that use the p12 certificate-based authentication (a more secure type of SSL certificate).</p> <p>Example of using the SOAP web service action on page 3097</p>

What's new
<p>Improved accessibility, usability of content on Terminal Emulator window (Service Cloud case ID: 01609467)</p> <p>You can now have improved accessibility and usability of the content displayed on the Terminal Emulator window. When you use the enhanced Get text action of the Terminal Emulator package, you can now view and extract all the lines and text present in the Terminal Emulator window and perform an operation based on your requirement.</p> <p>Using Get text action for Terminal Emulator on page 2996</p>
<p>Run bots with or without window title matching in letter case</p> <p>You can now run bots even when the title of a captured window does not match the letter case. For a bot to identify a static window or browser titles and titles with a wildcard character, you can opt for a case-sensitive match if you want the letter case to be matched, or a case-insensitive match otherwise, by using the Case sensitive option.</p>
<p>Control image preview and storage in Control Room during secure recording</p> <p>You can now choose whether or not the object images are available for preview and stored in the Control Room during secure recording by enabling the Recorder preview image setting. When you enable the setting, the image is previewed in the Bot editor and stored in the Control Room for 60 minutes. If you choose not to preview, images are not captured.</p> <p>Secure recording on page 990 Secure recording mode on page 2179 Settings on page 1728</p>
<p>Automate Microsoft Excel spreadsheets from SharePoint</p> <p>You can now automate Microsoft Excel spreadsheets that are uploaded and shared on SharePoint. Use Excel advanced > Open action to open the Microsoft Excel spreadsheets from SharePoint location.</p> <p>Using the Open action for Excel advanced on page 2485</p>
<p>Automate Citrix Virtual Apps in Edge with IE mode</p> <p>When using the Recorder, you can now automate Citrix Virtual Apps running on Microsoft Edge Chromium with IE mode.</p>
<p>Automate controls using Microsoft UI Automation (COM) technology</p> <p>For automation, you can now use the Microsoft UI Automation (COM) technology in the following scenarios:</p> <ul style="list-style-type: none">• Capturing controls with secure recording mode• Capturing and automating combo box and list view controls• Using Object exists and Object does not exist Recorder conditions in If, Loop, and Wait packages <p>Capture using specific technology on page 2824 Actions performed on objects captured with Universal Recorder on page 2804</p>

What's new

Seamless automation of Citrix Virtual Apps and other Citrix applications

With the new Automation 360 remote agent for Citrix, you can now seamlessly automate all types of Citrix Virtual Apps and other Citrix applications that are supported on desktop applications using the Recorder.

The new Automation 360 remote agent for Citrix supports the following browsers and technologies:

- Google Chrome
- Internet Explorer
- Microsoft Edge
- Microsoft Edge with IE mode
- Mozilla Firefox
- Java
- Electron apps
- Microsoft Active Accessibility (MSAA)
- Microsoft UI automation

[Installing Automation Anywhere remote agent on Citrix servers](#) on page 1171 | [Using the Recorder on Citrix Virtual Apps servers](#) on page 1166

Implement coding standards with code analysis

You can now implement best coding practices by configuring coding rules in the Control Room. This feature helps you prevent potential errors, improve bot reliability, and makes the code more uniform, accessible, reliable, and efficient.

- As an administrator or a user with **View policies** and **Manage policies** permission, you can configure the code analysis policy for all users.
- As a Citizen Developer, you can run code analysis to analyze your bots against readability, maintenance, security, and compliance best practices.

[Code analysis](#) on page 2103

Fetch execution details for specific execution IDs with new Control Room API

You can now fetch the execution details, such as `botOutVariables` and `CallbackInfo`, for a specific execution ID by using the new API endpoint, `v3/activity/execution/<id>` API.

Automation Co-Pilot for Business Users

What's new
<p>Embedded automation with OAuth 2.0</p> <p>Embedded automation streamlines access to the automation experience.</p> <p>Embed automations in your application using Automation Co-Pilot for Business Users on page 3147</p> <ul style="list-style-type: none">Automation Co-Pilot Integrations embeds in web applications as a widget, so if you are an end user, you can access automated processes and bots without leaving your environment.Automation Co-Pilot Extensions offers further adaptability through Chrome browser extensions, enabling automation directly in any web scenario. Business users can now access automations through a widget, available through an extension in their web browser.With an OAuth 2.0 connection, existing access to automations in the Control Room are now shared with the Extensions to offer you a seamless user experience. <p>Automation Co-Pilot for Business Users using embedded widget and Chrome extension on page 3149</p>
<p>Delete files permanently from Automation Co-Pilot cloud storage</p> <p>You can now delete files permanently from Automation Co-Pilot cloud storage. When you delete a request, the associated file is also permanently deleted now and not just sent to the recycle bin.</p> <p>Cloud storage usage on page 3333</p>
<p>Append or overwrite operations in your form</p> <p>Append or overwrite operations in your form by using the Assign form rules for the web, with the Checkbox and Radio Button elements, which now support form rules.</p>
<p>Assign dynamic values with support for new elements in your forms</p> <p>When you use the interactive forms package, you can now assign dynamic values with the Assign action, which now supports Checkbox and Radio Button elements in your form.</p> <p>You can also change the label of the selected form elements with the Change label action for the Button element.</p> <p>Interactive forms package on page 2633</p>

IQ Bot

What's new
<p>Search for form or table fields</p> <p>When creating a learning instance, when you are configuring fields, you can now search for fields by field name, field label, or data type.</p>

Previous Community Edition Release Notes

Review the release notes for previous Community Edition releases.

Automation 360 v.25 Community Edition Release Notes

Release date: 21 June 2022

Review what's new in the Community Edition of the Automation 360 v.25 (Build 14304) release.

Important: This release includes an optional Bot Agent update. You can continue to run your existing bots without updating the Bot Agent. However, if you want to use the new features in Automation 360 v.25, you must update the Bot Agent available with this release.

For more information on updating to this release, see these resources:

- [Automatically update the Bot Agent](#) on page 1302 | [Manually update the Bot Agent](#) on page 1303
- [Compatibility with release builds](#) on page 1275

Automation Workspace

What's new
<p>Support to automate applications supported on Citrix Workspace app (Service Cloud case ID: 01758063)</p> <p>The Citrix Workspace app is now supported on Automation 360. You can now automate applications that are accessed through the Citrix Workspace app by using the Recorder > Capture action or the Start recording option.</p>
<p>Install Bot Agent on devices that have Enterprise 11 Enterprise Client</p> <p>When you are creating a bot in Automation 360, you can now install the Bot Agent on a device with an existing Enterprise 11 Enterprise Client. You can create or run bots from both the Control Room instances.</p> <p>Install Bot Agent and register device on page 1288</p>

What's new

IE 11 EOL notification banner displayed in Control Room

Starting from the Automation 360 v.25 release, if you use the Microsoft Internet Explorer browser to access the Control Room, you will be prompted to use an alternative supported browser, such as Google Chrome or Microsoft Edge (Chromium). When you log in to the Control Room, a notification banner is displayed indicating that support for Internet Explorer 11 is ending.

[Log in to Automation Anywhere Control Room](#) on page 1428

AISense Recorder: Support for Korean language and complex table operations

- You can now use AISense Recorder to automate applications that use Korean and a combination of Korean and English interfaces.

[AISense for recording tasks from remote applications](#) on page 2180

- With AISense Recorder, you can now extract tabular data from complex tables. You can capture and automate tables with wider columns and tables that have columns with controls such as check boxes and options. You can also capture specific columns from tables.

Note: If the table is not detected automatically, use the **Define** option to detect the table.

[Table data extraction through AISense Recorder](#) on page 2194

Enhancements to Recorder

- When you run a bot, you can now automate objects that appear behind the bot runtime window by using the **Recorder > Capture** action. (Service Cloud Case ID: 00684306, 00770636, 01146672)
- You can now use the Recorder to capture and automate objects with a specific technology. The **Capture object** tab now has the option to select a specific technology and capture using that technology. You can capture objects with the following technologies:
 - Microsoft Active Accessibility (MSAA)
 - UI automation
 - Microsoft (MS) COM UI Automation

[Capture using specific technology](#) on page 2824

(Service Cloud Case ID: 01760871, 01865823)

- You can now use the Recorder to automate third-party plug-in window objects on Google Chrome or Microsoft Edge browsers by using a specific technology.

Reduce Data Loss option in PDF package

In the **PDF > Extract text** action, for the **Structured text** type field, a new **Reduce Data Loss** option is now available. When you use this option, you can extract the complete text with minimal overlap of characters.

[Using Extract text action from PDF](#) on page 2766

What's new
<p>Enhancement to the String package (Service Cloud case ID: 00770822)</p> <p>In the String > Extract text action, a new When extracting option is now available. You can use this option to specify whether the case of the text in the extracted substring must match that in the source string.</p> <p>Using Extract text action of String package on page 2960</p>
<p>Download files from URLs that require NTLM authentication (Service Cloud case ID: 01189873)</p> <p>With the enhanced Browser package, you can now download files from URLs that require NTLM authentication by using the Browser > Download file action.</p>
<p>Enhancement to multiple attachments option in Send email action (Service Cloud case ID: 00800976, 00817136, 00821405, 00936080, 01256523, 01256320, 01262069, 01259369, 00936080, 01801928)</p> <p>When you send email from bots, you can now send multiple attachments as a list of files or a variable that contains the list of file objects. With this feature, you can attach files such as data files, spreadsheets, and word processor documents to your email. You can attach multiple filepaths from a local drive or a network drive, or you can use a variable that contains a filepath.</p> <p>Using the Send action on page 2454</p>
<p>Enhancement to SOAP Web Service package</p> <p>When you build a SOAP response for an Xpath expression in the SOAP Web Service package, the result of the Xpath expression can be stored as a list of strings.</p> <p>Example of using the SOAP web service action on page 3097</p>
<p>View version history of non-bot file dependencies (Service Cloud case ID: 01615105)</p> <p>You can now view the version history of your non-bot file dependencies. This helps to identify relevant changes made to your file by other users during a specific date and time along with the check-in messages.</p> <p>View version history of non-bot file dependencies on page 2272</p>
<p>Edit non-empty folder names in private workspace (Service Cloud case ID: 00535388, 00730075, 00786633, 00791528, 01615295, 01820406)</p> <p>You can now edit your non-empty folder names in the private workspace. With this feature, you can now manage folders more easily. Ensure the following when you rename a folder:</p> <ul style="list-style-type: none">• It does not contain checked-out or cloned bots even at subfolder levels.• It does not contain more than 100 items including subfolders and files. <p>Create and rename folders on page 2234</p>

What's new

View dependency maps for bots

You can now view the dependency map for your bot in both the public and private workspaces. The dependency map shows the immediate parent and child bots for any selected bot. If you are an RPA developer, you can use the dependency map to better understand where a bot is invoked and which child bots are invoked by the bot. With this information, you can gauge the impact of the change in a bot, use the bot effectively, maintain better bot code and reusability, and prevent conflicts.

[View bot dependency map](#) on page 2224

Automation Co-Pilot for Business Users**What's new**

Create request in new tab

You can now open and run your new requests in a separate tab when you select the **Open request in New Tab** option in the initial form. With this option, you can create requests concurrently without changing your current page navigation.

[Create a request and complete a task](#) on page 3264

Duplicate rows for Table element

In the web interface, when you are adding rows to your form by using the **Table** element, you can now save time by duplicating a row in the table with the new **Duplicate row** option. The duplicated row will now be placed under the highlighted row that you had selected.

Interface triggers support more technologies

You can now use interface triggers with the following technologies:

- Windows native
- SAP Desktop
- Google Chrome and Edge Chromium browsers

[Add an interface trigger](#) on page 3240

What's new

Enhancements to form rules

- Use custom formatting

When you are adding a rule, if you use the **If** menu to set the rule conditions on certain elements such as **Text Box** or **Text Area**, you can now select **Is** from the drop-down menu to enable additional options. Select the **Custom** option and click **Add regular expression** to apply custom formatting requirements on the selected element.

Consider a scenario where the user IDs of all your employees have AV as prefix. For example, for an employee whose name is Adam, the user ID is AVAdam. Use the **Add regular expression** option to set the value in the **Regular expression** field as ^AV. If a user enters Adam in the user ID field, an alert is displayed.

- Set custom value or append element value

When you are adding a rule, use the **Then** menu to select a form element. For this form element, you can set one of the corresponding actions using **Set Value** or **Append value**:

- **Value**: Data entered in the **Enter value** field is applied to the selected element.
- **Form element**: Data from the form element selected in the **Select element** drop-down menu is appended.

Consider a scenario where a user registration form has 'First name' and 'Employee ID' fields. You can set one of the following rules for the value in the Employee ID field:

- Select **Value** and enter Emp1013 as preset value.

This value is displayed in the 'Employee ID' field when the bot runs.

- Select **Form element** and set 'First name' element in the **Select element** drop-down menu.

The value from the 'First name' field is appended to the 'Employee ID' field when the bot runs.

You can use elements in the same way that variables are used in the Bot editor. You can enter **\$** to view a list of elements.

[Add rules to form elements](#) on page 3229

Document Automation

IQ Bot Extraction360 (Preview) is now Document Automation. Community Edition enables users to try features from Document Automation, including creating up to five learning instances, connecting to learning instances in Automation 360 IQ Bot, uploading documents for processing, and validating documents using Automation Co-Pilot task manager.

[Community Edition](#) on page 3533

What's changed

The **Document Workspace** folder now holds learning instance assets (bots, process, and form). Previously, these assets were located in the **IQ Bot Processes** folder.

What's changed
The actions which support document processing are now located in the Document Extraction package. Previously, these actions were located in the IQ Bot Extraction360 (Preview) package.
Learning instances from prior releases have been deleted to enable the upgrade to Build 14304.

Limitations
Document Automation supports a device username of 21 characters or fewer.
The value beside the Validate documents link, which indicates the number of documents awaiting validation for a learning instance, sometimes does not appear.
When you are validating a document, if you draw a box, zoom in, and then click Fit to screen , the box appears at a different location from where you clicked.
If you connect to a learning instance from Automation 360 IQ Bot with an optional field that has a set default value and some fields that are unmapped, when you process documents in that learning instance in Document Automation, the default value appears in the unmapped fields.
When a bot runs an action from the Document Extraction package, the Activity > In progress page shows the item name as IQBotAutoExtract.
Although the Learning instances page states that users can not delete learning instances, a user can delete a learning instance by mousing over the actions menu to the right of the learning instance and clicking the Delete icon.

Automation 360 v.24 Community Edition Release Notes

Release date: 22 March 2022

Review what's new in the Community Edition of the Automation 360 v.24 (Build 12350) release.

Note: For information about Automation 360 v.24R2 patch for Community Edition, see [Automation 360 v.24R2 Release Notes for Internet Explorer 11 EOL](#) on page 323.

Automation Workspace

Important: This release includes an optional Bot Agent update. To use the new features in v.24 (including updates to Bot Migration, Browser, DLL, Process Discovery, and Recorder packages), update the Bot Agent available with this release. However, note that if you want to run your existing bots, you do not have to update your Bot Agent to this release.

For more information on updating to this release, see these resources:

- [Automatically update the Bot Agent](#) on page 1302 | [Manually update the Bot Agent](#) on page 1303
- [Compatibility with release builds](#) on page 1275

What's new
<p>Do more with Microsoft Edge Chromium</p> <p>You can now use the Microsoft Edge Chromium browser extension for the following:</p> <ul style="list-style-type: none">• Bot Agent proxy configuration• Automatic population of device credentials <p>Browser requirements for Automation Workspace on page 1154</p>
<p>Reduce turnaround time</p> <p>You can now reduce the turnaround time for collecting information on issues by capturing log files from the Bot Runner device. You can save the log files by using the new <code>-collectLogs</code> command with the Bot Agent diagnostic utility.</p> <p>Perform Bot Agent diagnostic checks on page 1306</p>
<p>Enhancement to AISense Recorder</p> <p>You can now use AISense Recorder to automate applications that use Japanese and a combination of Japanese and English interfaces.</p> <p>AISense for recording tasks from remote applications on page 2180</p>
<p>Support for copying metadata from one bot to another</p> <p>You can now copy image and metadata files from one bot to another by using the Copy to shared clipboard option.</p>
<p>Wait time option in SOAP Web Service and REST Web Service packages (Service Cloud case ID: 00756730, 00792793, 01255869, 01753287)</p> <p>When you create a bot, you can now set a time-out value for actions in REST and SOAP requests. To indicate how long a bot should wait for a response from the server before timing out, you can set a wait time (in milliseconds) in the Wait for actions to complete field. You can enter a number or a variable or provide a global value.</p>
<p>Format text with new HTML editor in Email package</p> <p>In the Email package, when you use the Send, Reply, and Forward actions, you can now create and customize your email layout and body by using the new HTML design editor. Use the editor toolbar to make various changes to your text, such as applying bold, italic, and other formatting effects, inserting links, and changing the font and size of the text. You can copy the content from the design editor and paste it to other windows.</p>
<p>Task Bot package now supports passing Window variable to child bot (Service Cloud case ID: 00691890, 00804359, 01258948, 01764292)</p> <p>In the Run action of the Task Bot package, when you select Input values fields and enter the values or variables to pass to the child bot, you can now choose the <code>Window</code> type variable and pass it from parent bot to child bot.</p>

What's new
<p>New option in Content type field of REST Web Service package (Service Cloud case ID: 00666852, 00789910, 00771194, 00785116, 00825945, 01762199)</p> <p>You can now use the multipart/form-data option to upload files and data through REST Web Service. The content type multipart/form-data can be used to submit form elements containing files, non-ASCII data, and binary data. This option is available for actions such as POST, PUT, and PATCH.</p>
<p>Custom delimiter option in SOAP Web Service package</p> <p>For responses specific to XPath, you can now use the custom delimiter option to delimit the return content from the SOAP response. In the Custom Delimiter field, you can provide a character or a variable, and the output of the delimited response will be a complete string.</p>
<p>New option in Run function action of DLL package (Service Cloud case ID: 00830568, 01063654, 01259336, 01767965)</p> <p>In the Run function action of the DLL package, when the C# DLL interacts with the Windows API to perform system-related operations, such as keystroke, mouse click, or window switching, an intermediate window (AAZeroSizeForm) is displayed occasionally and interrupts the user's operation when the bot is running. In some cases, the DLL function does not interact with the Windows API to perform actions, such as keystroke, mouse click, or window switching, on the operating system UI through the DLL function. In such cases, you can now select the Run function in background check box to bypass the intermediate window (AAZeroSizeForm) and run the C# DLL in the console application without the form. This feature also helps to improve the performance of the DLL execution if the Run function in background check box is selected.</p>
<p>Autoscroll supported in Bot editor (Service Cloud case ID: 00730747)</p> <p>When you are creating or editing bots with a large number of lines of code and when you drag actions up or down the page, the page now automatically scrolls up or down accordingly. This feature is supported in both Flow and List views.</p>
<p>New JSON package</p> <p>Use the JSON package to automate JSON data. You can now extract the required information from JSON text or file and directly use the values in the bot.</p> <p>Json package on page 2657</p>
<p>New option in Catch action of Error handler package (Service Cloud case ID: 00766117)</p> <p>In the Error handler package, you can now ignore errors from actions inside the Catch block by using the Catch > On error, continue with next action option. When you select the On error, continue with next action check box, even if there is an error from an action in the Catch block, no exception is thrown and the bot ignores the error and continues to the next action.</p> <hr/> <p>Note: This enhancement applies to all nested actions in the Catch block. For example, if you have a Try/Catch action inside a main Catch action, if the check box is selected on the main Catch action, any error from actions within the nested block will also be ignored.</p>

What's new
<p>Enhancement to String package</p> <p>In the Extract text action of the String package, when you use the After or Before and/or after option, you can now extract a substring from a specified source string that occurs in the range of 1 through 999999 times in a file.</p>
<p>Search for files by specific date</p> <p>You can now search for files created or modified on a specific date by using the new On a date option available in the File Date condition of various packages.</p> <p>You can use this feature with the following packages and actions:</p> <ul style="list-style-type: none">• File package<ul style="list-style-type: none">• Copy Desktop files action• Delete action• Print action• Print multiple files action• Rename action• Folder package<ul style="list-style-type: none">• Copy action• Delete action• Rename action• If > File date condition• Loop > While > File date condition
<p>New action in Excel advanced package (Service Cloud Case ID: 01263892, 01782290)</p> <p>When you perform actions in a Microsoft Excel worksheet, you can now disable or enable real-time screen update by using the new Disable or enable real-time screen update action of the Excel advanced package. This action is useful to improve the performance of Excel-based automations at run time when dealing with large data sets.</p> <p>Worksheet operations in Excel advanced on page 2488</p>
<p>Use Recorder conditions in Chromium-based Microsoft Edge with Internet Explorer (IE) mode</p> <p>You can now use the Object exists and Object does not exist Recorder conditions in Chromium-based Microsoft Edge with IE mode for the following packages:</p> <ul style="list-style-type: none">• Loop > While condition• Wait > Wait for condition• If package

What's new

Internet Explorer browser support for Browser package and window variables

- The following actions of the Browser package now support the Internet Explorer browser:
 - Open
 - Close
 - Go back
 - Get source code
- In the **Browser** option, you can now select the Internet Explorer tabs from the list of active tabs.

[Browser package](#) on page 2348

Enhancement to Datetime package

The **Variable** option in the **Datetime > Assign** action is now enhanced and divided into two options:

- **Datetime**: Enables you to select the date and time along with the time zone manually and assign it to a Datetime variable.
- **Variable**: Enables you to select the Datetime variable or other variables that can have Datetime as a subtype, such as the Dictionary, Record, and list variables.

[Using the Assign action](#) on page 2399

Enhancement to Recorder package

You can now capture and automate objects inside a cross-domain IFrame that has multiple IFrames with the same frame source and IFrames that are loaded at run time in Google Chrome and Microsoft Edge Chromium browsers. You can do this by using the **Recorder > Capture** or the **Start recording** option. This support is also available for offline Google Chrome extensions.

[Recorder package](#) on page 2798

Support for pop-up windows and dialog boxes in Google Chrome, Microsoft Edge Chromium, and Mozilla Firefox browsers (Service Cloud Case ID: 00762207, 00769773, 00781196, 00786646, 00777907, 00795677, 00785995, 00808600, 00811044, 00767486, 01282172, 01286665, 01256750, 01762040)

When you are automating a web page on the supported browsers, you can now capture the pop-up windows, alert dialog boxes, confirmation dialog boxes, and prompt dialog boxes that appear. You can do this by using the **Recorder > Capture** or **Start recording** option.

[Recorder package](#) on page 2798

What's new
<p>Retrieve source code of an iFrame in Google Chrome browser</p> <p>You can now retrieve the source code of an iFrame in the Google Chrome browser by using the Browser > Get source code action. You can use the new Capture object option to capture these iFrames.</p> <hr/> <p>Note: The Capture object feature is optional and is only used to retrieve the source code of an iFrame.</p> <hr/>
<p>Run JavaScript inside an iFrame in Google Chrome browser</p> <p>You can now run JavaScript in a page that contains iFrames in the Google Chrome browser by using the Browser > Run JavaScript action. You can use the new Capture object option to capture iFrames on which you want to run JavaScript.</p> <hr/> <p>Note: The Capture object feature is optional and is only used to run JavaScript inside an iFrame.</p> <hr/>
<p>Global session support for Excel basic package</p> <ul style="list-style-type: none">• The Global session option is now supported for the Excel basic package. Use the Global session option to share a Microsoft Excel session across multiple bots so that you can use the same Excel worksheet across these bots.• The Session name field is now renamed Create Excel session. <p>Using the Open action for Excel basic on page 2477</p> <hr/>
<p>Default variable to hold number type data</p> <p>When you are building or testing a bot, you can now use the default number variable <code>SampleNumber</code>, which is included in the Variables palette.</p> <hr/> <p>Note: The default number variable is only available in new bots.</p> <hr/>
<p>Export and import password-protected files</p> <p>To improve security by providing protection against unauthorized access and malicious editing and also to protect privacy, the export and import features are now enhanced to include the password option. With this feature you can now perform the following:</p> <ul style="list-style-type: none">• Set a password for the files that you want to export from your Control Room.• Import the password-protected exported file into your Control Room. <p>Export bots on page 1967 Import bots on page 1969</p>

What's new
<p>New options in Git configuration (Service Cloud case ID: 00782957, 00837059, 00687394, 00783715, 00714059, 00659476, 00749755, 00786233, 00748166, 00776417)</p> <p>You can now perform the following actions for Git configuration:</p> <ul style="list-style-type: none"> • Choose either the HTTPS or SSH authentication method to set up the Git configuration. The SSH authentication method is more secure as the authentication is based on a public and private key pair. • Specify the branch to which you want to push your Git commits. This helps with team coordination and workflow management. • Connect to your Git repository by using a proxy server. <p>Configure a remote Git repository in Control Room on page 1762 Restore bots from Git repository on page 1770</p>

Automation Co-Pilot for Business Users

What's new
<p>Microsoft Edge Chromium and Safari supported for Automation Co-Pilot</p> <p>You can now create forms and processes in the Automation Workspace and run your requests, tasks, and bots in the web interface on Microsoft Edge Chromium and Safari browsers.</p> <p>Browser requirements for Automation Workspace on page 1154</p>
<p>Create password fields and hide sensitive information (Service Cloud case ID: 00714159, 01063512)</p> <p>In the Automation Workspace, you can now create password fields by using the Password element in your form builder. You can use the Password element in the web interface to add masked text to your password fields in the initial forms to hide sensitive information.</p> <p>About Process Composer on page 3297 Password element behavior on page 3304</p>
<p>Reference ID enhancement to requests</p> <p>You can now view the reference ID associated with your process in the Reference column of the Requests page. The reference ID is a combination of a prefix and a number that is created from a Process Key that you can enter when you edit your process for the first time. This reference ID is incremented whenever a request is created from the corresponding process.</p> <p>Reference ID properties on page 3260 Configure a process on page 3278</p>
<p>Cancelled status for tasks</p> <p>You can now filter tasks by the Cancelled status in the Tasks page. This status will show a Cancelled label next to the filtered results to inform you of the tasks that were cancelled by a user. You can filter by this status from the drop-down menu in the status bar.</p> <p>Filter and search for a task on page 3273</p>

What's new
<p>Fill initial form elements by URL parameters</p> <p>When you create a request, you can now fill initial form elements by creating query scripts that enter specific parameters in the initial form URL. These parameters are applicable only for Date, Number, Text Box, and Time elements.</p> <p>Construct URL parameters for supported elements on page 3303</p>
<p>Customize text in forms using updates to Label element</p> <p>You can now customize the text in your forms in various ways, such as applying bold, italic, underline, and other formatting effects, changing the font size and color, and so on, by using the Label element. With these options, you can highlight specific messages or texts, such as next steps, warnings, or errors, when they are rendered in the initial form in the web interface.</p> <p>The Label element now provides the following formatting options:</p> <ul style="list-style-type: none"> • Emphasis • Font color • Font size • Text alignment <p>Using the Label element on page 3220</p>
<p>Search and filter columns in a table</p> <p>On the form builder screen, if you select the Enable column filtering check box for the Table element, users can search and filter the content for all the available columns when the bot is running.</p> <p>When you use the Table element to render a table in your initial forms, you now have the enhanced ability to search each column of your table by value.</p> <p>Using the Table element on page 3226</p>

Discovery Bot

What's new
<p>Save the recording with a name</p> <p>After recording a process, you can now save the recording with a name. The name of the recording is displayed on the Recordings page for that process.</p> <p>Record a Discovery Bot business process on page 3709</p>
<p>Share a description of the recording</p> <p>You can now provide a description for a recording of a process by using the Recordings page for that process. In the Recordings page, use the Description field to share the context and the purpose of the recording with the analyst. The description provided is also displayed in the PDD.</p> <p>Record a Discovery Bot business process on page 3709</p>

What's new	
Delete a recording	
<p>After you record a process, if you do not want to submit the recording data to an analyst for review, you can delete the recording by using the Recordings page for that process. In the Recordings page, use the Delete option to delete the recording.</p> <p>Record a Discovery Bot business process on page 3709</p>	
Record business processes using Automation Co-Pilot Desktop Assistant	
<p>You can now use Automation Co-Pilot Desktop Assistant to record business processes without signing in to the Control Room. To record a business process, start Automation Co-Pilot Desktop Assistant by double-clicking the Automation Co-Pilot icon on your desktop.</p> <p>Record a Discovery Bot process using Automation Co-Pilot Desktop Assistant on page 3713</p>	
Enhancements to custom opportunities	
<p>You can now update the potential cost and savings for custom opportunities and save your changes to the process diagram. The potential cost and potential savings can be updated at any time as you review the steps from various recordings and make changes within the process diagram.</p> <p>Review opportunities, convert to bot, and generate PDD on page 3715</p>	
Enhancement to PDD	
<p>You can now view the entire process diagram from within Discovery Bot by clicking the URL link provided in the PDD. The PDD does not display the process diagram if more than 100 steps are selected.</p> <p>Review opportunities, convert to bot, and generate PDD on page 3715</p>	

Fixes	
Service Cloud case ID	Description
--	In the Community Edition and Free Trial version, you can now create and delete five or more processes, and the autogeneration opportunity does not fail. You can create up to five opportunities.

Automation 360 v.23 Community Edition Release Notes

Release date: 30 December 2021

Review what's new in the Community Edition of the Automation 360 v.23 (Build 11524) release. Build 11524 replaces Build 11513.

Important: Build 11524 includes a fix for the issue of frequent device disconnections caused by either high load or the database being locked.

Automation Workspace

Important: This release includes a required update to your . Ensure that you complete the update to continue with your automation activities when upgrading from a previous release to this release.

[Automatically update the Bot Agent](#) on page 1302 | [Manually update the Bot Agent](#) on page 1303

To verify which version is compatible with this release, see [Compatibility with release builds](#) on page 1275.

What's new
<p>Microsoft Edge (Chromium) supported for Control Room and Bot Agent</p> <p>You can now perform Control Room operations, and install and register your Bot Agent device using the Microsoft Edge based on Chromium browser.</p> <p>Browser requirements for Automation Workspace on page 1154</p>
<p>Support to automate Microsoft Edge Chromium with Internet Explorer compatibility mode (Service Cloud case ID: 00767502, 00787186)</p> <p>You can now automate web applications running on Microsoft Edge Chromium, by enabling the Internet Explorer compatibility mode, using the Universal Recorder where the objects are captured using HTML technology.</p> <p>Record a task with the Universal Recorder on page 2164</p>
<p>Support for cross-domain IFrames in Google Chrome and Microsoft Edge Chromium browsers (Service Cloud case ID: 00825656)</p> <p>You can now capture and automate objects inside a cross-domain IFrame in Google Chrome and Microsoft Edge Chromium browsers by using Recorder > Capture or the Start recording option. After you capture an object inside a cross-domain IFrame, the path to the frame is stored in the FrameDOMXPath property, by default.</p> <p>The new FrameDOMXPath property identifies the path to the frame in which the object is located. You must select this property to run the bot successfully to capture objects on a cross-domain IFrame.</p> <p>Note: This feature is available for the bots you create using the 2.4.0-20211016-070100 version of the Recorder package starting from this release.</p> <p>Recorder package on page 2798</p>
<p>Support for Capture anchor in AISense Recorder</p> <p>The AISense Recorder now supports the Capture Anchor option. When you run a bot to search for an object in an application in which the anchor changes frequently, you can use Capture anchor to override the default anchor and manually select an anchor to detect the object.</p> <p>Edit a task recorded using AISense on page 2183</p>

What's new
<p>Enhanced support when selecting Object property in Recorder package</p> <p>After you capture an object using the Recorder > Capture action, you can now select a particular object property name from the list of available properties in order to retrieve the value of the object property using the Get property action. The list includes suggested property names from the search criteria in the Object Properties table.</p> <p>Recorder package on page 2798</p>
<p>File ID supported in Check permission action of Google Drive package (Service Cloud case ID: 00777716)</p> <p>The Check permission action of the Google Drive package now supports the File ID option to refer to files available in the <code>Shared with me</code> folder of Google Drive. By providing the File ID, you can now verify the Read, Write, or Delete access granted to you in the <code>Shared with me</code> folder of the Google Drive files.</p> <p>Google Drive package on page 2591</p>
<p>New Credential package</p> <p>You can now use the Assign action in the Credential package to assign an insecure string or a variable directly to the credential variable.</p> <p>Credential package on page 2361</p>
<p>Web Services security supported in SOAP Web Service package (Service Cloud case ID: 00481836)</p> <p>As a Bot Creator, you can now provide credential variables in the raw data of the SOAP Web service action. You can create a credential variable, map the credential with a reference name in the credential mapper, and use the reference name in the raw data. Because this ensures that all security-related data can be defined in the Credential Vault and the credentials can be used in bots, you can safely deploy tasks without compromising security.</p> <p>Example of using the SOAP web service action on page 3097</p>
<p>New option in SOAP Web Service package</p> <p>Use the Build Xpath option in the SOAP Web Service package to extract values from the SOAP response. You can now specify the Xpath expression or select the appropriate node from the response body and store the output in a variable.</p>
<p>Read email from shared mailbox in Microsoft Outlook (Service Cloud case ID: 00728579, 00831622)</p> <p>To automate email-related tasks, you can now select a shared account in Microsoft Outlook so that email messages can be read from the shared mailbox.</p>

What's new

New encoding types supported in the Write to file action of Data Table package (Service Cloud case ID: 00767158)

When you use the **Write to file** action to write data from a Table type variable to a CSV or TXT file, you can now use the following encoding types from the encoding list:

- UTF-8: Works as UTF-8 without BOM
- UTF-8 with BOM (called UTF-8 previously)
- UTF-16LE
- Shift-JIS (Japanese encoding)

Auto-save functionality in Bot editor

In the Bot editor, when you use actions to build an automation, when a bot is not manually saved, an auto-save is performed and the bot now automatically saves the changes for specific events.

Note: The auto-save functionality is currently available only for specific events.

Some of the events that support auto-save functionality are as follows:

- Recorder: When you create a bot with certain actions and click **Recorder**, the event is saved, and when the recording is complete, the event is automatically saved.
- Variable manager: When you create or edit a variable to insert it in an action, the changes are saved.

Note: The auto-save functionality is not supported when you delete a variable or insert it by pressing F2 to open the variable list.

- Actions menu (vertical ellipsis): When you select any action from this menu, for example **Packages**, the event is saved automatically. When you make any change to the **Packages** page and return to the Bot editor, the event is saved.
- Find a file: When you click the **Find a file** icon, the bot is saved if it is not manually saved. Also, after you click the **Add** option, the bot is automatically saved.
- Dialog boxes: When a dialog box is opened, it is automatically saved if any changes are made.

Note: Auto-save is triggered only for top-level dialog boxes and not for nested dialog boxes.

- Deleting variables: When you delete unused variables, the event is saved.
- Bot name change: If you edit the name of a bot, the event is saved.

New option in FTP / SFTP package (Service Cloud case ID: 00792346)

Use the **Credential** option when you connect with the **Secure FTP** server type to automate a task. You can now use username and password for authentication.

[Connect action](#) on page 2532

What's new
<p>Enhancement to AI Sense Recorder</p> <p>AI Sense Recorder now supports automation of applications that use Brazilian-Portuguese and a combination of Brazilian-Portuguese and English interfaces.</p> <p>AI Sense for recording tasks from remote applications on page 2180</p>
<p>Enhancements to Number package</p> <ul style="list-style-type: none">• In the Random action of the Number package, you can now specify and limit the number of decimal digits required in the random number generated in the output.• The existing Save the outcome to a number variable field is now renamed as Save the outcome to a variable. <p>Number package on page 2697</p>
<p>Enhancements to Wait package</p> <p>Use the new Capture region feature in the Wait for screen change action of the Wait package to capture a specific region on an application by drawing a rectangle around it so that the bot automatically captures the coordinates of this region. You can perform the following actions:</p> <ul style="list-style-type: none">• Capture a specific region on a Windows application.• Preview the captured image in the Preview window.• Recapture a region if the image in the Preview window is not per user requirement. <p>The coordinates are renamed as follows:</p> <ul style="list-style-type: none">• Left is now X• Top is now Y• Right is now Width• Bottom is now Height <p>Using Wait for screen change action on page 3027</p>
<p>Enhancement to String package</p> <p>In the Extract text action of the String package, you can now extract a substring from a specified source string that occurs more than 1000 times in a file and up to a maximum limit of 999999.</p>
<p>Enhancement to File conditions in If package</p> <p>You can now use the new File extension condition from the Condition list in the If package to check the extensions of files and then execute actions based on the results.</p>
<p>Enhancement to Excel advanced package (Service Cloud case ID: 00799071)</p> <p>Use the Open action of the Excel advanced package to open files with .ods, .htm, .html, .mht, .mhtml, .slk, and .pdf extensions.</p> <p>Excel advanced package on page 2479</p>

What's new
<p>Global session support for loop iterator based on Excel advanced</p> <p>You can now use the Global session option when you loop through each row in an Excel advanced worksheet. Use the Global session option to share a Microsoft Excel session across multiple bots so that you can use the same Excel worksheet across these bots.</p> <p>Using the Open action for Excel advanced on page 2485</p>
<p>New APIs for devices</p> <p>You can now allocate default devices by using the new APIs introduced in the v1/ Devices section. Choose to set or not set a specific device as the default deployment device for a specified user by using the following APIs respectively:</p> <ul style="list-style-type: none"> • <code>/runasusers/default</code> • <code>/runasusers/default/unset</code>

Automation Co-Pilot for Business Users

What's new
<p>New query filter in Query Requests and Query Tasks actions</p> <p>Use the new filter now available in the Query Requests and Query Tasks actions of the AARI Web package to filter query requests and tasks by team name in the Automation Co-Pilot web interface.</p>
<p>Team name filter</p> <p>You can filter your tasks and requests by team name in the Task and Request pages in the web interface, respectively. Select the Team label from the filter and search by team name to view the teams assigned to a task or request.</p> <p>Filter and search for a request on page 3271 Filter and search for a task on page 3273</p>
<p>Support for audit logs (Service Cloud case ID: 00801166)</p> <p>You can now view the audit logs and refer to events relating to requests, teams, scheduler, process setups, bot setups, human tasks, and bot tasks that you have created, deleted, updated, submitted, or recovered.</p> <p>Audit log on page 2068</p>

What's new

Enhancement to user task assignment in Human Task

In the process editor, the **Auto-assign this task** option in **Human Task** provides the following alternatives:

- **The user who created the request:** The task is automatically assigned to the user creating the request in the web interface.
- **The user who opens this task:** The task is automatically assigned to the user who opens the task in the web interface.

This feature helps to reduce conflicts in assigning a task to oneself, particularly in case of specialized users such as Validator for whom the action of opening a task is equivalent to assigning the task to oneself.

Enhancement to team setup

You can now simultaneously add multiple users with similar roles (custom role) to the Automation Co-Pilot team in the web interface. The custom role in the Control Room is now aligned with a team in the Automation Co-Pilot web interface, and the enhanced team setup works as follows:

- The users added with the role are assigned a **Member** role in the team. The role cannot be changed to **Owner** or **Admin**.
- You cannot view these users in the **Users** tab of the **Team** page.
- If a user is both part of a role and added manually to the team, their role in the team will be the same as the role assigned to them manually. For example, if a user is a member, they will continue to have the **Member** role whereas if the user is an owner, they will be assigned the **Owner** role in the team.
- If the user is no longer part of a role, the user will also not be a part of the team.

Also, the **Team** page is now enhanced with navigation options at the top so that you can navigate through the various tabs (**General**, **Users**, **Roles**, **Processes**, and **Bots**). Use the **General**, **Users**, and **Roles** tabs to create teams and add users to them. The **Processes** and **Bots** tabs display the processes and bots assigned to teams, respectively.

[Team management](#) on page 3258 | [Create a team and assign roles to team members](#) on page 3267

Bot setup support

The Automation Co-Pilot Admin can use the **Bot Setup** page to view the bots that are assigned to a team, assign teams to a bot, and edit bots to remove or reassign teams. Attended Bot Runners who can view all the bots that are checked in to the **Public** workspace can now view the bots that are assigned to teams in Automation Co-Pilot Desktop Assistant.

[Bot setup for Bot Runner users](#) on page 3270

Enhancement to the form logo

You can now use the **Logos in footer** field to select up to two separate logos that are displayed in the footer of the form during bot runtime.

What's new

Add rules to various form elements

When you are creating or editing a form in the form builder, you can now add rules to the following form elements by using the **Form rules** tab:

- **Checkbox**
- **Date**
- **Document**
- **Dropdown**
- **Label**
- **Number**
- **Password**
- **Radio Button**
- **Rich Text Editor**
- **Text Area**
- **Text Box**
- **Time**

For the **Checkbox** and **Radio Button** elements, the rules are triggered only if the corresponding presets are selected. For example, if a form has two mutually exclusive options, such as **Yes** and **No**, the rules associated with these options are triggered only when you select one of the two options.

[Add rules to form elements](#) on page 3229

What's new

Updates to triggers

The following triggers are now available to run a bot:

- **Process trigger:** Starts a bot when the status of the specified process in Microsoft Windows meets one of the following preset conditions:

- **Starts**
- **Stops**

[Add a process trigger](#) on page 3242

- **Service trigger:** Starts a bot when the status of the specified service in Microsoft Windows meets one of the following preset conditions:

- **Starts**
- **Stops**
- **Resumes**
- **Pauses**
- **Is running**
- **Has stopped**
- **Is paused**

[Add a service trigger](#) on page 3243

- **Window trigger:** Starts a bot when the specified application window meets one of the following preset conditions:

- **Opens**
- **Closes**

[Add a window trigger](#) on page 3243

Discovery Bot

What's new

Install Bot Agent seamlessly

If you have not already installed the Bot Agent, you are now prompted to install the Bot Agent from the **Processes** tab. Follow the screen instructions to install the Bot Agent. After the installation, you are prompted to enable a Chrome plug-in in order to proceed with your recording tasks.

[Prerequisites for Discovery Bot](#) on page 3695

What's new
<p>Enhancement to auto-generated opportunities</p> <p>You can now begin reviewing an auto-generated opportunity from the Opportunities tab when at least one process recording is submitted for review. Review the auto-generated opportunity and choose to create a custom opportunity from an auto-generated opportunity, as required.</p> <p>Review opportunities, convert to bot, and generate PDD on page 3715</p>
<p>New recordings for review for custom opportunity</p> <p>You can now review new recordings submitted by a Discovery Bot user for a custom opportunity. You can choose to accept or dismiss the recording updates as part of the custom opportunity work flow. This option allows you to quickly and easily review new recordings in real time as the recordings are submitted by the user for that process.</p> <p>Review opportunities, convert to bot, and generate PDD on page 3715</p>
<p>Enhancements to Opportunities page</p> <p>The opportunities page is now updated to include an opportunities evolution map, along with other graphs, to help you review and analyze data for a potential opportunity for automation. Use the opportunities evolution map to help guide you on which opportunities to automate first.</p> <p>Analyzing opportunities for automation on page 3714</p>
<p>Download PDD document from the Recordings page</p> <p>You can now download and export a PDD document from the Recordings page. After you submit a recording for an analyst to review, the PDD begins processing in the background automatically. When the PDD is generated, the field changes from Processing PDD to Download. You can now choose to download the document in Word format, PDF, or both. An email notification to the business user is also sent to the email address on file. The Download PDD for Word or PDF document is also available for a custom opportunity from the Opportunities list table.</p> <p>Review opportunities, convert to bot, and generate PDD on page 3715</p>
Limitations
<p>In the Community Edition and Free Trial version, if five processes are created by the user and then deleted, the auto-generated opportunity will fail when the recording is submitted for the sixth process.</p> <p>Workaround: Create a new Community Edition and Free Trial user to create new processes and opportunities.</p>

IQ Bot

What's new
<p>Document Automation released in Community Edition</p> <p>Community Edition now offers limited features from the Document Automation version. This version is integrated with the Community Control Room. When you create a learning instance, IQ Bot automatically creates RPA bots to extract and download the data and an Automation Co-Pilot process to manage the end-to-end process. Validation now takes place in Automation Co-Pilot tasks.</p> <p>Use IQ Bot Community Edition to extract data from invoices in English.</p> <p>Community Edition on page 3533</p>
<p>Classifier enhancements</p> <p>You can now create custom document groups in a learning instance. This reduces the possibility of an OCR failing to detect fields in a document, which will cause the Classifier to create a document group unnecessarily or send the document to a wrong group.</p> <p>About the Classifier on page 3551</p>

Automation 360 v.22 Community Edition Release Notes

Release date: 15 September 2021

Review the new features in the Community Edition of the Automation 360 v.22 (Build 10535) release.

Automation Workspace

What's new
<p>Introducing Text file package</p> <p>A new Text file package is now available and includes the Get text action. Use this action to extract text from files that have Japanese characters with Shift-JIS encoding and then save the content in the files to a string variable.</p> <p>Text file package on page 3005</p>
<p>Share session across bots</p> <p>Share a DLL, Excel, and Terminal Emulator session across multiple bots using the Global session option. You can also share a session with specific child bots using the Variable option and share a session with only the current bot using the Local session option.</p> <p>Sharing sessions across bots on page 2417</p>

What's new
<p>Enhancement to AISense Recorder</p> <p>AISense Recorder now enables automation of applications that use Russian and a combination of Russian and English interfaces.</p> <p>AISense for recording tasks from remote applications on page 2180</p>
<p>Enhancements to recorder conditions for packages</p> <ul style="list-style-type: none">• Use the new Object does not exist condition from the Condition list of any package to verify whether a specific object in a window exists and then execute actions based on the result. <p>This condition works with SAP technology as well.</p> <ul style="list-style-type: none">• The existing Object condition is now renamed as Object exists. <p>Loop package on page 2679</p>
<p>Enhancements to Excel advanced package</p> <ul style="list-style-type: none">• Open files with <code>.xml</code> and <code>.txt</code> extensions using the Open action.• Use the wildcard character (*) in the Open action for file names to search based on the wildcard pattern.• When you use the Run macro action and specify an argument that has a blank value, this blank value can now be passed to the macro.
<p>New option in Database: Disconnect action</p> <p>In the Database: Disconnect action, you can now use the Keep database schema in cache until bot finishes running option to enable the Loop action to iterate the dataset by using cached schema after disconnecting from the database.</p>
<p>Use regular expressions in File > Open action (Service Cloud case ID: 00737614)</p> <p>Use regular expressions (regex) in the Open action of the File package to support pattern-based search.</p>
<p>Specify timeout for bots (Service Cloud case ID: 00667049, 00690892, 00699158, 00706491, 00739420, 00739415, 00741590, 00769795)</p> <p>You can now specify the amount of time by which the execution of a bot must be completed. The system stops the bot execution if it is not completed within the time you specified.</p> <p>Configure timeout for bot execution on page 2233</p>
<p>New Exchange version supported in Email package</p> <p>In the Email package, when you choose an EWS server to establish a connection, you can now use the Exchange2013 option in the Exchange Version field.</p>

What's new
<p>New actions in Window package</p> <ul style="list-style-type: none"> • Use the Close all action to close all windows or programs running on the system, except the windows added in the Add window field. • Use the Restore action to restore the size of a maximized or a minimized window or application running on the system. <p>Window package on page 3044</p>
<p>New option to search text within bot content in Bot editor (Service Cloud case ID: 00735685, 00736201, 00739122, 00740481, 00733885, 00748970, 00746459, 00738181,00756441,00759037,00761453,00764478)</p> <p>In the Bot editor, use the search box in the Flow, List, or Dual view to search for text, variables, or actions in the entire bot content such as package name, action name, string name, or variable name. This feature helps you to view or edit a bot with long code lines to determine where the searched text, such as variables, strings, or actions, is used and in which line.</p> <p>Actions to build bots on page 2272</p>
<p>Enhanced support for SOAP Web Service URI (Service Cloud case ID: 00759811)</p> <p>In the SOAP Web Service package, if the input to the Address location field is empty, the bot now retrieves the address location from the WSDL file.</p>
<p>New option in SOAP Web Service package</p> <p>Use the Build SOAP request option in the SOAP Web Service package to retrieve SOAP request details from the SOAP URI or the WSDL file. You can now select any operations from the list of services and ports available in the SOAP Request to automatically populate data in the fields of the SOAP Web Service action.</p> <p>Example of using the SOAP web service action on page 3097</p>
<p>TNS name supported for Oracle Database connection</p> <p>TNS (Transparent Network Substrate) name is now supported in the Oracle Database. You can connect to the Oracle Database by specifying the TNS name and path of the <code>tnsnames.ora</code> configuration file.</p>
<p>Wait time option in Google Sheets package (Service Cloud case ID: 00738249, 00817449, 00814775)</p> <p>When you use the Connect in the action in the Google Sheets package to establish a connection with the Google server, you can now set a wait time in the Wait for actions to complete field when performing actions such as Get, Set, or Delete. For example, if you have a large file that takes a long time to open, you can now set the wait time for the file to open before the system executes the next set of actions.</p>
<p>New option for Put action in Dictionary package</p> <p>You can now assign a static value to a key for a dictionary variable by using the Static value option in the Put action in the Dictionary package.</p> <p>Dictionary package on page 2406</p>

What's new

Relative click and occurrence supported in packages (Service Cloud case ID: 0055643,00754173)

When you capture a target image using the Image Recognition package, you can now use the **Preview** option to select a specific captured occurrence and position your click location relative to the image.

The feature is supported in the following packages and actions:

- Image Recognition > Find image in window
- Image Recognition > Find window in window
- If > Image Recognition condition
- Loop > While > Image Recognition condition
- Wait for condition action > Image Recognition condition

[Using Find image in window action](#) on page 2627|[Using the Find window in window action](#) on page 2630

Enhancements to execution type key in AATaskExecutor variable

- When you schedule a bot to run, the `Execution_Type` key in the AATaskExecutor variable now returns information about the execution type with schedule type (frequency) such as `Run as schedule Daily`, `Run as schedule Weekly`, or `Run as schedule Monthly`.
- When you use a trigger in a bot, the `Execution_Type` key can be accessed through the trigger data. The `Execution_Type` key returns the `Run through Trigger` as a string for triggers.

Language support for variable names

Variable names now support Greek and Japanese languages. You can now create variable names using the following characters:

- Greek uppercase and lowercase characters
- Japanese Katakana full-width and half-width characters.

New option in REST Web Service (Service Cloud case ID: 00764198, 00800287)

In the REST Web Service package, you can now use the **Allow insecure connection when using https** option to skip SSL certificate validation and to allow non-secure connections.

Work item ID and time filters for workload automations

Combine the work item ID and start time of a queue to search for specific work items and monitor the progress of these work items. The start time filters the list of all work items that start between specified start date and start time.

[Actions allowed on view queue page](#) on page 1950

What's new
<p>Enhancements to the bot structure</p> <p>We have enhanced the overall readability of the bot structure and updated the node labels of the bot to show selected properties and parameters of each action in detail in the Flow, List, and Dual views. You no longer have to expand each action to view these details.</p> <p>The Flow, List, and Dual views display the following properties of actions:</p> <ul style="list-style-type: none"> • The value you enter for actions such as Set text for all supported technologies • Names of objects on which actions such as Set text, Click, Left click, Get property, and Select item by index are performed • Name of the object property mentioned in the action • Name of the return variable if some value is assigned to a variable • List of properties for the Get property action
<p>Java applications supported in App integration package</p> <p>The App integration package now supports Java applications that are based on the Standard Widget Toolkit and Abstract Window Toolkit, which can draw text using Windows text-drawing APIs.</p>
<p>Direct download support in Bot Store</p> <p>Users who cannot connect their Control Room to the internet can now directly download Automation 360 bots and packages locally from Bot Store and then import them to their Control Room.</p> <p>Download locally and import bots and packages from Bot Store to Control Room on page 3444</p>

Automation Co-Pilot for Business Users

What's new
<p>Select File element input supported for Create a Request action</p> <p>The Create a Request action in the AARI Web package now supports passing input in the request creation forms for the Select File element. You can now use bots to create a request and upload or download files as input with the Select File element. These input files are uploaded to the storage service to be available for further processing in the request.</p>
<p>Output variables support in Process Editor</p> <p>The Output variables section in the process editor enables you to create a user-defined variable that can be set as an output to any process. This helps you pass the output from the child (sub) process, which was called in the Process Task, to the parent (main) process.</p> <p>Display child process automation output on page 3340</p>

What's new

Detail view in Tasks page

The new **Detail view** option in the **Tasks** page provides better insight into individual tasks for better task management. The detail view previews each task in its respective request view page without opening another page, which helps organize and correspond your tasks with the available requests. Users can interact with their tasks as well.

Discovery Bot**What's new**

View Groups of steps

When reviewing a process view, you can now use the group option or icon to display groups of steps that belong to the primary level action and secondary level action (and subgroup level actions) used during the recording session.

Use the group icon to help you decide what groups of steps to select for a task you want to automate. For example, a primary level action displays Microsoft Outlook, a secondary level action displays Outlook mail notification, and subgroup level actions display terms such as Email -Add To, Email – Add Subject.

[Create a process view with branches and opportunities](#)

Use Dynamic option for system-generated views

You can now use the **Dynamic** option from the Model options to view recordings where groups of steps display a set of repeating patterns that belong to the same application or same primary level action used during the recording session.

Use this option to decide the context of the process or the task you want to automate. Groups of steps that are labeled belong to supported applications such as Microsoft (Excel, Outlook, and Notepad), Notepad++, text editors, most windows use cases, and Chrome browser functionality.

[Create a process view with branches and opportunities](#)

Enhancements to PDD Word document

The PDD Word document now includes a process recording flow chart and the time on each individual step in hours, minutes, and seconds.

[Review opportunities and convert to](#)

Automation 360 v.21 Community Edition Release Notes

Release date: 02 June 2021

Review the new features in the Community Edition of the Automation 360 v.21 (Build 9664) release.

- [Automation Workspace](#) on page 778
- [AARI](#)

- [Discovery Bot](#) on page 782

Automation Workspace

Important: This release includes a required update to your . Ensure that you complete the update to continue with your automation activities when upgrading from a previous release to this release.

[Automatically update the Bot Agent](#) on page 1302 | [Manually update the Bot Agent](#) on page 1303

To verify which version is compatible with this release, see [Compatibility with release builds](#) on page 1275.

New features
<p>Automation 360 navigation enhancements</p> <p>We have enhanced the overall readability and accessibility of the Automation 360 interface. To make navigation easier, menus and views are organized based on frequently used features and related tasks.</p> <p>The interface includes the following updates:</p> <ul style="list-style-type: none"> • The Device, Profile, and Help icons are now located at the bottom of the navigation menu, consolidating all controls on the left for easy access. <p>When you click these icons, flyout panels of content and actions are shown.</p> <ul style="list-style-type: none"> • The side navigation menu can be collapsed to a slim bar to maximize the main workspace area. <p>You can continue to use the side navigation in collapsed mode, with flyouts for each section.</p> <p>Automation 360 navigation updates</p>
<p>Deploy workload automation on a multi-user Windows terminal server</p> <p>To optimize workload automation and multi-user devices, you can deploy workload automations on a multi-user Windows terminal server so that a single device can process multiple work items concurrently.</p> <p>About multi-user devices on page 1811 About device pools on page 1816</p>
<p>New actions in the SAP BAPI package</p> <p>Use the following new actions:</p> <ul style="list-style-type: none"> • Run standard workflow: Runs a standard workflow in SAP BAPI. • Run custom workflow: Runs a custom workflow in SAP BAPI. <p>SAP BAPI package on page 2876</p>

New features
<p>New actions in File package</p> <p>Use the following new actions:</p> <ul style="list-style-type: none">• Get name: Reads a file name and stores it to a string.• Get path: Reads the path of the file and stores it to a string. <p>File package on page 2513</p>
<p>Common table expression supported in Database package</p> <p>You can now use common table expression (CTE) in the Read from action using the WITH keyword in SQL-compliant databases such as Oracle and MySQL. Use CTE statements within a SQL query to simplify complex joins and subqueries.</p> <p>Using the Read from action on page 2388</p>
<p>Support for large numbers in Number package (Service Cloud case ID:00557619)</p> <p>You can now perform mathematical operations for large numbers with more precision in the Number package.</p> <p>Number package on page 2697</p>
<p>Snowflake database support using ODBC driver (Service Cloud case ID:00761695)</p> <p>Snowflake ODBC driver is now supported in the Database package. You can connect to the Snowflake database using ODBC-based client applications.</p> <p>The following actions support this feature:</p> <ul style="list-style-type: none">• Connect• Disconnect• Read from• Export to data table• Insert/Update/Delete
<p>Variables: new features and enhancements (Service Cloud Case ID:00740585)</p> <ul style="list-style-type: none">• Edit the variable name after the variable is created.• Delete all or a specific selection of unused variables from a bot.
<p>Universal Recorder new features and enhancements</p> <ul style="list-style-type: none">• Record object interactions in applications built on the Electron framework.• Perform double-click in all supported applications and browsers.
<p>Limit credential attribute use to password fields only (Service Cloud Case ID:00740585)</p> <p>When you create or edit a credential attribute, ensure that bots input the attribute value only in fields that are identified as password fields by selecting the Set this attribute as a password option.</p>

New features
<p>Default names for output variables</p> <p>When you configure an output variable for the actions in the Error handler and Python Script packages, the Control Room automatically generates a descriptive default variable name. If you create more than one output variable for an action, the subsequent variable names are appended with a -1, -2, -3, and so on to avoid a variable name conflict.</p>
<p>New string action to support nested variables</p> <p>Use the String > Evaluate value action to compare a user-specified string variable with the string variables in the bot. If a match is found, the action returns the value of the matching variable.</p> <p>String package on page 2957</p>
<p>Delete Global values</p> <p>A user with the AAE_Admin role can delete a global value from the All global values page.</p> <p>Global values on page 2260</p>
<p>ODBC driver support for all connection strings (Service Cloud Case ID: 00748887, 00777676)</p> <p>An Open Database Connectivity (ODBC) driver is now available to support all the ODBC connection strings in the same way it was used in the Enterprise 11 version. Using SQL as a standard for accessing and managing data, you can connect to MySQL, Google BigQuery, Snowflake, and other databases using the ODBC driver.</p>
<p>Share a DLL session</p> <p>You can now share a DLL session between bots.</p>

Automation Co-Pilot for Business Users

New features
<p>Download, delete, or view files in browser in initial forms or tasks</p> <p>Users can now use the Select File element to download files that are uploaded to the initial forms or tasks, and they can also delete files or access the hyperlink file to view the file in within the browser. The uploaded file can be accessed as a hyperlink, and new icons are available for download and delete.</p>

New features
<p>Enhancement to team roles</p> <p>The Automation Co-Pilot team consists of three roles:</p> <ul style="list-style-type: none">• Member: Can create, view, and delete their own requests. All the tasks are automatically assigned to the member when they create the request in a private team. In a shared team, the member can assign tasks to other members.• Owner: Can create, view, delete, and assign all the requests from the members in the team.• Admin: Can create, view delete, and assign all the requests from the members in the team. The admin can also modify the team. <p>An Automation Co-Pilot admin or manager can edit their teams and update their team members' roles. They also have the option to add or remove team members. The Automation Co-Pilot manager is the team admin by default when they create a team.</p>
<p>Assign to me feature in tasks</p> <p>When a task is unassigned and users access the tasks, use the Assign to me option to allow the tasks to be assigned to the current user so that they can immediately access the form.</p> <p>Assign or unassign a task on page 3270</p>
<p>New Bot page</p> <p>When Automation Co-Pilot team members with attended Bot Runner licenses access the web interface, they are automatically redirected to Automation Co-Pilot Desktop Assistant. Users can view all the bots created by them on this page. They can also pin, search, and sort their assigned bots.</p>
<p>New team reference in Request and Process pages</p> <p>The user can now reference the team from which a request is created by referring to the new Team column in the Request page or the team name added in the process tile in the Process page, to help guide their team assignment.</p>
<p>New Request Visibility field (Service Cloud case ID: 00718119)</p> <p>Request visibility enables users to allow or restrict access to a request they created to other team members. When the Request Visibility field is set to Shared, all the requests are accessible by all members, owners, and team admins. If the field is set to Private, the requests are available only to the user who has created the request, owner, and the team admin.</p>
<p>Enhancement to the Processes page</p> <p>The following enhancements are available on the Processes page:</p> <ul style="list-style-type: none">• Sort the processes by name, in ascending or descending order.• Toggle the pinning of a process.• Use the responsive view to adjust the display to the screen size.

New features
<p>Automation Co-Pilot Desktop Assistant for attended Bot Runners</p> <p>The Automation Co-Pilot Desktop Assistant application enables users with the attended Bot Runner license to access their bots without logging in to the Control Room. Automation Co-Pilot web users can use the Automation Co-Pilot Desktop Assistant when the attended Bot Runner license is enabled along with their Automation Co-Pilot User license without impacting their existing functionality.</p> <p>Automation Co-Pilot Desktop Assistant on page 3207</p>
<p>Add rows from header row context menu</p> <p>Only the header row is displayed when a form that has a table is launched during bot runtime. Use one of the following methods to add new rows to the table:</p> <ul style="list-style-type: none"> Header row context menu of the table <ul style="list-style-type: none"> Using the Table element on page 3226 The Set action in a bot <ul style="list-style-type: none"> Set action on page 2950

Discovery Bot

New features
<p>Sort for a process tile from the Processes page</p> <p>You can now use the sort field to help you locate a process tile quickly. From the Processes page, use the drop-down menu to sort on a process tile based on the process name in alphabetical order. Alternatively, you can sort in the order of the newest process created to the oldest process and vice versa.</p> <p>Create a Discovery Bot process on page 3704</p>
<p>Enhancements to opportunities</p> <p>You can now review and analyze automatically generated (or system-generated) opportunities immediately from the Opportunities page. Auto-generated opportunities are created when at least two recordings are approved by the user. You can create a custom opportunity from an auto-generated opportunity and apply the Model and Filter options to target a specific opportunity for automation.</p> <p>You can now prioritize opportunities based on a simple formula for all recordings in a process. From the Opportunities table, you can view the cost without automation and savings for an opportunity. The system automatically calculates the cost and potential savings for each opportunity generated. You can customize these metrics based on your organization's model for cost and savings.</p> <p>Review opportunities and convert to</p>

New features

Generated PDD files are available on your local server

The generated PDD file for an opportunity is now stored locally on your server for On-Premises deployments. The existing PDD files are automatically moved to the new location and are not deleted when a re-installation or upgrade is performed in the Control Room.

What's new

Automate SAP-related tasks using SAP BAPI

Use the actions available in the SAP BAPI package to automate SAP-related tasks using SAP BAPI.

[SAP BAPI package](#) on page 2876

What's new
<p>Default names for output variables</p> <p>When you configure an output variable for the following packages, the Control Room shows a descriptive default variable name. If you create several output variables, subsequent variable names are appended with a -1, -2, -3, and so on to avoid duplication.</p> <ul style="list-style-type: none">• Browser• CSV/TXT• Email• Excel advanced• JavaScript• Loop• Recorder• VBScript• Window
<p>PDF split with blank pages supports scanned image documents (Service Cloud case ID: 00683923)</p> <p>Use the PDF Split action to separate a blank page from pages with scanned images. With pixel-based split, you can now use Split document to split a PDF with blank page separators for scanned (image-based) documents.</p>
<p>SMTP port range expanded to include ports 1 through 65535</p> <p>The Email package now supports ports in the range of 1 through 65535 for the SMTP server. You can use the Send email action by configuring the SMTP port in this range.</p>
<p>New actions in the Active Directory package</p> <ul style="list-style-type: none">• Update account options: Sets account attributes for the user.• Change user password: Use this option to change a user's password. <p>User account operations on page 2293</p>
<p>Enhancement to Create user action in Active Directory package</p> <p>You can now use the Create user action to create an Active Directory user with password.</p> <p>Using the Create user action on page 2295</p>
<p>Universal Recorder expanded support and new features</p> <p>Use the Universal Recorder to perform the following:</p> <ul style="list-style-type: none">• Automate clicks and data retrieval in drop-down lists and combo boxes in Oracle EBS applications such as Compass.• Link an object that the bot cannot reliably identify to a nearby object (such as a link or button) that is easier for the bot to find. Use this feature in MSAA, UI Automation, or Java applications.

What's new
<p>Support for new languages in variable names</p> <p>You can now use Czech, Danish, Dutch, Finnish, French, German, Hungarian, Italian, Norwegian, Polish, Portuguese, Romanian, Spanish, and Swedish characters in variable names.</p> <p>Unicode range supported in variables on page 2251</p>
<p>Search and add child bot in the parent bot</p> <p>Search for a child bot in the public and private workspaces so that you can add it in the parent bot. You can search for the child bot from the Bot editor and the Run action of the Task Bot package.</p> <p>Using the Run action on page 2982 Bot editor for creating bots on page 2152</p>
<p>Obtain information about user that deployed the bot</p> <p>Use the AATaskInvoker system variable to return the username, first name, last name, and email of the user that ran or scheduled the bot. If the bot is deployed to an attended Bot Runner, this variable returns information about the logged-in user. If the bot is deployed by a trigger, this variable returns information about the user who set the trigger.</p> <p>System settings and parameters on page 2239</p>
<p>New condition in If package (Service Cloud case ID: 00536088, 00690073,00717514, 00737243, 00702383)</p> <p>Use the new Window with same title does not exist or Window with same title exist condition available in the If package to verify whether a window with the same title exists or whether the window title has changed.</p> <p>If package on page 2619</p>
<p>Google packages are now generally available</p> <p>Google Calendar, Google Drive, and Google Sheets packages are now generally available in Automation 360, and contain these new actions:</p> <ul style="list-style-type: none">• Write from data table and Insert row/column actions in the Google Sheets package.• Each Google package contains a Connect action to authenticate your account before adding other actions from that package to your automation. This action replaces the deprecated OAuth action from the G-Apps package.• Each Google package contains a Disconnect action to terminate the connection. <p>Using the Connect action for Google packages on page 2589</p>

Automation Co-Pilot for Business Users (Automation Co-Pilot)

What's new
<p>Get Storage file action</p> <p>The new Get Storage file action in the Automation Co-Pilot Web package enables you to download storage files to a bot device.</p> <p>Process Composer package on page 2777</p>
<p>Upload files in initial forms or tasks</p> <p>Add the Select File element to forms to enable users to select and upload files in the initial forms or tasks in the web interface. Users can browse to upload a new file or replace an existing file. The uploaded file is shown as a hyperlink and redirects users to a new tab when opened.</p> <p>About Process Composer on page 3297</p>
<p>Hyperlinks support for initial forms or tasks</p> <p>Use the new Hyperlink element to add links to forms and access them in initial forms and tasks.</p> <p>About Process Composer on page 3297</p>
<p>Configure a scheduler user for each process (Service Cloud case ID: 00713786)</p> <p>As an Automation Co-Pilot administrator, you can now configure a scheduler user for each process to allocate the Control Room resources (devices and unattended Bot Runners) on the web interface. By default, the Global scheduler user is selected if a scheduler user is not configured for individual processes.</p> <p>Configure scheduler user for Automation Co-Pilot on page 3293</p>
<p>Update to properties panel for human task (Service Cloud case ID: 00718109)</p> <p>As a Bot Creator, you can choose to not configure any actions in the human task by selecting the Make the form read-only check box in the Properties panel. The human task does not require any input and it is executed automatically to the next task.</p>
<p>Bookmark any page as landing page for Automation Co-Pilot on the web</p> <p>The web interface is now enhanced to a new multiple page system so that you can directly bookmark any page (Requests, Tasks, or Recycle Bin) as your landing page. Also, the tabs in the web interface have been removed so that the requests are opened one at a time and not simultaneously. To perform multiple tasks, you can open the requests pages in different browser tabs.</p>
<p>Navigation enhancement in Automation Co-Pilot on the web</p> <p>The web interface is now enhanced with a side navigation pane so that you can easily navigate to various pages (Processes, Requests, Recycle Bin, and Tasks).</p>

What's new
<p>New processes page (Service Cloud case ID: 00694786)</p> <p>As an Automation Co-Pilot user, navigate to your assigned processes and create new requests by using the new Processes page in the web interface. Use the navigation bar to quickly access the page.</p>
<p>Enhancements to the Button element</p> <ul style="list-style-type: none"> • Use the Disallow button click when this form is first loaded option to disable the Button element in a form when it is displayed for the first time during bot runtime. • Use the Subtle option in the Button type drop-down menu if you want the button element to appear as a link during bot runtime. <p>Using the Button element on page 3215</p>
<p>Enhancement to the form logo</p> <p>You can now use the Logos in footer field option to select up to two separate logos that are displayed in the footer of the form during bot runtime.</p> <p>Create a form</p>

Discovery Bot

What's new
<p>Search for a business process from the Processes page</p> <p>You can now use the search field to help you locate a specific process by name. The field is not case-sensitive. The search field is available from the Processes page.</p> <p>Create a Discovery Bot process on page 3704</p>
<p>View all captured images from the screenshot modal window</p> <p>You can now navigate across all captured screenshots when you click an image in full size from the modal window. Click the pagination located below the image to select a step number or use the right or left arrows to quickly display all captured images.</p> <p>Record a Discovery Bot business process on page 3709</p>
<p>Process Discovery package is included in default packages</p> <p>The Process Discovery package is now included in the default packages. You can preload the default package when you connect to your device. Preloading the package helps to speed the start time of the recorder the first time you begin recording a process</p> <p>Prerequisites for Discovery Bot on page 3695</p>

What's new

Recorder enhancements

You can now perform actions such as double-click, drag-drop, click and hold, and text select when recording a business process. Actions performed using keyboard strokes are displayed in the **Data** field. Double-click is captured by the recorder and displayed in the screenshot from the **Recordings** page.

Note: The Discovery Bot recorder does not capture the drag-drop and click and hold actions from the **Recordings** page. To include these actions performed during the recording, you can document the individual steps in the **Step description** text field for the analyst.

[Record a Discovery Bot business process](#) on page 3709

IQ Bot**Known limitations**

IPv6 addresses are not supported for IQ Bot, so ensure that you use only IPv4 addresses.

Bot Insight**What's new**

AAE_Admin role access to operations API from Power BI connector

The Power BI connector now provides the **AAE_Admin** user role access to the botrundata operational API. With this role, you can connect to the botrundata API and extract operational metrics to be analyzed and visualized within Power BI.

Enhancements to the publish (production) dashboard

Users with the **AAE_Bot Insight Admin** and **AAE_Bot Insight Expert** role can now edit the published dashboard. You can use the save as option to save the production dashboard as a custom production dashboard and add widgets to your custom dashboard. You can also delete a default production dashboard and a custom production dashboard.

[Save a published dashboard](#) on page 3746 | [Delete a published dashboard](#) on page 3746

Important: The supported packages information is moved to this topic: [Packages available in Automation 360](#) on page 2225.

- [Discovery Bot](#) on page 792

Community Edition

Important: This release includes a required update to your . Ensure that you complete the update to continue with your automation activities when upgrading from a previous release to this release.

[Automatically update the Bot Agent](#) on page 1302 | [Manually update the Bot Agent](#) on page 1303

To verify which version is compatible with this release, see [Compatibility with release builds](#) on page 1275.

New features
<p>New features in Data Table package (Service Cloud case ID: 00656843, 00707635)</p> <ul style="list-style-type: none">• Use the Change column type action in the Data Table package to perform operations on the column of a data table. Use this action to change the column data type to Boolean, Datetime, Number, or String.• Sort the data in the data table in Number, Datetime, Boolean, or String format. <p>Data Table package on page 2365</p>
<p>New action in App Integration package</p> <p>Use the Capture scrollable text action to extract text from the selected window or any control within the selected window and save it to a variable. If you click any control within the window, then text from that specific control is extracted. If you click outside the window, then all the text from that window is extracted.</p> <p>App Integration package on page 2321</p>
<p>New encoding combo box option in Terminal Emulator for VT Series</p> <p>To send and receive Japanese text, you can now use the Encoding and CodePage combo boxes when you connect to the Terminal Emulator for the VT series terminal type.</p> <p>Using Connect action for Terminal Emulator on page 2990</p>

New features
<p>New actions in Active Directory package</p> <p>Use the following actions in the Active Directory to automate a task:</p> <ul style="list-style-type: none"> • Move a computer Using the Move computer action on page 2286 • Move an organizational unit Using the Move organizational unit action on page 2292 • Add users to a group Using the Add users to group action on page 2294 • Remove users from a group Using the Remove users from group action on page 2297
<p>New system variable for new line character (Service Cloud case ID: 00669232, 00672775, 00673578)</p> <p>Use the \$String:Newline\$ system variable to add a new line character. This variable adds a new line character in various applications regardless of the operating system of the device.</p>
<p>Zero-size form for Enterprise A2019 (Service Cloud case ID: 00677611)</p> <p>The Run action uses the zero-size form with name <code>AAZeroSizeForm</code> that can be used by DLLs to identify zero-size forms created by Enterprise A2019.</p>
<p>Enhancement to define parent path in Active Directory</p> <p>When you establish a connection with an LDAP server, you can now select the LDAP path by connecting to the server.</p> <p>Using Connect action for Active Directory on page 2289</p>
<p>Obtain information about Run-As user after bot deployment</p> <p>Use the <code>AATaskExecutor</code> system variable to return the username, first name, last name, and email of the user that ran the bot. If the bot is deployed on an attended Bot Runner, this variable returns information about the logged-in user. If the bot is deployed by a trigger, this variable returns information about the user associated with that Bot Runner license.</p> <p>System settings and parameters on page 2239</p>
<p>Enhancements to the Recorder</p> <ul style="list-style-type: none"> • Universal Recorder now supports object capture in Mozilla Firefox. You must install the A2019 extension from Mozilla Firefox browser add-ons. • Capture table, grid view, and main window objects from SAP applications. <p>Universal Recorder supported applications and browsers on page 2172 Actions performed on objects captured with Universal Recorder on page 2804</p>

Automation Co-Pilot for Business Users (Automation Co-Pilot)

New features
<p>New filter task in the process editor</p> <p>In the process editor, the Filter Task enables users to filter variables such as human or bot task output with a specific filter criterion.</p> <p>Create a process automation in Process Composer on page 3312</p>
<p>New process task in the process editor</p> <p>Use the new Process Task option in the process editor to call a subprocess within the main process. This feature enables you to separate tasks into different processes instead of including all the tasks in a single process. Multiple teams can now work at the same time on different tasks within the main process and remain segregated, without any conflicts.</p> <p>Create a process automation in Process Composer on page 3312</p>
<p>Hide a task or view a hidden task</p> <p>With a Bot Creator license, you can now perform the following:</p> <ul style="list-style-type: none"> • Hide the display of human and bot tasks by selecting the Hide this task after completion option in the process editor. • View a hidden human or bot tasks by selecting the View hidden tasks option in the tasks view page. <p>Create a process automation in Process Composer on page 3312</p>
<p>Edit title in process editor</p> <p>Users can now edit the title in the process editor.</p>
<p>Rich-text editor updates (web interface)</p> <p>In the web interface, you can use rich-text editor features such as bold text, italics, underline, alignment, formatting, color, and size in tasks.</p>
<p>Table element updates (web interface)</p> <p>In the web interface, the Table element now supports the use of date, number, drop-down, and text values in tasks.</p>
<p>Updates to elements in form builder</p> <p>The form builder now includes the following new elements:</p> <ul style="list-style-type: none"> • Select Folder element: Add an upload folder option in the form. Using the Select Folder element on page 3225 • Hyperlink element: Assign a URL in the form. Using the Hyperlink element on page 3219

New features

Enhancement to the Checkbox action trigger

If a form with a **Checkbox** element is used within a trigger loop package, you can now use the **Value selected** and **Value unselected** trigger actions.

[Trigger loop package](#) on page 3007

Discovery Bot

New features

View the duration of each recorded step

A recorded step is now displayed in minutes and seconds for the business user and analyst. Use this information to understand which steps are a bottleneck in the current process and will provide most benefit from automation. The step duration is displayed from the **Recordings** page (below the screenshot image), and from the **View process** and **View opportunities** page from the Preview pane window.

[Record a Discovery Bot business process](#) on page 3709

Important: The supported packages information is moved to this topic: [Packages available in Automation 360](#) on page 2225.

Community Edition A2019.18 Release Notes

Release date: 05 January 2021

Review the new features and supported packages in the Community Edition A2019.18 release (Build 7560).

- [Community Edition A2019](#) on page 792
- [AARI](#)
- [Discovery Bot](#) on page 796
- [Bot Insight](#) on page 797
- [Supported packages](#)

Community Edition A2019

Important: This release includes a required update to your . Ensure that you complete the update to continue with your automation activities when upgrading from a previous release to this release.

[Automatically update the Bot Agent](#) on page 1302 | [Manually update the Bot Agent](#) on page 1303

Build 7560 (Community Edition) is compatible with Bot Agent 16.19.8232.

New features
<p>Configure timeout in Bot Migration package</p> <p>When migrating bots, you can now set a timeout value in the range of 3 through 90 minutes (default value is 90 minutes). If the migration of any specific bot is not completed within the set time, a timeout message is displayed and the migration process moves to the next bot.</p>
<p>Use regular expressions in variables (Service Cloud case ID: 00628227)</p> <p>Use regular expressions (regex) in value type variables to specify the entity on which you want to perform an operation. For example, actions in the File, Folder, String, and Window packages allow use of regular expression in variables.</p> <p>When Enterprise 11 or Enterprise 10 bots with commands that use regular expressions in variables are migrated, if their equivalent actions in Enterprise A2019 do not support regular expressions, the regular expression is converted to string in the migrated bots.</p>
<p>Recorder enhancements</p> <ul style="list-style-type: none"> • Use the AISense Recorder Define option to record an interaction, such as click active text, with an object that is only visible when you hover the mouse over the object. • If you record a click and keystrokes in a text box with a Control Type of <code>PASSWORD_TEXT</code>, the Recorder does not capture the keystrokes entered into the field. Instead, the action selects the Set text option and offers users the option to select a credential from the Credential Vault, enter a credential variable, or enter an insecure string.
<p>Efficiently map input and output variables between parent and child bots (Service Cloud case ID: 00537090, 00698697)</p> <p>For input variables, use the Quick map option to select the variables and set the values for the parent bot to pass. For output variables, use the Multiple variables tab to associate each dictionary key with a variable. This feature eliminates the need to use actions to extract the output dictionary values.</p> <p>Task Bot package on page 2980 Using the Run action on page 2982</p>
<p>Support for PowerBuilder application in App Integration package (Service Cloud case ID: 00680703)</p> <p>The App Integration package now supports PowerBuilder to capture and extract text from a window application. The Capture text of window action enables you to open a PowerBuilder screen to capture all the data and verify the captured text.</p>
<p>New action in Terminal Emulator package</p> <p>Use the Search Field action in the Terminal Emulator package to search for a field based on the text it contains. This action returns the name or index of the field based on the option selected.</p> <p>Terminal Emulator package on page 2988</p>

New features
<p>New action in PDF package</p> <p>Use the Get Property action in the PDF package to retrieve the properties of a PDF file and assigns the properties to a dictionary variable.</p> <p>Using the Get property action on page 2769</p>
<p>New actions in Browser package</p> <p>Use the following actions in the Browser package:</p> <ul style="list-style-type: none">• Close: Closes a Google Chrome browser window or tab.• Get source code: Retrieves the source code of a web page and saves it to a string variable.• Go back: Returns to a web page that you previously visited in the current tab.• Open: Opens the browser to a specific web page in an existing tab, new tab, or window.• Run JavaScript: Executes JavaScript in a web page. <p>Browser package on page 2348</p>
<p>Specify application window dimensions</p> <p>Use the Resize windows option to set the window height and width to specific dimensions or to the dimensions at which it was captured. This feature enhances the bot's ability to identify the target object.</p> <p>The following packages support this feature:</p> <ul style="list-style-type: none">• App Integration• If Image recognition condition• If Legacy Automation > Window Control condition• Image Recognition• Simulate keystrokes• Legacy Automation Desktop > Manage windows controls action• Loop While > Image recognition condition• Loop While > Legacy Automation > Window Control condition• Mouse• OCR• Screen
<p>Support for function keys in Terminal Emulator package</p> <p>Function keys (F1 through F24) are now supported to automate processes using ANSI and VT100 terminals in the Terminal Emulator package.</p>

New features
<p>Use regex case insensitive flag for Window title</p> <p>Enable the regex Case insensitive flag to identify a Window title field as not case-sensitive. This feature enables you to successfully run the bots even if the letter case does not match the captured window title.</p> <p>The following packages and actions support this feature:</p> <ul style="list-style-type: none"> • Wait • Image Recognition • Simulate keystrokes • Mouse > Click action • Legacy Automation Desktop > Manage windows controls • OCR > Capture window, Capture area • Screen > Capture window, Capture area • Recorder > Capture • Window: Activate, Close, Maximize, Minimize, Resize

Automation Co-Pilot for Business Users (Automation Co-Pilot)

New features
<p>New Automation Co-Pilot on the web package</p> <p>Use the Automation Co-Pilot on the web package to perform actions such as assign, query, and cancel tasks; create and query requests; and retrieve a list of team members.</p> <p>Process Composer package on page 2777</p>
<p>Filter by time</p> <p>You can now filter your requests and tasks by time:</p> <ul style="list-style-type: none"> • Requests tab: Use the Created and Updated options in the Filter window to select any dates. • Tasks tab: Use the Task created and Task updated options in the Filter window to select any dates. <p>Filter and search for a request on page 3271 Filter and search for a task on page 3273</p>
<p>View updated dates</p> <ul style="list-style-type: none"> • Use the new Updated column in the Requests tab to view the dates and time of a request that was last updated. • Use the new Task Updated column in the Tasks tab to view the date and time of a task that was last updated.
<p>Variable options</p> <p>In the Insert a variable window, the Variable field now shows child elements of available references, which include Dictionary, List, Record, and Table variable types.</p>

New features
<p>Delete a request</p> <p>Automation Co-Pilot administrators, managers, and users can now delete requests created by the Automation Co-Pilot process. The Automation Co-Pilot administrator can delete any requests. Automation Co-Pilot managers can delete requests of the team for which they are the owner. Automation Co-Pilot users can delete only the requests they have created.</p> <p>Delete a request on page 3265</p>
<p>Automatically assign managers and users</p> <p>Users can now select the Auto assign this task option in the Human Task to assign managers or users to the task. Users can also select the Auto assign the target task to option in the Go to element to assign managers to the task.</p> <p>Create a process automation in Process Composer on page 3312</p>

Discovery Bot

New features
<p>Access Discovery Bot capabilities in Community Edition</p> <p>Discovery Bot is now available in the Community Edition and the free trial version. Log in to the Control Room and click the Discovery Bot tab on the left panel to get started.</p> <p>The available limits to create processes, recordings, views, and opportunities are displayed on the respective page. Create any number of bots and download a PDD for your personal use as required.</p> <p>A single Community Edition user is a multi-role user with Admin plus Business user plus Analyst permissions.</p> <p>Get started with Discovery Bot on page 3689</p>
<p>Use Model option for system-generated views</p> <p>You can now use the Model option to compare and find the best aggregated view for your recordings. Use this option to save as many views with different combinations as required.</p> <p>You can also save the view as a manual view to further customize your view and compare side-by-side. Select either an Easy or Strict model so that you can view recordings where the steps are the same versus recordings with different results with more branches in the process path.</p> <p>Create a process view with branches and opportunities</p>
<p>Use Filter option for system-generated views</p> <p>You can now use the Filter option to use a set of values to compare different sections of a process across various recordings by selecting a specific path and step filter. Used along with the Model option, the path and step filter options for a system-generated or manual view can help you to determine and decide on a good candidate for automation.</p> <p>Create a process view with branches and opportunities</p>

New features
<p>Use toggle frequency counter option for system-generated views</p> <p>You can now use the toggle frequency counter to display the number of recordings that a particular path takes in the flow in a system-generated view. Use this option to help you understand the frequency of the path compared to other recordings or views.</p> <p>Create a process view with branches and opportunities</p>
<p>Remove recording screenshot for data privacy</p> <p>Use the Screen option (icon) to display or hide the recording screenshot before submitting the recording for the analyst to review. Use this option when you do not want to share personal image details with the analyst.</p> <p>Record a Discovery Bot business process on page 3709</p>
<p>Download PDD from the Opportunities table</p> <p>You can now download a process definition document (PDD) for an opportunity directly from the Opportunities table listed on the Opportunities page. The PDD is automatically generated when the opportunity is created. After the PDD is generated, the field changes from generating PDD to Download PDD. You can then download and save the document.</p> <p>Review opportunities and convert to</p>

Bot Insight

New features
<p>Access Bot Insight data from Tableau</p> <p>Use the Tableau connector in Bot Insight to access business and operational information. The Tableau connector connects to the Bot Insight APIs to create various business and operational metrics that you can analyze and visualize within Tableau.</p> <p>Configure Tableau web data connector in Bot Insight on page 3758</p>

Community Edition A2019.17 Release Notes

Release date: 13 November 2020

Review the new features and supported packages in the Community Edition A2019.17 (Build 7103) release. IQ Bot is on Build 7082.

- [Community Edition A2019](#) on page 799
- [AARI](#)
- [IQ Bot](#) on page 803
- [Bot Insight](#) on page 804
- [Supported packages](#)

Community Edition A2019

Important: This release includes a required update to your . Ensure that you complete the update to continue with your automation activities when upgrading from a previous release to this release.

[Automatically update the Bot Agent](#) on page 1302 | [Manually update the Bot Agent](#) on page 1303

New features
<p>Connect to EWS server with OAuth authentication</p> <p>A new authentication is available for the Exchange Web Services (EWS) protocol with OAuth. You can use the OAuth authentication and enable your EWS-managed API applications to access Exchange online in Office 365.</p> <p>Using Connect action for Email on page 2437</p>
<p>VT220 terminal type supported in Terminal Emulator</p> <p>To establish a connection and communicate with another machine, you can now use the VT220 terminal for sending and receiving text.</p> <p>Using Connect action for Terminal Emulator on page 2990</p>
<p>Enhancements to the Recorder</p> <ul style="list-style-type: none"> Record a task using the Universal Recorder or AISense Recorder from a single point of entry. Both recorders are now managed through a single package, which enables faster and more efficient updates. You can now record tasks in a Microsoft Edge browser that runs on Chromium (versions 79 and later). Use the AISense Recorder Define option to capture an object that is only visible when you hover the mouse over the object. Use the Resize window option in the Recorder > Capture action to set the window width and height. <p>This option delivers a more reliable bot. It resizes the window to the dimensions at which the task was recorded, thus increasing the likelihood that the bot identifies the target object.</p> <p>Get started with recorders on page 2162 Universal Recorder supported applications and browsers on page 2172 Using the Capture action on page 2818</p>
<p>Use shared session in Terminal Emulator</p> <p>Use the new Shared session option to pass the exact state of an application to a concurrently occurring Task Bot or MetaBot logic. For example, instead of connecting to the same application multiple times for different tasks, you can use the option to connect to the application using a single task, thus optimizing your automation logic in the long run.</p> <p>Share session between Task Bot logic on page 3004</p>
<p>Share an Excel session between bots</p> <p>Use the Set session action from the Excel basic or Excel advanced package to assign an Excel session to a variable, and then pass that variable from a parent to a child bot. This enables the child bot to access the worksheet opened in the parent bot.</p> <p>Excel basic package on page 2472 Excel advanced workbook operations Example for sharing an Excel session between bots on page 2985</p>
<p>New option for Run Task</p> <p>In the Task Bot package, you can now use the Run action with an option to repeat the selected task until you choose to stop it.</p>

New features
<p>New search for roles in User Management API</p> <p>Use the new <code>Search for roles</code> API in the User Management APIs in Swagger to obtain a list of all the roles or details for a specific role.</p>
<p>Capture response status of REST API</p> <p>In the REST Web Service package, you can capture the response status of the REST API in the dictionary variable. The dictionary variable now shows the response key with its value.</p>
<p>New option for REST Web Service (Service Cloud case ID: 00489741, 00646436)</p> <p>Use the Capture failure response action in the REST Web Service package to capture response details in the response body.</p>
<p>Use regular expressions in packages</p> <p>You can use regular expressions (regex) in certain actions to support pattern-based search in a file, folder, or Windows title. Regular expressions are supported in the actions of the File and File and Folder packages such as Copy, Delete, Rename, Print Multiple files, and Zip.</p> <p>You can also use regular expressions in some packages that support the wildcard character in their window titles.</p> <p>The following packages and actions support regular expressions:</p> <ul style="list-style-type: none"> • Wait • Image Recognition • Simulate keystrokes • Mouse > Click action • Legacy Automation > Manage windows control • OCR • Screen • Recorder > Capture • Run DLL > Run function (Legacy), Run function • Window: Activate, Close, Maximize, Minimize, Resize <p>Using Copy Desktop file action for file on page 2514 Using the Capture action on page 2818</p>
<p>Support for overloaded functions in DLL package</p> <p>The DLL > Run function action can now handle <code>.dll</code> files that contain multiple functions of the same name. The action calls the function based on the number of parameters passed.</p> <p>Using the Run function action on page 2419</p>
<p>New actions for SAP captured objects</p> <p>Use new actions that are available for Tree, Tab, and Label controls to perform operations for the various objects captured from an SAP application.</p> <p>Recorder actions supported in various SAP versions on page 2828</p>

New features
<p>Store multiple lines of text in a string variable</p> <p>You can use a string variable containing multiple lines of text in the following actions:</p> <ul style="list-style-type: none"> • String > Assign • String > Extract text • String > Compare • String > Lowercase • String > Replace • String > Reverse • Log to file • Message box • The string condition in the If, Wait, and While actions
<p>Arabic, Japanese, and Russian characters supported in variable names</p> <p>You can now create variables with names containing Arabic or Russian characters, or Japanese double-byte numbers.</p> <p>Unicode range supported in variables on page 2251</p>

Automation Co-Pilot for Business Users (Automation Co-Pilot)

New features
<p>View previous selected tasks</p> <p>Automation Co-Pilot users can now reference selected actions of their tasks. When they view a submitted task in request view, a check mark indicator is now displayed next to the buttons that are selected.</p>
<p>Run a process in private workspace</p> <p>You can now run a process in your private workspace by using the Run option in the process editor. The bots in the process are then executed on the default device of the Bot Creator.</p> <p>About Process Composer on page 3297</p>
<p>Use variables types</p> <p>You can now use new variables in the process editor such as createdOn and updatedOn (DateTime), id (Number), and title (String). These variables are part of a data flow (workflow engine) that moves data between each step of a process and requires variable input for the process to run properly.</p> <p>Supported variable types in Process Composer on page 3308</p>

New features
<p>Use the Data Privacy tag field</p> <p>The Data Privacy tag enables users to generate hidden custom output in their process tasks (Start panel, Human Task, and Bot Task). Users can enter the variables for this field during runtime with values. In the web portal, the Automation Co-Pilot admin can use this tag to check for requests or tasks by using personal user data. The admin can also filter using this field.</p> <p>Create a process automation in Process Composer on page 3312 Filter and search for a request on page 3271 Filter and search for a task on page 3273</p>

IQ Bot

New features
<p>Support for Arabic language</p> <p>When creating a learning instance, you can now choose the Arabic language from the Primary language of documents drop-down menu, with the following limitations:</p> <ul style="list-style-type: none"> • Advance table extraction is not available. • Search field on the is not supported. • Arabic numerals are not supported. <p>For example, if the document has date or time in Arabic language, it is extracted as text and validations can fail.</p> <hr/> <p>Note: You can still use string-based validation checks (such as regular expressions) for Arabic numerals.</p> <hr/> <ul style="list-style-type: none"> • Arabic is only supported on ABBYY FineReader Engine 12.4. <p>Creating a learning instance</p>
<p>Default validations for a group</p> <p>When editing a learning instance, you can now use the Select the default validations group drop-down menu to select an available group. This allows all the new group documents in production to be extracted based on the custom logic and validations defined in this selected group, before it goes to the Validator.</p> <p>Edit a learning instance</p>

Fixed features	
Service Cloud case ID	Description
-	You can now create and edit a bot even if a document associated with a deleted bot appears in production. Previously, if a bot was deleted and a document associated with it appeared in production, you could not create a new bot.

Bot Insight

New features
<p>New Automation Co-Pilot dashboard in Bot Insight</p> <p>Use the Automation Co-Pilot dashboard to view various widgets that provide information about requests created from published processes in Automation Co-Pilot. The dashboard also provides statistics on the status of created requests.</p> <p>Automation Co-Pilot dashboard on page 3739</p>

Sandbox environment

The sandbox environment for Automation 360 Cloud enables you to test your production bots to ensure that these bots work seamlessly in your production environment. Use the sandbox environment to help plan and test new features for upcoming Automation 360 releases.

The sandbox environment is the same as any Automation 360 Cloud instance but includes updates from the upcoming new release at least 3 weeks before Automation Anywhere Cloud is updated.

Note: The sandbox environment should not be used as your production environment.

IQ Bot is not included in the sandbox environment.

The following image shows how a new build is tested in the sandbox environment before it is pushed to the production environment.

Benefits

The environment provides the following benefits to the Automation 360 Cloud customers:

- Test new features and identify any changes that might be required in your current bots.
- Preview upcoming features and enhancements.
- Better plan and manage changes for the upcoming update to your environment.

The sandbox environment is available only for Automation 360 cloud and cloud-enabled deployments. The environment is not supported for a Control Room in a data center that is hosted by you or a third-party vendor. The environment includes upcoming updates for Automation 360, Discovery Bot, Document Automation, Automation Co-Pilot, and Bot Insight.

Prerequisites

- You must have a valid Automation 360 Cloud license to use the sandbox environment.
- You must purchase an orderable sandbox SKU.

Contact your Customer Success Manager (CSM) or Partner Enablement Manager (PEM) for more details.

Configure the environment

Perform the following tasks before you start using the environment:

1. De-allocate some of the licenses from your existing Automation 360 instances and allocate these licenses to the sandbox environment.
2. [Switch Bot Agent to the sandbox environment.](#)
3. Create the required users, roles, and other Automation 360 Cloud entities in the environment:
 - [Create a user](#) on page 1678
 - [Create a role](#) on page 1687
 - [Credentials and lockers in the Credential Vault](#) on page 1796
4. [Export bots from your existing Automation 360 Cloud .](#)
5. [Import the exported bots to the sandbox environment using Bot Lifecycle Management .](#)

Package updates overview

Packages are typically updated in Automation 360 releases as part of new Control Room builds. We also plan to release some updates between these releases for early delivery of critical updates and fixes as package-only updates.

These package updates are planned for the middle of specific months (dates might vary to avoid weekends or holidays).

For more information, see [Periodic package updates - summary list](#) on page 809.

How to get updated packages

Package updates will be automatically available on Cloud Control Room instances. For On-Premises Control Room instances, you can access these packages by enabling the package update feature.

- Cloud

When a new package is available, it will be downloaded automatically to the Control Room if the package is compatible with the Control Room.

The administrator can choose to enable or disable the package and choose to set an enabled package as default through **Administration > Settings > Packages > Package update**:

See [Automatic package updates for Cloud Control Room](#) on page 1841.

- On-Premises

The administrator can choose one of the following options:

- Enable cloud package updates.

See [Automatic package updates for On-Premises Control Room](#) on page 1840.

- Manually upload the package to the Control Room.

See [Add packages to the Control Room](#) on page 1842.

To get the updated package, download the file from this A-People page: [Automation 360 package releases \(A-People login required\)](#).

Note: For On-Premises instances when the **Automatically update packages from the cloud** option is enabled, or you manually upload a more recent package version to the Control Room and then later update the Control Room: If you have enabled the package version settings to

automatically set the latest version of the packages as the default version, then you might have to manually set the default package version to the new package version.

To avoid such disruption with these package updates, we recommend using **Enable** (set the default version when the packages are updated) or **Disable** options (prevent any automatic update of a newer version) before the On-Premises update to these packages.

Periodic package updates - summary list

We will be updating specific packages in the Control Room to enable you to get early access to critical updates and fixes.

Note: Each package is associated with a minimum Control Room version. If the automatic update of packages option is enabled in your Control Room, the new package is downloaded automatically if your Control Room version is compatible with the minimum Control Room requirements for that package. For more information, see [How to get updated packages](#) on page 808.

September 2023

Periodic package updates - FAQ

Review the FAQ to understand details on the periodic package updates.

What are these package updates?	These updates include enhancements and fixes to packages that we want our customers to get early access to. They are delivered in the form of package-only updates in between Automation 360 releases.
How often will such package updates be available?	These package updates will be delivered periodically, in the middle of specific months (dates might vary to avoid weekends or holidays).
Do I need to prepare anything in advance of receiving these package updates?	No. These updates do not require a maintenance window for the Control Room.
How will I know when a new version is made available?	We will post in-app notifications a few days before the new package versions are made available. <ul style="list-style-type: none">• For Cloud Control Room instances, package updates will be automatically available. When a new package is available, it will be downloaded automatically to the Control Room if the package is compatible with the Control Room. For more information, see Automatic package updates for Cloud Control Room on page 1841.• For On-Premises Control Room instances, you can access these packages by enabling the package update feature. For more information, see Automatic package updates for On-Premises Control Room on page 1840.
Will these package updates also be available in the main Automation 360 releases?	Yes, these package updates will be made available in subsequent Automation 360 releases.
I have an On-Premises deployment and I don't have auto-update enabled for packages. Can I get these package updates?	Yes, you can manually upload the packages to the Control Room, and choose whether to enable them and set them as the default, or only enable them but not set them as the default. For more information, see Add packages to the Control Room on page 1842.
Are these packages tested/validated like those available with main releases?	Customer success and trust continue to be our #1 priority at Automation Anywhere. Our Quality Assurance teams will certify the

<p>How do I know if these packages are compatible with my Control Room?</p>	<p>updated packages for compatibility with the minimum Control Room and Bot Agent versions defined.</p> <p>For the minimum compatible Control Room and Bot Agent version defined for each package, see Periodic package updates - summary list on page 809.</p> <p>Each package is associated with a minimum Control Room version that it is compatible with. For the minimum compatible Control Room version for each package, see Periodic package updates - summary list on page 809.</p>
<p>If I run into any issues with the new package version, what should I do?</p>	<p>These package updates are the same as those available with the main releases. So follow the same Support process in case you face any issues.</p>

Active Directory package updates

Review the updates in released versions of the Active Directory package such as new and enhanced features as well as fixes and limitations. The page also lists the release dates of each version, and the compatible Control Room and Bot Agent versions.

Versions summary

The following table lists the versions of Active Directory package released either with an Automation 360 release or as a package-only release (in descending order of release dates). Click the version link for information about updates in that package version.

Version	Release date	Release type	Bot Agent version	Control Room build
3.9.0 on page 812	6 September 2023	With Automation 360 v.30 (Sandbox) release	20.11 or later	8750 or later
3.8.0 on page 813	6 June 2023	With Automation 360 v.29 (Sandbox) release	20.11 or later	8750 or later

3.9.0

- Release date: 6 September 2023
- Compatible Bot Agent version: 20.11 or later
- Compatible Control Room version: 8750 or later

What's changed

Help Center for developers

- Help Center: We have added an in-app help for developers to get contextual information about and when building automations.
- Added intuitive icons for in a .

Fix

The following issues in the package are fixed:

- You can use the **Rename user** action to rename the user logon name or the user name.
- You can use the **Rename group** action to rename an existing group.

3.8.0

- Release date: 6 June 2023
- Compatible Bot Agent version: 20.11 or later
- Compatible Control Room version: 8750 or later

Fixes

In the Active Directory package, when you use user names with special DN (distinguished names) characters such as semicolon (;), hash sign (#), equal (=), plus (+), less than/greater than (< >), or backslash (\), the bot now runs successfully.

Previously, when you add a user to a group and if the user name had special characters, the bot failed when you tried to remove the user from the group.

When you create bots using the **Run query** action from the Active Directory package, it retrieves the complete object name even if the name contains special characters such as (or \).

Previously, it retrieved partial object name when the name contained special characters such as (or \).

Service Cloud case ID: 01924111

[Data Table package](#) on page 2365

The Data Table package contains actions that enable you to perform various operations on the values of table variables. Use these actions to join or merge content, search for specific values, insert rows and columns, remove duplicate rows, and write values to a file.

Database package updates

Review the updates in released versions of the Database package such as new and enhanced features as well as fixes and limitations. The page also lists the release dates of each version, and the compatible Control Room and Bot Agent versions.

Versions summary

The following table lists the versions of Database package released either with an Automation 360 release or as a package-only release (in descending order of release dates). Click the version link for information about updates in that package version.

Version	Release date	Release type	Bot Agent version	Control Room build
5.1.0 on page 827	16 August 2023	Package-only; post Automation 360 v.29 release	21.88 or later	10204 or later
4.12.2 on page 829	6 June 2023	With Automation 360 v.29 (Sandbox) release	21.88 or later	10204 or later

5.1.0

- Release date: 16 August 2023
- Compatible Bot Agent version: 21.88 or later
- Compatible Control Room version: 10204 or later

Note: This version is also available in the Automation 360 v.30 release.

What's new

Database package enhancements (Service Cloud case ID: 01881930, 01981681, 00743352, 01938224, 01946530, 01938224)

The following enhancements have been added to the Database package for Pro and Citizen Developers.

- Ability to share the Database session across parent and child bots.
 - You can now create a new global session using the **Database > Connect** action and pass this session from a parent to child bots or reuse this session in other actions of the Database package. This feature ensures data consistency in each bot because you perform the database operations on a standard set of data.
 - You can create a new session variable of the type database session to store the database sessions.
 - The existing session name field has been renamed to **Create Database session**.
- In default mode, you can now define connection strings with variables to substitute credentials such as username and password or any other security-related data in the **Connect** action. You can map these variables with credential vault values to ensure that sensitive information is not exposed in the connection string.
- You can now connect to any database with the JDBC connection string for the user-defined database option. This helps to significantly reduce development time and maintenance overhead because you are no longer required to automate processes that involve other databases.

[Using Connect action for database](#) on page 2382

What's changed

Changes to storing the database schema in Disconnect action (Service Cloud case ID: 00743352, 01938224, 01946530, 01938224)

In the **Disconnect** action, if you select the **Keep database schema in cache until bot finishes running** option and then try to create a new database session after the **Disconnect** action, while keeping the same session name as the previous one, an error occurs, and the new database session is not created. To avoid this, leave the **Keep database schema in cache until bot finishes running** option unchecked.

[Disconnect action](#) on page 2387

Fixes

For the **Insert/Update/Delete** action in the Database package, the 'Stream Closed' error is no longer displayed when you run a large SQL query (up to 65K ASCII text) over an ODBC connection.

Service Cloud case ID: 01991720

Fixed the vulnerabilities reported in the security scan.

Service Cloud case ID: 01967285

4.12.2

- Release date: 6 June 2023
- Compatible Bot Agent version: 21.88 or later
- Compatible Control Room version: 10204 or later

Fix
Fixed the vulnerabilities reported in the security scan. Service Cloud case ID: 01967285

DLL package updates

Review the updates in released versions of the DLL package such as new and enhanced features as well as fixes and limitations. The page also lists the release dates of each version, and the compatible Control Room and Bot Agent versions.

Versions summary

The following table lists the versions of DLL package released either with an Automation 360 release or as a package-only release (in descending order of release dates). Click the version link for information about updates in that package version.

Version	Release date	Release type	Bot Agent version	Control Room build
6.10.2 on page 832	17 July 2023	Package-only; post Automation 360 v.29 release	21.22 or later	15238 or later
6.9.0 on page 833	6 June 2023	With Automation 360 v.29 (Sandbox) release	21.22 or later	15238 or later

6.10.2

- Release date: 17 July 2023
- Compatible Bot Agent version: 21.22 or later
- Compatible Control Room version: 15238 or later

Note: This version is also available in the Automation 360 v.30 release.

Fix

When you work with **Run function** action and uses the following DLL function, the output will be retrieved as:

- If the DLL function return type is String (string) and the output is null, it will retrieve an empty string.
- If the DLL function return type is Array of String (string []) and the output is null, it will retrieve an empty array of strings.
- If the DLL function return type is List of String (List<string>) and the output is null, it will retrieve an empty list of strings.

Previously, when you used the DLL function return type as String (string), Array of String (string []), or List of String (List<string>), and if it contained a NULL value, the output retrieved as `true` string.

Service Cloud Case ID: 01964812, 01970306

6.9.0

- Release date: 6 June 2023
- Compatible Bot Agent version: 21.22 or later
- Compatible Control Room version: 15238 or later

A dynamic-link library (DLL) file contains a shared library of functions that can be used by Windows programs. The **DLL** package uses a .d11 file as reference and calls functions from the bot.

Document Extraction package updates

Review the updates in released versions of the Document Extraction packagesuch as new and enhanced features as well as fixes and limitations. The page also lists the release dates of each version, and the compatible Control Room and Bot Agent versions.

Versions summary

The following table lists the versions of Document Extraction package released either with an Automation 360 release or as a package-only release (in descending order of release dates). Click the version link for information about updates in that package version.

Version	Release date	Release type	Bot Agent version	Control Room build
3.30.24	21 September 2023	Package-only; post Automation 360 v.30 (Sandbox) release	21.252 or later	19223 or later
3.30.22	6 September 2023	With Automation 360 v.30 (Sandbox) release	21.252 or later	19223 or later
3.30.21 on page 835	21 August 2023	Package-only; post Automation 360 v.29	21.98 or later	15345 or later
3.30.19	16 August 2023	Package-only; post Automation 360 v.29	21.98 or later	15345 or later
3.29.17 on page 836	17 July 2023	Package-only; post Automation 360 v.29 release	21.98 or later	15345 or later
3.29.14 on page 837	6 June 2023	With Automation 360 v.29 (Sandbox) release	21.98 or later	15345 or later

3.30.24

- Release date: 21 September 2023
- Compatible Bot Agent version: 21.252 or later
- Compatible Control Room version: 19223 or later

Fixes
Users can now view the extracted data from second row correctly by using the heuristic feedback.
For the Purchase Order document type, you can now extract the table field values correctly from all the pages.
The generated feedback file no longer shows any error message and users can process documents successfully.

3.30.22

- Release date: 6 September 2023
- Compatible Bot Agent version: 21.252 or later
- Compatible Control Room version: 19223 or later

What's New
Document Automation provides an improved extraction through new Get document data and Update document data actions. You can use these actions to apply custom logic for data manipulation and validation to maximize straight-through processing (STP) and reduce manual verification efforts.

3.30.21

- Release date: 21 August 2023
- Compatible Bot Agent version: 21.98 or later
- Compatible Control Room version: 15345 or later

Fixes
This Document Extraction package release is a patch to fix the '501: DOCUMENT_PARTIALLY_FAILED' error that occurred while processing some documents.

3.30.19

- Release date: 16 August 2023
- Compatible Bot Agent version: 21.98 or later
- Compatible Control Room version: 15345 or later

Fixes

Fixes

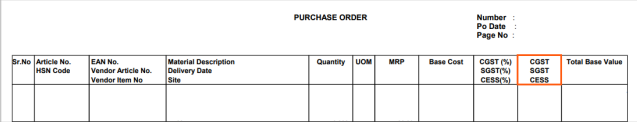

The Document Extraction package provides improved extraction capability for complex table header columns.

- Scenario 1: Extracting data from table column headers with multiple headers merged into a single column.
- Scenario 2: Extracting data from table column headers with multiple split sub-headers.

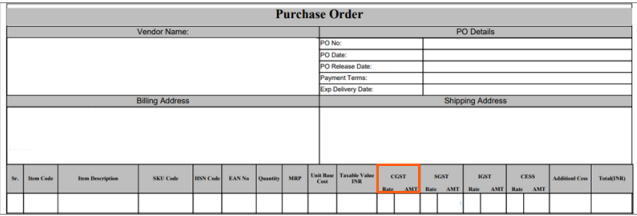

Follow these steps to enable improved table header data extraction:

1. Create or edit a learning instance.
2. To add or edit the table fields, navigate to the **Table fields** tab, and click the **Add a field > Field Properties**.
3. Add each table header as a separate table field. For Example:

Scenario 1: Add the column header and each merged sub-header as a separate table field. Using the screen-shot as a reference, you would extract data from the three merged column header fields, for which you would create three separate table fields such as CGST with alias CGST, SGST with alias SGST, and CESS with alias CESS.

Scenario 2: Add the column header and each split sub-header as a separate table field. Similar to the above example, for a column header CGST with split sub-headers Rate and AMT, you would need to create two separate table fields CGST Rate with alias CGST Rate, and CGST AMT with alias CGST AMT.

4. Click **Submit** to save your updates.

3.29.17

- Release date: 17 July 2023
- Compatible Bot Agent version: 21.98 or later
- Compatible Control Room version: 15345 or later

Fixes

The Document Extraction package has extraction improvement fixes for both form and table fields.

3.29.14

- Release date: 6 June 2023
- Compatible Bot Agent version: 21.98 or later
- Compatible Control Room version: 15345 or later

What's New

Document Automation provides an improved extraction through heuristic feedback with a focus on complex scenarios, such as multitables. Additionally, there are extraction improvements for both form fields and out-of-the-box performance (specifically for table fields).

Email package updates

Review the updates in released versions of the Email package such as new and enhanced features as well as fixes and limitations. The page also lists the release dates of each version, and the compatible Control Room and Bot Agent versions.

Versions summary

The following table lists the versions of Email package released either with an Automation 360 release or as a package-only release (in descending order of release dates). Click the version link for information about updates in that package version.

Version	Release date	Release type	Bot Agent version	Control Room build
3.18.2 on page 837	6 September 2023	With Automation 360 v.30 (Sandbox) release	21.210 or later	13980 or later
3.17.6 on page 839	6 June 2023	With Automation 360 v.29 (Sandbox) release	21.210 or later	13980 or later

3.18.2

- Release date: 6 September 2023
- Compatible Bot Agent version: 21.210 or later
- Compatible Control Room version: 13980 or later

Fixes

Create a bot to read emails that have regular and embedded attachments in the message body and perform the following steps:

1. Use the **Save attachment** action and select **HTML** or **PLAIN TEXT** format in the message body.
2. Use the dictionary variable `emailNoOfAttachments` to retrieve the attachment count and print it in the message box.

When you run the bot, it will display the correct attachment count.

Service Cloud case ID: 01971661

When you use actions such as **Reply** or **Forward** and connect to an email server with authentication type as **Client credentials**, the email shows the Sender address correctly.

Previously, the email displayed the Sender's address as unknown.

Service Cloud case ID: 01966831

A bot no longer displays an error and an email is sent in the following scenario: When you use actions such as **Send**, **Forward**, **Reply**, **ReplyAll** and connect to the EWS server, choose OAuth 2 (Client credentials or PKCE) authentication mode, and deselect the **Raise error if the attachments are missing**.

Service Cloud case ID: 01955838

Send email now works for locally hosted SMTP using the email server option.

Previously, if you used port 465 for a secured SMTP server and selected **Use secure connection (SSL/TLS)** option as **False**, the bot failed and displayed an error message.

Service Cloud case ID: 01961465

Known limitation

When you connect with the **EWS** server and use **Loop** action to retrieve all the emails from the email server, and if the email subject contains the following characters, the bot fails to execute and displays an error message.

- Control characters
 - Range: 0x00 - 0x08 (except 0x09 - Horizontal Tab) and 0x0B - 0x0C (except 0x0A - Line Feed and 0x0D - Carriage Return)
 - Hexadecimal values: 0x00-0x08, 0x0B-0x0C, 0x0E-0x1F
- High surrogate and low surrogate pairs
 - Range: 0xD800 - 0xDFFF
 - Hexadecimal values: 0xD800 - 0xDFFF
- Non-character code points
 - Range: 0xFDD0 - 0xFDEF, 0xFFFFE - 0xFFFF
 - Hexadecimal values: 0xFDD0 - 0xFDEF, 0xFFFFE - 0xFFFF
- Restricted ranges
 - Range: 0x1FFFE - 0x1FFFF, 0x2FFFE - 0x2FFFF, 0x3FFFE - 0x3FFFF, 0x4FFFE - 0x4FFFF, 0x5FFFE - 0x5FFFF, 0x6FFFE - 0x6FFFF, 0x7FFFE - 0x7FFFF, 0x8FFFE - 0x8FFFF, 0x9FFFE - 0x9FFFF, 0xAFFFE - 0xAFFFF, 0xBFFFE - 0xBFFFF, 0xCFFFE - 0xCFFFF, 0xDFFFE - 0xDFFFF, 0xEFFFE - 0xEFFFF, 0xFFFFE - 0xFFFFF, 0x10FFFE - 0x10FFFF
 - Hexadecimal values: 0x1FFFE - 0x1FFFF, 0x2FFFE - 0x2FFFF, 0x3FFFE - 0x3FFFF, 0x4FFFE - 0x4FFFF, 0x5FFFE - 0x5FFFF, 0x6FFFE - 0x6FFFF, 0x7FFFE - 0x7FFFF, 0x8FFFE - 0x8FFFF, 0x9FFFE - 0x9FFFF, 0xAFFFE - 0xAFFFF, 0xBFFFE - 0xBFFFF, 0xCFFFE - 0xCFFFF, 0xDFFFE - 0xDFFFF, 0xEFFFE - 0xEFFFF, 0xFFFFE - 0xFFFFF, 0x10FFFE - 0x10FFFF

Service Cloud case ID: 01983181

3.17.6

- Release date: 6 June 2023
- Compatible Bot Agent version: 21.210 or later
- Compatible Control Room version: 13980 or later

What's new

Enhanced error messages displayed during bot execution (Service Cloud case ID: 01887882)

When you create a bot using the **Send email** action with incorrect attachment logic, the bot execution fails and displays the following more detailed error message: `Incorrect inputs are specified for the Attachment field` when bot execution fails.

What's new

Email ID invalid option added to Send email action (Service Cloud case ID:01823424)

A new **Raise error if the email ids are invalid** option has been added to the **Send email** action of the Email package. If you add multiple addresses in the **To address** section and if any of the user email addresses are deactivated or invalid, the bot will display an appropriate error message.

[Using the Send action](#) on page 2454

Fixes

You can create a bot using **Email package > Connect > IMAP protocol** with OAuth2 PKCE flow, then use **Save attachment** action in a **Loop** with an iterator as **For each mail in mailbox**.

Previously, when you used **Save attachment** action within a loop and if emails contained attachments with a colon character (:) in the attachment name, the bot failed at the loop action with an error.

Service Cloud case ID: 01937048, 01911264, 01938122, 01943463, 01952184, 01959982, 01964181

You no longer encounter any issues when you use the **Email package > Connect** action with the **EWS** option and can perform email-related operations such as reading or sending emails.

Previously, when you used actions from the Email package, it was not working and threw a connection timeout if the proxy was configured.

Service Cloud case ID: 01940196, 01937082, 01925438

You can now use the **Connect** action in the **Email** package along with other actions (such as **Reply** or **Forward**) from the same package in a bot without any issues.

Service Cloud Case ID: 01908595

[Error handler package](#) on page 2466

If a bot encounters an error due to an abnormal condition or exceptions during execution, the normal execution of the bot is hindered, and the bot fails to complete the task. The Error handler package contains actions that enable you to easily handle exceptions a bot encounters and transfers control to the other actions within that bot.

Excel advanced package updates

Review the updates in released versions of the Excel advanced package such as new and enhanced features as well as fixes and limitations. The page also lists the release dates of each version, and the compatible Control Room and Bot Agent versions.

Versions summary

The following table lists the versions of Excel advanced package released either with an Automation 360 release or as a package-only release (in descending order of release dates). Click the version link for information about updates in that package version.

Version	Release date	Release type	Bot Agent version	Control Room build
6.16.4 on page 843	17 July 2023	Package-only; post Automation 360 v.29 release	21.112 or later	11307 or later
6.15.1 on page 844	6 June 2023	With Automation 360 v.29 (Sandbox) release	21.112 or later	11307 or later

6.16.4

- Release date: 17 July 2023
- Compatible Bot Agent version: 21.112 or later
- Compatible Control Room version: 11307 or later

Note: This version is also available in the Automation 360 v.30 release.

Fixes
You can now use the Open action in the Excel advanced package to open a Microsoft Excel file on Sharepoint even when the file name contains characters in Japanese language. Service Cloud Case ID: 01949384
The description of the Find action is now correctly translated in the Japanese language. Service Cloud Case ID: 01952045

Fix

In the Excel advanced package, you can use the **Match case** or **Match entire cell contents** options within the **Search options** field of the **Find** action to search for a value in an Excel sheet, even when the specified sheet is in a protected or read-only mode.

Service Cloud Case ID: 01970516, 01973805, 01981779

6.15.1

- Release date: 6 June 2023
- Compatible Bot Agent version: 21.112 or later
- Compatible Control Room version: 11307 or later

Fix

You can now create an Excel workbook or `.csv` file using the **Create workbook** action in the **Excel advanced** package without any issues.

Service Cloud Case ID: 01945223

Excel basic package updates

Review the updates in released versions of the Excel basic package such as new and enhanced features as well as fixes and limitations. The page also lists the release dates of each version, and the compatible Control Room and Bot Agent versions.

Versions summary

The following table lists the versions of Excel basic package released either with an Automation 360 release or as a package-only release (in descending order of release dates). Click the version link for information about updates in that package version.

Version	Release date	Release type	Bot Agent version	Control Room build
6.15.0 on page 845	6 June 2023	With Automation 360 v.29 (Sandbox) release	21.112 or later	11307 or later

6.15.0

- Release date: 6 June 2023
- Compatible Bot Agent version: 21.112 or later
- Compatible Control Room version: 11307 or later

Fixes
You can use the Get cell address action in the Excel basic package to read data from a specified cell in an Excel sheet, even when that cell contains advanced Excel function or formula (such as AVERAGEIFS,COUNTIF). Service Cloud Case ID: 01791154
The Get multiple cells action now displays the correct field name for selecting the range of cells.

File package updates

Review the updates in released versions of the File package such as new and enhanced features as well as fixes and limitations. The page also lists the release dates of each version, and the compatible Control Room and Bot Agent versions.

Versions summary

The following table lists the versions of File package released either with an Automation 360 release or as a package-only release (in descending order of release dates). Click the version link for information about updates in that package version.

Version	Release date	Release type	Bot Agent version	Control Room build
6.7.0 on page 845	6 June 2023	With Automation 360 v.29 (Sandbox) release	21.98 or later	10789 or later

6.7.0

- Release date: 6 June 2023
- Compatible Bot Agent version: 21.98 or later
- Compatible Control Room version: 10789 or later

What's new

Performance improvement for Copy Desktop file action (Service Cloud case ID: 01858508)

To copy multiple files simultaneously, you can now use the new **Copy multiple files at the same time to increase the copy speed** option in the **File > Copy Desktop file** action.

This enhances the performance of your bot enabling you to meet your SLAs quicker and effectively copy large number of files over a shared or network location.

[Using Copy Desktop file action for file](#) on page 2514

Fix

If you have used the **Open** action from the **Excel advanced** package, errors are no longer displayed when you use the **Create shortcut** action in the **File** package.

Automate various file-related operations, such as creating, opening, copying, renaming, and deleting a file, by using the actions available in the File package.

Folder package updates

Review the updates in released versions of the Folder package such as new and enhanced features as well as fixes and limitations. The page also lists the release dates of each version, and the compatible Control Room and Bot Agent versions.

Versions summary

The following table lists the versions of Folder package released either with an Automation 360 release or as a package-only release (in descending order of release dates). Click the version link for information about updates in that package version.

Version	Release date	Release type	Bot Agent version	Control Room build
6.8.0 on page 846	6 September 2023	With Automation 360 v.30 (Sandbox) release	20.11 or later	8750 or later
6.7.0 on page 845	6 June 2023	With Automation 360 v.29 (Sandbox) release	20.11 or later	8750 or later

6.8.0

- Release date: 6 September 2023

- Compatible Bot Agent version: 20.11 or later
- Compatible Control Room version: 8750 or later

What's new

Iterate each sub-folder recursively

You can now use the new **Include all sub-folders** option in the **Loop > For each folder in folder** iterator to recursively iterate through each sub-folder within a folder including hidden folders.

6.7.0

- Release date: 6 June 2023
- Compatible Bot Agent version: 20.11 or later
- Compatible Control Room version: 8750 or later

Fixes

You can now use the **Folder > Unzip** action to successfully extract a file from the zip folder where the folder name contains a space character at the trailing end.

Service Cloud case ID: 01947468

If you have used the **Open** action from the **Excel advanced** package, errors are no longer displayed when you use the **Create shortcut** action in the **Folder** package.

Versions summary

Version	Release date	Release type	Bot Agent version	Control Room build
3.0.0	21 September 2023	Package-only; post Automation 360 v.30 (Sandbox) release	21.88 or later	10195 or later
2.29.1-20230403-101855	10 June 2023	With Automation 360 (.29 Sandbox)	20.11 or later	8750 or later

3.0.0

- Release date: 21 September 2023
- Compatible Bot Agent version: 20.88 or later
- Compatible Control Room version: 10195 or later

Whats changed

Due to back-end updates, the package jar file size has increased which has resulted in the initial package download time to increase.

Whats changed
With this enhancement, in any automation a key-stroke or a mouse-click on a text-box, text-area, rich-text, number, date, or time element will trigger the associated rules. This is in addition to the focus-out cursor motion functionality that also triggers the associated rules.
Initially, the system displayed an error only if a form was called in an automation where the mandatory fields were not populated with data. Now, when creating or rendering a form from any automation, if the mandatory fields are missing value, the system displays an error.
In the Forms Composer, the rich-text element should be configured with 350 pixel width for a complete rendering of rich-text editor properties.
To troubleshoot issues for rendering an interactive form, refer to this new log-file location for more details: C:\ProgramData\AutomationAnywhere\BotRunner\Logs\uiForms-electron.log.

Limitation
The dynamic components for forms is not supported.

2.29.1-20230403-101855

- Release date: 6 June 2023
- Compatible Bot Agent version: 20.11 or later
- Compatible Control Room version: 8750 or later

Fixes
Security updates to address vulnerabilities in Blackduck Apache PDFBox.

The JavaScript package contains actions to run a JavaScript from a bot. These actions can run JavaScript on Windows, Linux, and UNIX based devices.

JSON package releases

Review the updates in released versions of the JSON package such as new and enhanced features as well as fixes and limitations. The page also lists the release dates of each version, and the compatible Control Room and Bot Agent versions.

Versions summary

The following table lists the versions of JSON package released either with an Automation 360 release or as a package-only release (in descending order of release dates). Click the version link for information about updates in that package version.

Version	Release date	Release type	Bot Agent version	Control Room build
1.4.1 on page 863	6 June 2023	With Automation 360 v.29 (Sandbox) release	21.98 or later	10520 or later

1.4.1

- Release date: 6 June 2023
- Compatible Bot Agent version: 21.98 or later
- Compatible Control Room version: 10520 or later

Fix

Few dependencies in the JSON jar file were updated to mitigate the security risk.

Legacy Automation package updates

Review the updates in released versions of packages such as new and enhanced features as well as fixes and limitations. The page also lists the release dates of each version, and the compatible Control Room and Bot Agent versions.

Versions summary

The following table lists the versions of Legacy Automation package released either with an Automation 360 release or as a package-only release (in descending order of release dates). Click the version link for information about updates in that package version.

Version	Release date	Release type	Bot Agent version	Control Room build
6.3.2 on page 864	6 September 2023	With Automation 360 v.30 (Sandbox) release	21.200 or later	13279 or later
6.2.0 on page 864	6 June 2023	With Automation 360 v.29 (Sandbox) release	21.200 or later	13279 or later

6.3.2

- Release date: 6 September 2023
- Compatible Bot Agent version: 21.200 or later
- Compatible Control Room version: 13279 or later

Fix
Fixed security vulnerability issues. For more information, click the release download link and view the Security & Compliance reports at A-People Downloads page (Login required) .

6.2.0

- Release date: 6 June 2023
- Compatible Bot Agent version: 21.200 or later
- Compatible Control Room version: 13279 or later

Fix
Fixed security vulnerability issues. For more information, click the release download link and view the Security & Compliance reports at A-People Downloads page (Login required) .

1.0.1 on page 875	6 June 2023	With Automation 360 v.29 (Sandbox) release	21.210 or later	13980 or later

1.2.3

- Release date: 21 September 2023
- Compatible Bot Agent version: 21.210 or later
- Compatible Control Room version: 13980 or later

Fix
<p>Intermittent connectivity issues that were observed with the Connect action in the Microsoft 365 Outlook package are now resolved. Therefore, you can use this action to automate any of the Microsoft Outlook related tasks.</p> <p>Service Cloud Case ID: 01981156, 01991340, 01994570</p>

1.1.5

- Release date: 6 September 2023
- Compatible Bot Agent version: 21.210 or later
- Compatible Control Room version: 13980 or later

What's changed

Help Center for developers

- Help Center: We have added an in-app help for developers to get contextual information about and when building automations.
[In-product user assistance](#) on page 1103
- Added intuitive icons for in a .

1.1.4

- Release date: 17 July 2023
- Compatible Bot Agent version: 21.210 or later
- Compatible Control Room version: 13980 or later

What's new

The **Connect** action in the Microsoft 365 Outlook package now supports a global session variable, that enables you to share the same session across parent and child bots

[Connect action in Microsoft 365 Outlook package](#) on page 2744.

1.0.1

Note: This package is new in v.29 and is based on Graph API. Microsoft has deprecated EWS API for Exchange Online and has recommended that users move to Graph API. See [Upcoming API Deprecations in Exchange Web Services for Exchange Online](#).

Note: The integration of Graph API requires an administrator to grant access, after which you can configure an application access policy and limit the scope of application permissions. See [Configure application access policy](#).

- Release date: 6 June 2023
- Compatible Bot Agent version: 21.210 or later
- Compatible Control Room version: 13980 or later

What's new

Use the Microsoft 365 Outlook package (based on Graph API) to automate email-related tasks for sending, receiving, and modifying emails and folders, and saving attachments from email messages in Microsoft 365 Outlook.

[Microsoft 365 Outlook package](#) on page 2741.

Limitation

If you have used the **Connect** action in the Microsoft 365 Outlook package to automate any of the Microsoft Outlook related tasks, the bot might fail intermittently.

[Record package](#) on page 2794

The **Record** package enables you to perform various operations on record-type variables. A record-type variable holds a row of data extracted from a database, spreadsheet, or table in name-field pairs. The fields can store values of Boolean, datetime, number, or string data type.

Recorder package updates

Review the updates in released versions of the Recorder package such as new and enhanced features as well as fixes and limitations. The page also lists the release dates of each version, and the compatible Control Room and Bot Agent versions.

Versions summary

The following table lists the versions of Recorder package released either with an Automation 360 release or as a package-only release (in descending order of release dates). Click the version link for information about updates in that package version.

Version	Release date	Release type	Bot Agent version	Control Room build
2.14.1-20230904-102210 on page 889	21 September 2023	Package-only; post Automation 360 v.30 (Sandbox) release	21.210 or later	14068 or later
2.13.6-20230809-163403 on page 890	16 August 2023	Package-only; post Automation 360 v.29 release	21.210 or later	14068 or later
2.11.5-20230512-063852 on page 892	8 June 2023	With Automation 360 v.29 (Sandbox) release	21.210 or later	14068 or later

2.14.1-20230904-102210

- Release date: 21 September 2023
- Compatible Bot Agent version: 21.210 or later
- Compatible Control Room version: 14068 or later

Fixes
The Recorder > Get table action for SAP technology successfully exports all the table data from the SAP application.

Fixes

AI Sense technology now validates the table captured in the legacy Recorder package and the **Give** action is executed successfully.

Service Cloud case ID: 01952160, 01952160

2.13.6-20230809-153403

- Release date: 16 August 2023
- Compatible Bot Agent version: 21.210 or later
- Compatible Control Room version: 14068 or later

Note: This version is also available in the Automation 360 v.30 release.

What's new

Automate UI elements having parent controls with inline JavaScript

Use the new **Debugger click** action in the Recorder when you are unable to execute the **Click** action on a control whose parent control has an inline JavaScript.

Note:

- You can use this action to automate controls only on web pages using HTML technology.
- Ensure that you install the 3.1.0.0 version of Google Chrome and Microsoft Edge extensions and the Recorder package (version 2.13.6-20230809-153403) released with Automation 360 v.30.

What's changed

Capture Electron applications using Microsoft UI Automation (COM) technology (Service Cloud case ID: 00785350)

When automating an Electron application, the Recorder now captures specific controls on the application using the Microsoft UI Automation (COM) technology by default. This enables you to automate Electron applications seamlessly without having to recapture the object with a specific technology.

Support device credentials in UPN format with Recorder

The Recorder now captures and automates objects successfully when you enter your device credentials in the UPN (user principal name) format.

What's changed

The **Handle unexpected pop-ups** functionality is enhanced with the following changes:

- Manage multiple (up to 5) pop-ups.
- Handle unexpected pop-ups for the HTML technology.

[Manage unexpected pop-ups](#) on page 1029

Fixes

When you capture an object in any browser using **Recorder > Capture** action with technology type as **Microsoft Active Accessibility**, the bot can now perform left click/right click/double click the object.

Previously, when you captured an object in any browser using MSA technology, the bot could not perform left click/right click/double click due to the runtime window in the foreground, and the control was not in focus (not visible).

Service Cloud case ID: 01969776

When you capture the **Page tab** or **Tree** control using Java technology and then use the **Get selected** or **Select item by text** actions, the application does not crash during bot execution.

Previously, the application on which Recorder package executed was crashing.

Service Cloud case ID: 01972119, 01983570, 01976678, 01986154

When you capture the **Page tab** control and perform the **Select item by text** action on an already selected tab, it will now execute the bot successfully without any issue.

Previously, the bot displayed an error when you executed the **Select item by text** action.

When you use Microsoft Edge in Internet Explorer mode to play the **HTML Recorder** action, the `Automation.CSharpDLLWrapper.exe` in the Recorder package does not crash any longer. Previously, the `Automation.CSharpDLLWrapper.exe` crashed intermittently when the `frame.length` was null.

Service Cloud case ID: 01983400

The **Capture** action now times out if the SAP application stops responding while trying to capture any interaction.

Service Cloud case ID: 01979580

When you use the Recorder to capture controls using Java technology, the bot now successfully extracts the **Path** object property of that specific control.

Previously, when you tried to extract the **Path** object property, it returned a blank value.

When you use the Recorder to automate controls on a Java application, use the **Get selected text** action to retrieve data from the selected item, and run the bot, the Java application no longer gets terminated.

Service Cloud case ID: 01986154, 01976678

Fixes
Removed JxCapture dependency.
<p>When you migrate a bot containing an Object Cloning command or MetaBot created using Java technology and run the same bot in Automation 360, it executes successfully without delay.</p> <p>Previously, when you executed the migrated bot in Automation 360, it took longer to complete execution due to some performance issues.</p> <p>Service Cloud case ID: 01957525</p>
<p>You can now use the Recorder to search and capture a specific control on a Java web application running on Microsoft Edge with IE mode using the Path or variable path object property. Previously, the Recorder searched the object by location if the search by path failed on a Java web application.</p> <p>Service Cloud case ID: 01948537, 01946746</p>
<p>You can now use the Recorder with Microsoft UI automation (COM) technology to successfully capture and extract rows from a Table control.</p> <p>Service Cloud case ID: 01937622, 01937158, 01942234, 01960301, 01956515, 01973683</p>
<p>You can now use the Recorder with Microsoft UI automation (COM) technology to capture and automate tables that have large data sets.</p> <p>Service Cloud case ID: 01953882, 01958202</p>
<p>When you use the Recorder (version 2.10.2-20230104-214915) to capture objects on a SAP Fiori application, the bot now captures the objects successfully. Previously, the bot failed with an error message: Unable to find BUTTON. Search Criteria did not match.</p> <p>Service Cloud case ID: 01983593</p>
<p>You no longer encounter issues when you use the Recorder package to automate SAP applications and then use the Control type as <code>Table</code> (Grid view) to set cell by text or index.</p> <p>Previously, when you used the Control type as <code>Table</code> (Grid view) to set cell by text or index, the bot failed to set the values.</p>

2.11.5-20230512-083852

- Release date: 6 June 2023
- Compatible Bot Agent version: 21.210 or later
- Compatible Control Room version: 14068 or later

What's new

Automate controls using Microsoft UI Automation (COM) technology

You can use the Microsoft UI Automation (COM) technology to capture and automate the following controls:

- Calendar controls
- Menu controls
- Slider controls

[Capture using specific technology](#) on page 2824 | [Actions performed on objects captured with Universal Recorder](#) on page 2804

New actions for Table control

When you use the Microsoft UI Automation (COM) technology in the Recorder to automate a table, you can select the following new **Table** control actions from the **Action** drop-down:

- **Click on cell by index**
- **Click on cell by text**
- **Left click on cell by index**
- **Left click on cell by text**
- **Right click on cell by index**
- **Right click on cell by text**
- **Double click on cell by index**
- **Double click on cell by text**

[Actions performed on objects captured with Universal Recorder](#) on page 2804

Automate business applications on remote devices accessed over VMWare VDIs

By installing our native Remote Agent on VMware server, you can now automate your business applications that are running on remote devices and are accessed over VMware VDIs. Our native Remote Agent enables secure communication between VMware server and Bot Agent and provides the object level information for automation creation and play back. This enhances the automation coverage to new use cases while providing a reliable native desktop user experience.

VMware-based automation is supported for all VMware protocols, viz VMware Blast, PCoIP, and Microsoft RDP. This eliminates the requirement for any security exceptions by IT administrators. VMware-based automation is supported for Web applications, Java applications and applications built on Microsoft Active Accessibility or UI Automation technologies.

[Automate applications running on remote machines](#) on page 2826

What's new

Improved performance when automating applications with multiple controls

When you use UI automation technology to automate window applications with more number of UI elements, you can now use the new **IsFirst** object property to enable the bot to detect the first object whose **ID** matches your search criteria. This improves the performance of your bot because the bot no longer needs to traverse the entire tree to match every control based on your search criteria, which would otherwise take more time and impact the performance of your bot. You can use the **IsFirst** object property when an object does not have a unique Automation ID and when the object hierarchy changes in the application.

[Using the Capture action](#) on page 2818

Fixes

When you use the **Recorder > Object exists** condition in the **If** action to detect an object in a window, use the **IsVisible** object property as a search criterion, and run the bot, the bot now returns the result based on the value (true or false) added in the **IsVisible** property for the captured object.

Service Cloud case ID: 01920409

When you use the Recorder package (version 2.11.5 and later) in your bot that runs on a multi-user Citrix machine on Windows Server 2012, the bot no longer fails with an error message: `Unable to initialize bot execution environment`

Note: If you are using a Recorder package (version earlier than 2.11.5) in your bots, then we recommend that you use the same version of the Recorder package in all your bots. However, from version 2.11.5 and later, you can use a combination of version 2.11.5 and later versions of the Recorder package.

Service Cloud case ID: 01959207

Related reference

[Recorder package](#) on page 2798

Recorder package captures a series of tasks in a process and then automates them. You can automate your business applications (for example, desktop, Web, SAP, and Java applications) using the Recorder to capture actions performed on application objects such as a text box, button, table, radio button, combo box, and list view.

Remote agent updates

Review updates in the Remote agent versions such as new and enhanced features as well as fixes and limitations.

Versions summary

The following table lists the Remote agent versions.

Version	Compatible with Recorder package version
2.3.3.29 on page 895	2.11.5 and later versions

2.3.3.29

Fix
<p>You no longer encounter issues when you capture an object and run the bot in the Xen app environment.</p> <p>Previously, when you captured an object, closed the application, and reran the same bot, it failed with an error.</p> <p>Service Cloud case ID: 01981082</p>

Rest Web Services package updates

Version	Release date	Release type	Bot Agent version	Control Room build
2.1.2	<ul style="list-style-type: none"> 6 September 2023 16 August 2023 	<ul style="list-style-type: none"> With Automation 360 v.30 (Sandbox) release Package-only; post Automation 360 v.29 release 	21.250 or later	18000 or later
1.0.4 on page 904	6 June 2023	With Automation 360 v.29 (Sandbox) release	21.250 or later	18000 or later

2.1.2

Updated in v.30 release

- Release date: 6 September 2023
- Compatible Bot Agent version: 21.250 or later
- Compatible Control Room version: 18000 or later

Note: Additional updates are available in the version in v.30, including the updates made available on .

What's new

Control room OAuth connection

Use this connection method by creating a custom SharePoint OAuth connection and storing it in the Control Room.

[SharePoint authenticate action](#) on page 2911

Updated in August 2023

- Release date: 16 August 2023
- Compatible Bot Agent version: 21.250 or later
- Compatible Control Room version: 18000 or later

What's new

You can now connect to a SharePoint Teams site using the **Teams site** option in the authenticate action. After connecting to the Teams site you can perform all SharePoint operations.

[SharePoint authenticate action](#) on page 2911

You can now use either a list name or a list ID when creating a list item in SharePoint. Previously, only list name was supported.

[SharePoint create list item action](#) on page 2929

1.0.4

- Release date: 6 June 2023
- Compatible Bot Agent version: 21.250 or later
- Compatible Control Room version: 18000 or later

What's new

You can use the new SharePoint package to manage your documents, sites, and data. You can use the SharePoint package to perform the following CRUD (create, read, update, and delete) actions in a SharePoint site:

- CRUD operations for folder and file
- CRUD operations for list and list items

String package updates

Review the updates in released versions of the String package such as new and enhanced features as well as fixes and limitations. The page also lists the release dates of each version, and the compatible Control Room and Bot Agent versions.

Versions summary

The following table lists the versions of String package released either with an Automation 360 release or as a package-only release (in descending order of release dates). Click the version link for information about updates in that package version.

Version	Release date	Release type	Bot Agent version	Control Room build
5.8.0 on page 909	6 September 2023	With Automation 360 v.30 (Sandbox) release	20.18 or later	9130 or later
5.7.1 on page 909	6 June 2023	With Automation 360 v.29 (Sandbox) release	20.18 or later	9130 or later

5.8.0

- Release date: 6 September 2023
- Compatible Bot Agent version: 20.18 or later
- Compatible Control Room version: 9130 or later

Fixes
<p>The Before and After options in the String > Extract text action in the interface are now correctly translated in Japanese language.</p> <p>Service Cloud Case ID: 01959775, 01995941</p>

5.7.1

- Release date: 6 June 2023
- Compatible Bot Agent version: 20.18 or later
- Compatible Control Room version: 9130 or later

What's new
<p>Extract maximum number of characters from the source string</p> <p>A new Up to field has been added to the String > Extract text action that enables you to enter the maximum number of characters to extract from the source string.</p> <p>Using Extract text action of String package on page 2960</p>
<p>New option in the Substring action</p> <p>When you use the String > Substring action to extract a part of content from a string, you can select the Return blank if the range is not found check box. This enables the bot to return a blank value when the value in the Start from index field is greater than the length of the source string.</p> <p>Substring action on page 2970</p>
Fixes
<p>When you use the String > Extract text action and select either Before, Before and/or after, or After options to extract the text, the event data now correctly shows the options that you select.</p> <p>Previously, when you used one of the specified options to extract the text, the event data of the bot showed only the Before option irrespective of the option that you had selected.</p>
<p>The bot no longer generates an incorrect output when you use the String > Replace action to find and replace a string which contains a regular expression.</p> <p>Service Cloud Case ID: 01967997, 01969353, 01969353</p>

Terminal Emulator package updates

Review the updates in released versions of the Terminal Emulator package such as new and enhanced features as well as fixes and limitations. The page also lists the release dates of each version, and the compatible Control Room and Bot Agent versions.

Versions summary

The following table lists the versions of Terminal Emulator package released either with an Automation 360 release or as a package-only release (in descending order of release dates). Click the version link for information about updates in that package version.

Version	Release date	Release type	Bot Agent version	Control Room build
4.11.0 on page 913	21 September 2023	Package-only; post Automation 360 v.30 (Sandbox) release	21.93 or later	10353 or later
4.10.0 on page 914	6 June 2023	With Automation 360 v.29 (Sandbox) release	21.93 or later	10353 or later

4.11.0

- Release date: 21 September 2023
- Compatible Bot Agent version: 21.93 or later
- Compatible Control Room version: 10353 or later

What's new

New capabilities added to the Terminal Emulator package (Service Cloud case ID: 01959254)

The following features have been added to enhance the professional developer experience:

- You can use the new **Set key mappings** action to overwrite the default mapping of keys. The set key mapping enables developers to map from the key lists, especially when keys behave differently on different terminals. For example, you can map `KEY_PAGEUP` to `{Page Up}`, `{Roll Down}`, or `\x1b[5~` based on the terminal host you connected with.
- When you select the **VT series** terminal type, you can select the **Custom DA string** check box and specify the string value so that the string is sent in response to a Device Attributes request.
- You can select a new **Linux** terminal type to connect a Linux-based terminal. Using a Linux terminal, developers can execute commands and perform tasks faster.

[Using Set key mappings](#) on page 3001 | [Using Connect action for Terminal Emulator](#) on page 2990

4.10.0

- Release date: 6 June 2023
- Compatible Bot Agent version: 21.93 or later

Fix

When the input XML file contains comments before and after the root node and if the **Remove text nodes that contain only white space** (**Start Session** action) and **Use Prettyprint** (**Save session data** action) check boxes are selected, the output XML file formatting is displayed correctly on bot execution and a new line is added after the comment node.

3.10.0

- Release date: 6 June 2023
- Compatible Bot Agent version: 20.11 or later
- Compatible Control Room version: 8750 or later

Use the actions in the XML package to automate the processing of XML data generated from web services and cloud computing applications.

Previous Package SDK Release Notes

Review the new, changed, fixed, and deprecated features, and security fixes, known issues, and limitations for the previous Automation 360 (formerly Enterprise A2019) Package SDK.

Automation 360 v.28

Feature	Description
Added security fix.	Added a security fix to the vulnerabilities reported in the previous release.

Feature	Description
Added allowed_agent_targets	<p>Added allowed_agent_targets attribute in @CommandPkg, which will mark the bot if it can be run as a service. Supported values are:</p> <ul style="list-style-type: none"> - AllowedTarget.HEADLESS - AllowedTarget.WINDOWS

SDK download link: [A360-package-sdk-2.7.0.zip](#)

Docs download link: [A360-package-sdk-2.7.0-javadoc.zip](#)

Automation 360 v.27

Feature	Description
Added documentation_url and tutorial_url	<p>Added documentation_url and tutorial_url attributes in @CommandPkg.</p> <ol style="list-style-type: none"> 1. documentation_url - Use this to add a documentation link to an action. 2. tutorial_url - Use this to add a video tutorial link to an action. <p>For example:</p> <pre>@CommandPkg (node_label = "[[CMtoINCH.node_label]]", label = "[[CMtoINCH.label]]", description = "[[CMtoINCH.description]]", name = "CMtoInch", icon = "ruler_icon.svg", documentation_url = "https://example.com/doc/ CMtoINCH.html", tutorial_url = "https://example.com/ tutorial/CMtoINCH.html", minimum_controlroom_version = "13980", minimum_botagent_version = "21.210")</pre>

[A360-package-sdk-2.6.1.zip](#)

Automation 360 v.25

Feature	Description
Added default session_value	Added default_session_value attribute in @CommandPkg to set up the default value for global session.

[A360-package-sdk-2.5.0.zip](#)

Automation 360 v.23

Feature	Description
Log4j version	Log4j version upgrade to 2.17.1.

[A360-package-sdk-2.4.1.zip](#)

Automation 360 v.22

Feature	Description
Rebranded the package name	The package name is rebranded from A2019 to A360.
Added return settings	Added return settings for @CommandPkg to decide the setting or configurations related to the return type of the command.
Added a new annotation	Added a new annotation for SessionObject to indicate that the session object is passed to the command.
Added a new annotation	Added a new annotation for SessionAllowNonExistent to indicate that a non-existing session can be passed to the command.
Added a new attribute type	Added a new attribute type BAPIOBJECT that works with the control type named BAPIWORKFLOW with the following three tables. <ul style="list-style-type: none"> • Import • Export • Table
Added multiple return settings	Added multiple return settings in @CommandPkg to return multiple values from the command.

Feature	Description
Runtime library updates	Bundled the latest bot runtime libraries.

[A360-package-sdk-2.3.0.zip](#)

Automation 360 v.21

Feature	Description
Added a new annotation	Added the new annotation for the Control Room and the Bot Agent.
Added a new annotation	Added the new annotation for the credential password (@CredentialAllowPassword).
Added a new example	Added the new example at: <code>botcommand/samples/commands/basic/types</code> , called CredentialTypeDemo.java file.
Added a new annotation	Added the new annotation to support the Trigger3 interface.
Updated trigger examples	Updated trigger examples to support the Trigger3 interface.
Runtime library updates	Bundled latest bot runtime libraries.

[A2019-package-sdk-2.1.0](#)

Enhancements A2019.20

Feature	Description
Runtime library updates	Bundled latest bot runtime libraries.

[A2019-package-sdk-2.0.9](#)

Enterprise A2019.19

Feature	Description
Runtime library updates	Bundled latest bot runtime libraries.
Added annotation rule	Added the <code>MultipleRecordPicker</code> annotation rule.
Added annotations	Added annotations for desktop operation stages.

[A2019-package-sdk-2.0.8](#)**Enterprise A2019.18**

Feature	Description
Runtime library updates	Bundled latest bot runtime libraries.
Added shared session	Added support for shared sessions.
Enhanced property creation	Now properties can accept one parameter.
Added rule for WindowResize and WindowBrowser	Added a new rule for WindowResize and WindowBrowser.
Non-essential dependencies in the <code>build.gradle</code> are commented out	Non-essential dependencies in the <code>build.gradle</code> are now commented out. Enable it to compile the Package SDK samples.

[A2019-package-sdk-2.0.7](#)**Enterprise A2019.17**

Feature	Description
Runtime library updates	Bundled latest bot runtime libraries.
Added author name in custom packages	Added support to add the author name in the vendor column of custom packages.
Added File2 attribute	Added the new attribute type File2.
Added File Type rule	Added the new rule File Type.

[A2019-package-sdk-2.0.6](#)**Enterprise A2019.16**

Feature	Description
Runtime library updates	Bundled latest bot runtime libraries.
Added NoLogging	Added NoLogging support.

[A2019-package-sdk-2.0.5](#)

Enterprise A2019.15

Feature	Description
Runtime library updates	Bundled latest bot runtime libraries.

[A2019-package-sdk-2.0.4](#)

Enterprise A2019.14

Feature	Description
Desktop operations	Added desktop operations support.
Samples for actions in the download file	Added additional samples for actions in the Package SDK download file.
Runtime library updates	Bundled latest bot run-time libraries.

[A2019-package-sdk-2.0.3](#)

Enterprise A2019.13

Feature	Description
Time validation for locales	Added compile time validation for locales JSON file.
Entry list	Added support for ENTRYLIST
Runtime library updates	Bundled latest bot runtime libraries.

[A2019-package-sdk-2.0.2](#)

Enhancements A2019.12.1

Feature	Description
Trigger samples	Added trigger samples in the Package SDK download file. Download the latest Package SDK to access the sample files.

[A2019-package-sdk-2.0.1.zip](#)

Enterprise A2019.12

Feature	Description
Runtime libraries	Added the latest runtime libraries.
Custom trigger	Creating custom triggers is supported in this release.
Sample	We added more code samples.
HierarchyDemo.java code example added to package documentation. (Service Cloud case ID: 00469066)	Create a simple action with multiple choices. The UI differs based on the options selected.

[A2019-package-sdk-2.0.0.zip](#)

Enhancements A2019.11

Feature	Description
Runtime libraries	This package contains the latest runtime libraries.

[A2019-package-sdk-1.0.11.zip](#)

Enterprise A2019.10

Feature	Description
Updated annotation support	Added new attributes annotation support.
Improved bundling of SDK	Bundled java doc inside package SDK zip. You only need to download one zip file now.
Runtime libraries	Bundled latest bot runtime libraries.
More examples	Added new examples inside zip.
Datatypes	Added new datatypes.

[A2019.10-package-sdk-1.0.0.zip](#)

Note: All the components for the Package SDK are included in a single zip file starting with the A2019.10 release.

Enterprise A2019.09

Feature	Description
Bot runtime libraries	Bundled latest bot runtime libraries for A2019.09 Package SDK.

- SDK Demo Package: [A2019.09-packageSDK-1.0.0.zip](#)
- Documentation: [A2019.09-package-annotations-javadoc.zip](#)

Enterprise A2019.08

Feature	Description
Bot runtime libraries	Bundled latest bot runtime libraries for A2019.08 Package SDK.
Properties support	Extended support for properties.
Comments expanded and improved	Added more comments to sample commands to help use SDK.
Comment field formatting	Added text color and background color to comment fields.

- SDK Demo Package: [A2019.08-packageSDK-1.0.0.zip](#)
- Documentation: [A2019.08-package-annotqations-javadoc.zip](#)

A2019.07

Feature	Description
Bot runtime libraries	The A2019.07 bot runtime libraries are bundled in the SDK package.
CREDENTIAL attribute	We provide support for credential attributes that require input from action screens.
Localized error messages and actions UI text	Enables developing packages with i18n error messages and localized (l10n) actions UI with localized text.
Java Development Kit 11	The A2019.07 Package Development Kit supports JDK 11.

Process Discovery version 1.76.0 release notes

Review the new features and fixes available in this release.

Release Date: 29-August-2023

For information related to features and fixes in previous Process Discovery releases, see the PDFs for these releases: [Process Discovery documentation \(release versions\)](#).

Note: Version 1.75.0 is an internal-only release.

What's new

Flow Graph is set to default mining type

The Flow Graph is the default mining type when you run a basic or an advanced mining run.

[Create a Mining Run](#) on page 3639

Recommended and Highly Recommended processes

Mining runs with Flow Graph Process results are now tagged as Recommended and Highly Recommended where applicable to help you determine which processes to focus on for optimization.

What's changed

Flow Graph Enhancements

The following enhancements are added to Flow Graph:

- The Start and end nodes are labeled
- Frequency counts are added to the start/end nodes and start/end connections.
- All the Flow Graphs are now accessible under **Visualizations**.

Privacy Enhanced Gateway version 3.3.16 Release Notes

Review the new features and fixes available in this release.

Release Date: [5-Sep-2023](#)

For information related to features and fixes in previous Privacy Enhanced Gateway releases, see the PDFs for these releases: [Process Discovery documentation \(release versions\)](#).

What's new

View status of all the events

Review the status of all the events such as completed, pending or failed. In addition, you can also track specific reason for failure of each event when being transmitted to the Process Discovery platform from PEG.

[Manage PEG events](#) on page 3676

Regex to filter redaction results

Use the real-time redaction review to assess and setup redaction configurations based on regular expressions.

[Review redaction results](#) on page 3670

Export PEG metrics

As part of managing the redaction configurations, click the **Export PEG Metrics** button to export and download PEG metrics.

[Manage redaction list configurations](#) on page 3667

Fix

Fix

OCR is now enhanced for mainframe applications to address poor detection results. The updated Deduction model that is available with this release is better at detection results, specifically in the Mainframe applications.

Privacy Enhanced Gateway version 3.3.15 Release Notes

Review the new features and fixes available in this release.

Release Date: [29-May-2023](#)

For information related to features and fixes in previous Privacy Enhanced Gateway releases, see the PDFs for these releases: [Process Discovery documentation \(release versions\)](#).

What's new
<p>View real-time redaction results</p> <p>Real-time redaction enables users to test out different redaction settings on the same set of data and immediately view the results without permanently changing the redaction settings. After the user determines the ideal redaction settings, they can commit the changes to the system, as well as export the new settings.</p> <p>Review redaction results on page 3670</p>
<p>Delete images in bulk using the PEG interface</p> <p>Users can free up PEG storage space by generating a list of images that meet a specific criteria, then selecting the images for deletion.</p> <p>Using Bulk delete on page 3676</p>
<p>Generate new redaction results after updating word lists</p> <p>Apply updated word lists to images that have already been redacted but were not forwarded to the Process Discovery platform using the Run re-redaction sync job feature.</p> <p>Review redaction results on page 3670</p>

Discovery Bot release notes

Review what's new and changed, and the fixes and limitations in the Discovery Bot release.

Limitations from previous releases (Discovery Bot v.26, v.27, v.28, v.29)
<p>Depending on the memory available in your system, the PDD (in PDF or Microsoft Word format) can support up to 250 recorded steps captured in the document. If a process is recorded with more than 250 steps, the PDD generation periodically stops functioning.</p> <p>Workaround: Regenerate the PDD and click Download.</p>

CoE Manager Release Notes

Review the CoE Manager feature available in Automation 360 v.26 release.

Introduction

Use CoE Manager - powered by Shibumi to scale your automation programs more quickly and efficiently. CoE Manager provides visibility into your end-to-end automation lifecycle and accelerates pipeline generation. It provides a consistent way of assessing automation opportunities which helps in minimizing the variations and maximizing the ROI.

CoE Manager is available out of the box and requires minimal configuration for first-time use.

Automation Anywhere Enterprise compatibility

Automation 360: The Control Room can be a Cloud or On-Premises deployment.

[CoE Manager](#) on page 1980.

Browser extensions for Automation 360

Create automation from supported browsers by using browser extensions. Extensions are periodically updated to support feature enhancements and fixes. Therefore, ensure that you have the latest versions of extensions for the Google Chrome, Microsoft Edge, and Mozilla Firefox browsers.

Before you download the latest version of a browser extension, review the information in the following tables:

Browser extension for Manifest V3

Extension name	Extension Fixes version		Link to extension
Google Chrome	3.1.0.0	<ul style="list-style-type: none"> You can run the JavaScript command and execute the JavaScript code without any issues. 	Google Chrome extension for Automation 360
Microsoft Edge based on Chromium	3.1.0.0	<ul style="list-style-type: none"> The bot runs the actions on the captured objects of the SAP Fiori application successfully while using the Recorder package (version 2.10.2-20230104-214915). Previously, the bot encountered an error as it was unable to find the button when the search criteria did not match. 	Microsoft Edge extension for Automation 360

Note: Browser extension is used in the **Capture** action of the Recorder package. The information captured through the browser extension is stored within the bot and this information is not shared externally. Additionally, this stored information is only used on the machine where the bot was created or deployed.

Browser extensions for Manifest V2

Impact to our customers: Automations that use Google Chrome Manifest V2 based extensions will stop working sometime after June 2023. The deprecation timelines of Manifest V2 based extensions are currently under review and subject to change by Google.

- For Google Chrome Manifest V2 extensions timelines, see [Manifest V2 support timeline](#).
- For Microsoft Edge Manifest V2 extensions timelines, see [Overview and timelines for migrating to Manifest V3](#).

Extension name	Extension version	Link to extension
Google Chrome	1.7.0.0	Automation 360 extension for Chrome
Microsoft Edge based on Chromium	1.7.0.0	Automation 360 extension for Microsoft Edge
Mozilla Firefox	1.7.0.0	Automation 360 extension for Mozilla Firefox

Access the Automation Workspace interface from a browser. After you have installed and enabled extensions in the browser, perform several tasks through the Automation Workspace interface based on your user role and automation requirements.

[Bot Agent compatibility](#) on page 1274

Before you install the Bot Agent, ensure that you review the compatible Automation 360 builds.

Browser extensions for web applications

You can create automations using the Google Chrome and Microsoft Edge browser extensions for web applications running on Google Chrome and Microsoft Edge, which enables you to automate with enhanced security and performance.

Features using browser extensions for web applications

The following Automation 360 features use the browser extensions for web applications running on Google Chrome or Microsoft Edge browsers:

- Automation of web applications through Universal Recorder or Browser package
- User interface-based triggers
- Bot Agent device registration with the Control Room
- Packages that use window titles, for example, OCR and **Mouse > Click**.

Use browser extensions to automate web applications

To automate web applications, the browser extensions capture the properties of the targeted UI elements, application window title, and URL that enables you to create or update the actions that are specific to the Recorder in the bots. Newly created or updated bots are then uploaded from the browser of the Bot Creator to the Control Room. All bots are stored in the Control Room along with the properties of the UI element. When a bot is running, browser extensions are used to automate actions on the targeted UI elements of the web-based business applications.

When a Bot Creator or a Bot Runner user connects to the Control Room for the first time over Google Chrome or Microsoft Edge browsers, the browser extensions enable you to register your device by automatically sharing the device name and windows username, with the Control Room.

Note: Firefox browser extension supports object-based automation of web applications running in Firefox browser. Registering your device over Firefox browser is not yet supported.

Previous versions of browser extensions

Review the version history of browser extensions from past releases.

Version 3.0.9.0

Extension name	Fixes
Google Chrome	<ul style="list-style-type: none"> You can perform web automation actions without any issues due to the following changes: <ul style="list-style-type: none"> The logic to use <code>DOMXPath</code> sent in as a request to retrieve an element was removed. Functionality to add the Automation Anywhere dynamic attribute and retrieve the element using the ID of the dynamic attribute instead was added. Previously, if you used the custom <code>DOMXPath</code> with a double quotation mark while executing the click action on inline JavaScript controls, then Automation Anywhere had to enable the Debugger and inject the JavaScript to execute that action. The logic to search on <code>hasFrame</code> and <code>frameSrc</code> was removed. As a result, the search for Frame information occurs within frame information object in the searched HTML element. The mechanism to wait for (Content Security Policy (CSP) flag to be set to True or False is now included before Automation Anywhere attempts to inject detect framework scripts with the Debugger in pages such as Salesforce(which have a CSP policy). The <code>invisible</code> property in the search algorithm has been added as search criteria.
Microsoft Edge based on Chromium	

Version 3.0.8.0

Extension name	Fixes
Google Chrome	During web automation, the web page maintains its position when the target object is already visible on the page. This improves the automation reliability when there is a fixed pane on the web page and physical actions (such as mouse click) do not work as expected.
Microsoft Edge based on Chromium	

Version 3.0.7.0

Extension name	Fixes
Google Chrome	<ul style="list-style-type: none"> • Timeout issues no longer occur on websites that previously had high loading time because now the JavaScript with debugger is performed successfully on any page that has a CSP policy. • Fix provided for <code>document.evaluate</code> if the <code>document.querySelector</code> is blocked. Previously, user interaction functions on some websites were not available because the <code>document.querySelector</code> was blocked.
Microsoft Edge based on Chromium	<ul style="list-style-type: none"> • Timeout issues no longer occur on websites that previously had high loading time because now the JavaScript with debugger is performed successfully on any page that has a CSP policy. • Fix provided for <code>document.evaluate</code> if the <code>document.querySelector</code> is blocked. Previously, user interaction functions on some websites were not available because the <code>document.querySelector</code> was blocked.

Version 3.0.6.0

Extension name	Fixes
Google Chrome	<ul style="list-style-type: none"> • Enhancement to add case sensitivity option for static window titles in Google Chrome and Microsoft Edge • Fixes to capture objects and perform selected actions in a migrated bot using Recorder in Google Chrome and Microsoft Edge • Fixes to run JavaScript after executing Recorder actions in a bot in Google Chrome and Microsoft Edge • Fixes to capture pop-up windows with Automation 360 plug-in enabled in Google Chrome and Microsoft Edge.

Extension name	Fixes
Microsoft Edge based on Chromium	<ul style="list-style-type: none"> In the Recorder package, you can now use the Click or Left click action on the JavaScript alert, prompt, and confirmation pop-up windows to automate web pages on Microsoft Edge browser. In the package, you can now use the Click for the Link and Form tag controls that have inline scripting with using Manifest V3 extensions.

Version 3.0.5.0

Extension name	Fixes
Google Chrome	<ul style="list-style-type: none"> Fixes to run JavaScript inside an iFrame in Google Chrome Enhancement to exclude page load for default pages in Google Chrome and Microsoft Edge
Microsoft Edge based on Chromium	

Automation 360 feature comparison matrix

Package SDK enables you in creating and uploading action packages to your Control Room.

Related reference

[Operating system, environment, and platform supported for Control Room](#) on page 1138

Automation 360 can be hosted on AWS, Microsoft Azure, Google Cloud Platform, IBM, and any public, private, or hybrid cloud service that meets the Control Room and Bot Agent hardware and software requirements.

[Automation 360 FAQ](#) on page 965

For details and questions on the latest Automation Anywhere platform, Automation 360, review this FAQ.

[Variable mapping for migration](#) on page 1593

In migration, some variables map directly from previous product versions to Automation 360 while others behave differently or contain configuration changes.

[Global values](#) on page 2260

Global values enable users to reuse identical values between bots instead of creating new variables for each bot. A user with the `AAE_admin` role configures a global value with a default value and can enable non-admin users to overwrite the value to use in their bots.

[Recursive expressions](#) on page 2249

Use a recursive expression to insert a variable in the place of an index or key of a dictionary, list, record, or table variable.

Automation 360 IQ Bot feature comparison matrix

Compare the key features of Automation 360 IQ Bot deployment models and review the feature parity with the latest IQ Bot 11.3.x release.

Automation 360 IQ Bot version compatibility

Review the version compatibility information before you update from an earlier version of Automation 360 IQ Bot to the latest Automation 360 IQ Bot version, or from earlier versions of IQ Bot to Automation 360 IQ Bot.

Compatibility with Automation 360 Control Room

Automation 360 IQ Bot On-Premises version compatibility with Automation 360 Control Room:

Important: The following table lists the latest build of each Control Room release that is compatible with the IQ Bot build. Note that, IQ Bot is compatible with all Automation 360 builds in a release. For example, Automation 360 v.21, IQ Bot build 9642 is compatible with Control Room build 9664 and builds released after that such as 9595, and 9642 for the same release version. We recommend that you update to the latest Control Room build for the latest fixes.

IQ Bot On-Premises	Control Room
Build 19621	Build 19621 (Automation 360 v.30)
Build 18345	Build 18371 (Automation 360 v.29)
Build 17571	Build 17571 (Automation 360 v.28)
Build 16685	Build 16685 (Automation 360 v.27)
Build 15459	Build 15459 (Automation 360 v.26)
Build 15112	Build 15112 (Automation 360 v.25)
Build 13343	Build 13343 (Automation 360 v.24R2)
Build 12350	Build 12350 (Automation 360 v.24)
Build 11513	Build 11513 (Automation 360 v.23)

IQ Bot On-Premises	Control Room
Build 10520	Build 10526 (Automation 360 v.22)
Build 9642	Build 9664 (Automation 360 v.21)
Build 8815	Build 8815 (A2019.20)
Build 8098	Build 8147 (A2019.19)
Build 7554	Build 7560 (A2019.18)
Build 7082	Build 7103 (A2019.17)
Build 6443	Build 6463 (A2019.16)
Build 5931	Build 5933 (A2019.15)
Build 5322	Build 5322 (A2019.14)
Build 4695	Build 4705 (A2019.13)
Build 4088	Build 4105 (A2019.12)
Build 3337	Build 3337 (A2019.11)
Build 2545	Build 2545 (A2019.10)
Build 2079	Build 2079
Build 1610	Build 1610
Build 1089	Build 1089
Build 550	Build 550

Automation 360 IQ Bot Cloud version compatibility with Automation 360 Control Room:

IQ Bot Cloud	Control Room
Build 18345	Build 18361 (Automation 360 v.29)
Build 17566	Build 17566 (Automation 360 v.28)
Build 16701	Build 16701 (Automation 360 v.27)
Build 15436	Build 15459 (Automation 360 v.26)
Build 14288	Build 14298 (Automation 360 v.25)
Build 12342	Build 12342 (Automation 360 v.24)

Migration compatibility with earlier IQ Bot versions

Review the following version compatibility table to understand the available update options for Automation 360 IQ Bot:

IQ Bot version	Automation 360 IQ Bot (On-Premises)
Version 11.3.5.x	Yes

IQ Bot version	Automation 360 IQ Bot (On-Premises)
Version 11.3.4.x	Yes

To migrate to Automation 360 IQ Bot On-Premises from a version earlier than 11.3.4.x, first upgrade to IQ Bot Version 11.3.4.x or later.

[Migrate to Automation 360 IQ Bot](#) on page 1657

Importing learning instances between different IQ Bot versions is not supported. If you want to retain the associated data for a learning instance, ensure you update or migrate to the correct IQ Bot version before importing the corresponding learning instance. For example, if you export a learning instance in IQ Bot On-Premises (Build 8815), you can only import it within an equivalent IQ Bot On-Premises or Cloud build.

[Migrate learning instances](#) on page 1664

Automation 360

The Automation Anywhere Digital Workforce platform is the foundation to deliver the automation of complex business work securely and at scale. Automation 360 is an industry-leading RPA and digital workforce platform that combines an easy-to-use user interface with enterprise-class reliability and the security to enable real-time self-automation.

Overview

Automation 360 is an industry-leading RPA and digital workforce platform that combines an easy-to-use user interface with enterprise-class reliability and the security to enable real-time self-automation. It delivers a browser-based, intuitive experience for business users to quickly automate tasks and tools for developers to build process automation. Automation 360 provides both On-Premises and Cloud deployment options and is the first platform that provides RPA-as-a-Service as an automation solution. It enables users to automate applications across different infrastructures and industries such as banking, telecommunications, and business process outsourcing (BPO) organizations.

Automation 360 provides capabilities such as the following:

- An intuitive interface to create a bot and design business process automation workflows.
- Support for multiple operating systems including Windows, Linux, and MacOS.
- Different views of bot to facilitate collaboration: flow view for business users, list view for developers, and dual view for collaboration.
- Recorder that works across various platforms such as Microsoft Windows, Citrix, Web, and SAP.
- Advanced variables capabilities and support for JavaScript, Python, and VBScript.
- A flexible architecture that enables you to add new packages.

The platform also includes attended automation and plug-ins that enable business users to automate tasks from within their business applications such as Microsoft Excel and Salesforce. This capability makes automation of front-office processes easier, faster, and more cost-efficient.

Automation 360 is available globally and in 10 languages, including English, French, German, Japanese, Korean, Italian, Portuguese, Russian, Spanish, Simplified Chinese, and Traditional Chinese.

Automation 360 components

Automation Co-Pilot for Business Users
(Automation Co-Pilot)

Automation Co-Pilot is an easy-to-use interface that enables business users to collaborate with bots. Users can start process automations, provide feedback to bots to resume processes, and escalate requests to additional users for downstream processing. Automation Co-Pilot enables the enterprise to unlock new automation opportunities between humans and bots that RPA could not previously address.

Automation Workspace	<p data-bbox="850 191 1406 254">Automation Co-Pilot for Business Users on page 3144</p> <p data-bbox="850 279 1406 436">(formerly known as RPA Workspace) A web-based workspace that provides the tools and capabilities to create, upload, and deploy bots to automate repetitive tasks and processes. It includes the following:</p> <ul data-bbox="850 457 1081 625" style="list-style-type: none">• Control Room• Bot Runner• Bot editor• Bot Creator• Credential Vault <p data-bbox="850 663 1406 726">Automation Workspace provides the following capabilities:</p> <ul data-bbox="850 747 1406 940" style="list-style-type: none">• Enables users to manage, schedule, and execute bots• Enables user management through Active Directory role mapping• Enables users to manage large number of Work Items through workload management
Process Discovery	<p data-bbox="850 989 1427 1398">An intelligent business solution that delivers a real-time, data-driven map of your business to help you uncover transformational process insights across all applications, through each department, and for every single task. Process Discovery follows the human instead of process logs by using advanced computer vision, machine learning, and artificial intelligence to capture every step in every process across every system. It requires zero integration, is universally compatible, and provides the privacy and security of an on-premises solution.</p>
Privacy Enhanced Gateway	<p data-bbox="850 1419 1427 1797">Using Privacy Enhanced Gateway (PEG), enterprises can confidently execute on their strategic business initiatives by filtering their sensitive data in a secure and scalable manner. PEG works by redacting sensitive data that has been obtained on customer's machines within their own network before forwarding the data to the Process Discovery cloud for analysis. As all traffic from the agents goes through PEG before leaving the customer's perimeter, PEG removes personally identifiable information (PII) and sensitive data.</p> <p data-bbox="850 1818 1427 1873">Getting started with Privacy Enhanced Gateway on page 3652</p>

Discovery Bot

An intelligent business solution for enterprise businesses that provides capabilities for end users to discover opportunities for automation using process discovery. Discovery Bot focuses on process automation by capturing document processes, identifying opportunities from business centric processes, and prioritizing opportunities based on ROI, and create bots automatically. Discovery Bot aligns business workers to uncover automation opportunities that can optimize the return on your RPA investment.

[Process discovery by using Discovery Bot](#) on page 3687

IQ Bot

An intelligent document processing solution that can read and process various complex documents and emails. IQ Bot combines RPA with multiple AI techniques to intelligently capture, classify, and extract semi-structured and unstructured data, allowing document-centric business processes to be automated end-to-end.

[Install and update Automation 360 IQ Bot](#) on page 1366

Bot Insight

The analytics platform that provides real-time, interactive, and smart insights about business processes and operational intelligence. Bot Insight uses the large amount of content-level and productivity data that the deployed bots generate and translates the data into insights through automatically generated and customizable dashboards.

[Business analytics through Bot Insight](#) on page 3724

Bot Store

Online marketplace for pre-built bots and Digital Workers that run on the Automation 360 platform. Access Bot Store directly from the Control Room to download or submit bots and packages.

[Bot Store](#) on page 3440

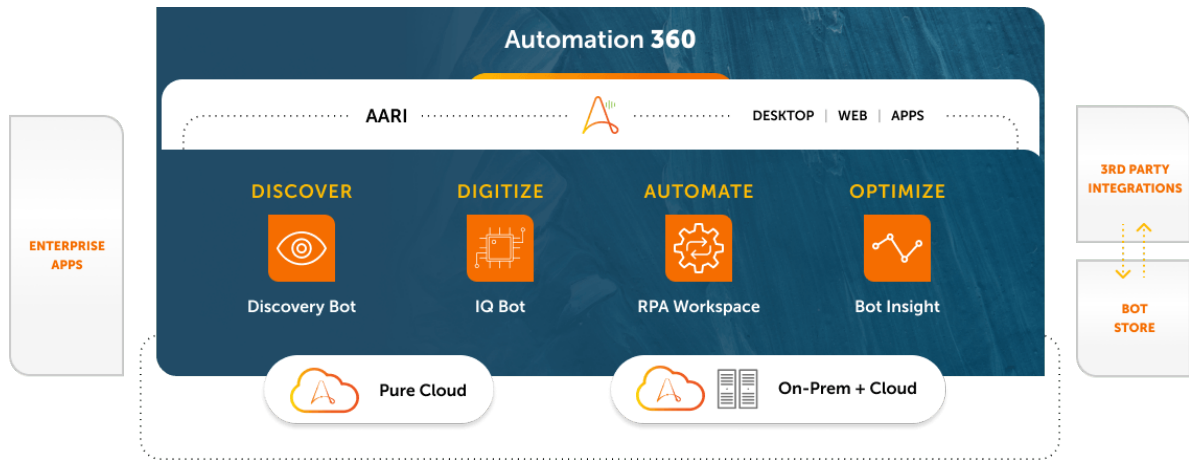

Private Bot Store

A secure internal bot marketplace for a company to post and share details and documentation for all internally developed bots. Employees can easily discover internal

bots and commands to reuse in addition to all of bots from the Automation Anywhere Bot Store.

[Private Bot Store](#) on page 3445

The following image shows the components of Automation 360:

Benefits

Faster time to value

- Instant web-based deployment that enables you to start developing bots quickly
- An intuitive interface that enables users with varying skill levels to easily use the product and speed up the learning process
- Easy collaboration between business, process, and IT

Business agility

- Regular updates to stay up-to-date on any device anywhere
- Business continuity with high availability and disaster recovery
- Scalability

Lowest total cost of ownership (TCO)

- No additional infrastructure investment required
- Single platform across front office, back office, and employee applications
- Reduced maintenance cost

Deployment models

Automation 360 provides the following deployment models:

Cloud	Automation 360 Cloud is hosted by Automation Anywhere, providing an easy consumption model of the Automation 360 platform built on a cloud-native architecture. With the Automation 360 Cloud service, the Automation 360 platform, which includes the Automation 360 Control Room and applications (Automation Workspace, IQ Bot, Bot Insight, Automation Co-Pilot, and Discovery Bot), is hosted by Automation Anywhere and accessed by users through a web browser. The Bot Agent devices where the bots run and execute the automations remain on the customer's infrastructure and securely connect to the Automation 360 Cloud service through HTTPS.
Cloud-enabled	In this deployment model, data is hosted On-Premises. This model is suitable for customers who have to adhere to strict regulatory norms where data sovereignty is mandatory.
On-Premises with packages updates through Cloud	With Automation Anywhere On-Premises with packages updates through Cloud service, all business, personal, and operational data is kept on and deployed from the server on-premises on the customer network.

The following image shows the deployment models for Automation 360:

See also [Cloud operational responsibilities](#) on page 980.

Available offerings

The Automation 360 platform includes the following offerings:

- Automation 360 delivered in the cloud, hosted by Automation Anywhere with no client installation or additional infrastructure required
- Automation 360, the full platform delivered On-Premises
- Community Edition, a free web-based option for users to experience a wide-range of Automation 360 bot creation capabilities

Note: For information on the in-product help and guide, see [In-product user assistance](#) on page 1103.

Automation 360 FAQ

For details and questions on the latest Automation Anywhere platform, Automation 360, review this FAQ.

What is Automation 360?

Automation 360 delivers a browser-based, intuitive experience for business users to easily automate tasks and powerful tools for developers to build process automation, delivering security, governance, and control on a scalable infrastructure for IT.

What is included in Automation 360?

Everything to build the bots you need to automate your business processes: Control Room cluster, Bot editor, Bot Runner, Universal Recorder, Enterprise-grade security certifications, support, access to the Bot

How is Automation 360 deployed?

Store, and courses on Automation Anywhere University.

Automation 360 can be deployed On-Premises as well as in the Cloud.

For Automation 360 On-Premises deployment, the installation is on the customer's servers. With the web-based nature of the Bot Creator, there is no installation or deployment required on the user machines, resulting in a significant reduction in total cost of ownership (TCO).

Automation 360 deployed in the Cloud offers a turnkey solution where the buyers do not have to worry about choosing the cloud provider, or any other infrastructure elements– Automation Anywhere takes care of it all. Admins get the complete set of features for user management, security, governance, and control that they also access through a web browser. The end users can then access the platform using their browser, log in, and start creating their bots.

What additional cloud hosting options are available?

Automation 360 can be hosted on AWS, Microsoft Azure, Google Cloud, IBM, and any public, private, or hybrid cloud service.

How is Automation 360 delivered?

You can start your automaton journey with Automation 360 in one of the following ways:

- Automation 360 (Cloud or On-Premises): Automation 360 is an intelligent cloud-native end-to-end platform you can use to automate your business processes across systems and applications.

For more information see: [Automation 360](#) on page 960.

- Community Edition: Community Edition provides a free web-based option for users to experience a range of Automation 360 bot creation capabilities. Community Edition can be used by small organizations (less than 250 machines).

Community Edition provides one Bot Creator license that you can use to log in to one device, and deploy one bot at a time. There is no limitation to the number of automations that you can create, but you will have access to only limited features.

For more information, see: [Get started with Community Edition](#) on page 1269

| [Community capacity and limitations](#) on page 1270.

What scripting languages does Automation 360 support?	Automation 360 supports JavaScript, Python, and VBScript.
Is Automation 360 available in languages other than English?	Yes, Automation 360 is available in 10 languages: English, French, German, Italian, Japanese, Korean, Portuguese, Spanish, Simplified Chinese, and Traditional Chinese.
How is Automation 360 updated?	<p>For Cloud deployed Automation 360, customers are always on the latest version with updates rolled out by Automation Anywhere on a regular basis. For features such as action packages, admins and users have the ability to test the latest packages before choosing to accept the update.</p> <p>For On-Premises customers, regular updates are made available through the customer portal, providing admins an opportunity to keep their business-wide installation on the version of their choice.</p>
What are some of the data privacy and security aspects of Automation 360?	<p>Automation Anywhere Cloud privacy is engineered with a comprehensive set of security features that either automatically provide or are configurable by the data owner to provide data protection. Automation Anywhere Cloud includes comprehensive security and encrypts data both in transit and at rest. No personal data goes outside of the environment—unless you tell it to; it remains completely under the control of the IT manager.</p> <p>To ensure customers can trust the AAI Enterprise Cloud, Automation Anywhere Cloud services are secured based on industry standards and frameworks like NIST Cybersecurity Framework, AWS Cloud Adaption Framework, Center for Information Security (CIS) baselines, and others.</p> <p>For more information see Compliance Portal and Automation Trust and Security.</p>

[Automation 360 Cloud FAQ](#) on page 1006

Answers to frequently asked questions (FAQ) and related information provide insight into various aspects related to Automation 360 Cloud.

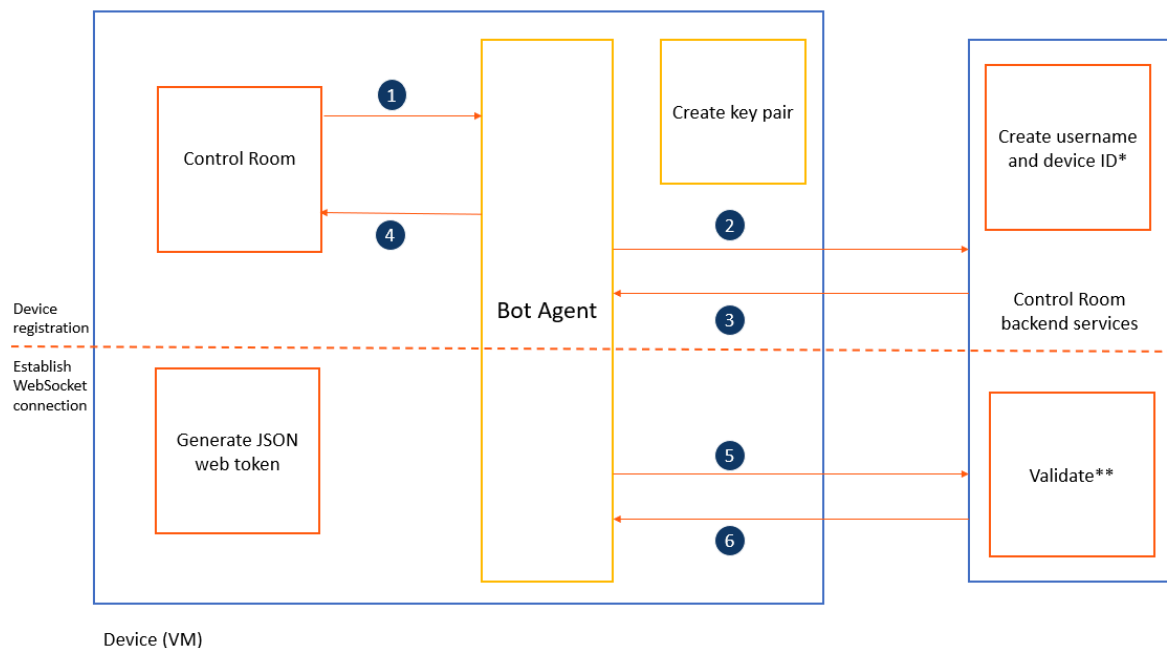

Automation 360 architecture and resiliency

Automation 360 is a single, integrated platform that transcends front office and back office technology silos to automate business processes across all systems and applications, including both SaaS and legacy apps.

The Automation 360 platform is deployed using a distributed architecture.

Centralized management is done through a web-based server, called the Control Room, to manage all development and execution of the digital workforce. The Bot Agent executes automation and are run time systems installed on the devices.

The following image shows the architecture and relation between Control Room and Bot Agent:

- *indicates that the Control Room creates a unique user name and device ID to persist in the public key in the database.
- **indicates that device public key is validated by the Control Room and a new token is created.

The following table describes the flow and the actions that occur between the Control Room, Bot Agent and the back end services (as numbered in the previous image):

Actions	Description
1	The browser sends the device token to the Bot Agent for registration.

Actions	Description
2	The Bot Agent then registers the device request to create a public key and a token.
3	The back end services of the Control Room sends a response to the Bot Agent that the device has been registered with a unique user name and device ID.
4	The Bot Agent sends a message to the browser that the device has been registered successfully.
5	The Bot Agent sends a message to the back end services of the Control Room to indicate that the JSON web token has been authenticated successfully.
6	The back end services of the Control Room then validates the device public key and establishes a Web Socket connection with the new token.

Control Room and Bot Agent resiliency

The following table provides you the behavior and resiliency differences between Automation 360 and Enterprise 11.

Bot Agent in Automation 360	Bot Runner Client in Enterprise 11	Notes
Services are run on the local device.	Installation services are run inside an active user session.	
Device is registered to the Control Room.	An active user is registered to the Control Room.	Bot Agent service runs on the local system.
Control Room stores the agent public key in the database.	Control Room stores the authentication key in the memory.	In Automation 360, the Control Room stores the public key in the database. So when the Control Room restarts, the reconnection is accepted faster. The Bot Agent is resilient across Control Room restarts. However, in Enterprise 11, the Control Room reconnection does not happen after a restart.

Bot Agent in Automation 360	Bot Runner Client in Enterprise 11	Notes
<p>Priority of bots is verified at deployment.</p> <p>When bots are queued for a Bot Runner user, higher-priority bots are deployed before lower-priority bots.</p> <p>However, if a lower-priority bot is already running, higher-priority bots are deployed only after the lower-priority bot completes running.</p>	<p>When a low-priority bot is running and a high-priority bot is deployed, the system pauses the low-priority bot and runs the high-priority bot.</p> <p>After the high-priority bot is run, the low-priority bot resumes.</p>	<p>Advantage in Automation 360 is that lower priority bots are not paused and complete their deployment before the high-priority bots are deployed.</p>
<p>Error handling package handles actions to easily handle exceptions a bot encounters and transfers control to other actions within that bot.</p>	<p>Error Handling command helps in debugging when the Task Bot and MetaBot Logic are run.</p>	
<p>Devices reconnected when device is registered with the Control Room.</p> <p>Reconnects when the device restarts.</p>	<p>When the Bot Runner Client restarts or loses connectivity with the Control Room, you must re-log to the Client to reconnect.</p>	<p>Bot Agent reconnects without individually logging in to every single device.</p>
<p>Bot Agent reconnects automatically if there is an interruption.</p>	<p>The Bot Runner client needs to be reconnected manually.</p>	<p>Bot registration in Automation 360 is more robust and can reconnect automatically to the Control Room.</p>
<p>Public and private key is generated at the time of registration. This key is used to authenticate to the Control Room.</p>	<p>Same behavior as in Automation 360.</p>	
<p>Services Bot Agent is run as a service. When device reboots, the services are automatically connected to the Control Room.</p> <p>Bot Agent continues to check for connection even if the Control Room is down by using the public and private key.</p>	<p>Requires a client to log in and perform tasks.</p>	

Bot Agent in Automation 360	Bot Runner Client in Enterprise 11	Notes
<p>Remote Desktop Protocol is supported only on multi-user devices.</p> <p>The Control Room does not maintain the RDP.</p>	<p>Remote Desktop Protocol is supported on both single and multi-user devices.</p> <p>In Enterprise 11, Remote Desktop Protocol connection is established from the Control Room and maintained by the Control Room.</p>	
<p>Control Room administrator updates those to automatically update the Bot Agent to a later version using auto-update capability.</p>	<p>Auto-update option is not available.</p>	<p>Auto-update reduces downtime because each user is not required to log in to the Control Room to update the Bot Agent installed on the user device.</p>
<p>Configuration updates pushed through updates</p>	<p>No standalone configuration updates, but you can change it manually.</p> <p>Enhancements to the configurations are released as patches.</p>	
<p>Configure device settings automatically set a user's current device as default device after the user logs in to the Control Room.</p>	<p>Not available</p>	

Bot Agent in Automation 360	Bot Runner Client in Enterprise 11	Notes
<p>Bots that are already running will run to completion during the update.</p> <p>from Bot Agent to Control Room</p>		<p>In general, bots already running can run to completion during the update. Exceptions are as follows:</p> <ul style="list-style-type: none"> • If the bot tags data for Bot Insight, the bot will not run. • Parent/child bots will run to completion because the child bots are downloaded at the start of running the parent bot. However, if child bots are referenced using a variable parameter, calling those child bots need the Control Room to be available during parent bot runs. • Bots that use workload management (WLM) will not run. • If a bot is using values from Credential Vault, the bot execution might fail if the Control Room connection is interrupted or lost. This happens as the bot fetches the value from Credential Vault at the time of use.

Scheduling resiliency

Device pools provide built-in high availability (HA) for the Bot Runner devices if your unattended license is free to use. You are not tied to a single Bot Runner device, so if your device is unavailable for any reason and your unattended license is free for deployment, your automation is not affected. The scheduled automation will automatically run on the next available Bot Runner device, thereby providing high availability.

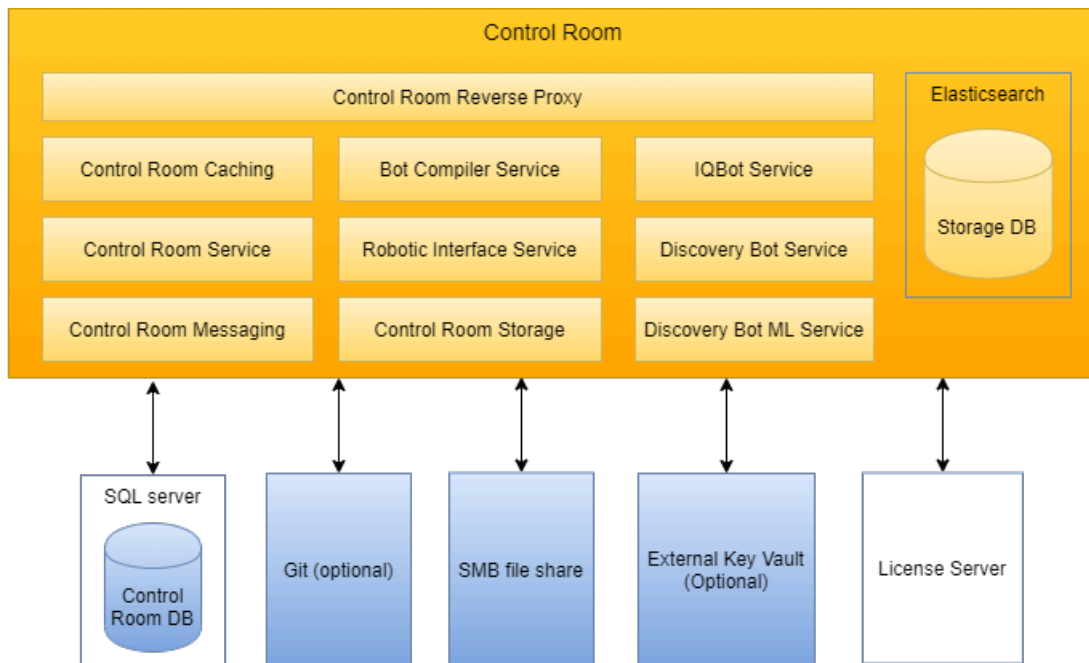

See [About device pools](#) on page 1816.

Control Room overview

The Control Room manages, schedules, executes, and configures various capabilities of bots and Bot Runners using a collection of specialized web services.

Components

The Control Room is a centralized management point for all bots. A reverse proxy is responsible for listening for remote connection requests and forwarding those requests to the correct specialized service. The following figure shows the On-Premises Control Room components and general data center interaction. Control Room components are shown in orange and data center components provided by your organization are shown in blue. Components that are centrally hosted on cloud and managed by Automation Anywhere such as license server are shown in white.

In the data center, Control Room is installed on a server and configured to interact with the other data center components.

The Control Room includes objects that performs the following:

- Control Room reverse proxy is managed through the following functions:
 - Control Room services
 - Control Room messaging
 - Control Room caching
- OpenSearch
- Licensing

The Control Room required data center components include:

- An SQL server with a Control Room database.

- A Server Message Block (SMB) file share

For Cloud Control Room architecture, see [Cloud Control Room architecture image](#).

Centralized Automation Deployment

- Control Room acts as the single point of access and control for bot execution.
- Control Room provides bot upload and download features to facilitate seamless collaboration for end to end business process automation by multiple users.
- All scheduling is managed by the Control Room. Bots are deployed on the Bot Runners either ad hoc or on pre-defined schedules. Once the schedules are created, Control Room automatically and intelligently picks up the subsequent updates to bots, without any need to alter automation schedules.

Centralized Access Control

- Least Privilege and Access controls user access. They are implemented in the Control Room through Role Based Access Control (RBAC).
- All Users and Roles are created and managed from the Control Room.

Collaboration Centralized Workforce Management

- Control Room dashboards provide a single view of the entire automation infrastructure.
- Control Room receives real time heartbeat and telemetry from automations with events, exceptions and alerts.
- Unauthorized users cannot pause, resume or stop any of the ongoing automations on any Bot Runner.
- All historical automation data is logged in and available through Control Room Audit Logs.

[Control Room overview](#)

Distributed architecture

Automation Anywhere platform is deployed using a distributed architecture.

Centralized management is accomplished via a web-based server, called the Control Room, to manage all development and execution of the digital workforce. The Control Room is connected to Bot Creators and Bot Runners. Bot Creators are development systems used for authoring and tailoring of automations. Bot Runners execute the automations; they are run-time systems installed on machines. Bot Runners can be deployed on desktops, on virtual machines in data centers or cloud.

Distributed architecture with HA/DR support

The Automation 360 self-contained platform within the customer environment mitigates the risk of "cross-contamination" from an unlikely event of a security breach from another network.

Automation Anywhere supports distributed architecture to deliver the optimal performance and security. Following are the main distributable components of Control Room which can be clustered to achieve High Availability (HA). In the image below, Automation Anywhere components are shown in orange and components provided by your organization are shown in blue. Components that are centrally hosted on cloud and managed by Automation Anywhere such as license server are shown in white.

Figure 1: Distributed Mode

Distributed Cache

Control Room architecture uses distributed cache to update all other nodes as soon as any information is updated in one of the nodes. This ensures fastest data synchronization across all the nodes and delivers seamless user experience. Automation 360 platform uses clustering mechanism to implement distributed cache, to synchronize all data operations. For example, when the Credential Vault is opened from one node, it is automatically opened for all other nodes too.

For information on HA/DR architecture for Automation 360 Cloud, see [Automation 360 Cloud Security and Data Privacy](#).

Related concepts

[HA and DR deployment models](#) on page 1174

Automation 360 provides several deployment options to meet various levels of enterprise cost/price performance and resiliency requirements. The options include installation on single nodes and on multiple nodes. Multi-node deployments can be configured for highly available (HA) clusters and disaster recovery (DR) sites.

Security architecture

Many of the largest financial organizations in the world rely on the Automation 360 secure digital workforce platform to automate security-sensitive operations.

The platform's security architecture is founded on Least Privilege principles and a strict Separation of Duty model with 41 technical controls implemented across seven NIST 800-53r4 Control Families. Controls are applied across three components: the Control Room, Bot Creators (development systems), and Bot Runners (bot execution run times) through the bot life cycle from creation through decommissioning. This security architecture and the underlying controls are mapped to industry best practices as defined by NIST and can be readily mapped to other frameworks, for example, CoBIT (SOX) and ISO 27002.

Access controls

Automation 360 limits and controls human and bot access to logical resources across components.

- Two independent control planes enforce least privilege. Only developers are enabled to read or write, only authorized Control Room users to execute automations, (Control Room authorizes and executes) subject to fine-grained Role Based Access Controls (RBAC) down to individual automations (bot), Bot Runners and domains.
- Bot- level Separation of Duty is enforced. Each bot is obfuscated and executed by its corresponding authorized Bot Runners.
- Bot execution is controlled via RBAC. Domain privileges are defined across groups of bot and Bot Runners.
- Security at-rest and in-transit: All access credentials are secured at-rest via a central Credential Vault with support for third-party credential stores. All communications are secured in-transit via SSL and TLS.

Configuration management

Configuration management is controlled at both bots and Bot Runner levels.

- The Control Room authorizes, enforces, and logs changes to all Bot Creators and Bot Runners.
- Bots are controlled via a robust version control system, for rollback and full event logging.
- Bot change control on execution is enforced through encryption and authentication.

Identification and authentication

Identification and authentication is controlled through Microsoft Windows authentication services.

- Bot Creators use Active Directory for authentication
- Bot Runners have two levels of authentication, one for autologin authentication of the runner and the other for execution of bots.
- Credentials are secured at-rest and in-motion through the Credential Vault or integration with third-party products.

Risk assessment

Risk assessment is undertaken on Static, Dynamic, and Network-based Vulnerability Assessments. Audit and accountability are established through event capture, logging and auditing on all three components with granular event capture at the bot level and nonrepudiation. Bot Insight embedded analytics provides near-real-time Incident Response and integration with Security Event and Information Management systems.

[RPA Security](#)

Security architecture model

Automation Anywhere Cognitive security architecture is founded on Least Privilege principles and a strict Separation of Duty model with 41 technical controls implemented across seven NIST Control families.

The NIST framework was selected as a foundation for best practices as a way to enumerate the controls implemented throughout. Translations from NIST to other control frameworks are widely available, resources are provided at the end of this topic.

The product security architecture is maintained by the Automation Anywhere Product Management team and forms part of a formal policy model as an integral part of the Automation Anywhere Development Roadmap. The following table lists the Control families and the corresponding features and security impacts. Details on each Control family and how the security architecture is implemented in Automation Anywhere products are in the corresponding topics.

Control Family	Control Code	Control Room Feature	Security Impact
Access controls	AC-3, 6, 7, 9, 10, 12	Central policy control	Enforce access restrictions for change control and least privileges on system components: <ul style="list-style-type: none"> • Fine grained access to bots and Bot Runners is controlled via RBAC, • Bot and Bot Runner domains can be assigned to roles via RBAC • RBAC roles are fully audited
	AC-2, 3, 5, 6	Role-based access control (RBAC)	Enable user access, restricts operational privileges, enforces least privilege principles
	AC-17	Bot repository	Bot versioning system with access restrictions
	AC-3, 7, 9, 10, 11	Bot and Bot Runner encryption	Encryption and obfuscation of sensitive information at bot level through credential vault and integration with key management systems
Configuration (change) management	CM-2, 5, 6, 7, 9	Centralized Bot Runner control	Restrict functionality based on roles, domains, implement deny-all and allow-by exception
	CM-10	Centralized licensing	Centralized provisioning, tracking and enforcement of Bot Creator and Bot Runner licensing
	CM-2, 5, 6, 8	Bot operations room	
	CM-8	Inventory control	Maintains centralized inventory control of all bots and runtimes

Control Family	Control Code	Control Room Feature	Security Impact
Bot Creator configuration management	SA-10	Bot Creator management, bot check-in, check-out	Control Room applies software life cycle management to bots from development, test, and production. Bot versioning enables change control of automations.
Audit and accountability	AU-1 through 15	Audit trail	Automated event logs captured on three levels: Control Room, Bot Runners, and Bot Creators. Non-repudiation is assured through read-only logs, all user identities are bound to actions.
Identification and authentication	IA-1 through 5	Active Directory integration, Bot Runner ID and Attestation	Implements Windows platform security including cryptographic bidirectional authentication, Bot Runner identification and attestation, and password management policies. Credential vault with integration with key management systems, protects the integrity of credentials.
Incident response	IR-4, 6	Incident response	Bot Insight embedded analytics capabilities can monitor events and generate alerts to SIEM systems for response.

Control Family	Control Code	Control Room Feature	Security Impact
Controlled maintenance	MA-2	Automated maintenance	Control Room versioning system provides an automated mechanism to roll out updates to bots, historical information is maintained.

(1) Resources: ISACA provides guides that map NIST SP800-53 to other security frameworks such as CoBIT (SOX), SANS Top20.

Cloud operational responsibilities

Learn about secure deployment models, data element locations, and operational responsibilities.

Securing the Cloud

Automation Anywhere Cloud is deployed to only allow access to Automation Anywhere Cloud Operations personnel and Security Team resources. Network and cloud control plane access is restricted using VPN with multi-factor authentication for AAI operational and security personnel. All AAI users must first authenticate using MFA tokens to retrieve short-term credentials to access cloud resources. User credentials are continuously monitored for compliance. All other operational users, cloud resources, and applications are restricted from access to the Control Room. Regular AAI user access certification is conducted to ensure only necessary access is provided to cloud operations personnel.

The cloud service is multi-tenanted and each customer control room environment uses a unique tenant identifier to ensure data separation between the Control Rooms. Automation Anywhere members cannot access a customer environment unless specific permission is provided by the customer, typically under support troubleshooting procedures and controls.

Cloud

With the Automation Anywhere Cloud offering, all business, personal, and operational data is stored on Automation Anywhere administered cloud. Automation Anywhere is the cloud data controller and is responsible for customer data privacy as published in accordance with Automation Anywhere cloud security and compliance with data privacy.

[Privacy Policy for Automation Anywhere](#)

Cloud-enabled

With the Automation Anywhere Cloud-enabled solution, business, personal, and operational data is stored and managed on the customer-controlled infrastructure, while specific operational data related to RPA is shared between the Automation Anywhere Cloud and the customer infrastructure. All data privacy and compliance rests with the customer.

On-Premises with updates through Cloud

With Automation Anywhere On-Premises with updates through Cloud service, all business, personal, and operational data is kept on and deployed from the server on-premises on the customer network. All data privacy and compliance rests with the customer.

The following table lists the securing data and operations responsibilities:

Data requirement	Cloud	Cloud-enabled	On-Premises with updates through Cloud
Infrastructure and data security	Automation Anywhere Cloud	Shared customer and Automation Anywhere Cloud	Customer
Continuity and disaster recovery	Automation Anywhere Cloud	Shared customer and Automation Anywhere Cloud	Customer
High availability	Automation Anywhere Cloud	Shared customer and Automation Anywhere Cloud	Customer
Data localization	Automation Anywhere Cloud	Customer	Customer
Data privacy	Automation Anywhere Cloud	Customer	Customer
Software upgrades	Automation Anywhere Cloud	Shared customer and Automation Anywhere Cloud	Customer

Personal data <ul style="list-style-type: none"> • Username and password • Security key • User device information and credentials • Bot Runner device access • Bot device IP/FQDN • Bot application credentials • User application logs 	Cloud	Customer network	Customer network

Securing the RPA environment with external controls

The Automation Anywhere architecture consists of a standard desktop and server class infrastructure for the registered devices and the Control Room.

RPA platform

This topic details the best practices for securing the RPA platform with external security controls. Network-based firewalls, Intrusion Detection Systems, anti-malware, and external log servers are all standard security controls that are relevant to RPA deployment and the other infrastructure in your environment. The following figure shows logically where these components are deployed in the RPA deployment:

In the image, Control Room components are shown in orange and data center components provided by your organization are shown in blue.

Each external security control is discussed in detail in the following sections, in terms of placement and configuration. Supporting network services such as Active Directory, SMB File Share, Microsoft SQL Server, and production applications, and are accessed through network firewalls or directly, depending on their placement relative to the RPA components.

Network-based access control to protect RPA with firewalls

Network-based firewalls and local server-based firewall are used to protect the Control Room or all nodes in a Control Room cluster. By default, required protocols on the Control Room are permitted from the corporate network. Additionally, all clustering protocols are permitted only between the nodes in the Control Room cluster. Network-based firewalls are used to isolate Development, Test, and Production RPA environments from the corporate network and from each other.

For unattended automation environments, the Bot Runners are placed in a specific isolated network and protected by a network-based firewall. Attended automations run from corporate

workstations with the Bot Runner Bot Agent installed and are protected via the corporate perimeter firewalls or internal firewalls protecting the corporate desktop infrastructure, like any desktop.

Anti-malware to protect RPA from viruses and malware

The Automation Anywhere Bot Agent runs on desktop class infrastructure and is considered a corporate desktop. Anti-malware or anti-virus software is used to protect the registered device environment from malicious software in the form of viruses and malware.

Intrusion detection systems to protect RPA from direct attacks

Intrusion Detection and Prevention Systems (IPS) protect the corporate network by detecting network-based attack through network traffic analysis. Like any other critical section of the data center, an IPS protects the RPA platform at the egress point, behind the network-based firewall.

Independent categories for Bot Creators and Bot Runners

For logical separation of duties, Control Room divides automation users into two broad categories: Bot Creators (development) users and Bot Runners (run-time) users.

Bot Creators exist on a separate Microsoft Windows system with its own credentialing system to create, update, and unit test the bots on the Bot Creator. Bot Creators only upload and download bots to and from the Control Room. Users on the Control Room users have privileges to execute bots on Bot Runners but have no access to the Bot Creators. This separation of duty constitutes a dual authorization by requiring both the developer and the business user to create and execute the bot in conformance with NIST AC-3 best practices.

RBAC in Control Room

Control Room implements Least Privileges and Separation of Duties through a configurable Role-Based Access Control (RBAC) capability that conforms to requirements in NIST AC 2, 3, 5, and 6.

All Control Room users are assigned one or more roles. Access are available based on the usage conditions assigned to each role when users are a member. Authorized users can temporarily or permanently suspend other users when needed. RBAC enforces session handling to prevent unauthorized access. If an unauthorized user attempts to view session details or gain access, the Control Room cluster will prevent this progress and immediately terminates the unauthorized session. The unauthorized user will be prompted to log in with valid credentials. Inactive accounts can be disabled.

The administrator controls are responsible for all security functions, consistent with best practices in NIST SC-3: Security Function Isolation.

The Control Room includes segmented administrator roles by default. Many permissions are supported for creating new roles.

Controls are implemented at the Control Room, Bot Creators, and Bot Runners layers, for NIST Access Controls (AC) and Change Management (CM) guidelines. The following technical controls are implemented to ensure access is governed through NIST Least Privileges.

RBAC on bots

Access is deny all and allow by exception based on roles, except for admin roles. Addressing NIST AC-17 (access control), NIST configuration managements for NIST CM-2 (base line configurations), access restrictions for NIST CM-5, NIST CM-6, and NIST CM-7 (least functionality), and monitoring NIST CM-9 for bot activity across the development, test, and production environment.

RBAC on Bot Runners

RBAC on Bot Runners facilitates complete isolation of one department Bot Runner seamlessly from the remaining departments' Bot Runners.

Bots are executed from the Control Room cluster. Local bot executions are protected through multiple layered security, and are designed to prevent fraud as a result from escalation of privileges on Microsoft Windows. The Bot Runner are executed by Windows, addressing access control enforcement in accordance with NIST AC-3 Access Enforcement and AC-6 Least Privilege for Code Execution.

If user roles does not have access to sets of Bot Runners, as a result, these users are unable to view the Bot Runners' executions or remote scheduling automation. See [\(Role-based processing domains on page 986\)](#).

RBAC for Credential Vault credentials management

Credentials created in the Control Room are used across Bot Creators and Bot Runners.

These credentials are securely stored in the centralized Credential Vault to facilitate access control, and to divide in logical groups called lockers. These lockers enable complete separation between the credentials of one department from another.

Role-based permissions

Permissions for credential management-related roles include the following:

Manage my credentials and lockers	By default, all users can manage their own credentials and interact with the lockers to which they have permissions.
Manage my lockers	Allows the user to create and manage their own lockers.
Administer ALL lockers	User can do all the actions in the Admin row of the Locker permissions table below.
Create standard attributes for a credential	User can set an attribute value that remains the same for other users of that credential attribute.

Locker permissions

Locker permissions are set when a locker is created or edited. A user can have the following permissions in a locker:

	View locker	Edit locker	Delete locker	Add participant owner	Remove participant owner	View credential	Assign credential	Remove credential	User-provided value	Standard value
Consume						#			#	
Participate						#	#			

	View locker	Edit locker	Delete locker	Add participant owner	Remove participant owner	View credential	Assign credential	Remove credential	User-provided value	Standard value
Manage	#	#	#			#	#	#		#
Own	#	#	#	#	#	#	#	#		#
Admin	#	#	#	#	#	#	#	#		#

Related tasks

[Create credential](#) on page 1798

Create a credential and add the required attributes.

[Create locker](#) on page 1801

Create a locker to group similar credentials to share with other users.

Related reference

[Credentials and lockers in the Credential Vault](#) on page 1796

The Credential Vault securely stores sensitive information such as passwords, account numbers, and social security numbers in credentials and lockers for use in automation tasks. It facilitates role-based access for users of a Control Room and ensures that sensitive values are not stored in bots or on devices.

Role-based processing domains

The Control Room RBAC applies the least privilege principles to domains by implementing Processing Domains, specifying role-based privileges and permissions at the bots and Bot Runners level.

RBAC is applied at a folder level to completely and seamlessly isolate one department bot from the remaining department bots. If the user role does not have access to a set of bots, those bots do not exist, thereby enabling the separation of duties across different domains. For example, finance and accounting roles can access only the bots that automate their respective functions, and specific Bot Runners can execute these bots. This is consistent to best practices as defined by NIST AC-4 Processing Domains.

Authorized users assign various roles based on the business need.

RBAC on Audit Log

Audit is automated for all privileged and nonprivileged roles to conform to best practices, as defined in NIST AC-6.

Access is view-only based on a deny all and allow by exception based on roles and domains as defined in the Audit section 7 addressing Audit and Accountability (NIST AU 1 through 15) and as required by NIST AC-2 Automated System Account Management. If a role does not have permission to view Audit Logs, then the Audit Trail tab is not visible to all members of that role. Audit automatically captures all events related to creation, modification, enablement, disablement, and removal of users, bots, Bot Creators, and Bot Runners.

RBAC on viewing bot activity

The Control Room **Activity** menu provides options shows the status of the Automation Anywhere Enterprise automations. These options are: **In Progress**, **Scheduled**, and **Historical**.

Access to bot Activity status is deny all and allow by exception based on roles and domains as defined in RBAC. Two levels of checks are applied to access the bot Activity data. The user is required to be a member of a role that has access to view the Control Room. Users with Control Room access that can view only the bots belonging to their departments, as applied through RBAC on bots.

RBAC on User Management

Access is deny all and allow by exception based on roles, domains as defined in RBAC. Only those users with access to User Management can manage other users in system.

This permission is further divided into the following sub permissions:

Create Users	Only those users that create new users from the Control Room.
Edit Users	Only those users that edit existing users from the Control Room.
Delete Users	Only those users that delete existing users from the Control Room.

Authorized users assign various combinations of these access permissions to different sets of users and roles based on the business requirements.

RBAC on roles and permissions management

Access is deny all and allow by exception based on roles, domains as defined in RBAC.

Users with access to roles and permissions management can create, edit, and delete roles in the system. This permission is typically assigned to administrators and power users from across enterprises.

RBAC on bot schedules

Access is deny all and allow by exception based on roles and domains as defined in RBAC.

This permission is further divided into the following sub permissions:

Schedule my bots to run	Only those users that create new schedules.
Edit my scheduled activity	Only those users that edit their schedules.
Delete my scheduled activity	Only those users that delete their schedules.
View and manage ALL scheduled activity	Only those users that manage (edit or delete) all the existing schedules created by any user.

Administrators assign various permutation and combinations of these accesses to different sets of users and roles based on the business requirements.

RBAC on license management

Access to license management is deny all and allow by exception based on roles and domains as defined in RBAC.

Only those users with access to license management permission are able to update the license from the Control Room. A common license exists for all the users across Automation 360 for a

specific Control Room. The updated license is effective for all the Bot Creators and Bot Runners registered with the corresponding Control Room.

Bot execution access by dynamic access token

The Control Room implements and enforces a Trusted Path for registration and authentication of Bot Creators and Bot Runners in accordance with NIST SC-11 to protect against any attempt to execute unauthorized bots.

The Control Room issues new client access tokens or identifiers through hashing, signed by the Control Room and sent to Bot Creators and Bot Runners over HTTPS. Every subsequent communication between Control Room and Bot Creator or Bot Runner is serviced by the Control Room after validation of the signature of the latest access token sent by the Bot Creator or Bot Runner. Each access token is unique to every Bot Creator or Bot Runner. This ensures that even if an unauthorized user could bypass enterprise security and access the system, the Control Room security restricts any damage.

Secure credential store through Credential Vault

The Automation Anywhere platform provides a centralized Credential Vault to securely store all credentials and provision them to bots on an on-demand basis.

Use the Credential Vault to store other information deemed confidential or sensitive. The credential store implements NIST controls IA-2 to uniquely identify and authenticate organizational users (or processes acting on behalf of organizational users).

Sensitive information does not have to be stored in bots or on Bot Runner systems, the Credential Vault facilitates a logical separation of credentials from the bots.

Credential Vault variables (credentials) are created in the Control Room. They are available to the Bot Creators and Bot Runners who are assigned roles that provide them access to the lockers that contain the credentials.

The Credential Vault adds flexibility and dynamic character to bots because only the credential references are present in the bots, and not the credentials. When bots are moved from one environment to another environment, absolutely no change is required in the bots. Bots can seamlessly pick up the credentials values applicable for the new environment from the Credential Vault of that environment. Additionally, the Control Room automatically stores configuration-related sensitive data into the Credential Vault by default.

Credential Vault encryption

The Automation 360 platform offers the embedded Credential Vault and provides an extensive set of safeguards to protect data at rest and in transit, but also while it is in use on individual systems.

Encryption keys and vault

During the Automation 360 installation process, the system generates an RSA 2048 bit public/private key pair and an AES 256 bit key. The private key of the RSA 2048 pair is referred to as the Master Key, while the AES 256 key is referred to as the Data Key. The Master Key is presented to the installing administrator for safekeeping in a physically secure location off system. The public key is used to encrypt the Data Key. Both the public key and the encrypted Data Key are then stored in the database. When in use, all keys and encrypted data are placed in encrypted secure memory using the Microsoft Data Protection API (DPAPI).

During Automation Anywhere Control Room startup or reboot, the administrator is prompted to supply the Master Key. The encrypted Data Key is retrieved from the database and decrypted using the Master Key. The Data Key is now ready for use. As the system stores and retrieves data from the Credential Vault, the Data Key is used to encrypt and decrypt that data.

vault is used to store all system managed credentials and critical system configuration data. It can also be used to store any other sensitive data used in an organization's automations. As a result, bot builders can avoid the insecure practice of hard-coding credentials and other sensitive data/arguments directly within their automations.

Multi-layer authentication and fine-grained access control are essential for a tightly controlled environment. So is end-to-end data protection, which is also necessary to maintain the confidentiality and integrity of business-critical processes, sensitive data, and related credentials.

Master key

This RSA-2048 bit key is managed and securely stored on a key management system. This key unlocks the Credential Vault. For On-Premises deployments, when the Credential Vault mode is set to manual and the Control Room cache service is restarted from all nodes, the administrator types the Master key each time the Control Room is started. When the vault is open, the master key is immediately erased from memory and it is not stored anywhere in the Automation Anywhere platform.

Note:

- On-Premises: Customers own the master key and need to ensure that the key is securely stored and maintained.
- Cloud: Automation Anywhere owns the master key and ensures that the key is securely stored and maintained.

Data encryption key

This AES-256 bit key is stored in the Control Room database and is used to encrypt and decrypt the credentials at the time of storage or provisioning. This key is encrypted using the Master key. The Data encryption key does not leave the Credential Vault at any time. Credential encryption and decryption are done at the Credential Vault.

Protection of data at rest

In addition to encrypting local credentials and selecting runtime data used by bots, the Credential Vault provides secure storage for sensitive configuration parameters and details pertaining to the integral version control and email services.

Credential storage

All sensitive data is stored in the Credential Vault using AES-256 encryption.

These credentials are encrypted by the Credential Vault service to conform to NIST SC-28 and to prevent unauthorized access or disclosure of credentials. Only encrypted credentials travel from the Control Room to the Database server and are stored in the database in an encrypted form. The data encryption key encrypts all credentials using an AES 256-bit key generated by a FIPS 140-2 Level 1 validated module to meet the NIST IA-7, SC-12, and 13 requirements for implementation of mechanisms for authentication to a cryptographic module that meets the requirements of applicable federal laws.

The data for user credentials for autologin to Bot Runners is also encrypted and securely stored in the Credential Vault with the bot credentials.

Credential provisioning to bots

Credentials are provisioned only during the execution of automation.

Bot Runners or bots do not store credentials locally. Credentials are provisioned only during the execution of the automation. When the credentials are requested by Bot Runners, encoded (64 bit) credentials travel from the Control Room to Bot Runner over HTTPS protocol. When the bots finish execution, credentials are erased from the memory.

Secure recording

You can enable or disable image captures of business applications by setting up secure recording in the Control Room.

Overview

When secure recording is enabled, Bot Creators or Bot Runners cannot capture the application images, values, or texts. As a result, no sensitive data is (intentionally or unintentionally) stored in the bots in the form of images. The remaining automation data, for example, UI object details are captured, and they continue to be captured so that the automation can work seamlessly.

As an administrator, you can apply this setting from the Control Room for all Bot Creators and Bot Runners (for all users or for specific user roles).

Set up secure recording

1. Log in to the Control Room as an administrator.
2. Navigate to **Administration** > **Settings** > **Bots**.
3. In the **Secure recording** section, click **Edit** to configure the settings.
4. Select **Enable**.

The default value is **Disable**.

5. In the **Recorder preview image** tab, select one of the following options:
 - **Enabled**: A preview of the image is shown in the Bot editor when the object is captured but discarded after you refresh the Bot editor. The image is stored in the Control Room and deleted after 60 minutes.
 - **Disabled**: Image is not captured and not stored in the Control Room.

Secure recording

When Secure Recording is on, images and control values will NOT be captured during business process recording by Bot creators. Recommended when you are automating secure applications (e.g. Bank accounts).

Enable Disable

Recorder preview image

Enabled
Preview image is available in the Bot Editor when objects are captured but discarded after save

Disabled
Preview image is not available and will not be stored in Control Room

6. Choose the settings based on your requirements:

Option	Action
All users	Select this option to enable secure recording for all users who have access to the product.
Users with selected roles	To enable secure recording for users with specific roles: <ol style="list-style-type: none"> a) From the Available roles column, search and select roles for which you want to enable secure recording. b) Move these roles to the Selected column.

7. Save your changes.

Authentication with Control Room

When a Bot Creator or Bot Runner tries to connect to Control Room, the credentials are encrypted using AES (256 bits key length) and RSA (2048 bits key length) and then transmitted on top of the existing layer of Transport Layer Security (TLS).

This extra layer of message level encryption provides protection against network stack issues (such as Heartbleed where OpenSSL was leaking sensitive data from memory) and also adds protection to the last hop of the connection when TLS is terminated at the load balancer. These credentials are decrypted by Control Room and authenticated against the hashed (PBKDF2 and HMAC SHA512 algorithm) user passwords or against via Lightweight Directory Access Protocol (LDAP).

Supported authentication methods for On-Premises Control Room

Review the authentication methods supported for an On-Premises Control Room.

Supported authentication methods

Note: Integration of LDAP with a load balancer for Active Directory using Kerberos authentication is not supported.

- Active Directory using LDAP

- Active Directory using Kerberos
- SAML
- Local authentication using a database

The benefits of integrating with Active Directory are as follows:

Easier adoption	Integrates with an existing authentication solution, compliant with the standards.
Maintenance	All passwords and password policies are centrally administered.
Better user experience	Fewer passwords to remember.

Kerberos provides additional benefits over NTLM pass-through authentication.

- Open standard versus closed proprietary standard
- Mutual authentication of client and server
- Integration with smart cards for 2FA

Local authentication manages user passwords through the Credential Vault. Passwords are hashed using the HMACSHA512 algorithm, which is keyed by the output of the Password-Based Key Derivation Function (PBKDF2). User passwords are encrypted in transit through TLS 1.2.

All authentication and session management is handled through the well-tested Spring Security framework. Kerberos integration is provided through the well-tested Waffle framework. SAML integration is provided through the well-tested OneLogin framework.

Active Directory integration for authentication

Automation 360 offers seamless integration with Microsoft Windows Active Directory for access to the Control Room, Bot Creators, and Bot Runners.

When the Control Room is integrated with Active Directory, all the Active Directory users with basic details are directly available in the Control Room without any extra configuration. For Active Directory integration, user passwords stay only in the Active Directory and are not saved in the platform.

In addition to Active Directory authentication, the Control Room has its own controls to prevent unauthorized access to any automation data. See [Dynamic access token authentication of Bot Runners](#) on page 996.

Bot Runner users can also configure their Active Directory credentials for Bot Runner machine autologin. These credentials are saved in the centralized Credential Vault.

Multi-domain Active Directory support

The Automation 360 platform architecture supports multi-forest, multi-domain Active Directory integration. Multi-forest, multi-domain integration requires trust relationships between the forests and the domains. See [Configure Control Room for Active Directory: auto mode](#) for details.

Automation 360 On-Premises can be configured with an Active Directory global catalog server in a way that the Control Room, Bot Creators, and Bot Runners can all be in the same or different Active Directory forests and domains. This gives added flexibility and control for large-scale complex deployment where users are spread across geographies.

Multi-domain support is provided out-of-the-box and no additional configuration is required. User provisioning in an On-Premises Control Room from different Active Directory domains is also seamless. It enables the On-Premises admin to centrally orchestrate the digital workforce running across the globe.

Support for secure protocols

The Automation Anywhere platform supports secure protocols (TLS 1.2 and TLS 1.3).

- Deployment of bots from the Control Room to remote Bot Runners is done over secure communication.
- Upload and download of bots from the Bot Creator to the Control Room is done over HTTPS.
- Transfer of any information from the Control Room to the database and vice versa is done over secure communication.
- Transfer of encoded credentials from the Control Room to Bot Runners is done over HTTPS.
- WebSocket communication with the real-time data service in the Control Room is done over HTTPS.

Network security overview

All communication between the Control Room, Bot Creator, and Bot Runners is done using outbound communications WCF TLS 1.2 or later versions and inbound communications HTTPS TLS 1.2 or later versions.

Bot deployment to remote bot runners, provisioning of credentials, automation scheduling, and event capture are done exclusively through the Control Room. Use only HTTPS in the production environment.

- The REST APIs use Distributed Cache Service to get shared cached data required for specific functionality.
- The Scheduler Service makes REST API calls to run a task on a specific client machine at a specific time.
- Real-time Data Service makes REST API calls to authenticate incoming connection requests. It receives task execution progress updates by Bot Runners and sends that information to all connected browser clients using WebSocket Secure (WSS) protocol.
- The Control Room makes REST calls for user authentication and repository operations, for example, upload a task, download a task, or compare two tasks.
- The Control Room makes REST calls to the validate user session at regular intervals. The Control Room deploys and runs a task on a specific device using Bot Agent. It uses a TCP/IP channel.
- The Scheduler Service makes REST calls for autologin credentials. It also communicates to the Control Room to get a license and user session-related information.
- The Control Room makes REST calls to get autologin credentials for a logged-in device. It also communicates to the Control Room to get the license and user session-related information.

Change management

Access restrictions for configuration management.

Baseline inventory controls for Bot Creators, Bot Runners and bots

The Control Room provides a single-pane-of-glass on all automation operations and infrastructure, providing a way to baseline the configuration of the environment. Inventory controls are maintained through the application of RBAC and the use of the Bot Repository, Operations Room, and License Management to establish a single point of control for Base Line Configurations (NIST CM 2) access restrictions for configuration management (NIST CM 5 and 6). Configure automated baseline reporting using the auditing and reporting systems in the Control Room.

Change control and documentation RBAC

The Control Room RBAC provides a point of access control and management for all changes to the Control Room, Credential Vault, Bot Creators, bots, and Bot Runners with an automated mechanism to prohibit changes and report on any attempts to make unauthorized changes. The logging and auditing system on the Control Room provides the reporting mechanism for change management to conform to best practices as described in NIST CM-3 through 5.

Software usage and license management

The Control Room provides an automated mechanism for tracking and controlling the use of licensed software across Bot Creators and Bot Runners, addressing NIST Change Management CM 10.

Dual authorization change management

Separation of duties is implemented at multiple levels. Dual authorization is achieved through separation of control planes for the Bot Creators and Bot Runners. Only bots created by an authorized Bot Creator can be executed by a separately authorized Bot Runner and only by a user who has been given the privileges to do so by an administrator.

Identity and authentication

All automation actions, for example, create, view, update, deploy, and delete, across Automation 360 are done only after Control Room authentication is successfully completed.

After authentication is successful, the platform applies a second mandatory level of access control enforcement in the form of fine-grained Role-Based Access Control (RBAC).

The Control Room has its own controls to prevent unauthorized access to any automation data.

Password hashing

Password hashing does a one-way, permanent transformation of the passwords of the Control Room users, inline with standard password management practices.

Control Room passwords are concatenated with a salt and then hashed using the PBKDF2WithHmacSHA512 algorithm before being stored in the database.

- The salt is 256 bits in size and is randomly generated by a cryptographically secure PRNG.
- The HMAC SHA512 algorithm is used for hashing and provides additional security over traditional approaches.
 - A keyed hash provides protection against hash length extension attacks.
 - SHA 512 bit key is larger than the commonly used SHA 256 bit key.
- The key used for the HMAC is from the secure Password-Based Key Derivation Function (PBKDF2).
- Hashing is done for 100,000 rounds (based on NIST recommendations).

Every time a Bot Creator or Bot Runner authenticates against Control Room, its credentials are authenticated against the hashed credentials.

Secure authentication

If an authentication attempt fails, the Automation 360 platform does not specifically state if the username or password is incorrect. It only states that the supplied credentials are incorrect.

This is one critical information security requirement for Automation Anywhere customers and defends the system against a brute force attack.

This authentication involves the following:

- Bot Creator, Bot Runner connection to Control Room
- User log in to the Control Room from the browser
- Connection from the Control Room to the SQL Server

All failed authentication attempts are logged. See [Audit log](#) on page 2068. Audit Log access is provided as per RBAC and audit logs are made available on a read-only basis for all users.

Authentication for Bot Runners

Two layers of authentication are present for deploying the bots on remote Bot Runners.

The Bot Runner is logged on/connected/unlocked using the configured credentials. These credentials are fetched from the centralized Credential Vault over HTTPS. This first level of authentication is done against the domain automatically, on behalf of the user and is called Bot Runner autologin.

After being authenticated, Bot Runners can be authorized to execute bots independently and asynchronously.

The following table shows what happens to the user session on the Bot Runner after bot deployment.

User session status before bot deployment	During deployment	User session after bot execution finishes
No session exists	Create a new session and deploy the bot	Log off
Unlocked	Deploy the bot	Session remains unlocked
Locked	Unlock the session and deploy the bot	Session is relocked

User session status before bot deployment	During deployment	User session after bot execution finishes
Disconnected	Unlock the session and deploy the bot	Log off

Dynamic access token authentication of Bot Runners

The Control Room implements and enforces a Trusted Path for registration and authentication of Bot Creators and Bot Runners in accordance with NIST SC-11.

The Automation 360 platform protects the automation data against any attempt to subvert the path. The Control Room issues new client access tokens, or identifiers, after a predefined time period. These tokens are protected to conform to NIST IA-5 by being signed by the Control Room and sent to Bot Creators and Bot Runners over HTTPS. Every subsequent communication between the Control Room and Bot Creator/Bot Runner is serviced by the Control Room only after validation of the signature of the latest access token sent by the Bot Creator/Runner.

The access token is unique to every Bot Creator/Bot Runner. This protects the system from an unauthorized attempt to bypass security and execute an unauthorized bot, and is consistent with the best practices to conform to NIST IA-9 Service Identification and Authorization. These controls implement IA-3 for cryptographically based bidirectional authentication and attestation of Bot Runners and Bot Creators before establishing connections. This also addresses requirements around unique, automated, identifier management IA-4 for multiple forms of authorization and identification. Identifiers are dynamically managed for audit and control purposes. Identifiers are used as authenticators and managed for verification on initial deployment, revoke, and prevent reuse. There are no static, unencrypted, identifiers in use by Bot Creators or Bot Runners and cached tokens are cleared periodically.

Defenses against common vulnerabilities

The Automation 360 platform provides some defenses against common attacks on applications.

The list below contains several examples of these attacks and the security controls in place to prevent them.

SQL Injection (SQLi)

SQL injection is a high-risk vulnerability that can seriously impact the confidentiality, integrity, and availability of a database. It enables an attacker to execute any SQL of his or her choosing inside the DB, thus allowing them to read sensitive data, modify/insert data, and execute various operations.

The Control Room prevents SQL injection using query provided by the Hibernate framework.

Cross Site Scripting (XSS)

Cross-site scripting is a high-risk vulnerability that can seriously impact the confidentiality, integrity, and availability of any user web session. It enables an attacker to execute any JavaScript inside the victim's browser, allowing them to spy on the user's input/output or take unauthorized actions on behalf of the user. They could also redirect the user offsite to a malicious malware download or a credential phishing page.

The Control Room prevents cross-site scripting using automatic output encoding provided by the ReactJS framework.

OWASP Top 10

Automation Anywhere provides the following controls to protect against the OWASP Top 10:

Risk	Control
A1: Injection	All input is escaped before commands or queries are executed.
A2: Broken authentication and session management	See the identification and authentication section.
A3: Cross-site scripting	All output is encoded before being returned.
A4: Insecure direct object references	Centralized authorization via Spring Security.
A5: Security misconfiguration	No default passwords, stack traces hidden, secure server configuration
A6: Sensitive data exposure	See the Security at rest and Security in motion sections
A7: Missing function level access control	Centralized authorization via Spring Security
A8: Cross-site request forgery	Using authorization HTTP header
A9: Using components with known vulnerabilities	Black Duck software composition analysis tool
A10: Unvalidated redirects and forwards	N/A - No redirect functionality present

Compliance and vulnerability scanning

Review details about Automation Anywhere compliance and vulnerability scanning.

Secure software development life cycle (S-SDLC)

Automation Anywhere has implemented a development security plan and protocol that defines a specific depth of testing and evaluation to be done by the Engineering team on each release, conforming with best practices as defined by NIST SA-11 Developer Security Testing and Evaluation and NIST SA-15, Development Process, Standards, and Tools. This plan has been documented and shared with the Automation Anywhere Engineering teams.

Veracode vulnerability scanning for static and dynamic code analysis

In each weekly build, during the development process and before every release, all Automation Anywhere software is scanned for flaws using the Veracode tool. Automation Anywhere Enterprise meets the requirements for the strictest security policy available in the tool, Veracode Level 5, which is defined as no Very High, High, or Medium severity vulnerabilities. Analysis reports are available with each release.

Dependency analysis

In each weekly build, during the development process and before every release, all of the third-party libraries and dependencies in Automation Anywhere software are scanned for known vulnerabilities using the Black Duck tool. Automation Anywhere upgrades vulnerable libraries when new versions become available. Analysis reports are available with each release.

All Critical/High vulnerabilities are fixed for each release. Medium vulnerabilities will be considered for fixes in future releases depending on the scope of the Automation Anywhere releases. The list of OSS used by the application is published for each release.

Penetration testing

Automation Anywhere does a penetration test through a third-party vendor before each major release. Additionally, Automation Anywhere incorporates the feedback from penetration tests conducted by customers, which includes some of the largest financial institutions in the world. Analysis reports are available with each release.

Cryptographic providers

Use only the listed supported cryptographic providers.

Control Room

Cryptographic Provider	Supported Version
AES-256	All Bouncy Castle FIPS versions mentioned in the Automation Anywhere Open Source Software (OSS) Notice
AES/CBC/PKCS5Padding	
ECDH/AES/GCM/NoPadding	
HMAC-SHA256	
PBKDF2 with HMAC-SHA512	
RSA-2048	
RSA/ECB/OAEP with SHA-256 and MGF1 Padding	

See: [Compliance and vulnerability scanning](#) .

Cryptographic ciphers

Cryptographic ciphers are used to encrypt data to protect the confidentiality, integrity, and availability of the data.

Use only the listed supported cryptographic ciphers.

Note: Cloud deployments support TLS 1.2 and later versions.

- AWS supports only TLS 1.2 version.
- Google Cloud Platform (GCP) supports TLS 1.2 and later versions.

The following table provides the list of cryptographic ciphers supported on Cloud:

Cloud providers	Ciphers supported	TLS version supported
AWS	<ul style="list-style-type: none"> • ECDHE-ECDSA-AES128-GCM-SHA256 • ECDHE-RSA-AES128-GCM-SHA256 • ECDHE-ECDSA-AES256-GCM-SHA384 • ECDHE-RSA-AES256-GCM-SHA384 	TLS 1.2

Cloud providers	Ciphers supported	TLS version supported
GCP	<ul style="list-style-type: none"> • TLS_ECDHE_ECDSA_WITH_AES_128_GCM_SHA256 • TLS_ECDHE_ECDSA_WITH_AES_256_GCM_SHA384 • TLS_ECDHE_ECDSA_WITH_CHACHA20_POLY1305_SHA256 • TLS_ECDHE_RSA_WITH_AES_128_GCM_SHA256 • TLS_ECDHE_RSA_WITH_AES_256_GCM_SHA384 • TLS_ECDHE_RSA_WITH_CHACHA20_POLY1305_SHA256 	TLS 1.2 and later versions

The following table provides the list of cryptographic ciphers supported on On-Premises:

Ciphers supported	TLS version supported
<ul style="list-style-type: none"> • TLS_ECDHE_RSA_WITH_AES_128_GCM_SHA256 • TLS_ECDHE_RSA_WITH_AES_256_GCM_SHA384 • TLS_ECDHE_RSA_WITH_CHACHA20_POLY1305 	TLS 1.2 and later versions

Additional security controls

Automation Anywhere Control Room restricts the database connection configuration with the system administrator account.

Restrict installation from database system administrator account

All the database level transactions are done with a nonsystem administrator account. The Control Room installer passes the SQL Server 2012 certification test.

Autolock the device

When Automation Anywhere bots are deployed from the Control Room to remote Bot Runners, they revert the Bot Runner system to its original state. For example, if the Bot Runner machine was logged off and our bot logged into the machine, it logs it off after the automation execution finishes. This ensures that system level security is not compromised.

Using SHGetKnownFolderPath function

Automation Anywhere software uses the SHGetKnownFolderPath function and Knownfolder_ID to determine the full path to the special folders. This is a recommended practice from Microsoft and use of this function ensures that system will never redirect automation data to any other folder, even if someone attempts to hack the function call. This is also one of the InfoSec requirements of Automation Anywhere customers.

API level security

Automation Anywhere software does authentication and authorization level checks at the API level. API calls are serviced only for those users who have permission on the automation data. Unauthorized users cannot bypass system security through rogue API calls.

Clean uninstall

When Automation Anywhere Enterprise Client software is uninstalled, it leaves no trailing files or folders behind. This clean uninstall of the Enterprise Client software complies with InfoSec policies.

Store data in Program Data folder

Automation Anywhere software allows storing of automation data in the Program Data folder, for the files which must be edited by end users. Permissions are also set on the directory during the installation so that the user can edit the content of the folder. This complies with the InfoSec requirements of Automation Anywhere customers.

Protected handling of MSVC DLL files

Automation Anywhere Enterprise Client software uses MSVCxxx.dll files for automation purposes, but it does not install these files by itself. Client software directly uses the DLL files installed by only the Microsoft operating system. This ensures that client software does not overwrite the DLL files installed by Microsoft and our customers do not have to worry about doing one more cycle of checking for any introduced vulnerabilities.

Assembly manifest

All the executables (.exe file) of the Automation Anywhere Control Room and Enterprise Client software contain the manifest files which describe assembly metadata, for example, filename, version number, and culture. This makes our platform comply with organizational InfoSec policies.

Application path on network

Automation Anywhere supports configuration of reading and writing automation data to a location on a network drive. This enables users to keep all automation data at one place.

Autologin without disabling legal disclaimer

When Automation Anywhere bots are deployed from the Control Room to remote Bot Runners, our customers do not need to change security settings, for example, disable login page or disable legal disclaimer. Automation deployment works seamlessly without disabling these settings.

Secure Java automation

The Automation Anywhere platform can securely automate even those difficult-to-automate business applications which download the Java runtime environment (jre) during automation execution. Whenever these applications are started, an Automation Anywhere agent gets associated with Java executable noninvasive and automates the business application. After the automation finishes, the Automation Anywhere agent is automatically terminated.

Automation in nonEnglish languages

Users can securely use German, French, Italian, and Spanish language keyboard characters through the embedded automation commands in Bot Creators. This enables users to write data into these languages. Automation Anywhere customers do not need to depend on less secure third-party libraries for this automation.

General Data Protection Regulation compliance

The General Data Protection Regulation (GDPR) is one of the strictest compliance frameworks for maintaining privacy of personal data. The GDPR defines personal data as any data that can be used to identify a natural person (Data Subject).

To generate a GDPR compliance report for a user, see [Compliance reporting](#).

For the most current description of Automation Anywhere GDPR compliance statement, see [Cloud Automation Agreement](#) and [Privacy Policy for Automation Anywhere](#).

Automation 360 Cloud for secure access and connectivity

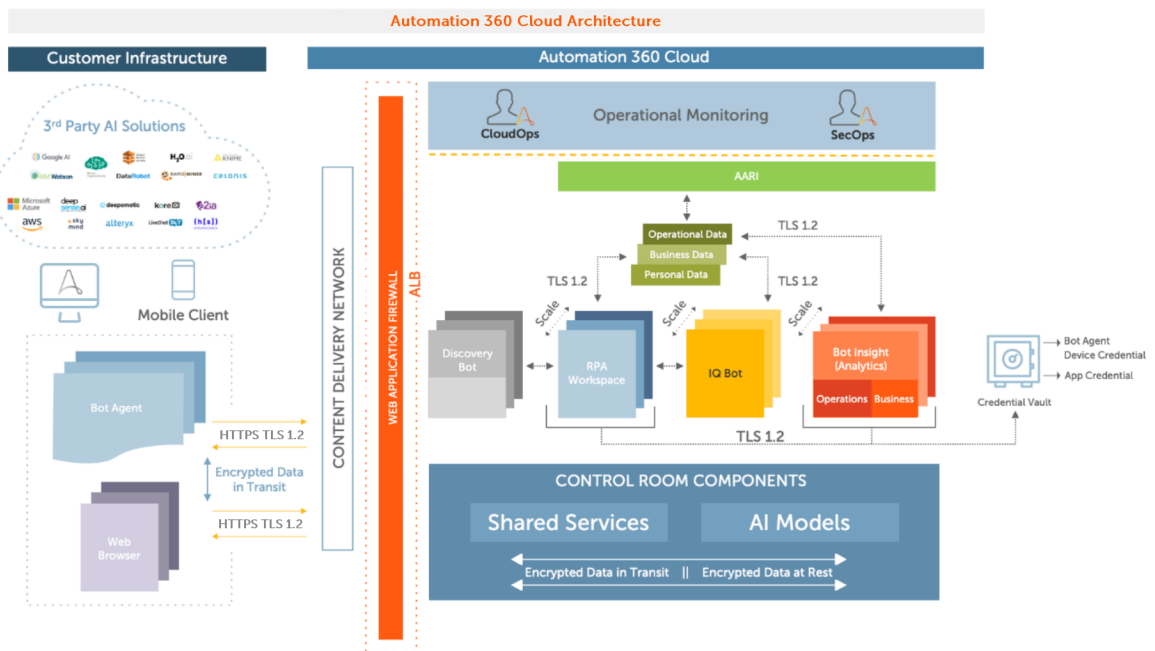

You can develop and run bots securely using the Automation 360 Cloud access security.

High-level architecture of Cloud deployment

The following information provides a high-level workflow of the Automation 360 Cloud deployment:

1. Using a browser, you log into the Control Room and create users and roles. You perform this process on the Automation 360 Cloud.
2. You install the Bot Agent on your Windows device to run bots locally. You perform this process on your infrastructure.
3. Data flow between the Automation 360 Cloud and the Bot Agent on your Windows device on your infrastructure is encrypted using TLS 1.2 (outbound port 443 only).

The following image shows the Automation 360 Cloud architecture:

Identity and Access Management (IAM) security for user system

- When an admin user logs into the Automation 360 Control Room for the first time, the admin can configure SAML 2.0 to connect the Automation 360 Cloud Control Room to their own Identity Provider (IdP) so that their users can log in to the Control Room using MFA (multi-factor authentication).
- The admin can then create the required users and roles or permissions to perform certain activities (such as developing and running bots) in the Control Room.
- The Automation 360 Control Room users can then log in through MFA and start creating and running bots.
- Additionally, the admin can configure an allowed IP address range to manage user logins through the Administrator settings in the Control Room.

To learn more about Automation 360 Cloud, see [Get started with Automation 360 Cloud](#) on page 1109.

Secure connectivity to run bots

You run bots locally on a Windows machine on which the Bot Agent is deployed. You can download and install the Bot Agent on your devices or deploy to a pool of virtual machines.

Before you install the Bot Agent, the following criteria must be met:

- The integrity of the device on which the Bot Agent is installed is not compromised.
- The user organization has instituted security safeguards and controls to prevent Bot Agent takeover and system-level user breaches.
- The user environment is safe from network-based attacks such as Domain Name System (DNS) cache poisoning, Address Resolution Protocol (ARP) spoofing, and so on.

Note: Automation 360 Cloud includes security operation controls to check for man in the middle (MITM) attacks and malicious intercepts.

Bot Agent installation and registration

When you register your device, the Bot Agent device is provided a JSON Web Token (JWT) to start the registration process with the Control Room. If the token provided by the Bot Agent device does not match the token provided by the Control Room, the registration process will fail. This authenticates the client Bot Agent device to the Control Room.

In the bulk installation and registration mode of the Bot Agent, the Bot Agent device comes online preregistered with the Control Room URL specified in the `autoregistration.properties` file. When using the bulk registration settings, one cannot enter or specify a fake Control Room URL without administrator privileges on that device. When the Bot Agent starts for the first time, it will read the `autoregistration.properties` file and register itself to the Control Room URL specified in the properties file. By default, the option to switch the Bot Agent registration from one Control Room to another is disabled. Only the Control Room administrators can enable this option. If someone tries to register another URL when this option is disabled, the registration would fail immediately and generate an error mentioning that says Control Room is already registered and switching of the Control Room URL is not allowed.

By providing write access to a cache folder for the admin only and read permissions to all other users who can run bots, we can assure that when a bot is downloaded to the device cache, it cannot be manipulated to perform potentially harmful things.

Communication between Bot Agent and Control Room

The Bot Agent device establishes a websocket connection to the Control Room using HTTPS (outbound port 443) and no inbound connection is required.

- Server authentication: The Transport Layer Security (TLS) handshake ensures that the Common Name (CN) in the server certificate issued by the well-known certification authority (CA) matches the legitimate hostname as included in the certificate chain of trust.

- Client authentication: After registration, a valid token key is always required from the Bot Agent to establish a connection to the Control Room. The token is encrypted using the Bot Agent private key and can only be decrypted by using the Bot Agent public key that was used when the Bot Agent device was registered to the Control Room. The token also authenticates the Bot Agent device every time the Bot Agent connects to the Control Room.

Data connection between a customer's network and the Cloud service is protected with a strong TLS connection that leverages at least 2048-bit RSA server certificates, 128-bit symmetric encryption keys, and stronger TLS protocols. This secure connection makes it virtually impossible to breach the established TLS connection.

After the websocket connection is established, the communication between a customer's network and the Cloud service is secured and bidirectional. The connection between the Bot Agent device and the Automation 360 Cloud hosted Control Room is permanent and automatically reestablished if connectivity is lost. This connection is used to download the bots to run and send operational status information to the Control Room.

Note: The connectivity is established only one time and not for each bot.

Schedule bots to run

Control Room users can schedule bots to run. Compiled bots are downloaded to run on the Bot Agent devices and operational logs are sent from the Bot Agent devices to the Control Room.

For the bots to run, the Bot Agent establishes an active Windows session by authenticating as the licensed Bot Runner user on the Bot Agent device.

Secure credentials for bots

Bots that run on the Bot Agent devices need to log in to the device using credentials. You can store credentials securely in the Automation 360 Cloud Control Room credential vault. Alternatively, you can store credentials in a customer-hosted key management system (for example, CyberArk). When you store credentials in the customer-hosted key management system, you must have connectivity between

the Control Room and the customer's key management system. To provide connectivity and allow access, you must configure the Automation 360 Cloud IP addresses for the specific Automation 360 Cloud region that is hosting the Control Room in their firewall. For more information, see [Control Room IP addresses for external integrations](#) on page 1767.

Secure operations in Automation 360 Cloud

Automation 360 Cloud is run securely and meets compliance standards for: SOC 1, SOC 2, ISO 27001, and HITRUST.

- For information about Automation 360 Cloud deployment and operational models, see [Automation 360 Cloud Security and Data Privacy](#).
- For Automation 360 Cloud compliance reports, see [Compliance Portal](#).

Automation 360 Cloud FAQ

Answers to frequently asked questions (FAQ) and related information provide insight into various aspects related to Automation 360 Cloud.

Where can I find an overview of Automation 360 Cloud security?

An overview and details about Automation 360 Cloud security can be found in this document: [Automation 360 Cloud Security and Data Privacy](#).

As a customer, how can I start using Automation 360 Cloud?

The prerequisites and additional, optional steps for getting started can be found on the Automation Anywhere documentation portal at the following location: [Get started with Automation 360 Cloud](#) on page 1109.

For most customers, the basic requirement is to allow secure access, using HTTPS, to their new Control Room environment hosted on Automation 360 Cloud. If this is not already enabled, you need to open port 443 in your firewall to allow outward HTTPS communication from your browser and the Bot Agent to the Control Room. After the Bot Agent is installed, it establishes a web socket connection to the Control Room. No ports need to be open on the customer site for these inbound connections.

Does Automation 360 Cloud provide a service-level agreement (SLA) for service availability?

Yes, an SLA for 99.9 percent monthly availability is provided for the customer's access to their production Control Room environment. The

SLA does not include planned downtime for maintenance and updates to the service. If a customer believes that the SLA has not been met, a service credit can be claimed through Support. Details can be found in our [Availability Service Level Terms](#).

How does Automation 360 Cloud support high availability (HA)?

Each customer's Automation 360 environment is deployed using application load balancing across highly available public Cloud infrastructure services. The infrastructure services support both microservices running on Docker containers in Kubernetes clusters and datastores (database, cache, logging, file system, storage) supporting HA across multiple zones within a region. Both AWS and GCP public clouds are used.

Does Automation 360 Cloud support disaster recovery (DR)?

Yes, Automation 360 Cloud supports DR. Under a disaster recovery scenario the customer's tenants will be brought up in another region using the same URL and their Bot Agent will reconnect automatically. In case of major incidents, where imminent resolution seems unavailable, a disaster situation is declared and all the tenants within the region affected by the incident are failed over to another, remote region. The current objectives for this recovery are as follows:

Recovery Time Objective (RTO)	The time taken to get a new region up and running with the last backup data restored is 4 hours.
Recovery Point Objective (RPO)	The maximum duration for data loss during a restore is 4 hours.

Note: RPO is based on backups taken and pushed to another backup region.

Do all customers receive notifications about upcoming general releases from Automation Anywhere via email?

All Cloud and On-Premises customers receive general release announcements from Automation Anywhere via email. The release announcements are sent two weeks before the release date. Additionally for Cloud customers, the announcement is also sent to

	<p>the administrators who registered when first provisioning the Control Room.</p>
<p>How do customers determine what region their Control Room is in?</p>	<p>A Customer License User (CLU) can log in to the Control Room and find the region where Control Room is hosted. To find the region, navigate to the License and Cloud Services portal on the A-People site and click the Cloud Control Room Instances tab. For more information, see Licenses and cloud services on page 1344.</p>
<p>Are there maintenance windows for the Automation 360 Cloud?</p>	<p>Yes, Automation Anywhere updates Automation 360 Cloud every 3 months so that customers will receive automatic and regular updates to the latest software version. For more information, see Automation 360 software lifecycle policy on page 1023.</p> <p>The primary channel for communicating the timing of Cloud status and maintenance windows is the Automation 360 Cloud Service Status site. You can subscribe to this website and receive the updates. Note that you cannot choose when the updates are rolled out across the multitenant Cloud. The Automation 360 architecture is designed to allow these timeless updates to roll out without affecting customers' bot development lifecycles.</p>
<p>As a customer, what actions should I take to plan for an Automation 360 maintenance window?</p>	<p>A customer's bot operations should take account of scheduling bots to run outside of the published maintenance windows. These updates are scheduled to run outside of normal business hours on the same day and time per region, and focuses on mid-month, avoiding month ends. More details guiding customers on planning around maintenance windows can be found on this KB article: Automation 360 Cloud updates on page 1020.</p>
<p>Is customer data stored on the Automation 360 Cloud?</p>	<p>Yes, basic automation processes allow customers to keep customer business data on their own infrastructure using careful bot design. However, Automation 360 applications increasingly store customer data on the Cloud. Several Automation Anywhere products store customer data as part of customer-defined automations, although typically only temporarily, that is, during the automation process defined by the customer.</p>

For example:

- IQ Bot use typically involves uploading images for processing.
- Recorder and AISense Recorder store recorded screenshots.

Note: Secure recording can be enabled by administrators to ensure that these are not stored.

- AARI stores data processed by attended forms.
- Bot Insight can be used to create dashboards made from tagged business data being processed by a bot.
- WLM stores Work Items in its queues.

The customer has control over what business data is stored on the Automation 360 Cloud. Note that the source data remains with the customer, and the customer is in control of deleting the data on the Automation 360 Cloud. In general, the business data a customer keeps in our Cloud through the use of bots is for automation purposes only and can then be deleted. The primary storage for the data is not on our Cloud. Customers might need to keep audit logs and dashboard data. Both of these can be exported.

What is the Automation 360 Cloud Data Retention Policy?

During a customer's subscription period, data on the Automation 360 Cloud is in their control. Audit logs have a retention policy maximum of 270 days.

Backups are taken every 4 hours and kept for seven days. After a subscription ends, according to our retention policy, data is held for another 30 days, to allow for renewal or recovery of bots and reports, and is deleted after that. After 60 days, the entire tenant environment is deleted.

Is data stored on the Automation 360 Cloud using common storage infrastructure?

Yes. The data storage services used by Automation 360 Cloud are shared across customers as part of the multitenant design. In this way, the infrastructure and operational costs are not passed on to our customers. Automation Anywhere applications use a unique tenant ID to ensure that data access is logically segregated by tenant. No data processing or storage operations can expose the data of one customer to another customer.

Can Automation Anywhere personnel access customer data stored on the Automation 360 Cloud?	Yes. However, operational controls governed by Automation Anywhere compliance certifications ensure that such access is limited to a well-defined set of individuals in CloudOps, SecOps, and Support organizations under strict separation of duties. Customer data will be accessed only based on a customer granting permission in order to resolve a support case.
What compliance covers Automation 360 Cloud?	<p>CloudOps is governed by the following certifications based on third-party audits: SOC 1 Type 2, SOC 2 Type 2, ISO 27001, and HITRUST</p> <p>The Automation Anywhere Business Continuity Management system is also certified with ISO 22301.</p> <p>Customers rely on industry standard certifications for regulatory and compliance reasons. SOC 2 is created by the American Institute of CPAs (AICPA), and it measures IT security controls. The SOC 2 Type 2 certification verifies that Automation Anywhere CloudOps and SecOps teams have taken the appropriate controls and have put operational processes in place to meet industry standards for secure Cloud operations.</p>
Are the compliance certifications and summary reports for the certifications available for customers to review?	Yes, customers can now access the various summary reports and certifications on the Compliance Portal under NDA.
How does Automation 360 Cloud support GDPR and an individual's privacy?	Automation Anywhere has put processes in place to handle individuals' data privacy rights, and reviews them on a regular basis to ensure GDPR compliance. For more information, see our Privacy Policy .
Do Automation Anywhere personnel monitor an Automation 360 Cloud tenant's environment?	Yes. All infrastructure and application-level audit logs are monitored to ensure the correct operation of the environment under load. This way, when load thresholds are reached, additional resources can be applied to ensure service availability and performance.
Does Automation Anywhere report unsuccessful data breaches to a customer?	No, Automation Anywhere reports only successful breaches to a customer when that customer's data has been compromised and on a timeline determined by local law.
What data does Automation Anywhere collect to improve the Automation 360 Cloud service?	To operate and support the service, Automation Anywhere captures logs that can include usernames from the system. These rotate and are overwritten every 30 days. Automation Anywhere collects and uses telemetry data only for purposes of improving

the service. Collected telemetry data includes the following:

- Audit logs: These reflect user activities in the Control Room and applications, for example, a bot was run successfully or a user created a bot.

Note: The actual username is masked. Logs might include IP addresses, device names, and bot names.

- User clicks on a UX feature: Helps in providing user-specific help and guidance options to the user in the UI based on their experience.
- Where documents are uploaded for processing (for example, when using IQ Bot or AISense), Automation Anywhere may reconstruct the format of the document, without the customer's data, for the purpose of further training the Automation Anywhere AI/ML models to recognize document fields that might contain data for extraction. This aids in improving the application's data extraction accuracy.

This telemetry data can be used to monitor the service and is visible per tenant Control Room, and in aggregate, so that feature usage and adoption can be estimated. This can be used by product management to determine which features to prioritize for improvement and to identify features or applications not being adopted. This data can also help CSMs to advise customers on unused features that they could start using and benefit from.

In which geographical region is a customer's data stored when using Automation 360 Cloud?

In general, for the pure Cloud deployment model, a customer specifies the regional location at the time of provisioning their Control Room instances, for example, US East or Japan.

Note that we cannot provide the detailed address or location of the physical data center because we use public Cloud providers, who reserve the right to move and do not disclose locations for safety and security reasons. We provide this regional capability to ensure that the Control Room is located in the same region where the customer will perform most of their operations to ensure high performance and usability and to reduce latency. For most locations, for business continuity, the disaster

recovery element of the service sends data backups every six hours to another region. The other region is usually in another country.

Which regional locations does Automation 360 Cloud support?

Automation Anywhere Control Room environments can be hosted in the following regions:

Primary	Backup/DR
US West	US East
US East	US West
EU-West	EU-Central
Japan	Singapore
Singapore	Japan
Brazil	US East
Bahrain	EU-West
India	Singapore
Australia	-
South Africa	EU-West
US Central	US East
EU-West4	EU-Central
Canada	-

What if the customer is concerned about data sovereignty (that is, maintaining data in a specified region)?

For customers concerned about data sovereignty, the Pure Cloud model can only guarantee that data is stored in the US, EU, and in Australia. This does not prevent the data from being accessed from outside those regions (for example, for support purposes). For the US, the DR region is kept within the US.

Note:

1. The DR service is not supported in Canada and Australia (specifically because most customers in Canada and Australia are conscious of data sovereignty).
2. For EU, we cannot guarantee that data is kept within a specific country within the EU.

Which public Cloud providers are used to deliver Automation 360 Cloud services?

Automation 360 Cloud uses Amazon Web Services (AWS) and Google Cloud Platform (GCP) to deliver Automation 360 Cloud

services. Automation Anywhere decides on the default provider to use. However, if you have a strong preference for AWS or GCP, you should work with your account team to choose the preferred Cloud service at the time of closing the sales transaction. For existing customers in the US and EU who provision for a new Control Room, the new tenants are created in the same region where your other tenants are located.

Note:

- IQ Bot classic is not supported on GCP.
- Migration of Enterprise 11 On-Premises Control Room to Automation 360 Cloud service on GCP using the Cloud Migration Utility is not supported.

What is a sandbox Control Room?

A sandbox is a fully functional and supported Control Room that receives new release updates at least 3 weeks prior to a customer's main Control Room for Bot Lifecycle Management (Dev/Test/Prod). The sandbox environment primarily allows customers to try out new releases and sanity-test their production bots.

Note: IQ Bot and DR are not supported on sandbox environments.

Is the sandbox the same as a trial environment?

No. Unlike a sandbox, a trial or proof-of-concept Control Room is provided free of charge for 30 days ahead of a sale, as part of the selling motion with customers.

Automation 360 Cloud Service Status site

The Automation 360 Cloud Service Status site displays real-time operational status, historical operational status, maintenance information, and incident history for all Automation 360 Cloud services worldwide, across all hosting regions.

[Automation 360 Cloud Service Status site](#)

How you can use the site

You can use the Automation 360 Cloud Service Status site to view various updates:

Note: In addition to viewing updates, you can also receive updates regarding ongoing incidents and upcoming scheduled maintenance by email or RSS feed by using the **Subscribe** option on the top-right corner.

- Use the **Component Summary** section to view the real-time operational status of all the Cloud services hosted from all regions worldwide.
- Use the **Component Status History** section to view the historical operational status of all Automation 360 Cloud services hosted across all regions worldwide.

Note: This historical information can be traced back for a maximum of three months.

- Use the **Upcoming Maintenance - Next 14 days** section to view maintenance information about ongoing and upcoming incidents for the next 14 days.
 - Use the **Incident History** section to view information about incidents that are resolved and scheduled maintenance events that are completed .
-

Note: In the Automation 360 Cloud Service Status site and in this documentation, the term "component" refers to the Automation Anywhere service within a hosting region.

Real-time operational status

Automation Anywhere frequently monitors the accessibility and health of components from various geographical regions across the world to report on the operational statuses of components in real time. The **Component Summary** section provides a real-time view of the operational status of various components.

The following table provides a list of operational statuses along with definitions and examples:

Component statuses along with definitions and examples

Component status	Definition	Example
Operational	All the services in the region are operational and available.	All the Control Room URLs are accessible, and customers can log in to their Control Room instances.
Informational	All the services in the region are operational but have an incident that does not affect customers.	
Under Maintenance	The services in the region are currently unavailable.	The service is undergoing a planned maintenance event.
Degraded Performance	There is an incident that affects performance significantly.	<ul style="list-style-type: none"> • The service is available, but one or more capabilities of the service are not performing optimally. • Services in the region are occasionally inaccessible or interrupted. • Bots in the region occasionally fail for some customers.

Component status	Definition	Example
Partial Outage	There is a major incident that affects a few customers significantly.	<ul style="list-style-type: none"> Services in the region are inaccessible, or some customers (more than 25 percent of customers in the region) cannot log in to their Control Room instances. Bots in the region fail for some customers. A security or data breach has occurred for some customers in the region.
Major Outage	There is a critical incident with very high impact across the region.	<ul style="list-style-type: none"> Services in the region are inaccessible, and customers cannot log in to their Control Room instances. Bots fail to run successfully on the Control Room instances in the region. A security or data breach has occurred for all the customers in the region. A Cloud region has completely failed, triggering a disaster recovery event.

Historical operational status

The **Component Status History** section provides a historical view of the availability status of all the components over the preceding seven days. You can use the **Search Components** option at the top-left corner of the section to search for the historical operational status of a specific component. You can use the arrows on the top-right corner of the section to view the historical operational status of components, one week at a time, for the preceding three months.

This section also provides an aggregated incident status for all the incidents for any given day. Click the days with incidents to view a summary of uptime details along with a list of incidents reported for that day.

Note: Planned maintenance windows are reported as incidents.

Maintenance information

Two types of incidents are monitored for and reported on the Automation 360 Cloud Service Status site:

- **Planned incidents:** Incidents that are primarily related to planned maintenance windows for software updates, such as patch updates, security updates, and infrastructure updates.
- **Unplanned incidents:** Unplanned interruptions that result in reduced or degraded service performance or total interruption to service availability for some or all customers.

Planned maintenance events

The planned maintenance window is published well in advance of scheduled events and is conducted to improve multiple aspects of a service. A planned maintenance event is scheduled to deploy a software update, a patch to fix an existing issue, a security patch to resolve a security vulnerability, or an infrastructure component update to improve the reliability, resiliency, and availability of the service. Users who are subscribed to incident notifications receive an email notification about the details of maintenance windows.

Planned maintenance events typically last for four to six hours per geographical region when updates are rolled out. Although the actual downtime during the update varies, completion is typically within 10 to 15 minutes. If IQ Bot is in use, completion time is typically 20 to 30 minutes.

The Automation 360 Cloud Service Status site provides information about the following types of planned maintenance events:

Planned maintenance event for deploying Automation 360 release update	This planned maintenance event deploys new Automation 360 software release update to the Automation 360 Cloud. Here are the notification fields for this software release update:
Title	Planned update for Automation 360 Cloud for a region
Description	Planned update for Automation 360 to the Automation 360 Cloud, which results in minor interruptions to the service during this period.
<p>Note: We recommend that you do not run bots during this period.</p>	
Advance Notice	The notification announcing this maintenance window is published at least two weeks in advance on the Automation

Planned maintenance event for deploying patch (non-security) release for Control Room	This planned maintenance event deploys Automation 360 software patches to Automation 360 Cloud to fix existing or unknown issues. Here are the notification fields for this patch release update:	360 Service Status site. The release notes are published in advance of the update.
	Title	Critical update for Automation 360 Cloud for a region
	Description	This is a critical, non-security patch update for Automation 360 to the Automation 360 Cloud, which results in minor interruptions to the service during this period.
		<hr/> Note: We recommend that you do not run bots during this period. <hr/>
	Advance Notice	The notification announcing this maintenance window is published with best effort, in advance, on the Automation 360 Service Status site. The release notes are published in advance of the update.
Planned maintenance event for deploying patch (security) release for Control Room	This planned maintenance event deploys Automation 360 security fixes to Automation 360 Cloud to fix existing vulnerabilities, known security issues, and Cloud component updates to resolve vulnerabilities. Here are the notification fields for this update:	
	Title	Critical security update for a region
	Description	This is a critical security patch update for Automation 360 to the Automation 360

		Cloud, which results in minor interruptions to the service during this period.
		<hr/> Note: We recommend that you do not run bots during this period. <hr/>
	Advance Notice	The notification announcing this maintenance window is published with best effort, in advance, on the Automation 360 Service Status site depending on how critical the security issue is. The release notes are published in advance of the update.
Planned maintenance event for Automation 360 infrastructure updates	This planned maintenance event deploys updates related to the Automation 360 Cloud infrastructure. Here are the notification fields for this update:	
	Title	Planned infrastructure update for Automation 360 Cloud for a region
	Description	This is a planned infrastructure update for Automation 360 Cloud, which results in minor interruptions to the service during this period.
		<hr/> Note: We recommend that you do not run bots during this period. <hr/>
	Advance Notice	The notification announcing this maintenance window is published at least two weeks in advance on the Automation 360 Service Status

Planned maintenance event for patch (security) release for IQ Bot Hybrid	Title	site. The release notes are published in advance of the update.
	Description	<p>Planned update for Automation 360 Cloud for IQ Bot Cloud servers for a region</p> <p>This is a critical patch update for IQ Bot on the Automation 360 Cloud, which results in interruptions to the IQ Bot service during this period. #Access to the main Automation 360 Cloud Control Room and other services are not affected.</p> <hr/> <p>Note: We recommend that you do not schedule bots that use IQ Bot capabilities to start during this period.</p> <hr/>
	Advance Notice	<p>The notification announcing this maintenance window is published at least two weeks in advance on the Automation 360 Service Status site. The release notes are published in advance of the update.</p>

Incident history

The **Incident History** section shows a detailed list of resolved incidents and completed scheduled maintenance events for the preceding seven days.

The list includes the following details about each incident:

- Incident description
- Incident duration (start time, end time, and duration of the outage)

- Affected components
- Incident status updates
- Information in cases of unplanned service outages

Automation 360 Cloud updates

Automation 360 Cloud is a multitenant cloud service that leverages the latest best practices in delivering web-scale SaaS to rolling out incremental updates globally using a continuous deployment pipeline.

Automation 360 Cloud provides updates to the Bot Agent instances running on your infrastructure. The Bot Agent is a lightweight, Java-based, modular application that handles particular bots and their packages when they are scheduled to run.

Bot Agent updates are transparent to active Bot Creator users. For operations, the Bot Agent updates are carried out automatically, by default, without requiring administrative privileges (much like browser updates).

Note: This is regardless of whether the Bot Agent was installed as a system user or local user.

With each update, products such as Automation Workspace, Control Room, IQ Bot, Bot Insight, Discovery Bot, and Automation Co-Pilot have improved security and enhanced features. Application command packages can also be enhanced and made available for inclusion into bots on your release cycle.

Updates are rolled out over a 3-hour maintenance window per geographical region. These maintenance windows are posted on the Automation 360 Cloud Service Status site. Although the actual downtime during the update varies, completion is typically within 10-15 minutes. If IQ Bot is in use, completion time is typically 20 - 30 minutes. In general, bots run to completion during updates, with the following scenarios being exceptions:

- The bot tags data for Bot Insight.
- Bots that run WLM.
- Credentials directly entered as command input are pulled from the Control Room at execution time. Instead, use credential type variables.
- Child bots: Parent/child bots run to completion because the child bots are downloaded when the parent bot starts its run.

Exceptions:

- If a child bot is referenced using a variable parameter because the child bot requires the Control Room to be available when the parent bot runs.
- If a child bot does not use the same global variables as the parent bot.
- If a child bot is using credential type variables.

After the Bot Agent has reconnected to the Control Room, the bot status is updated in the bot run activity logs.

Automated Bot Agent update takes place after an agent completes any current bot run and the Bot Agent reconnects to the Control Room.

During this short downtime, any bots scheduled to run will not be run. It is therefore recommended that bots are not scheduled to start to run during the planned maintenance window.

The following table provides a list of regions and the day and time of their maintenance windows. The upgrade occurs sequentially over a three week period:

- Week 1 - First rollout will begins in the AP-AUS and AP-Sing regions
- Week 2 - Second rollout begins in the EU-West1, EU-West4, LATAM, ME, S, Africa, US-East, US-Central, and India regions
- Week 3 - Third and final rollout begins in the US-West, Canada, and Japan

Important:

Times mentioned below are in UTC (Coordinated Universal Time). To convert to your local time, refer to a universally recognized online resource such as <https://www.worldtimezone.com/>.

Region	Day and time in UTC
AP-AUS	Wednesday, 12:00 to 15:00
AP-Sing	Wednesday, 16:00 to 19:00
EU-West1	Tuesday, 20:00 to 23:00
EU-West4	Tuesday, 20:00 to 23:00
LATAM	Thursday, 02:00 to 05:00
ME	Thursday, 20:00 to 23:00
S. Africa	Thursday, 20:00 to 23:00
US-East	Friday, 02:00 to 05:00
US-Central	Friday, 02:00 to 05:00
India	Friday, 20:00 to 23:00
US-West	Monday, 02:00 to 05:00
Canada	Monday, 02:00 to 05:00
Japan	Monday, 16:00 to 19:00

Note: A small interim update might be planned to address urgent, priority updates mid-cycle between the primary quarterly updates. These will occur on the same day of the week and time as the schedule mentioned previously.

Regular updates

Regular updates are planned approximately every 3 months and are scheduled to occur during non-business hours and not close to the beginning or end of a month. Notifications are posted to the Service Status site 2 weeks in advance of the update. A notification message is also pushed to administrators in the Control Room in advance.

You can review changes in the release notes that are made available 3 weeks before each update.

Note: As a customer, you can use a sandbox Control Room environment to try out the next update at least 3 weeks before the main Dev/UAT/Prod environments are updated.

Command packages might be updated and made the default for creating new bots. Existing bots continue to use their existing package versions. New bots use the new default package version. However, as a user, you can also choose to revert to the previous version.

Cloud infrastructure updates

Cloud infrastructure updates are carried out typically once every 3-month period. If these infrastructure updates involve planned downtime for Automation 360 Cloud, notifications are posted on the Service Status site at least 1 week in advance.

Critical patch updates

Patch updates might be required for either critical security updates or where serious issues with an update affect the majority of Cloud customers.

Patches require a maintenance window although they typically do not require a Bot Agent update. For patch updates, advance notice will be provided on the Service Status site.

Planned maintenance windows

Automation Anywhere offers planned update maintenance windows to enable customer operations to support Bot Lifecycle Management. Outside of planned maintenance windows for the updates mentioned previously, the Automation 360 Cloud availability SLA is 99.9 percent per month.

Note: For more information, see [Cloud Automation Agreement](#).

The following table provides information such as frequency, time expectation, and client action for different types of updates:

Type of update	Frequency	Time expectation	Client action
Regular Automation 360 Control Room and Bot Agent	3 - 4 months	3-hour window Around 10 minutes of downtime	Bots can run to completion. Do not schedule bots to start during this 3-hour window.
Sandbox	At least 3 weeks prior to regular Cloud updates		Try new features out after the window. Sanity-test production bots.
Cloud infrastructure	Once every 3-month period	Varies. Scheduled on weekends.	Bots can run to completion. Do not schedule bots to start during the window.

Type of update	Frequency	Time expectation	Client action
Critical patch	As needed	Critical notice given	

Subscribing to notifications

In the Automation 360 Cloud Service Status site, subscribe to email notifications about planned maintenance events and unplanned incidents that affect service availability.

To subscribe to email notifications from the Automation 360 Cloud Service Status site about planned maintenance events and unplanned incidents that affect service availability, click **Subscribe** on the top-right corner of the Service Status site.

Provide your name and email address when subscribing to notifications.

You can manage your subscription by clicking **Manage Existing Subscription**. The system sends you a link, by email, with which you can manage your incident notification subscription. You can select the service and the region for which you want to receive status notifications.

To subscribe to incident notifications for the Cloud region where your services are hosted, open an Automation Anywhere support ticket.

Personalizing the Service Status site

You can personalize the Automation 360 Cloud Service Status site by selecting the language and time zone of your choice for showing incidents. To select language and time zone, click the gear icon on the top-right corner.

Language	You can select a language from among seven supported languages.
Time zone	When you select a time zone, the incidents from the selected time zone will be shown.

Automation 360 software lifecycle policy

Automation Anywhere software lifecycle policy aims to make innovations and enhancements available to you quickly. Through this policy, we provide you predictability, quality, and importantly nondisruptive access to the latest innovations and enhancements so that you can control when and how you want to adopt these enhancements.

Note: The policies mentioned on this page apply to both Automation 360 Cloud and On-Premises deployments unless where the differences are called out explicitly.

Overview

The software lifecycle policy helps you with change management while providing you the latest software updates with enhancements in the Control Room, Bot Agent, and packages.

Our policy aims to provide faster access to features, bug fixes, and other enhancements for a better customer experience:

- Predictability: With frequent, regular deployment cycles, you can get access to new and enhanced packages sooner than before with predictable release cadence.
- Deploy new features: With control over introducing changes to your bots, you can test new features and deploy them at your own pace.
- Quality: With automated deployments from Automation 360 Cloud, you can use new packages that include critical bug and security fixes.
- Nondisruptive access: You can update packages without disrupting your existing configurations.
- Backward compatibility: You now have the option to safely update bots while still having the option to change back to a previous version of a package.

The following image shows the advantages of this lifecycle policy:

Bot Agent updates

When a new version of Bot Agent is available, by default, the Bot Agent is deployed automatically across a customer's pool of devices without impacting existing bot functionality. However, Control Room administrators can disable this default update capability and choose to update the Bot Agent manually. In case of manual updates and in the event of a mandatory update, users will

be notified that the Bot Agent must be updated and all bot execution on these devices will stop until the Bot Agent is updated.

For larger deployments where device pools are deployed using standard device Amazon Machine Images (AMI) on separate schedules, these updates will require coordination, change management processes, and approvals in the customer environment. Therefore, Automation 360 will support backward-compatible Bot Agent for a release every 6 months.

Starting with Automation 360 v.24 release, 4 Bot Agent updates will be released each year with 2 optional and 2 updates that might be declared mandatory. You can skip the optional update and update to the next mandatory Bot Agent update.

Our Q2 and Q4 releases will have optional Bot Agent updates and you can choose to skip the Bot Agent update. However, the Q1 and Q3 updates might have mandatory Bot Agent updates. We will notify customers 3 months in advance if a mandatory Bot Agent update is required with a Control Room release.

Package updates

Starting with Automation 360 v.24 release, delivery of packages is developed to be separate from the main platform updates. This will help us respond quickly to changes and fixes required and provide the flexibility to deliver updates in packages, going forward.

With this capability, new packages and new package versions can now be automatically downloaded from Automation Anywhere Cloud when they are predictably released on a quarterly release cadence. These downloaded packages become the default package so that customers can start using these package versions on an ongoing basis as they become available.

This capability is enabled differently for Cloud and On-Premises Control Room instances, as listed in the following table:

Seamless package update capability	Cloud Control Room	On-Premises Control Room
Download packages from Automation Anywhere Cloud	Enabled by default and cannot be disabled.	Disabled by default and can be enabled.
Set downloaded package to default version	Enabled by default and can be disabled.	Enabled by default and can be disabled.

- Cloud users: Automatic package download capability is now enabled across all Control Room instances in all regions at the same time.
You can start using the latest packages on your current Control Room version before the Control Room update is made available in your region.
- On-Premises users: This capability is disabled by default but it can be enabled by package administrators.

We recommend that bot developers always use the latest version of the packages because that version provides the latest innovations and all the code and security fixes from previous versions. However, administrators can change this default behavior at any time and roll out the packages to developers after verifying them. These new package versions are also backward-compatible with the existing platform version.

Note that this capability has no impact on existing bots, which continue to run unchanged. Bots that are developed with a particular package version will always continue to do so unless explicitly

changed by the bot developer. This provides bot developers the flexibility to adopt new package versions when they are ready for it. Bot developers must explicitly edit the bots in the Bot editor view and use the new package version.

Support and deprecation policy for packages

Support and deprecation policy for packages aims to provide bot longevity and reduce overall maintenance efforts to keep bots updated. The design consideration is to minimize the bot changes required to keep the bot functioning.

Note: This policy is in effect from Control Room release v.23.

Package versions supported for a minimum of 2 years	<p>Package versions that are released will continue to be supported for a minimum of 2 years after the release. Even after 2 years, a package version will continue to be supported unless it is deprecated.</p> <p>Typically, a new version of the package will be made available if a package is deprecated. All issues and security fixes reported for the package will be fixed in the latest version, with no backporting.</p> <p>You will be notified 3 months in advance when a package version is planned for deprecation. If there is a critical security vulnerability, we will make the best effort to send an advanced notification.</p>
Packages version compatibility with Bot Agent and Control Room	<p>Package versions and bots that use these versions will be compatible with all the Control Room and Bot Agent versions released within the 2 years after the package version release. Bots that use these supported package versions do not have to be configured to be compatible with the Control Room and Bot Agent versions.</p>
Deprecation policy on package version	<p>Package versions will not be depreciated within the 2 years after their release unless there is a critical security vulnerability that has to fixed. In such a case, a new package version will be made available with the fix.</p>
Minimal bot changes	<p>The package version support policy aim is to minimize the effort required to change existing bots and to keep them functioning.</p> <p>Bots using a specific package version do not have to be updated to use the package versions if the existing package version is supported. However, we recommend that you use the latest version of the package when developing the bot to increase the longevity of the bot. The package versions used in a bot will have to be</p>

updated before they are deprecated for the bot to remain supported.

Bot lifecycle

The design assumption for bots is that the version of the package used in the bots is present in the Control Room that is used to run the bots. Before developers promote bots, we recommend that the developers verify that the package version used in the bots matches the package version in the higher environments.

When promoting bots to higher environments (for example, testing and production) that are on a lower software version, ensure that you include the dependent packages for bots. This will ensure that the target environment has all the package versions required by the bot.

Note: Some package versions will not be backward compatible with an earlier version of the Control Room or Bot Agent. Therefore, refrain from using such incompatible package versions during the Control Room environment update phase.

Automation 360 Cloud is a multitenant cloud service that leverages the latest best practices in delivering web-scale SaaS to rolling out incremental updates globally using a continuous deployment pipeline.

Automation and generative AI

Combine the power of generative AI and automation to unlock productivity across each system, team, and process in your business.

Our automation platform provides these generative AI powered offerings:

Automation Co-Pilot for Business Users

An on-demand, Intelligent Automation assistant powered by generative AI. Embedded in any business application, Automation Co-Pilot helps knowledge workers and customer service agents accelerate routine business tasks, such as processing emails, summarizing applications, and generating reports. Learn more: [Automation Co-Pilot for Business Users](#) on page 3144.

Document extraction using generative AI

Document Automation has been a leading technology for processing critical business information. With the power of generative AI, it can now ingest, comprehend, and extract data from any unstructured document type in the flow of work. This capability opens up a whole new world of data that was historically challenging and costly to extract for process automation. Learn more: [Document Automation data extraction using Generative AI](#) on page 3531.

Generative AI packages

Use our new generative AI packages containing native integrations with hyperscaler LLMs to easily build out automations. Supported LLMs include Google Vertex AI, Azure OpenAI, and OpenAI. Learn more: [Generative AI packages](#) on page 2538.

Watch the following video on how to put generative AI to work with our automation platform:

Automation resiliency

Automation (bot) resiliency enables bot executions to complete without any interruptions from other background applications, thereby making the bots more resistant to events that occur during runtime.

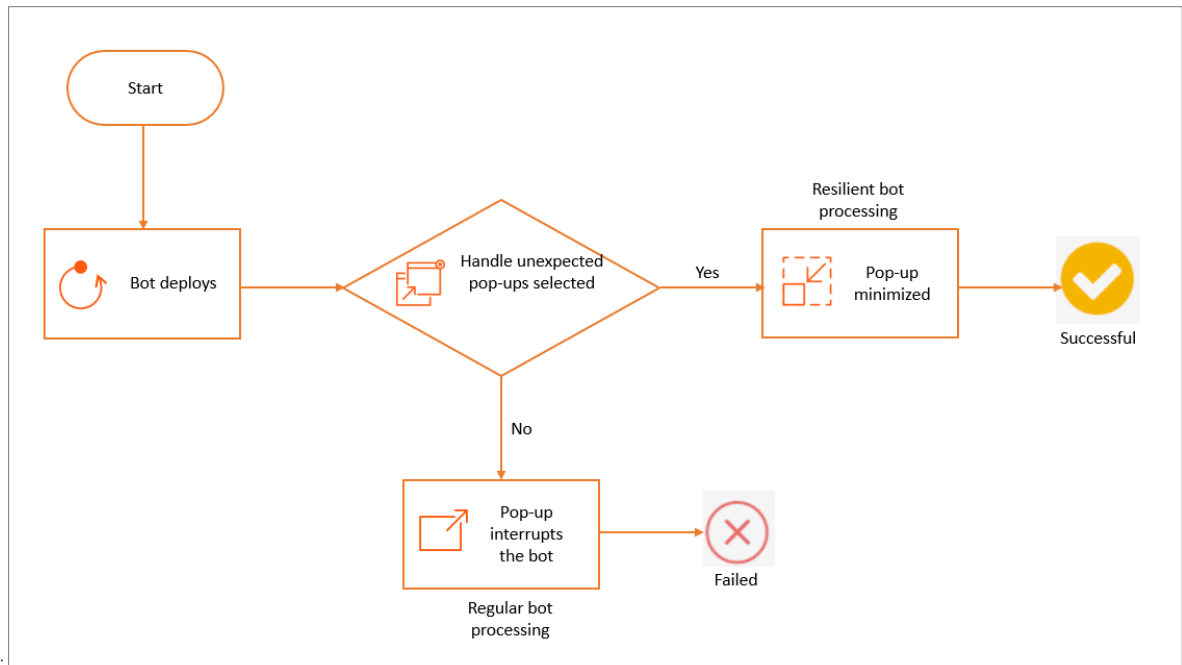

Any window that is external to the target application is considered a pop-up. For example, if you are using the Google Chrome browser, a Microsoft Windows Update notification is considered a pop-up. A pop-up window is detected by comparing the point or area of action window with the target application window. The detected window is marked as pop-up and handled if it is different from the target window.

System pop-ups such as anti-virus alerts, Windows update notifications, or notifications from other applications (such as Teams) might interrupt and even stop bot execution. With regular error handling logic, it can be difficult to block these pop-ups during bot runtime. Resilient automation can detect and triage these pop-ups to ensure a seamless bot execution.

SAP and HTML are the currently supported technologies.

Note: The handle unexpected pop-ups functionality is not available as part of the standard Control Room installation (or update) and must be enabled separately. Contact your Automation Anywhere Customer Success Manager (CSM) for assistance.

The following diagram shows how a resilient and non-resilient bot handles pop-

ups:

Automation resiliency provides the following benefits:

- Makes bots more resilient to changes from underlying applications.
- Leverages the enhanced performance of bots to increase the automated tasks.
- Enables automation scaling on demand.
- Conforms to security standards for stronger protections against unauthorized access.

Manage unexpected pop-ups

Manage or handle unexpected pop-ups in Automation 360 so that your bots can complete without any runtime interruptions.

When a pop-up is detected, the system attempts to set the target application window at the top (topmost) of all other windows. If the pop-up window persists, then it is minimized and the automation is attempted. However, the automation might fail if the system is unable to minimize the pop-up window.

Note: The **Handle unexpected pop-ups** is not available as part of the standard Control Room installation (or update) and must be enabled separately. Contact your Automation Anywhere Customer Success Manager (CSM) for assistance.

Limitations for handling pop-ups

The automation might fail if the system is unable to handle pop-ups in the following scenarios:

- The pop-up is from an application that is running with administrator privileges.

Note: As a workaround, you can run the automation with administrator privileges by selecting the **Run with administrative privileges** check box in the **Run bot now** window.

- The pop-up application has any of the defensive programming such as pop-up should not be minimized or cannot change its z-order.
 - Pop-ups are not handled by commands that contain one of the following options:
 - Active window
 - Desktop window
 - Screen
-
1. Log in to Control Room and click **Automation** on the left pane.
A list of available bots and forms is displayed.
 2. For the bot that you want to enable the pop-up handler, click the actions menu (vertical ellipsis).
 3. Click **Run Task Bot**.
The **Run bot now** screen is displayed.
 4. In the **General** tab, select the **Handle unexpected pop-ups** check box.
The following video shows how to enable the functionality:
 5. Click the **Run bot now** button.
The selected bot is deployed with the capability to manage pop-ups. Any unexpected pop-ups that occur during the bot run are now handled to ensure the bot execution is successful.

Feature deprecations affecting Automation Anywhere products

Review the features and capabilities (from Automation Anywhere or third party) that are deprecated or nearing deprecation to understand how they affect your automation and what action is required.

Definition: Deprecation refers to features or capabilities available in the current (latest) release that are planned to be removed or unsupported in a future release.

You can use the specified alternatives or updated versions when they are made available.

Third-party feature deprecations

Upcoming: The following table lists third-party features that will be deprecated by the date mentioned:

Feature or capability	Deprecation date	Customer impact and recommendation	Resources
Manifest V2 based extensions (Automation 360 v.26 and later releases)	October 23, 2023	<p>From Automation 360 v.26 and later releases, we have published new Google Chrome and Microsoft Edge Manifest V3 extensions.</p> <p>Starting on October 23, 2023, we will deprecate support for Manifest V2 extensions on Automation 360 v.26 and later releases. After this date, we will not address any issues relating to Manifest v2 extensions. If you are on Automation 360 v.26 or a later release and still using Manifest V2 extensions for Google Chrome and Microsoft Edge, we recommend that you upgrade your Google Chrome and Microsoft Edge browser extensions to Manifest V3 extensions before October 23, 2023.</p>	Chrome and Edge Manifest V3 extensions

Feature or capability	Deprecation date	Customer impact and recommendation	Resources
<p>EWS API</p> <p>See Upcoming API Deprecations in Exchange Web Services for Exchange Online</p>	<p>Ongoing deprecation</p>	<p>Automation 360 currently uses EWS API in Email package and Email trigger for the EWS option to connect to Exchange Online hosted on Azure Cloud and access emails from Microsoft 365.</p> <p>Microsoft has recommended that customers move to a REST-based Graph API, which is more secure and scalable compared with the legacy SOAP-based EWS API. Therefore Automation 360 will provide support for Microsoft 365 Outlook package based on Graph APIs which will enable you to switch from EWS API to Graph API from an upcoming release.</p> <p>This deprecation by Microsoft might impact bots for email automations (Email package and Email trigger) that connect to Exchange Online using EWS API. Note that there is no immediate impact on your existing bots and they continue to run properly.</p> <p>Recommended: Update the impacted bots by replacing each email-related action with the equivalent new actions in the Microsoft 365 Outlook package, planned in the upcoming release if your bots are impacted by the deprecation.</p>	<p>--</p>

Completed: The following table lists third-party features that are already deprecated:

Feature or capability	Deprecation date	Customer impact and recommendation	Resources
Transport Layer Security (TLS) 1.0 and TLS 1.1	April 2023	<p>Automation 360 Cloud deployments currently support the following TLS protocol versions:</p> <ul style="list-style-type: none">• TLS 1.0• TLS 1.1• TLS 1.2• TLS 1.3 <p>However, the TLS 1.0 and TLS 1.1 protocol versions have security vulnerabilities as per the industry security standards. Therefore, Automation 360 Cloud deployments for Amazon Web Services and Google Cloud Project will support only the TLS 1.2 and TLS 1.3 protocol versions.</p> <hr/> <p>Note: For Automation 360 Cloud deployments, the changes will be effective as part of the Cloud deployment configurations, not as part of the Automation 360 release.</p> <hr/>	Deprecating TLS 1.0 and TLS 1.1

Automation Anywhere feature deprecations

Completed: The following table lists Automation Anywhere features that are already deprecated:

Feature or capability	Deprecation date	Customer impact and recommendation	Resources
V2 Repository Files List API	June 2023	<p>From Automation 360 v.29, the Repository Files List API (<code>v2/repository/file/list</code>) will be deprecated.</p> <p>Recommended: You can use the <code>/v2/repository/workspaces/{workspaceType}/files/list</code></p>	Deprecated API: <code>v2/repository/file/list</code>
Descoped language support	June/July 2023	<p>Beginning with Automation 360 v.29, the User Interface for Automation Anywhere product will no longer support Italian, Russian, and Simplified Chinese languages. In addition, updated release documentation will no longer be available in these three languages though older documentation will be accessible.</p>	--

Feature or capability	Deprecation date	Customer impact and recommendation	Resources
IQ Bot Extraction package		This package is deprecated from Automation 360 v.26. Document Automation provides all the capabilities provided by the IQ Bot Extraction package. To move your bots from the IQ Bot Extraction package to Document Automation, see Move from IQ Bot Extraction package to Document Automation .	Archived Documentation (PDF):
IQ Bot Extraction package	October 2022	<p>From Automation 360 v.25, the IQ Bot Extraction package no longer supports pre-trained machine learning model for invoice data extraction but will continue to support learning instance group based-training extraction.</p> <p>Recommended: Use the new command package called Document Extraction, released in v.25 as part of Document Automation.</p> <p>Released: Automation 360 v.25</p>	Move from IQ Bot Extraction package to Document Automation on page 2647
IQ Bot - Tesseract OCR v3	October 2022	<p>For all existing learning instances trained using Tesseract OCR v3, we recommend that you plan to train them with alternative OCRs (including Tesseract4 OCR) before you update to v.26. Note that Automation 360 IQ Bot Cloud customers will receive the v.26 release by default from October 2022.</p> <p>Released: Automation 360 v.26</p>	--

Feature or capability	Deprecation date	Customer impact and recommendation	Resources
G-Suite Apps	September 2022	<p>From Automation 360 v.26, the GSuite Apps package no longer supports using the Connect and Disconnect actions to establish a connection with the Google server and automate tasks.</p> <p>Recommended: For specific G-Suite applications, the functionality of the G-Suite Apps package is available in the following G-Suite packages:</p> <ul style="list-style-type: none"> • Google Drive • Google Calendar • Google Sheets <p>To automate tasks, in the appropriate G-suite package, use the corresponding Connect and Disconnect actions.</p>	<p>Using the Connect action for Google packages on page 2589</p>
Automation Anywhere Mobile app	July 2022	<p>The Automation Anywhere Mobile app is deprecated and will not be updated to subsequent versions of iOS and Android. The mobile app is no longer available and no further support will be offered. A replacement product is currently not available.</p>	<p>Archived Documentation (PDF): EN-US</p>
V2 Activity List API	June 2022	<p>From Automation 360 v.25, the Activity List API (<code>v2/activity/list</code>) is deprecated.</p> <p>Recommended: With the newly implemented Activity List API (<code>v3/activity/list</code>), you can return the job executions without call back and bot output information.</p> <hr/> <p>Note: If you want to get the <code>botOutVariables</code> or <code>callbackInfo</code>, use <code>/v3/activity/execution/{id}</code> Bot Execution Orchestrator API.</p> <hr/>	<p>New API: Activity List <code>v3/activity/list</code> Bot Execution Orchestrator API</p> <p>Deprecated API: <code>v2/activity/list</code></p>

Feature or capability	Deprecation date	Customer impact and recommendation	Resources
Automation Anywhere for Excel	January 2022	<p>Automation Anywhere for Excel has been deprecated. The plug-in is no longer available to download as a product. However, support will be offered to current customers already using the product.</p> <p>A replacement product as a plug-in for Microsoft Excel is not available. However, as an alternative, new customers can develop bots for Excel within the Automation 360 Automation Workspace and use input variables to allow specifying file names, worksheets, and ranges for bots to operate on. In Automation Anywhere for Excel, this action was triggered from within the Excel application, whereas now, this action is taken from the Automation Anywhere Control Room.</p>	Documentation: Archived docs for RPA Bots for Excel v2.0
IQ Bot [Local Device] package	September 2021	This package is deprecated from Automation 360 v.22 (Build 10526). We recommend using Document Automation with the Document Extraction package that provides all the capabilities provided by the IQ Bot [Local Device] package along with some improvements.	Archived Documentation (PDF): IQ Bot [Local Device] package (Archived PDF)
Process package	January 2021	<p>The Process package is no longer supported with the Create a Request action as this has been replaced by the AARI web package (now renamed to Process Composer package) in Enterprise A2019.18.</p> <p>Recommended: Use the Create a Request action in Process Composer package.</p>	<p>New: Process Composer package on page 2777</p> <p>Deprecated: Process package on page 2786</p>

Feature or capability	Deprecation date	Customer impact and recommendation	Resources
Human-Bot Collaboration 11.3.x	August 2020	<p>Human-Bot Collaboration (HBC) 11.3.x was deprecated from August 2020 with the release of Enterprise A2019.15.</p> <p>Recommended: Migrate to Automation 360 to use the Automation Co-Pilot for Business Users (Automation Co-Pilot) that includes Desktop and Web.</p> <hr/> <p>Note: For this migration, there is no automated migration path between HBC 11.3.x and Automation Co-Pilot because of an absence of parity between the two products (including sets of features).</p> <hr/>	<p>New: Automation Co-Pilot for Business Users on page 3144</p> <p>Deprecated: :</p>

Related concepts

[Automation 360 software lifecycle policy](#) on page 1023

Automation Anywhere software lifecycle policy aims to make innovations and enhancements available to you quickly. Through this policy, we provide you predictability, quality, and importantly nondisruptive access to the latest innovations and enhancements so that you can control when and how you want to adopt these enhancements.

[Deprecation of Basic authentication in Exchange Online](#) on page 1066

Microsoft will permanently disable Basic authentication for specific protocols in Exchange Online starting from October 1, 2022. This impacts customers running bot for email automation that connect to Exchange Online using IMAP, POP3, or EWS protocols with Basic authentication.

[Chrome and Edge Manifest V3 extensions](#) on page 1082

As Google will deprecate Manifest V2 extensions, this might impact your existing automations that use the current Manifest V2 extensions for Google Chrome and Microsoft Edge browsers. We have published Manifest V3 extensions with the Automation 360 v.26 release to help you start switching to Manifest V3 extensions.

[Microsoft Internet Explorer EOL overview](#) on page 1041

Microsoft has announced retiring Internet Explorer (IE) for certain versions of Windows operating systems and recommends impacted users to move their apps or websites running on IE to Microsoft Edge with IE mode.

Related reference

[Microsoft 365 Outlook package updates](#) on page 873

Review the updates in released versions of Microsoft 365 Outlook package such as new and enhanced features as well as fixes and limitations. The page also lists the release dates of each version, and the compatible Control Room and Bot Agent versions.

Bot Scanner for EOL features

Verify if your automations include EOL features such as EWS API, basic authentication, and Internet Explorer by using the Bot Scanner. Review the report generated by the scanner and take the required next steps to ensure your automations continue to run successfully.

Note: The contents on this page apply only to Bot Scanner for EOL features. For information about Bot Scanner used for migration (from Enterprise 11 to Automation 360), see [Bot Scanner for migration](#) on page 1469.

Scanning bots that use EWS API

You can use Bot Scanner to scan bots that are using EWS APIs in the Email package and Email trigger.

Bot Scanner scans all bots and identifies those that use EWS API so that you do not have to identify them manually. The Bot Scanner then generates a report that provides details on the number of bots that can be updated, along with review messages.

For more information, see [Running Bot Scanner to scan bots for EOL features](#) on page 1077.

Scanning bots that use basic authentication

You can use Bot Scanner to scan bots that are using basic authentication in the Email package and Email trigger.

Bot Scanner scans all bots and identifies those that use basic authentication so that you do not have to identify them manually. The Bot Scanner then generates a report that provides details on the number of bots that can be updated, along with review messages.

For more information, see [Running Bot Scanner to scan bots for EOL features](#) on page 1077 and [Basic authentication scanning messages](#) on page 1081.

Scanning bots that use Internet Explorer

You can use Bot Scanner to scan Internet Explorer bots that have to be converted to a supported browser.

To help convert bots that use Internet Explorer, Bot Scanner scans all bots and identifies those that use Internet Explorer so that you do not have to identify them manually. The Bot Scanner then generates a report that provides details on the number of bots that can be converted and the number of bots that cannot be converted, along with review messages.

For more information, see the following topics:

- [Scan Automation 360 bots for Internet Explorer usage](#) on page 1057
- [Analyze report for Internet Explorer bots](#) on page 1059

- [Internet Explorer conversion or scanning messages](#) on page 1654

Microsoft Internet Explorer EOL overview

Microsoft has announced retiring Internet Explorer (IE) for certain versions of Windows operating systems and recommends impacted users to move their apps or websites running on IE to Microsoft Edge with IE mode.

While support for the Control Room (Automation 360 v.25) on IE will end, new and advanced features will be added to Automation 360 v.24R2 patch that will be supported on alternative browsers.

To ensure your existing IE bots are supported on Microsoft recommended browsers, such as Microsoft Edge with IE mode, based on the release you have installed, we recommend that you update to Automation 360 v.24R2 patch. To support conversion of IE bots to Microsoft Edge with IE mode, the following tools are available in this patch:

- Bot Scanner to scan Enterprise 11 bots for IE usage. This helps you to plan your efforts in the IE bot conversion process whether you continue on Enterprise 11 or migrate to Automation 360.
[Bot Scanner for migration](#) on page 1469 | [Scan Enterprise 11 or 10 bots using Bot Scanner](#) on page 1471
- Bot Migration Wizard to support conversion of IE bots to Microsoft Edge with IE mode. This will help Enterprise 10 or Enterprise 11 users to migrate bots to Automation 360 and convert the IE bots at the same time.
[Bot Migration Wizard](#) on page 1526
- Update Bot wizard to help Automation 360 new users as users who have migrated from Enterprise 10 or Enterprise 11 and want to convert their IE bots to Microsoft Edge with IE mode.
[Update Bot wizard for converting IE bots](#) on page 1061

See the following video on preparing your automations for IE EOL:

Update scenarios

- If you are using Enterprise 10, to update your IE bots to Microsoft Edge with IE mode, you can choose one of the following methods:
 - Upgrade to Automation Anywhere Enterprise Version 11.3.5.6 that supports IE bot conversion to Microsoft Edge with IE mode, convert your IE bots to Microsoft Edge with IE mode, and later migrate to the latest Automation 360 release.
 - Upgrade to Automation 360 v.24R2 patch, migrate your IE bots and update the IE bots to Microsoft Edge with IE mode.
- If you are using Enterprise 11 and are yet to migrate to Automation 360, update to Automation Anywhere Enterprise Version 11.3.5.6, which supports Microsoft Edge with IE mode. You can then migrate to Automation 360.
[Supported Control Room versions for migration](#) on page 1446
- If you are using Enterprise 11 and plan to complete migration to Automation 360 before IE EOL, you can migrate to the latest Automation 360 v.24R2 patch, which supports Microsoft Edge with IE mode.

- If you are using Enterprise 11 and plan to complete migration to Automation 360 after IE EOL, you can use one of the following methods:
 - Update to the latest Automation 360 release, convert the migrated bots created in IE to Microsoft Edge with IE mode.
 - Update to the latest Enterprise Client version that supports Microsoft Edge with IE mode and convert the pending bots created in IE to Microsoft Edge with IE mode in Enterprise 11, and later migrate these bots to the latest Automation 360 release.
- If you are using Automation 360 v.24 On-Premises or earlier and have created IE bots, you can update to Automation 360 v.24R2 patch to convert your IE bots to Microsoft Edge with IE mode.

Note: To ensure that your bots continue to run on Internet Explorer after EOL, Microsoft recommends that you register your site or application running on Internet Explorer to the Microsoft Site List manager. See [Enterprise Mode and the Enterprise Mode Site List](#).

For additional information on different upgrade scenarios, see [Enterprise 11 and upcoming Internet Explorer 11 EOL FAQ](#) | [Microsoft Internet Explorer 11 EOL FAQ](#) on page 1044

IE bot update workflow

Update from Automation 360 to Automation 360 On-Premises

1. Update to the latest Automation 360 release.
[Update Automation 360 to latest version](#) on page 1363
2. Set up Automation 360 Bot Runners for bot updates.
[Install Bot Agent and register device](#) on page 1288
3. Back up the Control Room repository.
[Restore bots from Git repository](#) on page 1770
4. Identify bots created in Internet Explorer using the Bot Scanner.
[Scan Enterprise 11 or 10 bots using Bot Scanner](#) on page 1471
5. Convert the bots created in IE to Microsoft Edge with IE mode using the Update Bot wizard.

[Update Bot wizard for converting IE bots on page 1061](#)

- Analyze the updated bots report using the Update Bot wizard.

[Viewing conversion details for Internet Explorer bots on page 1064](#)

- Verify that the updated bots can run or be deployed.

[Schedule a bot on page 2056](#) | [Run a bot on page 2206](#)

Important: Before you deploy your bots, register your site or application running on Internet Explorer to the Microsoft Site List manager. For details, see [Enterprise Mode and the Enterprise Mode Site List](#).

Note that you can convert your IE bots to Microsoft Edge with IE mode in one environment (for example, DEV) and then move these bots to another environment (for example, UAT and PROD) without updating the bots in each environment.

Upgrade from Enterprise 11 to latest Automation 360 On-Premises

- Upgrade from Enterprise 11 to the latest Automation 360 release that supports Microsoft Edge with IE mode.

[Prepare for Enterprise 11 to Automation 360 On-Premises migration on page 1502](#)

- Set up Automation 360 Bot Runners for bot updates.

[Install Bot Agent and register device on page 1288](#)

- Back up the Control Room repository.

[Restore bots from Git repository on page 1770](#)

- Identify the bots created in Internet Explorer using the Bot Scanner.

[Scan Enterprise 11 or 10 bots using Bot Scanner](#) on page 1471

5. Migrate Bot Runners and IE bots from Enterprise 11 to Automation 360.

[Bot Migration Wizard](#) on page 1526

6. View the bot migration report.

[View migration reports](#) on page 1614

7. Verify that the migrated bots can run or be deployed.

[Schedule a bot](#) on page 2056 | [Run a bot](#) on page 2206

Microsoft Internet Explorer 11 EOL FAQ

Microsoft has announced end-of-life (EOL) for Internet Explorer beginning June 2022 and recommends using Microsoft Edge or Microsoft Edge in Internet Explorer (IE) mode. This will impact automations (bots) based on the operating system currently in use where the bots are run.

For details, see the following table:

Microsoft operating system	Automation 360 and Enterprise 11 bots
Windows 10 Semi-Annual Channel	Update bots to use a compatible browser. For a list of supported browsers, see Browser requirements for Automation Workspace on page 1154.
All other supported operating systems	No immediate impact

Starting from the Automation 360 v.25 release, you will be prompted to access the Control Room through an alternative supported browser, such as Google Chrome or Microsoft Edge (Chromium) instead of Internet Explorer. Your Control Room will no longer be accessible on Internet Explorer. By aligning with the Microsoft strategy for browser support, we can provide you

with enhanced functionality that latest browsers such as Google Chrome and Microsoft Edge make technologically possible.

General FAQ

How do I know if I am going to be impacted by the Internet Explorer EOL?	<p>To assess whether you are actually impacted by the Internet Explorer EOL, you need to do the following:</p> <ul style="list-style-type: none">• Check whether the underlying legacy application or website can run only on Internet Explorer and is not moved to any other browser.• Check whether the device on which the bot is running has Windows 10 version using Semi-Annual Channel (SAC) license. <p>If the answer to both of the above is Yes, you are impacted by the Internet Explorer EOL.</p>
Why this change?	<p>Microsoft recently announced that Internet Explorer will be retired on June 15, 2022 for certain versions of Windows operating systems.</p> <p>While we will end support for the Control Room on Internet Explorer, we will continue to add new and advanced features that will be supported on alternative browsers.</p> <p>Browser requirements for Automation Workspace on page 1154 Internet Explorer EOL</p>
When will the support end?	<p>Starting from the upcoming Automation 360 v.25 release, any user trying to access the Control Room through Internet Explorer will be prompted to use alternative browsers such as Google Chrome or Microsoft Edge (Chromium).</p>
Can I connect to Enterprise 11 or Enterprise 10 Control Room?	<p>You can continue to use Internet Explorer to connect to the Enterprise 11 Control Room.</p>
What about the automations that I have already built using Internet Explorer?	<p>Microsoft is planning to discontinue support for Internet Explorer from June 2022 on certain operating systems. If this change impacts you, you should start planning to update your automations to use other browsers, such as Microsoft Edge (Chromium).</p> <p>See Internet Explorer EOL for list of Windows operating systems supporting Internet Explorer.</p>

Does the EOL impact my running automations if they are running on OS versions other than Windows 10 Professional or Enterprise licensed through the Semi-Annual Channel (SAC)?

No, your automations will not be impacted if they are running on OS versions other than Windows 10 Professional or Enterprise licensed through SAC. For more information, see the FAQ available from Microsoft.

[Internet Explorer EOL](#)

My organization has legacy apps and websites based on Internet Explorer 11 that are automated using Automation 360. We plan to move our legacy apps to Microsoft Edge with Internet Explorer mode before the EOL date. What will happen to my existing automations built on Internet Explorer 11?

After you move your legacy apps to Microsoft Edge with Internet Explorer mode, the automations that you previously built on Internet Explorer 11 will run only after you edit them and make them work for Microsoft Edge with Internet Explorer mode.

You might have to capture the objects again and update the corresponding actions on these objects so that the automations can run successfully on Microsoft Edge with Internet Explorer mode.

My application is running on Microsoft Edge with Internet Explorer mode. Can I create and run object-based automations on Microsoft Edge with Internet Explorer mode using Automation 360?

Yes, starting from Automation 360 v.23, object-based automations are supported for Microsoft Edge with Internet Explorer mode. You can record objects and perform various actions by using Universal Recorder to automate your applications that run on Microsoft Edge with Internet Explorer mode.

Note: A separate plug-in extension is not required. You can use the Microsoft Edge plug-in extension for your Microsoft Edge browser with Internet Explorer mode as well.

Will Automation Anywhere provide any tool to convert automations that use Internet Explorer to Microsoft Edge?

Microsoft recommends users to use Microsoft Edge in Internet Explorer Compatibility mode. We will be providing a utility to convert automations that use Internet Explorer to use Microsoft Edge in Internet Explorer Compatibility mode.

Migration FAQ

What is the guidance for Automation 360 users on the general availability of a conversion tool?

For Automation 360 users, we are planning a patch release on Automation 360 v.24 for On-Premises and Cloud users. You must apply this patch to take advantage of the support for Microsoft Edge with Internet Explorer mode. This patch contains packages that are

certified on Microsoft Edge in Internet Explorer mode and a bot update wizard. You can either manually update your bots or use the bot update wizard to update your bots in bulk so that they work with Microsoft Edge in Internet Explorer mode.

Note: On-Premises users can get early access to this patch to test it in the dev environment.

What is the guidance for Enterprise 11 users on the general availability of a conversion tool?

For Enterprise 11 users, we are planning to release a patch on the Version 11.3.5.x trail to support Microsoft Edge in Internet Explorer mode. You must update to the latest version to take advantage of this patch. Along with this patch, a conversion utility and an enhanced Bot Scanner will also be released. With the enhanced Bot Scanner, you can get statistics on the usage of Internet Explorer in your bots so that you can plan and devise an overall conversion strategy. You can either manually update your bots or use the conversion utility to convert your bots in bulk to work with Microsoft Edge in Internet Explorer mode.

Note: You can get early access to this patch to test it in the development (dev) environment.

If you are migrating from Enterprise 11 to Automation 360, you can combine the migration and conversion of your bots to use Microsoft Edge in Internet Explorer mode in a single operation after updating to the Automation 360 v.24 patch.

What options are available for users to maintain business continuity if their automations are being affected by the Internet Explorer EOL?

You can maintain business continuity by choosing one of the following options:

- 1.** Change the license of your Windows version from Semi-Annual Channel (SAC) to Long-Term Servicing Channel (LTSC).
For details, see [Internet Explorer EOL](#).
- 2.** Upgrade the Windows operating system version for your device that is running automations to a version other than Windows 10 SAC.
For details, see [Internet Explorer EOL](#).
- 3.** Manually edit the affected bots by recapturing the application objects by using supported browsers (other than Internet Explorer) and change the window

titles, variables, or any of the corresponding actions that are browser-specific. Validate your automation and run the updated bots on target applications in the selected browser.

Note: This is not applicable to migrated Enterprise 11 or Enterprise 10 bots that use the Web Recorder command.

4. Recreate the bots, replacing the old ones by using any of the supported browsers, such as Microsoft Edge or Google Chrome.
5. Use the conversion tool provided by Automation Anywhere to convert your bots based on Internet Explorer to Microsoft Edge with Internet Explorer mode.

Note: The tool cannot be used to convert bots built in Internet Explorer to other supported browsers, such as Google Chrome, Microsoft Edge (Standard mode), or Mozilla Firefox.

After the Windows update, Internet Explorer requests are redirected to Microsoft Edge. Will the IE mode be set automatically or need to be set manually?

- The approach recommended by Microsoft is to register your site or application running on Internet Explorer to the Microsoft Site List manager.

For details, see [Enterprise Mode and the Enterprise Mode Site List](#).

- Alternatively, you can list certain websites to open only in IE mode by using the Microsoft Edge IE mode compatibility settings in Microsoft Edge. Note that these settings need to be updated every 30 days.

Migration scenario A: If you are new to Automation 360 and have bots built using Internet Explorer, or if you have migrated from Enterprise 11 or Enterprise 10 to Automation 360 and have bots built using Internet Explorer, review the following information.

What do I need to do to ensure that my automations built on Internet Explorer continue to run after Internet Explorer reaches EOL?

To ensure that your automations continue to run on Internet Explorer after EOL, you need to do the following:

- Register your site or application running on Internet Explorer to the Microsoft Site List manager. For details, see [Enterprise Mode and the Enterprise Mode Site List](#).
- Update Automation 360 to the latest patch on Automation 360 v.24 release with

support for Microsoft Edge with Internet Explorer mode.

- Use the Update bot wizard to convert each bot running on Internet Explorer to Microsoft Edge with Internet Explorer mode.
 - Bots that do not use commands related to Internet Explorer will not be converted.
 - If the bot update is completed without any errors, a new version of the bot will be created in the Control Room public repository.
- Check the update bot report to see whether you need to review the updated bot or take any action.
- Run the updated bot to validate that the bot runs fine in Microsoft Edge with Internet Explorer mode.

I am using an earlier version of Automation 360 On-Premises. Can I directly update to Automation 360 v.24 patch release or should I manually uninstall the previous version and install the new patch version?

Yes, you can directly update your existing Automation 360 version to the latest Automation 360 v.24 patch release.

Note that we support directly updating from n-3 releases (where n is the latest release). For updating from a version of Automation 360 earlier than that, you must perform a multistep update. For example, if you are on Automation 360 v.19, you must first update to Automation 360 v.22 and then to Automation 360 v.24.

Do I need to update my Automation 360 Bot Agent?

Yes, the Bot Agent needs to be updated.

Starting from the Automation 360 v.24 release, Bot Agent update is optional with some releases.

Migration scenario B: If you are currently on Enterprise 11 or Enterprise 10 and plan to migrate to Automation 360, review the following information.

I have not started the migration to Automation 360 yet. What is your recommendation for planning the migration?

Migration to Automation 360 involves the conversion of the Enterprise 11 or Enterprise 10 bots to Automation 360 compatible format so that the converted bot runs successfully in Automation 360.

If these bots are automated using Internet Explorer 11, then you will have to include the efforts involved in further converting these bots to Microsoft Edge with Internet Explorer mode and validate the bots in the new browser.

If you are on Enterprise 11 and are impacted by Internet Explorer EOL, our recommendation

is that you continue on Enterprise 11 and convert the bots related to Internet Explorer to Microsoft Edge with Internet Explorer mode so that you can test and validate the bots before the EOL date.

For details on the conversion tool, see [Enterprise 11 and upcoming Internet Explorer 11 EOL FAQ](#). Migration to Automation 360 can be planned at a later date according to your convenience.

If you are on Enterprise 10 and are impacted by Internet Explorer EOL, we recommend that you migrate to Enterprise 11 first and convert the bots related to Internet Explorer to Microsoft Edge with Internet Explorer mode so that you can test and validate the bots before the EOL date.

For details on the conversion tool, see [Enterprise 11 and upcoming Internet Explorer 11 EOL FAQ](#). Migration to Automation 360 can be planned at a later date according to your convenience.

For any new bots that you plan to build in Enterprise 11 or Enterprise 10, we recommend that you build them in Automation 360 by using any of the supported browsers to minimize the impact of the Internet Explorer EOL.

Migration scenario C: If you are currently on Enterprise 11 or Enterprise 10 and are in the middle of migration to Automation 360, review the following information.

I have migrated a few bots to Automation 360, which use Internet Explorer, and have a few bots that are pending migration in Enterprise 11, which use Internet Explorer. What is your recommendation regarding maintaining two parallel environments?

If you are in the middle of your migration journey, maintaining two parallel environments where there are bots based on Internet Explorer on both Enterprise 11 and Automation 360 versions, then you need to ensure that these bots are converted to Microsoft Edge in Internet Explorer mode in their respective environments in case you cannot complete migration of your pending Enterprise 11 bots to Automation 360 before the Internet Explorer EOL.

For Enterprise 11 bots based on Internet Explorer, upgrade your Enterprise 11 to the latest Version 11.3.5.x patch release, which supports Microsoft Edge with Internet Explorer mode. After the upgrade, use the Enterprise 11 conversion utility to convert these bots in Microsoft Edge with Internet Explorer mode so that these bots continue to run in Enterprise 11 even after the Internet Explorer EOL.

Similarly, for Automation 360 bots based on Internet Explorer, update to the latest Automation 360 v.24 patch release, which supports Microsoft Edge with Internet Explorer mode. After the update, use the Automation 360 bot update wizard to convert these bots in Microsoft Edge with Internet Explorer mode so that these bots continue to run in Automation 360 even after Internet Explorer EOL.

You can later decide when to migrate the Enterprise 11 bots converted to Microsoft Edge with Internet Explorer mode to Automation 360. When you decide to do so, note that you can use the Automation 360 Bot migration wizard without the **Convert bots built using IE to Edge with IE mode** option.

For details, see [Bot Migration Wizard](#) on page 1526.

Note: For Enterprise 10 bots based on Internet Explorer, we do not plan to release a patch on Enterprise 10 that supports Microsoft Edge with Internet Explorer mode. Hence, Enterprise 10 users must ensure that their bots based on Internet Explorer are migrated to Automation 360 v.24 patch release.

How can I determine which bots use commands or actions related to Internet Explorer and hence require conversion to Microsoft Edge with Internet Explorer mode?

For Enterprise 11 bots, you can run the Bot Scanner utility with an option to scan bots for Internet Explorer usage. This utility generates a report that lists all the bots that use commands related to Internet Explorer.

For Automation 360 bots, the tool to scan bots and generate Internet Explorer usage report is currently not available.

Do I need to manually change the bot after it is migrated to Automation 360 using the Bot Migration Wizard along with the Convert bots built using IE to Edge with IE mode option?

Yes, only for bots that are migrated to Automation 360 with **Action Required** or **Review Required** messages. Review the messages in the Migration Report that suggest that the user edit the bot, for example, if the bot uses a reference of Internet Explorer in the window title through a variable, file, and so on.

Contact your assigned CSM or Support for any further questions about this change.

Known behavior and limitations

The following table lists known behavior and limitations that apply to bots migrated from Enterprise 11 to Automation 360 and to Automation 360 bots that run on Microsoft Internet Explorer and are converted to Microsoft Edge with IE mode.

Description	Applies to Enterprise 11 to Automation 360 (migration)	Applies to Automation 360 to Automation 360 (updating)
The bot conversion utility updates only bots that use Internet Explorer for automations and does not update bots that use other browsers.	Yes	Yes
For web pages or URLs to open in Microsoft Edge with Internet Explorer mode, you must register your site or application running on Internet Explorer to Microsoft Site List Manager or Group Policy within your organization. Enterprise Mode and the Enterprise Mode Site List	Yes	Yes
The Open Program/File command that contains a variable to store the location of the program or file property is not migrated or converted to use Microsoft Edge with Internet Explorer mode. If the variable is pointing to Internet Explorer, update it to point to Microsoft Edge browser instead.	Yes	Yes
The following commands are not migrated or converted because browser components such as the menu bar, status bar, favorites bar, command bar, and other non-web page components differ in each browser. This can potentially impact captured screens or properties of the actions. We recommend that you review and recapture the screen or update the properties if required. <ul style="list-style-type: none">• Image Recognition• OCR• Mouse• Wait> Wait for screen (Menu/Non-HTML objects)• Screen• Recorder• App Integration > Capture area	Yes	Yes
Keystroke action that is based on the menu bar of a browser is not migrated or converted.	Yes	Yes
For Mouse commands such as Click, Move or Scroll , due to the difference in header bar height in Internet Explorer and Microsoft Edge with Internet Explorer mode, there might be an incorrect Y-axis after the migration or conversion. <hr/> Note: This difference applies only to the Y-axis and not X-axis. <hr/>	Yes	Yes

Description	Applies to Enterprise 11 to Automation 360 (migration)	Applies to Automation 360 to Automation 360 (updating)
<p>In the Image Recognition command, when the target image is on the lower and upper boundaries of the source image, the command is not migrated or converted because of the difference in the height of the header bar in Internet Explorer and Microsoft Edge browsers. The following target actions are impacted: Right click, Left click, and Double click.</p>	Yes	Yes
<p>Review and recapture all commands, except Image Recognition that captures window coordinates with negative values, after migration or conversion.</p> <hr/> <p>Note: In Enterprise 11, the coordinates are captured the top-left of the screen at 0, 0. In Automation 360, the coordinates are captured as negative values.</p> <hr/>	Yes	Yes
<p>Due to differences in the height of the header bar in Internet Explorer and Microsoft Edge with Internet Explorer mode, the output of the actions might not be as expected. The following commands are impacted:</p> <ul style="list-style-type: none"> • OCR> Capture area • Mouse <ul style="list-style-type: none"> • Button: Left button, Middle button, Right button • Event: Click, Double click, Button down, Button up • Screen> Capture area 	Yes	Yes
<p>Window titles with regular expression variables containing partial text from Internet Explorer might be converted to the corresponding title in Microsoft Edge. However, sometimes the conversion might not happen. For example:</p> <ul style="list-style-type: none"> • Internet • .Int, • Int • Expl* • .Expl • Internet Exp 	Yes	Yes
<p>Using the Microsoft registry setting, if you have changed the default text of the Internet Explorer window title bar to your preferred text, the changes applied on the title bar are not available after conversion.</p>	Yes	Yes

Description	Applies to Enterprise 11 to Automation 360 (migration)	Applies to Automation 360 to Automation 360 (updating)
<p>In the Open Program/File, if you have used the <code>taskkill /F /IM iexplore.exe</code> command to terminate Internet Explorer, then after conversion, when you run the bot, it will forcefully terminate <code>msedge.exe</code>. But when you run the bot for the second time, it will display a Microsoft Edge Closed Unexpectedly error message. We recommend that you avoid the use of <code>/F</code> so that the bots run seamlessly.</p>	Yes	Yes
<p>Local HTML files are not supported for loading in Microsoft Edge with Internet Explorer mode through Enterprise Site List Manager.</p> <p>Workaround: You can deploy the local HTML file in localhost.</p> <p>Example: The <code>file:///C:/SampleHTML/sample.html</code> URL will be replaced with <code>https://localhost/SampleHTML/sample.html</code></p>	Yes	Yes
<p>The wait for the browser does not work for Microsoft Edge with Internet Explorer mode for commands such as Mouse, Insert Keystrokes, or Recorder. After conversion, the User32 API does not return the child window list. As a result, it cannot find the page Microsoft Edge with Internet Explorer mode.</p>	Yes	Yes
<p>Object Cloning commands developed on a Citrix environment with Xen App Remote Agent and Microsoft Edge with Internet Explorer mode are not supported.</p> <p>Object Cloning commands developed on Silverlight and Flash technologies and Microsoft Edge with Internet Explorer mode are not supported.</p>	Yes	Not applicable

Description	Applies to Enterprise 11 to Automation 360 (migration)	Applies to Automation 360 to Automation 360 (updating)
<ul style="list-style-type: none"> Object Cloning commands (with coordinates play mode) where Internet Explorer based toolbar is enabled and locked are not migrated or converted. Object Cloning commands (with coordinates play mode) are not migrated or converted because browser components such as menu bar, status bar, favorites bar, command bar, and other non-web page components differ in each browser. This can potentially impact the captured screens or the properties of the actions. We recommend that you review and recapture the screen or update the properties if required. Due to the difference in the height of the header bar in Internet Explorer and Microsoft Edge with Internet Explorer mode, an incorrect Y-axis might occur after the migration or conversion. This difference can be seen in Get text, Set text, Left click, Right click, Middle click, Double click of the coordinates play mode. <hr/> <p>Note: This difference applies only to the Y-axis and not X-axis.</p> <hr/>	Yes	No
Migrated bots with Mouse Click command might not work as expected when the Relative to property is Screen. This is because of the difference in the offset of the address bar between Internet Explorer and Microsoft Edge.	Yes	Yes
Objects captured on Internet Explorer using Standard or Legacy technology in the Object Cloning command will not work after migration or conversion.	Yes	No
The commands that store window titles with wildcard characters such as *Applet* are based on the Internet Explorer browser window with Web Java technology. If you have selected the None of the above option for such commands, note that the commands will not work in Microsoft Edge with IE mode as these are not migrated to Edge.	Yes	No
Bot Scanner does not count the commands that use variables to store the window title as part of the statistics. However, these commands are displayed in the Review Required tab so you can review these commands manually to verify if the window title is based on the Internet Explorer browser window.	No	Yes
